TECHNICAL REFERENCE MANUAL

NVIDIA Tegra K1 Mobile Processor

Abstract

The Technical Reference Manual focuses on the logical organization and control of Tegra K1 mobile processors. It provides information for those modules that interface to external devices, or those that control fundamental chip operations. The modules detailed in this document provide an overview, any necessary programming guidelines, and a register listing for that module. Internal functional units such as video and graphics hardware acceleration are controlled by NVIDIA provided software and not documented here.

Revision History

Version	Date	Description
v01p	MAR 20, 2014	Public release to support Open Source Development. This document is a work in progress. There will be follow-up releases as new information is made available.
v02p	JUL 15, 2014	• Revised DSI and eDP maximum resolution to 3200x2000. • I2C Controller: Revised encoding for BC_TERMINATE field. • USB Complex: Revised maximum packet size supported on any endpoint to 1024 bytes. Clarified encoding of MEM_ALIGNMENT_MUX_EN fields.
v03p	OCT 15, 2014	• Activity Monitor/HDMI: New sections. • APB: Added “APB_MISC_GP_MIPI_PAD_CTRL_0”. Moved SATA_AUX registers to the SATA section. • AVP Cache Controller: Added “Initializing the AVP Cache Controller”. Added registers from offsets 0x18 through 0x84. • Clock and Reset Controller: Added “CLK_RST_CONTROLLER_PLLE_SS_CNTL_0” and “CLK_RST_CONTROLLER_PLLD2_SS_CFG_0”. Updated reset and default values of CLK_RST_CONTROLLER_PLLC3_MISC_0_0. • I2C Controller: Corrected encoding of I2C_I2C_BUS_CLEAR_CONFIG_0 register. • Interrupt Controller: Added “EVP Registers”. • MIPI-CSI (Camera Serial Interface): Updated the Pin Muxing for DSI and CSI Controllers figure. • Power Management Controller: Updated the description of the APBDEV_PMC_NO_IOPOWER_0 register. Added “Secure Boot Registers”. • SATA Controller: Added steps for System Power Management driver using software override to “ELPG Entry” and “ELPG Exit”. • SPI Controller: Added “Known Limitations” and “Special Guidelines for Slave Mode”. Clarified packet size in Unpacked Mode for Master and Slave modes. • Thermal Sensor: Added “Temperature Sensor Calibration Registers”.

1.0 INTRODUCTION

The NVIDIA® Tegra® K1 mobile processor is a complete applications and digital media system built around several powerful hardware elements:

- Graphics: NVIDIA® GeForce® Kepler Graphics Processing Unit (GPU). The GPU fully supports DX11, Shader Model 4, and OpenGL4.3 as well as OpenGL ES 3.0. It supports Unified shaders and is GPU compute capable with 192 CUDA cores. The GPU supports all the same features as discrete NVIDIA GPUs, including PhysX, CUDA, OpenCL, and DX compute. It is highly power optimized for best performance in mobile use cases.
- CPU Complex: Quad Cortex®-A15 Symmetric Multi-Processing ARM® Cores in a 4-PLUS-1™ configuration with a quad-core fast CPU complex and a fifth Battery Saver Core. The Cortex-A15 core features triple instruction issue and both out-of-order and speculative execution. It has full cache coherency support for the quad symmetric processors. All processors have 32 KB Instruction and 32 KB Data Level 1 caches; and there is a 2 MB shared Level 2 cache for the quad-core complex and a 512 KB Level 2 cache for the fifth core. The NVIDIA 4-PLUS-1 architecture uses the fifth Battery Saver Core, which operates exclusively with the main CPU complex, for very low-power, low-leakage operation at the light CPU loads common to multimedia and lightly loaded use situations.
- Memory Controller: 64-bit DRAM interface providing high bandwidth. LP-DDR3 and DDR3L DRAM types are supported.
- Audio/Video Decoder: the Audio-Video Processor (AVP) subsystem includes dedicated audio and video decode hardware acceleration, an ARM7 processor, and embedded RAM. This subsystem provides full motion playback of up to 1440P high-definition video and supports H.264 BP/MP/HP/MVC, VC-1, VP8, MPEG-2 and MPEG-4 video standards and multiple audio standards with dedicated hardware.
- Video Encoder: A high performance H.264 capable hardware video encoder. This processor supports H.264 BP/MP/HP/MVC and VP8 encoding.
- Imaging: A high-quality hardware accelerated still-image and video capture path, with dual next-generation ISP3s.
- Display: Dual display controllers with MIPI-DSI output, along with LVDS or eDP support for LCD panels and HDMI output for external display devices. Multiple line pixel storage allows more memory-efficient scaling operations and pixel fetching. Hardware display surface rotation is also provided for bandwidth reduction.

In addition to these major elements, Tegra K1 mobile processors have a broad range of peripheral interfaces to enable communication with wireless baseband, other communications peripherals, audio codecs, power management, and mass storage. When combined with baseband and PMIC chips, the Tegra K1 mobile processor provides the functionality needed to build a range of low-power devices. Dedicated high-performance mass storage controllers, with their own DMA engines, free the CPU Complex from routine data management tasks.

1.1 The Role of the Technical Reference Manual

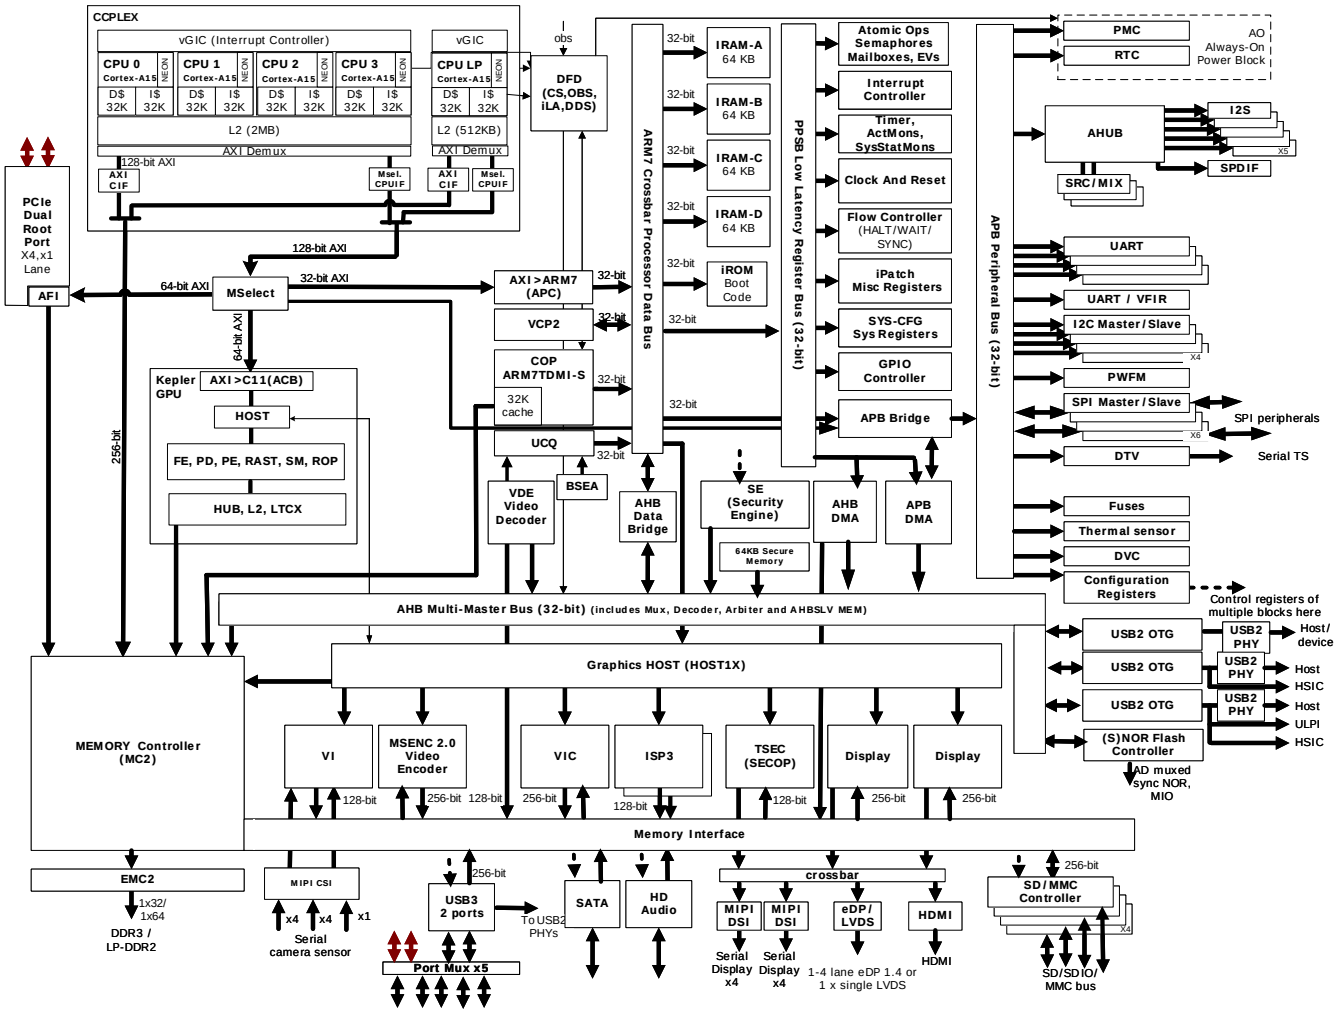
This document is intended to provide guidance to programmers writing code for Tegra K1 devices. It describes the register interfaces and hardware functionality, with the goal to aid anyone in understanding and potentially modifying the NVIDIA provided code.

It may also describe hardware functions not currently supported by NVIDIA drivers; thus the description of a capability in this document does not necessarily imply software support for that function.

1.2 Block Diagram

This diagram provides an overview of a Tegra K1 mobile processor.

Figure 1: Tegra K1 Processor Block Diagram



1.3 Memory Controller and Internal Bus Architecture

The Tegra K1 mobile processor has a highly optimized 64-bit memory controller, supporting low latency access for the CPU, optimized high bandwidth access for the graphics and video devices, and controlled latency for real time devices such as display.

There is a three-level hierarchy of memory clients:

1. Memory controller clients: The memory controller directly arbitrates between these using a complex algorithm optimizing DRAM efficiency. The highest bandwidth clients all fall into this class, and they communicate directly with the memory controller using a proprietary high-speed bus.
2. AHB devices: These generally have a built-in DMA engine, and share a single memory client using the AHB bus protocol.
3. APB devices: All APB devices are slaves, and are serviced by a shared multi-channel APB DMA controller which is also an APB device.

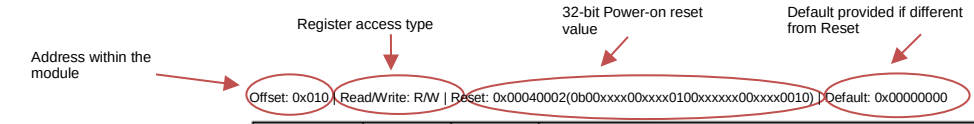
Special provisions are made for the CPU to bypass parts of the memory controller arbitration to help achieve a lower latency.

1.4 Reading Register Tables

Every register table has an address line followed by a table containing the bit descriptions for that register. The address line contains:

- **Offset:** the address of the register within the specific module. Refer to the system memory map for the start address of the module, and apply the offset at the top of the table to get the register address.
- **Read/Write:** the register access type. When a register table contains the R/W column, individual bits within the register will have different R/W properties. When there is no R/W column, all bits in that register have the same R/W property.
- **Reset:** gives the power-on reset value in 32-bit binary. A value of x implies that the register bit has an undefined value at reset. A hexadecimal value is listed for convenience, where appropriate.
- **Default:** only displayed if the default setting is different from the Reset value.

Unspecified bits may not appear in tables (see example below). Unspecified bits should be written with their Reset values, while reads return an unknown value.



Unspecified bits in this example register: 31:26, 23:20, 15:10, 7:4

In the Reset field above the table, most unspecified bits are shown as 'x' in binary format. In hex format, unspecified bits within nibbles are shown as 0 in the Reset field above the table.

At power-on reset, write only the provided reset value to unspecified bits for proper operation. For example, in the Reset field above the table, bits [31:30], which are not specified in the table, must be written as 0s.

Bit	R/W	Reset	Description
25:24	RW	N1	EMEM_NUMDEV 0 = N1 1 = N2
19:16	RO	D64MB	EMEM_DEVSIZE 0 = D4 MB 1 = D8 MB 2 = D16 MB 3 = D32 MB 4 = D64 MB 5 = D128 MB 6 = D256 MB 7 = D512 MB
9:8	RW	W2	EMEM_BANKWIDTH 1 = W1 2 = W2 3 = W3
3:0	RO	W9	EMEM_COLWIDTH 0 = W7 1 = W8 2 = W9 3 = W10 4 = W11

1.5 Glossary

This glossary is intended to cover the Tegra specific acronyms used in this document; along with some others related to the ARM SOC world. Many acronyms in this document are in broad engineering use and are not documented here; we assume you already know what USB and CPU are, for example.

Term	Definition
ADX	Audio Demultiplexer Block, part of the Audio Hub used to demultiplex multiple audio streams.
AHB	AMBA High-Speed Bus, a multi-master high-speed (relative to APB) bus supporting arbitration and split transactions, defined as part of AMBA 2.
AHBSLVMEM	The AHB slave used for the main memory interface. Acts as an AHB slave and provides a path from there to main memory. Refer to the AHB section.
AMBA	Advanced Microcontroller Bus Architecture, a set of standard buses defined by ARM.
AMX	Audio Multiplexer Block, part of the Audio Hub used to multiplex multiple audio streams together.
APB	AMBA Peripheral Bus, a simple 32-bit single master bus for peripheral devices.
APBDMA	A multi-channel DMA controller for devices on the APB bus, performing DMA between APB and AHB.
ARM	Advanced RISC Machines, a company that licenses CPU IP to Tegra. Also: Architecture Reference Manual, so the ARM defines the CPU architecture.
AVP	Audio-Video Processor, the term used both to describe the ARM7 processor in Tegra devices, and to describe the broader audio and video decode acceleration hardware and RAM associated with the ARM7. Note that the AVP is sometimes known as COP in legacy documentation and registers.
AXI	AMBA Advanced eXtensible Interface, a more advanced bus than AHB defined as part of AMBA 3.
BSEA	Bit Stream Engine for Audio applications
CAR	Clock and Reset module allows controlling clocks and resets to all the modules and subsystems in the Tegra processor.
CEC	Consumer Electronics Control, a part of the HDMI interface specification used for sending device control commands, often from a remote control.
COP	CO-Processor, an obsolete name for the AVP still present in legacy documentation and registers.
CSI	MIPI Camera Serial Interface, a standard high-speed serial interface for connecting cameras to the Tegra processor.
DAM	Digital Audio sample-rate conversion and Mixing block, a block within the Audio Hub that performs audio mixing and sample rate conversion
DSI	MIPI Display Serial Interface, a standard high-speed serial interface for connecting displays to the Tegra processor.
DTV	Digital TV input block, used to stream a serial TV transport stream of compressed data into Tegra, using an SPI like protocol.
DVC	Dynamic Voltage Controller module
eDP	Embedded Display Port
EMC	External Memory Controller, a module that interfaces with external DDR/LPDDR devices.
GART	Graphic Address Relocation Table, a now obsolete mechanism for mapping from virtual to physical addresses for devices. Remains in Tegra only as an aperture to memory that may be mapped though the SMMU, the replacement for the GART.
GPIO	General Purpose Input/Output, an I/O signal uncommitted to a specific role and controlled by software.
HDMI	High-Definition Multimedia Interface, a digital connection carrying uncompressed video and audio at high speed over a single connector.
HSI	MIPI High-Speed Synchronous Interface, a standard high-speed serial interface for bi-directional communications with baseband processors and other devices.

Term	Definition
IDE	Integrated Drive Electronics (or Integrated Device Electronics)
ISP	Image Signal Processor, a hardware engine that is part of the camera processing pipeline.
KBC	Keyboard Controller module allows the Tegra processor to be connected to keyboard matrices of sizes up to 11x8.
LVDS	Low Voltage Differential Signaling
MC	Memory Controller module handles requests from internal clients and arbitrates among them to allocate memory bandwidth.
MCCIF or MC-CIF	Memory Controller Client InterFace, the standard interface block between the memory controller sub-system fabric and the client device. Note that some modules may have multiple client interfaces.
MIPI	The Mobile Industry Processor Interface and industry alliance promoting a number of standard interfaces for mobile devices.
MPCORE	Multi-processor CPU core, a generic term for a CPU capable of operating as part of an SMP group.
MPE	An older name for the Video Encoder in the Tegra processor capable of encoding raw video stream into MPEG. Now referred to as MSENC.
MSENC	Multi-Standard video Encoder engine.
NAND	A type of flash memory supporting high densities, and commonly used for non-volatile mass storage in portable devices. Accessed in sequential blocks to be generally treated as a file system.
NOR	A type of flash memory, with a direct bus interface that allows random access so code can be executed in place. Generally more costly and less dense than NAND flash memory.
OGL	Open Graphics Library, also known as OpenGL. An API supported on Tegra devices and accelerated in hardware by dedicated 3D and 2D engines.
PCIe	Peripheral Component Interconnect Express, a high-speed interface for external devices connected to the Tegra SOC.
PMC	Power Management Controller module controls the various power management features in the system.
PPSB	PortalPlayer System Bus, a proprietary register bus used for some blocks. Similar to APB. PortalPlayer is a company that was acquired by NVIDIA, and from where parts of Tegra are derived including this bus.
PWFM	Pulse Width Frequency Modulation module generates programmed pulse widths typically used to control backlight in display panels.
PVT	Process, Voltage, & Temperature
RISC	Reduced Instruction Set Computer, the CPU architecture used by ARM CPUs.
SATA	Serial Advanced Technology Attachment (ATA)
SDMMC	SD and MMC controller. An I/O controller supporting
SLINK	Serial Link, a legacy and now obsolete name for the SPI controller
SMMU	System Memory Management Unit, a block within the memory controller used to map from a virtual address space to physical addresses for device DMA.
SMP	Symmetric Multi-Processing
SOC	System On a Chip, an integrated circuit containing a CPU, memory controller and the peripheral devices needed for a computing system.
SOR	Serial Output Resource. SOR is GPU IP for driving HDMI/DP/LVDS. It converts the output of the display to a more modern high-speed serial protocol. DSI is not included since it's not GPU IP based
S/PDIF	Sony/Philips Digital Interconnect Format
SPI	Serial Peripheral Interface Bus, a synchronous serial data link, that operates in full duplex mode.
TSEC	Tegra Security co-processor, an embedded security processor used mainly to manage the HDCP encryption and keys on the HDMI link.
TZ	Trust Zone, a secure operating environment of the ARM CPU and the related secure parts of the SOC backbone and devices

Term	Definition
TZRAM	Trust Zone secured RAM on the SOC.
UCQ	Unified Command Queue – a sub module within Video Decoder Engine
VCP2	Vector Co-Processor version 2, a hardware acceleration block for the signal processing parts of audio decode and filtering. Use to offload the ARM7 AVP during audio playback.
VDE	Video Decode Engine, a Tegra hardware acceleration block dedicated to decoding compressed video in various formats.
VI2	Video Input 2 block, the acronym used to describe the Tegra K1 block used for camera and related input functions.
VIC	Video Image Compositer, a Tegra K1 block that implements video post-processing functions needed by a video playback application to produce the final image for the player window.

2.2 Available DRAM Address Ranges

Table 2 describes the various address regions that are available as DRAM in Tegra® K1 devices.

The address map available varies by master, because MMIO is not available to any direct MC client except the processors. These other direct MC clients are therefore able to access all DRAMs on 4GB systems, with the spaces reserved for MMIO on the processors available to them as DRAM. This may be used as a carve-out or for similar purposes.

Note: MMIO in Table 2 below refers to the MMIO target, register, or non-DRAM region. Not all of the MMIO regions actually have an MMIO target.
Physical/Virtual Address Range is available for Host1X clients for all apertures.

Table 2: DRAM Address Ranges

Aperture		Range	Size (MB)	H/W Config Option	Physical DRAM Range				IOVA Range Available for:	
					2 GB	3GB	4 GB	>4 GB	COP/ AVP?	AHB Clients?
DRAM		8000_0000 - FFFF_FFFF	2048	Always DRAM	DRAM	DRAM	DRAM	DRAM	Yes	Yes
DRAM2		1_0000_0000 - 2_7FFF_FFFF	6144	Always DRAM	N/A	N/A	N/A	DRAM	No	No
AHB_A2_rsvd		7E00_0000 - 7FFF_FFFF	32	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes

APB_rsvd		7100_0000 - 77FF_FFFF	112	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
APB		7000_0000 - 70FF_FFFF	16	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
ExtIO_rsvd		6900_0000 - 6FFF_FFFF	112	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
ExtIO		6800_0000 - 68FF_FFFF	16	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
PPSB_rsvd		6100_0000 - 67FF_FFFF	112	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
PPSB		6000_0000 - 60FF_FFFF	16	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
GART/GPU_GART		5700_0000 - 5FFF_FFFF	144	Always MMIO	MMIO	MMIO	MMIO	MMIO	Yes	Yes
Graphics Host rsvd (HOST1X_DR_RSVD)		5500_0000 - 56FF_FFFF	32	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
Graphics Host (HOST1X_DR)		5400_0000 - 54FF_FFFF	16	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
Verif Aper + Rsvd		5100_0000 - 53FF_FFFF	48	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes
Host1x+PERIPH[1]		5000_0000 - 50FF_FFFF	16	Always MMIO	MMIO	MMIO	MMIO	MMIO		
Host1X+ PERIPH	Host1x	5000_0000 – 5002_7FFF	160KB	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
	PERIPHBASE	5004_0000 - 5005_FFFF	128KB	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	Yes
	MSELECT	5006_0000 - 5006_0FFF	4KB	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	Yes
NOR_A3		4B00_0000 - 4FFF_FFFF	80	Selectable	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	Yes if no NOR.	Yes if no NOR.
NOR_A2		4900_0000 - 4AFF_FFFF	32	Selectable	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	Yes if no NOR.	Yes if no NOR.
NOR_A1		4800_0000 - 48FF_FFFF	16	Selectable	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	Yes if no NOR.	Yes if no NOR.
IRAM_rsvd		4100_0000 - 47FF_FFFF	112	Selectable	DRAM+	DRAM+	DRAM	DRAM+	Yes	Yes

[1] The Host1X+PERIPH is split into multiple apertures.

Aperture	Range	Size (MB)	H/W Config Option	Physical DRAM Range				IOVA Range Available for:	
				2 GB	3GB	4 GB	>4 GB	COP/ AVP?	AHB Clients?
IRAM	4000_0000 - 40FF_FFFF	16	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No
PCIE_A3	1000_0000 - 3FFF_FFFF	768	Selectable	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	Yes	Yes
PCIE_A2	0200_0000 - 0FFF_FFFF	224	Selectable	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	Yes	Yes
PCIE_A1	0100_0000 - 01FF_FFFF	16	Selectable	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	DRAM/ MMIO	Yes	Yes
IROM_LOVEC	0000_0000 - 00FF_FFFF	16	Always MMIO	MMIO	MMIO	MMIO	MMIO	No	No

Notes:

- The IOVA Range column is available for AVP or AHB clients that have SMMU translation enabled or PA address for AHB clients that have SMMU translation disabled.
- “DRAM” really means “Memory Controller”. In particular:
  - The GART range (5700_0000 – 5FFF_FFFF) has been used as an SMMU bounce range, which through the SMMU points to DRAM.
  - If the system configuration includes a PCIe device, then the PCIE_A* regions need to be configured as MMIO (appropriately as required by address space requirement). If the system does not include any PCIe devices, then these regions should be configured as DRAM.
  - All configurable regions that do not have a real MMIO target (labeled as DRAM+) in the above table should be configured as DRAM to provide the largest and uniform IOVA view (in 2GB or 4GB system) for the AVP and other clients that generate virtual addresses to access DRAM.
- Requests from all clients (except the main CPU) are allowed to use SMMU translation. Any request address range that can reach the MC can be translated by the SMMU.
- SMMU is a sub-unit in the memory controller. Address ranges marked as "No" in the table will not reach the memory controller.
- All Host1x clients can see the full 4GB physical or IOVA range.

Clients/Controllers are logically (static) grouped in different SWNAME/SWID. SMMU translation can be enabled/disabled for individual SWNAME. The following table gives the Client to SW Name mapping details.

Table 3: Client to SW Name Mapping

SW Group	Client	Description
AFI	AFI	PCIe reads
AVPC	AVP Cache	ARM7 Audio-Video Processor (AVP)
DC	Display	Display reads, window A, window C, window D, window T, cursor
DCB	Displayb	Display reads, window B, window C, cursor
GPU	GPU	Kepler GPU, 3D engine
HC	Host1x	Host interface
HDA	HDA	High-definition Audio engine
ISP2	ISP2	Image Signal Processor, instance a
ISP2B	ISP2B	Image Signal Processor, instance b
MPCORE	AXICIF	Cortex-A15 CPU cores, writes
MPCORELP	AXICIF_LP	Cortex-A15 Shadow CPU core, writes
MSENC	MSENC	Multi Standard Video Encoder
PPCS	AHBDMA, AHBSLV	Clients in the AHB cluster (ppcs2mc_swid=1'b0)
PPCS1	AHBDMA, AHBSLV	Same as PPCS, ppcs2mc_swid=1'b0)
PPCS2	AHBDMA, AHBSLV	Same as PPCS, ppcs2mc_swid=1'b0)
PTC	MC (SMMU)	Misses from SMMU PTC
SATA	SATA	Serial ATA
SDMMC1a	SDMMCA	SDMMC1
SDMMC2a	SDMMCAA	SDMMC2
SDMMC3a	SDMMC	SDMMC3
SDMMC4a	SDMMCAB	SDMMC4
TSEC	TSEC	Tegra Security coprocessor
VDE	VDE	Video Decode Engine
VI	VI2	Video Input engine for CSI
VIC	VIC	Video Image Compositer
XUSB_HOST	USB3 Host	Although the same driver is expected to control both units, each has its own SWNAME
XUSB_DEV	USB3 Device	

Note: Requests from all clients (except main CPU) are allowed to use SMMU translation. Any request address range that can reach the MC can be translated by the SMMU.

The clients behind AHBSLV in the above table are:

- VCP
- CSITE
- ARC
- AHBDMA
- USB
- APBDMA
- SNOR
- BSEV
- SE
- DDS
- BSEA
- USB2
- MIPIHSI

Each client in the above list has a SWID register field which controls whether the client maps to PPCS or PPCS1 SWNAME.

3.0 INTERRUPT CONTROLLER

This section provides the mapping and hierarchical groups of the Tegra® K1 family processor interrupts. It also describes the architecture for routing and handling of these interrupts. It describes semaphores, which provide a mechanism for the processors to arbitrate for the use of various resources.

From the perspective of interrupts: devices (GPU, Memory Controller, Video encode/decode engines, and various I/O devices) are the sources of interrupts; and processors are the target of interrupts. From sources, interrupts go to interrupt controllers which, based on configuration, prioritize and route them to the appropriate target processor. There are two different types of interrupt controllers used in Tegra K1 devices: The ARM® vGIC and the Legacy Interrupt Controller (LIC).

Glossary and Acronyms

Acronym	Description
COP	Refers to ARM7™ AVP
CPU	Unless specified otherwise, refers to CPU complex
FIQ	Fast Interrupt Request
GIC	Also known as vGIC, see below
IPI	Inter Processor Interrupt
IRQ	Interrupt Request
LIC	Legacy Interrupt Controller (used for the ARM7 AVP)
MSI	Message Signaled Interrupt
PPI	Private Peripheral Interrupts
SGI	Software Generated Interrupt
SMP	Symmetric MultiProcessors
SPI	Shared Peripheral Interrupts
vGIC	Virtual GIC (also known as GICv2, part of the CPU complex)
WFE	Wait For Event (an ARM instruction)
WFI	Wait For Interrupt (an ARM instruction)

3.1 References

Some ARM documentation is required to fully understand the Tegra interrupt architecture. Refer to ARM's website for further details and to access these.

Document	Description
vGIC Architecture	ARM Virtual Generic Interrupt Controller (also known as GIC v2) Architectural Specification
Timers Architecture	ARM Generic Timer Architectural Specification
Cortex-A15 TRM	Cortex-A15 Technical Reference Manual for Cortex-A15 implementation specific information (Tegra K1 32-bit).
ARM Technical Reference Manual v8	For implementation specific information (Tegra K1 64-bit)

3.2 Interrupt Mapping

The following five tables show the mapping of the interrupts from system devices to the bit fields in the Tegra K1 interrupt controllers.

Interrupts to the CPU's embedded interrupt controller (vGIC) are in this same order, but start at offset 32 because the first 32 are reserved for the CPU's internal interrupts.

Table 4: Primary Interrupt Controller (PRI_ICTRL) Mapping

Global Interrupt Number	Interrupt Target	LIC Interrupt Number	Interrupt Name	Source Block	Interrupt Description	Interrupt Order
31		31	SDMMC4	SDMMC	SDMMC4 Controller	0
30		30	OWR	OWR	OWR Interrupt	0
29	CPU	29	ARB_SEM_GNT_CPU	Semaphore	GNT.0 Arbitration Grant Status of CPU	0
28	COP	28	ARB_SEM_GNT_COP	Semaphore	GNT.1 Arbitration Grant Status of COP	0
27	CPU	27	AHB_DMA_CPU	AHB_DMA	AHB DMA Controller (CPU)	0
26	CPU	26	APB_DMA_CPU	APB_DMA	APB Bridge DMA Controller (CPU)	0
25		25	VCP	VCP	VCP	0
24		24	Unmapped		Unassigned	0
23		23	SATA_CTL	SATA	SATA Controller Interrupt	0
22		22	Unmapped		Unassigned	0
21		21	USB2	USB	USB Device	0
20		20	USB	USB	USB Device	0
19		19	SDMMC3	SDMMC	SDMMC3 Controller	0
18		18	AVP_UCQ	AVP_UCQ	AVP UCQ Interrupt	0
17		17	VDE	VDE	VDE Interrupt	0
16		16	Unmapped		Unassigned	0
15		15	SDMMC2	SDMMC	SDMMC2 Controller	0
14		14	SDMMC1	SDMMC	SDMMC1 Controller	0
13		13	SATA_RX_STAT	SATA	SATA RX Wake Up Interrupt	1
12		12	VDE_SXE	VDE	VDE SXE Interrupt	3
11		11	VDE_BSEA	VDE	AVP BSEA Interrupt	0
10		10	VDE_BSEV	VDE	VDE BSE-V Interrupt	1
9		9	VDE_SYNC_TOKEN	VDE	VDE Sync Token Interrupt	0
8		8	VDE_UCQ	VDE	VDE UCQ Error Interrupt	4
7	CPU	7	SHR_SEM_OUTBOX_ EMPTY	Semaphore	CPU Outbox Empty Interrupt	3
6	COP	6	SHR_SEM_OUTBOX_FULL	Semaphore	COP Outbox Full Interrupt	2
5	COP	5	SHR_SEM_INBOX_EMPTY	Semaphore	COP Inbox Empty Interrupt	1
4	CPU	4	SHR_SEM_INBOX_FULL	Semaphore	CPU Inbox Full Interrupt	0
3		3	CEC	CEC	CEC General Interrupt	0
2		2	RTC	RTC	RTC Interrupt	0
1		1	TMR2	Timer	TMR2 Interrupt	0
0		0	TMR1	Timer	TMR1 Interrupt	0

Table 5: Secondary Interrupt Controller (SEC_ICTLR) Mapping

Global Interrupt Number	Interrupt Target	LIC Interrupt Number	Interrupt Name	Source Block	Interrupt Description	Interrupt Order
63		31	I2C6	I2C	I2C6 Interrupt	0
62		30	CLDVFS	CL-DVFS	Close Loop DVFS control logic	0
61	COP	29	AHB_DMA_COP	AHB_DMA	AHB-DMA Interrupt (COP)	1
60	COP	28	APB_DMA_COP	APB_DMA	APB-DMA Interrupt (COP)	1
59		27	SPI1	SPI	SPI Controller (SBC1)	0
58		26	SE	SE	SE and TZRAM General Interrupt	0
57		25	USB3_DEV_PME	USB3	USB3_DEV_PME	0

Global Interrupt Number	Interrupt Target	LIC Interrupt Number	Interrupt Name	Source Block	Interrupt Description	Interrupt Order
56		24	USB3_DEV_SMI	USB3	USB3_DEV_SMI	0
55		23	GPIO5	GPIO (external)	GPIO4 Interrupt	0
54		22	STAT_MON	sts_stat_mon	SYS_STATS_MON	0

3.3 Hierarchical Groups

The following table is a hierarchical interrupt grouping which generates interrupts for the first level of interrupt controllers.

Table 9: Hierarchical Interrupt Grouping

Hierarchical Interrupt Controller Name	Interrupt Number	Interrupt Name	Source Block	Interrupt Description
HIER_GROUP1	31 - 16	Currently Unmapped		Currently Unassigned
HIER_GROUP1	15	MselectError		Unassigned
HIER_GROUP1	14	MPCORE_CTIIRQ3		CPU3 CTI interrupt
HIER_GROUP1	13	MPCORE_CTIIRQ2		CPU2 CTI interrupt
HIER_GROUP1	12	MPCORE_CTIIRQ1		CPU1 CTI interrupt
HIER_GROUP1	11	MPCORE_CTIIRQ0		CPU0 CTI interrupt
HIER_GROUP1	10	TMR_SHARED	Timer	TMR_SHARED interrupt
HIER_GROUP1	9	FLOW_RSM_COP	FlowCtlr	FLOW - RSM1 Resume for COP or COP1
HIER_GROUP1	8	FLOW_RSM_CPU	FlowCtlr	FLOW - RSM0 Resume for CPU
HIER_GROUP1	7	Currently Unmapped		Currently Unassigned
HIER_GROUP1	6	Currently Unmapped		Currently Unassigned
HIER_GROUP1	5	EVENT_GPIO_D	GPIO (External)	Event Detector GPIO Port D
HIER_GROUP1	4	EVENT_GPIO_C	GPIO (External)	Event Detector GPIO Port C
HIER_GROUP1	3	EVENT_GPIO_B	GPIO (External)	Event Detector GPIO Port B
HIER_GROUP1	2	EVENT_GPIO_A	GPIO (External)	Event Detector GPIO Port A
HIER_GROUP1	1	MPCORE_INTERRIRQ	CCPLEX	CPU INTERRIRQ
HIER_GROUP1	0	MPCORE_AXIERRIRQ	CCPLEX	CPU AXIERRIRQ

3.4 Functional Description

3.4.1 Interrupt Handling Mechanism

The two different types of interrupt controllers (vGIC, and LIC) receive interrupts from devices (i.e., hardware interrupts also known as SPIs) or processors (i.e., software interrupts including IPI), arbitrate them, and send them to the appropriate target

processor(s). From an interrupt perspective, there are two different types of processors: CPUs (Cortex-A15) and COP (ARM7 AVP). The vGIC is the interrupt controller for the CPUs, and the LIC is the interrupt controller for the ARM7 AVP. Any processor can initiate a software interrupt, targeted to any one or more processors (including itself). However, IPIs can only be initiated by a Cortex-A15 CPU to any one or more Cortex-A15 CPUs (including itself).

There are 160 hardware interrupts in Tegra K1 devices. Interrupt sources are allocated one or more interrupts as required. The 160 interrupts are grouped into slices of 32, where each slice can be configured independently.

3.4.1.1 ARM Processors' IRQ and FIQ

ARM processors (Cortex-A15, and ARM7) each have two input pins to receive two different types of interrupts. These interrupts are called IRQ (Interrupt Request) and FIQ (Fast Interrupt Request). The interrupts are implemented as active-low pins on the ARM processor input; thus the processor pins are named nIRQ and nFIQ.

The ARM processor goes into the IRQ mode or the FIQ mode depending up on which interrupt is activated. Generally, interrupts that require low latency or are time critical are configured as FIQ. All other interrupts are configured as IRQ. Non-secure interrupts can only be IRQ.

3.4.1.2 Interrupt Controllers

The interrupt controller receives interrupts from a large number of sources. The interrupt sources can be assigned a target processor, a type (IRQ versus FIQ), priority levels, etc., by configuring interrupt-controller registers. The interrupt controller arbitrates among different incoming interrupts and sends the interrupt to the nIRQ or nFIQ pin of the targeted processor.

In general, any incoming hardware interrupt can be routed to either nIRQ or nFIQ pin of any of the processors.

The Legacy Interrupt Controller (LIC) is primarily used for COP (ARM7). But it is also used for generating interrupts as wake events for CPUs. All of the device hardware interrupt signals are sent to the LIC first, which routes them to the ARM7 AVP as well as forwards them to other interrupt controller. The LIC also provides a software set/clear mechanism for all of the interrupts.

The interrupt controller used for CPUs (Cortex-A15 CPUs) is called vGIC (virtual generic interrupt controller). The vGIC is an SMP interrupt controller. It receives interrupts targeted to any one or more of the CPUs in the SMP complex. There is one vGIC per CPU cluster.

3.4.1.3 vGIC Interrupt Sources

The vGIC supports 256 interrupts. All interrupts are identified by a unique ID. There are three types of interrupt sources for the vGIC: SGIs, PPIs, and SPIs.

Software Generated Interrupts (SGIs)

SGIs are software interrupts which are generated by writing to a vGIC register. Software can generate a maximum of 16 SGIs, with ID0-15. The SGIs are also referred to as IPIs (Inter Processor Interrupts).

Private Peripheral Interrupts (PPIs)

PPIs are interrupts generated by a peripheral that is specific to a single processor.

There are seven PPIs for each CPU: virtual maintenance interrupt (ID25), hypervisor timer interrupt (ID26), virtual timer interrupt (ID27), legacy nFIQ (ID28), secure physical timer interrupt (ID29), non-secure physical timer interrupt (ID30), and legacy nIRQ (ID31).

Tegra K1 devices use all PPIs except for the legacy nFIQ and legacy nIRQ.

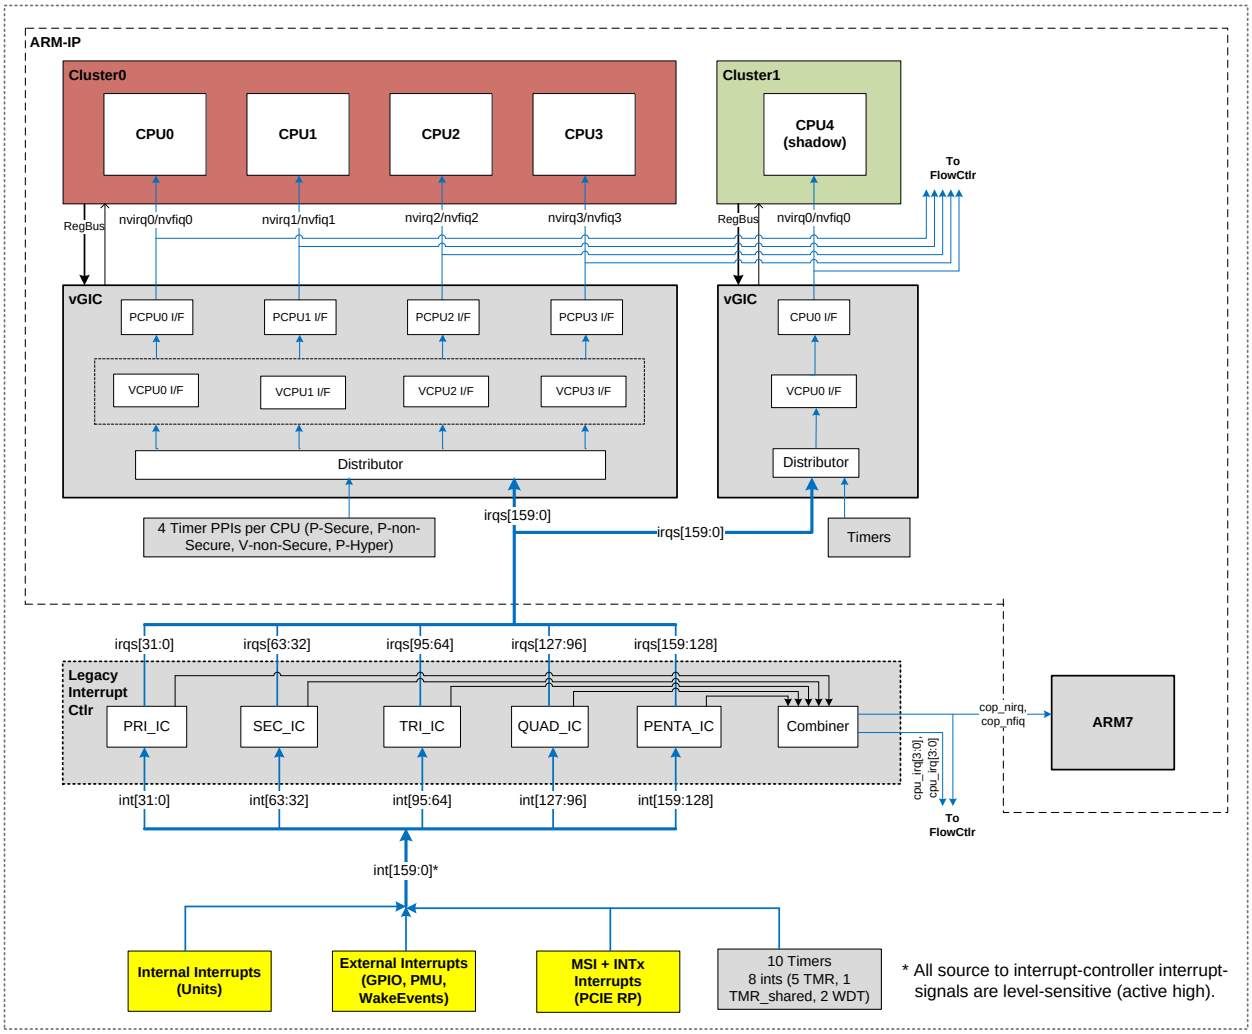
Shared Peripheral Interrupts (SPIs)

SPIs are external hardware interrupts which are generated by asserting signals on vGIC input pins (called IRQs). From a Tegra hardware perspective, these are the interrupts which are generated by various units to be sent to interrupt controllers. Tegra K1 devices use 160 of the possible 224 SPIs generated through the IRQS[223:0] pins. SPIs start at ID32. Tegra K1 devices use level-sensitive SPIs only.

3.4.1.4 Interrupt Routing

Tegra hardware interrupts (also known as shared peripheral interrupts) can be generated either by internal SoC units, external events (through GPIO, USB, etc.), or PCIe® unit (MSI, legacy INTx, or Wake interrupts). All of these hardware interrupts are routed through sideband active-high level-sensitive signals to the LIC. The MSI and INTx (from external PCIe devices) are intercepted by the PCIe unit and converted to a sideband interrupt signal. The PCIe unit ensures MSI ordering; that is, it ensures that upstream writes ahead of MSI have been completed/acknowledged before asserting an interrupt signal to the LIC. Also, the PCIe unit captures MSI information into a register that software can read to identify MSI vectors, etc.

Figure 2: Interrupt Routing (Top-Level View) for Tegra K1 32-Bit



As shown in the figure above, hardware interrupts are routed to the interrupt controllers (called IC32) within the LIC, where each IC32 handles 32 interrupts. The interrupt signals are synchronized within the LIC to the system clock. The synchronized signals are combined with software set/clear bits per interrupt. This allows software to set or clear individual interrupts,

provided the corresponding interrupt is not asserted by hardware. The resulting interrupt signals are broadcast to the LIC (for further processing) and the vGIC. Within the LIC and vGIC, per interrupt and per CPU enable-masks are configured to qualify the interrupt targeted for the corresponding processor. This mechanism allows any interrupt to be targeted to any one or more processors in Tegra K1 devices.

For details on interrupt handling within the LIC and vGIC, refer to the following sections.

3.4.1.5 Interrupt Handling with Targeted CPU and vGIC Powered Off

When a CPU and associated vGIC are powered off (e.g., the CPU rail is powered off for cluster0), then the legacy interrupt controller is configured to act as a “proxy” interrupt controller to generate IRQ/FIQ for that CPU. Also, Tegra K1 timers (instead of vGIC timers) have to be set up if a timer interrupt is required. The flow controller uses legacy interrupt controller IRQ/FIQ to power-up the targeted CPU (and vGIC).

The following sequence describes the steps to follow to handle interrupts when the targeted CPU and vGIC are powered off:

- [SW-CPU] Prepare the CPU (including vGIC) for power off
  - Flush caches and save context
  - Set up the Tegra timer (if required)
  - Configure the corresponding legacy interrupt controller
  - Configure the flow controller for an interrupt (from the flow controller) wake-up event
  - Trigger power-off by WFI/WFE instruction
- [HW-Flow] Power off the CPU with the help of the PMC
- [HW-Flow] Wait for a wake-up interrupt (from the legacy interrupt controller)
- [HW-Flow] At interrupt assertion, power up the CPU with the help of the PMC
- [SW-CPU] Restore the context (including vGIC context)
- [SW-CPU] The CPU receives the interrupt and jumps to the interrupt handler

Because Tegra interrupts are level-triggered, the interrupt that triggered the wake-up is still asserted and is now visible to the vGIC. The vGIC will process the interrupt and send it to the CPU.

3.4.1.6 Interrupt Handling with Targeted CPU Powered Off

Each CPU can be individually powered off while the corresponding vGIC is powered on. In this case, the flow controller uses vGIC interrupts to wake up the CPU. This allows vGIC timers and IPI interrupts to be used as wake events.

The following sequence describes the steps to follow to handle interrupts when the targeted CPU is powered off:

- [SW-CPU] Prepare the CPU for power off
  - Flush caches and save context
  - Configure the flow controller for an interrupt (from the vGIC) wake-up event
  - Trigger power-off by WFI/WFE instruction
- [HW-Flow] Power off the CPU with the help of the PMC
- [HW-Flow] Wait for a wake-up interrupt (from the vGIC)
- [HW-Flow] At interrupt assertion, power up the CPU with the help of the PMC
- [SW-CPU] Restore the context
- [SW-CPU] The CPU receives the interrupt and jumps to the interrupt handler

Because the vGIC IRQ and FIQ are level-triggered, the interrupt that triggered the wake-up is still asserted.

3.4.2 Virtual Generic Interrupt Controller (Tegra K1 32-Bit)

This section describes the Cortex-A15 vGIC (also known as GICv2). Refer to the ARM Cortex-A15 TRM for the vGIC implementation specific specification and/or the ARM vGIC architectural specification.

The vGIC consists of the physical CPU interface and the physical distributor. In addition, to support CPU virtualization it consists of the virtual CPU Interface which is configured by the Hypervisor and used by the virtual machine (VM).

3.4.2.1 Functional Description

Split EOI Functionality

Every interrupt has a priority, and any interrupt being active will prevent another interrupt of equal (or lower) priority from being asserted to the CPU. This causes problems for virtualization where there is not necessarily any well-defined priority for interrupts between the various VMs. To address this problem the functionality associated with EOI is divided into two distinct functions:

- Priority Drop to be used after the interrupt is acknowledged to drop the running priority of the CPU back down but leave the interrupt in the ACTIVE state
- Deactivate Interrupt to be used when the interrupt handling is truly completed by the VM, causing the interrupt to transition from ACTIVE to INACTIVE in the physical distributor.

To avoid Hypervisor intervention being necessary when a Guest OS completes interrupt processing, the virtual CPU Interface is able to directly trigger a Deactivate Interrupt event on the interrupt distributor.

Virtual CPU Interface

The Virtual CPU Interface supports CPU virtualization.

The Virtual CPU Interface provides two sets of registers for each CPU in the system. The “front-end” registers are intended to be mapped into the VM’s IPA space where the Guest OS’ CPU Interface registers are expected to reside. The “back-end” registers are intended to be accessed by the Hypervisor only. The front-end and back-end registers are mapped into separate 4KB address spaces. The back-end registers primarily comprise a list of active and pending interrupts for the current Virtual CPU. These registers are updated by the Hypervisor when new interrupts occur, and by the VCPUIF itself in response to accesses to the front end from the VM.

Security and Virtual FIQ

In ARM virtualization, Hypervisor and all VMs run in the TrustZone™ Non-Secure domain. Therefore, all vGIC features are available to Non-Secure accesses. Protection of the Hypervisor view of the Virtual CPU Interface is achieved using MMU protection. However, some operating systems running as Guests might require the security features of the GIC architecture to allow interrupts to be divided into IRQ and FIQ. To support this, the Hypervisor and Virtual CPU Interface provide a view compatible with the Secure view of the physical GIC, even though the software is running in the Non-Secure domain. This means that the GIC interface includes various security-related bits that have no relationship to TrustZone but exist purely to support this model.

Interrupt Processing in the vGIC

- Physical Interrupt Asserted

  The physical interrupt is routed to the vGIC, which generates an interrupt that is taken by the Hypervisor. The Hypervisor reads INTACK on the physical vGIC to determine the interrupt number. Determining that the interrupt is destined for a virtual machine, the EOI register is written to prevent further interrupts being masked by the vGIC.

  Hypervisor locates an empty list register (in the target VM’s virtual CPU interface) and writes a new value indicating that this is a Valid interrupt in PENDING state, with the physical and virtual interrupt numbers and its priority as assigned by the VM.

- Virtual Interrupt Asserted

  Upon the write to the list register, the VCPU interface will re-evaluate whether to assert the Virtual IRQ signal, based on the priority of the interrupt, any currently active interrupts, and the current setting of the Priority Mask register. Assuming these conditions are met, the Virtual Interrupt signal will be asserted. When the CPU returns to the virtual machine (with the CPSR.I bit clear), the Virtual Interrupt will be taken triggering a jump to the normal IRQ vector.

- Virtual Interrupt Acknowledged

  The Guest OS's interrupt handler will access the VCPU Interface's INTACK register. In response to this, the VCPU interface determines the highest priority PENDING interrupt stored in the list. Its priority is checked against the Active Priorities register and the Priority Mask register. Assuming that the pending interrupt's priority is higher, its virtual interrupt number is returned, its status in the list register changed to ACTIVE, and the corresponding bit in the Active Priorities register is set. Otherwise, the spurious interrupt value is returned. Once the Guest OS has received the virtual interrupt number it is able to execute interrupt processing exactly as it would if it were running on bare hardware with a real GIC.

- Virtual Interrupt EOI

  Once interrupt processing is complete, the Guest OS writes to the EOI register on the VCPU interface to indicate completion. In response, the VCPU interface determines the highest priority ACTIVE interrupt from the list registers, and the highest priority set bit in the Active Priorities register. This highest priority set bit is cleared. Assuming a highest priority ACTIVE interrupt was found, a Deactivate Interrupt signal is sent to the Interrupt Distributor specifying the physical interrupt number from the list register. The list register is updated to indicate that the entry is now empty (INVALID).

Timers

The Cortex-A15 processor provides a set of four timers for each processor in the cluster:

- A Secure Physical Timer and a Non-Secure Physical Timer for use in Secure and Non-secure PL1 modes, respectively. These are generated as two separate interrupts to the core: ID29 (secure) and ID30 (non-secure).
- Virtual Timer for use in Non-secure PL1 modes.
- Physical Timer for use in Hypervisor mode.

The counter value is distributed to the processor with a synchronous binary encoded 64-bit bus, CNTVALUEB[63:0]. Within each processor, a set of Timer registers are allocated to the CP15 coprocessor space.

For more information, see the Timers section in this TRM and the *ARM Architecture Reference Manual v7* for generic timer specifications.

3.4.2.2 vGIC Clock Frequency

The vGIC can operate at any integer multiple that is slower than the main Cortex-A15 CPU clock (CLK) using the PERIPHCLKEN signal. For example, the CLK to internal vGIC clock frequency ratio can be 2:1 or 3:1. PERIPHCLKEN is asserted one CLK cycle prior to the rising edge of the internal IC clock. The CLK to internal vGIC clock frequency ratio can be changed dynamically using PERIPHCLKEN.

Both CPU clusters (cluster0 and cluster1) incorporate their own vGIC. The vGIC runs at half the CPU CLK frequency of the cluster it is in.

3.4.2.3 vGIC Context Save/Restore

The vGIC and timers are part of the Cortex-A15 non-CPU (also known as L2) logic. The cluster0 vGIC is powered by the CPU rail, and cluster1 is powered by the SoC rail. Also, if non-CPU is power gated then vGIC is power gated as part of non-CPU partition.

In general, the vGIC context needs to be saved/restored in following cases.

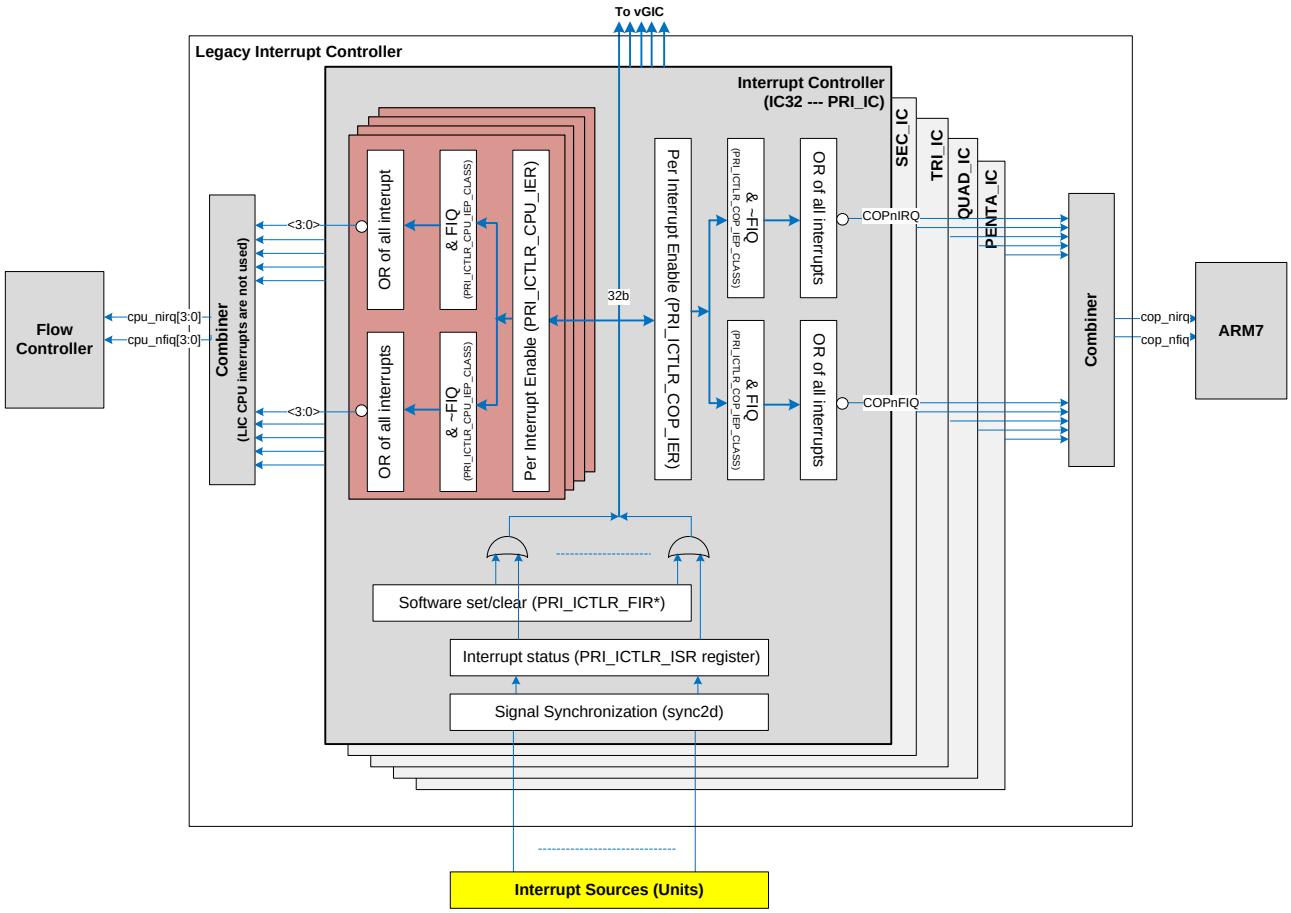
- When CPU(s) is individually power gated (i.e., LP2 power state), the vGIC is still powered, so the vGIC context does not have to be saved/restored. Therefore, CPUs can be individually powered-off (that is, put into the LP2 state) and powered on without saving/restoring their vGIC context.
- When the non-CPU partition is power-gated or the CPU rail is powered off, the context of the corresponding vGIC needs to be saved.
- When one cluster is migrated to the other cluster, the VGIC context needs to be migrated from the source cluster to the destination cluster.
- When the SoC rail is powered off (that is, LP0 power state), the vGIC is powered off. Thus the vGIC has to be configured/restored at LP0 exit (warm boot)
- When using the virtualization extension of the vGIC, for switching from one VM to another, Hypervisor will save the contents of all the back-end registers (i.e., VM view of VCPU Interface registers) from the outgoing VM and load them into the registers for the incoming VM. This restores the VCPU interface to the correct state for the incoming VM.

  When a VCPU is migrated (context switched) to another physical CPU, the software has to save the contents of all the back-end registers (that is, the VM view of the VCPU Interface registers) associated with the outgoing CPU, and load them into the corresponding registers of the incoming CPU.

3.4.3 Legacy Interrupt Controller (LIC)

Interrupts from various Tegra K1 units are routed to the LIC. The LIC consists of five interrupt controllers (called IC32); each IC32 handles 32 interrupts (for a total of 160 interrupts). Each IC32 generates five sets of IRQ/FIQ interrupts: one for COP (ARM7) and the other ones for CPU<3:0>. The interrupts for CPU<3:0> are used by the flow controller only for wake events.

Figure 3: Legacy Interrupt Controller Block Diagram



The following text discusses interrupts as they relate to the COP IRQ/FIQ interrupts. Unless specified otherwise, this also applies to the CPU<3:0> IRQ/FIQ interrupts.

3.4.3.1 LIC Functional Description

Each IC32 in the LIC handles 32 interrupts. As shown in above figure, the IC32 synchronizes the incoming hardware interrupt requests and combines (bitwise OR) them with software interrupts (FIR). The software interrupt can set be set or cleared by the FIR register. The combined software/hardware interrupt signals are broadcast to the vGIC, and are used by the IC32 for targeting interrupts to the COP. This allows any interrupt to be routed to any one or more processors (Cortex-A15/ ARM7) in a Tegra system. Note that routing can be changed dynamically. In addition, any of these interrupts can be mapped to either IRQ or FIQ.

The interrupt routing (to the COP) is achieved by configuring the Interrupt Enable Register (IER) and the Interrupt Class Registers (IEP_CLASS). Each IC32 has a set of IER and IEP Class registers. The COP registers are called COP_IER and COP_IEP_CLASS. Similarly, the CPU IER/IEP Class Registers are called CPU_IER/CPU<1,2,3>_IER and CPU_IEP_CLASS/CPU_IEP_CLASS.

When a 1 is set in the proper bit position in the COP_IER register, that particular source is capable of interrupting the COP. Also, the class is set in the proper bit position of COP_IEP_CLASS for the corresponding interrupt to be routed as IRQ or FIQ.

The interrupt status register (ISR) allows the processor to view the state of the pending hardware interrupt requests regardless of the bit enables programmed in COP_IER. The forced interrupt status register (FIR) allows the software to selectively force set or clear specific interrupts. The read-only VIRQ/VFIQ allows the COP to determine the source of the interrupt request(s) causing the processor to enter the interrupt service routine.

The nIRQ signals generated by five IC32 controllers are logically ANDed in the combiner to generate the final nIRQ (called nirq1 in the above diagram) which is routed to the COP. Similarly, nFIQ signals are logically ANDed in the combiner to generate nFIQ which is routed to the COP.

3.4.3.2 LIC Registers Description

The LIC consists of five interrupt controllers (called IC32); each IC32 handles 32 interrupts (for a total of 160 interrupts). Each IC32 defines two sets of registers: one set for the COP (ARM7) and other set for the Cortex-A15 CPU.

Each IC32 has sixteen 32-bit registers. The COP and CPU<n> interrupt enable registers (COP_IER/CPU_IER) indicate the interrupts enabled for the COP and CPU<3:0>, respectively. These registers have their respective SET and CLR registers that allow setting or clearing individual bits of these registers without the need of a Read-Modify-Write cycle.

The COP/CPU Interrupt Class Register (COP_IEP_CLASS/CPU_IEP_CLASS) controls whether the interrupt will be routed to the IRQ or the FIQ interrupt of the respective processor.

The Forced Interrupt Status Register (FIR) allows the software to force the set and clear of individual interrupts. This could be used for debugging/testing purposes or could be used in the working system. Note that software cannot force set/clear an interrupt which is already asserted by a hardware source. The FIR has its corresponding SET and CLR registers.

The Valid Interrupt Status Register (VIRQ_COP/VIRQ_CPU) and Valid FIQ Interrupt Status Register (VFIQ_COP/VFIQ_CPU) indicate the currently active interrupts that are valid on the respective pins (nIRQ or nFIQ).

The differences between ISR and VFIQ/VIRQ registers are:

- The VFIQ/VIRQ registers indicate the interrupt which is sent to the processor (i.e., these registers indicate interrupts outgoing from the interrupt controller). On the other hand, ISR indicates hardware interrupt incoming into the interrupt controller.
  - The VFIQ/VIRQ registers indicate the interrupts set by hardware or by software. The ISR register indicates registers set by only hardware.
  - The VFIQ/VIRQ registers only show the enabled interrupts. ISR shows the interrupt status irrespective of whether the interrupt is enabled or not.
  - The ISR shows the interrupt to be active whether it is routed to the FIQ pin or to the IRQ pin. The VFIQ/VIRQ registers contain only the routed interrupts.

The VIRQ_COP and VIRQ_CPU registers are calculated as follows.

VIRQ_COP = (ISR **|** FIR) **&** IER_COP **&** (**~**COP_IEP_CLASS)

VIRQ_CPU<n> = (ISR **|** FIR) **&** IER_CPU<n> **&** (**~**CPU_IEP_CLASS)

Similarly, the VFIQ_COP and VFIQ_CPU<n> registers are generated as follows.

VIRQ_COP = (ISR **|** FIR) **&** IER_COP **&** COP_IEP_CLASS

VIRQ_CPU<n> = (ISR **|** FIR) **&** IER_CPU<n> **&** CPU<n>_IEP_CLASS

3.4.3.3 Hierarchical Interrupts Grouping

To reduce the number of interrupts (as seen by interrupt controllers also known as IRQs), interrupt sources that are non-critical or unlikely to be used are grouped together. The hierarchical interrupt group (HIER_GROUPx) assembles 32 interrupts into two interrupts: one for the CPU (called HIER_GROUPx_CPU) and the other one for the COP (called HIER_GROUPx_COP). There is a software configurable enable register (HIER_GROUPx_{CPU,COP}_ENABLE) for each of the two interrupts which can be independently programmed to select interrupts for that destination. Also, there is a status register (HIER_GROUPx_{CPU,COP}_STATUS) for each of the two interrupts which provides the status of interrupts that are qualified by an enable register. Note that incoming interrupt signals are active-high level signals, so interrupts have to be cleared (by software) at the source unit. The interrupts are grouped as follows.

```
HIER_GROUP1_CPU_STATUS[31:0] = HIER_GROUP1_CPU_ENABLE[31:0] & source_INT[31:0]
HIER_GROUP1_CPU = | HIER_GROUP1_CPU_STATUS[31:0]     //OR-ing of all bits

HIER_GROUP1_COP_STATUS[31:0] = HIER_GROUP1_COP_ENABLE[31:0] & source_INT[31:0]
HIER_GROUP1_COP = | HIER_GROUP1_COP_STATUS[31:0]    //OR-ing of all bits
```

The HIER_GROUPx_{CPU,COP}_ENABLE registers act as mask registers for the hierarchical interrupts. Each bit in the ENABLE register can mask the interrupt for the corresponding hierarchical group. Refer to Table 9 for the hierarchical interrupt grouping per bit.

The Address Interrupt section of this document lists the interrupt sources which are in the hierarchical interrupts group(s).

3.4.4 Arbitration Semaphores

Arbitration semaphores provide a mechanism by which the CPU and COP can arbitrate for the use of various resources. These semaphores provide a hardware locking mechanism, so that when a processor is already using a resource, the second processor is not granted that resource. There are 32 bits of Arbitration semaphores provided in the system. The hardware does not enforce any resource association to these bits. It is left to the software to assign and use these bits. Any processor that needs to access a particular resource will request for the corresponding bit in the Arbitration semaphores by writing a one to that bit in the Arbitration Semaphore Request register (SMP_GET register). Software will then check the corresponding bit in the Semaphore Granted Status register (SMP_GNT_ST register)

If the requesting processor has been granted the resource, then the status returned will be a one. Alternately, the processor can configure the interrupt controller to generate an interrupt when the resource becomes available.

When the processor has finished using the resource, it releases the resource by writing a one to the corresponding bit in the Arbitration Semaphore Put Request register (SMP_PUT register). Additionally, pending request status is provided through the Arbitration Request Pending Status register (SMP_REQ_ST register).

The Primary Interrupt Controller (PRI_ICTLR) supports Arbitration Grant Interrupts. When a processor is granted access to a resource, the Arbitration semaphore module can be programmed to send a Grant signal to the interrupt controller. The interrupt controller can then interrupt the processor to indicate that it has been granted exclusive access to a particular resource. The individual ARB_GNT bits are OR'ed together and presented to the Primary Interrupt controller as Interrupt Number 29.

The Arbitration/Grant interrupts mechanism registers are described in the Arbitration Semaphores section of this document.

3.4.5 Interrupts Used for Processor Power-Ups

The interrupt signals (nIRQ and nFIQ per processor) are routed to each processor as well as the Flow Controller unit. Based on configuration, the flow controller uses them to power up the corresponding CPU. Refer to the Flow Controller section in this TRM for the details of processor wake-up.

3.5 Interrupt Registers

3.5.1 Interrupt Controller Registers

NOTE: The interrupt controller (IC32) register descriptions do not follow the standard register table protocol described in "Reading Register Tables" in the Introduction section. Each register's relative offset, access type, and power-on reset value are located in Table 11. The bit descriptions for each register are defined in Table 12 according to interrupt controller (IC32).

Each IC32 has a set of 34 registers with names using the form <ID>_<FUNCTION>_0:

- ID identifies the specific IC32: PRI_ICTLR, SEC_ICTLR, TRI_ICTLR, QUAD_ICTLR, PENTA_ICTLR. Based on the IC32, ID defines a base address and mapping (see below).

- FUNCTION identifies the use for this register. Refer to the LIC Registers Description subsection for more details. FUNCTION is defined as one of the following:
  - VIRQ_<DEST> and VFIQ_<DEST>: indicates the Valid status, as an IRQ or FIQ, respectively, for this destination. DEST is COP, CPU, CPU1, CPU2, or CPU3.
  - ISR: indicates the latched Interrupt Status
  - FIR: indicates Force Interrupt
  - FIR_SET and FIR_CLR: to control FIR, bits set to 1 are set or cleared, respectively, in FIR.
  - <DEST>_IER: indicates that the corresponding event is enabled as an interrupt
  - <DEST>_IER_SET and <DEST>_IER_CLR: to control IER, bits equal to 1 are set or cleared, respectively, in IER.
  - <DEST>_IEP_CLASS: Interrupt Enable Priority Class, a bit set to 0 indicates IRQ, and set to 1 indicates FIQ.

Table 10 associates the following with each IC32: the ID (used in the register names), the base offset (address map of the five IC32s), and interrupt mapping reference.

Table 10: IC32 Characteristics

ID	Base Offset	Mapping
PRI_ICTLR	0x000	See Table 4: Primary Interrupt Controller (PRI_ICTLR) Mapping
SEC_ICTLR	0x100	See Table 5: Secondary Interrupt Controller (SEC_ICTLR) Mapping
TRI_ICTLR	0x200	See Table 6: Tertiary Interrupt Controller (TRI_ICTLR) Mapping
QUAD_ICTLR	0x300	See Table 7: Quaternary Interrupt Controller (QUAD_CTLR) Mapping
PENTA_ICTLR	0x400	See Table 8: Fifth Interrupt Controller (PENTA_ICTLR) Mapping
HIER2_ICTLR1	0x800	

The table below summarizes all 34 registers for each IC32 (where <ID> is the controller name), their relative offsets, register access types (RO, WO, or RW), and their 32-bit power-on reset values. The actual offset for each register is the base offset (from the table above) plus the relative offset. The PRI_ICTLR, SEC_ICTLR, TRI_ICTLR, QUAD_ICTLR, and PENTA_ICTLR have same set of registers at the same address offset with the exception of the ARBGNT registers which are only in PRI_ICTLR. The ARBGNT registers are defined in the “Arb_gnt Specific Interrupt Controller Registers” subsection.

3.5.2 Arb_gnt Specific Interrupt Controller Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

Arbitration semaphores provide a mechanism by which the two processors can arbitrate for the use of various resources. These semaphores provide a hardware locking mechanism, so that when a processor is already using a resource, the second processor is not granted that resource. There are 32 bits of Arbitration semaphores provided in the system.

The hardware does not enforce any resource association to these bits. It is left to the firmware to assign and use these bits.

The Arbitration Semaphores can also generate an interrupt when a hardware resource becomes available. The registers in this module configure these interrupts. When a 1 is set in the corresponding bit position of the Arbitration Semaphore Interrupt Source Register (CPU_enable or COP_enable), an interrupt will be generated when the processor achieves Grant Status for that resource.

The current Grant status can be viewed in the CPU_STATUS or COP_STATUS registers.

3.5.2.1 PRI_ICTLR_ARBGNT_CPU_STATUS_0

CPU Arbitration Semaphore Interrupt Status Register

Offset: 0x40 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GNT31_GNG0: Each bit is set by hardware when the corresponding arbitration semaphore ownership is granted to the CPU. Interrupt is cleared when the CPU writes the ARB_SMP.PUT register with the corresponding bit set.

3.5.2.2 PRI_ICTLR_ARBGNT_CPU_ENABLE_0

CPU Arbitration Semaphore Interrupt Enable Register

Offset: 0x44 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	GER31_GER0: Writing a 1 in any bit position will enable the corresponding arbitration semaphore interrupt.

3.5.2.3 PRI_ICTLR_ARBGNT_COP_STATUS_0

COP Arbitration Semaphore Interrupt Status Register

Offset: 0x48 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	GNT31_GNG0: Each bit is set by hardware when the corresponding arbitration semaphore ownership is granted to the COP. The interrupt is cleared when the COP writes the ARB_SMP.PUT register with the corresponding bit set.

3.5.2.4 PRI_ICTLR_ARBGNT_COP_ENABLE_0

COP Arbitration Semaphore Interrupt Enable Register

Offset: 0x4c | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	GER31_GER0: Writing a 1 in any bit position will enable the corresponding arbitration semaphore interrupt.

3.5.3 Hier Group Interrupt Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

This subsection describes the registers for Hier group interrupts for the CPU and the COP.

3.5.3.1 HIER_GROUP_CPU_ENABLE_0

Hier Group Enable for CPU

Offset: 0x800 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	CPU_ENABLE: Enable for the hier group interrupt for the CPU. Writing a 1 in any bit position will enable the corresponding interrupt.

3.5.3.2 HIER_GROUP_CPU_STATUS_0

Hier Group Status (ISR) Register for CPU

Offset: 0x804 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	CPU_STATUS: Status for the hier group interrupt for the CPU.

3.5.3.3 HIER_GROUP_COP_ENABLE_0

Hier Group Enable for COP

Offset: 0x808 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	COP_ENABLE: Enable for the hier group interrupt for the COP. Writing a 1 in any bit position will enable the corresponding interrupt.

3.5.3.4 HIER_GROUP_COP_STATUS_0

Hier Group Status (ISR) for COP

Offset: 0x80c | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	COP_STATUS: Status for the hier group interrupt for the COP.

3.5.3.5 HIER_GROUP_FIR_STATUS_0

Status Register for FIR Register in Hier Group

Offset: 0x810 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	FIR_STATUS: Software interrupts for the hier group.

3.5.3.6 HIER_GROUP_FIR_SET_0

FIR Set for Hier Group

Offset: 0x814 | Read/Write: WO | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	FIR_SET: FIR set for the hier group.

3.5.3.7 HIER_GROUP_FIR_CLEAR_0

FIR Clear for Hier Group

Offset: 0x818 | Read/Write: WO | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	FIR_CLEAR: FIR clear for the hier group.

3.5.4 EVP Registers

Each processor sees its own set of EVP reset vector registers.

3.5.4.1 EVP_RESET_VECTOR_0

Offset: 0x0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	RESET_VECTOR: RESET Exception Vector Pointer

[THIS PAGE INTENTIONALLY LEFT BLANK]

4.0 SEMAPHORES

4.1 Arbitration Semaphores

Arbitration semaphores provide a mechanism by which the two processors can arbitrate for the use of various resources.

These semaphores provide a hardware locking mechanism to ensure that when a processor is already using a resource, the second processor is not granted that resource. There are 32 bits of arbitration semaphores provided in the system. The hardware does not enforce any resource association to these bits and it is left to the user to assign and use these bits.

Any processor that needs to access a particular resource will request for the corresponding bit in the arbitration semaphores by writing a one to that bit in the Arbitration Semaphore Request register (SMP_GET register). Firmware will then check the corresponding bit in the Semaphore Granted Status register (SMP_GNT_ST register). If the requesting processor has been granted the resource, then the status returned will be a one.

Alternately, the processor can configure the interrupt controller to generate an interrupt when the resource becomes available. When the processor has finished using the resource, it releases the resource by writing a one to the corresponding bit in the Arbitration Semaphore Put Request register (SMP_PUT register). Additionally, pending request status is provided through the Arbitration Request Pending Status register (SMP_REQ_ST register).

(Note that an alternative mechanism to this exists in the Atomics block. Please refer to the corresponding section of this document for further details. At the time of this writing, NVIDIA software does not make use of the Atomics block.)

4.2 Semaphore Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

4.2.1 Arbitration Semaphore Registers

4.2.1.1 ARB_SEMA_SMP_GNT_ST_0

Semaphore Granted Status Register

Offset: 0x0 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	ARB_31_ARB_0: A one in any bit indicates that the processor reading this register as granted status for that bit. A zero indicates semaphore not granted.

4.2.1.2 ARB_SEMA_SMP_GET_0

Request Arbitration Semaphore Register

Offset: 0x4 | Read/Write: WO | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	GET_31_GET_0: Writing a one in any bit is a request for that semaphore bit by the processor performing the register write.

4.2.1.3 ARB_SEMA_SMP_PUT_0

Arbitration Semaphore Put Request Register

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	PUT_31_PUT_0: Writing a one in any bit will clear the corresponding semaphore bit by the processor performing the register write.

4.2.1.4 ARB_SEMA_SMP_REQ_ST_0

Arbitration Request Pending Status (1=PENDING) Register

Offset: 0xc | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	REQ_31_REQ_0: A one in any bit indicates a request pending status. The corresponding bits are set when the request for the individual resource is pending. The read by the CPU of this register shows the pending status for the CPU and a read of this register by AVP (COP) shows the pending status for AVP.

4.2.2 Shared Resource Semaphore Registers

4.2.2.1 RES_SEMA_SHRD_SMP_STA_0

Shared Resource Semaphore Status

Offset: 0x0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	SMP_31_SMP_0: SMP.27:SMP.24: Available in APB_DMA.REQUESTORS register

4.2.2.2 RES_SEMA_SHRD_SMP_SET_0

Shared Resource Semaphore Set-Bit Request

Offset: 0x4 | Read/Write: WO | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SET_31_SET_0: Semaphore set register. Writing a one to any bit will set the corresponding semaphore bit. Shared resource set-bit requests.

4.2.2.3 RES_SEMA_SHRD_SMP_CLR_0

Shared Resource Semaphore Clr-bit Request Register

Offset: 0x8 | Read/Write: WO | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	CLR_31_CLR_0: Corresponding semaphore bit.

4.2.2.4 RES_SEMA_SHRD_INBOX_0

Shared Resource Inbox (Messages from COP (ARM7) to CPU)

Offset: 0x10 | Read/Write: R/W | Reset: 0x00000000 (0b000x00000000000000000000000000000)

Bit	Reset	Description
31	0x0	IE_IBF: Interrupt CPU on INBOX Full (TAG=1) 0 = EMPTY 1 = FULL
30	0x0	IE_IBE: Interrupt COP on INBOX Empty (TAG=0) 0 = EMPTY 1 = FULL
29	0x0	TAG: Set when the COP writes this register and cleared when CPU writes this register with this bit set to 1 (write one clear). 0 = INVALID 1 = VALID
27:24	0x0	IN_BOX_STAT: General-purpose data bits, suggested usage is for INBOX status (software can change the definition)
23:17	0x0	IN_BOX_CMD: General-purpose data bits, suggested usage is for INBOX command (software can change the definition)
16:0	0x0	IN_BOX_DATA: General-purpose Inbox data bits, suggested usage is for INBOX data (software can change the definition)

4.2.2.5 RES_SEMA_SHRD_OUTBOX_0

Shared Resource Outbox (Messages from CPU to COP (ARM7))

Offset: 0x20 | Read/Write: R/W | Reset: 0x00000000 (0b000x00000000000000000000000000000)

Bit	Reset	Description
31	0x0	IE_OBF: Interrupt COP on OUTBOX Full (TAG=1) 0 = EMPTY 1 = FULL
30	0x0	IE_OBE: Interrupt CPU on OUTBOX Empty (TAG=0) 0 = EMPTY 1 = FULL
29	0x0	TAG: Set when the CPU writes this register and cleared when the COP writes this register with this bit set to 1 (write one clear). 0 = INVALID 1 = VALID
27:24	0x0	OUT_BOX_STAT: General-purpose data bits, suggested usage is for Outbox OUTBOX status (software can change the definition)
23:17	0x0	OUT_BOX_CMD: General-purpose data bits, suggested usage is for Outbox OUTBOX command (software can change the definition)
16:0	0x0	OUT_BOX_DATA: General-purpose Outbox data bits, suggested usage is for OUTBOX data (software can change the definition)

5.0 CLOCK AND RESET CONTROLLER

The Clock and Reset (CAR) block contains all the logic needed to control most of the clocks and resets to the Tegra® K1 device. The CAR block provides the registers to program the PLLs and controls most of the clock source programming, and most of the clock dividers.

Power on reset (SYS_RESET_N_) is the primary reset for the Tegra K1 chip and is provided by the external PMC.

5.1 Hardware Features

5.1.1 External Clock Sources

The CAR block takes two external clock sources as input:

- A single external 32.768 kHz clock, normally provided by the Power Manager Integrated Circuit (PMIC)
- An oscillator clock (OSC) at 12, 13, 16.8, 19.2, 26, 38.4, or 48 MHz, provided by an external crystal. Not all these frequencies may be supported by software.

5.1.2 Clock Sources and PLLs

Clock sources are provided by 16 PLLs in the Tegra K1 clock system:

- PLLM: Clock source for EMC 2x clock
- PLLX: Clock source for the fast CPU cluster and the shadow CPU
- PLLC: Clock source for general use
- PLLC2 and PLLC3: Clock source for engine scaling
- PLLC4: Clock source for ISP/VI units
- PLLP: Clock source for most peripherals
- PLLA: Audio clock sources:
  - 11.2896 MHz
  - 12.288 MHz
  - 24.576 MHz
- PLLU: Clock source for USB PHY, provides 12/60/480 MHz
- PLLD and PLLD2: Clock sources for the DSI and display subsystem
- refPLLe and PLLE generate the 100 MHz reference clock for USB 3.0 and can generate a spread-spectrum clock
- PLLDP: Clock source for eDP/LVDS (spread spectrum)
- DFLLCPU: DFLL clock source for the fast CPU cluster
- GPCPLL: Clock source for the GPU

5.1.3 Clock Dividers / Skippers / Multiplier

There are a number of clock skippers and clock dividers as well as one clock multiplier in use in the Tegra K1 devices.

- Clock skippers:
  - An M/N clock-skipping divider that is used to generate the CPU clock and also the Tegra K1 "system clock" (sclk).
  - Clock skippers that are used to generate the "AHB clock" (hclk) and "APB clock" (pclk). One that divides down by a 2-bit unsigned value (U2).

- Clock dividers:
  - An unsigned 16-bit divider (U16) that is the divider for the I2C and UART devices.
  - An unsigned 8-bit divider that provides 7 bits of mantissa and 1 bit of fraction (U7.1). Tegra K1 devices have reduced the number of divider types and in particular this U7.1 divider is the default divider for most all blocks in Tegra K1 devices.

    Note: The clock-skipping divider and the U7.1 divider when programmed with the 1b fraction do not create 50/50 duty-cycle clock waveforms and may not be suitable for all modules under all circumstances.

- Clock multiplier:
  - A times-two multiplier used to double the external reference frequency by delaying and XORing the input clock with a 4-bit programmable delayed reference clock. Care must be exercised when using this dual-frequency and widely varying duty-cycle clock.

5.2 Clocking Architecture

Tegra K1 clocks are classified into two categories: core clocks and I/O clocks. Core clocks drive the non-I/O modules on the Tegra K1 chip. I/O clocks are custom designed for each I/O module. Only core clocks are described here.

5.2.1 Core Clocks

The core clock structure consists of:

- Sources
- Switches
- Distribution and skew balancing
- Second-level non-functional clock gates

Core clocks originate from external clock sources which are used by on-chip PLLs to generate a set of primary clock sources. Secondary clock sources are created by dividing down various PLL outputs. This group of external, PLL, and divided PLL clocks constitutes the clock sources.

These sources feed the clock switches. Each module has its own switch. A clock switch consists of one or more clock sources selected through a Clock Source Selection Mux and driving a clock divider. Multiple clock source options are available to the module divider to allow software to choose a clock frequency based on the unit's performance requirements and overall SOC power. Switching a clock source away from a PLL when it is locking after being reprogrammed to a new frequency may also be required. There are three types of dividers: fixed divide value, fractional divider, or clock skipping (pulse eating) divider.

5.2.2 Main Clock Sources

There are three types of clock sources:

- External clock sources
- PLLs
- Derived clock sources

Table 13: External Clocks to Tegra K1 Devices

Clock Name	Description
dbg_oscout:	This clock runs at 12MHz, 13 MHz, 19.2 MHz, 26 MHz, 16.8 MHz, 38.4 MHz, or 48 MHz. Only 12 MHz is currently supported.
ck32khz_IB:	This clock runs at 32.768 kHz.

Table 14: Primary Clock Sources in Tegra K1 Devices

Clock Name	Description
osc_div_clk:	This clock runs at 12 MHz, 13 MHz, 16.8 MHz, 19.2 MHz, or 26 MHz. Only 12 MHz is currently supported.
car_sclk:	This is the system clock whose maximum frequency is 200 MHz
clk_m:	This clock (with DFT control) runs at 12 MHz, 13 MHz, 16.8 MHz, 19.2 MHz, 26 MHz, 38.4 MHz, or 48 MHz. Only 12 MHz is currently supported.
car_clk_m:	This clock (with DFT control) runs at 12 MHz, 13 MHz, 16.8 MHz, 19.2 MHz, 26 MHz, 38.4 MHz, or 48 MHz. Only 12 MHz is currently supported.
dfllCPU_out:	This is the dfllCPU's output clock.
pllC_out:	This is the PLLC's output clock.
pllC2_out:	This is the PLLC2's output clock.
pllC3_out:	This is the PLLC3's output clock.
pllC4_out:	This is the PLLC4's output clock, which is used for the VI and ISP blocks.
pllM_out:	This is the PLLM's output clock.
int_pllA_out	This is the PLLA's output clock.
pllD_out:	This is the PLLD's output clock.
pllD2_out:	This is the PLLD2's output clock.
pllDP_out	This is the PLLDP's output clock.
pllU:	This is the PLLU's output clock. USB2 I/O.
refPLLE_out:	This is the refPLLE's output clock. Low jitter reference clock for PLLE, USB.
pllE_out0:	This is the PLLE's output clock. USB3 I/O.
pllP_out:	This is the PLLP's output clock which is set to 408 MHz.
pllX	This is the output clock for the fast CPU cluster and the shadow CPU
GPCPLL	This is the output clock for the GPU
clk_s:	This clock (with DFT control) runs at 32.768 kHz.
car_clk_s:	CAR's clock tree balanced version of clk_s.

Table 15: Derived Clock Sources in Tegra K1 Devices

Clock Name	Description
pllC_out1:	This is the U7.1 divider output clocked by "pllC_out".
pllM_out1:	This is the U7.1divider output clocked by "pllM_out".
pllP_out1:	This is the U7.1 divider output clocked by "pllP_out" (28.8 MHz boot, changed to 9.6 MHz).
pllP_out2:	This is the U7.1 divider output clocked by "pllP_out" (48 MHz boot, changed to 48 MHz).
pllP_out3:	This is the U7.1 divider output clocked by "pllP_out". (72 MHz boot, changed to 102 MHz).
pllP_out4:	This is the U7.1 divider output clocked by "pllP_out" (108 MHz boot, changed to variable)
pllP_out5:	This is the U7.1 divider output clocked by "pllP_out" (204 MHz boot, changed to variable).
pllA_out0:	This is the U7.1 divider output clocked by "int_pllA_out".

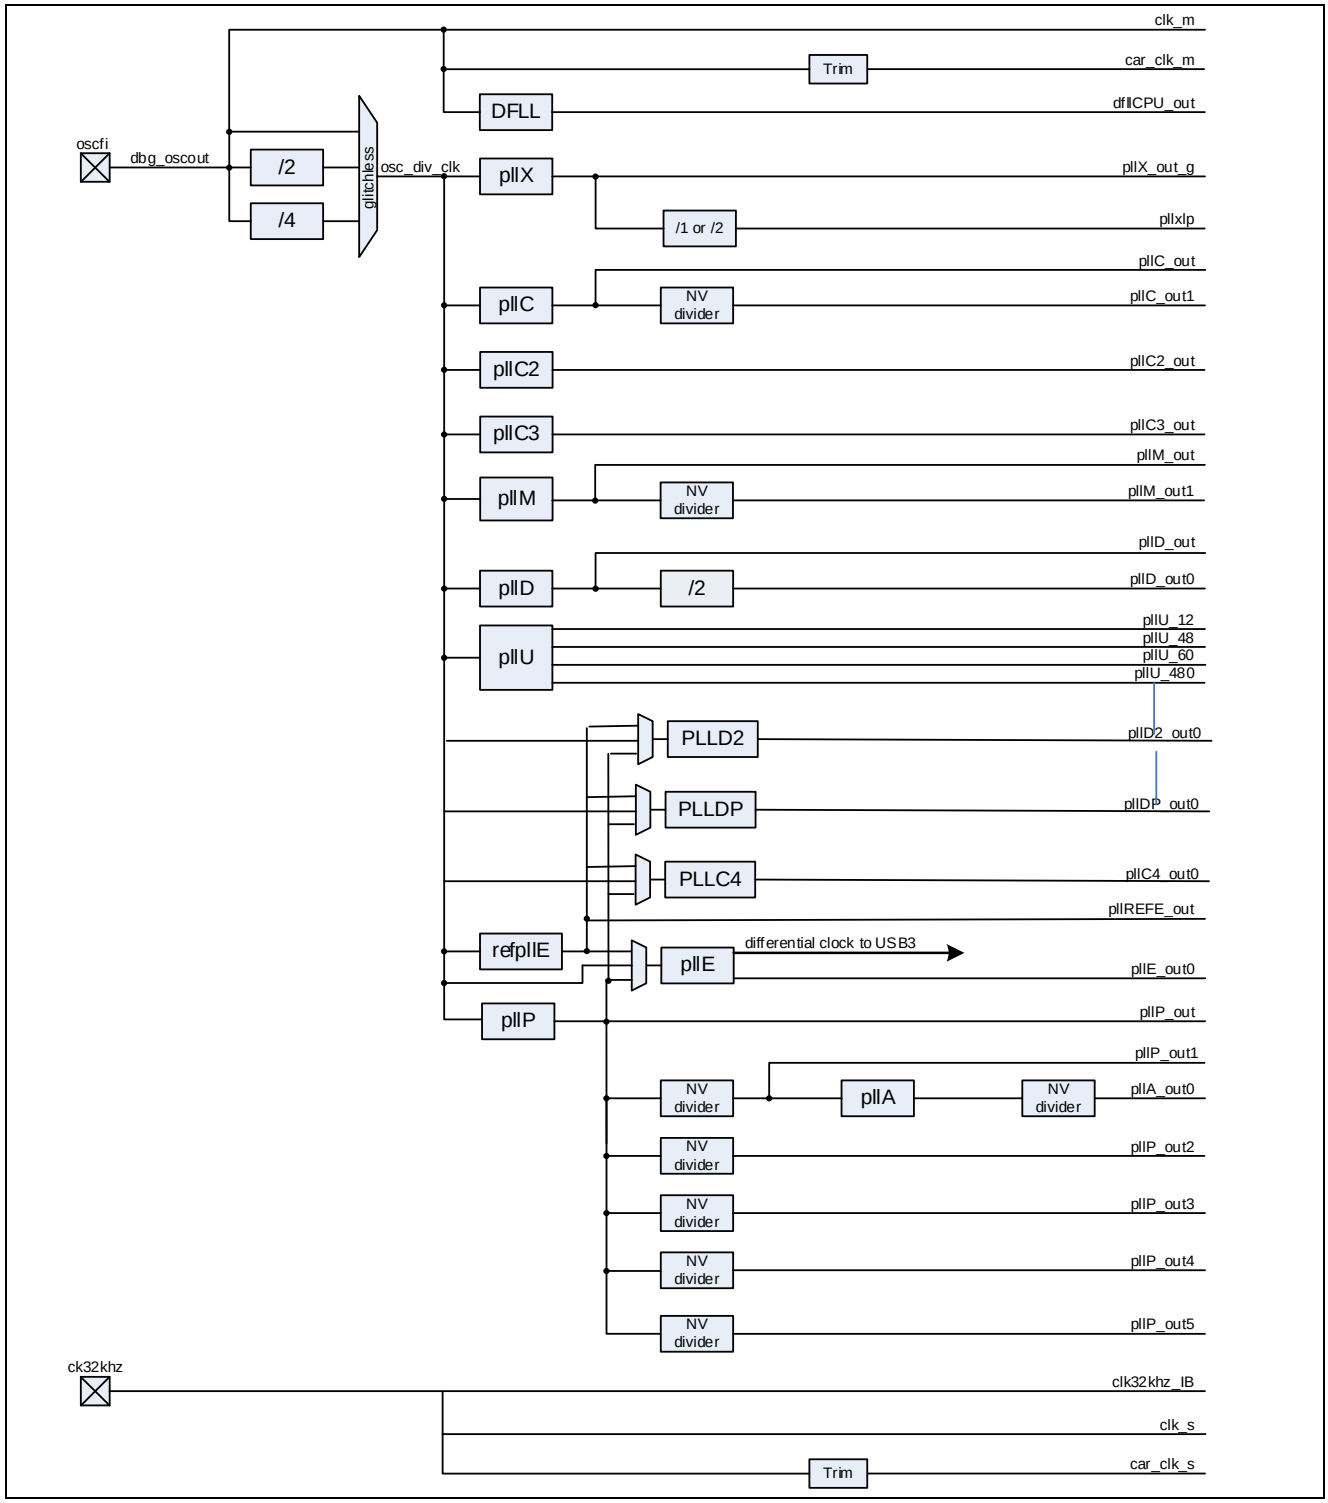
The table below lists which clock source they are derived from and their divider size.

Table 16: Clock Sources for the Derived Clocks

	dbg_oscout	pllC_out	ck32khz_lB	pllM_out	pllM_2x_out	pllP_out	int_pllA_out	Have super clock divider ? (# of bits)	Have U7.1 divider? (# of bits)
pllC_out1		x							8
pllM_out1				x					8
pllP_out1						x			8
pllP_out2						x			8
pllP_out3						x			8
pllP_out4						x			8
pllP_out5						x			8
pllA_out0							x		8

These clock sources are shown in the following figure.

Figure 4: Clocking Sources



The two tables below give a quick overview of the root clock generators. They include the clock sources and the divider type and size. For example, the ACTMON root clock has 6 clock sources (000=pllP_out, 001=pllC2_out, 010=pllC_out, 011=pllC3_out, 100=ck32khz_IB, 110=dbg_oscout) and has an 8-bit wide U7.1 fractional divider. The default reset value is shown as an underlined value such as 6.

Notes:

- Clock source pllX_out is an output of a mux that can select between the pllX_out clock and a predivide-by-2 pllX_out clock. Clock source dfllCPU_out is an output of a mux that can select between the dfllCPU_out clock and a predivide-by-2 dfllCPU_out.
- When EMC clock source = 4, the U7.1 divider is bypassed/ignored. This setting will give a very short low jitter clock path from pllM_out to EMC clock.
- When clock source = 14 or 15, in addition to being selected into the glitch-less switching logic in CAR, the selected clock will also bypass the U7.1 divider creating a short low jitter clock path to the output clock.
- The Clock Skipper is controlled by SOC Therm hardware.

5.2.3 Generic Clock Core Structure

Root clock generation is typically a clock source selection mux followed by a U7.1 fractional divider. The clock source selection mux is made glitch-less by the addition of a state machine that gates off the clocks that might be impacted by the glitch, switching the clock source, and then ungating the clock.

Changing the fractional divider ratio is also glitch-less and will use one of two mechanisms. When used in a switch with a clock source selection mux, the switching state-machine described above is used. When used without a clock source selection mux such as in the pllP_out1,2,3,4,5 dividers, the divider is not stopped and seamlessly switches to the new frequency at the end of a clock period. In this latter scheme, no dead cycles exist– between the original frequency and then the newly requested frequency.

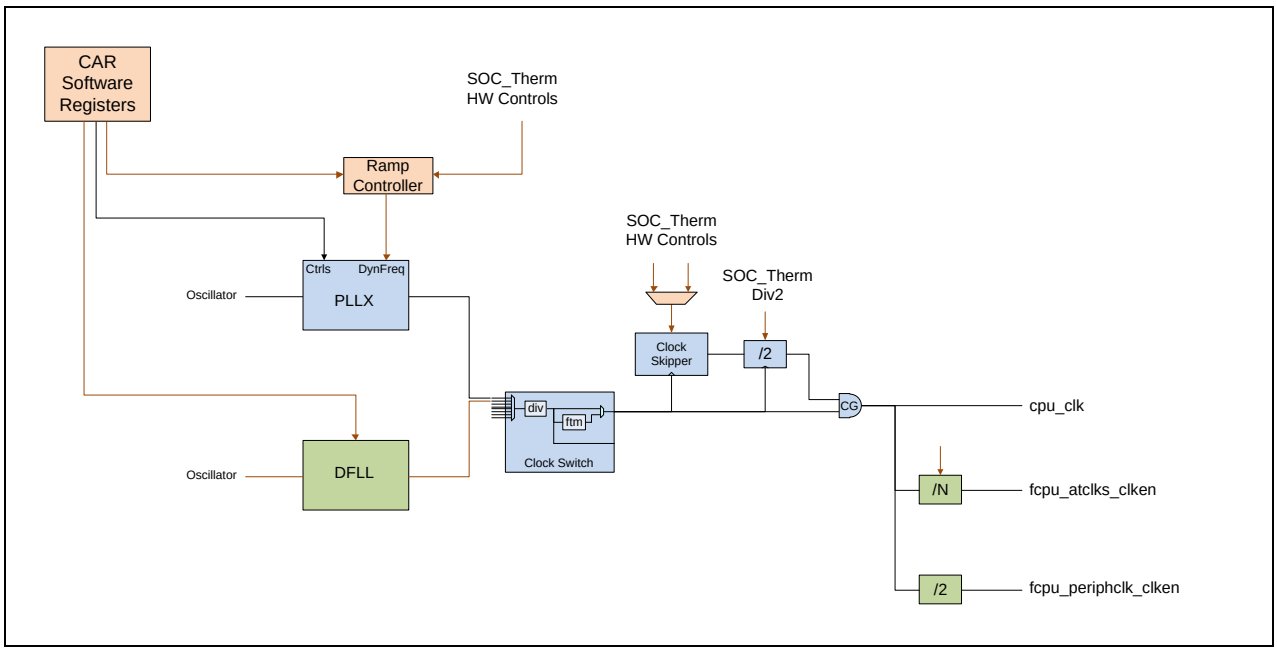
In all structures above, when the clock is gated off, it occurs at the end of the clock period so that 1) there are no runt pulses, and 2) the output clock will be stopped low.

5.2.4 Custom Core Clocks

5.2.4.1 FCPU Clock

The following figure shows a block diagram of the components of the Fast CPU (FCPU) clocking.

Figure 5: FCPU Clock Generation



PLLX

PLLX is one of two possible primary clock sources for the FCPU. It contains two dynamic frequency mechanisms: a fast one that could overshoot and a slower one with no overshoot.

DFLL

The alternate primary clock source for the FCPU is the DFLL. The DFLL is based around a ring oscillator with supporting structures for di/dt management and frequency control.

Clock Skipper

An M/N clock skipper that is managed by the SOC Thermal module.

SOC Therm Div 2

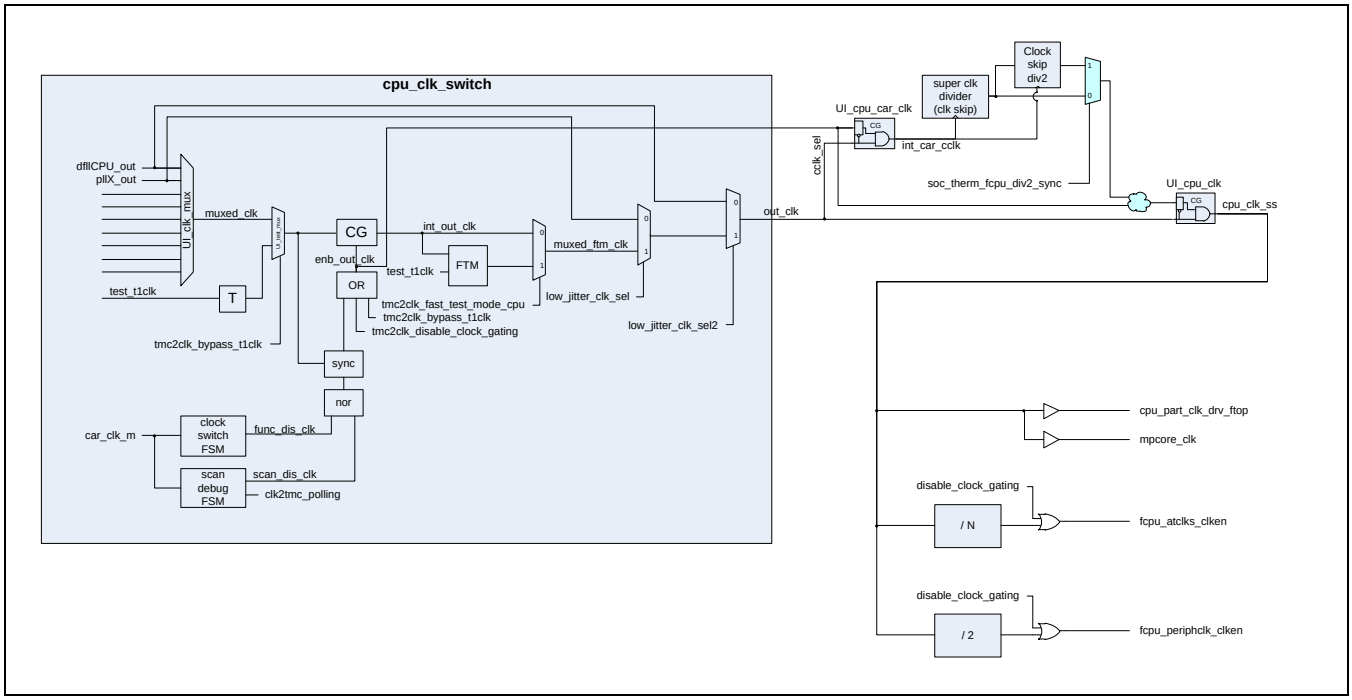
This logic will slow the CPU clock to manage thermal runaway.

Clock Switch

The clock switch consists of a clock source selection mux that can switch glitchlessly between a number of clock sources including the PLLX and DFLL. This is followed by a programmable U7.1 divider. For low jitter when the divider is not required, a direct bypass path from PLLX or DFLL inputs to the output is also provided.

The following figure shows the details of the clock switch, clock skipper, SOC Therm Div 2, and root clock generation. The clock sources to the clock source selection mux are described in the table entitled “Root Clock Clock Sources” in the “Main Clock Sources” section.

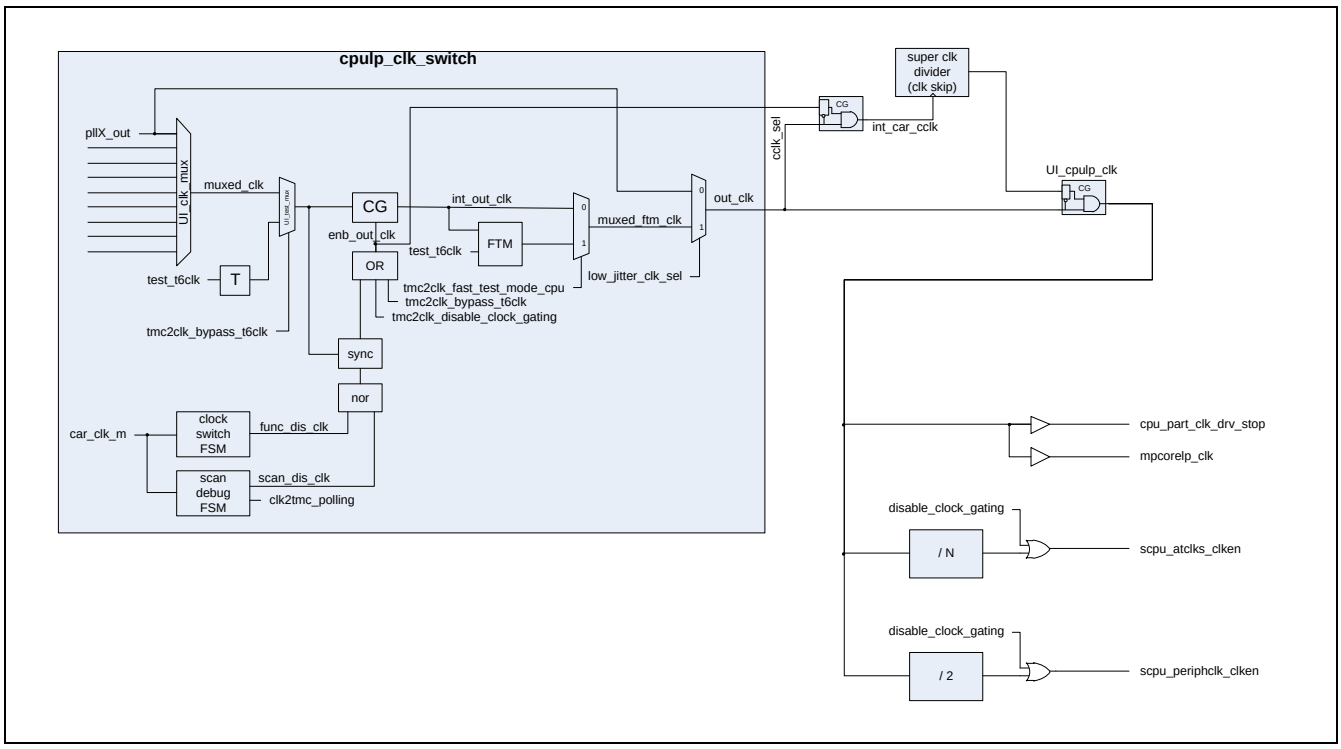
Figure 6: FCPU Clock Details



5.2.4.2 SCPU Clock

The following figure shows the details of the Clock Switch, Clock Skipper, and root clock generation for the Slow CPU (SCPU). The clock sources to the clock source selection mux are described in the table entitled “Root Clock Clock Sources” in the “Main Clock Sources” section.

Figure 7: SCPU Clock Details



5.2.4.3 EMC/MC Clock

The PLLM's primary purpose is to clock the MC and EMC. The EMC/MC clocking structure is complicated due to the need to support high speed DRAMs, avoid clock switching when DRAMs are being accessed, and conserve power.

When changing the EMC frequency, internal logic sequencing handles the requirement that the DRAMs must be placed into self-refresh before the clock frequency is changed. Certain register fields when written do not get immediately applied but rather are applied at the correct time during the sequencing. These registers are referred to as "shadowed". Other register fields initiate the sequencing state-machine and therefore should be written last. At the end of the sequencing, the DRAMs are restored to being operational.

The reprogramming sequence is:

1. Program the MC/EMC shadow registers corresponding to the new frequency. These registers are "shadowed", as noted in their descriptions, and will not impact the hardware until later during the clock change sequence.
2. Program the EMC clock change FIFO (CCFIFO) with the pre-/post-clock change sequence.
3. Program CAR CLK_SOURCE_EMC register to trigger a clock change. At this point hardware takes the following actions:
   - The CAR block asserts the clock change request to the EMC.
   - The EMC stops MC transactions, flushes its internal outstanding requests, executes MRSs/enter self-refresh, and then updates the timing to copy the EMC shadow
   - Register contents (including CDB phase select) to EMC current register.
   - The EMC asserts clock change acknowledge to the CAR block.
   - The CAR stops the clock to PLLM/CDB, updates to the new clock source, and passes the EMC CDB phase select control to the CDB.
   - The CAR re-enables the clock to PLLM/CDB.
   - The CAR de-asserts the clock change request to the EMC (telling it the clock change is done).

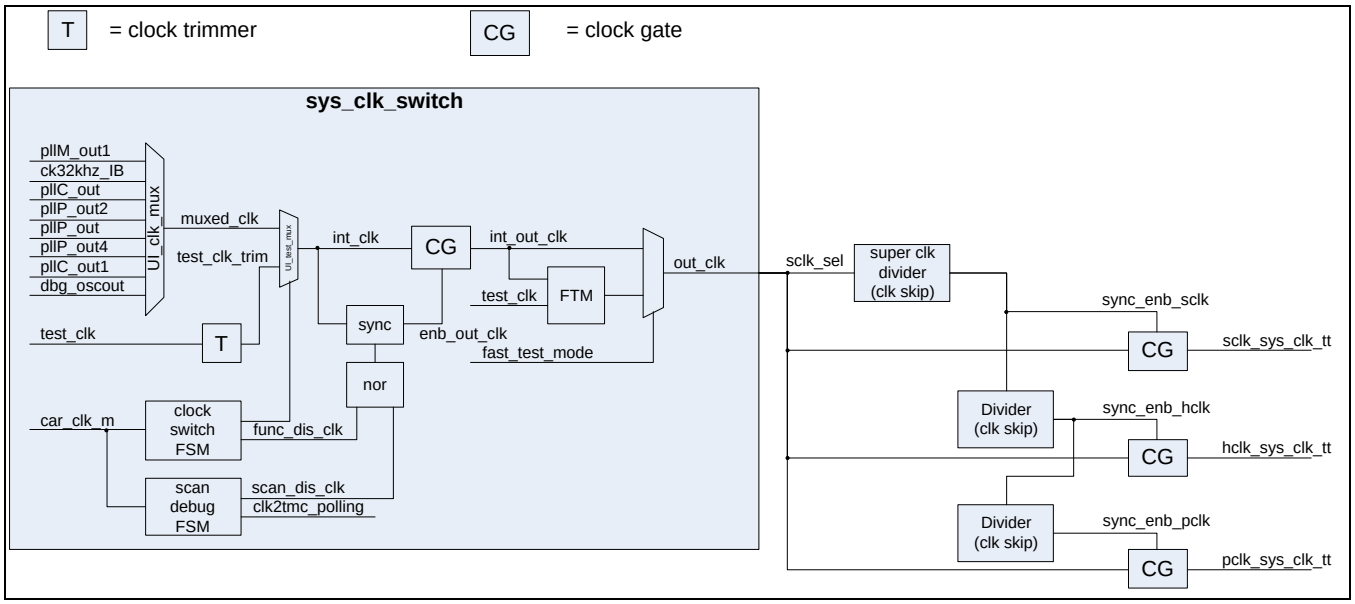
- The EMC unblocks MC transactions, de-asserts clock change acknowledge.
- The EMC executes the post clock change sequence (self-refresh exit, MRSs).
- Normal memory access resumes.

4. Software monitors the clock change complete interrupt status from the EMC register to know when the clock change is done.

5.2.4.4 SYS Clock Generation (SCLK, HCLK, PCLK)

The system clock sclk is used by the AVP sub-system (COP), hclk is the AHB bus clock, and pclk is the APB bus clock.

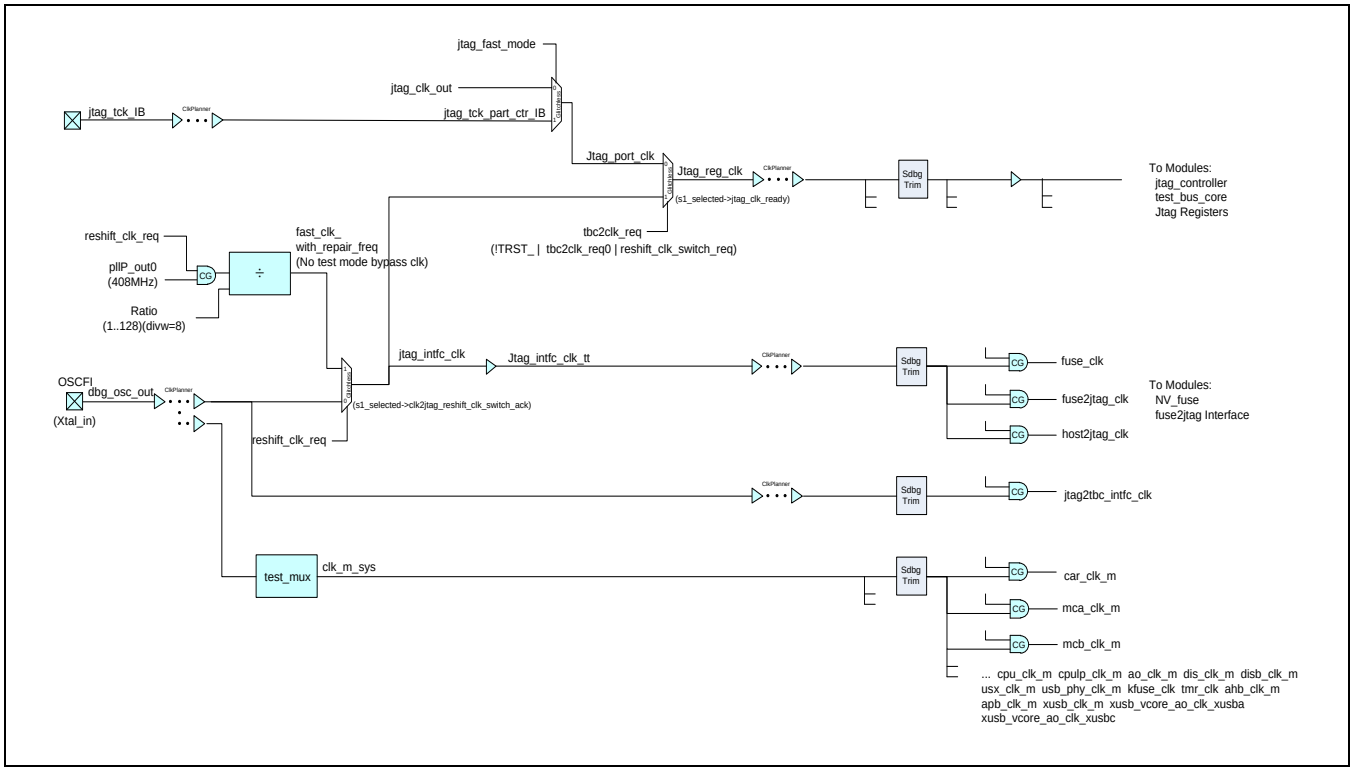
Figure 8: SCLK Clock Generation



5.2.4.5 Jtag_ref_clk and fuse_clk

The RAMs in the Fast CPU need to support RAM repair. Since the power rail to the FCPU will be shut down in modes such as LP1, the RAM repair information will be lost. When power is returned, the RAM repair information needs to be reprogrammed. A faster clock is needed to avoid delays in bringing the FCPU online. Additionally, a synchronous clock relationship is temporarily needed between the fuse and the re-repair logic running on the JTAG clock.

Figure 9: Jtag_ref_clk and fuse_clk Clock Generation



5.3 PLLs

5.3.1 DFLLCPU

DFLLCPU is a dedicated clock source for the Fast CPU. The DFLL is based on a ring oscillator and translates voltage changes into frequency compensation changes needed to prevent the CPU from failing.

5.3.2 PLLX

Tegra K1 devices require an alternative clock source in addition to DFLLCPU. Additionally, for EDP management and to avoid creating di/dt problems, this PLL needs a dynamic frequency changing mechanism.

Similar to prior Mobile products, PLLX is dedicated for this purpose. This PLL will feed to both the Fast CPU Cluster and Shadow CPU. This PLL cannot be easily used opportunistically for other units.

5.3.2.1 PLLX Startup Sequence

PLLX has additional logic for support of dynamic ramp. To improve leakage power, additional logic in the PLL is also power-gated with help of an IDDQ control. The sequence between IDDQ and ENABLE is detailed below.

1. After powering up, the PLL rails (in case of LP0 exit), change IDDQ from 1 to 0.

2. Wait for 2 µs.

3. Program PLL parameters in registers.

4. Change ENABLE from 0->1 while the reference clock is running and stable.

5. ENABLE=1 and IDDQ=1->0 is not allowed for starting PLL.

5.3.3 refPLLE, PLLE, USB3 Brick PLLs

USB 3.0 requires a spread spectrum (SS) clock. It also has stringent jitter requirements to be met. A spread-spectrum PLL with high VCO frequency (for low jitter) meets these requirements. A dedicated PLL (PLLE) is used for this purpose.

In addition to PLLE, to ensure that oscillator clock jitter gets filtered out prior to feeding it to PLLE, a reference PLL (refPLLE) is required. There are additional PLL(s) in the pad brick used for physical layer signaling for USB 3.0. For cases where spread spectrum might not be required and jitter may not be an issue, an option is kept to bypass PLLE to save power. This option requires that the crystal be 12 MHz or 48 MHz to be able to create the required PLLE output frequency of 100 MHz.

5.3.4 PLLU and UTMI PLL

USB 2.0 mode requires 8 phase data sampling logic per USB 2.0 port to capture data. This requires a dedicated PLL (UTMI_PLL) with 5 data sampling logic ports. XUSB needs 2 samplers (that is, one for host mode and one for device mode). Synopsys IP needs 3.

The dedicated PLL (PLLU) is used to generate the low jitter reference clock for UTMI_PLL. There is a provision to bypass PLLU for cases where a slightly higher jitter is acceptable for UTMI PLL reference clock. USB2 mode requires 8 phase data sampling logic per USB2 port to capture data. This requires a dedicated PLL (UTMI_PLL) with 5 data sampling logic ports.

5.3.5 PLLM

The DDR interface in Tegra K1 devices is required to operate at 1866 MT/s. This means that the EMC should work at 933 MHz and the MC should work at 466 MHz. The memory subsystem (DDR, EMC, and MC) is required to support a number of discrete frequencies such as DDR1866, DDR 1600, DDR 1333, DDR 1066, DDR 800 as well as slower frequencies to conserve power. A dedicated PLL (PLLM) is used for memory clocks.

DDR interface signaling also needs a DLL to support ¼ clock shift to reliably capture/drive DQ. In addition, a CDB (clock distribution buffer) is required to get a low jitter/skew clock for each byte/command group.

5.3.6 PLLA and PLLP

All audio clocks are a multiple of the sampling frequency which can be 32 KHz, 44.1 KHz or 48 KHz. A frequency of 56.448 MHz or 73.728 MHz can be used to generate any of these sampling rates. It is not possible to generate both of these frequencies from the osc_freq by just using PLLA so a cascade of 2 PLLs, PLLP to PLLA, is required to generate the audio clocks.

PLLP is fixed at generating 408 MHz, and PLLA takes in 9.6 MHz (PLLP / 42.5) to generate the two required audio frequencies.

Because PLLP generates a fixed frequency clock for audio, it can also be divided down and used for other modules which might need a fixed frequency clock.

Most audio codecs have their own PLL, which turns out to be more power efficient, so it is possible that PLLA does not get used in a typical system for audio. In such a case PLLA can be used as a general purpose PLL.

5.3.7 Display Clocks and PLLs (PLLD, PLLD2, and PLLDP)

The display requires three PLLs:

- PLLD (MIPI PLL) – Used to feed CSI/DSI pads.
- PLLD2 (SS PLL) – Used for HDMI
- PLLDP – Used for eDP/LVDS

PLLD is a dedicated PLL (with differential clock outputs and some DSI specific functionality) which should be used for DSI0 and DSI1. This PLL can be configured to generate the pixel clock from any oscillator frequency. These PLLs consume high

power (estimated at 4 times a regular general purpose PLL) and should be used only if DSI is required. For HDMI, the pad brick has PLLs which are used for interface signaling. These PLLs expect a pixel clock as an input.

5.3.7.1 PLLD and PLLD2 Startup Sequence

Additional logic in the PLL is also power-gated with help of an IDDQ control. The sequence between IDDQ and ENABLE is detailed below.

1. After powering up the PLL rails (in case of LP0 exit), change IDDQ from 1 to 0.
2. Wait for 2 µs.
3. Program PLL parameters in registers
4. Change ENABLE from 0->1 while the reference clock is running and stable.
5. ENABLE=1 and IDDQ=1->0 is not allowed

5.3.8 PLLC, PLLC2, PLLC3, and PLLC4

The AVP (300MHz), MSENC (333 MHz), imaging (VI/ISP – 600 MHz), VDE (366 MHz) and various other high frequency peripherals have different maximum frequency requirements. PLLC2 and PLLC3, can go up to 700 MHz, are used for these modules.

PLLC4 is used to provide 600 MHz dedicated output to VI and ISP blocks.

5.3.8.1 PLLC and PLLC4 Startup Sequence

PLLC has additional logic for support of dynamic ramp. Additional logic in the PLL is also power-gated with help of an IDDQ control. The sequence between IDDQ and ENABLE is detailed below.

1. After powering up the PLL rails (in case of LP0 exit), change IDDQ from 1 to 0.
2. Wait for 2 µs.
3. Program PLL parameters in registers.
4. Change ENABLE from 0->1 while reference clock is running and stable.
5. ENABLE=1 and IDDQ=1->0 is not allowed.

5.3.8.2 Digital PLLs (PLLC2, PLLC3) Startup Sequence

To save more power, additional power gating is implemented in digital PLLs; the additional ENABLE control has a corresponding register bit added.

1. PLL rails are turned ON (in case they are OFF when coming out from LP0)
2. IDDQ changes from 1 to 0 with ENABLE being 0
3. Program the PLL parameters
4. ENABLE is also asserted with guarantee that the reference clock is running.
5. ENABLE=1 and IDDQ=1->0 is not allowed.

5.3.9 GPU PLL

The GPU uses a dedicated GPCPLL inside the GPU core (PLL20G_DYN_PRB_ESD). This PLL has dynamic frequency scaling capabilities and generates a 400 MHz gpcclk.

5.4 Reset Architecture

The external PMC provides the primary power-on reset (SYS_RESET_N_). Apart from POR, some other events can also result in a system reset. These are:

1. Reset due to an indication from a thermal sensor. The thermal sensor module would assert a reset signal tsensor2pmc_reset, which would in turn generate a reset for the whole chip and in the process de-assert tsensor2pmc_reset itself.
2. Expiry of watchdog timer. The watchdog timer has a counter which is loaded with an initial value and ticks on periodic intervals. Once the counter expires, it reloads itself with the initial value, increments an expiry count, and generates an event for software. If software acknowledges the event, the expiry count is cleared and the counter is loaded back with initial value. This process continues indefinitely. Depending on the current expiry count, the event generated for software could be different. There are 2 types of watchdog timers in Tegra K1 systems depending on how they generate the reset:
   - Deadman timer (referred as WDT in reset code): This is the legacy implementation in which:

     1st expiry an interrupt is issued

     2nd expiry a reset is issued. This reset, however, resets only a subset of units.
   - Watchdog timer (referred as WDT2 in reset code):

     1st expiry – interrupt is issued

     2nd expiry – FIQ is issued

     3rd expiry – CPU reset is issued

     4th expiry – full system reset – This is the relevant reset for this section
3. Software reset. This reset is controlled by a configuration bit in the PMC address space (main_swrst). Once asserted, this result in a reset generation for the whole chip and in the process de-asserts itself.
4. LP0 wakeup reset. This is controlled by the logic within the PMC.

The POR (SYS_RESET_N_) is de-asserted by the external PMC after the power sequencing is done and after the RTC clock (clk_32KHz) and crystal clock is already running. For the other sources, the reset is originated within the Tegra K1 hardware.

5.5 Power Gating and Ungating

5.5.1 Clamp/Reset/Clock/PG-Enable Sequencing

5.5.1.1 Power Gating

For power-gating (powering off) a partition, the clamp, reset, clocks, and PG-enable (also known as sleep-enable) controls must be sequenced as shown in following diagram. For CCPLEX PG partitions, this sequencing is ensured by hardware (when power-gating is done via the flow controller). For SoC (non-CCPLEX) PG partitions, this sequencing needs to be ensured by software.

The following registers are used for the Clamp/PG-Enable control of each PG partition:

- PMC_PWRGATE_TOGGLE
- PMC_REMOVE_CLAMPING_CMD

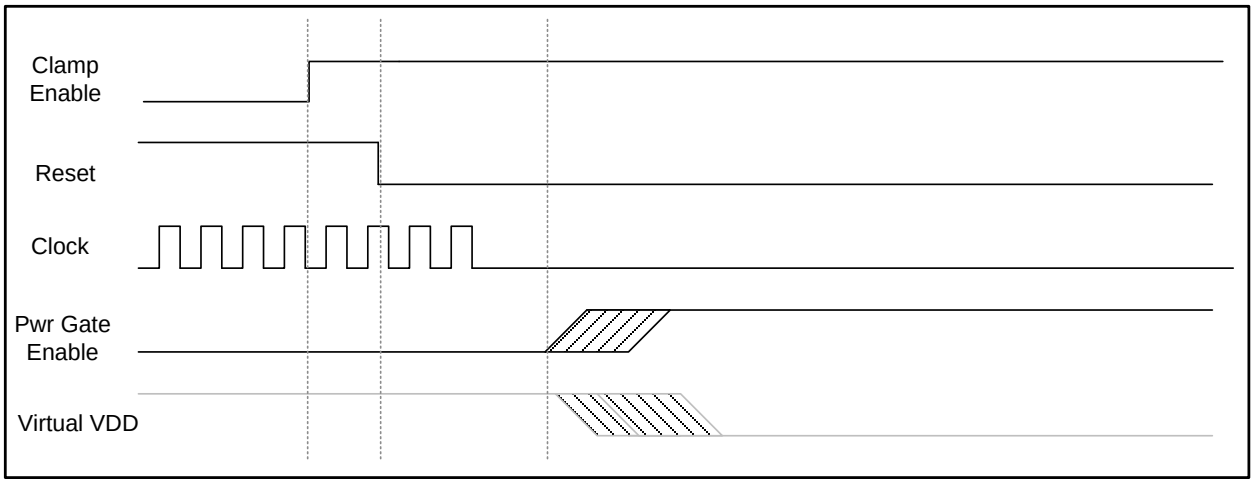
The following registers are used for the Clock/Reset control of each unit:

- RST_DEVICES_L/H/U/V/W/X
- CLK_OUT_ENB_L/H/U/V/W/X

In general, clamp-enable should be asserted before reset (as shown in the diagram). This works with synchronous or asynchronous clamping. However, if a unit can guarantee that its output signals will have the same clamp values as their pre-

clamp values (idle values) as well as their reset values, then clamp and reset ordering is not critical. Note it is non-trivial to verify the above guarantee.

Figure 10: Power-Gating Timing Sequence for Clamp/Reset/Clock/PG-Enable

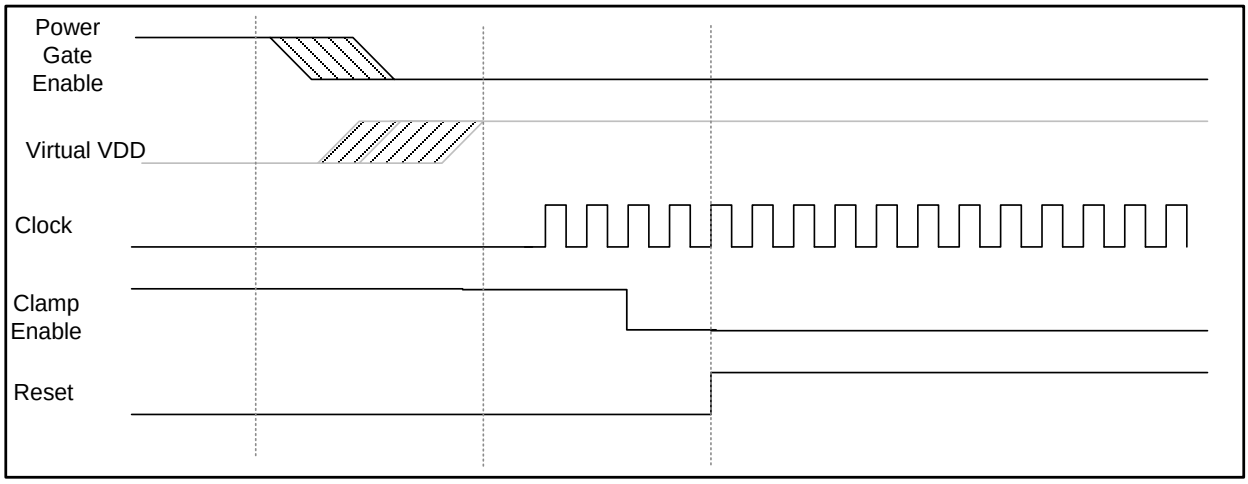


5.5.1.2 Power Ungating

For power-ungating (powering on) a partition, we have to ensure that clamp, reset, clocks, and PG-enable (sleep-enable) controls are sequenced as shown in the following diagram. For CCPLEX PG partitions, this sequencing is ensured by hardware (when power-gating is done via the flow controller). For SoC (non-CCPLEX) PG partitions, this sequencing needs to be ensured by software.

In general, the clamp enable should be de-asserted before reset (as shown in the diagram). This works with synchronous or asynchronous clamping. However, if a unit can guarantee that its output signals will have same clamp values as its post-clamp values (idle values), then clamp and reset ordering is not critical for power ungating. Note it is non-trivial to verify the above guarantee.

Figure 11: Power-Ungating Timing Sequence for Clamp/Reset/Clock/PG-Enable



5.5.2 Power-Gating Controller

The PMC provides power-gating controllers as programmable sequencers. When the power gating/ungating in is triggered, the controller sequences PG-enable signals with a programmable delay (measured in APB clock cycles) between consecutive

"zones" PG-enable controls. There are two types of power-gating controllers: CPU and SOC power-gating controllers. The following sections describe both types of controllers.

5.5.2.1 SOC Power-Gating Controller

The SOC power-gating controller is used to sequence power gating of SOC (including shadow CPU cluster) power partitions. It uses 8 zones and shares the same programming register for inter-zone delays. The zones are powered up in one order and powered down in reverse order, using the same inter-zone timings. So only one set of delays are used for both powering down and up.

For all non-CPU SOC partitions, power-gating can only be turned on/off by direct register write. For CPU (shadow) SOC partitions, power-gating can be turned on/off via flow-controller. Refer to "SOC Power Gating Controllers" in the PMC section.

GPU Power Gating

The GPU power gating is controlled by the GPMU unit inside the Kepler GPU. This is independent of the SOC/CPU power-gating control.

If the GPU has its own rail, then the software mutual exclusion for GPU ELPG and SoC power gating is not needed. But for a heavily cost reduced system where the GPU and SoC might share a rail, the software must interlock the two mechanisms in order to avoid di/dt problems (which could result if the two mechanisms were to alter power gating state simultaneously).

5.5.2.2 Fast CPU Power-Gating Controller

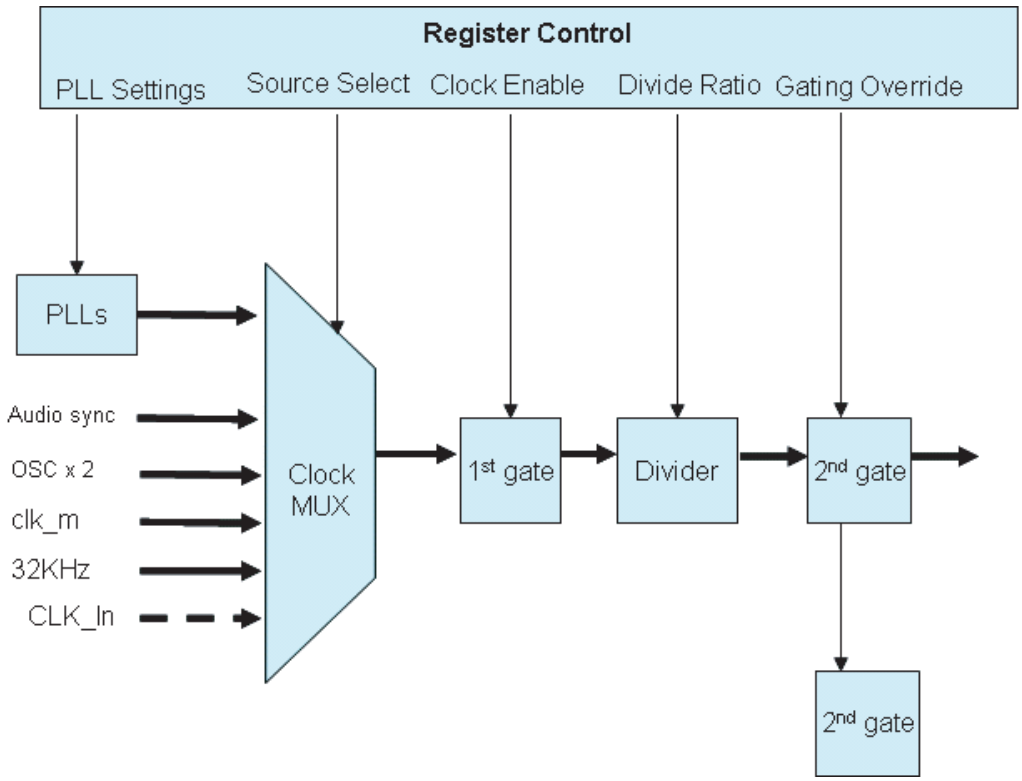
The fast CPU power-gating controller is used to sequence power-gating of fast CPU partitions. All CPU partitions (CE0/1/2/3 and C0NC) share the same programming register for inter-zone delays, which are different from inter-zone delays in SoC partitions. The zones are powered up in one order and powered down in reverse order, using the same inter-zone timings. So only one set of delays are used for both powering down and up. For fast CPU partitions, power gating can be turned on/off via the flow controller. Refer to "CPU-G Power Gating Controllers" in the PMC section.

5.6 Software Features and Programming Model

5.6.1 Clock Control

The figure below illustrates the software clock control model.

Figure 12: Clock Control



5.6.2 PLL Programming

PLL output frequencies are programmed by setting their N, M, and P values. The governing equations are:

VCO = (Fi / M) * N,

Fo = VCO / (2 ^ P)

where *Fo* is the output frequency from the PLL.

> **Note:** Not all PLLs have the simple mapping for the P value listed above. Contact your NVIDIA representative for assistance.

There are three requirements for each PLL that must be complied with:

- Each PLL has a legal input frequency (*Fi*) range.
- Each PLL has a legal comparison frequency (*CF*) range, where *CF = Fi / M*
- Each PLL has a legal *VCO* frequency range, where *VCO = CF * N*.

To change a PLL, do the following:

- Ensure that no enabled module is using the PLL that will change.
- Program the new PLL settings
- Wait for PLL stabilization
- Change the divider values for each clock that will use the PLL to divide-down to the target frequency, and change the module clock sources for all modules that will use the new PLL settings.

5.6.3 Clock Division Control

The ratio as defined by the *1/divisor* for an 8-bit fractional divider, of 7 bits of *d* and 1 bit of *h* is:

divisor = (ddddddd + 1) + (h * 0.5)

The divisor for UART 16b integer divider it is:

divisor = (dddddddddddddddd)

The divisor for the I2C 16b integer divider it is:

divisor = (ddddddddddddddddd + 1)

5.6.4 Changing Clock Sources and Clock Dividers

Changing a clock source (except the clock sources to the audio_sync_clk) to a running module is "glitch free". The clock source and divide ratio can be set concurrently without creating spurious frequencies. For the audio_sync_clk, the clock source select needs to be set up before changing the device clock source to use that audio clock or to enable the device which uses that audio clock.

The glitch-free clock divider to a running module can also be changed. All modules support changing the clock divider ratio without disabling the clock; write the new divider to the appropriate register See the section on Power below.

To change the clock source and divider (either after system reset or for any other reason), follow this sequence:

Sequence 1 to change clock source and divider:

1. Assert reset to the module if it is not already asserted
2. Enable clock to the module if the clock is not already enabled
3. Change the clock divider and/or the clock source to the module
4. Wait 2 µs for the clock to flush through the pipe / logic.
5. De-assert reset to the module.

5.6.5 Clock Gating (Override)

Please refer to the register definition section for more information.

5.6.5.1 Power

The following guidelines should be followed in pursuit of the lowest use-case power consumption:

- Target the least number of PLLs running at their lowest allowable frequencies for the given use-case.
- For each module, use the source with the lowest frequency that provides adequate performance for the use case.
- Turn off all clocks not required for the given use-case - employ maximum clock-gating.
- Use hardware dynamic clock bursting whenever possible. Turn on the desired frequency, burst to completion, and then disable the input frequency (allowing PLLs to be turned off or their output frequencies to be lowered)
- Use the CPU and COP/system super clock divider for lower CPU frequency where possible.
- Disable the oscillator input and/or clock outputs when they are not in use.

5.6.6 Programming Guide for Power Gating and Ungating

This section covers the software procedures for power gating and ungating of SOC power domains. Power gating and ungating of CPU power domains is not covered here because it is handled through the Flow Controller.

5.6.6.1 Procedure Summary

The general procedure for power gating an SOC power domain is as follows:

1. Write MC register to flush and block MC clients
2. Write CAR register to assert unit resets
3. Write CAR register to disable clocks
4. Write PMC register to gate power domain

The general procedure for power ungating an SOC power domain is as follows:

1. Write PMC register to ungate power domain
2. Write CAR register to enable clocks
3. Write CAR register to de-assert resets
4. Write MC register to enable MC clients

In some cases, partitions require specific deviations from the general procedure. Deviations are covered in the domain-specific sections below.

This table summarizes the respective clock and reset bits and MC clients in each SOC power domain.

Table 19: MC Clients for Clocks and Resets per Domain

Domain	Units	MC Clients
VE	VI, CSI, ISP	VI, ISP
VE2	ISPB	ISP2B
VDE	VDE	VDE
PCX	AFI	AFI
MPEA	MSENC	MSENC
SAX	SATA	SAX

Domain	Units	MC Clients
DIS	DISPLAY	DC
DISB	DISPLAYB	DCB
SOR	MIPI_CAL, DPAUX, SOR, HDMI, DSI, DSIB	None
XUSBB	XUSB_DEV	XUSB_DEV
XUSBC	XUSB_HOST	XUSB_HOST
VIC	VIC	VIC

5.6.6.2 Procedures for VE Power Domain

VE Power Gating

1. Flush MC clients VI and ISP by setting the following bits:
   - MC_CLIENT_HOTRESET_CTRL_0.VI_FLUSH_ENABLE
   - MC_CLIENT_HOTRESET_CTRL_0.ISP2_FLUSH_ENABLE
   - MC_CLIENT_HOTRESET_CTRL_1_0.ISP2B_FLUSH_ENABLE

   Also Poll MC_CLIENT_HOTRESET_STATUS_1_0 until ISP2B_HOTRESET_STATUS is set.
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bits are set:
   - VI_HOTRESET_STATUS
   - ISP2_HOTRESET_STATUS
3. Set the following bits to assert reset to VI, ISP, ISPB, and CSI:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_VI
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_ISP
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_X_0.CLK_ENB_ISPB
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_CSI
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILAB
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILCD
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILE
4. Clear the following bits to disable clocks to VI, ISP, ISPB, and CSI:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_VI
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_ISP
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_CSI
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILAB
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILCD
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILE
5. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = VE
   - START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the VE bit is set

VE Power Ungating

1. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = VE

- START = ENABLE

2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the VE bit is cleared
3. Set the following bits to enable clocks to VI, ISP, ISPB, and CSI:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_VI
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_ISP
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_X_0.CLK_ENB_ISPB
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_CSI
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILAB
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILCD
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_CILE
4. Remove power-gating clamps by writing a 1 to the following bit:
   - APBDEV_PMC_REMOVE_CLAMPING_CMD_0.VE
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the VE bit is cleared
6. If needed, clear the following bits to de-assert the reset to VI, ISP, ISPB, and CSI:
   - CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_VI_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_ISP_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_X_0.SWR_ISPB_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_CSI_RST
7. Enable MC clients VI and ISP by clearing the following bits:
   - MC_CLIENT_HOTRESET_CTRL_0.VI_FLUSH_ENABLE
   - MC_CLIENT_HOTRESET_CTRL_0.ISP2_FLUSH_ENABLE
   - MC_CLIENT_HOTRESET_CTRL_1_0.ISP2B_FLUSH_ENABLE

5.6.6.3 Procedures for VDE Power Domain

VDE Power Gating

1. Flush the VDE MC client by setting the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.VDE_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bit is set:
   - VDE_HOTRESET_STATUS
3. Set the following bits to assert the reset to the VDE:
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_VDE_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_BSEV_RST
4. Clear the following bits to disable clocks to the VDE:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_VDE
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_BSEV
5. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = VDE
   - START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the VDE bit is set

VDE Power Ungating

1. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = VDE
   - START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the VDE bit is cleared
3. Set the following bits to enable clocks to the VDE:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_VDE
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_BSEV
4. Remove power-gating clamps by writing a 1 to the following bit:
   - APBDEV_PMC_REMOVE_CLAMPING_CMD_0.VDE
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the VDE bit is cleared
6. Clear the following bits to de-assert the reset to the VDE:
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_VDE_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_BSEV_RST
7. Enable the VDE MC client by clearing the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.VDE_FLUSH_ENABLE

5.6.6.4 Procedures for PCX Power Domain

PCX Power Gating

1. Flush the AFI MC client by setting the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.AFI_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bit are set:
   - AFI_HOTRESET_STATUS
3. Set the following bits to assert the reset to the PCIE and AFI:
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_PCIE_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_AFI_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_PCIEXCLK_RST
4. Clear the following bits to disable clocks to PCIE and AFI:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_PCIE
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_PCIERX0
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_PCIERX1
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_PCIERX2
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_PCIERX3
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_PCIERX4
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_AFI
5. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = PCX
   - START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the PCX bit is set

PCX Power Ungating

1. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = PCX
   - START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the PCX bit is cleared
3. Set the following bits to enable clocks to PCIE:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_PCIE
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_PCIERX0
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_PCIERX1
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_PCIERX2
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_PCIERX3
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_PCIERX4
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_AFI
4. Remove power-gating clamps by writing a 1 to the following bit:
   - APBDEV_PMC_REMOVE_CLAMPING_CMD_0.PCX
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the PCX bit is cleared
6. Clear the following bits to de-assert the reset to the PCX:
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_PCIE_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_AFI_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_PCIEXCLK_RST
7. Enable the AFI MC client by clearing the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.AFI_FLUSH_ENABLE

5.6.6.5 Procedures for MPE Power Domain

MPE Power Gating

1. Flush the MSENC MC client by setting the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.MSENC_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bit is set:
   - MSENC_HOTRESET_STATUS
3. Set the following bit to assert the reset to the MSENC:
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_MSENC_RST
4. Clear the following bit to disable clocks to the MSENC:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_MSENC
5. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = MPE
   - START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the MPE bit is set

MPE Power Ungating

1. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = MPE

- START = ENABLE

2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the MPE bit is cleared
3. Set the following bits to enable clocks to the MSENC:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_MSENC
4. Remove power-gating clamps by writing a 1 to the following bit:
   - APBDEV_PMC_REMOVE_CLAMPING_CMD_0.MPE
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the MPE bit is cleared
6. Clear the following bits to de-assert the reset to the MSENC:
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_MSENC_RST
7. Enable the MSENC MC client by clearing the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.MSENC_FLUSH_ENABLE

5.6.6.6 Procedures for SAX Power Domain

SAX Power Gating

1. Flush the SATA MC clients by setting the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.SATA_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bit is set:
   - SATA_HOTRESET_STATUS
3. Set the following bits to assert the reset to SATA:
   - CLK_RST_CONTROLLER_RST_DEVICES_V_0.SWR_SATA_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_W_0.SWR_SATACOLD_RST
4. Clear the following bit to disable clocks to SATA:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_V_0.CLK_ENB_SATA
5. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = SAX
   - START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the SAX bit is set

SAX Power Ungating

1. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = SAX
   - START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the SAX bit is cleared
3. Set the following bit to enable clocks to SATA:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_V_0.CLK_ENB_SATA
4. Remove power-gating clamps by writing a 1 to the following bit:
   - APBDEV_PMC_REMOVE_CLAMPING_CMD_0.SAX
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the SAX bit is cleared
6. Clear the following bits to de-assert the reset to SAX:
   - CLK_RST_CONTROLLER_RST_DEVICES_V_0.SWR_SATA_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_W_0.SWR_SATACOLD_RST

7. Enable the SATA MC clients by clearing the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.SATA_FLUSH_ENABLE

5.6.6.7 Procedures for DIS Power Domain

DIS Power Gating

The VE power domain has to be gated before the DIS can be gated.

1. Flush the DC MC client by setting the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.DC_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bit is set:
   - DC_HOTRESET_STATUS
3. Set the following bit to assert the reset to DISP1:
   - CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_DISP1_RST
4. Clear the following bit to disable clocks to DISP1:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_DISP1
5. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = DIS
   - START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the DIS bit is set

DIS Power Ungating

DIS power ungating requires the SOR to be ungated as well.

1. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   - PARTID = DIS
   - START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the DIS bit is cleared
3. Set the following bit to enable clocks to DISP1:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_DISP1
4. Remove power-gating clamps by writing a 1 to the following bit:
   - APBDEV_PMC_REMOVE_CLAMPING_CMD_0.DIS
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the DIS bit is cleared
6. Clear the following bit to de-assert the reset to DISP1:
   - CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_DISP1_RST
7. Enable the DC MC client by clearing the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.DC_FLUSH_ENABLE

5.6.6.8 Procedures for DISB Power Domain

DISB Power Gating

1. Flush the DCB MC client by setting the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.DCB_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bit is set:

- DCB_HOTRESET_STATUS

3. Set the following bit to assert the reset to DISP2:
   - CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_DISP2_RST
4. Clear the following bits to disable clocks to DISP2:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_DISP2
5. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = DISB
   - START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the DISB bit is set

DISB Power Ungating

DISB power ungating requires the SOR to be ungated as well.

1. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   - PARTID = DISB
   - START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until bit DISB is clear
3. Set the following bits to enable clocks to DISP2:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_L_0.CLK_ENB_DISP2
4. Remove power-gating clamps by writing a 1 to the following bit:
   - APBDEV_PMC_REMOVE_CLAMPING_CMD_0.DISB
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the DISB bit is cleared
6. Clear the following bits to de-assert reset to DISP2:
   - CLK_RST_CONTROLLER_RST_DEVICES_L_0.SWR_DISP2_RST
7. Enable the DCB MC client by clearing the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.DCB_FLUSH_ENABLE

5.6.6.9 Procedures for SOR Power Domain

SOR Power Gating

SOR can only be power gated when both DIS and DISB are gated.

1. Set the following bits to assert the reset to MIPI_CAL, DPAUX, SOR, HDMI, DP2, DSI and DSIB:
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_MIPI_CAL_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_X_0.SWR_DPAUX_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_X_0.SWR_SOR0_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_HDMI_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_DSI_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_DSIB_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_W_0.SWR_DP2_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_W_0.SWR_ HDA2HDMICODEC_RST
2. Clear the following bits to disable clocks to MIPI_CAL, DPAUX, SOR, HDMI, DP2, DSI and DSIB:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_MIPI_CAL
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_X_0.CLK_ENB_DPAUX

- CLK_RST_CONTROLLER_CLK_OUT_ENB_X_0.CLK_ENB_SOR0
- CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_HDMI
- CLK_RST_CONTROLLER_CLK_OUT_ENB_X_0.CLK_ENB_HDMI_AUDIO
- CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_DSI
- CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_DSIB
- CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_DSIA_LP
- CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_DSIB_LP
- CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_DP2
- CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0. CLK_ENB_HDA2HDMICODEC

3. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = SOR
   - START = ENABLE
4. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the SOR bit is set

SOR Power Ungating

1. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = SOR
   - START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the SOR bit is cleared
3. Set the following bits to enable clocks to MIPI_CAL, DPAUX, SOR, HDMI, DP2, DSI and DSIB:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_MIPI_CAL
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_X_0.CLK_ENB_DPAUX
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_X_0.CLK_ENB_SOR0
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_HDMI
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_X_0.CLK_ENB_HDMI_AUDIO
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_H_0.CLK_ENB_DSI
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_DSIB
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_DSIA_LP
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_DSIB_LP
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_DP2
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_HDA2HDMICODEC
4. Remove power-gating clamps by writing a 1 to the following bit:
   - APBDEV_PMC_REMOVE_CLAMPING_CMD_0.SOR
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the SOR bit is cleared
6. Clear the following bits to de-assert the reset to MIPI_CAL, DPAUX, SOR, HDMI, DP2, DSI and DSIB:
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_MIPI_CAL_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_X_0.SWR_DPAUX_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_X_0.SWR_SOR0_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_HDMI_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_H_0.SWR_DSI_RST
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_DSIB_RST

- CLK_RST_CONTROLLER_RST_DEVICES_W_0.SWR_DP2_RST
- CLK_RST_CONTROLLER_RST_DEVICES_W_0.SWR_HDA2HDMICODEC_RST

5.6.6.10 Procedures for XUSBA Power Domain

XUSBA Power Gating

1. Set the following bit to assert the reset to XUSB_SS:
   - CLK_RST_CONTROLLER_RST_DEVICES_W_0.SWR_XUSB_SS_RST
2. Clear the following bit to disable clocks to XUSB_SS:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_XUSB_SS
3. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = XUSBA
   - START = ENABLE
4. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the XUSBA bit is set

XUSBA Power Ungating

1. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = XUSBA
   - START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the XUSBA bit is cleared
3. Set the following bit to enable clocks to XUSB_SS:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_W_0.CLK_ENB_XUSB_SS
4. Remove power-gating clamps by writing a 1 to the following bit:
   - APBDEV_PMC_REMOVE_CLAMPING_CMD_0.XUSBA
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the XUSBA bit is cleared
6. Clear the following bit to de-assert the reset to XUSB_SS:
   - CLK_RST_CONTROLLER_RST_DEVICES_W_0.SWR_XUSB_SS_RST

5.6.6.11 Procedures for XUSBB Power Domain

XUSBB Power Gating

Software should be aware that disabling XUSB_DEV clock will also affect the XUSB_HOST module that is in XUSBC power domain.

1. Flush XUSB_DEV MC client by setting the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.XUSB_DEV_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bit is set:
   - XUSB_DEV_HOTRESET_STATUS
3. Set the following bit to assert reset to XUSB_DEV:
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_XUSB_DEV_RST
4. Clear the following bits to disable clocks to XUSB_DEV:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_XUSB_DEV
5. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = XUSBB

- START = ENABLE

6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the XUSBB bit is set

XUSBB Power Ungating

1. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = XUSBB
   - START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the XUSBB bit is cleared
3. Set the following bit to enable clocks to XUSB_DEV:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_XUSB_DEV
4. Remove power-gating clamps by writing a 1 to the following bit:
   - APBDEV_PMC_REMOVE_CLAMPING_CMD_0.XUSBB
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the XUSBB bit is cleared
6. Clear the following bit to de-assert the reset to XUSB_DEV:
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_XUSB_DEV_RST
7. Enable the XUSB_DEV MC client by clearing the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.XUSB_DEV_FLUSH_ENABLE

5.6.6.12 Procedures for XUSBC Power Domain

XUSBC Power Gating

Software should be aware that disabling XUSB_HOST clock will also affect the XUSB_SS module that is in the XUSBA power domain.

1. Flush the XUSB_HOST MC client by setting the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.XUSB_HOST_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bit is set:
   - XUSB_HOST_HOTRESET_STATUS
3. Set the following bits to assert the reset to XUSB_HOST:
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_XUSB_HOST_RST
4. Clear the following bits to disable clocks to XUSB_HOST:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_XUSB_HOST
5. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = XUSBC
   - START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the XUSBC bit is set

XUSBC Power Ungating

1. Write to APBDEV_PMC_PWRGATE_TOGGLE_0 with the following fields:
   - PARTID = XUSBC
   - START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the XUSBC bit is cleared
3. Set the following bit to enable clocks to XUSB_HOST:

- CLK_RST_CONTROLLER_CLK_OUT_ENB_U_0.CLK_ENB_XUSB_HOST

4. Remove power-gating clamps by writing a 1 to the following bit:
   - APBDEV_PMC_REMOVE_CLAMPING_CMD_0.XUSBC
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the XUSBC bit is cleared
6. Clear the following bit to de-assert the reset to XUSB_HOST:
   - CLK_RST_CONTROLLER_RST_DEVICES_U_0.SWR_XUSB_HOST_RST
7. Enable the XUSB_HOST MC client by clearing the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.XUSB_HOST_FLUSH_ENABLE

5.6.6.13 Procedures for VIC Power Domain

VIC Power Gating

1. Flush the VIC MC client by setting the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.VIC_FLUSH_ENABLE
2. Poll MC_CLIENT_HOTRESET_STATUS_0 until the following bit is set:
   - VIC_HOTRESET_STATUS
3. Set the following bit to assert the reset to the MSENC:
   - CLK_RST_CONTROLLER_RST_DEVICES_X_0.SWR_VIC_RST
4. Clear the following bit to disable clocks to the VIC:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_X_0.CLK_ENB_VIC
5. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = VIC
   - START = ENABLE
6. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the VIC bit is set

VIC Power Ungating

1. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = VIC
   - START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the VIC bit is cleared
3. Set the following bit to enable clocks to the VIC:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_X_0.CLK_ENB_VIC
4. Remove power-gating clamps by writing a 1 to the following bit:
   - APBDEV_PMC_REMOVE_CLAMPING_CMD_0.VIC
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the VIC bit is cleared
6. Clear the following bits to de-assert the reset to the VIC:
   - CLK_RST_CONTROLLER_RST_DEVICES_X_0.SWR_VIC_RST
7. Enable the VIC MC client by clearing the following bit:
   - MC_CLIENT_HOTRESET_CTRL_0.VIC_FLUSH_ENABLE

5.6.6.14 Procedures for IRAM Power Domain

IRAM Power Gating

1. Set the following bit to enable first level clock gating when IRAMs are not in use:
   - CLK_RST_CONTROLLER_ CLK_OUT_ENB_U_0.CLK_ENB_IRAM[A|B|C|D]
2. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = IRAM
   - START = ENABLE
3. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the IRAM bit is set

IRAM Power Ungating

1. Write to these APBDEV_PMC_PWRGATE_TOGGLE_0 fields with the following settings:
   - PARTID = IRAM
   - START = ENABLE
2. Poll APBDEV_PMC_PWRGATE_STATUS_0 until the IRAM bit is cleared
3. Set the following bit to disable first level clock gating:
   - CLK_RST_CONTROLLER_CLK_OUT_ENB_ U_0.CLK_ENB_ IRAM[A|B|C|D]
4. Remove power-gating clamps by writing a 1 to the following bit:
   - APBDEV_PMC_REMOVE_CLAMPING_CMD_0.IRAM
5. Poll APBDEV_PMC_REMOVE_CLAMPING_CMD_0 until the IRAM bit is cleared

5.7 Clock and Reset Controller Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

Because this chip is the system controller, resets are generated in hardware automatically as part of the power-on (POR) or system (either hardware or software) reset sequence.

In POR, all blocks will be held in reset (with clocks disabled) except the minimal set of modules that are needed for system boot-up. At POR, the appropriate bits in RST_DEVICES_L/H/U/V/W/X registers are set automatically by hardware. A "1" in the bit position signifies that block will be held at reset after POR. A "0" in the bit position signifies that block will have its reset de-asserted after POR.

Similarly for clocks, the appropriate bits in CLK_OUT_ENB_L/H/U/V/W/X registers are set automatically by hardware. A "1" in the bit position signifies that block will have clock running during and after POR. A "0" in the bit position signifies that block will not have clock running during or after POR.

The blocks necessary for boot (known as boot blocks) include:

- The ARM7 AVP Processor (COP) and its L1 cache
- All system buses (PPSB, AHB, APB, etc.)
- Timer
- RTC
- NOR Flash controller
- eFUSE
- GPIO
- CoreSight

Each of the boot block devices will have their reset de-asserted at the end of the POR period (as well as their clocks enabled and use the Oscillator clock for their clock source). Boot blocks clock dividers are all set to divided-by-one.

During POR or system reset, the reset controller will de-assert reset to the boot blocks first and extend the resets to the CPU/ARM7 for another 511 oscillator clock periods. This will prevent either processor from talking to a boot device while it is still in the reset state.

Releasing a non-boot block/device from reset to bring into operation will require software to initiate a carefully controlled sequence with clock and reset control registers. This sequence must be implemented by software precisely to ensure correct operation of the hardware.

5.7.1 Precautions

- Unless noted elsewhere, all modules support changing the clock divider ratio without disabling the clock.
- Unless noted elsewhere, all modules' clock switching is glitch-free except "audio_sync_clk".
- For "audio_sync_clk", the clock source select needs to be set up before changing the device clock source to use that audio clock or to enable the device which use that audio clock.
- Before stopping the clock (via CLK_OUT_ENB_L/H/U/V/W/X registers) and/or asserting reset (via RST_DEVICES_L/H/U/V/W/X registers) to a module, first check the module to make sure it is not active. Stopping clock/asserting reset while the module is still busy can cause relatively minor problem such as incorrect data read/written, or catastrophic problem such as system hang. To ensure a module is not active, (a) disable the module by programming its disable bit if not already done so, and (b) wait until the module is not active by checking for its busy bit, done bit, count, or similar mechanism.

To set up a non-boot device for operation (only apply if a device has a CLK_SOURCE_<mod> register)

1. Make sure the device's reset is asserted (via RST_DEVICES_L/H/U/V/W/X registers).
2. Enable clock to the device (via CLK_OUT_ENB_L/H/U/V/W/X registers).
3. Change the clock divisor to the device (via CLK_SOURCE_ register).
4. Wait 1 µs to make sure the clock divider has changed.
5. Change the clock source to the device (via the CLK_SOURCE_<mod> register).
6. Wait 2 µs to make sure clock source/device logic is stabilized.
7. De-assert the device's reset (via RST_DEVICES_L/H/U/V/W/X registers).

To change a device's clock divider and/or source after boot-up (only apply if a device has a CLK_SOURCE_<mod> register):

(A) Method 1 -- (using reset).

1. Make sure the device is disabled (via the device's register).
2. Assert device's reset (via RST_DEVICES_L/H/U/V/W/X registers).
3. Make sure clock to the device is enabled (via CLK_OUT_ENB_L/H/U/V/W/X registers).
4. Change the clock divisor to the device (via CLK_SOURCE_<mod> register).
5. Wait 1 µs to make sure the clock divider has changed.
6. Change the clock source to the device (via the CLK_SOURCE_<mod> register).
7. Wait 2 µs to make sure clock source/device logic is stabilized.
8. De-assert the device's reset (via RST_DEVICES_L/H/U/V/W/X registers).

(B) Method 2 -- (not using reset).

1. Make sure the clock to the device is enabled (via CLK_OUT_ENB_L/H/U/V/W/X registers).

2. Depending on the maximum rated frequency of the device and the current and target clock source/divider value, either change the divider first or the clock source first to avoid a temporary situation where the maximum frequency for that device is violated. Make sure to wait for 1 µs between changing the divider and clock source programming.).
3. Wait 2 µs to make sure the device logic is stabilized.

To reset a device (without need to change clock) after boot-up:

1. Make sure the device's reset is asserted (via RST_DEVICES_L/H/U/V/W/X registers).
2. Wait 2 µs to make sure the device logic is stabilized.
3. De-assert the device's reset (via RST_DEVICES_L/H/U/V/W/X registers).

Method Used to wait for 1 or 2 µs.

1. To use one of the four timers, refer to the Timers section of this document.
2. Program the TMR_PTV register's TMR_PTV field with the desired microsecond count.
3. Program the TMR_PTV register's EN field to enable the timer.
4. Poll the TMR_PCR register's TMR_PCV field until it reaches 0 to indicate the microsecond count has been reached.
5. Program the TMR_PTV register's EN field to disable the timer.

Invert Duty-Cycle Distortion Control

Some dividers have a feature to help mitigate clock duty-cycle distortion -- the distortion of the positive edge of a clock can be swapped with the distortion of the negative edge. This ability may prove useful to counteract some of the inherent distortion that occurs in clock generation logic and distribution. For example, a divider with a ratio of 1.0 having a 51%/49% duty cycle could be made to have a 49%/51% duty cycle, if the duty-cycle inversion control is activated.

- **Frequency Change Caution**:

  An INVERT_DCD field can be changed while the clock is running. In circumstances described in item 3 below, this may temporarily cause a negative impact on the divided clock frequency, causing the module to fail if the frequency to the module is not temporarily adjusted first.

  1. Asserting INVERT_DCD adds 1/2 clock period (divider input clock) to the low pulse of a single divided output clock period during the change. This causes the divided output clock frequency to be lowered for one clock period.
  2. For ratios other than 1.0, de-asserting INVERT_DCD removes 1/2 clock period (divider input clock) from the low pulse of a single divided output clock period during the change. Because this effectively speeds up the divided output clock frequency for one clock period, which can cause a module to fail, the module clock frequency may need to be changed to a lower frequency before de-asserting INVERT_DCD.
  3. De-asserting INVERT_DCD with a ratio of 1.0 is unique in that removing 1/2 clock period (divider input clock) from the low pulse effectively removes the low pulse altogether. The resulting combination of the high pulses on either side will effectively look like 1/2 clock period was added to the high pulse instead. Thus there occurs a lower frequency for one clock period rather than an increased frequency like all other divide ratios.

- **Latency**:

  Once the INVERT_DCD signal gets to the divider logic, there will be a maximum delay of 6 divider input clocks + 1 divider output clock before the change will complete.

Main clock sources used by the system:

(A) Primary clocks.

- "osc" or "clk_m" which can be either 12 MHz, 13 MHz, 19.2 MHz 26 MHz, 16.8 MHz, 38.4 MHz, or 48 MHz (Not all the frequencies listed under osc or clk_m can be met).
- "clk_s" which is 32 kHz.

(B) PLL clocks.

- "PLLC" is general purpose and its output is called "pllC_out".
- "PLLC2" is general purpose and its output is called "pllC2_out".
- "PLLC3" is general purpose and its output is called "pllC3_out".
- "PLLC4" is general purpose and its output is called "pllC4_out".
- "PLLM" (memory) is primarily used for memory and its output is called "pllM_out".
- "PLLP" (peripheral) has a fixed frequency and its output is called "pllP_out0".
- "PLLA" (audio) is cascaded from PLLP and is used for audio purposes.
- "PLLU" (USB) has fixed outputs at 12 MHz, 48 MHz, 60 MHz, and 480 MHz.
- "PLLD"(DSI) is primarily used for the display and its output (after a /2 fix) is called "pllD_out0".
- "PLLD2"(DSI) is primarily used for the display and its output (after a /2 fix) is called "pllD2_out0".
- "PLLX" has extra high frequency used primarily by the fast CPU and is called "pllX_out0".
- “PLLDP” is used for eDP/LVDS (spread spectrum) and is called “pllDP_out0”.
- "refPLLE" is only used by PLLE.
- "PLLE" is only used by PCIe, SATA, USB3 (if they are present)

(C) PLL divided down clocks (each divider has 7 integer bits and 1 fractional bit).

- "pllC_out1" is divided-down from "pllC_out0".
- "pllM_out1" is divided-down from "pllM_out0".
- "pllP_out1" is divided-down from "pllP_out0".
- "pllP_out2" is divided-down from "pllP_out0".
- "pllP_out3" is divided-down from "pllP_out0".
- "pllP_out4" is divided-down from "pllP_out0".
- "pllP_out5" is divided-down from "pllP_out0".
- "pllA_out0" is divided-down from the "pllA" output.

Note: With the exception of PLLA, the other PLLs all use "osc_div_clk" as the reference clock. This is the same frequency as "osc" with the exception of the following crystals:

38.4 MHz - Needs to be divided by 2 providing 19.2 MHz to the PLLs.

48.0 MHz - Needs to be divided by 4 providing 12.0 MHz to the PLLs

Note: In this document, CPULP, SCPU, and Slow CPU are synonymous. CPUG, FCPU, and Fast CPU are also synonymous.

5.7.2 Multi-Address Tagging

A register or bit marked with a [* Multi-Address] tag indicates multiple addresses can access the same register/bit. The two types of Multi-Address tags are described below.

[CCLK Multi-Address] Tags

These tags apply to legacy, CPUG, and CPULP multiple address registers and bits. For CCLK (CPU_CLK) related registers values:

- Three sets of addresses are provided to support single cluster legacy, CPUG, and CPULP clusters.
- Two sets of hardware flops are used to store programmed values for G and LP CPU clusters. Legacy single cluster registers are aliased to one of these based on the active cluster at the time the register is referenced.
- In some cases, only the CPU bit in an otherwise single access register is multi-address accessible, for example, CLK_ENB_CPU.

[FUSE Multi-Address] Tags

These tags apply to Fuse and CAR multiple address registers:

- A bond_out_* register can be programmed via fuse or CAR CLK_RST_CONTROLLER_BOND_OUT_L_0 register or fuse FUSE_SKU_BOND_OUT_L_0 register.
- Fuse bond_out writes are updated on fuse2all_fuse_outputs_valid rising edge
- CAR bond_out writes are updated on register writes

5.7.3 CLK_RST_CONTROLLER_RST_SOURCE_0

WatchDog (Deadman) Timer

The watchdog timer is used to recover from hang/lockup condition by resetting the system and/or COP (ARM7) and/or CPU (MPCore). Either timer1 or timer2 can be used as watchdog timer. Refer to the Timer section of this document for more information on watchdog timer usage.

Offset: 0x0 | Read/Write: R/W | Reset: 0x000XXX00 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00x000)

5.7.10 CLK_RST_CONTROLLER_CCLK_BURST_POLICY_0

CPU (CCLK) and COP/System (SCLK) Clock Control

In this section, MPCore is referred to as CPU while ARM7 is referred to as COP. In this context, CPU refers to the active CPULP or CPUG cluster. Each CCLK and SCLK clock domain can have 5 states: SUSP (suspend) where the clock source is 32 kHz, and normal states (IDLE, RUN, IRQ, FIQ).

Each of the normal states can be selected by software from 8 different clock sources. Furthermore, if any of the CPU/COP FIQ/IRQ bit is enabled, a hardware auto trigger feature will be enabled such that hardware will jump from any state to IRQ or to FIQ automatically. Of course, if the source is from a PLL, software needs to guarantee that the PLL clock is running and stable before changing clock sources.

There are many usage models that can be derived from this mechanism: For example:

- Software can simply keep changing the clock source to one state (i.e., just CWAKEUP_IDLE_SOURCE) without changing the CPU_STATE field.

- Software can have the concept of multiple states by first setting up CWAKEUP__SOURCE and then changing the CPU_STATE field.
- Software can enable hardware auto detect of IRQ/FIQ to jump to the IRQ or FIQ state.

Note: Whenever the clock source is switched, the clock is stopped for approximately 400-600 ns.

CCLK and SCLK Super Clock Divider Control

The super clock divider allows a very fine tune of clock frequency going to CPU and COP/system using clock skipping technique. It is different from a traditional divider (1/n) in that both the numerator and denominator are programmable (m/n). Both the numerator and denominator are 8 bits each. Thus, "effective" frequency = source frequency * (m/n). Furthermore, if any of the CPU/COP FIQ/IRQ bits is enabled, hardware will auto disable the super clock divider functionality.

There are many usage models that can be derived from this mechanism. For example:

- There is no clock source switching penalty. Software can just pick a PLL output as a maximum frequency source via CCLK/SCLK_BURST_POLICY and just keep changing SUPER_CCLK/SCLK_DIVIDER to yield the desired lower "effective" frequency.
- For applications where the "osc" frequency is more than sufficient to do the job, PLLs can be turned off to save power and the super clock divider can further divide down the "osc" clock to yield even more power saving.
- If auto IRQ/FIQ feature is enabled, CCLK/SCLK will automatically jump back to full frequency to handle high priority interrupt routines.

Note: From a dynamic voltage scaling (DVS) standpoint, the full clock frequency source (not the output frequency of the super clock divider) going into the super clock divider should be used to determine how low one can lower the voltage.
If m > n, the resulting super clock divider output frequency will be the same as the input frequency. In other words, there will be no clock skip or divide down.

5.7.17 CLK_RST_CONTROLLER_CLK_CPU_CMPLX_0

[CCLK Multi-Address]: See “Multi-Address Tagging” in this section for more details.

The CPU complex consists of the CPU, L2 cache controller, and a number of bridge devices interfacing CPU/L2 cache to the rest of the system. Except for the CPU, L2 cache controller, and bridge logic to external memory which always runs at non-divided-down CPU frequency, other bridge devices can run at various programmable divided-down CPU clock ratios.

Note: However, since the CPU clock can be selected from 1-of-9 clock sources (refer to the CCLK_BURST_POLICY register), the user is responsible for not selecting a bridge divide-down CPU clock ratio that will exceed 1/4 of the "MAX" CPU frequency supported. The "MAX" CPU frequency is 1.1 GHz.

5.7.18 CLK_RST_CONTROLLER_OSC_CTRL_0

Oscillator Control

"osc" can have any of the hardware-supported frequencies (12, 13, 19.2, 26, 16.8, 38.4, 48 MHz) . The OSC_FREQ field provides a way for software to inform hardware what the incoming clock frequency is. This information is used by hardware to auto setup the parameters (DIVN, DIVM, DIVP, CPCON, LFCON, VCOCON, DCCON, OUT1_RATIO, OUT2_RATIO, OUT3_RATIO, OUT4_RATIO, and OUT5_RATIO) to PLLP and its dividers. If a different frequency is used, there is a way to override the hardware auto-generated PLLP parameters.

5.7.19 CLK_RST_CONTROLLER_PLL_LFSR_0

Offset: 0x54 │ Read/Write: RO │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
15:0	X	RND: Random number generated from PLL linear feedback shift register.

5.7.20 CLK_RST_CONTROLLER_OSC_FREQ_DET_0

Oscillator Frequency Detect

The “osc” can have any one of the seven supported crystal frequencies (12, 13, 19.2, 26, 16.8, 38.4, 48 MHz). Hardware provides the following mechanism to detect which frequency of osc is running. To determine the osc frequency, program the number of 32.768 kHz clock periods to create a fixed time window in which the "osc" clocks will be counted. Once the counting process is done, the count value can be used to determine the osc frequency.

OSC Frequency (MHz)	Approximate OSC_FREQ_DET_CNT (using two 32 kHz periods as window)
12.00	732 (0x02DC)
13.00	794 (0x031A)
16.80	1025 (0x0401)
19.20	1172 (0x0494)
26.00	1587 (0x0633)
38.40	2344 (0x0928)
48.00	2930 (0x0B72)

Offset: 0x58 │ Read/Write: R/W │ Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
31	DISABLE	OSC_FREQ_DET_TRIG: 0 = default, 1 = enable osc frequency detect. 0 = DISABLE 1 = ENABLE
3:0	0x0	REF_CLK_WIN_CFG: Indicates the number of 32.768 kHz clock periods as window in n+1 scheme.

5.7.21 CLK_RST_CONTROLLER_OSC_FREQ_DET_STATUS_0

Offset: 0x5c │ Read/Write: RO │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	OSC_FREQ_DET_BUSY: 0 = not busy, 1 = busy.
15:0	X	OSC_FREQ_DET_CNT: Indicates the number of osc counts within the 32.768 kHz clock reference window.

5.7.22 CLK_RST_CONTROLLER_PLLE_SS_CNTL_0

Offset: 0x68 | Read/Write: R/W | Reset: 0x00005c00 (0b00000000000000000010111x000000000) | Default: 0x20010025

Bit	Reset	SW Default	Description
31:30	0x0	_NONE_	PLLE_INTEGOFFSET: interpolator bias current.
29:24	0x0	0x20	PLLE_SSCINCINTRV: Triangle generator increment interval control.
23:16	0x0	0x1	PLLE_SSCINC: Triangle generator increment control.
15	0x0	0x0	PLLE_SSCINVERT: 0: gives down spread, 1: gives up-spread.
14	0x1	0x0	PLLE_SSCCENTER: 0: gives control to SSCINVERT, 1: enables center spread.
13	0x0	_NONE_	PLLE_SSCPDMBYP: Bypass from pulse density modulator. Normally set to zero.
12	0x1	0x0	PLLE_SSCBYP: 0: enables spreading, 1: disables spreading.
11	0x1	0x0	PLLE_INTERP_RESET: Interpolator reset. 0: normal operation, 1: resets SS machine.
10	0x1	0x0	PLLE_BYPASS_SS: When set feedback clock bypasses interpolator. Default value is zero.
8:0	0x0	0x25	PLLE_SSCMAX: Spread limit control.

5.7.23 CLK_RST_CONTROLLER_PLLC_BASE_0

Tegra K1 devices have 14 PLLs controllable by clock control. Consult the PLL specifications for electrical requirements. Below are the PLL cells used for each PLL referenced in this TRM:

- PLLC is of type PLL14G_DYN_ESD.
- PLLC2 and PLLC3 are of type PLL12G_DIG_E1.
- PLLM is of type PLL10G_4PH_ESD.
- PLLP and PLLA are of type CLKPLL700_LP.
- PLLU is of type CLKPLL960_USB.
- PLLD is of type CLKPLL15G_MIPI.
- PLLD2 is of type PLL12G_SSD_ESD.
- PLLDP and PLLC4 are of type PLL12G_SSD_AESD
- PLLX is of type PLL24G_DYN_PRB_ESD.
- refPLLE is of type PLL600_ESD.
- PLLE is of type PLL24G_SSA_33VCML_ESD.

In general, there are 3 requirements for each PLL with which software needs to comply:

- Input frequency range (REF).
- Comparison frequency range (CF). CF = REF/DIVM, where DIVM is the input divider control.
- VCO frequency range (VCO). VCO = CF * DIVN, where DIVN is the feedback divider control.

Note: The final PLL output frequency (FO) = VCO>>DIVP, where DIVP is the post divide control.

Crystals 38.4 MHz and 48 MHz require pre-divider PLL_REF_DIV settings of 2 and 4, respectively, to meet the input frequency requirements of all PLLs that use "osc_div_clk" as a reference. All other supported crystals are used by the PLLs directly, without any pre-divider.

Contact your NVIDIA representative for more details on the PLLs.

PLLP Configuration Information

PLLP is configured as a fixed frequency PLL. The code in the Boot ROM configures PLLP at a fixed 408 MHz. Later on, software (typically the Boot Loader) may change this to another "fixed" frequency.

For Tegra K1 devices, software changes this frequency from 216 MHz to 408 MHz. Boot ROM configuration values for 408 MHz are listed below.

Table 20: Boot ROM Configuration to 216 MHz

Reference Frequency	13.0 MHz	19.2 MHz	12.0 MHz	26.0 MHz	16.8MHz	38.4MHz	48.0MHz	Resulting Frequency
DIVN	408 (198h)	340 (154h)	408 (198h)	204 (0cch)	340 (154h)	340 (154h)	204 (0cch)	-
DIVM	13 (0dh)	16 (10h)	12 (0ch)	13 (0dh)	14 (0eh)	16 (10h)	6 (06h)	-

PLL_REF_DIV					/1 (0h)	/2 (1h)	/4 (2h)

Special Consideration when Using PLLX as a Clock Source for the CPU

PLLX is shared between G and LP CPU clusters. To save power, the proper PLLX_FO_LP_DISABLE or PLLX_FO_G_DISABLE bit should only be de-asserted when the output is being used.

5.7.46 CLK_RST_CONTROLLER_CLK_SOURCE_I2S1_0

Clock Configuration for Each Peripheral

In general, each block or module has a dedicated CLK_SOURCE_ register that provides clock source and clock divider control to that device. The clock source select is typically 2 bits long to select one of the four clock sources. The divider is typically 8 bits long, consisting of a 7-bit integer and a 1-bit fraction. Furthermore, depending on the specific module, the CLOCK_SOURCE_ register may contain additional control bits.

Note: The 16-bit UARTA/UARTB/UARTC clock divider control is provided by the UART register set and not by the CLK_SOURCE_ registers.
To switch from one clock source to the next, both clock sources must be active/running.

Special PLL Clock Usage by Certain Peripherals

As mentioned previously, each peripheral has a clock source select in its corresponding CLK_SOURCE_ register. There are a number of modules that take in an additional fixed PLL clock source for portion of their logic.

Listed below are the modules/logic and the fixed PLL clock source they use.

Module/Logic	Fixed PLL Clock Source Used
LFSR	pllM_out0
DSI	pllP_out3
DSIB	pllP_out3
CSI	pllP_out3
I2C1	pllP_out3
I2C2	pllP_out3
I2C3	pllP_out3
UARTA	pllP_out3
UARTB	pllP_out3
UARTC	pllP_out3
UARTD	pllP_out3

More information about clock sources and divider widths can be found under “Hardware Features” in this section.

Audio Sync Clock

The audio sync clock synchronizes communication between 2 audio devices to prevent a FIFO overrun/underrun condition in either of the audio devices. For example, one can receive data from SPDIFIN and transmit the same data back out to an I2S speaker. But if the SPDIFIN stream is 43.9 kHz while transmitting a 44.1 kHz sample rate to I2S, the SPDIFIN receive FIFO can get overrun while the I2S transmit FIFO can get underrun.

Note: There is no clock switching protection for the audio sync clock so one needs to set up the desired clock source before enabling the audio transmit/receive device.

5.7.70 CLK_RST_CONTROLLER_CLK_SOURCE_EMC_0

When changing the EMC frequency, internal logic sequencing handles the requirement that the DRAMs must be placed into self-refresh before its clock frequency is changed.

To support this, certain register fields when written do not get immediately applied but rather are applied at the correct time during the sequencing. These registers are referred to as "shadowed".

Other register fields initiate the sequencing state machine and therefore should be written last. Note that the value of the field must change to start the state machine - simply writing the same value to the field is insufficient.

At the end of the sequencing, the DRAMs are restored to being operational.

As an alternative to writing one of the sequencing initiating fields, the FORCE_CC_TRIGGER is provided to force the state machine to run. This is not the recommended method.

There are EMC/MC configuration registers that are shadowed or can initiate a clock change sequence are described below:

- Initiates sequencing (value must change):
  - CLK_SOURCE_EMC.EMC_2X_CLK_SRC
  - EMC_2X_CLK_DIVISOR
  - MC_EMC_SAME_FREQ

- FORCE_CC_TRIGGER
- Shadowed (will be applied during sequencing):
  - CLK_SOURCE_EMC.EMC_2X_CLK_SRC
  - EMC_2X_CLK_DIVISOR
  - MC_EMC_SAME_FREQ
- Not shadowed:
  - CLK_SOURCE_EMC.EMC_INVERT_DCD (must be set during initial configuration and before the EMC clock is started)

5.7.93 CLK_RST_CONTROLLER_RST_DEV_L_SET_0

The RST_DEV_(L,H,U, V, W, X)_(SET,CLR) and CLK_ENB_(L,H,U, V, W, X)_(SET,CLR) registers are provided as an alternate method of programming the same registers found in RST_DEVICES_(L,H,U, V, W, X) and CLK_OUT_ENB_(L,H,U, V, W, X) registers, respectively.

Therefore, using either methods will change the same underlying peripherals reset, and clock enable control for writes. For reads, you can use either method to retrieve the reset/clock-enable state of each peripheral.

5.7.118 CLK_RST_CONTROLLER_CLK_CPUG_CMPLX_0

[CCLK Multi-Address]: See “Multi-Address Tagging” in this section for more details..

The CPUG complex consists of the CPUG, L2 cache controller, and a number of bridge devices interfacing the CPUG and L2 cache to the rest of the system. Except for the CPUG, L2 cache controller, and bridge logic to external memory which always runs at the non-divided-down CPUG frequency, other bridge devices can run at various programmable divided-down CPUG clock ratios.

Note: Because the CPUG clock can be selected from 1-of-9 clock sources (refer to the CCLKG_BURST_POLICY register), it is the user’s responsibility to not select a bridge divide-down CPUG clock ratio that will exceed 1/4 of the maximum CPUG frequency supported. The maximum CPUG frequency is 1.1 GHz.

Offset: 0x378 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxx0000xxxxxx00)

Bit	Reset	Description
11	0x0	CPUG3_CLK_STP: 1 = CPUG3 clock stop, 0 = CPUG3 clock run.

Bit	Reset	Description
8	0x0	CPULP0_CLK_STP: 1 = CPULP0 clock stop, 0 = CPULP0 clock run.

5.7.120 CLK_RST_CONTROLLER_CPU_SOFTRST_CTRL_0

Earlier Tegra chips had a single state-machine that took care of sequencing reset (delaying reset de-assertion based on a timer value) in case of a flow-controller request or a WatchDog Timer (WDT) expiry request. This changed in Tegra K1 devices because a flow-controller initiated request has more to do. The timer control of reset de-assertion for WDT initiated requests is in the same place while the new controls have been added to the new registers.

Offset: 0x380 | Read/Write: R/W | Reset: 0x00000010 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00010000)

Bit	Reset	Description
7:0	0x10	CPU_SOFTRST_LEGACY_WIDTH: CPU soft reset de-assertion counter value for legacy WDT resets.

5.7.121 CLK_RST_CONTROLLER_CPU_SOFTRST_CTRL1_0

5.7.164 CLK_RST_CONTROLLER_UTMIP_PLL_CFG0_0

The data sampling frequency relies on a 960 MHz clock, so the goal of the PLL is to have:
In_Frequency * (PLL_VCOMULTBY2+1) * (PLL_NDIV/PLL_MDIV) = 960 MHz. With a 12 MHz input from PLL_U, the default setting of PLL_VCOMULTBY2 = 1, PLL_NDIV = 40, and PLL_MDIV = 1 results in a correct output.

This register is used to configure the PHY PLL contained in the UTMIP module.

UTMIP PLL Configuration Register 0

Offset: 0x480 │ Read/Write: R/W │ Reset: 0x005001XX (0bx00000000101000000000001xxxxx000)

30:29	RW	0x0	UTMIP_PLL_VREG_BG_CTRL: Voltage regulator and band-gap probe mux control. VREG_BG_CTRL = 0 => VREG_BG_PRB = 0. VREG_BG_CTRL = 1 => VREG_BG_PRB = bandgap. VREG_BG_CTRL = 2 => VREG_BG_PRB = Vregulator. See cell specification.
28:27	RW	0x0	UTMIP_PLL_VREG_CTRL: Voltage regulator voltage level control. See cell specification.
26:25	RW	0x0	UTMIP_PLL_KCP: KCP of the UTMIP PHY PLL. Charge Pump Gain control. Default value is zero. See cell specification.
23:16	RW	0x50	UTMIP_PLL_NDIV: NDIV[7:0] input of UTMIP PLL. This is the feedback divider on the VCO feedback. 0x0 is not allowed. See cell specification.
15:8	RW	0x1	UTMIP_PLL_MDIV: MDIV[7:0] input of the UTMIP PLL. This is the predivide on the PLL. 0x0 is not allowed. See cell specification.
3	RO	X	UTMIP_PLL_RESERVED: Reserved.
2	RW	0x0	UTMIP_PLL_LOCK_OVR: LOCK_OVERRIDE control of the UTMIP PLL. Forces PLL_LOCK to 1. See cell specification.
1	RW	0x0	UTMIP_PLL_EN_FSTLCK: EN_FSTLCK input of UTMIP PLL. Reserving pin for PLL fast lock circuitry. See cell specification.
0	RW	0x0	UTMIP_PLL_ENB_LCKDET: ENB_LCKDET input of UTMIP PLL. When set to 1, powers down the lock detect. Setting ENB_LCKDET=X, LOCK_OVERRIDE=1, PLL_LOCK=1, and PLL_FREQLOCK=1 also powers down lock detect. 0 0 0->1(after lock) 0->1 (after lock) 1 0 0 0 lock detect power down. See cell specification.

5.7.165 CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0

UTMIP PLL Configuration and Parameters

In normal operation, the following clock generators are in play for USB:

Crystal (Xtal) clock -> enters PLL_U to generate 12 MHz clock -> enters USB_PHY PLL to generate 480/60 MHz clock.

The following parameters control the bring-up of the PLLs (coming out of reset or suspend):

- PllUOnState: start pllu_enable_count and pll_lock_count
  - Wait ~1 µs to enable the PLL_U (pllu_enable_count == ClkXtal * PLLU_ENABLE_DLY_COUNT * 8)
  - Wait ~1 ms until PLL_U is stable (pll_lock_count == ClkXtal * PLLU_STABLE_COUNT * 256) => USB_PHY PLL_ENABLE
  - pll_active_count = 0
    - Wait 5 µs to enable pll_active: pll_active_count == ClkXtal * PLL_ACTIVE_DLY_COUNT * 16 => USB_PHY PLL_ACTIVE
  - Wait ~2.5 ms until USB_PHY is stable (pll_lock_count == ClkXtal * XTAL_FREQ_COUNT * 256) => USB_PHY

Values for a 19.2 MHz Xtal clock are:

- PLLU_ENABLE_DLY_COUNT[4:0] = 1 * 12 / 8 = 2.4 = 3 = 0x03
- PLLU_STABLE_COUNT[11:0] = 1000 * 19.2 / 256 = 75 = 0x4b
- PLL_ACTIVE_DLY_COUNT[4:0] = 10 * 19.2 / 16 = 12 = 0x0c
- XTAL_FREQ_COUNT[11:0] = 2500 * 19.2 / 256 = 187 = 0xbb

0	RW	DISABLE	PLLE_CML0_OEN: PLLE CML0 clock out enable. Used for PCIe. 0 = DISABLE 1 = ENABLE

5.7.168 CLK_RST_CONTROLLER_SATA_PLL_CFG0_0

SATA Power Sequencer Input Software Control Program Guide

The software control input can be used for test coverage or diving the power sequencer SM via software. The SATA power sequencer is driven by 3 primary reset and power-down input signals: reset, lane_pd, and padpll_pd. The normal power-up sequence de-asserts in this order: padpll_pd > lane_pd > reset. The normal power-down sequence asserts in this order: reset > lane_pd > padpll_pd.

It is acceptable to assert all three signals at the same time. It is also acceptable for reset or lane_pd to return to the power-up state in the middle of a power-down sequence.

5.7.171 CLK_RST_CONTROLLER_PROG_AUDIO_DLY_CLK_0

- Clock doubler with 1X/2X is available for the S/PDIF clock.
- The CLK_ENB_SPDIF_DOUBLE bits in the CLK_OUT_ENB_V register must be enabled for either SYNC_1X_CLK or SYNC_2X_CLK to operate.
- PROG_DLY_CLK_SPDIF provides programmable delay for the S/DIF clock doublers.

Enable Sync Clocks

There are 3 related clock enables/selects to enable the sync clocks:

- CG_1. AUDIO_SYNC_CLK_SPDIF-SYNC_CLK_DIS: disable output of sync_clk mux
- CG_2. CLK_OUT_ENB_V-CLK_ENB_SPDIF_DOUBLER: disable input to doubler
- SEL_3. PROG_AUDIO_DLY_CLK-SPDIF_1X_SEL: Select 1x sync clock. 0=2x, 1=1x

Flow of Clock Logic

sync_clk mux (CG_1) -> (CG_2) (SEL_3) doubler -> clk switch

Suggested Programming for Sync Clock Enable:

- Leave CG_2 as default enabled.
- Use CG_1 to disable or enable (default) sync clock.

- Use SEL_3 to select 1x or 2x sync clock.

SYNC_CLK_DIS	CLK_ENB_SPDIF_DOUBLER	SPDIF_1X_SEL	SYNC_CLK
0	1	0	2x (Default)
0	1	1	1x
1	1	X	0 (off, recommended)
1	X	X	0 (off)
X	0	X	0 (off)

5.7.183 CLK_RST_CONTROLLER_CPU_FINETRIM_BYP_0

CPU Trimmer Registers

Bit	Name	Direction	Default Value	Description
7	byp	Read/Write	0	When asserted, the trimmer is bypassed.
6	select	Read/Write	0	When asserted, rise'rise clock propagation delay will be specified by {dr,r} fields. Otherwise, hardwired default delay will be applied. Similarly, fall'fall clock propagation delay will be specified by {df, f} fields when select is asserted.
5	dr	Read/Write	0	0: Minimal rise'rise clock propagation delay 1: Use one of the four delay steps specified by the {r} field.
4:3	r	Read/Write	0	00,01,10,11: Increment rise'rise clock delay by 1, 2, 3, or 4 steps
2	df	Read/Write	0	0: Minimal fall'fall clock propagation delay 1: Use one of the four delay steps specified by {f} field.
1:0	f	Read/Write	0	00, 01, 10, 11: Increment fall'fall clock delay by 1, 2, 3, or 4 steps

These registers control the delay through the programmable trimmers (CORE_CLOCKS_shaper) inside the Cortex®-A15 partitions.

- CPU_FINETRIM_BYP
- CPU_FINETRIM_SELECT
- CPU_FINETRIM_DR
- CPU_FINETRIM_DF

- CPU_FINETRIM_F
- CPU_FINETRIM_R

The naming convention of the fields of these registers is:

- FCPU_n: partition n in fast CPU cluster
- SCPU_n: partition n in slow CPU cluster

The partitions related to these registers are as follows:

- FCPU_1: fcpu0 partition
- FCPU_2: fcpu1 partition
- FCPU_3: fcpu2 partition
- FCPU_4: fcpu3 partition
- FCPU_5: fl2 partition
- FCPU_6: ftop partition
- SCPU_7: not used
- SCPU_8: not used
- SCPU_9: not used

5.7.189 CLK_RST_CONTROLLER_PLLC2_BASE_0

There are special startup and programming considerations for this digital PLL. Consult the datasheet for details

Some field descriptions will have a LATCHED or a DIRECT keyword:

- LATCHED: The writes to this field are latched by STROBE. Software should note that while readback will tell the last written value, that might not be the latched value.
- DIRECT: It is a DIRECT read/write field. The writes to this field are not latched by STROBE. So, readback will always tell the correct state.

5.7.202 CLK_RST_CONTROLLER_XUSBIO_PLL_CFG0_0

XUSB I/O PLL Power Sequencer Input Software Control Program Guide

The software control input can be used for test coverage or driving power sequencer SM via software.

The XUSB power sequencer is driven by a primary reset input signal: reset. Reset is expected to be held static until the power-up or power-down sequence is complete.

Offset: 0x51c │ Read/Write: R/W │ Reset: 0x0X00000d (0bxxxxxx10xxxxxxxxxxxxxxxxx0001101)

Bit	R/W	Reset	Description

0	RW	0x1	XUSBIO_PADPLL_RESET_SWCTL: 0=Reset by hardware, 1=Reset by software

5.7.203 CLK_RST_CONTROLLER_XUSBIO_PLL_CFG1_0

The range value is the recommended range. All counters support 0-255 µs range in 1 µs steps.

Offset: 0x520 │ Read/Write: R/W │ Reset: 0x000a0a0f (0bxxxxxxxx00001010000010100000 1111)

Bit	Reset	Description
23:16	0xa	XUSBIO_PADPLL_RESET2_PADPLL_IDDQ_DLY: PT1: Delay from XUSBIO PAD PLL RESET assertion to the PAD PLL IDDQ assertion. Range is 0 - 10 µs.

Bit	Reset	Description
15:8	0xa	XUSBIO_PADPLL_IDDQ2_PADPLL_RESET_DLY: PT2: Delay from XUSBIO PAD PLL IDDQ de-assertion to the PAD PLL reset de-assertion. Range is 0 - 10 µs.
7:0	0xf	XUSBIO_PADPLL_PU_POST_DLY: PT3: Delay from XUSBIO PAD PLL Reset de-assertion to the PLL LOCK. Range is 0 -15 µs.

5.7.204 CLK_RST_CONTROLLER_PLLE_AUX1_0

The range value is the recommended range. All counters support 0-255 step range.

Offset: 0x524 │ Read/Write: R/W │ Reset: 0x00000105 (0bxxxxxxxxxxxxxxxx0000000100000101)

Bit	Reset	Description
15:8	0x1	PLLE_INTRESET_DLY: Delay between PLLE SSC_BYP -> PLLE INTERP_RESET [delay 300 ns-500 ns minimum]. 300 ns to 500 ns delay is required for the interpolator biasing to stabilize. The state machine can give a minimum 1 µs of delay.
7:0	0x5	PLLE_ENABLE_DLY: Delay from PLLE IDDQ de-assertion to PLLE ENABLE assertion. [~5 µs] IDDQ enables Vregulator. ENABLE starts PLL. It takes 5 µs for the voltage regulator to come up. The voltage regulator needs to be up before the PLL is started.

5.7.205 CLK_RST_CONTROLLER_PLLP_RESHIFT_0

Offset: 0x528 │ Read/Write: R/W │ Reset: 0x0000003b (0bxxxxxxxxxxxxxxxxxxxxxxxx0000111011)

Bit	Reset	Description
9:2	0xe	PLLP_OUT0_RATIO: PLLP_OUT0 divider from base PLLP (lsb denotes 0.5x). The default is 408/8=51 MHz.
1	ENABLE	PLLP_OUT0_CLKEN: PLLP_OUT0 divider clock enable. 0 = DISABLE 1 = ENABLE
0	RESET_DISABLE	PLLP_OUT0_RSTN: PLLP_OUT0 divider reset. 0 = reset, 1 = not reset. 0 = RESET_ENABLE 1 = RESET_DISABLE

5.7.206 CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0

6.0 CL-DVFS

The CL_DVFS module contains control logic that provides a hardware mechanism for controlling the clock rate and power supply voltage of the fast CPU complex.

This section describes the closed-loop dynamic voltage and frequency scaling (CL-DVFS) registers. It is not intended to be a programming guide to CL-DVFS, as it is expected that NVIDIA supplied drivers will always be used with it. However, the register interface is documented to aid with understanding those drivers.

6.1 CL-DVFS Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

6.1.1 CL_DVFS_CTRL_0

Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1:0	0x0	DFLL_CTRL_MODE: DFLL Control Mode. 0 = DISABLE: Disabled. The ring oscillator does not run. 1 = ENABLE_OPEN_LOOP: In Enable Open Loop mode, the ring oscillator will run, but the control loop will remain inactive. 2 = ENABLE_CLOSED_LOOP: In Enable Closed Loop mode, the control loop is enabled and the I2C interface will continuously update the control output in order to maintain the desired frequency set in the DFLL_FREQ_REQ_xxxx fields.

6.1.2 CL_DVFS_CONFIG_0

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000006 (0bxxxxxxxxxxxxxxxxxxxxxxxx00000110)

Bit	Reset	Description
7:0	0x6	DFLL_CONFIG_DIV_S: Refclk divider for setting DFLL control loop sample rate. Refclk is divided by 32x the value in this field

6.1.3 CL_DVFS_PARAMS_0

Offset: 0x8 | Read/Write: R/W | Reset: 0x000000f0 (0bxxxxxxx000000000xxxxx00011110000)

Bit	Reset	Description
24	0x0	DFLL_PARAMS_CG_SCALE: If set to 1, reduces the overall loop gain by a factor of 8.
23:22	0x0	DFLL_PARAMS_FORCE_MODE: 0 = DISABLE : Disabled. The I2C control value is never forced during a frequency change. 1 = FIXED : In Fixed Delay mode, the I2C control value is forced for a fixed number of sample periods. 2 = AUTO: In Auto mode, the I2C control value is forced for a calculated number of sample periods.
21:16	0x0	DFLL_PARAMS_CF_PARAM: Length of time that a forced I2C control value will be applied after a frequency change if forcing was requested for that change. In Fixed Delay mode, it provides the number of sample periods to force the I2C control value. In Auto mode, the force time is equal to I2C control output delta * cf_param / 16
10:8	0x0	DFLL_PARAMS_CI_PARAM: Integral term gain in the control loop controls how a cycle deficit/surfeit after a frequency change is cleared. It temporarily raises or lowers the core voltage to allow the total clock cycle count to converge with the ideal number of cycles that should have been produced since the last frequency change request. 0 = DISABLE 1 = DIV2 2 = DIV4 : 3 = DIV8 4 = DIV16

Bit	Reset	Description
		5 = DIV32 : 6 = DIV64 7 = DIV128
7:0	0xf0	DFLL_PARAMS_CG_PARAM: Overall loop gain control (SIGNED value), controls the overall response time of the control loop

6.1.4 CL_DVFS_TUNE0_0

Offset: 0xc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000000000000000000000)

Bit	Reset	Description
23:16	0x0	DFLL_TUNE0_DLY_STK: Input bits to both coarse (4) and fine (4) tune the delay
15:8	0x0	DFLL_TUNE0_DLY_SRAM: Input bits to both coarse (3) and fine (5) tune the delay of the SRAM path.
7:0	0x0	DFLL_TUNE0_DLY_INV: Input bits to both coarse (3) and fine (5) tune the delay of the inverter path

6.1.5 CL_DVFS_TUNE1_0

Offset: 0x10 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxx00000000000000000000)

Bit	Reset	Description
19:11	0x0	DFLL_TUNE1_DLY_FINE: Input bits to tune the two phases of the clock. 8 bits to tune, and 1 bit to choose high vs. low
10:0	0x0	DFLL_TUNE1_DLY_WIRE: Input bits to both coarse (2) and fine (9) tune the delay of wire dominated path

6.1.6 CL_DVFS_FREQ_REQ_0

Offset: 0x14 | Read/Write: R/W | Reset: 0x0000ff40 (0bxxx00000000000011111111101000000)

Bit	Reset	Description
28	0x0	DFLL_FREQ_REQ_FORCE_EN: Set to '1' to force I2C control output to initial value specified by the 'force_val' field
27:16	0x0	DFLL_FREQ_REQ_FORCE_VAL: Value forced onto the integrator during a frequency transition, only used if the 'force_en' field below is '1' AND the global 'force_mode' field of the dfll_params register is not set to 'disable'. The best value is (desired I2C control value - safe I2C control value) x 128) / Cg.
15:8	0xff	DFLL_FREQ_REQ_SCALE: Proportion of output clock cycles (+1) to *not* skip over a period of 256 cycles
7	0x0	DFLL_FREQ_REQ_VALID: Set to '1' to indicate that the frequency configuration is valid and should be used. If this bit is '0', the control loop will revert to 'open loop' mode, and the I2C control interface value will be determined by the 'safe' value.
6:0	0x40	DFLL_FREQ_REQ_MULT: Primary frequency multiplication factor 'F'. The ring oscillator output frequency will be (REF_CLK/2) x F.

6.1.7 CL_DVFS_SCALE_RAMP_0

Offset: 0x18 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3:0	0x0	DFLL_OUTPUT_RAMP_RATE: The ramp up/ramp down rate of the control signal to the output scaler. Determines the number of cycles (+1) to wait for each counter step.

6.1.8 CL_DVFS_DROOP_CTRL_0

Offset: 0x1c | Read/Write: R/W | Reset: 0x00000810 (0bxxxxxxxx00000000xxxx100000010000)

Bit	Reset	Description
23:16	0x0	DFLL_DROOP_CTRL_MIN_FREQ: The minimum allowed ring oscillator frequency before the 'droop' clock skipper is enabled. The value written determines the minimum number of cycles that are allowed in 4 REF_CLK cycles' Fmin = droop_ctrl.min_freq * (REF_CLK / 4)
11:8	0x8	DFLL_DROOP_CTRL_CUT: CPU clock is scaled by (cut+1)/16 immediately after reaching the minimum ring oscillator frequency
7:0	0x10	DFLL_DROOP_CTRL_RATE: Controls the rate at which clock cycles are re-introduced to the droop skipper after it has been ramped down to compensate for a frequency droop. It is the number of cycles (+1) to wait for each counter step

6.1.9 CL_DVFS_OUTPUT_CFG_0

Offset: 0x20 | Read/Write: R/W | Reset: 0x50200000 (0bx1010000xx100000xx00000000000000)

Bit	Reset	Description
30	0x1	DFLL_OUTPUT_CONFIG_I2C_ENABLE: Master enable control for I2C control value updates. If this field is '0', then I2C control messages are inhibited, regardless of the DFLL mode.
29:24	0x10	DFLL_OUTPUT_CONFIG_SAFE: 'Safe' value for the OUTPUT control interface. This value will be output whenever OUTPUT is enabled but the DFLL is disabled, or in open loop mode.
21:16	0x20	DFLL_OUTPUT_CONFIG_MAX: Maximum allowed value on the OUTPUT control interface.
13:8	0x0	DFLL_OUTPUT_CONFIG_MIN: Minimum allowed value on the OUTPUT control interface.
7	0x0	DFLL_OUTPUT_CONFIG_DELTA_EN: 1: In conjunction with 'clk_en'=1, causes the PWM clock/data output to only become active (for 32 cycles) whenever a change in the PWM value occurs. 0: The PWM data/clock outputs run continuously when enabled.
6	0x0	DFLL_OUTPUT_CONFIG_CLK_EN: Enables the PMIC control clock output for digitally controlled PMICs.
5:0	0x0	DFLL_OUTPUT_CONFIG_DIV_D: Divider setting for PWM PMIC control output (divides the SOC clock).

6.1.10 CL_DVFS_OUTPUT_FORCE_0

Offset: 0x24 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
6	0x0	DFLL_OUTPUT_FORCE_ENABLE: Enable the force value onto the OUTPUT control output
5:0	0x0	DFLL_OUTPUT_FORCE_VALUE: Value to force OUTPUT control output whenever the i2c_ctrl_force_enable field is set to 1.

6.1.11 CL_DVFS_MONITOR_CTRL_0

Offset: 0x28 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000)

Bit	Reset	Description
2:0	0x0	DFLL_MONITOR_CTRL_SELECT: Selects a control loop data source for monitoring 0 = DISABLE 1 = CYCLE_INT 2 = PRO_TERM 3 = INT_TERM 4 = OUTPUT_INT 5 = OUTPUT_VALUE 6 = FREQ

6.1.12 CL_DVFS_MONITOR_DATA_0

Offset: 0x2c | Read/Write: RO | Reset: 0x000XXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
16	X	DFLL_MONITOR_DATA_NEW: Set to '1' whenever a new sample is generated. Cleared on reads.
15:0	X	DFLL_MONITOR_DATA_VAL: Read data monitor source selected by dfll_monitor_ctrl_select. If monitoring is enabled, this field is updated every sample period.

6.1.13 CL_DVFS_I2C_CFG_0

Offset: 0x40 | Read/Write: R/W | Reset: 0x0010f000 (0bxxxxxxxxxxx1x0001111x00000000000)

Bit	Reset	Description
20	0x1	I2C_BUS_ARB: Enables arbitration for bus
18:16	0x0	I2C_MASTER_CODE: Master code for high-speed transfers
15	0x1	I2C_PACKET_MODE: Enables Packet mode for high-speed transfers
14:12	0x7	I2C_SIZE: Size of voltage values from 1 to 7
10	0x0	I2C_ADDR_7BIT_10BIT: 0: Selects 7-bit addressing 1: Select 10-bit addressing
9:0	0x0	I2C_SLAVE_ID: External slave ID address

6.1.14 CL_DVFS_I2C_VDD_REG_ADDR_0

Offset: 0x44 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:8	0x0	I2C_DEFAULT_DATA: Default data
7:0	0x0	I2C_ADDR_DATA: Address for voltage sel

6.1.15 CL_DVFS_I2C_STS_0

Offset: 0x48 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
6:1	X	I2C_LAST_VALUE: Output value from the DFLL of last I2C request that was completed successfully
0	X	I2C_REQ_PENDING: Indicates there is an outstanding I2C request

6.1.16 CL_DVFS_INTR_STS_0

Offset: 0x5c | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1	0x0	MAX_VDD_LIMIT_INTR: Interrupt to indicate the DFLL has hit the VDD ceiling as programmed in DFLL_OUTPUT_CONFIG_MAX
0	0x0	MIN_VDD_LIMIT_INTR: Interrupt to indicate the DFLL has hit the VDD floor as programmed in DFLL_OUTPUT_CONFIG_MIN

6.1.17 CL_DVFS_INTR_EN_0

Offset: 0x60 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1	0x0	MAX_VDD_LIMIT_INTR_EN: Enable for interrupt to indicate the DFLL has hit the VDD ceiling as programmed in DFLL_OUTPUT_CONFIG_MAX
0	0x0	MIN_VDD_LIMIT_INTR_EN: Enable for interrupt to indicate the DFLL has hit the VDD floor as programmed in DFLL_OUTPUT_CONFIG_MIN

6.1.18 CL_DVFS_I2C_CLK_DIVISOR_REGISTER_0

The divisor values (N) must be programmed so that:

- SCL frequency (Std/Fast/Fm+ modes) = ClkSourceFreq/((tlow+thigh+3)*(N+1)) for lower values of N, up to 3
- SCL frequency (Std/Fast/Fm+ modes) = ClkSourceFreq/((tlow+thigh+2)*(N+1)) for higher values of N, above 3
- SCL frequency (HS mode) = ClkSourceFreq/((ths_low+ths_high+4)*(N+1)) for lower values of N, up to 4
- SCL frequency (HS mode) = ClkSourceFreq/ ((ths_low+ths_high+2)*(N+1)) for higher values of N, above 4

Offset: 0x16c | Read/Write: R/W | Reset: 0x00190001 (0b00000000000110010000000000000001)

Bit	Reset	Description
31:16	0x19	I2C_CLK_DIVISOR_STD_FAST_MODE:N = Divide by n+1
15:0	0x1	I2C_CLK_DIVISOR_HSMODE:N = Divide by n+1

6.1.19 CL_DVFS_OUTPUT_LUT_0

This lookup table (LUT) contains voltage LUT values stored in a 33-deep by 8 bit wide RAM. To program the LUT, simply sequentially address the RAM, using the base offset address of 0x20 (10’b10xxxxxxx). Addresses are DWORD aligned, not BYTE aligned. PMIC values must be programmed to span the entire desired operating range, and be monotonically increasing. The logic assumes that the middle entry (16th) corresponds to the ‘safe’ initial voltage, as specified in the DFLL_OUTPUT_CONFIG.SAFE field. DFLL_OUTPUT_CONFIG_SAFE is initialized by default to 0x10, which corresponds to the middle of the LUT. However, the safe value can point to any LUT entry.

[THIS PAGE INTENTIONALLY LEFT BLANK]

7.0 TIMERS

This section documents the various timers available to software in a Tegra® K1 system. The following table summarizes these timers.

> **Note:** The same logic is present in both Tegra K1 variants. References to Shadow CPU, Cluster1, and CPUs 2 and 3 in the Fast CPU (FCPU) cluster are not relevant to Tegra K1 64-bit.

Table 23: List of Timers

Name	Primary Use	Related Interrupt	Secure	Freq.	Notes
RTC	Wall Clock Timer	RTC	Pseudo	32kHz	See the Real-Time Clock section in this TRM for detailed information.
TMR	NVIDIA® Generic Timers	TMR9-0	Cfg	1MHz	Configurable to be secure
WDT	TMR timers used as Watchdog	WDT_<>	Cfg	1MHz	Configurable to be secure
TSC	Reference for GIT	N/A	Yes	OSC	Counter value can only be updated in secure mode.
GIT	ARM CPU Generic Timers	PPIs*	Yes	TSC	These timers use TSC as reference.

*PPIs are per CPU Private Peripheral Interrupts

7.1 ARM CPU Generic Timers (GITs)

The ARM® Generic Timer architecture defines generic CPU timer requirements. The architecture requires that the SoC supply a timestamp counter reference that is independent of the CPU clock frequency.

The CPU Generic Timer includes:

- A physical counter that contains the count value of the system counter.
- A virtual counter that indicates virtual time. The virtual counter contains the value of the physical counter minus a 64-bit virtual offset.
- A set of four timers per CPU.

The four timers are the following:

- Secure Physical Timer
- Non-Secure Physical Timer
- Hypervisor Timer
- Virtual Timer

Refer to the appropriate ARM Architecture Reference Manual for generic timer specifications.

7.2 Generic Timer System Counter (TSC)

The ARM Generic Timer Specification requires a system time-stamp counter (TSC) supplied by the SoC.

The TSC is implemented as part of the Tegra K1 Power Management Controller (PMC). It is a 56-bit counter which runs at the crystal oscillator clock frequency. Refer to the Power Management Controller section in this TRM for additional TSC information.

7.3 NVIDIA Timers (TMR)

The programmable timer block contains ten 29-bit programmable timer counters and one 32-bit timestamp counter.

Timer interval, one-shot, or periodic interrupts are configured in the Timer Present Value register (PTV). When enabled, the timer loads the Timer Present Value count and begins decrementing every one microsecond. The timer generates a timer request when the count reaches zero.

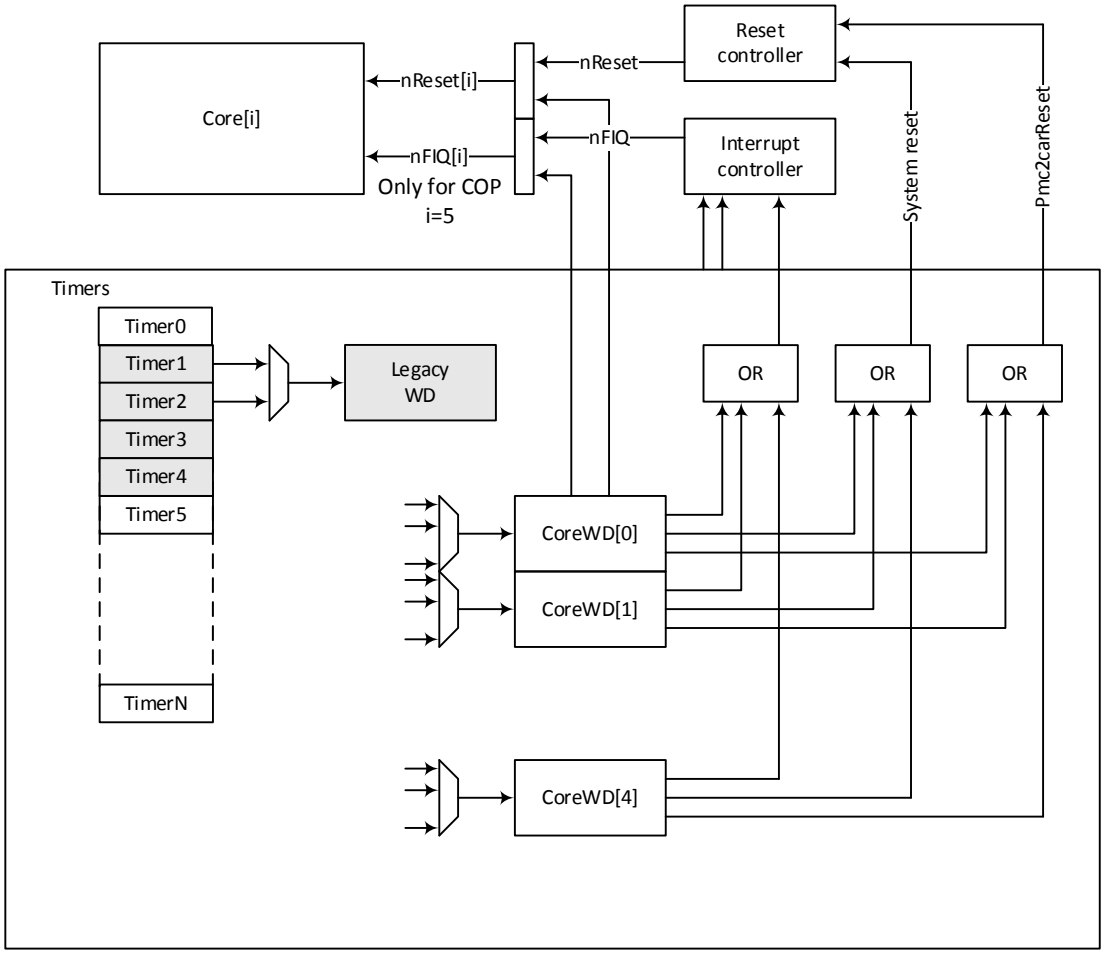
If the PTV periodic control bit is set, the timer reloads the PTV interval and continues decrementing the timer.

The timer count is 29 bits wide, supporting timer intervals of 536.87 seconds maximum or 1 microsecond minimum. Bit 30 of the periodic Timer Value (PTV) is the enable bit for the timer. Reading the PTV Register clears any pending timer interrupt.

A read-only Preset count register (PCR) allows the processor to inspect the current value of the timer decrement counter. The timestamp counter (32 bits wide) is cleared to zero on reset, and counts upwards every 1 µs.

The figure below shows a reference decomposition of the timers in functional blocks.

Figure 13: Timer Functional Block Diagram



- The timers are numbered 0 to 9
- All timers have a dedicated interrupt bit
- Timers 0, 6, 7, 8, and 9 also share a common interrupt called SharedTimerInterrupt.
- Timer interrupts are assigned as follows:
  - Timer 1 = primary interrupt controller bit 0

- Timer 2 = primary interrupt controller bit 1
- Timer 3 = secondary interrupt controller bit 9
- Timer 4 = secondary interrupt controller bit 10
- Timer 5 = fourth interrupt controller bit 25
- Timer 6 = fifth interrupt controller bit 24
- Timer 7 = fifth interrupt controller bit 25
- Timer 8 = fifth interrupt controller bit 26
- Timer 9 = fifth interrupt controller bit 27
- Timer 0 = fifth interrupt controller bit 28
- SharedTimerInterrupt = hierarchical group 1, bit 10

7.4 Watchdog Timers (WDTs)

A watchdog timer facilitates recovery from system lockup conditions. The watchdog timer can interrupt the processor when the selected timer counter expires. Under normal operation, this interrupt is serviced by reading the timer status register (TIMER_WDTx_STATUS). Any timer in the Tegra K1 timer block may be configured as a watchdog timer.

- The Tegra K1 series processor provides five Watchdog Timers, one each for main CPUs and one for COP (AVP): WDT0 is allocated to CPU0 of cluster0 or the shadow CPU of cluster1
- WDT1 is allocated to CPU1
- WDT2 is allocated to CPU2
- WDT3 is allocated to CPU3
- WDT4 is allocated to COP (AVP)

The 5 watchdog timers are directly associated with a processor core, i.e., 4 CPU cores and the COP:

- The watchdog is reset by the corresponding core reset signal
- WD timers 0 to 3 are associated with CPU 0 to 3, WD 4 is associated with COP

There are no dedicated timers for the WDTs. Each WDT can be configured to use any one of the TMRs as its timer source.

Based on the configuration of the TIMER_WDTx_CONFIG register, a WDT works as follows:

- When the timer decrements to zero the first time, a WDT interrupt can be generated
- When the timer consecutively decrements down to zero a second time, without the processor reading the interrupt status register (TIMER_TMRx_TMR_PCR), a per core FIQ can be generated. This feature only works for the COP; the corresponding signal does not propagate to the CPU cores.
- When the timer consecutively decrements down to zero a third time, without the processor reading the interrupt status register (TIMER_TMRx_TMR_PCR), a per CPU reset can be generated.
- When the timer consecutively decrements down to zero a fourth time, a system reset can be generated. The cause of this system reset can be read by reading PMC_RST_STATUS[RST_SOURCE] (see the Power Management Controller section for more information).

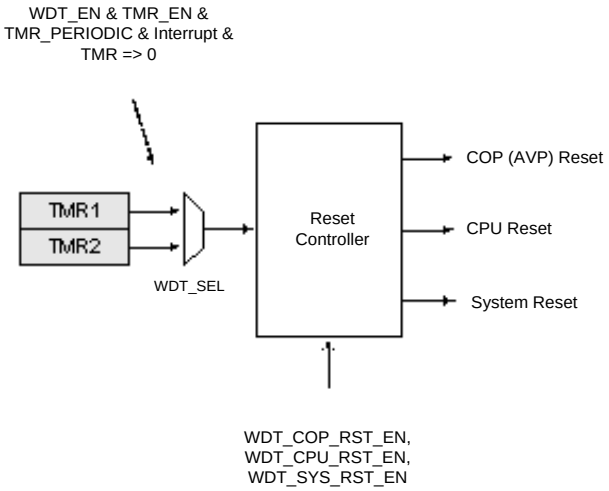
7.5 Secure TMRs and Secure WDTs

The Tegra K1 series processor TMRs and/or WDTs can be configured to be secure timers. As described in TIMER_SECURE_CFG register table later in this section, a secure register TIMER_SECURE_CFG -- which itself can only be written by secure writes – can be configured such that each of the TMRs and WDTs can be independently configured to be secure. By default all of TMRs and WDTs are non-secure and backward compatible.

7.6 Legacy Watchdog Timer

The legacy watchdog timer can use one TMR1 or TMR2 as the source and can generate a set of reset signals. This facility is deprecated and replaced by the more versatile WDTs.

Figure 14: Watchdog Block Diagram



The legacy watchdog timer can be programmed to reset just the CPU, just the AVP, or the entire system.

If only the CPU is reset, then the AVP will continue running as-is. The CPU reset vector should be programmed in advance so that it skips the iROM boot code and jumps directly into its own CPU boot routine (which can be anywhere).

If only the AVP is reset, the same is true. The CPU keeps running as-is. If the AVP reset vector is set to default, it runs the normal boot code. It is up to the Boot Loader to decide if it needs to restart the CPU as well.

The watchdog timer can be programmed to the maximum timeout value of 0x3fffffff. At 1 µs/count, this is more than one thousand seconds.

The watchdog timer operates as follows:

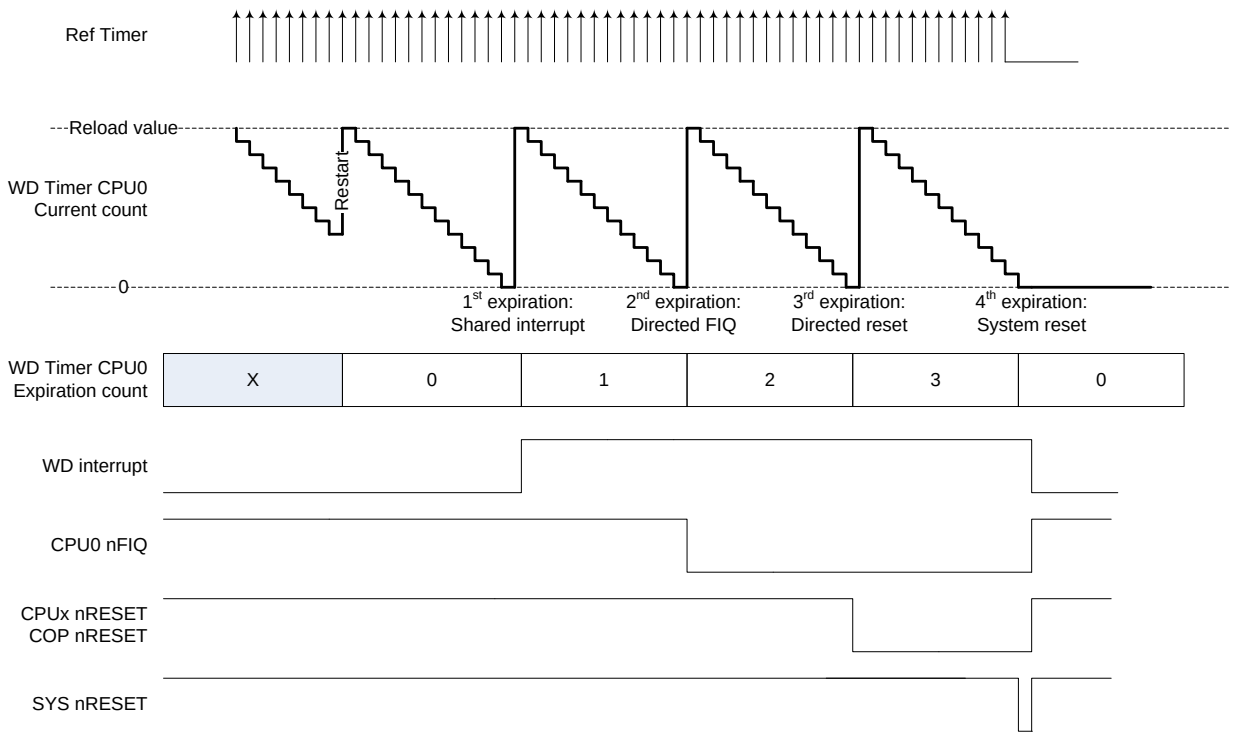
1. Watchdog generates an interrupt based on the Timer
    a. TMR1 or TMR2 can be selected as source
    b. Timer should be programmed as Periodic with Interrupt.
    c. CAR.RST_SOURCE.WDT_EN = 1
    d. CAR.RST_SOURCE.WDT_SEL selects TMR2/TMR1
2. Reset can be for the AVP, CPU, or full system
    a. CAR.RST_SOURCE.WDT_***_RST_EN = 1
3. Upon reboot, CAR.RST_SOURCE.WDT_*_RST_STA indicates the cause of the reset

7.7 Watchdog Timer Programming Guide

The five watchdog timers operate as follows:

- Select any one of the general-purpose timers as timing reference
- Standard down counter with programmable period, that also counts expirations, specific action are taken at the counter expiration
  - If the expiration count is 0, a normal interrupt may be generated (probably pooled)
  - If the expiration count is 1, the FIQ for the corresponding processor may be asserted, this operation bypasses the normal interrupt controller
  - If the expiration count is 2, the reset for a programmable set of processors is asserted, this may be the null set
  - If the expiration count is 3, a system wide reset may be asserted (two variants, standard system or closer to external hardware reset)

Figure 15: Watchdog Example Timing Diagram



Any operation that targets CPU0 is done in the following way:

- Any output is broadcast to both instances of CPU0, in CPU cluster 0 (G) and 1 (LP). This applies to the reset and FIQ signals.
- Resetting any of the CPU0 results in resetting the WD associated with CPU 0

Although the timing diagram implies that you need to restart the timer when you service the interrupt, this is not necessary as long as you can always service the interrupt (clear the TMR interrupt) before the next timeout occurs. The reset only happens if a new timeout occurs when the TMR interrupt is still active.

7.8 Timers Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

Each timer uses two registers called PTV and PCR at two consecutive word addresses. The format is the same for all 10 timers and is defined only once with <t> taking values between 0 and 9. Note that the start offset sequence is haphazard for legacy reasons.

Table 24: Start Offsets for PTV and PCR Timer Registers

Timer	Start Offset for Register Pair
TMR1	0x00
TMR2	0x08
TMR3	0x50
TMR4	0x58
TMR5	0x60
TMR6	0x68
TMR7	0x70
TMR8	0x78
TMR9	0x80
TMR0	0x88

7.8.1 TIMER_TMR<t>_TMR_PTV_0

Parameter <t> takes a value from 0 to 9. The start offset for the timer is defined relative to the start address in Table 24.

Before programming the timer:

- Input oscillator frequency must be specified in the TIMERUS_USEC_CFG register.
- Program the number of 1 µs timer counts per "tick" in the PTV (Present Trigger Value) register.
- Set the PTV EN (enable bit) to start counting down.
- When the count reaches zero, an interrupt is generated.
- To auto-reload the timer counter, set the PTV PER (periodic) bit. Otherwise, leave it clear for a one-shot.

Timer Present Trigger Value (Set) Register

Offset: See Table 24 │ Read/Write: R/W │ Reset: 0x00000000 (0b00x00000000000000000000000000000)

Bit	Reset	Description
31	0x0	EN: Enable Timer 0 = DISABLE 1 = ENABLE
30	0x0	PER: Enable Periodic Interrupt 0 = DISABLE 1 = ENABLE
28:0	0x0	TMR_PTV: Trigger Value: count trigger value (count length). This is in n+1 scheme. If you program the value n, the count trigger value will actually be n+1.

7.8.2 TIMER_TMR<t>_TMR_PCR_0

Parameter <t> takes a value from 0 to 9. The start offset for the timer is defined relative to the start address in Table 24.

When an interrupt is generated, write "1" to PCR[30] to clear the interrupt

Timer Present Count Value (Status) Register

Offset: See Table 24 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bx0xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	R/W	Reset	Description
30	RW	0x0	INTR_CLR: 1 = clears the interrupt, 0 = no affect. Write-1-to-Clear
28:0	RO	X	TMR_PCV: Counter value: decrements from PTV.

7.9 Fixed Time Base Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

The USEC_CFG/CNTR_1US registers provide a fixed time base (in microseconds) to be used by the rest of the system regardless of the clk_m frequency (i.e., 12 MHz, 13 MHz, 19.2 MHz, 26 MHz, or other frequencies).

7.9.1 TIMERUS_CNTR_1US_0

This free-running read-only register/counter changes once every microsecond and is used mainly by hardware (can also be used by software). It starts counting from 0 once it is out of system reset and will continue counting forever, unless the oscillator clock is stopped or during a system reset.

(A) Software Use

Although there is no interrupt mechanism for this register, software can read the content of this register multiple times to determine the amount of time that has elapsed.

(B) Hardware Use

- Used by the 4 timers to determine whether the programmed timer value has been reached; these 4 timers can trigger interrupts.
- To provide a periodic USEC pulse to be used by the flow controller to count the programmable number of microseconds before a flow control condition is triggered.
- Used by secure boot logic.

Offset: 0x0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:16	x	HIGH_VALUE: Elapsed time in microseconds
15:0	x	LOW_VALUE: Elapsed time in microseconds

7.9.2 TIMERUS_USEC_CFG_0

Software should first configure this register by telling what fraction of 1 microsecond each clk_m represents. For example, if the clk_m is running at 12 MHz, then each clk_m represents 1/12 of a microsecond.

"USEC_DIVIDEND" and "USEC_DIVISOR" are used to indicate what fraction of 1 microsecond each clk_m represents.

Table 25: clk_m Frequency Indicator for USEC

clk_m Frequency	Dividend/Divisor	USEC_DIVIDEND/USEC_DIVISOR
12 MHz	1/12	0x00 / 0x0b
13 MHz	1/13	0x00 / 0x0c
19.2 MHz	5/96	0x04 / 0x5f
26 MHz	1/26	0x00 / 0x19
16.8 MHz	5/84	0x04 / 0x53
38.4 MHz	5/192	0x04 / 0xbf
48 MHz	1/48	0x00 / 0x2f

Offset: 0x4 | Read/Write: R/W | Reset: 0x0000000c (0bxxxxxxxxxxxxxxxx0000000000001100) | Default: 0x0000000b

Bit	Reset	SW Default	Description
15:8	0x0	NONE	USEC_DIVIDEND: Microsecond dividend. (n+1)
7:0	0xc	0xb	USEC_DIVISOR: Microsecond divisor. (n+1)

7.9.3 TIMERUS_CNTR_FREEZE_0

Offset: 0x3c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4	0x0	DBG_FREEZE_COP: 1 = freeze timers when COP is in debug state, 0 = no freeze.
3	0x0	DBG_FREEZE_CPU3: 1 = freeze timers when CPU3 is in debug state, 0 = no freeze.
2	0x0	DBG_FREEZE_CPU2: 1 = freeze timers when CPU2 is in debug state, 0 = no freeze.
1	0x0	DBG_FREEZE_CPU1: 1 = freeze timers when CPU1 is in debug state, 0 = no freeze.
0	0x0	DBG_FREEZE_CPU0: 1 = freeze timers when CPU0 is in debug state, 0 = no freeze.

7.10 Watchdog Timers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

Each Watchdog timer uses four registers called CONFIG, STATUS, COMMAND, and UNLOCK PATTERN, at four consecutive word addresses. The format is the same for all four timers and is defined only once with <w> taking values from 0 to 4.

The following register offsets are relative to the TMR block base.

Each Watchdog timer has the following:

- CoreWatchdog Configuration Register
- Timer sources are numbered 1 through 10 (0 is not used and results in undefined behavior)

- Period of 0 results in MAX period
- The generated interrupt is dependent on the WD index.
- WD0 to 3 generate a CPU_WD_Interrupt,
- WD4 generates a COP_WD_Interrupt
- CPU0 settings apply to both clusters
- Core numbering: 0-3 applies to CPU0-CPU3, 4 applies to COP

7.10.1 TIMER_WDT<w>_CONFIG_0

Parameter <w> takes a value from 0 to 4.

Core Watchdog Configuration Register

Offset: 0x100 + (0x20 * <w>) | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxx00000000000000000000)

Bit	Reset	Description
20:16	0x0	CoreResetBitmapEn: Enable reset of a set of cores at third expiration counter (one bit per processor) same level the signal from PMC asserted in case of external reset.
15	0x0	Pmc2CarResetEn: Enable Full system reset at fourth expiration of the counter 0 = DISABLE 1 = ENABLE
14	0x0	SystemResetEnable: Enable system reset at fourth expiration of the counter, at same level as existing watchdog interrupt 0 = DISABLE 1 = ENABLE
13	0x0	FIQEnable: Enable FIQ assertion at second expiration of the counter 0 = DISABLE 1 = ENABLE
12	0x0	InterruptEnable: Enable interrupt at first expiration of the counter 0 = DISABLE 1 = ENABLE
11:4	0x0	Period: Measured in periods of selected timer, this is the reload value
3:0	0x0	TimerSource: Select the timer used as reference (TMR0 – TMR9) 0 = TMR0 1 = TMR1 2 = TMR2 3 = TMR3 4 = TMR4 5 = TMR5 6 = TMR6 7 = TMR7 8 = TMR8 9 = TMR9

7.10.2 TIMER_WDT<w>_STATUS_0

Parameter <w> takes a value from 0 to 4.

Core Watchdog Status

Offset: 0x104 + (0x20 * <w>) | Read/Write: RO | Reset: 0x0000XXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
13:12	X	CurrentExpirationCount: Current count of expiration since the last start of expiration
11:4	X	CurrentCount: Current value of the counter
2	X	FiqStatus: Current status of FIQ, cleared by start
1	X	InterruptStatus: Current status of interrupt, cleared by start
0	X	Enabled: 1 when counter is active. When true, writes to the corresponding config register are ignored

7.10.3 TIMER_WDT<w>_COMMAND_0

The StartCounter bit enables watchdog counter operation, loads the watchdog counter, starts the watchdog timer to count down, resets the expiration count to 0, and clears all flags. Also used as restart.

The counter can be disabled by setting the DisableCounter bit, but only if the unlock register has been programmed before with the correct pattern. Writing to the command register always clears the disable unlock register. When set while StartCounter is 0 and the unlock register contains the unlock pattern the Watchdog transitions back to disabled.

The register fields are Write to set only.

Parameter <w> takes a value from 0 to 4.

CoreWatchdogCommand Register

Offset: 0x108 + (0x20 * <w>) | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1	0x0	DisableCounter: Write 1 to disable WDT counter if unlocked
0	0x0	StartCounter: Write 1 to enable WDT counter

7.10.4 TIMER_WDT<w>_UNLOCK_PATTERN_0

Parameter <w> takes a value from 0 to 4.

CoreWatchdogDisableUnlock Register

Offset: 0x10c + (0x20 * <w>) | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:0	0x0	UnlockPattern: Must be written with value 0xC45A to allow write to DisableCounter to take effect. The pattern is reset at each write to Command Reg.

7.11 Timer Shared Interrupt Status

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

TimerSrcBitmap is used for Timers 6 through 10 which share a common interrupt line to the controller. Bit b is set if timer 6+b generated an interrupt. The corresponding bit is cleared by writing INTR_CLR bit of the TMR_PCR register.

WatchdogSrcBitmap is used for the 5 watchdog timers. This is the set of Interrupt Status bits from the corresponding CoreWatchdogStatus, but as a bitmap.

7.11.1 SHARED_INTR_STATUS_0

Offset: 0x0 | Read/Write: RO | Reset: 0x00000XXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
10:6	X	TimerSrcBitmap: Timer[0,9:6] interrupt status in bitmap form
4:0	X	WatchdogSrcBitmap: WDT[4:0] interrupt status in bitmap form

7.11.2 SHARED_TIMER_SECURE_CFG_0

Offset: 0x4 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxx0xxx00000xx0000000000)

Bit	Reset	Description
20	0x0	USEC: TIMERUS_USEC_CFG secure mode config. If this bit is set (=1) then TIMERUS_USEC_CFG register can only be written by secure writes. If this bit is cleared then TIMERUS_USEC_CFG register can be written by secure or non-secure writes. This register can always be read by secure or non-secure reads. Note: this bit should be set if any one of the TMR is enabled to be secure. 1: ENABLE 0: DISABLE
16	0x0	WDT4: WDT4 secure mode config. See the WDT0 bit description. This bit is reserved since WDT4 belongs to COP and it has no notion of Secure or Non-Secure transactions
15	0x0	WDT3: WDT3 secure mode config. See the WDT0 bit description.
14	0x0	WDT2: WDT2 secure mode config. See the WDT0 bit description.
13	0x0	WDT1: WDT1 secure mode config. See the WDT0 bit description.
12	0x0	WDT0: WDT0 secure mode config. If this bit is set (=1) then WDT0 registers (i.e. TIMER_WDT0_{CONFIG,COMMAND,UNLOCK_PATTERN}) can only be written by secure writes. A non-secure read will not trigger read-side-effect, but would return proper read value. If this bit is cleared then the WDT0 registers can be written by secure or non-secure writes. WDT0 registers can always be read by secure or non-secure reads. Note: if this bit is set, then the TMR used for this WDT0 should be enabled to be secure. 1: ENABLE 0: DISABLE
9	0x0	TMR9: Timer9 secure mode config. See the TMR0 bit description.
8	0x0	TMR8: Timer8 secure mode config. See the TMR0 bit description.
7	0x0	TMR7: Timer7 secure mode config. See the TMR0 bit description.
6	0x0	TMR6: Timer6 secure mode config. See the TMR0 bit description.
5	0x0	TMR5: Timer5 secure mode config. See the TMR0 bit description.
4	0x0	TMR4: Timer4 secure mode config. See the TMR0 bit description.
3	0x0	TMR3: Timer3 secure mode config. See the TMR0 bit description.

Bit	Reset	Description
2	0x0	TMR2: Timer2 secure mode config. See the TMR0 bit description.
1	0x0	TMR1: Timer1 secure mode config. See the TMR0 bit description.
0	0x0	TMR0: Timer0 secure mode config. If this bit is set (=1) then TMR0 registers (i.e., TIMER_TMR0_TMR_{PTV,PCR}) can only be written by secure writes. A non-secure read will not trigger read-side-effect, but would return proper read value. If this bit is cleared then TMR0 registers can be written by secure or non-secure writes. TMR0 registers can always be read by secure or non-secure reads. 0: DISABLE 1: ENABLE

8.0 MULTI-PURPOSE I/O PINS AND PIN MULTIPLEXING (PINMUXING)

8.1 Overview

Tegra® K1 devices can be configured with different I/O functions on particular pins to allow use in a variety of different configurations. This section discusses how this is controlled and how the pins themselves are set up.

Many of the pins on Tegra K1 devices are connected to multi-purpose I/O (MPIO) pads. An MPIO can operate in two modes: either acting as a signal for a particular I/O controller, referred to as a Special-Function I/O (SFIO); or as a software-controlled general-purpose I/O function, referred to as GPIO. Each MPIO has up to four SFIO functions as well as being a GPIO.

Though each MPIO has up to 5 functions (a GPIO function and up to 4 SFIO functions), a given MPIO can only act as a single function at a given point in time. The Pinmux controller in Tegra K1 devices includes the logic and registers to select a particular function for each MPIO.

This section describes the following features of MPIOs, the Pinmux controller, and the GPIO controller:

- Basic capabilities of the MPIO pads
- Differences between the variety of MPIO pads
- Mapping of MPIO pads to I/O controllers (i.e., pinmuxing)
- Behavior of the MPIO pads during power-up
- Behavior of the MPIO pads before, during, and after deep sleep
- Recommendations for software programming related to the MPIO pads.

This section covers the Multi-Purpose digital I/O pads. It does not address the special-purpose I/O pads, such as those used for USB, IC_USB, SATA, PCIE, TVO/DAC, MIPI DSI, MIPI CSI, the oscillator, or DRAM interfaces.

8.2 Terms and Acronyms

Some common terms used with Tegra K1 processor pinmuxing are as follows:

Term	Definition
CZ	Controlled-output impedance MPIO pads
DD	Dual-driver MPIO pads
Deep sleep	Also known as LP0. A full-chip power state in which VDD_CORE is turned off but VDD_RTC (i.e., VDD_AO) and many of the I/O power rails remain on
DPD	Deep Power Down (a mode in which the pad can tolerate VDD_CORE being turned off)
GPIO	General-Purpose I/O
LV	Low-voltage MPIO pads
MPIO	Multi-Purpose I/O
OD	Open-drain MPIO pads
SFIO	Special-Function I/O
ST	Standard MPIO pads

8.3 MPIO Pad Description

Each MPIO pad consists of:

- An output driver with:
  - Tristate capability
  - Drive strength controls AND

- Push-pull mode, open-drain mode, or both

- An input receiver with:
  - Schmitt mode, CMOS mode, or both
- A weak pull-up and a weak pull-down

Tegra K1 devices include five types of MPIO pads, which all share a common structure. The following table summarizes the differences between the five MPIO pad types.

Table 26: MPIO Pad Types

Pad Type	I/O Rail Voltage	Input Buffer	Output Buffer	I/O Voltage Tolerance	Nominal Pull Strength	"Slew Rate" Control	Drive Strength Control
ST	1.8, 2.8-3.3	Schmitt & CMOS	push-pull	VDDIO	100 kΩ	2 bits, up & down	5 bits, up & down
CZ	1.8, 2.8-3.3	Schmitt & CMOS	push-pull	VDDIO	15 kΩ	2 bits, up & down	7 bits, up & down
DD	1.8, 2.8-3.3	Schmitt & CMOS	push-pull & open-drain	3.3V for open-drain, VDDIO otherwise	50 kΩ	2 bits, up & down	5 bits, up & down
LV	1.2, 1.8	CMOS	push-pull	VDDIO	15 kΩ	4 bits, up & down	5 bits, up & down
OD	1.8, 2.8-3.3	Schmitt & CMOS	open-drain	5V	100 kΩ -- down only	2 bits, down only	5 bits, up

The ST (standard) MPIO pads are the most common pads on the chip.

The DD (dual-driver) MPIO pads are similar to the ST pads with the addition of a 3.3V tolerant true open-drain mode. A DD pad can tolerate its I/O pin being pulled up to 3.3V (regardless of supply voltage) as long as the pad's output-driver is set to open-drain mode. There are special power-sequencing considerations when using this functionality.

Note: Refer to "Power Sequencing" in the *NVIDIA Tegra K1 Processors Data Sheet* (DS-06742-001) for a complete description of the power-up sequencing requirements for Tegra K1 processors.
Refer to the same section in the *NVIDIA Tegra K1 64-Bit Processors Data Sheet* (DS-07070-001) for Tegra K1 64-bit processors.

The OD (open drain) MPIO pads are optimized to tolerate 5V on the I/O pin regardless of the supply voltage. They are similar to ST pads except for an improved I/O voltage tolerance, the absence of a weak pull-up, and the absence of a push-pull output driver.

The CZ (controlled output impedance) MPIO pads are optimized for use in applications requiring a tightly controlled output impedance. They are similar to ST pads except for changes in the drive strength circuitry and in the weak pull-ups/pull-downs. Tegra K1 processors include CZ pads on the VDDIO_SDMMC1 and VDDIO_SDDMC3 power rails. Each of those rails also includes a pair of CZ_COMP pads. Circuitry within the Tegra K1 device continually matches the output impedance of the CZ pads to the on-board pull-up/-down resistors attached to the CZ_COMP pads.

The LV (low voltage) MPIO pads are optimized for use with a 1.2V supply voltage (and signaling level). They support a 1.8V supply voltage (and signaling level) as a secondary mode. The Tegra K1 processors include LV pads on VDDIO_SDMMC4. The SDMMC4 interface also has a pair of COMP pads, i.e., LV_COMP pads, to generate impedance code.

Note: Refer to "Pin Definitions" in the *NVIDIA Tegra K1 Processors Data Sheet* (DS-06742-001) for the list of the pad types and the nominal pull-up/-down strength associated with each MPIO. See the columns labeled "MPIO Pad Type" and "Nominal Pull Strength." The power rail information is located in the "Power Sequencing" section.
Refer to the same section in the *NVIDIA Tegra K1 64-Bit Processors Data Sheet* (DS-07070-001) for Tegra K1 64-bit processors.

8.4 Pad Controls

The Tegra K1 devices include many controls for each MPIO pad. Some of these controls can be set on a per-pin basis. Other controls are shared across multiple pins.

8.4.1 Per Pad Options

The following controls can be independently configured on a per-pad basis:

PUPD	Internal Pull-up/down option: Option to enable internal Pull-up, Pull-down resistors or neither
TRISTATE	Tristate (high-z) option: Disables or enables the pad's output driver. This setting overrides any other functional setting and also whether pad is selected for SFIO or GPIO. Can be used when the pad direction changes or the pad is assigned to different SFIO to avoid glitches.
E_INPUT	Input Receiver (Enable/Disable): Enables or disables input receiver.
OD	Open Drain option: (Applies to DD pads only) Selects between an open-drain output driver and a push-pull driver.
IO_RESET	Not used.
RCV_SEL	(Applies to OD pads only). Selects between "High VIL/VIH" and "Normal VIL/VIH" receivers. RCV_SEL=1: "High VIL/VIH" RCV_SEL=0: "Normal VIL/VIH"

During normal operation, these per-pad controls are driven by the pinmux controller registers. See the section called "Pinmuxing" below for more information.

During deep sleep, the PMC bypasses and then resets the pinmux controller registers. Software should reprogram these registers as necessary after returning from deep sleep. See the section called "Deep Sleep Behaviors" for more information on the interaction of PMC, software, and the pinmux controller following deep sleep.

8.4.2 Per Pad Control Group

The MPIO pads are partitioned into 35 "pad control groups". The following controls can be configured independently for each pad control group. Pad control groups are associated with a group of pads that share similar functionality for example, GMI, SDMMC.

HSM	High Speed Mode (Enable/Disable)
SCHMT	Schmitt Trigger (Enable/Disable)
LPMD	Low Power Mode. Select Low Power Modes (different impedance/current values)
DRVDN / UP	Drive Down / Up. Driver Output Pull-Up/Pull-Down drive strength code. Normally, the code is 5 bits but for CZ type pads, it is 7 bits.
SLWR/ SLWF	Slew Falling / Rising. Driver Output Pull-Up/Pull-Down slew control code. Normally, the code is 2 bits. In general, the code corresponding to the minimum slew is set (2'b11).

The controls are configured via the "pad control group registers". There is one pad control register per pad control group. During deep sleep, all of these pad control registers automatically return to their power-on-reset state. Software should reprogram these registers as necessary following deep sleep.

Table 27 lists the register address for each pad control group. Additionally, the table describes the bit positions of the controls within each register.

For example, writing a 1 to bit 3 of register 0x700000884 will enable the Schmitt trigger mode for the pads in group "cdev1cfg" pins, DAP_MCLK1 and DAM_MCLK1_REQ. Similarly, clearing bits 14 through 23 of register 0x70000900 will minimize the drive strength (both up and down) of pads in the gmacfg pad control group.

Table 27: Pad Control Groups Register Addresses

Pad Control Group	Register Address	PREEMP	HSM	SCHMT	DRV_TYPE	DRVDN	DRVUP	SLWR	SLWF
gmacfg	0x70000900	0	2	3	7:6	18:14	24:20	29:28	31:30
sdio1cfg	0x700008ec		2	3		18:12	26:20	29:28	31:30

8.4.3 Per I/O Power Rail

These per-power-rail controls are included in the PMC registers which maintain their state during deep sleep. Software does NOT need to reprogram these register following deep sleep. The following table summarizes the functionality of these signals along with how they are controlled in the PMC.

Pin Name	Pin Description	Control/Grouping Mechanism in PMC
E_33V	Active high 3.3V mode select. When low, selects VDDP 1.8V mode.	Generated based on respective PWR_DET signal and the logic is maintained in the PMC, i.e., AO domain By default, it is maintained at Logic 1 to ensure safe power up of I/Os that are pulled to 3.3V
E_NO_IOPWR	Active high. When high, prevents leakage	Maintained per power rails for 16 power rails. Ideally, should have

Pin Name	Pin Description	Control/Grouping Mechanism in PMC
	when I/O power is gone while core power is still on.	been set during Cold Reset so that I/O rail voltage ramping does not affect the pad. However, it is reset in the chips. Whenever an I/O power rail is shut off on any specific use case, this bit has to be set to Logic1 before the I/O rails are brought down to avoid excessive leakage to the pad.

Nine pads are used for Power Detect status of various I/O rails. They are used to sense the I/O rail voltage level (3.3V or not). They are reflected through the PWR_DET set of registers in the PMC which will in turn control the E_33V pin of the pad.

8.5 Pinmuxing

Tegra K1 processors include many types of I/O controllers (such as I^2C, SDMMC, NAND, and GMI). For some of these controller types, Tegra K1 processors include multiple "controller instances". For example, Tegra K1 processors include five active I^2C controller instances.

Each controller instance on a Tegra K1 processor communicates with external devices via a set of "external signals". For each controller instance, each signal can be brought out on (at least) one MPIO. For example, each I^2C controller has two external signals: CLK and DAT. The CLK signal of the I2C1 controller is available on the MPIO whose ball name is GEN1_I2C_SCL.

Many of the pins on Tegra K1 devices are connected to multi-purpose I/O (MPIO) pads. To connect an MPIO to a particular I/O controller, configure it as a Special-Function I/O (SFIO) rather than a General-Purpose I/O (GPIO). Each MPIO has up to four SFIO functions. Each MPIO can as also be programmed to function as a GPIO. For example, the pin named UART3_CTS_can act in one of these five ways:

- As a GPIO
- As the signal CTS for UART3
- As the signal CMD for SDMMC
- As the signal CLK for DTV
- As the signal CS3 for SPI4B controller

Though each MPIO supports multiple functions, a given MPIO can only act as a single function at a given point in time. The Pinmux controller on a Tegra K1 device includes the logic and registers to select a particular function for each MPIO.

Some controller instances have a particular signal available on more than one MPIO. Before using any controller, make sure that the pinmux registers are programmed to bring each signal out on at most ONE MPIO. For example, UART3's TXD signal is available on the MPIOs whose ball names are ULPI_CLK, GMI_A16, etc. In a system which brings out UART3's TXD signal on the GMI_A16 ball, the pinmux registers for ULPI_CLK should be programmed to select some other signal.

Some controller instances make their entire set of signals available on two or more sets of MPIOs. That is, such controllers have more than one "interface". Before using any controller, make sure that the pinmux registers are programmed to bring out the controller's signals on at most ONE interface.

Note: The Pinmux controller includes one register per MPIO. It can be controlled on a per-pin basis.

Figure 16 shows the pinmux logic associated with a single MPIO. The ENB in the diagram (equivalent to the EN pin at the pad) is active Low. Thus, the pad is active when ENB is Low and is in the High-Z state when ENB is High.

In the figure below, GPIO_OE and SFIO_OE[3:0] are considered active Low; that is, when they are Low, the pad's output is enabled.

Figure 16: Structure of Pinmux Controller (per MPIO)

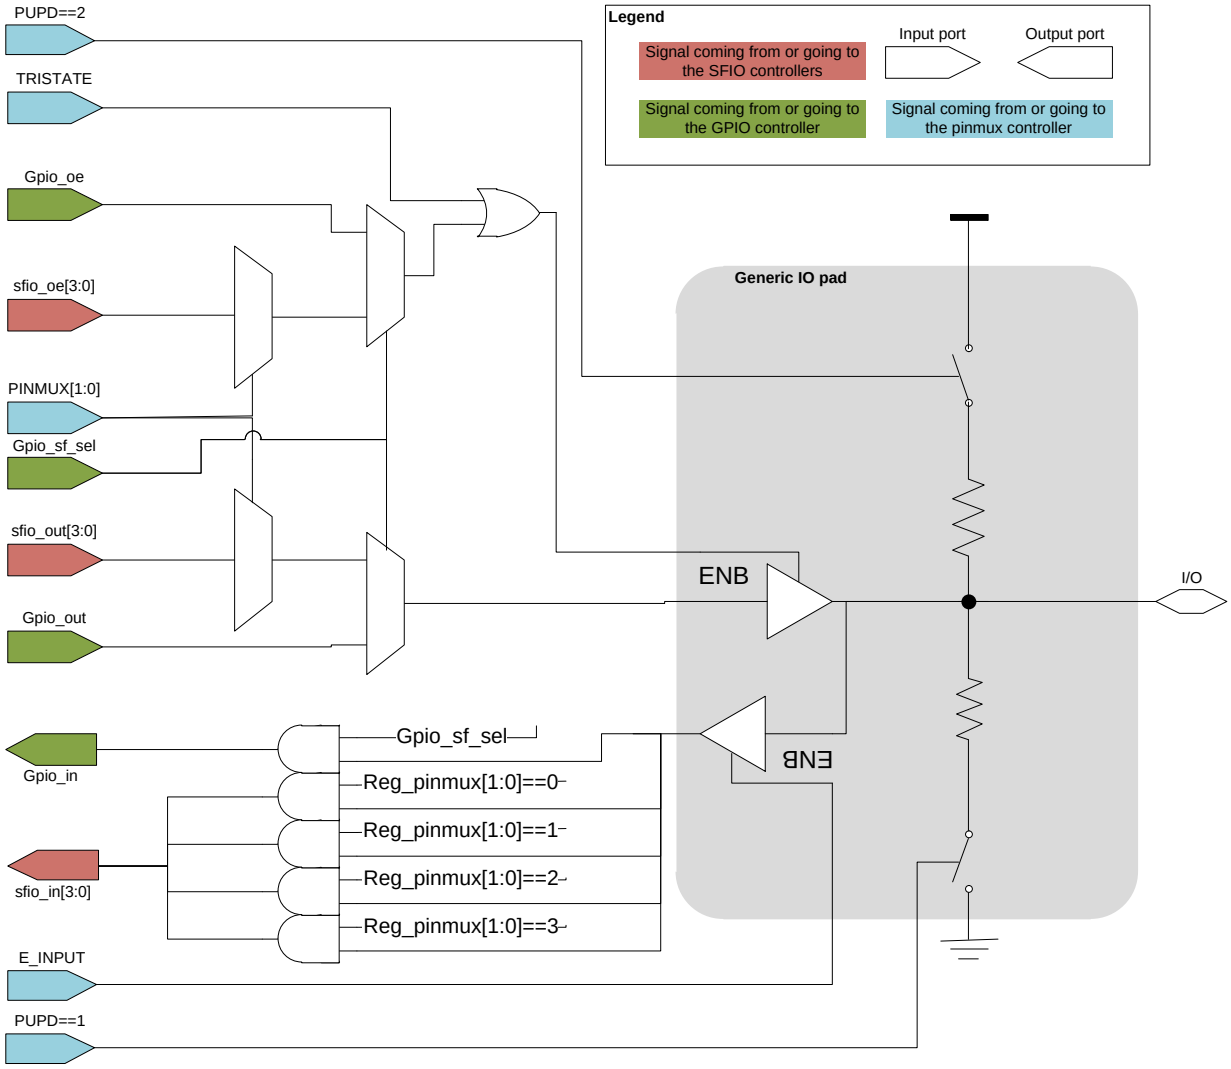

Table 28 describes the layout of each Pinmux controller register.

Table 28: Pinmux Register Format

Field Name	Bit Position	Default Value	Description
RCV_SEL	9	0/1 (depends on the type of interface)	Applicable for "OD" pads
IO_RESET	8	-	This is a dummy pin for MPIO pads and not used. The effect of applying IO_RESET is achieved by keeping A and EN pins of the pads to Logic 0.

Field Name	Bit Position	Default Value	Description
LOCK	7	0	0: Writes to this register are accepted 1: Writes to this register are ignored (until the next wake from Deep Sleep) This is a sticky bit. Once software sets this bit to 1, the only way to clear it is to reset the chip or enter and exit Deep Sleep.
E_OD	6	DD pads:1	0: the pad's output driver operates in push-pull mode. 1: the pad's output driver operates in open-drain mode. WARNING: the DD pads are only 3.3V tolerant when this bit is set. When this bit is cleared, the voltage tolerance is limited to the I/O power supply voltage. Before pulling/driving external I/Os to a value greater than the I/O power supply, this bit must be set to avoid excessive leakage. Default value recommended for DD pads is 1 to ensure that during power up no excessive leakage occurs irrespective of I/O voltage. Weak pull-ups are disabled if E_OD is set to 1 for DD pads.
		Other pads: 0	This bit only matters for DD pads. It is not implemented for other MPIO pad types.
E_INPUT	5	0/1 (depends on the type of functionality)	0: the pad's input receiver is disabled. 1: the pad's input receiver is enabled. Refer to the Tegra K1 Pinmux spreadsheet.
TRISTATE	4	0/1 (depends on the type of functionality)	0: the pad's output driver is enabled. 1: the pad's output driver is disabled (i.e., the output driver is in a high-impedance state). Refer to the Tegra K1 Pinmux spreadsheet.
PUPD	3:2	0-2 (depends on the type of functionality)	0: the pad's weak pull-up and pull-down are both disabled 1: the pad's weak pull-down is enabled and the weak pull-up is disabled. 2: the pad's weak pull-up is enabled and the weak pull-down is disabled. 3: this is an illegal combination. Refer to the Tegra K1 Pinmux spreadsheet.
PINMUX	1:0	00	0: set the pinmux logic for SFIO0. 1: set the pinmux logic for SFIO1. 2: set the pinmux logic for SFIO2. 3: set the pinmux logic for SFIO3. Note that the choice between SFIO and GPIO is controlled via the GPIO registers. Refer to the Tegra K1 Pinmux spreadsheet.

Refer to the Tegra K1 Pinmux spreadsheet for a list of the SFIO functions supported by each MPIO on Tegra K1 devices. Each SFIO is listed in the table with the following format: <ControllerType><ControllerInstance><InterfaceLetter>-<Signal>

- **ControllerType** indicates the type of I/O controller associated with this SFIO function
- **ControllerInstance** indicates the I/O controller, if the Tegra K1 processor has more than one I/O controller of the specified type
- **InterfaceLetter** differentiates between the pin sets, if the controller instance can connect to more than one set of pins
- **Signal** identifies the particular role this SFIO plays for the I/O controller.

For some of the MPIOs, the hardware includes SFIO functions that are omitted from the spreadsheet. Many of these are deprecated. Contact NVIDIA for more information.

8.6 Cold Boot Reset

The following list is a simplified description of the device power on/boot process for Tegra K1 devices concentrating on those aspects which relate to the MPIO pins.

- System-level hardware executes the power-up sequence. This sequence ends when system-level hardware releases SYS_RESET_N.
- Each MPIO pin has a deterministic power-on-reset state. The particular reset state for each pin is chosen to minimize the need of on-board components like pull-up resistors in a Tegra K1 based system. For example, the on-chip weak pull-ups are enabled during power-on-reset for pins which are usually used to drive active-low chip selects.
- Pins that act as a strap source for cold boot must have their inputs enabled (through E_INPUT control). If they have MPIO Pinmuxing enabled, the strap source should be the primary function.
- The rising edge of SYS_RESET_N does not trigger any of the MPIOs to change their output state.

> **Note:** Refer to "POR Behavior" in the *NVIDIA Tegra K1 Processors Data Sheet* (DS-06742-001) for a list of the power-on-reset states for each of the MPIOs.
> Refer to the same section in the *NVIDIA Tegra K1 64-Bit Processors Data Sheet* (DS-07070-001) for Tegra K1 64-bit processors.

Following the power-up sequence, most of the MPIOs on the chip will stay in their power-on-reset state until system-dependent software (e.g., the Boot Loader or the OS) reprograms them. However, depending on the secondary boot device used in a given system, the Boot ROM may change the state of some of the MPIOs. The following sections list the MPIOs that the Boot ROM uses for each type of secondary boot device.

8.7 Secondary Boot

The following list is a simplified description of the device boot process for Tegra K1 devices concentrating on those aspects which relate to the MPIO pins.

1. System-level hardware executes the power-up sequence. This sequence ends when system-level hardware releases SYS_RESET_N.
2. The Boot ROM on the Tegra K1 device begins executing and programs the on-chip I/O controllers to access the secondary boot device.
3. The Boot ROM on the Tegra K1 device fetches the BCT and Boot Loader from the secondary boot device.
4. If the BCT and Boot Loader are fetched successfully, Boot ROM on the Tegra K1 device yields to the Boot Loader.
5. Otherwise, Boot ROM on the Tegra K1 device enters USB recovery mode.

Each MPIO pin has a deterministic power-on-reset state. The particular reset state for each pin is chosen to minimize the need of on-board components like pull-up resistors in a Tegra K1 based system. For example, the on-chip weak pull-ups are enabled during power-on-reset for pins which are usually used to drive active-low chip selects.

Pins that act as a strap source must have their inputs enabled by default. If they have MPIO functionality, then the default configuration group should choose strap functionality.

> **Note:** Refer to " POR Behavior" in the *NVIDIA Tegra K1 Processors Data Sheet* (DS-06742-001) for a list of the power-on-reset states for each of the MPIOs.
> Refer to the same section in the *NVIDIA Tegra K1 64-Bit Processors Data Sheet* (DS-07070-001) for Tegra K1 64-bit processors.

System designs must adhere to the described power-up sequence.

Following the power-up sequence, most MPIOs on the Tegra K1 device will stay in their power-on-reset state until system-dependent software (the Boot Loader or the OS) reprograms them. However, depending on the secondary boot device used in a given system, the Boot ROM may change the state of some of the MPIOs and associated pinmux so that the Boot ROM can interface with the secondary device to fetch the Boot Loader.

The following subsections list the MPIOs that the Boot ROM uses for each type of secondary boot device. Depending on the type of secondary boot device used, the associated I/O rails have to be brought up by the Boot ROM/PMIC to facilitate the data exchange.

8.7.1 SPI Boot

SPI4C is used for a SPI interface for secondary boot. The pins are spread across different MPIOs as summarized below.

Ball Name	SFIO Usage	I/O Power Rail	Default Pinmux Selection	Change Needed?
GPIO_PI3	SPI4C_CS0	vddio_gmi	ALTERNATE2	YES. To be changed to ALTERNATE3
GPIO_PG5	SPI4C_SCK	vddio_gmi	ALTERNATE2	YES. To be changed to ALTERNATE3
GPIO_PG7	SPI4C_DIN	vddio_gmi	ALTERNATE2	YES. To be changed to ALTERNATE3
GPIO_PG6	SPI4C_DOUT	vddio_gmi	ALTERNATE2	YES. To be changed to ALTERNATE3

TRISTATE control of all the pins needs to be changed to NORMAL. Also the pinmux selection should be changed to select ALTERNATE3.

8.7.2 eMMC Boot

There are four SDMMC interfaces; the one used as a secondary boot interface is SDMMC4. SDMMC4 has all the necessary functionality for SDMMC assigned as primary function, and thus there is no need to change the Pinmux configuration. However, the Boot ROM has to remove the TRISTATE control bit on these pins (through the Pinmux control register) to ensure the pins do not have the overriding TRISTATE that is making the pins inputs.

Ball names include:

- SDMMC4_CLK
- SDMMC4_CMD
- SDMMC4_DAT0
- SDMMC4_DAT1
- SDMMC4_DAT2
- SDMMC4_DAT3
- SDMMC4_DAT4
- SDMMC4_DAT5
- SDMMC4_DAT6
- SDMMC4_DAT7

8.8 Deep Sleep Behaviors

Deep Sleep is an ultra-low-power standby state in which a Tegra K1 device maintains much of its I/O state while most of the chip is powered off. The following lists offer a simplified description of the deep sleep entry and exit concentrating on those aspects which relate to the MPIO pads.

8.8.1 Deep Sleep Entry

The steps to enter deep sleep are as follows:

1. LP-entry software programs the PMC to alert about Deep Sleep entry.

2. LP-entry software also programs the APBDEV_PMC_IO_DPD_REQ registers to emulate a software based overriding request to enter the DPD. This is done to control the deassertion of E_DPD during LP0 exit which is needed to arrest glitches associated with I/Os on the LP0 sequence.
3. I/O controllers are brought into the IDLE state.
4. The PMC latches much of Tegra K1's I/O state, i.e., currently driven by functional logic by sampling the pinmux controllers output. There are small variations on this logic depending on the pad type (mentioned below). Latching of the I/O state is triggered by writing into APBDEV_PMC_DPD_SAMPLE_0 register maintained in the PMC register space.
5. Along with latching the I/O values, various pad controls, such as E_IO_HV,E_33V, have to be latched and driven depending on the pad type.
6. The PMC runs the state machine to drive the control pins in the pad that puts them in the DPD state. There are two control pins (E_DPD and SEL_DPD) which have to be driven with proper timing as per the Pad data sheet. The PMC logic provides a configurable timer to select this. The timer is provided in the APBDEV_PMC_SEL_DPD_TIM_0 register. Entering into DPD is triggered through APBDEV_PMC_IO_DPD_REQ_0. Both registers are in the PMC register space.
7. The PMC deasserts CORE_PWR_REQ.
8. The PMIC powers down VDD_CORE.
9. The PMC continues to drive the I/O state that it has latched
10. As a result of the LP0 entry sequence, the pads are put in the DPD state by asserting E_DPD and SEL_DPD. When these signals are asserted, the core supply to the pad (VAUXC_CORE) can be successfully removed and the pad can be powered using VDD_AO/VDD_RTC. This way the pads keep the I/O states yet consume low power.

> **Note:** For more information about deep sleep entry, refer to the *NVIDIA Tegra K1 Processors Data Sheet* (DS-06742-001) .or the *NVIDIA Tegra K1 64-Bit Processors Data Sheet* (DS-07070-001) as well as the PMC section in this TRM.

8.8.2 Deep Sleep Exit

1. The PMC detects a wake event (for example, a rising edge on an appropriately configured MPIO)
2. The PMC asserts CORE_PWR_REQ.
3. The PMIC powers up VDD_CORE.
4. The PMC resets the logic within VDD_CORE.
5. The Boot ROM executes Warm Boot code, and it does not clear the APBDEV_PMC_DPD_SAMPLE_0 register.
6. The LP0-exit code in DRAM retrieves pinmux registers for every pin and ensures the TRISTATE/PARKED bit is set to 1 in the respective pinmux register.
7. The LP-exit code in DRAM deasserts APBDEV_PMC_IO_DPD_REQ so that the PMC removes E_DPD.
8. The PMC takes the I/Os out of E_DPD but continues to drive them in SEL_DPD mode. This way the I/O values do not change during Deep Sleep exit until platform-specific software (i.e., typically customer owned) takes control of the I/Os.
9. The LP0-exit code in DRAM re-initializes the I/O controllers.
10. The LP0-exit code in DRAM changes the Pinmux configurations to the appropriate controller (based on what was configured during LP0) and clears TRISTATE/PARKED in the Pinmux register of each pin.
11. The LP0-exit code in DRAM, after restoring all the Pinmux register, clears the APBDEV_PMC_DPD_SAMPLE_0 register, which results in SEL_DPD removal of the pad through hardware logic.

> **Note:** For more information about deep sleep exits, refer to the *NVIDIA Tegra K1 Processors Data Sheet* (DS-06742-001) .or the *NVIDIA Tegra K1 64-Bit Processors Data Sheet* (DS-07070-001) as well as the PMC section in this TRM.

8.8.3 Pad Capabilities During Deep Sleep

The MPIO pads do not all have identical behavior during deep sleep. They differ with respect to:

- Output buffer behavior during deep sleep:
  - Does it maintain a programmable (0, 1, or tristate) constant value OR
  - Is it capable of changing state while the chip is still in deep sleep (for example, a pin related to the keyboard controller)?
- Input buffer behavior during deep sleep:
  - Is it forcibly disabled OR
  - Can it be enabled for use as a “GPIO wake event” OR
  - Can it be enabled for some other purpose (for example, a “clock request” pin)?
- Weak pull-up/pull-down behavior during deep sleep
  - Are they forcibly disabled OR
  - Can they be configured?
- Behavior coming out of deep sleep
  - All the pads should maintain the state until software configures the I/O controller
- Pads that do not enter DPD mode during LP0
  - Some pads whose outputs are dynamic have a special type and they don’t enter DPD mode during LP0. The PMC has a configurable option to exclude specific pads from entering DPD during LP0 (see the PMC register APBDEV_PMC_DPD_PADS_ORIDE_0)
  - Pads that are associated with PMIC logic do not enter DPD mode during LP0
  - Some pads like JTAG do not enter DPD mode.

Refer to the “Deep Sleep Behavior” section in the *NVIDIA Tegra K1 Processors Data Sheet* (DS-06742-001) or the *NVIDIA Tegra K1 64-Bit Processors Data Sheet* (DS-07070-001) for a summary of the capabilities of each MPIO during deep sleep.

8.8.3.1 Output Buffers During Deep Sleep

The output buffers of most MPIO pads are “configurable” during deep sleep. Immediately prior to entering deep sleep, the PMC latches the state of the output buffers for such pads. If the pad was driving high (or low) prior to entering deep sleep, the PMC ensures that it continues to drive high (or low) throughout deep sleep. If the pad was tristated during deep sleep, the PMC ensures that it remains tristated throughout deep sleep.

The weak pull-ups and pull-downs of most of the MPIO pads are “disabled” or “not available” during deep sleep to reduce the Tegra K1 device’s static current consumption. For the remainder of the MPIO pads, the weak pull-up and pull-down are “configurable” during deep sleep. If the pull-up (or pull-down) was enabled prior to entering deep sleep, the PMC ensures that it remains enabled throughout deep sleep. Similarly, if the pull-up (or pull-down) was disabled prior to entering deep sleep, the PMC ensures that it remains enabled throughout deep sleep.

Some MPIO pads have an output buffer which behaves in a “special” way during deep sleep. The output state of these pads may change while the Tegra K1 device remains in deep sleep. For example, the keyboard controller may continue scanning the keypad matrix during deep sleep.

8.8.3.2 Input Buffers During Deep Sleep

The input buffers of most MPIO pads are “disabled” during deep sleep. The input buffers are placed in an ultra-low power state. The Tegra K1 device will not respond to transitions on these pads while it is in deep sleep.

Some MPIO pads have an input buffer which has a “special” behavior during deep sleep. Most of these pads can act as “Deep Sleep Wake Sources”. Others offer some other functional behavior. For example, SYS_CLK_REQ can function as a clock request pin even during deep sleep.

For a complete description of the behavior of these pads during deep sleep, refer to the *NVIDIA Tegra K1 Processors Data Sheet* (DS-06742-001) or the *NVIDIA Tegra K1 64-Bit Processors Data Sheet* (DS-07070-001). Pads whose input can be sampled during Deep Sleep are mentioned as ENABLED in the input buffer column. To ensure the PMC wake logic can sense these wake events, the signals must be directly taken from the ZI pin of the pad because pinmux controls are not available during LP0. Pads that are acting as wake source should satisfy the following condition: The pad’s power rail should be active.

8.8.3.3 Behavior During Deep Sleep Exit

MPIO pads “hold” their deep sleep state until system-dependent software deasserts the TRISTATE bit in the associated Pinmux controller registers. This gives software the opportunity to re-initialize the pinmux and I/O controllers without any glitches in the state of the MPIO pads.

8.9 GPIO Controller

The GPIO controller for Tegra K1 devices provides the tools for configuring each MPIO for use as a software-controlled GPIO.

The GPIO controller is divided into 8 banks. Each bank handles the GPIO functionality for up to 32 MPIOs. Within a bank, the GPIOs are arranged as four ports of 8 bits each. The ports are labeled consecutively from A through Z and then AA through FF. Ports A through D are in bank 0. Ports E through H are in bank 1. In total, there are 162 GPIOs, and the banking and numbering conventions will have some break in between but will maintain backward compatibility in register configurations for the GPIOs as that of previous generation chips.

> **Note:** Refer to the “Pin Descriptions” section in *NVIDIA Tegra K1 Processors Data Sheet* (DS-06742-001) *or the NVIDIA Tegra K1 64-Bit Processors Data Sheet* (DS-07070-001) for a map of each of the Tegra K1 device MPIO pads to a particular GPIO port and bit. See the column labeled “GPIO.”

Each GPIO can be individually configurable as Output/Input/Interrupt sources with level/edge controls.

GPIO configuration has a lock bit controlling every bit separately. When the LOCK bit is set, the associated control aspects of the bits (for example, whether it is an Output/Input or used as GPIO or SFIO or values driven) cannot be modified (locked). The LOCK bit gets cleared only by system reset; it is sticky. This bit can be used for security-related functionality where an authorized entity owning the GPIO can set the configuration and lock it. The lock bit also covers the GPIO output value, so this may not be varied dynamically once lock is enabled.

The GPIO controller also has masked-write registers. Values written to these registers specify both a mask of bits to be updated in the underlying state (the mask bits are not sticky) as well as new values for that state. Individual bits of the state can be updated without the need for a read-modify-write sequence. Thus different portions of software can modify the GPIO controller state without coordination.

8.10 Programming Considerations

8.10.1 Controller Instances with Multiple Pin-outs

Several of the I/O controller instances on a Tegra K1 device have more than one pin-out. That is, the controller can communicate with the outside world via more than one set of pins. Special care is warranted when programming the Pinmux controller for these SFIOs. For a given signal on a given controller’s interface, only a single pin-out should be selected in the pinmux registers.

For example, TXD is an output signal from UART A. It is available on six pins: ULPI_DATA0, SDMMC1_DATA2, SDMMC3_DATA1, GPIO_PU0, GPIO_PS1, and UART2_RTS_N. Depending on the value programmed into the corresponding pinmux registers, each of those six pins might toggle when UART A transmits data.

Similarly, RXD is an input signal to UART A. It is available on six pins: ULPI_DATA1, SDMMC1_DATA1, SDMMC3_CMD, GPIO_PU1, GPIO_PS2, and UART2_CTS_N. Depending on the value programmed into the corresponding pinmux registers, UART A might see the logical-OR of the signal on those six pins. This scenario will almost certainly lead to data corruption. If the UART A RXD signal is brought out on ULPI_DATA1, the pinmux registers for the other five pins should be programmed to some other function.

8.10.2 Resume From Deep Sleep

As the Tegra K1 device enters Deep Sleep, most of its register state is lost. In particular the pinmux, GPIO, and pad control registers lose their state during LP0. Software is responsible for reprogramming those registers upon resume from deep sleep.

8.10.3 Unused Pins

For each unused MPIO, assert its tristate and disable its input buffer. For pins whose internal pull-up is enabled during power-on-reset, assert the internal pull-up. Otherwise, assert the internal pull-down.

If all of the pins in a pad-control group are unused, set the drive strengths and slew rates to minimum.

If all of the pins on a power-rail are unused, assert E_NOIOPOWER for that rail in the PMC registers.

8.10.4 Security Considerations for the Pinmux Register

Though attacks via Pinmux are mostly Denial Of Service (DoS) attacks, there are specific cases which are a concern, for example:

- Pins interfacing with Platform PMICs (by reprogramming those pinmuxes, one can cause severe user disruption)
- Any I/O device that is transferring secret data (typically like Serial PROMs having keys). By reprogramming the pinmux, it is possible to redirect the data to wrong interface

In such cases, it is better to make use of the LOCK bit in the Pinmux control register so that values cannot be tampered with. The Boot Loader can perform this task so that customer software does not have to configure those pins. As part of LP0 exit, the lock bit will have to be re-enabled, because the lock is not retained across LP0. Similarly, the GPIO controller has a lock bit for each GPIO to preserve the configuration, value driven, and also the pin is configured as GPIO or SFIO. The configuration can be protected using the lock bit in the GPIO register. This way secure software such as a Boot Loader can ensure that certain pins have the required configuration, irrespective of the actions of less secure software.

8.10.5 Drive Strengths

For all pads that do not have corresponding calibration pads, the drive strength has to be programmed. The common default value assumed for the pad drive impedance is 50 ohms and hence pads have to be programmed with a code that can give 50 ohm impedance. Because the code depends on VDDP, i.e., I/O rail, and also PVT (Process, Voltage and Temperature) corners default a code corresponding to TT-NV-NT (Typical process, Normal Voltage, and Normal Temperature) corner as a function of VDDP voltage is chosen.

In Tegra K1 devices, the primary boot device (SDMMC4) has an auto-calibration option. Thus those pads get an impedance code that matches the PVT conditions, etc. and hence enable the boot process. For all other MPIO pads (which are not involved during boot), the BCT can have a value of the code based on the I/O rail and pad data sheet. The same is programmed by the Boot Loader or any platform-specific software, and it overrides the default Power on Reset values. If the values have to be changed based on SI results, then the same can be loaded in the primary device.

8.11 GPIO Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

Each port of each GPIO controller has several registers for the control and monitoring of the port’s 8 GPIO pins. The registers provide per-pin control of the following features:

- GPIO_CNF_* / GPIO_MSK_CNF — Select SPIO or GPIO
- GPIO_OE_* / GPIO_MSK_OE_* — Output Enable
- GPIO_OUT_* / GPIO_MSK_OUT_* — GPIO Output Value
- GPIO_IN_* — GPIO Input Value (Read Only)
- GPIO_INT_STA_* / GPIO_MSK_INT_STA_* — GPIO Interrupt Status
- GPIO_INT_ENB_* / GPIO_MSK_INT_ENB_* — Interrupt Enable
- GPIO_INT_LVL_* / GPIO_MSK_INT_LVL_* — Interrupt Selection (Edge/Level)
- GPIO_INT_CLR_* — Interrupt Flag Set-to-Clear

Many of the control registers are accessible from two offsets. Accesses to the lower offsets affect all 8 pins for the GPIO port. Accesses to the upper offsets provide a per-pin mask capability allowing adjustments to a subset of the pins. Using the upper offsets can eliminate the need for Read-Modify-Write operations. For example, a write to GPIO_MSK_CNF can substitute for a Read-Modify-Write of GPIO_CNF.

Table 29: Tegra K1 GPIO Register Summary

Register Name	Offset (Lower: Read-Modify-Write)				Offset (Upper: Per-Pin Mask Write)			
GPIO Controller 1 – Port	**A**	**B**	**C**	**D**	**A**	**B**	**C**	**D**
GPIO_CNF_0	000	004	008	00C	080	084	088	08C

8.11.1 GPIO_CNF_0

Designate whether each pin operates as a GPIO or as an SFIO. By default all pins come up in SFIO mode. These can be programmed to GPIO mode at any stage. This is an array of 4 identical register entries; the register fields below apply to each entry.

Lock bits are used to control the access to the CNF and OE registers. When set, no one can write to the CNF and OE bits. They can be programmed ONLY during Boot and get reset by chip reset only.

GPIO Port Configuration Registers

Offset: 0h..fh | Read/Write: R/W | Reset: 0b0000000000000000

Bit	Reset	Description
15	DISABLE	LOCK_7: Lock access to pin 7 CNF, OE and OUT 0 = DISABLE 1 = ENABLE
14	DISABLE	LOCK_6: Lock access to pin 6 CNF, OE and OUT 0 = DISABLE 1 = ENABLE
13	DISABLE	LOCK_5: Lock access to pin 5 CNF, OE and OUT 0 = DISABLE 1 = ENABLE
12	DISABLE	LOCK_4: Lock access to pin 4 CNF, OE and OUT 0 = DISABLE 1 = ENABLE
11	DISABLE	LOCK_3: Lock access to pin 3 CNF, OE and OUT 0 = DISABLE 1 = ENABLE
10	DISABLE	LOCK_2: Lock access to pin 2 CNF, OE and OUT 0 = DISABLE 1 = ENABLE
9	DISABLE	LOCK_1: Lock access to pin 1 CNF, OE and OUT 0 = DISABLE 1 = ENABLE
8	DISABLE	LOCK_0: Lock access to pin 0 CNF, OE and OUT 0 = DISABLE 1 = ENABLE
7	0x0	BIT_7: Configures each pin to be in either GPIO or SFIO mode 0 = SPIO 1 = GPIO

Bit	Reset	Description
6	0x0	BIT_6: Configures each pin to be in either GPIO or SFIO mode 0 = SPIO 1 = GPIO
5	0x0	BIT_5: Configures each pin to be in either GPIO or SFIO mode 0 = SPIO 1 = GPIO
4	0x0	BIT_4: Configures each pin to be in either GPIO or SFIO mode 0 = SPIO 1 = GPIO
3	0x0	BIT_3: Configures each pin to be in either GPIO or SFIO mode 0 = SPIO 1 = GPIO
2	0x0	BIT_2: Configures each pin to be in either GPIO or SFIO mode 0 = SPIO 1 = GPIO
1	0x0	BIT_1: Configures each pin to be in either GPIO or SFIO mode 0 = SPIO 1 = GPIO
0	0x0	BIT_0: Configures each pin to be in either GPIO or SFIO mode 0 = SPIO 1 = GPIO

8.11.2 GPIO_OE_0

GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid.

The set of registers below are used to either drive the signal out or as an Input. This needs to be programmed depending upon whether the pin needs to be in either Input or Output.

This is an array of 4 identical register entries; the register fields below apply to each entry.

GPIO Port Enable Registers

Offset: 10h..1fh | Read/Write: R/W | Reset: 0b00000000

Bit	Reset	Description
7	0x0	BIT_7: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = TRI_STATE 1 = DRIVEN
6	0x0	BIT_6: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN
5	0x0	BIT_5: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN
4	0x0	BIT_4: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN
3	0x0	BIT_3: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN
2	0x0	BIT_2: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN

Bit	Reset	Description
1	0x0	BIT_1: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN
0	0x0	BIT_0: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = TRI_STATE 1 = DRIVEN

8.11.3 GPIO_OUT_0

GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be valid. This register will take affect only in GPIO mode. This register is used to drive the value out on a given pin.

This is an array of 4 identical register entries; the register fields below apply to each entry.

GPIO Port Output Value Registers (Read/Write)

Offset: 20h..2fh | Read/Write: R/W | Reset: 0b00000000

Bit	Reset	Description
7	0x0	BIT_7: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
6	0x0	BIT_6: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
5	0x0	BIT_5: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
4	0x0	BIT_4: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
3	0x0	BIT_3: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
2	0x0	BIT_2: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
1	0x0	BIT_1: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH
0	0x0	BIT_0: GPIO_CNF.x=1 (in GPIO mode) AND GPIO_OE.x=1 (GPIO output enabled) must be true for this to be a valid state 0 = LOW 1 = HIGH

8.11.4 GPIO_IN_0

GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. This is a read-only register used to read the value from the pin. This is an array of 4 identical register entries; the register fields below apply to each entry.

GPIO Port Input Value Registers (Read Only)

Offset: 30h..3fh | Read/Write: R/W | Reset: 0b00000000

Bit	Reset	Description
7	0x0	BIT_7: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = LOW 1 = HIGH
6	0x0	BIT_6: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH
5	0x0	BIT_5: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH
4	0x0	BIT_4: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH
3	0x0	BIT_3: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH
2	0x0	BIT_2: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH
1	0x0	BIT_1: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH
0	0x0	BIT_0: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid 0 = LOW 1 = HIGH

All GPIO inputs can be independently programmed to generate an interrupt request.

In addition, the individual trigger level for interrupt on each input pin can be programmed as either active-on-high or active-on-low. For example, to program an active-on-high interrupt on bit 3 of GPIO-PORT_C, write '1' into bit 3 of GPIO_INT.LVL.C register (this sets the interrupt to be active-on-high), and then write '1' into bit 3 of GPIO_INT.ENB.C (this enables interrupt on the named bit).

The interrupt flag status can be read in the appropriate bit of the GPIO_INT.STA.C register. Once the programmed interrupt occurs, status should be cleared by writing into the appropriate bit of the GPIO_INT.CLR.C register. Note that the interrupt thus generated is routed to the processor only if the corresponding bit for GPIO interrupts in the Secondary interrupt controller is enabled.

8.11.5 GPIO_INT_STA_0

GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. Every GPIO pin generates an Interrupt when switching from Low-High to High-Low. Interrupt status for each port is saved in an Interrupt status register.

This is an array of 4 identical register entries; the register fields below apply to each entry.

GPIO Port Interrupt Status Registers

Offset: 40h..4fh | Read/Write: R/W | Reset: 0b00000000

Bit	Reset	Description
7	0x0	BIT_7: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE = ACTIVE

Bit	Reset	Description
6	0x0	BIT_6: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE
5	0x0	BIT_5: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE
4	0x0	BIT_4: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE
3	0x0	BIT_3: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE
2	0x0	BIT_2: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE
1	0x0	BIT_1: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE
0	0x0	BIT_0: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = IN_ACTIVE 1 = ACTIVE

8.11.6 GPIO_INT_ENB_0

Every bit of the GPIO pin has an enable which, when enabled, routes the Interrupt to the Interrupt controller. This is an array of 4 identical register entries; the register fields below apply to each entry.

GPIO Port Interrupt Enable Registers

Offset: 50h..5fh | Read/Write: R/W | Reset: 0b00000000

Bit	Reset	Description
7	0x0	BIT_7: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE
6	0x0	BIT_6: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE
5	0x0	BIT_5: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE
4	0x0	BIT_4: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE
3	0x0	BIT_3: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE
2	0x0	BIT_2: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
1	0x0	BIT_1: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE
0	0x0	BIT_0: GPIO mode (GPIO_CNF.x=1) must be true for this condition to be valid. 0 = DISABLE 1 = ENABLE

8.11.7 GPIO_INT_LVL_0

The GPIO can detect an interrupt for any edge- or level-sensitive signal.

This is an array of 4 identical register entries; the register fields below apply to each entry

GPIO Port Interrupt Activation Level Registers

Offset: 60h..6fh | Read/Write: R/W | Reset: 0b00000000000000000000000000

Bit	Reset	Description
23	0x0	DELTA_7: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
22	0x0	DELTA_6: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
21	0x0	DELTA_5: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
20	0x0	DELTA_4: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
19	0x0	DELTA_3: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
18	0x0	DELTA_2: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
17	0x0	DELTA_1: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
16	0x0	DELTA_0: 1 means Trigger Interrupt on ANY change of input if EDGE is TRUE
15	0x0	EDGE_7: 1 means Configure as Edge-Triggered Interrupt
14	0x0	EDGE_6: 1 means Configure as Edge-Triggered Interrupt
13	0x0	EDGE_5: 1 means Configure as Edge-Triggered Interrupt
12	0x0	EDGE_4: 1 means Configure as Edge-Triggered Interrupt
11	0x0	EDGE_3: 1 means Configure as Edge-Triggered Interrupt
10	0x0	EDGE_2: 1 means Configure as Edge-Triggered Interrupt
9	0x0	EDGE_1: 1 means Configure as Edge-Triggered Interrupt
8	0x0	EDGE_0: 1 means Configure as Edge-Triggered Interrupt
7	0x0	BIT_7: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH
6	0x0	BIT_6: Interrupt Activation Level or Edge (HIGH for High level or Rising Edge) 0 = LOW 1 = HIGH

8.11.8 GPIO_INT_CLR_0

This write-only register clears the Interrupts that are set. This is valid only in GPIO mode when GPIO_INT.ENB is set.

This is an array of 4 identical register entries; the register fields below apply to each entry.

GPIO Port Interrupt Flag Set-to-Clear Registers

Offset: 70h..7fh | Read/Write: R/W | Reset: 0b00000000

Bit	Reset	Description
7	0x0	BIT_7: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
6	0x0	BIT_6: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
5	0x0	BIT_5: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
4	0x0	BIT_4: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
3	0x0	BIT_3: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
2	0x0	BIT_2: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR
1	0x0	BIT_1: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR

Bit	Reset	Description
0	0x0	BIT_0: GPIO mode (GPIO_CNF.x=1) and GPIO_INT.ENB.x=1 must be true for this condition to be valid. 0 = SET 1 = CLEAR

8.11.9 GPIO_MSK_CNF_0

Each register is provided with an individual 16-bit version for enabling Masked Writes to avoid a Read-Modify-Write operation by the firmware. The exception is for the interrupt clear register, whose functionality is combined in the interrupt status register. Individual pins only can be programmed by suitably enabling the write masks in the upper byte of these 16-bit registers.

This is an array of 4 identical register entries; the register fields below apply to each entry.

MASKED PRIMARY GPIO/SFIO Config Registers (Masked Writes)

Offset: 80h..8fh | Read/Write: R/W | Reset: 0b0000000000000000

Bit	R/W	Reset	Description
15	WO	0x0	MSK7: 0=Disable bit for write 0 = DISABLE 1 = ENABLE
14	WO	0x0	MSK6: 0=Disable bit for write 0 = DISABLE 1 = ENABLE

8.12 Pinmux Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

This section defines the Pinmux selects, Pullup, Pulldn, and E_input programmability for each pin/ball in Tegra K1 devices. Every register has 7 bits defined for Functional Pin Select. The rest are specific to a few pads such as OD and IO_RESET.

1:0 PM --> Functional Pin Select.

3:2 PUPD --> Pullup / PullDn control.

4 Tristate --> Tristate Enable / Disable.

5 E_INPUT --> Input Receiver Enable/Disable.

7 LOCK --> Locks access to all configurable bits for pins, including itself.

--> 1 = Enable (preferably done during boot)

--> 0 = Disable (can only be done by full system reset)

8 IO_RESET --> Forces output drivers disabled (PU/PD control only). Required to guarantee pin state on *LPDDR2* pads during POR.

--> IO_RESET_N will override the enable signal of main driver. After power-up, core controls should be enabled first to drive the pad with the same value as programmed by E_PULL. Then IO_RESET_N / E_PULL can be deasserted.

--> If IO_RESET_N is deasserted before core controls come up, there could be unknown outputs or glitches.

Optional bits:

6 OD --> Open Drain Enable / Disable. Specifically for I2C pads.

9 RCV_SEL --> Select between High and Normal VIL/VIH receivers. RCVR_SEL=1: High VIL/VIH RCVR_SEL=0: Normal VIL/VIH

8.12.1 PINMUX_AUX_ULPI_DATA0_0

Offset: 0x3000 | Read/Write: R/W | Reset: 0x00000038 (0bxxxxxxxxxxxxxxxxxxxxxxxxxx0x111000)

Bit	Reset	Description

9.0 POWER MANAGEMENT CONTROLLER

9.1 Register Definitions for the PMC

To speed up operation, the PMC register file operates in the local peripheral interface bus domain (APB) rather than in the 32 kHz clock domain used for PMC processing.

Registers in the PMC control entering/exiting Deep Sleep/Suspend mode, power detect, and I/O power functions. They also control CORE_PWR_REQ, SYS_CLK_REQ, and LED_BLINK pins.

The following registers should be programmed/read for different power events in order for PMC to function properly.

IMPORTANT:	**NO_IO_POWER REGISTER (APBDEV_PMC_NO_IOPOWER_0)** Before an I/O power rail is turned off, ramping up, or no longer used and ready to turn off, the corresponding bit in this register should be set to 1. The bit only needs to be turned on when the I/O power rail is stable and you are ready to enable some interface on the I/O power rail.

BEFORE/ON ENTERING DEEP SLEEP MODE

- PMC Control Register (bits PWRREQ_POLARITY, PWRREQ_OE, SYSCLK_POLARITY,SYSCLK_OE, LATCHWAKE_EN)
- WAKE_MASK
- WAKE_LVL
- DPD_PADS_ORIDE (for required overrides)
- PWRGOOD_TIMER
- DPD_SAMPLE
- DPD_ENABLE

AFTER WAKE-UP FROM DEEP SLEEP

- WAKE_STATUS
- SW_WAKE_STATUS
- DPD_ENABLE
- PMC Control Register (bit LATCHWAKE_EN)

BEFORE/ON POWERING DOWN PARTITIONS

- PWRGATE_STATUS
- PWRGATE_TIMER_OFF (for power down)
- PWRGATE_TIMER_ON (for power up). This has been deprecated.
- PWRGATE_TOGGLE
- REMOVE_CLAMPING_CMD (for power up)

FOR POWER DETECT SEQUENCE

- PWR_DET
- PWR_DET_LATCH

FOR BLINK

- BLINK_TIMER
- PMC Control Register (bit BLINK_EN)
- DPD_PADS_ORIDE (for blink field)

All other operations require single register access.

9.2 PMC Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

9.2.1 APBDEV_PMC_CNTRL_0

This register controls the clock to the RTC, and the reset to the CAR and RTC. It also manages polarity and output enable of the sys_clk_req and core_pwr_req pins. At reset, both are disabled since the PMIC properties are unknown.

Auxiliary functions include enabling of blinking functions, side-effect option, and software wake-up latching.

The LP0 entry is to be triggered by the PMC side-effect option. Software needs to configure the PMC for the side-effect option before triggering the power off of last CPU. If the side-effect option is set, then the PMC would initiate LP0 in the following cases:

- A power-off request for the CPU rail will lead to CPU rail power-off followed by LP0 entry.
- A power-gating request for cluster1 non-CPU (i.e., C1NC) will lead to power-gating of the C1NC followed by LP0 entry

PMC Control Register

Offset: 0x0 │ Read/Write: R/W │ Reset: 0x00010a00 (0bxxxxxxxxxx00000100001010000000000)

Bit	Reset	Description
21:20	0x0	CPUPWRGOOD_SEL: CPUPWRGOOD pin select. There are 4 potential source pins (soc_therm_oc{1,2,3,4}) used as PWRGOOD. This field needs to be programmed (at boot) based on which pin is used as PWRGOOD. 0 = SOC_THERM_OC1 (default) 1 = SOC_THERM_OC2 2 = SOC_THERM_OC3 3 = SOC_THERM_OC4
19	0x0	CPUPWRGOOD_EN:CPU_PWR_GOOD (From PMIC to PMC) signal is enabled. 0 = DISABLE 1 = ENABLE
18	0x0	FUSE_OVERRIDE: Fuse override 0 = DISABLE 1 = ENABLE
17	0x0	INTR_POLARITY: Inverts INTR polarity 0 = DISABLE 1 = ENABLE
16	0x1	CPUPWRREQ_OE: Power request output enable. Resets to tri-state 0 = DISABLE 1 = ENABLE
15	0x0	CPUPWRREQ_POLARITY: Inverts power request polarity 0 = NORMAL 1 = INVERT

Bit	Reset	Description
14	0x0	SIDE_EFFECT_LP0: When set, causes the side effect of entering LP0 after powering down the CPU 0 = DISABLE 1 = ENABLE
13	0x0	AOINIT: AO initialized purely software diagnostic and interpretation 0 = NOTDONE 1 = DONE
12	0x0	PWRGATE_DIS: Disable power gating - global override, will override function of PWRGATE_TOGGLE register. All partitions will stay enabled. **Note**: Only write to this bit when CRAIL is on. 0 = DISABLE 1 = ENABLE
11	0x1	SYSCLK_OE: Enables output of system enable clock - works only if the SYS_CLK field in DPD_PADS_ORIDE is set to 1. 0 = DISABLE 1 = ENABLE
10	0x0	SYSCLK_POLARITY: Inverts SYS_CLK_REQ enable polarity 0 = NORMAL 1 = INVERT
9	0x1	PWRREQ_OE: CORE_PWR_REQ output enable. Resets to tristate 0 = DISABLE 1 = ENABLE
8	0x0	PWRREQ_POLARITY: Inverts CORE_PWR_REQ polarity 0 = NORMAL 1 = INVERT
7	0x0	BLINK_EN: Enables blinking counter and blink output works only if the BLINK field in DPD_PADS_ORIDE is set to 1. 0 = DISABLE 1 = ENABLE
6	0x0	GLITCHDET_DIS: Reserved
5	0x0	LATCHWAKE_EN: Enables latching wakeup events - stops latching on transition from 1 to 0 (sequence - set to 1,set to 0) 0 = DISABLE 1 = ENABLE
4	0x0	MAIN_RST: Resets everything but scratch 0 and reset status. 0 = DISABLE 1 = ENABLE
3	0x0	KBC_RST: Reserved
2	0x0	RTC_RST: Software reset to RTC. 0 = DISABLE 1 = ENABLE
1	0x0	RTC_CLK_DIS: Disable 32 KHz clock to RTC. 0 = DISABLE 1 = ENABLE
0	0x0	KBC_CLK_DIS: Reserved

9.2.2 APBDEV_PMC_SEC_DISABLE_0

On separate reset (same as CAR), this register disables access (read/write to secure scratch registers). Once writes are disabled, secure registers cannot be written until power on reset or reset when exiting Deep Sleep mode.

Once reads are disabled, reads from scratch registers will return 0 until power on reset or reset when exiting Deep Sleep mode.

Single register can be disabled for reads/writes; bits 0 and 1 have an overwrite function.

Secure Register Disable

Offset: 0x4 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxx00000000000000000000)

Bit	Reset	Description
21	0x0	TSC_NS_WRITE: Non-secure (i.e., non-TZ) write-disable for the PMC_TSC_MULT register and the PMC_DPD_ENABLE[TSC_MULT_EN] register-bit. 0: Non-secure or secure can write. 1: Only secure can write. This bit is write-once only. Once it is set to '1', it remains '1' until reset by LP0 or system reset. 0 = OFF 1 = ON
20	0x0	AMAP_WRITE: Disable writes to the PMC_GLB_AMAP_CFG register 0 = OFF 1 = ON
19	0x0	READ7: Disable reads from secure register 7 0 = OFF 1 = ON
18	0x0	WRITE7: Disable writes to secure register 7 0 = OFF 1 = ON
17	0x0	READ6: Disable reads from secure register 6 0 = OFF 1 = ON
16	0x0	WRITE6: Disable writes to secure register 6 0 = OFF 1 = ON

12	0x0	WRITE4: Disable writes to secure register 4 0 = OFF 1 = ON
11	0x0	READ3: Disable reads from secure register 3 0 = OFF 1 = ON

Bit	Reset	Description
10	0x0	WRITE3: Disable writes to secure register 3 0 = OFF 1 = ON
9	0x0	READ2: Disable reads from secure register 2 0 = OFF 1 = ON
8	0x0	WRITE2: Disable writes to secure register 2 0 = OFF 1 = ON
7	0x0	READ1: Disable reads from secure register 1 0 = OFF 1 = ON
6	0x0	WRITE1: Disable writes to secure register 1 0 = OFF 1 = ON
5	0x0	READ0: Disable reads from secure register 0 0 = OFF 1 = ON
4	0x0	WRITE0: Disable writes to secure register 0 0 = OFF 1 = ON
3:2	0x0	NOT_USED: legacy - redundant - not used
1	0x0	READ: Disable reads from all secure registers 0 = OFF 1 = ON
0	0x0	WRITE: Disable writes to all secure registers 0 = OFF 1 = ON

9.2.3 APBDEV_PMC_PMC_SWRST_0

Reset only by the POR cell; sets itself back to inactive after 2 clock cycles. Only used for emergency debugging purposes; not to be used in any functional mode.

Note: Defunct. Kept only for binary code compatibility only. Will not do anything

Register Write which Resets PMC Only

Offset: 0x8 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	RST: Software reset to the PMC only 0 = DISABLE 1 = ENABLE

9.2.4 APBDEV_PMC_WAKE_MASK_0

The APBDEV_PMC_WAKE registers handle wake events whose number is less than or equal to 32. For wake events whose number is greater than 32, refer to the APBDEV_PMC_WAKE2 registers below.

Current pin assignments wake_mask, wake_status, sw_wake_status, and wake levels:

- WAKE_STATUS[0] = ulpi_data4 (wake event 0)
- WAKE_STATUS[1] = gp3_pv[1] (wake event 1)
- WAKE_STATUS[3] = sdmmc3_dat1 (wake event 3)
- WAKE_STATUS[4] = hdmi_int (wake event 4)
- WAKE_STATUS[6] = gp3_pu[5] (wake event 6)
- WAKE_STATUS[7] = gp3_pu[6] (wake event 7)
- WAKE_STATUS[8] = gpio_pc[7] (wake event 8)
- WAKE_STATUS[9] = kb_row10 (wake event 9)
- WAKE_STATUS[10] = sdmmc4_dat1 (wake event 10)
- WAKE_STATUS[11] = gpio_w3_aud (wake event 11)
- WAKE_STATUS[12] = gpio_w2_aud (wake event 12)
- WAKE_STATUS[13] = sdmmc1_dat1 (wake event 13)
- WAKE_STATUS[14] = pe_wake_n (wake event 14)
- WAKE_STATUS[15] = gpio_pj[2] (wake event 15)
- WAKE_STATUS[16] = rtc_irq (wake event 16)
- WAKE_STATUS[17] = kbc_interrupt (wake event 17)
- WAKE_STATUS[18] = pwr_int (wake event 18)
- WAKE_STATUS[19] = usb1_vbus (wake event 19)
- WAKE_STATUS[20] = usb_vbus_wakeup[1] (wake event 20)
- WAKE_STATUS[23] = gpio_pi[5] (wake event 23)
- WAKE_STATUS[24] = gp3_pv[0] (wake event 24)
- WAKE_STATUS[25] = kb_row12 (wake event 25)
- WAKE_STATUS[26] = kb_row13 (wake event 26)
- WAKE_STATUS[27] = kb_row8 (wake event 27)
- WAKE_STATUS[28] = kb_row14 (wake event 28)
- WAKE_STATUS[29] = kb_row15 (wake event 29)
- WAKE_STATUS[30] = dap1_dout (wake event 30)

This register masks which event can cause a wake-up from Deep Sleep mode. It has to be set up before entering Deep Sleep mode. It works in conjunction with the WAKE_LVL register.

Only enabled events at the proper wake_lvl will cause exit from Deep Sleep mode.

PMC Wake-up Event Mask

Offset: 0xc │ Read/Write: R/W │ Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31	0x0	RESET_N: External reset wake enable 0 = DISABLE 1 = ENABLE
30:23	0x0	EVENT_RES: 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
22:19	0x0	USB_EVENT: 0 = ACTIVE_LOW 1 = ACTIVE_HIGH
18	0x0	PWR_INT_N: PWR_INT_N wake enable 0 = DISABLE 1 = ENABLE
17	0x0	KBC: KBC wake enable 0 = DISABLE 1 = ENABLE
16	0x0	RTC: RTC wake enable 0 = DISABLE 1 = ENABLE
15:0	0x0	EVENT: pin 0-15 wake enable 0 = DISABLE 1 = ENABLE

9.2.5 APBDEV_PMC_WAKE_LVL_0

This register sets the active level for the wake event. It will cause an exit from Deep Sleep mode if the input signal level matches the level set in this register and WAKE_MASK is set for the event to 1.

PMC Wake Level

Offset: 0x10 │ Read/Write: R/W │ Reset: 0x7f9fffff (0b01111111100111111111111111111111)

Bit	Reset	Description

15:0	0xffff	EVENT: Pin 0-15 wake level 0 = ACTIVE_LOW 1 = ACTIVE_HIGH

9.2.6 APBDEV_PMC_WAKE_STATUS_0

This register stores the status of the wake events. The event will be set if the level matches and is not masked.

A write will reset the set wake event.

PMC Wake Status

Offset: 0x14 │ Read/Write: R/W │ Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31	0x0	RESET_N: external reset 0 = NOT_SET 1 = SET
30:23	0x0	EVENT_RES: 0 = NOT_SET 1 = SET
22:19	0x0	USB_EVENT: USB wake events 0 = NOT_SET 1 = SET
18	0x0	PWR_INT_N: power interrupt 0 = NOT_SET 1 = SET
17	0x0	KBC: KBC wake 0 = NOT_SET 1 = SET
16	0x0	RTC: RTC wake 0 = NOT_SET 1 = SET
15:0	0x0	EVENT: pin 0-15 wake 0 = NOT_SET 1 = SET

9.2.7 APBDEV_PMC_SW_WAKE_STATUS_0

This register stores status of the wake events. Latching of the events in software wake status is enabled by the PMC_CNTRL register bit LATCHWAKE_EN.

Latching will stop at a 1-to-0 transition on this bit. An event will be set if the level matches. Masking does not affect this register. A write will reset the set wake events.

PMC Software Wake Status

Offset: 0x18 │ Read/Write: R/W │ Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31	0x0	RESET_N: External reset 0 = NOT_SET 1 = SET

Bit	Reset	Description
30:23	0x0	EVENT_RES: 0 = NOT_SET 1 = SET
22:19	0x0	USB_EVENT: USB wake events 0 = NOT_SET 1 = SET

16	0x0	RTC: RTC wake 0 = DISABLE 1 = ENABLE
15:0	0x0	EVENT: Pin 0-15 wake 0 = DISABLE 1 = ENABLE

9.2.8 APBDEV_PMC_DPD_PADS_ORIDE_0

This register enables overriding values from pinmux with values driven by the KBC (keyboard) or the PMC (sys_clk_req, blink).

If a bit is set to 1, the associated I/O will drive the direct value from the KBC or PMC, not the pinmux value. During Deep Sleep mode, the pads with the bit set to 1 will not be in Deep Power Down mode. It will not drive data from mini pad macros stored during sample cycle, but direct data from the KBC or PMC.

Note: This register has to be set before entering Deep Sleep mode.

DPD Pads Override

Offset: 0x1c │ Read/Write: R/W │ Reset: 0x00200000 (0b00000000001000000000000000000000)

0	0x0	KBC_COL0: Override DPD idle state of the gp3_pr[0] pad 0 = DISABLE 1 = ENABLE

9.2.9 APBDEV_PMC_DPD_SAMPLE_0

Setting this register will trigger sampling pads data and direction in which the pad will be driven during Deep Sleep mode.

Before writing to this register, all interfaces going to pads must be set to the ideal "idle" mode, which is expected to be driven by pads when the Tegra K1 chip enters Deep Sleep.

DPS Power Down Sample has to precede Deep Power Down Enable write. The DPD sample should not be deasserted until the transition from Deep Sleep to WB0.

This affects only for MPIO pads.

Note: Only one sample signal exists to perform sampling while entering DPD mode. Thus all interfaces are sampled at the same time. The sequence of multiple DPD groups requires keeping all interfaces (already in DPD mode) in idle.

Deep Power Down Sample

Offset: 0x20 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	ON: Sets the sampling of pads value 0 = DISABLE 1 = ENABLE

9.2.10 APBDEV_PMC_DPD_ENABLE_0

Setting this register will trigger entering Deep Sleep state. It must be preceded by a DPD_SAMPLE write.

Will cause request for shutting down the system clock and the core req power. Puts the PLLs and I/Os in Deep Power Down mode. Will cut off (clamp) all signals going from core power to AO and pads.

If none of the wake-up events is set, only power-on reset can re-enable access to the chip.

After servicing of the wake-up event is completed, the register should be set back to 0 to complete a Deep Sleep cycle.

Deep Power Down Enable

Offset: 0x24 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1	0x0	TSC_MULT_EN: TSC multiplier enable. 0: DISABLE (i.e., counter runs at oscillator clock and increments by 1 every clock cycle). 1: ENABLE (i.e., counter runs at 32 kHz and increments by TSC_MULT_VALUE every clock cycle). 0 = DISABLE 1 = ENABLE
0	0x0	ON: Sets sampling of pads value 0 = DISABLE 1 = ENABLE

9.2.11 APBDEV_PMC_PWRGATE_TIMER_OFF_0

Specifies the number of APB cycles after which the rail line goes off (turns the power to part of power-gated partition). Each rail controls part of the powered partition. This register should be set before the write to Power Gate Toggle. Shared between all power partitions.

Power Gate Timer Off Register

Offset: 0x28 │ Read/Write: R/W │ Reset: 0xedcba987 (0b11101101110010111010100110000111)

Bit	Reset	Description
31:28	0xe	RAIL7: Timer value for rail 7
27:24	0xd	RAIL6: Timer value for rail 6

Bit	Reset	Description
23:20	0xc	RAIL5: Timer value for rail 5

0	X	CRAIL: Clamp status of CPU Rail 0 = DISABLE 1 = ENABLE

9.2.13 APBDEV_PMC_PWRGATE_TOGGLE_0

Write to this register will turn power on/off to the specified power-gated partition. Only one partition is turned on/off at a time.

PWRGATE_STATUS should be read to determine the state of the partition before writing to this register.

Turning the partition off will cause automatic clamping of all signals generated by the power-gated partition being turned off. Before the partition is turned off, all clocks to the partition should be stopped, and the reset to the partition should be asserted.

Turning the partition on will not remove clamping. Clamping is removed only after a REMOVE_CLAMPING_CMD write.

The user must allow a minimum 20 APB clock cycles between consecutive partition Power-Gate Toggle requests.

The role of the START bit has changed from prior Tegra devices. The START bit is cleared by hardware when the PMC accepts the request to power-gate or unpower-gate the partition. So in order to power-gate/unpower-gate a partition, software needs to do the following:

- Check to see if the partition is already in the correct state, by looking at the PWRGATE_STATUS register.
- If the partition is not in the correct state, software reads the PWRGATE_TOGGLE register to see if the START bit is 0.
- If the START bit is not 0, software polls until the start bit is set to 0.

- Then program the PWRGATE_TOGGLE register with the START bit set to 1 and choose the required partition to be power-gated.
- Ideally, software can poll to check the START bit going back to 0, which indicates that the PMC has accepted the request, and then poll the STATUS register to make sure the required partition is power-gated/unpower-gated.

Power Gate Toggle

Offset: 0x30 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0xxx00000)

Bit	Reset	Description
8	0x0	START: Start power down/up 0 = DISABLE 1 = ENABLE

9.2.14 APBDEV_PMC_REMOVE_CLAMPING_CMD_0

This is a bitmap with one bit per power partition controller by the PMC.

When written to 1b, the PMC removes the clamp signals to the corresponding partition. If the partition is not powered on, the register write will be ignored.

The bit is automatically reset to 0b when the clamping has been removed. Software is responsible for writing to this register at the correct time, that is, when the clocks are started but the blocks in that partition are still held in reset.

Remove Clamping

Offset: 0x34 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxx00000000000x0000000000000)

9.2.16 APBDEV_PMC_PWRGOOD_TIMER_0

This register programs the length of the wake-up reset, asserted after wake-up from Deep Sleep. This register should be set before entering Deep Sleep mode.

Programmed values depend on the properties of the PMIC.

Timer value x 30.51 µs = reset pulse length

Power Good Timer

Offset: 0x3c │ Read/Write: R/W │ Reset: 0x003f007f (0bxxxxxxxx00111111000000001111111)

Bit	Reset	Description
23:16	0x3f	OSC_PREPWR: OSC clock stabilization timer prior to SoC rail pwr-req assertion. The timer value is 4*OSC_PREPWR+1 number of 32.768 kHz clock cycles; that is, the timer value is (OSC_PREPWR*122.07)+30.518 µs.
15:8	0x0	OSC_POSTPWR: OSC clock stabilization timer after SoC rail power is stabilized. The timer value is 4*OSC_POSTPWR+1 number of 32.768 kHz clock cycles; that is, the timer value is (OSC_POSTPWR*122.07)+30.518 µs.
7:0	0x7f	PWRGOOD: SoC rail power-on stabilization timer.The timer value is PWRGOOD+1 number of 32.768 kHz clock cycles; that is, the timer value is (PWRGOOD*30.52)+30.518 µs.

9.2.17 APBDEV_PMC_BLINK_TIMER_0

Will output value to pad only if the PMC Control register has BLINK_EN set and DPD_PADS_ORIDE has blink bit set.

Setting bit 15 to 1 will output 32 kHz clock (the registers above still have to be set)

- On time DATA_ON << 2 x 30.51 µs
- Off time DATA_OFF << 2 x 30.51 µs.

Blinker Timer for External Blinker

Offset: 0x40 │ Read/Write: R/W │ Reset: 0xffffffff (0b11111111111111111111111111111111)

Bit	Reset	Description
31:16	0xffff	DATA_OFF: Time off
15	0x1	FORCE_BLINK: if 0 32 kHz clock
14:0	0x7fff	DATA_ON: Time on

9.2.18 APBDEV_PMC_NO_IOPOWER_0

IMPORTANT: Before an I/O power rail is turned off, ramping up, or no longer used and ready to turn off, the corresponding bit in this register should be set to 1. The bit only needs to be turned on when the I/O power rail is stable and you are ready to enable some interface on the I/O power rail.

No I/O Power Register

Offset: 0x44 │ Read/Write: R/W │ Reset: 0x00010080 (0bxxxxxxxxxxxxxxx010000000x1x000000)

9.2.19 APBDEV_PMC_PWR_DET_0

Active high, sets power detection for nine power rails only. - MIPI does not have power detect.

The proper sequence for turning on power detects:

- Write 1 to PWR_DET register for fields requiring power detect
- Allow for 3 µs delay (in APB clock cycles)
- Write 1 to PWR_DET_LATCH

For turning PWR_DET off:

- Write 0 to PWR_DET_LATCH
- No delay is necessary
- Write 0 to PWR_DET

Power Detect

Offset: 0x48 │ Read/Write: R/W │ Reset: 0x0002bc2f (0bxxxxxxxxxxxxxxx1x1x1111xxxx1x1111)

9.2.51 APBDEV_PMC_CPUPWRGOOD_TIMER_0

CPU Power Good Timer

The behavior for the DATA timers 0 to 2 is the same (i.e., 2 cycles of delay).

This timer runs on the APB clock.

It should also be used to mask OC during CPU rail power up when OC is multiplexed to the PG pin using APBDEV_PMC_CNTRL_0_CPUPWRGOOD_EN based on how long the PMIC drives PG on this signal.

Offset: 0xc8 │ Read/Write: R/W │ Reset: 0x0000ffff (0b00000000000000001111111111111111)

Bit	Reset	Description
31:0	0xffff	DATA: Timer data

9.2.52 APBDEV_PMC_CPUPWROFF_TIMER_0

CPU Power Off Timer

Used for On-to-Off transitions.

This timer runs on the APB clock

It should also be used to mask OC during CPU rail power down when OC is multiplexed to the PG pin using APBDEV_PMC_CNTRL_0_CPUPWRGOOD_EN based on how long the PMIC keeps PG low.

Note: This timer must always have a non-zero value.

Offset: 0xcc │ Read/Write: R/W │ Reset: 0x0000ffff (0b00000000000000001111111111111111)

Bit	Reset	Description

9.2.59 APBDEV_PMC_DDR_PWR_0

This register is used to program the "E_18V" pin of the DDR pads.

Offset: 0xe8 │ Read/Write: R/W │ Reset: 0x00000003 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx11)

Bit	Reset	Description
1	0x1	EMMC: GMI pins 0 = E_12V 1 = E_18V
0	0x1	VAL: DVI pins 0 = E_12V 1 = E_18V

9.2.60 APBDEV_PMC_USB_DEBOUNCE_DEL_0

Determines number of 32 kHz clock cycles to debounce USB signal events.

Note: The programmed debounce values must be greater than 1.

Reset values are for Cold Hardware Reset only.

Offset: 0xec │ Read/Write: R/W │ Reset: 0x00000002 (0bxxxxxxxx00000000000000000000010)

Bit	Reset	Description
23:20	0x0	UHSIC_LINE_DEB_CNT: Number of 32 kHz debounce cycles for UHSIC port 0
19:16	0x0	UTMIP_LINE_DEB_CNT: Number of 32 kHz debounce cycles for UTMIP port 0
15:0	0x2	VAL: Debounce period for ID and VBUS events on all USB ports. The programmed value must be greater than 1.

9.2.61 APBDEV_PMC_USB_AO_0

Power downs for various USB features controlled by the PMC.

Each UTMIP has the following power downs for features that can lead to wake-up events.

- USBOP_VAL_PD: Power down for D+ value detector (I/O pad)
- USBON_VAL_PD: Power down for D- value detector (I/O pad)
- ID_PD: Power down for ID detector (bias pad)
- VBUS_WAKEUP_PD: Power down for VBUS detector (bias pad)

Each UHSIC port has the following power downs for features that can lead to wake-up events:

- STROBE_VAL_PD: Power down for STROBE VALUE detector
- DATA_VAL_PD: Power down for DATA VALUE detector

Note: These HSIC pins have not been added to the pad yet.

Line Debounce Periods for UTMIP and HSIC PORTS

9.2.62 APBDEV_PMC_CRYPTO_OP_0

A complete solution requires a "semi-sticky" bit in the always-on domain. The Boot ROM would clear this semi-sticky bit for cold boots, but use its value to propagate the crypto-disable flag across LP0. (The Boot ROM always requires crypto functionality, so a pure hardware solution probably isn't reasonable.)

The Boot ROM would be able to clear (to zero) and read the sticky bit, but outside the Boot ROM users would only be able to set (to one) and read the sticky bit. On cold boot, the Boot ROM would always clear the stick bit. On WB0, the Boot ROM would read the sticky bit and copy it's setting to the crypto disable flag.

Crypto Engine Disable Sticky Bit

Offset: 0xf4 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx1)

Bit	Reset	Description
0	0x1	VAL: Disabled by default 0 = ENABLE 1 = DISABLE

9.2.63 APBDEV_PMC_PLLP_WB0_OVERRIDE_0

Master control for all WB0 PLL overrides.

Offset: 0xf8 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx0000000000000)

Bit	Reset	Description
12	0x0	PLLM_ENABLE: 1 = enable PLLM, 0 = disable PLLM

Bit	Reset	Description
1	0x0	BREAD: disable read from bondout secure registers 0 = OFF 1 = ON
0	0x0	BWRITE: disable write to bondout secure registers 0 = OFF 1 = ON

9.2.88 APBDEV_PMC_GATE_0

This register is used for software controlled synchronization between APB domain and the 32 kHz domain. Software is expected to set the GAKE_WAKE/GATE_DBNS field high to cut the 32 kHz gated clock before updating WAKE_LVL, AUTO_WAKE_LVL, WAKE_MASK and USB_DEBOUNCE_DEL registers. After these registers have been written the GATE_WAKE/GATE_DBNS bit should be written back to '0' to enable the 32 kHz gated clock.

This gates the 32 kHz clock to just the flops that store the above fields.

Offset: 0x15c │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	GATE_WAKE: 0 = OFF 1 = ON

Bit	Reset	Description
0	0x0	GATE_DBNS: 0 = OFF 1 = ON

9.2.89 APBDEV_PMC_WAKE2_MASK_0

Auto-wake is not present for wake2 events in Tegra K1 devices.

The APBDEV_PMC_WAKE2 registers handle wake events whose number exceeds 32. For wake events whose number is less than or equal to 32, refer to the APBDEV_PMC_WAKE registers above.

Wake2 alignments for masks, level, and status:

- WAKE2_*[0] = ulpi_data3 (wake event 32)
- WAKE2_*[1] = gpio_pj[0] (wake event 33)
- WAKE2_*[2] = gpio_pk[2] (wake event 34)
- WAKE2_*[3] = gpio_pi[6] (wake event 35)
- WAKE2_*[7]= utmip0_line_wakup_event (wake event 39)
- WAKE2_*[8]= utmip1_line_wakup_event (wake event 40)
- WAKE2_*[9]= utmip2_line_wakup_event (wake event 41)

4:0	0x0	EVENT: 0 = DISABLE 1 = ENABLE

9.2.90 APBDEV_PMC_WAKE2_LVL_0

This register sets the active level for a wake event. It causes an exit from the Deep Sleep state if the input signal level matches the level set in this register and if WAKE2_MASK is set for the event to 1. A level is not needed for 4 line wakeup events; the level is always 1.

Set the following PMC register bits to '1' to set the wake signal active level to 'HIGH':

- APBDEV_PMC_WAKE2_LVL_0[5] for VBUS wakeup
- APBDEV_PMC_WAKE2_LVL_0[6] for ID wakeup
- APBDEV_PMC_WAKE2_LVL_0[7] for USB2.0 port 0 wakeup
- APBDEV_PMC_WAKE2_LVL_0[8] for USB2.0 port 1 wakeup
- APBDEV_PMC_WAKE2_LVL_0[9] for USB2.0 port 2 wakeup
- APBDEV_PMC_WAKE2_LVL_0[10] for HSIC port 0 wakeup
- APBDEV_PMC_WAKE2_LVL_0[11] for HSIC port 1 wakeup
- APBDEV_PMC_WAKE2_LVL_0[26] for USB3.0 ports wakeup

PMC Wake Level

4:0	0x0	EVENT: Pin 0-2 wake enable 0 = NOT_SET 1 = SET

9.2.92 APBDEV_PMC_SW_WAKE2_STATUS_0

This register stores the status of the wake events. Latching of the events in software wake status is enabled by the PMC_CNTRL register bit LATCHWAKE_EN. Latching will stop at a 1-to-0 transition on this bit.

An event is set if the level matches. Masking does not affect this register. Writes will reset the set wake events.

PMC Software Wake Status

Offset: 0x16c │Read/Write: R/W │ Reset: 0x00000000 (0bxxx00000000000000000000000000000)

Bit	Reset	Description
0	0x0	EN: when set to 1, sets the EDPD to PCX (PLL toggle) 0 = OFF 1 = ON

9.2.106 APBDEV_PMC_OSC_EDPD_OVER_0

This register can be programmed to keep the oscillator ON during LP0 mode. It cuts the latency time on LP0 wake if the oscillator pad does not have to be restarted.

When the oscillator pad is on, during LP0 mode, DSPARE, duty, strength, and bypass are controlled by the fields below.

The oscillator can be in one in four modes during LP0 - in DPD, not in DPD but not enabled, running, or running only when an external request is active.

Offset: 0x1a4 | Read/Write: R/W | Reset: 0x0000007e (0bxxxxxxxx00000000000000001111110)

Bit	Reset	Description
23	0x0	CLK_OK: Crystal oscillator clk_ok signal 0 = DISABLE 1 = ENABLE
22	0x0	OSC_CTRL_SELECT: select whether the CAR's OSC_CTRL or the PMC's OSC_CTRL_OVER affects the oscillator cell. This bit should always be "1" in LP0. 0 = CAR 1 = PMC
21:20	0x0	XO_LP0_MODE: control the behavior of the oscillator during LP0 (assuming OSC_CTRL_SELECT is set to PMC during LP0). Put the oscillator in DPD mode during LP0, bypass DPD, but do not enable the oscillator during LP0, force the oscillator to run during LP0, or run the oscillator when requested by an external clock request pin 0 = DPD. 1 = OFF

Bit	Reset	Description
		2 = ON 3 = EXT_REQ
19:12	0x0	OSCFI_SPARE: Crystal oscillator spare register control.
11:7	0x0	XODS: Crystal oscillator duty cycle control.
6:1	0x3f	XOFS: Crystal oscillator drive strength control.
0	0x0	XOBP: Crystal oscillator bypass enable (1 = enable bypass).

9.2.107 APBDEV_PMC_CLK_OUT_CNTRL_0

This register controls 3 clock outputs of the Tegra K1 chip. Each of the clock outputs can be in 1 of 4 modes: not running, running when request is active high, running when request is active low, or always running. The clock output when not running can be tristated, high, or low.

The clock source might be from the CAR unit (not available when in LP0 mode), osc, osc_div2, or osc_div4.

The clock source switching on dap_mclk1_out , clk3_out and clk2_out is not glitch free. If dpd_override is not set before entering LP0, the selected clock source will get latched to "0" or "1" in LP0 (which is not glitch free).dpd_override can be "0" only when external device does not need clock in LP0, and it should be in reset before PMC_SAMPLE bit is written by LP0 entry code.

The clock source should only be switched when the pad output is not being used by an external device.

When an external device requests for a clock, the first few clocks should not be used by the external device.

Offset: 0x1a8 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxx00000000000000000000000)

0	0x1	PADPLL_IDDQ_SWCTL: Defunct. 0: The SATA pad PLL is put in IDDQ mode by hardware (SATA +AFI+CAR) signals.1: The SATA pad PLL is put in IDDQ mode by software (default) 0 = OFF 1 = ON

9.2.109 APBDEV_PMC_SENSOR_CTRL_0

For sensor shutdown and control.

The sensor control register defines chip behavior when a sensor request is triggered. It can power-gate down all CPUs if enabled. It can trigger a reset (will cause a CPU power request to go down and power-gates down all CPUs)

IMPORTANT-- to preserve RAM content, any reads/writes to scratch registers will be blocked after a sensor triggered reset.

Software must reset BLOCK_SCRATCH_WRITE to enable writes to scratch registers.

Offset: 0x1b0 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000)

Bit	Reset	Description
2	0x0	BLOCK_SCRATCH_WRITE: Reset by user, set by the PMC when entering sensor reset 0 = OFF 1 = ON
1	0x0	ENABLE_RST: Enables reset on sensor going up. 0 = OFF 1 = ON
0	0x0	ENABLE_PG: Power gates CPUs on temperature sensor going up. 0 = OFF 1 = ON

9.2.110 APBDEV_PMC_RST_STATUS_0

Simplified Reset and Reset Source

Offset: 0x1b4 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000)

Bit	Reset	Description
2:0	0x0	RST_SOURCE: Source of reset 0 = POR 1 = WATCHDOG 2 = SENSOR 3 = SW_MAIN 4 = LP0

9.2.111 APBDEV_PMC_IO_DPD_REQ_0

Puts I/O rails in or out of DPD mode, even though the chip is not in LP0. Multiple bits are allowed to be set at the same time. No new operation will be triggered until previous one completes. Consecutive operations issued by completion time of first one will be dropped. The register is still updated.

Setting IO_DPD_REQ should be preceded by writing to the DPD_SAMPLE registers (to enable a snapshot of data to be driven) and the SEL_DPD_TIM register. SEL_DPD_TIM is set to a safe value, but it can be lowered if SYS clock is slower (a minimum of 200 ns is required).

Note: Only one sample signal exists to perform sampling while entering DPD mode. Thus all interfaces are sampled at the same time. The sequence of multiple DPD groups requires keeping all interfaces (already in DPD mode) in idle.

DPD Request

Offset: 0x1b8 | Read/Write: R/W | Reset: 0x00000000 (0b0000000000000x000000000xx0000000)

9.2.118 APBDEV_PMC_PLLM_WB0_OVERRIDE_FREQ_0

PLL WB Override Registers to Accelerate Warm Boot Time

Offset: 0x1dc │ Read/Write: R/W │ Reset: 0x0000010c (0bxxxxxxxxxxxxxxxx0000000100001100)

Bit	Reset	Description
15:8	0x1	PLLM_DIVN: PLL feedback divider.
7:0	0xc	PLLM_DIVM: PLL input divider.

9.2.119 APBDEV_PMC_TEST_PWRGATE_0

Force Test Power Gate Override Off/On

Offset: 0x1e0 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4	0x0	RESET_DEBUG: used for debug, assertion of reset will be disabled, if this bit is set 0 = OFF 1 = ON
3	0x0	DPD_ENABLE_DEBUG: used for debug, assertion of dpd_enable will be disabled if this bit is set 0 = OFF 1 = ON
2	0x0	MAIN_CLAMP_DEBUG: used for debug, assertion of main clamp will be disabled if this bit is set 0 = OFF 1 = ON
1:0	0x0	OP: FORCE_ON - force power gated partition to be powered, FORCE_OFF - force power gating partition to be powered down 0 = NONE 1 = FORCE_ON 2 = FORCE_OFF

9.2.120 APBDEV_PMC_PWRGATE_TIMER_MULT_0

The time for each rail set by PWRGATE_TIMER_OFF will be multiplied by MULT for power-gating up/down any power-gated region except CPU. In the CPU power-gated case, MULT_CPU will be used with PWRGATE_TIMER_CE* registers value. All timers are in sys_clk units.

Offset: 0x1e4 │ Read/Write: R/W │ Reset: 0x0000001b (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx011011)

Bit	Reset	Description
5:3	0x3	MULT_CPU: 0 = ONE 1 = TWO 2 = FOUR 3 = EIGHT 4 = SIXTEEN
2:0	0x3	MULT: 0 = ONE 1 = TWO 2 = FOUR 3 = EIGHT 4 = SIXTEEN

9.2.121 APBDEV_PMC_DSI_SEL_DPD_0

Register to control sel_dpd for the DSI pad. Allows driving LP0 value on the DSI pad beyond LP0 exit. This enables the DSI to be programmed properly at LP0 exit while the LP0 value is still driven by the brick pad.

Offset: 0x1e8 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3	0x0	SET_DSID: 0 = OFF 1 = ON
2	0x0	SET_DSIC: 0 = OFF 1 = ON
1	0x0	SET_DSIB: 0 = OFF 1 = ON
0	0x0	SET_DSIA: 0 = OFF 1 = ON

9.2.122 APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0

PMC trigger events for the UTMIP ports as well as the UHSIC port. Sleep walk clearing returns the walk pointer to 00, the first entry in a USB line walk. This is the only way to return a pointer to 0.

Pad configuration captures a set of FLLS parameters prior to resting the port so their value can be retained in deep sleep.

The trigger should only happen on the fields that are set to TRIG (1) when writing. The returned read value should always be all NULL fields.

The FORCE_WALK bits trigger a SLEEP.

Any value read back should be 0.

Triggers for USB Ports

Offset: 0x1ec │ Read/Write: R/W │ Reset: 0x0000XXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
15	X	UHSIC_CLR_WAKE_ALARM_P0: Clear wake event for UHSIC port 0 0 = NULL 1 = TRIG
14	X	UTMIP_CLR_WAKE_ALARM_P2: Clear wake event for UTMIP port 2 0 = NULL 1 = TRIG

9.2.123 APBDEV_PMC_UTMIP_UHSIC_SAVED_STATE_0

Save some critical information about USB port prior to entering DPD in a suspend state.

SPEED:

- HS - Suspend DPD was entered from a high speed mode, restore high speed at DPD exit
- FS - Suspend DPD was entered from a full speed mode, restore full speed at DPD exit
- LS - Suspend DPD was entered from a low speed mode, restore low speed at DPD exit
- RST - Reset Port, Hardware reset or DPD was not entered suspended bus, Reset and Re-enumerate port

SCRATCH -- save other critical information about the port, software choice.

Reset value should read 0x0F0F0F0F, reset should occur on Cold Hardware Reset only

Saved DPD State for all UTMIP and UHSIC Ports

Offset: 0x1f0 │ Read/Write: R/W │ Reset: 0x0f0f0f0f (0b00001111000011110000111100001111)

1:0	X	LS_RSLEW_P0: I/O pad LS_RSLEW1..0 for UTMIP P0

9.2.125 APBDEV_PMC_UTMIP_TERM_PAD_CFG_0

Set of termination configuration values for USB I/O pads under DPD mode. These configuration values are programmed, not captured, at a time prior to entering DPD. Capturing them would be complex because it would require costly synchronizers as well as some logic. The range for RCTRL and TCTRL is 0 to 16.

These values need to be converted to a thermal encoding (only one 0 to 1 transition allowed in the word from MSB to LSB). For example:

0 - 0000_0000_0000_0000

1 - 0000_0000_0000_0001

2 - 0000_0000_0000_0011

...

15 - 0111_1111_1111_1111

16 - 1111_1111_1111_1111

I/O Termination Configuration for all UTMIP Ports

Offset: 0x1f8 │ Read/Write: R/W │ Reset: 0x00000108 (0bxxxxxxxxxxxxxxxxxxxxxxxx0100001000)

Bit	Reset	Description
9:5	0x8	TCTRL_VAL: HS termination calibration value, range 0 to 16
4:0	0x8	RCTRL_VAL: 1.5kOhm pull up calibration value, range 0 to 16

9.2.126 APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0

Register that configures the value of the line that could cause a wake-up event.

- ANY -- signifies any line change DM EDGE or DP EDGE for UTMIP.
- NONE -- signifies no wakeup possible.

One can use the two most significant bits (3:2) of the WAKE_VAL to 4x1 select whether:

- 00: Check both bits for value on two LSB (1:0).
- 01: Check bit DM (or strobe for HSIC) against bit 0

- 10: Check bit DP (or DATA for HSIC) against bit 1
- 11: Check for edge on DP against bit 1, edge on DM against bit 0

Sleep Walk Sequence Enables

9.2.128 APBDEV_PMC_UTMIP_SLEEPWALK_P0_0

These registers hold the sequence of control values to the UTMIP pads on the four consecutive cycles of a walk. The pad pins that are controlled are:

- MASTER_USBOP_RPD
- MASTER_USBON_RPD
- MASTER_USBOP_RPU
- MASTER_USBON_RPU
- MASTER_AP
- MASTER_AN
- MASTER_HIGHZ

For the walk to take effect at the pad, the MASTER_ENABLE pin must be set high in the config register. Otherwise the pad will ignore the values.

If no walk is enabled or forced, then the walk pointer remains stuck on phase A. The walk pointer should use a 2 bit Gray code so that Phase A is 00, Phase B is 01, Phase C is 11, and Phase D is 10. Once Phase D is reached, only a reset of the phase pointer can bring it back to Phase A.

Four phases should be sufficient to handle most wake-up events.

9.2.131 APBDEV_PMC_UHSIC_SLEEPWALK_P0_0

These registers hold the sequence of control values to the UTMIP pads on the four consecutive cycles of a walk. The pad pins that are controlled are:

- STROBE_RPD
- DATA_RPD
- STROBE_RPU
- DATA_RPU

At this time there are no STROBE, DATA ports that should be driven by the host. So these outputs from the module should be left unconnected until a time that departure may be implemented.

Signaling Sequence for UHSIC Port 0 Wakeup

Offset: 0x210 │ Read/Write: R/W │ Reset: 0x06060606 (0b00000110000001100000011000000110)

9.2.133 APBDEV_PMC_UTMIP_UHSIC_FAKE_0

Instead of using the pad value for USBOP_VAL, USBON_VAL, STROBE_VAL, DATA_VAL, VBUS_WAKEUP, ID from the UTMIP and HSIC pads, force a 2x1 mux at the input of the PMC pad macro when fake values are enabled. This could the useful feature of putting a line at rest when needed. It also has important debug merits. This mux should be placed in front of the NP synchronizer for these signals (saved power on the synchronizer). This will have to be waived in our sync checks.

Fake the Line Value for the PMC Pad Macro

Offset: 0x218 │ Read/Write: R/W │ Reset: 0x01111111 (0bxxxx00010001000100010001000100010001)

31:0	0x0	ECO2: Reserved.

9.2.154 APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0

Offset: 0x26c | Read/Write: R/W | Reset: 0x0000000f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx1111)

Bit	Reset	Description
3	0x1	UHSIC_LINE_WAKEUP_EN_P0: enables latching line wakeup event on UHSIC p0
2	0x1	UTMIP_LINE_WAKEUP_EN_P2: enables latching line wakeup event on UTMIP p2
1	0x1	UTMIP_LINE_WAKEUP_EN_P1: enables latching line wakeup event on UTMIP p1
0	0x1	UTMIP_LINE_WAKEUP_EN_P0: enables latching line wakeup event on UTMIP p0

9.2.155 APBDEV_PMC_UTMIP_BIAS_MASTER_CNTRL_0

Offset: 0x270 | Read/Write: R/W | Reset: 0x0000000d (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx1101)

Bit	Reset	Description
3	0x1	UTMIP_BIAS_MASTER_AWAKE_AND: When not PROGRAMMABLE and E_DPD=0, AND the MASTER_ENABLE of all IO ports for bias cell. If not AND or OR, force to 0.
2	0x1	UTMIP_BIAS_MASTER_AWAKE_OR: When not PROGRAMMABLE and E_DPD=0, OR the MASTER_ENABLE of all IO ports for bias cell
1	0x0	UTMIP_BIAS_MASTER_PROG_VAL: When PROGRAMMABLE, this is the value to program too
0	0x1	UTMIP_BIAS_MASTER_PROG_CTRL: MASTER_ENABLE pin uses a programmable value on BIAS pad, at all times

9.2.156 APBDEV_PMC_UTMIP_MASTER_CONFIG_0

MASTER_CONFIG selects the MASTER function's mode of operation, in this case:

- 0 for 500 µA usage
- 1 for smaller current usage when driving.

Offset: 0x274 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3	0x0	UHSIC_PWR_P0: enables UHSIC p0 low power mode
2	0x0	UTMIP_PWR_P2: enables UTMIP p2 low power mode
1	0x0	UTMIP_PWR_P1: enables UTMIP p1 low power mode
0	0x0	UTMIP_PWR_P0: enables UTMIP p0 low power mode

9.2.157 APBDEV_PMC_TD_PWRGATE_INTER_PART_TIMER_0

TD Power-Gating Timing Between Partition Power-Gating

Offset: 0x278 │ Read/Write: R/W │ Reset: 0x0000000f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx1111)

Bit	Reset	Description
3:0	0xf	DATA: timing between consecutive partitions

9.2.158 APBDEV_PMC_UTMIP_UHSIC2_TRIGGERS_0

PMC trigger events for the UTMIP ports as well as the UHSIC port. Sleep walk clearing returns the walk pointer to 00, the first entry in a USB line walk. This is the only way to return a pointer to 0.

Pad configuration capture a set of FLLS parameters prior to resting the port so their value can be retained in deep sleep.

The trigger should only happen on the fields that are set to TRIG (1) when writing. Returned read value should always be all NULL fields. The FORCE_WALK bits trigger a SLEEP

This does not need to be a real register, so it should not consume much area. Any value read back should be 0.

Triggers for USB Ports

Offset: 0x27c │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
3	X	UHSIC_CLR_WAKE_ALARM_P1: Clear wake event for UHSIC port 0 0 = NULL 1 = TRIG
2	X	UHSIC_FORCE_WALK_P1: Force pointer walk for UHSIC port 0 0 = NULL 1 = TRIG
1	X	UHSIC_RESERVED_P1: Reserved for UHSIC port 0 0 = NULL 1 = TRIG
0	X	UHSIC_CLR_WALK_PTR_P1: Clear sleep walk pointer for UHSIC port 1 0 = NULL 1 = TRIG

9.2.159 APBDEV_PMC_UTMIP_UHSIC2_SAVED_STATE_0

Save some critical information about USB port prior to entering DPD in a suspend state.

SPEED

- HS: Suspend DPD was entered from a high speed mode, restore high speed at DPD exit
- FS: Suspend DPD was entered from a full speed mode, restore full speed at DPD exit
- LS: Suspend DPD was entered from a low speed mode, restore low speed at DPD exit
- RST: Reset Port, Hardware reset or DPD was not entered suspended bus, Reset and Re-enumerate port

SCRATCH -- Save other critical information about the port, software choice. Reset value should read 0x0F0F0F0F, reset should occur on Cold Hardware Reset only

Saved DPD State for all UTMIP and UHSIC Ports

Offset: 0x280 │ Read/Write: R/W │ Reset: 0x00000007 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00000111)

Bit	Reset	Description
7	0x0	UHSIC_WAKE_EX_P1: Wake up on anything except a particular line value 0 = OFF 1 = ON
6	0x0	UHSIC_IGNORE_MASTER_CFG_P1
5:1	0x3	UHSIC_SCRATCH_P1
0	0x1	UHSIC_MODE_P1: UHSIC Speed prior to DPD 0 = HS 1 = RST

9.2.160 APBDEV_PMC_UTMIP_UHSIC2_SLEEP_CFG_0

This register configures the value of the line that could cause a wake-up event.

- ANY: signifies any line change DM EDGE or DP EDGE for UTMIP.
- NONE: signifies no wake-up possible.

One can use the two most significant bits (3:2) of the WAKE_VAL to 4x1 select whether:

- 00: Check both bits for value on two LSB (1:0).
- 01: Check bit DM (or strobe for HSIC) against bit 0
- 10: Check bit DP (or DATA for HSIC) against bit 1
- 11: Check for edge on DP against bit 1, edge on DM against bit 0

Sleep Walk Sequence Enables

Offset: 0x284 │ Read/Write: R/W │ Reset: 0x000000c0 (0bxxxxxxxxxxxxxxxxxxxxxxxx11000000)

Bit	Reset	Description
7:4	0xc	UHSIC_WAKE_VAL_P1: Line Value Wake Up Condition on UHSIC P1 0 = SD00 1 = SD01 2 = SD10 3 = SD11 4 = S0 5 = S1 8 = D0 10 = D1 12 = NONE

Bit	Reset	Description
		13 = SEDGE 14 = DEDGE 15 = ANY
3:1	0x0	UHSIC_RESERVED_P1: Reserved for later use for UHSIC P1
0	0x0	UHSIC_MASTER_ENABLE_P1: Enable use of master pins on UHSIC P1

9.2.161 APBDEV_PMC_UTMIP_UHSIC2_SLEEPWALK_CFG_0

This register determines when sleep walking should take effect: upon a specific GPIO event, on any wake event, or on a line value change.

Note that it is also possible to force a sleep walk: see register UTMIP_UHSIC_TRIGGERS to force the event.

Sleep Walk Sequence Enables

Offset: 0x288 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7	0x0	UHSIC_LINEVAL_WALK_EN_P1: Perform walk on USB line value wake up for UHSIC P1
6	0x0	UHSIC_WAKE_WALK_EN_P1: Perform walk on any chip wake up event for UHSIC P1
5	0x0	UHSIC_GPIO_WALK_EN_P1: Perform walk on associated GPIO event for UHSIC P1
4:0	0x0	UHSIC_DESIGNATED_GPIO_P1: GPIO Number associated with UHSIC P1

9.2.162 APBDEV_PMC_UHSIC2_SLEEPWALK_P1_0

This register holds the sequence of control values to the UTMIP pads on the four consecutive cycles of a walk. The pad pins that are controlled are:

- STROBE_RPD
- DATA_RPD
- STROBE_RPU
- DATA_RPU

At this time there are no STROBE, DATA ports that should be driven by the host. So these outputs from the module should be left dangling (unconnected) until a time that feature may be implemented.

Signaling Sequence for UHSIC Port 0 Wakeup

Offset: 0x28c │ Read/Write: R/W │ Reset: 0x06060606 (0b00000110000001100000011000000110)

0	0x0	UHSIC_STROBE_RPD_A: Phase A Pull Down on STROBE Line

9.2.163 APBDEV_PMC_UTMIP_UHSIC2_STATUS_0

Read-only register that provides current walk pointer information as well as the line value.

Status of UTMIP UHSIC Wakeup Circuitry

Offset: 0x290 │ Read/Write: RO │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
4	X	UHSIC_WAKE_ALARM_P1: A wake event occurred on UHSIC port 1
3	X	DATA_VAL_P1: Value of DATA line detector for UHSIC port 1
2	X	STROBE_VAL_P1: Value of STROBE line detector for UHSIC port 1
1:0	X	UHSIC_WALK_PTR_P1: Walk pointer for UHSIC port 0

9.2.164 APBDEV_PMC_UTMIP_UHSIC2_FAKE_0

Instead of using the pad value for USBOP_VAL, USBON_VAL, STROBE_VAL, DATA_VAL, VBUS_WAKEUP, ID from the UTMIP and HSIC pads, force a 2x1 mux at the input of the PMC pad macro when fake values are enabled. This could the useful feature of putting a line at rest when needed. It also has important debug merits. This mux should be placed in front of the NP synchronizer for these signals (saved power on the synchronizer). This will have to be waived in our sync checks.

Fake the Line Value for the PMC Pad Macro

Offset: 0x294 │ Read/Write: R/W │ Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0001)

Bit	Reset	Description
3	0x0	UHSIC_FAKE_DATA_EN_P1: Enable the fake line value for DATA for the PMC pad macro for UHSIC P0
2	0x0	UHSIC_FAKE_STROBE_EN_P1: Enable the fake line value for STROBE for the PMC pad macro for UHSIC P0
1	0x0	UHSIC_FAKE_DATA_VAL_P1: Fake line value for DATA for the PMC pad macro for UHSIC P0
0	0x1	UHSIC_FAKE_STROBE_VAL_P1: Fake line value for STROBE for the PMC pad macro for UHSIC P0

2	0x1	CE2:CE2 VVDD partition sensing override.

Bit	Reset	Description
1	0x1	CE1:CE1 VVDD partition sensing override.
0	0x1	CE0:CE0 VVDD partition sensing override.

9.2.174 APBDEV_PMC_GLB_AMAP_CFG_0

This register configures some of the address apertures (in CCPLEX-AXD) to be MMIO or DRAM. Each bit is used to configurable one of the address aperture. For each bit 0=>MMIO and 1=>DRAM.

By default, all configurable apertures are MMIO address space. But they can be configured (at boot time) to be DRAM by programming this register. This register can be write-disabled (by the PMC_SEC_DISABLE register). The bits of this register are used as follows.

GLB_AMAP_CFG

Offset: 0x2bc │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxx00000000000000000)

Bit	Reset	Description

9.2.213 APBDEV_PMC_STRAPPING_OPT_A_0

Strapping Options Register

Offset: 0x464 | Read/Write: R/W | Reset: 0xXXX000X0 (0bxxxxxxxxxxxxxxxxxxxxxxx00xxxxxxx0)

Bit	Reset	Description
29:26	X	BOOT_SELECT: read at power-on reset time from gmi_ad[3:0] strap pads.

Bit	Reset	Description
		0 = MPCORE_G 1 = MPCORE_LP
25	X	BOOT_SRC_USB_RECOVERY_MODE: read at power-on reset time from gmi_oe_n strap pad 0 = DISABLED 1 = ENABLED
24	X	BOOT_SRC_NOR_BOOT: read at power-on reset time from gmi_wr_n strap pad 0 = IROM 1 = NOR
23:22	X	ARM_JTAG: read at power-on reset time from gmi_ad[19:18] strap pads 00=Serial_JTAG 01=CPU_only 10=COP_only 11=Serial_JTAG(same as 00 case) 0 = SERIAL 1 = CPU 2 = COP 3 = SERIAL_ALT
9	0x0	BOOT_FAST_UART: UART Boot speed from TMC JTAG config bit 0=57600 baud 1=Osc Frequency (1 bit per OSC clock) 0 = SLOW 1 = FAST
8	RSVD1	MIO_WIDTH: 0 = RSVD1 1 = RSVD2
7:4	X	RAM_CODE: read at power-on reset time from gmi_ad[7:4] strap pads. In emulation (HIDREV_MAJORREV==0), this field indicates the RAM type connected. For QT (HIDREV_MINORREV==0): 0=SIM, 1=DDR, 2=DDR2, 3=LPDDR2. For FPGA (HIDREV_MINORREV==1): 0=SIM, 1=DDR, 2=DDR2, 3=LPDDR2 0 = LPDDR3_800 1 = ELPIDA_LPDDR2 2 = RSVD2 3 = DDR3_2GB 4 = RSVD4 5 = DDR3_2GB_NO_DSR 6 = DDR3_934 7 = DDR3_800 8 = RSVD8 9 = DDR3_x64_2GB 10 = DDR3_X64_8GB_667 11 = DDR3_X64_8GB_800
0	RSVD1	NOR_WIDTH: 0 = RSVD1 1 = RSVD2

Bit	Reset	Description
31:0	0x0	Reserved

9.3 PMC Counter 0 Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

9.3.1 SYSCTR0_CNTCR_0

The control registers are read/written by secure accesses only except the CNTFID0 and COUNTERID11-0 registers, which can be written only once by secure or non-secure access.

The CNTFID0 and COUNTERID11-0 registers are read-only; however, to initialize them at boot (by the ARM7 or main CPU), they are defined as write once.

A non-secure write to the control registers is ignored. A non-secure read to the control registers returns all 1s.

Counter Control Register

Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0xxxxxx00)

Bit	Reset	Description
8	0x0	FCREQ: Requested frequency modes table entry. This bit is not used.
1	0x0	HDBG: Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter or not. 0: System counter ignores Halt-on-debug.1: Asserted Halt-on-debug signal halts the system counter update. 0 = DISABLE 1 = ENABLE
0	0x0	EN: Enables the counter. When this bit is written to '1', then the TSC is loaded with the CNTCVx register’s value, and starts incrementing from that value. When this bit is written to '0', the TSC halts counting and stays at that value. 0: System counter disabled 1: System counter enabled. 0 = DISABLE 1 = ENABLE

9.3.2 SYSCTR0_CNTSR_0

Counter Status Register

Offset: 0x4 | Read/Write: RO | Reset: 0x00000X0X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
8	X	FCREQ: Frequency change acknowledge. This bit is a copy of the value of the CNTCR[FCREQ] bit.
1	X	HDBG: Indicates whether or not the counter is halted because the Halt-on-Debug signal is asserted: 0: Counter is not halted. 1: Counter is halted. 0 = DISABLE 1 = ENABLE
0	X	RESERVED: Reserved, no impact.

9.3.3 SYSCTR0_CNTCV0_0

Counter Count Value [31:0] Register

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	CV: Counter value [31:0]. A read of this register provides the TSC[31:0] value at the time of the read. When CNTCR[EN]=0, a write to this register is used to initialize the TSC[31:0] value. When

Bit	Reset	Description
		CNTCR[EN]=1, a write to this register has an unpredictable behavior.

9.3.4 SYSCTR0_CNTCV1_0

Counter Count Value[63:32] Register

Offset: 0xc | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	CV: Counter value [63:32]. A read of this register provides the TSC[63:32] value at the time of the read. When CNTCR[EN]=0, a write to this register is used to initialize the TSC[63:32] value. When CNTCR[EN]=1, a write to this register has an unpredictable behavior.

9.3.5 SYSCTR0_CNTFID0_0

Frequency Table Entry Register

Offset: 0x20 | Read/Write: R/W | Reset: 0x00b71b00 (0b00000000101101110001101100000000)

Bit	Reset	Description
31:0	0xb71b00	FV: Counter frequency value in Hz. The default is set to 12 MHz. This register can be written only once.

9.3.6 SYSCTR0_CNTFID1_0

Frequency Table End Marker

Offset: 0x24 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	FV: Counter frequency value end marker (all 0s, read-only).

9.3.7 SYSCTR0_COUNTERID4_0

The COUNTERID11-0 registers are read-only; however, to initialize them at boot (by the ARM7™ or main CPU), they are defined as write once.

Offset: 0xfd0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7:0	0x0	VALUE: Peripheral ID value

9.3.8 SYSCTR0_COUNTERID5_0

Offset: 0xfd4 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	RESERVED: Reserved. A read will return all 0s.

9.3.9 SYSCTR0_COUNTERID6_0

9.3.13 SYSCTR0_COUNTERID2_0

Offset: 0xfe8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7:0	0x0	VALUE: Peripheral ID value

9.3.14 SYSCTR0_COUNTERID3_0

Offset: 0xfec | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7:0	0x0	VALUE: Peripheral ID value

9.3.15 SYSCTR0_COUNTERID8_0

Offset: 0xff0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7:0	0x0	VALUE: Component ID value

9.3.16 SYSCTR0_COUNTERID9_0

Offset: 0xff4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxx000000000000)

Bit	Reset	Description
7:0	0x0	VALUE: Component ID value

9.3.17 SYSCTR0_COUNTERID10_0

Offset: 0xff8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7:0	0x0	VALUE: Component ID value

9.3.18 SYSCTR0_COUNTERID11_0

Offset: 0xffc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7:0	0x0	VALUE: Component ID value

9.4 PMC Counter 1 Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

The status registers are some control registers readable via the CNTReadBase base address by secure or non-secure accesses.

These are the same physical registers that are described in the Control Register section.

9.4.1 SYSCTR1_CNTCV0_0

Counter Count Value [31:0] Register

Offset: 0x8 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	CV: Counter value [31:0]

9.4.2 SYSCTR1_CNTCV1_0

Counter Count Value [63:32] Register

Offset: 0xc | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	CV: Counter value [63:32]

9.4.3 SYSCTR1_COUNTERID4_0

Offset: 0xfd0 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	VALUE: Peripheral ID value.

9.4.4 SYSCTR1_COUNTERID5_0

Offset: 0xfd4 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	RESERVED: Reserved. A read will return all 0s.

9.4.5 SYSCTR1_COUNTERID6_0

Offset: 0xfd8 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	RESERVED: Reserved. A read will return all 0s.

9.4.6 SYSCTR1_COUNTERID7_0

Offset: 0xfdc | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	RESERVED: Reserved. A read will return all 0s.

9.4.7 SYSCTR1_COUNTERID0_0

Offset: 0xfe0 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	VALUE: Peripheral ID value

9.4.8 SYSCTR1_COUNTERID1_0

Offset: 0xfe4 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	VALUE: Peripheral ID value

9.4.9 SYSCTR1_COUNTERID2_0

Offset: 0xfe8 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	VALUE: Peripheral ID value

9.4.10 SYSCTR1_COUNTERID3_0

Offset: 0xfec | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	VALUE: Peripheral ID value

9.4.11 SYSCTR1_COUNTERID8_0

Offset: 0xff0 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	VALUE: Component ID value

9.4.12 SYSCTR1_COUNTERID9_0

Offset: 0xff4 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	VALUE: Component ID value

9.4.13 SYSCTR1_COUNTERID10_0

Offset: 0xff8 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
7:0	X	VALUE: Component ID value

9.4.14 SYSCTR1_COUNTERID11_0

Offset: 0xffc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx00000000)

Bit	Reset	Description
7:0	0x0	VALUE: Component ID value

9.5 Secure Boot Registers

9.5.1 SB_CSR_0

Secure Boot Control Status Register

Offset: 0x0 | Read/Write: R/W | Reset: 0x0000002X (0bxxxxxxxxxxxxxxxx000000000010xx01)

Bit	R/W	Reset	Description
15:12	RW	0x0	COT_FAIL_COUNT: Chain-of-Trust Fail Count
11:8	RW	0x0	SWDM_FAIL_COUNT: Secure Watchdog Monitor fail Count
7	RW	0x0	SWDM_ENABLE: Secure Watchdog Monitor Enable 1 = ENABLE 0 = DISABLE
6	RW	0x0	HANG: Secure Boot Hang 1 = ENABLE 0 = DISABLE
5	RW	0x1	JTAG_DISABLE: Secure JTAG Disable

Bit	R/W	Reset	Description
			0 = ENABLE 1 = DISABLE
4	RW	0x0	PIROM_DISABLE: Protected iROM Disable 0 = ENABLE 1 = DISABLE
3:2	RO	X	Rsrvd_31: Reserved
1	RW	0x0	NS_RST_VEC_WR_DIS: Non-secure reset vector write disable 0 = ENABLE 1 = DISABLE
0	RW	0x1	SECURE_BOOT_FLAG: 1 = Booted into Secure Mode 1 = ENABLE 0 = DISABLE

9.5.2 SB_PIROM_START_0

This specifies the offset from the start of the Boot ROM to the protected Region. This register is only programmable while in Secure_Mode (SECURE_BOOT_FLAG above == 1)

The lower 7 bits (6:0) are not significant and are assumed to be zero.

Secure Boot Protected ROM Start

Offset: 0x4 | Read/Write: R/W | Reset: 0x00001000 (0b00000000000000000001000000000000)

Bit	Reset	Description
31:0	0x1000	PROTECTED_ROM_START: PROTECTED_ROM_START

9.5.3 SB_PFCFG_0

Secure Boot Processor Feature Configuration Register

Offset: 0x8 | Read/Write: R/W | Reset: 0x00XX008f (0bxxxxxxxx0110xxxxxxxx0000010001111)

Bit	R/W	Reset	Description
24	RW	0x0	CS_DEADSTATUS_EN: Coresight™ Debug bit to enable return codes on bad accesses 1 = ENABLE 0 = DISABLE
23	RW	0x1	CS_ACCESS_CHECK_EN: Debug bit to Enable Checking for bad Csite accesses such as when CPU not in active partition 1 = ENABLE 0 = DISABLE
22	RW	0x1	CS_CODES_EN: Coresight Debug bit to Enable Status Codes 1 = ENABLE 0 = DISABLE
21	RW	0x0	CS_TIMEOUT_TM: Coresight Timeout Testmode 1 = ENABLE 0 = DISABLE
20	RO	X	DBGACK_AVP: DBGACKnowledge Status from AVP 1 = ENABLE 0 = DISABLE
19	RO	X	DBGACK_CPU3: DBGACKnowledge Status from CPU3 1 = ENABLE 0 = DISABLE
18	RO	X	DBGACK_CPU2: DBGACKnowledge Status from CPU2

Bit	R/W	Reset	Description
			1 = ENABLE 0 = DISABLE
17	RO	X	DBGACK_CPU1: DBGACKnowledge Status from CPU1 1 = ENABLE 0 = DISABLE
16	RO	X	DBGACK_CPU0: DBGACKnowledge Status from CPU0. The following bits assert the Processor External Debug Request signal. Setting these bits can cause a break. Clearing these bits will NOT restart the processor, but the request needs to be cleared before the debugger can restart the processor 1 = ENABLE 0 = DISABLE
12	RW	0x0	EDBGRQ_AVP: External Debug Request for AVP 1 = ENABLE 0 = DISABLE
11	RW	0x0	EDBGRQ_CPU3: External Debug Request for CPU3 via CoreSight 1 = ENABLE 0 = DISABLE
10	RW	0x0	EDBGRQ_CPU2: External Debug Request for CPU2 via CoreSight 1 = ENABLE 0 = DISABLE
9	RW	0x0	EDBGRQ_CPU1: External Debug Request for CPU1 via CoreSight 1 = ENABLE 0 = DISABLE
8	RW	0x0	EDBGRQ_CPU0: External Debug Request for CPU0 via CoreSight.Coresight Timeout Enable for bus transactions 1 = ENABLE 0 = DISABLE
7	RW	0x1	CS_TIMEOUT_EN: Coresight Timeout Enable RTCK delay control 1 = ENABLE 0 = DISABLE
6	RW	0x0	CS_RTCK_SPEED: RTCK delay (Synchronized or Direct) The following bits configure the Processor Feature pins. Once these bit values are assigned to the Most-Secure mode, they cannot be flipped back again 0 = SLOW 1 = FAST
5	RW	0x0	CP15SDISABLE: Disable access to system control registers 1 = DISABLE 0 = ENABLE
4	RW	0x0	CFGSDISABLE: Disable access to secure control registers 1 = DISABLE 0 = ENABLE
3	RW	0x1	DBGEN: Debug Enable (Not the same as JTAG enable) 1 = ENABLE 0 = DISABLE
2	RW	0x1	NIDEN: Non-Invasive Debug Enable 1 = ENABLE 0 = DISABLE
1	RW	0x1	SPIDEN: Secure Privileged Invasive Debug Enable 1 = ENABLE 0 = DISABLE
0	RW	0x1	SPNIDEN: Secure Privileged Non-Invasive Debug Enable 1 = ENABLE 0 = DISABLE

9.5.4 SB_SECURE_SPAREREG_0_0

Offset: 0xc | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SECURE_SPAREREG_0

9.5.5 SB_SECURE_SPAREREG_1_0

Offset: 0x10 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SECURE_SPAREREG_1

9.5.6 SB_SECURE_SPAREREG_2_0

Offset: 0x14 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SECURE_SPAREREG_2

9.5.7 SB_SECURE_SPAREREG_3_0

Offset: 0x18 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SECURE_SPAREREG_3

9.5.8 SB_SECURE_SPAREREG_4_0

Offset: 0x1c | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SECURE_SPAREREG_4

9.5.9 SB_SECURE_SPAREREG_5_0

Offset: 0x20 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description

10.0 ACTIVITY MONITOR

This section describes the activity monitor (ACTMON) block. The ACTMON acts as a central repository for activity indicators from various units, performs averaging of past samples, and indicates any abnormality in activity levels by sending an interrupt to software. Devices provide an idle/busy signal to the ACTMON block.

10.1 Functional Description

Activity monitoring is a means to dynamically measure the utilization of units in the system to help drive software power management policies. In Tegra processors, Dynamic Voltage and Frequency Scaling (DVFS) is used as a power management mechanism. It uses utilization information from various units to select an efficient voltage and frequency that the unit should operate at, while providing the requisite performance. Voltage change decisions are handled by this central software agent, but the unit frequency can be modulated in one of the following ways:

- The unit controls its own frequency - no need for activity monitoring support.
- The device driver controls the unit frequency based on calculated workload or hints from a user-level driver – no need for activity monitoring support.
- The device driver controls the unit frequency based on utilization information from a “unit ACTMON”.
- The central DVFS agent controls the unit frequency based on utilization information from a “central ACTMON”.

In addition to tracking utilization, activity monitoring is also used to provide hardware support to make the process of activity monitoring interrupt-driven instead of polling-based. This support is in the form of averaging, watermark detection, and histogram hardware. This reduces software overhead in procuring and tracking utilization data.

The ACTMON block has the following features:

- One 32-bit counter for each signaling device that accumulates activity counts.
- Running average computation for each counter over past N samples (N=128).
- Watermark breach detection logic for each counter. This is used to detect abrupt change in utilization.
- Interrupt-driven operation.

The DVFS thread can directly access and use the activity monitors to compute the target frequency (and consequently, voltage) for each unit for the next sampling interval.

The following table summarizes the Tegra K1 activity monitors.

Table 30: Activity Monitors

Module	Counter Description (Counter Width = 32 Bits)
A7AVP	Number of system clock cycles that A7AVP is in the halt state
AHB	Number of AHB clock cycles when no data transfer is detected on the bus. Can select one specific master or all of them.
APB	Number of APB clock cycles when no data transfer is detected on the bus. Can select one specific master or all of them.
CPU	The flow controller asserts a signal when ALL the cores are halted.
MC-ALL	Number of Memory Controller clock cycles when any (including CCPLEX) memory access event is detected. The MC toggles a signal to ACTMON every ‘W’ cycles.
MC-CPU	Number of MC clock cycles when any memory access event from CCPLEX is detected. MC toggles a signal to ACTMON every ‘W’ cycles.

Module	Counter Description (Counter Width = 32 Bits)
VDE	Number of video pipe cycles when the pipe is empty.

The table above assumes that the following units either run at a fixed frequency or do their own frequency management based on fixed workload, so they do not need central ACTMON support.

- VI/CSI (fixed)
- Display (workload-based, no monitors needed)
- Host (fixed)
- ISP (workload-based)
- MSENC/VIC (utilization-based and uses per-unit ACTMON)
- SEC (fixed frequency)
- USB3 –Falcon (workload-based)
- MSELECT (frequency is based on other units and cannot be controlled independently)

10.2 ACTMON Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

10.2.1 ACTMON GLB Status Register

10.2.1.1 ACTMON_GLB_STATUS_0

Offset: 0x0 | Read/Write: RO | Reset: 0xXX00XX00 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	CPU_INTR: CPU Monitor Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR 1 = INTR
30	X	COP_INTR: COP Monitor Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR 1 = INTR
29	X	AHB_INTR: AHB Monitor Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR 1 = INTR
28	X	APB_INTR: APB Monitor Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR 1 = INTR
27	X	VDE_INTR: VDE Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR 1 = INTR
26	X	MCALL_INTR: MC_ALL Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR 1 = INTR
25	X	MCCPU_INTR: MC_CPU Interrupt status. 1 = Interrupt detected; 0 = Interrupt not detected 0 = NOINTR : 1 = INTR
15	X	CPU_MON_ACT: CPU monitor active status. 1 = active 0 = INACTIVE 1 = ACTIVE

Bit	Reset	Description
14	X	COP_MON_ACT: COP monitor active status. 1 = active 0 = INACTIVE 1 = ACTIVE
13	X	AHB_MON_ACT: 0 = inactive. 1 = active 0 = INACTIVE 1 = ACTIVE
12	X	APB_MON_ACT: 0 = inactive. 1 = active 0 = INACTIVE 1 = ACTIVE
10	X	VDE_MON_ACT: 0 = inactive. 1 = active 0 = INACTIVE 1 = ACTIVE
9	X	MCALL_MON_ACT: 0 = inactive. 1 = active 0 = INACTIVE 1 = ACTIVE
8	X	MCCPU_MON_ACT: 0 = inactive. 1 = active 0 = INACTIVE 1 = ACTIVE

10.2.2 ACTMON Global Period Register

10.2.2.1 ACTMON_GLB_PERIOD_CTRL_0

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx000000000)

Bit	Reset	Description
8	0x0	SOURCE: 0 = MSEC : Sampling period time base in milliseconds 1 = USEC : Sampling period time base in microseconds
7:0	0x0	SAMPLE_PERIOD: Sampling period in milliseconds/microseconds (implemented as n+1 counter). Programming a 0 implies a 1 millisecond/microsecond sampling period.

10.2.3 CPU Registers

10.2.3.1 ACTMON_CPU_CTRL_0

Monitor Control Register

Offset: 0x80 | Read/Write: R/W | Reset: 0x00001800 (0b00000000000000xxxxx110xxxxxxxxxx)

Bit	Reset	Description
31	0x0	ENB: Enable Monitor. Set by software to enable sampling. Cleared in one of the following ways: (a) When software intends to stop the monitor, it can do so by clearing this field, (b) when the sampling period expires (and we are not in the periodic mode) 0 = DISABLE 1 = ENABLE
30	0x0	CONSECUTIVE_ABOVE_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_UPPER_NUM' upper watermark breaches are detected 0 = DISABLE : interrupt is disabled. 1 = ENABLE: interrupt is enabled
29	0x0	CONSECUTIVE_BELOW_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_LOWER_NUM' lower watermark breaches are detected. 0 = DISABLE : interrupt is disabled. 1 = ENABLE: interrupt is enabled
28:26	0x0	CONSECUTIVE_ABOVE_WMARK_NUM: Number (N+1) of consecutive upper watermark breaches

Bit	Reset	Description
		that need to occur to raise an interrupt 0 = DISABLE : interrupt is disabled. 1 = ENABLE: interrupt is enabled
25:23	0x0	CONSECUTIVE_BELOW_WMARK_NUM: Number (N+1) of consecutive lower watermark breaches that need to occur to raise an interrupt 0 = DISABLE : interrupt is disabled. 1 = ENABLE: interrupt is enabled
22	0x0	WHEN_OVERFLOW_EN: Enable interrupt for number of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE: interrupt is enabled
21	0x0	AVG_ABOVE_WMARK_EN: Enable interrupt when AVG value is above its upper watermark value. 0 = DISABLE : interrupt is disabled. 1 = ENABLE: interrupt is enabled
20	0x0	AVG_BELOW_WMARK_EN: Enable interrupt when AVG value is below its lower watermark value. 0 = DISABLE : interrupt is disabled. 1 = ENABLE: interrupt is enabled
19	0x0	AT_END_EN:Enable interrupt at the end of sample period. 0 = DISABLE : interrupt is disabled. 1 = ENABLE: interrupt is enabled
18	0x0	ENB_PERIODIC: Enable periodic mode. Sample for one sample period or periodic sampling 0 = DISABLE : periodic mode is disabled, samples for only 1 period 1 = ENABLE: periodic mode is enabled, keeps on sampling and updating value after every sample period
12:10	0x6	K_VAL: variable for IIR filter. Default is 6, which translates to 2^(K+1) = 128.

10.2.3.2 ACTMON_CPU_UPPER_WMARK_0

Upper Watermark Register

Offset: 0x84 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.3.3 ACTMON_CPU_LOWER_WMARK_0

Lower Watermark Register

Offset: 0x88 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.3.4 ACTMON_CPU_INIT_AVG_0

Initial AVG value, specified by SW to set up the filter

Offset: 0x8c | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL

10.2.3.5 ACTMON_CPU_AVG_UPPER_WMARK_0

AVG Upper Watermark Register

Offset: 0x90 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.3.6 ACTMON_CPU_AVG_LOWER_WMARK_0

AVG Lower Watermark Register

Offset: 0x94 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.3.7 ACTMON_CPU_COUNT_WEIGHT_0

Count Weight Register

Offset: 0x98 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: weight value for count measurements.

10.2.3.8 ACTMON_CPU_COUNT_0

Monitor Status0 Register

Offset: 0x9c | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the number of active count pulses in one period

10.2.3.9 ACTMON_CPU_AVG_COUNT_0

Monitor Status1 Register

Offset: 0xa0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the AVG count value

10.2.3.10 ACTMON_CPU_INTR_STATUS_0

Monitor Interrupt Register

Offset: 0xa4 | Read/Write: R/W | Reset: 0x00000000 (0b000xx000xxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	CONSECUTIVE_UPPER: Assert at the end of sampling period, if count value crosses upper watermark value consecutively for the number of times specified in CONSECUTIVE_UPPER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect

Bit	Reset	Description
		0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
30	0x0	CONSECUTIVE_LOWER: Assert at the end of sampling period, if count value crosses lower watermark value consecutively for the number of times specified in CONSECUTIVE_LOWER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
29	0x0	AT_END: Assert at the end of sampling period, if interrupt at end of sample period is enabled. A write value of 1 clears this interrupt; writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
26	0x0	WHEN_OVERFLOW: Assert at the end of sampling period, if there is an overflow. A write value of 1 clears this interrupt; writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
25	0x0	AVG_BELOW_WMARK: Assert at the end of sampling period, if AVG count value crosses lower AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect. 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
24	0x0	AVG_ABOVE_WMARK: Assert at the end of sampling period, if AVG count value crosses upper AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected

10.2.4 COP Registers

10.2.4.1 ACTMON_COP_CTRL_0

Monitor Control Register

Offset: 0xc0 | Read/Write: R/W | Reset: 0x00001800 (0b00000000000000xxxxx110xxxxxxxxxx)

Bit	Reset	Description
31	0x0	ENB: Enable Monitor. Set by software to enable sampling. Cleared in one of the following ways: (a) When software intends to stop the monitor, it can do so by clearing this field, (b) when the sampling period expires (and we are not in the periodic mode) 0 = DISABLE 1 = ENABLE
30	0x0	CONSECUTIVE_ABOVE_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_UPPER_NUM' upper watermark breaches are detected. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
29	0x0	CONSECUTIVE_BELOW_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_LOWER_NUM' lower watermark breaches are detected. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
28:26	0x0	CONSECUTIVE_ABOVE_WMARK_NUM: Number (N+1) of consecutive upper watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
25:23	0x0	CONSECUTIVE_BELOW_WMARK_NUM: Number (N+1) of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
22	0x0	WHEN_OVERFLOW_EN: Enable interrupt for the Number of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled.

Bit	Reset	Description
		1 = ENABLE : interrupt is enabled.
21	0x0	AVG_ABOVE_WMARK_EN: Enable interrupt when AVG value is above its upper watermark value. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
20	0x0	AVG_BELOW_WMARK_EN: Enable interrupt when AVG value is below its lower watermark value. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
19	0x0	AT_END_EN: Enable interrupt at the end of sample period. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
18	0x0	ENB_PERIODIC: Enable periodic mode. Sample for one sample period or periodic sampling 0 = DISABLE : periodic mode is disabled, samples for only 1 period 1 = ENABLE : periodic mode is enabled, keeps on sampling and updating value after every sample period
12:10	0x6	K_VAL: variable for IIR filter. Default is 6, which translates to 2^(K+1) = 128.

10.2.4.2 ACTMON_COP_UPPER_WMARK_0

Upper Watermark Register

Offset: 0xc4 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.4.3 ACTMON_COP_LOWER_WMARK_0

Lower Watermark Register

Offset: 0xc8 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.4.4 ACTMON_COP_INIT_AVG_0

Initial AVG value, specified by software to set up the filter

Offset: 0xcc | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL

10.2.4.5 ACTMON_COP_AVG_UPPER_WMARK_0

AVG Upper Watermark Register

Offset: 0xd0 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.4.6 ACTMON_COP_AVG_LOWER_WMARK_0

AVG Lower Watermark Register

Offset: 0xd4 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.4.7 ACTMON_COP_COUNT_WEIGHT_0

Count Weight Register

Offset: 0xd8 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: weight value for count measurements.

10.2.4.8 ACTMON_COP_COUNT_0

Monitor Status0 Register

Offset: 0xdc | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the number of active count pulses in one period

10.2.4.9 ACTMON_COP_AVG_COUNT_0

Monitor Status1 Register

Offset: 0xe0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the AVG count value

10.2.4.10 ACTMON_COP_INTR_STATUS_0

Monitor Interrupt Register

Offset: 0xe4 | Read/Write: R/W | Reset: 0x00000000 (0b000xx000xxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	CONSECUTIVE_UPPER: Assert at the end of sampling period, if count value crosses upper watermark value consecutively for the number of times specified in CONSECUTIVE_UPPER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
30	0x0	CONSECUTIVE_LOWER: Assert at the end of sampling period, if count value crosses lower watermark value consecutively for the number of times specified in CONSECUTIVE_LOWER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
29	0x0	AT_END: Assert at the end of sampling period, if interrupt at end of sample period is enabled. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected

Bit	Reset	Description
		1 = INTR : 1 = interrupt detected
26	0x0	WHEN_OVERFLOW: Assert at the end of sampling period, if there is an overflow. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
25	0x0	AVG_BELOW_WMARK: Assert at the end of sampling period, if AVG count value crosses lower AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
24	0x0	AVG_ABOVE_WMARK: Assert at the end of sampling period, if AVG count value crosses upper AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected

10.2.5 AHB Registers

10.2.5.1 ACTMON_AHB_CTRL_0

Monitor Control Register

Offset: 0x100 | Read/Write: R/W | Reset: 0x00001800 (0b00000000000000xxxxx1100000000000)

Bit	Reset	Description
31	0x0	ENB: Enable Monitor. Set by SW to enable sampling. Cleared in one of the following ways: (a) When software intends to stop the monitor, it can do so by clearing this field, (b) when the sampling period expires (and we are not in the periodic mode) 0 = DISABLE 1 = ENABLE
30	0x0	CONSECUTIVE_ABOVE_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_UPPER_NUM' upper watermark breaches are detected. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
29	0x0	CONSECUTIVE_BELOW_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_LOWER_NUM' lower watermark breaches are detected. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
28:26	0x0	CONSECUTIVE_ABOVE_WMARK_NUM: Number (N+1) of consecutive upper watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
25:23	0x0	CONSECUTIVE_BELOW_WMARK_NUM: Number (N+1) of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
22	0x0	WHEN_OVERFLOW_EN: Enable interrupt for the Number of consecutive lower watermark breaches that need to occur to raise an interruptd. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
21	0x0	AVG_ABOVE_WMARK_EN:Enable interrupt when AVG value is above its upper watermark value. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
20	0x0	AVG_BELOW_WMARK_EN:Enable interrupt when AVG value is below its lower watermark value. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
19	0x0	AT_END_EN:Enable interrupt at the end of sample period. 0 = DISABLE : interrupt is disabled.

Bit	Reset	Description
		1 = ENABLE : interrupt is enabled.
18	0x0	ENB_PERIODIC: Enable periodic mode. Sample for one sample period or periodic sampling 0 = DISABLE : periodic mode is disabled, samples for only 1 period 1 = ENABLE : periodic mode is enabled, keeps on sampling and updating value after every sample period
12:10	0x6	K_VAL: variable for IIR filter. Default is 6, which translates to 2^(K+1) = 128.
9:4	0x0	MONITOR_COND: Selection criteria on parent module for the activity signal, used only for APB/AHB monitors. Indicates which AHB master to monitor. All 1s means any master. 0 = CPU 1 = COP 2 = VCP 3 = CSITE 4 = ARC 5 = AHBDMA 6 = USB 7 = APBDMA 8 = NA1 9 = NA2 10 = NA3 11 = SNOR 12 = NA4 13 = BSEV 14 = SE 15 = DDS 16 = BSEA 17 = USB3 18 = USB2 19 = NA5 20 = NA6 21 = MIPIHSI 22 = NA7 23 = NA8 24 = NA9 63 = ALL
3:0	0x0	SAMPLE_COND: Selection criteria on parent module for type of pulse signal, used only for APB/AHB monitor. 0 = AHB_MASTER_ACTIVE 1 = AHB_MASTER_SLAVE_ACTIVE 2 = AHB_DATA_XFER 3 = AHB_IDLE 4 = MASTER_IDLE 5 = AHB_BUSY 6 = DISABLE

10.2.5.2 ACTMON_AHB_UPPER_WMARK_0

Upper Watermark Register

Offset: 0x104 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.5.3 ACTMON_AHB_LOWER_WMARK_0

Lower Watermark Register

Offset: 0x108 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.5.4 ACTMON_AHB_INIT_AVG_0

Initial AVG value, specified by software to set up the filter

Offset: 0x10c | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL

10.2.5.5 ACTMON_AHB_AVG_UPPER_WMARK_0

AVG Upper Watermark Register

Offset: 0x110 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.5.6 ACTMON_AHB_AVG_LOWER_WMARK_0

AVG Lower Watermark Register

Offset: 0x114 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.5.7 ACTMON_AHB_COUNT_WEIGHT_0

Count Weight Register

Offset: 0x118 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: weight value for count measurements.

10.2.5.8 ACTMON_AHB_COUNT_0

Monitor Status0 Register

Offset: 0x11c | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the number of active count pulses in one period

10.2.5.9 ACTMON_AHB_AVG_COUNT_0

Monitor Status1 Register

Offset: 0x120 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the AVG count value

10.2.5.10 ACTMON_AHB_INTR_STATUS_0

Monitor Interrupt Register

Offset: 0x124 | Read/Write: R/W | Reset: 0x00000000 (0b000xx000xxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	CONSECUTIVE_UPPER: Assert at the end of sampling period, if count value crosses upper watermark value consecutively for the number of times specified in CONSECUTIVE_UPPER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
30	0x0	CONSECUTIVE_LOWER: Assert at the end of sampling period, if count value crosses lower watermark value consecutively for the number of times specified in CONSECUTIVE_LOWER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
29	0x0	AT_END: Assert at the end of sampling period, if interrupt at end of sample period is enabled. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
26	0x0	WHEN_OVERFLOW: Assert at the end of sampling period, if there is an overflow. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
25	0x0	AVG_BELOW_WMARK: Assert at the end of sampling period, if AVG count value crosses lower AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
24	0x0	AVG_ABOVE_WMARK: Assert at the end of sampling period, if AVG count value crosses upper AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected

10.2.6 APB Registers

10.2.6.1 ACTMON_APB_CTRL_0

Monitor Control Register

Offset: 0x140 | Read/Write: R/W | Reset: 0x00001800 (0b00000000000000xxxxx1100000000000)

Bit	Reset	Description
31	0x0	ENB: Enable Monitor. Set by SW to enable sampling. Cleared in one of the following ways: (a) When SW intends to stop the monitor, it can do so by clearing this field, (b) when the sampling period expires (and we are not in the periodic mode) 0 = DISABLE 1 = ENABLE
30	0x0	CONSECUTIVE_ABOVE_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_UPPER_NUM' upper watermark breaches are detected. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
29	0x0	CONSECUTIVE_BELOW_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_LOWER_NUM' lower watermark breaches are detected. 0 = DISABLE : interrupt is disabled.

Bit	Reset	Description
		1 = ENABLE : interrupt is enabled.
28:26	0x0	CONSECUTIVE_ABOVE_WMARK_NUM: Number (N+1) of consecutive upper watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
25:23	0x0	CONSECUTIVE_BELOW_WMARK_NUM: Number (N+1) of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
22	0x0	WHEN_OVERFLOW_EN: Enable interrupt for the Number of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
21	0x0	AVG_ABOVE_WMARK_EN: Enable interrupt when AVG value is above its upper watermark value. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
20	0x0	AVG_BELOW_WMARK_EN: Enable interrupt when AVG value is below its lower watermark value. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
19	0x0	AT_END_EN: Enable interrupt at the end of sample period. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
18	0x0	ENB_PERIODIC: Enable periodic mode. Sample for one sample period or periodic sampling 0 = DISABLE : periodic mode is disabled, samples for only 1 period 1 = ENABLE : periodic mode is enabled, keeps on sampling and updating value after every sample period
12:10	0x6	K_VAL: variable for IIR filter. Default is 6, which translates to 2^(K+1) = 128.

10.2.6.2 ACTMON_APB_UPPER_WMARK_0

Upper Watermark Register

Offset: 0x144 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.6.3 ACTMON_APB_LOWER_WMARK_0

Lower Watermark Register

Offset: 0x148 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.6.4 ACTMON_APB_INIT_AVG_0

Initial AVG value, specified by SW to set up the filter

Offset: 0x14c | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL

10.2.6.5 ACTMON_APB_AVG_UPPER_WMARK_0

AVG Upper Watermark Register

Offset: 0x150 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.6.6 ACTMON_APB_AVG_LOWER_WMARK_0

AVG Lower Watermark Register

Offset: 0x154 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.6.7 ACTMON_APB_COUNT_WEIGHT_0

Count Weight Register

Offset: 0x158 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: weight value for count measurements.

10.2.6.8 ACTMON_APB_COUNT_0

Monitor Status0 Register

Offset: 0x15c | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the number of active count pulses in one period

10.2.6.9 ACTMON_APB_AVG_COUNT_0

Monitor Status1 Register

Offset: 0x160 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the AVG count value

10.2.6.10 ACTMON_APB_INTR_STATUS_0

Monitor Interrupt Register

Offset: 0x164 | Read/Write: R/W | Reset: 0x00000000 (0b000xx000xxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	CONSECUTIVE_UPPER: Assert at the end of sampling period, if count value crosses upper watermark value consecutively for the number of times specified in CONSECUTIVE_UPPER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
30	0x0	CONSECUTIVE_LOWER: Assert at the end of sampling period, if count value crosses lower watermark value consecutively for the number of times specified in CONSECUTIVE_LOWER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
29	0x0	AT_END: Assert at the end of sampling period, if interrupt at end of sample period is enabled. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
26	0x0	WHEN_OVERFLOW: Assert at the end of sampling period, if there is an overflow. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
25	0x0	AVG_BELOW_WMARK: Assert at the end of sampling period, if AVG count value crosses lower AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
24	0x0	AVG_ABOVE_WMARK: Assert at the end of sampling period, if AVG count value crosses upper AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected

10.2.6.11 ACTMON_APB_CTRL_SAPB_0

Monitor Interrupt Register

Offset: 0x168 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0000000000)

Bit	Reset	Description

18	0x0	ENB_PERIODIC: Enable periodic mode. Sample for one sample period or periodic sampling 0 = DISABLE : periodic mode is disabled, samples for only 1 period 1 = ENABLE : periodic mode is enabled, keeps on sampling and updating value after every sample period
12:10	0x6	K_VAL: variable for IIR filter. Default is 6, which translates to 2^(K+1) = 128.

10.2.7.2 ACTMON_VDE_UPPER_WMARK_0

Upper Watermark Register

Offset: 0x184 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.7.3 ACTMON_VDE_LOWER_WMARK_0

Lower Watermark Register

Offset: 0x188 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.7.4 ACTMON_VDE_INIT_AVG_0

Initial AVG value, specified by SW to set up the filter

Offset: 0x18c | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL

10.2.7.5 ACTMON_VDE_AVG_UPPER_WMARK_0

AVG Upper Watermark Register

Offset: 0x190 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.7.6 ACTMON_VDE_AVG_LOWER_WMARK_0

AVG Lower Watermark Register

Offset: 0x194 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.7.7 ACTMON_VDE_COUNT_WEIGHT_0

Count Weight Register

Offset: 0x198 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: weight value for count measurements.

10.2.7.8 ACTMON_VDE_COUNT_0

Monitor Status0 Register

Offset: 0x19c | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the number of active count pulses in one period

10.2.7.9 ACTMON_VDE_AVG_COUNT_0

Monitor Status1 Register

Offset: 0x1a0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the AVG count value

10.2.7.10 ACTMON_VDE_INTR_STATUS_0

Monitor Interrupt Register

Offset: 0x1a4 | Read/Write: R/W | Reset: 0x00000000 (0b000xx000xxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	CONSECUTIVE_UPPER: Assert at the end of sampling period, if count value crosses upper watermark value consecutively for the number of times specified in CONSECUTIVE_UPPER_NUM field. a write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
30	0x0	CONSECUTIVE_LOWER: Assert at the end of sampling period, if count value crosses lower watermark value consecutively for the number of times specified in CONSECUTIVE_LOWER_NUM field. a write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
29	0x0	AT_END: Assert at the end of sampling period, if interrupt at end of sample period is enabled. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
26	0x0	WHEN_OVERFLOW: Assert at the end of sampling period, if there is an overflow. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
25	0x0	AVG_BELOW_WMARK: Assert at the end of sampling period, if AVG count value crosses lower AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
24	0x0	AVG_ABOVE_WMARK: Assert at the end of sampling period, if AVG count value crosses upper AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected

10.2.8 MC_ALL Registers

10.2.8.1 ACTMON_MCALL_CTRL_0

Monitor Control Register

Offset: 0x1c0 | Read/Write: R/W | Reset: 0x00001800 (0b00000000000000xxxxx110xxxxxxxxxx)

Bit	Reset	Description
31	0x0	ENB: Enable Monitor. Set by software to enable sampling. Cleared in one of the following ways: (a) When software intends to stop the monitor, it can do so by clearing this field, (b) when the sampling period expires (and we are not in the periodic mode) 0 = DISABLE 1 = ENABLE
30	0x0	CONSECUTIVE_ABOVE_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_UPPER_NUM' upper watermark breaches are detected. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
29	0x0	CONSECUTIVE_BELOW_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_LOWER_NUM' lower watermark breaches are detectedd. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
28:26	0x0	CONSECUTIVE_ABOVE_WMARK_NUM: Number (N+1) of consecutive upper watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
25:23	0x0	CONSECUTIVE_BELOW_WMARK_NUM: Number (N+1) of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.

Bit	Reset	Description
22	0x0	WHEN_OVERFLOW_EN: Enable interrupt for the Number of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
21	0x0	AVG_ABOVE_WMARK_EN:Enable interrupt when AVG value is above its upper watermark value. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
20	0x0	AVG_BELOW_WMARK_EN:Enable interrupt when AVG value is below its lower watermark value. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
19	0x0	AT_END_EN:Enable interrupt at the end of sample period. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
18	0x0	ENB_PERIODIC: Enable periodic mode. Sample for one sample period or periodic sampling 0 = DISABLE : periodic mode is disabled, samples for only 1 period 1 = ENABLE : periodic mode is enabled, keeps on sampling and updating value after every sample period
12:10	0x6	K_VAL: variable for IIR filter. Default is 6, which translates to 2^(K+1) = 128.

10.2.8.2 ACTMON_MCALL_UPPER_WMARK_0

Upper Watermark Register

Offset: 0x1c4 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.8.3 ACTMON_MCALL_LOWER_WMARK_0

Lower Watermark Register

Offset: 0x1c8 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.8.4 ACTMON_MCALL_INIT_AVG_0

Initial AVG value, specified by SW to set up the filter

Offset: 0x1cc | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL

10.2.8.5 ACTMON_MCALL_AVG_UPPER_WMARK_0

AVG Upper Watermark Register

Offset: 0x1d0 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.8.6 ACTMON_MCALL_AVG_LOWER_WMARK_0

AVG Lower Watermark Register

Offset: 0x1d4 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.8.7 ACTMON_MCALL_COUNT_WEIGHT_0

Count Weight Register

Offset: 0x1d8 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: weight value for count measurements.

10.2.8.8 ACTMON_MCALL_COUNT_0

Monitor Status0 Register

Offset: 0x1dc | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the number of active count pulses in one period

10.2.8.9 ACTMON_MCALL_AVG_COUNT_0

Monitor Status1 Register

Offset: 0x1e0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the AVG count value

10.2.8.10 ACTMON_MCALL_INTR_STATUS_0

Monitor Interrupt Register

Offset: 0x1e4 | Read/Write: R/W | Reset: 0x00000000 (0b000xx000xxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	CONSECUTIVE_UPPER: Assert at the end of sampling period, if count value crosses upper watermark value consecutively for the number of times specified in CONSECUTIVE_UPPER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
30	0x0	CONSECUTIVE_LOWER: Assert at the end of sampling period, if count value crosses lower watermark value consecutively for the number of times specified in CONSECUTIVE_LOWER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
29	0x0	AT_END: Assert at the end of sampling period, if interrupt at end of sample period is enabled. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected

Bit	Reset	Description
		1 = INTR : 1 = interrupt detected
26	0x0	WHEN_OVERFLOW: Assert at the end of sampling period, if there is an overflow. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
25	0x0	AVG_BELOW_WMARK: Assert at the end of sampling period, if AVG count value crosses lower AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
24	0x0	AVG_ABOVE_WMARK: Assert at the end of sampling period, if AVG count value crosses upper AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected

10.2.9 MC_CPU Registers

10.2.9.1 ACTMON_MCCPU_CTRL_0

Monitor Control Register

Offset: 0x200 | Read/Write: R/W | Reset: 0x00001800 (0b00000000000000xxxxx110xxxxxxxxxx)

Bit	Reset	Description
31	0x0	ENB: Enable Monitor. Set by software to enable sampling. Cleared in one of the following ways: (a) When software intends to stop the monitor, it can do so by clearing this field, (b) when the sampling period expires (and we are not in the periodic mode) 0 = DISABLE 1 = ENABLE
30	0x0	CONSECUTIVE_ABOVE_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_UPPER_NUM' upper watermark breaches are detected. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
29	0x0	CONSECUTIVE_BELOW_WMARK_EN: Enable interrupt when consecutive 'CONSECUTIVE_LOWER_NUM' lower watermark breaches are detected. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
28:26	0x0	CONSECUTIVE_ABOVE_WMARK_NUM: Number (N+1) of consecutive upper watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
25:23	0x0	CONSECUTIVE_BELOW_WMARK_NUM: Number (N+1) of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
22	0x0	WHEN_OVERFLOW_EN: Enable interrupt for the Number of consecutive lower watermark breaches that need to occur to raise an interrupt. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
21	0x0	AVG_ABOVE_WMARK_EN: Enable interrupt when AVG value is above its upper watermark value. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
20	0x0	AVG_BELOW_WMARK_EN: Enable interrupt when AVG value is below its lower watermark value. 0 = DISABLE : interrupt is disabled. 1 = ENABLE : interrupt is enabled.
19	0x0	AT_END_EN: Enable interrupt at the end of sample period. 0 = DISABLE : interrupt is disabled.

Bit	Reset	Description
		1 = ENABLE : interrupt is enabled.
18	0x0	ENB_PERIODIC: Enable periodic mode. Sample for one sample period or periodic sampling 0 = DISABLE : periodic mode is disabled, samples for only 1 period 1 = ENABLE : periodic mode is enabled, keeps on sampling and updating value after every sample period
12:10	0x6	K_VAL: variable for IIR filter. Default is 6, which translates to 2^(K+1) = 128.

10.2.9.2 ACTMON_MCCPU_UPPER_WMARK_0

Upper Watermark Register

Offset: 0x204 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.9.3 ACTMON_MCCPU_LOWER_WMARK_0

Lower Watermark Register

Offset: 0x208 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.9.4 ACTMON_MCCPU_INIT_AVG_0

Initial AVG value, specified by software to set up the filter

Offset: 0x20c | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL

10.2.9.5 ACTMON_MCCPU_AVG_UPPER_WMARK_0

AVG Upper Watermark Register

Offset: 0x210 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Upper watermark for count value.

10.2.9.6 ACTMON_MCCPU_AVG_LOWER_WMARK_0

AVG Lower Watermark Register

Offset: 0x214 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Lower watermark for count value.

10.2.9.7 ACTMON_MCCPU_COUNT_WEIGHT_0

Count Weight Register

Offset: 0x218 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: weight value for count measurements.

10.2.9.8 ACTMON_MCCPU_COUNT_0

Monitor Status0 Register

Offset: 0x21c | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the number of active count pulses in one period

10.2.9.9 ACTMON_MCCPU_AVG_COUNT_0

Monitor Status1 Register

Offset: 0x220 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VAL: Indicates the AVG count value

10.2.9.10 ACTMON_MCCPU_INTR_STATUS_0

Monitor interrupt Register

Offset: 0x224 | Read/Write: R/W | Reset: 0x00000000 (0b000xx000xxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	CONSECUTIVE_UPPER: Assert at the end of sampling period, if count value crosses upper watermark value consecutively for the number of times specified in CONSECUTIVE_UPPER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
30	0x0	CONSECUTIVE_LOWER: Assert at the end of sampling period, if count value crosses lower watermark value consecutively for the number of times specified in CONSECUTIVE_LOWER_NUM field. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
29	0x0	AT_END: Assert at the end of sampling period, if interrupt at end of sample period is enabled. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
26	0x0	WHEN_OVERFLOW: Assert at the end of sampling period, if there is an overflow. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected
25	0x0	AVG_BELOW_WMARK: Assert at the end of sampling period, if AVG count value crosses lower AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected

Bit	Reset	Description
24	0x0	AVG_ABOVE_WMARK: Assert at the end of sampling period, if AVG count value crosses upper AVG watermark value. A write value of 1 clears this interrupt, writing a 0 has no effect 0 = NOINTR : 0 = interrupt not detected 1 = INTR : 1 = interrupt detected

10.2.10 Histogram Registers

10.2.10.1 ACTMON_HISTOGRAM_CONFIG_0

Histogram Configuration

Offset: 0x300 | Read/Write: R/W | Reset: 0x00000XXX (0bxxxxxxxxxxxxxxxx0000xxxxxxxxxxx)

Bit	Reset	Description
15:12	NONE	SOURCE: 0 = NONE 1 = AHB 2 = APB 3 = COP 4 = CPU 5 = MC_ALL 6 = MC_CPU 7 = VDE 8 = VDEA 9 = APB_MMIO
8:4	X	SHIFT: Scaling factor for the idle counter before the value is used to update histogram bucket.
3	X	STALL_ON_SINGLE_SATURATE: FALSE : continue incrementing buckets even when another bucket has saturated TRUE : stop incrementing bucket when at least one other bucket has saturated 0 = FALSE 1 = TRUE
2	X	NO_UNDERFLOW_BUCKET: FALSE : increase bucket 0 when idle time is less than the minimum value TRUE : ignore idle times that are less than the minimum value 0 = FALSE 1 = TRUE
1	X	LINEAR_MODE: DISABLE : bucket width increases exponentially with a power of two ENABLE : bucket width is the same for all buckets 0 = DISABLE 1 = ENABLE
0	X	ACTIVE: ENABLE : enable histogram recording 0 = DISABLE 1 = ENABLE

10.2.10.2 ACTMON_HISTOGRAM_CTRL_0

Offset: 0x304 | Read/Write: R/W | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
0	X	CLEAR: Clear all

10.2.10.3 ACTMON_HISTOGRAM_DATA_0

This is an array of 32 identical register entries; the register fields below apply to each entry.

Offset: 0x380..0x3ff | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	VALUE

11.0 REAL-TIME CLOCK

The Real-Time Clock (RTC) module maintains seconds and milliseconds counters, and five alarm registers. The RTC is in the ‘always-on’ power domain, allowing for the counters to run and alarms to trigger when the system is in low-power state. If configured, interrupts triggered by the RTC can cause the system to wake up from a low-power state.

Features

- 10-bit milliseconds counter that runs off of a 32.768 KHz clock source.
- 32-bit seconds counter that increment for every 1000 milliseconds.
- Alarm feature that triggers an interrupt when the specified value matches the milliseconds counter.
- Alarm feature that triggers an interrupt when the specified value matches the seconds counter.
- Count-down alarm feature that triggers an alarm after counting down the specified number of seconds.
- Count-down alarm feature that triggers an alarm after counting down the specified number of milliseconds.
- Security bit that disables further processor writes to the seconds counter and ensures that the RTC clock keeps running.
- Hardware adjusts drift in clock which can occur due to PPM variations in oscillator output.

11.1 Functional Description

The RTC operates in two clock domains: the APB clock domain and the 32 KHz clock domain. The RTC continues updating the millisecond and second counters and continues triggering interrupts even when the MAIN partition is powered down. Since the APB clock is disabled when MAIN is powered down, registers are implemented in the 32 KHz clock domain.

All the registers except the BUSY register are implemented in the 32 KHz clock domain. Writes are transferred to the 32 KHz domain with BUSY.STATUS set to BUSY until the transfer is completed. Reads are shadowed in the APB clock domain and return immediately.

The RTC implements a Seconds Counter register, a Milliseconds Counter register, three Alarm registers, two countdown alarms, and various interrupt-related registers.

Writes to the seconds counter can be disabled by writing to the CONTROL.DIS_WR_SEC_CNT bit. Alarm registers and countdown alarm registers set interrupt bits when corresponding events occur. Interrupt status, mask, set and source registers reflect the status and also allow setting and clearing of various bits. All registers (except the BUSY register) are implemented in the 32K clock domain. Writes are transferred to the 32K domain with BUSY STATUS set to BUSY until the transfer completes. Reads are shadowed in the APB domain and will return immediately.

Resets

The RTC receives an asynchronous reset which is synchronized to the APB clock and RTC clock domains.

11.2 RTC Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

11.2.1 APBDEV_RTC_CONTROL_0

Control Register

Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	WR_SEC_CNT: When set, writes to the SECONDS counter are disabled. Can only be cleared by resetting the RTC module 0 = DISABLE 1 = ENABLE

11.2.2 APBDEV_RTC_BUSY_0

Busy Register

Offset: 0x4 | Read/Write: RO | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
0	X	STATUS: This bit is set when a write is initiated on the APB side. It is cleared once the write completes in RTC 32 KHz clock domain, which could be several thousands of APB clocks. This must be IDLE before a write is initiated. Note that this bit is only for writes. 0 = IDLE 1 = BUSY

11.2.3 APBDEV_RTC_SECONDS_0

Seconds Counter Register

The SECONDS register is copied over to the APB side every eight 32 KHz clocks (~250 µs). Because of this, performing a read immediately after a write might return an old value. This covers 49710.26 Days (or) 136.192 Years of 365 days each.

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SECONDS: The seconds counter is incremented every 1000 milliseconds.

11.2.4 APBDEV_RTC_SHADOW_SECONDS_0

Shadowed Seconds Counter Register

Shadow SECONDS register is updated over to the APB side whenever there is a read to milliseconds counter.

Since the software cannot read both registers at any given point of time, the Seconds register content is captured in this register. If software needs to read both seconds and milliseconds, read the MILLI_SECONDS register followed by a read of this register.

Offset: 0xc | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	SHADOW_SECONDS: A snapshot of the SECONDS counter is taken, whenever there is a read to MILLI_SECONDS Register.

11.2.5 APBDEV_RTC_MILLI_SECONDS_0

Milliseconds Counter Register

The Milliseconds register is copied over to the APB side every eight 32 KHz clocks (~250 µs). Because of this, performing a read immediately after a write might return an old value.

Offset: 0x10 | Read/Write: RO | Reset: 0x00000XXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
9:0	X	MILLI_SECONDS: Milliseconds counter is incremented using the Bresenham algorithm

11.2.6 APBDEV_RTC_SECONDS_ALARM0_0

Seconds Alarm0 Registers

When the value in this register matches the seconds counter, the corresponding interrupt status bit is set. If enabled, the interrupt line is asserted. A value of zero disables the alarm.

Offset: 0x14 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SECS_MATCH_VALUE: Match value to trigger the alarm

11.2.7 APBDEV_RTC_SECONDS_ALARM1_0

Seconds Alarm1 Registers

When the value in this register matches the seconds counter, the corresponding interrupt status bit is set. If enabled, the interrupt line is asserted. A value of zero disables the alarm.

Offset: 0x18 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	SECS_MATCH_VALUE: Match value to trigger the alarm

11.2.8 APBDEV_RTC_MILLI_SECONDS_ALARM_0

Milliseconds Alarm Register

When the value in this register matches the milliseconds counter, the corresponding interrupt status bit is set. If enabled, the interrupt line is asserted. A value of zero disables the alarm.

Offset: 0x1c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0000000000)

Bit	Reset	Description
9:0	0x0	MSEC_MATCH_VALUE: Milliseconds match value.

11.2.9 APBDEV_RTC_SECONDS_COUNTDOWN_ALARM_0

Countdown Alarm Register

If ENABLE is set to ENABLED, an internal counter is loaded with VALUE and counted down. The interrupt bit corresponding to the countdown_alarm_0 is set after the specified number of seconds have elapsed.

The interrupt bit corresponding to the countdown alarm (SEC_CDN_ALARM) is set after the specified interval has expired. If REPEAT is ENABLED, the countdown operation is performed repeatedly.

Offset: 0x20 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31	0x0	ENABLE: Enable bit for the countdown operation. If repeat is not set, this bit is cleared once the internal counters counts down to specified value. 0 = DISABLED 1 = ENABLED
30	0x0	REPEAT: Repeat bit for the countdown operation 0 = DISABLED 1 = ENABLED
29:0	0x0	VALUE: Number of seconds to countdown

11.2.10 APBDEV_RTC_MILLI_SECONDS_COUNTDOWN_ALARM_0

Countdown Alarm Register

If ENABLE is set to ENABLED, an internal counter is loaded with VALUE and counted down. The interrupt bit corresponding to the countdown_alarm_0 is set after the specified number of milliseconds have elapsed.

The interrupt bit corresponding to the countdown alarm (MSEC_CDN_ALARM) is set after the specified interval has expired. If REPEAT is ENABLED, the countdown operation is performed repeatedly.

Offset: 0x24 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31	0x0	ENABLE: Enable bit for the countdown operation. If repeat is not set, this bit is cleared once the internal counters counts down to specified value. 0 = DISABLED 1 = ENABLED
30	0x0	REPEAT: Repeat bit for the countdown operation 0 = DISABLED 1 = ENABLED
29:0	0x0	VALUE: Number of milliseconds to countdown

11.2.11 APBDEV_RTC_INTR_MASK_0

Interrupt Mask Register

This register stores the masks for the interrupts. If a bit is set 1 and the corresponding interrupt condition is satisfied, interrupt line to system interrupt controller is asserted.

Offset: 0x28 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4	0x0	MSEC_CDN_ALARM
3	0x0	SEC_CDN_ALARM
2	0x0	MSEC_ALARM
1	0x0	SEC_ALARM1
0	0x0	SEC_ALARM0

11.2.12 APBDEV_RTC_INTR_STATUS_0

Interrupt Status Register

Bits in this register are high after the interrupt condition is satisfied. Any bits that are set to one in the data written to this register will clear their corresponding data bits. Any bits set to zero have no effect.

Offset: 0x2c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4	0x0	MSEC_CDN_ALARM
3	0x0	SEC_CDN_ALARM
2	0x0	MSEC_ALARM
1	0x0	SEC_ALARM1
0	0x0	SEC_ALARM0

11.2.13 APBDEV_RTC_INTR_SOURCE_0

Interrupt Source Register

This read-only register returns the AND of the Interrupt Source and Interrupt Mask registers.

Offset: 0x30 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
4	X	MSEC_CDN_ALARM
3	X	SEC_CDN_ALARM
2	X	MSEC_ALARM
1	X	SEC_ALARM1
0	X	SEC_ALARM0

11.2.14 APBDEV_RTC_INTR_SET_0

Interrupt Set Register

Reserved. This write-only register is used for testing purposes only.

Offset: 0x34 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000)

Bit	Reset	Description
4	0x0	MSEC_CDN_ALARM
3	0x0	SEC_CDN_ALARM
2	0x0	MSEC_ALARM
1	0x0	SEC_ALARM1
0	0x0	SEC_ALARM0

11.2.15 APBDEV_RTC_CORRECTION_FACTOR_0

Correction Factor (Digital Trimming) Register

Support is for +/- 500 ppm. The expected maximum deviation of the standard clock sources is +/- 50 ppm.

Offset: 0x38 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxx0000000000)

Bit	Reset	Description
9	0x0	DIRECTION: 0 = DECREMENT 1 = INCREMENT
8:0	0x0	PPM

12.0 HOST SUBSYSTEM

The host controller (referred to as Host1x) provides a sophisticated programming and control interface to various graphic and video engines, and display. In addition to Host1x's control interfaces with these units, it also has a slave (IP) interface to the ARM7 crossbar (xbar), TSEC, and a direct memory interface to fetch command structures from system memory. Commands are either gathered from a push buffer in memory or provided directly by the CPU, and then supplied to the clients behind Host1x via Host1x channels. The channels also provide a means of synchronization between software and any individual block or amongst the blocks themselves via hardware Sync Point signals (syncpts).

12.1 Glossary

Term	Definition
CDMA	The command DMA. It is responsible for reading commands from memory and supplying them to all channels. It starts from the address in the channel's DMASTART register and continues until it reaches the address in the channel's DMAPUT register.
Channel	A piece of hardware that provides a programming interface to one or more classes. A channel contains a sequence of commands embodied in a command FIFO. This sequence of commands can also be thought of as a thread of execution and of a single context. There exists only one sequence of commands or context per channel. That is to say, there is no hardware-managed context switching within a single channel.
Channel Commands	Entries in the command FIFO. Commands take a common form interpretable by Host and are used for 3 main functions: controlling class ownership and class virtualization of the channel; command expansion via gather commands; and issuing class methods.
Channel switch	A transfer of ownership of a client from one channel to another; a type of context switch. Sometimes a source of confusion, this is not a transfer of ownership of a channel, but of a client. This is the preferred narrowed nomenclature to context switch in order to avoid confusion.
Class	An abstraction of a client, device, or resource. It is a collection of methods. A class can only be owned by multiple channels, but only one channel may actively be using any class, which is known as a channel's working class. The transfer of working class from one channel to another is known as a context switch, which is managed by Host.
Class ID	A unique tag corresponding to each class.
Class method	A method that belongs to an unspecified class.
Class switch	A change in the current in the active class of a client; a type of context switch. In the event that a class switch also involves a channel switch, channel switch is the preferred declaration.
Client, device, resource	A piece of hardware that resides behind Host, connected via the HRD and HRW buses. Client is the preferred terminology for this document. Generally mapped one-to-one with a class, although this is not a strict requirement.
Command FIFO	Holds channel commands supplied by the CDMA or PIO accesses. It is stalled by synchronization methods, backpressure from its destination client, or ownership of the

Term	Definition
	destination client by a different channel
Context switch	A Host event where it facilitates a client's state transition. A context switch is either a channel switch or a class switch.
Direct register access	Access to a client initiated by the CPU. If a channel and the CPU initiate a data transaction to the same client at the same time, the CPU gets priority. Direct register accesses are orthogonal to channels in regards to client ownership.
DMAGET register	Holds the current address of the CDMA. One exists per channel.
DMAPUT register	Holds the end address of a command stream in memory. One exists per channel.
DMASTART register	Holds the start address of a command stream in memory. One exists per channel.
Gather	A channel command to gather contiguous chunks of memory and inserts it into the command stream.
Host Master	General term to indicate an entity that can control Host. The current list is the CPU, AVP, and TSEC.
Host method	A method that belongs to the Host class.
Increment	A channel command that specifies an offset and a count. Increment works like nonincrement, except the offset is incremented by one on each on each write.
Indirect register access	Access to a client initiated by the CPU, but requires two Host register accesses. This is deprecated in the SOC version of the host; it comes from the companion-chip mode where fixed-latency interfaces to the CPU may exist. Like direct register accesses, indirect takes priority over channel transactions. Indirect register accesses must be tied a channel because they require a read return FIFO.
Mask	A channel command that specifies an offset and a mask. A mask command works much like increment and non-increment, except the offsets are calculated by looking at the bits set in the mask. The bit position indicates the relative offset from the specified offset in the command. Mask expects the number of words to follow to be equal to the number of bits set in the mask.
Method	An operation on a class. The most common example is a single register write.
Nonincrement	A channel command that specifies an offset and a count. The offset specifies a method in the current class and the count indicates the number of subsequent words to be written at that offset.
Protected Channel	Deprecated feature previously used by software for flow control.
Push-buffer	A set of commands residing contiguously in memory. It is a communication method between the processor and Host. Commands are placed at the end of the buffer and a pointer is updated in Host.
SetClass	A channel command that takes a class id as an argument. SetClass is the sole means to indicate the current virtualization of the channel. It also the sole means that a channel can acquire ownership of a class. Subsequent

Term	Definition
	channel commands are directed towards this class.
Sync Point (Syncpt)	A counter used for synchronization. Every time a specified event occurs, the counter is incremented. A channel can wait until the syncpt attains a specified value, or an interrupt can be generated when a specified value is reached.
Teardown	Can be either a module or channel teardown. Essentially, it means all links and references within Host between the specified module or the specified channel are removed and reset.
Tick Count	Running count of the Host clock after it has been enabled.
WAIT	A host method that takes a single vector argument. It is used in conjunction with syncpt. A WAIT stalls the command FIFO until the supplied vector intersects the RAISE register at all.

12.2 Features

The key features of the Host1x controller are summarized below:

- 12 Channels
- 192 Sync Points
- 64 Syncpt Base Registers
- 32-bit Syncpt Comparison
- 32-bit Timeout register
- Stall and transfer counters
- Unit Activity Monitor (ACTMON): MSENC and VIC
- Master clients: Crossbar and TSEC
- TZ secure bit In MMIO path
- Master Interface protocol: Native Crossbar
- Client Interface protocol: Hwr/Hrd
- 32-bit Host1x2MC address

12.2.1 Class Based Programming

GPUs support a programming interface that is based on writing to offsets within a “class” that implements a function, rather than to specific register offsets and formats.

By using “class” interface register offsets/formats need not to remain fixed so there is nothing chip specific in the API. This will allow both hardware flexibility and software driver compatibility.

12.2.2 Command Buffer DMA

To maximize the Host1x bandwidth, it is important to burst as many write cycles as possible, which requires the processor to first combine writes. The write buffering typically requires sequential offsets to be written and also may not follow strict programming order. The CPU will first store this buffered data directly to memory and then program the Host1x engine to DMA it.

12.2.3 Multiple Channels

A channel is a thread of execution within Host1x. Similar to a multithreaded CPU, a channel helps defining a context that can be used to allow multiple users of the Host1x and plays a role in context switching.

A channel switch does not always require a client module context switch. There will be a state change within the Host1x, but if channels have non-overlapping usage (e.g., possibly a VIC channel and MSENC encode channel), there may be no need to context switch any Host1x client module.

12.3 Hardware Features

12.3.1 Channels

The Tegra K1 processor has 12 Host1x channels. Each channel has a set of registers and a command FIFO. Each channel can be associated with one or more Host1x clients. The channel is the primary means of delivering commands to clients, which is described in the Host1x Programming Model section.

12.3.1.1 Channel Registers

Channel registers are broken into two functional groups: one grouping is associated with the command FIFO and command delivery to clients; the other grouping is associated with register and memory access.

CDMA Registers

- **HOST1X_CHANNEL_DMASTART_0:** This register triggers a DMA fetch from memory for this channel, if PUT register does not equal the GET register.
- **HOST1X_CHANNEL_DMAPUT_0:** This register triggers a DMA fetch from memory for this channel, if the PUT register does not equal the GET register. This address is relative to the DMASTART base address. It does not support byte writes. All 4-byte data need to be programmed.
- **HOST1X_CHANNEL_DMAGET_0:** This register tracks the MC offset, which DMA engine has read. It gets incremented as entries are loaded from the channels command buffer into the FIFO. This address is relative to the DMASTART base address.
- **HOST1X_CHANNEL_DMAEND_0:** This is the boundary of illegal addresses (either end of push-buffer or end of physical memory). This is designed to prevent DMA from prefetching illegal addresses. If DMA reaches this address before seeing a RESTART, it will stop. This would be a software error condition.
- **HOST1X_CHANNEL_DMACTRL_0:** The various fields of DMA control register are described as below:
  - **DMAGETRST**: Reset GET pointer to '0'. Useful for cleaning up crashed channels. DMAGET value is not updated instantly. It takes 4 cycles between programming of reset and valid DMAGET.
  - **DMAGETINIT**: Reset GET pointer to the value of DMAPUT when DMAGETRST is asserted.
  - **DMASTOP**: Stop DMA from fetching on this channel.

> **Note:** A Command DMA channel needs to be enabled for PIO-gather to work.

Access Registers

- **HOST1X_CHANNEL_INDOFF_0 and HOST1X_CHANNEL_INDOFF2_0:** The INDOFF and INDOFF2 registers (along with INDCNT and INDDATA) are used to indirectly read/write modules outside the host. If AUTOINC is set, INDOFFSET value is increments by 4 on every access of INDDATA. REGFNUMEMPTY is polled to determine when valid data can be read from INDDATA. The INDOFF register has limited capability on chips with large memory maps. If the top bit of the memory address is >= 27, all of memory cannot be addressed with INDOFF. In these cases, use

INDOFF2 to set the offset while still using INDOFF to set other parameters. Always have INDOFFUPD set to NO_UPDATE in these cases.

- For register accesses, using INDOFF (with INDOFFUPD set to UPDATE) is always more efficient, since it only requires one write.
- **HOST1X_CHANNEL_INDCNT_0:** Indirect register access count used to trigger indirect reads. Holds the number of registers/memory locations that will be read out. Channels should not request more than there is space available in their output FIFO. For indirect frame buffer reads, each channel cannot issue more than NV_HOST1X_MAX_IND_FB_READS at once. The read data must return and be written into the per-channel output FIFO before any additional reads can be issued.
- **HOST1X_CHANNEL_INDDATA_0:** This register, when written, writes to the data to the INDOFFSET in INDOFF. For reads, a REGFNUMEMPTY number of 32-bit values can be read before needing to poll FIFOSTAT again. The per-channel output FIFO (OUTFENTRIES) is readable via this offset. A read of INDDATA will pop an entry off of the per-channel output FIFO.
- **HOST1X_CHANNEL_CMDSWAP_0:** Command swap control. Affects swapping on writes to the PIO region and the frame-buffer buffered memory write region.
- **HOST1X_CHANNEL_FIFOSTAT_0:** CFNUMEMPTY is the number of free slots available in the per-channel command FIFO (needed for PIO or polling for completion of a wait).

12.3.1.2 Channel Command FIFO

The command FIFO is loaded either the CDMA or via PIO access. PIO is mainly used for debug purposes, but it allows a Host1x master to fill the command FIFO with channel commands by writing into “command FIFO” region of the channel's address space. PIO Command FIFO accesses should not be issued while a “Gather” process is busy.

A command FIFO has a set of registers that point to a location in memory where a sequence of channel commands resides. This sequence of commands is generally referred to as a “Push-buffer”.

A Host1x master can write either to DMAPUT or DMASTART register to trigger command fetching by the CDMA. DMASTART indicates where to start fetching, and DMAPUT indicates where to stop. DMAGET is a read-only reference to the present location of the command FIFO; it is incremented when the command is popped from the command FIFO. DMAPUT and DMAGET are relative addresses to DMASTART.

DMAEND provides an upper boundary to prevent the CDMA from fetching illegal addresses; fetching will cease when DMAGET equals DMAEND.

The command FIFO can be halted by writing the DMASTOP field in the Dmactrl register. Dmactrl also provides a mechanism to reset the DMAGET pointer (*Dmagetrst* field) to either 0 or to the value of DMAPUT (Dmainitget field).

12.3.1.3 Channel Commands

Channel commands can be split into two categories:

- **Class commands:** A class command is a mechanism to communicate a class write to a client. The channel must have an active class when processing class commands. The active class is set by a SETCL (SetClass) command.
- **DMA commands:** DMA commands control what is being fetched. They are processed at the top of the command FIFO while class commands are processed at the bottom of the command FIFO. This is because DMA commands change the command stream and must be processed before entering the FIFO.

Offsets in class commands are relative to the active class' base as they are limited to only the methods in the active class.

Channel Commands

- **SETCL (SetClass)** – A channel command that takes a class ID as an argument. SetClass is the sole means to indicate the current virtualization of the channel. It also means that a channel can acquire ownership of a class. Subsequent channel commands are directed towards this class.
- **NONINCR (NonIncrement) –** Takes an offset and count as arguments. There will be <count> data following this class command that will be written to the specified offset. Nonincrement indicates that the offset will not be incremented per data write.
- **INCR (Increment) –** Takes an offset and count as arguments. There will be <count> data following this command that will be written starting at the specified offset. The offset is incremented after each write.
- **MASK (Mask) –** Takes an offset and count as arguments. The number of data to write after the command is equal to the number of set bits in the count. Each data is written to the specified offset plus the next active bit location. For example, a count equal to 0x5, would have 2 data that are written to (offset+0) and (offset+2).
- **IMM (Immediate) –** Takes an offset and 16-bit data as arguments. The 16-bit data is written to the offset.

DMA Commands

- **RESTART (Restart or Jump) –** This command specifies an offset relative to DMASTAT. The next command fetched will be from (DMASTART + offset).
- **GATHER** – Command comprises 2 words and has arguments: offset, insert, type, count, and address. When GATHER is processed, <count> data is fetched from the address and inserted into the command stream. If the <insert> argument is enabled, it will insert either an INCR or NONINCR opcode preceding the fetched data, which is specified by <type>.

DMA commands do not need an active class, but often are processed when an active class exists. In the case of GATHER, if <insert> is enabled, there must be an active class.

12.3.1.4 Channel Control

Channel status and control resides in the synchronous register space of the Host1x address map. These registers are aliased in each channel's space. The details of these registers are as below:

- **CH<0..n>_STATUS:** Status includes client ownership and whether the channel is blocked or not (n is the number of channels – 1).
- **CH_TEARDOWN:** Using this register each channel can be reset, which is referred to as a teardown. This means all channel state is cleared and all client and class ownership is relinquished.
- **MOD_TEARDOWN:** Similar to channel teardown, there exists a mechanism to reset modules. Setting this register can clears all state associated with a given client/module.
- **<client>_STATUS** : This register indicates the client's currently active class.

12.3.2 Host1x Class

Host1x has its own class that can be executed from the command FIFO. It is comprised of methods to access client registers as well as methods to control channel flow.

12.3.2.1 INDOFF

The following Host1x methods operate identically to the channel registers used for indirect access. Refer to the Host Channel Registers and Indirect Register Access sections.

- INDOFF
- INDOFF2
- INDCTRL

- INDDATA

INDCNT is absent from the list above. In Host1x master-initiated indirect register reads, INDCNT is written to trigger the read. Conversely, reads from the command FIFO are trigged by a write to INDDATA. Reads issued from the command FIFO are returned to the channel's register return FIFO (return_FIFO).

12.3.2.2 DELAY_USEC

Delay_Usec stalls the command FIFO for the number of microseconds specified. This command has no impact on indirect register accesses if **not** initiated from the command FIFO. The microsecond period is calculated based on setting in the Usec_Clk register. The Usec_Clk register is programmed on the basis of Host1x clock for example if host clock is 250 MHz, then this register should be programmed to a value of 250.

12.3.2.3 TICKCOUNT

Tickcount_Hi, Tickcount_Lo, and Tickctrl can also be controlled from the command FIFO. Their operation is identical whether controlled from the command FIFO or a Host1x master.

12.3.2.4 INCR_SYNCPT

All Host1x modules, including the Host1x itself, implement the Incr_Syncpt class.

Incr_Syncpt <Cond> <Indx>

For the Host1x, this method immediately increments Syncpt[Indx] irrespective of the cond.

12.3.2.5 WAIT_SYNCPT

Wait on syncpt – the command dispatch will stall until the syncpt counter pointed by the index field reaches the threshold value specified in the Thresh field:-

Wait_Syncpt <Indx> <Thresh>

The channel will wait until the following is true:

Syncpt[Indx][15:0] >= Thresh[15:0]

where the “>=” takes into account wrapping (see the “Sync Points (SYNCPTs)” section for more information on wrapping). More specifically, the channel will wait until:

((Syncpt[indx] – thresh) & (1 << 15)) != 0

12.3.2.6 WAIT_SYNCPT_BASE

This method uses Syncpt Base registers to calculate threshold value for channel wait operation. The syncpt index, base index and also optional offset will be a part of Wait_Syncpt_Base command:-

Wait_Syncpt_Base <Indx> <Base_Indx> <Offset>

The channel will wait until the following is true:

Syncpt[Indx][15:0] >= (Syncpt_Base[Base_Indx] + Offset)[15:0]

Where the “>=” takes into account wrapping. See the “Sync Points (SYNCPTs)” section for more information on wrapping.

12.3.2.7 WAIT_SYNCPT_INCR

Wait until syncpt increments:

Wait_Syncpt_Incr <Indx>

The channel will stall until Syncpt[Indx] is incremented. Note that this wait method is not recommended.

12.3.2.8 LOAD_SYNCPT_BASE

Load a new value into the Syncpt_Base register:

load_syncpt_base <base_indx> <value>

Syncpt_Base[Base_Indx] will be loaded with <Value>.

12.3.2.9 INCR_SYNCPT_BASE

Add an offset to the value in the Syncpt_Base register:

Incr_Syncpt_Base <Base_Indx> <Offset>

The following operation will be done:

Syncpt_Base[Base_Indx] += Offset

12.3.2.10 STALLCOUNT

STALLCOUNT_HI, STALLCOUNT_LO, and STALLCTRL are methods to control “stall counters” through the command FIFO. Details of stall counters are given later in this document.

12.3.2.11 XFERCOUNT

Channel_Xfer_Hi, Channel_Xfer_Lo, and Xferctrl are methods to control “xfer counters” through the command FIFO.

12.3.2.12 32-Bit Sync Point Comparison Methods

Five methods are used for 32-bit sync point comparison. Software should send these commands using the following format:

LOAD_SYNCPT_PAYLOAD_32, <other_command>

where <other_command> is one of the following::

- WAIT_SYNCPT_32
- WAIT_SYNCPT_BASE_32 ,
- LOAD_SYNCPT_BASE_32,
- INCR_SYNCPT_BASE_32

LOAD_SYNCPT_PAYLOAD_32 <Payload(32)>

This method loads a 32-bit value into the corresponding channel's Channel_Syncpt_Payload register:

Channel_Syncpt_Payload[31:0]= <Payload(32)>

WAIT_SYNCPT_32 <Indx(8)>

This method stalls the current channel until following condition is true:-

(SYNCPT [<indx>][31:0] - PAYLOAD[31:0]) & 0x80000000) == 0

Here the Payload value is taken from Channel_Syncpt_Payload of the current channel.

This is essentially a wrapping stall until ((SYNCPT [<indx>][31:0] >= PAYLOAD[31:0])

WAIT_SYNCPT_BASE_32 <Indx(8)> <Base_Indx(8)> :

This method stalls the current channel until following condition is true:-

((Syncpt [<Indx>][31:0] - (Payload[31:0] + Syncpt_Base[<Base_Indx>][31:0]) & 0x80000000) == 0

Here the Payload value is taken from Channel_Syncpt_Payload register of the current channel.

This is essentially a wrapping:-

stall until ((Syncpt [<Indx>][31:0] >= (Payload[31:0] + Syncpt_Base[<Base_Indx>][31:0]))

LOAD_SYNCPT_BASE_32 <Base_Indx(8)>

This method copies the value from the current channel's Channel_Syncpt_Payload register into the Syncpt_Base register specified through the Base_Indx field:-

Syncpt_Base[<Base_Indx>][31:0] = Channel_Syncpt_Payload[31:0]

INCR_SYNCPT_BASE_32 <Base_Indx(8)>

This method adds the value of the current channel's Channel_Syncpt_Payload register into the Syncpt_Base register specified through Base_Indx:-

Syncpt_Base[<Base_Indx>][31:0] += Channel_Syncpt_Payload[31:0]

12.3.3 Context Switching

Context management of Host1x 1x-based modules will be completely under software control (there will be no automatic context switching done by hardware). This mean a module will never produce a context switch interrupt, it will always operate in auto-acknowledge mode.

12.3.4 Behavior of SetClass

The SetClass does not mean implicit acquisition of a module's ownership. It is possible to send commands simultaneously from more than one channel to the same module. If exclusive ownership of a module is required for software correctness, then acquire_mlock and release_mlock opcodes should be used, which acquire and release the MLOCKn semaphore bits. An acquire_mlock that fails will cause that channel's commands to stall until it wins subsequent MLOCK arbitration (arbitrations happen with each release_mlock).

Here is the summary of SetClass behavior:-

- SetClass simply instructs the channel hardware which module and context to use for the following commands.
- If multiple channels write simultaneously to the same class ID, and no MLOCKs are used, then the actual commands are interleaved in round-robin fashion (one command per channel).
- If multiple channels write simultaneously to different class IDs in the same hardware module (and no MLOCKs are used), then the actual commands are interleaved, but in blocks of N-cycle bursts (each burst of commands must be preceded with a CTXSW to the module giving the new context ID).

  N in this case is programmable number configured through Ctxsw_Timeout_Cfg register.

12.3.5 Sync Points (SYNCPTs)

A Sync point is a mechanism to synchronize between software and Host1x clients and also in between Host1x clients. This is implemented as 32-bit counters which are incremented by 1 whenever some predestinated condition (or event) occurs. When a counter reaches its maximum value, it wraps back to zero on the next increment.

Tegra K1 processors have 192 sync points. Sync points are not permanently associated with a channel; sync point allocation is done by software during initialization time.

There are two basic ways for sync point increments: -

- When a CPU writes an index to the Host1x's "syncpt_cpu_incr" register.
- When a Host1x client has received an "incr_syncpt" method and the condition specified by this method has become true.

Synchronization using sync points can be done in the following ways:

- A CPU can be interrupted when a sync point reaches a pre-specified value.
- A Host1x channel can have "wait" commands so that channel will wait for a pre-specified sync point value.

Sync points are normally not reset, but can wrap -- the comparison takes into account the possibility of wrapping.

Note:	Sync point wrapping works only if (Syncpt value - Syncpt Threshold) <= $2^{(syncpt\_width-1)}$ For 16-bit syncpt comparisons, the difference should be less than or equal to 32768. Software must take care of wrapping issues. For 32-bit comparisons, the difference should be less than or equal to 2,147,483,648, Because of the large value, software will not see any wrapping issues.

All Host1x clients (e.g., VI) implement the following increment syncpt method:

Incr_Syncpt <Condition> <Index>

The Host1x client would receive the "Incr_Syncpt" method and store the index for each condition. Whenever the "condition" event occurs, the client would return the index back to Host1x.

12.3.5.1 Client Model for Syncpt Behavior

Software Programming Model

The basic programming model that software will follow is:

Each module will be programmed to do a unit of work (an operation) by Host1x using CDMA and push buffers.

Examples of an operation include:-

- BLT (VIC)
- Draw a set of triangles (GPU)
- Encode a single frame (MSENC).

If nothing else is programmed, then module will go idle until Host1x sends commands to start another operation (no continuous mode).To do its operation, a module reads data from memory and writes the results to memory. Modules interact with each other using memory buffers: one module is the producer of data, and another is the consumer of that data.

There are exceptions to this model which we will discuss in detail later, but should be mentioned here. The exceptions include VI and DISPLAY which work in continuous mode (they continue to process data without the need of additional Host1x programming).

Basic Synchronization

There are two basic needs for synchronization: management of memory buffers and timing of control register writes.

Memory buffers used to pass data from one module to the next use a producer/consumer model with circular buffers. To prevent buffer underflow and overflow, synchronization needs to be done in both directions:

- The consumer cannot read until producer is done writing (and the writes are committed to memory).

- The producer cannot reuse an output buffer (i.e., write to buffer) until the consumer is done reading the buffer.

Thus, the synchronization events required for memory buffers are:

- The module has completed all reads from the buffer.
- The module has completed all writes to the buffer (and they are committed by the memory controller).

To understand the requirements for timing the writes to control registers, a typical sequence is provided below:

1. reg wr for operation A
2. reg wr for operation A
3. reg wr (trigger) for operation A
4. reg wr for operation B
5. reg wr for operation B
6. reg wr (trigger) for operation B

If no WAIT method is placed between the trigger for A and the first register write for B, then in the worst case, corruption of operation A may occur because the new value of the control register is used before operation A is done. For modules that protect against this corruption, there is still the undesirable behavior of the module delaying the register write and subsequently causing back pressure on the Host1x write bus. If we wish to allow direct register reads to be used by ISRs they will happen asynchronously to the channel command writes, so one must ensure that the Host1x bus does not stall for significant periods of time.

For synchronizing writes to control register, a safe time to start writing register for the next operation is defined to be when:

- No corruption will occur for previous operations.
- No stall of the HWRBUS bus will result.

12.3.5.2 Standard Set of Incr_Syncpt Conditions

The following values of the “incr_syncpt cond” field are predefined:

- **0** (Immediate): Return indx to Host1x immediately (used by software push-buffer allocation and helpful for debug).
- **1** (Op_Done): Return indx to Host1x when all previously triggered operations have completed and their writes to memory are committed.
- **2** (Rd_Done): Return indx to Host1x when all previously triggered operations have completed their reads from memory.
- **3** (Reg_Wr_Safe): Return indx to Host1x when it is safe to program registers for the next operation. Safe means no corruption to previous operations and no stalling of Host1x write bus will occur.

There are special cases which would require use of additional condition values. Some modules have multiple read buffers condition = 2 (all reads done) would mean all reads to all buffers done, but it might be useful to software to know when reads are done to a specific input buffer. For some modules, e.g., VI, there are different safe times to update different sets of registers, so condition = 3 will need several variations (one for each "safe time"). If a module can have two operations happening at one time (as in VI), then special considerations will need to be made for these cases: either two separate Incr_Syncpt methods or one Incr_Syncpt method with many special conditions.

For some modules, one condition can replace another if the two conditions always happen within a short period of time of each other. Then the condition that always happens last can be used for both.

12.3.5.3 Continuous Mode — Display and VI

For each display, software wants a free-running syncpt increment on every display “Vsync”. The most appropriate implementation of this is to have an additional register which has “Enable” and “Indx” fields to control the increment of syncpt on every “Vsync” event. If enable is set, then on every “Vsync”, display would return this “Indx” back to Host1x.

A similar situation exists for VI, where besides a set of conditions for the “Incr_Syncpt” method, it would also need a register with “Enable” and “Indx” which would control the incrementing of a syncpt on every camera “Vsync”.

Host1x clients will implement the logic associated with these registers. When this continuous mode is enabled, the client should set a pending bit for when the condition occurs. When the pending bit is set, the client will arbitrate for the hrd_<client>2host1x bus and if selected it will send “Indx” tagged with “Syncpt type” on hrd_ bus. After successfully sending the indx on hrd bus, the client will clear the pending bit.

One of the issues for continuous operation of VI is that not all modes of operation allow the consumer of their output buffers to signal backpressure when the consumer has fallen behind in reading. To alleviate this problem, VI has registers which, when written to, signal that the reading of one buffer has completed.

See Table 32 for a list of the Host1x clients.

12.3.5.4 Allowing Multiple Pending INCR_SYNCPTS

Clients can have multiple pending syncpts which are queued into the client’s syncpt FIFOs, which are dedicated ones for each syncpt conditions.

The behavior of these syncpt FIFOs is controlled by an “Incr_Syncpt_Cntrl” register in client’s register space:

INCR_SYNCPT_CNTRL< No_Stall>< Soft_Reset>

- No_Stall:

  If this bit is 1 and an Incr_Syncpt method is received but the syncpt FIFO for that condition is full, then this method will be dropped and the Incr_Syncpt_Error[Cond] bit will be set.

  If this bit is 0, then instead of dropping next method in case of a syncpt FIFO full condition, the client will just stall the host interface.

- Soft_Reset:

  if Soft_Reset is set, then all internal state of the client syncpt block will be reset. To do a soft reset, first set Soft_Reset of all Host1x clients affected, then clear all Soft_Resets.

INCR_SYNCPT_ERROR<Cond_Status>

This register stores error status in case of above mentioned syncpt FIFO full condition.

12.3.5.5 32-bit Sync Point Comparison

In Tegra 3 and previous chips, sync point counters were implemented as 32-bit registers but comparison takes into account 16-bit value only. In Tegra K1 devices, sync point comparison is extended to 32 bits. To support this feature, Host1x has the following changes:-

Host1x 32-Bit Registers

The following registers are extended to 32 bits:

- Syncpoint base register [Host1x 1x_Sync_Syncpt_Base]
- Syncpt Threshold register [Host1x 1x_Sync_Syncpt_Int_Thresh]

The following 32-bit register stores the payload value required in syncpt methods:

- Channel_Syncpt_Payload[31:0]

Host1x Method Changes

To support 32-bit syncpt comparisons, new Host1x methods have been introduced and are described later in this document.

12.4 Unit Description

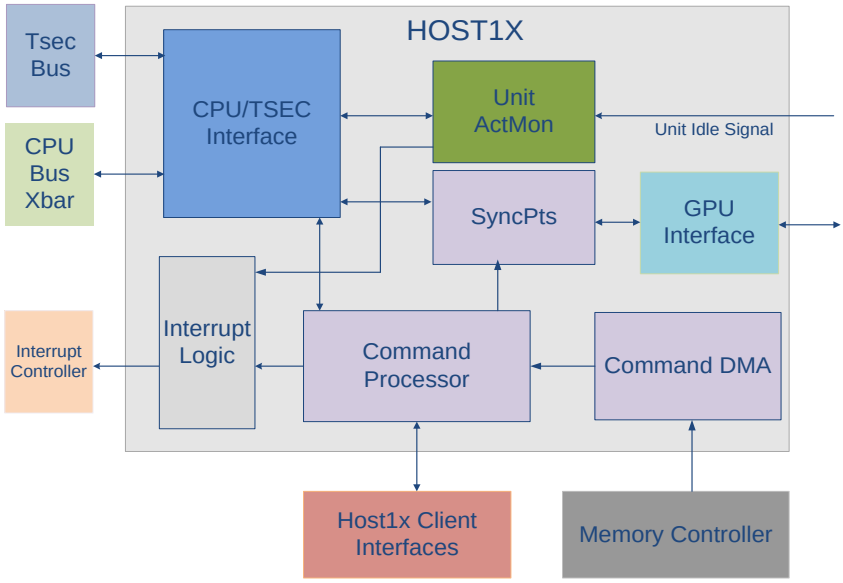
Host1x has a master client interface with the CPU Xbar bus and also a TSEC unit to receive CPU/TSEC read/write commands. The incoming commands are either processed inside Host1x if they are Host1x specific or routed to clients.

Host1x has a point-to-point interface with its clients using HWR/HRD buses, which are used for sending requests and accepting responses from clients.

There is a memory controller interface to fetch Push-Buffer commands from memory through the “Command DMA” unit. The incoming Push-Buffer commands are processed inside “Command Processor” and afterwards either consumed inside Host1x or it will generate tractions to client interface. There is an internal “syncpt” unit which is used to synchronize between Host1x clients and also between software.

There is a “Unit ActMon” block to monitor activities of Host1x clients. The ActMon statistics are used by software for power management.

Figure 17: Host1x Top-Level Block Diagram

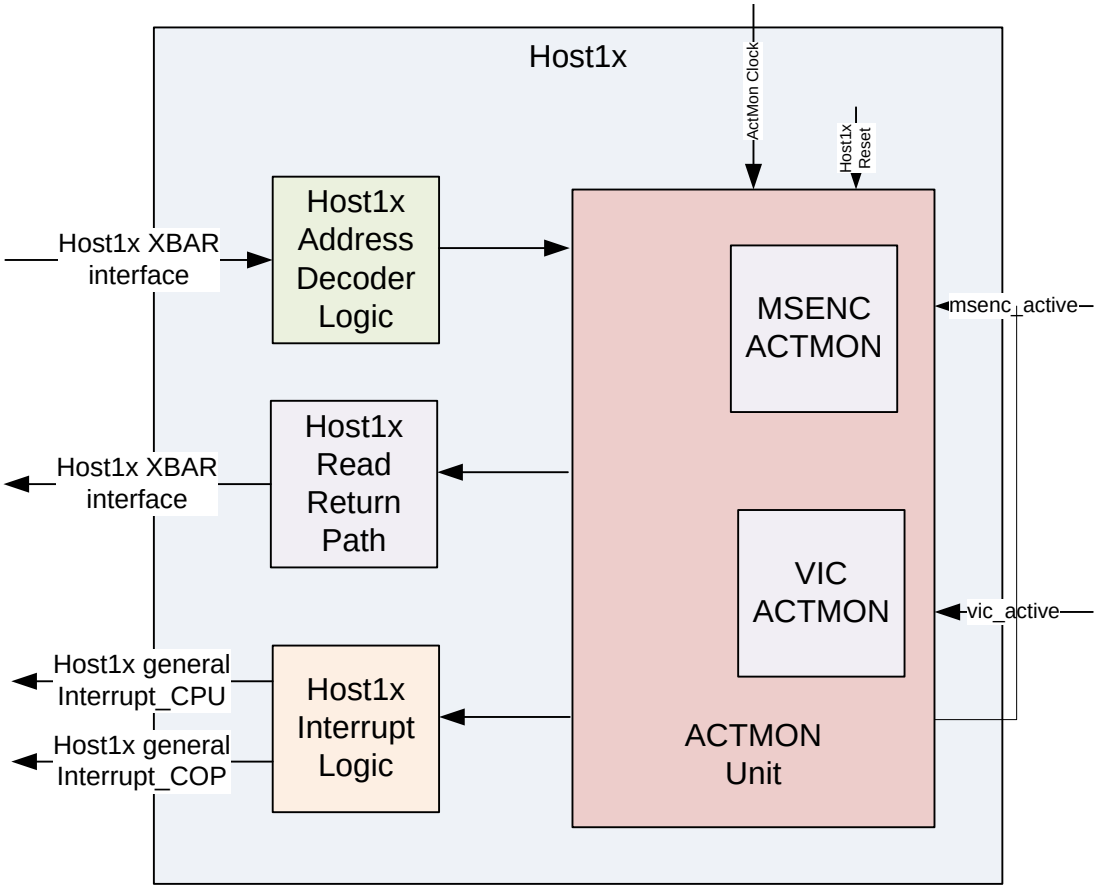


12.4.1 Activity Monitor

The Host1x unit implements 32-bit activity monitor (ACTMON) counters to monitor the idleness of the MSENC/VIC units.

The MSENC/VIC units send active information to Host1x through the same “active” signal (which is a level signal). The ACTMON block provides averaging, watermark detection, and interrupt functionality similar to the central activity monitors. The Host1x driver manages these monitors.

Figure 18: ACTMON Interface



The clock for the ACTMON unit is a low-frequency (10 MHz ~ 50 MHz), non gateable clock.

There is 1 interrupt status bit (per MSENC and VIC ACTMON interrupt) in Host1x, which is set by the actmon_intr_set_msenc and actmon_intr_set_vic signals and cleared by software. Also there are corresponding interrupt mask bits for these interrupt lines to enable/disable interrupts.

The ACTMON register accesses are handled by the ACTMON itself. The Host1x will forward the access control/address/data signal to the ACTMON unit.

The ACTMON registers are a part of Host1x register space.

12.4.2 Filtering Out Kernel Commands from the Gather Buffer

This feature maintains user mode driver versus kernel driver protection. The host1x kernel driver sets up mode bits, which need to be protected from the user mode driver, so that driver cannot directly break the kernel.

Host1x checks the incoming commands from the gather buffer. If it contains the SetClass kernel mode command, then Host1x should drop these commands and raise an “Invalid Gbuffer cmd” interrupt to software. Software will read the interrupt status register to detect the channel that received the invalid gbuffer command. That particular channel needs to be restarted through the “channel teardown” mechanism.

- HOST1X_SYNC_HINTSTATUS_EXT1_0[0:11]

  Bit (i) :-ch(i)_Invalid_gbuffer_cmd_int_status

  Where i = 0..11

- HOST1X_SYNC_HINTMASK_EXT1_0[0:11]

  Bit (i) :- ch(i)_Invalid_gbuffer_cmd _int_mask

  Where i = 0..11

There might be some cases where a channel can still see setClass, for example, context switching. For those channels this feature must be disabled. This feature is controlled through CHANNELCTRL for each channel:

CHANNELCTRL[2]

- 0: disable filtering of kernel command(setClass).
- 1: enable filtering of kernel command(setClass).

12.4.3 Timeout Mechanism

Host1x has a mechanism to generate an interrupt for unserviced CPU read/write requests, which is controlled through a timeout register (HOST1X 1x_IP_TIMEOUT). Host1x generates a timeout Interrupt, and a violating address is stored in the following registers:

- IP_READ_TIMEOUT_ADDR
- IP_WRITE_TIMEOUT_ADDR

The width of the timeout register is 32 bits to provide a timeout value of ~19 seconds.

The TSEC master client interface also uses this mechanism to generate a timeout interrupt to CPU in case of illegal read/write access. The HINTSTATUS_EXT register has been modified to indicate if the timeout is from native CPU access or TSEC access.

Also in case of a TSEC read timeout, the returned response packet will have an additional bit (tsec2host1x 1x_iprdata_timeout) to indicate a timeout error.

HINTSTATUS[Timeout_source=bit10] =

- 0 Timeout from TSEC access.
- 1 Timeout from XBAR access.

The current scheme saves only the last timeout address in case of multiple timeout happens before clearing the timeout interrupt by software.

12.4.4 Performance Statistics Counters

Host1x has performance counters for profiling, which can be enabled independent of push-buffer commands. Host1x needs the following statistics per channel:

- Total clocks
- Clocks stalled waiting for syncpt
- Clocks transferring data

12.4.4.1 Tick Counter

Each channel has its own 64-bit tick counter that is incremented on each Host1x clock, given that it is enabled. TICKCTRL enables and disables the tick counter.

The 32-bit TICKCOUNT_LO and TICKCOUNT_HI registers can be written to initialize the tick counter. Reads of these registers return the tick count. TICKCOUNT_LO stores the lower 32 bits, and TICKCOUNT_HI stores the upper 32 bits. TICKCOUNT_HI is calculated as follows:

if (TICKCOUNT_LO == 0xFFFF_FFFF && TICKCTRL == enable) TICKCOUNT_HI++;

12.4.4.2 Channel Stall Counter

The 64-bit CHANNEL_STALL counter per channel, when enabled, is incremented on each clock cycle if that particular channel is waiting for syncpt.

The following registers control this counter:

- STALLCTRL: This 1-bit register enables/disables the CHANNEL_STALL counter.
- STALLCOUNT_LO: This 32-bit register initializes the lower 32 bits of the CHANNEL_STALL counter.
- STALLCOUNT_HI: This 32-bit register initializes the upper 32 bits of the CHANNEL_STALL counter.

The following Host1x class methods are used to program this counter:

- STALLCOUNT_HI: This method initializes the high 32 bits of the tick count value in the CHANNEL_STALL counter.
- STALLCOUNT_LO: This method initializes the low 32 bits of the tick count value in the CHANNEL_STALL counter.
- STALLCTRL: This method enables/disables the CHANNEL_STALL counter.

12.4.4.3 Channel Xfer Counter

There is a 64-bit CHANNEL_XFER counter per channel to measure the data transfer interval per channel. This counter is incremented at each clock cycle, if the channel is not idle (busy in fetching channel commands).

The following registers are used to initialize this counter:

- XFERCTRL: This 1-bit register enables/disables the CHANNEL_XFER counter.
- CHANNEL_XFER_LO[31:0]: This 32-bit register initializes the lower 32 bits of the CHANNEL_XFER counter.
- CHANNEL_XFER_HI[31:0]: This 32-bit register initializes the lower 32 bits of the CHANNEL_XFER counter.

The following Host1x class methods are used to program this counter:

- CHANNEL_XFER_HI: This method initializes the high 32 bits of the tick count value in the CHANNEL_XFER counter.
- CHANNEL_XFER_LO: This method initializes the low 32 bits of the tick count value in the CHANNEL_XFER counter.
- XFERCTRL: This method enables/disables the CHANNEL_XFER counter.

Note: Counter operations are identical irrespective of whether they are controlled through registers or other methods.

12.4.5 TZ Non-Secure Bit for the Display Engine

To support programming of a Host1x client (display engines) in TZ (Trust Zone) mode through direct register access, the Host1x needs to transfer a TZ non-secure bit from the CPU to the display and VI engines.

The following table describes the behavior of TZ non-secure signal to clients.

Table 31: Behavior of TZ Non-Secure Signal

Access-Mode	CPU TZ NS bit	TZ Non-Secure Bit to Client
Direct MMIO access(read/write)	0	0
Direct MMIO access(read/write)	1	1

Access-Mode	CPU TZ NS bit	TZ Non-Secure Bit to Client
Indirect MMIO access(read/write)[1]	0	X
Indirect MMIO access(read/write)	1	1
Push-buffer access(write)(DMA/PIO)	X	1
Push-buffer access(Indirect reads)(DMA/PIO)	X	1

12.4.6 Interrupts

Host1x has following types of interrupts:

12.4.6.1 Host1x Client Interrupt

Host1x is the collection point for all of its clients interrupts. Also it has control over those using status and mask registers with fields for each client. These client interrupts are forwarded to the central interrupt controller unit, individually through per client interrupt lines.

12.4.6.2 Host1x Interrupts

Host1x -specific interrupts are specified through the HOST1X_SYNC_HINTSTATUS_0 register while additional interrupts have been specified through the HOST1X_SYNC_HINTSTATUS_EXT_0 register (see Registers below). Each Host1x interrupt also has a corresponding mask. An interrupt is cleared by writing a 1 to the corresponding bit.

12.4.6.3 Host1x Syncpt Interrupts

Host1x can generate a syncpt interrupt upon reaching a threshold value by syncpt registers. It can also generate an interrupt to either CPU (referred to as CPU0 below) or AVP (referred to as CPU1 below).

An interrupt is routed to cpuN when:

> (SYNCPT[indx] >= SYNCPT_INT_THRESH[indx]) && (SYNCPT_THRESH_INT_MASK[indx] == cpuN)
>
> The comparison takes wrapping into account. See the “Sync Points (SYNCPTs)” section for more information on wrapping.

The status is sticky and is PENDING until cleared. Write 1's to clear.

12.4.7 Indirect Register Access

Host1x provides indirect register access to all its clients. An indirect register access involves multiple steps and requires a channel for the read return data. All registers required for indirect accesses reside in a channel.

Writes involve two Host1x register writes in the owning channel's space; the first write indicates the address (INDOFF, or INDOFF2 and INDCTRL), and the second indicates the data (INDDATA).

Reads involve two direct Host1x writes, the first indicates the address (again INDOFF, or INDOFF2 and INDCTRL), and the second indicates the number of reads (INDCNT). It also requires an indeterminable number of direct Host1x reads to the read return FIFO status register followed by a read to the read return FIFO.

- INDOFF
- INDOFF2
- INDCTRL

[1] This mode is not supported for “secure access”, The CPU has to use only “direct access” in “secure mode”.

- INDDATA
- INDCNT

Pitfalls — Indirect accesses require a software mutex to ensure that no other software threads access the indirect registers while issuing the access (since the series of accesses is non-atomic). Indirect reads can only issue counts less than the read return FIFO size to prevent a deadlock – too many read requests can block popping of the read return FIFO. This restriction may be even tighter. All module accesses must also be tied to a channel.

In case an indirect write is sent, software must check whether the previous indirect write is through using an immediate sync increment command to the client.

12.4.8 Direct Register Access

All clients under Host1x have 256KB of address space, which originates from the space specified by indirect offset register (INDOFF). Host1x's client address map is dictated by its client's module IDs; these IDs are used in INDOFF to specify the target module of the register access. A client's address in the Host1x space is calculated as:

address = direct_access_base_address (0x54000000) + (module_id << 18) + 4 * register_offset

Only one pending read per interface can exist. Reads are returned from the client when the client is ready. There are no latency restrictions.

Indirect versus Direct — a pitfall of direct addressing is variable latency of Host1x's clients. While this has no impact on writes, the CPU is blocked until the read returns rendering the CPU idle during that time.

12.4.9 Host Clients

The following table lists the clients that are accessed via Host1x with their module (client) ID, which is used to determine addresses for direct addressing.

Table 32: Host1x Clients

Client	ID
Host1x	0x0
VI	0x2
Display A	0x8
Display B	0x9
HDMI	0xa
DSI	0xc
VIC	0xd
CSI	0xf
DSIB	0x10
MSENC	0x13
TSEC	0x14
SOR	0x15
DPAUX	0x17
ISP	0x18
ISPB	0x1a

12.4.10 Class IDs

The following table lists the class IDs.

Class	ID
NV_HOST1X_CLASS_ID	0x01
NV_VIDEO_ENCODE_MSENC_CLASS_ID	0x21
NV_VIDEO_STREAMING_VI_CLASS_ID	0x30
NV_VIDEO_STREAMING_ISP_CLASS_ID	0x32
NV_VIDEO_STREAMING_ISPB_CLASS_ID	0x34
NV_GRAPHICS_VIC_CLASS_ID	0x5D
NV_DISPLAY_CLASS_ID	0x70
NV_DISPLAYB_CLASS_ID	0x71
NV_HDMI_CLASS_ID	0x77
NV_DISPLAY_DSI_CLASS_ID	0x79
NV_DISPLAY_DSIB_CLASS_ID	0x7A
NV_TSEC_CLASS_ID	0xE0
NV_SOR_CLASS_ID	0x7B
NV_DPAUX_CLASS_ID	0x7D

12.4.11 Host Address Space

Each channel is allocated 16KB of space, and they are aligned contiguously at the top of the Host's address space. A channel's space consists of channel registers, the command FIFO, and an aliased frame buffer region, which are unique per channel. The rest of the space consists of asynchronous, synchronous and read DMA registers, which are aliased in each channel – there exists only one copy.

12.4.11.1 Channel Map

The following table gives offsets from the channel base address for different sets of registers available to each channel.

Table 33: Host1x Channel Map

0x0000	Channel Registers	
0x0600	RDMA Registers	
0x0800	Command FIFO	
0x1000	Frame Buffer	
0x2000-0x20FF	Unit ACTMON Registers	ACTMON1(MSENC) = 0x2000 – 0x203F
		ACTMON2(VIC) =0x2040 – 0x207F
		ACTMONRSVD =0x2080 – 0x20FF
0x2100*	Synchronous Registers	
0x3FFF	Bottom	

* 0x2100 is the synchronous registers base (HOST1X_CHANNEL_SYNC_REG_BASE)

12.4.11.2 Host1x Map

The following table shows the Host1x addresses for the CPU. Channels start at the lowest addresses and are aligned contiguously. Direct access to Host clients starts at 5400_0000, but this is configurable through a BAR register.

Table 34: Host1x Map

Address Range	Channel
5000_0000-5000_3FFF	Channel 0 (16KB)
5000_4000-5000_7FFF	Channel 1 (16KB)
5000_8000-5000_BFFF	Channel 2 (16KB)
5000_E000-5001_2FFF	Channel 3 (16KB)
5001_3000-5001_6FFF	Channel 4 (16KB)
5001_7000-5001_AFFF	Channel 5 (16KB)
5001_B000-5001_BFFF	Channel 6 (16KB)
5001_C000-5001_FFFF	Channel 7 (16KB)
5002_0000-5002_3FFF	Channel 8 (16KB)
5002_4000-5002_7FFF	Channel 9 (16KB)
5002_8000-5002_BFFF	Channel 10 (16KB)
5002_C000-5002_FFFF	Channel 11 (16KB)

12.5 Performance

12.5.1 Key Use Cases

Command throughput must be sufficient when all channels are active, the CDMA is active, and spooling is active.

12.5.2 Latency Targets

Direct read latency must be under 1 ms. Clients that cannot guarantee that a read will return in under 1 ms must not be read directly but indirectly.

12.5.3 Bandwidth Targets

As Host1x unit is used only for sending control commands to clients and usually at the frame interval.

As these control commands are short (~200 to 300 words maximum), it is expected that the bandwidth requirement on each client should be less than 1MB/s, whereas the maximum available bandwidth per client on the HWR bus will be (206*4B)/12 =68MB/s at 206 MHz Host1x clock. The minimum bandwidth on the HWR bus per client is 33.34 MB/s at 100 MHz clock which should easily meet the client requirement.

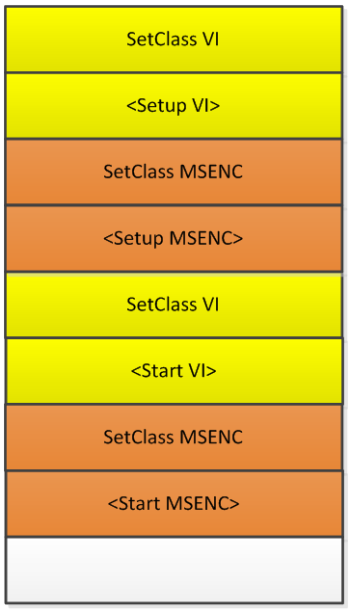
12.6 Host1x Programming Model

The Host programming models resides on top of the concept of channels. A channel provides the means for software to supply an ordered sequence of commands to one or more classes. There are no restrictions on how many classes a channel may own or how often it can switch between classes, but it can only operate on one class at a time (known as the working class) and one command at a time. A stalled channel does not allow any commands to proceed from any class – there is a

strict ordering of commands. A channel starts processing commands simply when commands are present, either supplied by the CPU or gathered from memory. A channel can be stopped explicitly by a CPU write to channel state.

A single channel owning multiple classes and clients:

Figure 19: Single Channel Example



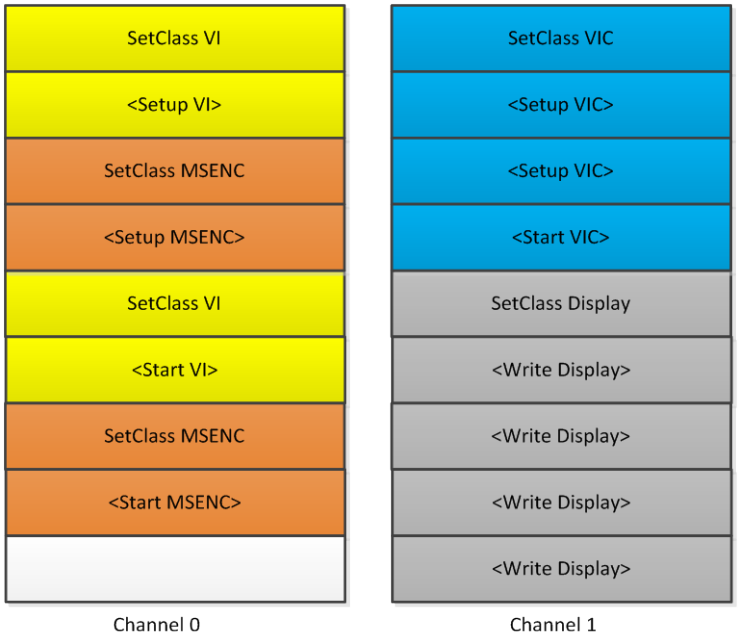
12.6.1 Concurrency

Channels operate in parallel and are unhindered by one another except in two specific cases:

- Synchronization points
- Class contention

The following figure depicts such concurrency.

Figure 20: Channel Concurrency Example



In the example above, no channel is blocked by another at any time so both can work concurrently. Care must be taken when assigning clients to channels. Channel concurrency as well as channel throughput is crucial for performance. For example, a client that is event-driven with a low latency requirement should exist in its own channel. Conversely, two clients that must be steadily supplied with commands could possibly coexist in the same channel given that their synchronization points are not conflicting (if they have any real synchronization points at all). Clients that operate sequentially on the same piece of data can easily reside in the same channel.

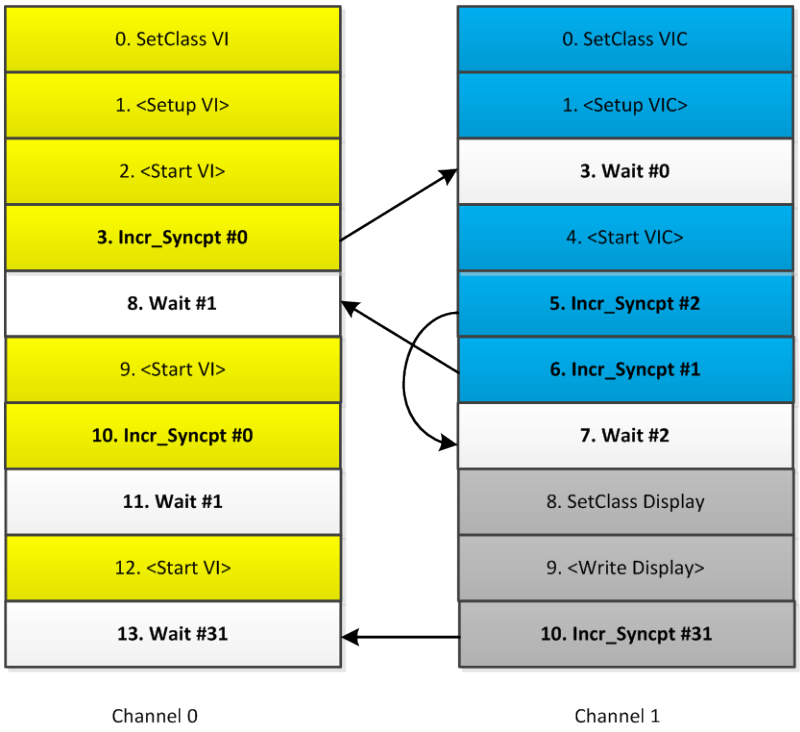
Clients with low-latency requirements like described in the first example above should possibly be moved to a PIO programming model and away from a channel-based model.

12.6.2 Synchronization

There are 192 total synchronization points (syncpts). Similar to semaphores, syncpt methods are issued to clients, mentioning syncpt counter index and returning condition. Any channel can be made to wait on a syncpt value of a particular syncpt index through Host1x “wait” method. Once the syncpt method is received by clients, based on syncpt condition, they will return a syncpt index back to Host1x. On receiving a syncpt index from the client, Host1x will increment that particular syncpt counter.

The following simple example below details how syncpts and waits allow for synchronization. The arrows simply indicate channel dependencies, which channel is waiting for syncpt increment from other channel.

Figure 21: Channel Synchronization Example



12.6.3 Progress Status

Channel progress is monitored through two means – GET and syncpts. GET is a channel state that indicates the address of the last command that has executed in the channel. GET is the same as DMAGET.

Syncpts are counter registers that are incremented when specified events occur (e.g., after the completion of each operation done by a module). The 32-bit syncpt values typically are monotonically increasing and can be used for in channel waits and out-of-channel interrupts.

The GET and syncpt registers can also be read directly (out-of-band) by the CPU.

12.6.4 Syncpt Base Register Use Case

The syncpt base registers are modified through LOAD_SYNCPT_BASE_32 or INCR_SYNCPT_BASE_32 methods and are used with the WAIT_SYNCPT_BASE_32 method.

This mechanism is useful when software wants to wait for a particular syncpt increment, but software does not know the absolute value of the sync point register until later.

The "future-value" of a sync point is the value that the syncpt register contains right after a particular increment has occurred.

Consider this example:

In this example, time increases downward (later (lower) lines are ahead in time).

Software "knows" the syncpointA future-value equals N at this point; software "knows" the baseA future-value equals N at this point.

1. command1
2. increment syncpointA to N+1
3. command2

4. increment syncpointA to N+2

5. command3

6. wait until command1 is done (syncpoint == N+1)

7. command4

8. wait until command2 is done (syncpoint == N+2)

9. command5

If software actually DOES know the value of N then regular WAIT_SYNCPT works fine here. However, the user space software driver (which is creating this list of commands) does not know what the value N is until after these commands (1-9) are all flushed to the kernel space driver.

The kernel space driver receives packets of commands from many different user space processes. When it receives a packet of commands it queues those commands (i.e., writes the Host1x PUT pointer). It also keeps track of all increments that have occurred in all commands that have been queued so far. The "future-value" of each sync point is simply the total number of increments that have occurred since the beginning of time (actually "beginning of time" is really the point in time where the kernel space driver was initialized and reset all the syncpt registers to 0).

So when the kernel space driver queues these commands (1-9), it knows the value N (i.e., the sum of all increments since the beginning of time). It can pass this back to the user space driver. But the user space driver does not know how many increments will be queued before commands 1-9 are queued because any other process can queue commands (including increments) at any time (e.g., after the user space driver has written commands 2 and 4 to the buffer, but before those commands have been queued by the kernel driver).

To solve this, we add a command at the end of each packet that increments the base register the same number of times as the sync point was incremented:

10. baseA += 2

This means that, at the start of any packet of commands, the future value of syncpointA and the future value of baseA are always the same. So command 6 can be:

WAIT_SYNCPT_BASE syncpt=A base=A offset=1

and command 8 can be:

WAIT_SYNCPT_BASE syncpt=A base=A offset=2

Note: Software never writes a new value to the syncpointA or baseA register except when the kernel driver is initialized (e.g., when the system boots). After that only the syncpoint register is incremented and only the base register is added to. All of this depends on all software that creates cooperating command buffers. Software has this policy (e.g., the user space driver always tells the kernel driver how many increments are contained in each packet of commands).

12.6.5 Indirect/Direct Register Addressing Scheme

The indirect addressing scheme works as follows:

- An address is decoded and either routed to a channel register or to a synchronous register
- A write to INDCNT or INDDATA triggers a register access to the register specified in INDOFF
- A transaction is created and pushed into the REGF FIFO. The owning channel is specified by which INDCNT or INDDATA is written. The client and offset are specified in INDOFF.
- The transaction is routed to the target client over the HWR bus.

- If the access is a write, the transaction is complete. In the case of a read, the processor polls the channel's read return FIFO status (FIFOSTAT), waiting for a nonempty FIFO.
- The client returns the read to the channel's return FIFO.
- The processor reads INDDATA register of that particular channel to pops data from the return FIFO.

Direct addressing uses the same flow with some adjustments:

- An address is decoded and either routed to a channel register, a synchronous register, or a client
- This step is nonexistent; direct accesses do not require a trigger.
- In the case of a client decode, a transaction is created and pushed into a FIFO called REGF. The owning channel is specified as CPU_READ_RETURN_TAG. The client and offset are indicated by the address: the client is created by shifting the address down by 18; the offset is simply the lower 18 bits.
- The transaction is routed to the target client over the HWR bus. If the access is a write, the transaction is complete.
- In case of a read, client returns the read data and channel ID in the returned packet indicates its destination, be it interface or a channel's return FIFO. If the channel is 0-8, it is an indirect read and returned to the indicated channel. If the channel matches CPU_READ_RETURN_TAG(0xf), the data is returned to the IP interface.

Currently, there is support for only one pending read per interface.

12.7 Host Channel Opcodes

This section provides the format of opcodes that can be sent through the command FIFO.

HCFCMD

Generic command FIFO packet (contains fields common to all opcodes) and is used for initial decode. All command FIFO packets are multiples of 32 bits.

HCFSETCL

The SetClass opcode specifies which class is being referenced (may cause rerouting of subsequent methods/data). In addition to switching classes, the opcode allows some methods to be programmed on the switch similar to an HCFMASK opcode.

HCFINCR

The Incrementing opcode indicates the offset should be incremented for each data that is part of the packet. The count argument indicates how many 32-bit values are following. If channel protect is enabled, the host should prevent a channel switch from occurring at the end of this command packet.

HCFNONINCR

The Non-Incrementing opcode indicates the same offset should be sent for each data that is part of the packet. The count argument indicates how many 32-bit values are following. If channel protect is enabled, the host should prevent a channel switch from occurring at the end of this command packet.

HCFMASK

The Mask opcode, from the starting offset, generates offsets based on where the bits are set in the mask. The host expects the amount of data following to equal the number of bits set. If channel protect is enabled, the host should prevent a channel switch from occurring at the end of this command packet.

HCFIMM

The Immediate opcode indicates the offset and data are contained in the same 32-bit data. Only the lowest 16 bits of data are sent to the module (IMMDATA). The upper 16 bits are zeroed out.

HCFRESTART

The Restart opcode is specific to DMA operation and causes the host to set DMAGET to (ADDRESS << 4), so the next command fetch will be from (DMASTART + DMAGET).

In legacy chips, bits 27:0 were not decoded and assumed to be 0's (allowing only simply wrapping of GET back to the top of the command buffer). ADDRESS can be 0 for compatible RESTARTs or non-zero acting as a JUMP.

Note that the jump address granularity is 16 bytes, since the bottom 4 bits cannot be specified.

HCFGATHER

The Gather opcode allows contiguous portions of memory to be fetched and placed in line with the command stream, replacing the two words of the gather command. It optionally can put an incrementing or non-incrementing opcode in the stream ahead of the gathered data. This allows for the gathered data to be a pure data stream and not be required to have host opcodes inside.

HCFCHDONE

This opcode indicates to the command processor that the current channel is done processing for now and is willing to give up any of its owned modules to other channels that need them.

12.8 Host Channel Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

12.8.1 HOST1X_CHANNEL_FIFOSTAT_0

CFNUMEMPTY is the number of free slots available in the per-channel command. A FIFO is needed for PIO or polling for completion of a wait.

Offset: 0x0 │ Read/Write: RO │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	INDRDY: Indicates that INDCOUNT==0, so it should be OK to issue another read
28:24	X	OUTFENTRIES: Number of entries available for reading in this channel's output FIFO
20:16	X	REGFNUMEMPTY: Register write/read FIFO free count
12	X	CFGATHER: Indicates whether GATHER is active. If a GATHER command issued via PIO, software must wait for the GATHER to be IDLE before issuing another command. 0 = IDLE 1 = BUSY
11	X	CFEMPTY: Indicates whether the command FIFO is empty or not 0 = NOTEMPTY 1 = EMPTY
10:0	X	CFNUMEMPTY: Command FIFO free count

12.8.2 HOST1X_CHANNEL_INDOFF_0

The INDOFF and INDOFF2 registers (along with INDCNT and INDDATA) are used to indirectly read/write modules outside the host. If AUTOINC is set, INDOFFSET increments by 4 on every access of INDDATA. REGFNUMEMPTY is polled to determine when valid data can be read from INDDATA.

The INDOFF register has limited capability on chips with large memory maps. If the top bit of the memory address is >= 27, all of memory cannot be addressed with INDOFF. In these cases, use INDOFF2 to set the offset while still using INDOFF to set the other parameters. Always have INDOFFUPD set to NO_UPDATE in these cases. For register accesses, using INDOFF (with INDOFFUPD set to UPDATE) is always more efficient, since it only requires one write.

Indirect frame buffer writes are STRONGLY DISCOURAGED. There are better ways to write to memory (direct and through the channel memory map) and there is limited flow control in the host. It is very easy to get into trouble with indirect frame buffer writes.

Offset: 0x4 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	AUTOINC: Auto increment of read/write address 0 = DISABLE 1 = ENABLE
30	X	ACCTYPE: Access type: indirect register or indirect frame buffer 0 = REG 1 = FB
29	X	BUF32B: Buffer up 32 bits of register data before sending it. Otherwise, register writes will be sent as soon as they are received. Does not support byte writes in 16-bit host. Does not affect frame buffer writes. 0 = NOBUF 1 = BUF
28:27	X	INDSWAP: Indirect frame buffer access swap control. 00 = No byte swap 01 = 16-bit byte swap ([31:0] -> {[23:16],[31:24],[7:0],[15:8]}) 10 = 32-bit byte swap ([31:0] -> {[7:0],[15:8],[23:16],[31:24]}) 11 = 32-bit word swap ([31:0] -> {[15:8],[7:0],[31:24],[23:16]}) 0 = NONE 1 = BYTE16 2 = BYTE32 3 = WORD32

12.8.3 HOST1X_CHANNEL_INDCNT_0

Indirect Register Access Count

Used to trigger indirect reads. Holds the number of registers/memory locations that will be read out. Channels should not request more than there is space available in their output FIFO. Only the protected channel should make liberal use of this feature for speeding up context switching.

For indirect frame buffer reads, each channel cannot issue more than NV_HOST1X_MAX_IND_FB_READS at once. The read data must return and be written into the per-channel output FIFO before any additional reads can be issued.

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:0	0x0	INDCOUNT

12.8.4 HOST1X_CHANNEL_INDDATA_0

This register, when written, writes to the data to the INDOFFSET in INDOFF. For reads, a REGFNUMEMPTY number of 32-bit values can be read before needing to poll FIFOSTAT again. The per-channel output FIFO (OUTFENTRIES) is readable via this offset. A read of INDDATA will pop an entry off of the per-channel output FIFO.

Offset: 0xc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	INDDATA: read or write data

12.8.5 HOST1X_CHANNEL_RAISE_0

The general-purpose channels have DMA and RAISE/REFCOUNT functionality.

Any raise values returned from a client module are converted to vectors and update the per-channel raise register. The RAISE vector is also writable by the CPU. Any bits set in the RAISE field when written will be set in the RAISE register, allowing any pending WAITs to continue.

Offset: 0x10 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:2	X	RAISE: This channel's RAISE vector

12.8.6 HOST1X_CHANNEL_DMASTART_0

This register triggers a DMA fetch from the frame buffer for this channel, if the Put register does not equal the DMA Get register.

Offset: 0x14 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:2	X	DMASTART: cmdbuf frame buffer offset

12.8.7 HOST1X_CHANNEL_DMAPUT_0

This register triggers a DMA fetch from the frame buffer for this channel, if the PUT register does not equal the GET register. This address is relative to the DMASTART base address. Does not support byte writes. All 4-byte data need to be programmed.

Offset: 0x18 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000xx)

Bit	Reset	Description
31:2	0x0	DMAPUT: cmdbuf frame buffer offset

12.8.8 HOST1X_CHANNEL_DMAGET_0

This register tracks the frame-buffer offset the DMA engine has read up to (incremented as entries are loaded from the channels command buffer into the FIFO). This address is relative to the DMASTART base address.

Offset: 0x1c | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:2	X	DMAGET: cmdbuf frame buffer offset

12.8.9 HOST1X_CHANNEL_DMAEND_0

The boundary of illegal addresses (either end of push-buffer or end of physical memory). This is designed to prevent DMA from prefetching illegal addresses. If DMA reaches this address before seeing a RESTART, it will stop. This would be a software error condition.

Offset: 0x20 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:2	X	DMAEND: cmdbuf frame buffer offset

12.8.10 HOST1X_CHANNEL_DMACTRL_0

DMA Control Register

DMAGETRST: Reset GET pointer to '0'. Useful for cleaning up crashed channels. DMAGET is not updated instantly. Takes 4 cycles between programming of reset and a valid DMAGET.

DMAGETINIT: Reset the GET pointer to the value of DMAPUT when DMAGETRST is asserted.

DMASTOP: Stop DMA from fetching on this channel.

Note: A Command DMA channel needs to be enabled for PIO-gather to work.

Offset: 0x24 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx001)

Bit	Reset	Description
2	0x0	DMAINITGET: Reset GET pointer to the value of DMAPUT when DMAGETRST is asserted. 0 = DISABLE 1 = ENABLE
1	0x0	DMAGETRST: Reset GET pointer to '0'. Useful for cleaning up crashed channels. 0 = DISABLE 1 = ENABLE
0	0x1	DMASTOP: Stop DMA from fetching on this channel. NOTE: a Command DMA channel needs to be enabled for PIO gather to work. 0 = RUN 1 = STOP

12.8.11 HOST1X_CHANNEL_INDOFF2_0

The INDOFF and INDOFF2 registers (along with INDCNT and INDDATA) are used to indirectly read/write modules outside the host. If AUTOINC is set, INDOFFSET increments by 4 on every access of INDDATA. REGFNUMEMPTY is polled to determine when valid data can be read from INDDATA.

The INDOFF register has limited capability on chips with large memory maps. If the top bit of the memory address is >= 27, all of memory cannot be addressed with INDOFF. In these cases, use INDOFF2 to set the offset while still using INDOFF to set the other parameters. Always have INDOFFUPD set to NO_UPDATE in these cases. For register accesses, using INDOFF (with INDOFFUPD set to UPDATE) is always more efficient, since it only requires one write.

Indirect frame-buffer writes are STRONGLY DISCOURAGED. There are better ways to write to memory (direct and through the channel memory map) and there is limited flow control in the host. It is very easy to get into trouble with indirect frame-buffer writes.

0	X	CH0_TEARDOWN: 0 = NO_ACTION 1 = TEARDOWN

12.9.14 HOST1X_SYNC_MOD_TEARDOWN_0

Module teardown register. If a module is reset, the host needs to reset its state with respect to which channels own that module. Whenever a module is reset, the corresponding teardown bit in this register should be written. Module teardown will only work if the command FIFO and command processor are in a good state (the FIFO is empty of traffic for that channel and the command processor is at an opcode boundary). If an entire channel needs to be reset, the CH_TEARDOWN register should be used instead.

Offset: 0xb4 │ Read/Write: R/W │ Reset: 0x0XXXXX0X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

12.9.33 HOST1X_SYNC_CDMA_ASM_TIMEOUT_0

Timeout value determines how long the assembly logic will wait before it flushes data from the data FIFO to avoid head-of-line blocking.

Note: Do not use a value of zero -- causes immediate flushing so no forward progress is made.

Offset: 0x1b4 │ Read/Write: R/W │ Reset: 0x00000404 (0bxxxxxxxxxxxxxxxxxxxx00100xxx00100)

Bit	Reset	Description
12:8	0x4	CDMA_ASM_GFIFO_TIMEOUT
4:0	0x4	CDMA_ASM_DFIFO_TIMEOUT

12.9.34 HOST1X_SYNC_CDMA_MISC_0

CDMA_DELAY_PUT

Delay put_addr updates. This can potentially increase MC performance slightly by gathering multiple consecutive put_addr updates into 1 update, which reduces the amount of requests to the MC. In addition, it can be used to cover a race condition where a write to memory has not completed before CDMA starts fetching the data. But in this case, the counter has to be set to a high value, which *will* affect performance.

CDMA_SIMPLE_PREFETCH

Reduce per-channel requests to 1 every 3 cycles. This can reduce performance in 2 ways:

- The memory request FIFO will fill up slightly slower, but the impact will be minimal.
- It will cause the channel arbiter to switch to other channels when they have a request available, which will reduce locality. On the plus side, it has much less nasty corner cases.

CDMA_PUT_SYNC_DISABLE

CDMA_EN_STATS

Enable statistics counters.

- - Count the number of 128-bit words fetched by CDMA
- - Count the number of 128-bit words thrown away by CDMA

This allows us to get an idea how efficient the CDMA really is when there are multiple push-buffers active at the same time.

12.9.39 HOST1X_SYNC_HC_MCCIF_FIFOCTRL_0

Memory Client Interface FIFO Control (where applicable) and Clock Gating Control Register

Note: This FIFO timing aspects of this register are no longer supported, but are retained for software compatibility.

The clock override/ovr_mode fields of this register control the 2nd-level clock gating for the client and MC side of the MCCIF. All clock gating is enabled by default.

A '1' written to the rclk/wclk override field results in one of the following:

- With wclk/rclk override mode = LEGACY, the clock reverts to legacy mode of operation where the clock is on whenever the client clock is enabled.

- With wclk/rclk override mode = ON, the clock is always on inside the MCCIF and PC.

A '1' written to the cclk override field keeps the client's clock always on inside the MCCIF.

Offset: 0x1dc │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxx00000xxxxxxxxxxxx0000)

12.9.41 HOST1X_SYNC_MLOCK_0_0

MLOCK Registers

MLOCK is 1 whenever someone holds the lock, and is 0 otherwise. MLOCK is normally set and cleared using the host methods ACQUIRE_MLOCK and RELEASE_MLOCK.

If a CPU wants to acquire a lock, then it reads this register. If the value returned is 0, it has successfully acquired the MLOCK. A return value of 1 indicates that the acquire failed. At any time, the CPU can write 0 to MLOCK, releasing the MLOCK (note that hardware does not check if the CPU owned the lock). If the CPU writes a 1 to MLOCK, this is undefined and is ignored by the hardware (a NOP). Use MLOCK_OWNER to read the status of a lock (since reading MLOCK itself has a side effect).

12.9.57 HOST1X_SYNC_MLOCK_OWNER_0_0

MLOCK_OWNER is a read-only status for MLOCK. When MLOCK_*_OWNS are all zeros, it indicates that the MLOCK is free (zero). When MLOCK has been acquired (set), then one of MLOCK_*_OWNS will be non-zero.

Either bit 0 or 1 will be set -- indicating whether a channel or a CPU has acquired the MLOCK. If a channel owns the MLOCK, then the channel number is given by the MLOCK_OWNER_CHID field.

12.9.74 HOST1X_SYNC_SYNCPT_BASE_n_0

Syncpt base registers are used by wait_syncpt_base method. The wait will be released when SYNCPT[indx] >= (BASE[base_indx] + offset), where indx, base_indx, and offset are supplied by the wait method.

There are 64 Syncpt base registers, where n = 0 through 63.

Offset: 0x600 + (n * 0x4) │ Read/Write: R/W │ Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	BASE_n

12.10 Host Class Methods

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

Class offsets are always relative to the class (based at 0).

12.10.1 NV_CLASS_HOST_INCR_SYNCPT_0

All Classes have the INCR_SYNCPT method. For host, this method, immediately increments SYNCPT[indx], irrespective of the condition. Note that INCR_SYNCPT_CNTRL and INCR_SYNCPT_ERROR are included for consistency with host clients, but writes to INCR_SYNCPT_CNTRL have no effect on the operation of Host1x, and because there are no condition FIFOs to overflow, INCR_SYNCPT_ERROR will never be set.

Offset: 0x0 │ Byte Offset: 0x0 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description

7:0	0x0	INDX: syncpt index value

12.10.2 NV_CLASS_HOST_INCR_SYNCPT_CNTRL_0

Offset: 0x1 | Byte Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0xxxxxxx0)

Bit	Reset	Description
8	0x0	INCR_SYNCPT_NO_STALL: If NO_STALL is 1, then when FIFOs are full, INCR_SYNCPT methods will be dropped and the INCR_SYNCPT_ERROR[COND] bit will be set. If NO_STALL is 0, then when FIFOs are full, the client host interface will be stalled.
0	0x0	INCR_SYNCPT_SOFT_RESET: If SOFT_RESET is set, then all internal states of the client syncpt block will be reset. To do a soft reset, first set SOFT_RESET of all Host1x clients affected, then clear all SOFT_RESETs.

12.10.3 NV_CLASS_HOST_INCR_SYNCPT_ERROR_0

Offset: 0x2 | Byte Offset: 0x8 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	COND_STATUS: COND_STATUS[COND] is set if the FIFO for COND overflows. This bit is sticky and will remain set until cleared. Cleared by writing 1.

12.10.4 NV_CLASS_HOST_WAIT_SYNCPT_0

Wait on syncpt method.

Command dispatch will stall until:

SYNCPT[indx][NV_HOST1X_SYNCPT_THRESH_WIDTH-1:0] >= threshold[NV_HOST1X_SYNCPT_THRESH_WIDTH-1:0]

The comparison takes into account the possibility of wrapping. Note that more bits are allocated for index and threshold than may be used in an implementation. Use NV_HOST1X_SYNCPT_NB_PTS for the number of syncpts, and NV_HOST1X_SYNCPT_THRESH_WIDTH for the number of bits used by the comparison.

Offset: 0x8 | Byte Offset: 0x20 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:24	X	INDX
23:0	X	THRESH

12.10.5 NV_CLASS_HOST_WAIT_SYNCPT_BASE_0

Wait on syncpt method using base register.

Command dispatch will stall until:

SYNCPT[indx][NV_HOST1X_SYNCPT_THRESH_WIDTH-1:0] >= (SYNCPT_BASE[base_indx]+offset)

The comparison takes into account the possibility of wrapping. Note that more bits are allocated for INDX and BASE_INDX than may be used in an implementation. Use NV_HOST1X_SYNCPT_NB_PTS for the number of syncpts, Use NV_HOST1X_SYNCPT_NB_BASES for the number of syncpt_bases, and NV_HOST1X_SYNCPT_THRESH_WIDTH for the number of bits used by the comparison If NV_HOST1X_SYNCPT_THRESH_WIDTH is greater than 16, the offset is sign-extended before it is added to SYNCPT_BASE.

Offset: 0x13 │ Byte Offset: 0x4c │ Read/Write: R/W │ Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
0	X	TICKCNT_ENABLE: Enable or Disable tick counter 0 = DISABLE 1 = ENABLE

12.10.16 NV_CLASS_HOST_INDCTRL_0

Indirect Addressing

These registers (along with INDDATA) are used to indirectly read/write either register or memory. Host registers are not accessible using this interface. If AUTOINC is set, INDOFFSET increments by 4 on every access of INDDATA.

Either INDCTRL/INDOFF2 or INDOFF can be used, but INDOFF may not be able to address all memory in chips with large memory maps. The redundant bits in INDCTRL and INDOFF are shared, so writing either offset sets those bits.

Note: The following restrictions apply to the use of indirect memory writes:

- At initialization time, do a dummy indirect write (with all byte enables set to zero)
- Dedicate an MLOCK for indirect memory writes, then before a channel issues a set of indirect memory writes it must acquire this MLOCK; after the writes have been issued, the MLOCK is released -- this will restrict the use of indirect memory writes to a single channel at a time.

Offset: 0x2b │ Byte Offset: 0xac │ Read/Write: R/W │ Reset: 0xXX00000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

12.11 Host Proto Channel Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

12.11.1 HOST1X_PROTCHANNEL_FIFOSTAT_0

CFNUMEMPTY is the number of free slots available in the per-channel command FIFO (needed for PIO or polling for completion of a wait).

Offset: 0x0 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	INDRDY: Indicates that INDCOUNT==0, so it should be OK to issue another read
28:24	X	OUTFENTRIES: Number of entries available for reading in this channel's output FIFO
20:16	X	REGFNUMEMPTY: Register write/read FIFO free count
12	X	CFGATHER: Indicates whether or not GATHER is active. If a GATHER command issued via PIO, software must wait for the GATHER to be IDLE before issuing another command. 0 = IDLE 1 = BUSY
11	X	CFEMPTY: Indicates whether the command FIFO is empty or not 0 = NOTEMPTY 1 = EMPTY
10:0	X	CFNUMEMPTY: Command FIFO free count

12.11.2 HOST1X_PROTCHANNEL_INDOFF_0

The INDOFF and INDOFF2 registers (along with INDCNT and INDDATA) are used to indirectly read/write modules outside the host. If AUTOINC is set, INDOFFSET increments by 4 on every access of INDDATA. REGFNUMEMPTY is polled to determine when valid data can be read from INDDATA.

The INDOFF register has limited capability on chips with large memory maps. If the top bit of the memory address is >= 27, all of memory cannot be addressed with INDOFF. In these cases, use INDOFF2 to set the offset while still using INDOFF to set the other parameters. Always have INDOFFUPD set to NO_UPDATE in these cases. For register accesses, using INDOFF (with INDOFFUPD set to UPDATE) is always more efficient, since it only requires one write.

Indirect frame buffer writes are STRONGLY DISCOURAGED. There are better ways to write to memory (direct and through the channel memory map) and there is limited flow control in the host. It is very easy to get into trouble with indirect frame buffer writes.

Offset: 0x4 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	AUTOINC: Auto increment of read/write address 0 = DISABLE 1 = ENABLE
30	X	ACCTYPE: access type: indirect register or indirect frame buffer 0 = REG 1 = FB
29	X	BUF32B: Buffer up 32 bits of register data before sending it. Otherwise, register writes will be sent as soon as they are received. Does not support byte writes in 16-bit host. Does not affect frame buffer writes. 0 = NOBUF 1 = BUF
28:27	X	INDSWAP: Indirect frame buffer access swap control. 00 = No byte swap 01 = 16-bit byte swap ([31:0] -> {[23:16],[31:24],[7:0],[15:8]}) 10 = 32-bit byte swap ([31:0] -> {[7:0],[15:8],[23:16],[31:24]}) 11 = 32-bit word swap ([31:0] -> {[15:8],[7:0],[31:24],[23:16]}) 0 = NONE 1 = BYTE16 2 = BYTE32 3 = WORD32

0	X	INDOFFUPD: Optionally disable the update of INDOFFSET when writing this register 0 = UPDATE 1 = NO_UPDATE

12.11.3 HOST1X_PROTCHANNEL_INDCNT_0

Indirect register access count

Used to trigger indirect reads. Holds the number of registers/memory locations that will be read out. Channels should not request more than there is space available in their output FIFO. Only the protected channel should make liberal use of this feature for speeding up context switching.

For indirect frame buffer reads, each channel cannot issue more than NV_HOST1X_MAX_IND_FB_READS at once. The read data must return and be written into the per-channel output FIFO before any additional reads can be issued.

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:0	0X0	INDCOUNT

12.11.4 HOST1X_PROTCHANNEL_INDDATA_0

This register, when written, writes the data to the INDOFFSET in INDOFF. For reads, a REGFNUMEMPTY number of 32-bit values can be read before needing to poll FIFOSTAT again.

The per-channel output FIFO (OUTFENTRIES) is readable via this offset. A read of INDDATA will pop an entry off of the per-channel output FIFO.

Offset: 0xc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	0X0	INDDATA: Read or write data

12.11.5 HOST1X_PROTCHANNEL_INDOFF2_0

Note: This spec file contains additions to the "common" registers that cannot be put in the common section, otherwise all of the other registers will shift.

The INDOFF and INDOFF2 registers (along with INDCNT and INDDATA) are used to indirectly read/write modules outside the host. If AUTOINC is set, INDOFFSET increments by 4 on every access of INDDATA. REGFNUMEMPTY is polled to determine when valid data can be read from INDDATA.

The INDOFF register has limited capability on chips with large memory maps. If the top bit of the memory address is >= 27, all of memory cannot be addressed with INDOFF. In these cases, use INDOFF2 to set the offset while still using INDOFF to set the other parameters. Always have INDOFFUPD set to NO_UPDATE in these cases. For register accesses, using INDOFF (with INDOFFUPD set to UPDATE) is always more efficient, since it only requires one write.

Indirect frame buffer writes are STRONGLY DISCOURAGED. There are better ways to write to memory (direct and through the channel memory map) and there is limited flow control in the host. It is very easy to get into trouble with indirect frame buffer writes.

Offset: 0x8c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

13.0 VIDEO IMAGE COMPOSITOR (VIC)

The VIC is the Video Image Compositor unit. It is also referred to as the Video Scalar (VS) unit. The VIC unit is suitable for use in mobile systems. It implements video post-processing functions needed by a video playback application to produce the final image for the player window.

The compositor implements much of the DirectX Video Acceleration 2.0 Enhanced Video Processor specification, including deinterlacing, scaling, color conversion, proc-amp, and compositing for up to 5 input surfaces. It supports advanced features like histogram correction, gamma correction, and non-linear color enhancement.

13.1 Features

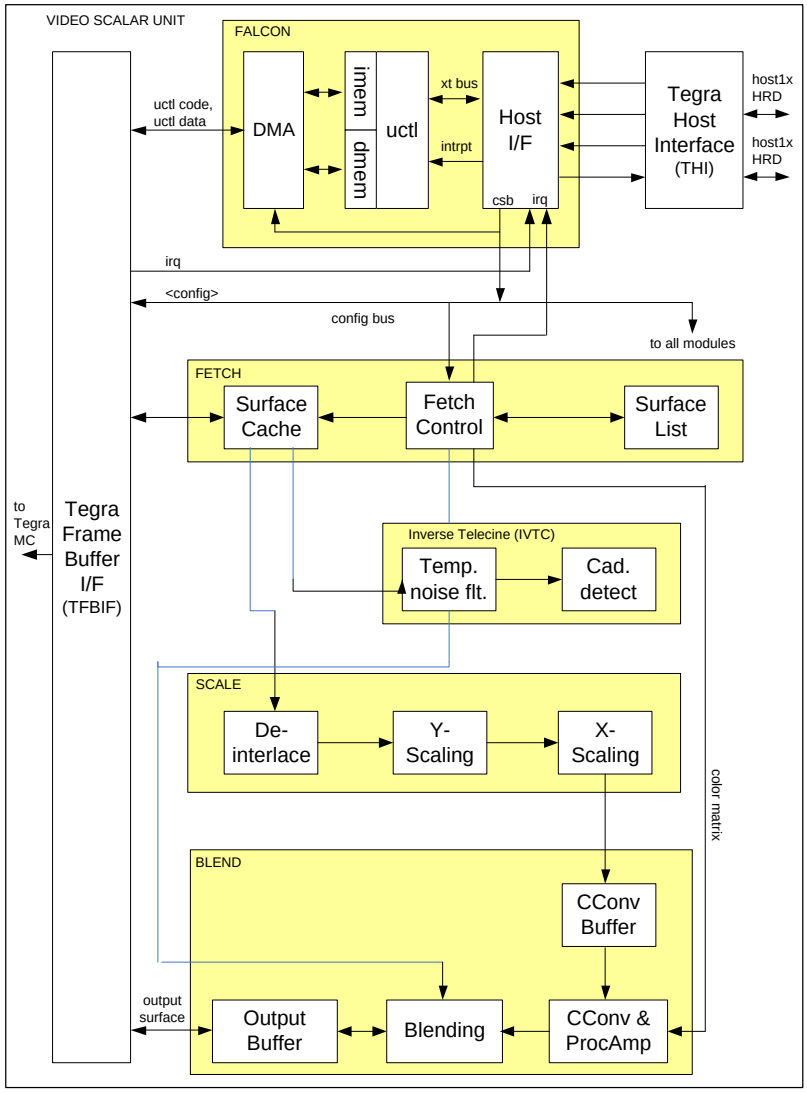
The VIC implements the following features:

- Deinterlacing
- Inverse Teleciné
- Scale
- Color Conversion
- Memory Format Conversion
- Blend/Composite
- Stereo Pixel Interleave
- Rotation

13.2 Block Diagram Description

The following figure shows the top-level block diagram of the Video Image Compositor.

Figure 22: VIC Block Diagram



13.2.1 Falcon Microprocessor

The NVIDIA Falcon Microcontroller is used for method processing and performing processing related to inverse telecine.

13.2.2 Tegra Host Interface (THI)

The Tegra Host Interface (THI) shim handles incoming methods from the host1x bus and passes those methods to the Falcon microcontroller, in addition to handling Tegra sync points.

13.2.3 Tegra Frame Buffer Interface (TFBIF)

The Tegra Frame Buffer Interface (TFBIF) interfaces with the Tegra K1 memory system. The TFBIF has one read and one write MCCIF client.

13.2.4 Fetch Unit

During preprocessing (IVTC passes) the fetch control breaks the output surfaces into 16x16 byte tiles and processes columns of these tiles at a time.

During main processing, the fetch control breaks the output surface up into 64x16 pixel tiles and processes those individually. For each tile, the fetch unit loops over all input surfaces.

When processing each tile, 64*16+*n* pixels need to be fetched, where *n* is the extra padding needed for scaling and deinterlacing. Each tile being fetched is stored in the Surface Cache. This cache holds 128 entries of 256 bytes.

13.2.5 Inverse Telecine (IVTC) Unit

The IVTC unit runs on individual video streams at a time and consists of 2 separate passes.

The first pass does noise reduction and motion buffer updates. It also calculates the weave and artifact counts used for the IVTC decision. The final decision for IVTC is done in Falcon microcode.

The second pass combines the updated motion buffer and the previous motion buffer (which has a different parity) and combines them for DiSi1 deinterlacing during the main processing pass.

13.2.6 Scale Unit

The Scale Unit consists of three blocks:

- The first block deinterlaces the input. The deinterlacing modes supported are DiSi1, BOB, and WEAVE. Weave is only used on progressive content or when inverse telecine detected a cadence.
- The second block scales the data in the vertical direction producing at most 16 lines of output to the next stage.
- The third block scales the data in the horizontal direction producing at most 64 pixels of output.

13.2.7 Blend Unit

The Blend Unit consists of four blocks:

- The first block buffers the incoming data and converts from any input order into interleaved pixel order (either ARGB or AYUV).
- The second block performs all color conversion tasks.
- The third block blends data into the output buffer. This stage is also used during preprocessing.
- The fourth block is an input-output DMA that can read original buffer data from the memory system and write back the final blended result. The reading is only used during preprocessing.

13.3 Functionality

13.3.1 Slots

The VIC supports up to five different input pictures that can be composited on to a single surface.

Support for five input pictures enables composition of multiple video streams from Blu-ray video content in a single pass:

- Background
- Primary Video
- Secondary Video
- Presentation Graphics
- Interactive Graphics

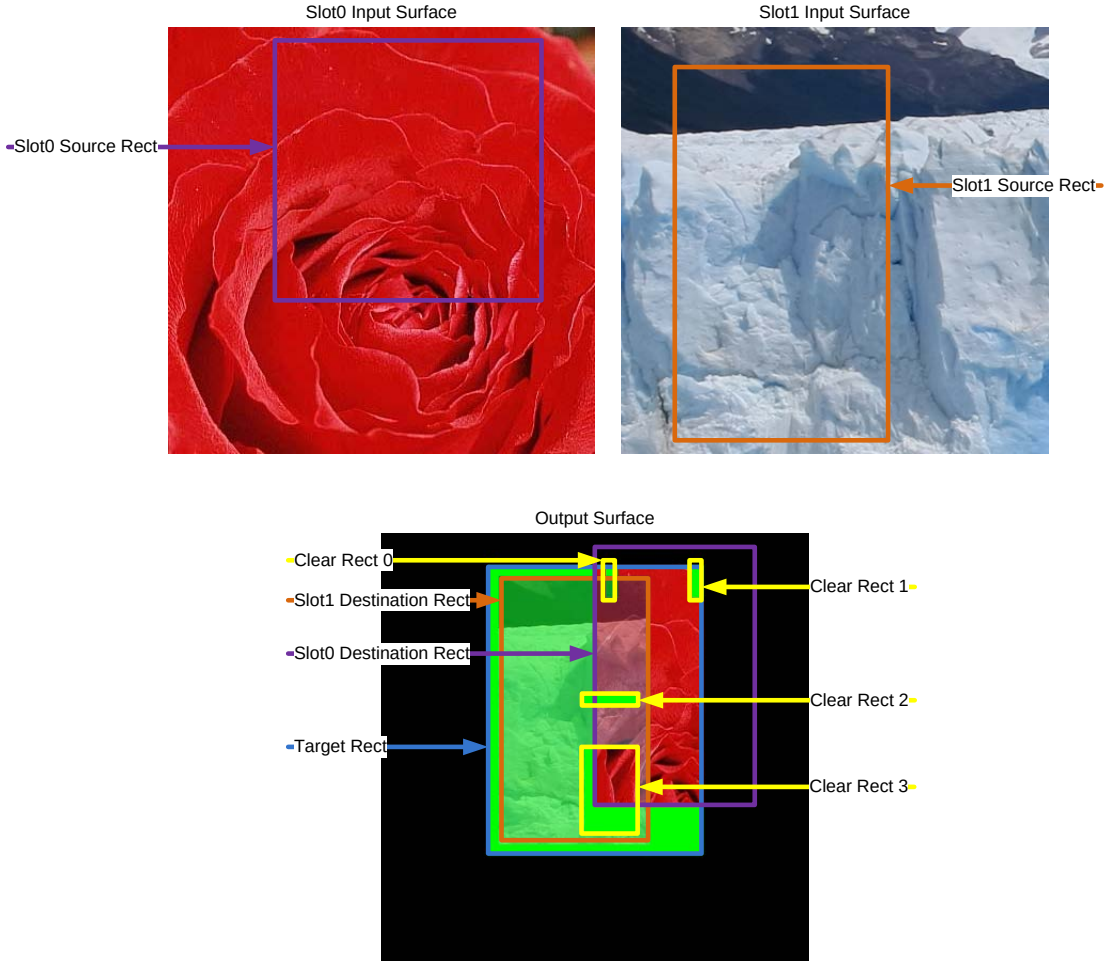
Each slot has a state that is specified through the config structure. Control parameters, such as the input formats, deinterlacing, scaling factors, clipping, color-space conversion, are independently set per input surface. All slots support the same functionality.

During the composition stage, the slots are blended in ascending order (that is, the output of slot1 will be blended onto slot 0, the output of slot 2 is blended on to slot 1, etc.).

Each slot can be programmed to access multiple surfaces. The number of surfaces used depends on the type of slot input (e.g., interlaced versus progressive), input format (e.g., packed versus planar color formats), and also on the type of processing (e.g., temporal noise reduction versus cadence detection versus deinterlacing).

13.3.1.1 Surface Composition

Figure 23: Programming Input and Output Surface Parameters



The maximum dimension of any image on the input or output sides of the VIC is 16384 pixels. The upper two bits of any 14-bit surface dimension will just be ignored.

Via the SurfaceListSurfaceStruct config structures, the dimensions of each input slot surface can be defined along with the pixel and memory format types. Note that the pixel format type must also be specified in the SurfaceCache0Struct config structure. A source rectangle defines the region of pixels of the input slot surface that will contribute to the composition of the output surface, and a destination rectangle defines the region of the output surface that is affected by a given input slot. Together, the source and destination rectangle parameters specify the scaling ratios desired. Each slot can also dictate how pixel data is laid out in each surface cache entry by specifying the amount of pixel data, i.e., the number of bytes wide, logically represented by each cache entry; this provides flexibility in reducing the memory overfetch associated with fetch of surfaces under various use cases (e.g., scaling ratios, deinterlacing modes).

Via the Blending0Struct config structure, the dimensions of the output surface can be defined along with the pixel and memory format types. Via the Blending0Struct and the SurfaceList0Struct config structs, a target rectangle can also be defined to restrict the pixel processing output to a certain rectangle in the output surface. A programmable color can also be set to fill the background of the target rectangle.

The VIC allows the programming of clear rectangles that prevent the fetch of pixels from specific rectangular regions of input slots. The use of the clear rectangles can be used to reduce redundant pixel fetches, for example, if an opaque surface is known to occlude a layer below it, a clear rectangle can be specified to prevent fetching of pixels from the occluded region of the lower layer. Up to eight clear rectangles are specified via the SurfaceListClearRectStruct config structs, and per-slot clear rect mask enables are specified via the SurfaceIList0Struct config struct, Clear rectangle coordinates are specified relative to the output surface base.

With the addition of the sub-pixel source rectangle feature, source rectangle coordinates are specified in the config structure in a U14.16 format, allowing the source rectangle to be specified at a sub-pixel resolution. Destination, target, and clear rectangles coordinates are pixel aligned.

13.3.2 Memory Format Support

The following memory formats must be supported on input and output. Input and output memory formats do not have to match.

- Pitch Linear
- Block Linear (16Bx2 kind with sector ordering)
  - 64x8 byte GOB format with 16x2 byte sectors
  - Contiguous 64B atoms are laid out as 32x2 byte blocks

The VIC Surface Cache supports the above memory formats on input when fetching pixel data from memory.

The VIC Output Buffer supports the above memory formats on input when reading background image data when pre-processing inverse telecine data from memory, and on the output side when writing composited image data back to memory.

Memory formats supported by the VIC are enumerated as follows:

Table 35 : Memory Format Enumerations

Surface Kind Enumeration	Encoding (Four Bits)
BLK_KIND_PITCH	0x0
BLK_KIND_GENERIC_16Bx2_TEGRA	0x1

To fully support the Block Linear format, block height should be parameterizable. The following set of enumerations is valid.

Table 36 : Block Height Enumerations

Block Height Enumeration	Value	Encoding (Four Bits, log2 Encoding)
ONE_GOB	1	0
TWO_GOBS	2	1
FOUR_GOBS	4	2
EIGHT_GOBS	8	3
SIXTEEN_GOBS	16	4

Block Height Enumeration	Value	Encoding (Four Bits, log2 Encoding)
THIRTYTWO_GOBS	32	5

13.3.2.1 Surface Transformation

The Fetch Control unit will be responsible for generating the source image addressing that will implement mirroring (across X-axis and/or Y-axis) of tiles within the Target rectangle of the output surface.

The output buffer can mirror pixels in the X and Y directions within each output tile. This ability in addition to the fetch control changes mentioned above gives the ability to flip the contents of the entire Target rectangle about its axis.

The output buffer also supports transposition of the Target Rectangle. This ability when combined with the target rectangle flips described above gives the ability to rotate images by any multiple of 90 degrees.

Rotation must be done in the pipeline after deinterlacing because the deinterlacer assumes a normal orientation of the input fields (interlaced field lines run horizontal). Rotation of the image prior to deinterlacing will make the deinterlacer ineffective.

Figure 24: Interlaced Field Lines Run Horizontally

The programmed starting address of the source and destination rectangles will remain at the upper left corner of the unit. The ‘Source Image’ diagrammed below shows the logical tile traversal pattern as the input rectangle traverses the VIC unit (tiles are read in raster order from left to right, then top to bottom), and the destination rectangle diagrammed below shows the expected transformations when the programmer specifies the combination of flipX, flipY, and transposeXY transformations available to be applied to the output rectangle.

Figure 25: Surface Transformation Orientations

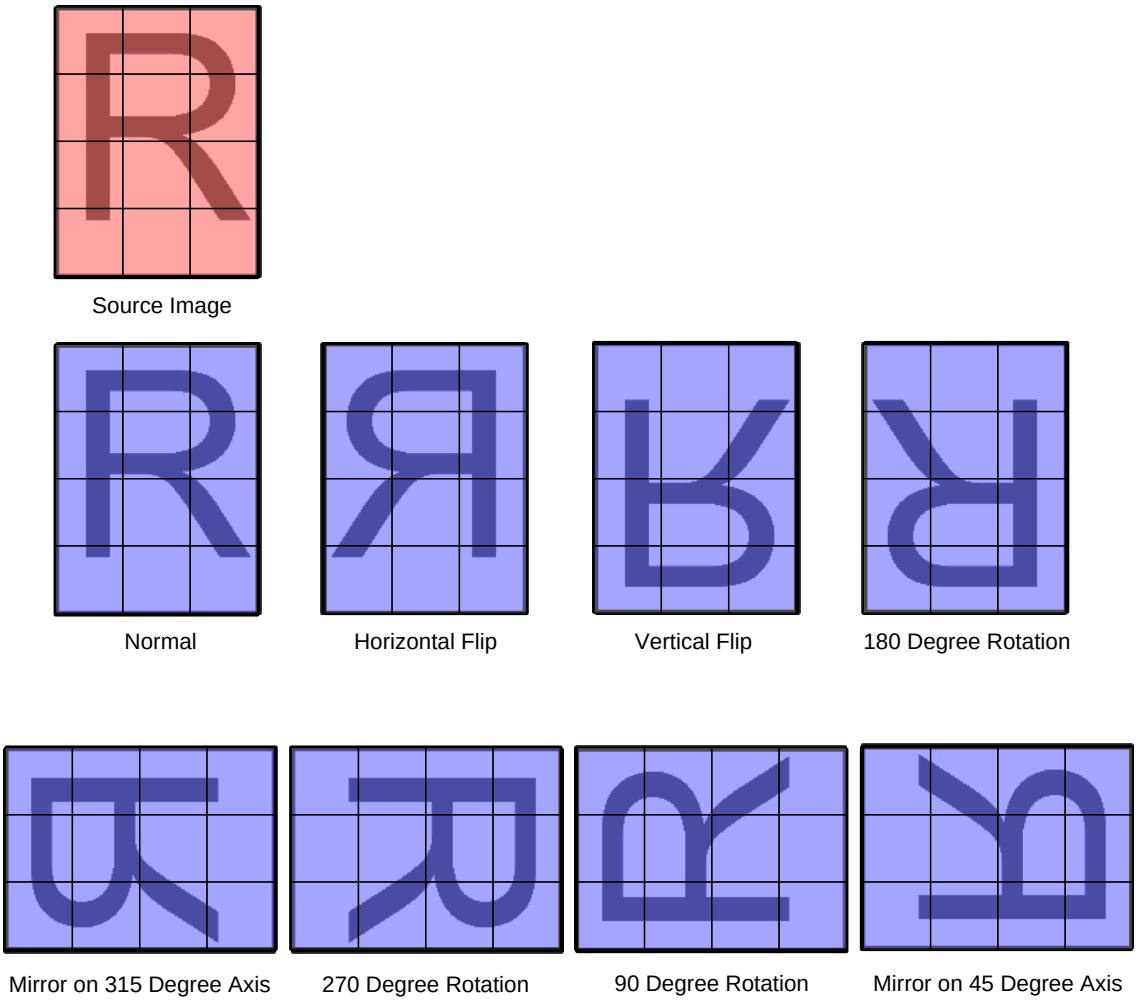


Table 37: Output Buffer Surface Transformation Controls

Transformation	transposeXY	flipY	flipX
Normal (no transformation)	0	0	0
H flip (mirror on vertical axis)	0	0	1
V flip (mirror on horizontal axis)	0	1	0
180-degree rotation	0	1	1
Mirror on 315-degree axis	1	0	0
270-degree rotation	1	1	0
90-degree rotation	1	0	1
Mirror on 45-degree axis	1	1	1

Surface mirroring (FlipX/FlipY) is accomplished via programming of the SurfaceList0Struct, FetchControl0Struct, and the Blending0Struct config structures. Surface transposition is accomplished via programming of the OutputTranspose field of the Blending0Struct config structure.

The table below shows the output image for a certain surface composition and how the output transformations affect the final output. The results of the transformations are summarized in the rules below.

1. The output surface parameters (SurfaceWidth/Height, LumaWidth/Height, ChromaWidth/Height) are not affected by any of the transformations. It is software's responsibility to allocate a large enough buffer so that the target rectangle fits within the output surface even after transformation.
2. The target rectangle position in the output surface does NOT change when output flips (in X or Y) are enabled. However, the position of the target rectangle is transposed when OutputTranspose is enabled.
3. When output flips are enabled, the entire contents of the target rectangle are flipped, including all ClearRects and DestinationRects and their contents. The axis of the flip is the axis of the TargetRectangle.
4. When OutputTranspose is enabled, the position of the target rectangle is transposed, as well as all of its contents (including all clear/destination rectangles).
5. When transpose and flips are enabled together, the overall effect of the transformation happens as if the flip operations occur first, followed by the transpose operation.
6. When flip operations are enabled, every Destination Rectangle has to lie fully within the TargetRectangle. This rule has to be enforced to get consistent results while flipping because we define the flip operation as happening about the target rectangle axis, and clip after we do the flip.

Table 38: Output Buffer Surface Transformation Examples

Transformation	TransposeXY	FlipY	FlipX	Image
Normal (no transformation)	0	0	0	H flip (mirror on vertical axis)	0	0	1	
Transformation	TransposeXY	FlipY	FlipX	Image
V flip (mirror on horizontal axis)	0	1	0	180-degree rotation	0	1	1	
Transformation	TransposeXY	FlipY	FlipX	Image
Mirror on 315-degree axis	1	0	0	270-degree rotation	1	1	0	

Transformation	TransposeXY	FlipY	FlipX	Image
90-degree rotation	1	0	1	Mirror on 45-degree axis	1	1	1	
13.3.3 Memory Copy

The VIC memory copy bandwidth scales with the VIC core frequency. The VIC core pixel processing pipeline can output up to 4x2 components (2 pixels) per VIC clock.

13.3.4 Temporal Noise Reduction

VIC 1.0 implemented a temporal noise reduction algorithm based on a motion adaptive IIR filter, where the filter weight was adapted based on a few constants and the SOS difference between a 3x3 neighborhood of pixels around the current pixel in the current and previous frames.

The VIC 1.0 TNR algorithm (hereafter called TNR1) works well for videos or captures that have good lighting conditions and lower levels of noise in the input video. However, when the lighting conditions are poor and there is a lot of noise in the input video/capture, the algorithm tries to be safe by not modifying it much, and allows most of the noise to pass through into the output.

The TNR2 algorithm performs significantly better in the above mentioned cases by pre-filtering the data spatially and allowing significantly higher alpha values in the IIR blend. This algorithm can be turned on by programming the AdvancedDenoise* fields in the SurfaceCache0Struct. The TNR2 algorithm also requires information about the lighting conditions at which the video or capture is being shot (information that will probably be derived from ISP statistics), and this information should be programmed into the LightLevel fields in the SurfaceListSurfaceStructs (4 bits, 0-darkest, 15-brightest).

13.3.5 Inverse Telecine

There are two statistics that the VIC hardware calculates: the difference count and the artifact count. The VIC hardware just calculates the statistics; a state machine on the Falcon Microcontroller has to interpret these.

13.3.6 Deinterlacing

The VIC supports various modes of deinterlacing the input video content such as DiSi1, BOB, and WEAVE. Weave is only used on progressive content or in case inverse telecine detected a cadence.

13.3.7 Color Fill

Programming the output surface with only a background color and writing to memory will produce a color fill.

13.3.8 Bayer Pixel Formats

Bayer pixel data can come from camera sensor equipment in various sizes, for example, 6 bits, 10 bits, 14 bits, 16 bits. Most Bayer data is stored using existing pixel formats, such as T_L8, or T_L16. In some special cases, special formats are created to pack pixel data efficiently to work with existing memory formats, for example, T_X2Lc10Lb10La10, T_X2Le6Ld6Lc6Lb6La6.

13.3.9 Pixel Format Support

The VIC pipeline supports an increased number of pixel formats compared to what is currently comprehended by VIC1.0 on input and output. The VIC pipeline can accept a surface of a given input pixel format and produce a given output pixel format.

The table below lists the supported pixel formats. The symbols in color conversion mode column describe the internal VIC representation of the format, (e.g., 1P_1C represents 1 plane with 1 component pixels, 2P_1+2C represents 2 planes, 1 plane with 1 component pixels and a second plane with 2 component pixels).

Table 39: Pixel Format Support

Pixel Format	FOURCC	Input Support	Output Support	Rotation	Scaling	High Quality Deinterlacing	New index	Color_Conversion_Mode
T_A8		Y	Y	Y	Y	N	0	1P_1C

Pixel Format	FOURCC	Input Support	Output Support	Rotation	Scaling	High Quality Deinterlacing	New index	Color_Conversion_Mode
T_Y8___U8___V8_N422 (YUV422 planar)	e.g., YV16	Y	Y	Y	Y	N	64	3P_1+1+1C
T_Y8___U8___V8_N422R (YUV422R planar)		Y	Y	Y	Y	N	65	3P_1+1+1C
T_Y8___U8___V8_N420 (YUV420 planar)	e.g., YV12	Y	Y	Y	Y	Y	66	3P_1+1+1C

*Currently, DiSi1 deinterlacing only works on NV24 surfaces and field-based variants of NV12, YV12, YUY2, and UYVY formats (with each field stored in a separate surface).

In the color format, the notation called “A:B:C” notation is used to describe how often U and V are sampled relative to Y.

444 (4:4:4) means no downsampling of the chroma channels.

422 (4:2:2) means 2:1 horizontal downsampling, with no vertical downsampling. Every scan line contains four Y samples for every two U and V samples.

420 (4:2:0) means 2:1 horizontal downsampling, with 2:1 vertical downsampling.

R refers to ‘rotated’. 422 by default means horizontal downsampling; while 422R means vertical downsampling. Instead of the chroma being shared between 2 horizontally adjacent luma components, it is shared between 2 vertically adjacent luma components.

The VIC does not support 24-bit color formats, either RGB or YUV.

13.3.10 Scaling and Filtering

The VIC contains Y and X-scaler units that together allow 5- or 10-tap polyphase filtering and scaling of the input surface. The hardware can be programmed with a set of filter coefficients for each filter-type (Detail/Noise/Normal), phase (0,1/32,2/32, .. 32/32), scale ratio (1:1, 2:1, 4:1, 8:1, 16:1), filter_length (5-tap, 10-tap) and stream (sub-picture or normal). Based on the actual scale-ratio, phase, etc., the hardware can then interpolate between these programmed values for use in the actual filters.

There are four filter types (5-tap non-substream, 5-tap substream, 10-tap non-substream, 10-tap substream). Five tables are needed for each coefficient type as different tables are needed for different scale down ratio of 1:1, 2:1, 4:1, 8:1 and 16:1[1]. Thus 20 tables are needed with a maximum downscale ratio of 16:1.

Each table has 16X4 memory entries (for the 5-tap filter) or 16X9 memory entries (for 10-tap filter). Each memory entry has three 10-bit base coefficients (for Detail/Noise/Default) that will be feed into a LERP3 simultaneously to interpolate based on different noise and detail weight. The table has 16 columns, and each column stores all the coefficients for phase 0/32, 1/32, 2/32, 3/32, 4/32, 5/32, 6/32, 7/32, 8/32, 9/32, 10/32, 11/32, 12/32, 13/32, 14/32 and 15/32, with the exception that the first column stores coefficients for both 0/32 and 16/32.

Each column stores four sets of base coefficients for the 5-tap filter because the last coefficient can be derived from the remaining four. phase 0/32 and 16/32 are special cases in that only two sets of base coefficients are needed for each of them in the 5-tap case,only four sets of base coefficients are needed for phase 0/32 in the 10-tap case, and five sets of base coefficients are needed for phase 16/32 in the 10-tap case. Therefore, phase 0/32 and 16/32 are folded into the same column. Due to symmetry, the base coefficients for phases 17 through 31 do not need to be stored.

[1] 1:1 ratio contains identify filter that can be used for all scale up cases. Different scale down ratio requires different coefficients since the filter is a low pass filter the bandwidth of which is related to the scale ratio. Coefficients for 2:1, 4:1, 8:1 and 16:1 are stored to interpolate any downscale ratios.

13.3.10.1 Panoramic Scaling

The VIC also implements a “panoramic” scaling mode which can be used to convert images between different aspect ratios while avoiding any letterboxing. This mode essentially implements a non-linear scaling in the horizontal direction, with the scale ratio changing as we move away from the center of the image.

Panoramic scaling has an additional parameter *p* ([-1, 1]) that defines the magnitude of the second order term in a polynomial. The polynomial parameters for scaling can then be defined as follows.

The original scaling factor *f* is changed based on the location *x* ([-1, 1]) within the destination rectangle.

$$scaling\_factor_x = f*(a+3bx^2) \text{ with } a=\begin{cases}1-\frac{1}{2}p & p<0\\ 1-p & p\geq 0\end{cases} \text{ and } b=\begin{cases}\frac{1}{2}p & p<0\\ p & p\geq 0\end{cases}$$

The source sample position *x'* is therefore calculated as:

$$x' = f*(ax+bx^3) = a'x+b'x^3 \text{ with } a' = fa \text{ and } b' = fb$$

The new scaling factor can be calculated incrementally using 2 counters.

Panoramic scaling for 4:3 to 16:9 conversion should have $p=-\frac{2}{3}$, while 16:9 to 4:3 conversion should have $p=\frac{1}{4}$ for 1:1 scaling in the center.

13.3.11 Pixel Format Conversion

Color conversion and proc-amp are implemented using a matrix multiplication on every pixel. The matrix only changes when the surfaces changes.

Current chain of operations:

- Proc-amp + Output CC (4x3 matrix)
- Clamping (optional soft clamping, 2 control entry)

The 4x3 matrix values are specified in the ColorConversionMatrixStruct as S12.8 values. In addition, the result of the matrix multiplication will be right shifted by r_shift. To allow for highest accuracy r_shift should always be as high as possible without losing any range in the other coefficients. Note that the constant offsets (c03, c13, c23) are S12.8 and are not affected by r_shift.

$$\begin{pmatrix}out0\\ out1\\ out2\end{pmatrix} = \begin{pmatrix}c00 & c01 & c02 & c03\\ c10 & c11 & c12 & c13\\ c20 & c21 & c22 & c23\end{pmatrix}\begin{pmatrix}in0 \gg r\_shift\\ in1 \gg r\_shift\\ in2 \gg r\_shift\\ 1\end{pmatrix}$$

Soft clamping defines a piecewise linear function consisting of three pieces. The control entries define the area of soft clamping. For example, the following equation applies for the values *a* and *b*:

$$v' = \begin{cases}0 & v<-a\\ \frac{v+a}{2} & -a\leq v<a\\ v & a\leq v<b\\ \frac{v+b}{2} & b\leq v<2-b\\ 1 & 2-b\leq v\end{cases}$$

When converting between pixel formats with components of varying bit width, bit replication is used for expanding component bit widths, and truncation is used for reducing component bit widths.

Dithering and undithering are not supported.

Data Size Conversion

When expanding the number of bits in a component (e.g., from RGB565 to RGB888), expansion should use bit replication of the MSBs of the original value to fill in the LSBs of the expanded bit length value. For example, if converting from a 5-bit value to an 8-bit value, the first 3 MSBs of the source 5-bit value should be concatenated as the 3 new LSBs to the original 5-bit value to produce the new expanded 8-bit value.

For example: 5-bit R5=**110**00'b expanded to 8 bit R8=**110**00*110*'b

When reducing the number of bits in a component (for example, from RGB888 to RGB565), the LSBs of the old value should be truncated to arrive at the shortened value.

For example: 8-bit R8=11000*000*'b reduced to 5 bit R5=11000'b

Replication followed by truncation will ensure that the truncated value will equal the original pre-replicated operand, i.e., RGB565→RGB888 expansion followed immediately by RGB888→RGB565 reduction will result in the same original value.

Luminance Conversion

Conversion from luminance-only color formats (e.g., L8/Y8/YUV100, A8L8) to and from RGB or YUV formats should be done as outlined below.

- Luminance-only to YUV

  L→Y, 128→U, 128→V
- Luminance-only to RGB

  L→R, L→G, L→B
- YUV to Luminance-only

  Y→L
- Clamp L between 0.0 and 1.0
- RGB to Luminance-only

  (R*5 + G*9 + B*2)/16 → L
- Clamp L between 0.0 and 1.0

Adding and Removing Alpha

If converting from a pixel format with alpha to a pixel format with no alpha, the alpha value should be dropped.

If converting from a pixel format with no alpha to a pixel format with alpha, the alpha value in the destination pixel format should be set to 1.0.

13.3.12 Luma Keying

Coefficient values to compute the Luma value of the pixel from the pixel components can be specified in the ColorConversionLumaAlphaStruct, along with the upper and lower luma key values. Any pixel that has a luma that falls within the luma key range will have its alpha value zeroed out so that it can be processed appropriately in the blending stage.

13.3.13 Blender

The blender interface allows for symmetric blend modes between the VIC and Display units.

The VIC blender supports the following different blending modes:

- DXVAHD_ALPHA_FILL_MODE_OPAQUE
- DXVAHD_ALPHA_FILL_MODE_BACKGROUND
- DXVAHD_ALPHA_FILL_MODE_DESTINATION
- DXVAHD_ALPHA_FILL_MODE_SOURCE_STREAM
- DXVAHD_ALPHA_FILL_MODE_COMPOSITED
- DXVAHD_ALPHA_FILL_MODE_SOURCE_ALPHA

All modes other than _ALPHA_FILL_MODE_COMPOSITED are as defined in the Microsoft DXVA spec and are carried over from VIC 1.0. The new mode that allows the VIC and Display blenders to match each other is enabled by setting the AlphaFillModein the VIC Config Structure to _ALPHA_FILL_MODE_COMPOSITED. When the AlphaFillMode is set to anything other than _ALPHA_FILL_MODE_COMPOSITED, the srcFact and dstFact parameters specified below are ignored and do not affect the processing.

The parameterizable blender interface allows a variety of blend modes, including the following:

- Per-Pixel Non-Premultiplied Alpha Blend

  output = src*src_alpha + dst*(1-src_alpha)
- Per Pixel Source Premultiplied Alpha Blend

  output = src + dst*(1-src_alpha)
- Constant-Alpha Blend

  output = src*const_alpha + dst*(1-const_alpha)
- Per-Pixel Non-Premultiplied Alpha Blend with constant blend

  output = src*src_alpha*const_alpha + dst*(1-src_alpha*const_alpha)
- Per-Pixel Premultiplied Alpha Blend with constant blend

  output = src*const_alpha + dst*(1-src_alpha*const_alpha)

Note that ColorKeySelect should always be set to disabled.

The blend data path will require the color key comparison match result, and per-slot inputs from the config structure to formulate the blend equation.

srcFactC, srcFactA, dstFactC, and dstFactA multiplicand inputs are determined by the config structure programming and color key comparison results. Note that VIC's internal pixel pipeline represents each pixel component as 10 bits, and as a result, constants from the config struct also require 10-bit representation.

Table 40 : Per-Slot Blend Configuration

Blend Spec Name	Register Name	Description
K1	AlphaK1	10-bit constant alpha value
K2	AlphaK2	10-bit constant alpha value
srcFactC_Match_Select	srcFactCMatchSelect	3-bit enum which sets srcFactC: K1: AlphaK1 K1_TIMES_DST: AlphaK1*dstA NEG_K1_TIMES_DST: 1.0-(AlphaK1*dstA) K1_TIMES_SRC: AlphaK1*srcA ZERO: 0
dstFactC_Match_Select	dstFactCMatchSelect	3-bit enum which sets dstFactC: K1: AlphaK1 K2: AlphaK2 K1_TIMES_DST: AlphaK1*dstA

Blend Spec Name	Register Name	Description
		NEG_K1_TIMES_DST: 1.0-(AlphaK1*dstA) NEG_K1_TIMES_SRC: 1.0-(AlphaK1*srcA) ZERO: 0 ONE: 1.0
srcFactA_Match_Select	srcFactAMatchSelect	3-bit enum which sets srcFactA: K1: AlphaK1 K2: AlphaK2 ZERO: 0 NEG_K1_TIMES_DST: 1.0-(AlphaK1*dstA)
dstFactA_Match_Select	dstFactAMatchSelect	3-bit enum which sets dstFactA: K2: AlphaK2 NEG_K1_TIMES_SRC: 1.0-(AlphaK1*srcA) ZERO: 0 ONE: 1.0
UseK3	UseOverrideR	1-bit Boolean to override srcR with constant values K3R
UseK3	UseOverrideG	1-bit Boolean to override srcG with constant values K3G
UseK3	UseOverrideB	1-bit Boolean to override srcB with constant values K3B
UseK3	UseOverrideA	1-bit Boolean to override srcA with constant values K3A
K3R	OverrideR	10-bit source override R value
K3G	OverrideG	10-bit source override G value
K3B	OverrideB	10-bit source override B value
K3A	OverrideA	10-bit source override A value
MaskR	MaskR	1-bit Boolean to override outputR to equal dstR
MaskG	MaskG	1-bit Boolean to override outputG to equal dstG
MaskB	MaskB	1-bit Boolean to override outputB to equal dstB
MaskA	MaskA	1-bit Boolean to override outputA to equal dstA

Given the source and destination factor settings based on config structure inputs and color match results, the per-pixel blend equations are as follows, where srcR, srcG, srcB, srcA, dstR, dstG, dstB, and dstA represent the incoming R, G, B, A components of the incoming source and already present destination pixels in the SFMem buffer (blended results of background and slot[0] through to slot[n-1] for input slot[n]).

```
outputR = (srcFactC * srcR) + (dstFactC * dstR)
outputG = (srcFactC * srcG) + (dstFactC * dstG)
outputB = (srcFactC * srcB) + (dstFactC * dstB)
outputA = (srcFactA * srcA) + (dstFactA * dstA)
```

If the ColorKeySelect is set to DISABLED, then srcFactC, srcFactA, dstFactC, and dstFactA will be programmed by srcFactCMatchSelect, srcFactCMatchSelect, srcFactCMatchSelect, and srcFactCMatchSelect, respectively.

If the ColorKeySelect is set to ENABLED, then srcFactC, srcFactA, dstFactC, and dstFactA are programmed by srcFactCMatchSelect, srcFactCMatchSelect, srcFactCMatchSelect, and srcFactCMatchSelect, respectively, if the destination color key match result returns true, and programmed by srcFactCNoMatchSelect, srcFactCNoMatchSelect, srcFactCNoMatchSelect, and srcFactCNoMatchSelect, respectively, if the destination color key match result returns false.

UseK3 allows the incoming source components to be overrided by constant color components K3R, K3G, K3B, K3A.

MaskR, MaskG, MaskB, and MaskA Boolean settings provide additional per-component mask bits to allow pass-through of the destination pixel components to the output pixel

There is no post-blend color space conversion available. As a result, blending should be done in the destination color space. If the destination color space is RGB, all input slots should be converted to RGB color space before blending.

A programmable background color will still be set to fill the target rectangle background via the Blending0Struct, as in VIC1.0.

13.3.14 Subpixel Source Rectangles

Source rectangles can be specified to a sub-pixel resolution. This feature can be used to smoothly zoom into a portion of an image in real-time, for example, when using the zoom button on a camera. Specifying source and destination rectangles to a pixel resolution quantizes the allowed zoom factor, and hence can cause the zoom to feel jerky. Allowing the source rectangles to be specified to a sub-pixel resolution avoids this problem and makes the zoom smooth.

The config structure is therefore modified to make the source rectangle coordinates U14.16 numbers. Once we have the (decimal) source rectangles, we can calculate adjust the starting phase of the scaling filters accordingly so as to achieve the sub-pixel shift/scale required.

Note that all source coordinates (left, top, right, bottom) include the bounding pixels. For instance: (0,0)-(0,0) contains 1 pixel, while (0,0)-(1-1) contains a square of 2x2 pixels. This means that rectangles which are less than 1 pixel wide or tall cannot be used. Also, specifying a rectangle of (0.0,0.0)-(0.0,0.1) results in a source rectangle that is 1 pixel wide and 1.1 pixel high, which is not immediately apparent.

13.3.15 Maximum Surface and Rectangle Size Support

The VIC supports surface and rectangle sizes up to 16384x16384 pixels.

This size affects all input and output surfaces parameters as well as all fetch calculations related to these parameters:

- Per-input slot and output surface width/height, luma width/height, chroma width/height
- Per-input slot source and destination rectangle dimensions
- Clear rectangle dimensions
- Output target rectangle dimensions

13.4 Programming Guidelines

13.4.1 Class Operation

The operation of this class can be summarized as follows:

1. The driver should set up input and output context DMAs as specified here.
2. After setting up the surfaces, the driver should send the parameter methods which specify:
   - Control Configuration
   - Configuration structure offset
   - Palette buffer offset
   - History buffer offset
   - Input/Output/Intermediate surface offsets
   - Context ID methods
   - Fetch Control Engine (FCE) microcode offset
3. When Execute() method is sent, the Falcon program will be initiated.

The compositor operation requires the following buffers. These buffers are explained in more detail in the following sections.

Buffers	I/O	Producer	Description/Restrictions
Config Buffer	I	Driver	Configuration parameters
Palette Buffer	I	Driver	Palette table
History Buffer	I/O	App	Histogram and Cadence parameters
Input surfaces	I	Driver/VIC	Input Surfaces
Noise reduced surfaces	I/O	VIC	Noise reduced version of input
Motion map surfaces	I/O	VIC	Motion map of input
FCE Microcode buffer	I	Driver	FCE microcode

13.4.1.1 Restrictions

- Maximum slots (MAX_SLOTS) supported are 5.
- Maximum downscale ratio is 16:1.
- When enabling panoramic scaling, the maximum downscale ratio is 7:1. In addition, the minimum destination rectangle size is 4x4 pixels.
- Minimum source rectangle size is 4 pixels x 4 pixels.
- The only pixel formats supported in video pre-process operations (IVTC, TNR, DiSi1 deinterlacing) are NV12, YV12, YUY2, and UYVY.

13.4.2 Application Memory Structures

13.4.2.1 Enumerates and Constants

Below are the enumerators used in the configuration structures passed by the driver:

- DXVAHD_FRAME_FORMAT
- PIXEL_FORMAT
- DXVAHD_DEINTERLACE_MODE_PRIVATE
- DXVAHD_ALPHA_FILL_MODE
- BLK_KIND
- BLEND_SRCFACTC
- BLEND_DSTFACTC
- BLEND_SRCFACTA
- BLEND_DSTFACTA

13.4.3 Config Structure

The Config structure is read from the frame buffer by the surface cache unit and is stored in small memories inside each subunit. The entire ConfigStruct is the concatenation of the Surface Cache, Surface List, Color Conversion, Blending and Fetch Control structs (in this order). The structs are read in 128-bit units from memory and sent to the according subunits memory with the correct memory address by the Surface Cache.

The config structure is broken up into smaller structs that are used depending on the active slots and their content. Each structure is a multiple of 128 bits in size, and the start of the struct needs to be aligned to a 256 byte boundary.

Note: NV12 and NV24 share the same pixel format but can be distinguished by the fact that NV24 is a field based format (i.e., every surface contains a single field) whereas NV12 is frame based (i.e., every surface contains an entire frame).

Note: For highest quality, filter override mode as defined in FetchControlCoeffStruct should always be used.

The following table defines the smaller structs that comprise ConfigStruct.

Table 41: ConfigStruct Substructures

Name	Data Type	Offset	Notes
surfaceCache0Struct	SurfaceCache0Struct (128 bits)	0	
surfaceList0Struct	SurfaceList0Struct (128 bits)	128	
surfaceListClearRectStruct[4]	SurfaceListClearRectStruct (128 bits)	256 + (i * 128)	Up to eight clear rectangles supported. Each SurfaceListClearRectStruct specifies two rectangles
surfaceListSurfaceStruct[5]	SurfaceListSurfaceStruct (384 bits)	768 + (i * 384)	
colorConversionLumaAlphaStruct[5]	ColorConversionLumaAlphaStruct (128 bits)	2688 + (i * 128)	
colorConversionMatrixStruct[5]	ColorConversionMatrixStruct (256 bits)	3328 + (i * 256)	Conversion matrix for brightness, hue and saturation values
colorConversionClampStruct[5]	ColorConversionClampStruct (128 bits)	4608 + (i * 128)	
blending0Struct	Blending0Struct (256 bits)	5248	
blendingSurfaceStruct[5]	BlendingSurfaceStruct (128 bits)	5504 + (i * 128)	
fetchControl0Struct	FetchControl0Struct (512 bits)	6144	
fetchControlCoeffStruct[520]	FetchControlCoeffStruct (128 bits)	6656 + (i * 128)	520 coefficient structs

13.4.3.1 SurfaceCache0Struct

This structure contains enable bits for each slot, which need to be set as described below.

- Noise reduction requires a forward and a backward reference field for interlaced content and a backward reference for progressive content (see the “Method Naming and Programming” section about how to set surfaces). Both require a noise reduced surface (field for interlaced, frame for progressive).
- MotionMap calculation is required for DiSi1/DiNewBob and also needs a forward and a backward reference. Behavior is not defined for progressive streams so enabling it needs to be flagged as an error.
- Cadence Detection enables artifact and weave counts. It also enables Falcon code to force deinterlace mode to weave if a cadence was detected.

Table 42: SurfaceCache0Struct Details

Name	Data Type	Offset	Notes
DeNoise0	fixed<0,1,0> (1 bit)	0	Enable bit for noise reduction
CadenceDetect0	fixed<0,1,0> (1 bit)	1	Cadence detection enable bit
MotionMap0	fixed<0,1,0> (1 bit)	2	Motion map enable bit for each slot. Required for DiSi1/DiNewBob
MedianFilter0	fixed<0,1,0> (1 bit)	3	Do not enable Median filtering
DeNoise1	fixed<0,1,0> (1 bit)	4	

Name	Data Type	Offset	Notes
CadenceDetect1	fixed<0,1,0> (1 bit)	5	
MotionMap1	fixed<0,1,0> (1 bit)	6	
MedianFilter1	fixed<0,1,0> (1 bit)	7	
DeNoise2	fixed<0,1,0> (1 bit)	8	
CadenceDetect2	fixed<0,1,0> (1 bit)	9	
MotionMap2	fixed<0,1,0> (1 bit)	10	
MedianFilter2	fixed<0,1,0> (1 bit)	11	
DeNoise3	fixed<0,1,0> (1 bit)	12	
CadenceDetect3	fixed<0,1,0> (1 bit)	13	
MotionMap3	fixed<0,1,0> (1 bit)	14	
MedianFilter3	fixed<0,1,0> (1 bit)	15	
DeNoise4	fixed<0,1,0> (1 bit)	16	
CadenceDetect4	fixed<0,1,0> (1 bit)	17	
MotionMap4	fixed<0,1,0> (1 bit)	18	
MedianFilter4	fixed<0,1,0> (1 bit)	19	
IsEven0	fixed<0,1,0> (1 bit)	20	Select if current field is even (used for cadence detection)
IsEven1	fixed<0,1,0> (1 bit)	21	
IsEven2	fixed<0,1,0> (1 bit)	22	
IsEven3	fixed<0,1,0> (1 bit)	23	
IsEven4	fixed<0,1,0> (1 bit)	24	
MMapCombine0	fixed<0,1,0> (1 bit)	25	Enable bit for combine motion map for each slot. This is required for DiSi1/DiNewBob. This requires MotionMap being enabled and also required a prevMotionMap surface (see “Method Naming and Programming”). Behavior without MotionMap enabled is undefined and has to be flagged as an error.
MMapCombine1	fixed<0,1,0> (1 bit)	26	
MMapCombine2	fixed<0,1,0> (1 bit)	27	
MMapCombine3	fixed<0,1,0> (1 bit)	28	
MMapCombine4	fixed<0,1,0> (1 bit)	29	
reserved0	fixed<0,2,0> (2 bits)	30	
PixelFormat0	fixed<0,7,0> (7 bits)	32	Pixel format for each stream (PIXEL_FORMAT) Only NV12, YUY2 and UYVY allow for motion buffer calculation and DiSi1/DiNewBob deinterlacing and noise reduction.
reserved1	fixed<0,1,0> (1 bit)	39	

Name	Data Type	Offset	Notes
PixelFormat1	fixed<0,7,0> (7 bits)	40	
reserved2	fixed<0,1,0> (1 bit)	47	
PixelFormat2	fixed<0,7,0> (7 bits)	48	
reserved3	fixed<0,1,0> (1 bit)	55	
PixelFormat3	fixed<0,7,0> (7 bits)	56	
reserved4	fixed<0,1,0> (1 bit)	63	
PixelFormat4	fixed<0,7,0> (7 bits)	64	
reserved5	fixed<0,1,0> (1 bit)	71	
reserved6	fixed<0,24,0> (24 bits)	72	
PPMotion0	fixed<0,1,0> (1 bit)	96	Enable bit for previous motion calculation for each slot. PPMotion is obsolete and should not be enabled.
PPMotion1	fixed<0,1,0> (1 bit)	97	
PPMotion2	fixed<0,1,0> (1 bit)	98	
PPMotion3	fixed<0,1,0> (1 bit)	99	
PPMotion4	fixed<0,1,0> (1 bit)	100	
reserved7	fixed<0,3,0> (3 bits)	101	
ChromaEven0	fixed<0,1,0> (1 bit)	104	Enable if chroma of current field is even
ChromaEven1	fixed<0,1,0> (1 bit)	105	
ChromaEven2	fixed<0,1,0> (1 bit)	106	
ChromaEven3	fixed<0,1,0> (1 bit)	107	
ChromaEven4	fixed<0,1,0> (1 bit)	108	
reserved8	fixed<0,3,0> (3 bits)	109	
AdvancedDenoise0	fixed<0,1,0> (1 bit)	112	Enable the advanced denoising algorithm (TNR2) for each slot.
AdvancedDenoise1	fixed<0,1,0> (1 bit)	113	
AdvancedDenoise2	fixed<0,1,0> (1 bit)	114	
AdvancedDenoise3	fixed<0,1,0> (1 bit)	115	
AdvancedDenoise4	fixed<0,1,0> (1 bit)	116	
reserved9	fixed<0,3,0> (3 bits)	117	
reserved10	fixed<0,8,0> (8 bits)	120	

13.4.3.2 SurfaceList0Struct

The per-slot clear rectangle masks enable or disable each of the 8 clear rectangles defined in the SurfaceListClearRectStruct for that slot. This structure also specifies the output flip enables and Target rectangle.

Table 43: SurfaceList0Struct Details

Name	Data Type	Offset	Notes
ClearRectMask0	fixed<0,8,0> (8 bits)	0	Clear rectangle mask for slot 0
ClearRectMask1	fixed<0,8,0> (8 bits)	8	Clear rectangle mask for slot 1
ClearRectMask2	fixed<0,8,0> (8 bits)	16	Clear rectangle mask for slot 2
ClearRectMask3	fixed<0,8,0> (8 bits)	24	Clear rectangle mask for slot 3
ClearRectMask4	fixed<0,8,0> (8 bits)	32	Clear rectangle mask for slot 4
reserved0	fixed<0,22,0> (22 bits)	40	
OutputFlipX	fixed<0,1,0> (1 bit)	62	Flip output image horizontally
OutputFlipY	fixed<0,1,0> (1 bit)	63	Flip output image vertically
TargetRectLeft	fixed<0,14,0> (14 bits)	64	Target rectangle. Restricts the output to a certain rectangle inside the output surface. Pixels outside of this area are guaranteed to remain unmodified.
reserved1	fixed<0,2,0> (2 bits)	78	
TargetRectRight	fixed<0,14,0> (14 bits)	80	
reserved2	fixed<0,2,0> (2 bits)	94	
TargetRectTop	fixed<0,14,0> (14 bits)	96	
reserved3	fixed<0,2,0> (2 bits)	110	
TargetRectBottom	fixed<0,14,0> (14 bits)	112	
reserved4	fixed<0,2,0> (2 bits)	126	

13.4.3.3 SurfaceListClearRectStruct[4]

The SurfaceListClearRectStruct structures together define 8 clear rectangles. These rectangles are enabled or disabled for each slot using the fields in SurfaceList0Struct.

Table 44: SurfaceListClearRectStruct[4] Details

Name	Data Type	Offset	Notes
ClearRect0Left	fixed<0,14,0> (14 bits)	0	First clear rectangle of 128-bit chunk
reserved0	fixed<0,2,0> (2 bits)	14	
ClearRect0Right	fixed<0,14,0> (14 bits)	16	
reserved1	fixed<0,2,0> (2 bits)	30	

Name	Data Type	Offset	Notes
ClearRect0Top	fixed<0,14,0> (14 bits)	32	
reserved2	fixed<0,2,0> (2 bits)	46	
ClearRect0Bottom	fixed<0,14,0> (14 bits)	48	
reserved3	fixed<0,2,0> (2 bits)	62	
ClearRect1Left	fixed<0,14,0> (14 bits)	64	Second clear rectangle of 128-bit chunk
reserved4	fixed<0,2,0> (2 bits)	78	
ClearRect1Right	fixed<0,14,0> (14 bits)	80	
reserved5	fixed<0,2,0> (2 bits)	94	
ClearRect1Top	fixed<0,14,0> (14 bits)	96	
reserved6	fixed<0,2,0> (2 bits)	110	
ClearRect1Bottom	fixed<0,14,0> (14 bits)	112	
reserved7	fixed<0,2,0> (2 bits)	126	

13.4.3.4 SurfaceListSurfaceStruct[5]

Surface parameters for each slot.

Table 45: SurfaceListSurfaceStruct[5] Details

Name	Data Type	Offset	Notes
Enable	fixed<0,1,0> (1 bit)	0	Enable or disable bit for this slot
FrameFormat	fixed<0,4,0> (4 bits)	1	Frame format of the frame (DXVAHD_FRAME_FORMAT)
PixelFormat	fixed<0,7,0> (7 bits)	5	Pixel format for each stream (PIXEL_FORMAT)
reserved0	fixed<0,2,0> (2 bits)	12	
ChromaLocHoriz	fixed<0,2,0> (2 bits)	14	Horizontal chroma location 0: Co-located with even luma 1: In between even and odd luma 2: Co-located with odd luma 3: Between odd and next even luma
ChromaLocVert	fixed<0,2,0> (2 bits)	16	Vertical chroma location 0: Co-located with even luma 1: In between even and odd luma 2: Co-located with odd luma 3: Between odd and next even luma
Panoramic	fixed<0,12,0> (12 bits)	18	Panoramic scaling parameter. For details on this parameter, refer to the Panoramic Scaling subsection.
reserved1	fixed<0,4,0> (4 bits)	30	
SurfaceWidth	fixed<0,14,0> (14 bits)	34	Width of surface minus 1. Any pixel data outside of this will not be used inside the VIC but might still be read.

Name	Data Type	Offset	Notes
reserved2	fixed<0,1,0> (1 bit)	48	
SurfaceHeight	fixed<0,14,0> (14 bits)	49	Height of surface minus 1. Any pixel data outside of this will not be used inside the VIC but might still be read.
reserved3	fixed<0,1,0> (1 bit)	63	
LumaWidth	fixed<0,14,0> (14 bits)	64	Padded luma width of surface minus 1. Any pixel data outside of this will not be read.
reserved4	fixed<0,1,0> (1 bit)	78	
LumaHeight	fixed<0,14,0> (14 bits)	79	Padded luma height of surface minus 1. Any pixel data outside of this will not be read.
reserved5	fixed<0,1,0> (1 bit)	93	
ChromaWidth	fixed<0,14,0> (14 bits)	94	Padded chroma width of surface minus 1. Any pixel data outside of this will not be read. This value is not required for pixel interleaved surfaces such as ARGB.
reserved6	fixed<0,1,0> (1 bit)	108	
ChromaHeight	fixed<0,14,0> (14 bits)	109	Padded chroma height of surface minus 1. Any pixel data outside of this will not be read. This value is not required for pixel interleaved surfaces such as ARGB
reserved7	fixed<0,1,0> (1 bit)	123	
CacheWidth	fixed<0,3,0> (3 bits)	124	Number of horizontal bytes per surface-cache cache-line. Each 256B cache line can store a source region of size as enumerated below. 0: 16Bx16 (BL16Bx2) 1: 32Bx8 (BL16Bx2) 2: 64Bx4 (BL16Bx2, PL) 3: 128Bx2 (BL16Bx2, PL) 4: 256Bx1 (PL)
reserved8	fixed<0,1,0> (1 bit)	127	
FilterLengthY	fixed<0,2,0> (2 bits)	128	Filter length for each stream: 0: 1-tap (nearest neighbor) 1: 2-tap (bi-linear) 2: 5-tap 3: 10-tap
FilterLengthX	fixed<0,2,0> (2 bits)	130	
DetailFltClamp	fixed<0,6,0> (6 bits)	132	
reserved9	fixed<0,2,0> (2 bits)	138	
LightLevel	fixed<0,4,0> (4 bits)	140	Describes the level of lighting present when the input image was captured. This parameter is used along with the AdvancedDenoise bits to determine the exact denoising algorithm to be applied for noise reduction.
reserved10	fixed<0,4,0> (4 bits)	144	
reserved11	fixed<0,8,0> (8 bits)	148	
reserved12	fixed<0,32,0> (32 bits)	156	
BlkKind	fixed<0,4,0> (4 bits)	188	Block-linear kind (BLK_KIND)

Name	Data Type	Offset	Notes
DestRectLeft	fixed<0,14,0> (14 bits)	192	The destination rectangle defines the region of the output surface that is affected by this slot. Together with the source rectangle it also defines the scaling rations. Any pixel outside of this region will not be affected by this input stream. For any non-4:4:4 format, all corners need to fall on a multiple of 2 (Right and Bottom are minus 1 encoded though).
reserved13	fixed<0,1,0> (1 bit)	206	
DestRectRight	fixed<0,14,0> (14 bits)	207	
reserved14	fixed<0,1,0> (1 bit)	221	
DestRectTop	fixed<0,14,0> (14 bits)	222	
reserved15	fixed<0,1,0> (1 bit)	236	
DestRectBottom	fixed<0,14,0> (14 bits)	237	
reserved16	fixed<0,1,0> (1 bit)	251	
BlkHeight	fixed<0,4,0> (4 bits)	252	Block-linear height (in gobs, log2)
SourceRectLeft	fixed<0,30,0> (30 bits)	256	The source rectangle defines the region of pixels that will be read from the source surface. Any pixel data outside of this will not be used inside the VIC but might still be read. The source rectangle coordinates are specified in a U14.16 format, allowing fractional coordinates to be specified. The source rectangle should lie entirely within the input surface for the slot; that is, negative values, or values greater than the size of the surface, are illegal.
reserved17	fixed<0,2,0> (2 bits)	286	
SourceRectRight	fixed<0,30,0> (30 bits)	288	
reserved18	fixed<0,2,0> (2 bits)	318	
SourceRectTop	fixed<0,30,0> (30 bits)	320	
reserved19	fixed<0,2,0> (2 bits)	350	
SourceRectBottom	fixed<0,30,0> (30 bits)	352	
reserved20	fixed<0,2,0> (2 bits)	382	

13.4.3.5 ColorConversionLumaAlphaStruct[5]

Enables luma keying and plane alpha parameters.

Table 46: ColorConversionLumaAlphaStruct[5] Details

Name	Data Type	Offset	Notes
l0	fixed<0,20,0> (20 bits)	0	Matrix entry (0) of 4x1 luma conversion matrix in S12.8 format
l1	fixed<0,20,0> (20 bits)	20	Matrix entry (1) of 4x1 luma conversion matrix in S12.8 format
l2	fixed<0,20,0> (20 bits)	40	Matrix entry (2) of 4x1 luma conversion matrix in S12.8 format

Name	Data Type	Offset	Notes
r_shift	fixed<0,4,0> (4 bits)	60	The result of the matrix multiplication is right shifted by r_shift. To allow for highest accuracy r_shift should always be as high as possible without losing any range in the other coefficients.
l3	fixed<0,20,0> (20 bits)	64	Matrix entry (3) of 4x1 luma conversion matrix in S12.8 format. Is not affected by r_shift.
PlanarAlpha	fixed<0,10,0> (10 bits)	84	10-bit planar alpha value. This planar alpha is multiplied with the alpha value coming from the stream. In case of palettized alpha formats (like AI44/A8P8/AI88), the stream alpha value is the alpha value from the surface multiplied with the alpha value from the palette.
ConstantAlpha	fixed<0,1,0> (1 bit)	94	If true planar alpha value is used instead of stream alpha, if false, stream alpha is multiplied with planar alpha. Constant alpha has to be set for all surfaces not containing any alpha data (like XRGB/NV12/YUY2/UYVY/YV12).
ClipEnabled	fixed<0,1,0> (1 bit)	95	Enables clip against negative values after gamut matrix
LumaKeyLower	fixed<0,10,0> (10 bits)	96	Lower luma key value
reserved6	fixed<0,3,0> (3 bits)	106	
StereoInterleave	fixed<0,3,0> (3 bits)	109	Enables pixel interleave for auto-stereoscopic panels (STEREO_INTERLEAVE)
LumaKeyUpper	fixed<0,10,0> (10 bits)	112	Upper luma key value
reserved7	fixed<0,2,0> (2 bits)	122	
reserved8	fixed<0,1,0> (1 bit)	124	
LumaKeyEnabled	fixed<0,1,0> (1 bit)	125	Luma key enable
reserved9	fixed<0,2,0> (2 bits)	126	

13.4.3.6 ColorConversionMatrixStruct[5]

The matrices defined in these structures specify the color space conversion between input and output pixel formats, if any.

Table 47: ColorConversionMatrixStruct[5] Details

Name	Data Type	Offset	Notes
c00	fixed<0,20,0> (20 bits)	0	Matrix entry (0,0) of 4x3 color conversion matrix. Precision and right shift are the same as for the luma vector.
c10	fixed<0,20,0> (20 bits)	20	Matrix entry (1,0) of 4x3 color conversion matrix
c20	fixed<0,20,0> (20 bits)	40	Matrix entry (2,0) of 4x3 color conversion matrix
r_shift	fixed<0,4,0> (4 bits)	60	Right shift value for matrix
c01	fixed<0,20,0> (20 bits)	64	Matrix entry (0,1) of 4x3 color conversion matrix
c11	fixed<0,20,0> (20 bits)	84	Matrix entry (1,1) of 4x3 color conversion matrix
c21	fixed<0,20,0> (20 bits)	104	Matrix entry (2,1) of 4x3 color conversion matrix
reserved0	fixed<0,4,0> (4 bits)	124	

Name	Data Type	Offset	Notes
c02	fixed<0,20,0> (20 bits)	128	Matrix entry (0,2) of 4x3 color conversion matrix
c12	fixed<0,20,0> (20 bits)	148	Matrix entry (1,2) of 4x3 color conversion matrix
c22	fixed<0,20,0> (20 bits)	168	Matrix entry (2,2) of 4x3 color conversion matrix
reserved1	fixed<0,4,0> (4 bits)	188	
c03	fixed<0,20,0> (20 bits)	192	Matrix entry (0,3) of 4x3 color conversion matrix
c13	fixed<0,20,0> (20 bits)	212	Matrix entry (1,3) of 4x3 color conversion matrix
c23	fixed<0,20,0> (20 bits)	232	Matrix entry (2,3) of 4x3 color conversion matrix
reserved2	fixed<0,4,0> (4 bits)	252	

13.4.3.7 ColorConversionClampStruct[5]

Specifies the upper and lower clamp boundaries for pixels after the matrix multiplication.

Table 48: ColorConversionClampStruct[5] Details

Name	Data Type	Offset	
low	fixed<0,10,0> (10 bits)	0	Lower soft clamping boundaries
reserved0	fixed<0,6,0> (6 bits)	10	
high	fixed<0,10,0> (10 bits)	16	Upper soft clamping boundaries
reserved1	fixed<0,6,0> (6 bits)	26	
reserved2	fixed<0,32,0> (32 bits)	32	
reserved3	fixed<0,32,0> (32 bits)	64	
reserved4	fixed<0,32,0> (32 bits)	96	

13.4.3.8 Blending0Struct

Specifies parameters related to the alpha-blending of the different slots and the output surface/rectangle parameters.

Table 49: Blending0Struct Details

Name	Data Type	Offset	Notes
PixelFormat	fixed<0,7,0> (7 bits)	0	Pixel format of the output surface (PIXEL_FORMAT)
reserved0	fixed<0,1,0> (1 bit)	7	
AlphaFillMode	fixed<0,3,0> (3 bits)	8	Alpha fill mode (DXVAHD_ALPHA_FILL_MODE)
AlphaFillSlot	fixed<0,3,0> (3 bits)	11	SlotId for when AlphaFillMode == Source stream/Source alpha
BackgroundAlpha	fixed<0,10,0> (10 bits)	14	Background color A

Name	Data Type	Offset	Notes
BackgroundR	fixed<0,10,0> (10 bits)	24	Background color R
BackgroundG	fixed<0,10,0> (10 bits)	34	Background color G
BackgroundB	fixed<0,10,0> (10 bits)	44	Background color B
ChromaLocHoriz	fixed<0,2,0> (2 bits)	54	Chroma location of the output surface (see SurfaceListSurfaceStruct)
ChromaLocVert	fixed<0,2,0> (2 bits)	56	
reserved1	fixed<0,6,0> (6 bits)	58	
LumaWidth	fixed<0,14,0> (14 bits)	64	Padded output surface luma width minus 1
reserved2	fixed<0,2,0> (2 bits)	78	
LumaHeight	fixed<0,14,0> (14 bits)	80	Padded output surface luma height minus 1
reserved3	fixed<0,2,0> (2 bits)	94	
ChromaWidth	fixed<0,14,0> (14 bits)	96	Padded output surface chroma width minus 1
reserved4	fixed<0,2,0> (2 bits)	110	
ChromaHeight	fixed<0,14,0> (14 bits)	112	Padded output surface chroma height minus 1
reserved5	fixed<0,2,0> (2 bits)	126	
TargetRectLeft	fixed<0,14,0> (14 bits)	128	Target rectangle, restricts the output of pixels to this region. For any non-4:4:4 format, all corners need to fall on a multiple of 2 (Right and Bottom are minus 1 encoded though).
reserved6	fixed<0,2,0> (2 bits)	142	
TargetRectRight	fixed<0,14,0> (14 bits)	144	
reserved7	fixed<0,2,0> (2 bits)	158	
TargetRectTop	fixed<0,14,0> (14 bits)	160	
reserved8	fixed<0,2,0> (2 bits)	174	
TargetRectBottom	fixed<0,14,0> (14 bits)	176	
reserved9	fixed<0,2,0> (2 bits)	190	
SurfaceWidth	fixed<0,14,0> (14 bits)	192	Output surface width minus 1
reserved10	fixed<0,2,0> (2 bits)	206	
SurfaceHeight	fixed<0,14,0> (14 bits)	208	Output surface height minus 1
reserved11	fixed<0,2,0> (2 bits)	222	
BlkKind	fixed<0,4,0> (4 bits)	224	The block linear kind of the output surface (BLK_KIND)
BlkHeight	fixed<0,4,0> (4 bits)	228	Block-linear height (in gobs, log2)
OutputFlipX	fixed<0,1,0> (1 bit)	232	Horizontal Flip enable

Name	Data Type	Offset	Notes
OutputFlipY	fixed<0,1,0> (1 bit)	233	Vertical Flip enable
OutputTranspose	fixed<0,1,0> (1 bit)	234	Transpose enable
reserved12	fixed<0,21,0> (21 bits)	235	

13.4.3.9 BlendingSurfaceStruct[5]

Input parameters to blend equations in DXVAHD_ALPHA_FILL_MODE_COMPOSITED alpha fill mode

- outputR = (srcFactC * srcR) + (dstFactC * dstR)
- outputG = (srcFactC * srcG) + (dstFactC * dstG)
- outputB = (srcFactC * srcB) + (dstFactC * dstB)
- outputA = (srcFactA * srcA) + (dstFactA * dstA)

Table 50: BlendingSurfaceStruct[5] Details

Name	Data Type	Offset	Notes
AlphaK1	fixed<0,10,0> (10 bits)	0	Constant Alpha value
reserved0	fixed<0,6,0> (6 bits)	10	Constant Alpha value
AlphaK2	fixed<0,10,0> (10 bits)	16	Constant Alpha value
reserved1	fixed<0,6,0> (6 bits)	26	
SrcFactCMatchSelect	fixed<0,3,0> (3 bits)	32	Blend Source Factor for Color if the color key comparison matches (BLEND_SRCFACTC)
reserved2	fixed<0,1,0> (1 bit)	35	
DstFactCMatchSelect	fixed<0,3,0> (3 bits)	36	Blend Destination Factor for Color if the color key comparison matches (BLEND_DSTFACTC)
reserved3	fixed<0,1,0> (1 bit)	39	
SrcFactAMatchSelect	fixed<0,3,0> (3 bits)	40	Blend Source Factor for Alpha if the color key comparison matches (BLEND_SRCFACTA)
reserved4	fixed<0,1,0> (1 bit)	43	
DstFactAMatchSelect	fixed<0,3,0> (3 bits)	44	Blend Source Factor for Alpha if the color key comparison matches (BLEND_DSTFACTA)
reserved5	fixed<0,1,0> (1 bit)	47	
reserved6	fixed<0,4,0> (4 bits)	48	
reserved7	fixed<0,4,0> (4 bits)	52	
reserved8	fixed<0,4,0> (4 bits)	56	
reserved9	fixed<0,4,0> (4 bits)	60	
reserved10	fixed<0,2,0> (2 bits)	64	
OverrideR	fixed<0,10,0> (10 bits)	66	Source RGBA override values

Name	Data Type	Offset	Notes
OverrideG	fixed<0,10,0> (10 bits)	76	
OverrideB	fixed<0,10,0> (10 bits)	86	
OverrideA	fixed<0,10,0> (10 bits)	96	
reserved11	fixed<0,2,0> (2 bits)	106	
UseOverrideR	fixed<0,1,0> (1 bit)	108	Enable source RGBA value override
UseOverrideG	fixed<0,1,0> (1 bit)	109	
UseOverrideB	fixed<0,1,0> (1 bit)	110	
UseOverrideA	fixed<0,1,0> (1 bit)	111	
MaskR	fixed<0,1,0> (1 bit)	112	Per-component blend output override enables (replace blend output with destination RGBA values)
MaskG	fixed<0,1,0> (1 bit)	113	
MaskB	fixed<0,1,0> (1 bit)	114	
MaskA	fixed<0,1,0> (1 bit)	115	
reserved12	fixed<0,12,0> (12 bits)	116	

13.4.3.10 FetchControl0Struct

Specifies various parameters related to scaling and filtering. Also specifies which input surfaces are enabled and the processing required for each slot.

Table 51: FetchControl0Struct Details

Name	Data Type	Offset	Notes
TargetRectLeft	fixed<0,14,0> (14 bits)	0	Target rectangle, restricts the output of pixels to this region
reserved0	fixed<0,2,0> (2 bits)	14	
TargetRectRight	fixed<0,14,0> (14 bits)	16	
reserved1	fixed<0,2,0> (2 bits)	30	
TargetRectTop	fixed<0,14,0> (14 bits)	32	
reserved2	fixed<0,2,0> (2 bits)	46	
TargetRectBottom	fixed<0,14,0> (14 bits)	48	
reserved3	fixed<0,2,0> (2 bits)	62	
Enable0	fixed<0,8,0> (8 bits)	64	Indicates which surfaces are enabled for fetching: Bit 0: Current field Bit 1: Previous field Bit 2: Next field Bit 3: Next field (noise filtered, takes priority over unfiltered field) Bit 4: Current motion field

Name	Data Type	Offset	Notes
			Bit 5: Previous motion field Bit 6: Previous previous motion field Bit 7: Combined motion field
Enable1	fixed<0,8,0> (8 bits)	72	
Enable2	fixed<0,8,0> (8 bits)	80	
Enable3	fixed<0,8,0> (8 bits)	88	
Enable4	fixed<0,8,0> (8 bits)	96	
DownsampleHoriz	fixed<0,11,0> (11 bits)	104	TargetWidth/DownsampleWidth (U9.2 used to lob bias filter). Set to 0 to enable filter override mode (mapping between stream and filter is explained in “Scaling and Filtering”)
reserved4	fixed<0,1,0> (1 bit)	115	
DownsampleVert	fixed<0,11,0> (11 bits)	116	TargetHeight/DownsampleHeight (U9.2 used to lob bias filter). Set to 0 to enable filter override mode (mapping between stream and filter is explained in “Scaling and Filtering”)
reserved5	fixed<0,1,0> (1 bit)	127	
FilterNoise0	fixed<0,10,0> (10 bits)	128	Strength of the spatial noise filter for slot 0. All detail and noise filter values (including chroma) become meaningless and should be set to 0 as soon as filter override is enabled
FilterDetail0	fixed<0,10,0> (10 bits)	138	Strength of the detail filter for slot 0
FilterNoise1	fixed<0,10,0> (10 bits)	148	Strength of the noise filter for slot 1
reserved6	fixed<0,2,0> (2 bits)	158	
FilterDetail1	fixed<0,10,0> (10 bits)	160	Strength of the detail filter for slot 1
FilterNoise2	fixed<0,10,0> (10 bits)	170	Strength of the noise filter for slot 2
FilterDetail2	fixed<0,10,0> (10 bits)	180	Strength of the detail filter for slot 2
reserved7	fixed<0,2,0> (2 bits)	190	
FilterNoise3	fixed<0,10,0> (10 bits)	192	Strength of the noise filter for slot 3
FilterDetail3	fixed<0,10,0> (10 bits)	202	Strength of the detail filter for slot 3
FilterNoise4	fixed<0,10,0> (10 bits)	212	Strength of the noise filter for slot 4
reserved8	fixed<0,2,0> (2 bits)	222	
FilterDetail4	fixed<0,10,0> (10 bits)	224	Strength of the detail filter for slot 4
reserved9	fixed<0,22,0> (22 bits)	234	
ChromaNoise0	fixed<0,10,0> (10 bits)	256	Strength of the noise filter for slot 0
ChromaDetail0	fixed<0,10,0> (10 bits)	266	Strength of the detail filter for slot 0
ChromaNoise1	fixed<0,10,0> (10 bits)	276	Strength of the noise filter for slot 1
reserved10	fixed<0,2,0> (2 bits)	286	

Name	Data Type	Offset	Notes
ChromaDetail1	fixed<0,10,0> (10 bits)	288	Strength of the detail filter for slot 1
ChromaNoise2	fixed<0,10,0> (10 bits)	298	Strength of the noise filter for slot 2
ChromaDetail2	fixed<0,10,0> (10 bits)	308	Strength of the detail filter for slot 2
reserved11	fixed<0,2,0> (2 bits)	318	
ChromaNoise3	fixed<0,10,0> (10 bits)	320	Strength of the noise filter for slot 3
ChromaDetail3	fixed<0,10,0> (10 bits)	330	Strength of the detail filter for slot 3
ChromaNoise4	fixed<0,10,0> (10 bits)	340	Strength of the noise filter for slot 4
reserved12	fixed<0,2,0> (2 bits)	350	
ChromaDetail4	fixed<0,10,0> (10 bits)	352	Strength of the detail filter for slot 4
reserved13	fixed<0,22,0> (22 bits)	362	
Mode0	fixed<0,4,0> (4 bits)	384	Deinterlace mode (DXVAHD_DEINTERLACE_MODE_PRIVATE)
AccumWeight0	fixed<0,3,0> (3 bits)	388	Accumulation weight for motion IIR filter for slot 0 (the default is 6). The first time an even/odd motion field is calculated, AccumWeight should be set to 0 to avoid having to clear the motion buffer beforehand.
Iir0	fixed<0,11,0> (11 bits)	391	Accumulation weight for noise reduction IIR filter for slot 0 (default value is 0x300).
reserved14	fixed<0,2,0> (2 bits)	402	
Mode1	fixed<0,4,0> (4 bits)	404	
AccumWeight1	fixed<0,3,0> (3 bits)	408	
Iir1	fixed<0,11,0> (11 bits)	411	
reserved15	fixed<0,2,0> (2 bits)	422	
Mode2	fixed<0,4,0> (4 bits)	424	
AccumWeight2	fixed<0,3,0> (3 bits)	428	
Iir2	fixed<0,11,0> (11 bits)	431	
reserved16	fixed<0,6,0> (6 bits)	442	
Mode3	fixed<0,4,0> (4 bits)	448	
AccumWeight3	fixed<0,3,0> (3 bits)	452	
Iir3	fixed<0,11,0> (11 bits)	455	
reserved17	fixed<0,2,0> (2 bits)	466	
Mode4	fixed<0,4,0> (4 bits)	468	
AccumWeight4	fixed<0,3,0> (3 bits)	472	

Name	Data Type	Offset	Notes
lir4	fixed<0,11,0> (11 bits)	475	
reserved18	fixed<0,8,0> (8 bits)	486	
OutputFlipX	fixed<0,1,0> (1 bit)	494	Flip output image horizontally
OutputFlipY	fixed<0,1,0> (1 bit)	495	Flip output image vertically
reserved19	fixed<0,10,0> (10 bits)	496	
reserved20	fixed<0,6,0> (6 bits)	506	

13.4.3.11 FetchControlCoeffStruct[520]

Specifies the coefficients used in the scalars for scaling/edge-enhancement/noise filtering. These coefficients are interpolated in the hardware to get the exact coefficients needed for the use case.

Table 52: FetchControlCoeffStruct[520] Details

Name	Data Type	Offset	
f00	fixed<0,10,0> (10 bits)	0	First coefficient of noise filter for 128-bit packet
f10	fixed<0,10,0> (10 bits)	10	First coefficient of normal scaling filter in 128-bit packet
f20	fixed<0,10,0> (10 bits)	20	First coefficient of detail filter in 128-bit packet
reserved0	fixed<0,2,0> (2 bits)	30	
f01	fixed<0,10,0> (10 bits)	32	Second coefficient of noise filter in 128-bit packet
f11	fixed<0,10,0> (10 bits)	42	Second coefficient of normal scaling filter in 128-bit packet
f21	fixed<0,10,0> (10 bits)	52	Second coefficient of detail filter in 128-bit packet
reserved1	fixed<0,2,0> (2 bits)	62	
f02	fixed<0,10,0> (10 bits)	64	Third coefficient of noise filter in 128-bit packet
f12	fixed<0,10,0> (10 bits)	74	Third coefficient of normal scaling filter in 128-bit packet
f22	fixed<0,10,0> (10 bits)	84	Third coefficient of detail filter in 128-bit packet
reserved2	fixed<0,2,0> (2 bits)	94	
f03	fixed<0,10,0> (10 bits)	96	Fourth coefficient of noise filter in 128-bit packet
f13	fixed<0,10,0> (10 bits)	106	Fourth coefficient of normal scaling filter in 128-bit packet
f23	fixed<0,10,0> (10 bits)	116	Fourth coefficient of detail filter in 128-bit packet
reserved3	fixed<0,2,0> (2 bits)	126	

13.4.4 Palette Structure

PaletteStruct sends palette information for indexed formats. Each slot has its own space in the palette buffer even if the format is not indexed. For non-indexed formats the space should left blank and should not be used by any other slots to send palette data. The number of palette entries for each slot can be at most 256.

13.4.5 History Buffer

The History buffer is used to store inter-frame communication data. It has two parts. The first part of the structure holds cadence-related information, and the second part stores histogram data for each slot.

The first Dword of the hist_control (control_vector) should be set by the driver. It informs Falcon whether to calculate the cadence.

13.4.6 FCE Microcode Buffer

This buffer holds the Fetch Control Engine (FCE) microcode that Falcon should load to the FCE unit. The driver should also pass the size of the FCE microcode with the SetFceUcodeSize() method.

13.4.7 Input Picture Buffers

Each picture is a separate buffer with its own surface offset method. The driver needs to send these offset methods for only the used pictures (source and reference) for the current execute.

13.4.8 Noise Reduced Picture Buffers

This buffer is used by the app to keep a noise-reduced picture data of future fields if DeNoise is enabled. In the next execute, noise-reduced picture data is used as the current field, and noise-reduced picture data of the previous execute will be used as previous picture. Noise reduction requires a forward and a backward reference field for interlaced content and a backward reference for progressive content.

In the NV24 case, the VIC app uses an additional surface to keep noise reduced field of the current picture. In this case, the current noise reduced surfaces are used as previous reference surfaces.

Noise-reduced picture buffer dimensions for a slot should be same as input buffer of that slot.

13.4.9 Motion Map Buffers

These buffers keep motion map data of the current and previous fields if MotionMap is enabled. The previous motion map buffer should be initialized to 255 (both luma and chroma) at the start of the clip. Use the motion map buffer of the previous execute pass prev motion map in the current execute for subsequent frames. MotionMap calculation is required for DiSi1 and also needs a forward and a backward reference. Behavior is not defined for progressive streams.

Motion map buffer dimensions for a slot should be same as input buffer of that slot.

13.4.10 Output Buffer

This buffer stores output data.

13.4.11 Method Naming and Programming

The VIC uses generic names to avoid confusing name overloading to the 16 surfaces (8 luma, 8 chroma) methods for the MAX_SLOTS

- SetSurfacexSlotyLumaOffset()
- SetSurfacexSlotyChromaOffset()

with x in [0..7] and y in [0..MAX_SLOTS]

The following sets of methods are required for a given ConfigStruct setup. Any setup not covered in this section should be regarded as illegal.

Note:

- NV24 frames are treated as NV12 fields. The frame format for NV24 has to be set to FRAME_FORMAT_TOP_FIELD.
- In case of noise reduction all previously noise reduced surfaces should be used as references instead of the original ones. In case of interlaced fields this also applies to the current fields as they have previously been noise reduced.
- Surface6 has been obsoleted and should not be used.
- History buffer is always required and should be owned by Falcon.

13.4.11.1 Progressive Frames

No Preprocessing

Enable bits have to be set to 0x01 in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()

Noise Reduction

Enable bits have to be set to 0x07 in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (backward reference surface)
- SetSurface2SlotLumaOffset() (noise reduced surface)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference surface)
- SetSurface2SlotChromaOffset() (noise reduced surface)

13.4.11.2 Progressive Fields

No Preprocessing

Enable bits have to be set to 0x03 in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset() (top field)
- SetSurface1SlotLumaOffset() (bottom field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset() (top field)
- SetSurface1SlotChromaOffset() (bottom field)

Noise Reduction

Enable bits have to be set to 0x03f in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset() (top field)
- SetSurface1SlotLumaOffset() (bottom field)
- SetSurface2SlotLumaOffset() (top field of backward reference surface)
- SetSurface3SlotLumaOffset() (bottom field of backward reference surface)
- SetSurface4SlotLumaOffset() (top field of noise reduced surface)
- SetSurface5SlotLumaOffset() (bottom field of noise reduced surface)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset() (top field)
- SetSurface1SlotChromaOffset() (bottom field)
- SetSurface2SlotChromaOffset() (top field of backward reference surface)
- SetSurface3SlotChromaOffset() (bottom field of backward reference surface)
- SetSurface4SlotChromaOffset() (top field of noise reduced surface)
- SetSurface5SlotChromaOffset() (bottom field of noise reduced surface)

13.4.11.3 Interlaced Frames

No Preprocessing

Enable bits have to be set to 0x01 in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()

Noise Reduction

Enable bits have to be set to 0x07 in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (backward reference surface)
- SetSurface2SlotLumaOffset() (noise reduced surface)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference surface)
- SetSurface2SlotChromaOffset() (noise reduced surface)

13.4.11.4 Interlaced Fields

No Preprocessing

This is for BOB_FIELD only. For WEAVE, see “No Preprocessing” under “Progressive Fields“.

Enable bits have to be set to 0x01 in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()

Cadence Detection

Enable bits have to be set to 0x07 in fetchControl0Struct. This also requires cadence detection to be enabled.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (backward reference field)
- SetSurface2SlotLumaOffset() (forward reference field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference field)
- SetSurface2SlotChromaOffset() (forward reference field)

Motion Calculation

Enable bits have to be set to 0x17 in fetchControl0Struct. The data in the current motion field is read first and IIR filtered with the newly calculated motion before it is written back.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (backward reference field)
- SetSurface2SlotLumaOffset() (forward reference field)
- SetSurface4SlotLumaOffset() (current motion field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference field)
- SetSurface2SlotChromaOffset() (forward reference field)
- SetSurface4SlotChromaOffset() (current motion field)

Motion Calculation and Cadence Detection

Same as above in Motion Calculation except that cadence detection is enabled.

DISI1 (Motion Calculation and Motion Combine)

Enable bits have to be set to 0xb7 in fetchControl0Struct. The data in the current motion field is read first and IIR filtered with the newly calculated motion before it is written back. The combined motion field is generated out of current motion and previous motion to be used in DiSi1 deinterlacer.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (backward reference field)
- SetSurface2SlotLumaOffset() (forward reference field)
- SetSurface4SlotLumaOffset() (current motion field)
- SetSurface5SlotLumaOffset() (previous motion field)
- SetSurface7SlotLumaOffset() (combined motion field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference field)
- SetSurface2SlotChromaOffset() (forward reference field)
- SetSurface4SlotChromaOffset() (current motion field)
- SetSurface5SlotChromaOffset() (previous motion field)
- SetSurface7SlotChromaOffset() (combined motion field)

DISI1 (Motion Calculation and Motion Combine) and Cadence Detection

Same as above in DiSi1 except that cadence detection is enabled.

Noise Reduction

Enable bits have to be set to 0x0f in fetchControl0Struct.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (previously noise reduced backward reference field)
- SetSurface2SlotLumaOffset() (forward reference field)
- SetSurface3SlotLumaOffset() (noise reduced forward reference field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (previously noise reduced backward reference field)
- SetSurface2SlotChromaOffset() (forward reference field)
- SetSurface3SlotChromaOffset() (noise reduced forward reference field)

Noise Reduction and Cadence Detection

Same as above in Noise Reduction except that cadence detection is enabled.

Noise Reduction and Motion Calculation

Enable bits have to be set to 0x1f in fetchControl0Struct. The data in the current motion field is read first and IIR filtered with the newly calculated motion before it is written back.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (backward reference field)
- SetSurface2SlotLumaOffset() (forward reference field)
- SetSurface3SlotLumaOffset() (noise reduced forward reference field)
- SetSurface4SlotLumaOffset() (current motion field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference field)
- SetSurface2SlotChromaOffset() (forward reference field)
- SetSurface3SlotChromaOffset() (noise reduced forward reference field)
- SetSurface4SlotChromaOffset() (current motion field)

Noise Reduction and Motion Calculation and Cadence Detection

Same as above in Noise Reduction and Motion Calculation except that cadence detection is enabled.

Noise Reduction and DISI1 (Motion Calculation and Motion Combine)

Enable bits have to be set to 0xbf in fetchControl0Struct. The data in the current motion field is read first and IIR filtered with the newly calculated motion before it is written back. The combined motion field is generated out of current motion and previous motion to be used in DiSi1 deinterlacer.

Required methods for all pixel formats:

- SetSurface0SlotLumaOffset()
- SetSurface1SlotLumaOffset() (backward reference field)
- SetSurface2SlotLumaOffset() (forward reference field)
- SetSurface3SlotLumaOffset() (noise reduced forward reference field)
- SetSurface4SlotLumaOffset() (current motion field)
- SetSurface5SlotLumaOffset() (previous motion field)
- SetSurface7SlotLumaOffset() (combined motion field)

Required methods for pixel formats with separate chroma plane:

- SetSurface0SlotChromaOffset()
- SetSurface1SlotChromaOffset() (backward reference field)
- SetSurface2SlotChromaOffset() (forward reference field)
- SetSurface3SlotChromaOffset() (noise reduced forward reference field)
- SetSurface4SlotChromaOffset() (current motion field)
- SetSurface5SlotChromaOffset() (previous motion field)
- SetSurface7SlotChromaOffset() (combined motion field)

Noise Reduction and DISI1 (Motion Calculation and Motion Combine) and Cadence Detection

Same as above in Noise Reduction and DiSi1 except that cadence detection is enabled.

13.4.12 Application ID

Application ID is not needed as there is only one application for the engine (unlike different codecs for the MSDEC). But to use it with MSDEC infrastructure, the driver needs to pass the ApplicationId as 1 (corresponding to overlay 1).

13.4.13 Application-Specific Error Codes

The following table defines the error codes.

Table 53: Error Codes

Error Code	Value	Description
MSDECOS_ERROR_NONE	0x00000000	Default return code for app
MSDECOS_ERROR_EXECUTE_INSUFFICIENT_DATA	0x00000001	To be returned by the app to the OS
MSDECOS_ERROR_SEMAPHORE_INSUFFICIENT_DATA	0x00000002	Insufficient semaphore methods received. Method Data written out into MAILBOX1. MAILBOX0 bits 31:20- Method ID. MAILBOX0 bits 19-12: Method Count (SWFIFO + MTHDCOUNT register)
MSDECOS_ERROR_INVALID_METHOD	0x00000003	Unsupported method
MSDECOS_ERROR_INVALID_DMA_PAGE	0x00000004	Unsupported method
MSDECOS_ERROR_UNHANDLED_INTERRUPT	0x00000005	The app has either no interrupt handler or an unhandled OS error
MSDECOS_ERROR_EXCEPTION	0x00000006	Exception raised by Falcon
MSDECOS_ERROR_INVALID_CTXSW_REQUEST	0x00000007	Invalid CTXSW request to the OS
MSDECOS_ERROR_APPLICATION	0x00000008	Application returned a nonzero error code
MSDECOS_ERROR_SWBREAKPT	0x00000009	Exception raised to dump registers in debug mode

13.4.14 Application Method Registers

The VIC application method registers are accessed directly by the driver. Because the VIC uses the MSDEC infrastructure, two ranges of methods are used (in the MSDEC, there are common and application specific ranges). The range of method registers is:

- 0x700-0x73F (common method range) and
- 0x400-0x53F (method range corresponding to overlay 1)

The following table defines the method map.

Address	Method
0x0100	VIC.Nop
0x0140	VIC.PmTrigger
0x0200	VIC.SetApplicationID
0x0204	VIC.SetWatchdogTimer
0x0240	VIC.SemaphoreA
0x0244	VIC.SemaphoreB
0x0248	VIC.SemaphoreC

Address	Method
0x024c	VIC.CtxSaveArea
0x0250	VIC.CtxSwitch
0x0300	VIC.Execute
0x0304	VIC.SemaphoreD
0x0400	VIC.SetSurface0Slot0LumaOffset
0x0404	VIC.SetSurface0Slot0ChromaU_Offset
0x0408	VIC.SetSurface0Slot0ChromaV_Offset
0x040c	VIC.SetSurface1Slot0LumaOffset
0x0410	VIC.SetSurface1Slot0ChromaU_Offset
0x0414	VIC.SetSurface1Slot0ChromaV_Offset
0x0418	VIC.SetSurface2Slot0LumaOffset
0x041c	VIC.SetSurface2Slot0ChromaU_Offset
0x0420	VIC.SetSurface2Slot0ChromaV_Offset
0x0424	VIC.SetSurface3Slot0LumaOffset
0x0428	VIC.SetSurface3Slot0ChromaU_Offset
0x042c	VIC.SetSurface3Slot0ChromaV_Offset
0x0430	VIC.SetSurface4Slot0LumaOffset
0x0434	VIC.SetSurface4Slot0ChromaU_Offset
0x0438	VIC.SetSurface4Slot0ChromaV_Offset
0x043c	VIC.SetSurface5Slot0LumaOffset
0x0440	VIC.SetSurface5Slot0ChromaU_Offset
0x0444	VIC.SetSurface5Slot0ChromaV_Offset
0x0448	VIC.SetSurface6Slot0LumaOffset
0x044c	VIC.SetSurface6Slot0ChromaU_Offset
0x0450	VIC.SetSurface6Slot0ChromaV_Offset
0x0454	VIC.SetSurface7Slot0LumaOffset
0x0458	VIC.SetSurface7Slot0ChromaU_Offset
0x045c	VIC.SetSurface7Slot0ChromaV_Offset
0x0460	VIC.SetSurface0Slot1LumaOffset
0x0464	VIC.SetSurface0Slot1ChromaU_Offset
0x0468	VIC.SetSurface0Slot1ChromaV_Offset
0x046c	VIC.SetSurface1Slot1LumaOffset
0x0470	VIC.SetSurface1Slot1ChromaU_Offset
0x0474	VIC.SetSurface1Slot1ChromaV_Offset
0x0478	VIC.SetSurface2Slot1LumaOffset
0x047c	VIC.SetSurface2Slot1ChromaU_Offset
0x0480	VIC.SetSurface2Slot1ChromaV_Offset
0x0484	VIC.SetSurface3Slot1LumaOffset

Address	Method
0x0488	VIC.SetSurface3Slot1ChromaU_Offset
0x048c	VIC.SetSurface3Slot1ChromaV_Offset
0x0490	VIC.SetSurface4Slot1LumaOffset
0x0494	VIC.SetSurface4Slot1ChromaU_Offset
0x0498	VIC.SetSurface4Slot1ChromaV_Offset
0x049c	VIC.SetSurface5Slot1LumaOffset

13.5 VIC THI Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

13.5.1.1 NV_PVIC_THI_INCR_SYNCPT

Offset: 0x0 │ Read/Write: R/W │ Reset: 0x00000000

Bit	R/W	Reset	Description
31:16	R	0	Reserved
15:8	R/W	0	NV_PVIC_THI_INCR_SYNCPT_COND: 0: COND_IMMEDIATE (default) 1: COND_OP_DONE

Bit	R/W	Reset	Description
7:0	R/W	0	NV_PVIC_THI_INCR_SYNCPT_INDX: 0: INDX_INIT (default)

13.5.1.2 NV_PVIC_THI_INCR_SYNCPT_ERR

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:4	R	0	Reserved
1	RW1C	0	NV_PVIC_THI_INCR_SYNCPT_ERR_COND_STS_OPDONE: 0: COND_STS_OPDONE_INIT (default) 1: COND_STS_OPDONE_CLEAR
0	RW1C	0	NV_PVIC_THI_INCR_SYNCPT_ERR_COND_STS_IMM: 0: COND_STS_IMM_INIT (default) 1: COND_STS_IMM_CLEAR

13.5.1.3 NV_PVIC_THI_CTXSW_INCR_SYNCPT

Offset: 0xc | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:8	R	0	Reserved
7:0	R/W	0	NV_PVIC_THI_CTXSW_INCR_SYNCPT_INDX: 0: INDX_INIT (default)

13.5.1.4 NV_PVIC_THI_CTXSW

Offset: 0x20 | Read/Write: R/W | Reset: 0x0000F800

Bit	R/W	Reset	Description
31:28	R/W	0	NV_PVIC_THI_CTXSW_NEXT_CHANNEL: 0: NEXT_CHANNEL_INIT (default)
27:26	R	0	Reserved
25:16	R/W	0	NV_PVIC_THI_CTXSW_NEXT_CLASS: 0: NEXT_CLASS_INIT (default)
15:12	R/W	Fh	NV_PVIC_THI_CTXSW_CURR_CHANNEL: Fh CURR_CHANNEL_INIT (default)
11	R	1	NV_PVIC_THI_CTXSW_AUTO_ACK: 1: AUTO_ACK_INIT (default)
10	R	0	Reserved
9:0	R/W	0	NV_PVIC_THI_CTXSW_CURR_CLASS: 0: CURR_CLASS_INIT (default)

13.5.1.5 NV_PVIC_THI_CONT_SYNCPT_EOF

Offset: 0x28 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:9	R	0	Reserved
8	R/W	0	NV_PVIC_THI_CONT_SYNCPT_EOF_COND: 0: COND_INIT (default)

Bit	R/W	Reset	Description
7:0	R/W	0	NV_PVIC_THI_CONT_SYNCPT_EOF_INDEX: 0: INDEX_INIT (default)

13.5.1.6 NV_PVIC_THI_METHOD0

Offset: 0x40 | Read/Write: R/W | Reset: 0x00000000

There are two method registers METHOD0 and METHOD1

Bit	R/W	Reset	Description
31:12	R	0	Reserved
11:0	R/W	0	NV_PVIC_THI_METHOD0_OFFSET: 0X 0: OFFSET_INIT (default)

13.5.1.7 NV_PVIC_THI_METHOD1

Offset: 0x44 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:0	R/W	0	NV_PVIC_THI_METHOD1_DATA: 0: DATA_INIT (default)

13.5.1.8 NV_PVIC_THI_INT_STATUS

Offset: 0x78 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:1	R	0	Reserved
0	RW1C	0	NV_PVIC_THI_INT_STATUS_FALCON_INT: 0: FALCON_INT_INIT (default) 1: FALCON_INT_CLEAR

13.5.1.9 NV_PVIC_THI_INT_MASK

Offset: 0x7c | Read/Write: R/W | Reset: 0x00000001

Bit	R/W	Reset	Description
31:1	R	0	Reserved
0	R/W	1	NV_PVIC_THI_INT_MASK_FALCON_INT: 1: FALCON_INT_INIT (default)

13.6 HOSTIF Miscellaneous Registers

13.6.1 NV_PVIC_FALCON_ITFEN

Offset: 0x1048 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:3	R	0	Reserved
2	R/W	0	NV_PVIC_FALCON_ITFEN_PRIV_POSTWR. Indicates whether to use a post write on the main priv interface. By default, all writes to the Control and Status Bus (CSB) from the main priv interface are non-posted to support error reporting. 0: PRIV_POSTWR_INIT (default)

Bit	R/W	Reset	Description
			0: PRIV_POSTWR_FALSE 1: PRIV_POSTWR_TRUE
1	R/W	0	NV_PVIC_FALCON_ITFEN_MTHDEN. Method interface enable. When set, allows the host to push methods into the method FIFO 0: MTHDEN_INIT (default) 0: MTHDEN_DISABLE 1: MTHDEN_ENABLE
0	R/W	0	NV_PVIC_FALCON_ITFEN_CTXEN. Context switch interface enable. When set, allows the context switch state machine to react to incoming context switch requests from the host. 0: CTXEN_INIT (default) 0: CTXEN_DISABLE 1: CTXEN_ENABLE

13.7 Falcon UCTL Registers

13.7.1 NV_PVIC_FALCON_CPUCTL

Offset: 0x1100 │ Read/Write: R/W │ Reset: 0x000000XX

Bit	R/W	Reset	Description
31:6	R	0	Reserved
5	R	Unknown	NV_PVIC_FALCON_CPUCTL_STOPPED: Indicates whether the CPU is currently in the stopped state. Falcon exits this state if a 1 is written to the STARTCPU bit or if an interrupt arrives on one of its 2 inputs and the corresponding IE bit in CSW is set. 1: STOPPED_TRUE 0: STOPPED_FALSE
4	R	Unknown	NV_PVIC_FALCON_CPUCTL_HALTED: Indicates whether the CPU is currently in the halted state. Falcon can only exit this state when a 1 is written to the STARTCPU bit. 1: HALTED_TRUE 0: HALTED_FALSE
3	RW1C	Unknown	NV_PVIC_FALCON_CPUCTL_HRESET: Set to TRUE to apply hard reset. This bit will auto-clear. Setting it FALSE has no effect. 1: HRESET_TRUE 0: HRESET_FALSE
2	RW1C	Unknown	NV_PVIC_FALCON_CPUCTL_SRESET: Set to TRUE to apply soft reset. This bit will auto-clear. Setting it FALSE has no effect. 1: SRESET_TRUE 0: SRESET_FALSE
1	RW1C	Unknown	NV_PVIC_FALCON_CPUCTL_STARTCPU: Set STARTCPU to TRUE to start CPU execution while in a HALTED state. If a start request is still pending, setting to FALSE will cancel the start request. Writing any value has no effect while the CPU is running. 1: STARTCPU_TRUE 0: STARTCPU_FALSE
0	RW1C	Unknown	NV_PVIC_FALCON_CPUCTL_IINVAL: Set to TRUE to mark all blocks in IMEM except block 0 as INVALID. This bit will auto-clear. Setting to FALSE has no effect. 1: IINVAL_TRUE 0: IINVAL_FALSE

13.7.2 NV_PVIC_FALCON_BOOTVEC

Offset: 0x1104 │ Read/Write: R/W │ Reset: 0x00000000

Bit	R/W	Reset	Description
31:0	R/W	0	NV_PVIC_FALCON_BOOTVEC_VEC: Stores the initial execution start address of the CPU when it is first started after a reset.

Bit	R/W	Reset	Description
			0: VEC_INIT (default)

13.8 Falcon DMA Registers

13.8.1 NV_PVIC_FALCON_DMACTL

Offset: 0x110c | Read/Write: R/W | Reset: 0x000000XX

Bit	R/W	Reset	Description
31:7	R	0	Reserved
6:3	R	None	NV_PVIC_FALCON_DMACTL_DMAQ_NUM: Indicates valid request number at DMA request queue.
2:1	R	0	Reserved
0	R/W	1	NV_PVIC_FALCON_DMACTL_REQUIRE_CTX: When set to TRUE, a valid context must be loaded before any DMA request can be serviced. Pending requests without a valid current context remain pending, and do not prevent the engine from reporting idle. When clear, DMA requests are serviced regardless of the current context. Once a request is issued, it must complete before the engine can report idle, as needed for example to process WFI context switch requests. 1: REQUIRE_CTX_INIT (default) 1: REQUIRE_CTX_TRUE 0: REQUIRE_CTX_FALSE

13.8.2 NV_PVIC_FALCON_DMATRFBASE

Offset: 0x1110 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:0	R/W	0	NV_PVIC_FALCON_DMATRFBASE_BASE: 0: BASE_INIT (default)

13.8.3 NV_PVIC_FALCON_DMATRFMOFFS

IMEM/DMEM offset for the transfer.

Offset: 0x1114 | Read/Write: R/W | Reset: 0x00000000

Bit	R/W	Reset	Description
31:16	R	0	Reserved
15:0	R/W	0	NV_PVIC_FALCON_DMATRFMOFFS_OFFS: 0: OFFS_INIT (default)

13.8.4 NV_PVIC_FALCON_DMATRFCMD

Offset: 0x1118 | Read/Write: R/W | Reset: 0x0000XXXX

Bit	R/W	Reset	Description
31:15	R	0	Reserved
14:12	R/W	Unknown	NV_PVIC_FALCON_DMATRFCMD_CTXDMA:
11	R	0	Reserved
10:8	R/W	Unknown	NV_PVIC_FALCON_DMATRFCMD_SIZE: 0: SIZE_4B

Bit	R/W	Reset	Description
			1: SIZE_8B 2: SIZE_16B 3: SIZE_32B 4: SIZE_64B 5: SIZE_128B 6: SIZE_256B
7:6	R	0	Reserved
5	R/W	Unknown	NV_PVIC_FALCON_DMATRFCMD_WRITE: 1: WRITE_TRUE 0: WRITE_FALSE
4	R/W	Unknown	NV_PVIC_FALCON_DMATRFCMD_IMEM: 1: IMEM_TRUE 0: IMEM_FALSE
3:2	R	0	Reserved
1	R	Unknown	NV_PVIC_FALCON_DMATRFCMD_IDLE: Indicates that the DMA engine is still busy with a transfer or has more transfers pending in the queue. 1: IDLE_TRUE 0: IDLE_FALSE
0	R	Unknown	NV_PVIC_FALCON_DMATRFCMD_FULL: Indicates that the DMA request queue is full and a valid request is still needed to move into the queue. 1: FULL_TRUE 0: FULL_FALSE

13.8.5 NV_PVIC_FALCON_DMATRFFBOFFS

Frame buffer (FB) offset for the transfer.

Offset: 0x111c │ Read/Write: R/W │ Reset: 0x00000000

Bit	R/W	Reset	Description
31:0	R/W	0	NV_PVIC_FALCON_DMATRFFBOFFS_OFFS: 0: OFFS_INIT (default)

[THIS PAGE INTENTIONALLY LEFT BLANK]

14.0 CPU

The NVIDIA® Tegra® K1 processor CPU complex contains quad ARM® Cortex®-A15 CPUs in a 4-PLUS-1 configuration with a fifth architecturally identical power-saving Cortex-A15 Companion Core.

14.1 Cortex-A15 CPU

The Cortex-A15 CPU is an advanced processor design with many features for high instruction throughput. It integrates the L2 cache controller into the CPU complex unlike Cortex-A9 CPUs. All of the CPUs include the NEON Media Processing Engine. Further details of the Cortex-A15 CPU itself are available from ARM.

These two documents are the key Cortex-A15 references, and both are available from ARM's website:

- Cortex-A15
  Revision: r3p3
  Technical Reference Manual

  Published by ARM Limited, document number ARM DDI 0438D.
- ARM Architecture Reference Manual
  ARM v7-A and ARM v7-R edition

  Published by ARM Limited, document number ARM DDI 0406C.

> **Note:** These are the current versions at the time of writing. You should periodically look for updates and always refer to the latest available version of this material.

You should also review the latest version of the ARM errata for Cortex-A15 CPUs. ARM has published this on their website as the Software Developers' Errata Notice.

14.1.1 Cortex-A15 Implementation Details

Many aspects of the Cortex-A15 CPU may be configured for a specific implementation. The Tegra K1 implementation has the following features:

Cortex-A15 Processor Configuration		
	Option	
Feature	Main Quad-Core Complex	Companion Core
Processor Revision	r3p3	r3p3
Number of processors	4	1
L2 Cache Size	2MB	512KB
L2 Arbitration register slice	1	0
L2 Tag RAM register slice	1	1
L2 Data RAM register slice	1	1
L2 Tag RAM latency	2	2
L2 Data RAM latency	3 cycle	2 cycle
L2 Logic idle gated clock	Included	Included
ECC/parity support	None	None
VFP and Neon	Included	Included

Cortex-A15 Processor Configuration		
	Option	
Feature	Main Quad-Core Complex	Companion Core
Generic Interrupt Controller	Included	Included
Shared Peripheral Interrupts	160	160

14.2 4-Plus-1 Configuration and Control

The NVIDIA 4-PLUS-1 processor architecture has a fifth Companion Core available for low power operation. In addition to the main quad core CPU complex, the Companion Core is an additional CPU complex replicating CPU 0 of the main complex, and implemented in a low-leakage technology. The Companion Core is also sometimes referred to by its engineering name, the “shadow” core; and also is commonly referred to as the LP Core or LP CPU Cluster referring to its Low Power operating capability.

The goal of this architecture is to provide efficient CPU operation across a very broad range of processor loads, with the quad-core complex optimized for high-speed operation with low dynamic power, and the Companion Core optimized for low-speed operation where transistor leakage becomes an important factor in power. These two CPU complexes operate exclusively to each other, meaning the hardware does not support simultaneous operation in any form. The main quad core complex has 2 Megabytes of L2 cache RAM, the companion core as a separate 512 Kilobyte L2 cache RAM.

The quad core complex implements separate power-gating for each of the four cores, and also a fifth power gate domain for the shared logic and L2.

Refer to the Flow Controller section of this document for details on how this is controlled.

14.3 Exclusive Operations

The Tegra K1 processor supports ARM exclusive operations (LDREX*, STREX* and CLREX) in cacheable memory only. Device or Strongly-Ordered memory spaces should not be used with these instructions.

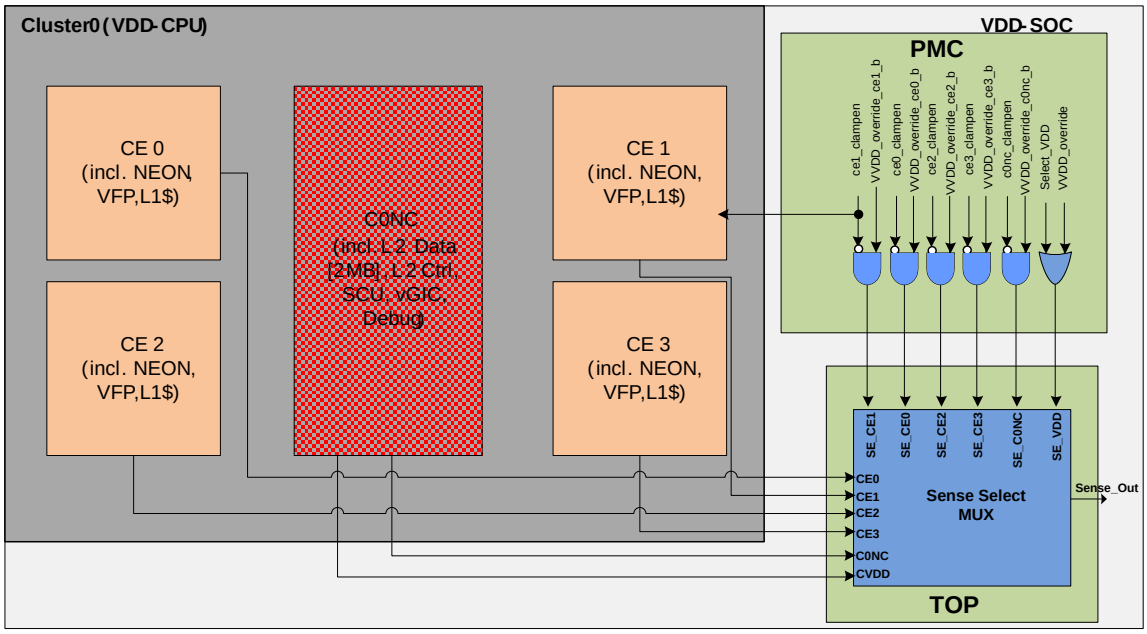
14.4 CPU Voltage Sensing Control

The Voltage Regulator (VR) delivers power to the board, then to the package and to the transistors in the silicon. The VR regulates its voltage output based on the sense feedback. To reduce inaccuracy in the VR output voltage level, the sense voltage needs to be as close to the transistors as possible.

For a power-gated partition, if the sense point is at the real VDD power grid, then the drop across the power-gate adds to the inaccuracy of the sense voltage. To reduce this inaccuracy, virtual VDD can be sensed. However, if the PG partition is power-gated, then its virtual VDD is off and cannot be used for sense feedback. Because partitions are power-gated/ungated dynamically, there needs to be control logic to provide dynamic control for the voltage-sense mux such that the virtual VDD is selected only when the corresponding PG partition is power-ungated.

As shown in the following diagram, a 6-input mux is used to select one (or more) of sensed voltages. The 6-input voltages are VVDD of each of the 5 PG partitions (in cluster0) and the real CPU VDD. The mux is expected to select the VVDD of all PG partitions that are power-ungated (powered on). If none of the 5 PG partitions are power-ungated, then real VDD is selected as the sense voltage.

Figure 26: CPU Voltage Sensing Mux Control Signals



The PMC provides a 6-bit mux select bus. The mux corresponding to 5 partitions is selected if those partitions are powered on. During normal operation, selection of the correct voltage sense signal is handled entirely by the PMC. For debug purposes, a per partition override register (see the APBDEV_PMC_CPU_VSENSE_OVERRIDE_0 register) is provided which can be configured to disable input from any of the 5 PG partitions, and select real VDD. The sensing mux select control needs to be as follows:

- Never select the VVDD of a partition which is power-gated
- Select VVDD of all partitions that are power-ungated
- When all partitions are power-gated, select real VDD
  - During transition, both power-ungated (VVDD) and real VDD can be selected.

15.0 FLOW CONTROLLER

The flow controller provides the sequencing of hardware-controlled CPU power states for the main CPU complex and the AVP coprocessor (also known as COP). It also provides hardware support for CPU cluster switching between the fast quad-core complex and the companion core.

The flow controller receives CPU power-state requests from CPUs, prioritizes them, and sends power on/off requests to PMC, which powers gates/ungates corresponding CPUs. It monitors per CPU interrupts and events to determine CPU wake condition and initiates the CPU wake based on wake events/interrupts.

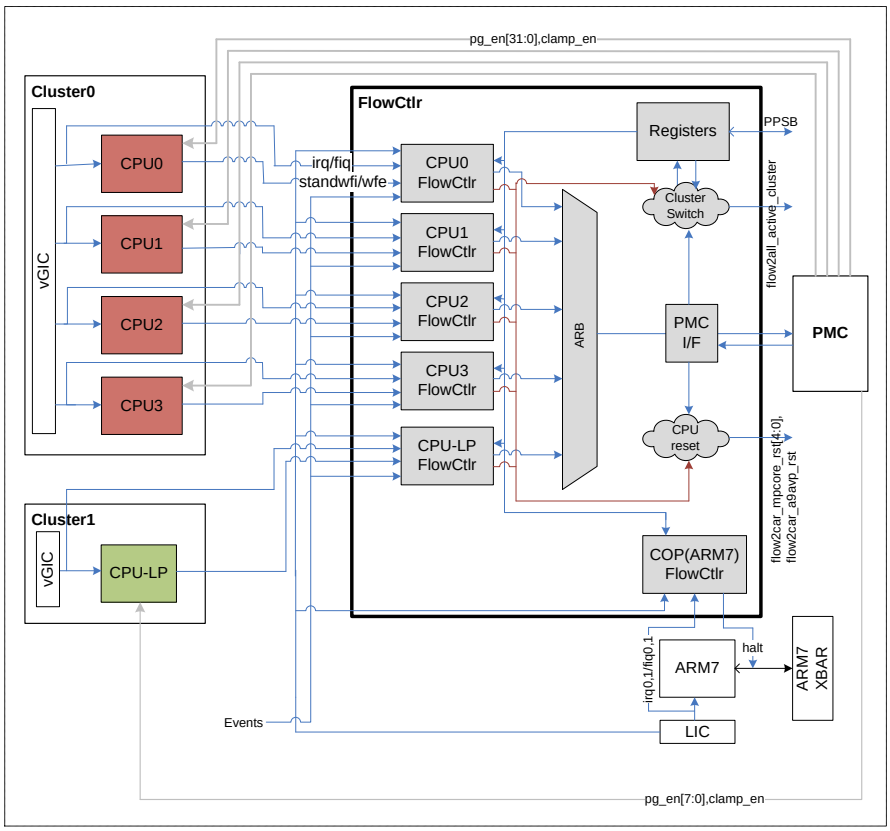
The flow controller provides configuration registers for software to configure wake events, etc. The flow controller provides a mechanism to halt conditionally or unconditionally:

- Conditional halt/resume is based on a variety of events, including timers, external trigger, and internal clocks.
- COP (AVP) is halted by extending a bus cycle.
- CPU can be halted by software interaction: software issues the WFI instruction to stop the processor, the flow controller asserts the EVENT input of the CPU to restart it.

15.1 Features and Functionality

The flow controller receives requests from processors (Cortex®-A15 processors and the AVP) to change their power state, or system power state. It also receives the interrupts from the interrupt controllers (vGIC and LIC) and other events which it uses to wake them up. It also provides support for cluster switching.

Figure 27: Flow Controller Block Diagram



15.1.1 WFI Instructions and STANDBYWFI Signals Usage

Tegra K1 devices use the WFI (Wait For Interrupt) instruction of ARMv7-A architecture (supported by both Cortex-A15 and Cortex-A9 processors), used by the CPU to interlock with the flow controller for the purpose of triggering low-power-state transitions.

When executing WFI, the processor waits for all prior instructions to complete before entering the idle (low-power) state. The WFI instruction ensures that all explicit memory accesses that are prior to the WFI instruction in program order have completed. Also, WFI ensures that all speculative memory accesses have completed.

After executing WFI, the processor asserts the STANDBYWFI signal. Assertion of STANDBYWFI guarantees that the processor is in idle, and there is no outstanding memory access. The processor continues to assert STANDBYWFI until one of the interrupt (IRQ or FIQ) is asserted or processor is reset.

The flow controller can be configured to trigger (per CPU) power-gating based on WFI instruction execution.

15.1.2 CPU (A15) Low-Power States

15.1.2.1 CPU Clock Gating

If a CPU is idle for a short period of time, then it can be halted which results in its CPU clock-gating. This is referred to as LP3 CPU power-state. The WFI instruction is executed for putting CPU into LP3 (i.e. for clock-gating). After executing WFI, CPU disables most of the clocks in the CPU except the clock for the small wake up logic clock.

Exit from halt state occurs when the CPU detects an interrupt on IRQ or FIQ pins. Note that this state is per CPU. This clock-gating is internal to the Cortex-A15 processor, so it does not require any support from the flow controller.

15.1.2.2 CPU Power Gating

The flow controller uses a (separate) state machine to sequence power-gating for each CPU. The main CPUs flow-controller state machines are different from that for the CPU Rail PwrUp and COP. So it has three different variants of state machines: one for main CPUs (which is instantiated 4 times, one for each CPU), one for CPU Rail PwrUp and one for COP. If the active cluster is cluster1, then based on CPU-ID, corresponding state machine is used for CPU-LP.

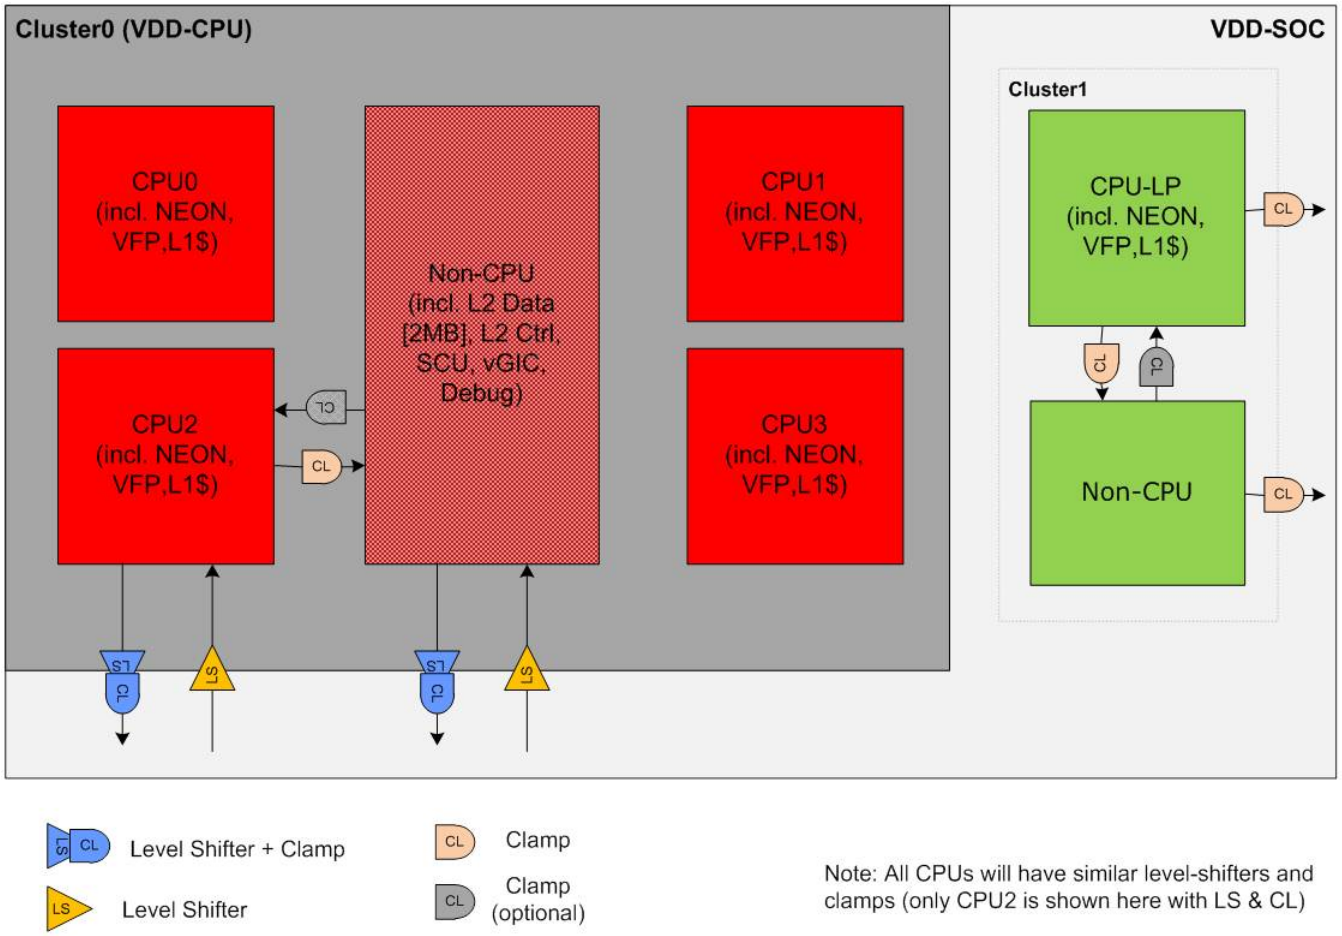
The flow controller can have one or more power-gating requests outstanding. However, it only issues one request at a time to the PMC. A fixed priority arbiter is used to arbitrate among CPU power-gating on/off requests, and the winning request is sent to the PMC. This is primarily for two reasons: i) to avoid power noise issues, only one partition is power gated/ungated at a time, ii) PMC's power-gating controller supports only one request at a time.

The flow controller to PMC interface includes core-ID which explicitly indicates which CPU or non-CPU partition should be power gated/ungated. PMC is not expected to use cluster-ID for identifying whether request is for cluster0 or cluster1 CPU.

CPU Power Gated Domains

As shown in the figure below, each CPU is an independent power-gated domain. The cluster0 non-CPU may be power gated as a separate domain. The cluster1 non-CPU is power-gated as a separate domain.

Figure 28: CPUs PG Domains



15.1.2.3 Cluster0 CPU-Rail Gating

At boot, CPU rail is off by default, and is powered on by the AVP boot code using a direct register write to PMC (or by direct I2C commands to PMIC). Also, at LP0 exit, the CPU rail (if need be) is powered-on (by software) by direct register write to the PMC (or by direct I2C commands to PMIC).

The CPU rail can be powered off by software running on the companion core after a cluster switch using a direct register write to PMC. Refer to the “Cluster Switch” section for details.

15.1.2.4 Cluster0 CPU Power Gating

Each of the cluster0 CPUs can be independently power-gated with the help of the flow controller. If the CPU being power-gated is not the last one (or is not requesting the CPU rail to be powered off), then it is power gated/ungated as described in the section on “CPU Power Gating/Ungating Sequence”.

The last CPU being power-gated can request non-CPU to be power-gated or CPU rail to be powered off. Similar when the first CPU is being woken up, then the flow controller would power on (if it was off) the CPU rail or power-ungate non-CPU (if it was power-gated).

Note:	The flow controller will either sequence the CPU rail controls or the non-CPU power-gating controls (with last CPU power-gating request), but not both.

The flow controller can be set up to power gate/ungate each of the CPU independently. In addition, the flow controller can be set up to power gate/ungate non-CPU as a result of a CPU power gate/ungate request. The following section describes a non-

CPU power gate/ungate along with CPU. The individual CPU only power gate/ungate is described in the section on “CPU Power Gating/Ungating Sequence”.

The following table indicates power-on options which can be triggered when the flow controller receives CPU wakeup event.

Per CPU Power Ungate	Non-CPU Power UnGate	CPU Rail Power On	Comments
Yes	No	No	Individual CPU power-ungating
Yes	Yes	No	

15.1.2.5 Cluster1 CPU Power Gating

The cluster1 CPU (also known as shadow CPU or CPU-LP) can be power gated/ungated with the help of the flow controller. Along with CPU-LP power-gating, its non-CPU can be power gated (by configuring flow controller before requesting CPU power-gating). From PMC perspective, CPU-LP and non-CPU are two separate power-gated domains. The flow controller sends CPU-LP and non-CPU power-gating requests to the PMC as follows:

The flow controller can be set up to power gate/ungate CPU-LP only. In addition, the flow controller can be set up to power gate/ungate non-CPU along with CPU-LP as result of CPU-LP power gate/ungate request. The next section describes non-CPU power gate/ungate along with CPU-LP. The CPU-LP only power gate/ungate is described in the section on “CPU Power Gating/Ungating Sequence”.

Power-Gating (Power-Off) CPU and Non-CPU

To initiate CPU-LP power-gating, SOFTWARE configures the flow-controller registers associated with CPU-ID (in MPID register). The SOFTWARE initiates CPU-LP (with non-CPU) power-gating request as described in section on CPU Power-Gating (Power OFF) Sequence. After that, the flow controller sequences CPU-LP and non-CPU power-gatings as follows:

- [SW-CPU] Initiate CPU-LP power gating with non-CPU power-gating rail (refer to the section on CPU Power-Gating (Power OFF) Sequence) for details of software steps
- [HW-Flow] CPU power-gating step
  - Request PMC to power-gate the CPU (Refer to the section on “CPU Power-Gating (Power OFF) Sequence”)
  - Wait for PMC acknowledgment
- [HW-Flow] Non-CPU power-gating step
  - If non-CPU is off (see CPU_PWR_CSR[C1NC_STS]), or in the process of being powered on or off then this step is done.

    Note: This condition should never be seen. But this makes the cluster1 sequence the same as that of cluster0, so it is all right to make this check in the state machine.
  - Update non-CPU power status register (CPU_PWR_CSR[C1NC_STS]) to be in the process powering off
  - Request PMC to power-gate non-CPU (refer to the section on “Non-CPU Power Gating/Ungating Sequence”)
  - Waits for PMC acknowledgment
  - Update non-CPU power status (CPU_PWR_CSR[C1NC_STS]) to be powered off

Power-Ungating (Power On) CPU and Non-CPU

Based on CPU-LP wake-up event ((see HALT_CPUx_EVENT register), the flow controller power-ungates CPU-LP (and non-CPU).

- [HW-Flow] Receives CPU-LP wake event
- [HW-Flow] Non-CPU power-ungating step
  - If non-CPU is power-ungated, then this step is done. Else,

- If non-CPU is in the process of being powered on, then wait for it to be powered on. After that, this step is done. Else,
- If non-CPU is in the process of being powered off, then wait for it to be powered off. After that continue to power it off.

> **Note:** The above two steps should never be encountered. But making these checks is all right and makes this sequence similar to corresponding cluster0 sequence.

- Update non-CPU power status register (CPU_PWR_CSR[C0NC_STS]) to be in the process of powering on.
- Request PMC to power-ungate non-CPU
- Wait for PMC acknowledgment
- Update non-CPU power status register (CPU_PWR_CSR[RAIL_STS]) to be powered on.

- [HW-Flow] CPU power-ungating step
  - Request PMC to power-ungate CPU
  - Waits for PMC ack

15.1.3 Cluster Switch

15.1.3.1 Cluster1 (Shadow) to Cluster0 Switch

The cluster switch is a variant of LP2 low-power state transition. From usage perspective, cluster1 to cluster0 switch is latency critical. For cluster1 to cluster0 switch, the cluster1 CPU is power-gated (with its non-CPU power-gating), cluster switched is performed, and a cluster0 CPU is powered on (either immediately or conditional on a wake event).

Following is the cluster1 to cluster0 migration sequence:

- [SW-CPU] Configure the flow controller for cluster switch
- [SW-CPU] Configure cluster0 CPU wake event
  - Software has to configure wake event for the CPU which is in the CPU-ID. After cluster switch, the flow controller can only wake-up the CPU which is pointed to by CPU-ID.
- [SW-CPU] Trigger CPU rail on sequence as described in “CPU Rail Gating/Ungating Sequence”.

> **Note:** This step allows the CPU rail (cluster0 power) to be powered up in parallel with the cluster1 power-gate sequence. However, cluster1 is still an active cluster (until the cluster state is switched by the flow controller).

- [SW-CPU] Initiate power-gating of cluster1 CPU (with non-CPU)
- [HW-Flow] Perform cluster1 non-CPU and CPU-LP power-gating as described in the section on “Cluster1 CPU Power Gating”
- [HW-Flow] After cluster1 power-gating, wait for pre-cluster-switch delay (programmed in a flow-controller register)
- [HW-Flow] Perform cluster switch
- [HW-Flow] Wait for post-cluster-switch-delay (programmed in a flow-controller register)
- [HW-Flow] Waits for the wake event (this could be immediate)
- [HW-Flow] Power-on first CPU of cluster0 as described in the section on Cluster0 CPU Power Gating

15.1.3.2 Cluster0 to Cluster1 (Shadow) Switch

The cluster switch is a variant of LP2 low-power state transition. For cluster0 to cluster1 switch, the last CPU of cluster0 is power-gated, the cluster is switched, and cluster1 CPU is power ungated (either immediately or conditional on wake event).

Following is the cluster0 to cluster1 migration sequence:

- [SW-CPU] Configure the flow controller for cluster switch

- [SW-CPU] Configure cluster1 CPU wake event
- [SW-CPU] Configure the CPU-ID of CPU which is being migrated to CPU-LP
- [SW-CPU] Initiate power-gating of last CPU (with non-CPU power gatingoption) as described in section on “Cluster0 CPU Power Gating” for CPU power-gating and non-CPU power gating.
- [HW-Flow] Wait for pre-cluster-switch delay (programmed in a flow-controller register)
- [HW-Flow] Perform cluster switch
- [SW-CPU] Software running on cluster 1 can power down the CPU rail by directly writing to the CRAIL bit of the APBDEV_PMC_PWRGATE_TOGGLE_0 register. The CPU rail has to be brought up by software prior to switching the cluster back to cluster 0 using the same mechanism.
- [HW-Flow] Wait for post-cluster-switch-delay (programmed in a flow-controller register)
- [HW-Flow] Waits for the wake event (if needed)
  - At the wake event, the flow controller powers up cluster1 as described in section on “Cluster1 CPU Power Gating”

15.1.4 CPU-ID Function

When the active cluster is cluster1, then the flow controller uses CPU-ID (programmed in MPID register) to associate CPU-LP to corresponding CPU state machine which is used to power gate/ungate CPU-LP. Also, during cluster1 to cluster0 switch, flow-controller uses CPU-ID to wake the corresponding cluster0 CPU (based on configured wake events).

Also, CPU-ID is used to drive cluster1 CPU-ID pins, which are captured in the CPU (CP15) register that software uses to read the CPU-ID of the current CPU. Note that the CP15 register captures the MPID value, which is the virtualized MPIDR, not the physical MPIDR. Thus, it must be read by the CPU in monitor mode or virtualization mode.

Once cluster0 is active and cluster migration has been completed, then the flow controller does not have any use for CPU-ID.

15.1.5 AVP Low-Power States

15.1.5.1 Halt (Clock Gating)

There is no specific halt instruction in the AVP. However, its memory bus cycle can be extended by any number of cycles.

When configured to put the AVP into halt, the flow controller forces its memory bus interface into wait-state. After that if the AVP issues any bus cycle (e.g., fetching next instruction), then that bus cycle does not return unless flow-controller releases its bus (i.e., wakes it up). The flow controller can be configured to wake up the AVP by IRQ/FIQ or other wake up events. During an AVP halt state, its clock is automatically gated by hardware.

15.1.5.2 Power-Gating

The AVP is not power-gated.

15.1.6 CPU Power Gating/Ungating Sequence

The processor’s (A15 or A9) power-gating can be triggered by either i) a direct register write to PMC or ii) interacting with the flow controller. This section describes the power-gating sequence via flow-controller interaction.

The flow controller interfaces with the Processors, PMC, and CAR to implement power-gating on/off hardware-sequence. The power-gating controller is in the PMC, while clock and reset controls are in the CAR.

15.1.6.1 CPU Power-Gating (Power OFF) Sequence

- [SW-CPU] Prepare processor (flush CPU L1$, context save, set up flow controller) for power-gating

- [SW-CPU] Execute WFI to make sure there is no outstanding processor transaction
- [HW-CPU] Assert *STANDBYWFI* to the flow controller
- [HW-Flow] Assert flow2car_*_rst
  - This is not used in power gate sequence when powergate_enable is high
  - When powergate enable is “0”, CAR uses this to assert CPU reset
- [HW-Flow] Request PMC (by asserting flow2pmc_req and associated bus) to power-off CPU
- [HW-PMC] Assert the clamp control signal. This goes to ccplex and also goes to CAR.
- [HW-CAR] Assert CPU reset and reset the CPU clock
  - [HW-CPU] Stop CPU clock
- [HW-CAR] Ack PMC to indicate CPU clock is stopped
- [HW-PMC] Power off CPU (assert CPU PG-enables)
- [HW-PMC] Clear PWRGATE_STS register bit. This is to indicate that CPU is power-gated.
- [HW-PMC] Ack to the flow controller to confirm power-off (by asserting pmc2flow_ack)
  - **Note:** After receiving ack from the PMC, the flow controller must not issue a new request to the PMC until pmc2flow_ack goes idle.
- [HW-Flow] Deassert flow2pmc_req (after seeing the Ack)
- [HW-PMC] Deassert Ack (after seeing request deassertion)
- [HW-Flow] Do not start another request until Ack goes down

15.1.6.2 CPU Power-Ungating (Power ON) Sequence

The generic CPU power-ungating (power OFF) sequence is described below. The specific details of main CPU (Cortex-A15) are described in their respective power-gating sections.

- [HW-Flow] After detecting wake up condition, request PMC to power-on CPU (by asserting flow2pmc_req and associated bus)
- [HW-PMC] Power-on the CPU (deassert CPU PG-enables)
- [HW-PMC] Set PWRGATE_STS register bit. This indicates that the CPU is power-ungated
- [HW-PMC] Ack flow controller (by asserting pmc2flow_ack) that CPU is powered on
- [HW-Flow] Deassert flow2car_*_rst to CAR
- [HW-CAR] Request CPU to ungate CPU clock (by deasserting car2ce*_cke)
- [HW-CPU] Ungate CPU clock
- [HW-CAR] Request PMC to remove CPU clamp (by asserting car2pmc_ack)
  - This is to make sure that clock gets ungated well ahead of reset deassertion
- [HW-PMC] Removes the clamping (by deasserting pmc2ce*_clamp)
  - This goes to the CPU and also to the CAR
- [HW-PMC] Ack flow controller (by deasserting pmc2flow_ack)
- [HW-CAR] Deasserts reset
- [SW-CPU] CPU fetches code from reset vector.
  - Note all of the Cortex-A15 CPUs share one reset-vector register (in EVP registers).

15.1.7 Non-CPU Power Gating/Ungating Sequence

From a software perspective, non-CPU power gating/ungating is done as part of CPU power gating/ungating request. The flow controller issues a separate request (to PMC) for power-gating CPU and non-CPU domain. The main reason is that PMC can

only sequence one power domain at a time, so the flow controller serializes requests on behalf of PMC. From the flow controller hardware perspective, the sequence for non-CPU domain power gating is similar to CPU domain power gating/ungating which is described in above sections.

There is an ARM requirement for Cortex-A15 CPUs that there must be a minimum of 16 clocks prior to clamps being deasserted on outputs from the CPU core partitions to the non-CPU partition. To address this issue, the CAR waits for CCPLEX to assert ccplex2car_pmc_cntr_ack before it deasserts car2pmc_<pgpart>_ack. CCPLEX implements the 16 CPU clock cycle wait after reset is released and clocks unstopped by the CAR, before it asserts the ack to CAR. The 16-cycle counters are implemented in the VDD_CPU power rail domain and the acks are generated from the same domain. The per-core acks are not affected by the ce0/ce1/ce2/ce3 clamps. The c0nc, c1nc, and unpower-gated VDD_CPU logic are not affected by the additional handshake logic between CCPLEX and CAR. So these partitions rely on the CAR2PMC_NONCPU_ACK_WIDTH counter for CAR to allow the PMC to release the clamp controls on these partitions.

In the CAR register space, to enable the legacy mode i.e. disable the 16-cycle counter:

- Set CLK_RST_CONTROLLER_CPU_SOFTRST_CTRL2_0_IGNORE_HW_ACK_WIDTH to 1
- Set CLK_RST_CONTROLLER_CPU_SOFTRST_CTRL2_0_IGNORE_SW_ACK_WIDTH to 0

  This will cause CPU core partition power gating FSMs in the SOC to use the CLK_RST_CONTROLLER_CPU_SOFTRST_CTRL2_0_CAR2PMC_CPU_ACK_WIDTH counter.

To enable the fix and use both the existing T3 counter and the 16-cycle counter inside CCPLEX:

- Set CLK_RST_CONTROLLER_CPU_SOFTRST_CTRL2_0_IGNORE_HW_ACK_WIDTH to 0
- Set CLK_RST_CONTROLLER_CPU_SOFTRST_CTRL2_0_IGNORE_SW_ACK_WIDTH to 0

To enable the fix and use only the 16-cycle counter inside CCPLEX but not the existing T3 counter:

- Set CLK_RST_CONTROLLER_CPU_SOFTRST_CTRL2_0_IGNORE_HW_ACK_WIDTH to 0
- Set CLK_RST_CONTROLLER_CPU_SOFTRST_CTRL2_0_IGNORE_SW_ACK_WIDTH to 1

15.1.8 CPU Rail Gating/Ungating Sequence

CPU Rail gating/ungating is only supported on Tegra K1 devices when a cluster switch is taking place or during LP0 entry when the PMIC turns the rail off.

15.1.8.1 CPU Rail Gating Constraints

The FCPU cluster cannot be rail-gated as a side-effect of the last FCPU core asserting WFI.

The ccplex2car_pmc_cntr_ack_fcpu{0-3} and DFT-related signals use tmc2clamp_pmc2c0nc_clamp as the clamp enable with the effect that the clamps are not asserted when FCCPLEX is rail gated. The tmc2clamp_pmc2c0nc_clamp signal is asserted only when the C0NC (non-CPU) partition is power gated. Since power-gating C0NC is mutually exclusive with respect to rail gating FCCPLEX, there are two constraints:

- FCCPLEX can only be rail gated by a cluster switch sequence by programming CSR_ENABLE_EXT field to 2'b10. FCCPLEX still needs to be rail gated during LP0 entry from FCPU, which results in an unavoidable window of time when the level shifters may leak when SOC and CPU rails are simultaneously being turned off by the external PMIC.
- During a cluster switch from FCCPLEX to SCCPLEX, F-C0NC should be power gated only. The FCCPLEX rail can be later turned off by software running from the SCPU:
  - Set CSR_ENABLE_EXT to 0x1
  - Trigger cluster switch
  - Toggle the CRAIL bit of APBDEV_PMC_PWRGATE_TOGGLE_0. This step will cause the correct clamps to be asserted.

When switching back to the FCPU, the CPU rail needs to be powered up using PMC controls. Flow controller RAIL_ENABLE cannot be used for this purpose.

15.1.8.2 Cluster0 RAM Re-Repair

At (cold or warm) boot power-up of the CPU rail, software powers up the CPU rail (by direct register writes to the PMC or the PMIC), and triggers RAM repair by writing to the RAM_REPAIR[REQ] register of the flow controller. After that software polls RAM_REPAIR[STS] to ensure that the repair is done.

After boot power-up of the CPU rail, whenever the CPU rail is powered up by the flow controller, the flow-controller hardware also requests cluster0 RAM re-repair, and ensures that the repair is completed.

The re-repair request and ack signals are per segment of the CPU repair chain. The request, once asserted (high), must remain high for as long as it does not receive the corresponding ack signal.

15.1.9 Cortex-A15 Debug Power Up/Down Requirements

The Cortex-A15 processor requires debug power up/down related support. The flow controller provides the following debug support.

15.1.9.1 DBGPWRUPREQ

The CoreSight can initiate power-up (for a CPU which is power-gated via the flow controller) by writing to the Cortex-A15 DBGPRCR register. As a result of this register write, A15 asserts DBGPWRUPREQ signal (a per CPU active-high level). Note, this signal can never be asserted when C0NC (or C1NC) is power-gated (since the logic generating this is inside those partitions).

The flow controller uses this signal as a wake-event (in addition to the wake events programmed in CPUx_CSR register) to wake the corresponding CPU-only. The flow controller qualifies this signal by corresponding PWRUPREQ_QUAL bit (of FLOW_DBG_QUAL register). In summary, the flow controller uses the following condition to wake up a CPU.

*CEx wake-condition = (CEx wake-event as programmed in CPUx_CSR) || (<**ccplex2flow**>**_DBGPWRUPREQx && PWRUPREQ_QUALx**)*

15.1.9.2 DBGNOPWRDWN

The CoreSight can force CPU power-down to be power-down “emulation” only by writing to the Cortex-A15 DBGPRCR register. As a result of this register write, the Cortex-A15 asserts DBGNOPPWRDWN signal (a per CPU active-high level). Note, this signal is asserted to emulate CPU-only power-gating.

The flow controller qualifies <ccplex2flow>_DBGNOPPWRDWNx signal by corresponding NOPPWRDWN_QUALx bit (of FLOW_DBG_QUAL register) and uses that as an indication of CPU power-gating without the pg_enable option.

Note that CPU power-gating is still triggered by CPUx_CSR write only (based on WFI). But regardless of CPUx_CSR register configuration, if (<>_ DBGNOPPWRDWNx && NOPPWRDWN_QUALx == TRUE), then only CPUx is power-gated without the pg_enable option.

15.1.9.3 DBGPWRDWNREQ/DBGPWRDWNACK

Cortex-A15 debug logic needs to know about power-gating requests. It also needs to make sure that power-gating starts only after it has acknowledged (so it can flush trace buffers, etc.). For this purpose, the Cortex-A15 provides per CPU DBGPWRDWNREQ/ DBGPWRDWNACK interface.

Logically, STANDBYWFIx (Cortex-A15 output) can be fed to DBGPWRDWNREQx (Cortex-A15 input). But STANDBYWFI can be asserted for many reasons, so it has to be qualified when it is asserted for CPU power-gating. The flow controller provides qualifier (PWRDWNREQ_QUALx bits of FLOW_DBQ_QUAL register) which will be set by software at the power-gating entry, and cleared by software at CPU power-ungating.

Also, if qualifier (i.e., PWRDWNREQ_QUALx) is set, then the flow controller needs to wait for DBGPWRDWNACKx (in addition to waiting for existing STANDBYWFIx condition) before starting the CPUx power-gating.

In summary, the following is needed in each ccplex cluster:

<ccplex>_ DBGPWRDWNREQx = <ccplex>_STANDBYWFIx & <flow2ccplex>_PWRDWNREQ_QUALx

The flow controller needs to wait for **<ccplex2flow>_DBGPWRDWNACKx & PWRDWNREQ_QUALx** (in addition to existing wait for STANDBYWFIx etc condition).

15.2 Flow Controller Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

In the Flow Controller register descriptions, CPU refers to CPU0, and COP refers to the AVP coprocessor. CPU-LP (CPU4) has its own set of control registers. This is required because there is a case (cluster1 to cluster0 switch) where both sets of registers can be configured in parallel. Also, since CPU-LP may morph into any of the four CPUs, it is better to keep its control register separate.

The EVENTS register is replicated per core, once for COP, four times for the cores of Cluster0.

The fields and enums have the following interpretation:

- MODE defines how the flow controller logic operates; the reset value is 0x0 for CPU0 and COP (does nothing) and 0x2 for CPU1, 2, 3 (WAITEVENT). This is related to the default behavior of the reset generator.
- Enumerated values for the field MODE are defined below.

Field Mode	Enumerated Value	Description
FLOW_MODE_NONE	0	No flow control
FLOW_MODE_RUN_AND_INT	1	Keep running but generate interrupt when event conditions met (not used)
FLOW_MODE_WAITEVENT	2	Stop running until event conditions met
FLOW_MODE_WAITEVENT_AND_INT	3	Same as FLOW_MODE_WAITEVENT but generate an interrupt when resumed (not used)
FLOW_MODE_STOP_UNTIL_IRQ	4	Stop until an interrupt controller interrupt occurs
FLOW_MODE_STOP_UNTIL_IRQ_AND_INT	5	Same as FLOW_MODE_STOP_UNTIL_INT but generate another interrupt when resumed (not used)
FLOW_MODE_STOP_UNTIL_EVENT_AND_IRQ	6	Stop until event conditions met AND an interrupt controller interrupt occurs

There is no enum for 7

- Bit 31: (also known as Halt) = This bit is set to configure the wake up (of corresponding CPU) by any of the interrupts (LIC_IRQ/FIQ, or GIC_RIQ/FIQ) corresponding to that CPU. If this bit is set, then none of the other fields of this register need to be set for CPU wake. This bit is set by software and cleared by hardware when any of these interrupt is received by hardware.
- Bit 30: (also known as Wait) = This bit is set to configure the wake up (of corresponding CPU) by any of the enabled "events". The events can be enabled by setting other fields of this register (incl. *_IRQ, *_FIQ). If this bit is set, then at least one of the events needs to be enabled to generate wake event. This bit is set by software and cleared by hardware when wait event is observed by hardware.
- Bit 29: (also known as Sync) = This bit causes the NEXT Flow Controller register read to stall the processor until the wake event occurs (Used for COP. Obsolete for CPUs).

The rest of the fields define which conditions will be taken into account to restart a halted processor.

There are two types of events:

- Counted events: Decrement the field called ZERO. Flow controller resumes when this counter reaches 0
- Activity events: The flow controller resumes when the activity occurs, no counting

All conditions are disabled at reset:

- JTAG: Resume on JTAG activity
- SCLK : Resume on Nth SYSCLK cycle ticks
- X32K : Resume on Nth X32K clock input ticks
- uSEC: Resume on Nth uSEC clock ticks (uSEC = microsecond)
- mSEC: Resume on Nth mSEC clock ticks (mSEC = millisecond)
- SEC : Resume on Nth second RTC clock ticks
- X_RDY: Resume on Nth XIO.RDY Ext. IO Ready events
- SMP3[1,0]: Resume on Nth SMP.3[1,0] Semaphore set events
- XRQ_[D,C,B,A] : Resume on Nth XRQ.[D,C,B,A] External Trigger events
- [O,I]B[E,F]: Resume on Nth [O,I]B[E,F] [Outbox, Inbox] [Empty, Full] Events
- [LIC, GIC]_[IRQ,FIQ]: Resume on [LIC, GIC] [IRQ,FIQ].
- ZERO: Initialized then decremented

Note: If more than one event is enabled, the event counter will decrement based on an OR condition of enabled events

15.2.3 FLOW_CTLR_CPU_CSR_0

The CPU_CSR registers are replicated for each CPU cores. They define additional characteristics of the flow controller linked to CPU cores, especially the interaction of the flow controller with power management functions. The LP1 state is normally entered and exited via side effects of the flow controller operation.

All fields of the CPU_CSR register have an initial value of 0. The different fields are:

- PWR_STATE : Current state of the PowerGate State Machine
- WAIT_EVENT: CPU is waiting, wake up is via an event
- HALT: CPU is halted
- P2F_ACK: pmc2flow_ack signal, this is the same signal for both CPU cores
- F2P_PWRUP: flow2pmc_pwrup, this is the same signal for both CPU cores
- F2P_REQ: flow2pmc_req valid, this is the same signal for both CPU cores
- F2C_MPCORE_RST: TRUE when requesting reset of MPCore
- PWR_OFF_STS: TRUE when CPU Power-Gated is OFF by Flow Controller
- INTR_FLAG: TRUE when Interrupt is Active -- Write-1-to-Clear
- EVENT_FLAG: TRUE when Event is Active -- Write-1-to Clear
- ENABLE_EXT: If ENABLE is TRUE, then this specifies what to power off.
    - 00b: Power Gate CPU only.
    - 01b: Power Gate CPU and non-CPU (note, this option must be used only when last CPU is being power-gated).
    - 10b: Reserved.
    - 11b: PG Emulation. Note, this option is for CPU-only PG emulation except for cluster-switch case (i.e. with SWITCH_CLUSTER=1) in which emulation applies to all PG steps of source cluster. In PG emulation, PG partition is reset but not power-gated..

- IMMEDIATE_WAKE: If set, CPU is powered up immediately (without waiting for an interrupt or event). Note: If this is set then HALT_CPUx_EVENTS[MODE] should be set to 0x2 for immediate wake.
- SWITCH_CLUSTER: If set, the active cluster will be switched when all indicated CPU reach STANDBY_WFI. This bit self clears once the cluster switch sequence is completed
- WAIT_WFI_BITMAP: All cores indicated in bitmap must be in STANDBY_WFI before switching Cluster
- EVENT_ENABLE: Generates an event when the flow controller exits the halted state

- ENABLE: PowerGate Enable - Halt or Event-wait causes CPU power-gating.

16.0 MEMORY CONTROLLER

Tegra® K1 devices feature a hybrid 2x32-bit / 1x64-bit memory controller. These are interleaved to provide high performance with the load shared across both channels.

The Tegra K1 memory controller (MC) handles memory requests from internal clients and arbitrates among them to allocate memory bandwidth for DDR3L and LPDDR3 SDRAMs.

The Tegra K1 memory controller (MC) handles memory requests from internal clients and arbitrates among them to allocate memory bandwidth for DDR3L and LPDDR3 SDRAMs. The external memory controller (EMC) communicates with external DDR3L and LPDDR3 devices.

Key features in the Tegra K1 memory controller include:

- Enhanced arbiter design for higher memory efficiency
- System Memory Management Unit (SMMU)/Translation Unit (TU) for virtual to physical address mapping for any device
- Support for low-voltage DDR3 and LPDDR3 SDRAMs
- 8 burst transfers per transaction (BL8)
- Support for two DRAM ranks of unequal device densities
- Operates in either single x32 or single x64 configuration
- Variable transaction sizes based on the requests from the clients (one 64-byte transaction with variable dimensions, two 32-byte transactions with variable dimensions, etc.)
- x32 sub-partitions support for x64 configuration: additional address bits allow targeting different columns of each sub-partition
- QUSE functionality for qualification of the tristatable DQS clock in SDRAMs

The memory interface speed varies with memory type and the specific Tegra K1 SKU, so is not stated in this document.

16.1 Memory Controller Architecture

The memory controller architecturally consists of the following parts:

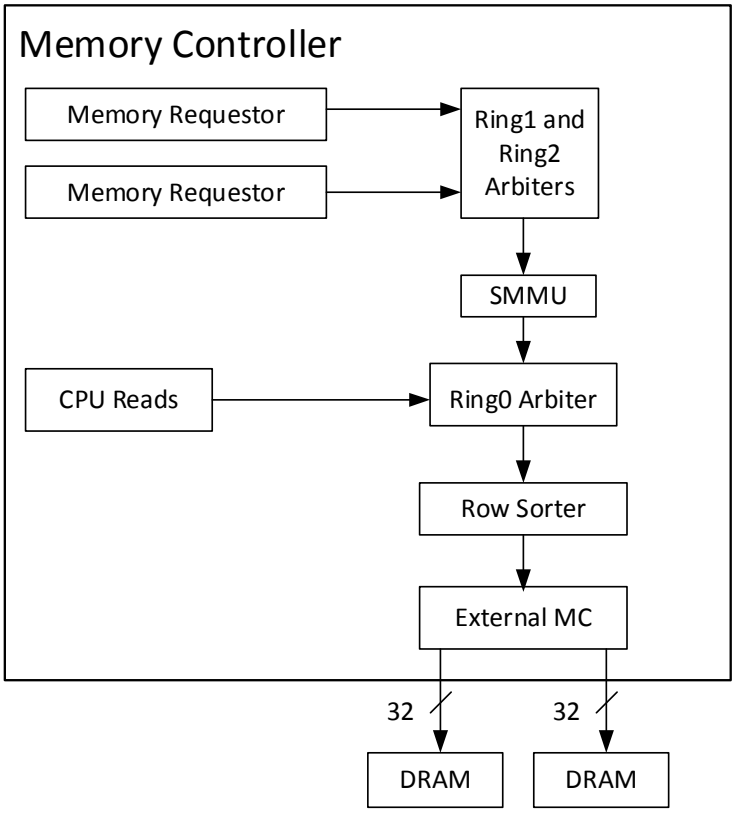
- Arbitration Domains (ADs), which can handle a single request or response per clock from a group of clients. Typically, a system has a single Arbitration Domain, but an implementation may divide the client space into multiple Arbitration Domains to increase the effective system bandwidth. Multiple Traffic Classes within a single Arbitration Domain and Protocol Arbiter are allowed.
- Protocol Arbiters (PAs), which manage a related pool of memory devices. A system may have a single Protocol Arbiter or multiple Protocol Arbiters.
- Memory Crossbar, which routes request and responses between Arbitration Domains and Protocol Arbiters. In the simplest version of the system, the Memory Crossbar is just a pass through between a single Arbitration Domain and a single Protocol Arbiter.
- Global Resources, which include entities such as configuration registers which are shared across the Memory Subsystem.
- Write CAMs (WCAMs), which improves performance and throughput for PCIe ordered clients (PCIe, SATA, HDA, and USB3), CPU writes, and CPU copies.
- Memory Controller Client Interface (MCCIF), which provides a standardized interface for access to the Memory Controller.
- Translation Unit, which handles virtual-to-physical address translation, aperture decode, physical address security checks, and protocol arbiter-specific decodes (such as external DRAM address decodes).

The Tegra K1 device supports a single physical channel of memory interface, which operates in either single 1x32 or hybrid 2x32 / 1x64 configurations. There is an alternate path through the memory controller to access IRAM via AHB re-direction.

Figure 29 below is a simplified view of how memory requests are arbitrated in the Tegra K1 MSS. Memory client requests are first arbitrated through a sequence of ring arbiters which perform a type of round-robin arbitration. There are three ring arbiters referred to as ring0, ring1, and ring2. Ring1 arbiter clients are the ISO clients (display and camera) and the winner of the ring2 arbiter. Each ring has a rate control mechanism referred to as Priority Tier Snap Arbiter (PTSA). The client's bandwidth guarantee is specified by the PTSA rate (also referred to as "DDA").

The block labelled "Row Sorter" is a pending request buffer (it sorts requests by the DRAM row that it refers to). This row sorter is made up of many "bank queues" which hold the requests made to the same DRAM bank/row. The number of requests pending in the row sorter can affect whether ring1 or ring2 arbiters are throttled (slowed down) based on thresholds.

Figure 29: Memory Request Arbitration



16.2 Hardware Features

16.2.1 DRAM Protocol Arbiter Features

- Hybrid 2x32-bit / 1x64-bit data bus
  - 4 chip selects
  - 4 individually controllable clock-enables
  - 4 individually controllable ODTs (DDR3L)
  - Operates in either single x32 or hybrid 2x32 / 1x64 configuration
  - Supports per-byte data masks
- Each chip select may support different sizes and geometries

  - Size of Rank 0 must be larger than or equal to Rank 1
  - 2 or 3 bank bits
  - Column width: 9 to 12 bits
  - Row width: 12 to 16 bits
- Per-byte data masks
- Support for BL8
- Data transfer minimization:
  - DDR3 burst chop support
- Discrete LPDDR3 and DDR3 devices up to 933 MHz
- Support for 1T and 2T
- Support for low-power modes:
  - Software controllable entry/exit from: self-refresh, power down, deep power down
  - Hardware dynamic entry/exit from: power-down, self-refresh
  - Support for intermittent or disabled DLL
  - Disable unused address/command taps based on whether in POP or Discrete mode.
  - Pads use DPD mode during idle periods
- For Tegra K1 devices, trims can be set/adjusted per-byte AND per-chip-select. The PVT-compensated value can still be used and a PVT/frequency-compensated adjustment can be added to it (1/16, 1/8, 3/16 of a cycle) or a non-PVT-offset can be added.
- Support for x32, x16, or x8 chips attached to the channel
  - DQ/DQS swizzling: MRR_BYTESEL need to match byte swizzling.
- Deadline-based arbitration with a latency allowance that can be specified per-client, and under some circumstances, dynamically adjusted for a given client.

16.2.2 Memory Crossbar

The Memory Crossbar (MXB) is in charge of adapting Arbitration Domains (ADs) to Protocol Arbiters (PAs). In the simplest system with a single AD and PA running off of a single clock, the MXB is a simple pass-through or does not exist. The Tegra K1 MXB has one AD and two PAs, one for DRAM and the other for requests redirected to the AHB. The MXB handles conflict arbitration between responses from multiple PAs to the same AD.

16.2.3 Memory Sub-Partitions

The Tegra K1 Memory Controller implements sub-partitions. The 64B memory atom is divided into two sectors: one sector containing bytes 0 to 31 and the other containing bytes 32 to 63. Each sector is stored in one of the two DRAM channels. With three additional column address bits for the second sector, clients can make 64B requests of different shapes while retaining the bandwidth and power efficiency of a 64B memory atom. This feature also allows the CPU to request that one of the two 32B sectors in a 64B atom be returned first.

The sub-partition mechanism is used by the GPU, display clients (for rotation), VIC (for rotation), MSENC (in x,y flip mode), and the CPU (for critical-word-first). Clients that choose not to use the sub-partition feature set the extra column address bits to the same values as the other channel. They see the DRAM as a simple 64B memory system. The sub-partition feature is only beneficial in systems with a 64b memory. In systems with 32b memory, client addressing and request granularity are unchanged, but the MC treats each 32B sector as an independent 32B atom.

See the “Sub-Partitions” subsection for more information.

16.2.4 Global Resources

The Memory Subsystem also contains some global resources not owned by a particular AD or PA:

- A combined SMMU/TU
- Configuration registers and statistics counters

16.2.5 Supported Page Sizes

The MSS considers the following uses of pages and page size:

- DRAM page sizes from 1KB to 4KB.
- OS page: 4KB for all operating systems
- Row Sorter page: 1KB

16.3 Software Features

The majority of software interaction with the memory subsystem involves:

- Initial configuration
- Power management
- Device management
- Translation management
- ISO client bandwidth allocation
- Statistics and debugging

16.3.1 Initial Configuration

The details for configuring the Memory Subsystem (MSS) can be broken down into the following:

- Global Memory Subsystem configuration
- Arbitration Domain configuration
- Protocol Arbiter configuration
- Client configuration

> **Note:** This configuration must be performed as part of the chip-wide boot sequence

16.3.1.1 Global Memory Subsystem Configuration

Some parts of the Memory Subsystem must be configured before any transfers are allowed into the system. The address map must be configured to set which portions of the physical address map are allocated to which Protocol Arbiters, and what portions of it are protected by the physical address protection mechanisms.

The Arbitration Domains operate off of a unified arbitration clock. This clock is further divided-down to produce a clock-rate independent clock for counting latency intervals across the Memory System (also known as “ticks”). This divide-down should be programmed to a constant interval at initialization (and any other clock-rate change). A 30 ns interval is suggested since it is an even divide-down of many common DRAM clocks, but any convenient granularity may be chosen.

There are several global memory system tuning options that tend to shape the memory performance. Some of these can be set statically, at initialization time, others depend on clock frequencies. For example, with SMMU configuration, the SMMU requires software to set up and maintain page tables in memory, enable translation for clients, and assign clients to address space identifiers.

16.3.1.2 Arbitration Domain Configuration

Physical implementation decisions (such as the mapping of clients to partition clients) and default client bandwidth allocations require configuration options in the Arbitration Domain.

16.3.1.3 Protocol Arbiter Configuration

Each Protocol Arbiter has its own requirements for initialization. Timing parameters specific to the Arbiter, the DRAM and the current operating clock speed have to be written into Protocol Arbiter configuration registers. The type and geometry of the attached DRAM also have to be programmed. Afterwards, the DRAM will require a set of initialization cycles to be issued.

Device/Rank Geometry

DRAM devices come in many sizes, widths, etc. The arbiter must be programmed to drive the correct combination of address bits, data bits, and protocol.

Device Timing and Arbiter Timing

A DRAM arbiter has configuration related to timing parameters specific to the attached device. The JEDEC timing specifications for the device have to be converted from nanoseconds to cycle counts. The controller must also be programmed with the cycles per tick number for their particular clock domain (see also the subsection on “Global Memory Subsystem Configuration” below).

Other Arbiter Parameters

Other parameters related to arbitration that need to be configured include:

- overall number of requests outstanding
- which clients are considered isochronous
- which clients participate in power-saving hysteresis operations

Device/Rank Initialization and Calibration Cycles

In particular, PAs need to write registers in the DRAM devices via special cycles to initialize the DRAM. In general all special cycles to a device are done via a hardware/software handshake that looks like:

- Software writes information about the special cycle to an Arbiter-specific register
- The Controller does the special cycle out to the DRAM device(s) when timing requirements are met
- Software checks a status register to ensure the special cycle is complete; or for Mode Register Read operations, the Controller issues an interrupt to indicate that the special cycle has been consumed

Special cycles may be emitted during normal operation as well; the Arbiter will inject them into the data stream at the appropriate places (typically along with refresh cycles).

During device initialization, software must ensure that no client can access the memory. This can be done with per-module flush-enable bits.

16.3.1.4 Client Configuration

The Priority Tier Snap Arbiters normally are configured dynamically to provide bandwidth guarantees to ISO clients. However, for certain clients the PTSA settings are programmed statically (for example, when the PTSA is used as a timeout). For these clients, the PTSA settings are part of the initial configuration.

Latency allowance may also be configured dynamically for certain clients. Latency allowance should be programmed to default values during initial configuration.

16.3.2 Power Management

The primary forms of system power management involve transition to and from low-power DRAM states and management of clock frequency.

16.3.2.1 Low-Power States

The DRAM controller and DRAMs can operate in a number of low-power states. The controller can be programmed to automatically enter a precharge power-down or self-refresh state after some amount of time without a request. The power-down state can be independently entered for each individual DRAM device/rank – it is possible for one device/rank to be in power-down while another is active. If software knows that the system will not be making further DRAM requests, it can cause an immediate transfer to the self-refresh state by writing an override register. If multiple chip selects are available for the DRAM controller, both the hardware and software may choose to enter low-power states on a per-chip-select basis.

Once a request is queued to the controller for that DRAM, the hardware will automatically wake from the low-power state if it entered that state via hardware control. This can take a relatively long amount of time since the controller may be required to issue a number of refresh cycles first. For software-initiated self-refresh, software must issue a register write to start the transition from self-refresh back to a fully-powered state.

Deep power-down must be explicitly requested by software, since it causes DRAM data to be lost. Software must disable new incoming requests to the MSS, wait for all outstanding in-flight requests to retire, and then write a register to transition to the deep power-down state. To exit the state, software must reinitialize the DRAM and controller before re-enabling transfers. Deep power-down mode may be enabled for each chip-select in a Protocol Arbiter independently and each Protocol Arbiter independently.

Normal active bank power optimization is managed principally by the Protocol Arbiter. The arbiter will arrange to close banks as soon as possible and to hold requests for as long as the latency timer will allow, with the intent of grouping same-page accesses into a coherent burst.

16.3.2.2 Request Dribble

The “OSIdle” use cases (with or without display active) are important cases of active power management. Display and audio clients can be prone to “dribbling”, that is, sending isolated requests at infrequent intervals.

There are two main causes of dribbling:

- Isochronous dribble, caused by a low periodic request rate. This can be (and should be) managed in the Display client by using hysteresis (high and low watermarks) on the request buffer to group requests into bursts.
- Clock crossing dribble, which is caused by a large disparity between the client clock and the Arbitration Domain clock. If the client’s clock is slow (which it often is for Display), individual requests will have several idle cycles between each request. In general, this is unavoidable by the client.

It is difficult for the Protocol Arbiter to handle the second type of dribble when it is under load, because it cannot “see” a large enough window of requests to group the traffic efficiently. Low-data-rate isochronous clients should have client-side request hysteresis to handle isochronous dribble. The Protocol Arbiter can handle clock-crossing dribble when it is under load, because the delays are smaller and it will schedule other traffic preferentially while waiting for the dribbling traffic to accumulate. When in the OSIdle use case, the Protocol Arbiter will not have enough traffic to keep the client dribble from becoming DRAM dribble (isolated requests that open and close the DRAM pages more often than necessary).

To manage DRAM dribble, the controller adds the concept of the “*hysteresis hold-off*” (also known as iso holdoff), which is a per-controller state bit. When the hold-off is active, the controller is held off from issuing activate commands to open new DRAM pages. Incoming requests will back up in the Protocol Arbiter’s row sorter and store buffer until the hold-off is released.

The hold-off is enabled whenever an individual device goes idle due to lack of work. It is released automatically whenever a latency timer expires, or the Protocol Arbiter stalls due to fullness. The net effect of the hold-off is to group *all* requests for the DRAM into activity bursts.

The hold-off causes a delay in requests transitioning from a memory-idle state. This can affect some traffic in a negative manner – principally requests that are low-latency like the CPU. To keep the hold-off from impacting these requests, software has a per-module configuration bit that disables the hold-off for certain known-latency-sensitive clients. Whenever a request with the holdoff-disable bit set enters the Protocol Arbiter, the hold-off is released. The holdoff is enabled whenever an individual device/rank goes idle due to lack of pending requests. The holdoff is released automatically whenever a request expires, the Protocol Arbiter stalls due to fullness, a request from a non-hysteresis client is received, or the bank-queue length reaches a programmable threshold. The net effect of the holdoff is to group requests for the DRAM into activity bursts.

16.3.2.3 Clock Frequency Scaling

A final aspect of power management is scaling the Memory System clocks. In principle, there are two sets of clocks that can be controlled:

- The Memory System “arbitration clock”, which is the clock used by the Arbitration Domains. Changing this clock reduces the overall bandwidth of the system and reduces the power required by the client interfaces and cross-chip Memory System routing.
- Individual Protocol Arbiter clocks. These reduce the bandwidth available to a particular memory pool and reduce the power consumed by the external pins and the external DRAM. Some Protocol Arbiters may be synchronous to the arbitration clock and not be explicitly controllable via a separate clock enable.

Tegra K1 devices have a single clock domain for the Arbitration Domain and the Protocol Arbiter: mcclk. The command controller runs on a second clock called emcclk, which matches the frequency of the command bus on the DRAMs. Mcclk can be configured to run at 1x, 1/2x, or 1/4x of emcclk. Mcclk and emcclk are phase-aligned.

Both clocks may be changed as part of frequency scaling. Changing the arbitration clock rate affects the Arbitration Domain’s idea of the latency timeout. Software should change the divide-down register to keep the scale of latency timeout “ticks” to a (relatively) constant time unit. Generally a tick time of 30 ns is used since it divides evenly into most of the common DRAM frequencies, but any value of tick granularity may be chosen.

Both the arbitration clock and memory clock have separate divide-downs.

Changing the Protocol Arbiter clock rate affects the relative memory timing parameters. The DRAM timing parameters are double-buffered to allow software to update the timing values for the next clock speed setting and then simultaneously switch to using the new values by writing a trigger.

The DRAM protocol itself may require further clock-change restrictions. For example, DDR3 requires a certain number of cycles in which to re-lock the on-DRAM DLL. To further facilitate the hardware/software handoff and reduce latency for the clock-change operation, a hardware handshake exists between the clock controller module and the Protocol Arbiter.

The MSS maintains two copies of each configuration register that may need to change due to a clock-change, the “active” and “assembly” copies; this is also known as a “shadowed” register. The active copy is what the MSS is currently configured to use, and cannot be written to. The assembly copy can be written to at any time, and it can be copied onto the active via a trigger mechanism. The clock-change handshake includes a hardware-initiated trigger for this shadow update.

To assist in full-system power analysis using silicon, the Protocol Arbiter should include enough statistics about the DRAM bus cycles to be able to calculate the DRAM power consumed.

16.3.3 Device Management

The EMC is primarily responsible for DRAM device management (ZQCAL, thermal management, etc.).

The exception to this is that the MC schedules refresh commands to the DRAM.

16.3.4 Translation Management

Surface allocation for most Tegra K1 clients is straightforward: software allocates the surface out of the device's virtual space, and then backs the mappings with physical pages. The mapping between virtual and physical addresses is described using PTE and PDEs in the SMMU's page table.

GPU surfaces have their own virtual address space that is translated by the GMMU within the GPU. The GMMU either translates requests into physical addresses that bypass the SMMU or into a second virtual address space that is then translated into physical addresses by the SMMU.

16.3.5 Statistics and Debugging

Statistics are used for performance monitoring and for generating usage information for guiding dynamic voltage and frequency scaling. Hardware will provide a set of statistics counters that are used for DVFS, both for global MSS bandwidth and for individual PA bandwidth. A separate set of counters with additional filtering support will be available for performance monitoring and debugging.

The hardware blocks illegal transfers to memory. Some transfers are based on physical DRAM limitations (addressing outside of the address map), permissions (addressing "secure" physical memory from a non-secure client) and from the SMMU (accessing an unmapped page). All of these are reported via a fault interface which records the transfer information of the last faulting address, including the following data:

- Virtual address of fault
- Module and client ID of fault
- Fault type

Faulting transfers continue through the system, but faulting reads return all-ones and faulting writes discard the write data. Writing a fault triggers a (maskable) interrupt.

16.3.6 Coherency and Ordering

For coherence and ordering:

1. The MSS does not guarantee the coherency between different clients if the write-response tag has not been provided back to the clients.
2. The MSS guarantees that if a write is sent with a write-response tag and that tag is returned to the client, no other read or write issued after the response is received from anywhere in the system can pass that write.
3. The MSS guarantees that within a single client, write responses will complete in-order.
4. For PCIe ordered clients, the MSS guarantees that all writes will complete in-order.

For the most part, the memory system is fire-and-forget. Software however needs to be involved in the configuration, translation, and power management services as described above.

16.4 Software Interfaces

The primary software interface for configuration is via the APB bus registers.

- Initial configuration
- Power management
- Device/rank management
- Translation management
- ISO client bandwidth allocation (per use case)
- Statistics and debugging

16.4.1 Boot

Tegra K1 devices have a two-stage boot:

- The Boot ROM is responsible for getting the chip out of reset to where driver-level software can take over.
- The Boot Loader or the OS-recovery code is the portion of the driver responsible for completing the boot process to the general-purpose OS.

The Boot ROM is an actual ROM built into the chip, and the Boot Loader and OS recovery section are externally loaded code. The Boot Loader is only used for Cold boot; Warm boot utilizes operating-system recovery code.

Tegra K1 devices can “boot” in two ways: “Warm boot” or “Cold boot”. Cold boot is defined as booting from a fully powered-off or fully reset state. Warm boot is defined as recovery from the lowest-power state (LP0), where the external DRAM has been held in self-refresh mode while the Tegra K1 core was powered off. Warm boot use case occurs much more often; for example, it is the use case hit whenever a SmartPhone wakes from Standby to answer a call.

16.4.1.1 IRAM Use

Tegra K1 device contain a protocol arbiter for accessing IRAM (ARC). This path is used only during boot.

The use of this path does not require the SMMU to be set as the IRAM addresses are expected to be physical addresses. The MC redirects requests to IRAM before the SMMU translation.

This is an additional step in the boot process for these scenarios. ARC_CLK_OVR_ON must be enabled to use the ARC path. Once all IRAM accesses are done for boot, ARC_CLK_OVR_ON should be disabled.

16.4.1.2 Cold Boot

Before Memory Subsystem boot can begin, the Boot ROM must read the Boot Configuration Tables (BCTs) from flash memory (slow storage) into on-chip RAM. These tables include the configuration data for up to 4 initial DRAM configurations supported. The Boot ROM then reads the strap signals assigned to the SDRAM and begins to bring up the memory subsystem.

The Cold boot Boot ROM sequence:

1. Fetch the BCT values from the storage device and move them to IRAM using AHB redirection.
2. Configure the PLL used by the MC/EMC based on BCT values
3. Wait for PLLs to lock
4. Program necessary always-on static pad configurations in the PMC
5. Configure memory clocks based on BCT values
6. Enable the MC/EMC clocks
7. Release memory subsystem resets
8. Program other necessary pad/pad-macro configuration
9. Program initial configuration for the MC/EMC based on BCT values
10. Perform the DRAM initialization sequence. This sequence is specific to the DRAM protocol used and varies depending on the requirements of a particular device. For example, a DDR3 sequence goes as follows:
    a. Apply power to the device
    b. Wait until voltage is stable
    c. Assert DRAM reset
    d. Wait 200 µs
    e. Deassert DRAM reset
    f. Apply stable clocks

g. Wait 500 µs
h. Assert and hold CKE high
i. Precharge all banks
j. Send 2 Auto-refresh commands
k. Write to Mode register 0, 1, 2, 3
l. Issue ZQ Calibration command
m. Wait for ZQ calibration and DRAM DLL lock time to complete

11. Enable power-saving features such as clock stop, active power down, dynamic-self-refresh
12. Start periodic sequences such as auto refresh, ZQ calibration, auto-calibration
13. Release the memory-initialization hardware lock[1]

After this, the external DRAM and Memory Subsystem are ready for use.

16.4.1.3 Warm Boot

The Warm Boot sequence is very similar to the Cold Boot sequence; many of the same steps are performed. One difference is that instead of powering on the DRAM, it is awakened out of SelfRefresh. Another difference is the configuration data for Boot ROM portion of MC/EMC initialization is stored in the Power Management Controller (PMC) Scratch registers.

The PMC Scratch registers are in the Always-On partition, and are powered during LP0. The power and area limitations of this implementation restricts the number of PMC Scratch registers available; there are a smaller number of PMC Scratch Registers than the number of bits needed to fully configure the MC and EMC. The Scratch Registers are only used to store the minimum required configuration to get to working DRAM. The Boot ROM may not be able to Warm boot to full POR speed using only the Scratch Register data; if this limitation is confirmed, the Boot Loader may be required to mimic DVFS software and reprogram the MC/EMC to full-speed operation using data stored in DRAM. It is up to the LP0 Entry software code to ensure the proper configuration gets written to the Scratch Registers.

The Warm boot code provided by the MSS includes algorithms for deriving the approximate MC arbiter performance parameters from the EMC timing parameters. The EMC has provided generation code for the packing/unpacking calls for the scratch registers to ease the software maintenance burden.

The Warm boot Boot ROM sequence:

1. Configure memory PLLs and memory clocks based on Scratch values
2. Wait for PLLs to lock
3. Configure memory clocks based on scratch values
4. Enable the MC/EMC clocks
5. Release memory subsystem resets. Program any necessary static pad configuration that was powered-off in LP0
6. Program any necessary static pad configuration that was powered-off in LP0.
7. Program initial configuration for the MC/EMC based on Scratch values
8. Release the DRAM from software-controlled Self Refresh. This sequence is specific to the DRAM protocol used and may further vary depending on the requirements of a particular device. For example, a DDR3 sequence goes as follows:
   a. Apply stable clocks
   b. Assert and hold CKE high
   c. Issue ZQ Calibration command

[1] AHB_ARBITRATION_XBAR_CTRL.MEM_INIT_DONE

d. Wait for ZQ calibration and DRAM DLL lock time to complete
e. Write to Mode registers if different from LP0 entry values
f. Issue refreshes to ensure tREFI is satisfied

9. Enable power saving features such as clock stop, active power down, dynamic-self-refresh
10. Start periodic sequences such as auto refresh, ZQ calibration, auto-calibration
11. Release the memory-initialization hardware lock

After the Boot ROM sequence is complete, the operating system restore code may access DRAM and restore a different or higher-speed operation. The operating system may also restore translation or client configuration settings before allowing any user code to execute.

16.4.2 Security Apertures

To secure the MC registers, the CPU complex's page table entries for the MC register space must be marked as secured. Then to access the registers securely, the CPU must be switched into secure mode. For more details about these CPU operations, please read the appropriate ARM Architecture Reference Manual.

To secure a region of EMEM, the page table entries for that region must be marked as secured. Then the MC registers must be configured for the secured region, using the CPU in the secured mode:

RegWrite(MC_SECURITY_CFG0, security_aperture_base_address);

RegWrite(MC_SECURITY_CFG1, security_aperture_size_in_megabytes);

After the registers are updated, the CPU must be in secure mode to access the described region of memory:

- Video Protection region
- Security Coprocessor Secure region

For more information on handling security violations, see the subsection "MC Interrupts" below.

16.4.3 Software Client-Groupings

The Memory Subsystem inherently implements a hardware mapping of memory clients ("MCCIFs") to super-clients, and super-clients to the hardware modules. Additionally, the MSS implements a system of mapping modules to "software groups" (also known as SWGROUP or SWNAME). This allows a single point of control for all clients for that hardware "engine". Often the list of clients in a SWGROUP is the same as the list of clients in the module that implements the hardware engine.

Each SWGROUP has registers associated with it that select an ASID (Address Space Identifier) and determine whether SMMU translation is enabled or disabled for the client. Normally, each client is associated with one SWGROUP, thus has one ASID associated with it. A few clients have multiple SWGROUPs associated with them, which are selectable on a transaction-by-transaction basis via a 1- or 2-bit SWID flag provided by the client.

The mapping of SWGROUP to modules for Tegra K1 devices is listed in the following table.

SWGROUP	Modules	Translatable?	Further Description
AFI	PCIE	Yes	PCIExpress
AVPC	AVP Cache	Yes	ARM7 Audio-Video Processor (AVP)
DC	Display head 0	Yes(1)	Display reads, head 0, with dis2mc_swid=1'b0
DC1	Display head 0, secure client	Yes(1)	Display reads, head 0, with dis2mc_swid=1'b1 (TZ-Display window)
DCB	Display head 1	Yes	Display reads, head 1 (dis2mc_swid=don't care)
GPU	GPU	No(2)	Kepler GPU with a[34]==0

SWGROUP	Modules	Translatable?	Further Description
GPUB	GPU	Yes[2]	Kepler GPU with a[34]==1
HC	Host1x	Yes	Host interface
HDA	HDA	Yes	High-Definition Audio engine
ISP2	ISP2	Yes	Image Signal Processor
ISP2B	ISP2	Yes	Image Signal Processor (second instance)
MPCORE	AXICIF	No	CPU Complex
MPCORELP	AXICIF_LP	No	Shadow CPU Complex (Tegra K1 32-bit devices only)
MSENC	MSENC	Yes	Multi Standard Video Encoder
PPCS	AHBDMA, AHBSLV	No[3]	Clients in the AHB cluster, with ppcs2mc_swid = 2'b00
PPCS1	AHBDMA, AHBSLV	Yes	Same as PPCS, with ppcs2mc_swid = 2'b01
PPCS2	AHBDMA, AHBSLV	Yes[1]	Same as PPCS, with ppcs2mc_swid = 2'b10
PTC	MC (SMMU)	N/A	Misses from SMMU PTC
SATA	SATA	Yes	Serial ATA
SDMMC1A	SDMMC1	Yes	SDMMC controller. Each SDMMC controller has a unique use case and can be run via standard (Windows/Android) or NVIDIA drivers, hence each controller has its own (hardcoded) SWID.
SDMMC2A	SDMMC2	Yes	
SDMMC3A	SDMMC3	Yes	
SDMMC4A	SDMMC4	Yes	
TSEC	TSEC	Yes	Tegra Security coprocessor
VDE	VDE	Yes	Video Decode Engine
VI	VI	Yes	Video Input engine for CSI, VIP
VIC	VIC	Yes	Video Compositor
XUSB_HOST	USB3 Host	Yes	Although the same driver is expected to control both units, each has its own SWNAME to maintain compatibility with the Tegra 4 device.
XUSB_DEV	USB3 device	Yes	

16. The MC defines the ASID mapping on a per software-ID (SWGROUP) basis. To support secure ASID for the SE engine (in the AHB cluster) and TZ-Display, additional SWID signals are added to the interfaces. The additional SWID signal allows the MC to map the client to different SWIDs, providing flexibility to use a secure ASID for the SMMU.

17. Although the GPU has one physical read client and one physical write client, it can specify one of two SWGROUPs (GPU and GPUB) for a given request, depending on the value of address bit a[34]. LTCX maps a[34] to the MCCIF SWID field. SMMU translation is disabled for SWGROUP GPU and enabled for GPUB. This is how the GPU indicates whether SMMU translation is needed. The MC also performs special video protection region checks for the GPUB.

18. To support the CPU's view of 4GB memory, part of the 0-2G memory address space is used by the CPU to address DRAM. The devices which were previously making requests in the 0-2G address range, assuming that they would be always mapped to other memory space by SMMU, now overlap with devices making physical address requests in the 0-2G range. An additional bit ppcs2mc_swid indicates which requests need to remain untranslated and which requests need SMMU translation. This additional bit selects between the two SWIDs (for AHB clients). These two SWIDs map to two separate ASIDs, where one indicates SMMU translation and the other indicates no translation.

16.4.4 Virtual Addressing: Using the SMMU

For a discussion of the virtual-address translation features provided by the SMMU, read Section 16.5.1 on "Virtual Addressing" below.

In Tegra K1 devices, the CPU has its own MMU and issues physical addresses to the MSS. Thus it is not possible to enable SMMU translation for the CPU.

16.4.4.1 SMMU Initialization

1. For each Virtual Address Space (VAS) to be used, set up the page table in the DRAM. See the subsection on “Virtual Addressing” below for details on the page-table formats supported.
2. For each ASID, set up the pointer to the page-table base and the ASID-wide protection bits. Since the PTB pointers are stored in a RAM, this uses an indirect access mechanism involving two register writes:
    a. Write MC_SMMU_PTB_ASID_0 with the ASID to be modified.
    b. Write MC_SMMU_PTB_DATA_0 with the information for this VAS:
        - Page Table Base pointer
        - Whether non-secure accesses are allowed
        - Whether reads are allowed
        - Whether writes are allowed
3. Assign hardware engines (SWNAMES) to the ASIDs and turn on translation for those engines. This involves writes to various MC_SMMU_<SWNAME>_ASID_0 registers.
4. If needed for Hardware Diagnostics purposes, disable or enable translation within a SWNAME on a per-client basis. This involves writes to various bits in MC_SMMU_TRANSLATION_ENABLE_*_0 registers.
5. If desired, secure the ASIDs, which prevents untrusted code from modifying the ASID PTB pointers by enabling a requirement for TrustZone security on register writes that modify the PTBs. This operation involves a write to MC_SMMU_ASID_SECURITY_0. Note that this register itself is secured by TrustZone to prevent it from being modified by untrusted sources, and in some situations writes to it must also be TrustZone secured for them to take effect. In particular, you cannot change a module’s ASID with a non-secure write if you are trying to change it to a secure ASID, or if it is already a secure ASID.
6. If desired, enable ASID promotion, which allows clients without security access to inherit the security status based on the page-table translation. This operation involves a write to MC_SMMU_ASID_SECURITY_0.
7. Write PTC_FLUSH_TYPE=ALL to MC_SMMU_PTC_FLUSH_0.
8. Write TLB_FLUSH_VA_MATCH=ALL to MC_SMMU_TLB_FLUSH_0.
9. Configure reserved bits found to be necessary during chip bring-up, if any. There are reserved bits in MC_SMMU_PTC_CONFIG_0 and MC_SMMU_TLB_CONFIG_0.
10. Enable the SMMU by writing SMMU_ENABLE=ENABLE to MC_SMMU_CONFIG_0. Note that this register is secured by TrustZone to prevent it from being modified by untrusted sources, and writes to it must also be TrustZone secured for them to take effect.

The following alternate initialization sequence is used when TrustZone is enabled on Win8, since the UEFI (Boot Loader) is secure, whereas the SW memory driver (NVMEM) is not:

1. Hardware initializes the MC_SMMU_TRANSLATION_ENABLE_*_0 register to enable translation. This is done by enabling the bits by default on cold boot (reset) or warm boot (lp0). Note that software depends on this. The software memory driver cannot configure the MC_SMMU_TRANSLATION_ENABLE_*_0 register, since it is TrustZone protected.
2. The UEFI sets up the display for SMMU translation: SMMU_ASID_DC = x, SMMU_ASID_DCB = x.
3. Enable the SMMU: SMMU_ENABLE=ENABLE to MC_SMMU_CONFIG_0.
4. Later the software memory driver sets up the rest of the ASIDs: SMMU_ASID_xxx = y (y is a non-secure ASID).

16.4.4.2 Page Table Modifications after Initialization

Modifications may be made to the page tables while the system is operating, however, care must be taken to avoid modifying an entry that is in active use. Modifying an entry in active use will result in undefined operation; the most likely failure is the use of an out-of-date cached translation. The general rules for safe modification are:

- If no client is using an ASID, then that ASID and its page table can be modified.
- If no client is using any PTE in a PDE, that PDE can be modified.
- If no client is using a PTE, that PTE can be modified.

It is up to software to ensure these rules are followed when virtual address translations need changed. Once software has updated the page-table or ASID mappings, the final step is to perform PTC and TLB invalidates on the modified entries. Note that the granularity of invalidation is at the PTE group, which is the number of PTEs that fit in a memory atom. Software can write:

- MC_SMMU_TLB_FLUSH_0 to flush a specific page group, 4MB section, entire ASID or the entire TLB.
- MC_SMMU_PTC_FLUSH_0 to flush a specific PTE or PDE from the PTC

16.4.4.3 Collecting Statistics on SMMU Performance

The TLB and PTC each have hit and miss statistics counters. To enable statistics collection, set MC_SMMU_*_CONFIG_0.*_STATS_ENABLE == ENABLE, where * stands for PTC or TLB. The counters will begin collecting information when enabled. To check the results, read the appropriate registers:

- MC_SMMU_STATS_TLB_HIT_COUNT_0
- MC_SMMU_STATS_TLB_MISS_COUNT_0
- MC_SMMU_STATS_PTC_HIT_COUNT_0
- MC_SMMU_STATS_PTC_MISS_COUNT_0

These counters do not saturate when full; instead they wrap from MAX_UINT to 0. There is no explicit reset for these counters; the only reset-like option is to force the counter bits to all 1's using the MC_SMMU_*_CONFIG_0.*_STATS_TEST trigger bits. This is essentially like resetting the counters to -1.

16.4.5 Clock Frequency Management

Software programs the emcclk and mcclk frequencies to provide the required bandwidth and latency while minimizing power.

1. The performance of some devices are highly sensitive to MC clock frequency. Some drivers dynamically specify a minimum emcclk frequency that meets their needs. Drivers make these requests on behalf of the CPU, AVP , HDMI, the various USB controllers, GPU, MPE (MSENC), and ACTMON.
2. ISO drivers specify their ISO bandwidth requirements, which imply a minimum emcclk frequency. The ISO manager (part of IMP) ensures that the bandwidth requested is feasible within system parameters.
3. Thermal throttling dynamically specifies the highest MC clock frequency that should be allowed.
4. The central clock code computes the new EMC/MC frequency as:

   MIN(MAX(frequency_requests_from_1), ISO_MBps_to_MHz(sum(bandwidth_requests_from_2)), frequency_request_from_3)

16.4.6 DVFS Sequences

DVFS (Dynamic Voltage and Frequency Scaling) is a software feature for controlling system power. A key hardware feature for supporting that is changing SDRAM frequency on the fly with minimal impact on system performance. That indicates the following requirements:

- EMC timing parameters and their corresponding MC arbitration timing parameters need to be adjusted to the optimal performance for the new frequency. These parameters can usually be derived from DRAM datasheet and do not need characterization.
- All trimmer values need to be adjusted for the new frequency. These values need to be characterized across PVT (process, voltage, temperature) and frequencies.

- The pad configurations that can be turned off to save power at low frequencies should also change with frequency change, such as pad terminations and DQS pulls.
- All registers involved in frequency change should be shadowed. That includes the reserved register fields that can possible be turned on only in a certain frequency range. Note that any Hardware Diagnostics feature that has power implications should be considered to be shadowed.
- No software interference should be expected from software after software pulls the trigger to change frequency and before the clock change completes: Software runs on the CPU from SDRAM. Once the EMC blocks the requests to SDRAM, the CPU may be frozen until the EMC finishes frequency change and unblocks the requests. Note that the CPU can also possibly run out of the contents in cache during clock change, so we need to consider both scenarios.
- The delay caused by clock change should not cause functional failures or visible artifacts.

That results in a design as follows:

- The CAR module handshakes with the EMC on clock change. The EMC handshakes with the MC on shadow register latching. The whole process is done by hardware and transparent to software.
- A rough estimation of clock change delay is 2-6 µs for LPDDR3.
- Supports two clock change mode: self-refresh clock change mode and power-down clock change mode. Both LPDDR3 and DDR3 support both modes. We recommend clock change power-down mode for LPDDR3 since it takes shorter time. We recommend self-refresh clock change mode for DDR3, since power-down clock change mode does not allow DLL to be turned off.
- For flexibility, EMC has a 16-deep FIFO to hold register programming and release them during or immediately after clock change. That enables us to send DRAM command or latch in unshadowed registers. Here are a few examples:
  - Self-refresh clock change mode requires programming EMC_SELF_REF to put DRAM in self-refresh during clock change.
  - DDR3 precharge-power-down mode requires programming EMC_PRE to close all banks before clock change.
  - Both DDR3 and LPDDR3 clock change requires writing mode registers after clock change.
  - To support DLL-ON/DLL-OFF mode switching on DDR3, program mode registers before or after clock change according to the DDR3 specification.

This is a summary of the frequency change process:

- Software turns off features like self-refresh or auto-calibration if necessary to minimize their interference with DVFS sequence.
- Software programs MC/EMC shadow registers for the new frequency.
- Software sets up the appropriate threshold registers in the Display and VI/ISP for *_ready_for_latency_event.
- Software programs EMC clock change flow control registers, such as entering self-refresh before clock change and programming SDRAM mode registers after clock change.
- Software programs the MC/EMC clock source register to trigger the clock change.
- The CAR sends clock change request to the EMC (clock divider and/or clock source).
- The EMC waits for the iso_ready_for_latency_event signal to be asserted. If and while this signal is deasserted, the EMC/MC continues normal DRAM operation.
- The EMC stalls all DRAM commands including refreshes.
- The EMC handshakes with the MC to stalls incoming transactions and waits until EMC pipe is flushed
  Within handshaking, EMC may enters power down state if it is in power-down clock change mode.
- The EMC executes pre-clock change sequence such as entering self-refresh and programming mode register to turn off DLL.
- The EMC latches in shadowed registers and requests the MC to latch in shadow registers.
- The EMC acknowledges the CAR to change clock.

- The CAR changes the MC/EMC clock.
- The CAR deasserts the clock change request to the EMC indicating the clock change is done.
- The EMC executes post-clock-change sequence, such as exiting self-refresh and programming SDRAM mode registers.
- The EMC deasserts the clock change acknowledgement to the CAR.
- The EMC unstalls DRAM commands including refresh and resumes incoming MC transactions.
- Software waits 1µs before continuing.

Software programming sequence on the Tegra K1 clock change sequence:

- Before any clock change, usually at boot time
  - Keep these register fields in reset values:
    CLKCHANGE_REQ_ENABLE = ENABLED
    CLKCHANGE_SR_ENABLE = DISABLED
  - CLKCHANGE_PD_ENABLE:
    ENABLED: power-down clock change mode (for LPDDR3)
    DISABLED: self-refresh clock change mode (for DDR3)
- At each clock change:
  - Disable DSR (dynamic-self-refresh) if it is currently enabled. There are two ways to do this (software can choose which)
    - EMC_DBG.WRITE_MUX = ACTIVE
      Read-modify-write: EMC_CFG. DYN_SELF_REF = DISABLE
      EMC_DBG.WRITE_MUX = ASSEMBLY
    - Read-modify-write: EMC_CFG. DYN_SELF_REF = DISABLE
      EMC_TIMING_CONTROL.TIMING_UPDATE = 1
      poll for EMC_EMC_STATUS.TIMING_UPDATE_STALLED == 0
  - Program shadow registers.
  - Program STALL_THEN_EXE_BEFORE_CLKCHANGE = 1
    All following EMC register programming will happen after flushing DRAM requests and stalling further DRAM commands, including auto-refreshes. Note that EMC register reads still will not work from this point until the clock change is complete: issuing an EMC register read in this duration will hang the system.
  - (optional) Program unshadowed EMC registers that need to change with clock change
  - (self-refresh clock change mode only, DLL-ON to DLL-OFF mode switching only, DDR3 only)
    Program EMC_MRS to disable DLL.
  - (self-refresh clock change mode only) Program SELF_REF to enter self-refresh:
    SELF_REF.DISABLED = ENABLED
    SELF_REF.DEV_SELECTN = depending on DRAM configuration
  - Program STALL_THEN_EXE_AFTER_CLKCHANGE = 1
    All following EMC register programming will happen after clock change but before unblocking DRAM requests
  - (self-refresh clock change mode only) Program SELF_REF to exit self-refresh
    SELF_REF.DISABLED = DISABLED
    SELF_REF.DEV_SELECTN = depending on DRAM configuration
  - Program DRAM mode registers by MRS/EMRS (DDR3) or MRW (LPDDR3) to change CL/WL/TWR etc.
    On DLL-OFF to DLL-ON switch on DDR3, DLL is turned on with this step.
  - Program UNSTALL_RW_AFTER_CLKCHANGE = 1
    All following EMC register programming can happen with on-going traffic after clock change

- Wait 1 µs to ensure the EMC programming goes through before programming CLK_SOURCE_EMC.
- Program CLK_SOURCE_EMC to change the clock:
  EMC_2X_CLK_SRC: MC/EMC clock source
  USE_PLLM_UD: use low jitter clock
  MC_EMC_SAME_FREQ: drive EMC versus MC clock ratio at 1:1, otherwise 2:1
  EMC_2X_CLK_DIVISOR: EMC clock divider
- Wait 1 µs, in case the next clock change starts before the current one completes, which is possible if the software runs out of cache.

16.4.7 ZQ Calibration Sequence

ZQ calibration is a feature of LPDDR3 and DDR3 to calibrate R on (the output driver) across PVT (process, voltage, temperature), and also ODT values on DDR3. The EMC supports periodically sending ZQ calibration commands to both DRAMs, requiring only initial configuration after booting. The EMC also supports one time calibration commands at booting.

For cold booting, the boot ROM does a ZQ-init on LPDDR3 and a ZQ-long on DDR3, and then enables periodic ZQ-short.

For warm booting, boot ROM does ZQ-long on both LPDDR3 and DDR3, and then enables periodic ZQ-short.

Self-refresh exit:

There are three cases:

- Software-controlled self-refresh as part of LP0/LP1. The device may spend an arbitrarily long time in either of these low-power states, thus could suffer significant drift temperature since the last ZQ calibration. Software must perform ZQ-long at self-refresh exit.
- Hardware-controlled self-refresh after extended period of idle. The duration should not be long (if the duration were long, software should have triggered LP1). Normal, timer-initiated ZQ-short should be sufficient.
- Hardware-controlled self-refresh as part of DVFS. The self-refresh duration deliberately is kept small since the DVFS sequence is as short as possible. There is no need to perform a ZQ calibration within the DVFS sequence itself, since DRAM voltage is not affected by DVFS. Normal, timer-initiated ZQ-short should be sufficient.

One time calibration:

- LPDDR3, Write MC_MRW:
  - MRW_DEV_SELECTN: 2 for device 0, 1 for device 1. Or use 0 for both (not used because software must control the delays between commands in boot ROM).
  - MRW_MA: 10
  - MRW_OP: 0xFF for ZQ-init. 0xAB for ZQ-long, 0x56 for ZQ-short
- DDR3: Write EMC_ZQ_CAL
  - ZQ_CAL_DEV_SELECTN: 2 for device 0, 1 for device 1. Or use 0 for both (not used because software must control the delays between commands in boot ROM)
  - ZQ_CAL_LENGTH:
    SHORT: issue ZQ-short command
    LONG: issue ZQ-long command
  - ZQ_CAL_CMD: 1

Periodic calibration:

- EMC_ZCAL_INTERVAL: Number of microseconds to wait between periodical ZQ commands. Program this register to 0 to disable periodic ZQ calibration
- EMC_ZCAL_WAIT_CNT: Number of clocks to wait after each ZQ command before other commands
- EMC_ZCAL_MRW_CMD:

- ZQ_MRW_DEV_SELECTN
  2 for device 0 only, 1 for device 1 only, 0 for both devices
- ZQ_MRW_MA
  LPDDR3: 10
  DDR3: 0 for ZQ-short, 1 for ZQ-long
- ZQ_MRW_OP
  LPDDR3: 0x56 for ZQ-short; 0xAB for ZQ-long
  DDR3: 0

16.4.8 MRR Sequence

Mode Register Read (MRR) is desirable on LPDDR3 for reading the manufacturer ID to identify DRAM vendors, or reading back from the LPDDR3 temperature sensor.

Simple sequence:

- Before any MRR, such as at booting:
  - Set MRR_BYTESEL and MRR_BYTESEL_X16 corresponding to data byte sizzling, if applied on board. The reason is that LPDDR3 always returns MRR at low byte of a data strobe, which is the only case that EMC needs to know about swizzling.
- For each MRR
  - Check EMC_STATUS.MRR_DIVLD = 0. If not true, read EMC_MRR until it becomes true
  - Issue MRR:
    MRR_MA: the index of the mode register to read back
    MRR_DEV_SELECTN: 2 for device 0, 1 for device 1. 0 or 3 are illegal. If both devices are desired, repeat this sequence on each device.
  - Poll for EMC_STATUS.MRR_DIVLD = 1
  - Read EMC_MRR. Data is in the MRR.DATA field

16.4.9 Auto-Calibration Sequence

Auto-calibration is for periodically calibrating the output driver of Tegra K1 pads. The EMC supports periodic auto-calibration without software interference, usually initiated at booting.

To enable auto-calibration:

- Program AUTO_CAL_INTERVAL: the number of microseconds between two auto-calibrations
- Program EMC_AUTO_CAL_CONFIG:
  AUTO_CAL_START = 1
  AUTO_CAL_ENABLE = 1
  AUTO_CAL_OVERRIDE: 1 to enable override, 0 to use normal auto-calibration
  AUTO_CAL_PD_OFFSET: override value
  AUTO_CAL_PU_OFFSET: override value
  AUTO_CAL_E_CAL_UPDATE: number of EMC clocks E_CAL_UPDATE is asserted
  AUTO_CAL_STEP: number of microseconds between each calibration step

To disable auto-calibration:

- Program AUTO_CAL_INTERVAL to 0

To re-enable auto-calibration after disabling it:

- Program AUTO_CAL_INTERVAL to the new value

16.4.10 LP0/LP1 Entry/Exit

LP0 and LP1 are both power saving modes with DRAM in self-refresh mode. The only difference is that the MC and the EMC are ON during LP1 but powered OFF during LP0.

LP0 and LP1 entry share the same sequence:

- Disable DSR (Dynamic self-refresh) by read-modify-write EMC_CFG. DYN_SELF_REF = DISABLED then program EMC_TIMING_CONTROL.TIMING_UPDATE = 1 to latch in the shadowed register EMC_CFG
- Wait 5 µs for worst case DSR exit time
- Program EMC_REQ_CTRL to stall all transactions
  STALL_ALL_WRITES = 1
  STALL_ALL_READS = 1
- Wait until the EMC pipe is flushed
  poll EMC_EMC_STATUS.NO_OUTSTANDING_TRANSACTIONS == 1
- Enter self-refresh
  EMC_SELF_REF.SELF_REF_CMD = 1
  EMC_SELF_REF.SREF_DEV_SELECTN: 2 for device/rank 0 only, 1 for device/rank 1 only, 0 for both
- (optional) Wait until the device/rank is in self-refresh
  poll EMC_EMC_STATUS.DRAM_IN_SELF_REFRESH ==
  1: dev0/rank0 is in self-refresh; 2: dev1/rank1 is in self-refresh; 3: both devices/ranks are in self-refresh

LP0-exit is also called warm boot. Refer to the “Warm Boot” subsection.

LP1-exit:

- Exit self-refresh
  EMC_SELF_REF.SELF_REF_CMD = 0
  EMC_SELF_REF.SREF_DEV_SELECTN = 2 for device/rank 0 only, 1 for device/rank 1 only, 0 for both
- poll for self-refresh completes
  poll for EMC_EMC_STATUS.DRAM_IN_SELF_REFRESH == 0
- Program EMC_REQ_CTRL to unstall all transactions
  STALL_ALL_WRITES = 0
  STALL_ALL_READS = 0
- (optional) if it is desired to re-enable DSR (possibly turned off by LP1 entry sequence):Read-modify-write EMC_CFG.
  DYN_SELF_REF = ENABLED
  EMC_TIMING_CONTROL.TIMING_UPDATE = 1 to latch in shadowed EMC_CFG

16.4.11 Performance Tuning

Note: The capitalization in the below sections refers to the actual register name of the associated setting.

16.4.11.1 Per Client Knobs

Each client of the MSS has some configuration knobs that affect the behavior of the request in the PA. These knobs are:

- ISOchronous
- HYSTeresis

Most clients set their ISO and HYST bits based on the behavior profile of the client; which is static for all systems. The default programming should be acceptable for these bits.

16.4.12 Errors (Interrupts)

Both the MC and the EMC implement a handful of interrupts to inform the software of completed events or error conditions encountered by the hardware. Both the MC and the EMC have implemented the same style of interrupt interface, so this section will use the MC as the example.

The interrupt interface for MC consists of two registers and a hardware output wire. The output signal is wired to the central interrupt handling module on Tegra K1 devices; from there it can be routed to any of the CPU complexes. The first register, INTSTATUS, contains the interrupt vector for MC. Each bit in this register is set when the hardware detects an interrupt. Writing a 1 to the interrupt vector bit will clear the associated interrupt. The second register is INTMASK, each bit in this register corresponds to a vector bit in INTSTATUS. If the MASK bit for an interrupt is *clear (MASKED)*, the corresponding interrupt will *not* forward the interrupt to the central interrupt handling module. If any UNMASKED interrupt vector bits are set, the MC will assert the interrupt to the central interrupt handling module.

16.4.12.1 EMC Interrupts

The EMC generates interrupts on the following conditions:

- DLL alarm: From the EMC Digital DLL when the output delay code reaches the maximum value.
- Attempt to issue a command to a device that is in self-refresh.
- Read data from the MRR is available (to prevent software from polling for data)
- DRAM clock change sequence complete
- Refresh overflow

16.4.12.2 MC Interrupts

The MC contains two classes of interrupts: address decode errors and performance warnings.

When an address decode error occurs, the offending address is captured in the MC_ERR_ADDR register, and information about the error is captured in one or more MC_ERR_*STATUS registers. The captured information assists developers in debugging the error.

A single request can trigger multiple errors. There are multiple error status registers (MC_ERR_*STATUS) that capture the status of different types of errors, as listed below:

- MC_ERR_STATUS – Multiple violations. When more than one of the following violations occurs, the highest-priority violation is reported (listed below in descending priority order):
  - ERR_TYPE = SECURITY_TRUSTZONE – TrustZone carveout violations
  - ERR_TYPE = INVALID_SMMU_PAGE – Any SMMU translation violation

    Decode error on PDE/PTE (reserved bits non-zero)

    Request violates RW, nonsecure PTB/PDE/PTE bit values
  - ERR_TYPE = DECERR_EMEM - DRAM minimum/maximum allowed memory addresses
- MC_ERR_SEC_STATUS - All SEC carveout violations
- MC_ERR_MTS_STATUS - All microcode carveout violations
- MC_ERR_VPR_STATUS - All VPR carveout violations

The capture registers record the following information about the error:

- the Virtual or Physical address of the error (depending on the type of fault)
- which type of fault the captured error corresponds to
- a read/write indicator
- the requestor client ID

- the swap bit sent by the client
- if the error was an INVALID_SMMU_PAGE, then information about the page's protection status is also captured (only in MC_ERR_STATUS):
  - whether the page was marked non secure in the page-table
  - whether the page was marked readable in the page-table
  - whether the page was marked writeable in the page-table
  - Note that SMMU page protection bits are formed by ANDing the page protection bits from the Page Table Base, PDE, and PTEs from all three stages of the page-walk. The ANDed protection bits and the type of the provoking transaction are both available in the status register.

Subsequent errors (of any type) will not change the status and address registers until the corresponding interrupt is cleared.

To prevent requests with address decode errors from modifying memory or accessing memory they do not have permission to, the MC “squashes” the requests. A write request that is “squashed” has had its byte-enables forced to all-zeros, this prevents the write data from being applied to DRAM. A read request that is “squashed” will have its read-return data forced to all-ones, this protects the data in DRAM from being read by non-secure sources.

There is one performance warning type interrupt: ARBITRATION_EMEM. It fires when the MC detects that a request has been pending in the Row Sorter long enough to hit the DEADLOCK_PREVENTION_SLACK_THRESHOLD. In addition to true performance problems, this interrupt may fire in situations such as clock-change where the EMC backpressures pending traffic for long periods of time. This interrupt helps developers identify and debug performance issues and configuration issues.

SMMU-Translated Requests and Physical Aperture Errors

All Virtual Addresses are translated through the SMMU, then run through the Physical Aperture checks. There are a number of confusing scenarios when debugging these interactions including:

- SMMU fault followed by any physical aperture error of any sort: because the SMMU translation occurs first, the data captured by the ERR_ADR and ERR_STATUS registers will always be the SMMU fault information. Both interrupt bits are set.
- Decode error on a successfully translated (i.e., no SMMU fault indicated) client request: the PA checks will throw a decode error; the data captured includes the Physical Address, not the Virtual Address. The client request is squashed. The decode-error interrupt bit is set.
- Decode error on a Page-Table fetch (PDE or PTE): the page-table fetch will throw a decode error; the data captured includes the Physical Address of the PDE or PTE, and the client ID corresponds to the PTC. In addition, the data returned to the PTC is modified to turn off all access permissions, marking the page INVALID. This forces the client request to also throw a SMMU fault when it is translated. Both the decode-error and SMMU-fault interrupt bits are set. The PDE or PTE are then cached with those modified access permissions, so any subsequent requests to that virtual page are also SMMU fault.
- TrustZone security violation on a translated client request: the PA checks throw a security error, the data captured includes the Physical Address, not the Virtual Address. The security violation interrupt bit is set. The client request is squashed. This behavior allows the Secure Aperture to stand as a “last line of defense” against SMMU page-table modification attacks.
- Protected-region security violation on a translated client request: the PA checks throw a security error. The data captured includes the Physical Address, not the Virtual Address. The security violation interrupt bit is set. However, the client request is squashed.
- Video Protection-region security violation on a translated client request: the PA checks throw a security error. The data captured includes the Physical Address, not the Virtual Address. The security violation interrupt bit is set.

16.5 Functionality

16.5.1 Addressing

The 34-bit physical address space supported by the MC is 16GB. Clients may support larger (e.g. 40-bit) addresses internally, but address msbs above those connected to the memory controller are assumed to be zero. Clients may use virtual or physical addresses. If a client uses virtual addresses, the addresses are limited to 32-bits (the input width of the SMMU). The SMMU outputs 34-bit physical addresses.

16.5.1.1 Address Map and Aperture

Tegra K1 device's physical address space includes apertures for DRAM, I/O devices, and the AHB redirection region, as defined in the address map (see the section entitled "Address Map"). The range from 0 to 2GB is designated as the MMIO region. All non-DRAM devices (including the AHB redirection region) map (sparsely) within the MMIO region. Address decoders above the MC decode the address ranges for the MMIO devices and intercept requests for the respective devices before the requests reach the MC.

Requests that reach the MC map to one of the following ranges:

- AHB redirection range between IRAM_BOM and IRAM_TOM
- External memory (DRAM) between EMEM_BOM and EMEM_TOM (maximum of 8 GB)
- Not Assigned range (if the address does not fall in either of the two ranges above)

The AHB redirection path allows MC clients that need to access boot media to access IRAM during boot. See the "AHB Redirection Region" section for details on the use and programming of the AHB redirection feature. Note that the AHB redirection range might not map on top of the external memory range, depending on how EMEM_BOM is set.

For accesses that fall within the Not Assigned region, an error is logged, writes are acknowledged and squashed before the WCAM, and reads return all 1s.

Four additional programmable apertures restrict which devices can access defined regions of DRAM:

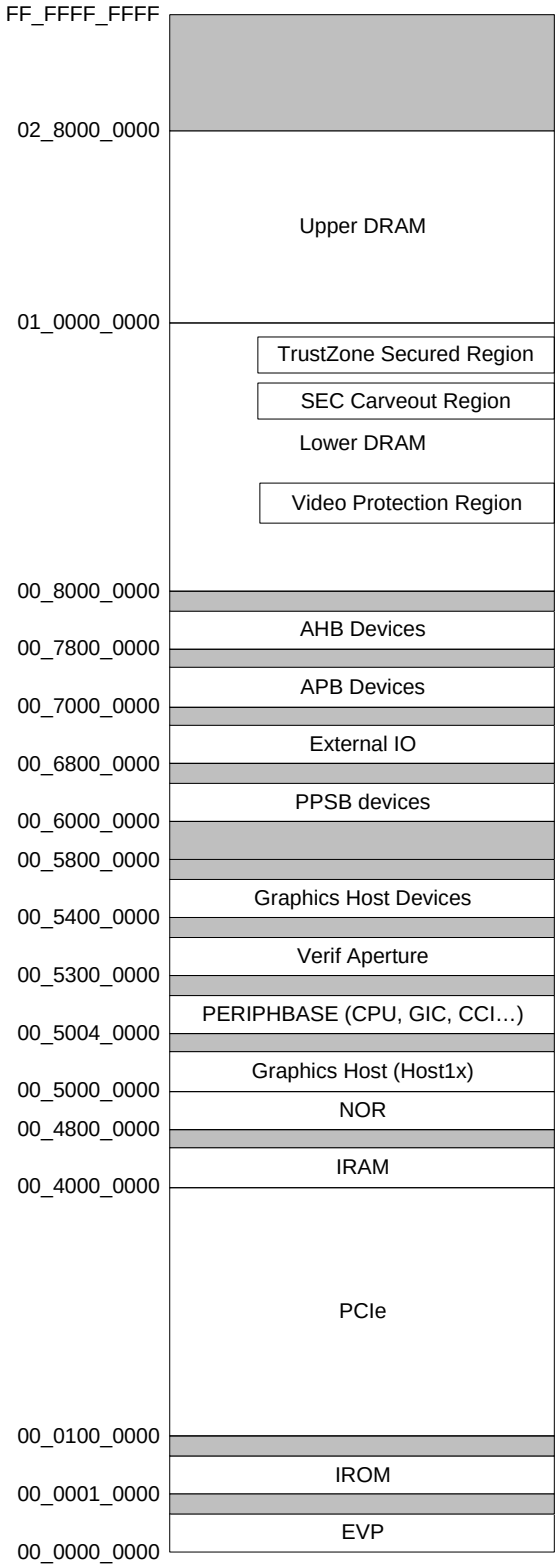
- TrustZone region
- Video Protection region
- Security Coprocessor Secure region
- Microcode Carveout Protection region

Each of these may be placed anywhere in the external memory range and have programmable size. For details on these programmable apertures, see the "TrustZone Security Region", "Video Protection Memory Region", and "Security Coprocessor Secure Region" sections for more information.

In addition, a range of contiguous physical addresses may be designated as "carveout". Virtual memory pages mapping to carveout are required to maintain physical contiguity. Carveout is a software-defined region with no hardware aperture detection.

The following figure shows a possible address map for a Tegra K1 system with 8GB of physical memory. For systems with 32-bit addressing (e.g., Windows 8 systems), all memory must live below the 4 GB boundary. If 4GB of DRAM is desired, the external memory range must be configured to map from 0 to 4GB. DRAM is then mapped in the holes in the sparsely populated MMIO space, providing nearly 4GB of addressable DRAM memory. This is the "Swiss Cheese" approach.

Figure 30: Physical Address Map Example for a System with 8 GB of DRAM



16.5.1.2 Client Types

The Memory Subsystem supports five types of clients:

- **32-bit clients with virtual addressing.** These clients use the SMMU for page-based and ASID-based address protection and translation
- **32-bit clients with physical addressing.** These clients either support native scatter-gather or require regions of contiguous physical addresses. Because of the 32-bit input address width, these clients can only access the low 4GB of physical address space. These clients still have ASID protection for secure regions.
- **34-bit clients with virtual addressing.** These clients use the SMMU for page-based and ASID-based address protection and translation. Because the SMMU only handles 32-bit input addresses, the upper two address bits are ignored when operating in this mode.
- **34-bit clients with physical addressing.** These clients either support native scatter-gather or require regions of contiguous physical addresses.
- **34-bit CPUs.** These clients have their own memory management unit and CANNOT under any circumstance use the SMMU for address protection or translation

For Tegra K1 devices, the following list indicates the clients that support 34-bit addressing:

- CPU Complex
- GPU
- XUSB (USB3)
- AFI (PCIE)
- SATA
- SDMMC
- HDA
- VI2/ISP2 (Virtual address client, so only 32 bits are relevant)
- Display (Virtual address or physical address client. When virtual, only 32 bits are relevant)

16.5.2 Tegra K1 Granularity

The minimum burst length for DDR3 is 8. LPDDR3 supports burst lengths of 8. The Memory Subsystem only supports BL8 DRAM. Because of x64 DDR3, the minimum quantum to transfer is 64B. When using a 32-bit DRAM channel, the EMC will construct two BL8 requests to DRAM to service the 64B request from the MC.

To match this, MC transactions carry 64B of data payload. The 64B can be contiguous or can consist of two non-contiguous 32B “sectors” that lie within the same 512B “gob”, each mapping to a different 32-bit DRAM sub-partition (see the “Memory Sub-Partitions” section). Byte access remains possible but involves a 64B access: write accesses can use byte enables to write a set of bytes (including a null set), and read accesses always return two full 32B sectors with potentially unneeded data (also known as overfetch). To efficiently operate in DDR3 mode, most engines in Tegra K1 devices use 64B memory requests.

The granularity of external access is linked to the burst size programmed for DRAM access. Bursts into each 32-bit DRAM channel always start at a 32B aligned boundary and consist of 8 data beats. For x32 configurations, the two 32B sectors in an MC request correspond to two transfers of 8 data beats.

DDR3 and LPDDR3 support different features to enable less data from being transferred than what the Burst Size indicates. The resulting minimum data transfer is indicated in the following table.

Table 54: LPDDR3 and DDR3 Minimum Data Transfers

LPDDR3	BL8
x32	32B
x64	64B
DDR3	BL8
x32	32B
x32 with Chop	16B
x64	64B

Tegra K1 devices support:

- BL8, LPDDR3 and DDR3
- DDR3 Burst Chop

16.5.3 Virtual Addressing

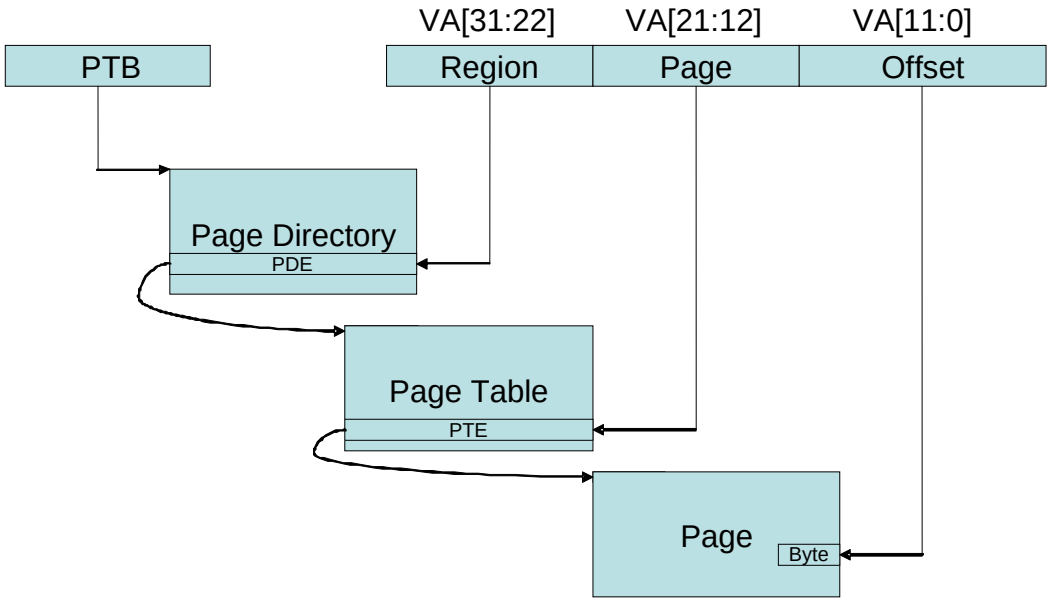
The SMMU is a centralized virtual-to-physical translation for MSS. It maps a 32 virtual address to a 34 bit physical address. If the client address is 40b then bits 39:32 are ignored. It allows the following:

- Memory allocation for hardware pools (surfaces and buffers) could be made from non-contiguous page-sized chunks of memory
- Areas of the hardware memory map could be marked as protected, preventing access from hardware devices
- Hardware memory access can be controlled on a per-device or per-process basis

The virtual-to-physical translation is via a two-level page table that carves up the virtual address as follows:

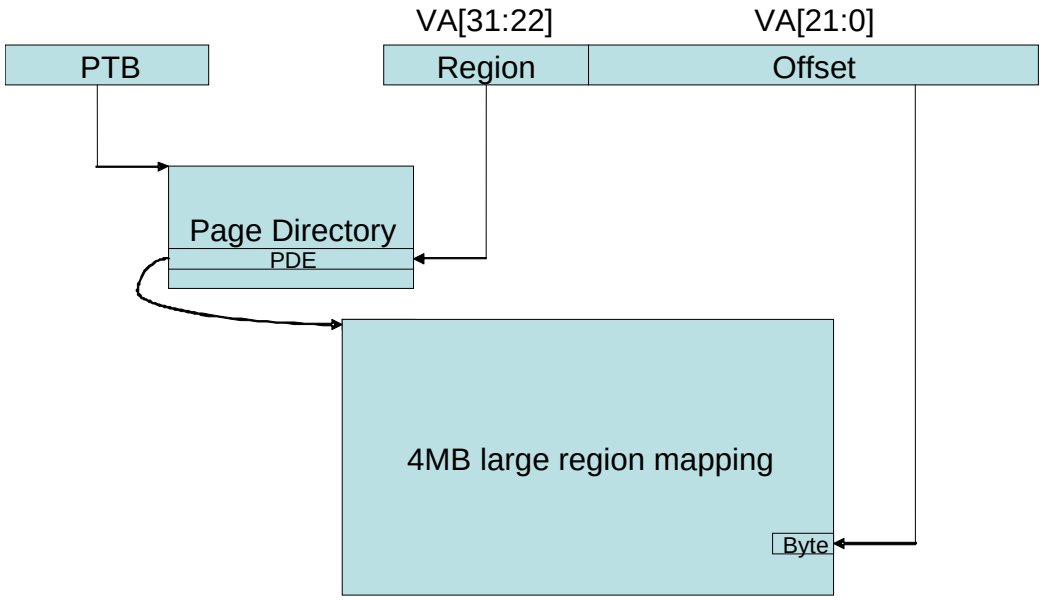
- Bits 31:22 choose a page directory entry (PDE). Each page directory has 1,024 PDEs, each mapping 4MB region.
- Bits 21:12 choose a page table entry (PTE) from a page table. Each page table has 1,024 PDEs, each mapping a 4kB page.
- Bits 11:0 choose a byte within a page

Figure 31: Page Table and Virtual Address



Each PTE or PDE consume 32 bits of memory, so that each page directory or page table consumes one 4kB memory page. In addition, the page directory lookup does an early-out either to map an entire 4MB region of the virtual space as invalid, or to map the region to a contiguous range of physical pages.

Figure 32: Large Region Mapping



The SMMU supports multiple address spaces, each with its own page-table-base register (PTB) and page table. Each address space is tagged with an address space identifier (ASID). This allows for multiple virtual mappings to exist at the same time. Typically, software will assign a different address space to each process that directly uses the hardware drivers, allowing process isolation. The number of ASIDs is 128. Software is responsible for managing the assignments between processes and ASIDs, flushing ASIDs out of the TLB as needed when they are remapped between processes.

ASIDs are assigned based on the SWNAME of the incoming request. An on-chip mapping between SWNAME and the ASID is maintained by the SMMU. For register-based devices, the driver is responsible for updating the mapping between the SWNAME and the ASID when a device in context is swapped between processes.

Untranslated modules are also supported. The SWNAME-to-ASID mapping has a translation-enable bit to allow translation on a per-SWNAME basis. There is also a per-client translation-enable bit for Hardware Diagnostics purposes. This can be used by any client but is typically used by clients that generate 40-bit addresses. In addition, a global “translation enable” bit disables all translation when cleared (cleared is the default out of reset).If translation is disabled, client address bits 33:0 are sent directly to the output of the TU. If the client only provided a 32-bit address, the physical address bits 33:32 will be set to 0.

If translation is enabled, the lower 32 bits of the client address will be used to generate the physical address. Note that this means that client address bits 39:32 will be ignored if a client sends a 40-bit client address and its associated ASID has translation enabled. This is done to minimize the changes to the SMMU. It is expected that 40-bit clients will typically target ASIDs that have translation disabled.

Both the page and directory tables are stored in DRAM. A translation look-aside buffer (TLB) will be used to cache recently-used translations. Translations that miss in the TLB would incur potentially two additional round-trip DRAM delays, but the latency-scheduling features of the Protocol Arbiter will be used to hide this latency behind the normal latency incurred by the DRAM reordering policy. The TLB is backed by a page-table cache (PTC) to reduce this memory traffic further.

To further improve CPU latency, the Tegra K1 CPU low-latency read paths bypass the SMMU altogether; the hardware also restricts the CPU write paths to untranslated-mode to prevent any configuration mishaps.

16.5.3.1 Page Table Layout

The in-memory layout of a PTE looks like

- 22 bits of physical address (PA[33:12]) for the base of the page
- Protection bits which include
  - A “readable” bit which allows clients to read this page
  - A “writeable” bit which allows clients to write this
  - A “nonsecure” bit which (when unset) restricts access of this page to “secure” TrustZone clients

The remaining bits in the 32-bit word are reserved.

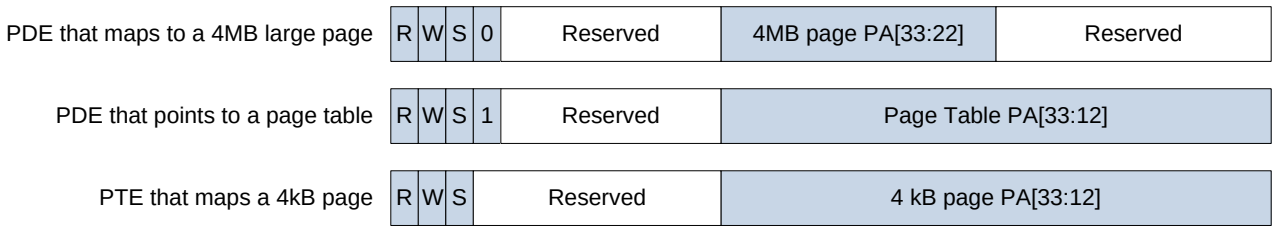
> **Note:** Wherever physical addresses are used in this document, it is assumed that the device can address 8GB of physical memory.

The in-memory layout of a PDE looks like:

- A “next level” bit which says if this PDE maps a single 4MB region, or if it points to a page containing a table of PTEs for the second level of translation
- If the “next level” bit is set, there are 22 bits of physical address (PA[33:12]) that point to a page containing the base of the PTE table for this PTE. If the “next level” bit is clear, 12 bits (PA[33:22]) are used to point to the base of an aligned 4MB physical region mapped directly by the PDE.
- The remaining bits set the permissions for the access. For 4MB large pages, these are used directly for the region. For PDEs that point to a second-level page table, these permissions are ANDed with those of the PTE to give the final permission
  - A “readable” bit for the region
  - A “writeable” bit for the region
  - A “nonsecure” bit for the region

The remaining bits in both interpretations are reserved. Reserved bits should be 0, otherwise they can cause an SMMU fault. Because these are compressed in PTC before they are identified as being PDE or PTE, only the subset of reserved bits that are common to all formats (bits [27:22]) will trigger an SMMU fault.

Figure 33: PDE and PTE Formats



The base address of the page directory for a particular ASID is stored on-chip in the ASID table. Changes to this table may require flushing the ASID in question from the TLB.

16.5.3.2 Page Validity and Protection

There is a need on the software side to distinguish between an invalid mapping (which has an invalid PA field) and a mapping that is valid, but has no access. The following pseudo-code describes the recommended conventions.

```
// page/section/address space permission types
//
// note that INVALID implies the PA field is unused.
// PA is valid for all others, including NO_ACCESS.
enum Permission {
    INVALID               = NvU32(0),
    NO_ACCESS             =                              NONSECURE,
    SECURE_WRITE_ONLY     =             WRITABLE,
    WRITE_ONLY            =             WRITABLE |       NONSECURE,
    SECURE_READ_ONLY      = READABLE,
    READ_ONLY             = READABLE |                   NONSECURE,
    SECURE                = READABLE |  WRITABLE,
    ANY                   = READABLE |  WRITABLE |       NONSECURE
 };
```

For more information on handling SMMU faults, see the subsection on “MC Interrupts” above.

16.5.3.3 Flushes and Page Table Updates

Changes to the page tables require the TLB to be flushed. A software interface for selectively flushing parts of the TLB is provided. The flush command can flush any TLB entries that match a particular subset of virtual addresses. Each address component may be included for matching:

- Match on the ASID, or not
- Match VA[31:22], or not
- Match VA[31:16] or no VA match

Disabling all matches flushes the entire TLB. Note that the TLB is 16 entries wide, so when you match any particular VA, you flush the entire line, which is why the VA matches are down to 16, rather than 12. 4 MB pages are still matched down to VA[16] since they are stored in the TLB using the 4 KB page format.

In addition to the TLB, page table updates require flushing stale entries out of the PTC. This needs to be done on a slot-by-slot basis by writing the PDE or PTE’s physical address (PA[33:4]) to the PTC flush command. Each flush flushes 16 aligned PTEs or PDEs (one DRAM atom’s worth) out of the cache.

A page table update requires three writes – one to write the PTE to memory, one to flush the stale PTE out of the PTC, and a third to flush the stale VA mapping out of the TLB. However, since a single PTC flush flushes 16 PTEs or PDEs and a single TLB flush can flush the entire TLB, software can reduce the flush traffic by merging flushes from multiple updates.

16.5.4 DRAM Device/Rank, Bank and Page Mapping

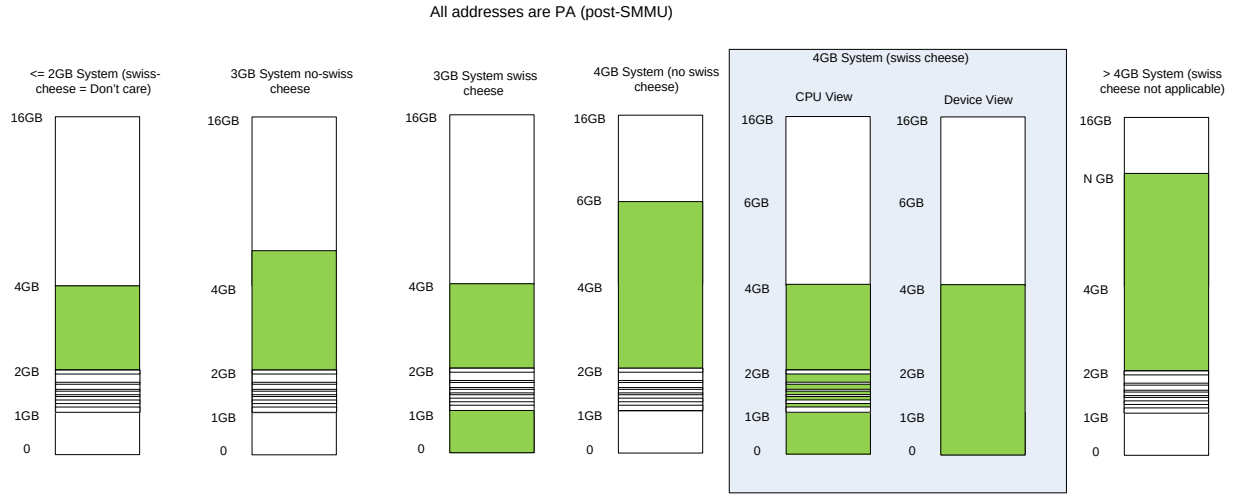
Tegra K1 devices support two modes of addressing; normal addressing mode and swiss-cheese mode. The EMEM_BOM field in the MC_EMEM_CFG_0 register supports the two addressing modes.

EMEM_BOM == 1'b0 : EMEM Base is 2GB // Normal AMAP

EMEM_BOM == 1'b1 : EMEM Base is 0 // Swiss-cheese mode, EAMAP

The various address ranges for DRAM in both configurations are shown the figure below.

Figure 34: Physical DRAM Address Space for Configurations



In case of any errors, MC logs the address of the violating request in the MC_ERR_STATUS_0.ERR_ADR_HI and MC_ERR_ADR_0 registers. In case this error address is due to decerr, the logged address is the original Physical Address.

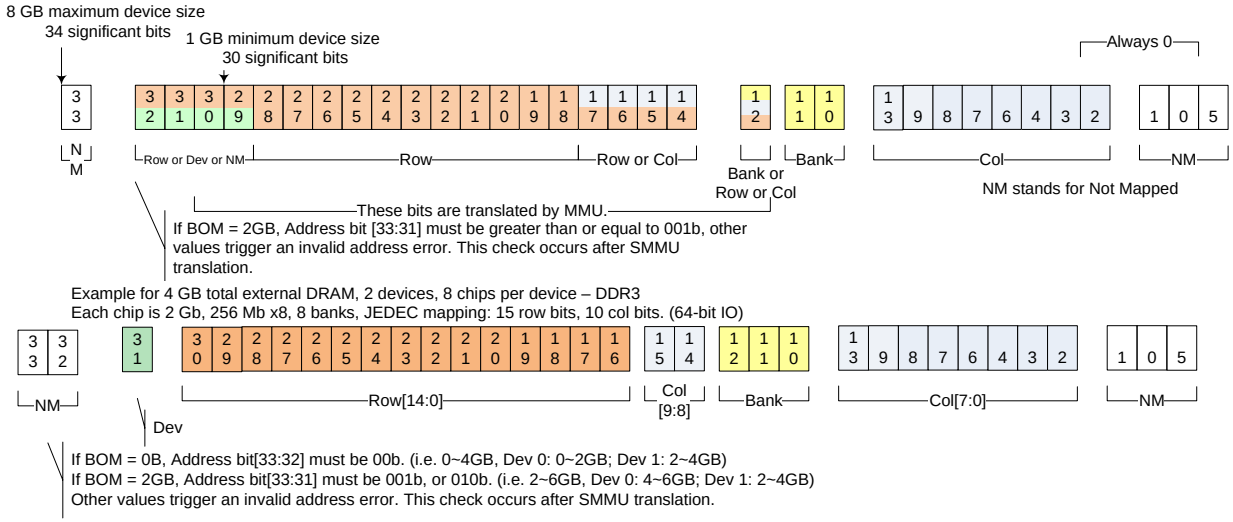
The EMC supports multiple devices with data widths of 8, 16, or 32 bits[2], all identical to form a single rank of either 32 or 64 bits . Up to two ranks are supported.

The bit mapping between the internal linear address and the device/rank, row, column and bank bits is performed as follows:

- The 2 LSBs of the linear address are ignored as the address granularity of the DRAM is 32 bits/4 bytes
- In 64-bit systems, bit 5 of the linear address determines the 32-bit subpartition (with hashing of MSBs)
- In 64-bit systems, bits[9:6,4:2] of the linear address are mapped as column bits [6:0]
- In 32-bit systems, bits[9:2] of the linear address are mapped as column bits [7:0]
- Bits [11:10] are bank bits, possibly hashed.
- Bit [12] is a bank bit if the device has more than two bank bits, possibly hashed.
- The next bits of the linear address are mapped as column bits, as many as remaining after previous mapping
- The next bits of the linear address are mapped as row bits, as many as needed for the selected device
- The next bit is a device/rank bit if device/rank bits are needed

[2] A x32 device may be a single x32 chip or two x16 chips in parallel.

Figure 35: Address Mapping Example



The number of sub-partition, bank, column, row, and device bits is limited by the number of address pins available:

- Sub-partition width: 1 or 0
- Bank width: 2 or 3
- Column width: 9 to 12
- Row width: 12 to 16
- Logical Devices/Ranks (also known as chip selects): 1 or 2

When two logical devices/ranks are used, the total memory mapped by the second device/rank must be less than or equal to the first device/rank. The second device/rank also may have a different row, bank, column mapping from the first device.

16.5.5 DRAM Power Modes

The following table maps between the system power modes and DRAM power modes.

Table 55: System Power Modes and DRAM Power Modes

	VDD_CORE	VDD_CPU	MC/EMC Power	PLL	MC/EMC Clock	DRAM State
LP0 (deep sleep)	off	off	off	off	off	self-refresh
LP1 (suspend)	on	off	on	off	off	self-refresh
LP2 (idle)	on	off	on	on	on	active

This subsection briefly describes the Tegra K1 system power modes. Refer to the PMC section for more details.

- LP0: The goal is ultra-long standby time in a cell phone. In this mode, major power rails are off and I/Os are held constant. DRAM is commanded by the AVP to enter self-refresh. The MC and EMC are powered off. Exiting LP0 is called warm boot, in comparison to cold boot which restarts the system. On warm boot, the MC and EMC are re-initialized from the PMC scratch registers and then DRAM is brought out of self-refresh. The LP0 entry code is executed from IRAM and the LP0 exit code is executed from boot ROM, both by the AVP.
- LP1: The goal is to suspend the CPU while allowing the hardware path to be externally accessible. All PLLs are turned off, and therefore MC/EMC/DRAM clocks are frozen. The DRAM is commanded by the AVP to enter self-refresh (it shares the same code with LP0 entry). Because the MC and EMC keep power during LP1, they do not

need re-initialization. To exit LP1, simply enable the clock and exit self-refresh. Both LP1 entry and exit code are executed by the AVP from IRAM.

- LP2: The goal is to power off the CPU while still appearing functional to users. The DRAM can still be accessed by the display, audio, video, and other system modules, although no access comes from the CPU. The LP2 entry/exit sequences do not involve the MC/EMC/DRAM.

For pads and DRAM, LP0 and LP1 are in the same state, and LP2 and normal running mode are in the same state.

16.5.6 Bank Hashing

To achieve a good bank interleave, Tegra K1 devices perform a hash of address MSBs into the bank bits.

16.5.7 AHB Redirection Region

During boot, USB3 and flash media (SDMMC/SATA) devices need access to IRAM. Because these clients connect to the MC and do not have a direct path to the IRAM, The MC implements AHB redirection during boot to allow path to IRAM. In this mode, accesses to a programmed memory address aperture are directed to the AHB bus, allowing access to the IRAM.

The AHB aperture is defined by the IRAM_BOM and IRAM_TOM registers, which are initialized to disable this aperture. If the fuse indicates that the boot media is present in one of these clients, that Boot ROM will initialize this aperture to 0x40000000 and 0x4003f000 (1GB, 1GB+IRAM_SIZE), respectively. Once bootup is complete, the boot ROM programs the IRAM_BOM to 0xffffffff and IRAM_TOM to 0x00000000, thus disabling access to IRAM. DRAM is then potentially accessible in this address range. These aperture register also have an access_control/lock bit. After disabling the aperture, the access_control register should be programmed to lock the registers.

AHB routes the requests targeted to IRAM appropriately and routes all non-DRAM aperture requests (as defined by the swiss-cheese and related configuration) back to the MC as the default DRAM region. Care must be taken to program the IRAM aperture register to prevent a request from being stuck in a loop.

16.5.8 TrustZone Security Region

The MC can secure a region in the physical address aperture from insecure software sources. The region can be defined on 1MB boundaries in the external memory region, in multiples of 1 MB. If a non-secure request is made to the secured region or if a secure request from the CPU is made outside of the secured region (after this mode is enabled), the MC generates an interrupt (if enabled) and logs the details of the request (address, client ID). After the details are logged, write requests are dropped and read requests are forced to return all 1's, thus protecting the secured region from corruption by the insecure source and avoiding aliasing in the CPU cache.

Only clients configured for security can make secure requests.

After the TZ aperture is established, the CPU_STRICT_TZ_APERTURE_CHECK bit in the MC_TZ_SECURITY_CTRL_0 register is set in the MC, which forces correct behavior as follows:

- Secure requests from the CPU can only access TZ secure memory space and not access the memory outside TZ secure memory space.
- Secure requests from other clients may access the TZ secure memory space and also may access memory outside TZ secure memory space.
- Non-secure requests from any client can only access memory outside the TZ secure memory space.

The register MC_TZ_SECURITY_CTRL_0.CPU_STRICT_TZ_APERTURE_CHECK itself is sticky and cannot be changed once set after cold boot.

16.5.9 Video Protection Memory Region

This protected memory aperture prevents the CPU (and other unauthorized clients) from accessing data within the region. The MC secures a region in memory from access and modifications by engines that are not part of the video decode and display process.

This aperture is defined by the VIDEO_PROTECT_BOM and VIDEO_PROTECT_SIZE_MB (reset value 0x0) registers. The value 0 for the size register disables this aperture.

In addition to protecting the region in memory, the registers are allowed only secured access by the Boot Loader only. On cold boot when this register is initially programmed, it is also written to the secure PMC-scratch region. On LP0 resume, the register value is restored from this region. This eliminates need for saving this register content on LP0 entry. An additional lock bit locks down the access to this register. On reset the lock bit is cleared. When the lock bit is cleared, the writes are allowed to the VPR aperture registers. When the VPR registers are initialized, the lock bit is set. When the lock bit is set, all writes to the VPR aperture registers are ignored. This lock bit is used for cold boot as well for LP0 exit.

For systems that do not implement VPR, the Boot Loader must still set the lock bit to indicate that programming is completed.

16.5.10 Security Coprocessor Secure Region

The Security Coprocessor (SEC) engine needs a secured memory space meant exclusively for use by this engine. This memory region, SECR (SEC region) should be accessed only by the SEC engine; no other clients are allowed to read or write to this memory region. This memory region is defined by physical memory range.

The SEC engine (also referred to as TSEC) uses this carveout region as an extension to its I-cache and D-cache. Without this carveout, the TSEC has to encrypt the data before writing to normal DRAM.

The SECR_BOM and SECR_SIZE_MB registers (reset value 0x0) define the 1MB aligned base and size register for this region. In addition to protecting this memory region, these aperture definition registers themselves need to be protected and are allowed to be modified only by the Boot Loader (during cold boot) and the Boot ROM (during LP0 resume) and should be implemented similar to the VPR aperture registers. An additional sticky/secure bit controls this register. On reset this sticky/secure bit is cleared, thus allowing write access to the SECR aperture registers. When the Boot Loader initializes the aperture registers, it also sets this sticky/secure register bit. When this sticky/secure bit is set, all subsequent writes to this register are ignored. On LP0 resume, reset clears this sticky bit; it is set again when the aperture register is restored from the PMC secure scratch space. To avoid saving this aperture register on LP0 entry, the Boot Loader (during cold boot) should store this aperture definition to the PMC secure scratch space.

The size for this carveout region is 1MB.

Any access to this memory aperture by any other client (other than SEC) is ignored (read returns all 1s as the response and writes are dropped) and an error is logged.

16.5.11 Microcode Carveout Protection Region (Tegra K1 64-Bit Only)

Microcode carveout is a protected region of physical memory required by the CPU architecture. Only native CPU accesses from the CCPlex client are allowed to read or write locations in microcode carveout.

The protected region is defined to start at MTS_CARVEOUT_BOM and ends at MTS_CARVEOUT_SIZE. It can start and be extended in multiples of 1MB . The only clients allowed to access the protected region are the CPU read and write clients:

- MPCORER
- MPCOREW
- MPCORELPR
- MPCORELPW

All other clients attempting to access this region will cause the MC to issue an interrupt and log the details of the request (address, client ID). After the details are logged, write requests are dropped and read requests are forced to return all 1s, thus protecting the region from corruption by the insecure source.

The registers defining the aperture also need to be protected. As with the VPR aperture registers, an additional sticky/secure bit controls these registers. On reset this sticky/secure bit is cleared, allowing write access to these registers. When this sticky/secure bit is set, all subsequent writes to these registers are ignored.

The Microcode Carveout Protection Region should be set up and locked at or soon after the time of DRAM configuration, before or during the micro-architectural cold boot process, before any accesses occur to the protected region by the CPU cores. In order to minimize the boot impact, the CPU will begin using the carveout DRAM in parallel with Tegra firmware reading the Boot Loader binary. When entering LP0, microcode will store information sufficient to reconstruct the Microcode Carveout aperture registers into the PMC secure scratch space. On LP0 exit, reset clears the sticky bit; it is set again when the Boot ROM initiates the LP0 DMCE exit sequence to restore the aperture registers from the PMC secure scratch space.

16.6 Memory Tiling

Tegra K1 supports the memory tiling formats described below.

Table 56: Client Shared Tiling Formats

Format	Status	Used for	Description
Pitch Linear	Supported by some clients	Software-compatibility, clients that linearly access memory	Simple array ordering
Block linear 16Bx2 with Tegra K1 sector ordering	Supported by all clients	Kepler color surfaces, clients that access memory in blocks or vertically	Square DRAM page arrangement (blocks) with folded atoms
Legacy (Prior to Tegra 2 devices)	Not Supported		

The parameters associated with each tiling format are listed below:

Table 57: Surface Descriptor Parameters

Parameter	Used by	Description	Values	Minimum Alignment
Layout	All	Surface layout	PITCH, BLOCKLINEAR	N/A
Base Address	Pitch	Starting address of surface, in bytes	32-bit virtual address (40-bit virtual address within the GPU) -or- 34-bit physical address	64B (general) 128B (GPU) 256B (MSENC, VIC)
Pitch	Pitch	Line-to-line stride in bytes	Large enough for at least 4,096 pixels in bytes (some clients may support larger values)	64B (general) 128B (GPU) 256B (MSENC) up to 256B (VIC)[3]
Base Address	Block Linear	Starting address of surface, in bytes	32-bit virtual address (40-bit virtual address within the GPU) -or- 34-bit physical address	512B (one gob)

[3] The pitch alignment restrictions for VIC depend on its cache line shape: 256Bx1: 256B, 128Bx2: 128B, otherwise: 64B.

Parameter	Used by	Description	Values	Minimum Alignment
Block Width	Block Linear	Width of block in gobs	ONE_GOB (this is the only setting supported on 32-bit Tegra K1)	N/A
Block Height	Block Linear	Height of block in gobs	[ONE_GOB, THIRTYTWO_GOBS] (SIXTEEN_GOBS is the normal setting, but ONE_GOB may be needed for display surfaces outside carveout	N/A
Block Depth	Block Linear	Depth of block in gobs	[ONE_GOB, THIRTYTWO_GOBS] (values greater than ONE_GOB are currently only supported by the GPU)	N/A
Width	Block Linear	Width of surface in samples	[1, 4096] samples (some clients may support larger values)	1 sample

(x,y) to linear address translation is the responsibility of clients. The MCCIF only supports linear address inputs. Contact your NVIDIA representative for access to libraries with translation code to simplify implementation.

16.6.1 Block Linear

The block linear formats map batches of contiguous addresses into rectangular *blocks*, and tile these blocks linearly. Blocking serves two purposes: 1) it maps a DRAM page into a rectangular region, rather than into a one-pixel-tall strip, to capture locality in a graphics geometry stream or other 2D-oriented client, such as an MPEG encoder or decoder, and 2) it makes it possible to predictably interleave banks in x and y, minimizing bank conflicts over a large region.

Blocks themselves are arranged from *GOB*s (*Groups of Bytes*). A Kepler GOB is 512 bytes arranged as 64x8 bytes. GOBs are stacked vertically to form a block. The number of GOBs stacked vertically in a block is controlled by an additional surface parameter called the *block height*. The recommended block height for most buffers in Tegra K1 devices is 16 GOBs (128 lines). This supports 8x8 bank interleaving. For buffers for which linear display access is more important than access by GPU, VIC, or other block-oriented engine, block height can be set to 1 GOB, providing more locality for the display client.

Blocks are arranged horizontally into a *Row of Blocks (ROBs)* to fill out the surface to the width value (or slightly beyond, if the width is not a multiple of the 64B block width). Upper address bit swizzling in the bank swizzling algorithm generally makes it unnecessary to pad the surface width further.

16.6.2 Sub-Partitions

The 64-bit DRAM channel can be divided into two sub-partitions with DQ[31:0] forming sub-partition A and DQ[63:32] forming sub-partition B.

Each 64B atom is divided into 2 sectors of 32B. One sector contains bytes 0 – 31 while the other contains bytes 32 – 63.

16.6.3 Software Guidelines

Software should allocate surfaces respecting the minimum alignments specified in Table 57. This section gives additional alignment restrictions for certain clients and advice on allocating surfaces for best performance.

Certain clients, such as MSENC, VDE, and VIC use 32-bit registers (left-shifted 8) to specify 40-bit base addresses of a buffer. Base addresses for these clients must be aligned to a minimum of 256B.

Certain clients, such as MSENC and VIC, have a fixed cache line size and read all data within a cache line, even if it is beyond the nominal height and width of the surface. For such clients, surface width and height need to be padded to at least the next multiple of the cache line size so the unit does not read beyond the end of the buffer.

Surface Type

- **Block linear** format generally provides best performance and should be chosen by default.
- **Pitch format** may be preferable if producer and consumer clients perform linear accesses and both clients support pitch.
- **Private formats** are used by a few units, such as MSENC and VDE. For private formats, the client-required allocation and padding rules must be followed.

Block Linear

- **Alignment**. Align surface start address as follows:
  - 512B is the minimum alignment for correct behavior. Performance will be poor (no zero-bandwidth clears, poor page locality).
  - 1KB alignment is better. Zero bandwidth clears will work. Bank interleave will be suboptimal.
  - 8KB alignment is best. All compression features work. Bank interleave assumes 8KB alignment. Use this setting for large buffers.
- **Block height** should normally be programmed to SIXTEEN_GOBS (128 lines). For certain surfaces for which display is the primary client, block heights of ONE_GOB or TWO_GOBS are recommended. Surfaces to be accessed by the GPU texture unit may require a smaller block height under certain conditions.[4]
- **Width** is typically prescribed by the application. Hardware allocates a block linear surface to be an integral number of blocks wide, so its allocated width is width*Bpp rounded up to the next block boundary (64B), which is sufficient padding in almost all circumstances.[5]
- **Height padding**. Surfaces should be an integral number of blocks tall. If a client such as MSENC or VIC has a cache line that is taller than the block height, additional row(s) of blocks may be required for padding.

Pitch

- **Alignment**. Align surface start address to a minimum of:
  - 128B if surface is to be accessed by the GPU
  - 256B if surface is to be accessed by MSENC, VDE, or VIC (due to the 8-bit left-shift issue)
  - 64B otherwise
- **Pitch**. Surface pitch must be a multiple of:
  - 128B bytes if surface is to accessed by GPU
  - 128B if surface is to be read by VIC with 128x2 cache line shape
  - 256B if surface is to be read by VIC with 256Bx1 cache line shape
  - 64B otherwise.
- **Height padding**. For clients, such as MSENC and VIC, additional lines of padding might be required beyond the nominal height of the surface. For example, when the VIC is reading a source buffer with an internal cache line shape of 32x8, the source buffer must be a multiple of 8 lines tall.

[4] For buffers that are to be accessed using the GPU texture unit, the BlockHeight parameter must match that used by the texture unit. In particular, note that if a texture surface is smaller than the specified size in blocks, texture uses a shrunken blockHeight instead of the nominal parameter specified in the Texture Header.

[5] If VIC cacheline shapes of 128x2 or 256x1 are used (generally not recommended for block linear), width must be padded up to a multiple of the cache line width. If this is not possible, a narrower cache line shape must be used

16.7 Memory Controller Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

16.7.1 MC Registers

USAGE NOTE: Many MC register fields are shadowed.

Writes to shadowed register fields update the shadow copy (this is default, assumes TIMING_CONTROL_DBG.WRITE_MUX==ASSEMBLY).

Reads to shadowed register fields return the currently-active copy (this is default, assumes TIMING_CONTROL_DBG.READ_MUX==ACTIVE).

This allows a new set of frequency-dependent timing parameters to be written to the shadow registers while memory traffic is ongoing, then when the parameters are completely written, the MC hardware can perform a timing-safe switch.

Such switches can be triggered via two methods: TIMING_CONTROL.TIMING_UPDATE (generally used during initialization), or the automatic CAR/EMC handshake on a clock-frequency or divider change (assuming TIMING_CONTROL_DBG.IGNORE_EMC_TRIGGERS==DISABLED).

Registers that are shadowed are marked by a comment:

This register is shadowed: see usage note at the top of Section 16.7.1

USAGE NOTE: Many MC registers should be programmed by the Boot Loader as part of the warm boot (also known as "wake from LP0") and cold boot (also known as "power up") sequences. Suggested actions for the Boot ROM/Boot Loader are noted under "Boot requirements:".

USAGE NOTE: Some MC registers may only be accessed by TrustZone-secured register transactions. See the appropriate ARM Architecture Reference Manual for information on how to handle security. Such registers are marked by a comment:

“Access to this register is restricted to TrustZone-secured requestors.”

USAGE NOTE: The MC register fields to be stored in PMC scratch registers for warm boot must have "[PMC]" in their comments. After adding and removing such PMC flag, the tool warmboot_code_gen must be rerun to generate new boot ROM code.

USAGE NOTE: When writing to a register, any bits that are not intended to be modified should be rewritten with their existing values.

USAGE NOTE: Unspecified bits may not appear in tables and should be written with their Reset values.

16.7.1.1 MC_INTSTATUS_0

Interrupt Status

This register contains trigger bit fields. Bit fields not shown here are reserved.

Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0xx000000x0xxxxxx)

Bit	Reset	Description
16	CLEAR	DECERR_MTS_INT: This interrupt is for access violation on MTS carveout region in the MC. If a client other than CPU read or write is trying to access the region. 0 = CLEAR 1 = SET
13	CLEAR	SECERR_SEC_INT: The request violated the SEC Carveout requirements - Only TSEC clients may access the SEC carveout. 0 = CLEAR

Bit	Reset	Description
		1 = SET
12	CLEAR	DECERR_VPR_INT: The request violated the VPR requirements - in case of a read, the request address fell in the VPR range, but the VPR attribute of the request was not set. In case of a write, the request had the VPR attribute set in the request, but the request address did not fall in the VPR range. 0 = CLEAR 1 = SET
11	CLEAR	INVALID_APB_ASID_UPDATE_INT: ASID Update through APB interface resulted in an error. APB interface tried to update secure ASID through Non-secure interface. 0 = CLEAR 1 = SET
10	CLEAR	INVALID_SMMU_PAGE_INT: Address translation error: An access was attempted to an invalid page or a protected page. See ERR_STATUS and ERR_ADR for more information. 0 = CLEAR 1 = SET
9	CLEAR	ARBITRATION_EMEM_INT: Warning that a pending request has reached the deadlock-prevention slack threshold. This indicates that the MC could not meet the programmed performance goals. This interrupt is for use with assisting debug of performance-related issues. 0 = CLEAR 1 = SET
8	CLEAR	SECURITY_VIOLATION_INT: Address translation error: A nonsecure access was attempted to a secured region. See ERR_STATUS and ERR_ADR for more information. 0 = CLEAR 1 = SET
6	CLEAR	DECERR_EMEM_INT: Address translation error: EMEM Address Decode Error. See ERR_STATUS and ERR_ADR for more information. 0 = CLEAR 1 = SET

16.7.1.2 MC_INTMASK_0

Interrupt Masks

Boot requirements: This register should be saved to SDRAM registers and restored by the OS during warm boot. Bit fields not shown here are reserved.

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0xx000000x0xxxxxx)
Default: 0x00003540

Bit	Reset	SW Default	Description
16	MASKED	_NONE_	DECERR_MTS_INTMASK: 0 = MASKED 1 = UNMASKED
13	MASKED	UNMASKED	SECERR_SEC_INTMASK: Prevents SECERR_SEC_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED
12	MASKED	UNMASKED	DECERR_VPR_INTMASK: Prevents DECERR_VPR_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED
11	MASKED	_NONE_	INVALID_APB_ASID_UPDATE_INTMASK: Prevents INVALID_APB_ASID_UPDATE_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED

Bit	Reset	SW Default	Description
10	MASKED	UNMASKED	INVALID_SMMU_PAGE_INTMASK: Prevents INVALID_SMMU_PAGE_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED
9	MASKED	_NONE_	ARBITRATION_EMEM_INTMASK: Prevents ARBITRATION_EMEM_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED
8	MASKED	UNMASKED	SECURITY_VIOLATION_INTMASK: Prevents SECURITY_VIOLATION_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED
6	MASKED	UNMASKED	DECERR_EMEM_INTMASK: Prevents DECERR_EMEM_INT from triggering an interrupt to the interrupt controller. 0 = MASKED 1 = UNMASKED

16.7.1.3 MC_ERR_STATUS_0

Error Data Capture: Status

If a translation error is detected (for example, address-out-of-bounds, security fault, protection fault), this register records information about this access:

- which fault the captured error corresponds to
- a read/write indicator and
- the request ID (global client ID assigned by the memory controller, see the list below).

If the error was an INVALID_SMMU_PAGE, then information about the page's protection status is also captured:

- whether the page was marked non secure in the page-table
- whether the page was marked readable in the page-table
- whether the page was marked writeable in the page-table

Note that SMMU page protection bits are formed by ANDing the page protection bits from the Page Table Base, Page Directory Entry, and Page Table Entries from all three stages of the page-walk. The ANDed protection bits and the type of the provoking transaction are both available in the status register.

Subsequent faults (of any type) will not change the status and address registers until the corresponding interrupt is cleared.

The global memory client IDs are defined as follows:

Client	ID	ID (hex)	SWGROUP	INBAND-SWID	Module	Partition	Description
csr_ptcr	0	(0x00)	ptc				Misses from System Memory Management Unit (SMMU) Page Table Cache (PTC)
csr_display0a	1	(0x01)	dc		display	dis	Display reads, window A
csr_display0ab	2	(0x02)	dcb		displayb	disb	Display reads, window A
csr_display0b	3	(0x03)	dc		display	dis	Display reads, window B

Client	ID	ID (hex)	SWGROUP	INBAND-SWID	Module	Partition	Description
csr_display0bb	4	(0x04)	dcb		displayb	disb	Display reads, window B
csr_display0c	5	(0x05)	dc		display	dis	Display reads, window C
csr_display0cb	6	(0x06)	dcb		displayb	disb	Display reads, window C
csr_afir	14	(0x0e)	afi		afi	pcx	PCIE reads
csr_avpcarm7r	15	(0x0f)	avpc		avpc	avp	ARM7 Audio-Video Processor (AVP) reads via the avp_cache
csr_displayhc	16	(0x10)	dc		display	dis	Display reads, cursor
csr_displayhcb	17	(0x11)	dcb		display	disb	Display reads, cursor
csr_hdar	21	(0x15)	hda		hda	apb	High-definition audio (HDA) reads
csr_host1xdmar	22	(0x16)	hc		host1x	host	Host channel data reads
csr_host1xr	23	(0x17)	hc		host1x	host	Host indirect reads

Offset: 0x8 | Read/Write: RO | Reset: 0xXXXXX0XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
30:28	X	ERR_TYPE: Type of the corresponding error: 0 = RSVD : Code 0x0 is never used. 2 = DECERR_EMEM : There is no physical DRAM attached for this address based on the value of EMEM_SIZE_MB configuration register. 3 = SECURITY_TRUSTZONE : The non-secure client has attempted to access the Trustzone-secured aperture; or a secure client has attempted to access the Trustzone-secured aperture using a non-secure request. 4 = SECURITY_CARVEOUT : Reserved 6 = INVALID_SMMU_PAGE : The SMMU page-translation flagged an error for that access.
27	X	ERR_INVALID_SMMU_PAGE_READABLE: If INVALID_SMMU_PAGE error, set if page permission was readable (AND of PTB/PDE/PTE). Ignore if no INVALID_SMMU_PAGE error.
26	X	ERR_INVALID_SMMU_PAGE_WRITABLE: If INVALID_SMMU_PAGE error, set if page permission was writable (AND of PTB/PDE/PTE). Ignore if no INVALID_SMMU_PAGE error.
25	X	ERR_INVALID_SMMU_PAGE_NONSECURE: If INVALID_SMMU_PAGE error, set if page permission was non-secure (AND of PTB/PDE/PTE). Ignore if no INVALID_SMMU_PAGE error.
21:20	X	ERR_ADR_HI: Higher address bits of erring address whose lower bits are available in ERR_ADR register
18	X	ERR_SWAP: Swap bit for transaction
17	X	ERR_SECURITY: Set if the transaction was secure. 0 = NONSECURE 1 = SECURE
16	X	ERR_RW: Direction of the access that caused the error. 0 = READ 1 = WRITE
14:12	X	ERR_ADR1: Second subpartition unique address bits
6:0	X	ERR_ID: Client identifier (see above list) of the access that caused the error.

16.7.1.4 MC_ERR_ADR_0

Error Data Capture: Address

If a translation error is detected, this register records the request byte address.

Subsequent faults (of any type) will not change the status and address registers until the corresponding interrupt is cleared.

Note that the decode-error, security-Trustzone, and security-carveout checks occur on the physical address (in other words, after SMMU translation); thus those error types capture the physical address. All other errors capture the virtual address.

Offset: 0xc | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	ERR_ADR

16.7.1.5 MC_SMMU_CONFIG_0

Used for interrupt set/clear enums. When disabled, all transactions are untranslated. When enabled, transactions may be translated. See per-client and per-module enables in SMMU_* registers below.

This register can only be accessed by TrustZone-Secured accesses from the CPU.

Access to this register is restricted to TrustZone-secured requestors.

Boot requirements: This register should be saved to SDRAM registers and restored by the OS during warm boot.

SMMU Enable Register

Offset: 0x10 | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	DISABLE	SMMU_ENABLE: 0 = DISABLE 1 = ENABLE

16.7.1.6 MC_SMMU_TLB_CONFIG_0

Translation Lookaside Buffer Config Register

Controls usage of the TLB.

Boot requirements: This register should be saved to SDRAM registers and restored by the OS during warm boot.

Offset: 0x14 | Read/Write: R/W | Reset: 0x30000020 (0b0011xxxxxxxxxxxxxxxxxxxxx100000)

Bit	Reset	Description
31	DISABLE	TLB_STATS_ENABLE: Enable TLB Hit and Miss counters 0 = DISABLE 1 = ENABLE
30	DISABLE	TLB_STATS_TEST: Set stats registers to all "1s" 0 = DISABLE 1 = ENABLE
29	ENABLE	TLB_HIT_UNDER_MISS: Allow hits to pass misses in the TLB. This value may not be changed on the fly. Ideally, this should be set before enabling the SMMU. At the very least, the TLB needs to be flushed and traffic through the SMMU stopped before changing this value. 0 = DISABLE 1 = ENABLE
28	ENABLE	TLB_ROUND_ROBIN_ARBITRATION: When enabled, forces round robin (RR) arbitration between TLB hit and miss FIFOs. 0 = DISABLE 1 = ENABLE
4:0	0x10	TLB_ACTIVE_LINES: Set the number of active lines. Allows the TLB to be made "virtually smaller" to save power. "Inactive" lines will never hit and never hold data.

16.7.1.7 MC_SMMU_PTC_CONFIG_0

Controls usage of the PTC

Boot requirements: This register should be saved to SDRAM registers and restored by the OS during warm boot.

Page Table Cache Config Register

Offset: 0x18 | Read/Write: R/W | Reset: 0x2800003f (0b001x1000xxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
31	DISABLE	PTC_STATS_ENABLE: Enable PTC Hit and Miss counters 0 = DISABLE 1 = ENABLE
30	DISABLE	PTC_STATS_TEST: Set stats registers to all "1s" 0 = DISABLE 1 = ENABLE
29	ENABLE	PTC_CACHE_ENABLE: Enable the PTC cache. 0 = DISABLE 1 = ENABLE
27:24	0x8	PTC_REQ_LIMIT: Limit outstanding PTC fill requests to the DRAM. Minimum value is 5; otherwise the SMMU can have functional failures.
5:0	0x3f	PTC_INDEX_MAP: XOR pattern for tag generation

16.7.1.8 MC_SMMU_PTB_ASID_0

Page Table Bases (PTBs)

These pointers point to a 4KB-page aligned table of PDEs for each ASID. They also contain initial permission bits that are ANDed with those in the PDE and PTEs to determine the final permissions of accesses through this ASID.

The PTBs are stored in a RAM that is accessed indirectly though the SMMU_PTB_ASID and SMMU_PTB_DATA registers.

Boot requirements: This RAM should be saved to SDRAM and restored by the OS during warm boot.

Page Table Base ASID Register

This register selects which PTB is modified by the SMMU_PTB_DATA register.

Offset: 0x1c | Read/Write: R/W | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
6:0	X	CURRENT_ASID: ASID used to address SMMU_PTB register

16.7.1.9 MC_SMMU_PTB_DATA_0

Writes or reads to this register write or read the Page Table Base pointer for the ASID defined in the SMMU_PTB_ASID register.

This register is not TrustZone secure, but only a TrustZone secure access may alter the PTB for a secure ASID.

Secure ASIDs have additional privilege over other non-secure ASIDs - they may fetch page tables from secure memory and they can allow clients translated through them to make secure accesses if programmed to do so.

Attempts to write a secure ASID with a non-secure access will be ignored, and non-secure reads will return garbage.

Page Table Base Data Register

Offset: 0x20 | Read/Write: R/W | Reset: 0xX0XXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	ASID_READABLE: if set, reads are allowed for this ASID
30	X	ASID_WRITABLE: if set, writes are allowed for this ASID
29	X	ASID_NONSECURE: if set, non-secure accesses are allowed for this ASID
21:0	X	ASID_PDE_BASE: Pointer to page of PDEs, bits [33:12] for this ASID

16.7.1.10 MC_SMMU_TLB_FLUSH_0

Software can write this register to flush a specific page group, 4MB section, entire ASID or the entire TLB. There is independent control over matching part or all of the VA and/or matching the ASID.

Note: The granularity of VA mapping here is at a page group, which is the number of PTEs that fit in a memory atom.

Translation Lookaside Buffer Flush Register

Offset: 0x30 | Read/Write: R/W | Reset: 0xXX0XXXXX (0bxxxxxxxxxxx0xxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	TLB_FLUSH_ASID_MATCH: If enabled, only entries matching TLB_FLUSH_ASID are flushed. 0 = DISABLE 1 = ENABLE
30:24	X	TLB_FLUSH_ASID: ASID to match when TLB_FLUSH_ASID_MATCH is ENABLED
19:2	X	TLB_FLUSH_VA_GROUP: Virtual address to match for group flushes, VA[31:15]. VA[14] of this field is ignored due to the TLB line size.
1:0	X	TLB_FLUSH_VA_MATCH: Controls flushing based on VA, one of ALL: Flush entire TLB SECTION: Flush all entries with a VA[31:22] that match TLB_FLUSH_VA_SECTION GROUP: Flush all entries with a VA[31:14] that match TLB_FLUSH_VA_GROUP. By default, the GROUP setting takes effect if this field is programmed to a value of 1. 0 = ALL 2 = SECTION 3 = GROUP

16.7.1.11 MC_SMMU_PTC_FLUSH_0

Software can use this register to flush a specific PTE or PDE from the Page Table Cache (PTC) by writing the atom-aligned physical address of the PTE group. It can also flush the entire PTC via this register.

Note: The granularity of flushing is at the PTE group, which is the number of PTEs that fit in a memory atom.

Page Table Cache Flush Register

Offset: 0x34 | Read/Write: R/W | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx1xxx)

Bit	Reset	Description
31:4	X	PTC_FLUSH_ADR: Physical address of PTE group to match for address flushes, PA[31:4]
3	0x1	PTC_NO_WAIT_IDLE_FLUSH: Set bit to immediately flush without waiting for hit FIFO to go idle. Not required because it does not present an ordering hazard.

Bit	Reset	Description
0	X	PTC_FLUSH_TYPE: Controls flushing, one of ALL: Flush entire PTC ADR: Flush PTEs that are addressed by PTC_FLUSH_ADR 0 = ALL 1 = ADR

16.7.1.12 MC_EMEM_CFG_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.
- During warm boot, this register may be derived from EMEM_ADR_CFG* register values.

External Memory Aperture Configuration

Offset: 0x50 | Read/Write: R/W | Reset: 0x00002000 (0b0xxxxxxxxxxxxxxxxx10000000000000) | Default: 0x00000000

Bit	Reset	SW Default	Description
31	B2GB	B2GB	EMEM_BOM: Base of DRAM memory in GBs [PMC_SECURE]. B2GB should be used for 34b systems, while B0GB supports up to 4GB using extended mapping mode 1 = B0GB 0 = B2GB
13:0	0x7ff	NONE	EMEM_SIZE_MB: Specify the external memory aperture size in megabytes. This field must be set to less than or equal to the available physical memory for proper operation. This value is used to check for decode errors; requests to addresses greater than or equal to EMEM_BOM+EMEM_SIZE_MB will result in an EMEM decode error.

16.7.1.13 MC_EMEM_ADR_CFG_0

The EMEM_ADR_CFG* registers are used to specify the DRAM density and geometry parameters. The MC will use these parameters to derive device, row, bank, column addressing values to EMC.

> **Note:** The maximum size externally supported is dependent on pinout and address-map aperture limitations, and that it may be possible to configure the device/row/bank/column addresses in ways that exceed these limitations.

For each device attached [1..NUMDEV], the associated per-device address configuration must also be programmed, in the associated register EMEM_ADR_CFG_DEV{N-1}.

The maximum number of row bits carried internally is defined by NV_MC_EMEM_ROW_WIDTH.

The maximum number of address pins is defined by NV_MC_EMEM_ROWPIN_WIDTH.

If not being used to address a device, the chip-select pins may be re-used as row address pins for DDR3.

Valid settings for EMEM_ADR_CFG_DEV* registers should ensure device address width <= bank width + column width + NV_MC_EMEM_ROW_WIDTH

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

External Memory Address Configuration, System

Offset: 0x54 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	N1	EMEM_NUMDEV: [PMC] number of populated DRAM devices. 0 = N1 1 = N2

16.7.1.14 MC_EMEM_ADR_CFG_DEV0_0

Configures the density and geometry of the first attached device.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Note: DEVSIZE is per subpartition.

External Memory Address Configuration, Device 0

Offset: 0x58 | Read/Write: R/W | Reset: 0x00040202 (0bxxxxxxxxxxxx0100xxxxxx10xxxxx010)

Bit	Reset	Description
19:16	D64MB	EMEM_DEV0_DEVSIZE: [PMC] density of the first attached DRAM device, used to generate width of row address. 2 = D16MB 3 = D32MB 4 = D64MB 5 = D128MB 6 = D256MB 7 = D512MB 8 = D1024MB 8 = D1GB 9 = D2048MB 9 = D2GB 10 = D4096MB 11 = D8192MB 12 = D768MB
9:8	W2	EMEM_DEV0_BANKWIDTH: [PMC] width of bank address of the first attached DRAM device. 2 = W2 3 = W3
2:0	W9	EMEM_DEV0_COLWIDTH: [PMC] width of column address of the first attached DRAM device. W8 maps to 1KB page size, W9 to 2KB, W10 to 4KB, etc. 1 = W8 2 = W9 3 = W10 4 = W11 5 = W12

16.7.1.15 MC_EMEM_ADR_CFG_DEV1_0

Configures the density and geometry of the second attached device, if a second device is populated.

To allow for 2 devices with different column width/bank width to be used without creating holes in the system-level address map, the DEVSIZE setting of the second device may be smaller than the others to allow for non-powers-of-2 attached memory sizes.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

> **Note:** DEVSIZE is per subpartition.

External Memory Address Configuration, Device 1

Offset: 0x5c | Read/Write: R/W | Reset: 0x00040202 (0bxxxxxxxxxxxx0100xxxxxx10xxxxx010)

Bit	Reset	Description
19:16	D64MB	EMEM_DEV1_DEVSIZE: [PMC] Density of the second attached DRAM device, used to generate width of row address. 2 = D16MB 3 = D32MB 4 = D64MB 5 = D128MB 6 = D256MB 7 = D512MB 8 = D1024MB 8 = D1GB 9 = D2048MB 9 = D2GB 10 = D4096MB 11 = D8192MB 12 = D768MB
9:8	W2	EMEM_DEV1_BANKWIDTH: [PMC] width of bank address of the second attached DRAM device. 2 = W2 3 = W3
2:0	W9	EMEM_DEV1_COLWIDTH: [PMC] width of column address of the second attached DRAM device. W8 maps to 1KB page size, W9 to 2KB, W10 to 4KB, etc. 1 = W8 2 = W9 3 = W10 4 = W11 5 = W12

16.7.1.16 MC_SECURITY_CFG0_0

Security aperture: Can be only accessed by TrustZone-Secured accesses from the secure clients. Access to this register is restricted to TrustZone-secured requestors.

Boot requirements: This security configuration register should be saved to SDRAM and restored by the OS during warm boot.

The global memory client IDs with TrustZone-level security are as follows:

CLIENT	ID	ID (hex)	SWGROUP	MODULE	PARTITION	DESCRIPTION
csr_mpcorelpr	38	(0x26)	mpcorelp	mpcorelp	stop	Reads from Cortex-A15 Shadow CPU core via the L2 cache (Tegra K1 32-bit only)
csr_mpcorer	39	(0x27)	mpcore	mpcore	ftop	Reads from 4 CPU cores via the L2 cache
csw_mpcorelpw	56	(0x38)	mpcorelp	mpcorelp	stop	Writes from Cortex-A15 Shadow CPU core via the L2 cache (Tegra K1 32-bit only)
csw_mpcorew	57	(0x39)	mpcore	mpcore	ftop	Writes from 4 CPU cores via the L2 cache

Secure Region Configuration: Base

Offset: 0x70 | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x80000000 (0b100000000000xxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:20	0x800	SECURITY_BOM: SECURITY_BOM is the base of the secured region, limited to MB granularity. This must point to a region of the physical address map allocated to EMEM for it to be effective; MC cannot secure address space it does not own. (In other words, this is an absolute address, not an offset.) Above is the list of clients with the TrustZone-security access. Note that AXICIF clients will adhere to the standard AXI protocol "aprot[1]==0" indication for secure requests.

16.7.1.17 MC_SECURITY_CFG1_0

Access to this register is restricted to TrustZone-secured requestors.

Boot requirements:

This security configuration register should be saved to SDRAM and restored by the OS during warm boot.

Secure Region Configuration: Bound

Offset: 0x74 | Read/Write: R/W | Secure: Trust Zone Protected | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx0000000000000)

Bit	Reset	Description
12:0	0x0	SECURITY_SIZE_MB: SECURITY_SIZE_MB is the size, in megabytes, of the secured region. If set to 0, the security check in MC is disabled.

16.7.1.18 MC_EMEM_ARB_CFG_0

General configuration of the External Memory Arbiter.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM warm boot, this register may be derived from the emcclk and a standard tick-value.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration

Offset: 0x90 | Read/Write: R/W | Reset: 0x00000008 (0b00000000xxx00000xxxxxxx000001000)

Bit	Reset	Description
20:16	0x0	EXTRA_TICKS_PER_UPDATE: The number of extra ticks to add every deadline timer update. Used to keep cycles-per-tick constant when the mcclk period is less than the chosen wall-clock granularity for the deadline counter. If =0, then every tick increments the deadline counter by 1; if =1, then every tick increments the deadline counter by 2, etc. Assuming a target of 30ns-per-tick, some example programming (assumes DIV=2): 10MHz emcclk => 5MHz mcclk => would need to increment deadline counter by 6.67 if using 1 cycle-per-tick => or update by 20 every 3 cycles => 3 cycles-per-tick and 19 extra ticks per update. Since performance is not critical at such slow speeds, rounding errors may be deemed acceptable, so the previous example may be simpler to program as 1 cycle-per-tick and 5 extra ticks per update. Another example, the slowest supported clock speed using a 30ns tick that doesn't distort the tick is: 1.04MHz mcclk => with 31 extra ticks per update and updating every cycle.
8:0	0x8	CYCLES_PER_UPDATE: The number of mcclk cycles per deadline timer update. The target wall-clock granularity ("tick") for the deadline counter should be fixed for the design, then the CYCLES_PER_UPDATE should be used to convert the wall-time value into mcclk cycles. All client latency allowances are also expressed in units of "ticks". Of all deadline-related controls, only the CYCLES_PER_UPDATE and EXTRA_TICKS_PER_UPDATE values need to be

Bit	Reset	Description
		updated on a clock-change event. Assuming a target of 30ns per tick, some example programming (assumes DIV=2): 667MHz emcclk => 333MHz mcclk => 10 cycles per tick; 400MHz emcclk => 200MHz mcclk => 6 cycles-per-tick. Note that value 0x0 is illegal.

16.7.1.19 MC_EMEM_ARB_OUTSTANDING_REQ_0

This register can be used to limit the number of outstanding requests in the arbiter and monitor the count.

If outstanding transaction is greater than the maximum, requests are throttled based on MC_EMEM_ARB_RING1_THROTTLE_0 register

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from other MC settings.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: Outstanding Request Limiter

Offset: 0x94 | Read/Write: R/W | Reset: 0x8XXX0040 (0b10xxxxxxxxxxxxxxxxxxxxx001000000)

Bit	R/W	Reset	Description
31	RW	ENABLE	LIMIT_OUTSTANDING: when ENABLED, the total number of requests in the arbiter is limited to the value in ARB_MAX_OUTSTANDING 0 = DISABLE 1 = ENABLE
30	RW	DISABLE	LIMIT_DURING_HOLDOFF_OVERRIDE: when DISABLED, override the limiting of transactions during hold-off to let requests flow freely 0 = DISABLE 1 = ENABLE
24:16	RO	X	ARB_OUTSTANDING_COUNT: Current number of outstanding requests
8:0	RW	0x40	ARB_MAX_OUTSTANDING: The maximum number of requests allowed in the arbiter when LIMIT_OUTSTANDING is set to ENABLE.

16.7.1.20 MC_EMEM_ARB_TIMING_RCD_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: DRAM Timing: tRCD

Offset: 0x98 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	RCD: The minimum number of cycles between activate commands to the same bank. Program to max (1,ceil(max(EMC.WR_RCD,EMC.RD_RCD)/DIV)-1-1). Note that value 0x0 is illegal.

16.7.1.21 MC_EMEM_ARB_TIMING_RP_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: DRAM Timing : tRP

Offset: 0x9c | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
6:0	0x7f	RP: The minimum number of cycles between an internal precharge command and an activate command to the same bank. Program to ceil (EMC.RP/DIV)-1+SFA. The combined value of RAP2PRE+RP 0x0 is illegal; the combined value of WAP2PRE+RP 0x0 is illegal.

16.7.1.22 MC_EMEM_ARB_TIMING_RC_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: DRAM Timing : tRC

Offset: 0xa0 | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
6:0	0x7f	RC: This is the minimum number of cycles between activate commands to the same bank. Program to ceil (max(EMC.RC,(EMC.RAS+EMC.RP))/DIV)-1.

16.7.1.23 MC_EMEM_ARB_TIMING_RAS_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: DRAM Timing: tRAS

Offset: 0xa4 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	RAS: This is the minimum number of cycles between an activate command and a precharge command to the same bank. Program to ceil (EMC.RAS/DIV)-1-1.

16.7.1.24 MC_EMEM_ARB_TIMING_FAW_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: DRAM Timing: tFAW

Offset: 0xa8 | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
5:0	0x3f	FAW: For 8-bank devices: Only 4 activates may occur within this rolling window. Program to ceil (EMC.TFAW/DIV)-1. Programming this to 0x0 or not programming a device to 4 banks will turn off this check.

16.7.1.25 MC_EMEM_ARB_TIMING_RRD_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: DRAM Timing: tRRD

Offset: 0xac | Read/Write: R/W | Reset: 0x0000000f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx1111)

Bit	Reset	Description
3:0	0xf	RRD: The minimum number of cycles between an activate command and an activate command to a different bank. Program to ceil (EMC.RRD/DIV)-1.

16.7.1.26 MC_EMEM_ARB_TIMING_RAP2PRE_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: DRAM Timing: tRAP2PRE

Offset: 0xb0 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	RAP2PRE: The number of cycles between a read command with auto-precharge and the internal precharge command generated by the DRAM. Program to ceil (EMC_R2P/DIV). Note that: the combined value of RAP2PRE+RP 0x0 is illegal.

16.7.1.27 MC_EMEM_ARB_TIMING_WAP2PRE_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: DRAM Timing: tWAP2PRE

Offset: 0xb4 | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
6:0	0x7f	WAP2PRE: The number of cycles between a write command with auto-precharge and the internal precharge command generated by the DRAM. Program to ceil (EMC_W2P/DIV). Note that: the combined value of WAP2PRE+RP 0x0 is illegal.

16.7.1.28 MC_EMEM_ARB_TIMING_R2R_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: DRAM Timing: tR2R

Offset: 0xb8 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx11111)

Bit	Reset	Description
4:0	0x1f	R2R: The number of cycles between consecutive read commands to different devices (different chip selects). Program to ceil (EMC.REXT/DIV)-1+OTFA+SFA.

16.7.1.29 MC_EMEM_ARB_TIMING_W2W_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: DRAM Timing: tW2W

Offset: 0xbc | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx11111)

Bit	Reset	Description
4:0	0x1f	W2W: The number of cycles between consecutive write commands to different devices (different chip selects). Program to ceil (EMC.WEXT/DIV)-1+SFA.

16.7.1.30 MC_EMEM_ARB_TIMING_R2W_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: DRAM Timing: tR2W

Offset: 0xc0 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	R2W: The number of cycles to turn the bus from reads to writes. Program to ceil (EMC.R2W/DIV)-1+OTFA+SFA.

16.7.1.31 MC_EMEM_ARB_TIMING_W2R_0

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from EMC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: DRAM Timing: tW2R

Offset: 0xc4 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	W2R: The number of cycles to turn the bus from reads to writes. Program to ceil (EMC.W2R/DIV)-1+SFA.

16.7.1.32 MC_EMEM_ARB_DA_TURNS_0

The direction arbiter attempts to choose the highest efficiency (i.e., lowest bubbles) direction to open pages next. While programming this register incorrectly may lower performance, it should never cause chip-hangs since the EMC always controls the final DRAM timing decisions. This register should be reprogrammed after clock-change events to bring the computed values back in alignment with EMC's register values. These turn costs are deliberately not computed in hardware to provide better flexibility to tweak arbiter performance.

The configuration registers for turns for DA are separate from the timing registers to allow for flexibility in the programming.

Boot requirements:

- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from MC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: Direction Arbiter: Turns

Offset: 0xd0 | Read/Write: R/W | Reset: 0x0f0f0205 (0b00001111000011110000001000000101)

Bit	Reset	Description
31:24	0xf	W2R_TURN: Bubbles produced by a write to read bus turn. Approximately MC_EMEM_ARB_TIMING_W2R.
23:16	0xf	R2W_TURN: Bubbles produced by a read to write bus turn. Approximately MC_EMEM_ARB_TIMING_R2W.
15:8	0x2	W2W_TURN: Bubbles produced by a write to write (other device) bus turn. Approximately MC_EMEM_ARB_TIMING_W2W.
7:0	0x5	R2R_TURN: Bubbles produced by a read to read (other device) bus turn. Approximately MC_EMEM_ARB_TIMING_R2R.

16.7.1.33 MC_EMEM_ARB_DA_COVERS_0

The direction arbiter attempts to choose the highest efficiency (i.e., lowest bubbles) direction to open pages next. While programming this register incorrectly may lower performance, it should never cause chip-hangs since the EMC always controls the final DRAM timing decisions. This register should be reprogrammed after clock-change events to bring the computed values back in alignment with EMC's register values. These cover costs are deliberately not computed in hardware to provide better flexibility to tweak arbiter performance.

Boot requirements:

- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from MC settings using the given equations.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: Direction Arbiter: Covers

Offset: 0xd4 | Read/Write: R/W | Reset: 0x000f0f0f (0bxxxxxxxx00001111000011110000111 1)

Bit	Reset	Description
23:16	0xf	RCD_W_COVER: Cost to cover the activate-to-write delay. Approximately ceil ((EMC.RTP + EMC.RP + EMC.RD_RCD)/DIV)-1.
15:8	0xf	RCD_R_COVER: Cost to cover the activate-to-read delay. Approximately ceil ((EMC.WTP + EMC.RP + EMC.WR_RCD)/DIV)-1.
7:0	0xf	RC_COVER: Cost to cover the activate-to-activate delay. Approximately MC_EMEM_ARB_TIMING_RC.

16.7.1.34 MC_EMEM_ARB_MISC0_0

BC2AA_HOLDOFF: In the case where the currently-open pages have more work pending than the time it would take to open another page, it is better to hold off opening that page until it is truly needed. The Best-bank Cache computes the pending work and compares it to this threshold and advises the Activation Arbiter to hold-off.

Priority Inversion: In general, if the arbiter is working on a lower-priority request that blocks a higher-priority request, these thresholds are used to limit the number of low-priority requests we will service before the arbiter will interrupt the lower-priority traffic to start servicing the higher-priority traffic.

The priority classes are (in increasing priority order): Low (! expired), High (expired), HighIso.

There are three ways priority can be inverted: Bank Activation, Bus Direction, and Refresh:

Bank Activation: If an unexpired request to bank A, row R currently holds the page open, and a request to bank A, row S expires, the Transaction Arbiter must make a decision whether to finish out the work for row R or to interrupt that transfer to immediately service row S. The TA makes this decision based on the remaining work for row R and whether row S is for an isochronous client, and the two PRIORITY_INVERSION thresholds.

Bus Direction: If the Transaction Arbiter is currently working on expired requests in direction P, and requests are also expired (or expired-iso) in direction Q, the Transaction Arbiter must make a decision whether to continue working in direction P or switch the bus to direction Q. The Transaction Arbiter will service at maximum PRIORITY_INVERSION_THRESHOLD (or _INVERSION_ISO_THRESHOLD) requests in direction P before switching to direction Q.

Refresh: If the Transaction Arbiter is currently working on requests, and EMC asks to inject a refresh, the Transaction Arbiter must decide whether it is more efficient (overall) to close the pages immediately or to finish the pages and then close them. Depending on the setting of the REFRESH_ACK_THRESHOLD_USAGE configuration bit (in EMEM_ARB_MISC1 register, below), the Transaction Arbiter will either choose to close the page immediately (NONE), close the page immediately if its length is over the iso threshold (ISO), or close the page immediately if its length is over the normal threshold (NORMAL). If the length is less than the chosen threshold, the Transaction Arbiter will service all remaining requests to the page before acknowledging the EMC refresh request.

When in DDR3 coalesce-for-performance mode, the arbiters will monitor the traffic patterns and might halve the priority inversion thresholds if they detect the current traffic is not coalescing efficiently. When in MC_EMC_SAME_FREQ mode, the priority inversion thresholds should be set to half of their non-same-frequency values.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- The MC_EMC_SAME_FREQ field should be saved to scratch registers and restored by the Boot ROM during warm boot.
- The other fields of this register should be saved to SDRAM and restored by the OS during warm boot.
- During Boot ROM section of warm boot, this register may be derived from other settings.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: Miscellaneous Thresholds (0)

Offset: 0xd8 | Read/Write: R/W | Reset: 0x720a4010 (0bx11100100000101001000000000010000)

Bit	Reset	Description
30:28	0x7	ATOMS_PER_DVFS_PULSE: [PMC] ATOMS_PER_DVFS_PULSE is used to control the rate at which the MC updates the sys_stats_mon outputs. The MC will toggle the sys_stats_mon outputs for every 2^(ATOMS_PER_DVFS_PULSE+1) atoms of traffic, where an atom is defined as any transaction. Note that 16B, 32B, and 64B requests consume the same amount of memory bus resources. So, in this context, an atom is defined as any request and not cumulative 64B sized transactions. The maximum ATOMS_PER_DVFS_PULSEsetting supported is the reset value, also known as NV_MC_EMEM_DVFS_CNTR_CFG_RESET.
27	DISABLE	MC_EMC_SAME_FREQ: [PMC] Used in conjunction with EMEM_ARB_MISC1.COALESCE_FOR_PERFORMANCE to configure how often the MC can send EMC a data request, should be configured to mirror CAR's CLK_SOURCE_EMC.MC_EMC_SAME_FREQ. If configured to DIV=2 BL=4, then the MC can send a data request every cycle. If configured to DIV=1 BL=4, then the MC can send a data request every other cycle. If configured to DIV=2 BL!=4, then MC can send a data request every other cycle. If configured to DIV=1 BL!=4, then the MC can send a data request once every four cycles. 0 = MC is 1/2 the frequency of EMC (DIV=2). 1 = MC is the same frequency of EMC (DIV=1). 0 = DISABLE 1 = ENABLE
26:21	0x10	EXPIRING_SOON_SLACK_THRESHOLD: Slack threshold below which an isochronous request is considered to be expiring "soon". Used to de-assert mc2emc_idle signal early to wake EMC out of power-down or self-refresh. If using EMC's Dynamic Self Refresh features, set this to the ticks needed to cover exit self-refresh delay; otherwise, if using EMC's ACPD feature, set to the ticks needed to cover exit power-down delay; if neither power-saving feature is being used, the programming of this threshold should have no effect.

Bit	Reset	Description
20:16	0xa	PRIORITY_INVERSION_ISO_THRESHOLD: Bank Activation: maximum number of unexpired or expired-but-not-isochronous requests that can be serviced before switching to expired isochronous traffic. Bus Direction: maximum number of requests in direction P that can be serviced before switching to expired-isochronous traffic in direction Q. Refresh: maximum number of requests that can be serviced before refresh is sent. Values <= 0x2 disable the feature. Values < 0x6 should be avoided if coalescing for performance.
15	DISABLE	EMC_REQ_B2B_XFER: When enabled, the MC allows EMC transactions on back-to-back clocks regardless of EMC consumption bandwidth 0 = DISABLE 1 = ENABLE
14:8	0x40	PRIORITY_INVERSION_THRESHOLD: Bank Activation: maximum number of unexpired requests that can be serviced before switching to expired traffic. Bus Direction: maximum number of requests in direction P that can be serviced before switching to expired traffic in direction Q. Refresh: maximum number of requests that can be serviced before refresh is sent. Values <= 0x2 disable the feature. Values < 0x6 should be avoided if coalescing for performance.
7:0	0x10	BC2AA_HOLDOFF_THRESHOLD: If the pending work is greater than this value, hold off on activations. Generally should be set to match the page-opening cost: MC_EMEM_ARB_TIMING_RC+1.

16.7.1.35 MC_EMEM_ARB_MISC1_0

Two DVFS counters exist in the "NV_MC_ARB_EMEM_stats.v" module: one for all requests and another for CPU-only transactions. Both of these are down counters which decrement for each transaction atom on mcclk.

When these counters reach zero, a single mcclk pulse is generated, and the counters reinitialize to a value of ((2^(ATOMS_PER_DVFS_PULSE+1))-1). The single mcclk pulse that is generated (when the counters reach zero) gets synchronized to sclk (system clock) through a cross-clock domain FIFO control module, which has a minimum response time requirement of (4 * sclk_period + 4 * mcclk_period). Therefore, ATOMS_PER_DVFS_PULSE should never be set such that ((2^(ATOMS_PER_DVFS_PULSE+1)) * mcclk_period) is less than (4 * sclk_period + 4 * mcclk_period).

This translates to the following rule for setting the minimum value of ATOMS_PER_DVFS_PULSE:

ATOMS_PER_DVFS_PULSE >= log2((4 * sclk_period/mcclk_period) + 4) - 1

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- The COALESCE_FOR_PERFORMANCE field should be saved to scratch registers and restored by the Boot ROM during warm boot. It may also be derived from EMC settings.
- The other fields of this register should be saved to SDRAM and restored by the OS during warm boot.

This register is shadowed: see usage note at the top of Section 16.7.1

External Memory Arbitration Configuration: Miscellaneous Thresholds

Offset: 0xdc | Read/Write: R/W | Reset: 0x80a00002 (0b1000xx00101xxxxxxxx000000000xx10) | Default: 0x00000000

Bit	Reset	SW Default	Description
31:28	0x8	NONE	DEADLOCK_PREVENTION_SLACK_THRESHOLD: If the slack at the head of any bank-queue, or any of the slacks in the hit-under-miss FIFO is less than -(2^threshold), backpressure the input to the arbiter until the violating slack values have been arbitrated. This is intended to: (a) avoid deadline-wrapping in heavily backpressured corner-cases and (b) quickly get such cases back into high-efficiency arbitration. Value of 0x0 disables the feature. The reset value is NV_MC_EMEM_DL_WIDTH-1. Behavior with values greater than or equal to NV_MC_EMEM_DL_WIDTH is UNDEFINED. If the threshold is reached, ARBITRATION_EMEM_INT will fire.
25:24	NORMAL	NONE	REFRESH_ACK_THRESHOLD_USAGE: Determines which thresholds (if any) the refresh-acknowledge signal will use to determine how to close all pages after EMC has requested a refresh. 0 = NORMAL : Use priority-inversion threshold 1 = ISO : Use priority-inversion-ISO threshold 2 = NONE : Force a precharge immediately to close the page
23:21	USE_EXPIRING_SOON_SLACK_THRESHOLD	NONE	EXPIRING_SOON_SLACK_THRESHOLD_PD: [PMC] Slack threshold below which an isochronous request is considered to be expiring "soon". Used to deassert the mc2emc_idle_pd signal early to wake the EMC out of power-down. (EXPIRING_SOON_SLACK_THRESHOLD controls exit from self-refresh.) This register should be set to the ticks needed to cover the exit power-down delay. If the available choices are not sufficient, the value should be set in EXPIRING_SOON_SLACK_THRESHOLD and this register should be set to USE_EXPIRING_SOON_SLACK_THRESHOLD 0 = ZERO_TICKS : 0 tick threshold for PD expiring soon 1 = ONE_TICK: 1 tick threshold for PD expiring soon 2 = TWO_TICKS: 2 tick threshold for PD expiring soon 3 = FOUR_TICKS: 4 tick threshold for PD expiring soon 4 = EIGHT_TICKS: 8 tick threshold for PD expiring soon 5 = USE_EXPIRING_SOON_SLACK_THRESHOLD: Use the setting in EXPIRING_SOON_SLACK_THRESHOLD to control mc2emc_idle_pd
12:4	0x0	0x0	ALT_DEADLOCK_PREVENTION_SLACK_THRESHOLD: [PMC] Use the absolute value of deadlock prevention slack threshold instead of 2^n format. Note that the DEADLOCK_PREVENTION_SLACK_THRESHOLD field still needs to be programmed along with this one (for example, 7).
1	ENABLE	NONE	ALLOW_BCA_HOLDOFF_WHEN_EXP: [PMC] When enabled, allows BCA holdoff to occur even when expired requests are present. 0 = DISABLE 1 = ENABLE
0	DISABLE	0x0	BLOCK_LP_CPU_RD_IF_SMMU_INP_HP: [PMC] When enabled, low priority (due to DDA) CPU reads get blocked when the SMMU output is high priority and a request is present at the input to the SMMU. 0 = DISABLE 1 = ENABLE

16.7.1.36 MC_EMEM_ARB_RING1_THROTTLE_0

External Memory Arbitration Configuration: Snap Arbiter Throttle

Ring1 Snap Arbiter Throttle - Inserts some number of stall cycles at Ring1 after every request.

Throttle cycle count varies whether outstanding_request count is below (LOW) or above (HIGH) the max_outstanding threshold.

Boot requirements: During Boot ROM section of warm boot, this register may be derived from other settings.

This register is shadowed: see usage note at the top of Section 16.7.1

Offset: 0xe0 | Read/Write: R/W | Reset: 0x001f0000 (0bxxxxxxxxxxxx11111xxxxxxxxxxx00000)

Bit	Reset	Description
20:16	0x1f	RING1_THROTTLE_CYCLES_HIGH: Cycles of throttle after each request when outstanding transaction count is greater than or equal to threshold.
4:0	0x0	RING1_THROTTLE_CYCLES_LOW: Cycles of throttle after each request when outstanding transaction count is below threshold. Suggested programming: (DIV==1)? 1 : 0.

16.7.1.37 MC_EMEM_ARB_RING3_THROTTLE_0

External Memory Arbitration Configuration: Snap Arbiter Throttle

Highest Ring Snap Arbiter Throttle - Although called ring3, this register works on the highest ring.

Boot requirements: This register should be saved in the SDRAM and restored by the OS during warm boot.

This register is shadowed: see usage note at the top of Section 16.7.1

Offset: 0xe4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxx00000xxxxxxxxxxx00000)

Bit	Reset	Description
4:0	0x0	RING3_THROTTLE_CYCLES: Cycles of throttle after each request.

16.7.1.38 MC_EMEM_ARB_OVERRIDE_0

External Memory Arbitration Configuration: Feature Overrides

Boot requirements:

- Some fields of this register should be saved in the scratch registers and restored by the Boot ROM during warm boot.
- This register should be saved in the SDRAM and restored by the OS during warm boot.

16.7.1.41 MC_TIMING_CONTROL_0

Shadowed Registers: Update Trigger

Boot requirements: Writing this register with 0x1 will trigger a timing update event, which should be used in both warm boot and cold boot sequences.

Offset: 0xfc | Read/Write: R/W | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
0	X	TIMING_UPDATE

16.7.1.42 MC_STAT_CONTROL_0

Statistics: Control

Offset: 0x100 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3	DISABLE	EMC_PM_STOP_TRIGGER: 0 = DISABLE 1 = ENABLE
2	DISABLE	EMC_PM_START_TRIGGER: 0 = DISABLE 1 = ENABLE
1:0	RST	EMC_GATHER: 0 = RST 2 = DISABLE 3 = ENABLE

16.7.1.43 MC_CLIENT_HOTRESET_CTRL_0

Writing FLUSH_ENABLE to a bit in this register causes a flush to be performed on all of the clients for the selected swname. The status of the flush (done/in progress) can be monitored in the CLIENT_HOTRESET_STATUS register.

A proper client reset sequence is as follows:

1. Set the appropriate FLUSH_ENABLE bit in the CLIENT_HOTRESET_CTRL register to block further access by the client, and start the flush process.
2. Poll the CLIENT_HOTRESET_STATUS register until the appropriate bit returns FLUSH_DONE.
3. Clear module bit in the CLK_RST_CONTROLLER_RST_DEVICES_* register to reset the module.
4. Set module bit in the CLK_RST_CONTROLLER_RST_DEVICES_* register to release the module reset.
5. Clear the appropriate FLUSH_ENABLE bit in the CLIENT_HOTRESET_CTRL register to allow transactions to flow.

Memory Client Hot Reset Control Register

Offset: 0x200 | Read/Write: R/W | Reset: 0x00000000 (0b000xxxxxx000000000xx000000xx0000

16.7.1.45 MC_EMEM_ARB_ISOCHRONOUS_0_0

Controls whether a client is considered to be an isochronous client for EMEM arbitration. If a client is configured to be isochronous, the arbiter will favor expired isochronous requests over requests of any other type. This applies to arbitration for: best-bank arbiter (BA), activation arbiter (AA), direction arbiter (DA), and transaction arbiter (TA).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

Per-Client Isochronous Settings

16.7.1.51 MC_EMEM_ARB_HYSTERESIS_2_0

Controls whether a client is considered to be a hysteresis client for EMEM arbitration. If a client is NOT marked hysteresis, it will immediately cause the arbiter to turn off ts2aa_holdoff (see the comments for EMEM_ARB_OVERRIDE for further description of ts2aa_holdoff functionality).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

Per-client hysteresis settings

31	DISABLE	NV2_SMMU_ENABLE: if set, translation is enabled for this module 0 = DISABLE 1 = ENABLE
1:0	0x0	NV2_ASID: ASID to use for translation, if enabled

16.7.1.67 MC_SMMU_PPCS_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU PPCS ASID Assignment Register

Offset: 0x270 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	PPCS_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
6:0	0x0	PPCS_ASID: ASID to use for translation, if enabled

16.7.1.68 MC_SMMU_SATA_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU SATA ASID Assignment Register

Offset: 0x274 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	SATA_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
6:0	0x0	SATA_ASID: ASID to use for translation, if enabled

16.7.1.69 MC_SMMU_VDE_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU VDE ASID Assignment Register

Offset: 0x280 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	VI_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
6:0	0x0	VI_ASID: ASID to use for translation, if enabled

16.7.1.71 MC_SMMU_VIC_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU VIC ASID Assignment Register

Offset: 0x284 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	VIC_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
6:0	0x0	VIC_ASID: ASID to use for translation, if enabled

16.7.1.72 MC_SMMU_XUSB_HOST_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU XUSB_HOST ASID Assignment Register

Offset: 0x288 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	XUSB_HOST_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
6:0	0x0	XUSB_HOST_ASID: ASID to use for translation, if enabled

16.7.1.73 MC_SMMU_XUSB_DEV_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU XUSB_DEV ASID Assignment Register

Offset: 0x28c | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	XUSB_DEV_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
6:0	0x0	XUSB_DEV_ASID: ASID to use for translation, if enabled

16.7.1.74 MC_SMMU_TSEC_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

SMMU TSEC ASID Assignment Register

Offset: 0x294 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	TSEC_SMMU_ENABLE: if set, translation is enabled for this client 0 = DISABLE 1 = ENABLE
6:0	0x0	TSEC_ASID: ASID to use for translation, if enabled

16.7.1.75 MC_SMMU_PPCS1_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

16.7.1.78 MC_SMMU_TLB_SET_SELECTION_MASK_0_0

TLB Set Selection Mask (Bit 0)

Mask is ANDed with the Virtual Address, and the resulting value is XORed to a single bit. That bit selects either set0 or set1.

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

This register is shadowed: see usage note at the top of Section 16.7.1

Offset: 0x600 | Read/Write: R/W | Reset: 0x00008000 (0bxxxxxxxx000000001xxxxxxxxxxxxxxx)

Bit	Reset	Description
23:15	0x1	TLB_SET_SELECTION_MASK_0

16.7.1.79 MC_DISPLAY_SNAP_RING_0

Display Arbiter Ring Selection

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

Offset: 0x608 | Read/Write: R/W | Reset: 0x00000003 (0b0xxxxxxxxxxxxxxxxxxxxxxxxxxxxx11)

Bit	Reset	Description
31	ENABLED	DISPLAY_SNAP_RING_WRITE_ACCESS : 0 = ENABLED 1 = DISABLED
1	RING1	DISB_SNAP_RING : 0 = RING0 1 = RING1
0	RING1	DIS_SNAP_RING : 0 = RING0 1 = RING1

16.7.1.80 MC_ERR_VPR_STATUS_0

Offset: 0x654 | Read/Write: RO | Reset: 0x00XXX0XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
21:20	X	ERR_VPR_ADR_HI: Higher address bits of erring address whose lower bits are available in the ERR_VPR_ADR register
18	X	ERR_VPR_SWAP
17	X	ERR_VPR_SECURITY: Set if transaction was secure. 0 = NONSECURE 1 = SECURE
16	X	ERR_VPR_RW: Direction of the access that caused the error. 0 = READ 1 = WRITE
14:12	X	ERR_VPR_ADR1: Second subpartition unique address bits
6:0	X	ERR_VPR_ID: Client identifier (see above list) of the access that caused the error.

16.7.1.81 MC_ERR_VPR_ADR_0

Offset: 0x658 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	ERR_VPR_ADR

16.7.1.82 MC_EMEM_CFG_ACCESS_CTRL_0

Access Control Bit for EMEM_CFG Registers

This bit is "sticky." Registers are writeable by default. Once write access is disabled, it cannot be re-enabled without a system reset.

The following registers are controlled by this register:

- EMEM_CFG
- EMEM_ADR_CFG

- EMEM_ADR_CFG_DEV0
- EMEM_ADR_CFG_DEV1
- EMEM_ADR_CFG_CHANNEL_MASK
- EMEM_ADR_CFG_BANK_MASK_0
- EMEM_ADR_CFG_BANK_MASK_1
- EMEM_ADR_CFG_BANK_MASK_2
- EMEM_BANK_SWIZZLE_CFG0
- EMEM_BANK_SWIZZLE_CFG1
- EMEM_BANK_SWIZZLE_CFG2
- EMEM_BANK_SWIZZLE_CFG3

Offset: 0x664 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	ENABLED	EMEM_CFG_WRITE_ACCESS: 0 = ENABLED 1 = DISABLED

16.7.1.83 MC_TZ_SECURITY_CTRL_0

Trustzone Security Control Register

Controls "Strict"ness of TrustZone security check.

This register is "sticky" - once the strict check is enabled, it cannot be disabled without a reset.

Offset: 0x668 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	DISABLED	CPU_STRICT_TZ_APERTURE_CHECK: When this bit is set to ENABLED, the TrustZone security check requires that the CPU's security state bit exactly match the aperture. That is, when the CPU sets the NS bit to 0, it can ONLY access the TrustZone secured aperture. When the NS bit is 1, the CPU may NOT access the TrustZone secured aperture. Any violation causes a security violation to be flagged. When this bit is set to DISABLED, the security check is relaxed. In this mode, the CPU can access memory outside of the TrustZone secured aperture even though the NS bit is set to 0 (that is, even though the CPU is in secure mode). The above description only applies to the CPU complex clients (read and write). Other clients operate in the relaxed mode. 0 = DISABLED 1 = ENABLED

16.7.1.84 MC_EMEM_ARB_OUTSTANDING_REQ_RING3_0

External Memory Arbitration Configuration: Highest Ring Outstanding Request Limiter

> **Note:** Although called ring3, this register works on the highest ring.

This register is used to limit the number of outstanding requests in the arbiter and monitor the count. If the outstanding transactions are greater than the maximum, the highest ring requests are throttled based on the MC_EMEM_ARB_RING3_THROTTLE_0 register.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.

- During the Boot ROM section of warm boot, this register can be derived from other MC settings.

This register is shadowed: see usage note at the top of Section 16.7.1

Offset: 0x66c | Read/Write: R/W | Reset: 0x8XXX0080 (0b10xxxxxxxxxxxxxxxxxxxxx010000000)

Bit	R/W	Reset	Description
31	RW	ENABLE	LIMIT_OUTSTANDING_RING3: When ENABLED, requests into ring3 are throttled after the request count reaches ARB_MAX_OUTSTANDING_RING3. 0 = DISABLE 1 = ENABLE
30	RW	DISABLE	LIMIT_DURING_HOLDOFF_OVERRIDE_RING3: When DISABLED, overrides the limiting of ring3 transactions during holdoff to let requests flow freely. 0 = DISABLE 1 = ENABLE
24:16	RO	X	ARB_OUTSTANDING_COUNT_RING3: Current number of outstanding requests
8:0	RW	0x80	ARB_MAX_OUTSTANDING_RING3: The maximum number of requests allowed in the arbiter when LIMIT_OUTSTANDING is set to ENABLE

16.7.1.85 MC_SEC_CARVEOUT_BOM_0

Offset: 0x670 | Read/Write: R/W | Reset: 0xfff00000 (0b111111111111xxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:20	0xfff	SEC_CARVEOUT_BOM: [PMC_SECURE] Base address for the SEC carveout address space.

16.7.1.86 MC_SEC_CARVEOUT_SIZE_MB_0

Offset: 0x674 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxx000000000000)

Bit	Reset	Description
11:0	0x0	SEC_CARVEOUT_SIZE_MB: [PMC_SECURE] SEC_CARVEOUT_SIZE_MB is the size, in megabytes, of the SEC carveout region. If set to 0, the security check in MC is disabled.

16.7.1.87 MC_SEC_CARVEOUT_REG_CTRL_0

Offset: 0x678 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	ENABLED	SEC_CARVEOUT_WRITE_ACCESS: [PMC_SECURE] Sticky bit to control the writes to the other Sec Carveout aperture registers. 0 = ENABLED 1 = DISABLED

16.7.1.88 MC_ERR_SEC_STATUS_0

Offset: 0x67c | Read/Write: RO | Reset: 0x00XXX0XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
21:20	X	ERR_SEC_ADR_HI: Higher address bits of erring address whose lower bits are available in the ERR_ADR register
18	X	ERR_SEC_SWAP
17	X	ERR_SEC_SECURITY: Set if the transaction was secure. 0 = NONSECURE 1 = SECURE

Bit	Reset	Description
16	X	ERR_SEC_RW: Direction of the access that caused the error. 0 = READ 1 = WRITE
14:12	X	ERR_SEC_ADR1: Second subpartition unique address bits.
6:0	X	ERR_SEC_ID: Client identifier (see above list) of the access that caused the error.

16.7.1.89 MC_ERR_SEC_ADR_0

Bit	Reset	Description
31:0	X	ERR_SEC_ADR

16.7.1.90 MC_PC_IDLE_CLOCK_GATE_CONFIG_0

Partition Idle Clock Gate Config

Boot requirements:

This register should be saved in the SDRAM and restored by the OS during warm boot.

Offset: 0x684 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx11111)

Bit	Reset	Description
4:0	0x1f	CLOCK_GATE_IDLE_TICKS: Number of idle "ticks" before a partition client is clock-gated

16.7.1.91 MC_STUTTER_CONTROL_0

Offset: 0x688 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	SLOW_EMCCLK_DURING_DSR: When ENABLED, the clock to the EMC will be slowed during dynamic self refresh. 0 = DISABLED 1 = ENABLED

16.7.1.92 MC_EMEM_ARB_NISO_THROTTLE_0

External Memory Arbitration Configuration: Snap Arbiter Throttle

Highest Ring Snap Arbiter Input Throttle - This register applies to the inputs of the highest ring. Refer to the EMEM_ARB_NISO_THROTTLE_MASK register to see how partition clients are configured into the "NISO meta-client" group for the purpose of NISO client throttling.

Boot requirements:

- This register should be saved in the SDRAM and restored by the OS during warm boot.

This register is shadowed: see usage note at the top of Section 16.7.1

Offset: 0x6b0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxx00000xxxxxxxxxxx00000)

Bit	Reset	Description
20:16	0x0	NISO_THROTTLE_CYCLES_HIGH: Cycles of throttle after each request when the outstanding transaction count is greater than or equal to the threshold.

Bit	Reset	Description
4:0	0x0	NISO_THROTTLE_CYCLES: Cycles of throttle after each request.

16.7.1.93 MC_EMEM_ARB_OUTSTANDING_REQ_NISO_0

External Memory Arbitration Configuration: Highest Ring Input NISO Outstanding Request Limiter

Although called NISO, this register applies to the inputs of the highest snap-arbiter ring. Refer to the EMEM_ARB_NISO_THROTTLE_MASK register to see how partition clients are configured into the "NISO meta-client" group for the purpose of NISO client throttling.

This register can be used to limit the number of outstanding requests in the arbiter and monitor the count. If the outstanding transactions are greater than the maximum, the highest ring requests are throttled based on the MC_EMEM_ARB_NISO_THROTTLE register.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This arbitration configuration register should be saved to SDRAM and restored by the OS during warm boot.
- During the Boot ROM section of warm boot, this register may be derived from other MC settings.

This register is shadowed: see usage note at the top of Section 16.7.1

Offset: 0x6b4 | Read/Write: R/W | Reset: 0x8XXX0080 (0b10xxxxxxxxxxxxxxxxxxxxx010000000)

Bit	R/W	Reset	Description
31	RW	ENABLE	LIMIT_OUTSTANDING_NISO: When ENABLED, requests into NISO are throttled after the request count reaches ARB_MAX_OUTSTANDING_NISO. 0 = DISABLE 1 = ENABLE
30	RW	DISABLE	LIMIT_DURING_HOLDOFF_OVERRIDE_NISO: When DISABLED, overrides the limiting of NISO transactions during holdoff to let requests flow freely. 0 = DISABLE 1 = ENABLE
24:16	RO	X	ARB_OUTSTANDING_COUNT_NISO: Current number of outstanding requests.
8:0	RW	0x80	ARB_MAX_OUTSTANDING_NISO: The maximum number of requests allowed in the arbiter when LIMIT_OUTSTANDING is set to ENABLE.

16.7.1.94 MC_EMEM_ARB_NISO_THROTTLE_MASK_0

External Memory Arbitration Configuration: Highest Ring Input NISO Throttle Mask

This register is used to group partition clients in the highest level snap-arbiter ring into a "NISO meta-client" group for the purpose of throttling. This allows soft-ISO clients in this ring to meet their bandwidth needs.

To prevent non-ISO (NISO) clients from filling the MC row-sorter (which could prevent soft-ISO clients from getting bandwidth), selective throttling is implemented at the input of ring2. To do this, the EMEM_ARB_NISO_THROTTLE_MASK register is used to specify which partition clients get included into a "NISO meta-client" group. To implement throttling, a total number of outstanding transactions counter (for example, only one counter exists in the whole "NV_MC_cif" to track this, and is shared by all throttling circuits) gets compared to a programmable maximum limit for this NISO meta-client group. If the number is greater than the maximum limit, all clients included in the "NISO meta-client" group get throttled based on the EMEM_ARB_NISO_THROTTLE register. This NISO_THROTTLE register is used to specify a number of stall cycles that get inserted at the input to the ring after every request from any of the clients included in the NISO group.

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0x6b8 | Read/Write: R/W | Reset: 0x00000000 (0bxx0000xx00xx0x0xx0xxxx000xxx000x)

Bit	Reset	Description

16.7.1.98 MC_CLIENT_HOTRESET_CTRL_1_0

Memory Client Hot Reset Control Register

Writing FLUSH_ENABLE to a bit in this register causes a flush to be performed on all clients for the selected swname. The status of the flush (done/in progress) can be monitored in the CLIENT_HOTRESET_STATUS register.

A proper client reset sequence is as follows:

- Set the appropriate FLUSH_ENABLE bit in the CLIENT_HOTRESET_CTRL register to block further access by the client, and start the flush process.
- Poll the CLIENT_HOTRESET_STATUS register until the appropriate bit returns FLUSH_DONE.
- Clear module bit in the CLK_RST_CONTROLLER_RST_DEVICES_* register to reset the module.
- Set module bit in the CLK_RST_CONTROLLER_RST_DEVICES_* register to release the module reset.
- Clear the appropriate FLUSH_ENABLE bit in the CLIENT_HOTRESET_CTRL register to allow transactions to flow.

Offset: 0x970 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx000)

Bit	Reset	Description
2	DISABLE	GPU_FLUSH_ENABLE: 0 = DISABLE 1 = ENABLE 0 = DISABLED 1 = ENABLED

16.7.1.113 MC_SMMU_DC1_ASID_0

SMMU DC1 ASID Assignment Register

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

Offset: 0xa88 | Read/Write: R/W | Secure Trust Zone Protected | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	DC1_SMMU_ENABLE: If set, translation is enabled for this client. 0 = DISABLE 1 = ENABLE
6:0	0x0	DC1_ASID: ASID to use for translation, if enabled.

16.7.1.114 MC_SMMU_SDMMC1A_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

SMMU SDMMC1A ASID Assignment Register

Offset: 0xa94 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	SDMMC1A_SMMU_ENABLE: If set, translation is enabled for this client. 0 = DISABLE 1 = ENABLE
6:0	0x0	SDMMC1A_ASID: ASID to use for translation, if enabled.

16.7.1.115 MC_SMMU_SDMMC2A_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

SMMU SDMMC2A ASID Assignment Register

Offset: 0xa98 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	SDMMC2A_SMMU_ENABLE: If set, translation is enabled for this client. 0 = DISABLE 1 = ENABLE
6:0	0x0	SDMMC2A_ASID: ASID to use for translation, if enabled.

16.7.1.116 MC_SMMU_SDMMC3A_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

SMMU SDMMC3A ASID Assignment Register

Offset: 0xa9c | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	SDMMC3A_SMMU_ENABLE: If set, translation is enabled for this client. 0 = DISABLE 1 = ENABLE
6:0	0x0	SDMMC3A_ASID: ASID to use for translation, if enabled.

16.7.1.117 MC_SMMU_SDMMC4A_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

SMMU SDMMC4A ASID Assignment Register

Offset: 0xaa0 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	SDMMC4A_SMMU_ENABLE: If set, translation is enabled for this client. 0 = DISABLE 1 = ENABLE
6:0	0x0	SDMMC4A_ASID: ASID to use for translation, if enabled.

16.7.1.118 MC_SMMU_ISP2B_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

SMMU ISP2B ASID Assignment Register

Offset: 0xaa4 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	ISP2B_SMMU_ENABLE: If set, translation is enabled for this client. 0 = DISABLE 1 = ENABLE
6:0	0x0	ISP2B_ASID: ASID to use for translation, if enabled.

16.7.1.119 MC_SMMU_GPU_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

SMMU GPU ASID Assignment Register

Offset: 0xaa8 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	GPU_SMMU_ENABLE: Hardcoded for GPU to DISABLE. 0 = DISABLE 1 = ENABLE
6:0	0x0	GPU_ASID: ASID to use for translation, if enabled.

16.7.1.120 MC_SMMU_GPUB_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

SMMU GPUB ASID Assignment Register

Offset: 0xaac | Read/Write: R/W | Reset: 0x80000000 (0b1xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	ENABLE	GPUB_SMMU_ENABLE: Hardcoded for GPUB to ENABLE. 0 = DISABLE 1 = ENABLE
6:0	0x0	GPUB_ASID: ASID to use for translation, if enabled.

16.7.1.121 MC_SMMU_PPCS2_ASID_0

Enables or disables SMMU translation for the module and if enabled sets the ASID for translation.

This register is not TrustZone secure, but non-secure writes to this register will be dropped if either the current or new value of the ASID field is for a secure ASID (regardless of the current or new value of the SMMU_ENABLE field).

Boot requirements:

- This register should be saved to SDRAM and restored by the OS during warm boot.

SMMU PPCS2 ASID Assignment Register

Offset: 0xab0 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
31	DISABLE	PPCS2_SMMU_ENABLE: If set, translation is enabled for this client. 0 = DISABLE 1 = ENABLE
6:0	0x0	PPCS2_ASID: ASID to use for translation, if enabled.

16.7.2 EMC Registers

USAGE NOTE: Many EMC register fields are shadowed:

- Writes to shadowed register fields update the shadow copy (this is default, assumes DBG.WRITE_MUX==ASSEMBLY).
- Reads to shadowed register fields return the currently-active copy (this is default, assumes DBG.READ_MUX==ACTIVE).

This allows a new set of frequency-dependent timing parameters to be written to the shadow registers while memory traffic is ongoing, then when the parameters are completely written, the EMC hardware can perform a timing-safe switch.

Such switches can be triggered via two methods: TIMING_CONTROL.TIMING_UPDATE (generally used during initialization), or the automatic CAR/EMC handshake on a clock-frequency or divider change (assuming CFG_2.CLKCHANGE_REQ_ENABLE==ENABLED).

Registers that are shadowed are marked by a comment:

This register is shadowed: see usage note at the top of Section 16.7.2

Occasionally, only certain fields in the register will be shadowed; if so they are noted after the above comment.

USAGE NOTE: Many EMC registers play crucial roles in warm boot (also known as "wake from LP0") and cold boot (also known as "power up") sequences. Suggested actions for the Boot ROM/Boot Loader are noted after "Boot requirements:".

USAGE NOTE: The EMC register fields to be stored in the PMC must have "[PMC]", "[PMC2]", or "[PMC3]".in their comments. ([PMC2] registers are packed/unpacked after [PMC] register group in software code. [PMC3] is even later.) The fields that need to be stored in PMC Secure Scratch registers must have [PMC_SECURE] in their comments.

USAGE NOTE: When writing to a register, any bits that are not intended to be modified should be rewritten with their existing values.

USAGE NOTE: Unspecified bits may not appear in tables and should be written with their Reset values.

16.7.2.1 EMC_INTSTATUS_0

Interrupt Status Register

Clear on 1-write. Init value is clear. This register is “sticky”.

Offset: 0x0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0000000xxx)

Bit	Reset	Description
9	CLEAR	DLL_LOCK_TIMEOUT_INT: Indicates a DLL lock timeout has occurred. 0 = CLEAR 1 = SET
8	CLEAR	CCFIFO_OVERFLOW_INT: Clock change FIFO overflow. 0 = CLEAR 1 = SET
7	CLEAR	DLL_ALARM_INT: Indicates a DLL alarm has been set 0 = CLEAR 1 = SET
6	CLEAR	ACCESS_TO_SR_DPD_DEV_INT: Indicates a system attempt to access a self-refresh/deep-powered-down device. 0 = CLEAR 1 = SET
5	CLEAR	MRR_DIVLD_INT: LPDDR3 MRR data is available to be read. 0 = CLEAR 1 = SET
4	CLEAR	CLKCHANGE_COMPLETE_INT: CAR/EMC clock-change handshake complete. 0 = CLEAR 1 = SET
3	CLEAR	REFRESH_OVERFLOW_INT: Refresh request overflow timeout. 0 = CLEAR 1 = SET

16.7.2.2 EMC_INTMASK_0

Interrupt Mask Register

Init value is masked.

Offset: 0x4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0000000xxx)

Bit	Reset	Description
9	MASKED	DLL_LOCK_TIMEOUT_INTMASK: Mask for DLL lock timeout interrupt. 0 = MASKED 1 = UNMASKED
8	MASKED	CCFIFO_OVERFLOW_INTMASK: Mask for clock change FIFO overflow. 0 = MASKED 1 = UNMASKED

Bit	Reset	Description
7	MASKED	DLL_ALARM_INTMASK: Mask for DLL alarm 0 = MASKED 1 = UNMASKED
6	MASKED	ACCESS_TO_SR_DPD_DEV_INTMASK: Mask for access a self-refresh/deep-powered-down device interrupt. 0 = MASKED 1 = UNMASKED
5	MASKED	MRR_DIVLD_INTMASK: Mask for MRR data available. 0 = MASKED 1 = UNMASKED
4	MASKED	CLKCHANGE_COMPLETE_INTMASK: Mask for CAR/EMC clock-change handshake complete. 0 = MASKED 1 = UNMASKED
3	MASKED	REFRESH_OVERFLOW_INTMASK: Mask for refresh request overflow timeout. 0 = MASKED 1 = UNMASKED

16.7.2.3 EMC_CFG_0

Configuration Register

The CFG register is used to configure the external memory interface.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0xc | Read/Write: R/W | Reset: 0x03c0000e (0b0000x01111000000xxxxxx000000111x)

Bit	Reset	Description
31	DISABLED	DRAM_CLKSTOP_PD: [PMC] clock stop is only allowed to happen if the DRAM is in active/precharge powerdown (for all CKE bits associated with clock) 0 = DISABLED 1 = ENABLED
30	DISABLED	DRAM_CLKSTOP_SR: [PMC] clockstop is only allowed to happen if the DRAM is in self-refresh (for all CKE bits associated with clock) 0 = DISABLED 1 = ENABLED
29	NO_POWERDOWN	DRAM_ACPD: [PMC] Allows the DRAM controller to perform opportunistic active powerdown control using the CKE pin on the DRAM. The behavior of the powerdown control logic is controlled by the PDEX2* and *2PDEN registers. The value of DRAM_ACPD should only be changed when CKE is low, e.g., during software-controlled self-refresh or before DRAM initialization. 0 = NO_POWERDOWN 1 = ACTIVE_POWERDOWN
28	DISABLED	DYN_SELF_REF: [PMC] 0 = DISABLED 1 = ENABLED
26	DISABLED	REQACT_ASYNC: [PMC] Allows independent transfers of activates and transactions from the MC to the EMC. Disabled to preserve the order of requests selected by mc_arb logic. 0 = DISABLED 1 = ENABLED

Bit	Reset	Description
25	ENABLED	AUTO_PRE_WR: [PMC] enable using MC auto-precharge indication for writes. This bits, when set to DISABLE, will override the settings in the MC register (EMC ignore the auto-precharge indication from MC). Otherwise, they permit clients to make either auto or explicit precharge requests depend on the state of MAN_PRE_WR. 0 = DISABLED 1 = ENABLED
24	ENABLED	AUTO_PRE_RD: [PMC] enable using MC auto-precharge indication for reads. This bits, when set to DISABLE, will override the settings in the MC register (EMC ignores the auto-precharge indication from MC). Otherwise, they permit clients to make either auto or explicit precharge requests depend on the state of MAN_PRE_RD. 0 = DISABLED 1 = ENABLED
23	ENABLED	MAN_PRE_WR: [PMC] enable explicit-precharge in the EMC for writes. When this bit is enabled (and AUTO_PRE_WR=enable), EMC will issue an explicit precharge command after the memory write command. If this bit is disabled (and AUTO_PRE_WR=enable), the EMC will issue an auto-precharge with the memory write command. 0 = DISABLED 1 = ENABLED
22	ENABLED	MAN_PRE_RD: [PMC] enable explicit-precharge in the EMC for reads. When this bit is enabled (and AUTO_PRE_RD=enable), EMC will issue an explicit precharge command after the memory read command. If this bit is disabled (and AUTO_PRE_RD=enable), the EMC will issue an auto-precharge with the memory read command. 0 = DISABLED 1 = ENABLED
21	DISABLED	PERIODIC_QRST: [PMC] specifies whether or not to periodic reset the FBIO read-data FIFO during normal operation. The periodic resets can be used for graceful recovery from an intermittent failure condition; only the initial reset is absolutely required. Note: For LPDDRx and MRR (if ever used), this bit should be set to enable. 0 = DISABLED 1 = ENABLED
20	DISABLED	EN_DYNAMIC_PUTERM: [PMC] enable dynamic puterm. 0 = DISABLED 1 = ENABLED
19	DISABLED	DLY_WR_DQ_HALF_CLOCK: [PMC] 1 = delay write data by 1/2 clock. 0 = DISABLED 1 = ENABLED
18	DISABLED	DSR_VTTGEN_DRV_EN: [PMC] enable VTTGEN controls (via DSR_VTTGEN_DRV/TXDSRVTTGEN registers) during DSR. 0 = DISABLED 1 = ENABLED
17:16	TWOX	EMC2MC_CLK_RATIO: [PMC] EMC to MC clock ratio. 0 = TWOX 1 = ONEX 2 = FOURX 3 = RESERVED
9	0x0	WAIT_FOR_ISP2B_READY_B4_CC: [PMC] 1 = wait for isp2b ready event to be asserted before acknowledge clock change.
8	0x0	WAIT_FOR_VI2_READY_B4_CC: [PMC] 1 = wait for vi2 ready event to be asserted before acknowledge clock change.
7	0x0	WAIT_FOR_ISP2_READY_B4_CC: [PMC] 1 = wait for isp2 ready event to be asserted before acknowledge clock change.
6	0x0	INVERT_DQM: [PMC] 1 = invert DQM polarity.

Bit	Reset	Description
5	0x0	WAIT_FOR_DISPLAYB_READY_B4_CC: [PMC] 1 = wait for displayb ready event to be asserted before acknowledging clock change.
4	0x0	WAIT_FOR_DISPLAY_READY_B4_CC: [PMC] 1 = wait for display ready event to be asserted before acknowledging clock change.
3	0x1	EMC2PMACRO_CFG_BYPASS_DATAPIPE2: [PMC] 1 = bypass data pipeline stage2 (closer to I/O) between EMC and data pad-macro.
2	0x1	EMC2PMACRO_CFG_BYPASS_DATAPIPE1: [PMC] 1 = bypass data pipeline stage1 (closer to core) between EMC and data pad-macro.
1	0x1	EMC2PMACRO_CFG_BYPASS_ADDRPIPE: [PMC] 1 = bypass address pipeline stage between EMC and address pad-macro.

16.7.2.4 EMC_ADR_CFG_0

External Memory Address Configuration, System

The ADR_CFG register is used to specify the number of DRAM devices. DRAM density and geometry parameters are specified by the EMEM_ADR_CFG* registers in MC.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x10 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx1)

Bit	Reset	Description
0	N2	EMEM_NUMDEV: [PMC SECURE] Number of populated DRAM devices. 0 = N1 1 = N2

16.7.2.5 EMC_REFCTRL_0

Refresh Control Register

The REFCTRL register allows software to enable or disable the refresh controller.

REF_VALID should be enabled after the initialization sequence is completed.

Boot requirements:

- If per-device DPD is used, the DEVICE_REFRESH_DISABLE field should be parameterized in the BCT and written by the Boot ROM during cold boot.
- If per-device DPD is used, the DEVICE_REFRESH_DISABLE field should be parameterized the scratch registers and restored by the Boot ROM during warm boot.
- REF_VALID field should always be set to ENABLED for normal use, no need to parameterize in BCT/scratch.

Offset: 0x20 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
31	DISABLED	REF_VALID: Enable refresh controller. 0 = DISABLED 1 = ENABLED
1:0	0x0	DEVICE_REFRESH_DISABLE: Disables refresh to individual attached device (1 bit per DRAM chip select).

16.7.2.6 EMC_PIN_0

Controls State of Selected DRAM Pins

The PIN register allows software to control the state of the selected external DRAM pins.

Boot requirements:

- Both fields in this register should be set to NORMAL during cold boot.
- Both fields in this register should be set to NORMAL during warm boot.

Offset: 0x24 | Read/Write: R/W | Reset: 0x00000100 (0bxxxxxxxxxxxxxxxxxxxxxxxx1xxx0xxx0)

Bit	Reset	Description
8	INACTIVE	PIN_RESET: Selects the level of the DDR3 RESET# pin. 0 = ACTIVE 1 = INACTIVE
4	NORMAL	PIN_DQM: Is used to always mask DRAM writes. This pin should only be used for initialization. Certain DRAM vendors require the DQM to be high during initialization. The register value should be set to NORMAL after the initialization sequence. 0 = NORMAL 1 = INACTIVE
0	POWERDOWN	PIN_CKE: Selects the level of the CKE pin. This can be used to place the DRAM in power down state. PIN_CKE value is applied all CKE pins. 0 = POWERDOWN 1 = NORMAL

16.7.2.7 EMC_TIMING_CONTROL_0

Triggers an Update of the Timing-Related Registers

The TIMING_CONTROL register is used by software to trigger parameter updates for timing parameter registers, RDQS/QUSE delay controls, and some DLL controls. Writing the TIMING_UPDATE field updates the active state of these registers with the programmed assembly state. The active state is updated during a safe interval determined by the EMC. If CLKCHANGE_REQ_ENABLE is enabled, the active value will automatically be updated on completion of the clock change.

> **Note:** Programming of this register does not trigger the shadow register update event immediately. To prevent shadow register programming issued after programming this register from being latched accidentally, always poll for TIMING_UPDATE_STALLED==0 after programming this register.

Boot requirements:

- Writing this register with 0x1 will trigger a timing update event, which should be used in both warm boot and cold boot sequences.

Offset: 0x28 | Read/Write: R/W | Reset: 0x0000000X (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
0	X	TIMING_UPDATE

16.7.2.8 EMC_RC_0

DRAM Timing Parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2c | Read/Write: R/W | Reset: 0x0000007f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx1111111)

Bit	Reset	Description
6:0	0x7f	RC: [PMC] Specifies the row cycle time. This is the minimum number of cycles between activate commands to the same bank. LPDDR3 : ceil((tRASmin+tRPpb)/tCK) – 1 DDR3: max(0, ceil(tRC/tCK) - (CMD_2T_TIMING == 1 ? 2 : 1))

16.7.2.9 EMC_RFC_0

DRAM Timing Parameter

This register is shadowed: see usage note at the top of Section 16.7.2 .

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x30 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxx000111111)

Bit	Reset	Description
8:0	0x3f	RFC: [PMC] specifies the auto refresh cycle time. This is the minimum number of cycles between an auto refresh command and a subsequent auto refresh or activate command. LPDDR3: ceil(tRFCab/tCK) – 1 DDR2 : ceil(tRFC/tCK) - 1 DDR3: max(0, ceil(tRFC/tCK) - (CMD_2T_TIMING == 1 ? 2 : 1))

16.7.2.10 EMC_RAS_0

DRAM Timing Parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x34 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	RAS: [PMC] specifies the row active time. This is the minimum number of cycles between an activate command and a precharge command to the same bank. DDR3: max(0, ceil(tRASmin/tCK) - (CMD_2T_TIMING == 1 ? 2 : 1)) LPDDR3: max(3, ceil(tRASmin/tCK)) - 1

16.7.2.11 EMC_RP_0

DRAM Timing Parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x38 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	RP: [PMC] specifies the row precharge time. This is the minimum number of cycles between a precharge command and an activate command to the same bank. DDR3: max(0, ceil(tRP/tCK) - (CMD_2T_TIMING == 1 ? 2 : 1)) LPDDR3: max(3, ceil(tRP/tCK)) - 1

16.7.2.12 EMC_R2W_0

R2something and W2something registers are independent of burst length, and are relative to the last virtual CAS_ of a command. Counting starts from the last data transfer as related to where CAS_ would be if BL = 4.

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x3c | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx11111)

Bit	Reset	Description
4:0	0x1f	R2W: [PMC] specifies the minimum number of cycles from any read command to any write command, irrespective of bank. This parameter guarantees the read->write turnaround time on the bus. DDR3: RL - WL + 2 - (CMD_2T_TIMING == 1 ? 1 : 0) + (CTT_TERMINATION == 1 ? max(0, CTT + CTT_DURATION - RDV - 2) : (EMC2PMACRO_CFG_XM2DQS_E_STRPULL_DQS ? 1 : 0)) + (EMC2PMACRO_CFG_QUSE_MODE == ALWAYS_ON ? 1 : 0) LPDDR3: RL - WL + 1 + ceil(tDQSCKmax/tCK) + (EMC2PMACRO_CFG_XM2DQS_E_STRPULL_DQS ? 1 : 0) + (EMC2PMACRO_CFG_QUSE_MODE == ALWAYS_ON ? 1 : 0) Largest programming value is 29

16.7.2.13 EMC_W2R_0

R2something and W2something registers are independent of burst length, and are relative to the last virtual CAS_ of a command. Counting starts from the last data transfer as related to where CAS_ would be if BL = 4.

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x40 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx11111)

Bit	Reset	Description
4:0	0x1f	W2R: [PMC] specifies the minimum number of cycles from a write command to a read command, irrespective of bank. DDR3 : WL + max(4, ceil(tWTR/tCK)) - (CMD_2T_TIMING == 1 ? 1 : 0) LPDDR3 : WL + 1 + ceil(tWTR/tCK) Largest programming value is 29.

16.7.2.14 EMC_R2P_0

R2something and W2something registers are independent of burst length, and are relative to the last virtual CAS_ of a command. Counting starts from the last data transfer as related to where CAS_ would be if BL = 4.

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x44 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx11111)

Bit	Reset	Description
4:0	0x1f	R2P: [PMC] specifies the minimum number of cycles from a read command to a precharge command for the same bank. DDR3 : max(4, ceil(tRTP/tCK)) - (CMD_2T_TIMING == 1 ? 2 : 1) LPDDR3: BL/2 + max(2, ceil(tRTP/tCK)) 4 .

16.7.2.15 EMC_W2P_0

R2something and W2something registers are independent of burst length, and are relative to the last virtual CAS_ of a command. Counting starts from the last data transfer as related to where CAS_ would be if BL = 4.

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x48 | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	W2P: [PMC] Specifies the minimum number of cycles from a write command to a precharge command for the same bank. DDR3 : WL + max(2, ceil(tWR/tCK)) - (CMD_2T_TIMING == 1 ? 1 : 0) LPDDR3: WL + max(3, TWR)

16.7.2.16 EMC_RD_RCD_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x4c | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx011111)

Bit	Reset	Description
5:0	0x1f	RD_RCD: [PMC] Specifies the RAS to CAS delay. RD_RCD is the minimum number of cycles between an activate command and a read command to the same bank. DDR3 : ceil(tRCD/tCK) - (CMD_2T_TIMING == 1 ? 2 : 1) LPDDR3: max(3, ceil(tRCD/tCK)) - 1

16.7.2.17 EMC_WR_RCD_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x50 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx011111)

Bit	Reset	Description
5:0	0x1f	WR_RCD: [PMC] Minimum number of cycles between an activate command and a write command to the same bank. DDR3 : ceil(tRCD/tCK) - (CMD_2T_TIMING == 1 ? 2 : 1) LPDDR3: max(3, ceil(tRCD/tCK)) - 1

16.7.2.18 EMC_RRD_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x54 | Read/Write: R/W | Reset: 0x0000000f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx1111)

Bit	Reset	Description
3:0	0xf	RRD: [PMC] specifies the Bank X Act to Bank Y Act command delay. DDR3 : max(4, ceil(tRRD/tCK)) - (CMD_2T_TIMING == 1 ? 2 : 1) LPDDR3: max(2, ceil(tRRD/tCK)) - 1

16.7.2.19 EMC_REXT_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x58 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0001)

Bit	Reset	Description
3:0	0x1	REXT: [PMC] specifies the read to read delay for reads when multiple physical devices are present. DDR3: USE_PER_DEVICE_DLY_TRIM_IB == 1 ? 2 : 1 LPDDR3: ceil(3/tCK + 0.5) + USE_PER_DEVICE_DLY_TRIM_IB ? 1 : 0

16.7.2.20 EMC_WDV_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x5c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3:0	0x0	WDV: [PMC] The number of cycles to post (delay) write data from being asserted to the RAMs. DDR3 : WL - 1 LPDDR3 : WL 15 = MAX

16.7.2.21 EMC_QUSE_0

DRAM timing parameter

The QRST, QUSE, and RDV fields specify the delays from read to internal timing signals. These fields should be set as follows:

QUSE = CAS_LATENCY - 1 non-mobile SDRAM
= CAS_LATENCY - 2 for mobile SDRAM
QRST = CAS_LATENCY - 2
QSAFE >= RDV - QRST
RDV = CAS_LATENCY + 5
EINPUT = RDV - 7

Because SDRAM uses a tristating clock (the DQS), a method is needed to deal with the ambiguity of when DQS is tristated. Only one such method is supported: QUSE.

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x60 | Read/Write: R/W | Reset: 0x00000002 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx000010)

Bit	Reset	Description
5:0	0x2	QUSE: [PMC] Tells the chip when to look for read return data. LPDDR3/DDR3: obtained from characterization

16.7.2.22 EMC_QRST_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x64 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx000001)

Bit	Reset	Description
5:0	0x1	QRST: [PMC] time from expiration of QSAFE until reset is issued. DDR3 : CL - 2 LPDDR3: RL - 2

16.7.2.23 EMC_QSAFE_0

DRAM timing parameter

When PERIODIC_QRST is enabled, the QSAFE parameter is intended to guarantee that the QRSTs will not interfere with pending reads (for example, the queue is empty). This field must be set to at least (RDV - QRST).

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x68 | Read/Write: R/W | Reset: 0x00000007 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00111)

Bit	Reset	Description
4:0	0x7	QSAFE: [PMC] Time from a read command to when it is safe to issue a QRST (delayed by the QRST parameter). LPDDR3/DDR3 QSAFE >= RDV - QRST

16.7.2.24 EMC_RDV_0

DRAM timing parameter

RDV is the read latency register. This register value is not negotiable; it will work with the right value and will not with the wrong value. It uses sequential timing, not combinational (i.e., maybe the silicon is fast enough type) timing.

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x6c | Read/Write: R/W | Reset: 0x00000008 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx001000)

Bit	Reset	Description
5:0	0x8	RDV: [PMC] Time from read command to latching the read data from the pad macros. DDR3 : RL + 6 + f_ceil(fly-by-time/tCK) - (dram-dll-is-off ? 1 : 0) LPDDR3: RL + 6 + ceil((tDQSCKmax + fly-by-time)/tCK) Fly-by-time is board routing dependent, which usually should be less than 1.5ns. dram-dll-is-off is true below 150 MHz where DRAM DLL has to be turned off 45 = MAX

16.7.2.25 EMC_REFRESH_0

DRAM timing parameter

The value of REFRESH is calculated using the following formula:

```
{REFRESH, REFRESH_LO} = max[(tREF/#_of_rows) / (emc_clk_period) - 64,
                            (tREF/#_of_rows) / (emc_clk_period) * 97%]
```

For example, if the clock frequency is 133 MHz, and the refresh requirement is 64 ms per 4096 rows. The programming value is 0x7e3.

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x70 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxx0000000000011111)

Bit	Reset	Description
15:6	0x0	REFRESH: [PMC] Specifies the interval between refresh requests.
5:0	0x1f	REFRESH_LO: [PMC]

16.7.2.26 EMC_BURST_REFRESH_NUM_0

DRAM timing parameter

BURST_REFRESH_NUM is used to specify the refresh burst count. The refresh controller will wait until BURST_REFRESH_NUM refreshes have been scheduled, then issue them all at once. This can result in a performance improvement in many cases.

Note:	If tRAS(max) is less than the refresh interval (tREF/#_of_rows), tRAS(max) must be used instead of the refresh interval in the formula above. This is because refresh is used to satisfy tRAS(max) timing. Accordingly, BURST_REFRESH_NUM must be programmed in such a way that queuing up multiple refreshes does not violate tRAS(max) timing. Burst length = 2^BURST_REFRESH_NUM. Refreshes will be throttled to meet TREFBW limitation (8/window) if TREFBW > 0.
Note:	Do not program this register to value non-zero unless for testing.

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x74 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3:0	BR1	BURST_REFRESH_NUM: [PMC] Specify the refresh burst count. 0 = BR1 1 = BR2 2 = BR4 3 = BR8 4 = BR16 5 = BR32 6 = BR64 7 = BR128 8 = BR256 9 = BR512 9 = MAX

16.7.2.27 EMC_PDEX2WR_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x78 | Read/Write: R/W | Reset: 0x0000003e (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111110)

Bit	Reset	Description
5:0	0x3e	PDEX2WR: Specify the timing delay from exit of powerdown mode to a write command. DDR3 : max(3, ceil(tXP/tCK)) - (CMD_2T_TIMING == 1 ? 2 : 1) LPDDR3 : ceil(tXP/tCK) - 1 Note: on DDR3, if slow power down exit mode is used and ODT is enabled, use max(10, ceil(tXPDLL/tCK)) instead of max(3, ceil(tXP/tCK)) in the formula. The largest allowed value is 62.

16.7.2.28 EMC_PDEX2RD_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x7c | Read/Write: R/W | Reset: 0x0000003e (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111110)

Bit	Reset	Description
5:0	0x3e	PDEX2RD: Specify the timing delay from exit of powerdown mode to a read command. DDR3: (use-slow-pd-exit-mode ? max(10, ceil(tXPDLL/tCK)) : max(3, ceil(tXP/tCK))) - (CMD_2T_TIMING == 1 ? 2 : 1) LPDDR3: ceil(tXP/tCK) - 1 use-slow-pd-exit-mode is 1 if slow power down exit mode is used (MR0 bit 12 is 0). The largest allowed value is 62.

16.7.2.29 EMC_PCHG2PDEN_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x80 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx011111)

Bit	Reset	Description
5:0	0x1f	PCHG2PDEN: [PMC] Specify the timing delay from a precharge command to powerdown entry. DDR3: 1 LPDDR3: f_ceil(tRP]/tCK) - (CMD_2T_TIMING == 1 ? 1 : 0)

16.7.2.30 EMC_ACT2PDEN_0

[PMC] DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x84 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx011111)

Bit	Reset	Description
5:0	0x1f	ACT2PDEN: Specify the timing delay from an activate, MRS or EMRS command to power-down entry. DDR3/ LPDDR3: 0

16.7.2.31 EMC_AR2PDEN_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x88 | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxx000011111)

Bit	Reset	Description
8:0	0x1f	AR2PDEN: [PMC] Specify the timing delay from an autorefresh command to powerdown entry. DDR3: max(7, ceil((tXPDLL - tXP)/tCK)) LPDDR3: 1

16.7.2.32 EMC_RW2PDEN_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x8c | Read/Write: R/W | Reset: 0x0000001f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx011111)

Bit	Reset	Description
5:0	0x1f	RW2PDEN: [PMC] Specify the timing delay from a read/write command to powerdown entry. Auto-precharge timing must be taken into account when programming this field DDR3: max(RL+5, WL+4+TWR) - 1 LPDDR3: max(RL+BL/2+ceil((tDQSCKmax+1)/tCK)+1, WL+BL/2+1+ceil((tWR+1)/tCCK)) - 1

16.7.2.33 EMC_TXSR_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x90 | Read/Write: R/W | Reset: 0x000003fe (0bxxxxxxxxxxxxxxxxxxxxxxxx1111111110)

Bit	Reset	Description
9:0	0x3fe	TXSR: [PMC] Cycles between self-refresh exit & first DRAM command that does not require a locked DLL. Largest allowed value is 0x3fe. DDR3: max(5, ceil(tXSR/tCK)) LPDDR3: max(2, ceil(tXSR/tCK))

16.7.2.34 EMC_TCKE_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x94 | Read/Write: R/W | Reset: 0x0000003e (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111110)

Bit	Reset	Description
5:0	0x3e	TCKE: Specify the minimum CKE high pulse width. DDR3: Use-slow-pd-exit-mode ? max(10, ceil(max(tCKESR, uXPDLL)/tCK)) : max(4, ceil(max(tXP,tXP)/tCK)) LPDDR3: max(3, tCKE, ceil(tXP/tCK)) use-slow-pd-exit-mode is 1 if slow power down exit mode is used (MR0 bit 12 is 0).

16.7.2.35 EMC_TFAW_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x98 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
6:0	0x0	TFAW: [PMC] specify the width of the FAW (four-activate window) for 8-bank devices. Set to 0 to disable this timing check. Only 4 activates may occur within the rolling window. . DDR3/LPDDR3: ceil(tFAW/tCK)

16.7.2.36 EMC_TRPAB_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x9c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxx000000)

Bit	Reset	Description
5:0	0x0	TRPAB: [PMC] Specify precharge-all tRP allowance for 8-bank devices. Setting this field to 0 will cause EMC to use TRP.TRP for precharge-all. DDR3: ceil(tRP/tCK) + 1 LPDDR3: max(3, ceil((tRPpb+3)/tCK

16.7.2.37 EMC_TCLKSTABLE_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xa0 | Read/Write: R/W | Reset: 0x0000000f (0bxxxxxxxxxxxxxxxxxxxxxxxxxx01111)

Bit	Reset	Description
4:0	0xf	TCLKSTABLE: [PMC] Specify minimum number of cycles of a stable clock period prior to exiting powerdown or self-refresh modes. DDR3: max(5, ceil(tCKSRX/tCK)) - 1 LPDDR3: 2

16.7.2.38 EMC_TCLKSTOP_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xa4 | Read/Write: R/W | Reset: 0x0000000f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx01111)

Bit	Reset	Description
4:0	0xf	TCLKSTOP: [PMC] Delay from last command to stopping the external clock to DRAM devices. DDR3: max(5, ceil(tCKSRE/tCK)) - 1 LPDDR3: 2

16.7.2.39 EMC_TREFBW_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xa8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxx00000000000000)

Bit	Reset	Description
13:0	0x0	TREFBW: [PMC] specify the width of the burst-refresh window. If set to a non-zero value, only 8 refreshes will occur in this rolling window. Set to 0 to disable this timing check. DDR3: ceil(tREFI/tCK) LPDDR3: ceil(tREFBW/tCK)

16.7.2.40 EMC_ODT_WRITE_0

For DDR3, ODT may be enabled during writes and disabled during reads via control of ODT pin.

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xb0 | Read/Write: R/W | Reset: 0x00000000 (0b00xxxxxxxxxxxxxxxxxx0000xx000000)

Bit	Reset	Description
31	0x0	ENABLE_ODT_DURING_WRITE: enables ODT to be turned on prior to issuing write to DRAM. [PMC] If ENABLE_ODT_DURING_WRITE = 1 and DISABLE_ODT_DURING_READ = 0, ODT will always be enabled after the first write.
30	0x0	ODT_B4_WRITE: [PMC] If this field == 1, ODT is turned on ODT_WR_DELAY cycles prior to DRAM WRITE command. If this field == 0, ODT is turned on ODT_WR_DELAY cycles after DRAM WRITE command. Set ODT_B4_WRITE to 1 if (WL - ceiling(tAOND) - 2) < 0. This field is not used for DDR3.

Bit	Reset	Description
11:8	0x0	ODT_WR_DURATION: [PMC] for LPDDR3, indicate how long to assert ODT by.
5	0x0	SHARE_ONE_ODT: [PMC] For LPDDR3 only. When enabled, ODT[1] is not used. The ODT for both ranks will be sharing the same ODT[0]. When disabled, ODT[0] is controlling rank0, ODT[1] is controlling rank1.
4	0x0	DRIVE_BOTH_ODT: [PMC] If this field = 0, only the ODT for the requested device will be asserted during write. If this field = 1, ODTs for both devices will be asserted during write.
3:0	0x0	ODT_WR_DELAY: [PMC] Set this field = ABS (WL - ceiling(tAOND) - 2). The valid programming range is: 0 <= ODT_WR_DELAY <= 2, if ODT_B4_WRITE=0 0 <= ODT_WR_DELAY <= 1, if ODT_B4_WRITE=1. For DDR3, this field = (WL - 3). For LPDDR3, this field = (WL - 2).

16.7.2.41 EMC_ODT_READ_0

This register is not used. Please keep its reset value.

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xb4 | Read/Write: R/W | Reset: 0x00000000 (0b00xxxxxxxxxxxxxxxxxxxxxxxxxxxx000)

Bit	Reset	Description
31	0x0	DISABLE_ODT_DURING_READ: enables ODT to be turned off prior to issuing read to DRAM. If this field == 0, the ODT state is not changed for reads. If this field == 1, turn off ODT prior to READ command (has no effect if ODT ENABLE_ODT_DURING_WRITE == 0, as ODT will always be disabled). This field is not used for DDR3.
30	0x0	ODT_B4_READ: If this field == 1, ODT is turned off ODT_RD_DELAY cycles prior to DRAM READ command. If this field == 0, ODT is turned off ODT_RD_DELAY cycles after a DRAM READ command. Set ODT_B4_READ to 1 if (RL - ceiling(tAOFD) - 2) < 0. This field is not used for DDR3.
2:0	0x0	ODT_RD_DELAY: Set this field = ABS (RL - ceiling(tAOFD) - 2). The valid programming range is: 0 <= ODT_RD_DELAY <= 2 if ODT_B4_READ=0 0 <= ODT_RD_DELAY <= 1 if ODT_B4_READ=1 This field is not used for DDR3.

16.7.2.42 EMC_WEXT_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xb8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3:0	0x0	WEXT: [PMC] specifies the write to write delay for writes when multiple physical devices are present. DDR3: max(0, (USE_PER_DEVICE_DLY_TRIM_OB == 1 ? 5 : 0) - (CMD_2T_TIMING == 1 ? 1 : 0)) LPDDR3: USE_PER_DEVICE_DLY_TRIM_OB == 1 ? 5 : 0

16.7.2.43 EMC_CTT_0

DRAM timing parameter

CTT controls timing of internal read terminations. Based on read latency (CTT must frame read data). Adding non-RDV linked timing control for flexibility. Has no effect unless CTT_TERMINATION == ENABLED || E_PUTERM_DQ == ENABLED It is sequential timing, not combinational (i.e., maybe the silicon is fast enough type) timing.

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0xbc | Read/Write: R/W | Reset: 0x00000008 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx001000)

Bit	Reset	Description
5:0	0x8	CTT: [PMC] time from read command to CTT turn-on. DDR3 ? (CTT_TERMINATION == 1) ? CL + 7 : 0 LPDDR3: 0 45 = MAX

16.7.2.44 EMC_RFC_SLR_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0xc0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxx000000000)

Bit	Reset	Description
8:0	0x0	RFC_SLR: [PMC] Specifies the stagger refresh cycle time between ranks. This is the minimum number of cycles between an auto refresh command to one rank and a subsequent auto refresh to another rank. A zero value indicates stagger refresh is disabled.

16.7.2.45 EMC_MRS_WAIT_CNT2_0

This register allows the delay between an MRS/EMRS/MRW/MRR command and the following DRAM command

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0xc4 | Read/Write: R/W | Reset: 0x0208000f (0bxxxxxx1000001000xxxxxx0000001111) | Default: 0x03ff03ff

Bit	Reset	SW Default	Description
25:16	0x208	0x3ff	MRS_EXT2_WAIT_CNT: [PMC] Number of EMC clocks to wait before issuing

Bit	Reset	SW Default	Description
			any commands after sending an MRS ext2 command.
9:0	0xf	0x3ff	MRS_EXT1_WAIT_CNT: [PMC] Number of EMC clocks to wait before issuing any commands after sending an MRS ext1 command.

16.7.2.46 EMC_MRS_WAIT_CNT_0

This register allows the delay between an MRS/EMRS/MRW/MRR command and the following DRAM command.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0xc8 | Read/Write: R/W | Reset: 0x0208000f (0bxxxxxx1000001000xxxxxx0000001111)

Bit	Reset	SW Default	Description
25:16	0x208	0x3ff	MRS_LONG_WAIT_CNT: [PMC] Number of EMC clocks to wait before issuing any commands after sending an MRS long command.
9:0	0xf	0x3ff	MRS_SHORT_WAIT_CNT: [PMC] Number of EMC clocks to wait before issuing any commands after sending an MRS short command.

16.7.2.47 EMC_MRS_0

Command Trigger: MRS

The MRS register allows software to issue an MRS command.

BA0, BA1 are used to address MRS or EMRS registers in DRAM. Although this register can also program EMRS, use the EMRS register so that the hardware registers can shadow what is in the DRAM.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0xcc | Read/Write: R/W | Reset: 0x00000000 (0b00xx00xxxx00xxxxxx00000000000000)

Bit	Reset	Description
31:30	0x0	MRS_DEV_SELECTN: [PMC] Active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
27	0x0	USE_MRS_EXT_CNT: [PMC] 0 =USE_MRS_LONG_CNT will select between SHORT(0)/LONG(1), 1=USE_MRS_LONG_CNT will select between EXT1(0)/EXT2(1).
26	SHORT	USE_MRS_LONG_CNT: [PMC] Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
21:20	0x0	MRS_BA: [PMC] Set to 0x0 for MRS.
13:0	0x0	MRS_ADR: [PMC] Mode-register data to be written.

16.7.2.48 EMC_EMRS_0

Command trigger: EMRS

The EMRS register allows software to issue an EMRS command.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0xd0 | Read/Write: R/W | Reset: 0x00000000 (0b00xxx0xxxx00xxxxxx00000000000000)

Bit	Reset	Description
31:30	0x0	EMRS_DEV_SELECTN: [PMC] Active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
27	0x0	USE_EMRS_EXT_CNT: [PMC] 0 = USE_MRS_LONG_CNT will select between SHORT(0)/LONG(1), 1 = USE_MRS_LONG_CNT will select between EXT1(0)/EXT2(1).
26	SHORT	USE_EMRS_LONG_CNT: [PMC] Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
21:20	0x0	EMRS_BA: [PMC] Set to 0x1 for EMRS (and where applicable, 0x2 for EMRS2, and 0x3 for EMRS3).
13:0	0x0	EMRS_ADR: [PMC] Mode-register data to be written.

16.7.2.49 EMC_REF_0

Command Trigger: Refresh

Note: The REF register allows software to issue refresh commands. This is done to ensure proper DRAM initialization.

Boot requirements:

- This register triggers a refresh command. REF_CMD should be written with 0x1 during cold boot to trigger refresh commands during DRAM initialization.

Offset: 0xd4 | Read/Write: R/W | Reset: 0x00000000 (0b00xxxxxxxxxxxxxx00000000xxxxxx00)

Bit	Reset	Description
31:30	0x0	REF_DEV_SELECTN: active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
15:8	0x0	REF_NUM: perform (REF_NUM + 1) refresh cycles.
1	0x0	REF_NORMAL: 0 = execute first refresh immediately (this is use during DRAM initialization). 1 = execute refresh through normal refresh mechanism (this should be used in normal operation).
0	0x0	REF_CMD: causes the hardware to perform a REFRESH to all DRAM banks.

16.7.2.50 EMC_PRE_0

Command Trigger: Precharge-All

The PRE register allows software to issue a precharge all command. This command may be used to ensure proper DRAM initialization.

Boot requirements:

- This register triggers a precharge-all command. PRE_CMD should be written with 0x1 during cold boot to trigger refresh commands during DRAM initialization.
- If per-device DPD is used, the PRE_DEV_SELECTN field should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0xd8 | Read/Write: R/W | Reset: 0x00000000 (0b00xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
31:30	0x0	PRE_DEV_SELECTN: active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
0	0x0	PRE_CMD: causes the hardware to perform a PRECHARGE to all DRAM banks.

16.7.2.51 EMC_NOP_0

Command Trigger: NOP

The NOP register allows software to issue an explicit NOP command. This command may be used to ensure proper DRAM initialization.

Boot requirements:

- This register triggers a no-operation command. NOP_CMD should be written with 0x1 during cold boot to trigger no-op commands during DRAM initialization.

Offset: 0xdc | Read/Write: R/W | Reset: 0b00xxxxxxxxxxxxxxxxxxxxxxxxxxxxx0

Bit	Reset	Description
31:30	0x0	NOP_DEV_SELECTN: active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
0	0x0	NOP_CMD: causes the hardware to perform a NOP to all DRAM banks.

16.7.2.52 EMC_SELF_REF_0

Command Trigger: SELF REFRESH

The SELF_REF register allows software to issue self-refresh commands.

Do not program this register when a clock change sequence is on-going. Check the CLKCHANGE_COMPLETE_INT value if not sure.

Offset: 0xe0 | Read/Write: R/W | Reset: 0x00000000 (0b00xxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
31:30	0x0	SREF_DEV_SELECTN: active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1, 0x3 for neither device.
0	DISABLED	SELF_REF_CMD: causes the hardware to issue a SELF_REFRESH command. While CMD:ENABLED, the CKE pin is held deasserted. The CMD:ENABLED state will override the PIN:CKE setting. The DRAM will ignore all accesses until CMD:DISABLED. 0 = DISABLED 1 = ENABLED

16.7.2.53 EMC_DPD_0

Command Trigger: Deep Power Down

The DPD register allows software to issue a deep power down command.

Offset: 0xe4 | Read/Write: R/W | Reset: 0x00000000 (0b00xxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
31:30	0x0	DPD_DEV_SELECTN: active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.

Bit	Reset	Description
0	DISABLED	DPD_CMD: causes the hardware to issue the deep power down command (Burst Terminate with CKE low). While in DPD mode, the DRAM will not maintain data integrity. While CMD:ENABLED, the CKE pin is held deasserted. The CMD:ENABLED state will override the PIN:CKE setting. The DRAM will ignore all accesses until CMD:DISABLED. 0 = DISABLED 1 = ENABLED

16.7.2.54 EMC_MRW_0

Command Trigger: MRW

Mode Register Write: LPDDR3-only version of MRS/EMRS

Boot requirements:

- This register triggers a mode register write command. Multiple mode-register writes may be required by the cold boot sequence. Such commands should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0xe8 | Read/Write: R/W | Reset: 0x00000000 (0b00xx00xx00000000xxxxxxxx00000000

Bit	Reset	Description
31:30	0x0	MRW_DEV_SELECTN: [PMC] Active-low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for dev1.
27	0x0	USE_MRW_EXT_CNT: [PMC] 0 = USE_MRS_LONG_CNT will select between SHORT(0)/LONG(1), 1 = USE_MRS_LONG_CNT will select between EXT1(0)/EXT2(1).
26	SHORT	USE_MRW_LONG_CNT: [PMC] Indicate to use long or short MRS wait count.
23:16	0x0	MRW_MA: [PMC] Register address
7:0	0x0	MRW_OP: [PMC] Data to be written

16.7.2.55 EMC_MRR_0

Command Trigger: MRR

Mode Register Read: LPDDR3 only

Sequence

1. Read MRR until EMC_STATUS.MRR_DIVLD=0 (ok to skip if it is sure there are no pending MRR reads)

2. Write this register with the desired addr (MA) and device (DEV_SELECTN), device needs to be either DEV0 or DEV1: writing to both is illegal

3. Poll EMC_STATUS.MRR_DIVLD=1, or if using interrupt, wait for MRR_DIVLD_INT

4. Read back MRR. The value is in MRR_DATA field.

Note: It is okay to issue new MRR requests while there are on-going requests. For example, to issue 3 MRR requests, follow these steps: 1,2,2,2,3,4,3,4,3,4. Data read back in step 4 is in the same order requested in step 2.

To make sure the EMC is available for new MRR requests, poll for EMC_STATUS.MRR_FIFO_SPACE > 0 before step 2.

If using 2 x16 DRAM, MRR_DATA[15:8] can be used to store MRR from the second DRAM on the same CS (configured via CFG_3.MRR_BYTESEL_X16)

Offset: 0xec | Read/Write: R/W | Reset: 0x0000XXXX (0b00xx00xx00000000xxxxxxxxxxxxxxxx)

Bit	R/W	Reset	Description
31:30	RW	0x0	MRR_DEV_SELECTN: active-low chip-select, choose which device to send the command to. (enum for safety). 0 = ILLEGAL 1 = DEV1 2 = DEV0 3 = RESERVED
27	RW	0x0	USE_MRR_EXT_CNT: 0 = USE_MRS_LONG_CNT will select between SHORT(0)/LONG(1), 1 = USE_MRS_LONG_CNT will select between EXT1(0)/EXT2(1).
26	RW	SHORT	USE_MRR_LONG_CNT: Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
23:16	RW	0x0	MRR_MA: register address
15:0	RO	X	MRR_DATA: data returned

16.7.2.56 EMC_CMDQ_0

Command Queue Depth Register

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This arbitration configuration register should be parameterized in the BCT and written by the OS during cold boot and warm boot.

Offset: 0xf0 | Read/Write: R/W | Reset: 0x10004408 (0bxxx10000xxxxxxxxx100x100xxx01000)

Bit	Reset	Description
28:24	0x10	RW_WD_DEPTH
14:12	0x4	PRE_DEPTH
10:8	0x4	ACT_DEPTH
4:0	0x8	RW_DEPTH

16.7.2.57 EMC_MC2EMCQ_0

Command Queue Depth Register

Boot requirements:

- This arbitration configuration register should be parameterized in the BCT and written by the OS during cold boot and warm boot.

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0xf4 | Read/Write: R/W | Reset: 0x06000404 (0bxxxx0110xxxxxxxxxxxxx100xxxxx100)

Bit	Reset	Description
27:24	0x6	MCWD_DEPTH
10:8	0x4	MCACT_DEPTH
2:0	0x4	MCREQ_DEPTH

16.7.2.58 EMC_XM2DQSPADCTRL3_0

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0xf8 | Read/Write: R/W | Reset: 0x20820800 (0bx01000x01000x01000x01000xx0xxxx0)

Bit	Reset	Description
30:26	0x8	EMC2PMACRO_CFG_XM2DQS_BYTE3_VREF_DQS: [PMC]
24:20	0x8	EMC2PMACRO_CFG_XM2DQS_BYTE2_VREF_DQS: [PMC]
18:14	0x8	EMC2PMACRO_CFG_XM2DQS_BYTE1_VREF_DQS: [PMC]
12:8	0x8	EMC2PMACRO_CFG_XM2DQS_BYTE0_VREF_DQS: [PMC]
5	0x0	EMC2PMACRO_CFG_XM2DQS_E_VREF_DQS: [PMC]
0	0x0	EMC2PMACRO_CFG_XM2DQS_E_STRPULL_DQS: [PMC]

16.7.2.59 EMC_FBIO_SPARE_0

FBIO Spare Register

Note: CFG_FBIO_SPARE_0[1] = FBIO_SPARE[1] = lock further change to ADDR_SWIZZLE_STACK* and ADR_CFG. registers.

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- CFG_FBIO_SPARE_3 should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x100 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:24	0x0	CFG_FBIO_SPARE_3
23:16	0x0	CFG_FBIO_SPARE_2
15:8	0x0	CFG_FBIO_SPARE_1
7:0	0x0	CFG_FBIO_SPARE_0

16.7.2.60 EMC_FBIO_CFG5_0

FBIO Configuration Register

The trimmer value may be overridden by setting using MULT==0 and OFFS = value << 4.

The FBIO_CFG5 register controls the FBIO I/O cells.

The following fields are shadowed: DIFFERENTIAL_DQS, CTT_TERMINATION, DQS_PULLD, CMD_2T_TIMING.

Writes to these fields will not take effect until the active value is updated via TIMING_UPDATE or (if enabled) CLKCHANGE_REQ.

Boot requirements:

- This register (except for field DISABLE_CONCURRENT_AUTOPRE) should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register (except for field DISABLE_CONCURRENT_AUTOPRE) should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x104 | Read/Write: R/W | Reset: 0x10400815 (0bxxx1x00001000000000100000010101) | Default: 0x00400010

Bit	Reset	SW Default	Description
28	ENABLED	NONE	MASK_PUTERM_N_DQS_PULLD_DURING_ZQCAL: [PMC] When this bit is enabled; it deasserts DQ/DQS puterm and DQS pulld during ZQ calibration in hardware. 0 = DISABLED 1 = ENABLED
26	DISABLED	NONE	CMD_BUS_RETURN_TO_ONE: [PMC] this bit drives the cmd bus back to a one as a resting stage (legacy Tegra device behavior). Power is saved if this is not done (Tegra K1 behavior). Shadowed 0 = DISABLED 1 = ENABLED
25	DISABLED	NONE	LPDDR3_DRAM: [PMC] Enables differentiation between lpddr3 DRAM protocol. Should only be set if LPDDR3 is selected with DRAM_TYPE. 0 = DISABLED 1 = ENABLED
24	DISABLED	NONE	LPDDR3_WR_PREAMBLE_TOGGLE: [PMC] enable LPDDR3 write preamble toggle. 0 = DISABLED 1 = ENABLED
23:20	0x4	0x4	ERR_RD_BUBBLE: [PMC] Number of bubbles to be inserted in CMDQ after every error-Read. A dummy read is placed in CMDQ for each error read. This field controls the number of emcclk bubbles inserted for each dummy read. It is expected that this should be set to BL/2. Without this, ret_stat_fifo will build up and block non-error reads. This could cause ret_data_fifo to overflow as it is only 8 deep (area savings) where as ret_stat_fifo is 20 deep. Shadowed
19:16	DDR3L_4X16	NONE	CMD_MAPPING:[PMC_SECURE] Shadowed. The command mapping is locked from any additional updates once fbio_spare[1] is set. The MID_DDR3L_4X16_96_2T2B_SWONLY is a placeholder for a software-based cmd mapping based on MID_DDR3L_4X16_96_4TOP. The hardware register should always be programmed to MID_DDR3L_4X16_96_4TOP. 0 = DDR3L_4X16 1 = DSC_LPDDR3_1X64_253 2 = DSC_LPDDR2_2X32_134 3 = DSC_LPDDR3_2X32_178 4 = DSC_DDR3L_2X32_136 5 = DSC_DDR3L_4X16_96_2X2H 6 = DSC_DDR3L_4X16_96_2X2V 7 = DSC_DDR3L_4X16_96_2TBV 8 = DSC_DDR3L_4X16_96_2TBH 9 = DSC_DDR3L_4X16_96_1X4_2LYR 10 = MID_DDR3L_4X16_96_4TOP 11 = MID_DDR3L_2X32_136 12 = MID_DDR3L_8X8_78_8TOP 13 = MID_DDR3L_4X16_96_4BOT 14 = MID_DDR3L_4X16_96_2T2B_SWONLY
15:13	NORMAL	NONE	EMC2PMACRO_CFG_QUSE_MODE: [PMC] Select QUSE mode. Shadowed. (NORMAL = off-chip) (ALWAYS_ON = requires DQS PULL) (INTERNAL_LPBK selects on-chip loopback) (DIRECT_QUSE = directly controlled QUSE). 0 = NORMAL 1 = ALWAYS_ON 2 = INTERNAL_LPBK 3 = PULSE_INT

Bit	Reset	SW Default	Description
			4 = RESERVED 5 = DIRECT_QUSE 6 = RESERVED1
12	DISABLED	NONE	CMD_2T_TIMING: [PMC] Enable 2T command timing (RAS/CAS/WE/ROW/A/BA). Shadowed. 0 = DISABLED 1 = ENABLED
11	ENABLED	NONE	CFG_QUSE_EXTEND_HALF_CLK: [PMC] Extend the QUSE window by half clk in DIRECT_QUSE mode. Shadowed. 0 = DISABLED 1 = ENABLED
10	DISABLED	NONE	DISABLE_CONCURRENT_AUTOPRE: [PMC] Disables reads/writes to a device until the precharge command has been issued by the DRAM internally. 0 = DISABLED 1 = ENABLED
9	DISABLED	NONE	DQS_PULLD: [PMC] Enables pull-downs on DQS lines (and pull-ups on DQS_N if DIFFERENTIAL_DQS). Shadowed. 0 = DISABLED 1 = ENABLED
8	DISABLED	NONE	CTT_TERMINATION: [PMC] Enables CTT_TERMINATION mode in pads (DDR2 support). Shadowed. 0 = DISABLED 1 = ENABLED
7	DISABLED	NONE	DIFFERENTIAL_DQS: [PMC] Enables differential signaling on DQS strobes. Shadowed. 0 = DISABLED 1 = ENABLED
6	DISABLED	NONE	CFG_E_PUTERM_DQ: [PMC] Enables E_PUTERM_DQ mode in pads (DDR3 support). In the IOBRICK, the E_PUTERM_DQ mode overrides CTT_TERMINATION mode. Shadowed. 0 = DISABLED 1 = ENABLED
5	LOWER	LOWER	DRAM_DATA_SWZL: [PMC] Specifies which half of the data bytes are used in X32 mode. LOWER:B0-B3 UPPER:B4-B7 0 = LOWER 1 = UPPER
4	X64	X64	DRAM_WIDTH: [PMC] Specifies DRAM width. Platform specific. 0 = X32 1 = X64
3:2	BURST8	NONE	DRAM_BURST: [PMC] Specifies the burst length to use for the attached device(s). ON_THE_FLY BC4/BL8 is only use for DDR3. Shadowed. 0 = BURST4 1 = BURST8 2 = ON_THE_FLY 3 = RESERVED
1:0	DDR1	NONE	DRAM_TYPE: [PMC] Specifies which DRAM protocol to use for the attached device(s). 0 = DDR3 1 = DDR1 2 = LPDDR3 3 = DDR2

16.7.2.61 EMC_FBIO_CFG6_0

FBIO Configuration Register

QUSE_LATE determines how much added delay FBIO should add to the QUSE path. QUSE needs to align (approximately) with the incoming DQS in order to qualify it, since the incoming DQS/feedback clock is not always valid.

DRAMC can position QUSE with m2clk granularity (2 bit times). QUSE_LATE provides finer granularity of 1/2 an M2CLK cycle (1/2 bit time). The amount of delay added is primarily a function of the round trip wire delay to/from the DRAM. Other portions of the delay (driver and receiver delay) are compensated for by delay through a non-bonded QUSE pad cell.

Additional delay can be added to QUSE vi XFORM_QUSEx_MULT and XFORM_QUSEx_OFFS (applied to DLL offset).

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x114 | Read/Write: R/W | Reset: 0x00000002 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx010)

Bit	Reset	Description
2:0	0x2	CFG_QUSE_LATE: [PMC]

16.7.2.62 EMC_CFG_RSV_0

EMC Configuration Reserved

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x120 | Read/Write: R/W | Reset: 0xff00ff00 (0b11111111000000001111111100000000)

Bit	Reset	Description

16.7.2.63 EMC_ACPD_CONTROL_0

Threshold for ACPD

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x124 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:0	0x0	ACPD_THRESHOLD: [PMC] number of idle cycles to wait before allowing power-down entry

16.7.2.64 EMC_EMRS2_0

Command Trigger: EMRS2

The EMRS2 register allows software to issue an EMRS2 command.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0x12c | Read/Write: R/W | Reset: 0x00000000 (0b00xx00xxxx00xxxxxx00000000000000)

Bit	Reset	Description
31:30	0x0	EMRS2_DEV_SELECTN: [PMC] active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1.
27	0x0	USE_EMRS2_EXT_CNT: [PMC] 0=>USE_MRS_LONG_CNT will select between SHORT(0)/LONG(1), 1=>USE_MRS_LONG_CNT will select between EXT1(0)/EXT2(1).
26	SHORT	USE_EMRS2_LONG_CNT: [PMC] Indicate to use long or short MRS wait count. 0 = SHORT 1 = LONG
21:20	0x0	EMRS2_BA: [PMC] Set to 0x1 for EMRS (and where applicable, 0x2 for EMRS2, and 0x3 for EMRS3).
13:0	0x0	EMRS2_ADR: [PMC] mode-register data to be written.

16.7.2.65 EMC_EMRS3_0

Command Trigger: EMRS2

The EMRS3 register allows software to issue an EMRS3 command.

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0x130 | Read/Write: R/W | Reset: 0x00000000 (0b00xx00xxxx00xxxxxx00000000000000)

Bit	Reset	Description

16.7.2.70 EMC_R2R_0

DRAM Timing Parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x144 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3:0	0x0	R2R:

16.7.2.71 EMC_W2W_0

DRAM Timing Parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x148 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3:0	0x0	W2W:

16.7.2.72 EMC_EINPUT_0

DRAM Timing Parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x14c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxx000000)

Bit	Reset	Description
5:0	0x0	EINPUT: [PMC] specifies when to assert EINPUT for a read, should normally be the same as QUSE.

16.7.2.73 EMC_EINPUT_DURATION_0

DRAM Timing Parameter

The minimum for EINPUT_DURATION is 4.

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x150 | Read/Write: R/W | Reset: 0x00000004 (0bxxxxxxxxxxxxxxxxxxxxxxxxxx00100)

Bit	Reset	Description
4:0	0x4	EINPUT_DURATION: [PMC] Specifies how long the EINPUT should be asserted.

16.7.2.74 EMC_PUTERM_EXTRA_0

DRAM Timing Parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x154 | Read/Write: R/W | Reset: 0x00010000 (0bxxxxxxxxxx000001xxxxxxxxxxxxxxxx)

Bit	Reset	Description
21:16	0x1	PUTERM: [PMC] tells the chip when to assert dynamic PUTERM for read return data.

16.7.2.75 EMC_TCKESR_0

DRAM Timing Parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x158 | Read/Write: R/W | Reset: 0x0000003e (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111110)

Bit	Reset	Description
5:0	0x3e	TCKESR: [PMC] Specify minimum low CKE pulse width for self-refresh mode.

16.7.2.76 EMC_TPD_0

DRAM Timing Parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x15c | Read/Write: R/W | Reset: 0x0000003e (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx111110)

Bit	Reset	Description
5:0	0x3e	TPD: [PMC] specify minimum low CKE pulse width for power-down mode.

16.7.2.77 EMC_AUTO_CAL_CONFIG_0

Auto-Calibration Settings for EMC Pads

Boot requirements:

- This register (except for AUTOCAL_SLW_OVERRIDE and AUTO_CAL_START(trigger)) should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register (except for AUTOCAL_SLW_OVERRIDE and AUTO_CAL_START(trigger)) should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2a4 | Read/Write: R/W | Reset: 0x00f10000 (0b0000xx001111x001xxx00000xxx00000)

Bit	R/W	Reset	Description
31	RO	0x0	AUTO_CAL_START: [PMC] Writing a one to this bit starts the calibration state machine. This bit must be set even if the override is set in order to latch in the override value.
30	RW	0x0	AUTO_CAL_OVERRIDE: [PMC] 0 (normal operation): use AUTO_CAL_PU/PD_OFFSET as an offset to the calibration state machine setting 1 (override) : use AUTO_CAL_PU/PD_OFFSET register values directly
29	RW	DISABLED	AUTO_CAL_ENABLE: [PMC] 1 (normal operation): use EMC generated pullup/down (override or autocal) 0 (disabled): use emc2tmc_cfg* register settings for pullup/down 0 = DISABLED 1 = ENABLED
28	RW	0x0	AUTOCAL_SLW_OVERRIDE: [PMC] 0 (Normal operation) pad DRVDN/UP_SLWR/F tied to AUTO_CAL output DRDVDN/UP_SLWR/F[3:0] = AUTO_CAL_PULLDOWN/UP[4:1] 1 (override) use EMC2TMC_CFG*_DRVDN/UP_SLWR/F pins to control pad slew inputs
25:20	RW	0xf	AUTO_CAL_E_CAL_UPDATE: [PMC] wait time in EMC clocks between clk cal code change, and E_CAL_UPDATE assertion is AUTO_CAL_E_CAL_UPDATE - 4. Maximum value is 31.
18:16	RW	0x1	AUTO_CAL_STEP: [PMC] calibration step interval (in microseconds)
12:8	RW	0x0	AUTO_CAL_PD_OFFSET: [PMC] 2's complement offset for the pull-down value
4:0	RW	0x0	AUTO_CAL_PU_OFFSET: [PMC] 2's complement offset for the DQ/DQS pull-up value

16.7.2.78 EMC_AUTO_CAL_INTERVAL_0

EMC Pad Calibration Interval

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2a8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxx00000000000000000000)

Bit	Reset	Description
20:0	0x0	AUTO_CAL_INTERVAL: [PMC] 0: Calibrate once. Otherwise, auto-calibration occurs at intervals equivalent to the programmed number of microseconds.

16.7.2.79 EMC_AUTO_CAL_STATUS_0

EMC Pad Calibration Status

Offset: 0x2ac | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	X	AUTO_CAL_ACTIVE: One when auto calibrate is active - valid only after auto calibrate sequence has completed (EMC_CAL_ACTIVE == 0)
28:24	X	AUTO_CAL_PULLDOWN_ADJ: Pull-down code sent to pads
20:16	X	AUTO_CAL_PULLUP_ADJ: Pull-up code sent to pads
12:8	X	AUTO_CAL_PULLDOWN: Pull-down code generated by auto-calibration
4:0	X	AUTO_CAL_PULLUP: Pull-up code generated by auto-calibration

16.7.2.80 EMC_REQ_CTRL_0

Request Status/Control

When either STALL_ALL_READS and/or STALL_ALL_WRITES is asserted, the stalling of read and/or write requests will not take effect until the status bit from EMC_STATUS register's NO_OUTSTANDING_TRANSACTIONS field is asserted.

Offset: 0x2b0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1	0x0	STALL_ALL_WRITES: Stall incoming write transactions
0	0x0	STALL_ALL_READS: Stall incoming read transactions

16.7.2.81 EMC_EMC_STATUS_0

EMC State-Machine Status

DRAM_IN_POWERDOWN, DRAM_IN_SELF_REFRESH, DRAM_IN_DPD: active high signal indicating current DRAM status for each of these modes, with 1 status bit per device, bit[0] = dev0 status, bit[1] = dev1 status.

Example: DRAM_IN_SELF_REFRESH = 0x3, both devices are in self-refresh, DRAM_IN_DPD= 0x2 would indicate only dev1 is in deep-power-down mode.

> **Note:** If EMC is reset or powered down, the actual DRAM state could be different than indicated by these status bits. These bits do not reflect manually entered/exited powerdown or self-refresh (via use of PIN_CKE).

Offset: 0x2b4 | Read/Write: RO | Reset: 0x0XXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
27:26	X	ACPD_FSM_IDLE: Indicate dev[n] power-down FSM is idle.
25:24	X	DSR_FSM_IDLE: Indicate dev[n] dynamic self refresh FSM is idle.
23	X	TIMING_UPDATE_STALLED: Indicates timing update triggered by TIMING_CONTROL.TIMING_UPDATE is not yet completed.
22	X	ZQ_FSM_IDLE: Indicates auto ZQ state machine is idle.
21	X	CFG_ZQ_ACTIVE: Indicates ZQ configuration access is active.
20	X	MRR_DIVLD: MRR data available for reading
19:16	X	MRR_FIFO_SPACE: MRR FIFO space available

Bit	Reset	Description
13:12	X	DRAM_IN_DPD: dev[n] has been put into deep powerdown state
9:8	X	DRAM_IN_SELF_REFRESH: dev[n] has been put into self-refresh (will remain until SR exit cmd).
5:4	X	DRAM_IN_POWERDOWN: dev[n] has entered powerdown state (incoming req's will awaken if not stalled)
2	X	NO_OUTSTANDING_TRANSACTIONS: All non-stalled requests have completed
0	X	EMC_REQ_FIFO_EMPTY: Request FIFO is empty

16.7.2.82 EMC_CFG_2_0

EMC Configuration

Clock change sequencing: Once the divider is reprogrammed, CAR signals to EMC that a clock change is pending. If enabled, EMC stalls incoming requests, drains outstanding requests, and, if CLKCHANGE_(PD|SR)_ENABLE is enabled, puts DRAM into power-down (or self-refresh) before signalling to CAR that it is idle and ready for the change to happen. CAR will then change the divider/pll reprogramming. Once complete, EMC updates its shadow registers (assuming they may have been reprogrammed for new clock setting), unstalls requests, and resumes operation with new clock settings.

Some fields of this register are shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register (except for fields DRAMC_PRE_B4_ACT, MRR_BYTESEL_X16, MRR_BYTESEL) should be parameterized in the BCT and written by the Boot ROM during cold boot.

Offset: 0x2b8 | Read/Write: R/W | Reset: 0x00008057 (0b0000000000xxxxxx1000000001010111)

Bit	Reset	Description
31	DISABLED	DRAMC_PRE_B4_ACT: [PMC] Diagnostic bit, gives priority to activates over precharges, determining which (precharge/activate) is processed first if both are pending and unblocked. 0 = DISABLED 1 = ENABLED
13	DISABLED	USE_PER_DEVICE_DLY_TRIM_OB: [PMC] Diagnostic bit. Shadowed. Allows using different outbound delay trim values per device. When enabled, WDV must be programmed to >= 2 and WEXT >=5. 0 = DISABLED 1 = ENABLED
12	DISABLED	USE_PER_DEVICE_DLY_TRIM_IB: [PMC] Diagnostic bit. Shadowed. Allows using different inbound delay trim values per device. When enabled, REXT/RDV/QUSE must be programmed to >= 2. 0 = DISABLED 1 = ENABLED
11	0x0	DIS_CNTR_WITH_CFG_TIMING_UPDATE: [PMC] Diagnostic bit. 1 = Disable reset of timing parameter counters with TIMING_CONTROL.TIMING_UPDATE.
9:8	0x0	Reserved
7	0x0	EARLY_TRFC_8_CLK: [PMC] Diagnostic bit. Shadowed. 1 = 8 clocks early 0 = 16 clocks early.
6	0x1	DIS_STP_OB_CLK_DURING_NON_WR: [PMC] 1 = Disables stopping outbound data clock to I/O during non-write transactions.
5:3	0x2	ZQ_EXTRA_DELAY: [PMC] Additional delay to push out ZQCMD based on tODToff (maximum) & frequency.
2	0x1	REF_AFTER_SREF: [PMC] 1 = Enables trigger of refresh after exiting self-refresh.

Bit	Reset	Description
1	ENABLED	CLKCHANGE_PD_ENABLE: [PMC] Forces DRAM into power-down during CLKCHANGE. 0 = DISABLED 1 = ENABLED
0	ENABLED	CLKCHANGE_REQ_ENABLE: [PMC] Allows the EMC and CAR to handshake on PLL divider/source changes. 0 = DISABLED 1 = ENABLED

16.7.2.83 EMC_CFG_DIG_DLL_0

Configure Digital DLL

Controls for digital DLL's, which used to measure and maintain 1/4 cycle phase adjustment for RDQS strobes.

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register (except for field CFG_DLL_ALARM_DISABLE and DLL_RESET (trigger) and CFG_DLL_USE_OVERRIDE_UNTIL_LOCK(trigger)) should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register (except for field CFG_DLL_ALARM_DISABLE and DLL_RESET (trigger) and CFG_DLL_USE_OVERRIDE_UNTIL_LOCK(trigger)) should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2bc | Read/Write: R/W | Reset: 0xXX0000Xd (0bx0000x0000000000000000011x11x1)

Bit	R/W	Reset	Description
31	RO	X	CFG_DLL_USE_OVERRIDE_UNTIL_LOCK: [PMC] Writing 1 to this register causes override_val to be used in place of DLL output until DLL_LOCK/DLL_LOCK_TIMEOUT is obtained. Takes effect on next shadow update.
30	RO	0x0	DLL_RESET: [PMC] Writing 1 to this register will send reset pulse to DLL's on next shadow update. Must reset DLLs when changing clock frequency by factor >= 2. Reset occurs at next shadow update.
29:28	RW	0x0	CFG_DLL_LOCK_LIMIT: [PMC] Diagnostic in case DLL has problems locking. Shadowed. DLL will be treated as locked after LIMIT µs. Counter is reset with DLL_RESET (from above) or with each periodic update (if using RUN_PERIODIC). Settings are: 00: LIMIT = 16 µs 01: LIMIT = 64 µs 10: LIMIT = 128 µs 11: LIMIT = 512 µs
27	RW	0x0	CFG_DLL_ALARM_DISABLE: [PMC] Diagnostic bit. Shadowed. Disable override of DLL logic when DLL_ALM is set (otherwise overrides DLI to 0x3FF).
26	RO	X	CFG_DLL_UPDATE_AT_NXT_REFRESH: Writing 1 to this register causes the DLCELL update to occur at the next REFRESH interval. Ordinarily, updates are only performed if the DLL value is updated. This mechanism allows updates to the XFORM_MULT/OFF to be taken at the next REFRESH.
25:16	RW	0x0	CFG_DLL_OVERRIDE_VAL: [PMC] Value to use in place of DLI output if CFG_DLL_OVERRIDE_EN is set or prior to lock in RUN_TIL_LOCK mode. Shadowed.
15	RW	0x0	CFG_DLL_TESTEN: [PMC] Enable DLL test mode
14	RW	0x0	CFG_DLL_QUSE_TESTOUT: [PMC] Enable DLL TESTOUT on QUSE pads
13:12	RW	0x0	CFG_DLL_TESTSEL: [PMC] Select DLL test output

Bit	R/W	Reset	Description
11:8	RW	0x0	CFG_DLL_UDSET: [PMC] DLL Loop filter control (2^(udset+3)). Shadowed.
7:6	RW	RUN_TIL_LOCK	CFG_DLL_MODE: [PMC] Controls how frequently DLL runs. Shadowed. 0 = RUN_CONTINUOUS: DLL will run continuously. This option will consume the most power. Once LOCK/TIMEOUT occurs, trimmers will be updated at REFRESH or shadow update. 1 = RUN_TIL_LOCK: after DLL_RESET is set, DLL will run until it has locked/timed out, then be disabled. Trimmers updated at following REFRESH/shadow update. 2 = RUN_PERIODIC: after DLL_LOCK/TIMEOUT, DLL will be disabled and re-enabled after CFG_DLL_RUN_PERIOD µs to track delay changes (temperature/voltage). 3 = RESERVED
5	RW	0x1	CFG_DLL_LOWSPEED: [PMC] Enable DLL for use with low-speed EMCCLK operation (< 200 MHz). Shadowed. The DLL does power optimization by itself. This control should stay at 1.
4	RO	X	CFG_DLL_STALL_RW_UNTIL_LOCK: [PMC] Writing 1 to this register will cause the EMC to stall all RW traffic until the DLL locks. Takes effect on the next shadow update.
3	RW	0x1	CFG_DLL_STALL_ALL_TRAFFIC: [PMC] Enables stalling of all DRAM traffic while undergoing dll_stall condition;otherwise only block reads/writes are stalled during dll_stall. Shadowed.
2	RW	ENABLED	CFG_DLL_OVERRIDE_EN: [PMC] Override DLL's DLI output with OVERRIDE_VAL (still uses mult/offset). Shadowed. 0 = DISABLED 1 = ENABLED
0	RW	ENABLED	CFG_DLL_EN: [PMC] Enables digital DLL. Shadowed. 0 = DISABLED 1 = ENABLED

16.7.2.84 EMC_CFG_DIG_DLL_PERIOD_0

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x2c0 | Read/Write: R/W | Reset: 0x00008000 (0bxxxxxxxxxxxxxxxx1000000000000000)

Bit	Reset	Description
15:0	0x8000	CFG_DLL_RUN_PERIOD: [PMC] If CFG_DLL_MODE == RUN_PERIODIC, this specifies the interval between runs in microseconds.

16.7.2.85 EMC_DIG_DLL_STATUS_0

Digital DLL Status

Digital DLL Status bits directly from the DLL

Offset: 0x2c8 | Read/Write: RO | Reset: 0x0000XXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
15	X	DLL_LOCK
14	X	DLL_ALARM
13	X	DLL_LOCK_TIMEOUT
9:0	X	DLL_OUT

16.7.2.86 EMC_RDV_MASK_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2cc | Read/Write: R/W | Reset: 0x0000003f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx111111)

Bit	Reset	Description
5:0	0x3f	RDV_MASK: [PMC] This should be programmed to RDV.

16.7.2.87 EMC_WDV_MASK_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2d0 | Read/Write: R/W | Reset: 0x0000000f (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx1111)

Bit	Reset	Description
3:0	0xf	WDV_MASK: [PMC] This should be programmed to WDV.

16.7.2.88 EMC_CTT_DURATION_0

DRAM timing parameter

CTT_DURATION controls how long CTT remains enabled. If CTT + CTT_DURATION - RDV - 2 > 0, R2W must be increased by that amount.

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x2d8 | Read/Write: R/W | Reset: 0x00000003 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0011)

Bit	Reset	Description
3:0	0x3	CTT_DURATION: [PMC] Determines how long CTT remains enabled during reads. CTT determines when it will be enabled. DDR3: CTT_TERMINATION == 1 ? 4 : 0 LPDDR3: 0

16.7.2.89 EMC_CTT_TERM_CTRL_0

Configure CTT Termination Output Drive Strength

If CTT_TERMINATION is enabled, this controls the strength of the output drivers.

TERM_OVERRIDE forces use of EMC2TMC_CFG*_DRVDN_TERM, EMC2TMC_CFG*_DRVUP_TERM instead of using of AUTO_CAL DRVDN/DRVUP values with the following equation applied:

```
TERM_DRDN = (AUTO_CAL_DRVDN * TERM_SLOPE) / 4 + TERM_OFFSET
TERM_DRUP = (AUTO_CAL_DRVUP * TERM_SLOPE) / 4 + TERM_OFFSET
```

Recommended values for SLOPE/OFFSET

100ohm CTT: TERM_SLOPE = 0x1, TERM_OFFSET = 0x4

50ohm CTT: TERM_SLOPE = 0x2, TERM_OFFSET = 0x8

Note: setting slope = 0 allows TERM_DRDN/DRVUP = TERM_OFFSET

setting slope > 2 is not supported

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register (except for fields TERM_DRVDN and TERM_DRVUP) should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register (except for fields TERM_DRVDN and TERM_DRVUP) should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2dc | Read/Write: R/W | Reset: 0xXX0XX802 (0b0xxxxxxxxxxxxxxxxxx01000xxxxx010)

Bit	R/W	Reset	Description
31	RW	DISABLED	TERM_OVERRIDE: [PMC] 0 = DISABLED 1 = ENABLED
28:24	RO	X	TERM_DRVUP
19:15	RO	X	TERM_DRVDN
12:8	RW	0x8	TERM_OFFSET: [PMC]
2:0	RW	0x2	TERM_SLOPE: [PMC]

ZQ Calibration Registers -- LPDDR3/DDR3

1. Periodic mode

Allows a ZQ calibration command to be sent periodically to DRAM. After ZCAL_INTERVAL, ZCAL_MRW_CMD will be sent to each DRAM, 1 at a time, followed by ZCAL_WAIT_CNT interval in which no other commands will be allowed to be sent to either DRAM. So if ZQ_MRW_DEV_SELECTN == 2'b00, it would send the MRW command to dev0, wait ZCAL_WAIT_CNT, send the command to dev1, wait ZCAL_WAIT_CNT, resume normal operation. It will then wait ZCAL_INTERVAL microseconds before repeating the procedure. The ZQ calibration command will not be sent to devices that are 1) unpopulated and 2) either in or about to enter self-refresh or DPD.

To enable periodic ZQ calibration, program ZCAL_INTERVAL and ZCAL_WAIT_CNT to be non-zero, as well as ZCAL_MRW_CMD to contain the command and device selection, followed by TIMING_CONTROL to latch those three registers.

Note that ZCAL_WAIT_CNT will be used instead of MRS_WAIT_CNT for delaying the subsequent DRAM commands after the ZQ calibration commands, even though in LPDDR3 a ZQ calibration command is also an MRW command.

Disable this feature by setting ZCAL_INTERVAL.ZCAL_REF_INTERVAL = 0, followed by TIMING_CONTROL to latch it.

2. One-shot mode

Allows ZQ calibration command to be sent to DRAM.

To send a one-shot command, keep ZCAL_INTERVAL and ZCAL_WAIT_CNT equal to zero, program ZCAL_MRW_CMD with only one device selected, then program TIMING_CONTROL to latch in those registers, and finally program

ZCAL_ONE_SHOT to 1 to trigger the one-shot command. If more than one device needs to be calibrated, wait the ZQ calibration time and repeat the steps above with the other device selection bit enabled in ZCAL_MRW_CMD.

Do not send a one-shot ZQ calibration command when periodic mode is enabled.

16.7.2.90 EMC_ZCAL_INTERVAL_0

Configure ZQ Calibration

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2e0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxx00000000000000000000000)

Bit	Reset	Description
23:10	0x0	ZCAL_INTERVAL_HI: [PMC] Combined with ZCAL_INTERVAL_LO specifies the number of microseconds to wait between issuance of ZCAL_MRW_CMD. If 0, ZCAL is disabled and internal counter will be reset.
9:0	0x0	ZCAL_INTERVAL_LO [PMC]

16.7.2.91 EMC_ZCAL_WAIT_CNT_0

Configure ZQ Calibration

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2e4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0000000000)

Bit	Reset	Description
9:0	0x0	ZCAL_WAIT_CNT: [PMC] Number of EMC clocks to wait before issuing any commands after sending ZCAL_MRW_CMD.

16.7.2.92 EMC_ZCAL_MRW_CMD_0

Configure ZQ Calibration

This register is shadowed: see usage note at the top of Section 16.7.2

(However, it does not obey READ_MUX/WRITE_MUX non-default values.)

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2e8 | Read/Write: R/W | Reset: 0xc0000000 (0b11xxxxxx00000000xxxxxxxx00000000)

Bit	Reset	Description
31:30	0x3	ZQ_MRW_DEV_SELECTN: [PMC] Active-low chip-select, 0x0 applies command to both

Bit	Reset	Description
		devices (will happen 1 at a time), 0x2 to for only dev0, 0x1 for dev1.
23:16	0x0	ZQ_MRW_MA: [PMC] MRW MA field to be sent after ZCAL_INTERVAL
7:0	0x0	ZQ_MRW_OP: [PMC] MRW OP field to be sent after ZCAL_INTERVAL

16.7.2.93 EMC_ZQ_CAL_0

Trigger a Single ZQ Calibration

This register issues a ZQ calibration command for DDR3.

Offset: 0x2ec | Read/Write: R/W | Reset: 0x00000010 (0b00xxxxxxxxxxxxxxxxxxxxxxxxx1xxx0)

Bit	Reset	Description
31:30	0x0	ZQ_CAL_DEV_SELECTN: Active low chip-select, 0x0 applies command to both devices, 0x2 to for only dev0, 0x1 for only dev1, 0x3 for neither device (0x0, for both devices, is not allowed if the ZQ resister is shared between devices).
4	LONG	ZQ_CAL_LENGTH: Indicate short or long ZQ calibration. 0 = SHORT 1 = LONG
0	0x0	ZQ_CAL_CMD: Issues a ZQ calibration command (DDR3 only).

16.7.2.94 EMC_XM2CMDPADCTRL_0

Pad configuration registers from APB_MISC:

XM2CMD Pad Control Register

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x2f0 | Read/Write: R/W | Reset: 0x10000200 (0bxxx1xxxxxxxxxxxxxxxx01000000xxx)

Bit	Reset	Description
31:0	0x0	SCRATCH:

16.7.2.108 EMC_DLL_XFORM_DQS0_0

Configure Digital DLL

XFORM_DQSx_MULT and XFORM_DQSx_OFFS are a multiplier and offset, respectively, that can be used to modify the DLL output. Final products may be read out in DQS_TRIMMER_RD register. The default is multiply by 1 to keep the DLL's 1/4 cycle delay. Integer + fractional formats for multiplier and offset:

OFFS is 2's complement format, with bit [0] representing integer

The output of the XFORM is xform_out = (xform_in * MULT + OFFS*16)/ 16

Largest allowed MULT = 0x17

In the case of overflow, output is clamped according to these rules:

- out >= 0x600, xform_out = 0x000
- 0x600 > out >= 0x400, xform_out = 0x3ff

That means clamping works within 50% above the maximum (0x3ff) DLL output or 50% below the minimum (0) DLL output.

To make sure that is always satisfied, conservatively program OFFS so that 0x600 < OFFS < (0x5ff – ((MULT * 0x3ff) >> 4)). The DLL output is effectively overridden by setting XFORM_*_MULT to 0 and programming XFORM_*_OFFS[8:1] to override value.

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

The DQS_CURRENT_TRIM_VAL_BYTE_x registers provide a way to observe the values being used by the trimmers

16.7.2.124 EMC_DLL_XFORM_DQ0_0

Configure Digital DLL

XFORM_DQx_MULT and XFORM_DQx_OFFS are a multiplier and offset, respectively, that can be used to modify the DLL output. XFORM_DQx_* applies to all DQ/DM bits in each byte x. Final products may be read out in the DQ_TRIMMER_RD

register. The default is multiply by 1, providing 1/4 cycle skew to DQS to keep DLL's 1/4 cycle delay. Integer + fractional formats for multiplier & offset:

OFFS is 2's complement format, with bit [0] representing integer. The output of the XFORM is xform_out = (xform_in * MULT + OFFS*16)/ 16

Largest allowed MULT = 0x17

In the case of overflow, output is clamped according to these rules:

- out >= 0x600, xform_out = 0x000
- 0x600 > out >= 0x400, xform_out = 0x3ff

That means clamping works within 50% above the maximum (0x3ff) DLL output or 50% below the minimum (0) DLL output. To make sure that is always satisfied, conservatively program OFFS so that 0x600 < OFFS < (0x5ff – ((MULT * 0x3ff) >> 4)).

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x3c0 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
6:0	0x0	EMC2PMACRO_CFG_TXDQS6_DLI: [PMC]

16.7.2.147 EMC_DLI_TRIM_TXDQS7_0

Set DLI TRIM

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x3c4 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxx0000000)

Bit	Reset	Description
6:0	0x0	EMC2PMACRO_CFG_TXDQS7_DLI: [PMC]

16.7.2.148 EMC_STALL_THEN_EXE_BEFORE_CLKCHANGE_0

Scheme to change controller timing parameters + SDRAM mode timing atomically.

1. Program the EMC controller timing registers (shadowed).
2. Pre-program the SDRAM mode registers.
    a. Write 1 to the STALL_THEN_EXE_BEFORE_CLKCHANGE field, which will prevent further cfg execution until a clock change request has been detected.

    Note: After this step, no register read should happen on the EMC before the clock change (C) happens, otherwise the system will hang. Disable the EMC interrupt before this step if the interrupt handler reads EMC registers.

    b. Write to whatever EMC registers you want to be execute after clock change request has been detected but before the actual clock change happens. For example, if you want to disable DLL in DDR3 mode, you can,
        i. Issue a write to SDRAM's MR1 register via EMC MRS register to disable DLL.
        ii. Issue a Self-refresh entry via EMC SELF_REF register.

    Note: If there is no need to execute any register access before clock change, simply skip step (b); step (a) is still required.

    c. Write 1 to STALL_THEN_EXE_AFTER_CLKCHANGE field which will prevent further config execution until after the actual clock change has happened.
    d. Write to whatever EMC registers you want to be executed after the clock change. Using the same example as (b), you will,
        i. Issue a Self-refresh exit via EMC SELF_REF register.
        ii. Issue writes to SDRAM's MRx register(s) to change read/write latencies and/or enable DLL
        iii. Issue burst refreshes via EMC REF register.

    Note: If there is no need to execute any register access after clock change, simply skip step (d); step (c) is still required.

3. Program the CAR to change either clock source and/or clock divider.

> **Note:** In both sequences above, DYN_SELF_REF must be disabled off before the first step, then it can be restored after the last step.
>
> The interval between two clock change sequences are recommended to be at least 20 µs apart

Writes to this register will stall the register read/write path until a clock change request is detected. Once detected, whatever register access follows this register write will be executed until a STALL_THEN_EXE_AFTER_CKLCHANGE is encountered. At that point, EMC timing registers will be updated and the clock change request will be acknowledged.

Offset: 0x3c8 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	STALL_THEN_EXE_BEFORE_CLKCHANGE: Writing a one to this bit will stall subsequent register accesses.

16.7.2.149 EMC_STALL_THEN_EXE_AFTER_CLKCHANGE_0

Writes to this register will stall the register read/write path until after EMC timing registers are updated and that clock change has been completed. Once that happens, whatever register access follows this register write will be executed until UNSTALL_RW_AFTER_CLKCHANGE is encountered. At that point, normal memory read/write will be allowed to resume.

Offset: 0x3cc | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	STALL_THEN_EXE_AFTER_CLKCHANGE: Writing a one to this bit will stall subsequent register accesses.

16.7.2.150 EMC_UNSTALL_RW_AFTER_CLKCHANGE_0

Writing to this register will unstall memory reads/writes after a clock change. Use in conjunction with STALL_THEN_EXE_AFTER_CLKCHANGE.

Offset: 0x3d0 | Read/Write: RO | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	0x0	UNSTALL_RW_AFTER_CLKCHANGE: Writing a one to this bit will unstall memory reads/writes after a clock change.

16.7.2.151 EMC_AUTO_CAL_CLK_STATUS_0

EMC Pad Calibration Status

Offset: 0x3d4 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
28:24	X	AUTO_CAL_CLK_PULLDOWN_ADJ: Pull-down code sent to pads for MCLK pad.
20:16	X	AUTO_CAL_CLK_PULLUP_ADJ: Pull-up code sent to pads for MCLK pad.
12:8	X	AUTO_CAL_CLK_PULLDOWN: Pull-down code generated by auto-calibration for MCLK pad.
4:0	X	AUTO_CAL_CLK_PULLUP: Pull-up code generated by auto-calibration for MCLK pad.

16.7.2.152 EMC_SEL_DPD_CTRL_0

Configures Functional SEL_DPD Modes

Offset: 0x3d8 | Read/Write: R/W | Reset: 0x00040000 (0bxxxxxxxxxxxxxx100xxxxxxx0xx0000xx)

Bit	Reset	Description
18:16	0x4	SEL_DPD_DLY: [PMC] number of cycles to wait before asserting SEL_DPD
8	DISABLED	DATA_SEL_DPD_EN: [PMC] allow SEL_DPD assertion for data pads 0 = DISABLED 1 = ENABLED
5	DISABLED	ODT_SEL_DPD_EN: [PMC] tie SEL_DPD for ODT pads to ENABLE_ODT_DURING_WRITE 0 = DISABLED 1 = ENABLED
4	DISABLED	RESET_SEL_DPD_EN: [PMC] assert SEL_DPD for reset pad 0 = DISABLED 1 = ENABLED
3	DISABLED	CA_SEL_DPD_EN: [PMC] allow SEL_DPD assertion for discrete command/address pads 0 = DISABLED 1 = ENABLED
2	DISABLED	CLK_SEL_DPD_EN: [PMC] allow SEL_DPD assertion for discrete clock pad 0 = DISABLED 1 = ENABLED

16.7.2.153 EMC_PRE_REFRESH_REQ_CNT_0

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x3dc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:0	0x0	PRE_REF_REQ_CNT: [PMC] When the refresh counter reach this pre-refresh request count just before a burst refresh will be issued when it reach the {REFRESH,REFRESH_LO}, a pre-refresh request will be asserted to MC to close the banks/pages and flush its pipeline. A 0 value will disable this feature.

16.7.2.154 EMC_DYN_SELF_REF_CONTROL_0

Threshold for Dynamic Self-Refresh Entry

This register controls how dynamic self-refresh entry/exit is handled.

If ODT is enabled, the DSR_PER_DEVICE field must be set to DISABLED.

It is recommended to change the values of ODT_WRITE and DSR_PER_DEVICE with a clock change

To do it outside of a clock change sequence, one has to be aware that DSR enable/disable takes time to take effect. This is the sequence for disabling DSR_PER_DEVICE and enabling ODT outside of clock change:

1. DYN_SELF_REF <= DISABLED (DSR exit)
2. TIMING_UPDATE <= 1 (latch in the shadow value)
3. Read back and discard any EMC register such as INTSTATUS (ensure 1 and 2 have gone through)
4. Wait 2 µs for the last possible self-refresh entry
5. Poll for SDRAM_IN_SELF_REFRESH == 0 (ensure that self-refresh exits)

6. ODT_WRITE <= new value to turn on ODT

   DSR_PER_DEVICE <= DISABLED (turn off per-device DSR)

   DYN_SELF_REF <= ENABLED (re-enable DSR)

7. TIMING_UPDATE <= 1 (latch in the shadow values)

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x3e0 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
31	DISABLED	DSR_PER_DEVICE: [PMC] controls whether dynamic self-refresh is done on a per-device basis. 0 = DISABLED 1 = ENABLED
15:0	0x0	DSR_THRESHOLD: [PMC] number of idle cycles to wait before allowing dynamic self-refresh entry

16.7.2.155 EMC_TXSRDLL_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Note: If operating in non-DLL mode, this register needs to be updated with the non-DLL timing requirement.

Offset: 0x3e4 | Read/Write: R/W | Reset: 0x000007ff (0bxxxxxxxxxxxxxxxxxxxxx011111111111)

Bit	Reset	Description
11:0	0x7ff	TXSRDLL: [PMC] Cycles between self-refresh exit and first DRAM command requiring a locked DLL. For DDR3 only: READ (and RAP) and synchronous ODT commands. DDR3: 512. LPDDR3: TXSR (not used). Largest allowed value is 0xffe

16.7.2.156 EMC_CCFIFO_ADDR_0

CCFIFO_ADDR: This register contains the address offset of the EMC register that is intended to be executed during the clock change sequence.

> **Note:** Before triggering a clock change sequence from the CAR, you must configure the pre-/post- clock change sequence by writing, multiple times, to the CCFIFO_DATA/CCFIFO_ADDR register pair. After the CCFIFO_ADDR register is written, Hardware will write the register offset and corresponding data into the 32-deep clock change FIFO (CCFIFO).

Offset: 0x3e8 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:0	0x0	CCFIFO_ADDR: clock change FIFO address register.

16.7.2.157 EMC_CCFIFO_DATA_0

CCFIFO_DATA: This register contains the 32-bit data of the EMC register that is intended to be written to or pointed at by CCFIFO_ADDR.

Offset: 0x3ec | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
31:0	0x0	CCFIFO_DATA: clock change FIFO data register.

16.7.2.158 EMC_CCFIFO_STATUS_0

Offset: 0x3f0 | Read/Write: RO | Reset: 0x000000XX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
5:0	X	CCFIFO_COUNT

16.7.2.159 EMC_CDB_CNTL_1_0

CDB Control Register

The following table lists the mapping for the SEL_PI_TAP bits in CDB Control Register 1.

Table 58: SEL_PI_TAP Mapping

CDB SEL_PI_TAP#	EMC Signal	Comment
CDB SEL_PI_TAP15	EMC2PMACRO_SEL_PI_TAP15	data brick 7
CDB SEL_PI_TAP14	EMC2PMACRO_SEL_PI_TAP14	data brick 5
CDB SEL_PI_TAP13	EMC2PMACRO_SEL_PI_TAP13	data brick 6
CDB SEL_PI_TAP12	EMC2PMACRO_SEL_PI_TAP12	data brick 4
CDB SEL_PI_TAP11	EMC2PMACRO_SEL_PI_TAP11	CLKBUF 5 controls channel 1 sdr pins: cke_b0, cke_b1, odt_b0, odt_b1, cs_b0_, cs_b1_
CDB SEL_PI_TAP10	EMC2PMACRO_SEL_PI_TAP10	CLKBUF 4 controls channel 1 ddr/2T pins: ba0, ba1, ba2, a10, a12, a13, a15, a_b3, a_b4
CDB SEL_PI_TAP9	EMC2PMACRO_SEL_PI_TAP9	CLKBUF 3 controls channel 1 ddr/2T pins: a_b5,a11,a14
CDB SEL_PI_TAP8	EMC2PMACRO_SEL_PI_TAP8	MCLK_B
CDB SEL_PI_TAP7	EMC2PMACRO_SEL_PI_TAP7	MCLK
CDB SEL_PI_TAP6	EMC2PMACRO_SEL_PI_TAP6	CLKBUF 2 controls channel 0 sdr pins: cs1_ cs0_, odt1, odt0, cke0, cke1
CDB SEL_PI_TAP5	EMC2PMACRO_SEL_PI_TAP5	CLKBUF 1 controls channel 0 ddr/2T pins: ras_,cas_,we_,rst,a2,a3,a4,a6,a8

CDB SEL_PI_TAP#	EMC Signal	Comment

20:16	0x0	EMC2PMACRO_CFG_PI_CLK_TRIM: [PMC] pi_clk_trim to control the 32-tap trimmer on the ck pad-macro (pi clk domain)
13:8	0x0	EMC2TMC_CFG_XM2CLKB_DLY_TRM_P: [PMC]
5:0	0x0	EMC2TMC_CFG_XM2CLK_DLY_TRM_P: [PMC]

16.7.2.162 EMC_SWIZZLE_RANK0_BYTE_CFG_0

For byte swizzling, each SWZ_RANK*_BYTE*_SEL field indicates which SDRAM byte is mapped/connected to the corresponding byte of the chip.

The SWZ_RANK*_BYTE*_BIT*_SEL fields indicate which SDRAM data bit (0-7) within each byte is mapped/connected to the corresponding bit of the chip.

The Tegra K1 device has 8 bytes per partition without a per rank differentiation for swizzling. The RANK1 register set controls swizzling for the upper 4 byte of data.

16.7.2.172 EMC_CA_TRAINING_START_0

Procedure for LPDDR3 CA Training

(1a) Configure data swizzling (if needed) through the DATA_SWIZZLE_RANK[0,1]_[0:7] registers.

(1b) Enable EMC2PMACRO_CFG_BYPASS_ADDRPIPE if needed. There's no need to enable EMC2PMACRO_CFG_BYPASS_DATAPIPE* for CA training purposes.

(1c) Follow the procedure on optimal trim setting into the CA bus clock trimmer below.

(2) Configure the CA training engine through the CA_TRAINING_[TIMING_CNTL1,TIMING_CNTL2, CA_LEAD_IN, CA, and CA_LEAD_OUT] registers.

(3) Software configures the CA training engine to use MR41 mode (through the CA_TRAINING_CFG register).

(4) Software starts the CA training engine (in the CA_TRAINING_START register) and waits for the CA training to finish (CA_TRAINING_BUSY).

(5) Software saves the result from the CA_TRAINING_RESULT* registers.

(6) Software repeats steps 3-5 but configures for MR48 mode.

(7) Software combines the results from MR41/MR48 modes to come up with a single trim setting and programs the EMC2PMACRO_CFG_XM2CMD_DIGTRIM field.

(8) Software issues MR42 to rank0.

(9) If desired, software can repeat steps 3-8 for rank1.

(10) Software combines the results from MR41/MR48 modes (if desired, results for rank1 as well) to come up with a single trim setting and programs the EMC2PMACRO_CFG_XM2CMD_DIGTRIM field

(A) Put CLKBUF0/CLKBUF2 into trimmer mode by setting EMC2TMC_CFG_XM2CMD_CLKBUF[0,2]_CONFIG = 001.

(B) Put XFORM_ADDR[0,2]_MULT field to 5'b0.

(C) Program bits [7:2] in the XFORM_ADDR[0,2]_OFFS field (11 bits) with the optimal trim result. The other XFORM_ADDR[0,2]_OFFS bits should remain at 0.

(D) Write a 1 into the TIMING_UPDATE field to load the above fields from shadow to active.

Below is what should be programmed into the CA_TRAINING_TIMING_CONTROL* registers.

CACKEL = tCACKEL + 15 clks

CAENT = tCAENT + 3 clks

CACD = tCACD + 5 clks

CACKEH = tCACKEH – 1 clk

CAEXT = tCAEXT – 1 clk

CA_DQ_RDV = CACD

Offset: 0x428 | Read/Write: R/W | Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

16.7.2.185 EMC_AUTO_CAL_CONFIG3_0

Auto-Calibration Settings for EMC Pads

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x45c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxx00000xxx00000)

Bit	Reset	Description
12:8	0x0	AUTO_CAL_CLK_PD_OFFSET: [PMC] 2's complement offset for CLK pull-down value
4:0	0x0	AUTO_CAL_CLK_PU_OFFSET: [PMC] 2's complement offset for CLK pull-up value

16.7.2.186 EMC_AUTO_CAL_STATUS2_0

EMC Pad Calibration Status

Offset: 0x460 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
28:24	X	AUTO_CAL_CNTL_PULLDOWN_ADJ: Pullup/down code sent to pads
20:16	X	AUTO_CAL_CNTL_PULLUP_ADJ: Pullup/down code sent to pads
12:8	X	AUTO_CAL_CMD_PULLDOWN_ADJ: Pullup/down code sent to pads.
4:0	X	AUTO_CAL_CMD_PULLUP_ADJ: Pullup/down code sent to pads

16.7.2.187 EMC_IBDLY_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x468 | Read/Write: R/W | Reset: 0x00000001 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00001)

Bit	Reset	Description
4:0	0x1	IBDLY: [PMC] tells the chip when to change IBDLY for DQ/DQS.

16.7.2.188 EMC_DLL_XFORM_ADDR0_0

Configure Digital DLL for CMD/ADDR Group 0

XFORM_ADDRx_MULT and XFORM_ADDRx_OFFS are a multiplier and offset, respectively, that can be used to modify the DLL output. Final products may be read out in the ADDR_TRIMMER_RD register. The default is multiply by 1, to keep the DLL's 1/4 cycle delay. Integer + fractional formats for multiplier and offset:

OFFS is 2's complement format, with bit [0] representing integer

The output of the XFORM is xform_out = (xform_in * MULT + OFFS*16)/16

The largest allowed MULT = 0x17

In the case of overflow, the output is clamped according to these rules:

out >= 0x600, xform_out = 0x000

0x600 > out >= 0x400, xform_out = 0x3ff

That means clamping works within 50% above the maximum (0x3ff) DLL output or 50% below the minimum (0) DLL output. To make sure that is always satisfied, conservatively program OFFS so that 0x600 < OFFS < (0x5ff - ((MULT * 0x3ff) >> 4))

The DLL output is effectively overridden by setting XFORM_*_MULT to 0 and programming XFORM_*_OFFS[8:1] to override the value

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

The ADDR(0|1|2)_CURRENT_TRIM_VAL registers provide a way to observe the values being used by the trimmers.

CLKBUF assignments for XFORM_ADDR as well as DLI_DDR_TRIM are:

- XFORM_ADDR5 controls channel 1 sdr pins: cke_b0, cke_b1, odt_b0, odt_b1, cs_b0_, cs_b1_
- XFORM_ADDR4 controls channel 1 ddr/2T pins: ba0, ba1, ba2, a10, a12, a13, a15, a_b3, a_b4
- XFORM_ADDR3 controls channel 1 ddr/2T pins: a_b5, a11, a14
- XFORM_ADDR2 controls channel 0 sdr pins: cs1_ cs0_, odt1, odt0, cke0, cke1
- XFORM_ADDR1 controls channel 0 ddr/2T pins: ras_,cas_,we_,rst,a2,a3, a4, a6, a8
- XFORM_ADDR0 controls channel 0 ddr/2T pins: a0, a1, a5, a7, a9

Offset: 0x46c | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxx00000000000xxxxxxx00000)

Bit	Reset	Description
0	0x0	EMC2PMACRO_CFG_BYPASS_IB_ADDRPIPE1: [PMC] 1 = bypass address pipeline stage between EMC and address pad-macro.

16.7.2.246 EMC_QPOP_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Boot requirements:

- This register should be parameterized in the BCT and written by the Boot ROM during cold boot.
- This register should be saved in the scratch registers and restored by the Boot ROM during warm boot.

Offset: 0x564 | Read/Write: R/W | Reset: 0x00000006 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx000110)

Bit	Reset	Description
5:0	0x6	QPOP: [PMC] time from read command to pop data from the pad macro FIFO. 45 = MAX

16.7.2.247 EMC_QUSE_WIDTH_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x568 | Read/Write: R/W | Reset: 0x00000003 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0011)

Bit	Reset	Description
3:0	0x3	QUSE_DURATION: [PMC] Additional QUSE duration apart from default BL/2

16.7.2.248 EMC_PUTERM_WIDTH_0

DRAM timing parameter

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x56c | Read/Write: R/W | Reset: 0x00000005 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0101)

Bit	Reset	Description
3:0	0x5	PUTERM_DURATION: [PMC] Additional PUTERM duration apart from default BL/2

16.7.2.249 EMC_BGBIAS_CTL0_0

BGBIAS Pad controls

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x570 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000)

Bit	Reset	Description
3	0x0	BIAS0_DSC_E_PWRD_IBIAS_RX: [PMC] Bias current going out to brick receiver
2	0x0	BIAS0_DSC_E_PWRD_IBIAS_VTTGEN: [PMC] Active High. Disables biasing current going out to VTTGEN cells
1	0x0	BIAS0_DSC_E_PWRD: [PMC] Active High. Disables all DC current paths within entire cell.

Bit	Reset	Description
0	0x0	BIAS0_DSC_BG_SEL_N: [PMC] Active low; 0= select BandGap reference current;

16.7.2.250 EMC_PUTERM_ADJ_0

PUTERM controls

This register is shadowed: see usage note at the top of Section 16.7.2

Offset: 0x574 | Read/Write: R/W | Reset: 0x00000081 (0bxxxxxxxxxxxxxxxxxxxxxxxxx1xxxxx01)

Bit	Reset	Description
7	ENABLED	CFG_PUTERM_EXTEND_HALF_CLK: [PMC] extend the PUTERM window by half a clock 0 = DISABLED 1 = ENABLED
1:0	0x1	CFG_PUTERM_LATE: [PMC] Half-cycle increments

16.7.2.251 EMC_CA_TRAINING_SP1_RESULT1_0

Offset: 0x5f0 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	CA_TRIM_RESULT_SP1_31_0: Indicates which trim setting(s) pass the CA-to-DQ comparison.

16.7.2.252 EMC_CA_TRAINING_SP1_RESULT2_0

Offset: 0x5f4 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	CA_TRIM_RESULT_SP1_63_32: Indicates which trim setting(s) pass the CA-to-DQ comparison.

16.7.2.253 EMC_CA_TRAINING_SP1_RESULT3_0

Offset: 0x5f8 | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	CA_TRIM_RESULT_SP1_95_64: Indicates which trim setting(s) pass the CA-to-DQ comparison.

16.7.2.254 EMC_CA_TRAINING_SP1_RESULT4_0

Offset: 0x5fc | Read/Write: RO | Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:0	X	CA_TRIM_RESULT_SP1_127_96: Indicates which trim setting(s) pass the CA-to-DQ comparison.

17.0 AHB

17.1 AHB Bus

The AHB Bus conforms to the *AMBA Specification (Rev 2.0) Advanced High-performance Bus (AHB)* architecture as published by ARM.

AHB is a 32-bit multi-master bus. Despite what its name implies, it is a second tier bus in the Tegra® K1 processor, slower and less flexible than the AXI bus used by the CPU, or the memory client interface used by the high-speed devices.

The Master clients on the AHB are:

- The AHB memory controller slave, which is the interface between the AHB bus and the Memory Controller
- The AVP crossbar, both as a master and as a slave. This is the path to IRAM from AHB devices, and also the AVP and CPU path to AHB devices. Neither the CPU complex nor the AVP can access DRAM through this path.
- The APB DMA controller, used to provide data transfer between APB devices and memory
- The USB-OTG controller
- MIPI HSI controller
- ARC controller
- The security engine (SE), both as a master and as a slave
- BSEA and BSEV bitstream engines
- The CoreSight™ debug controller
- The deprecated AHB DMA controller master
- SNOR AHB master
- DDS
- USB2 and USB3 controllers

The Slave clients on the AHB are:

- XBAR
- DRAM
- USB-OTG, USB2, USB3
- SNOR
- TZRAM

AHB in the Tegra K1 processor supports secure access to memory, using the same secure bit mechanism used by the CPU TrustZone security mechanism. This is supported by the SE, which can make secure accesses to memory.

17.2 AHB Bus Arbiter

The AHB Arbiter controls AHB bus master arbitration. This effectively forms a second level of arbitration for access to the memory controller through the AHB Slave Memory device, although AHB masters in some circumstances can use other AHB slaves, in particular they can access IRAM.

The controls presented here are largely for diagnostic purposes only. For suspect AHB performance problems, try disabling the other masters for the device with performance issues. In normal operation bus parking is usually enabled, and all the masters are enabled.

Also see the AHB slave interface registers, where the AHB pre-fetch logic can be configured to enhance performance for devices doing sequential read access from DRAM.

Each AHB master is assigned to either the high or low priority bin.

17.2.1 Arbitration Scheme

In every AHB Arbitration cycle, it is first decided whether a request from the high or low priority bin will be served. If there are only requests active for one of the bins, then that bin is served. When there are active requests from both bins, then the value from the AHB_PRIORITY_WEIGHT field is considered. There is a counter that is loaded with the AHB_PRIORITY_WEIGHT whenever the current count is 0 and someone wins an AHB arbitration. This counter is decremented anytime the count is nonzero and the winner of AHB arbitration was from the high-priority bin. Whenever this counter is nonzero, then a high-priority bin request will win over any low-priority bin request. In a system where both high- and low- priority bin requests are constantly active, the AHB_PRIORITY_WEIGHT says how many high-priority requests will be served for every one low-priority request.

Within each bin, the arbitration algorithm is round robin. For example, after AHB Master 2 wins an arbitration, then Master 3 has precedence for winning the next (followed by Master 4, etc. while Master 2 is last). AHB Master ID's can be seen in the enumeration of AHB_MEM_PREFETCH_CFG* registers' "AHB_MST_ID" field.

17.2.2 AHB Arbiter Registers

Refer to "Reading Register Tables" in the Introduction section for the register table protocol as well as recommendations for accessing registers.

In prior generation Tegra processors, this location used to hold a configuration register for COP_CACHE, but COP_CACHE has been replaced with AVP_CACHE, which has a region in a different section. For software compatibility, this location is reserved.

17.2.2.1 AHB_ARBITRATION_DISABLE_0

The AHB arbitration control register allows user to tweak arbitration behavior of the AHB arbiter.

- Enable bus parking. This keeps the last serviced AHB master on the bus granted so that it can start another transaction faster. If bus parking is disabled, no AHB master will be able to start a new transaction until the arbitration is done and the master is granted the bus.
- Allows the user to specifically disable an AHB master from arbitrating on the AHB bus.

AHB Arbitration Controller

Offset: 0x4 │ Read/Write: R/W │ Reset: 0x00000000 (0b00xxxxxxxx0xx000000x0xxx00000000)

Bit	Reset	Description
31	0x0	DIS_BUS_PARK: 1 = Disable bus parking. 0 = ENABLE 1 = DISABLE
30	0x0	DIS_PENULTIMATE_ARB: 1 = Disable arbitration on the second to last transfer.
21	0x0	MIPIHSI: 1 = Disable MIPIHSI from arbitration. 0 = ENABLE 1 = DISABLE
18	0x0	USB2: 1 = Disable USB2 from arbitration. 0 = ENABLE 1 = DISABLE

Bit	Reset	Description
17	0x0	USB3: 1 = Disable USB3 from arbitration. 0 = ENABLE 1 = DISABLE
16	0x0	BSEA: 1 = Disable BSEA from arbitration. 0 = ENABLE 1 = DISABLE
15	0x0	DDS: 1 = Disable DDS from arbitration. 0 = ENABLE 1 = DISABLE
14	0x0	SE: 1 = Disable SE from arbitration. 0 = ENABLE 1 = DISABLE
13	0x0	BSEV: 1 = Disable BSEV from arbitration. 0 = ENABLE 1 = DISABLE
11	0x0	SNOR: 1 = Disable SNOR from arbitration. 0 = ENABLE 1 = DISABLE
7	0x0	APBDMA: 1 = Disable APB-DMA from arbitration. 0 = ENABLE 1 = DISABLE
6	0x0	USB: 1 = Disable USB from arbitration. 0 = ENABLE 1 = DISABLE
5	0x0	AHBDMA: 1 = Disable AHB-DMA from arbitration. 0 = ENABLE 1 = DISABLE
4	0x0	ARC: 1 = Disable ARC from arbitration. 0 = ENABLE 1 = DISABLE
3	0x0	CSITE: 1 = Disable CoreSight from arbitration. 0 = ENABLE 1 = DISABLE
2	0x0	VCP: 1 = Disable VCP from arbitration. 0 = ENABLE 1 = DISABLE
1	0x0	COP: 1 = Disable COP from arbitration. 0 = ENABLE 1 = DISABLE
0	0x0	CPU: 1 = Disable CPU from arbitration. 0 = ENABLE 1 = DISABLE

17.2.2.2 AHB_ARBITRATION_PRIORITY_CTRL_0

The AHB arbiter implements a 2-level priority scheme. In the first level, arbitration is determined between the high and low priority group according to the priority weight; the higher the weight, the higher the winning rate of the high priority group.

In the second level, within each of the high/low priority group, arbitration is determined in a round-robin fashion.

AHB Arbitration Priority Control Register

Offset: 0x8 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000) | Default: 0xe0000000

Bit	Reset	SW Default	Description
31:29	0x0	0x7	AHB_PRIORITY_WEIGHT: AHB priority weight count. This 3-bit field is used to control the amount of attention (weight) given to the high priority group before switching to the low priority group.
28:0	0x0	NONE	AHB_PRIORITY_SELECT: 0 = low priority group.

17.2.2.3 AHB_ARBITRATION_USR_PROTECT_0

USR Protection Register

Offset: 0xc | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxx0000x0000)

Bit	Reset	Description
8	0x0	CACHE: Abort on USR mode access to Cache memory space 0 = ABT_DIS 1 = ABT_EN

0	0x0	IRAMA: Abort on USR mode access to iRAMa memory space 0 = ABT_DIS 1 = ABT_EN

17.3 AHB “Gizmo”

AHB master/slave gizmos are essentially hardware layers used by many of the master/slave logic which need to connect to the AHB bus.

These hardware layers handle all the AHB bus protocols and convert the more complex AHB protocol into a much simpler IP interface/handshake.

Because the AHB master/slave gizmos interface with many IP logic with different characteristics varying in speed, latency, etc., the gizmos accept a number of static configuration bits. Depending on system speed, latency requirement, transfer direction, burst characteristic, etc., these static configuration bits can be pre-configured to give extra performance or improve bus efficiency.

17.3.1 AHB Gizmo Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

17.3.1.1 AHB_GIZMO_AHB_MEM_0

AHB Master/Slave Gizmo Register

Given below is a description of each configuration field, what they are used for and the pros and cons of using them.

> **Note:** These configuration bits are meant to be changed only when the particular gizmo you want to change is idle (not being used). Changing the configuration bits on-the-fly while that gizmo is active can hang the system.

AHB gizmo configuration bit definition:

(1) AHB Master Gizmo

1. MAX_AHB_BURSTSIZE: Controls the maximum burst size that this gizmo can generate on the AHB bus. For the current system, this field should be set to burst-of-8.
2. IMMEDIATE: Controls how quickly an AHB write request on the bus can start.
   - If 1, the gizmo will start an AHB write request once the IP side provides one beat of data of a burst. For IP that can provide quick continuous burst data, this setting provides parallelism between AHB request and IP data transfer. However, for IP that cannot provide quick burst data, this setting will force this gizmo to hold the AHB bus longer, reducing bus efficiency.
   - If 0, gizmo will wait until all beats of data of a burst are provided before starting an AHB write request. With this setting, AHB bus efficiency is realized but IP latency and efficiency may be reduced.
3. RD_DATA: Controls how read data will be returned from the gizmo to the IP side.
   - If 1, all beats of data of a burst have to be available before it indicates to the IP logic that read data is ready. This setting ensures there is no wait-state (bubble) between read data burst, but it will increase latency.
   - If 0, each beat of data of a burst will be sent from gizmo to the IP logic immediately. This setting will reduce latency, but can create non-consecutive data burst or bubble between data.
4. REQ_NEG_CNT: Provides a way to limit (in terms of number of AHB bus clock) how fast/often this master can request the AHB bus. The bigger the number, the slower the rate of AHB request.

(2) AHB Slave Gizmo

1. ENABLE_SPLIT: Controls enabling the split feature of the AHB bus.
   - If 1, the gizmo will always generate split response for a read. If 'DONT_SPLIT_AHB_WR' is set to 0, gizmo also generates split response if it can no longer accept a write request from the AHB master. This setting can increase AHB bus utilization since it allows other AHB masters to talk to other AHB slaves while this original AHB slave is fetching read data. However, the flip side is that it takes longer time for the original AHB master to get the read data, because the original AHB master has to re-arbitrate for the AHB bus again to get to the data it asked for.

- If 0, the gizmo will not generate split response. Instead, it will hold on to the AHB bus until all the requested read data is returned back to the AHB master. This setting will reduce read latency to the master, but decrease AHB bus utilization.

2. FORCE_TO_AHB_SINGLE: Controls how the gizmo treats the AHB master's burst request.
   - If 1, the gizmo will break up the burst request internally into individual single word requests.
   - If 0, the gizmo will burst request internally as burst request.
3. ENB_FAST_REARBITRATE: Controls when the gizmo can allow the original read requested AHB master to re-arbitrate for the AHB bus again so the AHB master can retrieve the originally requested read data.
   - If 1, once first read data of a burst is in the slave gizmo's FIFO, it will allow the original AHB master to re-arbitrate, thus, allowing arbitration to happen in parallel with subsequent read data of a burst. However, if the data burst has wait-states or bubbles, then this setting will decrease AHB bus utilization because the slave gizmo will hold on to the AHB bus longer.
   - If 0, all read data of a burst must be in the slave gizmo's FIFO before it allows the original AHB master to re-arbitrate to retrieve the read data. This increases read data latency, and also increase AHB bus utilization.
4. IP_WR_REQ_IMMEDIATE: Controls when the gizmo will start write data request to the IP logic.
   - If 1, the gizmo will start write request to the IP logic once it gets one write data of a burst from the AHB side. This setting will create non-consecutive/bubbles in a write data burst.
   - If 0, the gizmo will start write request to the IP logic only when it gets all write data of a burst from the AHB side. This setting will create consecutive data burst (no bubbles or wait-states).
5. MAX_IP_BURSTSIZE: Controls the maximum burst size that this gizmo can generate to the IP logic.
6. ACCEPT_AHB_WR_ALWAYS: Controls how the slave gizmo will treat AHB write request.
   - If 1, the gizmo will always accept a write request without checking whether it's FIFOs can accept the write or not. This setting can reduce bus utilization, but can reduce the rate of AHB retry.
   - If 0, the gizmo will check its FIFOs to make sure they have room before accepting the AHB write request. This setting increase bus utilization, but can create a lot of AHB retry.
7. DONT_SPLIT_AHB_WR: Controls whether to split AHB write request when the slave gizmo determines it cannot accept the write request.
   - If 1 and when ENABLE_SPLIT=1, the gizmo will generate split for write if its FIFOs are not ready to accept the AHB write request or data. This setting can improve AHB bus utilization as there are no continuous AHB master retries on the bus.
   - If 0, the gizmo will generate retry response for write if its FIFOs are not ready to accept the AHB write request. Software should leave this bit at 0 since this feature has not been proven.

AHB Gizmo AHB-DMA/Memory Control Register

Offset: 0x10 | Read/Write: R/W | Reset: 0x00020081 (0b00000000xxxxx010xxxxxx0010xxx001) | Default: 0x00000304

Bit	Reset	SW Default	Description
31:24	0x0	NONE	REQ_NEG_CNT: AHB master request negate count. This is an 8-bit counter used to indicate the minimum number of clock counts between requests from this AHB master.
18	0x0	NONE	IMMEDIATE: AHB master gizmo (AHB-DMA) – Start AHB write request immediately 1 = Start the AHB write request immediately as soon as the device has put one write data in the AHB gizmos queue. 0 = Start the AHB write request only when all the write data has transferred from the device to the AHB gizmos queue.

Bit	Reset	SW Default	Description
			0 = DISABLE 1 = ENABLE
17:16	0x2	NONE	MAX_AHB_BURSTSIZE: AHB master gizmo (AHB-DMA) – Maximum allowed AHB burst size. 00 = Single transfer 01 = Burst-of-4 10 = Burst-of-8 11 = Burst-of-16 0 = DMA_BURST_1WORDS 1 = DMA_BURST_4WORDS 2 = DMA_BURST_8WORDS 3 = DMA_BURST_16WORDS
9	0x0	ENABLE	EN_USB_WAIT_COMMIT_ON_1K_STALL: Enabling this register and enabling WR_WAIT_COMMIT_ON_1K causes MC requests to be stalled when the current request from the USB is in a different 4KB block with respect to the previous USB request. The register field name indicates 1K but the actual implementation is 4K. 0 = DISABLE 1 = ENABLE
8	0x0	ENABLE	WR_WAIT_COMMIT_ON_1K: writes to ahbslv will only be issued to the MC when all prior writes in different 4KB pages have reached the point of coherency. This is needed because the MC allows re-ordering of transactions. If this is not set, an entity which polls memory for a descriptor or flag to indicate some other memory has been written, may think something is available in memory when it is not. The register field name indicates 1K but the actual implementation is 4K. 0 = DISABLE 1 = ENABLE
7	0x1	NONE	DONT_SPLIT_AHB_WR: AHB slave gizmo (memory controller) – Do not split AHB write transaction 1 = Do not split AHB write transaction ever. 0 (and enable_split=1) = Allow AHB write transaction to be split. 0 = ENABLE 1 = DISABLE

17.4 AHB Memory Controller Slave

The AHB memory controller slave is the path used by AHB bus masters to access the Memory Controller. It provides access to DRAM from the AHB bus and can pre-fetch data.

17.4.1 AHB Memory Pre-Fetcher

The AHB memory controller slave contains a pre-fetcher block. This is intended to improve performance for AHB masters performing sequential reads from DRAM. Performance can be a problem because the AHB bus protocol only allows a single outstanding read request from a master, so the round trip latency limits bandwidth. As there are two level of arbitration, firstly on AHB and secondly within the memory controller, this latency can become large on a busy system.

There are eight such pre-fetchers, allowing this function to be active for up to eight AHB masters.

When the pre-fetcher is enabled, the first read request initiates a speculative read of up to 128 bytes, and subsequent linear reads will return the data directly to the AHB master without going through the memory controller to DRAM.

17.4.1.1 Pre-Fetch Invalidate

The pre-fetch buffer's contents are invalidated under any of the following conditions, in all cases a read refers to a DRAM read by the assigned AHB master:

- The programmed time-out value is reached since the last read
- A read occurs which is not sequential with the previous read
- A read occurs which is not the same size as the previous read, unless the corresponding DISABLE_CHECK_SIZE_MASTERx bit is set.
- A read occurs which is past the end of the pre-fetch buffer (this will trigger a new fill of the buffer).
- The pre-fetcher is disabled. A momentary disable and then re-enable can be used to invalidate the buffer.

17.4.1.2 Pre-Fetch Buffer Coherency

As the pre-fetch buffer contains a copy of data in DRAM, there is an inherent coherency risk if the DRAM data is updated. The hardware invalidation mechanisms provide some protection here, but there remains risk of subtle problems arising from this hardware. If an AHB master shows errors that appear to arise from stale data then a reasonable experiment is to disable the pre-fetcher to see if that cures the problem. If so, the following guidelines may help.

Problems have been seen for control structures such as USB Transfer Descriptors.

Two approaches can resolve this problem:

1. Pad the data

As the pre-fetcher invalidates the buffer for any non-sequential read, placing some padding will prevent pre-fetch issues. A problem can be triggered by using something like this:

```
struct dtd { unsigned HW_descriptor[K] ; } ; struct dtd dtd_array[N] ;
```

This makes the hardware descriptors structures as read by the USB DMA sequential, and so pre-fetchable.
If the definition is modified as:

```
struct dtd { unsigned HW_descriptor[K] ; unsigned Padding ; } ; struct dtd dtd_array[N] ;
```

Then reads by USB DMA of consecutive hardware descriptors become **not** sequential and so there is no coherency issue as the pre-fetch buffer will be invalidated.

2. Invalidate the pre-fetch buffer

After updating a memory structure, the pre-fetch buffer can be invalidated by disabling the pre-fetcher and then immediately re-enabling it.

17.4.2 AHB Memory Controller Slave Registers

Refer to "Reading Register Tables" in the Introduction section for the register table protocol as well as recommendations for accessing registers.

15:0	0x800	INACTIVITY_TIMEOUT

17.4.2.5 AHB_AHB_MEM_PREFETCH_CFG_X_0

If DISABLE_CHECK_SIZE is 0, then only read requests that have the exact same size as the original read request that kick-started the prefetch process will cause a "hit". In addition, the address must be the exact next one in the sequence.

For instance, if the first request on a prefetch-enabled AHB Master arrives with SIZE=ONE_BYTE and ADDR[31:0]=0x3, then the next access must have SIZE=ONE_BYTE and ADDR[31:0]=0x4 in order to be considered a hit.

If DISABLE_CHECK_SIZE is 1, then a read request will hit as long as the incoming ADDR[31:4]matches the expected_ADDR[31:4]. expected_ADDR[31:4] is always either "last ADDR[31:4]" or "last ADDR[31:4] + 1", where last ADDR is the prior read request actually issued by the AHB Master(as opposed to the last request to the CIF, which could have been a speculative read).

expected_ADDR[31:4] is always "last ADDR[31:4]" unless "SIZE" field in the last request uses the last byte in the 16-byte CIF word.

17.4.2.10 AHB_AHB_MEM_PREFETCH_CFG1_0

NV_ahbslvmem prefetch

The NV_ahbslvmem prefetch feature reduces latency and improves overall bandwidth for AHB Masters doing reads to SDRAM. AHB only allows one outstanding read transaction at a time. When enabled, and kick-started by a first read request (which will "miss" since there would be nothing in the prefetch FIFO) the prefetcher makes speculative read requests to the memory controller in consecutive progression of linear address. Without this feature, an AHB Master will suffer roundtrip latency through the gizmo, PPCS, CIF, MC arbitration, and all the read data passing for every AHB transaction.

Address Boundaries for prefetching will stop the sequential prefetch process from making additional speculations. This is useful to help prevent coherency issues -- software needs ways to stop the prefetcher from prefetching data before the data has been written in memory. If an AHB master can be known to make 256 byte transfers that are aligned accesses, ADDR_BNDRY should be set to a value of 4.

INACTIVITY_TIMEOUT is intended to prevent coherency problems. If no read request from the prefetch-enabled master is observed after the number of cycles specified in the inactivity timeout counter, then any speculatively prefetched read data is invalidated.

There are eight AHB masters that can be enabled for prefetching. Each prefetch buffer can hold up to 8 entries (of 128 bits each entry) of prefetched data.

0x6000_C0F0: ahbslv prefetch cfg1 --> reset value = 0x1483.0800.

17.4.2.20 AHB_AVPC_MCCIF_FIFOCTRL_0

Note: The FIFO timing aspects of this register are no longer supported, but are retained for software compatibility.

The clock override/ovr_mode fields of this register control the second-level clock gating for the client and MC sides of the MCCIF. All clock gating is enabled by default.

A '1' written to the rclk/wclk override field will result in one of the following:

- With wclk/rclk override mode = LEGACY, the clock reverts to legacy mode of operation where the clock is on whenever the client clock is enabled.
- With wclk/rclk override mode = ON, the clock is always on inside the MCCIF and PC

A '1' written to the CCLK override field keeps the client's clock always on inside the MCCIF.

Memory Client Interface FIFO Control (where applicable) and Clock Gating Control Register

18.0 APB

18.1 APB Miscellaneous Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

This section describes a number of system control registers that are grouped together in the aptly named miscellaneous registers section. These registers are all present on the APB bus.

18.1.1 JTAG Configuration Register

18.1.1.1 APB_MISC_PP_CONFIG_CTL_0

Configuration Control Register

The use of the SO bits below has been deprecated. Keep these bits disabled at all times.

Offset: 0x24 │ Read/Write: R/W │ Reset: 0x00000040 (0bxxxxxxxxxxxxxxxxxxxxxxxx01xxxx00)

Bit	Reset	Description
7	DISABLE	TBE: 0 = Disable ; 1 = Enable RTCK Daisy chaining 0 = DISABLE 1 = ENABLE
6	ENABLE	JTAG: 0 = Disable Debug ; 1 = Enable JTAG DBGEN 0 = DISABLE 1 = ENABLE
1	DISABLE	XBAR_SO_DEFAULT: Deprecated -- keep disabled -- default SO bit for non-CPU XBAR clients 0 = DISABLE 1 = ENABLE
0	DISABLE	CPU_XBAR_SO_ENABLE: Deprecated -- keep disabled --Enable CPU SO bit to propagate to XBAR 0 = DISABLE 1 = ENABLE

18.1.1.2 APB_MISC_PP_PINMUX_GLOBAL_0_0

Global Pinmux Control Register

When both CLAMP_INPUTS_WHEN_TRISTATED is set to ENABLE and the TRISTATE field is set to TRISTATE (1b1), the inputs to the core are clamped to zero. Software must set this bit before taking any controller using a pinmuxed pin out of reset.

Offset: 0x40 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0)

Bit	Reset	Description
0	DISABLE	CLAMP_INPUTS_WHEN_TRISTATED: 0 = Do not clamp inputs when tristated; 1 = Clamp inputs when tristated 0 = DISABLE 1 = ENABLE

18.1.2 PULL_UP/PULL_DOWN Control Register

Controls the pull_up/pull_down inputs of the pads. Used to eliminate external components on interfaces that need pullup/pulldown. Those are weak internal pullup/pulldowns

- NORMAL setting means pad is neither pulled up (driving weak 1) or pulled down (driving weak 0)
- PULL_DOWN selection means pad is driving weak 0
- PULL_UP selection means pad is driving weak 1

> **WARNING!** Driving an internal pull-up when the pad has an external pull-down and vice versa will cause a significant increase in power consumption.

Table 59: Cross Reference of Fields with Real Ball Names

Field Name	Controls Balls
XM2D_PU_PD	DDR_DQ0,DDR_DQ1,...,DDR_DQ31
XM2C_PU_PD	MIO_IORDY,DDR_DM0,..,DDR_DM3,DDR_DQS0,...,DDR_DQS3,DDR_A0,..,DDR_A13,DDR_BA0,DDR_BA1,DDR_CS0_,DDR_CS1_,DDR_CKE,DDR_RAS_,DDR_CAS_,DDR_WE_
DDRC_PU_PD	DDR_COMP_PU, DDR_COMP_PD

18.1.2.1 APB_MISC_PP_PULLUPDOWN_REG_C_0

Offset: 0xa8 | Read/Write: R/W | Reset: 0x00000000 (0b000000xxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31:30	NORMAL	XM2C_PU_PD: 0 = NORMAL 1 = PULL_DOWN 2 = PULL_UP 3 = RSVD
29:28	NORMAL	XM2D_PU_PD: 0 = NORMAL 1 = PULL_DOWN 2 = PULL_UP 3 = RSVD
27:26	NORMAL	DDRC_PU_PD: 0 = NORMAL 1 = PULL_DOWN 2 = PULL_UP 3 = RSVD

18.1.2.2 APB_MISC_SC1X_PADS_VIP_VCLKCTRL_0

VCLK Control Register

Enable VCLK pad to get external clock for VI.

Offset: 0x428 | Read/Write: R/W | Reset: 0x00000000 (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx00)

Bit	Reset	Description
1	0x0	INVERSION: VCLK invert enable 0 = DISABLE 1 = ENABLE
0	0x0	IE: VCLK input enable 0 = DISABLE 1 = ENABLE

18.1.2.3 APB_MISC_GP_HIDREV_0

Chip ID Revision Register

Offset: 0x804 │ Read/Write: RO │ Reset: 0x000XXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
19:16	X	MINORREV: Chip ID minor revision
15:8	X	CHIPID: Chip ID
7:4	X	MAJORREV: Chip ID major revision (0: Emulation, 1-15: Silicon) 0 = EMULATION 1 = A01
3:0	X	HIDFAM: Chip ID family register. 0 = GPU 1 = HANDHELD 2 = BR_CHIPS 3 = CRUSH 4 = MCP 5 = CK 6 = VAIO 7 = HANDHELD_SOC

18.1.3 Pad Control Registers

The registers below control pad behavior. For each digital pad, the following controls can be used to tune pad performance, functionality, and power consumption. The pads controlled by each pad group register can be found in the Pinmux section of this document.

- **HSM_EN** - High speed mode - active high, enables high speed mode for driver and receiver for better matching of the rise/fall delay in outbound and inbound paths. Use it for clocks and the high speed signaling where the matching timings are of importance.
- **SCHMT_EN** - Schmitt enable - active high, enables the Schmitt Trigger Type of I/P receiver. Default is Inverter Type of receiver.
- **LPMD** - Low power mode - select low power modes (different impedance and current value). The table depicts the function of low power mode

Table 60: Low Power Mode Functions

LPMD1	LPMD0	Power Mode Selected
0	0	X/8 Current Setting. Lowest Power or Current (8*Z ohm)
0	1	X/4 Current Setting (4*Z ohm)
1	0	X/2 Current Setting (2*Z ohm)
1	1	X Current Setting (Z ohm = 50 ohm). Highest Power or Current.

- CAL_DRVDN - drive down (falling edge) - Driver Output Pull-Down drive strength code.
- CAL_DRVUP - drive up (rising edge) - Driver Output Pull-Up drive strength code. Works with combination of LMPD bits. For lower power modes, higher drive strength are masked. See table below:

LPMD1	LPMD0	CAL_DRV*4	CAL_DRV*3	CAL_DRV*2	CAL_DRV*1	CAL_DRV*0
0	0	Masked to 0	Masked to 0	Masked to 0	Pass Code	Pass Code
0	1	Masked to 0	Masked to 0	Pass Code	Pass Code	Pass Code
1	0	Masked to 0	Pass Code	Pass Code	Pass Code	Pass Code
1	1	Pass Code	Pass Code	Pass Code	Pass Code	Pass Code

- DRVDN_SLWR - Driver Output Rising Edge Slew 2-bit control code.
  Code 11 is least slewing of signal, code 00 is highest slewing of the signal.
- DRVUP_SLWF -Driver Output Falling Edge Slew 2-bit control code.
  Code 11 is least slewing of signal, code 00 is highest slewing of the signal.

2	0x1	CFG2TMC_DDCCFG_HSM_EN: Data pins high speed mode enable 0 = DISABLE 1 = ENABLE

18.1.3.24 APB_MISC_GP_GMACFGPADCTRL_0

Controls for BDSDMEMLV pads of SDMMC4

The following calibration codes need to be used for the pad under default condition. In general, the calibration pad will provide the code for the pad. To bypass calibration and provide the default code for the required impedance, these values (in hexadecimal) should be used.

Table 63: DRV Codes (5-bit Code)

Supply	33 ohms		50 ohms	
	Up	DN	Up	DN
1.8V	0x7	0x7	0x2	0x1

Supply	33 ohms		50 ohms	
1.2V	0xE	0xE	0x5	0x5

GMACFG Pad Control Register

Offset: 0x900 │ Read/Write: R/W │ Reset: 0x00204040 (0b0000xxx00010x00001xxxxxx01xx00x0)

Bit	Reset	Description
31:30	0x0	CFG2TMC_GMACFG_CAL_DRVUP_SLWF. Maps to MSB of DRVDN[18:17].
29:28	0x0	CFG2TMC_GMACFG_CAL_DRVDN_SLWR. Maps to MSB of DRVUP[24:23].
24:20	0x2	CFG2TMC_GMACFG_CAL_DRVUP. 1.8V 50 ohm driver for eMMC.
18:14	0x1	CFG2TMC_GMACFG_CAL_DRVDN. 1.8V 50 ohm driver for eMMC.
7:6	0x1	CFG2TMC_GMACFG_DRV_TYPE. 0x1: 33-50 ohm driver 0x0: 66-100 ohm driver

18.1.6 Pin Mux Selects

Refer to the Multi-Purpose I/O Pins and Pin Multiplexing (Pinmuxing) section in this document for details on the Pinmux_aux registers.

18.2 APB DMA Controller

The APB DMA Controller is placed between the AHB Bus and the APB Bus and is a master on both buses.

The APB DMA Controller is used for block data transfers from a source location to the destination location. The source may be DRAM or IRAM, and the destination location could be devices placed on APB Bus; or vice versa. DMA transfers are done without any processor intervention other than register writes needed to program the parameters for a particular transfer, and accesses needed to handle any interrupts.

The APB DMA Controller has 32 fully programmable channels, which can all transfer data concurrently.

18.2.1 Features

- DMA master for transfers between external/internal memory and peripheral devices on the APB Bus
- Two modes of operation: single transfer (once) or continuous
- Programmable burst sizes of 1, 4, or 8 words
- Maximum transfer size is 1 GB per channel, with the minimum size being one word
- Programmable APB bus widths of 8, 16, and 32 bits
- Separate AHB and APB start addresses
- Per channel trigger and flow control mechanism support
- Channel to channel trigger support, i.e., ability to link up channels to start at the end of another channel's transfer, allowing scattering/gathering of physical memory.
- Interrupt generation at the completion of channel transfer
- Interrupts per channel can be routed to the CPU or AVP
- Ability to hold processor until transfer is done
- Wrap mode supported for all channels in Once mode
- Ping-Pong feature supported in continuous mode
- Weighted round robin arbitration among channels at burst granularity. The weights for each channel can be set.
- Runs on APB clock. The APB clock generally runs at 1:2:2 or 1:2:3 clock ratios (sclk : hclk : pclk).
- APB DMA secure access feature allows configuration of secure and non-secure areas
- Address wraparound
- Global or individual channel pausing

18.2.2 Functionality

There are 32 channels in APB DMA. An APB DMA channel can transfer specified portions of data from an AHB address space (can be iRAMs or DRAMs on the MC) to an APB address space. APB DMA follows a simple round robin arbitration scheme, starting with channel 0.

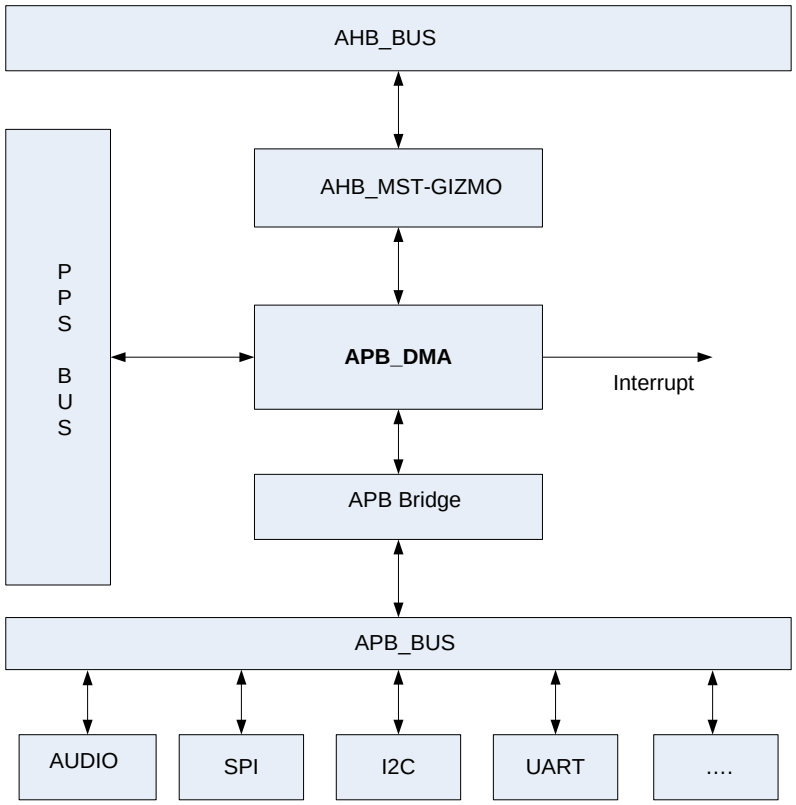
Each channel can have independent burst transfer sizes programmed to one word, four words, or eight words.

Each DMA channel supports:

- Enable bit: one for each channel and one global enable bit.
- Interrupt Enable at the end of transfer with ability to mask or route to desired processor.
- Ability to hold off a processor. The Processor that writes into this bit will be held until transfer is completed.
- Direction bit to determine the direction of transfer--AHB to APB or APB to AHB.

- Trigger and Flow selects. These are addition controls apart from channel enable, on which the transfer depends. Trigger is used to start a channel on some event to start the transfer and flow is used to proceed with every new burst transfer. These events are under either Software or Hardware control.
- Wrap feature wraps the LS nibble of the address back to 'b0000 instead of incrementing to the next address if the required number of words has been transmitted.
- APB bus width is configurable whereas the AHB bus width is fixed to 32 bits. The APB bus can be 8, 16, or 32 bits wide. For an AHB burst of 8 (burst is always with regard to words) and an APB bus size of 16, there are: 8 words transferred to the APB side, or 16 halfwords transferred.
- Double Buffering Mode makes the APB DMA Burst Address reset to AHB Base Address after every even (2nd, 4th, 6th, etc.) APB DMA Transfer. This mode is used only along with continuous mode (once bit 0).
- Separate AHB start address and APB start address.
- Ability to delay the burst rate with the help of a global counter which can be programmed to desired value, which equals number of clocks delay required between each burst.

Figure 36: APB-DMA Block Diagram



18.2.3 APB DMA Secure Access

APB DMA secure access is determined by the channel security enable bits in the APB DMA Security register. A particular channel is secured by enabling the respective bit field . Whether through the CPU or APB DMA, accesses are blocked if the SECURITY_EN bit of that region is enabled and the incoming access is non-secured.

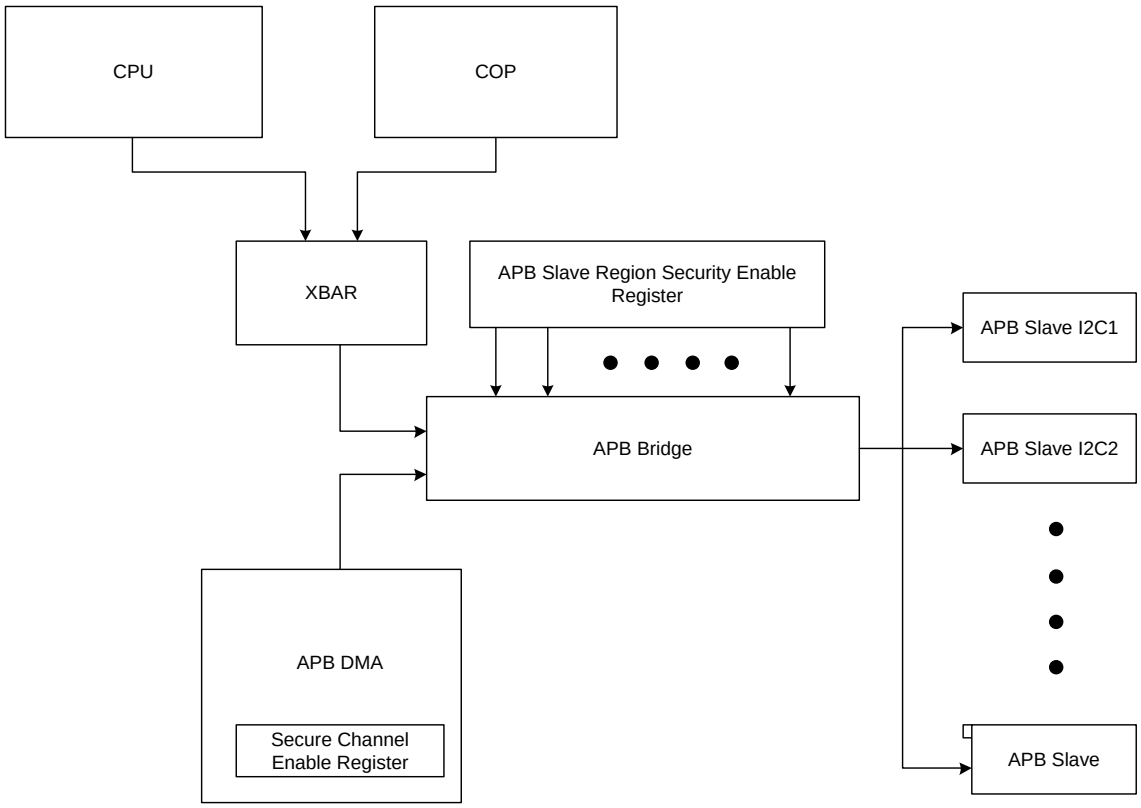
The APBDMA_SECURITY_REG register contains the fields CH_<0-31>_SECURITY_EN, which indicate which channel is secure. Write and read transactions to this register must always be secure.

If a channel is designated as secure, its registers must be written and read out in a secure manner. A non-secure write attempt will not affect any of the secure channel's registers and a non-secure read attempt will not generate any read data.

If a channel is non-secure, its registers can be written or read either in a secure or a non-secure manner.

The following figure shows the security flow.

Figure 37: Security Flow Diagram



18.2.4 Programming Guidelines

Follow these guidelines when programming the APB DMA Controller:

The DMA transfer size should be in multiples of 4 bytes only.

The APB burst size and the FIFO trigger levels (in the modules) need to be programmed such that they do not lead to an overflow/underflow of the FIFO in the APB client.

All registers of a channel should be programmed before the Channel Enable bit in the channel's control register is set as follows:

1. Program the AHB Starting Address and APB Starting address in the *AHB_PTR and *APB_PTR registers.
2. Program the required AHB BURST size, WRAP word window size, and AHB_DATA_SWAP (byte swapping) option in the *AHB_SWQ register. The AHB BUS WIDTH is fixed to a 32-bit bus.
3. Program the required APB_BUS_WIDTH (as the peripheral), APB_DATA_SWAP (byte swapping) option, and WRAP word window size in the *APB_SEQ register.
4. Program the number of words to be transferred in the *WCOUNT register.
5. Program the trigger in the CHANNEL_*_CSRE register.
6. Program the Interrupt option, Hold Processor option, DMA transfer direction, Transfer Mode, and Flow Enable in the CHANNEL_*_CSR register.

7. Program the Global Enable (GEN) bit in the APB_DMA Command Register. The GEN bit can also be programmed before programming the channel registers.
8. Whenever the channel's ENB bit is enabled, the DMA starts the data transfer.
9. Each channel's status is observed by polling the APB_DMA Status Register. The number of words remaining to be transferred will be in the WORD_TRANSFER register.
10. The Tx/Rx Flow/Trigger requestors are programmed in the APB-DMA Requestor Assignments Registers.
11. The busy (BSY) bit is set as soon as a DMA channel is enabled and is cleared after the transfer is completed.

Pausing and Ending of Data Transfers

- Clearing the Global Enable (GEN) bit causes the transfers that are in progress to be paused. Setting the GEN bit resumes the transfers. A channel should never be disabled when the DMA is in global pause.
- Setting the CHANNEL_PAUSE bit in the CSRE register pauses data transfers on that channel. If the CHANNEL_PAUSE bit of a particular channel is enabled during a data transfer, the data transfer is paused only on this channel after the completion of the current burst. It can be resumed by setting this bit to 0.
- If a channel's ENB is disabled independently while a transfer is in progress, the transfer ends after completing any burst sequence that is in progress.

Interrupts

- Interrupts are write-1-to-clear, i.e., an interrupt bit is cleared when the value of write data corresponding to the bit position of the interrupt bit is 1.
- An interrupt is generated when the last data is accepted by the AHB slave while writing on the AHB bus and once the last data is placed on APB bus while reading from AHB bus. Note that completion of an AHB write does not guarantee the data is written to DRAM. Refer to the AHB section of this document for how data is flushed from AHB to the MC for this master.

Wraparound

Wraparound does not occur in between bursts; it is only after completing a burst that the address wraps around. Wraparound is possible for both AHB and APB addresses.

The programming of the AHB wraparound needs to account for the address that is programmed in the AHB start address and the burst size.

Usually, APB clients have a buffer of a fixed size. If the APB addresses are incremented after each word transfer, it is likely that the address would cross the address limit of that client and go into the address range of another client. To avoid this, the wrap feature is used. The default wraparound on the APB side is wrapping on 1 word. It prevents unnecessary address switching on the APB.

With the address wrap feature enabled, the LS nibble of the address wraps back to 0 after completion of the programmed number of words instead of incrementing the address.

Example: AHB burst size = 4 words, AHB start address = 0x4000_0000, AHB wrap on 32 words

In this case, the AHB addresses would be:

0x4000_0000, 0x4000_0004, 0x4000_0008, 0x4000_000C

…….

0x4000_0070, 0x4000_0074, 0x4000_0078, 0x4000_007C

When the address wrap feature is disabled, the addresses are incremented after each word transfer. This helps transfer data from/to contiguous locations.

Flow Control

When flow control is enabled, the number of words to be transferred must always be a multiple of the burst size/APB trigger level. Without flow control the following are possible:

- If a burst of 8 is requested with an address that is not aligned to an 8-word boundary, the DMA will do a single burst until it aligns itself to the 8-word boundary and then starts issuing burst requests.
- If a burst of 8 is requested and at any point of time the transfer size goes below 8, the DMA completes the remaining transfers with a burst of 4 or 1, whichever is possible.
- If a burst of 4 is requested with an address that is not aligned to a 4-word boundary, the DMA transfers a single burst until it aligns itself to the 4-word boundary.
- If a burst of 4 is requested and at any point of time the transfer size goes below 4, the DMA completes the remaining transfers with a burst of 1.

Continuous Mode

In continuous mode, when a transfer is in progress, the APB and AHB addresses and the WCOUNT fields can be reprogrammed in the middle of a data transfer. When the current transfer completes and a new transfer starts, it picks up the newly programmed values. All new programming must complete before the channel completes the data transfer. To be sure about this, CHANNEL_PAUSE can be used.

2x Mode

In 2x mode, the reprogramming can be done only on the second half of the data transfer.

18.2.5 APB DMA Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

18.2.5.1 APBDMA_COMMAND_0

APB-DMA Command Register

The Global Enable (GEN) bit in the command register enables the APB DMA. Clearing this bit causes active DMA transfers to be paused. Pending bus transactions (on going burst) will be completed, and no new transactions will be initiated. Setting this bit again resumes the transfers. Disabling this bit will disable the channel register access.

Note that the power on reset value for the APB DMA Global Enable is 0. This bit must be written to 1 before any APB DMA transactions can begin.

Offset: 0x0 │Read/Write: R/W │ Reset: 0x00000000 (0b0xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	GEN: Enables Global APB-DMA 0 = DISABLE 1 = ENABLE

18.2.5.2 APBDMA_STATUS_0

APB-DMA Status Register

The Busy bits in the Status Register indicate which (if any) of the APB DMA channels have active pending APB DMA transfers. Note that Busy bits remain active in APB DMA transfers that are started in continuous (repetitive) mode until the enable bit for the APB DMA channel is cleared to 0 (by the software). Read-only flags are set/cleared by hardware.

18.2.5.3 APBDMA_CNTRL_REG_0

APB-DMA Counter Register

The APB DMA Counter is used to slow down the request rates on some APB DMA channels. The APB DMA Channel Counter Enable register stores bits that configure which (if any) channel(s) should be throttled (bits [31:0] of channel counter enable register correspond to the 32 APB DMA channels).

The APB DMA Counter initial/reload count value is programmed in the APB DMA Counter Register (bits[15:0]).The APB DMA Counter is loaded with this initial/reload count value whenever the APB DMA Counter Register is written, and is re-loaded to this saved initial count value on a burst complete (programmable). The APB DMA Counter value will decrement whenever an APB DMA burst complete, and the current count value is non-zero, and any of the bits [31:16] are set.

Offset: 0x10 │ Read/Write: R/W │ Reset: 0x00000000 (0bxxxxxxxxxxxxxxxx0000000000000000)

Bit	Reset	Description
15:0	0x0	COUNT_VALUE: DMA COUNT Value.

18.2.5.4 APBDMA_IRQ_STA_CPU_0

APB-DMA CPU IRQ STATUS Register

Gathers all the after-masking CPU directed IRQ status bits

Offset: 0x14 │ Read/Write: RO │ Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

18.2.6 APB DMA Channel Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

Each of the 32 APB DMA channels has its own set of 10 APB DMA registers. Each channel has 64 bytes of address space. This subsection defines one complete set of APB DMA channel registers. The register spaces per APB DMA channel are listed in the table below.

Table 64: APB DMA Channel Register Mapping

Register Space	Channel Registers
0x0 – 0x3f	Channel 0 APB DMA Channel Registers
0x40 – 0x7f	Channel 1 APB DMA Channel Registers
0x80 – 0xbf	Channel 2 APB DMA Channel Registers
0xc0 – 0xff	Channel 3 APB DMA Channel Registers
0x100 – 0x13f	Channel 4 APB DMA Channel Registers
0x140 – 0x17f	Channel 5 APB DMA Channel Registers
0x180 – 0x1bf	Channel 6 APB DMA Channel Registers
0x1c0 – 0x1ff	Channel 7 APB DMA Channel Registers
0x200 – 0x23f	Channel 8 APB DMA Channel Registers
0x240 – 0x27f	Channel 9 APB DMA Channel Registers
0x280 – 0x2bf	Channel 10 APB DMA Channel Registers
0x2c0 – 0x2ff	Channel 11 APB DMA Channel Registers
0x300 – 0x33f	Channel 12 APB DMA Channel Registers
0x340 – 0x37f	Channel 13 APB DMA Channel Registers
0x380 – 0x3bf	Channel 14 APB DMA Channel Registers
0x3c0 – 0x3ff	Channel 15 APB DMA Channel Registers
0x400 – 0x43f	Channel 16 APB DMA Channel Registers
0x440 – 0x47f	Channel 17 APB DMA Channel Registers
0x480 – 0x4bf	Channel 18 APB DMA Channel Registers
0x4c0 – 0x4ff	Channel 19 APB DMA Channel Registers
0x500 – 0x53f	Channel 20 APB DMA Channel Registers
0x540 – 0x57f	Channel 21 APB DMA Channel Registers
0x580 – 0x5bf	Channel 22 APB DMA Channel Registers
0x5c0 – 0x5ff	Channel 23 APB DMA Channel Registers
0x600 – 0x63f	Channel 24 APB DMA Channel Registers
0x640 – 0x67f	Channel 25 APB DMA Channel Registers
0x680 – 0x6bf	Channel 26 APB DMA Channel Registers
0x6c0 – 0x6ff	Channel 27 APB DMA Channel Registers
0x700 – 0x73f	Channel 28 APB DMA Channel Registers
0x740 – 0x77f	Channel 29 APB DMA Channel Registers
0x780 – 0x7bf	Channel 30 APB DMA Channel Registers
0x7c0 – 0x7ff	Channel 31 APB DMA Channel Registers

18.2.6.1 APBDMACHAN_CHANNEL_n_CSR_0

APB-DMA-n Control Register

There are 32 APB DMA Channel Control Registers, one per channel (n = 0 through 31).

Writing a 1 to bit [31] of an APB DMA Channel Control Register will initiate the APB DMA transfer. Because this action will depend on some values programmed in the other registers, it is recommended that the registers in the address space in the required APB DMA channel be programmed before writing into control register.

In "Once" mode, the channel is disabled after the APB DMA transfer has completed. When the channel's transfer completes, an interrupt will be sent if the IE.EOC bit is set. If the transfer requires a trigger or flow, then the corresponding trigger selected by the "TRIG_SEL" or "REQ_SEL" field must become active respectively before the channel can starts its transfer. If both Trigger and Flow bits are set, both conditions must be met before the channel starts each DMA burst.

Offset: 0x0+ (n * 0x40) │ Read/Write: R/W │ Reset: 0x00000000 (0b00000xxxxx000000xxxxxxxxxxxxxxxx)

Bit	Reset	Description
31	0x0	ENB: Enables DMA channel transfer 0 = DISABLE 1 = ENABLE

18:16	0x1	APB_ADDR_WRAP: APB Address Wrap-around Window. 0 = No Wrap. 1 = Wrap on 1 Word Window (default). 2 = Wrap on 2 Word Window. 3 = Wrap on 4 Word Window. 4 = Wrap on 8 Word Window. 5 = Wrap on 16 Word Window. 6 = Wrap on 32 Word Window. 7 = Wrap on 64 Word Windows (rsvd). 0 = NO_WRAP 1 = WRAP_0N_1WORDS 2 = WRAP_ON_2WORDS 3 = WRAP_ON_4WORDS 4 = WRAP_ON_8WORDS 5 = WRAP_ON_16WORDS 6 = WRAP_ON_32WORDS 7 = WRAP_ON_64WORDS

18.2.6.9 APBDMACHAN_CHANNEL_n_WCOUNT_0

APB-DMA-n Word Count Register

There are 32 APB DMA Word Count Registers, one per channel (n = 0 through 31).

Offset: 0x20 + (n * 0x40) │ Read/Write: R/W │ Reset: 0x00000000 (0bxx00000000000000000000000000xx)

Bit	Reset	Description
29:2	0x0	WCOUNT: Number of 32-bit word cycles.

18.2.6.10 APBDMACHAN_CHANNEL_n_WORD_TRANSFER_0

APB-DMA-n Word Transfer Register

There are 32 APB DMA Word Transfer Registers, one per channel (n = 0 through 31).

Offset: 0x24 + (n * 0x40) │ Read/Write: RO │ Reset: 0xXXXXXXXX (0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx)

Bit	Reset	Description
29:2	X	COUNT: APB-Current 32-bit Word Cycles. Flags set/cleared by hardware.

[THIS PAGE INTENTIONALLY LEFT BLANK]

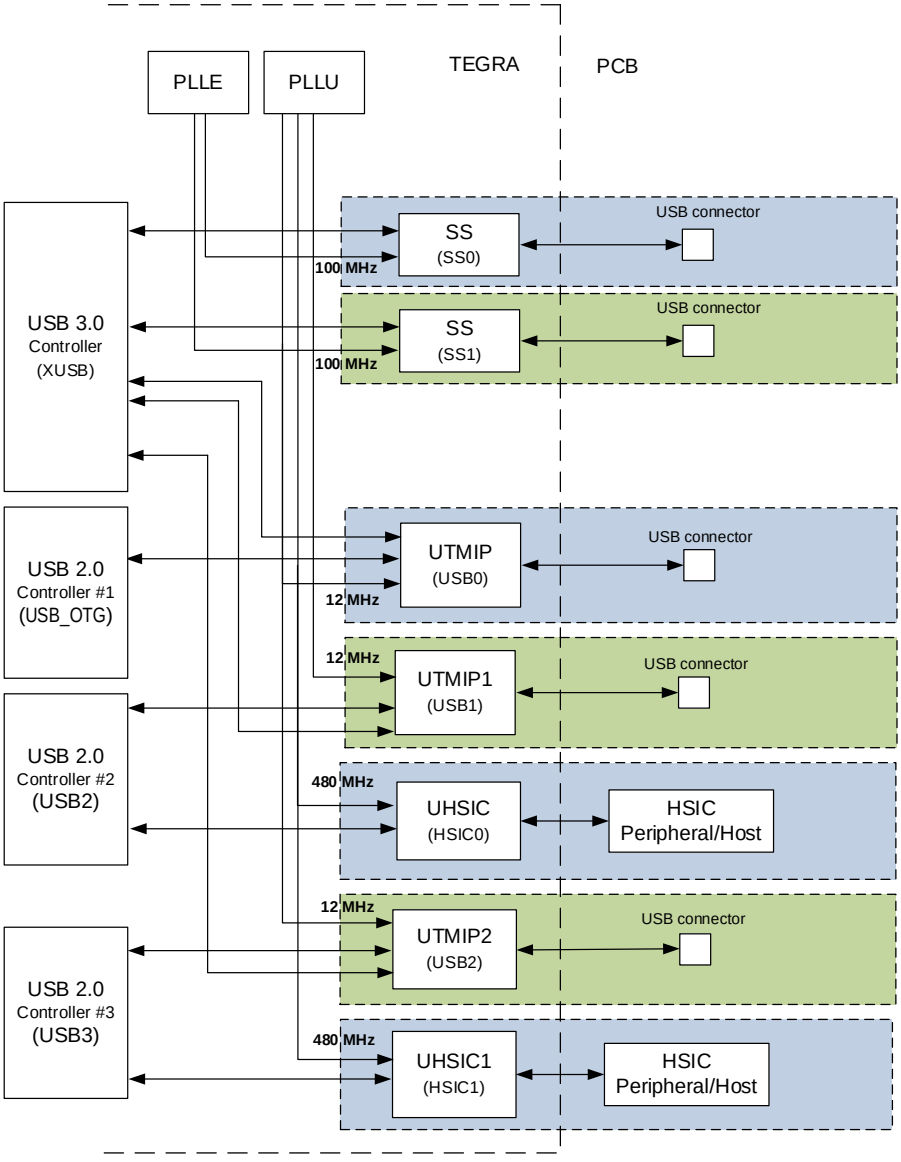
19.0 USB COMPLEX

Note: The ULPI and XUSB device mode functionalities described in this section have been deprecated from Tegra® K1 devices, and are not supported by NVIDIA.

19.1 USB Overview

The Tegra K1 device has three USB 2.0 (EHCI) controllers (named USB_OTG, USB2, and USB3) and one USB 3.0 (xHCI) controller (named XUSB), controlling a total of five exposed ports shared among them (named UTMIP, HSIC0, UTMIP1, HSIC1, and UTMIP2). The following diagram shows the relationship between the different USB controllers and interfaces. Note that some USB ports are shared between the USB 2.0 and USB 3.0 controllers.

Figure 38: Tegra K1 USB Controllers and Interfaces



Below is a summary of the key components in the USB complex:

- USB_OTG and UTMIP: This is the primary USB port that supports OTG. USB recovery is also supported on this interface.
- USB2 and UHSIC: This interface allows connection of an HSIC peripheral/host on the PCB board.
- USB2 and UTMIP1: This interface allows an additional USB port. It supports host mode of operation.
- USB3 and UHSIC1: This interface allows connection of an HSIC peripheral/host on the PCB board.
- USB3 and UTMIP2: This interface allows an additional USB port. It supports host mode of operation.
- XUSB and UTMIP2. XUSB can support multiple interfaces at the same time.
- XUSB and UTMIP1. XUSB can support multiple interfaces at the same time.
- XUSB and UTMIP. XUSB can support multiple interfaces at the same time.
- XUSB and SS. XUSB can support multiple interfaces at the same time.

On power-on-reset, USB2 and USB3 default to UTMI mode.

USB_OTG supports 16 bidirectional endpoints in device mode, where USB2 and USB3 should never be advised or programmed to support device mode. Endpoint 0 of USB_OTG is always a bidirectional control endpoint. All other endpoints can be programmed as one of Bulk, Interrupt, Isochronous, or Control type in either direction. Control endpoints are always bidirectional and hence to program an endpoint as control type, both IN and OUT directions need to be programmed to control type. Conversely, if an endpoint has either IN or OUT direction programmed to be non-control type, the other direction also needs to be programmed to be non-control type. The maximum packet size supported on any endpoint is 1024 bytes in high-speed mode, for both device and host modes.

19.2 USB 2.0 Controllers and Interfaces

The USB 2.0 controllers in the Tegra K1 mobile processors provide mechanisms for the processor to communicate with a PC as a peripheral or to communicate with USB 2.0 peripherals, such as keyboards, mouse devices, cameras, or storage devices, as a host using regular USB 2.0 ports. The USB 2.0 controllers also provide mechanisms for Tegra K1 devices to communicate with an on-board baseband controller with HSIC or regular UTMIP interfaces. Each Tegra K1 device provides three USB 2.0 controllers with five USB interfaces: three regular USB ports and two HSICs (see Figure 38).

The Tegra K1 device supports peripheral functionalities with USB 2.0 controller #1, which implements VBUS and ID sensing capabilities and associated interrupt mechanisms to support for device and host OTG operations with the regular USB 2.0 port. Tegra K1 devices support battery charging charger detection capabilities and associated interrupt mechanisms that are compliant with USB Battery Charging specification version 1.2 with USB 2.0 controller #1. For battery charging, software programming sequences are required to support the operations in response to hardware notifications from USB 2.0 controller #1.

All 3 USB 2.0 controllers support the EHCI programming model for scheduling transactions and interface managements as hosts. Each USB 2.0 controller contains an integrated transaction translator hub to support USB 1.1 transactions when connected to a USB 1.0 peripheral. USB 2.0 controller #1 supports EHCI-like programming models for scheduling responses to host requests.

Tegra K1 USB 2.0 controllers support L1 and L2 (suspend) link power managements. Tegra K1 USB 2.0 controllers support remote wakeup, wake on connect, wake on disconnect, and wake on overcurrent in all Tegra K1 power states, including deep sleep mode.

19.2.1 USB 2.0 Controller #1 (USB_OTG)

USB 2.0 Controller #1 only connects to USB 2.0 Port #1, which is the primary USB 2.0 port on Tegra K1 devices. USB 2.0 Controller #1 shares the same USB 2.0 Port #1 pins with the USB 3.0 xHCI controller. The pinmux must be programmed prior to USB 2.0 Controller #1 using USB 2.0 Port #1.

USB 2.0 Controller #1 supports both USB 2.0 device and USB 2.0 host operations. USB recovery is supported only with USB 2.0 Controller #1 and USB 2.0 Port #1.

Wake-up from deep sleep mode is also supported on VBUS and accessory detect (ACCx_DETECT) pins. Power and Ground pins for USB1 and USB3 are shared.

19.2.2 USB 2.0 Controller #2

USB 2.0 Controller #2 must always be configured to Host mode, and it can be configured to connect to USB2.0 Port #2 or HSIC Port #1.

USB 2.0 Port

USB 2.0 Controller #2 can be configured to use a regular USB 2.0 port. This is the second regular USB 2.0 port on Tegra K1 devices. USB 2.0 Controller #2 shares the same USB 2.0 Port #2 pins with the USB 3.0 controller. The pinmux must be programmed prior to USB 2.0 Controller #2 using USB 2.0 Port #2.

This USB 2.0 port only supports Host mode operations.

HSIC

USB 2.0 Controller #2 can be configured to use HSIC interface #1 that allows connection of an on-board peripheral supporting an HSIC interface to the Tegra K1 device. HSIC can be used to support baseband controllers that support an HSIC interface.

19.2.3 USB 2.0 Controller #3

USB 2.0 Controller #3 must always be configured to Host mode, and it can be configured to connect to USB2.0 Port #2or HSIC Port #2.

USB 2.0 Port

USB 2.0 Controller #3 can be configured to use a regular USB 2.0 port. This is the second regular USB 2.0 port on Tegra K1 devices. USB 2.0 Controller #3 shares the same USB 2.0 Port #3 pins with the USB 3.0 controller. The pinmux must be programmed prior to USB 2.0 Controller #3 using USB 2.0 Port #3.

This USB 2.0 port only supports Host mode operations.

HSIC

USB 2.0 Controller #3 can be configured to use the HSIC #2 interface that allows connection of an on-board peripheral supporting an HSIC interface to the Tegra K1 device. HSIC can be used to support baseband controllers that support an HSIC interface.

19.2.4 Interface Restrictions

Regular 2.0 port and HSIC are mutually exclusive for USB 2.0 controller #2 and #3, where only one of the interfaces can be used with a given board design.

On power-on-reset, the default interface for USB 2.0 controller #2 is the UTMIP interface, and the default interface of USB 2.0 controller #3 is the UTMIP interface.

19.2.5 AHB Interface

All 3 USB 2.0 controllers adapt the AHB interface as masters and slaves for communicating with the other Tegra K1 devices. The following table lists the AHB interface numbers for each controller.

Table 65: AHB Master and Slave Numbers

Controller	AHB Master Number	AHB Slave Number
USB 2.0 Controller #1	6	6
USB 2.0 Controller #2	18	9
USB 2.0 Controller #3	17	11

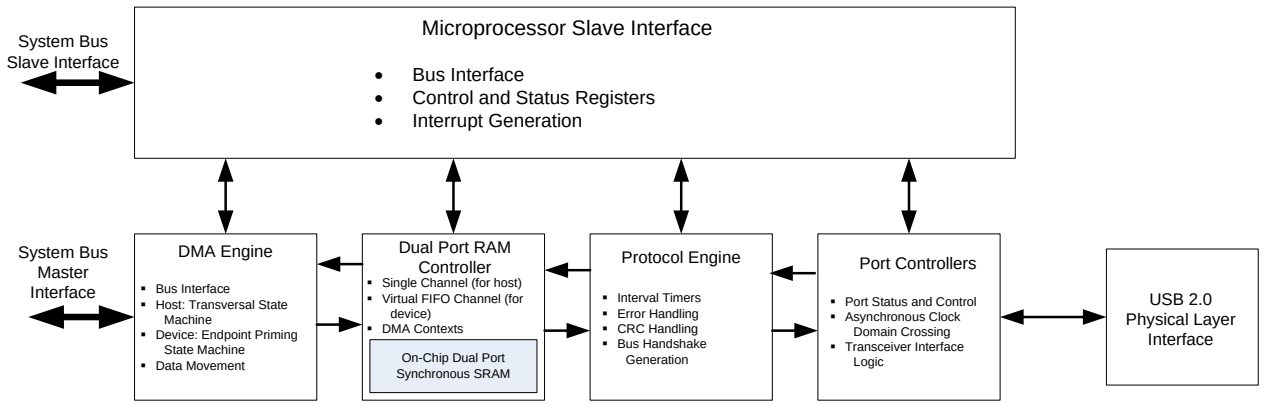
19.3 USB 2.0 Programming Interfaces

All 3 USB 2.0 controllers offer the same functionalities and may be configured to either host or device. However, due to interface restrictions, only USB 2.0 controller #1 should be configured to device mode, while USB 2.0 controller #2 and #3 must always be configured to host mode.

- Host controller registers and data structures are implemented as standard EHCI programming interface.
- Host controller supports USB 1.1 Full and Low speed devices via integrated transaction translator hub through EHCI standard data structures, instead of utilizing companion USB 1.1 host controller.
- Device controller registers and data structures are implemented as extensions to the EHCI programmers interface.

Figure 39 illustrates the control and datapaths block diagram of USB 2.0 controllers.

Figure 39: USB 2.0 Controller Block Diagram



19.3.1 Endpoint Capabilities

USB 2.0 controller #1 supports 16 IN and 16 OUT endpoints in device mode. Endpoint 0 is always a bidirectional control endpoint. All other endpoints can be configured as Bulk, Interrupt, Isochronous or Control endpoints in either direction. Control endpoints are always bidirectional. Hence for a control endpoint, the endpoints in both directions must be configured to be control endpoint. Conversely, if a particular endpoint number has either IN or OUT direction programmed to be a non-control endpoint, the other direction must also be configured as a non-control endpoint.

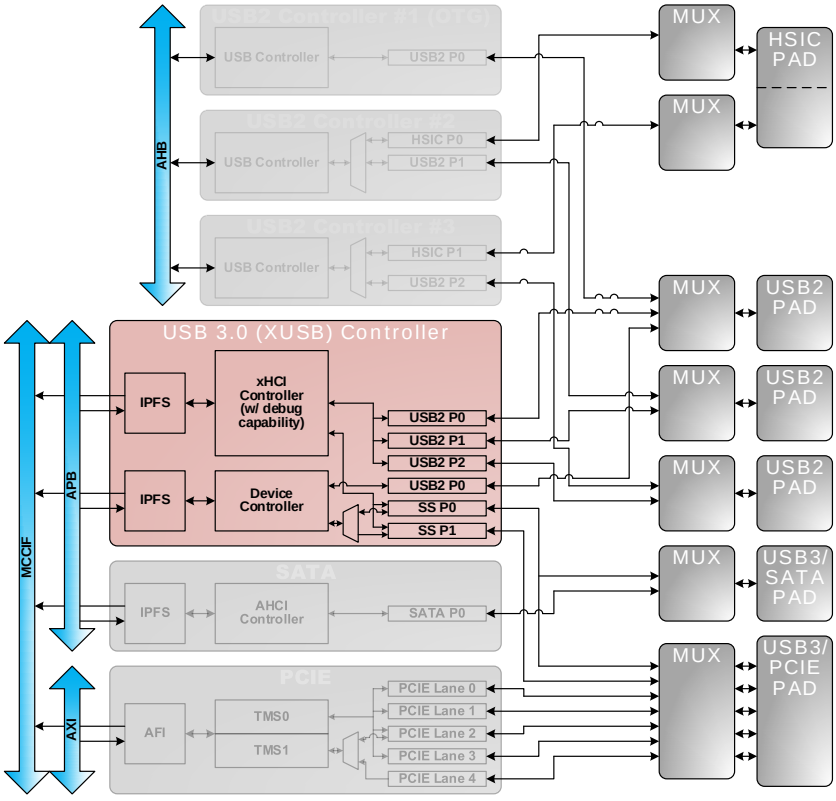
The maximum packet size supported on any endpoint is 1024 bytes in high-speed mode.

19.4 USB 3.0 Controller

The Tegra K1 device provides 1 USB 3.0 controller that can support up to 2 regular USB 3.0 ports and their companion regular USB 2.0 ports, or up to 3 standalone USB 2.0 ports. The USB 3.0 controller in Tegra K1 devices provides mechanisms to communicate with USB 2.0 peripherals, such as keyboards, mouse devices, and card readers. The USB 3.0 controller also provides mechanisms to communicate with USB 3.0 peripherals, such as cameras and storage devices, as a host using regular USB 3.0 ports.

The following figure illustrates the connection between USB 3.0 controllers and USB interfaces in Tegra K1 devices, where each USB 3.0 receptacle must encompass 1 USB 3.0 port and 1 USB 2.0 port from the USB 3.0 controller. USB 3.0 Controller shares the same USB 2.0 Port #1, #2, and #3 pins with USB 2.0 controllers #1, #2, and #3. The pinmux must be programmed prior to USB 3.0 Controller using USB 2.0 Port #1, #2, or #3.

Figure 40: Tegra K1 USB 3.0 Controller and Interfaces



The USB 3.0 controllers support the xHCI programming model for scheduling transactions and interface managements as a host that natively supports USB 3.0, USB 2.0, and USB 1.1 transactions with its USB 3.0 and USB 2.0 interfaces.

The Tegra K1 USB 3.0 controller supports USB 2.0 L1 and L2 (suspend) link power management and USB 3.0 U1, U2, and U3 (suspend) link power managements. The Tegra K1 USB 3.0 controller supports remote wakeup, wake on connect, wake on disconnect, and wake on overcurrent in all Tegra K1 power states, including deep sleep mode.

USB 2.0 Ports

Each USB 2.0 port operates in USB 2.0 High Speed mode when connecting directly to a USB 2.0 peripheral. Each USB 2.0 port operates in USB 1.1 Full and Low Speed modes when connecting directly to a USB 1.1 peripheral.

All USB 2.0 ports operating in High Speed mode share one High Speed Bus Instance, which means 480 Mb/s theoretical bandwidth is distributed across these ports. All USB 2.0 ports operating in Full or Low Speed modes share one Full/Low Speed Bus Instance, which means 12 Mb/s theoretical bandwidth is distributed across these ports.

USB 2.0 ports of the USB 3.0 controller support software initiated L1 and L2 (suspend) link power management. USB 2.0 ports of the USB 3.0 controller do not support hardware initiated L1 link power management.

USB 3.0 Ports

USB 3.0 ports only operate in USB 3.0 Super Speed mode. All USB 3.0 ports share one Super Speed Bus Instance, which means 5 Gb/s theoretical bandwidth is distributed across these ports.

USB 3.0 ports of the USB 3.0 controller support hardware initiated U1 and U2 link power management as well as software initiate U3 (suspend) link power management.

Falcon Microcontroller

The Tegra K1 USB 3.0 controller integrated an NVIDIA Falcon microcontroller to perform the following tasks:

- Command ring processing
- Event ring management
- Endpoint scheduling
- Context save and restore

19.4.1 Interface Restrictions

A USB3.0 connector includes both USB2.0 and USB3.0 interface signals. The USB2.0 interface signals of a USB3.0 connector must be assigned to the USB3.0 controller for xHCI specification compliance.

Similarly, if the USB3.0 interface signals are used to connect to a peripheral on the system board, such as a USB3.0 hub, the USB2.0 signals connecting to that peripheral must be assigned to the USB3.0 controller.

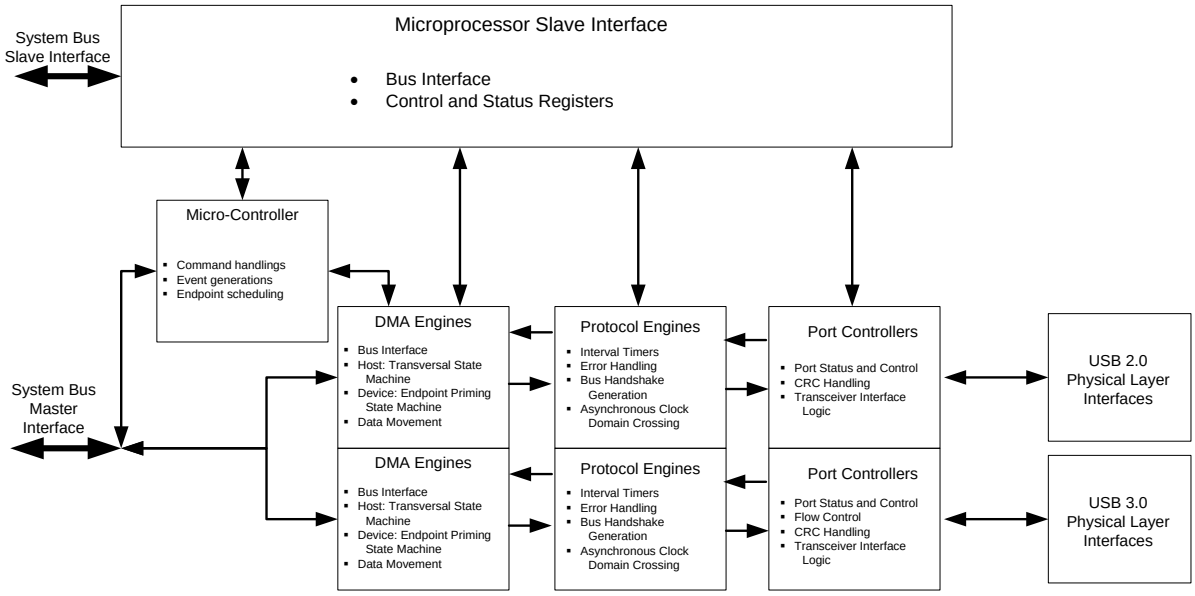
19.4.2 Host and Memory Access Interfaces

USB 3.0 controller adapts the APB interface as its host interface for configuration and memory-mapped I/O register accesses. USB 3.0 controller adapts direct memory as its memory interface for direct memory accesses.

19.5 USB 3.0 Programming Interface

The USB 3.0 Controller supports host functionality with host controller registers and data structures implemented as standard xHCI programming interface. Figure 41 illustrates the control and datapaths block diagram of the USB 3.0 controller.

Figure 41: USB 3.0 Controller Block Diagram



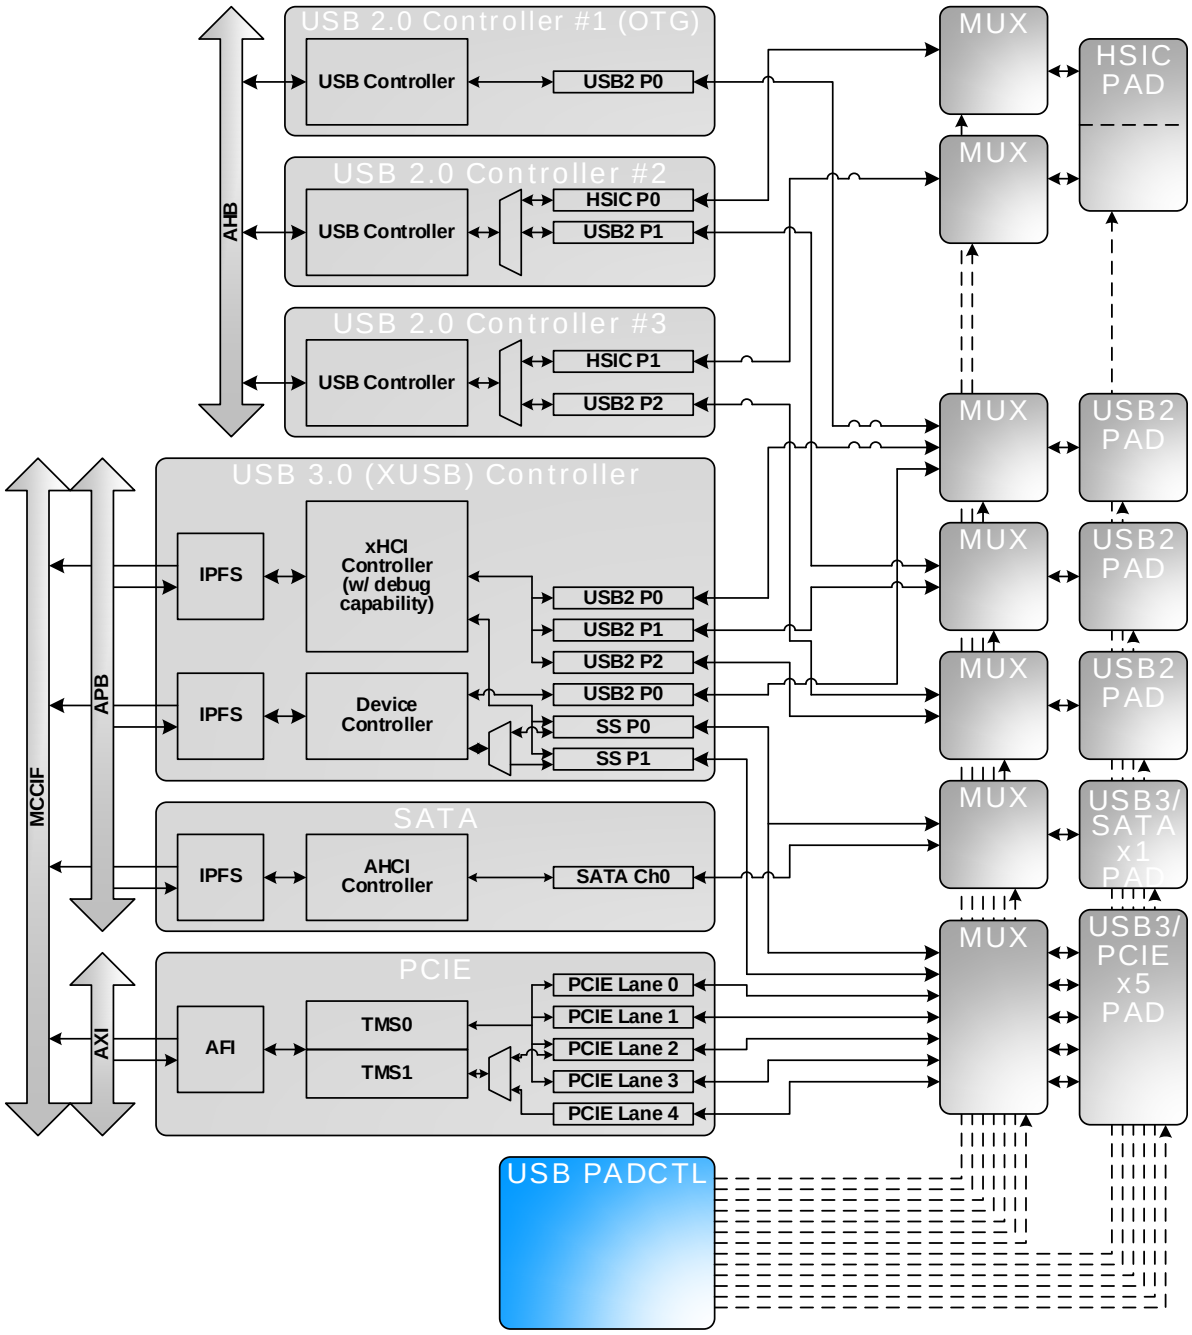
19.6 USB PADCTL

The USB PADCTL in Tegra K1 devices provides the programming interface to assign the USB 2.0 ports to either USB 2.0 controllers or the USB 3.0 controller. The USB PADCTL provides VBUS control and overcurrent mapping for all USB 2.0 controllers and the USB 3.0 controller.

The USB PADCTL also provides the programming interface to configure the pad parameters for the USB 3.0 pad and the USB 2.0 pad for the USB 2.0 port that is assigned to USB 3.0 controller.

The following figure illustrates the connection between USB PADCTL and USB interfaces in a Tegra K1 device.

Figure 42: Tegra K1 USB PADCTL and Interfaces



19.6.1 APB Interface

USB PADCTL adapts the APB interface as its host interface for configuration and memory-mapped I/O register accesses.

19.7 Programming Guidelines

19.7.1 USB_OTG Programming Guidelines

19.7.1.1 USB_OTG Programming

Clock Initialization

After power-on-reset, the USB clocks are disabled. Software can enable the USB clocks by setting CLK_ENB_USBD in the CLK_OUT_ENB_L register to ENABLE. Also, the USB controller stays in reset. Software should bring it out of reset by first setting SWR_USBD_RST in the RST_DEVICES_L register to ENABLE and then setting it to DISABLE.

Some parameters in UTMIP need to be programmed before the UTMIP can be brought out of reset. These parameters need to be programmed every time the USB controller is reset: the SWR_USBD_RST in RST_DEVICES_L register and RST in the USB2D_USBCMD register.

After UTMIP is reset, the PHY clock takes some time to come up, so software must wait until the USB_PHY_CLK_VALID bit in the USB_SUSP_CTRL register becomes valid. This bit, when set to 1, also generates an interrupt if RSM_IE is set in the USB_SUSP_CTRL register.

OTG_ID and VBUS Connection

Tegra K1 devices can use OTG_ID supported by the UTMIP/USB hardware, or a GPIO can be used for OTG_ID functions. If using OTG_ID as a GPIO, the GPIO can be sampled to detect the presence of a micro-A or micro-B plug and the sampled value can be written to the SW_ID bit in the PHY_VBUS_WAKEUP_ID_0 register. It is recommended that board design connects OTG_ID on the Tegra K1 device to the ID pin on the micro-AB connector even if OTG_ID is connected to a GPIO.

Tegra K1 devices have a VBUS pin connected to the UTMIP, and VBUS pin from the connector should be connected to this pin even though VBUS from the connector is connected to a GPIO. It is not required that VBUS from the connector directly connect to the VBUS pin. It is required that its voltage is above 3V when VBUS is on.

Both VBUS and ID are available as a wake-up event during DPD/LP0 state. USB bus D+/D- line wake events are also available as a DPD/LP0 state. Refer to the PMC section for more information.

Detection of USB Cable Insertion (General Use Cases)

The USB cable insertion event can be detected by a change in the ID or VBUS pin on the micro-AB connector. Initially, when the cable is not attached, the ID pin on the micro-AB connector is floating and is detected as 1 by the Tegra K1 device because of the weak pull-up on this pin. This makes the Tegra K1 start-up as a B-device, even though a cable is not connected (when the ID pin is seen as a 1 by the Tegra K1 device, there can be no-cable or micro-B connected).

When a user attaches the USB cable, one of the following two events occur:

1. The user connects the micro-A end of the cable to the Tegra K1 device. This changes the ID pin to 0. Hence software can detect the ID change and go to A-device mode. Software can then supply power to the USB and place the Tegra K1 device in host mode.
2. The user connects micro-B (or mini-B) end of the cable to the Tegra K1 device. The other end of the cable can be either micro-A or standard-A and is connected to an OTG host or a standard host, respectively. For both cases, the Host starts driving power on VBUS and software can detect the cable insertion event by checking that the voltage on VBUS has gone above the A_Sess_Vld level by reading the A_VBUS_VLD_STS bit in the USB_PHY_VBUS_SENSORS register. Once this is seen, it can place the Tegra K1 device in the device mode.

Notes:

1. ID change can be detected by enabling the GPIO interrupt.

2. VBUS change can be detected by enabling the interrupt A_VBUS_VLD_INT_EN in the USB_PHY_VBUS_SENSORS register.
3. The USB controller and PHY clocks need not be turned on for this detection.
4. To detect these events during DPD/LP0 modes, use VBUS/ID wakeup events in the PMC.

PHY Clock Control

The PHY clock can be turned off using the SUSP_SET bit in the USB_SUSP_CTRL register. This bit must be pulsed by first writing a 1 and then writing a 0 to the bit.

To turn on the PHY clock, software should write to SUSP_CLR in the USB_SUSP_CTRL register. This bit must be pulsed by first writing a 1 and then writing a 0 to the bit.

The current suspend status of the PHY can be checked by the USB_PHY_CLK_VALID bit of the USB_SUSP_CTRL register. If this bit is 1, the PHY clock is turned on; otherwise it is off.

The PHY clock can be turned on automatically on the events mentioned below. Set only the required wakeup enable bits based on the state of the USB as mentioned below. Do not set unnecessary wakeup enable bits. When the PHY clock wakes up under any such event, make sure that the wakeup enable bits are turned off as soon as possible.

There is an interrupt generated whenever the PHY clock is turned on which can be checked by checking that the value of USB_PHY_CLK_VALID in the USB_SUSP_CTRL register is 1. The interrupt can be enabled/disabled by setting the RSM_IE bit in USB_SUSP_CTRL to 1/0.

Notes:

1. The PLLU_ENABLE bit in the PLLU_BASE register should be always set to ENABLE. All parameters for PLLU in the PLLU_BASE and PLLU_MISC registers should be set according to the oscillator frequency used. Not doing that will put the USB PHY PLL in a free-running mode, and can result in undesirable side effects.
2. When the USB PHY is suspended, the PCLK should not be stopped. It can be reduced to 32 KHz, however. If the system clock is stopped, then it might not be possible to bring up the system on a wakeup event described below.

There are two cases to consider for controlling the PHY clocks depending on whether the Tegra K1 processor is in device or host mode.

Device Mode

The PHY clock can be turned off in two cases:

- When the USB cable is not connected, the VBUS signal is 0. In this case, software needs to turn on the PHY clock on cable insertion. Follow the procedure described above in “Detection of USB Cable Insertion”.
- When the USB cable is connected, the PHY clock can only be turned off when the SLI bit in the USB2D_USBSTS register is set to 1 when the USB Host puts the USB bus in suspend mode. This bit can be used to generate an interrupt if the SLE bit in the USB2D_USBINTR register is set to 1.

  In this case, software needs to set two bits in the USB_SUSP_CTRL register to turn on the PHY clock on a USB resume or a USB reset event from USB Host: WAKE_ON_DISCON_EN (Wake on Disconnect enable) and WK_RSM_EN (Wake on Resume enable).

  If WK_RSM_EN (bit 8) in the USB_SUSP_CTRL register is set to 1, the PHY clock can be turned on automatically on receiving a USB resume event from the USB Host. If WAKE_ON_DISCON_EN in the USB_SUSP_CTRL register is set to 1, the PHY clock can be turned on automatically on receiving a USB reset event from the USB Host or if the USB cable is disconnected. These bits should only be turned on after the PHY clock is turned off. The method described above can be used to interrupt the processor when the PHY clock is turned on. Also, turn off these bits when coming out of the suspend state.

Host Mode

When a device is not connected, software can set the WKCN bit in USB2D_PORTSC1 register. Make sure that VBUS is also turned on. After this, it can stop the PHY clock by using the method described above. The PHY clock resumes automatically when a device is connected. The method described above can be used to interrupt the processor when the PHY clock is turned on.

With a device connected, software needs to put the USB system in the suspend state by setting the SUSP bit in the USB2D_PORTSC1 register. It needs to wait until this bit is set to 1 by the controller to make sure that the USB system actually went into the suspend state. It can enable the WK_RSM_EN bit in the USB_SUSP_CTRL register and the WK_DS bit in the USB2D_PORTSC1 register. Then it can stop the PHY clock as described above. The PHY clock is turned on automatically if the USB device disconnects or it does a remote wakeup signaling. There is an interrupt associated with this as described above.

If the software wants to wake up the USB system, then it needs to turn on the PHY clock as described above.

Charger Detection 1 (Non-compliant Chargers)

There are four conditions for the different kind of non-compliant chargers: SE1, FS-PU, LS-PU, SE0. Any kind of non-compliant charger can be supported by following the generic procedure below:

1. VBUS detection (by whatever means software does it)
2. Enable USB controller and PHY power and clocks
3. Wait until PHY_CLKVALID = 1.
4. Wait for 10 microseconds more to give time for any filtering to pass through so software does not read the wrong values.
5. Set the DIV_DET_EN bit in the IF_USB_PHY_VBUS_WAKEUP_ID_0 register to 1.
6. Wait for about 10 microseconds to allow the divider detector to settle.
7. Read the {VOP_DIV2P7_DET, VOP_DIV2P0_DET, VON_DIV2P7_DET, VON_DIV2P0_DET} register bits in the IF_USB_PHY_VBUS_WAKEUP_ID_0 register.

   {VOP_DIV2P7_DET, VON_DIV2P7_DET } = 2'b11: Connected to charger_A1.

   {VOP_DIV2P7_DET, VON_DIV2P0_DET } = 2'b11: Connected to charger_A2.

   {VOP_DIV2P0_DET, VON_DIV2P7_DET } = 2'b11: Connected to charger_A3.

   {VOP_DIV2P0_DET, VON_DIV2P0_DET } = 2'b11: Connected to charger_A4.
8. Set the DIV_DET_EN bit in the IF_USB_PHY_VBUS_WAKEUP_ID_0 register to 0.
9. For A1, A2, A3, or A4, enable charging current per the connected charger's requirement (A1, A2, A3, or A4).
10. Read the LS bits [11:10] in the PORTSC register.

    Case 1: LS = 2'b11: Connected to charger_1.

    Case 2: LS = 2'b01: Connected to charger_2.

    Case 3: LS = 2'b10: Connected to charger_3.

    Case 4: LS = 2'b00: Connected to either charger_4, a compliant charger, or a PC host.
11. For case 1, 2, or 3, enable charging current as per that charger's requirement. This can vary for every implementation.

12. For case 4, the connection is to either a PC host or charger_4 (which could be a USB compliant charger as well). Go to step 15.
13. Set the USB circuit to low-power mode now. Make sure the charger circuit does not change state.
14. VBUS disconnect. Return to step 1.
15. Check for connection to a USB compliant charger by doing the charger detection from VBAT register. If yes, go back to step 8. If not, continue to the next step.
16. Set the USB controller to device mode and enable it by setting it to RUN mode. Wait for SOF.
17. If an SOF is not seen after timeout, then the connection is to charger_4. Set the current limit as required for that charger. Go to step 7.

Charger Detection 2 (Compliant Chargers)

This replaces step 10 in the above.

1. Make sure the UTMIP_PD_CHRG bit in the UTMIP_BAT_CHRG_CFG0_0 register is set to 0, so that charger detection circuit is on.
2. Set the UTMIP_OP_I_SRC_EN bit in the UTMIP_BAT_CHRG_CFG0_0 register to 1.
3. Wait for about 10 microseconds to allow the battery charger detector to settle.
4. Now check that the VDCD_DET_CHG_DET bit is 1, and the VDCD_DET_STS bit is 0 in the USB_PHY_VBUS_WAKEUP_ID register. This ensures that the data pins have made contact.
5. Set the UTMIP_OP_I_SRC_EN bit to 0 in the UTMIP_BAT_CHRG_CFG0_0 register.
6. Set the following register bits in the UTMIP_BAT_CHRG_CFG0_0 register to:

   UTMIP_OP_SRC_EN = 1

   UTMIP_ON_SINK_EN = 1

   UTMIP_OP_SINK_EN = 0

   UTMIP_ON_SRC_EN = 0
7. Wait for about 10 microseconds to allow the battery charger detector to settle.
8. Now check that the VDAT_DET_CHG_DET and VDAT_DET_STS bits in the USB_PHY_VBUS_WAKEUP_ID register are set to 1. This indicates connection to a USB compliant dedicated charger that supports up to 1.5A current. If these bits are not set, then the connection is to a PC host, where the downstream port may support charging.
9. Set the following bits in the UTMIP_BAT_CHRG_CFG0_0 register to:

   UTMIP_OP_SRC_EN = 0

   UTMIP_ON_SINK_EN = 0

   UTMIP_OP_SINK_EN = 1

   UTMIP_ON_SRC_EN = 1
10. Wait for about 10 microseconds to allow the battery charger detector to settle.
11. Now check that the VDAT_DET_CHG_DET and VDAT_DET_STS bits in the USB_PHY_VBUS_WAKEUP_ID register are both set to 1. This indicates connection to a USB compliant dedicated charger that supports up to 1.5A current. If these bits are not set, then the connection is to a PC host, where the downstream port supports a standard 500mA current when the high power device is enumerated.

12. Set the following bits in the UTMIP_BAT_CHRG_CFG0_0 register to:

    UTMIP_OP_SRC_EN = 0

    UTMIP_ON_SINK_EN = 0

    UTMIP_OP_SINK_EN = 0

    UTMIP_ON_SRC_EN = 0

13. Now normal USB operation can continue if connected to PC host.

19.7.1.2 LPM Support

Software should program the following register to set the duration that the host keeps generating resume signaling when the host initiated an exit from L1 based on system and device specific requirements:

CONTROLLER_USB2D_USBCMD_0.HIRD

The following software walk-around is required to extend the resume signaling if required.

1. Move PAD out of Suspend

   IF_USB_SUSP_CTRL_0.USB_SUSP_CLR = SET (1)

2. Fake resume signaling

   UTMIP_MISC_CFG0_0.UTMIP_DPDM_OBSERVE = 1

   UTMIP_MISC_CFG0_0.UTMIP_DPDM_OBSERVE_SEL = 0xE

3. Wait the required time following the encoding of the HIRD value

4. Enable hardware to drive the resume signaling

   CONTROLLER_USB2D_PORTSC1_0.FPR = Resume driven on port (1)

5. Disable fake resume signaling as hardware takes over

   UTMIP_MISC_CFG0_0.UTMIP_DPDM_OBSERVE = 0

6. Wait for hardware to finish driving resume signaling by checking the following bit:

   CONTROLLER_USB2D_PORTSC1_0.FPR = No resume driven on port (0)

7. Wait 50 µs

8. Enable hardware to start sending SOF and executing schedule:

   CONTROLLER_USB2D_USBCMD_0.RS = RUN (1)

Software Initiated L1 Support

Software puts the bus into the L1 or Suspend (L2) state by setting the same SUSP bit in PORTSC1 register. The difference is to put the link to L1, software should first program the following registers:

CONTROLLER_USB2D_PORTSC1_0.DA = N, Device Address of the attached device

CONTROLLER_USB2D_HOSTPC1_DEVLC_0. EPLPM = 0

CONTROLLER_USB2D_PORTSC1_0.SLP = Suspend using L1 (1)

Software should then set the following register bit to initiate L1 entry:

CONTROLLER_USB2D_PORTSC1_0.SUSP = 1

Software can check the following registers to ensure the link has entered L1:

CONTROLLER_USB2D_PORTSC1_0.SUSP = Port in suspend state (1)

CONTROLLER_USB2D_PORTSC1_0.SSTS = L1STATE_ENTERED (0)

If L1 cannot be entered successfully, the bus stays in the L0 state. Hardware will generate a port change interrupt when L1 entry fails. So software can check the following registers for the reason of the failed entry. Software can retry the L1 entry later if the reason is NYET_PERIPH, where the peripheral indicates it is not ready to put the bus into L1.

CONTROLLER_USB2D_PORTSC1_0.SUSP = Port not in suspend state (0)

CONTROLLER_USB2D_PORTSC1_0.SSTS = NYET_PERIPH (1), or

= L1STATE_NOT_SUPPORTED (2),

= PERIPH_NORESP_ERR (3),

When the bus is in the L1, software can set the following register at any time to bring the link back to the L0 state.

CONTROLLER_USB2D_PORTSC1_0.FPR = Resume driven on port (1)

Hardware Initiated L1 Support

Software can enable hardware to put the bus to L1 automatically. Software should first program the following registers, where *X* is the system specific idle threshold measured in number of SOFs with no activities in between:

CONTROLLER_USB2D_PORTSC1_0.DA = N, device address of the attached device

CONTROLLER_USB2D_HOSTPC1_DEVLC_0. EPLPM = 0

CONTROLLER_USB2D_HOSTPC1_DEVLC_0. LPMFRM = X

Software should then set the following register bit to enabled hardware initiated L1 entry:

CONTROLLER_USB2D_HOSTPC1_DEVLC_0. LPMX = 1

19.7.1.3 Streaming Mode

The USB controller supports streaming, where it starts sending DATA packets for OUT transactions when the controller has not finished fetching the entire data packet from system memory to its TX buffer. For IN transactions, the streaming mode allows data to be written to system memory before the entire data packet is received in its RX buffer. Streaming mode can be disabled with the following bit:

CONTROLLER_USB2D_USBMODE_0.SDIS

Enabling streaming mode allows lower latency and higher bandwidth of USB transfers but requires lower system memory latency.

Long system memory latency might cause TX buffer underrun/RX buffer overrun when streaming mode is enabled. Streaming mode should be kept enabled when USB controller is initialized and streaming mode should only be disabled if it is determined the system latency does cause the buffer overrun/underrun issues.

19.7.2 USB2 Programming Guidelines

The USB2 controller supports a UHSIC interface. All of these interfaces are directly controlled through USB2 register space.

19.7.2.1 Clock Initialization

After power-on-reset, the USB clocks are disabled. Software can enable the USB clocks by setting CLK_ENB_USBD in CLK_OUT_ENB_L register to ENABLE.

Also, USB stays in reset. So software should bring it out of reset by first setting the SWR_USBD_RST in RST_DEVICES_L register to ENABLE and then setting it to DISABLE.

After the clocks for USB2 are up, software can program any register for USB2 required for proper configuration.

PLLU outputs a 480 MHz clock (FO_UHSIC) for the UHSIC interface. If using any of these interfaces, PLLU should be programmed appropriately.

Any time after USB2 is reset, or the UHSIC PHY comes out of suspend, software needs to wait until ULPI/UHSIC PHY clock comes up. It can do that by checking for USB_PHY_CLK_VALID bit in USB2_IF_USB_SUSP_CTRL register. If this bit is 1, PHY clocks are up; otherwise, they are not. There are interrupts associated with this bit: if USB_PHY_CLK_VALID_INT_ENB is set to ENABLE, USB_PHY_CLK_VALID_INT_STS will be set to SET whenever the PHY clock becomes valid. Software can write a 1 to USB_PHY_CLK_VALID_INT_STS to clear the interrupt status.

Before doing anything useful on USB2, one of its interfaces needs to be selected and configured.

19.7.2.2 Selection of UTMIP2 Interface

The UTMIP1 I/O pads are in power-down state at power-on. Bring them out of power-down mode by writing 0 to the following fields (unless writing 1 is indicated):

1. FORCE_PD_POWERDOWN, FORCE_PD2_POWERDOWN, and FORCE_PDZI_POWERDOWN fields in the UTMIP_XCVR_CFG0 register.
2. OTGPD and BIASPD fields in the UTMIP_BIAS_CFG0 register.
3. FORCE_PDDISC_POWERDOWEN, FORCE_PDCHRP_POWERDOWN, and FORCE_PDDR_POWERDOWN fields in the UTMIP_XCVR_CFG1 register.
4. Hold UTMIP2 PHY in reset by writing a 1 to the UTMIP_RESET bit in the IF_USB_SUSP_CTRL register.
5. Program the PLLU parameters to enable the UTMIP2 PLLU clock.
6. Enable UTMIP2 interface by setting UTMIP_PHY_ENB in IF_USB_SUSP_CTRL register to 1.
7. Program the configuration parameters for UTMIP1.
8. Release reset to UTMIP2 by writing 0 to the UTMIP_RESET field in the IF_USB_SUSP_CTRL register.
9. Wait until the PHY clock comes up by checking the USB_PHY_CLK_VALID bit in the IF_USB_SUSP_CTRL register. An interrupt can be generated as explained above.
10. Set the CM field in the USB2D_USBMODE register to HOST mode.
11. Program the USB2 controller to use UTMIP2 PHY by setting the PTS field in the CONTROLLER_2_USB2D_HOSTPC1_DEVLC register to UTMIP (2’b00).

Selection of UHSIC Interface

1. UHSIC I/O pad is in power-down state at power-on. Bring it out of power-down mode by setting the PD_BG, PD_TX, PD_RX, PD_ZI and RPD_DATA, RPD_STROBE fields in the UHSIC_PADS_CFG1 register to 0.
2. Bring the tracking circuit out of power-down mode by clearing the PD_TRK bit.
3. Add 25 µs delay to allow calibration to complete.
4. Tracking circuit can be powered down now by setting PD_TRK=1.
5. Hold UHSIC in reset by writing 1 to the UHSIC_RESET field in the IF_USB_SUSP_CTRL register.
6. Program the PLLU parameters to enable the UHSIC PLLU clock.
7. Select the UHSIC interface by writing 1 to the UHSIC_PHY_ENB field in the IF_USB_SUSP_CTRL register.
8. Program the configuration parameters for UHSIC.

9. Release reset to the UHSIC by writing 0 to the UHSIC_RESET field in the IF_USB_SUSP_CTRL register.
10. Set the CM field in the USB2D_USBMODE register to HOST mode.
11. Program the USB2 controller to use the UHSIC PHY by writing 0 to the PTS field in the CONTROLLER_1_USB2D_HOSTPC1_DEVLC register.
12. Program the UHSIC_HS_POSTAMBLE_OUTPUT_ENABLE field in the UHSIC_TX_CFG0 register to “1”.
13. Wait until the PHY clock comes up by checking the USB_PHY_CLK_VALID bit in the IF_USB_SUSP_CTRL register. An interrupt can be generated as explained above.

19.7.2.3 PHY Clock Control

The PHY clock can be turned off using the PHCD bit in the USB_PORTSC1 register. Note: This bit does not need to be pulsed.

To turn on the PHY clock, software should write to USB_SUSP_CLR in USB2_IF_USB_SUSP_CTRL register. This bit must be pulsed by first writing a 1 and then writing a 0 to the bit.

Whenever the PHY is placed in the suspend mode, the PHY clock is turned off and USB_PHY_CLK_VALID in the USB2_IF_USB_SUSP_CTRL register is set to 0. Software should make sure that the PHY clock shuts down by polling this bit whenever it places the PHY into suspend mode.

The PHY clock can be turned on automatically on the events mentioned below. Set only the required wakeup enable bits based on the state of the USB as mentioned below. Do not set unnecessary wakeup enable bits. When the PHY clock wakes up under any such event, make sure that the wakeup enable bits are turned off as soon as possible.

To prevent the PHY clock from waking up on unnecessary glitches on the USB pins, software can set the USB_WAKEUP_DEBOUNCE_COUNT field in the USB_SUSP_CTRL register to a non-zero value (between 1-7). This will allow the wakeup event to be debounced by the equivalent number of HCLK cycles.

An interrupt is generated whenever the PHY clock is turned on, which can be checked by checking the value of USB_PHY_CLK_VALID in the USB_SUSP_CTRL register to be 1. The interrupt can be enabled/disabled by setting the USB_PHY_CLK_VALID_INT_ENB bit in the USB_SUSP_CTRL register to 1/0.

To clear the USB_WAKEUP_INT_STS and USB_PHY_CLK_VALID_INT_STS interrupts, software can write a 1 to corresponding bits.

Generally, whenever the PHY is woken up from the suspend mode, first a wakeup event is generated (USB_WAKEUP_INT_STS = 1) followed by a PHY clock valid interrupt (USB_PHY_CLK_VALID_INT_STS = 1) when PHY clock starts up.

19.7.2.4 Bus Signaling Procedure Changes for the UHSIC Interface

To support the UHSIC interface, some changes are required in the bus signaling procedure for USB2 controller (connect and bus reset sequences) as described in the subsections below:

Host Mode - Bus Connect Sequence

The normal connect sequence assumes that port power has been enabled on a downstream port and the device has signaled a “Connect” on the bus. This will generate a port change interrupt and the software takes action from here. Standard EHCI connect interrupt can be used to detect the device connect.

Host Mode: Bus Reset Sequence

This is a reconnect procedure without physically detaching the USB cable. This operation is demanded by software whenever necessary as it is the case when an unrecoverable anomaly takes place. It would then bring the bus, the port, and the device into a well-known state.

1. Check if PortReset (the PR bit in the USB2D_PORTSC1 register) is NOT active. If by any means a bus reset is already taking place, it must be stopped before proceeding. This is done by clearing the bit and polling until it goes LOW.
2. Enable the “PortReset” bit - Start the HSIC bus reset on a downstream port by activating the PR bit of the USB2D_PORTSC1 register.
3. Wait until the end of the reset. This wait time is defined by the USB 2.0 specification and has the effect of holding the reset signaling on the HSIC bus.
4. Clear the PR bit.Stop the reset signaling by clearing the respective port reset bit.
5. Poll until the reset bit goes LOW to guarantee that the reset bit is effectively cleared;
6. Poll until LineState is DPlus.This confirms that the reset signaling has really finished on the HSIC bus and that the USB2 controller is ready to connect again.
7. Proceed with the “HOST Bus Connect Sequence” as described above. From here on, the procedure is the same as with an initial connect, instructing the USB2 controller to enter HS directly, skipping speed negotiation.
8. Standard EHCI reset interrupt can be used in Tegra K1 HSIC because native HSIC support is built-in.

19.7.3 USB3 Programming Guidelines

The USB3 controller supports ICUSB and UTMIP3 interfaces. All of these interfaces are directly controlled through USB3 register space.

19.7.3.1 Clock Initialization

After power-on-reset, USB3 clocks are disabled. Software can enable USB3 clocks by setting CLK_ENB_USB3 in ARCLK_RST_CLK_OUT_ENB_H register to ENABLE.

Also, USB3 stays in reset at power-on and software should bring it out of reset by first setting SWR_USB3_RST in RST_DEVICES_H register to ENABLE and then set it to DISABLE.

After the clocks for USB3 are up, software can program any registers for USB3 required for proper configuration.

PLLU outputs a 60 MHz clock FO_ICUSB for ICUSB interface and a 12 MHz clock FO_USB for UTMIP3 interface. If any of these interfaces are used, PLLU should be programmed appropriately.

Any time after USB3 is reset or ICUSB/UTMIP3 PHY comes out of suspend, software needs to wait until ICUSB/UTMIP3 PHY clock comes up. It can do that by checking the USB_PHY_CLK_VALID bit in the USB3_IF_USB_SUSP_CTRL register. If this bit is 1, the PHY clocks are up; otherwise they are not. There are interrupts associated with this bit: if USB_PHY_CLK_VALID_INT_ENB is set to ENABLE, USB_PHY_CLK_VALID_INT_STS will be set to SET whenever PHY clock becomes valid. Software can write a 1 to USB_PHY_CLK_VALID_INT_STS to clear the interrupt status.

Before doing anything useful on USB2, one of its interfaces needs to be selected and configured.

19.7.3.2 Selection of the UTMIP3 Interface

1. UTMIP3 I/O pads are in power-down state at power-on. Bring them out of power-down mode by writing the following fields to 0:

- FORCE_PD_POWERDOWN, FORCE_PD2_POWERDOWN, FORCE_PDZI_POWERDOWN fields in UTMIP_XCVR_CFG0 register.
- OTGPD and BIASPD fields in UTMIP_BIAS_CFG0 register.
- FORCE_PDDISC_POWERDOWN , FORCE_PDCHRP_POWERDOWN, FORCE_PDDR_POWERDOWN fields in UTMIP_XCVR_CFG1 register.

2. Hold UTMIP3 PHY in reset by writing the UTMIP_RESET bit in the IF_USB_SUSP_CTRL register to 1.
3. Program the PLLU parameters to enable UTMIP3 PLLU clock.
4. Enable the UTMIP3 interface by setting UTMIP_PHY_ENB in the IF_USB_SUSP_CTRL register to 1.
5. Program the configuration parameters for UTMIP3.
6. Release the reset to UTMIP3 by writing 0 to the UTMIP_RESET field in the IF_USB_SUSP_CTRL register.
7. Wait until the PHY clock comes up by checking the USB_PHY_CLK_VALID bit in the IF_USB_SUSP_CTRL register. An interrupt can be generated as explained above.
8. Set the CM field in the USB2D_USBMODE register to HOST mode.
9. Program the USB3 controller to use UTMIP3 PHY by setting the PTS field in CONTROLLER_2_USB2D_HOSTPC1_DEVLC register to UTMIP (2'b00).

19.7.3.3 Selection of UHSIC Interface

1. UHSIC I/O pad is in power-down state at power-on. Bring it out of power-down mode by setting the PD_BG, PD_TX, PD_RX, PD_ZI, RPD_DATA, and RPD_STROBE fields in the UHSIC_PADS_CFG1 register to 0.
2. Bring the tracking circuit out of power-down mode by clearing the PD_TRK bit.
3. Add 25 µs delay to allow calibration to complete.
4. The tracking circuit can be powered down now by setting PD_TRK=1.
5. Hold UHSIC in reset by writing 1 to the UHSIC_RESET field in the IF_USB_SUSP_CTRL register.
6. Program the PLLU parameters to enable the UHSIC PLLU clock.
7. Select the UHSIC interface by writing 1 to the UHSIC_PHY_ENB field in the IF_USB_SUSP_CTRL register.
8. Program the configuration parameters for UHSIC.
9. Release reset to the UHSIC by writing 0 to the UHSIC_RESET field in the IF_USB_SUSP_CTRL register.
10. Set the CM field in the USB2D_USBMODE register to HOST mode.
11. Program the USB3 controller to use the UHSIC PHY by writing 0 to the PTS field in the CONTROLLER_1_USB2D_HOSTPC1_DEVLC register.
12. Program the UHSIC_HS_POSTAMBLE_OUTPUT_ENABLE field in the UHSIC_TX_CFG0 register to "1".
13. Wait until the PHY clock comes up by checking the USB_PHY_CLK_VALID bit in the IF_USB_SUSP_CTRL register. An interrupt can be generated as explained above.

19.7.3.4 Detection of USB Cable Insertion

The USB cable insertion event can be detected by a change in the ID or VBUS pin on the micro-AB connector. Initially, when the cable is not attached, the ID pin on the micro-AB connector is floating and is detected as 1 by Tegra K1 devices because of the weak pull-up on this pin. This makes a Tegra K1 device start up as a B-device, even though a cable is not connected (when the ID pin is seen as a 1 by a Tegra K1 device, there can be no cable or micro-B connected).

When a user attaches the USB cable, one of the following two events occur:

- User connects micro-A end of the cable to the Tegra K1 device. This changes the ID pin to 0. Hence the software can detect the ID change and go to A-device mode. Software can then supply power to the USB and place the Tegra K1 device in host mode.
- User connects micro-B (or mini-B) end of the cable to the Tegra K1 device. The other end of the cable can be either micro-A or standard-A and will be connected to a standard host, respectively.

For both cases, the Host will start driving power on VBUS and software can detect the cable insertion event by checking the VBUS status on corresponding GPIO. Once this is seen, it can place the Tegra K1 device in the device mode.

Note: Both ID and VBUS changes can be detected by enabling the corresponding GPIO interrupts.
USB controller/PHY clocks do not need to be turned on for this detection as this is done using GPIOs.
To detect these events during DPD/LP0 modes, use VBUS/ID wakeup events in the PMC.

19.7.3.5 PHY Clock Control

The PHY clock can be turned off by writing 1 to the PHCD bit in the USB2D_PORTSC1 register. Note: There is no need to pulse this bit.

To turn on the PHY clock, software should write to SUSP_CLR in the USB3_IF_USB_SUSP_CTRL register. This bit must be pulsed by first writing a 1 and then writing a 0 to it.

The current suspend status of the PHY and thereby whether the PHY clock is running can be checked by reading the bit USB_PHY_CLK_VALID in USB_SUSP_CTRL register. If the PHY is placed in suspend, then this bit will be set to 0, else it will be set to 1. Software should make sure that PHY clock shuts down by polling this bit whenever it places the PHY into suspend.

The PHY clock can be turned on automatically on the events mentioned below. Set only the required wakeup enable bits based on the state of the USB as mentioned below. Do not set unnecessary wakeup enable bits. When the PHY clock wakes up under any such event, make sure that the wakeup enable bits are turned off as soon as possible.

To prevent the PHY clock from waking up on unnecessary glitches on the USB pins, software can set the USB_WAKEUP_DEBOUNCE_COUNT field in USB_SUSP_CTRL register to a non-zero value (between 1-7). This will allow the wakeup event to be debounced by the equivalent number of HCLK cycles.

An interrupt is generated whenever the PHY is woken up from suspend, which can be verified by checking that the value of USB_WAKEUP_INT_STS in USB_SUSP_CTRL register is 1. The interrupt can be enabled/disabled by setting the bit USB_WAKEUP_INT_ENB in USB_SUSP_CTRL to 1/0.

An interrupt is generated whenever the PHY clock is turned on, which can be verified by checking that the value of USB_PHY_CLK_VALID_INT_STS in the USB_SUSP_CTRL register is 1. The interrupt can be enabled/disabled by setting the USB_PHY_CLK_VALID_INT_ENB bit in the USB_SUSP_CTRL register to 1/0.

To clear the USB_WAKEUP_INT_STS and USB_PHY_CLK_VALID_INT_STS interrupts, software can write a 1 to the corresponding bits.

Generally, whenever PHY is woken up from suspend, first a wakeup event is generated (USB_WAKEUP_INT_STS = 1) followed by a PHY clock valid interrupt (USB_PHY_CLK_VALID_INT_STS = 1) when the PHY clock starts up.

Note: The PLLU_ENABLE bit in PLLU_BASE register should be always set to ENABLE. All the parameters for PLLU in PLLU_BASE and PLLU_MISC register should be set according to the oscillator frequency used. Not doing that will put the USB PHY PLL in a free-running mode, and can result in undesirable side-effects.
When the USB PHY is suspended, the USB3 clock should not be stopped. It can be reduced to 32 KHz, however. If the system clock is stopped, then it may not be possible to bring up the system on a wakeup event described below.

When USB3 is in suspend, AHB clocks to USB3 controller are turned off, and hence there should be no register access to USB2_CONTROLLER_2_* registers. All registers marked as ARUSB3_IF_* are accessible, and can be used to resume the UTMIP3 PHY clocks.

When a device is not connected, software can set the WKCN bit in USB2D_PORTSC1 register. Make sure that VBUS is also turned on. After this, it can stop the PHY clock by using the method described above. The PHY clock will resume automatically when a device is connected. The method described above can be used to interrupt the processor when the PHY clock is turned on.

With a device connected, software needs to put the USB system under suspend by setting the bit SUSP in USB2D_PORTSC1 register. It needs to wait until this bit is set to 1 by the controller to make sure that the USB system actually went into suspend. It can enable the bits USB_WAKE_ON_RESUME_EN in USB_SUSP_CTRL register and WK_DS in USB2D_PORTSC1 register. Then it can stop the PHY clock as described above. The PHY clock will be turned on automatically if the USB device disconnects or it does a remote wakeup signaling. There will be an interrupt associated with this as described above.

If the software wants to wake up the USB system, it needs to turn on the PHY clock as described above.

19.7.3.6 USB3 Controller Power Gating

Initialization and Shutdown Procedure for USB

1. Bring up USB3 clocks by writing 1 to CLK_ENB_USB3 in ARCLK_RST_CLK_OUT_ENB_H register.
2. Set and clear the SWR_USB3_RST bit in the RST_DEVICES_H register to bring the USB block out of reset.
3. Set the UTMIP_RESET bit in the USB_SUSP_CTRL register to 1 to keep UTMIP3 PHY in reset.
4. Program the UTMIP and PLLU parameters.
   - Set the UTMIP_SUSPEND_EXIT_ON_EDGE bit (bit 22) in the UTMIP_MISC_CFG0 register to 0.
   - Set PLLU_ENABLE to 1, and never deassert it.
5. Set the UTMIP_RESET bit in the USB_SUSP_CTRL register to 0 to bring UTMIP3 out of reset.
   - Wait until PHY_CLKVALID is set to 1.
6. Set USB controller and PHY to suspend by writing 1 to PHCD in USB2D_PORTSC1 register. This will reduce the power consumption on USB3 controller and UTMIP3 PHY.
   - Wait until PHY_CLKVALID is set to 0.
7. Set all PD bits required to bring USB pads to low power mode.
   - UTMIP_OTGPD in UTMIP_BIAS_CFG0 is needed for VBUS detection, and so it should be set to 0.
   - If using VBUS_WAKEUP for VBUS detection, then UTMIP_BIASPD in UTMIP_BIAS_CFG0 can be set to 1 to save power. But if using A_SESS_VLD or any other VBUS sensor for VBUS detection, then this bit should be set to 0.
   - ID_PU in USB_PHY_VBUS_WAKEUP_ID should be set to 1 to enable ID detection.
   - UTMIP_IDPD_SEL in UTMIP_BIAS_CFG0 should be set to 0.
8. To interrupt the processor on VBUS or ID detection, software can set the following:
   - Enable appropriate VBUS interrupt enable, for example, I using A_SESS_VLD sensor for VBUS detection, set A_SESS_VLD_INT_EN in the USB_PHY_VBUS_SENSORS register to 1.
   - Enable ID detection interrupt by setting ID_INT_EN in the USB_PHY_VBUS_WAKEUP_ID register.
9. When (VBUS=1) or (ID=0) is detected, do the following:

- Bring the USB3 controller and PHY out of suspend mode by pulsing the SUSP_CLR in USB_SUSP_CTRL register by first writing 1 and then writing 0.
- Wait until PHY_CLKVALID is set to 1.
- Clear the PD bits that are required for the normal operation.

10. From this point on, the driver can run normal operations.
    - UTMIP should only be suspended by writing 1 to PHCD in the USB2D_PORTSC1 register when the USB cable is connected and only after the USB bus is suspended, for both device and host modes.
11. If a cable disconnect is detected (VBUS = 0) or (ID = 1), then go back to step 4.

19.7.4 UTMIP Programming Guidelines

A Tegra K1 device has a total of 3 UTMI+ interfaces. This results in three cabled USB ports. These ports are not part of a multiport host configuration. They are completely independent ports and can be configured in any combination of device or host. Internally, these ports correspond to USB controllers 1, 2, and 3, where controller 1 is often implicitly numbered. Externally, these are USB ports 0, 1, and 2. All UTMI+ PHY interfaces are identical instances of the same design. All three controllers use latest edition of USB core controller.

19.7.4.1 Holding USB in Reset

It is important that most static configuration of the UTMIP (and USB) be done while the unit is held in reset. For example, holding reset ensures that PLL_U is disabled and can be reconfigured. It also ensures that transactions are not occurring on the USB interface. Holding reset in both a controller and its corresponding PHY can be achieved by using the RST bit of the USB2D_USBCMD register.

19.7.4.2 PLL_U Programming

The USB ports use a cascaded PLL scheme to guarantee a high clock quality. First there is a PLL_U, which is the source clock for both the USB PLLs that are dedicated to ports. PLL_U (of type CLKPLL960_USB) produces reference clocks for all forms of USB (UTMIP, UHSIC). Table 66 describes the parameter settings that are dependent on the crystal clock reference frequency. The parameters are specified in decimal notation.

Table 66: 480 MHz PLL_U Output Frequency Fo = (Fi·N)÷(M· 2) With VCO_FREQ=0

Fi (MHz)	12.0MHz	13.0MHz	16.8MHz	19.2MHz	26.0MHz	38.4 MHz	48.0MHz
N (PLLU_DIVN)	960	960	400	200	960	200	960
M (PLLU_DIVM)	12	13	7	4	26	4	12

These parameters can be found in the PLLU_BASE register. The PLLU_OVERRIDE bit should be set to 0. PLLU_VCO_FREQ parameter must also be set to 0.

Note: PLL_U must be properly configured in the Boot ROM. DO NOT change the parameters of PLL_U while the unit is running. The same applies to the USB_PHY_PLL.

19.7.4.3 PLL_U and USB_PHY_PLL Automatic Startup Times

The PLL_U and USB_PHY_PLL automatic startup times are used in reset and suspend modes to kick start the PLLs. Software should not manually force the PLL up and down because it cannot do so rapidly enough to meet the protocol. The following table lists the start times, which must be set up in the Boot ROM.

Table 67: PLL Automated Start Times (Must be Set Up in the Boot ROM)

Crystal Frequency	12.0 MHz	13.0 MHz	16.8 MHz	19.2 MHz	26.0 MHz	38.4 MHz	48.0 MHz
PLLU_ENABLE_DELAY_COUNT	2	2	3	3	4	5	6
PLLU_STABLE_COUNT	47	51	66	75	102	150	188
PLL_ACTIVE_DLY_COUNT	8	9	11	12	9	24	31
XTAL_FREQ_COUNT	118	127	165	188	254	375	469

PLLU_ENABLE_DLY_COUNT should be set for at least 1 microsecond, PLLU_STABLE_COUNT should be set for at least 1 ms, the PLL_ACTIVE_DLY_COUNT should be at least 10 ms, and the XTAL_FREQ_COUNT set for about 2.5 ms.

19.7.4.4 Fuse Programming

The Tegra K1 device incorporates fuses to account for process variation in high speed data eye swing. The high speed data eye is controlled through the SETUP[6:0] transceiver pad parameter of the USB control registers. To set this parameter via the fuses, set the UTMIP_SPARE_CFG0[3] bit on all USB ports. This must be done in the Boot ROM. The default is to maintain backward compatibility, which implies no fuses are used by default. The objective is to get the data eye swing as close as possible to 400mV without falling below the mark under typical operating conditions.

19.7.4.5 Programming the Tracking Length Time

The PD_TRK signal is used to power down the bias cell. After 25 microseconds of bias cell operation, the PD_TRK signal can be turned high to save power. This can be automated by programming a timing interval as given in the following table.

Table 68: 25 µs Timer on Bias Cell Tracking (for Set Up in the Boot ROM)

Crystal Frequency	12.0 MHz	13.0 MHz	16.8 MHZ	19.2 MHz	26.0 MHz	38.4 MHz	48.0 MHz
UTMIP_BIAS_PAD_TRK_COUNT (UTMIP_BIAS_CFG1[7:3])	5	6	7	8	11	15	19

All values in the table are decimal. This parameter must be set in the Boot ROM while the crystal clock is stopped. To stop the crystal clock, disable the UTMIP_PHY_XTAL_CLOCKEN bit of register UTMIP_MISC_CFG1 and then re-enable it when done.

Because there is more than one UTMIP sharing the same bias cell, power down is done through a daisy chain, requiring power down across all ports.

19.7.4.6 Powering Down a USB Port Outside of Deep Power Down (DPD)

When a port is known to be disabled, there needs to be a mechanism to stop its power consumption for situations outside of DPD. This section addresses disabling a port while powered up.

Powering down of USB at times other than deep power down should be done by setting all specialized PLL and pad power down pins instead of using the global E_DPD pins of the USB analog components. It is safer to power down the cells through the traditional power down pins when the 3.3V and 1.2V supplies might still be on. This is achieved by setting the following pad controls from UTMIP register space. Before setting the power down bits; save previous registers values so that they may be restored. This type of power down should not be done in the Boot ROM.

Table 69: UTMIP Pad Controls

Pad Control	Analog Cell	Register Bit Settings
PD	Transceiver	UTMIP_FORCE_PD_POWER_DOWN=1
PD2	Transceiver	UTMIP_FORCE_PD2_POWER_DOWN=1
PD_ZI	Transceiver	UTMIP_FORCE_PDZI_POWER_DOWN=1
PD_DR	Transceiver	UTMIP_FORCE_PDDR_POWER_DOWN=1

Pad Control	Analog Cell	Register Bit Settings
PD_CHRP	Transceiver	UTMIP_FORCE_PDCHRP_POWER_DOWN=1
PD_DISC	Transceiver	UTMIP_FORCE_PDDISC_POWER_DOWN=1
PD_CHG	Transceiver	UTMIP_PD_CHG=1
PD	Bias	UTMIP_BIASPD=1
PD_TRK	Bias	UTMIP_FORCE_PDTRK_POWER_DOWN=1
OTG_PD	Bias	UTMIP_OTGPD=1
ID_PD	Bias	UTMIP_IDPD_SEL=1, UTMIP_IDPD_VAL=1
VBUS_WAKEUP_PD	Bias	UTMIP_VBUS_WAKEUP_POWER_DOWN=1
ENABLE	PHY PLL	UTMIP_FORCE_PLL_ENABLE_POWERDOWN=1
ACTIVE	PHY PLL	UTMIP_FORCE_PLL_ACTIVE_POWERDOWN=1
PD_SAMP_A/C	PHY_PLL	UTMIP_FORCE_PD_SAMP_A/C_POWERDOWN=1
ENABLE	PLL U	UTMIP_FORCE_PLLU_POWERDOWN=1
UTMIP	PHY	UTMIP_PHY_XTAL_CLOCKEN=0

19.7.4.7 Extending Debouncer Period Length

USB debouncers provide a programmable debounce to alleviate the software burden. This is done with the UTMIP_DEBOUNCE_TIME_SCALE parameter located at UTMIP_BIAS_CFG1[13:8]. The default implies a timescale factor of 1. The timescale should not be programmed at Boot ROM time. The timescale register field incremented by 1 multiplies the debounce duration for all debouncers.

In the Boot ROM, the A debounce period should be set to 10 ms. This is dependent on the crystal frequency scale. The following table shows how it is programmed.

Table 70: 10 ms Timer on the A Debounce Period

Crystal Frequency	12.0 MHz	13.0 MHz	16.8 MHZ	19.2 MHz	26.0 MHz	38.4 MHz	48.0 MHz
UTMIP_BIAS_DEBOUNCE_A	30000	32500	42000	48000	65000	96000	120000

To program values of 96000 and 120000 for crystal clock frequencies of 38.4 and 48 MHz, respectively, these steps must be followed:

1. In the debounce register, program 48000 for a 38.4 MHz crystal clock or 60000 for a 60 MHz clock.
2. Set UTMIP_BIAS_DEBOUNCE_TIMESCALE to 1 by writing into the USB2_UTMIP_BIAS_CFG1[1] register field.

19.7.4.8 Deep Power Down Behavior

Tegra K1 devices' deep power down behavior for USB wake-up events is controlled in the PMC via registers USB_DEBOUNCE_DLY, USB_AO and the WAKE_MASK (USB_EVENT field) of the PMC unit. These control the wake-up events, their debounce duration, and their debounce length while powered down. USB port 0 has a possible event on ID or VBUS detection. These can be configured at startup time. These registers take over from the UTMIP registers when the chip is powered down. The programming depends on the context of the chip. For example, if USB port 0 is a dedicated host port then the VBUS wake-up event should be kept powered down. Conversely, a dedicated device mode port may not want to wake-up on the detection of an ID connector and can chose to power down ID.

19.7.4.9 Miscellaneous Boot ROM Fields

The UTMIP fields in the following table must be programmed at Boot ROM time. These should be set when the USB device is held in reset.

Field	Value
UTMIP_FS_PREAMBLE_J (UTMIP_TX_CFG0)	1
UTMIP_PD_CHG (UTMIP_BAT_CHRG_CFG0)	1
UTMIP_XCVR_LSBIAS_SEL (UTMIP_XCVR_CFG0)	0
UTMIP_SPARE_CFG0[3]	1
UTMIP_IDLE_WAIT (UTMIP_HSRX_CFG0)	17
UTMIP_ELASTIC_LIMIT (UTMIP_HSRX_CFG0)	16
UTMIP_HS_SYNC_START_DLY (UTMIP_HSRX_CFG1)	9

19.7.4.10 PHY Resets

Additional controls have been provided to stop the USB PHY (and its clocks) by issuing a reset to the PHY only (as opposed to a reset encompassing the controller and the PHY). This is akin to the Reset found in the UTMI+ standard. This is done in both controllers. See the UTMIP_RESET field of the USB_SUSP_CTRL register for more information.

19.7.4.11 Static Boot ROM Configuration for UTMIP

The boot ROM configuration for UTMIP should be done while the unit is held in Reset. For correct behavior, the following sequence MUST be followed:

1. Apply Reset to the USB controller (and UTMIP).
2. Run the crystal clock for approximately 5 microseconds while the UTMIP is in reset.
3. Stop the crystal clock by setting UTMIP_PHY_XTAL_CLOCKEN Low. This only stops the crystal clocks in the UTMIP units.
4. Program PLL_U as described in the “PLL_U Programming” section.
5. Program automatic PLL start times as described in the “PLL_U and USB_PHY_PLL Automatic Startup Times” section.
6. Remove power downs from USB_PHY_PLL ACTIVE/ENABLE/PD_SAMP_A/C and PLL_U.
7. Program the tracking duration as described in “Programming the Tracking Length Time.” Remove the power downs from PD (Bias) and disable PD_TRK. After 25 µs (tracking time), enable PD_TRK by writing 0 into UTMIP_FORCE_PDTRK_POWER_DOWN.
8. Once PD (Bias) is disabled, disable OTG_PD after 1 µs.
9. Remove powerdowns from ID_PD and VBUS_WAKEUP_PD. This can be removed earlier, as there is no timing or sequential relation with other signals.
10. Once the PLL_U, USB_PHY_PLL, and Bias pad are ready, remove PD (Transceiver). After 400 ns, the USB pad is ready for HS/FS/LS operation.
11. There are other powerdowns which can be removed if needed (as such not needed for Boot ROM). These are PD / PD_ZI / PD_DR / PD_CHRP / PD_DISC / PD_CHG.
12. Program the debouncer length time as described in ”Extending Debouncer Period Length.”
13. Program various static parameters of the UTMIP as described in “Miscellaneous Boot ROM Fields.”
14. Restart the crystal clock by setting UTMIP_PHY_XTAL_CLOCKEN.

15. Resume any previous USB programming work that falls outside of UTMIP and release reset.From the UTMIP perspective it does not matter when reset is released, as long as it is after step 8. It will take about 3.5 ms before the 60 MHz clock appears once reset is released.

From a UTMIP perspective, ensure that all the cabled USB port PHYs are configured similarly in the Boot ROM.

19.7.4.12 EHCI Deviations

- Embedded Transaction Translator – Allows direct attachment of FS and LS devices in host mode without the need for a companion controller.
- Embedded design interface – This core does not have a PCI Interface and therefore the PCI configuration registers described in the EHCI specification are not applicable.

Programmable Physical Interface Behavior

This design supports multiple Physical interfaces which can operate in differing modes when the core is configured with software programmable Physical Interface Modes. Software programmability allows the selection of the Physical interface part during the board design phase instead of during the chip design phase. The control bits for selecting the Physical Interface operating mode have been added to the HOSTPCx register providing a capability that is not defined by EHCI.

Port Reset

The port connect methods specified by EHCI require setting the port reset bit in the PORTSCx register for a minimum duration of 10ms. Due to the complexity required to support the attachment of devices that are not high speed, there are counter already present in the design that can count the 10ms reset pulse to alleviate the requirement of the software to measure this duration. The basic connection is then summarized as the following:

- [Port Change Interrupt] Port connect change occurs to notify the host controller driver that a device has attached.
- Software shall write a ‘1’ to the reset the device.
- Software shall write a ‘0’ to the reset the device after 10 ms.
- Driver needs to wait until port change interrupt is asserted and port reset is cleared

> **Note:** Should the EHCI host controller driver attempt to write a ‘0’ to the reset bit while a reset is in progress the write will be ignored and the reset will continue until completion.

- [Port Change Interrupt] Port enable change occurs to notify the host controller that the device is now operational and at this point the port speed has been determined.

Port Speed Detection

After the port change interrupt indicates that a port is enabled, the EHCI stack should determine the port speed. Unlike the EHCI implementation which will re-assign the port owner for any device that does not connect at High-Speed, this host controller supports direct attach of non High-Speed devices. Therefore, the following differences are important regarding port speed detection:

- Port Owner is read-only and always reads 0.
- A 2-bit Port Speed indicator (PSPD) has been added to HOSTPCx to provide the current operating speed of the port to the host controller driver.

Port Reset duration is 55 ms instead of 50 ms.

Port Suspend (PORTSC.Suspend) bit is set immediately after setting the bit. As per EHCI a 4 ms delay is expected for this bit to be set.

Tegra K1 devices also have the following cases that are not directly compliant to EHCI:

- USB controller/PHY interface initialization
- PHY Clock shutdown/wakeup procedure during suspend/resume/connect/disconnect
- PMC logic use for special low power modes during suspend/LP0

19.7.5 Cold Boot

Step 1

The Boot ROM enables USB2.0 related PLLs with software override.

The Boot ROM deasserts reset to the XUSB PADCTL block.

Step 2

The PAD driver switches USB 2.0 related PLLs to under hardware control after the PAD driver is loaded.

- Program the following CAR registers to set up hardware control of UTMIPLL:
  - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_USE_LOCKDET] to ‘1’
  - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_CLK_ENABLE_SWCTL] to ‘0’
  - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_SEQ_START_STATE] to ‘1’
  - CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0[UTMIP_FORCE_PLL_ENABLE_POWERUP] to ‘0’
  - CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0[UTMIP_FORCE_PLL_ENABLE_POWERDOWN] to ‘0’
- Program the following CAR registers to set up software override of UTMIPLL’s IDDQ control.
  - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_IDDQ_SWCTL] to ‘1’
  - CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_IDDQ_OVERRIDE_VALUE] to ‘0’
- Program the following CAR register to enable hardware control to UTMIPLL:
  - Wait 1 µs then set CLK_RST_CONTROLLER_UTMIPLL_HW_PWRDN_CFG0_0[UTMIPLL_SEQ_ENABLE] to ‘1’
- Program the following CAR registers to set up hardware control of PLLU:
  - CLK_RST_CONTROLLER_PLLU_HW_PWRDN_CFG0_0[PLLU_USE_LOCKDET] to ‘1’
  - CLK_RST_CONTROLLER_PLLU_HW_PWRDN_CFG0_0[PLLU_CLK_ENABLE_SWCTL] to ‘0’
  - CLK_RST_CONTROLLER_PLLU_HW_PWRDN_CFG0_0[PLLU_CLK_SWITCH_SWCTL] to ‘0’
  - CLK_RST_CONTROLLER_PLLU_HW_PWRDN_CFG0_0[PLLU_SEQ_START_STATE] to ‘1’
- Program the following CAR register to set up hardware control of PLLU when all non-HSIC USB2.0 ports are assigned to XUSB:
  - CLK_RST_CONTROLLER_PLLU_HW_PWRDN_CFG0_0[PLLU_SEQ_IN_SWCTL] to ‘0’
- Program the following CAR register to enable hardware control of PLLU:
  - Wait 1 µs then set CLK_RST_CONTROLLER_PLLU_HW_PWRDN_CFG0_0[PLLU_SEQ_ENABLE] to ‘1’
- Program the following CAR register bits to disable the override to PLLU:
  - CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0[UTMIP_FORCE_PLLU_POWERUP] to ‘0’

- CLK_RST_CONTROLLER_UTMIP_PLL_CFG1_0[UTMIP_FORCE_PLLU_POWERDOWN] to ‘0’
- CLK_RST_CONTROLLER_PLLU_BASE_0[PLLU_OVERRIDE] to ‘0’

The PAD driver enables USB3.0 related PLLs.

- Program the following CAR register bits to ‘0’ to move the REFPLLE and PLLE out of IDDQ:
  - CLK_RST_CONTROLLER_PLLREFE_MISC_0[PLLREFE_IDDQ]
  - CLK_RST_CONTROLLER_PLLE_MISC_0[PLLE_IDDQ_OVERRIDE_VALUE]
- Program the following CAR register bits to configure the REFPLLE:
  - CLK_RST_CONTROLLER_PLLREFE_BASE_0[PLLREFE_MDIV]
  - CLK_RST_CONTROLLER_PLLREFE_BASE_0[PLLREFE_NDIV]
  - CLK_RST_CONTROLLER_PLLREFE_BASE_0[PLLREFE_PLDIV]
  - CLK_RST_CONTROLLER_PLLREFE_BASE_0[PLLREFE_KVCO]
  - CLK_RST_CONTROLLER_PLLREFE_BASE_0[PLLREFE_KCP]
- Set the following CAR register bit to ‘1’ to enable the PLL:
  - CLK_RST_CONTROLLER_PLLREFE_BASE_0[PLLREFE_ENABLE]
- Program the following CAR register to enable REFPLLE LOCK output
  - CLK_RST_CONTROLLER_PLLREFE_MISC_0[PLLREFE_LOCK_ENABLE] to ‘1’
- Poll the following CAR register to ensure REFPLLE is locked:
  - CLK_RST_CONTROLLER_PLLREFE_MISC_0[PLLREFE_LOCK] equals ‘1’
- Program the following CAR register bits to configure the PLLE according to the frequency of osc_clk:
  - CLK_RST_CONTROLLER_PLLE_BASE_0[PLLE_MDIV]
  - CLK_RST_CONTROLLER_PLLE_BASE_0[PLLE_NDIV]
  - CLK_RST_CONTROLLER_PLLE_BASE_0[PLLE_FDIV4B]
  - CLK_RST_CONTROLLER_PLLE_BASE_0[PLLE_PLDIV_CML]
- Set the following CAR register bit to ‘1’ to enable the PLL:
  - CLK_RST_CONTROLLER_PLLE_BASE_0[PLLE_ENABLE]
- Program the following CAR register to enable PLL LOCK output:
  - CLK_RST_CONTROLLER_PLLE_MISC_0[PLLE_LOCK_ENABLE] to 1’b1
- Poll the following CAR register to ensure PLLE is locked:
  - CLK_RST_CONTROLLER_PLLE_MISC_0[PLLE_LOCK] equals ‘1’

The PAD driver switches USB 3.0 related PLLs to under hardware control.

- Program the following CAR registers to set up hardware control of PLLE
  - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_USE_LOCKDET] to ‘1’
  - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_ENABLE_SWCTL] to ‘0’
  - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_SS_SWCTL] to ‘0’
  - CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_SEQ_START_STATE] to ‘1’
  - CLK_RST_CONTROLLER_PLLE_MISC_0[PLLE_IDDQ_SWCTL] to ‘0’

- Program the following CAR register to enable hardware control of PLLE:
  - Wait 1 µs then set CLK_RST_CONTROLLER_PLLE_AUX_0[PLLE_SEQ_ENABLE] to '1'
- Program the following CAR registers to set up hardware control of XUSB Brick's PLL, where XUSBIO_PLL is used by either or both XUSB and PCIE and SATA_PLL is used by either XUSB or SATA:
  - CLK_RST_CONTROLLER_XUSBIO_PLL_CFG0_0[XUSBIO_PADPLL_USE_LOCKDET] to '1'
  - CLK_RST_CONTROLLER_XUSBIO_PLL_CFG0_0[XUSBIO_CLK_ENABLE_SWCTL] to '0'
  - CLK_RST_CONTROLLER_XUSBIO_PLL_CFG0_0[XUSBIO_PADPLL_RESET_SWCTL] to '0'
  - CLK_RST_CONTROLLER_XUSBIO_PLL_CFG0_0[XUSBIO_SEQ_START_STATE] to '1'
  - CLK_RST_CONTROLLER_SATA_PLL_CFG0_0[SATA_PADPLL_USE_LOCKDET] to '1'
  - CLK_RST_CONTROLLER_SATA_PLL_CFG0_0[SATA_PADPLL_RESET_SWCTL] to '0'
  - CLK_RST_CONTROLLER_SATA_PLL_CFG0_0[SATA_SEQ_START_STATE] to '1'
- Wait 1 µs
- Program the following CAR registers to enable hardware control of the XUSB Brick's PLL:
  - CLK_RST_CONTROLLER_XUSBIO_PLL_CFG0_0[XUSBIO_SEQ_ENABLE] to '1'
  - CLK_RST_CONTROLLER_SATA_PLL_CFG0_0[SATA_SEQ_ENABLE] to '1'

Step 3

The PAD driver enables platform specific regulators enable power rails to the pads, VBUS, and pull-up voltage to the VBUS control PMIC's EN input.

The PAD driver assigns the USB ports to the controllers, then programs the port capabilities and pad parameters of ports assigned to XUSB after booting to OS.

- Program the following XUSB PADCTL registers to assign the USB2.0 ports to XUSB, according to the platform-specific configuration:
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_HSIC_PAD_PORT1]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_HSIC_PAD_PORT0]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT2]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT1]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT0]
- Program the following XUSB PADCTL registers to assign the port capabilities for USB2.0 ports owned by XUSB, according to the platform specific configuration:
  - XUSB_PADCTL_USB2_PORT_CAP_0[PORT2_CAP] for host/disabled
  - XUSB_PADCTL_USB2_PORT_CAP_0[PORT2_INTERNAL] for whether its internal port
  - XUSB_PADCTL_USB2_PORT_CAP_0[PORT1_CAP] for host/disabled
  - XUSB_PADCTL_USB2_PORT_CAP_0[PORT1_INTERNAL] for whether its internal port
  - XUSB_PADCTL_USB2_PORT_CAP_0[PORT0_CAP] for host/disabled
  - XUSB_PADCTL_USB2_PORT_CAP_0[PORT0_INTERNAL] for whether its internal port
- Program the following XUSB PADCTL registers to '0x7' to disable the overcurrent signal mapping for USB 2.0 ports owned by XUSB:
  - XUSB_PADCTL_SNPS_OC_MAP_0[CONTROLLER1_OC_PIN]

- XUSB_PADCTL_SNPS_OC_MAP_0[CONTROLLER2_OC_PIN]
- XUSB_PADCTL_SNPS_OC_MAP_0[CONTROLLER3_OC_PIN]
- XUSB_PADCTL_USB2_OC_MAP_0[PORT2_OC_PIN]
- XUSB_PADCTL_USB2_OC_MAP_0[PORT1_OC_PIN]
- XUSB_PADCTL_USB2_OC_MAP_0[PORT0_OC_PIN]
- XUSB_PADCTL_OC_DET_0[VBUS_ENABLE0_OC_MAP]
- XUSB_PADCTL_OC_DET_0[VBUS_ENABLE1_OC_MAP]
- XUSB_PADCTL_OC_DET_0[VBUS_ENABLE1_OC_MAP]

- Program the following XUSB PADCTL registers to assign the SuperSpeed port mapping to USB2.0 ports owned by XUSB, where the SuperSpeed ports inherit their port capabilities from the USB2.0 ports they mapped to, according to the platform specific configuration:
  - XUSB_PADCTL_SS_PORT_MAP_0[PORT1_MAP]
  - XUSB_PADCTL_SS_PORT_MAP_0[PORT0_MAP]
- Program the following XUSB PADCTL registers to assign the IOPHY lanes to XUSB, PCIE, or SATA, according to the platform-specific configuration
  - XUSB_PADCTL_USB3_PAD_MUX_0[PCIE_PAD_LANE0]
  - XUSB_PADCTL_USB3_PAD_MUX_0[PCIE_PAD_LANE1]
  - XUSB_PADCTL_USB3_PAD_MUX_0[PCIE_PAD_LANE2]
  - XUSB_PADCTL_USB3_PAD_MUX_0[PCIE_PAD_LANE3]
  - XUSB_PADCTL_USB3_PAD_MUX_0[PCIE_PAD_LANE4]
  - XUSB_PADCTL_USB3_PAD_MUX_0[SATA_PAD_LANE0]
- Program the following XUSB PADCTL registers to assign the PAD and PLL parameters of ports owned by XUSB, according to the platform-specific configuration:
  - XUSB_PADCTL_IOPHY_PLL_P0_CTL1_0
  - XUSB_PADCTL_IOPHY_PLL_P0_CTL2_0
  - XUSB_PADCTL_IOPHY_PLL_P0_CTL3_0
  - XUSB_PADCTL_IOPHY_PLL_P0_CTL4_0
  - XUSB_PADCTL_IOPHY_PLL_S0_CTL1_0
  - XUSB_PADCTL_IOPHY_PLL_S0_CTL2_0
  - XUSB_PADCTL_IOPHY_PLL_S0_CTL3_0
  - XUSB_PADCTL_IOPHY_PLL_S0_CTL4_0
  - XUSB_PADCTL_IOPHY_USB3_PAD0_CTL_1_0
  - XUSB_PADCTL_IOPHY_USB3_PAD0_CTL_2_0
  - XUSB_PADCTL_IOPHY_USB3_PAD0_CTL_3_0
  - XUSB_PADCTL_IOPHY_USB3_PAD0_CTL_4_0
  - XUSB_PADCTL_IOPHY_USB3_PAD1_CTL_1_0
  - XUSB_PADCTL_IOPHY_USB3_PAD1_CTL_2_0
  - XUSB_PADCTL_IOPHY_USB3_PAD1_CTL_3_0
  - XUSB_PADCTL_IOPHY_USB3_PAD1_CTL_4_0

- XUSB_PADCTL_IOPHY_MISC_PAD_P0_CTL_1_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P0_CTL_2_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P0_CTL_3_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P0_CTL_4_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P0_CTL_5_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P0_CTL_6_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P1_CTL_1_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P1_CTL_2_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P1_CTL_3_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P1_CTL_4_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P1_CTL_5_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P1_CTL_6_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P2_CTL_1_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P2_CTL_2_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P2_CTL_3_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P2_CTL_4_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P2_CTL_5_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P2_CTL_6_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P3_CTL_1_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P3_CTL_2_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P3_CTL_3_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P3_CTL_4_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P3_CTL_5_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P3_CTL_6_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P4_CTL_1_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P4_CTL_2_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P4_CTL_3_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P4_CTL_4_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P4_CTL_5_0
- XUSB_PADCTL_IOPHY_MISC_PAD_P4_CTL_6_0
- XUSB_PADCTL_IOPHY_MISC_PAD_S0_CTL_1_0
- XUSB_PADCTL_IOPHY_MISC_PAD_S0_CTL_2_0
- XUSB_PADCTL_IOPHY_MISC_PAD_S0_CTL_3_0
- XUSB_PADCTL_IOPHY_MISC_PAD_S0_CTL_4_0
- XUSB_PADCTL_IOPHY_MISC_PAD_S0_CTL_5_0
- XUSB_PADCTL_IOPHY_MISC_PAD_S0_CTL_6_0
- XUSB_PADCTL_USB2_OTG_PAD0_CTL_0_0
- XUSB_PADCTL_USB2_OTG_PAD0_CTL_1_0
- XUSB_PADCTL_USB2_OTG_PAD1_CTL_0_0

- XUSB_PADCTL_USB2_OTG_PAD1_CTL_1_0
- XUSB_PADCTL_USB2_OTG_PAD2_CTL_0_0
- XUSB_PADCTL_USB2_OTG_PAD2_CTL_1_0
- XUSB_PADCTL_USB2_BIAS_PAD_CTL_0_0
- XUSB_PADCTL_USB2_BIAS_PAD_CTL_1_0
- XUSB_PADCTL_HSIC_PAD0_CTL_0_0
- XUSB_PADCTL_HSIC_PAD0_CTL_1_0
- XUSB_PADCTL_HSIC_PAD0_CTL_2_0
- XUSB_PADCTL_HSIC_PAD1_CTL_0_0
- XUSB_PADCTL_HSIC_PAD1_CTL_1_0
- XUSB_PADCTL_HSIC_PAD1_CTL_2_0
- XUSB_PADCTL_HSIC_STRB_TRIM_CONTROL_0

- Program the following XUSB PADCTL register bits to ‘0’ to disable power down of the PAD:
  - XUSB_PADCTL_USB2_BATTERY_CHRG_BIASPAD_0[PD_OTG]
  - XUSB_PADCTL_USB2_OTG_PAD0_CTL_0_0[PD]
  - XUSB_PADCTL_USB2_OTG_PAD1_CTL_0_0[PD]
  - XUSB_PADCTL_USB2_OTG_PAD2_CTL_0_0[PD]
  - XUSB_PADCTL_USB2_OTG_PAD0_CTL_0_0[PD2]
  - XUSB_PADCTL_USB2_OTG_PAD1_CTL_0_0[PD2]
  - XUSB_PADCTL_USB2_OTG_PAD2_CTL_0_0[PD2]
  - XUSB_PADCTL_USB2_OTG_PAD0_CTL_0_0[PD_ZI]
  - XUSB_PADCTL_USB2_OTG_PAD1_CTL_0_0[PD_ZI]
  - XUSB_PADCTL_USB2_OTG_PAD2_CTL_0_0[PD_ZI]
  - XUSB_PADCTL_USB2_OTG_PAD0_CTL_1_0[PD_DR]
  - XUSB_PADCTL_USB2_OTG_PAD1_CTL_1_0[PD_DR]
  - XUSB_PADCTL_USB2_OTG_PAD2_CTL_1_0[PD_DR]
  - XUSB_PADCTL_USB2_BIAS_PAD_CTL_0_0[PD]
  - XUSB_PADCTL_USB2_BIAS_PAD_CTL_0_0[PD_TRK]
  - XUSB_PADCTL_HSIC_PAD0_CTL_1_0[PD_TX]
  - XUSB_PADCTL_HSIC_PAD1_CTL_1_0[PD_TX]
  - XUSB_PADCTL_HSIC_PAD0_CTL_1_0[PD_TRX]
  - XUSB_PADCTL_HSIC_PAD1_CTL_1_0[PD_TRX]
  - XUSB_PADCTL_HSIC_PAD0_CTL_1_0[PD_RX]
  - XUSB_PADCTL_HSIC_PAD1_CTL_1_0[PD_RX]
  - XUSB_PADCTL_HSIC_PAD0_CTL_1_0[PD_ZI]
  - XUSB_PADCTL_HSIC_PAD1_CTL_1_0[PD_ZI]
- Program the following XUSB PADCTL register bits to ‘0’ to release the XUSB SS wake logic state latching:
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP0_ELPG_CLAMP_EN]

- XUSB_PADCTL_ELPG_PROGRAM_0[SSP0_ELPG_CLAMP_EN_EARLY]
- XUSB_PADCTL_ELPG_PROGRAM_0[SSP0_ELPG_VCORE_DOWN]
- XUSB_PADCTL_ELPG_PROGRAM_0[SSP1_ELPG_CLAMP_EN]
- XUSB_PADCTL_ELPG_PROGRAM_0[SSP1_ELPG_CLAMP_EN_EARLY]
- XUSB_PADCTL_ELPG_PROGRAM_0[SSP1_ELPG_VCORE_DOWN]

- Program the following XUSB PADCTL register fields to enable the pad override to put the pad of the lanes assigned to XUSB in low power mode. These pads should be brought out of low power mode during SS clock frequency increasing sequence.
  - XUSB_PADCTL_IOPHY_MISC_PAD_P0_CTL_3_0[RX_IDLE_MODE] to '0'
  - XUSB_PADCTL_IOPHY_MISC_PAD_P0_CTL_3_0[RX_IDLE_MODE_OVRD] to '1'
  - XUSB_PADCTL_IOPHY_MISC_PAD_P1_CTL_3_0[RX_IDLE_MODE] to '0'
  - XUSB_PADCTL_IOPHY_MISC_PAD_P1_CTL_3_0[RX_IDLE_MODE_OVRD] to '1'
  - XUSB_PADCTL_IOPHY_MISC_PAD_S0_CTL_3_0[RX_IDLE_MODE] to '0'
  - XUSB_PADCTL_IOPHY_MISC_PAD_S0_CTL_3_0[RX_IDLE_MODE_OVRD] to '1'

Note: To avoid conflict or ambiguity, the XUSB controller should be under reset when updating the port assignments.

Step 4

The PAD driver programs the clocks and deasserts the resets to the controllers

- Set the following CAR register bit to '1' to enable the clocks to XUSB:
  - CLK_RST_CONTROLLER_CLK_ENB_W_SET_0[SET_CLK_ENB_XUSB]
- Set the following CAR register bits to '1' to enable the clocks to individual XUSB partitions:
  - CLK_RST_CONTROLLER_CLK_ENB_U_SET_0[SET_CLK_ENB_XUSB_HOST]
  - CLK_RST_CONTROLLER_CLK_ENB_W_SET_0[SET_CLK_ENB_XUSB_SS]
- Program the following CAR register bits to set the source of XUSB clocks, where PLLP_OUT0 runs at 408 MHz.
  - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_CORE_HOST_0[XUSB_CORE_HOST_CLK_SRC] to 'PLLP_OUT0'
  - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_CORE_HOST_0[XUSB_CORE_HOST_CLK_DIVISOR] to '0x6'
  - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_FALCON_0[XUSB_FALCON_CLK_SRC] to 'PLLP_OUT0'
  - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_FALCON_0[XUSB_FALCON_CLK_DIVISOR] to '0x2'
  - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_FS_0[XUSB_FS_CLK_SRC] to 'FO_48M'
  - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_FS_0[XUSB_FS_CLK_DIVISOR] to '0x0'
  - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_SS_0[XUSB_SS_CLK_SRC] to 'HSIC_480'
  - CLK_RST_CONTROLLER_CLK_SOURCE_XUSB_SS_0[XUSB_SS_CLK_DIVISOR] to '0x6'
- Set the following CAR register bits to '0' to deassert reset to XUSB:
  - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_HOST_RST]
  - CLK_RST_CONTROLLER_RST_DEVICES_W_0[SWR_XUSB_SS_RST]

Step 5

The PAD driver brings the IOPHY out of IDDQ.

- Program the following XUSB PADCTL registers to '1' to bring specific lanes of IOPHY out of IDDQ. Only lanes that are used in the platform are required to be bring out of IDDQ:
  - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE_MASK0]
  - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE_MASK1]
  - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE_MASK2]
  - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE_MASK3]
  - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE_MASK4]
  - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_SATA_PAD_IDDQ_DISABLE_MASK0]
- Alternatively, program the following XUSB PADCTL register to '0' to bring all lanes of IOPHY out of IDDQ:
  - XUSB_PADCTL_USB3_PAD_MUX_0[FORCE_PCIE_PAD_IDDQ_DISABLE]

The PAD driver releases the always on PAD muxing logic state latching.

- Program the following XUSB PADCTL register bits:
- Wait 1 µs
  - XUSB_PADCTL_ELPG_PROGRAM_0[AUX_MUX_LP0_CLAMP_EN] to '0'
- Wait 100 µs
  - XUSB_PADCTL_ELPG_PROGRAM_0[AUX_MUX_LP0_CLAMP_EN_EARLY] to '0'
- Wait 100 µs
  - XUSB_PADCTL_ELPG_PROGRAM_0[AUX_MUX_LP0_VCORE_DOWN] to '0'

The PAD driver enables the VBUS to the USB ports.

- Program the following XUSB PADCTL registers to assign the over current signal mapping for USB 2.0 ports owned by XUSB, according to the platform-specific configuration:
  - XUSB_PADCTL_SNPS_OC_MAP_0[CONTROLLER1_OC_PIN]
  - XUSB_PADCTL_SNPS_OC_MAP_0[CONTROLLER2_OC_PIN]
  - XUSB_PADCTL_SNPS_OC_MAP_0[CONTROLLER3_OC_PIN]
  - XUSB_PADCTL_USB2_OC_MAP_0[PORT2_OC_PIN]
  - XUSB_PADCTL_USB2_OC_MAP_0[PORT1_OC_PIN]
  - XUSB_PADCTL_USB2_OC_MAP_0[PORT0_OC_PIN]
  - XUSB_PADCTL_OC_DET_0[VBUS_ENABLE0_OC_MAP]
  - XUSB_PADCTL_OC_DET_0[VBUS_ENABLE1_OC_MAP]
  - XUSB_PADCTL_OC_DET_0[VBUS_ENABLE2_OC_MAP]
- Write '1' to the following XUSB PADCTL register bits to clear possible false reporting of overcurrent events before the over current signal mappings are properly programmed:
  - XUSB_PADCTL_OC_DET_0[OC_DETECTED0]
  - XUSB_PADCTL_OC_DET_0[OC_DETECTED1]
  - XUSB_PADCTL_OC_DET_0[OC_DETECTED2]

- XUSB_PADCTL_OC_DET_0[OC_DETECTED3]
- XUSB_PADCTL_OC_DET_0[OC_DETECTED_VBUS_PAD0]
- XUSB_PADCTL_OC_DET_0[OC_DETECTED_VBUS_PAD1]
- XUSB_PADCTL_OC_DET_0[OC_DETECTED_VBUS_PAD2]

- Set the following XUSB PADCTL register bits to '1' to enable the VBUS of the host ports
  - XUSB_PADCTL_OC_DET_0[VBUS_ENABLE0]
  - XUSB_PADCTL_OC_DET_0[VBUS_ENABLE1]
  - XUSB_PADCTL_OC_DET_0[VBUS_ENABLE2]

Step 6

The xHCI PEP driver initializes IPFS registers.

- Program the following XUSB IPFS registers to allow software accesses to XUSB's MMIO registers:
  - XUSB_HOST_AXI_BAR0_START_0[AXI_BAR0_START] to '0x70090'
  - XUSB_HOST_AXI_BAR0_SZ_0[AXI_BAR0_SIZE] to '0x00008'
  - XUSB_HOST_FPCI_BAR0_0[FPCI_BAR0_START] to '0x0010000'
  - XUSB_HOST_FPCI_BAR0_0[FPCI_BAR0_ACCESS_TYPE] to '0'
- Program the following XUSB IPFS register to enable the XUSB host:
  - XUSB_HOST_CONFIGURATION_0[EN_FPCI] to '1'

Note: XUSB configuration address mapping is hardcoded in IPFS.

The xHCI PEP driver initializes XUSB's configuration registers.

- Program the following XUSB configuration registers to initialize XUSB:
  - NV_PROJ__XUSB_CFG_1_BUS_MASTER to '1'
  - NV_PROJ__XUSB_CFG_1_MEMORY_SPACE to '1'
  - NV_PROJ__XUSB_CFG_4_BASE_ADDRESS to '0x02000'

Step 6

The xHCI PEP driver loads XUSB firmware.

The xHCI driver initializes the host controller.

19.7.6 LP0

19.7.6.1 LP0 Entry

Step 1

The xHCI driver performs a context save operation as described in section 4.23.2 of the xHCI specification.

The xHCI PEP driver performs an XUSB specific context save operation.

The xHCI PEP driver performs an XUSB IPFS specific context save operation.

- Read and store the value of the following registers
  - XUSB_HOST_MSI_BAR_SZ_0
  - XUSB_HOST_MSI_AXI_BAR_ST_0

- XUSB_HOST_MSI_FPCI_BAR_ST_0
- XUSB_HOST_MSI_VEC0_0
- XUSB_HOST_MSI_EN_VEC0_0
- XUSB_HOST_FPCI_ERROR_MASKS_0
- XUSB_HOST_INTR_MASK_0
- XUSB_HOST_IPFS_INTR_ENABLE_0
- XUSB_HOST_UFPCI_CONFIG_0
- XUSB_HOST_CLKGATE_HYSTERESIS_0
- XUSB_HOST_XUSB_HOST_MCCIF_FIFOCTRL_0

Step 2

The System Power Management driver programs the PMC USB2.0 sleepwalk logic as described in the “PMC Programming” section.

The System Power Management driver should enable the wake events according to the port states and Wake-on-Connect, Wake-on-Disconnect, and Wake-on-Over-Current settings of the XUSB registers ports accordingly.

The System Power Management driver enables wake events from USB ports.

- Set the following PMC register bits to ‘1’ to set the wake signal active level to ‘HIGH’
  - APBDEV_PMC_WAKE2_LVL_0[5] for VBUS wakeup
  - APBDEV_PMC_WAKE2_LVL_0[6] for ID wakeup
  - APBDEV_PMC_WAKE2_LVL_0[7] for USB2.0 port 0 wakeup
  - APBDEV_PMC_WAKE2_LVL_0[8] for USB2.0 port 1 wakeup
  - APBDEV_PMC_WAKE2_LVL_0[9] for USB2.0 port 2 wakeup
  - APBDEV_PMC_WAKE2_LVL_0[10] for HSIC port 0 wakeup
  - APBDEV_PMC_WAKE2_LVL_0[11] for HSIC port 1 wakeup
  - APBDEV_PMC_WAKE2_LVL_0[26] for USB3.0 ports wakeup
- Set the following PMC register bits to ‘1’ to enable USB wake events
  - APBDEV_PMC_WAKE2_MASK_0[5] for VBUS wakeup
  - APBDEV_PMC_WAKE2_MASK_0[6] for ID wakeup
  - APBDEV_PMC_WAKE2_MASK_0[7] for USB2.0 port 0 wakeup
  - APBDEV_PMC_WAKE2_MASK_0[8] for USB2.0 port 1 wakeup
  - APBDEV_PMC_WAKE2_MASK_0[9] for USB2.0 port 2 wakeup
  - APBDEV_PMC_WAKE2_MASK_0[10] for HSIC port 0 wakeup
  - APBDEV_PMC_WAKE2_MASK_0[11] for HSIC port 1 wakeup
  - APBDEV_PMC_WAKE2_MASK_0[26] for USB3.0 ports wakeup

Step 3

The system software puts the system in LP0.

19.7.6.2 LP0 Exit

After exiting LP0, the PMC will restore the partition power gating to the state before LP0 entry. This means if a partition was power gated before entering LP0, that partition would stay power gated after exiting LP0, and only partitions that were powered before entering LP0 would have their power restored after exiting LP0.

Step 1

The Boot ROM enables USB related PLLs with software override.

The Boot ROM deasserts reset to XUSB PADCTL block.

The system software puts the system in LP0.

Step 2

The PAD driver switches USB related PLLs to under hardware control.

Refer to Step 2 of “Cold Boot”for the programming sequence.

Step 3

The PAD driver assigns the USB port to the controllers, then programs the port capabilities and pad parameters of ports assigned to XUSB according to the platform specific configuration.

Refer to Step 3 of “Cold Boot”for the programming sequence.

Step 4

The PAD driver programs the clocks and deasserts the resets to the controllers.

Refer to Step 4 of “Cold Boot”for the programming sequence.

- Wait 1 µs
- Program the following XUSB PADCTL register bits to ‘0’ to release the XUSB SS wake logic state latching
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP1_ELPG_VCORE_DOWN]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP1_ELPG_VCORE_DOWN]
- Wait 100 µs.
- Program the following XUSB PADCTL register bits to ‘0’ to release the XUSB SS wake logic state latching
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP0_ELPG_CLAMP_EN_EARLY]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP0_ELPG_CLAMP_EN_EARLY]
- Wait 100 µs
- Program the following XUSB PADCTL register bits to ‘0’ to release the XUSB SS wake logic state latching
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP0_ELPG_CLAMP_EN]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP1_ELPG_CLAMP_EN]

Note: If XUSB was in ELPG before entering LP0 and the LP0 exit is not due to wake event from ports belong to XUSB, the PAD driver should keep XUSB in the ELPG state and only bring XUSB out of ELPG when wake events are detected for the ports owned by XUSB.

Step 5

The PAD driver enables the VBUS to the USB ports if VBUS was disabled during LP0.

Refer to Step 5 of “Cold Boot”for the programming sequence.

Step 6

The xHCI PEP driver performs XUSB specific IOPHY context restore for the following registers for the lanes assigned to XUSB based on the SS port mappings.

- Program the following XUSB PADCTL register bits with the context stored during the last time the port entered U0.
  - XUSB_PADCTL_IOPHY_MISC_PAD_P0_CTL_4_0[DFE_CNTL[28:24]]
  - XUSB_PADCTL_IOPHY_MISC_PAD_P0_CTL_4_0[DFE_CNTL[22:16]]
  - XUSB_PADCTL_IOPHY_MISC_PAD_P0_CTL_2_0[RX_EQ[13:8]]
  - XUSB_PADCTL_IOPHY_MISC_PAD_P0_CTL_2_0[RX_EQ[5:0]]
  - XUSB_PADCTL_IOPHY_MISC_PAD_P1_CTL_4_0[DFE_CNTL[28:24]]
  - XUSB_PADCTL_IOPHY_MISC_PAD_P1_CTL_4_0[DFE_CNTL[22:16]]
  - XUSB_PADCTL_IOPHY_MISC_PAD_P1_CTL_2_0[RX_EQ[13:8]]
  - XUSB_PADCTL_IOPHY_MISC_PAD_P1_CTL_2_0[RX_EQ[5:0]]
  - XUSB_PADCTL_IOPHY_MISC_PAD_S0_CTL_4_0[DFE_CNTL[28:24]]
  - XUSB_PADCTL_IOPHY_MISC_PAD_S0_CTL_4_0[DFE_CNTL[22:16]]
  - XUSB_PADCTL_IOPHY_MISC_PAD_S0_CTL_2_0[RX_EQ[13:8]]
  - XUSB_PADCTL_IOPHY_MISC_PAD_S0_CTL_2_0[RX_EQ[5:0]]

The xHCI PEP driver performs XUSB specific context restore operation

The xHCI PEP driver performs XUSB IPFS and XUSB register initialization as described in Step 6 of “Cold Boot”.

Step 7

The xHCI PEP Driver loads XUSB firmware.

Step 8

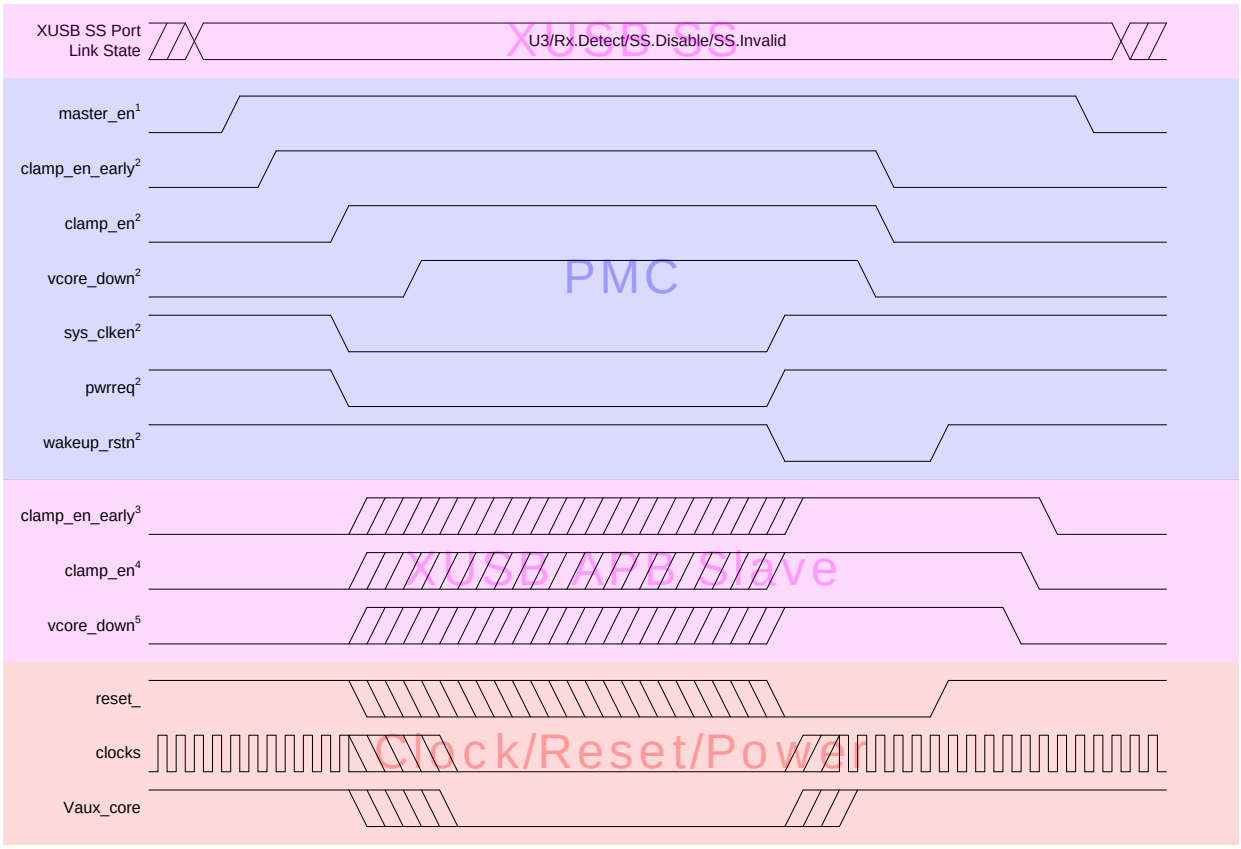
The xHCI driver performs context restore operation as described in section 4.23.2 of the xHCI specification,

Step 9

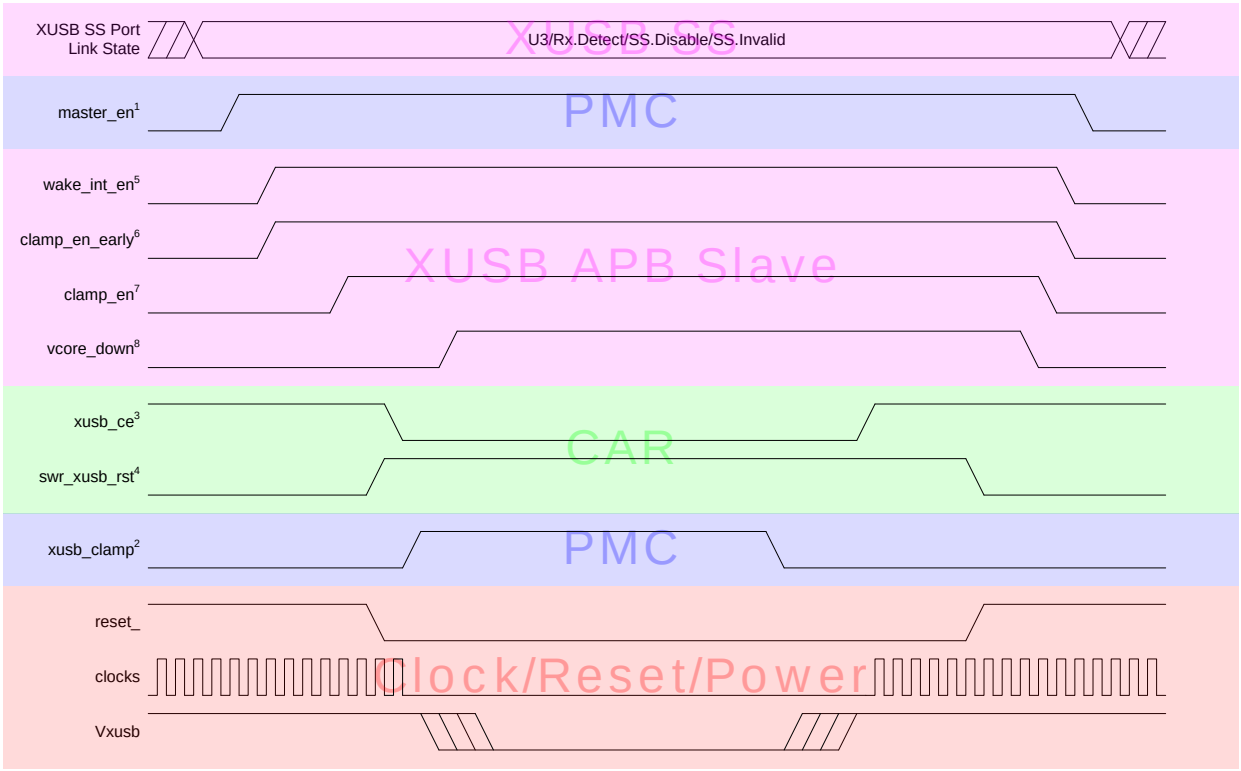
The System Power Management driver disables the PMC USB2.0 sleepwalk logic as described in the “PMC Programming” section.

19.7.7 XUSB Controller Power Gating

The following figure illustrates the signal sequences from the PMC that are used by XUSB SS Wake logic to enable its wake event detection.



The following figure illustrates the signal sequences from the XUSB PADCTL block that are required to follow the same sequence as from the PMC so XUSB SS Wake logic can enable its wake event detection.



The XUSB host controller has two partitions that can be selectively power gated with the following use cases, where unlisted combinations are not supported:

XUSBC (Host/USB2.0)	XUSBA (SuperSpeed)	Use Case Descriptions
Powered	Powered	Host controller in normal operations, with SuperSpeed links operational.
Powered	Power Gated	Host controller in normal operations, with SuperSpeed links in low power states. SuperSpeed link wake events report through XUSB PADCTL.
Power Gated	Power Gated	Host controllers power gated, with SuperSpeed links in low power states. All Host link wake events report through XUSB PADCTL.

19.7.7.1 All Partitions ELPG Entry

Step 1

The xHCI driver performs context save operation as described in section 4.23.2 of the xHCI specification.

The xHCI PEP driver performs XUSB_HOST specific context save operation.

The xHCI PEP driver performs XUSB IPFS specific context save operation.

- Read and store the value of the following registers
  - XUSB_HOST_MSI_BAR_SZ_0

- XUSB_HOST_MSI_AXI_BAR_ST_0
- XUSB_HOST_MSI_FPCI_BAR_ST_0
- XUSB_HOST_MSI_VEC0_0
- XUSB_HOST_MSI_EN_VEC0_0
- XUSB_HOST_FPCI_ERROR_MASKS_0
- XUSB_HOST_INTR_MASK_0
- XUSB_HOST_IPFS_INTR_ENABLE_0
- XUSB_HOST_UFPCI_CONFIG_0
- XUSB_HOST_CLKGATE_HYSTERESIS_0
- XUSB_HOST_XUSB_HOST_MCCIF_FIFOCTRL_0

Step 2

The System Power Management driver programs the PMC USB2.0 sleepwalk logic as described in the “PMC Programming” section.

The System Power Management driver should enable the wake events according to the port states and Wake-on-Connect, Wake-on-Disconnect, and Wake-on-Over-Current settings of the USB2 ports accordingly.

Step 3

The xHCI PEP driver enables the XUSB wakeup interrupts for the SuperSpeed and USB2.0 ports.

- Write ‘1’ to the following XUSB PADCTL register bits to clear the interrupt status.
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT0_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT1_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT0_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT1_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT2_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT0_WAKEUP_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT1_WAKEUP_EVENT]
- Set the following XUSB PADCTL register bits to ‘1’ to enable the interrupt.
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT1_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT1_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT2_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT1_WAKE_INTERRUPT_ENABLE]
- Set the following XUSB PADCTL register bits to ‘1’ to disable the output driver of the HSIC pad.
  - XUSB_PADCTL_HSIC_PAD0_CTL_1_0[PD_TX]
  - XUSB_PADCTL_HSIC_PAD1_CTL_1_0[PD_TX]

Step 4

The xHCI PEP driver initiates the signal sequence to enable the XUSB SSwake detection logic for the SuperSpeed ports.

- Write '1' to the following XUSB PADCTL register bits to assert the clamp_en_early signal.
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP0_ELPG_CLAMP_EN_EARLY]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP1_ELPG_CLAMP_EN_EARLY]
- Write '1' to the following XUSB PADCTL register bits to assert the clamp_en signal.
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP0_ELPG_CLAMP_EN]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP1_ELPG_CLAMP_EN]
- Wait 250 µs

Note: These two writes must not be combined.

Step 5

System Power Management driver flushes MCCIF and partition clients.

- Set the following MC register bit to '1' to enable flush to XUSB
  - MC_CLIENT_HOTRESET_CTRL_0[XUSB_HOST_FLUSH_ENABLE] for host mode
- Read the following MC register bit to be '1' to ensure flush to XUSB is enabled
  - MC_CLIENT_HOTRESET_STATUS_0[XUSB_HOST_HOTRESET_STATUS] for host mode

Step 6

The System Power Management driver asserts reset to XUSB then disables its clocks.

- Set the following CAR register bits to '1' to assert reset to XUSB
  - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_HOST_RST] for host mode
  - CLK_RST_CONTROLLER_RST_DEVICES_W_0[SWR_XUSB_SS_RST] for SuperSpeed ports
- Set the following CAR register bits to '1' to disable the clocks to individual XUSB partitions.
  - CLK_RST_CONTROLLER_CLK_ENB_U_CLR_0[CLR_CLK_ENB_XUSB_HOST] for host mode
  - CLK_RST_CONTROLLER_CLK_ENB_W_CLR_0[CLR_CLK_ENB_XUSB_SS] for SS ports

Step 7

The System Power Management driver disables the XUSB power rails.

- Program the following PMC register bits in a single write to disable the power rail to XUSB host:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to 'enable'
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to 'XUSBC'
- Read the following PMC register bit to confirm the power gating status of XUSB host
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBC] equals 'OFF'
- Program the following PMC register bits in a single write to disable the power rail to XUSB SuperSpeed:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to 'enable'
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to 'XUSBA'
- Read the following PMC register bit to confirm the power gating status of XUSB SuperSpeed:

- APBDEV_PMC_PWRGATE_STATUS_0[XUSBA] equals ‘OFF’

Note: Only one partition can be power gated at a time

Step 8

The xHCI PEP driver initiates the signal sequence to enable the XUSB SS wake detection logic for the SuperSpeed ports assigned to host.

- Write ‘1’ to the following XUSB PADCTL register bits to assert the vcore_off signal:
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP0_ELPG_VCORE_DOWN]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP1_ELPG_VCORE_DOWN]

19.7.7.2 Host Mode Partition ELPG Entry

Step 1

The xHCI driver performs context save operation as described in section 4.23.2 of the xHCI specification.

The xHCI PEP driver performs XUSB_HOST specific context save operation.

The xHCI PEP driver performs XUSB IPFS specific context save operation.

Step 2

The System Power Management driver programs the PMC USB2.0 sleepwalk logic as described in the “PMC Programming” section.

The System Power Management driver should enable the wake events according to the port states and Wake-on-Connect, Wake-on-Disconnect, and Wake-on-Over-Current settings of the USB2 ports accordingly.

Step 3

The xHCI PEP driver enables the XUSB wakeup interrupts for the SuperSpeed and USB2.0 ports.

Step 4

The System Power Management driver flushes MCCIF and partition clients.

- Set the following MC register bit to ‘1’ to enable flush to XUSB:
  - MC_CLIENT_HOTRESET_CTRL_0[XUSB_HOST_FLUSH_ENABLE] for host mode
- Read the following MC register bit to be ‘1’ to ensure flush to XUSB is enabled:
  - MC_CLIENT_HOTRESET_STATUS_0[XUSB_HOST_HOTRESET_STATUS] for host mode

Step 5

The System Power Management driver asserts reset to XUSB then disables its clocks.

- Set the following CAR register bit to ‘1’ to assert reset to XUSB
  - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_HOST_RST] for host mode
- Set the following CAR register bits to ‘1’ to disable the clocks to individual XUSB partitions.
  - CLK_RST_CONTROLLER_CLK_ENB_U_CLR_0[CLR_CLK_ENB_XUSB_HOST] for host mode

Step 6

The System Power Management driver disables the XUSB power rails.

- Program the following PMC register bits in a single write to disable the power rail to XUSB host:

- APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
- APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBC’

- Read the following PMC register bit to confirm the power gating status of XUSB host:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBC] equals ‘OFF’

Step 7

The xHCI PEP driver moves the port to be under USB2 controllers as a workaround to use USB2 controller outputs to put the USB2.0 PADs in low power mode.

- Program ‘SNPS’ to the following XUSB PADCTL register bits for ports assigned to XUSB:
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT2]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT1]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT0]

19.7.7.3 SuperSpeed Partition ELPG Entry

Step 1

The xHCI PEP driver communicates SuperSpeed partition ELPG entry with the System Power Management driver.

Step 2

The xHCI PEP driver enables the XUSB wakeup interrupts for the SuperSpeed ports.

Step 3

The xHCI PEP driver initiates the signal sequence to enable the XUSB SSwake detection logic for the SuperSpeed ports as described in Step 4 of the “All Partitions ELPG Entry” section.

Step 4

The System Power Management driver asserts reset to XUSB SuperSpeed partition then disables its clocks.

- Set the following CAR register bit to ‘1’ to assert reset to XUSB:
  - CLK_RST_CONTROLLER_RST_DEVICES_W_0[SWR_XUSB_SS_RST] for SuperSpeed ports
- Set the following CAR register bit to ‘1’ to disable the clocks to individual XUSB partitions:
  - CLK_RST_CONTROLLER_CLK_ENB_W_CLR_0[CLR_CLK_ENB_XUSB_SS] for SS ports

Step 5

The System Power Management driver disables the XUSB SuperSpeed partition power rails.

- Program the following PMC register bits in a single write to disable the power rail to XUSB SuperSpeed:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBA’
- Read the following PMC register bit to confirm the power gating status of the partitions:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBA] equals ‘OFF’

Note: Only one partition can be power gated at a time.

Step 6

The xHCI PEP driver initiates the signal sequence to enable the XUSB SS wake detection logic for the SuperSpeed ports as described in Step 7 of the “All Partitions ELPG Entry” section.

19.7.7.4 All Partitions ELPG Exit

In the case the wake event is not generated by SuperSpeed ports, the SuperSpeed related programming should be skipped, where the SuperSpeed partition should exit ELPG due to wake events detected by SuperSpeed ports.

Step 1

The xHCI PEP driver moves the USB2.0 port back to XUSB.

- Program the following XUSB PADCTL registers to assign the USB2.0 ports to XUSB, according to the platform specific configuration:
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT2]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT1]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT0]

Step 2

The System Power Management driver enables the XUSB power rails.

- Program the following PMC register bits in a single write to enable the power rail to XUSB host:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBC’
- Read the following PMC register bit to confirm the power gating status of XUSB host:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBC] equals ‘ON’
- Program the following PMC register bits in a single write to disable the power rail to XUSB SuperSpeed:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBA’
- Read the following PMC register bit to confirm the power gating status of XUSB SuperSpeed:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBA] equals ‘ON’

Note: Only one partition can be un-power gated at a time.

Step 3

The System Power Management driver enables XUSB clocks.

- Set the following CAR register bits to ‘1’ to enable the clocks to individual XUSB partitions.
  - CLK_RST_CONTROLLER_CLK_ENB_U_SET_0[SET_CLK_ENB_XUSB_HOST] for host mode
  - CLK_RST_CONTROLLER_CLK_ENB_W_SET_0[SET_CLK_ENB_XUSB_SS] for SS ports

Step 4

The System Power Management driver removes power clamps to XUSB partitions.

- Set the following PMC register bits to ‘1’ to remove the power clamps to individual XUSB partitions.
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBC] for host mode

- APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBA] for SS ports

- Read the following PMC register bits to confirm the power clamps to individual XUSB partitions are removed.
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBC] equals '0'
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBA] equals '0'

Step 5

The System Power Management driver deasserts reset to XUSB.

- Set the following CAR register bits to '0' to deassert reset to XUSB:
  - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_HOST_RST] for host mode
  - CLK_RST_CONTROLLER_RST_DEVICES_W_0[SWR_XUSB_SS_RST] for SuperSpeed ports
- Wait 1 µs

Step 6

The System Power Management driver disables flushes of MCCIF and partition clients.

- Set the following MC register bits to '0' to enable flush to XUSB:
  - MC_CLIENT_HOTRESET_CTRL_0[XUSB_HOST_FLUSH_ENABLE] for host mode

Step 7

The xHCI PEP driver disables the XUSB wakeup interrupts.

- Set the following XUSB PADCTL register bits to '0' to disable the interrupts.
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT1_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT1_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT2_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT1_WAKE_INTERRUPT_ENABLE]

Step 8

The xHCI PEP driver initiates the signal sequence to disable the XUSB SS wake detection logic.

- Write '0' to the following XUSB PADCTL register bits to deassert the vcore_off signal.
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP0_ELPG_VCORE_DOWN]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP1_ELPG_VCORE_DOWN]
- Wait 100 µs.
- Write '0' to the following XUSB PADCTL register bits to deassert the clamp_en_early signals.
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP0_ELPG_CLAMP_EN_EARLY]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP1_ELPG_CLAMP_EN_EARLY]
- Wait 100 µs.
- Write '0' to the following XUSB PADCTL register bits to deassert the clamp_en signals.
  - XUSB_PADCTL_ELPG_PROGRAM_0[SSP0_ELPG_CLAMP_EN]

- XUSB_PADCTL_ELPG_PROGRAM_0[SSP1_ELPG_CLAMP_EN]

Note: The write to clear vcore_off cannot be combined with the write to clear clamp_en and clamp_en_early.

Step 9

The xHCI PEP driver performs XUSB register initialization.

The xHCI PEP driver performs XUSB context restore operation.

Step 10

The xHCI PEP driver loads XUSB firmware.

The xHCI PEP driver notifies XUSB firmware whether context of SuperSpeed Partition should be restored.

Step 11

The xHCI driver performs context restore operation as described in section 4.23.2 of the xHCI specification.

Step 12

The System Power Management driver programs the PMC USB2.0 sleepwalk logic to disable the sleepwalk logic as described in the “PMC Programming” section.

The xHCI PEP driver clears the XUSB wakeup events.

- Write ‘1’ to the following XUSB PADCTL register bits to clear the events.
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT0_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT1_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT0_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT1_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT2_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT0_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT1_WAKE_EVENT]

19.7.7.5 Host Mode ELPG Exit

Step 1

The xHCI PEP driver driver moves the USB2.0 port back to XUSB.

- Program the following XUSB PADCTL registers to assign the USB2.0 ports to XUSB, according to the platform specific configuration:
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT2]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT1]
  - XUSB_PADCTL_USB2_PAD_MUX_0[USB2_OTG_PAD_PORT0]

Step 2

The System Power Management driver enables the XUSB power rails.

- Program the following PMC register bits in a single write to enable the power rail to XUSB host:
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBC’

- Read the following PMC register bit to confirm the power gating status of XUSB host:
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBC] equals ‘ON’

Step 3

The System Power Management driver enables XUSB clocks.

- Set the following CAR register bit to ‘1’ to enable the clocks to individual XUSB partitions:
  - CLK_RST_CONTROLLER_CLK_ENB_U_SET_0[SET_CLK_ENB_XUSB_HOST] for host mode

Step 4

The System Power Management driver removes power clamps to XUSB partitions.

- Set the following PMC register bit to ‘1’ to remove the power clamps to individual XUSB partitions:
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBC] for host mode
- Read the following PMC register bits to confirm the power clamps to individual XUSB partitions are removed.
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBC] equals ‘0’

Step 5

The System Power Management driver deasserts reset to XUSB.

- Set the following CAR register bit to ‘0’ to deassert reset to XUSB
  - CLK_RST_CONTROLLER_RST_DEVICES_U_0[SWR_XUSB_HOST_RST] for host mode
- Wait 1 µs

Step 6

The System Power Management driver disables flushes of MCCIF and partition clients.

- Set the following MC register bits to ‘0’ to enable flush to XUSB
  - MC_CLIENT_HOTRESET_CTRL_0[XUSB_HOST_FLUSH_ENABLE] for host mode

Step 7

The xHCI PEP driver disables the USB2.0wakeup interrupts for ports assigned to XUSB.

- Set the following XUSB PADCTL register bits to ‘0’ to disable the interrupts.
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT1_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT1_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT2_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT1_WAKE_INTERRUPT_ENABLE]

Step 8

The xHCI PEP driver performs XUSB register initialization.

The xHCI PEP driver performs XUSB specific context restore operation.

Step 9

The xHCI PEP Driver loads XUSB firmware.

The xHCI PEP Driver notifies XUSB firmware whether context of SuperSpeed Partition should be restored.

Step 10

The xHCI driver performs context restore operation as described in section 4.23.2 of the xHCI specification.

Step 11

The System Power Management driver programs the PMC USB2.0 sleepwalk logic to disable the sleepwalk logic as described in the “PMC Programming” section.

The xHCI PEP driver clears the XUSB wakeup events.

- Write ‘1’ to the following XUSB PADCTL register bits to clear the events.
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT0_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT1_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_PORT2_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT0_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[USB2_HSIC_PORT1_WAKE_EVENT]

19.7.7.6 SuperSpeed Partition ELPG Exit

Step 1

The xHCI PEP driver communicates SuperSpeed partition ELPG exit with System Power Management driver.

Step 2

The System Power Management driver enables the XUSB power rails.

- Program the following PMC register bits in a single write to disable the power rail to XUSB SuperSpeed
  - APBDEV_PMC_PWRGATE_TOGGLE_0[START] to ‘enable’
  - APBDEV_PMC_PWRGATE_TOGGLE_0[PARTID] to ‘XUSBA’
- Read the following PMC register bits to confirm the power gating status of XUSB SuperSpeed
  - APBDEV_PMC_PWRGATE_STATUS_0[XUSBA] equals ‘ON’

Note: Only one partition can be un-power gated at a time

Step 3

The System Power Management driver enables XUSB clocks.

- Set the following CAR register bits to ‘1’ to enable the clocks to individual XUSB partitions.
  - CLK_RST_CONTROLLER_CLK_ENB_W_SET_0[SET_CLK_ENB_XUSB_SS] for SS ports

Step 4

The xHCI PEP driver initiates the signal sequence to disable the XUSB SS wake detection logic for the SuperSpeed ports as described in Step 3 of the “All Partitions ELPG Exit” section.

Step 5

The xHCI PEP driver disable the XUSB SS wakeup interrupts.

- Set the following XUSB PADCTL register bits to ‘0’ to disable the interrupts.
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT0_WAKE_INTERRUPT_ENABLE]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT1_WAKE_INTERRUPT_ENABLE]

Step 6

The System Power Management driver removes power clamps to XUSB partitions.

- Set the following PMC register bit to ‘1’ to remove the power clamp to XUSB SS:
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBA]
- Read the following PMC register bits to confirm the power clamp to XUSB SS is removed.
  - APBDEV_PMC_REMOVE_CLAMPING_CMD_0 [XUSBA] equals ‘0’

Step 7

The System Power Management driver deasserts reset to XUSB.

- Set the following CAR register bit to ‘0’ to deassert reset to XUSB:
  - CLK_RST_CONTROLLER_RST_DEVICES_W_0[SWR_XUSB_SS_RST] for SuperSpeed ports

Step 8

The xHCI PEP driver clears the XUSB wakeup events.

- Write ‘1’ to the following XUSB PADCTL register bits to clear the events.
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT0_WAKE_EVENT]
  - XUSB_PADCTL_ELPG_PROGRAM_0[SS_PORT1_WAKE_EVENT]

19.7.8 PMC Programming

Sleepwalk logic in the PMC is used for wake event detection of USB2.0 ports, including wake on connect, wake on disconnect, and remote wakeup.

19.7.8.1 Initialize PMC Sleepwalk Logic

Step 1

The xHCI PEP driver initializes the sleepwalk logic:

- Set the following registers to ‘0’ to ensure sleepwalk logic is disabled:
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_MASTER_ENABLE_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_MASTER_ENABLE_P0]
- Set the following registers to ‘1’ to ensure sleepwalk logic is in low power mode:
  - APBDEV_PMC_UTMIP_MASTER_CONFIG_0[UTMIP_PWR_P0]
  - APBDEV_PMC_UTMIP_MASTER_CONFIG_0[UTMIP_PWR_P1]
  - APBDEV_PMC_UTMIP_MASTER_CONFIG_0[UTMIP_PWR_P2]
  - APBDEV_PMC_UTMIP_MASTER_CONFIG_0[UTMIP_PWR_P3]

- APBDEV_PMC_UTMIP_MASTER_CONFIG_0[UHSIC_PWR_P0]

- Program the following registers to set debounce time:
  - APBDEV_PMC_USB_DEBOUNCE_DEL_0[UTMIP_LINE_DEB_CNT]
  - APBDEV_PMC_USB_DEBOUNCE_DEL_0[UHSIC_LINE_DEB_CNT]
- Set the following registers to ‘0’ to ensure fake events of sleepwalk logic are disabled:
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBOP_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBON_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBOP_VAL_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBON_VAL_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBOP_EN_P1]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBON_EN_P1]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBOP_VAL_P1]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBON_VAL_P1]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBOP_EN_P2]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBON_EN_P2]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBOP_VAL_P2]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UTMIP_FAKE_USBON_VAL_P2]
  - APBDEV_PMC_UTMIP_UHSIC2_FAKE_0[UTMIP_FAKE_USBOP_EN_P3]
  - APBDEV_PMC_UTMIP_UHSIC2_FAKE_0[UTMIP_FAKE_USBON_EN_P3]
  - APBDEV_PMC_UTMIP_UHSIC2_FAKE_0[UTMIP_FAKE_USBOP_VAL_P3]
  - APBDEV_PMC_UTMIP_UHSIC2_FAKE_0[UTMIP_FAKE_USBON_VAL_P3]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UHSIC_FAKE_DATA_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UHSIC_FAKE_STROBE_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UHSIC_FAKE_DATA_VAL_P0]
  - APBDEV_PMC_UTMIP_UHSIC_FAKE_0[UHSIC_FAKE_STROBE_VAL_P0]
- Set the following registers to ‘0’ to ensure wake events of sleepwalk logic are not latched:
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P1]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P2]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P3]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UHSIC_LINE_WAKEUP_EN_P0]
- Program the following registers to ‘NONE’ to disable wake event triggers of sleepwalk logic:
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_WAKE_VAL_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_WAKE_VAL_P0]

- Set the following registers to ‘0’ to power down the line state detectors of the pad:
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P1]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P1]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P2]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P2]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P3]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P3]
  - APBDEV_PMC_USB_AO_0[DATA0_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[DATA1_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[STROBE_VAL_PD_P0]

19.7.8.2 Enable PMC Sleepwalk Logic

Step 1

The xHCI PEP driver re-initializes the sleepwalk logic as described in the “Initialize PMC Sleepwalk Logic” section.

Step 2

The xHCI PEP driver sets up the sleepwalk logic.

- Program the following registers to match the speed of the port:
  - APBDEV_PMC_UTMIP_UHSIC_SAVED_STATE_0[UTMIP_SPEED_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SAVED_STATE_0[UTMIP_SPEED_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SAVED_STATE_0[UTMIP_SPEED_P2]
  - APBDEV_PMC_UTMIP_UHSIC2_SAVED_STATE_0[UTMIP_SPEED_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SAVED_STATE_0[UHSIC_SPEED_P0]
- Set the following registers to ‘1’ to enable the trigger of the sleepwalk logic:
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UTMIP_WAKE_WALK_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UTMIP_LINEVAL_WALK_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UTMIP_WAKE_WALK_EN_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UTMIP_LINEVAL_WALK_EN_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UTMIP_WAKE_WALK_EN_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UTMIP_LINEVAL_WALK_EN_P2]
  - APBDEV_PMC_UTMIP_UHSIC2_SLEEPWALK_CFG_0[UTMIP_WAKE_WALK_EN_P3]
  - APBDEV_PMC_UTMIP_UHSIC2_SLEEPWALK_CFG_0[UTMIP_LINEVAL_WALK_EN_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UHSIC_WAKE_WALK_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEPWALK_CFG_0[UHSIC_LINEVAL_WALK_EN_P0]
- Write ‘1’ to the following registers to reset the walk pointer and clear the alarm of the sleepwalk logic, as well as capture the configuration of the USB2.0 pad:
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WALK_PTR_P0]

- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P0]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CAP_CFG_P0]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WALK_PTR_P1]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P1]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CAP_CFG_P1]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WALK_PTR_P2]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P2]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CAP_CFG_P2]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WALK_PTR_P3]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P3]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CAP_CFG_P3]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UHSIC_CLR_WALK_PTR_P0]
- APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UHSIC_CLR_WAKE_ALARM_P0]

- Program the following registers with electrical parameters read from XUSB PADCTL:
  - APBDEV_PMC_UTMIP_TERM_PAD_CFG_0[TCTRL_VAL] to XUSB_PADCTL_USB2_BIAS_PAD_CTL_1_0[TCTRL]
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[PCTRL_VAL] to XUSB_PADCTL_USB2_BIAS_PAD_CTL_1_0[PCTRL]
- Program the following registers to set up the pull-ups and pull-downs of the signals during the four stages of sleepwalk:
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[USBOP_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[USBON_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[USBOP_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[USBON_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[USBOP_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[USBON_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[USBOP_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[USBON_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[USBOP_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[USBON_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[USBOP_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[USBON_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[USBOP_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[USBON_RPD_{A/B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[USBOP_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[USBON_RPU_{A/B/C/D}] to ‘0’
  - APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[STROBE_RPD_A] to ‘0’
  - APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA0_RPD_A] to ‘1’
  - APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA1_RPD_A] to ‘1’

- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[STROBE_RPU_A] to ‘1’
- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA0_RPU_A] to ‘0’
- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA1_RPU_A] to ‘0’
- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[STROBE_RPD_{B/C/D}] to ‘1’
- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA0_RPD_{B/C/D}] to ‘0’
- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA1_RPD_{B/C/D}] to ‘1’
- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[STROBE_RPU_{B/C/D}] to ‘0’
- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA0_RPU_{B/C/D}] to ‘1’
- APBDEV_PMC_UHSIC_SLEEPWALK_P0_0[DATA1_RPU_{B/C/D}] to ‘0’

- Program the following registers to set up the driving values of the signals during the four stages of sleepwalk:
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[AP_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[AN_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[HIGNZ_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[AP_{B/C/D}] to ‘0’ for HS/FS and ‘1’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[AN_{B/C/D}] to ‘1’ for HS/FS and ‘0’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P0_0[HIGHZ_{B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[AP_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[AN_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[HIGNZ_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[AP_{B/C/D}] to ‘0’ for HS/FS and ‘1’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[AN_{B/C/D}] to ‘1’ for HS/FS and ‘0’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P1_0[HIGHZ_{B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[AP_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[AN_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[HIGNZ_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[AP_{B/C/D}] to ‘0’ for HS/FS and ‘1’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[AN_{B/C/D}] to ‘1’ for HS/FS and ‘0’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P2_0[HIGHZ_{B/C/D}] to ‘1’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[AP_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[AN_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[HIGNZ_A] to ‘0’
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[AP_{B/C/D}] to ‘0’ for HS/FS and ‘1’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[AN_{B/C/D}] to ‘1’ for HS/FS and ‘0’ for LS
  - APBDEV_PMC_UTMIP_SLEEPWALK_P3_0[HIGHZ_{B/C/D}] to ‘1’

Note: For HSIC and HSIS+, DATA1 is not used for signaling wake.

Step 3

The xHCI driver puts the ports in the U3 suspend state.

Step 4

The xHCI PEP driver enables the wake event detections.

- Set the following registers to '1' to power up the line state detectors of the pad
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P1]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P1]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P2]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P2]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P3]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P3]
  - APBDEV_PMC_USB_AO_0[DATA0_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[DATA1_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[STROBE_VAL_PD_P0]
- Wait 1 µs
- Set the following registers to '1' to switch the electric control of the USB2.0 pad to PMC
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_FSLS_USE_PMC_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_PCTRL_USE_PMC_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_TCTRL_USE_PMC_P3]
- Program the following registers to set the wake signaling trigger events
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P0] to 'ANY'
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P1] to 'ANY'
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P2] to 'ANY'
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_WAKE_VAL_P3] to 'ANY'
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_WAKE_VAL_P0] to 'SD10'
- Set the following registers to '1' to enable the wake detection
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P0]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P0]

- APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P1]
- APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P1]
- APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P2]
- APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P2]
- APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_MASTER_ENABLE_P3]
- APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P3]
- APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_MASTER_ENABLE_P0]
- APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UHSIC_LINE_WAKEUP_EN_P0]

Note: For USB2 ports, set wake value to ANY means any line state change would trigger wake.

Note: For HSIC and HSIS+, DATA1 is not used for wake detection.

19.7.8.3 Disable PMC Sleepwalk Logic

Step 1

The xHCI PEP driver disables the wake event detections.

- Set the following registers to '0' to disable the wake detection:
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P0]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P1]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_MASTER_ENABLE_P2]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_MASTER_ENABLE_P3]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UTMIP_LINE_WAKEUP_EN_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_MASTER_ENABLE_P0]
  - APBDEV_PMC_UTMIP_UHSIC_LINE_WAKEUP_0[UHSIC_LINE_WAKEUP_EN_P0]
- Set the following registers to '0' to switch the electric control of the USB2.0 pad to XUSB or USB2:
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_FSLS_USE_PMC_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_PCTRL_USE_PMC_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_TCTRL_USE_PMC_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_FSLS_USE_PMC_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_PCTRL_USE_PMC_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_TCTRL_USE_PMC_P3]

- Program the following registers to ‘NONE’ to disable wake event triggers of sleepwalk logic:
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P0]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P1]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UTMIP_WAKE_VAL_P2]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG1_0[UTMIP_WAKE_VAL_P3]
  - APBDEV_PMC_UTMIP_UHSIC_SLEEP_CFG_0[UHSIC_WAKE_VAL_P0]
- Set the following registers to ‘0’ to power down the line state detectors of the pad:
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P1]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P1]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P2]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P2]
  - APBDEV_PMC_USB_AO_0[USBOP_VAL_PD_P3]
  - APBDEV_PMC_USB_AO_0[USBON_VAL_PD_P3]
  - APBDEV_PMC_USB_AO_0[DATA0_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[DATA1_VAL_PD_P0]
  - APBDEV_PMC_USB_AO_0[STROBE_VAL_PD_P0]
- Write ‘1’ to the following registers to clear alarm of the sleepwalk logic:
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P0]
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P1]
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P2]
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UTMIP_CLR_WAKE_ALARM_P3]
  - APBDEV_PMC_UTMIP_UHSIC_TRIGGERS_0[UHSIC_CLR_WAKE_ALARM_P0]

19.8 Recommended PHY Settings

Contact your local NVIDIA representative for PHY settings specific to your design.

19.9 BIAS PAD Configuration

The UTMIP BIAS pad is shared across USB_OTG and USB3 controllers and the below common bias pad settings need to be configured from the USB1 controller only.

USB1_UTMIP_BIAS_CFG0_0:

- UTMIP_BIASPD
- UTMIP_HSCHIRP_LEVEL
- UTMIP_HSSQUELCH_LEVEL
- UTMIP_HSDISCON_LEVEL_MSB
- UTMIP_HSDISCON_LEVEL

- UTMIP_ACTIVE_TERM_OFFSET
- UTMIP_ACTIVE_PULLUP_OFFSET
- UTMIP_VBUS_LEVEL_LEVEL
- UTMIP_SESS_LEVEL_LEVEL

USB1_UTMIP_BIAS_CFG1_0:

- UTMIP_FORCE_PDTRK_POWERUP
- UTMIP_FORCE_PDTRK_POWERDOWN

Following is the sequence to configure above parameters of the BIAS pad:

1. Enable the clock to the USB1 controller
2. Set any of above parameters as required.
3. Disable the clock to the USB1 controller if it is not used.

19.10 BOOT ROM Initialization Sequence for USB Recovery

1. Program PLL_U.
   - Set the PLLU_BASE register fields, PLLU_DIVM, PLLU_DIVN, PLLU_VCO_FREQ, PLLU_BYPASS and PLLU_ENABLE fields as described in this document.
2. Configure USB_OTG
3. Bring up USB_OTG clocks by writing 1 to CLK_ENB_USBD in the CLK_OUT_ENB_L register.
4. Assert and deassert the master USBD reset in the CAR block (SWR_USBD_RST in the RST_DEVICES_L register) to bring USB_OTG out of reset.
5. Stop the crystal clock by setting UTMIP_PHY_XTAL_CLOCKEN in the UTMIP_MISC_CFG1 register to 0. This only stops the crystal clocks in the UTMIP units.
   - The default value of USB1_UTMIP_PHY_XTAL_CLOCKEN (= 1) now changes to 0.
   - To use the A Session Valid for cable detection logic, set the USB1_VBUS_SENSE_CTL field in the USB1_LEGACY_CTRL register to A_SESS_VLD (2'b11).
6. Program the automatic PLL start times.

   Set USB1_IF_UTMIP_PLLU_ENABLE_DLY_COUNT, UTMIP_PLLU_STABLE_COUNT, UTMIP_PLL_ACTIVE_DLY_COUNT and UTMIP_XTAL_FREQ_COUNT as per the values given in this document.
7. Program the tracking duration.

   Set USB1_IF_UTMIP_BIAS_CFG1.UTMIP_BIAS_PDTRK_COUNT as per the values given in this document.
8. Program the debouncer length times.

   Set UTMIP_DEBOUNCE_CFG0.UTMIP_BIAS_DEBOUNCE_A field.
9. Program various static parameters of the USB_OTG UTMIP1.
   - Set UTMIP_TX_CFG0.UTMIP_FS_PREAMBLE_J to 0x1.
   - Set UTMIP_BAT_CHRG_CFG0.UTMIP_PD_CHRG to 1.
   - Set UTMIP_XCVR_CFG0.UTMIP_XCVR_LSBIAS_SEL to 0.

- Set the third bit of UTMIP_SPARE_CFG0 to 1. i.e., UTMIP_SPARE_CFG0[3] to 1.
- Set UTMIP_HSRX_CFG0. UTMIP_IDLE_WAIT as per the values given in this document.
- Set UTMIP_HSRX_CFG0.UTMIP_ELASTIC_LIMIT to 16.
- Set UTMIP_HSRX_CFG1.UTMIP_HS_SYNC_START_DLY to 9

10. Restart the crystal clock by setting UTMIP_PHY_XTAL_CLOCKEN in the UTMIP_MISC_CFG1 register to 1 for USB_OTG.
11. Wait for cable connect on the USB_OTG UTMIP1 port. When cable is connected on USB_OTG UTMIP1 port, continue to the next step.
12. Bring UTMIP1 out of reset by writing 0 to the UTMIP_RESET bit of the USB1_IF_SUSP_CTRL register.
13. Wait until USB1_IF_USB_SUSP_CTRL.PHY_CLK_VALID is set to 1.
14. Then perform USB controller initialization.
    a. Reset the bus.
15. Wait until the bus comes out of reset.
16. Set the controller in device mode.
17. Perform USB operations.

19.11 Performance Settings for USB Controllers

To meet USB's strict bandwidth/latency requirements, some AHB programming needs to be done. The following gives a guideline on the programming requirements to achieve maximum performance from USB:

- The burst size for the USB controller should be programmed to 8 in the USB2D_BURSTSIZE register. Both TXPBURST and RXPBURST fields should be programmed to the same value of 8.
- The ENB_FAST_REARBITRATE field for AHB_MEM gizmo should be set to 1 in the AHB_GIZMO_AHB_MEM register.
- The IMMEDIATE field for USB gizmos should be set to 1 in the AHB_GIZMO_USB, AHB_GIZMO_USB2, or AHB_GIZMO_USB3 register, depending on the controller in use.
- USB controllers should be set as high-priority masters on AHB by setting the bits corresponding to each USB controller to 1 in AHB_PRIORITY_SELECT field in the register AHB_ARBITRATION_PRIORITY_CTRL and setting the priority weight to 7 by setting the AHB_PRIORITY_WEIGHT field in the same register. USB master numbers are 6 for USB_OTG, 18 for USB2, and 17 for USB3. The priority weight could be relaxed depending on requirements from other AHB masters in the system as required for different use cases.
- The prefetch engine needs to be set up correctly to enable prefetching of transmit data packets for USB masters. Each USB master needs one channel on the prefetch engine. There are 4 channels on the prefetch engine. If all 3 USB masters enable one channel at the same time, it would leave one more channel for another AHB master. Each prefetch channel is controlled by the AHB_AHB_MEM_PREFETCH_CFG[NO] register, where NO=1,2,3,4. To enable prefetch for a USB controller on a channel, program AHB_MST_ID_USB, AHB_MST_ID_USB2, or AHB_MST_ID_USB3 in the AHB_MST_ID field for the AHB_AHB_MEM_PREFETCH_CFG[NO] register. The ADDR_BNDRY field should be set to log2 (buffer size) according to the buffer size required for the corresponding USB master. The SPEC_THROTTLE field should be set to 0, and the INACTIVITY_TIMEOUT field should be set to 0x800.
- When a particular USB controller is in Host mode, the TXFIFOTHRES field in the USB2D_TXFILLTUNING register (offset 0x154) should be set to 0x10.

All this programming needs to be done before the RS bit in USB2D_USBCMD is set to RUN (1) for the corresponding USB controller.

19.12 USB Controller Handling of USB Resume Sequence

Following are the steps for how the USB controller handles a USB resume while the port is under PMC control:

1. The PMC maintains suspend mode on the bus.
2. When auto resume happens, the system starts restoring the USB controller.
3. Set the RUN bit from the USB controller to start SOFs.
4. The USB controller is brought back to suspend state.
5. Switch the USB bus from the PMC to the USB controller.
6. Wait until a resume complete notification from the USB controller. This is handled by the EHCI driver.
7. Further USB communication can start from here.

19.13 USB Registers

Refer to “Reading Register Tables” in the Introduction section for the register table protocol as well as recommendations for accessing registers.

19.13.1 USB 1 Controller Registers

19.13.1.1 USB2_CONTROLLER_USB2D_ID_0

USB2D Identification Register

Offset: 0x0 | Read/Write: RO |Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
31:29	X	CIVERSION: Identifies the CI version
28:25	X	VERSION: Identifies the version of the core
24:21	X	REVISION: Revision number of the USB controller. This is set to 0x0.
20:16	X	TAG: Identifies the tag of the core
15:8	X	NID: One’s complement version of ID. This field is set to 0xF9.
7:0	X	ID: Configuration number. This field is set to 0x06

19.13.1.2 USB2_CONTROLLER_USB2D_HW_HOST_0

USB2D Hardware Host Register

Offset: 0x8 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
3:1	X	NPORT: VUSB_HS_NUM_PORT-1: This host controller has only 1 port. So this field will always be 0.
0	X	HC: VUSB_HS_HOST: Indicates support for host mode. Set to 1.

19.13.1.3 USB2_CONTROLLER_USB2D_HW_DEVICE_0

USB2D Hardware Device Register

Offset: 0xc | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
5:1	X	DEVEP: VUSB_HS_DV_EP: Number of endpoints supported by this device controller. Set to 16. This includes control endpoint 0.
0	X	DC: Device capable: Set to 1 indicating support for device mode.

19.13.1.4 USB2_CONTROLLER_USB2D_HW_TXBUF_0

USB2D Hardware TX Buffer Register

Offset: 0x10 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
23:16	X	TXCHANADD: VUSB_HS_TX_CHAN_ADD: Total number of address bits for the transmit buffer of each transmit endpoint. Set to 7. Each transmit buffer is 128 words deep.
15:8	X	TXADD: VUSB_HS_TX_ADD: Total number of address bits for the transmit buffer. Set to 11. The total depth of the transmit buffer is 2048 words.
7:0	X	TCBURST: VUSB_HS_TX_BURST: Maximum burst size supported by the transmit endpoints for data transfers. Set to 8.

19.13.1.5 USB2_CONTROLLER_USB2D_HW_RXBUF_0

USB2D RX Buffer HW Parameters Register

Offset: 0x14 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
15:8	X	RXADD: VUSB_HS_RX_ADD: Total number of address bits for the receive buffer. Set to 7. The total depth of the receive buffer is 128 words
7:0	X	RXBURST: VUSB_HS_RX_BURST: Maximum burst size supported by the receive endpoints for data transfers. Set to 8.

19.13.1.6 USB2_CONTROLLER_USB2D_GPTIMER0LD_0

The host/device controller drivers can measure time-related activities using these timer registers. These registers are not part of the standard EHCI controller.

Offset: 0x80 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000000000)

Bit	Reset	Description
23:0	0x0	GPTIMER0LD: This field is the value to be loaded into the GPTCNT countdown timer on a reset action. The value in this register represents the time in microseconds minus 1 for the timer duration .

19.13.1.7 USB2_CONTROLLER_USB2D_GPTIMER0CTRL_0

Offset: 0x84 | Read/Write: R/W | Reset: 0x00XXXXXX (0b00xxxxx0xxxxxxxxxxxxxxxxxxxxxxx)

Bit	R/W	Reset	Description
31	RW	0x0	GTPRUN: This bit enables the general-purpose timer to run. Setting or clearing this bit will not

Bit	R/W	Reset	Description
			have an effect on the GPTCNT counter value.
30	WO	0x0	GPTRST: Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
24	RW	0x0	GPTMODE: This bit selects between a single timer countdown and a looped countdown. In one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by software. In repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	RO	X	GPTCNT: This field is the value of the running timer.

19.13.1.8 USB2_CONTROLLER_USB2D_GPTIMER1LD_0

Offset: 0x88 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000)

Bit	Reset	Description
23:0	0x0	GPTIMER1LD: This field is the value to be loaded into the GPTCNT countdown timer on a reset action. The value in this register represents the time in microseconds minus 1 for the timer duration .

19.13.1.9 USB2_CONTROLLER_USB2D_GPTIMER1CTRL_0

Offset: 0x8c | Read/Write: R/W | Reset: 0x00XXXXXX (0b00xxxxx0xxxxxxxxxxxxxxxxxxxxxxx)

Bit	R/W	Reset	Description
31	RW	0x0	GTPRUN: This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT counter value.
30	WO	0x0	GPTRST: Writing a one to this bit will reload the GPTCNT with the value in GPTLD.
24	RW	0x0	GPTMODE: This bit selects between a single timer countdown and a looped countdown. In one-shot mode, the timer will count down to zero, generate an interrupt, and stop until the counter is reset by software. In repeat mode, the timer will count down to zero, generate an interrupt, and automatically reload the counter to begin again.
23:0	RO	X	GPTCNT: This field is the value of the running timer.

19.13.1.10 USB2_CONTROLLER_USB2D_CAPLENGTH_0

USB2D Capability Register Length Register

Offset: 0x100 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
7:0	X	CAPLENGTH: Indicates which offset to add to the register base address at the beginning of the Operational Register. Set to 0x30.

19.13.1.11 USB2_CONTROLLER_USB2D_HCIVERSON_0

USB2D Host Interface Version Number Register

Offset: 0x102 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
15:0	X	HCIVERSION: Contains a BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision. This host controller supports EHCI revision 1.00.

19.13.1.12 USB2_CONTROLLER_USB2D_HCSPARAMS_0

USB2D Host Control Structural Parameters Register

Offset: 0x104 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
27:24	X	N_TT: Number of Transaction Translators: Indicates the number of embedded transaction translators associated with the USB2.0 host controller. This field is always set to 1 indicating only 1 embedded TT is implemented in this implementation. This is a non-EHCI field to support embedded TT.
23:20	X	N_PTT: Number of Ports per Transaction Translator: Indicates the number of ports assigned to each transaction translator within the USB2.0 host controller. Field always equals N_PORTS. This is a non-EHCI field to support embedded TT.
15:12	X	N_CC: Number of Companion Controller: Indicates the number of companion controllers. This field is set to 0.
11:8	X	N_PCC: Number of Ports per Companion Controller: Indicates the number of ports supported per internal companion controller. This field is set to 0.
4	X	PPC: Port Power Control: Indicates whether the host controller implementation includes port power control. 1 = Ports have port power switches 0= Ports do not have port power switches. This field affects the functionality of the port Power field in each port status and control register. This field is set to 1.
3:0	X	N_PORTS: Number of downstream ports. This field specifies the number of physical downstream ports implemented on this host controller. This field is fixed to 1, since this host controller only supports 1 port.

19.13.1.13 USB2_CONTROLLER_USB2D_HCCPARAMS_0

USB2D Host Control Capability Parameters Register

Offset: 0x108 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
18	X	PPC: Per-Port Change Event Capability - RO. Default = 1b. This field indicates the support for per-port change events. This field is related to the USBCMD PPE field, USBSTS PPCI field, and USBINTR PPCE field.
17	X	LEN: Link Power Management Capability - RO. Default = 1b. This field indicates the support for LPM L1 state. This field is related to USBCMD HIRD field, POSTSCx SSTS and DA fields and HOSTPCx LEN, BA, and EPLPM fields.
15:8	X	EECP: EHCI Extended Capabilities Pointer: Indicates a capabilities list exists. A value of 00h indicates no extended capabilities are implemented. For this implementation this field is always "0".
7:4	X	IST: Isochronous Scheduling Threshold. This field indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is zero, the value of the least significant 3 bits indicates the number of micro-frames a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is a one, then host software assumes the host controller may cache an isochronous data structure for an entire frame. This field will always be "0".
2	X	ASP: Asynchronous Schedule Park Capability. 1 = (Default) the host controller supports the park feature for high-speed queue heads in the Asynchronous Schedule. The feature can be disabled or enabled and set to a specific level by using the Asynchronous Schedule Park Mode Enable and Asynchronous Schedule Park Mode Count fields in the USBCMD register. This field is always 1.
1	X	PFL: Programmable Frame List Flag. 0 = System software must use a frame list length of 1024 elements with this host controller. The USBCMD register Frame List Size field is a read-only register and must be set to zero. 1 = System software can specify and use a smaller frame list and configure the host controller via the USBCMD register Frame List Size field. The frame list must always be aligned on a 4K-page boundary. This requirement ensures that the frame list is always physically contiguous. This field will always be "1".

19.13.1.14 USB2_CONTROLLER_USB2D_DCIVERSION_0

USB2D Device Interface Version Number Register

Offset: 0x120 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
15:0	X	DCIVERSION: The device controller interface conforms to the two-byte BCD encoding of the interface version number contained in this register.

19.13.1.15 USB2_CONTROLLER_USB2D_DCCPARAMS_0

USB2D Device Control Capabilities Register

Offset: 0x124 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
8	X	HC: Host Capable: 1 = This controller can operate as an EHCI compatible USB 2 0 host controller. This field is set to 1.
7	X	DC: Device Capable: 1 = Controller can operate as a USB 2.0 device. This field is set to 1.
5	X	LEN: Link Power Management Capability - RO. Default = 1b. This field indicates the support for LPM L1 state. This field is related to the DEVLCx ASUS, STL, BA, and NYT fields.
4:0	X	DEN: Device Endpoint Number: Number of endpoints built into the device controller. This is set to 16.

19.13.1.16 USB2_CONTROLLER_USB2D_EXTSTS_0

USB2D EXTSTS Register

Offset: 0x128 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000x

Bit	R/W	Reset	Description
4	RW	0x0	TI1: General Purpose Timer Interrupt 1 - RWC. Default = 0b. This bit is set when the counter in the GPTIMER1CTRL register transitions to zero. Writing a one to this bit will clear it.
3	RW	0x0	TI0: General Purpose Timer Interrupt 0 - RWC. Default = 0b. This bit is set when the counter in the GPTIMER1CTRL register transitions to zero. Writing a one to this bit will clear it.
2	RW	0x0	UPA: USB Host Periodic Interrupt (USBHSTPERINT) R/WC. This bit is set by the Host Controller when the cause of an interrupt is a completion of a USB transaction where the Transfer Descriptor (TD) has an interrupt on complete (IOC) bit set and the TD was from the periodic schedule. This bit is also set by the Host Controller when a short packet is detected AND the packet is on the periodic schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be zero. 0 = DISABLE 1 = ENABLE
1	RW	0x0	UAI: USB Host Asynchronous Interrupt (USBHSTASYNCINT) R/WC. This bit is set by the Host Controller when the cause of an interrupt is a completion of a USB transaction where the Transfer Descriptor (TD) has an interrupt on complete (IOC) bit set AND the TD was from the asynchronous schedule. This bit is also set by the Host when a short packet is detected AND the packet is on the asynchronous schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be zero. 0 = DISABLE 1 = ENABLE
0	RO	X	NAKI: NAK Interrupt Bit Read Only. This bit is read only. It is set by hardware when for a particular endpoint both the TX/RX Endpoint NAK bit and the corresponding TX/RX Endpoint NAK Enable bit are set. This bit is automatically cleared by hardware when the all the enabled TX/RX Endpoint NAK bits are cleared. 0 = DISABLE 1 = ENABLE

19.13.1.17 USB2_CONTROLLER_USB2D_USBEXTINTR_0

USB2D EXTINTR Register

Offset: 0x12c | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000

Bit	Reset	Description
4	0x0	TIE1: General Purpose Timer Interrupt Enable 1 - RWC. Default = 0b. When this bit is a one, and the TI1 bit in the EXTSTS register is a one, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the TI1 bit.
3	0x0	TIE0: General Purpose Timer Interrupt Enable 0 - RWC. Default = 0b. When this bit is a one, and the TI1 bit in the EXTSTS register is a one, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the TI1 bit.
2	0x0	UPIE: UPIE Interrupt Enable. 1 = USB controller issues an interrupt if the UPA bit in USBSTS register transitions. 0 = DISABLE 1 = ENABLE
1	0x0	UAIE: UAIE Interrupt Enable. 1 = USB controller issues an interrupt if the UAI bit in USBSTS register transitions. 0 = DISABLE 1 = ENABLE
0	0x0	NAKE: NAK Interrupt Enable. 1 = USB controller issues an interrupt if the NAKI bit in USBSTS register transitions. 0 = DISABLE 1 = ENABLE

19.13.1.18 USB2_CONTROLLER_USB2D_USBCMD_0

USB2D USB Command Register

Offset: 0x130 | Read/Write: R/W | Reset: 0bxxxx00000000010000000x1x11x0000000

Bit	R/W	Reset	Description
27:24	RW	0x0	HIRD: Host Initiated Resume Duration RW. Default = 0000b. This has the same behavior as bits 7:4 of the BA field of the HOSTPCx register. When writing to this field all BA[7:4] fields of all HOSTPCx registers will be set to this value. This field is used by system software to specify the minimum amount of time the host controller will drive the K-state during a host-initiated resume from an LPM state (e.g., L1), and is conveyed to each LPM-enabled device (via the HIRD bits within an LPM Tokens bmAttributes field) upon entry into a low-power state. Note the host controller is required to drive resume signaling for at least the amount of time specified in the HIRD value conveyed to the device during any proceeding host-initiated resume. Also note that the host controller is not required to observe this requirement during device-initiated resumes. Encoding for this field is identical to the definition for the similarly named HIRD field within an LPM Token, specifically: a value 0000b equals 50 µs and each additional increment adds 75 µs. For example, the value 0001b equals 125 µs, and the value 1111b equals 1,175 µs (~1.2 ms).
23:16	RW	0x8	ITC: Interrupt Threshold Control .Read/Write. Default 08h. The system software uses this field to set the maximum rate at which the host/device controller will issue interrupts. ITC contains the maximum interrupt interval measured in micro-frames. Valid values are shown below. Value Maximum Interrupt Interval. 00h: Immediate (no threshold). 01h: 1 micro-frame. 02h: 2 micro-frames. 04h: 4 micro-frames. 08h: 8 micro-frames. 10h: 16 micro-frames. 20h: 32 micro-frames. 40h: 64 micro-frames 0 = IMMEDIATE 2 = ONE_MF 4 = TWO_MF 8 = EIGHT_MF 16 = SIXTEEN_MF

Bit	R/W	Reset	Description
			32 = THIRTY_TWO_MF 64 = SIXTY_FOUR_MF
15	RW	0x0	FS2: Bit 2 of Frame List Size.
14	RW	0x0	ATDTW: Add DTD Tripwire. This bit is used as a semaphore when a DTD is added to an active (primed) endpoint. This bit is set and cleared by software and will be cleared by hardware when a hazard exists such that adding a dTD to a primed endpoint may go unnoticed. 0 = CLEAR 1 = SET
13	RW	0x0	SUTW: Setup Tripwire. This bit is used as a semaphore when the 8 bytes of setup data read extracted by the firmware. If the setup lockout mode is off, then there exists a hazard when new setup data arrives and firmware is copying setup data from the queue head (QH) for a previous setup packet. This bit is set and cleared by software and will be cleared by hardware when a hazard exists. 0 = CLEAR 1 = SET
11	RW	0x1	ASPE: Asynchronous Schedule Park mode Enable. Software uses this bit to enable or disable Park mode. When this bit is one, Park mode is enabled. When this bit is a zero, Park mode is disabled. This field is set to "1" in this implementation. 0 = DISABLE 1 = ENABLE
9:8	RW	0x3	ASP1_ASP0: Asynchronous Schedule Park Mode Count (OPTIONAL) Read/Write. If the Asynchronous Park Capability bit in the HCCPARAMS register is a one, then this field defaults to 3h and is R/W. Otherwise it defaults to zero and is RO. It contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the Asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid values are 1h to 3h. Software must not write a zero to this bit when Park Mode Enable is a one as this will result in undefined behavior. This field is set to 3h in this implementation and is Read/Write capable.
7	RO	X	LR: Light Host/Device Controller Reset (OPTIONAL). Read Only. Not Implemented. This field will always be "0".
6	RW	0x0	IAA: Interrupt on Async Advance Doorbell. When the host controller has evicted all appropriate cached schedule states, it sets the Interrupt on Async Advance status bit in the USBSTS register. If the Interrupt on Sync Advance Enable bit in the USBINTR register is one, then the host controller will assert an interrupt at the next interrupt threshold. The host controller sets this bit to zero after it has set the Interrupt on Sync Advance status bit in the USBSTS register to one. Software should not write a one to this bit when the asynchronous schedule is inactive. Doing so will yield undefined results. This bit is only used in host mode. Writing a one to this bit when device mode is selected will have undefined results. 0 = CLEAR 1 = SET
5	RW	0x0	ASE: Asynchronous Schedule Enable. This bit controls whether the host controller skips processing the Asynchronous Schedule. 0 = Do not process the Asynchronous Schedule. 1 = Use the ASYNCLISTADDR register to access the Asynchronous Schedule. Only the host controller uses this bit. 0 = DISABLE 1 = ENABLE
4	RW	0x0	PSE: Periodic Schedule Enable. This bit controls whether the host controller skips processing the Periodic Schedule. 0 = Do not process the Periodic Schedule 1 = Use the PERIODICLISTBASE register to access the Periodic Schedule. Only the host controller uses this bit. 0 = DISABLE 1 = ENABLE
3:2	RW	0x0	FS1_FS0: Frame List Size. (Read/Write). 000 = (Default). This field is Read/Write only if the Programmable Frame List Flag in the HCCPARAMS registers is set to one. Hence this field is Read/Write for this implementation. This field specifies the size of the frame list that controls which bits in the Frame Index Register should be used for the Frame List Current index. Note that this field is made up from USBCMD bits 15, 3, and 2. 000 = 1024 elements (4096 bytes) Default value 001 = 512 elements (2048 bytes) 010 = 256 elements (1024 bytes) 011 = 128 elements (512 bytes)

Bit	R/W	Reset	Description
			100 = 64 elements (256 bytes) 101 = 32 elements (128 bytes) 110 = 16 elements (64 bytes) 111 = 8 elements (32 bytes) Only the host controller uses this field.
1	RW	0x0	RST: Controller Reset. Software uses this bit to reset the controller. This bit is set to zero by the Host/Device Controller when the reset process is complete. Software cannot terminate the reset process early by writing a zero to this register. Host Controller: When software writes a one to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. Software should not set this bit to a one when the HCHalted bit in the USBSTS register is a zero. Attempting to reset an actively running host controller results in undefined behavior. Device Controller: When software writes a one to this bit, the Device Controller resets its internal pipelines, timers, counters, state machines etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. Writing a one to this bit in device mode is not recommended. 0 = CLEAR 1 = SET
0	RW	0x0	RS: Run/Stop: Host Controller: When set to a 1, the Host Controller proceeds with the execution of the schedule. The Host Controller continues execution as long as this bit is set to a one. When this bit is set to 0, the Host Controller completes the current transaction on the USB and then halts. The HCHalted bit in the status register indicates when the Host Controller has finished the transaction and has entered the stopped state. Software should not write a one to this field unless the host controller is in the Halted state (i.e., HCHalted in the USBSTS register is a one). Device Controller: Writing a one to this bit will cause the device controller to enable a pull-up on D+ and initiate an attach event. This control bit is not directly connected to the pull-up enable, as the pull-up will become disabled upon transitioning into high-speed mode. Software should use this bit to prevent an attach event before the device controller has been properly initialized. Writing a 0 to this will cause a detach event. 0 = STOP 1 = RUN

19.13.1.19 USB2_CONTROLLER_USB2D_USBSTS_0

USB2D USB Status Register

Offset: 0x134 | Read/Write: R/W | Reset: 0b00000000000000000x100x0000x0000

Bit	R/W	Reset	Description
31:16	RW	0x0	PPCI: Port-n Change Detect - RW. Default = 0000h. The definition for each bit is identical to the Port Change Detect field (bit 2 of this register) except these bits are specific to a given port, where bit 16 = Port 1, 17 = Port 2, etc. For example, if bit 17 is set to a one then a port change event was detected on Port 2. The N_PORTS field in HCSPARAMS specifies how many ports are exposed by the host controller and thus how many bits in this field are valid.
15	RW	0x0	AS: Asynchronous Schedule Status. This bit reports the current real status of the Asynchronous Schedule. When set to zero the asynchronous schedule status is disabled and if set to one the status is enabled. The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the USBCMD register. If AS = ASE: 1= Enable Asynchronous Schedule. 0= Disable Asynchronous Schedule. Only used by the host controller. 0 = DISABLE 1 = ENABLE
14	RW	0x0	PS: Periodic Schedule Status. This bit reports the current real status of the Periodic Schedule. When set to zero the periodic schedule is disabled, and if set to one the status is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the USBCMD register. If PS = PSE then: 1 = Periodic Schedule is enabled or 0 = Periodic Schedule is disabled. Only used by the host controller. 0 = DISABLE 1 = ENABLE

Bit	R/W	Reset	Description
13	RO	X	RCL: Reclamation. This is a read-only status bit used to detect an empty asynchronous schedule. Only used by the host controller. 0 = DISABLE 1 = ENABLE
12	RW	0x1	HCH: HCHalted. 1 = Default. This bit is a zero whenever the Run/Stop bit is a one. The Host Controller sets this bit to one after it has stopped executing because of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (e.g., internal error). Only used by the host controller. 0 = UNHALTED 1 = HALTED
11	RW	0x0	UALT_INT: ULPI alt_int Interrupt. 0 = Default. This interrupt bit is set when an RXCMD is received through the ULPI interface with bit 7 set (alt_int).The alt_int itself is set when an unmasked event occurs on any bit in the Carkit Interrupt Latch Register, in the ULPI PHY The software should read the Carkit Interrupt Latch Register (Read to Clear) through the ULPI Viewport to check the source of the interrupt. Only present in designs where configuration constant VUSB_HS_PHY_ULPI = 1. 0 = NOT_ULPI_ALT_INT 1 = ULPI_ALT_INT
10	RW	0x0	ULPI_INT: ULPI Interrupt. This bit is set whenever an interrupt is received from ULPI PHY. Software writes 1 to clear it. 0 = NOT_ULPI_INT 1 = ULPI_INT
8	RW	0x0	SLI: DCSuspend. When a device controller enters a suspend state from an active state, this bit will be set to a 1. The device controller clears the bit upon exiting from a suspend state. Only used by the device controller. 0 = NOTSUSPEND 1 = SUSPENDED
7	RW	0x0	SRI: SOF Received. When the device controller detects a Start Of (micro) Frame, this bit will be set to a one. When an SOF is extremely late, the device controller will automatically set this bit to indicate that an SOF was expected. Therefore, this bit will be set roughly every 1 ms in device FS mode and every 125 µs in HS mode and will be synchronized to the actual SOF that is received. Since the device controller is initialized to FS before connect, this bit will be set at an interval of 1 ms during the prelude to the connect and chirp. In host mode, this bit will be set every 125 µs and can be used by the host controller driver as a time base. Software writes a 1 to this bit to clear it. This is a non-EHCI status bit. 0 = SOF_NOT_RCVD 1 = SOF_RCVD
6	RW	0x0	URI: USB Reset Received. When the device controller detects a USB Reset and enters the default state, this bit is set to a 1. Software can write a 1 to this bit to clear the USB Reset Received status bit. Only used by the device controller. 0 = NO_USB_RESET 1 = USB_RESET
5	RW	0x0	AAI: Interrupt and Asynchronous Advance. System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing a one to the Interrupt on Async Advance Doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source. Only used by the host controller 0 = NOT_ADVANCED 1 = ADVANCED
4	RO	X	SEI: System Error. This bit is not used in this implementation and will always be set to "0". 0 = NO_ERROR 1 = ERROR
3	RW	0x0	FRI: Frame List Rollover. The Host Controller sets this bit to a 1 when the Frame List Index rolls over from its maximum value to 0. The exact value at which the rollover occurs depends on the frame list size. For example. If the frame list size (as programmed in the Frame List Size field of the USBCMD register) is 1024, the Frame Index Register rolls over every time FRINDEX [1 3] toggles. Similarly, if the size is 512, the Host Controller sets this bit to a 1 every time FHINDEX [12] toggles. Only used by the host controller. 0 = NO_ROLLOVER 1 = ROLLOVER

Bit	R/W	Reset	Description
2	RW	0x0	PCI: Port Change Detect. The Host Controller sets this bit to a 1 when on any port a Connect Status occurs, a Port Enable/Disable Change occurs, or the Force Port Resume bit is set as the result of a J-K transition on the suspended port. The Device Controller sets this bit to a one when the port controller enters the full or high-speed operational state. When the port controller exits the full or high-speed operational states due to Reset or Suspend events, the notification mechanisms are the USB Reset Received bit and the DCSuspend bits, respectively. This bit is not EHCI compatible. 0 = NO_PORT_CHANGE 1 = PORT_CHANGE
1	RW	0x0	UEI: USB Error Interrupt. This bit gets set by the Host/Device controller when completion of a USB transaction results in an error condition. This bit is set along with the USBINT bit, if the TD on which the error interrupt occurred also had its interrupt on complete (IOC) bit set. 0 = NO_ERROR 1 = ERROR
0	RW	0x0	UI: USB Interrupt. This bit is set by the Host/Device Controller when the cause of an interrupt is a completion of a USB transaction where the Transfer Descriptor (TD) as an interrupt on complete (IOC) bit set. This bit is also set by the Host/Device Controller when a short packet is detected. A short packet is when the actual number of bytes received was less than the expected number of bytes. 0 = NO_INT 1 = INT

19.13.1.20 USB2_CONTROLLER_USB2D_USBINTR_0

USB2D USB Interrupt Enable Register

Offset: 0x138 | Read/Write: R/W | Reset: 0b0000000000000000xxxx00x000000000

Bit	Reset	Description
31:16	0x0	PPCE: Port-n Change Detect Enable - RW. Default = 0000h. The definition for each bit in this field is identical to bit 2 of this register (Port Change Interrupt Enable) except these bits are specific to a given port, where bit 16 = Port 1, 17 = Port 2, etc. For example, if bit 17 is set (1b) then a port change event was detected on Port 2. When a bit in this field is a one, and the corresponding Port-n Change Detect bit in the USBSTS register is a one, the host controller will issue an interrupt. The interrupt is acknowledged by software clearing the Port-n Change Detect bit.
11	0x0	UALTIE: ULPI alt_int Interrupt Enable. 1 = USB controller issues an interrupt if the ULPI_ALT_INT bit in the USBSTS register transitions. The interrupt is acknowledged by software by writing a 1 to the ULPI_ALT_INT bit. 0 = DISABLE 1 = ENABLE
10	0x0	ULPIE: ULPI Interrupt Enable. 1 = USB controller issues an interrupt if ULPI_INT bit in USBSTS register transitions. The interrupt is acknowledged by software by writing a 1 to the ULPI_INT bit. 0 = DISABLE 1 = ENABLE
8	0x0	SLE: Sleep Enable. 1 = Device controller issues an interrupt if DCSuspend bit in USBSTS register transitions. The interrupt is acknowledged by software by writing a 1 to the DCSuspend bit. Only used by the device controller. 0 = DISABLE 1 = ENABLE
7	0x0	SRE: SOF Received Enable. 1 = Device controller issues an interrupt if SOF Received bit in USBSTS register = 1. The interrupt is acknowledged by software clearing the SOF Received bit. 0 = DISABLE 1 = ENABLE
6	0x0	URE: USB Reset Enable.1 = Device controller issues an interrupt if USB Reset Received bit in USBSTS register = 1. The interrupt is acknowledged by software clearing the USB Reset Received bit. Only used by the device controller. 0 = DISABLE 1 = ENABLE

Bit	Reset	Description
5	0x0	AAE: Interrupt on Asynchronous Advance Enable. 1 = The host controller issues an interrupt at the next interrupt threshold if Interrupt on Async Advance bit in USBSTS register = 1. The interrupt is acknowledged by software clearing the Interrupt on Async Advance bit. Only used by the host controller. 0 = DISABLE 1 = ENABLE
4	0x0	SEE: System Error Enable. 1 = Host/device controller issues an interrupt if the System Error bit in USBSTS register = 1. The interrupt is acknowledged by software clearing the System Error bit. 0 = DISABLE 1 = ENABLE
3	0x0	FRE: Frame List Rollover Enable. 1 = Host controller issues an interrupt if Frame List Rollover bit in the USBSTS register = 1. The interrupt is acknowledged by software clearing the Frame List Rollover bit. Only used by the host controller. 0 = DISABLE 1 = ENABLE
2	0x0	PCE: Port Change Detect Enable. 1 = Host/device controller issues an interrupt if Port Change Detect bit in USBSTS register = 1. The interrupt is acknowledged by software clearing the Port Change Detect bit. 0 = DISABLE 1 = ENABLE
1	0x0	UEE: USB Error Interrupt Enable. 1 = Host controller issues an interrupt at the next interrupt threshold if the USBERRINT bit in USBSTS = 1. The interrupt is acknowledged by software clearing the USBERRINT bit in the USBSTS register. 0 = DISABLE 1 = ENABLE
0	0x0	UE: USB Interrupt Enable. 1 = Host/device issues an interrupt at the next interrupt threshold if the USBINT bit in USBSTS = 1. The interrupt is acknowledged by software clearing the USBINT bit. 0 = DISABLE 1 = ENABLE

19.13.1.21 USB2_CONTROLLER_USB2D_FRINDEX_0

USB2D USB Frame Index Register

Offset: 0x13c | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
13:0	X	FRINDEX: Frame Index. The value in this register increments at the end of each time frame (micro-frame). Bits [N: 3] are used for the Frame List current index. Each location of the frame list is accessed 8 times (frames or micro-frames) before moving to the next index. The following illustrates values of N based on the value of the Frame List Size field in the USBCMD register, when used in host mode. USBCMD [Frame List Size] Number Elements N 000b (1024) 12 001b (512) 11 010b (256) 10 011b (128) 9 100b (64) 8 101b (32) 7 110b (16) 6 111b (8) 5 In device mode, the value is the current frame number of the last frame transmitted. It is not used as an index. In either mode bits 2:0 indicate the current micro-frame.

19.13.1.22 USB2_CONTROLLER_USB2D_PERIODICLISTBASE_0

USB2D Host Controller Frame List Base Address Register

Offset: 0x144 | Read/Write: R/W | Reset: 0b00000000000000000000xxxxxxxxxxxx

Bit	Reset	Description
31:25	0x0	USBADR: Device mode. The upper seven bits of this register represent the device address. After any controller reset or a USB reset, the device address is set to the default address (0). The default address will match all incoming addresses. Software shall reprogram the address after receiving a SET_ADDRESS request.
24	0x0	USBADRA: Device Address Advance. Default=0. When this bit is 0, any writes to USBADR are instantaneous. When this bit is written to a 1 at the same time or before USBADR is written, the write to the USBADR field is staged and held in a hidden register. After an IN occurs on endpoint 0 and is ACKed, USBADR will be loaded from the holding register. Hardware will automatically clear this bit on the following conditions: 1) IN is ACKed to endpoint 0. (USBADR is updated from staging register). 2) OUT/SETUP occur to endpoint 0. (USBADR is not updated). 3) Device Reset occurs (USBADR is reset to 0). Note: After the status phase of the SET_ADDRESS descriptor, the DCD has 2 ms to program the USBADR field. This mechanism will ensure this specification is met when the DCD cannot write of the device address within 2 ms from the SET_ADDRESS status phase. If the DCD writes the USBADR with USBADRA=1 after the SET_ADDRESS data phase (before the prime of the status phase), the USBADR will be programmed instantly at the correct time and meet the 2 ms USB requirement.
31:12	0x0	BASEADR: Host mode: This 32-bit register contains the beginning address of the Periodic Frame List in the system memory. The HCD loads this register prior to starting the schedule execution by the Host Controller. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the Frame Index Register (FRINDEX) to enable the Host Controller to step through the Periodic Frame List in sequence. Base Address (Low). These bits correspond to memory address signals [31:12], respectively. Only used by the host controller.

19.13.1.23 USB2_CONTROLLER_USB2D_ASYNCLISTADDR_0

USB2D Next Asynchronous List Address Register

Offset: 0x148 | Read/Write: R/W | Reset: 0b00000000000000000000000000xxxxx

Bit	Reset	Description
31:11	0x0	EPBASE: Device mode. This register contains the address of the top of the endpoint list in system memory. These bits correspond to memory address signals [31:11], respectively. This field will reference a list of up to 32 Queue Heads (QHs). Only used by the device controller.
31:5	0x0	ASYBASE: Host mode. This 32-bit register contains the address of the next asynchronous queue head to be executed by the host. Link Pointer Low (LPL). These bits correspond to memory address signals [31:5], respectively. This field may only reference a Queue Head (OH). Only used by the host controller.

19.13.1.24 USB2_CONTROLLER_USB2D_ASYNCTTSTS_0

USB2D Asynchronous Buffer Status for Embedded TT Register

Offset: 0x14c | Read/Write: R/W | Reset: 0bx0000000xxxxxxxxxxxxxxxxxxxxxx0x

Bit	R/W	Reset	Description
30:24	RW	0x0	TTHA: Internal TT Hub Address representation. This field is used to match the Hub Address field in Queue Head (QH) and split isochronous transaction descriptor (siTD) to determine if the packet is routed to the internal transaction translator (TT) for directly attached FS/LS devices. If the Hub Address in the QH or siTD does not match this address then the packet will be broadcast on the High Speed ports destined for a downstream High Speed hub with the address in QH/siTD.
1	RW	0x0	TTAC: Embedded TT Async Buffers Clear. (Read/Write to set). This field will clear all pending transactions in the embedded TT Async Buffer(s). The clear will take as much time as necessary

Bit	R/W	Reset	Description
			to clear buffer without interfering with a transaction in progress. TTAC will return to zero after being set by software only after the actual clear occurs.
0	RO	X	TTAS: Embedded TT Async Buffers Status. (Read Only). This read only bit will be 1 if one or more transactions are being held in the embedded TT Async. Buffers. When this bit is a zero, then all outstanding transactions in the embedded TT have been flushed.

19.13.1.25 USB2_CONTROLLER_USB2D_BURSTSIZE_0

USB2D Burst Size Register

Offset: 0x150 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxx0000100000001000

Bit	Reset	Description
15:8	0x8	TXPBURST: Programmable TX Burst Length. (Read/Write). This register represents the maximum length of a burst in 32-bit words while moving data from system memory to the USB bus.
7:0	0x8	RXPBURST: Programmable RX Burst Length. (Read/Write). This register represents the maximum length of a burst in 32-bit words while moving data from the USB bus to system memory.

19.13.1.26 USB2_CONTROLLER_USB2D_TXFILLTUNING_0

USB2D Transmit Fill Tuning Register

Offset: 0x154 | Read/Write: R/W | Reset: 0bxxxxxxxxxx000010xxx0000000000000

Bit	Reset	Description
21:16	0x2	TXFIFOTHRES: FIFO Burst Threshold. (Read/Write). This register controls the number of data bursts that are posted to the TX latency FIFO in host mode before the packet begins on to the bus. The minimum value is 2 and this value should be a low as possible to maximize USB performance. A higher value can be used in systems with unpredictable latency and/or insufficient bandwidth where the FIFO may underrun because the data transferred from the latency FIFO to USB occurs before it can be replenished from system memory. This value is ignored if the Stream Disable bit in USBMODE register is set.
12:8	0x0	TXSCHHEALTH: Scheduler Health Counter. (Read/Write To Clear) [Default = 0] This register increments when the host controller fails to fill the TX latency FIFO to the level programmed by TXFIFOTHRES before running out of time to send the packet before the next Start-Of-Frame. This health counter measures the number of times this occurs to provide feedback to selecting a proper TXSCHOH. Writing to this register will clear the counter and this counter will max out at 31.
7:0	0x0	TXSCHOH: Scheduler Overhead. (Read/Write) [Default = 0] This register adds an additional fixed offset to the schedule time estimator described above as Tff. As an approximation, the value chosen for this register should limit the number of back-off events captured in the TXSCHHEALTH to less than 10 per second in a highly utilized bus. Choosing a value that is too high for this register is not desired as it can needlessly reduce USB utilization. The time unit represented in this register is 1.267 µs when a device is connected in High-Speed Mode. The time unit represented in this register is 6.333 µs when a device is connected in Low/Full Speed Mode

19.13.1.27 USB2_CONTROLLER_USB2D_ICUSB_CTRL_0

This register enables and controls the ICUSB FS/LS transceiver.

USB2D ICUSB control register

Offset: 0x15c | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000

Bit	Reset	Description
3	0x0	IC_ENB1: ICUSB transceiver enable. This bit enables the ICUSB transceiver. To enable the interface, the bits PTS must be set to 11 in the PORTSCx. Writing a '1' to this bit selects the IC_USB interface. 0 = DISABLE

Bit	Reset	Description
		1 = ENABLE
2:0	0x0	IC_VDD1: ICUSB voltage select. It selects which voltage is being supplied to the ICUSB peripheral. 000 = No voltage 001 = 1.0V - reserved 010 = 1.2V - reserved 011 = 1.5V - reserved 100 = 1.8V 101 = 3.0V 110 = reserved 111 = reserved The Voltage negotiation should happen between enabling port power (PP) and asserting the run/stop bit in register.

19.13.1.28 USB2_CONTROLLER_USB2D_ULPI_VIEWPORT_0

This register provides indirect access to the ULPI PHY register set. Although the USB controller performs access to the ULPI PHY register set, there may be extraordinary circumstances where software may need direct access.

Note: WRITES TO THE ULPI THROUGH THE VIEWPORT CAN SUBSTANTIALLY HARM STANDARD USB OPERATIONS. CURRENTLY NO USAGE MODEL HAS BEEN DEFINED WHERE SOFTWARE SHOULD NEED TO EXECUTE WRITES DIRECTLY TO THE ULPI PHY. SEE EXCEPTION REGARDING OPTIONAL FEATURES BELOW.

Note: Executing read operations through the ULPI Viewport should have no harmful side effects to standard USB operations.

There are two operations that can be performed with the ULPI Viewport: wakeup and read /write operations.

The wakeup operation is used to put the ULPI interface into normal operation mode and reenable the clock if necessary. A wakeup operation is required before accessing the registers when the ULPI interface is operating in low power mode, serial mode, or carkit mode.

The ULPI state can be determined by reading the sync state bit (ULPI_SYNC_STATE). If this bit is a one, then ULPI interface is running in normal operation mode and can accept read/write operations. If the ULPI_SYNC_STATE indicates a 0 then then read/write operations will not be able to execute. Undefined behavior will result if ULPI_SYNC_STATE = 0 and a read or write operation is performed.

To execute a wakeup operation, write all 32-bits of the ULPI Viewport where ULPI_PORT is constructed appropriately and the ULPI_WAKEUP bit is a 1 and ULPI_RUN bit is a 0. Poll the ULPI Viewport until ULPI_WAKEUP is zero for the operation to complete.

To execute a read or write operation, write all 32 bits of the ULPI Viewport where ULPI_DATA_WR, ULPI_REG_ADDR, ULPI_PORT, ULPI_RD_WR are constructed appropriately and the ULPI_RUN bit is a 1. Poll the ULPI Viewport until ULPI_RUN is zero for the operation to complete. Once ULPI_RUN is zero, the ULPI_DATA_RD will be valid if the operation was a read.

The polling method above can be changed to interrupt driven using the ULPI interrupt defined in the USBSTS and USBINTR registers. When a wakeup or read/write operation is complete, the ULPI_INT interrupt will be set.

There are several optional features that may need to be enabled or disabled by system software as part of system configuration. These bits are contained in the Interface and OTG Control registers of the ULPI PHY register set. These registers also contain bits which are controlled by the link dynamically and therefore should be only modified by system software using the Set/Clear access method. Direct writes to these registers could have harmful side effects to the standard USB operations. The optional bits are as follows: Bits 3 through 7 in the Interface Control register and Bits 6 and 7 in the OTG Control register.

Please refer to the ULPI Specification Revision 1.1 for further information on the use of the optional features.

USB2D ULPI Viewport Register

Offset: 0x160 | Read/Write: R/W | Reset: 0b000xx00000000000xxxxxxxx00000000

Bit	R/W	Reset	Description
31	RW	0x0	ULPI_WAKEUP: ULPI Wakeup. Writing the 1 to this bit will begin the wakeup operation. The bit will automatically transition to 0 after the wakeup is complete. Once this bit is set, the driver cannot set it back to 0. Note: The driver must never execute a wakeup and a read/write operation at the same time. 0 = CLEAR 1 = SET
30	RW	0x0	ULPI_RUN: ULPI read/write Run. Writing the 1 to this bit will begin the read/write operation. The bit will automatically transition to 0 after the read/write is complete. Once this bit is set, the driver cannot set it back to 0. Note: The driver must never execute a wakeup and a read/write operation at the same time. 0 = CLEAR 1 = SET
29	RW	0x0	ULPI_RD_WR: ULPI read/write control. (0) Read; (1) Write. This bit selects between running a read or write operation. 0 = READ 1 = WRITE
27	RO	X	ULPI_SYNC_STATE: ULPI sync state. (1) Normal Sync. State. (0) In another state (i.e., carkit, serial, low power). This bit represents the state of the ULPI interface. 0 = NOT_NORMAL 1 = NORMAL
26:24	RW	0x0	ULPI_PORT: ULPI PHY port number. This field should be always written as 0.
23:16	RW	0x0	ULPI_REG_ADDR: ULPI PHY register address. When doing a read or write operation to the ULPI PHY, the address of the ULPI PHY register being accessed is written to this field.
15:8	RO	X	ULPI_DATA_RD: ULPI PHY data read. The data from the ULPI PHY register can be read from here after the read operation completes.
7:0	RW	0x0	ULPI_DATA_WR: ULPI PHY data write. The data to write to the ULPI PHY register is written here.

19.13.1.29 USB2_CONTROLLER_USB2D_PORTSC1_0

USB2D Port Status/Control 1 Register

Offset: 0x174 | Read/Write: R/W | Reset: 0b0000000xx0000000xxx1xx00x0xx010x

Bit	R/W	Reset	Description
31:25	RW	0x0	DA: Device Address - RW. Default = 0000000b. The 7-bit USB device address for the device attached to an immediately downstream of the associated root port. A value of zero indicates no device is present or software support for this feature is not present. This is used by the Controller when sending the LPM token. This field is only valid when the core is operating in host mode. If in device mode it will be read only and always equal to 0000000b.
24:23	RO	X	SSTS: Suspend Status - RO. Default = 00b. These two bits are used by software to determine whether an L1-based suspend request was successful, specifically: 00b - L1 state entered with success. ACK received from peripheral. 01b - NYET received from peripheral. It was not able to enter L1 state this time. 10b - L1 state not supported by peripheral. STALL received. 11b - Peripheral did not respond or an error occurred. The value of this field is only valid when the port resides in the L0 state - that is, the meaning of these bits is invalid whenever bit 7 of this register (SUSP) is one. Ideally, the Controller driver should read this register if it receives an interrupt after issuing a suspend using L1 support. In case of a non-success a port change interrupt will be fired and this field should be checked for a possible L1 failure. This field is only valid when the core is operating in host mode. If in device mode, it will be always equal to 00b. 0 = L1STATE_ENTERED 1 = NYET_PERIPH 2 = L1STATE_NOT_SUPPORTED

Bit	R/W	Reset	Description
			3 = PERIPH_NORESP_ERR
22	RW	0x0	WKOC: Default = 0b. Wake on Over-current Enable: Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. This field is zero if Port Power (PP) is zero. This bit should only be used when operating in Host mode. Writing this bit to 1 while the controller is working in device mode can result in undefined behavior. 0 = DISABLE 1 = ENABLE
21	RW	0x0	WKDS: Wake on Disconnect Enable: Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. This field is zero if Port Power (PP) is zero or in device mode. This bit should only be used when operating in Host mode. Writing this bit to 1 while the controller is working in device mode can result in undefined behavior. This bit should not be written to 1 if there is no device connected. After the device disconnect is detected, this bit should be cleared to 0. 0 = DISABLE 1 = ENABLE
20	RW	0x0	WKCN: Wake on Connect Enable: Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. This field is zero if Port Power (PP) is zero or in device mode. This bit should only be used when operating in Host mode. Writing this bit to 1 while the controller is working in device mode can result in undefined behavior. This bit should not be written to 1 while the device is connected. After the device connection is detected, this bit should be cleared to 0. 0 = DISABLE 1 = ENABLE
19:16	RW	0x0	PTC: Port Test Control: Any value other than zero indicates that the port is operating in test mode. Value Specific Test. 0000b: Not enabled. 0001b: J_ STATE. 0010b: K_STATE. 0011b: SEQ_NAK. 0100b: Packet. 0101b: FORCE_ENABLE. 0110b to 1111b: Reserved. | Refer to Chapter 7 of the USB Specification Revision 2.0 for details on each test mode. 0 = NORMAL_OP 1 = TEST_J 2 = TEST_K 3 = TEST_SE0_NAK 4 = TEST_PKT 5 = TEST_FORCE_ENABLE
15:14	RO	X	PIC: Port Indicator Control: This field is not supported in the current implementation. Please use a GPIO if you wish to use Port Indicators.
13	RO	X	PO: Port Owner. Port owner handoff is not implemented in this design, therefore this bit will always be 0.
12	RW	0x1	PP: Port Power: The function of this bit depends on the value of the Port Power Switching (PPC) field in the HCSPARAMS register. The behavior is as follows: PPC PP Operation 0b 0b Read Only. A device controller with no OTG capability does not have port power control switches. 1b 1b/0b RW. Host/OTG controller requires port power control switches. This bit represents the current setting of the switch (0=off, 1=on). When power is not available on a port (i.e., PP equals a 0), the port is non-functional and will not report attaches, detaches, etc. When an over-current condition is detected on a powered port and PPC is a one, the PP bit in each affected port may be transitioned by the host controller driver from a one to a zero (removing power from the port). 0 = NOT_POWERED 1 = POWERED

Bit	R/W	Reset	Description
11:10	RO	X	LS: These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. The encoding of the bits is: 00b = SE0. 01b = K-state. 10b = L-state. 11b = Undefined. The value of this field is undefined if Port Power (PP) is zero in host mode. In host mode, the use of line-state by the host controller driver is not necessary (unlike EHCI), because the port controller state machine and the port routing manage the connection of LS and FS. In device mode, the use of line-state by the device controller driver is not necessary. 0 = SE0 1 = K_STATE 2 = J_STATE 3 = UNDEFINED
9	RW	0x0	SLP: Suspend using L1 - RW. Default = 0b. When this bit is set to '1' and a non-zero Device Address (DA) is specified, the Controller will instigate L1 entry during suspend (bit 7) and L1 exit during resume (bit 6). When this bit is set to zero, the Controller will use the legacy (L2) mechanism. Software should only set this bit when the device attached immediately downstream supports L1 transitions. When acting as device, this bit is read-only and set to '1' by the hardware when the Controller enters is L1 state (LPM token received and accepted). Note: HSP is redundant with PSPD[27:26]. This bit is not defined in the EHCI specification.
8	RW	0x0	PR: This field is zero if Port Power (PP) is zero. In Host Mode: Read/Write. 1=Port is in Reset. 0=Port is not in Reset. When software writes a one to this bit the bus-reset sequence as defined in the USB Specification Revision 2.0 is started. This bit will automatically change to zero after the reset sequence is complete. This behavior is different from EHCI where the host controller driver is required to set this bit to a zero after the reset duration is timed in the driver. In Device Mode: This bit is a read only status bit. Device reset from the USB bus is also indicated in the USBSTS register. 0 = NOT_USB_RESET 1 = USB_RESET
7	RO	X	SUSP: Port suspend. 1=Port in suspend state. 0=Port not in suspend state. In Host Mode: Read/Write. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0x Disable 10 Enable 11 Suspend. When in the suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction if a transaction was in progress when this bit was written to 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. The host controller will unconditionally set this bit to zero when software sets the Force Port Resume bit to zero. A write of zero to this bit is ignored by the host controller. If host software sets this bit to a one when the port is not enabled (i.e., Port enabled bit is a zero), the results are undefined. This field is zero if Port Power (PP) is zero in host mode. In Device Mode: Read Only. This bit is a read only status bit. 0 = NOT_SUSPEND 1 = SUSPEND

Bit	R/W	Reset	Description
6	RW	0x0	FPR: Force Port Resume. 1= Resume detected/driven on port. 0=No resume (K state) detected/driven on port. In Host Mode: Software sets this bit to one to drive resume signaling. The Host Controller sets this bit to one if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to one. This bit will automatically change to zero after the resume sequence is complete. This behavior is different from EHCI where the host controller driver is required to set this bit to a zero after the resume duration is timed in the driver. Note that when the Host controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. This bit remains a one until the port has switched to the high-speed idle. Writing a zero has no effect because the port controller will time the resume operation to clear the bit when the port control state switches to HS or FS idle. This field is zero if Port Power (PP) is zero in host mode. This bit is not-EHCI compatible. In Device mode: After the device has been in Suspend State for 5ms or more, software must set this bit to one to drive resume signaling before clearing. The Device Controller will set this bit to one if a J-to-K transition is detected while the port is in the Suspend state. The bit will be cleared when the device returns to normal operation. Also, when this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to one. Software should ensure that the PHY clock is operational before writing a 1 to this bit to start the resume sequence. This is true for both Device and Host modes. 0 = NO_RESUME 1 = RESUME
5	RO	X	OCC: Over-current Change: Not supported 0 = NO_CHANGE 1 = CHANGE
4	RO	X	OCA: Over-current Active: Not supported 0 = NO_OVER_CURRENT 1 = OVER_CURRENT
3	RW	0x0	PEC: Port Enable/Disable Change: 1=Port enabled/disabled status has changed. 0=No change. In Host Mode: For the root hub, this bit gets set to a one only when a port is disabled due to disconnect on the port or due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification). Software clears this by writing a one to it. This field is zero if Port Power (PP) is zero. In Device mode: The device port is always enabled. (This bit will be zero.) 0 = NO_CHANGE 1 = CHANGE
2	RW	0x1	PE: Port Enabled/Disabled: 1=Enable. 0=Disable (default). In Host Mode: Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a one to this field. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by the host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events. When the port is disabled, (0b) downstream propagation of data is blocked except for reset. This field is zero if Port Power (PP) is zero in host mode. In Device Mode: The device port is always enabled. (This bit will be one) 0 = PORT_DISABLED 1 = PORT_ENABLED
1	RW	0x0	CSC: Connect Status Change: 1 =Change in Current Connect Status. 0=No change (default) In Host Mode: Indicates a change has occurred in the port's Current Connect Status. The host/device controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software clears this bit by writing a one to it. This field is zero if Port Power (PP) is zero in host mode. This bit is undefined in device controller mode. 0 = NO_CHANGE 1 = CHANGE

Bit	R/W	Reset	Description
0	RO	X	CCS: Current Connect Status. In Host Mode: 1=Device is present on port. 0=No device is present (default). This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. This field is zero if Port Power (PP) is zero in host mode. In Device Mode: 1=Attached 0=Not Attached (default) A one indicates that the device successfully attached and is operating in either high speed or full speed as indicated by the High Speed Port bit in this register. A zero indicates that the device did not attach successfully or was forcibly disconnected by the software writing a zero to the Run bit in the USBCMD register. It does not state the device being disconnected or suspended. 0 = NOT_CONNECTED 1 = CONNECTED

19.13.1.30 USB2_CONTROLLER_USB2D_HOSTPC1_DEVLC_0

USB2D Device Mode LPM Behavior and Control Register

This register controls the LPM behavior and controls the behavior of each USB port. Only available in device mode. This register shares the same address with the HOSTPC1 register (which is used only in host mode).

USB2D Host Mode LPM Behavior and Control Register

This register controls the LPM behavior and controls the behavior of each USB port. Only available in host mode. This register shares the same address with the DEVLC register (which is used only in device mode).

Offset: 0x1b4 | Read/Write: R/W | Reset: 0b0000xxx0000000000000xxxxxxxxxxx0

Bit	R/W	Reset	Description
31:29	RW	0x0	PTS: Parallel transceiver select. This bit is not defined in the EHCI specification. 0 = UTMI 1 = RESERVED 2 = ULPI 3 = ICUSB_SER 4 = HSIC
28	RW	0x0	STS: Serial transceiver not selected. This is the only value supported. This bit is not defined in the EHCI specification. 0 = PARALLEL_IF 1 = SERIAL_IF
27	RO	X	PTW: Parallel Transceiver Width. Fixed to 0. This bit is not defined in the EHCI specification. 0 = EIGHT_BIT 1 = RESERVED
26:25	RO	X	PSPD: This register field indicates the speed at which the port is operating. 00 = Full Speed 01 = Low Speed 10 = High Speed. This bit is not defined in the EHCI specification. 0 = FULL_SPEED 1 = LOW_SPEED 2 = HIGH_SPEED 3 = RESERVED
24	RW	0x0	ALPD: Auto Low Power While Disconnect - RW. Default = 0b. If set, this feature will be enabled, and every time the port enters the disconnect state it will also enter low power state,disabling the transceiver clock. The behavior will be same as if the PHCD bit was enabled (in fact this bit will be set to 1 as soon as low power mode is enabled).When this field is set the WKCN field of PORTSCx register (Wake on Connect Enable) will also be set. This way the core will wake up in case a connect is detected. There will be a delay between the detection of a disconnect and actually enter in low power mode. This delay can be controlled by writing to the ALPDD field in the register USBMODE. 0 = DONT_AUTO_LOW_POWER_WHILE_DISCONNECT 1 = AUTO_LOW_POWER_WHILE_DISCONNECT

Bit	R/W	Reset	Description
23	RW	0x0	PFSC: Port Force Full Speed Connect - RW. Default = 0b. Writing this bit to a '1b' will force the port to only connect at Full Speed. It disables the chirp sequence that allows the port to identify itself as High Speed. This is useful for testing FS configurations with an HS host, hub or device. This bit is not defined in the EHCI specification. 0 = DONT_FORCE_FULL_SPEED 1 = FORCE_FULL_SPEED
22	RW	0x0	PHCD: PHY Low Power Suspend - Clock disable: Writing this bit to a 1 will disable the PHY clock. Write a 0 enables it. Reading this bit will indicate the status of the PHY clock. NOTE: The PHY clock cannot be disabled if it is being used as the system clock. In device mode, the PHY can be put into Low Power Clock Disable when the device is not running (USBCMD RS=0b) or the host has signaled suspend (PORTSCx SUSP=1b). Low Power Clock Disable will be cleared automatically when the host has signaled resume. Before forcing a resume from the device, the Controller driver must clear this bit. In host mode, the PHY can be put into Low Power Suspend Clock Disable when the downstream device has been put into suspend mode or when no downstream device is connected. Low Power Clock Disable is completely under the control of software. 0 = DISABLE 1 = ENABLE
21:20	RW	0x0	LPMX: Auto LPM set - RW. Default = 00b. This bit field is **valid during Host Mode Only**. For Device Mode, this bit is reserved. Value Meaning 00b Disables auto LPM. 01b If there is no activity for a certain number of SOFs the controller will send an LPM token, enter in suspend and issue a port change interrupt. 10b Same as above but without issuing an interrupt. 11b Reserved for futures LPM enhancements. The detection of no activity is based on the absence of response from the downstream device. Because of this limitation this feature should not be used if ISO OUT endpoints are being used (as no handshake is expected).
17	RW	0x0	ASUS: Auto Low Power - RW. Default = 0b. This bit field is **valid during Device Mode Only**. In Host Mode, it is part of the ELPM field. This bit is used to control the auto low power feature. If set, the auto low power feature will be enabled and every time the port enters in suspend state it will also enter in low power state, disabling the transceiver clock. The behavior will be the same as if the PHCD bit was enabled (in fact this bit will be set to '1' as soon as low power mode is enabled). 0 = DISABLE 1 = ENABLE
19:16	RW	0x0	EPLPM: Endpoint for LPM token - RW. Default = 0000b. This bit field is **valid during Host Mode Only**. For Device Mode, bits [19:18] are reserved and bit 17 is ASUS, while bit 16 is STL. This sets the endpoint number to which the LPM token will be sent. It will be directly mapped to the ENDP field in the LPM token with the EXT PID.
16	RW	0x0	STL: STALL reply to LPM token - RW. Default = 0b. This bit field is **valid during Device Mode Only**. In Host Mode, it is part of the ELPM field. When this bit is set to '1', the Controller will reply always with STALL to all incoming LPM tokens. This bit overrides the LPM NYET bit (NYT). 0 = DISABLE 1 = ENABLE
15:12	RW	0x0	LPMFRM: Auto LPM SOF Threshold - RW. Default = 0000b. This bit field is **valid during Host Mode Only**. For Device Mode, this field is reserved. This holds the SOF counter threshold. When the number of SOFs with no activity in between reaches this threshold and the auto LPM is enabled, an LPM token will be sent and the port will enter in suspend state. The SOF counter for this threshold is incremented each 125 µs, even if the port is not in HS operation.
11:1	RO	X	BA: bmAttributes - RO. Default = 00000000000b. This holds the bmAttributes field of the LPM sub-token received, after the EXT PID token.

Bit	R/W	Reset	Description
0	RW	0x0	NYT_ASUS: NYET reply to LPM token - RW. Default = 0b. This bit is NYT during Device Mode. Details follow: When this bit is to '1', the device controller will NYET all the LPM tokens. When this bit is set to '0', the Controller will ACK all the LPM tokens if the STALL bit (STL) is also set to '0'. This bit is ASUS in Host Mode. Details follow: This bit is used to control the auto low power feature. If set, the auto low power feature will be enabled and every time the port enters in suspend state it will also enter in low power state, disabling the transceiver clock. The behavior will be the same as if the PHCD bit was enabled (in fact this bit will be set to '1' as soon as low power mode is enabled). 0 = DISABLE 1 = ENABLE

19.13.1.31 USB2_CONTROLLER_USB2D_OTGSC_0

USB2D On-The-Go (OTG) Status and Control Register

Offset: 0x1f4 | Read/Write: R/W | Reset: 0bx0000000x0000000xxxxxxxxxx100x00

Bit	R/W	Reset	Description
30	RW	0x0	DPIE: Data Pulse Interrupt Enable. Setting this bit enables the Data pulse interrupt. 0 = DISABLE 1 = ENABLE
29	RW	0x0	ONEMSE: 1 millisecond timer Interrupt enable. Setting this bit enables the 1 millisecond timer interrupt. 0 = DISABLE 1 = ENABLE
28	RW	0x0	BSEIE: B Session End Interrupt Enable. Setting this bit enables the B session end interrupt 0 = DISABLE 1 = ENABLE
27	RW	0x0	BSVIE: B Session Valid Interrupt Enable. Setting this bit enables the B session valid interrupt 0 = DISABLE 1 = ENABLE
26	RW	0x0	ASVIE: A Session Valid Interrupt Enable. Setting this bit enables the A session valid interrupt 0 = DISABLE 1 = ENABLE
25	RW	0x0	AVVIE: A VBus Valid Interrupt Enable. Setting this bit enables the A VBus valid interrupt 0 = DISABLE 1 = ENABLE
24	RW	0x0	IDIE: USB ID Interrupt Enable. Setting this bit enables the USB ID interrupt 0 = DISABLE 1 = ENABLE
22	RW	0x0	DPIS: Data Pulse Interrupt Status. This bit is set when data bus pulsing occurs on DP or DM. Data bus pulsing is only detected when USBMODE.CM = Host (11) and PORTSC(0). PortPower = Off (0). Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET
21	RW	0x0	ONEMSS: 1 millisecond timer Interrupt Status: This bit is set once every millisecond. Software writes a 1 to clear it. 0 = INT_CLEAR 1 = INT_SET
20	RW	0x0	BSEIS: B Session End Interrupt Status. This bit is set when VBus has fallen below the B session end threshold. Software writes a 1 to clear this bit . 0 = INT_CLEAR 1 = INT_SET
19	RW	0x0	BSVIS: B Session Valid Interrupt Status. This bit is set when VBus has either risen above or fallen below the B session valid threshold (0.8 VDC). Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET

Bit	R/W	Reset	Description
18	RW	0x0	ASVIS: A Session Valid Interrupt Status. This bit is set when VBus has either risen above or fallen below the A session valid threshold (0.8 VDC). Software writes a one to clear this bit. 0 = INT_CLEAR 1 = INT_SET
17	RW	0x0	AVVIS: A VBus Valid Interrupt Status. This bit is set when VBus has either risen above or fallen below the VBus valid threshold (4.4 VDC) on an A device. Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET
16	RW	0x0	IDIS: USB ID Interrupt Status. This bit is set when a change on the ID input has been detected. Software writes a 1 to clear this bit. 0 = INT_CLEAR 1 = INT_SET
14	RO	X	DPS: Data Bus Pulsing Status. A 1 indicates data bus pulsing is being detected on the port. 0 = STS_CLEAR 1 = STS_SET
13	RO	X	ONEMST: 1 millisecond timer toggle. This bit toggles once per millisecond 0 = STS_CLEAR 1 = STS_SET
12	RO	X	BSE: B session End. Indicates VBus is below the B session end threshold 0 = STS_CLEAR 1 = STS_SET
11	RO	X	BSV: B Session Valid. Indicates VBus is above the B session valid threshold 0 = STS_CLEAR 1 = STS_SET
10	RO	X	ASV: A Session Valid. Indicates VBus is above the A session valid threshold 0 = STS_CLEAR 1 = STS_SET
9	RO	X	AVV: A VBus Valid. Indicates VBus is above the A VBus valid threshold 0 = STS_CLEAR 1 = STS_SET
8	RO	X	ID: USB ID: 0 = A-device 1 = B-device 0 = A_DEV 1 = B_DEV
5	RW	0x1	IDPU: USB ID Pullup 0 = CLEAR 1 = SET
4	RW	0x0	DP: Data Pulsing. Setting this bit causes the pull-up on DP to be asserted for data pulsing during SRP. 0 = NO_DATA_PULSE 1 = DATA_PULSE
3	RW	0x0	OT: OTG Termination. This bit must be set when the OTG device is in device mode, this controls the pulldown on DM. 0 = NO_OTG_TERM 1 = OTG_TERM
1	RW	0x0	VC: VBUS Charge. Setting this bit causes the VBus line to be charged. This is used for VBus pulsing during SRP. 0 = NO_VBUS_CHRG 1 = VBUS_CHRG
0	RW	0x0	VD: VBUS_Discharge. Read/write. Setting this bit causes Vbus to discharge through a resistor. 0 = NO_VBUS_DISCHRG 1 = VBUS_DISCHRG

19.13.1.32 USB2_CONTROLLER_USB2D_USBMODE_0

USB2D USB Device Mode Register

Offset: 0x1f8 | Read/Write: R/W | Reset: 0b00000000000000000xxxxxxxxx0xxxxx

Bit	R/W	Reset	Description
31:16	RW	0x0	ALPDD: Auto Low Power While Disconnect Delay, Used when the ALPD field of the HOSTPCx register is set. Defines the delay between disconnect detection and entering in low power mode. The delay is <this register value>*64*100/3 in milliseconds. The maximum value is 65535*64*100/3 = 139,808 ms. The minimum value is 0. Only used in host mode.
15	RW	0x0	SRT: Shorten USB Reset Time. Software should never set this to 1.
5	RW	0x0	VBPS: VBUS Power Select This can be used by logic that selects between an on-chip Vbus power source (charge pump) and an off-chip source in systems when both are available. Only to be used in Host Mode. No functionality is implemented for this, so software should not use this bit.
4	RO	X	SDIS: Stream disable: 1: Streaming is disabled - helpful to avoid overruns/underruns when the system load is too high. 0 = STREAM_ENABLE 1 = STREAM_DISABLE
3	RO	X	SLOM: Setup Lockout Mode: In device mode, this bit controls the behavior of the setup lockout mechanism. 0: Setup lockout is ON (default). 1: Setup lockout is OFF. Firmware requires the use of setup tripwire semaphore in USB2D_USBCMD register. 0 = LOCKOUT_ON 1 = LOCKOUT_OFF
2	RO	X	ES: Endian Select: Note: For this implementation, this bit should be always set to 0 (little endian). 0 = LITTLE_ENDIAN 1 = RESERVED
1:0	RO	X	CM: Controller Mode: The controller mode will default to an idle state and will need to be initialized to the desired operating mode after reset. This register can only be written once after reset. If it is necessary to switch modes, software must reset the controller by writing to the RESET bit in the USBCMD register before reprogramming this register. 00 = Idle [Default]. 01 = Reserved. 10 = Device Controller. 11 = Host Controller. 0 = IDLE 1 = RESERVED 2 = DEVICE_MODE 3 = HOST_MODE

19.13.1.33 USB2_CONTROLLER_USB2D_ENDPTNAK_0

USB2D Endpoint NAK register

Offset: 0x200 | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:16	0x0	EPTN: TX Endpoint NAK R/WC. Each TX endpoint has 1 bit in this field. The bit is set when the device sends a NAK handshake on a received IN token for the corresponding endpoint. 0 = CLEAR 1 = SET
15:0	0x0	EPRN: RX Endpoint NAK R/WC. Each RX endpoint has 1 bit in this field. The bit is set when the device sends a NAK handshake on a received OUT or PING token for the corresponding endpoint. 0 = CLEAR 1 = SET

19.13.1.34 USB2_CONTROLLER_USB2D_ENDPTNAK_ENABLE_0

USB2D Endpoint NAK Enable register

Offset: 0x204 | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:16	0x0	EPTNE: TX Endpoint NAK Enable R/W. Each bit is an enable bit for the corresponding TX Endpoint NAK bit. If this bit is set and the corresponding TX Endpoint NAK bit is set, the NAK Interrupt bit is set. 0 = DISABLE 1 = ENABLE
15:0	0x0	EPRNE: RX Endpoint NAK Enable R/W. Each bit is an enable bit for the corresponding RX Endpoint NAK bit. If this bit is set and the corresponding RX Endpoint NAK bit is set, the NAK Interrupt bit is set. 0 = DISABLE 1 = ENABLE

19.13.1.35 USB2_CONTROLLER_USB2D_ENDPTSETUPSTAT_0

USB2D Endpoint Setup Status Register

Offset: 0x208 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxx0000000000000000

Bit	Reset	Description
15	0x0	ENDPTSETUPSTAT15: Endpoint 15 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in device mode. 0 = NOT_RCVD 1 = SETUP_RCVD
14	0x0	ENDPTSETUPSTAT14: Endpoint 14 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in device mode. 0 = NOT_RCVD 1 = SETUP_RCVD
13	0x0	ENDPTSETUPSTAT13: Endpoint 13 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in device mode. 0 = NOT_RCVD 1 = SETUP_RCVD
12	0x0	ENDPTSETUPSTAT12: Endpoint 12 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in device mode. 0 = NOT_RCVD 1 = SETUP_RCVD
11	0x0	ENDPTSETUPSTAT11: Endpoint 11 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in device mode. 0 = NOT_RCVD 1 = SETUP_RCVD

Bit	Reset	Description
10	0x0	ENDPTSETUPSTAT10: Endpoint 10 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in device mode. 0 = NOT_RCVD 1 = SETUP_RCVD
9	0x0	ENDPTSETUPSTAT9: Endpoint 9 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in device mode. 0 = NOT_RCVD 1 = SETUP_RCVD
8	0x0	ENDPTSETUPSTAT8: Endpoint 8 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in device mode. 0 = NOT_RCVD 1 = SETUP_RCVD
7	0x0	ENDPTSETUPSTAT7: Endpoint 7 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in device mode. 0 = NOT_RCVD 1 = SETUP_RCVD
6	0x0	ENDPTSETUPSTAT6: Endpoint 6 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in device mode. 0 = NOT_RCVD 1 = SETUP_RCVD
5	0x0	ENDPTSETUPSTAT5: Endpoint 5 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in device mode. 0 = NOT_RCVD 1 = SETUP_RCVD
4	0x0	ENDPTSETUPSTAT4: Endpoint 4 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. The response to a setup packet (as in the order of operations and total response time) is crucial to limit bus time-outs while the setup lock-out mechanism is engaged. This register is only used in device mode. 0 = NOT_RCVD 1 = SETUP_RCVD
3	0x0	ENDPTSETUPSTAT3: Endpoint 3 Setup Status: For every setup transaction that is received, this bit is set to 1. Software must clear or acknowledge the setup transfer by writing a 1 to it after it has read the setup data from Queue head. 19.13.1.38 USB2_CONTROLLER_USB2D_ENDPTSTATUS_0

USB2D Endpoint Status Register

Offset: 0x214 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
31	X	ETBR15: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in device mode. 0 = NOT_READY 1 = READY
30	X	ETBR14: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in device mode. 0 = NOT_READY 1 = READY
29	X	ETBR13: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in device mode. 0 = NOT_READY 1 = READY
28	X	ETBR12: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in device mode. 0 = NOT_READY 1 = READY
27	X	ETBR11: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in device mode. 0 = NOT_READY 1 = READY
26	X	ETBR10: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in device mode. 0 = NOT_READY 1 = READY
25	X	ETBR9: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. There will always be a delay between setting a bit in the ENDPTPRIME register and endpoint indicating ready. This delay time varies based upon the current USB traffic and the number of bits set in the ENDPTPRIME register. Buffer ready is cleared by USB reset, by the USB DMA system, or through the ENDPTFLUSH register. This is only used in device mode. 0 = NOT_READY 1 = READY

Bit	Reset	Description
24	X	ETBR8: Endpoint Transmit Buffer Ready: One bit for each endpoint indicates status of the respective endpoint buffer. This bit is set to a one by the hardware as a response to receiving a command from a corresponding bit in the ENDPTPRIME register. 19.13.1.39 USB2_CONTROLLER_USB2D_ENDPTCOMPLETE_0

USB2D Endpoint Complete Register

Offset: 0x218 | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31	0x0	ETCE15: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in device mode. 0 = NOT_COMPLETE 1 = COMPLETE
30	0x0	ETCE14: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in device mode. 0 = NOT_COMPLETE 1 = COMPLETE
29	0x0	ETCE13: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in device mode. 0 = NOT_COMPLETE 1 = COMPLETE

Bit	Reset	Description
28	0x0	ETCE12: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in device mode. 0 = NOT_COMPLETE 1 = COMPLETE
27	0x0	ETCE11: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in device mode. 0 = NOT_COMPLETE 1 = COMPLETE
26	0x0	ETCE10: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in device mode. 0 = NOT_COMPLETE 1 = COMPLETE
25	0x0	ETCE9: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in device mode. 0 = NOT_COMPLETE 1 = COMPLETE
24	0x0	ETCE8: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. If the corresponding IOC bit is set in the Transfer Descriptor, then this bit will be set simultaneously with the USBINT. Writing a one clears the corresponding bit in this register. This is only used in device mode. 0 = NOT_COMPLETE 1 = COMPLETE
23	0x0	ETCE7: Endpoint Transmit Complete Event: Each bit indicates a transmit event (IN/INTERRUPT) occurred and software should read the corresponding endpoint queue to determine the endpoint status. 19.13.1.40 USB2_CONTROLLER_USB2D_ENDPTCTRL0_0

USB2D Endpoint Control 0 Register

Offset: 0x21c | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
23	X	TXE: TX Endpoint Enable. Endpoint 0 is always enabled. 0 = DISABLE 1 = ENABLE
19:18	X	TXT: TX Endpoint Type. Endpoint 0 is fixed as a Control Endpoint. 0 = CTRL 1 = ISO 2 = BULK 3 = INTR
16	X	TXS: TX Endpoint Stall: Software can write a one to this bit to force the endpoint to return a STALL handshake to the Host. It will continue returning STALL until the bit is cleared by software or it will automatically be cleared upon receipt of a new SETUP request. 0 = EP_OK 1 = EP_STALL
7	X	RXE: RX Endpoint Enable. Endpoint 0 is always enabled. 0 = DISABLE 1 = ENABLE
3:2	X	RXT: RX Endpoint Type. Endpoint 0 is fixed as a Control Endpoint. 0 = CTRL 1 = ISO 2 = BULK 3 = INTR
0	X	RXS: RX Endpoint Stall: Software can write a one to this bit to force the endpoint to return a STALL handshake to the Host. It will continue returning STALL until the bit is cleared by software or it will automatically be cleared upon receipt of a new SETUP request. 0 = EP_OK 1 = EP_STALL

19.13.1.41 USB2_CONTROLLER_USB2D_ENDPTCTRLn_0

USB2D Endpoint Control 1 through 15 registers have the same field definitions and reset value. In the register offset, the value n is the register number (1 through 15).

USB2D Endpoint Control n Register

Offset: 0x220 + (n – 1) * 0x04 | Read/Write: R/W | Reset: 0bxxxxxxxx000x00x0xxxxxxxx000x00x0

Bit	R/W	Reset	Description
23	RW	0x0	TXE: TX Endpoint Enable. An Endpoint should be enabled only after it has been configured. 0 = DISABLE 1 = ENABLE
22	RW	0x0	TXR: TX Data Toggle Reset: Whenever a configuration event is received for this Endpoint, software must write a one to this bit in order to synchronize the data PIDs between the Host and device. 0 = KEEP_GOING 1 = RESET_PID_SEQ
21	RW	0x0	TXI: TX Data Toggle Inhibit: This bit is only used for test and should always be written as zero. Writing a one to this bit will cause this endpoint to ignore the data toggle sequence and always transmit DATA0 for a data packet. 0 = DIS_PID_SEQ 1 = ENB_PID_SEQ
19:18	RW	0x0	TXT: TX Endpoint Type: 00 = Control. 01 = Isochronous. 10 = Bulk. 11 = Interrupt. 0 = CTRL

Bit	R/W	Reset	Description
			1 = ISO 2 = BULK 3 = INTR
17	RO	X	TXD: This bit is fixed to 0.
16	RW	0x0	TXS: TX Endpoint Stall: This bit will be set automatically upon receipt of a SETUP request if this Endpoint is not configured as a Control Endpoint. It will be cleared automatically upon receipt of a SETUP request if this Endpoint is configured as a Control Endpoint. Software can write a one to this bit to force the endpoint to return a STALL handshake to the Host. It will continue to returning STALL until this bit is either cleared by software or automatically cleared as above. 0 = EP_OK 1 = EP_STALL
7	RW	0x0	RXE: RX Endpoint Enable. An Endpoint should be enabled only after it has been configured. 0 = DISABLE 1 = ENABLE
6	RW	0x0	RXR: RX Data Toggle Reset: Whenever a configuration event is received for this Endpoint, software must write a one to this bit in order to synchronize the data PIDs between the host and device. 0 = KEEP_GOING 1 = RESET_PID_SEQ
5	RW	0x0	RXI: RX Data Toggle Inhibit: This bit is only used for test and should always be written as zero. Writing a one to this bit will cause this endpoint to ignore the data toggle sequence and always accept data packet regardless of their data PID. 0 = DIS_PID_SEQ 1 = ENB_PID_SEQ
3:2	RW	0x0	RXT: RX Endpoint Type: 00 = Control. 01 = Isochronous. 10 = Bulk. 11 = Interrupt. 0 = CTRL 1 = ISO 2 = BULK 3 = INTR
1	RO	X	RXD: This bit is fixed to 0.
0	RW	0x0	RXS: RX Endpoint Stall: This bit will be set automatically upon receipt of a SETUP request if this Endpoint is not configured as a Control Endpoint. It will be cleared automatically upon receipt a SETUP request if this Endpoint is configured as a Control Endpoint. Software can write a one to this bit to force the endpoint to return a STALL handshake to the Host. It will continue to returning STALL until this bit is either cleared by software or automatically cleared as above. 0 = EP_OK 1 = EP_STALL

19.13.2 USB1 Controller Interface Registers

These are used to generate the actual RTL registers for USB1 controller interface.

19.13.2.1 USB1_IF_USB_SUSP_CTRL_0

This register controls the suspend and resume behavior of USB controller/PHY.

USB Suspend Control Register

Offset: 0x400 | Read/Write: R/W | Reset: 0bxxxxx00xxxxxx000xxx01000xx000000

Bit	R/W	Reset	Description
26	RW	0x0	FAST_WAKEUP_RESP: Enable Fast Response from UTMIP PHY for a Remote Wakeup request from device. This is used only for cases where wakeup response needs to be within 1 ms of spec. Used for Host mode ONLY. 0 = DISABLE 1 = ENABLE
25	RW	0x0	UTMIP_SUSPL1_SET: Enable SuspendL1 for UTMIP PHY. Enabling this will only cut off clocks to the UTMIP logic. The USB PLLs, PllU and UTMIP PLL will still be running.

Bit	R/W	Reset	Description
			0 = DISABLE 1 = ENABLE
18:16	RW	0x0	USB_WAKEUP_DEBOUNCE_COUNT: USB PHY wakeup debounce counter. USB will debounce any wakeup event by the number of clocks programmed in this counter. A value of 0 results in no debounce.
12	RW	0x0	UTMIP_PHY_ENB: Enable UTMIP PHY mode. Set this to 1 if using UTMIP PHY. Otherwise set this to 0. 0 = DISABLE 1 = ENABLE
11	RW	0x1	UTMIP_RESET: Reset going to UTMIP PHY (active high). This should be set to 1 whenever programming the UTMIP config registers. It should be cleared to 0 after the programming of UTMIP config registers is done. UTMIP config registers should be programmed only once before doing any transactions on USB. The UTMIP PHY registers should be programmed while UTMIP is in reset. 0 = DISABLE 1 = ENABLE
10	RW	0x0	USB_SUSP_POL: Polarity of the suspend signal going to USB PHY. 0 = Active low (default). 1 = Active high. This should not be changed by software. 0 = ACTIVE_LOW 1 = ACTIVE_HIGH
9	RW	0x0	USB_PHY_CLK_VALID_INT_ENB: USB PHY clock valid interrupt enable. If this bit is enabled, interrupt is generated whenever USB clocks are resumed from a suspend. 0 = DISABLE 1 = ENABLE
8	RO	0x0	USB_PHY_CLK_VALID_INT_STS: USB PHY clock valid interrupt status. This bit is set whenever the USB PHY clock is woken up from suspend. Software must write a 1 to clear this bit. 0 = UNSET 1 = SET
7	RO	X	USB_PHY_CLK_VALID: USB PHY clock valid status. This bit indicates whether the USB PHY is generating a valid clock to the USB controller. If USB PHY clock is running, this bit is set to 1, else it is set to 0. 0 = UNSET 1 = SET
6	RO	X	USB_CLKEN: USB AHB clock enable status. Indicates whether the AHB clock to the USB controller is enabled or not. If AHB clock to USB controller is enabled, this bit is set to 1, else it is set to 0. NOTE: even when this is set to 0, all essential blocks that are required to resume USB clocks from suspend will be active and their AHB clock will not be suspended. 0 = UNSET 1 = SET
5	RW	0x0	USB_SUSP_CLR: Suspend Clear. Software must write a 1 to this bit to bring the PHY out of suspend mode. This is used when the software stops the PHY clock during suspend and then wants to initiate a resume. Software should also write 0 to clear it. NOTE: It is required that software generate a positive pulse on this bit to guarantee proper operation. 0 = UNSET 1 = SET
4	RW	0x0	USB_WAKE_ON_DISCON_EN_DEV: Wake on Disconnect Enable (device mode). When enabled (1), the USB device will wake up from suspend on a disconnect event. This is only valid when USB controller is in device mode, it is not applicable when USB controller is in host mode. 0 = DISABLE 1 = ENABLE
3	RW	0x0	USB_WAKE_ON_CNNT_EN_DEV: Wake on Connect Enable (device mode). When enabled (1), USB device will wake up from suspend on a connect event. This is only valid when USB controller is in device mode, it is not applicable when USB controller is in host mode. 0 = DISABLE 1 = ENABLE
2	RW	0x0	USB_WAKE_ON_RESUME_EN: Wake on resume enable. If this bit is enabled, USB will wake up from suspend whenever a resume event is detected on USB. This is valid for both USB device and USB host modes. 0 = DISABLE

Bit	R/W	Reset	Description
			1 = ENABLE
1	RW	0x0	USB_WAKEUP_INT_ENB: USB wakeup interrupt enable. If this bit is enabled, interrupt is generated whenever USB wakeup event is generated. 0 = DISABLE 1 = ENABLE
0	RO	0x0	USB_WAKEUP_INT_STS: USB wakeup interrupt status. This bit is set whenever USB wakes up from suspend (a wakeup event is generated). Software must write a 1 to clear this bit. Note that during the wakeup sequence, PHY clocks will be resumed from suspend. Software can check when the PHY clocks are resumed by reading the bit USB_PHY_CLK_VALID. There is also a separate interrupt generated when PHY clock is resumed if USB_PHY_CLK_VALID_INT_EN is set. During the wakeup sequence, first USB_WAKEUP_INT_STS will be set, and it will take some time for the PHY clock to resume, which can be detected by checking USB_PHY_CLK_VALID. 0 = UNSET 1 = SET

19.13.2.2 USB1_IF_USB_PHY_VBUS_SENSORS_0

This register controls the OTG VBUS sensors in the USB PHY. There are 4 VBUS sensors:

- A_VBUS_VLD
- A_SESS_VLD
- B_SESS_VLD
- B_SESS_END

The debounced status of each sensor can be read from the corresponding _STS bit field of the sensor in this register. The _CHG_DET field is set to 1 whenever a change is detected in the value of the _STS bit field of the corresponding sensor. If _INT_EN is set, then an interrupt is generated to the processor. This interrupt can be routed to CPU/AVP by appropriately writing the USBD bits in the interrupt controller registers.

In case software wants to override the value for a sensor, it can set the corresponding _SW_EN to 1, and set the corresponding sensor _SW_VALUE to 1 or 0 as per the requirement.

There are two debouncers for each sensor - DEBOUNCE_A and DEBOUNCE_B. The debounce values for them are controlled by the register UTMIP_DEBOUNCE_CFG0, fields UTMIP_BIAS_DEBOUNCE_A and UTMIP_BIAS_DEBOUNCE_B. For each sensor, we can select whether to use DEBOUNCE_A or DEBOUNCE_B by setting the field _DEB_SEL_B to the appropriate value (SEL_A or SEL_B).

Note: Do not set either UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B to 0x0. If not using one of the debouncers, keep it at the default value of 0xFFFF.

USB PHY VBUS SENSORS Control Register

Offset: 0x404 | Read/Write: R/W | Reset: 0bx0000x00x0000x00x0000x00x0000x00

Bit	R/W	Reset	Description
30	RW	0x0	A_VBUS_VLD_WAKEUP_EN: A_VBUS_VLD wakeup enable. If this bit is enabled, USB will wake up from suspend whenever a change is detected on A_VBUS_VLD. 0 = DISABLE 1 = ENABLE
29	RW	0x0	A_VBUS_VLD_DEB_SEL_B: A_VBUS_VLD debounce A/B select. Selects between the two debounce values UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B from the register UTMIP_DEBOUNCE_CFG0. 0 = SEL_A 1 = SEL_B
28	RW	0x0	A_VBUS_VLD_SW_VALUE: A_VBUS_VLD software value. Software should write the appropriate value (1/0) to set/unset the A_VBUS_VLD status. This is only valid when A_VBUS_VLD_SW_EN is

Bit	R/W	Reset	Description
			set. 0 = UNSET 1 = SET
27	RW	0x0	A_VBUS_VLD_SW_EN: A_VBUS_VLD software enable. Enable Software Controlled A_VBUS_VLD. Software sets this bit to drive the value in A_VBUS_VLD_SW_VALUE to the USB controller. 0 = DISABLE 1 = ENABLE
26	RO	X	A_VBUS_VLD_STS: A_VBUS_VLD status. This is set to 1 whenever A_VBUS_VLD sensor output is 1. 0 = UNSET 1 = SET
25	RO	0x0	A_VBUS_VLD_CHG_DET: A_VBUS_VLD change detect. This field is set by hardware whenever a change is detected in the value of A_VBUS_VLD. software writes a 1 to clear it 0 = UNSET 1 = SET
24	RW	0x0	A_VBUS_VLD_INT_EN: A_VBUS_VLD interrupt enable. If this field is set to 1, an interrupt is generated whenever A_VBUS_VLD_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE
22	RW	0x0	A_SESS_VLD_WAKEUP_EN: A_SESS_VLD wakeup enable. If this bit is enabled, USB will wake up from suspend whenever a change is detected on A_SESS_VLD. 0 = DISABLE 1 = ENABLE
21	RW	0x0	A_SESS_VLD_DEB_SEL_B: A_SESS_VLD debounce A/B select. Selects between the two debounce values UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B from the register UTMIP_DEBOUNCE_CFG0. 0 = SEL_A 1 = SEL_B
20	RW	0x0	A_SESS_VLD_SW_VALUE: A_SESS_VLD software value. Software should write the appropriate value (1/0) to set/unset the A_SESS_VLD status. This is only valid when A_SESS_VLD_SW_EN is set. 0 = UNSET 1 = SET
19	RW	0x0	A_SESS_VLD_SW_EN: A_SESS_VLD software enable. Enable Software Controlled A_SESS_VLD. Software sets this bit to drive the value in A_SESS_VLD_SW_VALUE to the USB controller. 0 = DISABLE 1 = ENABLE
18	RO	X	A_SESS_VLD_STS: A_SESS_VLD status. This is set to 1 whenever A_SESS_VLD sensor output is 1. 0 = UNSET 1 = SET
17	RO	0x0	A_SESS_VLD_CHG_DET: A_SESS_VLD change detect. This field is set by hardware whenever a change is detected in the value of A_SESS_VLD. software writes a 1 to clear it 0 = UNSET 1 = SET
16	RW	0x0	A_SESS_VLD_INT_EN: A_SESS_VLD interrupt enable. If this field is set to 1, an interrupt is generated whenever A_SESS_VLD_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE
14	RW	0x0	B_SESS_VLD_WAKEUP_EN: B_SESS_VLD wakeup enable. If this bit is enabled, USB will wake up from suspend whenever a change is detected on B_SESS_VLD. 0 = DISABLE 1 = ENABLE
13	RW	0x0	B_SESS_VLD_DEB_SEL_B: B_SESS_VLD debounce A/B select. Selects between the two debounce values UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B from the register UTMIP_DEBOUNCE_CFG0. 0 = SEL_A

Bit	R/W	Reset	Description
			1 = SEL_B
12	RW	0x0	B_SESS_VLD_SW_VALUE: B_SESS_VLD software value. Software should write the appropriate value (1/0) to set/unset the B_SESS_VLD status. This is only valid when B_SESS_VLD_SW_EN is set. 0 = UNSET 1 = SET
11	RW	0x0	B_SESS_VLD_SW_EN: B_SESS_VLD software enable. Enable Software Controlled B_SESS_VLD. Software sets this bit to drive the value in B_SESS_VLD_SW_VALUE to the USB controller. 0 = DISABLE 1 = ENABLE
10	RO	X	B_SESS_VLD_STS: B_SESS_VLD status. This is set to 1 whenever B_SESS_VLD sensor output is 1. 0 = UNSET 1 = SET
9	RO	0x0	B_SESS_VLD_CHG_DET: B_SESS_VLD change detect. This field is set by hardware whenever a change is detected in the value of B_SESS_VLD. software writes a 1 to clear it 0 = UNSET 1 = SET
8	RW	0x0	B_SESS_VLD_INT_EN: B_SESS_VLD interrupt enable. If this field is set to 1, an interrupt is generated whenever B_SESS_VLD_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE
6	RW	0x0	B_SESS_END_WAKEUP_EN: B_SESS_END wakeup enable. If this bit is enabled, USB will wake up from suspend whenever a change is detected on B_SESS_END. 0 = DISABLE 1 = ENABLE
5	RW	0x0	B_SESS_END_DEB_SEL_B: B_SESS_END debounce A/B select. Selects between the two debounce values UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B from the register UTMIP_DEBOUNCE_CFG0. 0 = SEL_A 1 = SEL_B
4	RW	0x0	B_SESS_END_SW_VALUE: B_SESS_END software value. Software should write the appropriate value (1/0) to set/unset the B_SESS_END status. This is only valid when B_SESS_END_SW_EN is set. 0 = UNSET 1 = SET
3	RW	0x0	B_SESS_END_SW_EN: B_SESS_END software enable. Enable Software Controlled B_SESS_END Software sets this bit to drive the value in B_SESS_END_SW_VALUE to the USB controller. 0 = DISABLE 1 = ENABLE
2	RO	X	B_SESS_END_STS: B_SESS_END status. This is set to 1 whenever B_SESS_END sensor output is 1. 0 = UNSET 1 = SET
1	RO	0x0	B_SESS_END_CHG_DET: B_SESS_END change detect. This field is set by hardware whenever a change is detected in the value of B_SESS_END. software writes a 1 to clear it 0 = UNSET 1 = SET
0	RW	0x0	B_SESS_END_INT_EN: B_SESS_END interrupt enable. If this field is set to 1, an interrupt is generated whenever B_SESS_END_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE

19.13.2.3 USB1_IF_USB_PHY_VBUS_WAKEUP_ID_0

This register controls the battery charger (VDCD_DET, VDAT_DET), VBUS_WAKEUP and ID sensors. The following sensors are in this register:

- VBUS_WAKEUP
- ID
- VDAT_DET
- VDCD_DET

The debounced status of each sensor can be read from the corresponding _STS bit field of the sensor in this register. The _CHG_DET field is set to 1 whenever a change is detected in the value of the _STS bit field of the corresponding sensor. If _INT_EN is set, then an interrupt is generated to the processor. This interrupt can be routed to CPU/AVP by appropriately writing the USBD bits in the interrupt controller registers.

In case software wants to override the value for a sensor, it can set the corresponding _SW_EN to 1, and set the corresponding sensor _SW_VALUE to 1 or 0 as per the requirement.

There are two debouncers for each sensor - DEBOUNCE_A and DEBOUNCE_B. The debounce values for them are controlled by the register UTMIP_DEBOUNCE_CFG0, fields UTMIP_BIAS_DEBOUNCE_A and UTMIP_BIAS_DEBOUNCE_B. For each sensor, we can select whether to use DEBOUNCE_A or DEBOUNCE_B by setting the field _DEB_SEL_B to the appropriate value (SEL_A or SEL_B).

Note: Do not set either UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B to 0x0. If not using one of the debouncers, keep it at the default value of 0xFFFF.

There are debouncers for VDAT_DET and VDCD_DET. These use separate debouncers -CHRG_DEBOUNCE_PERIOD_A and CHRG_DEBOUNCE_PERIOD_B. The debounce values for them are controlled by the register UTMIP_CHRG_DEB_CFG0, fields UTMIP_CHRG_DEBOUNCE_PERIOD_A and UTMIP_CHRG_DEBOUNCE_PERIOD_B. For each sensor, we can select whether to use CHRG_DEBOUNCE_PERIOD_A or CHRG_DEBOUNCE_PERIOD_B by setting the field _DEB_SEL_B to the appropriate value (SEL_A or SEL_B).

Note: Do not set either UTMIP_CHRG_DEBOUNCE_PERIOD_A or UTMIP_CHRG_DEBOUNCE_PERIOD_B to 0x0. If not using one of the debouncers, keep it at the default value of 0xFFFF.

USB PHY VBUS Wakeup and ID Control Register

Offset: 0x408 | Read/Write: R/W | Reset: 0b00000x00xx000x00xx000x00x1000x00

Bit	R/W	Reset	Description
31	RW	0x0	DIV_DET_EN: Battery charger divider detection enable. This goes to the USB2OTG pad. 0 = DISABLE 1 = ENABLE
30	RW	0x0	VBUS_WAKEUP_WAKEUP_EN: VBUS_WAKEUP wakeup enable. If this bit is enabled, USB will wake up from suspend whenever a change is detected on VBUS_WAKEUP. 0 = DISABLE 1 = ENABLE
29	RW	0x0	VDCD_DET_DEB_SEL_B: VCDT_DET debounce A/B select. Selects the debounce value from UTMIP_CHRG_DEBOUNCE_PERIOD_A or UTMIP_CHRG_DEBOUNCE_PERIOD_B from the register UTMIP_CHRG_DEB_CFG0. 0 = SEL_A 1 = SEL_B
28	RW	0x0	VDCD_DET_SW_VALUE: VDCD_DET software value. Software should write the appropriate value (1/0) to set/unset the VDCD_DET status. This is only valid when VDCD_DET_SW_EN is set. 0 = UNSET 1 = SET

Bit	R/W	Reset	Description
27	RW	0x0	VDCD_DET_SW_EN: VDCD_DET software enable. Enable Software Controlled VDCD_DET. Software sets this bit to drive the value in VDCD_DET_SW_VALUE to the USB controller 0 = DISABLE 1 = ENABLE
26	RO	X	VDCD_DET_STS: VDCD_DET status. This is set to 1 whenever VDCD_DET sensor output is 1. 0 = UNSET 1 = SET
25	RO	0x0	VDCD_DET_CHG_DET: VDCD_DET change detect. This field is set by hardware whenever a change is detected in the value of VDCD_DET. software writes a 1 to clear it 0 = UNSET 1 = SET
24	RW	0x0	VDCD_DET_INT_EN: VDCD_DET interrupt enable. If this field is set to 1, an interrupt is generated whenever VDCD_DET_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE
23	RO	X	VOP_DIV2P7_DET: This read-only status bit is from the battery charging divider circuit of the USB2OTG pad 0 = UNSET 1 = SET
22	RO	X	VOP_DIV2P0_DET:This read-only status bit is from the battery charging divider circuit of the USB2OTG pad 0 = UNSET 1 = SET
21	RW	0x0	VDAT_DET_DEB_SEL_B: VDAT_DET debounce A/B select. Selects between the two debounce values UTMIP_CHRG_DEBOUNCE_PERIOD_A or UTMIP_CHRG_DEBOUNCE_PERIOD_B from the register UTMIP_DEBOUNCE_CFG0. 0 = SEL_A 1 = SEL_B
20	RW	0x0	VDAT_DET_SW_VALUE: VDAT_DET software value. Software should write the appropriate value (1/0) to set/unset the VDAT_DET status. This is only valid when VDAT_DET_SW_EN is set. 0 = UNSET 1 = SET
19	RW	0x0	VDAT_DET_SW_EN: VDAT_DET software enable. Enable Software Controlled VDAT_DET. Software sets this bit to drive the value in VDAT_DET_SW_VALUE to the USB controller 0 = DISABLE 1 = ENABLE
18	RO	X	VDAT_DET_STS: VDAT_DET status. This is set to 1 whenever the VDAT_DET sensor output is 1. 0 = UNSET 1 = SET
17	RO	0x0	VDAT_DET_CHG_DET: VDAT_DET change detect. This field is set by hardware whenever a change is detected in the value of VDAT_DET. software writes a 1 to clear it 0 = UNSET 1 = SET
16	RW	0x0	VDAT_DET_INT_EN: VDAT_DET interrupt enable. If this field is set to 1, an interrupt is generated whenever VDAT_DET_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE
15	RO	X	VON_DIV2P7_DET: This read-only status bit is from the battery charging divider circuit of the USB2OTG pad 0 = UNSET 1 = SET
14	RO	X	VON_DIV2P0_DET: This read-only status bit is from the battery charging divider circuit of the USB2OTG pad 0 = UNSET 1 = SET
13	RW	0x0	VBUS_WAKEUP_DEB_SEL_B: VBUS_WAKEUP debounce A/B select. Selects between the two debounce values UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B from the register UTMIP_DEBOUNCE_CFG0.

Bit	R/W	Reset	Description
			0 = SEL_A 1 = SEL_B
12	RW	0x0	VBUS_WAKEUP_SW_VALUE: VBUS wakeup software value. Software should write the appropriate value (1/0) to set/unset the VBUS_WAKEUP status. This is only valid when VBUS_WAKEUP_SW_EN is set. 0 = UNSET 1 = SET
11	RW	0x0	VBUS_WAKEUP_SW_EN: VBUS wakeup software enable. Enable Software Controlled VBUS_WAKEUP. Software sets this bit to drive the value in VBUS_WAKEUP_SW_VALUE to the USB controller. 0 = DISABLE 1 = ENABLE
10	RO	X	VBUS_WAKEUP_STS: VBUS wakeup status. This is set to 1 whenever VBUS_WAKEUP sensor output is 1. 0 = UNSET 1 = SET
9	RO	0x0	VBUS_WAKEUP_CHG_DET: VBUS wakeup change detect. This field is set by hardware whenever a change is detected in the value of VBUS_WAKEUP. software writes a 1 to clear it 0 = UNSET 1 = SET
8	RW	0x0	VBUS_WAKEUP_INT_EN: VBUS wakeup interrupt enable. If this field is set to 1, an interrupt is generated whenever VBUS_WAKEUP_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE
7	RO	X	STATIC_GPI: Static GPI status 0 = UNSET 1 = SET
6	RW	0x1	ID_PU: ID pullup enable. Set to 1. 0 = DISABLE 1 = ENABLE
5	RW	0x0	ID_DEB_SEL_B: ID debounce A/B select. Selects between the two debounce values UTMIP_BIAS_DEBOUNCE_A or UTMIP_BIAS_DEBOUNCE_B from the register UTMIP_DEBOUNCE_CFG0. 0 = SEL_A 1 = SEL_B
4	RW	0x0	ID_SW_VALUE: ID software value. Software should write the appropriate value (1/0) to set/unset the ID status. This is only valid when ID_SW_EN is set. 0 = UNSET 1 = SET
3	RW	0x0	ID_SW_EN: ID software enable. Enable Software Controlled ID. Software sets this bit to drive the value in ID_SW_VALUE to the USB controller 0 = DISABLE 1 = ENABLE
2	RO	X	ID_STS: ID status. This is set to 1 whenever ID sensor output is 1. 0 = UNSET 1 = SET
1	RO	0x0	ID_CHG_DET: ID change detect. This field is set by hardware whenever a change is detected in the value of ID. software writes a 1 to clear it 0 = UNSET 1 = SET
0	RW	0x0	ID_INT_EN: ID interrupt enable. If this field is set to 1, an interrupt is generated whenever ID_CHG_DET is set to 1. 0 = DISABLE 1 = ENABLE

19.13.2.4 USB1_IF_USB_PHY_ALT_VBUS_STS_0

USB PHY Alternate VBUS/ID Status Register

Offset: 0x40c | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
14	X	ID_DIG_C_ALT: IDDIG_C alternate status 0 = UNSET 1 = SET
13	X	ID_DIG_C: IDDIG_C status 0 = UNSET 1 = SET
12	X	ID_DIG_B_ALT: IDDIG_B alternate status 0 = UNSET 1 = SET
11	X	ID_DIG_B: IDDIG_B status 0 = UNSET 1 = SET
10	X	ID_DIG_A_ALT: IDDIG_A alternate status 0 = UNSET 1 = SET
9	X	ID_DIG_A: IDDIG_A status 0 = UNSET 1 = SET
8	X	VDCD_DET_ALT: VDCD_DET alternate status 0 = UNSET 1 = SET
7	X	VDAT_DET_ALT: VDAT_DET alternate status 0 = UNSET 1 = SET
6	X	A_SESS_VLD_ALT: A_SESS_VLD alternate status 0 = UNSET 1 = SET
5	X	B_SESS_VLD_ALT: B_SESS_VLD alternate status 0 = UNSET 1 = SET
4	X	ID_DIG_ALT: ID alternate status 0 = UNSET 1 = SET
3	X	B_SESS_END_ALT: B_SESS_END alternate status 0 = UNSET 1 = SET
2	X	STATIC_GPI_ALT: Static GPI alternate status 0 = UNSET 1 = SET
1	X	A_VBUS_VLD_ALT: A_VBUS_VLD alternate status 0 = UNSET 1 = SET
0	X	VBUS_WAKEUP_ALT: Vbus wakeup alternate status 0 = UNSET 1 = SET

19.13.2.5 USB1_IF_USB_INTER_PKT_DELAY_CTRL_0

This controls the interpacket delay between two consecutive transmit packets in HS mode. This only applies to host mode as device never transmits two packets in a row.

Inter Packet Delay Control

Offset: 0x420 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxx0010010

Bit	Reset	Description
6:0	0x12	IP_DELAY_TX2TX_HS: HS Tx to Tx inter-packet delay. Software should not change this.

19.13.2.6 USB1_IF_USB_RSM_DLY_0

USB Controller Resume Signaling Delay

Offset: 0x490 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxx0110100101111000

Bit	Reset	Description
15:0	0x6978	TIME_TO_RESUME: Send the resume back in number of 60 MHz cycles. Default gives 900 µs delay. Only applicable in host mode.

19.13.2.7 USB1_IF_SPARE_0

For ICUSB PADCTLS. Spare Register

Offset: 0x498 | Read/Write: R/W | Reset: 0b11111111111111110000000000000000

Bit	Reset	Description
31:16	0xffff	SPARE_HI: Spare register bits, defaulted to 1. SPARE_HI[0] - usb_port_reset_fix_en. Enable port-reset fix.
15:0	0x0	SPARE_LO: Spare register bits, defaulted to 0. SPARE_LO[4] - usb_hs_rsm_eop_fix_en, Enable HS_RESUME EOP fix. SPARE_LO[5] - usb_port_suspend_fix_en.

19.13.2.8 USB1_IF_USB1_NEW_CONTROL_0

USB Coherency and Memory Alignment Controls

Offset: 0x4c0 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxx00001111xxxxxx00

Bit	Reset	Description
15:8	0xf	REQUEST_EXPIRY_COUNTER: Time to wait for coalescing the request
1	0x0	MEM_ALIGNMENT_MUX_EN: Mux to select between Tegra 3 style (0) and Tegra K1 style (1) DMA request generation mechanism 0 = DISABLE 1 = ENABLE
0	0x0	COHERENCY_EN: Enable fence mechanism. 0 = DISABLE 1 = ENABLE.

19.13.3 USB1 UTMIP Configuration Registers

Note: Current UTMIP configuration registers use settings that support NV software drivers and should NOT be modified. If designing custom drivers, consult your NV representative prior to modifying these registers

19.13.3.1 UTMIP REGISTER: PLL_CFG0

This register was used to configure PLL inside UTMIP block prior to Tegra K1 devices. This has been de-featured from UTMIP space and moved to CAR space. This register is used to configure the PHY PLL contained in the UTMIP module. Refer to the Clock and Reset Controller section for details on this register.

> **Note:** This register has been moved to the Clock and Reset section of this document. PROGRAMMING THIS REGISTER HERE WILL HAVE NO EFFECT!

19.13.3.2 USB1_UTMIP_PLL_CFG1_0

UTMIP PLL and PLLU Configuration Register 1

> **Note:** This register has been moved to the Clock and Reset section of this document. PROGRAMMING THIS REGISTER HERE WILL HAVE NO EFFECT!

This register was used to configure the PLL inside the UTMIP block prior to Tegra K1 devices. This register has been defeatured from UTMIP space and moved to CAR space. Refer to the Clock and Reset Controller section for details on this register.

19.13.3.3 USB1_UTMIP_XCVR_CFG0_0

UTMIP Transceiver Cell Configuration Register 0

Offset: 0x808 | Read/Write: R/W | Reset: 0b00100000001001010110010100000000

Bit	Reset	Description
31:25	0x10	UTMIP_XCVR_HSSLEW_MSB: Most significant bits of HS_SLEW.
24:22	0x0	UTMIP_XCVR_SETUP_MSB: Most significant bits of SETUP.
21	0x1	UTMIP_XCVR_LSBIAS_SEL: Low speed bias selection method for USB transceiver pad
20	0x0	UTMIP_XCVR_DISCON_METHOD: Disconnect method on the USB transceiver pad
19	0x0	UTMIP_FORCE_PDZI_POWERUP: Force PDZI input into power up.
18	0x1	UTMIP_FORCE_PDZI_POWERDOWN: Force PDZI input into power down. (Overrides FORCE_PDZI_POWERUP.)
17	0x0	UTMIP_FORCE_PD2_POWERUP: Force PD2 input into power up.
16	0x1	UTMIP_FORCE_PD2_POWERDOWN: Force PD2 input into power down. (Overrides FORCE_PD2_POWERUP.)
15	0x0	UTMIP_FORCE_PD_POWERUP: Force PD input into power up.
14	0x1	UTMIP_FORCE_PD_POWERDOWN: Force PD input into power down. (Overrides FORCE_PD_POWERUP.)
13	0x1	UTMIP_XCVR_TERMEN: Enable HS termination.
12	0x0	UTMIP_XCVR_HSLOOPBACK: Internal loopback inside XCVR cell. Used for IOBIST.
11:10	0x1	UTMIP_XCVR_LSFSLEW: LS falling slew rate control.
9:8	0x1	UTMIP_XCVR_LSRSLEW: LS rising slew rate control.
7:6	0x0	UTMIP_XCVR_FSSLEW: FS slew rate control.
5:4	0x0	UTMIP_XCVR_HSSLEW: HS slew rate control. The two LSBs.
3:0	0x0	UTMIP_XCVR_SETUP: SETUP[3:0] input of XCVR cell. HS driver output control. 4 LSBs.

19.13.3.4 USB1_UTMIP_BIAS_CFG0_0

UTMIP Bias Cell Configuration Register 0

Offset: 0x80c | Read/Write: R/W | Reset: 0bx00000001100000000000110000000000

Bit	Reset	Description
30	0x0	UTMIP_IDDIG_C_VAL: See IDDIG_C_SEL.
29	0x0	UTMIP_IDDIG_C_SEL: 0: IdDig_c = IdDig_c. 1: IdDig_c = IDDIG_C_VAL.
28	0x0	UTMIP_IDDIG_B_VAL: See IDDIG_B_SEL.
27	0x0	UTMIP_IDDIG_B_SEL: 0: IdDig_b = IdDig_b. 1: IdDig_b = IDDIG_B_VAL.
26	0x0	UTMIP_IDDIG_A_VAL: See IDDIG_A_SEL.
25	0x0	UTMIP_IDDIG_A_SEL: 0: IdDig_a = IdDig_a. 1: IdDig_a = IDDIG_A_VAL.
24	0x0	UTMIP_HSDISCON_LEVEL_MSB: Most significant bit of UTMIP_HSDISCON_LEVEL, bit 2
23	0x1	UTMIP_IDPD_VAL: See IDPD_SEL.
22	0x1	UTMIP_IDPD_SEL: 0: Reserved. Refer to the PMC registers for this feature.
21	0x0	UTMIP_IDDIG_VAL: See IDDIG_SEL.
20	0x0	UTMIP_IDDIG_SEL: 0: IdDig = IdDig. 1: IdDig = IDDIG_VAL.
19	0x0	UTMIP_GPI_VAL: See GPI_SEL.
18	0x0	UTMIP_GPI_SEL: 0: StaticGpi = IdDig. 1: StaticGpi = GPI_VAL.
17:15	0x0	UTMIP_ACTIVE_TERM_OFFSET: Active termination control offset.
14:12	0x0	UTMIP_ACTIVE_PULLUP_OFFSET: Active 1.5K pullup control offset.
11	0x1	UTMIP_OTGPD: Power down OTG circuit.
10	0x1	UTMIP_BIASPD: Power down bias circuit.
9:8	0x0	UTMIP_VBUS_LEVEL_LEVEL: Vbus detector level.
7:6	0x0	UTMIP_SESS_LEVEL_LEVEL: SessionEnd detector level.
5:4	0x0	UTMIP_HSCHIRP_LEVEL: HS chirp detector level.
3:2	0x0	UTMIP_HSDISCON_LEVEL: HS disconnect detector level.
1:0	0x0	UTMIP_HSSQUELCH_LEVEL: HS squelch detector level.

19.13.3.5 USB1_UTMIP_HSRX_CFG0_0

UTMIP High Speed Receive Config 0

Offset: 0x810 | Read/Write: R/W | Reset: 0b10010001011001010011010000000000

Bit	Reset	Description
31:30	0x2	UTMIP_KEEP_PATT_ON_ACTIVE: Keep the stay alive pattern on active
29	0x0	UTMIP_ALLOW_CONSEC_UPDN: Allow consecutive ups and downs on the bits, debug only, set to 0.
28	0x1	UTMIP_REALIGN_ON_NEW_PKT: Realign the inertia counters on a new packet
27:24	0x1	UTMIP_PCOUNT_UPDN_DIV: The number of (edges-1) needed to move the sampling point
23:21	0x3	UTMIP_SQUELCH_EOP_DLY: Limit the delay of the squelch at EOP time
20	0x0	UTMIP_NO_STRIPPING: Do not strip incoming data
19:15	0xa	UTMIP_IDLE_WAIT: Number of idle cycles to declare IDLE.

Bit	Reset	Description
14:10	0xd	UTMIP_ELASTIC_LIMIT: Depth of elastic input store
9	0x0	UTMIP_ELASTIC_OVERRUN_DISABLE: Do not declare overrun errors until overflow of FIFO
8	0x0	UTMIP_ELASTIC_UNDERRUN_DISABLE: Do not declare underrun errors
7	0x0	UTMIP_PASS_CHIRP: When in Chirp Mode, allow chirp RX data through
6	0x0	UTMIP_PASS_FEEDBACK: Pass through the feedback, do not block it.
5:4	0x0	UTMIP_PCOUNT_INERTIA: Retime the path.
3:2	0x0	UTMIP_PHASE_ADJUST: Based on incoming edges and current sampling position, adjust phase
1	0x0	UTMIP_THREE_SYNCBITS: Sync pattern detection needs 3 consecutive samples instead of 4
0	0x0	UTMIP_USE4SYNC_TRAN: Require 4 sync pattern transitions (01) instead of 3

19.13.3.6 USB1_UTMIP_HSRX_CFG1_0

UTMIP High Speed Receive Config 1

Offset: 0x814 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxx010011

Bit	Reset	Description
5:1	0x9	UTMIP_HS_SYNC_START_DLY: How long to wait before start of sync launches RxActive
0	0x1	UTMIP_HS_ALLOW_KEEP_ALIVE: Allow Keep Alive packets

19.13.3.7 USB1_UTMIP_FSLSRX_CFG0_0

UTMIP Full and Low Speed Receive Config 0

Offset: 0x818 | Read/Write: R/W | Reset: 0b11111101010101001000010000101001

Bit	Reset	Description
31	0x1	UTMIP_FSLS_SE1_DRIBBLE_FILTER: One SE1, do not allow dribble
30	0x1	UTMIP_FSLS_SE1_FILTER: Filter SE1
29	0x1	UTMIP_FSLS_SERIAL_SE0_RCV
28:26	0x7	UTMIP_FSLS_UPR_DRIBBLE_SIZE: Do not allow <= dribble bits
25:23	0x2	UTMIP_FSLS_LWR_DRIBBLE_SIZE: Do not allow >= dribble bits
22	0x1	UTMIP_FSLS_EOP_ENDS_AT_SE0: Only look for transitioning out of EOP
21:16	0x14	UTMIP_FSLS_KCOUNT_MAX: Number of K bits in question
15	0x1	UTMIP_FSLS_KCOUNT_LIMIT: Limit the number of bit times a K can last
14	0x0	UTMIP_FSLS_ACTIVE_ON_FULL_SYNC: Require a full sync pattern to declare the data received
13:8	0x4	UTMIP_FSLS_IDLE_WAIT_MAX: 4 bits of SEO should exceed the time limit
7	0x0	UTMIP_FSLS_IDLE_WAIT_LIMIT: Enable the reset of the state machine on extended SE0
6:1	0x14	UTMIP_FSLS_IDLE_COUNT_MAX: 20 bits of idle should end the packet if FsLsIdleCountLimitCfg=1.
0	0x1	UTMIP_FSLS_IDLE_COUNT_LIMIT: Give up on packet if a long sequence of J

19.13.3.8 USB1_UTMIP_FSLSRX_CFG1_0

UTMIP Full and Low Speed Receive Config 1

Offset: 0x81c | Read/Write: R/W | Reset: 0bxxxxx01000100110011101000000000

Bit	Reset	Description
26	0x0	UTMIP_EARLY_LINE_STATE_FILTER: Assumes line state filtering table is inclusive, not exclusive
25:23	0x4	UTMIP_LS_BOUNCE_LENGTH: Number of clock cycle of LS stable
22:17	0x13	UTMIP_LS_EXTRACTION_COUNT: Phase count on which LS bits are extracted
16:11	0xe	UTMIP_LS_EOP_START_COUNT: Number of SEO clock cycles to block bit extraction
10:5	0x20	UTMIP_LS_SE0_COUNT: Only for this number of 60MHz of SEO and Idle to end packet
4	0x0	UTMIP_LS_LENIENT_DRIBBLE: Allow for large dribble in low speed mode
3	0x0	UTMIP_FS_LENIENT_DRIBBLE: Allow for large dribble in full speed mode
2	0x0	UTMIP_FS_WEAK_SYNC: Only look for a KK pattern, instead of KJKK
1	0x0	UTMIP_FS_DEBOUNCE: Whether full speed uses debouncing
0	0x0	UTMIP_FS_EOP_LENGTH: Whether full speed EOP is determined within 3(0) or 4(1) 60MHz cycles

19.13.3.9 USB1_UTMIP_TX_CFG0_0

UTMIP Transmit Config Signals

Offset: 0x820 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxx00010000001000000000

Bit	Reset	Description
19	0x0	UTMIP_FS_PREAMBLE_J: Output enable sends an initial J before sync pattern
18	0x0	UTMIP_FS_POSTAMBLE_OUTPUT_ENABLE: Output enable turns off 1/2 cycle after
17	0x0	UTMIP_FS_PREAMBLE_OUTPUT_ENABLE: Output enable turns on 1/2 cycle before
16	0x1	UTMIP_FSLS_ALLOW_SOP_TX_STUFF_ERR: Allow SOP to be source of transmit error stuffing
15	0x0	UTMIP_HS_READY_WAIT_FOR_VALID
14:10	0x0	UTMIP_HS_TX_IPG_DLY
9	0x1	UTMIP_HS_DISCON_EOP_ONLY: Only check during EOP
8	0x0	UTMIP_HS_DISCON_DISABLE: Disable high speed disconnect
7	0x0	UTMIP_HS_POSTAMBLE_OUTPUT_ENABLE: Output enable turns off 1 cycle after
6	0x0	UTMIP_HS_PREAMBLE_OUTPUT_ENABLE: Output enable turns on 1 cycle before
5	0x0	UTMIP_SIE_RESUME_ON_LINESTATE: SIE, not macrocell, detects LineState change to resume
4	0x0	UTMIP_SOF_ON_NO_STUFF: SOF when OpMode 3 -- perhaps, when sending controller made packets
3	0x0	UTMIP_SOF_ON_NO_ENCODE: SOF when OpMode 2 -- not likely, for Chirp
2	0x0	UTMIP_NO_STUFFING: No bit stuffing, static programming
1	0x0	UTMIP_NO_ENCODING: No encoding, static programming
0	0x0	UTMIP_NO_SYNC_NO_EOP: Do not send SYNC or EOP

19.13.3.10 USB1_UTMIP_MISC_CFG0_0

UTMIP Miscellaneous Configurations

Offset: 0x824 | Read/Write: R/W | Reset: 0bx00000111110000000000000001111000

Bit	Reset	Description
30:27	0x0	UTMIP_DPDM_OBSERVE_SEL: Select DP/DM obs signals
26	0x0	UTMIP_DPDM_OBSERVE: Use DP/DM as obs bus
25	0x1	UTMIP_KEEP_XCVR_PD_ON_SOFT_DISCON
24	0x1	UTMIP_ALLOW_LS_ON_SOFT_DISCON
23	0x1	UTMIP_FORCE_FS_DISABLE_ON_DEV_CHIRP
22	0x1	UTMIP_SUSPEND_EXIT_ON_EDGE: Suspend exit requires edge or simply a value.
21	0x1	UTMIP_LS_TO_FS_SKIP_4MS: Do not block changes for 4 ms when going from LS to FS (should not happen)
20:19	0x0	UTMIP_INJECT_ERROR_TYPE: Force error insertion into RX path. (Used for IOBIST.) 0 = DISABLE 1 = BIT_ERR 2 = RX_ERR 3 = BIT_RX_ERR
18	0x0	UTMIP_FORCE_HS_CLOCK_ON: Force HS clock always on.
17	0x0	UTMIP_DISABLE_HS_TERM: Force HS termination inactive.
16	0x0	UTMIP_FORCE_HS_TERM: Force HS termination active.
15	0x0	UTMIP_DISABLE_PULLUP_DP: Force DP pullup inactive. (Overrides FORCE_PULLUP_DP.)
14	0x0	UTMIP_DISABLE_PULLUP_DM: Force DM pullup inactive. (Overrides FORCE_PULLUP_DM.)
13	0x0	UTMIP_DISABLE_PULLDN_DP: Force DP pulldown inactive. (Overrides FORCE_PULLDN_DP.)
12	0x0	UTMIP_DISABLE_PULLDN_DM: Force DM pulldown inactive. (Overrides FORCE_PULLDN_DM.)
11	0x0	UTMIP_FORCE_PULLUP_DP: Force DP pullup active.
10	0x0	UTMIP_FORCE_PULLUP_DM: Force DM pullup active.
9	0x0	UTMIP_FORCE_PULLDN_DP: Force DP pulldown active.
8	0x0	UTMIP_FORCE_PULLDN_DM: Force DM pulldown active.
7:5	0x3	UTMIP_STABLE_COUNT: Number of cycles of crystal clock of signal not changing to consider stable.
4	0x1	UTMIP_STABLE_ALL: Determines if all signal need to be stable to not change a config.
3	0x1	UTMIP_NO_FREE_ON_SUSPEND: Do not use free running terminations during suspend.
2	0x0	UTMIP_NEVER_FREE_RUNNING_TERMS: Ignore free-running terminations, even when no clock
1	0x0	UTMIP_ALWAYS_FREE_RUNNING_TERMS: Use free-running terminations at all time
0	0x0	UTMIP_COMB_TERMS: Use combinational terminations or synced through CLKXTAL

19.13.3.11 USB1_UTMIP_MISC_CFG1_0

UTMIP Miscellaneous Configurations

Offset: 0x828 | Read/Write: R/W | Reset: 0bx10000000001100110000000000100100

Bit	Reset	Description
30	0x1	UTMIP_PHY_XTAL_CLOCKEN: Selects whether to enable the crystal clock in the module.

Bit	Reset	Description
29	0x0	UTMIP_LINESTATE_BYPASS: Bypass LineState reclocking logic
28	0x0	UTMIP_LINESTATE_NEG: Use negative edge sync for line state
27	0x0	UTMIP_LINESTATE_XCVRSEL3: 0: Use FS filtering on line state when XcvrSel=3 1: Use LS filtering on line state when XcvrSel=3
26:25	0x0	UTMIP_OBS_SEL
24	0x0	UTMIP_FSLS_TDM
23	0x0	UTMIP_FORCE_IOBIST_CLK_ON
22:18	0x6	UTMIP_PLL_ACTIVE_DLY_COUNT: Reserved. Config moved to the Clock and Reset space.
17:6	0x600	UTMIP_PLLU_STABLE_COUNT: Reserved. Moved to the Clock and Reset space.
5	0x1	UTMIP_RX_ERROR_CNT_CLR
4	0x0	UTMIP_RX_ERROR_CNT_EN
3	0x0	UTMIP_FLIP_FSLS_POLARITY
2	0x1	UTMIP_SUSPEND_TERMSEL
1:0	0x0	UTMIP_XCVRSEL3: Bit 0: 0: 0xa5 -> treat as KeepAlive 1: treat as regular packet Bit 1: 0: Turn on FS EOP detection 1: Turn off FS EOP detection

19.13.3.12 USB1_UTMIP_DEBOUNCE_CFG0_0

UTMIP Avalid and Bvalid Debounce

Debounce values IdDig, Avalid, Bvalid, VbusValid, VbusWakeUp, and SessEnd. Each of these signals has its own debouncer, and for each of those one out of 2 debouncing times can be chosen (BIAS_DEBOUNCE_A or BIAS_DEBOUNCE_B.)

The values of DEBOUNCE_A and DEBOUNCE_B are calculated as follows:

0xffff -> No debouncing at all

ms = *1000 / (1/19.2MHz) / 4

So to program a 1 ms debounce for BIAS_DEBOUNCE_A:

BIAS_DEBOUNCE_A[15:0] = 1000 * 19.2 / 4 = 4800 = 0x12c0

Offset: 0x82c | Read/Write: R/W | Reset: 0b11111111111111111111111111111111

Bit	Reset	Description
31:16	0xffff	UTMIP_BIAS_DEBOUNCE_B: simulation value -- Used for interrupts
15:0	0xffff	UTMIP_BIAS_DEBOUNCE_A: simulation value -- Used for interrupts

19.13.3.13 USB1_UTMIP_BAT_CHRG_CFG0_0

UTMIP Battery Charger Configuration

Offset: 0x830 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxx000000xx000001

Bit	Reset	Description
13:8	0x0	UTMIP_CHRG_DEBOUNCE_TIMESCALE: Debouncer time scaling, factor-1 to slow down debouncing by. So 0 is 1, 1 is 2, etc.
5	0x0	UTMIP_OP_I_SRC_EN
4	0x0	UTMIP_ON_SRC_EN

Bit	Reset	Description
3	0x0	UTMIP_OP_SRC_EN
2	0x0	UTMIP_ON_SINK_EN
1	0x0	UTMIP_OP_SINK_EN
0	0x1	UTMIP_PD_CHRG: Power down charger circuit

19.13.3.14 USB1_UTMIP_SPARE_CFG0_0

UTMIP Spare Configuration Bits

Offset: 0x834 | Read/Write: R/W | Reset: 0b11111111111111110000000011111000

Bit	Reset	Description
31:0	-65288	UTMIP_SPARE: Spare register bits 0: HS_RX_IPG_ERROR_ENABLE 1: HS_RX_FLUSH_ALAP. Flush as late as possible 2: HS_RX_LATE_SQUELCH. Delay Squelch by 1 CLK480 cycle. 3: FUSE_SETUP_SEL. Select between regular CFG value and JTAG values for UX_SETUP 4: FUSE_TERM_RANGE_ADJ_SEL. Select between regular CFG value and JTAG values for UX_TERM_RANGE_ADJ 5: FUSE_SPARE. Select between regular CFG value and JTAG values. For any ECOs. 6: FUSE_HS_SQUELCH_LEVEL. Select between regular CFG value and JTAG values 7: FUSE_HS_IREF_CAP_CFG. Select between regular CFG value and JTAG values 31 to 8: Reserved

19.13.3.15 USB1_UTMIP_XCVR_CFG1_0

UTMIP Transceiver Cell Configuration Register 1

Offset: 0x838 | Read/Write: R/W | Reset: 0bxxxx00000001100010000001000010101

Bit	Reset	Description
27:26	0x0	UTMIP_XCVR_RPU_RANGE_ADJ: 1.5k pull-up resistor range shift.
25:24	0x0	UTMIP_XCVR_HS_IREF_CAP: High-speed Iref cap control for bias current stability.
23:22	0x0	UTMIP_XCVR_SPARE: Spare bits for USB transceiver pad.
21:18	0x6	UTMIP_XCVR_TERM_RANGE_ADJ: Range adjustment on terminations.
17	0x0	UTMIP_RCTRL_SW_SET: Use a software override on RCTRL instead of automatic bias control.
16:12	0x8	UTMIP_RCTRL_SW_VAL: Encoded value to use on RCTRL when software override is enabled, 0 to 16 only.
11	0x0	UTMIP_TCTRL_SW_SET: Use a software override on TCTRL instead of automatic bias control
10:6	0x8	UTMIP_TCTRL_SW_VAL: Encoded value to use on TCTRL when software override is enabled, 0 to 16 only.
5	0x0	UTMIP_FORCE_PDDR_POWERUP: Force PDDR input into power up.
4	0x1	UTMIP_FORCE_PDDR_POWERDOWN: Force PDDR input into power down. (Overrides FORCE_PDDR_POWERUP.)
3	0x0	UTMIP_FORCE_PDCHRP_POWERUP: Force PDCHRP input into power up.
2	0x1	UTMIP_FORCE_PDCHRP_POWERDOWN: Force PDCHRP input into power down. (Overrides FORCE_PDCHRP_POWERUP.)
1	0x0	UTMIP_FORCE_PDDISC_POWERUP: Force PDDISC input into power up.

Bit	Reset	Description
0	0x1	UTMIP_FORCE_PDDISC_POWERDOWN: Force PDDISC input into power down. (Overrides FORCE_PDDISC_POWERUP.)

19.13.3.16 USB1_UTMIP_BIAS_CFG1_0

UTMIP Bias Cell Configuration Register 1

Offset: 0x83c | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxx00000000101101

Bit	Reset	Description
13:8	0x0	UTMIP_BIAS_DEBOUNCE_TIMESCALE: Debouncer time scaling. Slows down debouncing by a factor-1. So 0 is 1, 1 is 2, etc.
7:3	0x5	UTMIP_BIAS_PDTRK_COUNT: Control the BIAS cell power down lag. The lag should be 20 µs. For a crystal clock of 13 MHz, it should be set to 5.
2	0x1	UTMIP_VBUS_WAKEUP_POWERDOWN: Reserved. See the PMC registers for this functionality.
1	0x0	UTMIP_FORCE_PDTRK_POWERUP: Force PDTRK input into power up.
0	0x1	UTMIP_FORCE_PDTRK_POWERDOWN: Force PDTRK input into power down. (Overrides FORCE_PDTRK_POWERUP.)

19.13.3.17 USB1_UTMIP_BIAS_STS0_0

UTMIP Bias Cell Status Register 0

Offset: 0x840 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
31:16	X	UTMIP_TCTRL: Thermal encoding output from USB bias pad.
15:0	X	UTMIP_RCTRL: Thermal encoding output from USB bias pad.

19.13.3.18 USB1_UTMIP_CHRG_DEB_CFG0_0

UTMIP VDcd_Det and VDat_Det Debounce

Debounce values VDcd_Det and VDat_Det. Each of these signals has its own debouncer and for each of those, 1 out of 2 debouncing times can be chosen (CHRG_DEBOUNCE_PERIOD_A or CHRG_DEBOUNCE_PERIOD_B).

The values of DEBOUNCE_PERIOD_A and DEBOUNCE_PERIOD_B are calculated as follows:

0xffff -> No debouncing at all

ms = *1000 / (1/19.2MHz) / 4

So to program a 1 ms debounce for CHG_DEBOUNCE_PERIOD:

CHG_DEBOUNCE_PERIOD[15:0] = 1000 * 19.2 / 4 = 4800 = 0x12c0

Offset: 0x844 | Read/Write: R/W | Reset: 0b11111111111111111111111111111111

Bit	Reset	Description
31:16	0xffff	UTMIP_CHRG_DEBOUNCE_PERIOD_B: Simulation value -- Used for interrupts
15:0	0xffff	UTMIP_CHRG_DEBOUNCE_PERIOD_A: Simulation value -- Used for interrupts

19.13.3.19 USB1_UTMIP_MISC_STS0_0

UTMIP MISC Status Register

Offset: 0x848 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
21	X	UTMIP_FS_DRV_EN: Indicates when the controller is driving on the bus
20:0	X	UTMIP_SPARE_FUSES: Spare Fuses value to keep the connections preserved

19.13.3.20 USB1_UTMIP_PMC_WAKEUP0_0

UTMIP PMC Wakeup value

Offset: 0x84c | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx0

Bit	R/W	Reset	Description
1	RO	X	UTMIP_LINE_WAKEUP_EVENT_INT_STS: Indicates the status of the PMC wakeup event
0	RW	0x0	UTMIP_LINE_WAKEUP_EVENT_INT_ENB: Interrupt mask for the PMC wakeup event

19.13.3.21 USB2_QH_USB2D_QH_EP_n_OUT_0

USB2D Queue Head for OUT Endpoint n

There are 16 USB2D Queue Head for OUT Endpoint registers, where n = 0 through 15.

Offset: 0x1000 + (n * 0x80) | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:0	0x0	USB2D_QH: Queue Head for OUT endpoint n. This is used to store a local Queue Head data structure for either device mode or host mode. In device mode, it holds the Queue Head for OUT endpoint n.

19.13.3.22 USB2_QH_USB2D_QH_EP_n_IN_0

USB2D Queue Head for IN Endpoint n

There are 16 USB2D Queue Head for IN Endpoint registers, where n = 0 through 15.

Offset: 0x1040 | Read/Write: R/W | Reset: 0b00000000000000000000000000000000

Bit	Reset	Description
31:0	0x0	USB2D_QH: Queue Head for IN endpoint n. This is used to store a local Queue Head data structure for either device mode or host mode. In device mode, it holds the Queue Head for IN endpoint n.

19.13.4 USB2 Controller Registers

19.13.4.1 USB2_CONTROLLER_1_USB2D_ID_0

USB2D Identification Register

Offset: 0x0 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
31:29	X	CIVERSION: Identifies the CI version

Bit	Reset	Description
28:25	X	VERSION: Identifies the version of the core
24:21	X	REVISION: Revision number of the USB controller. This is set to 0x0.
20:16	X	TAG: Identifies the tag of the core
15:8	X	NID: One's complement version of ID. This field is set to 0xF9.
7:0	X	ID: Configuration number. This field is set to 0x06

19.13.4.2 USB2_CONTROLLER_1_USB2D_HW_HOST_0

USB2D Hardware Host Register

Offset: 0x8 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
3:1	X	NPORT: VUSB_HS_NUM_PORT-1: This host controller has only 1 port. So this field will always be 0.
0	X	HC: VUSB_HS_HOST: Indicates support for host mode. Set to 1.

19.13.4.3 USB2_CONTROLLER_1_USB2D_HW_DEVICE_0

USB2D Hardware Device Register

Offset: 0xc | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
5:1	X	DEVEP: VUSB_HS_DV_EP: Number of endpoints supported by this device controller. Set to 16. This includes control endpoint 0.
0	X	DC: Device capable: Set to 1 indicating support for device mode.

19.13.4.4 USB2_CONTROLLER_1_USB2D_HW_TXBUF_0

USB2D Hardware TX Buffer Register

Offset: 0x10 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
23:16	X	TXCHANADD: VUSB_HS_TX_CHAN_ADD: Total number of address bits for the transmit buffer of each transmit endpoint. Set to 7. Each transmit buffer is 128 words deep.
15:8	X	TXADD: VUSB_HS_TX_ADD: Total number of address bits for the transmit buffer. Set to 11. The total depth of the transmit buffer is 2048 words.
7:0	X	TCBURST: VUSB_HS_TX_BURST: Maximum burst size supported by the transmit endpoints for data transfers. Set to 8.

19.13.4.5 USB2_CONTROLLER_1_USB2D_HW_RXBUF_0

USB2D RX Buffer HW Parameters Register

Offset: 0x14 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
15:8	X	RXADD: VUSB_HS_RX_ADD: Total number of address bits for the receive buffer. Set to 7. The total depth of the receive buffer is 128 words.

Bit	Reset	Description
7:0	X	RXBURST: VUSB_HS_RX_BURST: Maximum burst size supported by the receive endpoints for data transfers. Set to 8.

19.13.4.6 USB2_CONTROLLER_1_USB2D_GPTIMER0LD_0

The host/device controller drivers can measure time-related activities using these timer registers. These registers are not part of the standard EHCI controller.

Offset: 0x80 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000)

Bit	Reset	Description
23:0	0x0	GPTIMER0LD: This field has the value to be loaded into the GPTCNT countdown timer on a reset action. The value in this register represents the time in microseconds minus 1 for the timer duration .

19.13.4.7 USB2_CONTROLLER_1_USB2D_GPTIMER0CTRL_0

Offset: 0x84 | Read/Write: R/W | Reset: 0x00XXXXXX (0b00xxxxx0xxxxxxxxxxxxxxxxxxxxxx)

Bit	R/W	Reset	Description
31	RW	0x0	GTPRUN: This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT counter value.
30	WO	0x0	GPTRST: Writing a one to this bit reloads the GPTCNT with the value in GPTLD.
24	RW	0x0	GPTMODE: This bit selects between a single timer countdown and a looped countdown. In one-shot mode, the timer counts down to zero, generates an interrupt, and stops until the counter is reset by software. In repeat mode, the timer counts down to zero, generates an interrupt, and automatically reloads the counter to begin again.
23:0	RO	X	GPTCNT: This field has the value of the running timer.

19.13.4.8 USB2_CONTROLLER_1_USB2D_GPTIMER1LD_0

Offset: 0x88 | Read/Write: R/W | Reset: 0x00000000 (0b00000000000000000000000000)

Bit	Reset	Description
23:0	0x0	GPTIMER1LD: This field has the value to be loaded into the GPTCNT countdown timer on a reset action. The value in this register represents the time in microseconds minus 1 for the timer duration .

19.13.4.9 USB2_CONTROLLER_1_USB2D_GPTIMER1CTRL_0

Offset: 0x8c | Read/Write: R/W | Reset: 0x00XXXXXX (0b00xxxxx0xxxxxxxxxxxxxxxxxxxxxx)

Bit	R/W	Reset	Description
31	RW	0x0	GTPRUN: This bit enables the general-purpose timer to run. Setting or clearing this bit will not have an effect on the GPTCNT counter value.
30	WO	0x0	GPTRST: Writing a one to this bit reloads the GPTCNT with the value in GPTLD.
24	RW	0x0	GPTMODE: This bit selects between a single timer countdown and a looped countdown. In one-shot mode, the timer counts down to zero, generates an interrupt, and stops until the counter is reset by software. In repeat mode, the timer counts down to zero, generates an interrupt, and automatically reloads the counter to begin again.
23:0	RO	X	GPTCNT: This field has the value of the running timer.

19.13.4.10 USB2_CONTROLLER_1_USB2D_CAPLENGTH_0

USB2D Capability Register Length Register

Offset: 0x100 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
7:0	X	CAPLENGTH: Indicates which offset to add to the register base address at the beginning of the Operational Register. Set to 0x30.

19.13.4.11 USB2_CONTROLLER_1_USB2D_HCIVERSON_0

USB2D Host Interface Version Number Register

Offset: 0x102 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
15:0	X	HCIVERSION: Contains a BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision. This host controller supports EHCI revision 1.00.

19.13.4.12 USB2_CONTROLLER_1_USB2D_HCSPARAMS_0

USB2D Host Control Structural Parameters Register

Offset: 0x104 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
27:24	X	N_TT: Number of Transaction Translators: Indicates the number of embedded transaction translators associated with the USB2.0 host controller. This field is always set to 1 indicating only 1 embedded TT is implemented in this implementation. This is a non-EHCI field to support embedded TT.
23:20	X	N_PTT: Number of Ports per Transaction Translator: Indicates the number of ports assigned to each transaction translator within the USB2.0 host controller. Field always equals N_PORTS. This is a non-EHCI field to support embedded TT.
15:12	X	N_CC: Number of Companion Controller: Indicates the number of companion controllers. This field is set to 0.
11:8	X	N_PCC: Number of Ports per Companion Controller: Indicates the number of ports supported per internal companion controller. This field is set to 0.
4	X	PPC: Port Power Control: Indicates whether the host controller implementation includes port power control. 1 = Ports have port power switches 0= Ports do not have port power switches. This field affects the functionality of the port Power field in each port status and control register. This field is set to 1.
3:0	X	N_PORTS: Number of downstream ports. This field specifies the number of physical downstream ports implemented on this host controller. This field is fixed to 1, since this host controller only supports 1 port.

19.13.4.13 USB2_CONTROLLER_1_USB2D_HCCPARAMS_0

USB2D Host Control Capability Parameters Register

Offset: 0x108 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
18	X	PPC: Per-Port Change Event Capability. Default = 1b. This field indicates the support for per-port change events. This field is related to the USBCMD PPE field, USBSTS PPCI field, and USBINTR PPCE field.

Bit	Reset	Description
17	X	LEN: Link Power Management Capability. Default = 1b. This field indicates the support for LPM L1 state. This field is related to the USBCMD HIRD field, POSTSCx SSTS and DA fields, and HOSTPCx LEN, BA, and EPLPM fields.
15:8	X	EECP: EHCI Extended Capabilities Pointer: Indicates a capabilities list exists. A value of 00h indicates no extended capabilities are implemented. For this implementation this field is always "0".
7:4	X	IST: Isochronous Scheduling Threshold. This field indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is zero, the value of the least significant 3 bits indicates the number of micro-frames a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is a one, then host software assumes the host controller may cache an isochronous data structure for an entire frame. This field will always be "0".
2	X	ASP: Asynchronous Schedule Park Capability. 1 = (Default) the host controller supports the park feature for high-speed queue heads in the Asynchronous Schedule. The feature can be disabled or enabled and set to a specific level by using the Asynchronous Schedule Park Mode Enable and Asynchronous Schedule Park Mode Count fields in the USBCMD register. This field is always 1.
1	X	PFL: Programmable Frame List Flag. 0 = System software must use a frame list length of 1024 elements with this host controller. The USBCMD register Frame List Size field is a read-only register and must be set to zero. 1 = System software can specify and use a smaller frame list and configure the host controller via the USBCMD register Frame List Size field. The frame list must always be aligned on a 4K-page boundary. This requirement ensures that the frame list is always physically contiguous. This field will always be "1".

19.13.4.14 USB2_CONTROLLER_1_USB2D_DCIVERSION_0

USB2D Device Interface Version Number Register

Offset: 0x120 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
15:0	X	DCIVERSION: The device controller interface conforms to the two-byte BCD encoding of the interface version number contained in this register.

19.13.4.15 USB2_CONTROLLER_1_USB2D_DCCPARAMS_0

USB2D Device Control Capabilities Register

Offset: 0x124 | Read/Write: RO | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Bit	Reset	Description
8	X	HC: Host Capable: 1 = This controller is capable of operating as an EHCI compatible USB 2 0 host controller operating as an EHCI compatible USB 2.0 host controller. This field is set to 1.
7	X	DC: Device Capable: 1 = Controller is capable of operating as USB 2.0 device. This field is set to 1
5	X	LEN: Link Power Management Capability - RO. Default = 1b. This field indicates the support for LPM L1 state. This field is related to the DEVLCx ASUS, STL,BA and NYT fields.
4:0	X	DEN: Device Endpoint Number: Number of endpoints built into the device controller. This is set to 16.

19.13.4.16 USB2_CONTROLLER_1_USB2D_EXTSTS_0

USB2D EXTSTS Register

Offset: 0x128 | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx0000x

Bit	R/W	Reset	Description
4	RW	0x0	TI1: General Purpose Timer Interrupt 1 - RWC. Default = 0b. This bit is set when the counter in the GPTIMER1CTRL register transitions to zero. Writing a one to this bit will clear it.
3	RW	0x0	TI0: General Purpose Timer Interrupt 0 - RWC. Default = 0b. This bit is set when the counter in the GPTIMER1CTRL register transitions to zero. Writing a one to this bit will clear it.
2	RW	0x0	UPA: USB Host Periodic Interrupt (USBHSTPERINT) R/WC. This bit is set by the Host Controller when the cause of an interrupt is a completion of a USB transaction where the Transfer Descriptor (TD) has an interrupt on complete (IOC) bit set and the TD was from the periodic schedule. This bit is also set by the Host Controller when a short packet is detected AND the packet is on the periodic schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be zero. 0 = DISABLE 1 = ENABLE
1	RW	0x0	UAI: USB Host Asynchronous Interrupt (USBHSTASYNCINT) R/WC. This bit is set by the Host Controller when the cause of an interrupt is a completion of a USB transaction where the Transfer Descriptor (TD) has an interrupt on complete (IOC) bit set AND the TD was from the asynchronous schedule. This bit is also set by the Host when a short packet is detected AND the packet is on the asynchronous schedule. A short packet is when the actual number of bytes received was less than the expected number of bytes. This bit is not used by the device controller and will always be zero. 0 = DISABLE 1 = ENABLE
0	RO	X	NAKI: NAK Interrupt Bit Read Only. This bit is read only. It is set by hardware when for a particular endpoint both the TX/RX Endpoint NAK bit and the corresponding TX/RX Endpoint NAK Enable bit are set. This bit is automatically cleared by hardware when the all the enabled TX/RX Endpoint NAK bits are cleared. 0 = DISABLE 1 = ENABLE

19.13.4.17 USB2_CONTROLLER_1_USB2D_USBEXTINTR_0

USB2D EXTINTR Register

Offset: 0x12c | Read/Write: R/W | Reset: 0bxxxxxxxxxxxxxxxxxxxxxxxxxxxx00000

Bit	Reset	Description
4	0x0	TIE1: General Purpose Timer Interrupt Enable 1 - RWC. Default = 0b. When this bit is a one, and the TI1 bit in the EXTSTS register is a one, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the TI1 bit.
3	0x0	TIE0: General Purpose Timer Interrupt Enable 0 - RWC. Default = 0b. When this bit is a one, and the TI1 bit in the EXTSTS register is a one, the controller will issue an interrupt. The interrupt is acknowledged by software clearing the TI1 bit.
2	0x0	UPIE: UPIE Interrupt Enable. 1 = USB controller issues an interrupt if the UPA bit in USBSTS register transitions. 0 = DISABLE 1 = ENABLE
1	0x0	UAIE: UAIE Interrupt Enable. 1 = USB controller issues an interrupt if the UAI bit in USBSTS register transitions. 0 = DISABLE 1 = ENABLE
0	0x0	NAKE: NAK Interrupt Enable. 1 = USB controller issues an interrupt if the NAKI bit in USBSTS register transitions. 0 = DISABLE 1 = ENABLE

19.13.4.18 USB2_CONTROLLER_1_USB2D_USBCMD_0

USB2D USB Command Register

Offset: 0x130 | Read/Write: R/W | Reset: 0bxxxx000000001000000x1x11x0000000

Bit	R/W	Reset	Description
27:24	RW	0x0	HIRD: Host Initiated Resume Duration RW. Default = 0000b. This has the same behavior as bits 7:4 of the BA field of the HOSTPCx register. When writing to this field all BA[7:4] fields of all HOSTPCx registers will be set to this value. This field is used by system software to specify the minimum amount of time the host controller will drive the K-state during a host-initiated resume from an LPM state (e.g., L1), and is conveyed to each LPM-enabled device (via the HIRD bits within an LPM Tokens bmAttributes field) upon entry into a low-power state. Note the host controller is required to drive resume signaling for at least the amount of time specified in the HIRD value conveyed to the device during any proceeding host-initiated resume. Also note that the host controller is not required to observe this requirement during device-initiated resumes. Encoding for this field is identical to the definition for the similarly named HIRD field within an LPM Token, specifically: a value 0000b equals 50µs and each additional increment adds 75µs. For example, the value 0001b equals 125µs, and a value 1111b equals 1,175µs (~1.2ms).
23:16	RW	0x8	ITC: Interrupt Threshold Control .Read/Write. Default 08h. The system software uses this field to set the maximum rate at which the host/device controller will issue interrupts. ITC contains the maximum interrupt interval measured in micro-frames. Valid values are shown below. Value Maximum Interrupt Interval 00h Immediate (no threshold) 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames 10h 16 micro-frames 20h 32 micro-frames 40h 64 micro-frames 0 = IMMEDIATE 2 = ONE_MF 4 = TWO_MF 8 = EIGHT_MF 16 = SIXTEEN_MF 32 = THIRTY_TWO_MF 64 = SIXTY_FOUR_MF
15	RW	0x0	FS2: Bit 2 of Frame List Size.
14	RW	0x0	ATDTW: Add DTD Tripwire. This bit is used as a semaphore when a dTD is added to an active (primed) endpoint. This bit is set and cleared by software and will be cleared by hardware when a hazard exists such that adding a dTD to a primed endpoint may go unnoticed. 0 = CLEAR 1 = SET
13	RW	0x0	SUTW: Setup Tripwire. This bit is used as a semaphore when the 8 bytes of setup data read extracted by the firmware. If the setup lockout mode is off, then there exists a hazard when new setup data arrives and firmware is copying setup data from the QH for a previous setup packet. This bit is set and cleared by software and will be cleared by hardware when a hazard exists. 0 = CLEAR 1 = SET
11	RW	0x1	ASPE: Asynchronous Schedule Park mode Enable. Software uses this bit to enable or disable Park mode. When this bit is one, Park mode is enabled. When this bit is a zero, Park mode is disabled. This field is set to "1" in this implementation. 0 = DISABLE 1 = ENABLE
9:8	RW	0x3	ASP1_ASP0: Asynchronous Schedule Park Mode Count (OPTIONAL) Read/Write. If the Asynchronous Park Capability bit in the HCCPARAMS register is a one, then this field defaults to 3h and is R/W. Otherwise it defaults to zero and is RO. It contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the Asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid values are 1h to 3h. Software must not write a zero to this bit when Park Mode Enable is a one as

Bit	R/W	Reset	Description
			this will result in undefined behavior. This field is set to 3h in this implementation and is Read/Write capable.
7	RO	X	LR: Light Host/Device Controller Reset (OPTIONAL) . Read Only. Not Implemented. This field will always be "0".
6	RW	0x0	IAA: Interrupt on Async Advance Doorbell. When the host controller has evicted all appropriate cached schedule states, it sets the Interrupt on Async Advance status bit in the USBSTS register. If the Interrupt on Sync Advance Enable bit in the USBINTR register is one, then the host controller will assert an interrupt at the next interrupt threshold. The host controller sets this bit to zero after it has set the Interrupt on Sync Advance status bit in the USBSTS register to one. Software should not write a one to this bit when the asynchronous schedule is inactive. Doing so will yield undefined results. This bit is only used in host mode. Writing a one to this bit when device mode is selected will have undefined results. 0 = CLEAR 1 = SET
5	RW	0x0	ASE: Asynchronous Schedule Enable. This bit controls whether the host controller skips processing the Asynchronous Schedule. 0 = Do not process the Asynchronous Schedule. 1 = Use the ASYNCLISTADDR register to access the Asynchronous Schedule. Only the host controller uses this bit. 0 = DISABLE 1 = ENABLE
4	RW	0x0	PSE: Periodic Schedule Enable. This bit controls whether the host controller skips processing the Periodic Schedule. 0 = Do not process the Periodic Schedule 1 = Use the PERIODICLISTBASE register to access the Periodic Schedule. Only the host controller uses this bit. 0 = DISABLE 1 = ENABLE
