10.3.7.1.8.4 Fields

Field	Function
31-0 CMDRSP2	Command response 2 See Command Response3 (CMD_RSP3) for the mapping of command responses from the SD bus to this register for each response type.

10.3.7.1.9 Command Response3 (CMD_RSP3)

10.3.7.1.9.1 Offset

Register	Offset
CMD_RSP3	1Ch

10.3.7.1.9.2 Function

This register is used to store part 3 of the response bits from the card.

The table below describes the mapping of command responses from the SD bus to Command Response registers for each response type. In this table, R[ ] refers to a bit range within the response data as transmitted on the SD bus.

Table 10-43. Response bit definition for each response type

Response type	Meaning of response	Response field	Response register
R1,R1b (normal response)	Card status	R[39:8]	CMDRSP0
R1b (auto CMD12 response)	Card status for auto CMD12	R[39:8]	CMDRSP3
R2 (CID, CSD register)	CID/CSD register [127:8]	R[127:8]	{CMDRSP3[23:0], CMDRSP2, CMDRSP1, CMDRSP0}
R3 (OCR register)	OCR register for memory	R[39:8]	CMDRSP0
R4 (OCR register)	OCR register for I/O etc.	R[39:8]	CMDRSP0
R5, R5b	SDIO response	R[39:8]	CMDRSP0
R6 (publish RCA)	New published RCA[31:16] and card status[15:0]	R[39:9]	CMDRSP0

This table shows that most responses with a length of 48 (R[47:0]) have 32-bits of the response data (R[39:8]) stored in the CMDRSP0 register. Responses of type R1b (Auto CMD12 responses) have response data bits (R[39:8]) stored in the CMDRSP3 register. Responses with length 136 (R[135:0]) have 120-bits of the response data (R[127:8]) stored in the CMDRSP0, 1, 2, and 3 registers.

To be able to read the response status efficiently, uSDHC only stores part of the response data in the Command Response registers. This enables the host driver to efficiently read 32-bits of response data in one read cycle on a 32-bit bus system. Parts of the response, the Index field and the CRC, are checked by uSDHC (as specified by the Command Index Check Enable and the Command CRC Check Enable bits in the Transfer Type register) and generate an error interrupt if any error is detected. The bit range for the CRC check depends on the response length. If the response length is 48, uSDHC checks R[47:1], and if the response length is 136 the uSDHC checks R[119:1].

Because uSDHC may have a multiple block data transfer executing concurrently with a CMD_wo_DAT command, uSDHC stores the Auto CMD12 response in the CMDRSP3 register. The CMD_wo_DAT response is stored in CMDRSP0. This allows uSDHC to

avoid overwriting the Auto CMD12 response with the CMD_wo_DAT and vice versa. When uSDHC modifies part of the Command Response registers, as shown in the table above, it preserves the unmodified bits.

10.3.7.1.9.3 Diagram

10.3.7.1.10.4 Fields

Field	Function
31-0 DATCONT	Data content The Buffer Data Port register is for 32-bit data access by the Arm platform or the external DMA. When the internal DMA is enabled, any write to this register is ignored, and any read from this register always yields 0s.

10.3.7.1.11 Present State (PRES_STATE)

10.3.7.1.11.1 Offset

Register	Offset
PRES_STATE	24h

10.3.7.1.11.2 Function

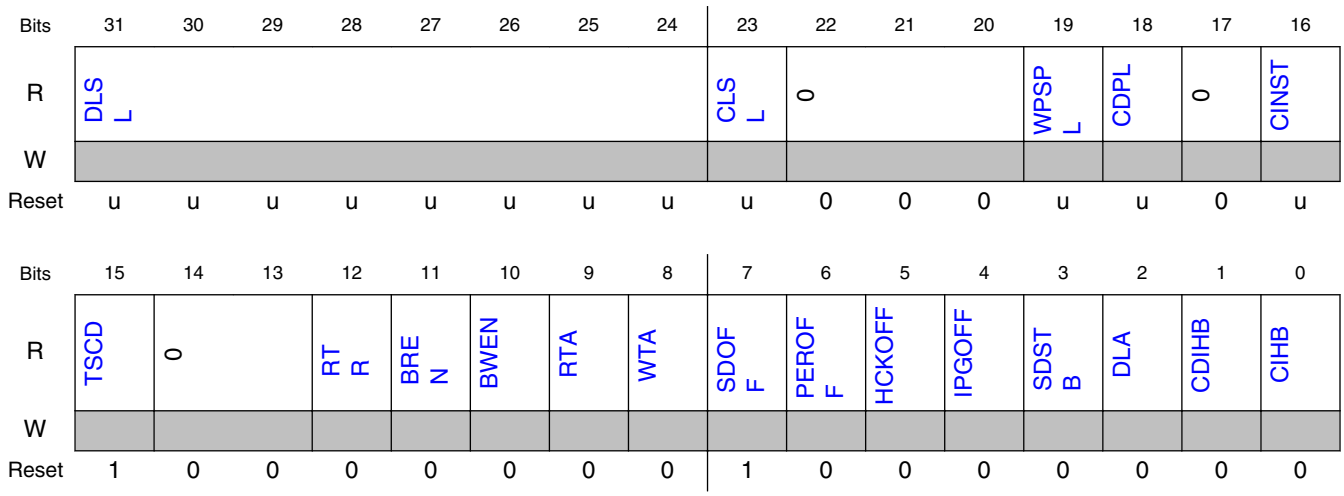
The host driver can get status of uSDHC from this 32-bit read only register.

The host driver can issue CMD0, CMD12, CMD13 (for memory) and CMD52 (for SDIO) when the DATA lines are busy during a data transfer. These commands can be issued when Command Inhibit (CMD) is set to zero. Other commands are issued when Command Inhibit (DATA) is set to zero. Possible changes to the SD Physical Specification may add other commands to this list in the future.

NOTE

The reset value of Present State register depends on board connectivity.

10.3.7.1.11.3 Diagram



10.3.7.1.11.4 Fields

Field	Function
31-24 DLSL	DATA[7:0] line signal level This status is used to check the DATA line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DATA0. The reset value is affected by the external pull-up / pull-down resistors. By default, the read value of this field field after reset is 8'b11110111, when DATA3 is pulled down and the other lines are pulled up. 00000000b - Data 0 line signal level 00000001b - Data 1 line signal level 00000010b - Data 2 line signal level 00000011b - Data 3 line signal level 00000100b - Data 4 line signal level 00000101b - Data 5 line signal level 00000110b - Data 6 line signal level 00000111b - Data 7 line signal level
23 CLSL	CMD line signal level This status is used to check the CMD line level to recover from errors, and for debugging. The reset value is affected by the external pull-up / pull-down resistor, by default, the read value of this field after reset is 1'b1, when the command line is pulled up.
22-20 —	Reserved
19 WPSPL	Write protect switch pin level The Write Protect switch is supported for memory and combo cards. This field reflects the inverted value of the WP pin of the card socket. A software reset does not affect this field. The reset value is affected by the external write protect switch. If the WP pin is not used, it should be tied low, so that the reset value of this field is high and write is enabled. 0b - Write protected (WP = 1) 1b - Write enabled (WP = 0)

Table continues on the next page...

Field	Function
18 CDPL	Card detect pin level This field reflects the inverse value of the CD_B pin for the card socket. Debouncing is not performed on this field. This field may be valid, but is not guaranteed, because of propagation delay. Use of this field is limited to testing because it must be debounced by software. A software reset does not affect this field. A write to the Force Event Register does not affect this field. The reset value is affected by the external card detection pin. This field shows the value on the CD_B pin (that is, when a card is inserted in the socket, it is 0 on the CD_B input, and consequently, the CDPL reads 1. 0b - No card present (CD_B = 1) 1b - Card present (CD_B = 0)
17 —	Reserved
16 CINST	Card inserted This field indicates whether a card has been inserted. The uSDHC module debounces this signal so that the host driver does not need to wait for it to stabilize. Changing from a 0 to 1 generates a Card Insertion interrupt in the Interrupt Status register. Changing from a 1 to 0 generates a Card Removal interrupt in the Interrupt Status register. A write to the Force Event Register does not affect this field. The Software Reset For All in the System Control register does not affect this field. A software reset does not affect this field. 0b - Power on reset or no card 1b - Card inserted
15 TSCD	Tape select change done This field indicates the delay setting is effective after write CLK_TUNE_CTRL_STATUS register. 0b - Delay cell select change is not finished. 1b - Delay cell select change is finished.
14-13 —	Reserved
12 RTR	Re-Tuning Request (only for SD3.0 SDR104 mode and EMMC HS200 mode) Host controller may request host driver to execute re-tuning sequence by setting this field when the data window is shifted by temperature drift and a tuned sampling point does not have a good margin to receive correct data. This field is cleared when a command is issued with setting Execute Tuning field in MIXER_CTRL register. Changing of this field from 0 to 1 generates Re-Tuning Event. See Interrupt status registers for more detail. This field isn't set to 1 if Sampling Clock Select in the MIXER_CTRL register is set to 0 (using fixed sampling clock). 0b - Fixed or well tuned sampling clock 1b - Sampling clock needs re-tuning
11 BREN	Buffer read enable This status field is used for non-DMA read transfers. The uSDHC module implements an internal buffer to transfer data efficiently. This read only flag indicates that valid data exists in the host side buffer. If this field is high, valid data greater than the watermark level exist in the buffer. A change of this field from 1 to 0 occurs when some reads from the buffer (read DATPORT (Base + 0x20)) are made and the buffer hasn't valid data greater than the watermark level. A change of this field from 0 to1 occurs when there is enough valid data ready in the buffer and the Buffer Read Ready interrupt has been generated and enabled. 0b - Read disable

Table continues on the next page...

Field	Function
	1b - Read enable
10 BWEN	Buffer write enable This status field is used for non-DMA write transfers. The uSDHC module implements an internal buffer to transfer data efficiently. This read only flag indicates if space is available for write data. If this field is 1, valid data greater than the watermark level can be written to the buffer. A change of this field from 1 to 0 occurs when some writes to the buffer (write DATPORT(Base + 0x20)) are made and the buffer hasn't valid space greater than the watermark level. A change of this field from 0 to 1 occurs when the buffer can hold valid data greater than the write watermark level and the Buffer Write Ready interrupt is generated and enabled. 0b - Write disable 1b - Write enable
9 RTA	Read transfer active This status field is used for detecting completion of a read transfer. This field is set for either of the following conditions: • After the end field of the read command • When writing a 1 to the Continue Request field in the Protocol Control register to restart a read transfer A transfer complete interrupt is generated when this field changes to 0. This field is cleared for either of the following conditions: • When the last data block as specified by block length is transferred to the System, that is, all data are read away from uSDHC internal buffer. • When all valid data blocks have been transferred from uSDHC internal buffer to the System and no current block transfers are being sent because of the Stop At Block Gap Request being set to 1. 0b - No valid data 1b - Transferring data
8 WTA	Write transfer active This status field indicates a write transfer is active. If this field is 0, it means no valid write data exists in uSDHC. This field is set in either of the following cases: • After the end field of the write command • When writing 1 to the Continue Request field in the Protocol Control register to restart a write transfer This field is cleared in either of the following cases: • After getting the CRC status of the last data block as specified by the transfer count (Single and Multiple) • After getting the CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request During a write transaction, a Block Gap Event interrupt is generated when this field is changed to 0, as result of the Stop At Block Gap Request being set. This status is useful for the host driver in determining when to issue commands during Write Busy state. 0b - No valid data 1b - Transferring data
7 SDOFF	SD clock gated off internally This status field indicates that the SD clock is internally gated off, because of buffer over / under-run or read pause without read wait assertion, or the driver set FRC_SDCLK_ON field is 0 to stop the SD clock in idle status. This field is for the host driver to debug data transaction on the SD bus.

Table continues on the next page...

Field	Function
	0b - SD clock is active. 1b - SD clock is gated off.
6 PEROFF	IPG_PERCLK gated off internally This status field indicates that the IPG_PERCLK is internally gated off. This field is for the host driver to debug transaction on the SD bus. When IPG_CLK_SOFT_EN is cleared, IPG_PERCLK is gated off, otherwise IPG_PERCLK is always active. 0b - IPG_PERCLK is active. 1b - IPG_PERCLK is gated off.
5 HCKOFF	HCLK gated off internally This status field indicates that the HCLK is internally gated off. This field is for the host driver to debug during a data transfer. 0b - HCLK is active. 1b - HCLK is gated off.
4 IPGOFF	Peripheral clock gated off internally This status field indicates that the peripheral clock is internally gated off. This field is for the host driver to debug. 0b - Peripheral clock is active. 1b - Peripheral clock is gated off.
3 SDSTB	SD clock stable This status field indicates that the internal card clock is stable. This field is for the host driver to poll clock status when changing the clock frequency. It is recommended to clear FRC_SDCLK_ON field in System Control register to remove glitches on the card clock when the frequency is changing. Before changing clock divisor value (SDCLKFS or DVS), host driver should make sure the SDSTB field is high. 0b - Clock is changing frequency and not stable. 1b - Clock is stable.
2 DLA	Data line active This status field indicates whether one of the DATA lines on the SD bus is in use. In the case of read transactions: This status indicates if a read transfer is executing on the SD bus. Changes in this value from 1 to 0, between data blocks, generates a Block Gap Event interrupt in the Interrupt Status register. This field is set in either of the following cases: • After the end field of the read command • When writing a 1 to the Continue Request field in the Protocol Control register to restart a read transfer This field is cleared in either of the following cases: • When the end field of the last data block is sent from the SD bus to uSDHC. • When the Read Wait state is stopped by a Suspend command and the DATA2 line is released. The uSDHC module waits at the next block gap by driving Read Wait at the start of the interrupt cycle. If the Read Wait signal is already driven (data buffer cannot receive data), uSDHC can wait for a current block gap by continuing to drive the Read Wait signal. It is necessary to support Read Wait to use the suspend / resume function. This field remains 1 during Read Wait. In the case of write transactions: This status indicates that a write transfer is executing on the SD bus. Changes in this value from 1 to 0 generate a Transfer Complete interrupt in the Interrupt Status register.

Table continues on the next page...

Field	Function
	This field is set in either of the following cases: • After the end field of the write command • When writing to 1 to the Continue Request field in the Protocol Control register to continue a write transfer This field is cleared in either of the following cases: • When the SD card releases Write Busy of the last data block, uSDHC also detects if the output is not busy. If the SD card does not drive the busy signal after the CRC status is received, uSDHC assumes the card drive "Not Busy". • When the SD card releases write busy, prior to waiting for write transfer, and because of a Stop At Block Gap Request. In the case of command with busy pending: This status indicates that a busy state follows the command and the data line is in use. This field is cleared when the DATA0 line is released. 0b - DATA line inactive 1b - DATA line active
1 CDIHB	Command inhibit (DATA) This status field is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this field is 0, it indicates that uSDHC can issue the next SD / MMC Command. Commands with a busy signal belong to Command Inhibit (DATA) (for example. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Interrupt Status register. **NOTE:** The SD host driver can save registers for a suspend transaction after this field has changed from 1 to 0. 0b - Can issue command that uses the DATA line 1b - Cannot issue command that uses the DATA line
0 CIHB	Command inhibit (CMD) If this status bit is 0, it indicates that the CMD line is not in use and uSDHC can issue a SD / MMC command using the CMD line. This field is set also immediately after the Transfer Type register is written. This field is cleared when the command response is received. Even if the Command Inhibit (DATA) is set to 1, commands using only the CMD line can be issued if this field is 0. Changing from 1 to 0 generates a Command Complete interrupt in the Interrupt Status register. If uSDHC cannot issue the command because of a command conflict error (see Command CRC Error) or because of a Command Not Issued By Auto CMD12 Error, this field remains 1 and the Command Complete is not set. The Status of issuing an auto CMD12 does not show on this field. 0b - Can issue command using only CMD line 1b - Cannot issue command

10.3.7.1.12 Protocol Control (PROT_CTRL)

10.3.7.1.12.1 Offset

Register	Offset
PROT_CTRL	28h

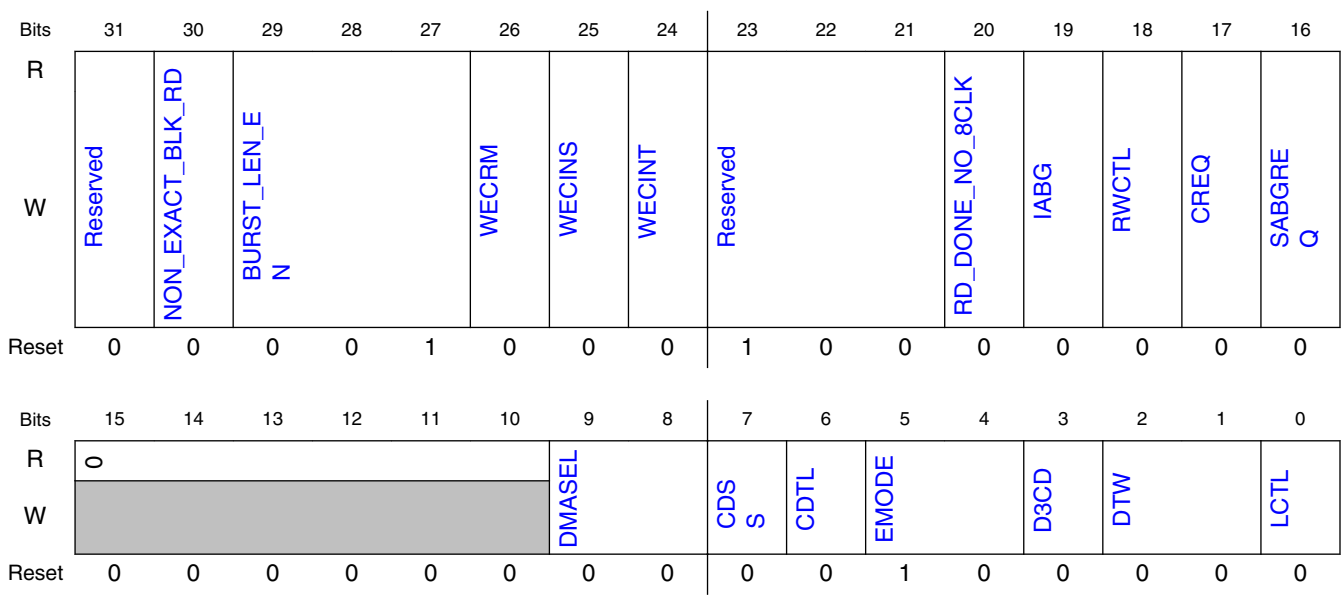
10.3.7.1.12.2 Function

There are three cases to restart the transfer after stop at the block gap. Which case is appropriate depends on whether uSDHC issues a Suspend command or the SD card accepts the Suspend command.

- If the host driver does not issue a Suspend command, the Continue request is used to restart the transfer.
- If the host driver issues a Suspend command and the SD card accepts it, a Resume command is used to restart the transfer.
- If the host driver issues a Suspend command and the SD card does not accept it, the Continue request is used to restart the transfer.

Any time stop at block gap request stops the data transfer, the host driver waits for a Transfer Complete (in the Interrupt Status register), before attempting to restart the transfer. When restarting the data transfer by Continue Request, the host driver clears the Stop At Block Gap Request before or simultaneously.

10.3.7.1.12.3 Diagram



10.3.7.1.12.4 Fields

Field	Function
31	Reserved
—	Always write as 0

Table continues on the next page...

Field	Function
30 NON_EXACT_BLK_RD	Non-exact block read Current block read is non-exact block read. It is only used for SDIO. 0b - The block read is exact block read. Host driver does not need to issue abort command to terminate this multi-block read. 1b - The block read is non-exact block read. Host driver needs to issue abort command to terminate this multi-block read.
29-27 BURST_LEN_EN	BURST length enable for INCR, INCR4 / INCR8 / INCR16, INCR4-WRAP / INCR8-WRAP / INCR16-WRAP This is used to enable / disable the burst length for the external AHB2AXI bridge. It is useful especially for INCR transfer because without burst length indicator, the AHB2AXI bridge does not know the burst length in advance. Without burst length indicator, AHB INCR transfers can only be converted to SINGLEs on the AXI side. 1xxb - Burst length is enabled for INCR4-WRAP / INCR8-WRAP / INCR16-WRAP. x1xb - Burst length is enabled for INCR4 / INCR8 / INCR16. xx1b - Burst length is enabled for INCR.
26 WECRM	Wakeup event enable on SD card removal This field enables a wakeup event, via a card removal, in the Interrupt Status register. FN_WUS (Wake Up Support) in CIS does not affect this field. When this field is set, the Card Removal Status and uSDHC interrupt can be asserted without CLK toggling. When the wakeup feature is not enabled, the CLK must be active to assert the Card Removal Status and uSDHC interrupt. 0b - Disables wakeup event enable on SD card removal 1b - Enables wakeup event enable on SD card removal
25 WECINS	Wakeup event enable on SD card insertion This field enables a wakeup event, via a card insertion, in the Interrupt Status register. FN_WUS (Wake Up Support) in CIS does not affect this field. When this field is set, the Card Insertion Status and uSDHC interrupt can be asserted without CLK toggling. When the wakeup feature is not enabled, the CLK must be active to assert the Card Insertion Status and uSDHC interrupt. 0b - Disable wakeup event enable on SD card insertion 1b - Enable wakeup event enable on SD card insertion
24 WECINT	Wakeup event enable on card interrupt This field enables a wakeup event, via a card interrupt, in the Interrupt Status register. This field can be set to 1 if FN_WUS (Wake Up Support) in CIS is set to 1. When this field is set, the Card Interrupt Status and uSDHC interrupt can be asserted without CLK toggling. When the wakeup feature is not enabled, the CLK must be active to assert the Card Interrupt Status and uSDHC interrupt. 0b - Disables wakeup event enable on card interrupt 1b - Enables wakeup event enable on card interrupt
23-21 —	Reserved Always write as 3'b100
20 RD_DONE_NO_8CLK	Read performed number 8 clock According to the SD/MMC spec, for read data transaction, 8 clocks are needed after the end field of the last data block. So, by default(RD_DONE_NO_8CLK=0), 8 clocks are active after the end field of the last read data transaction. However, these 8 clocks should not be active if user wants to use stop at block gap (include the auto stop at block gap in boot mode) feature for read and the RWCTL field (bit18) is not enabled. In this case, software should set RD_DONE_NO_8CLK to avoid these 8 clocks. Otherwise, the device might send extra data to uSDHC while uSDHC ignores these data. In a summary, this field should be set only if the use case needs to use stop at block gap feature while the device can't support the read wait feature.

Table continues on the next page...

Field	Function
19 IABG	Interrupt at block gap This field is valid only in 4-bit mode, of the SDIO card, and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SDIO card cannot signal an interrupt during a multiple block transfer, this field should be set to 0 to avoid an inadvertent interrupt. When the host driver detects an SDIO card insertion, it sets this field according to the CCCR of the card. 0b - Disables interrupt at block gap 1b - Enables interrupt at block gap
18 RWCTL	Read wait control The read wait function is optional for SDIO cards. If the card supports read wait, set this field to enable use of the read wait protocol to stop read data using the DATA2 line. Otherwise, uSDHC has to stop the SD clock to hold read data, which restricts commands generation. When the host driver detects an SDIO card insertion, it sets this field according to the CCCR of the card. If the card does not support read wait, this field should never be set to 1; otherwise, DATA line conflicts might occur. If this field is set to 0, stop at block gap during read operation is also supported, but uSDHC stops the SD clock to pause reading operation. 0b - Disables read wait control and stop SD clock at block gap when SABGREQ field is set 1b - Enables read wait control and assert read wait without stopping SD clock at block gap when SABGREQ field is set
17 CREQ	Continue request This field is used to restart a transaction which was stopped using the stop at block gap request. When a suspend operation is not accepted by the card, it is also by setting this field to restart the paused transfer. To cancel stop at the block gap, set stop at block gap request to 0 and set this field to 1 to restart the transfer. The uSDHC module automatically clears this field, therefore it is not necessary for the host driver to set this field to 0. If both stop at block gap request and this field are 1, the continue request is ignored. 0b - No effect 1b - Restart
16 SABGREQ	Stop at block gap request This field is used to stop executing a transaction at the next block gap for both DMA and non-DMA transfers. Until the transfer complete is set to 1, indicating a transfer completion, the host driver leaves this field set to 1. Clearing both the stop at block gap request and continue request does not cause the transaction to restart. Read Wait is used to stop the read transaction at the block gap. The uSDHC module supports the stop at block gap request for write transfers, but for read transfers it requires that the SDIO card support read wait. Therefore, the host driver does not set this field during read transfers unless the SDIO card supports Read Wait and has set the read wait control to 1; otherwise, uSDHC stops the SD bus clock to pause the read operation during block gap. In the case of write transfers in which the host driver writes data to the Data Port register, the host driver sets this field after all block data is written. If this field is set to 1, the host driver does not write data to the Data Port register after a block is sent. Once this field is set, the host driver does not clear this field before the Transfer Complete field in Interrupt Status register is set, otherwise uSDHC's behavior is undefined. This field effects read transfer active, write transfer active, DATA Line Active and Command Inhibit (DATA) in the Present State register. 0b - Transfer 1b - Stop
15-10 —	Reserved
9-8 DMASEL	DMA select This field is valid while DMA (SDMA or ADMA) is enabled and selects the DMA operation.

Table continues on the next page...

Field	Function
	00b - No DMA or simple DMA is selected. 01b - ADMA1 is selected. 10b - ADMA2 is selected. 11b - Reserved
7 CDSS	Card detect signal selection This field selects the source for the card detection. 0b - Card detection level is selected (for normal purpose). 1b - Card detection test level is selected (for test purpose).
6 CDTL	Card detect test level This bit is enabled while the card detection signal selection is set to 1 and it indicates card insertion. 0b - Card detect test level is 0, no card inserted 1b - Card detect test level is 1, card inserted
5-4 EMODE	Endian mode The uSDHC module supports all three endian modes in data transfer. See Data buffer for more details. 00b - Big endian mode 01b - Half word big endian mode 10b - Little endian mode 11b - Reserved
3 D3CD	DATA3 as card detection pin If this field is set, DATA3 should be pulled down to act as a card detection pin. Be cautious when using this feature, because DATA3 is also a chip-select for the SPI mode. A pull-down on this pin and CMD0 might set the card into the SPI mode, which uSDHC does not support. 0b - DATA3 does not monitor card insertion 1b - DATA3 as card detection pin
2-1 DTW	Data transfer width This field selects the data width of the SD bus for a data transfer. The host driver sets it to match the data width of the card. Possible data transfer width is 1-bit, 4-bits or 8-bits. 00b - 1-bit mode 01b - 4-bit mode 10b - 8-bit mode 11b - Reserved
0 LCTL	LED control This field, fully controlled by the host driver, is used to caution the user not to remove the card while the card is being accessed. If the software is going to issue multiple SD commands, this field can be set during all these transactions. It is not necessary to change for each transaction. When the software issues multiple SD commands, setting the field once before the first command is sufficient: it is not necessary to reset the bit between commands. 0b - LED off 1b - LED on

10.3.7.1.13 System Control (SYS_CTRL)

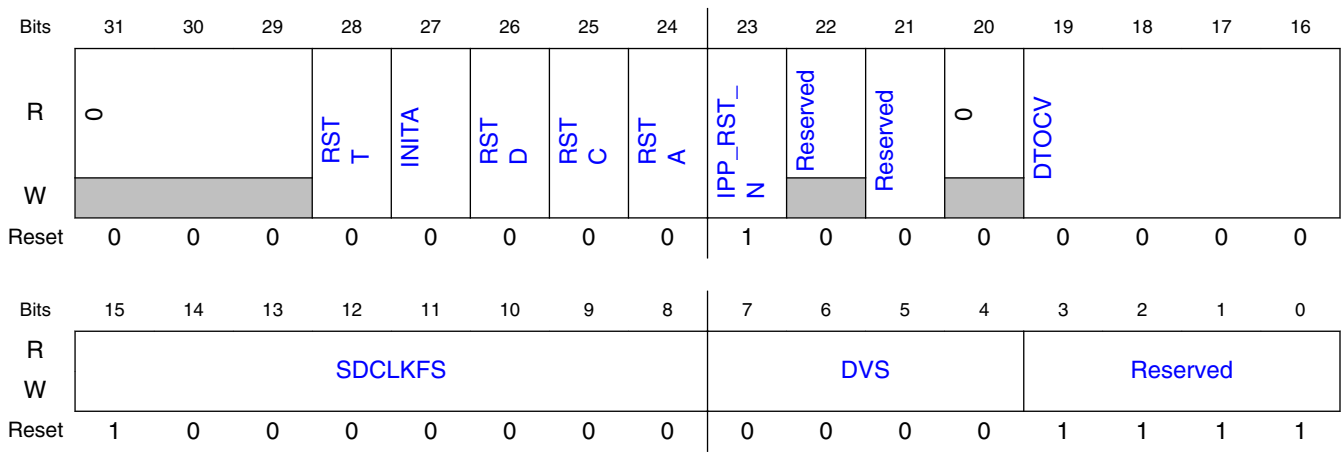
10.3.7.1.13.1 Offset

Register	Offset
SYS_CTRL	2Ch

10.3.7.1.13.2 Function

This register provides control of the system. See detail in the field description.

10.3.7.1.13.3 Diagram



10.3.7.1.13.4 Fields

Field	Function
31-29 —	Reserved
28 RSTT	Reset tuning When set this field to 1, it resets tuning circuit. After tuning circuits are reset, bit value is 0. Clearing execute_tuning field in AUTOCMD12_ERR_STATUS also sets this field to 1 to reset tuning circuit
27 INITA	Initialization active When this field is set, 80 SD-clocks are sent to the card. After the 80 clocks are sent, this field is self cleared. This field is very useful during the card power-up period when 74 SD-clocks are needed and the clock auto gating feature is enabled. Writing 1 to this bit when this field is already 1 has no effect. Writing 0 to this field at any time has no effect. When either of the CIHB and CDIHB fields in the Present State register are set, writing 1 to this field is ignored (that is, when command line or data lines are active, write to this field is not allowed). On the other-hand, when this field is set, that is, during initialization active period, it is allowed to issue command, and the command bit stream appears on the CMD pad after all 80 clock cycles are done. So, when this command ends, the driver can make sure the 80 clock cycles are sent out. This is very useful when the driver needs to send 80 cycles to the card and does not want to wait till this field is self cleared.
26	Software reset for data line

Table continues on the next page...

Field	Function
RSTD	Only part of the data circuit is reset. DMA circuit is also reset. After this field is set, the software waits for self-clear. The following registers and bits are cleared by this field: • Data Port register • Buffer is cleared and initialized • Present State register • Buffer read enable • Buffer write enable • Read transfer active • Write transfer active • DATA line active • Command Inhibit (DATA) Protocol Control register • Continue request • Stop At Block Gap Request Interrupt Status register • Buffer read ready • Buffer write ready • DMA interrupt • Block gap event • Transfer complete **NOTE:** When reset, the software must make sure there is no incomplete data transferring. If there is data transfer going on, the software needs to wait TC or DC INT_STATUS register is set. 0b - No reset 1b - Reset
25 RSTC	Software reset for CMD line Only part of the command circuit is reset. After this field is set, the software waits for self-clear. The following registers and bits are cleared by this field: • Present State Register Command Inhibit (CMD) • Interrupt Status register Command Complete 0b - No reset 1b - Reset
24 RSTA	Software reset for all This reset effects the entire host controller except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared. During its initialization, the host driver is set this field to 1 to reset uSDHC. The uSDHC module resets this field to 0 when the capabilities registers are valid and the host driver can read them. Additional use of Software Reset For All does not affect the value of the capabilities registers. After this field is set, it is recommended that the host driver reset the external card and re-initialize it. After this field is set, the software should wait for self-clear. In tuning process, after every CMD19 is finished, this field is set to retest uSDHC. **NOTE:** When reset, the software must make sure there is no incomplete data transferring. If there is data transfer going on, the software needs to wait TC or DC INT_STATUS register is set. 0b - No reset 1b - Reset
23 IPP_RST_N	Hardware reset This register's value is output to card through pad directly to hardware reset pin of the card if the card supports this feature.
22 —	Reserved
21	Reserved

Table continues on the next page...

Field	Function
—	
20 —	Reserved
19-16 DTOCV	Data timeout counter value This value determines the interval by which DAT line timeouts are detected. See the Data Timeout Error field in the Interrupt Status register for information on factors that dictate time-out generation. Time-out clock frequency is generated by dividing the base clock SDCLK value by this value. The host driver can clear the Data Timeout Error Status Enable (in the Interrupt Status Enable register) to prevent inadvertent time-out events. 0000b - SDCLK x 2^{14} 0001b - SDCLK x 2^{15} 0010b - SDCLK x 2^{16} 0011b - SDCLK x 2^{17} 0100b - SDCLK x 2^{18} 0101b - SDCLK x 2^{19} 0110b - SDCLK x 2^{20} 0111b - SDCLK x 2^{21} 1000b - SDCLK x 2^{22} 1001b - SDCLK x 2^{23} 1010b - SDCLK x 2^{24} 1011b - SDCLK x 2^{25} 1100b - SDCLK x 2^{26} 1101b - SDCLK x 2^{27} 1110b - SDCLK x 2^{28} 1111b - SDCLK x 2^{29}
15-8 SDCLKFS	SDCLK frequency select This register is used to select the frequency of the SDCLK pin. The frequency is not programmed directly, rather this register holds the prescaler (this register) and divisor (next register) of the Base Clock Frequency register. In Single Data Rate mode (DDR_EN field of MIXERCTRL is '0') Only the following settings are allowed: 80h) Base clock divided by 256 40h) Base clock divided by 128 20h) Base clock divided by 64 10h) Base clock divided by 32 08h) Base clock divided by 16 04h) Base clock divided by 8 02h) Base clock divided by 4 01h) Base clock divided by 2 00h) Base clock divided by 1 While in Dual Data Rate mode (DDR_EN field of MIXERCTRL is '1') Only the following settings are allowed: 80h) Base clock divided by 512 40h) Base clock divided by 256 20h) Base clock divided by 128

Table continues on the next page...

Field	Function
	10h) Base clock divided by 64 08h) Base clock divided by 32 04h) Base clock divided by 16 02h) Base clock divided by 8 01h) Base clock divided by 4 00h) Base clock divided by 2 When the software changes the DDR_EN field, SDCLKFS might need to be changed also. In Single Data Rate mode, setting 00h bypasses the frequency prescaler of the SD clock. Multiple bits must not be set, or the behavior of this prescaler is undefined. The two default divider values can be calculated by the frequency of ipg_perclk and the following Divisor bits. The frequency of SDCLK is set by the following formula: Clock Frequency = (Base Clock) / (prescaler x divisor) For example, in Single Data Rate mode, if the Base Clock Frequency is 96 MHz, and the target frequency is 25 MHz, then choosing the prescaler value of 01h and divisor value of 1h yields 24 MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400 kHz, the prescaler value of 08h and divisor value of eh yields the exact clock value of 400 kHz. The reset value of this field is 80h, so if the input Base Clock (ipg_perclk) is about 96 MHz, the default SD clock after reset is 375 kHz. According to the SD Physical Specification Version 1.1 and the SDIO Card Specification Version 1.2, the maximum SD clock frequency is 50 MHz and is never exceed this limit. Before changing clock divisor value (SDCLKFS or DVS), host driver should make sure the SDSTB field is high. If setting SDCLKFS and DVS can generate the same clock frequency,(for example, in SDR mode, SDCLKFS = 01h is same as DVS = 01h.) SDCLKFS is highly recommended.
7-4 DVS	Divisor This register is used to provide a more exact divisor to generate the desired SD clock frequency. Note the divider can even support odd divisors without deterioration of duty cycle. Before changing clock divisor value (SDCLKFS or DVS), Host driver should make sure the SDSTB field is high. The settings are as follows: 0000b - Divide-by-1 0001b - Divide-by-2 1110b - Divide-by-15 1111b - Divide-by-16
3-0 —	Reserved Always write as 1.

10.3.7.1.14 Interrupt Status (INT_STATUS)

10.3.7.1.14.1 Offset

Register	Offset
INT_STATUS	30h

10.3.7.1.14.2 Function

An interrupt is generated when the normal interrupt signal enable is enabled and at least one of the status fields is set to 1. For all fields, writing 1 to a bit clears it; writing to 0 keeps the bit unchanged. More than one status can be cleared with a single register write. For card interrupt, before writing 1 to clear, it is required that the card stops asserting the interrupt, meaning that when the card driver services the interrupt condition; otherwise, the CINT field is asserted again.

The table below shows the relationship between the command timeout error and the command complete.

Table 10-44. uSDHC status for command timeout error/command complete bit combinations

Command CRC Error	Command timeout error	Meaning of the status
0	0	X
X	1	Response not received within 64 SDCLK cycles
1	0	Response received

The table below shows the relationship between the transfer complete and the data timeout error.

Table 10-45. uSDHC status for data timeout error/transfer complete bit combinations

Transfer complete	Data timeout error	Meaning of the status
0	0	X
0	1	Timeout occurred during transfer
1	X	Data transfer complete

The table below shows the relationship between the command CRC error and command timeout error.

Table 10-46. uSDHC status for command CRC error/command timeout error bit combinations

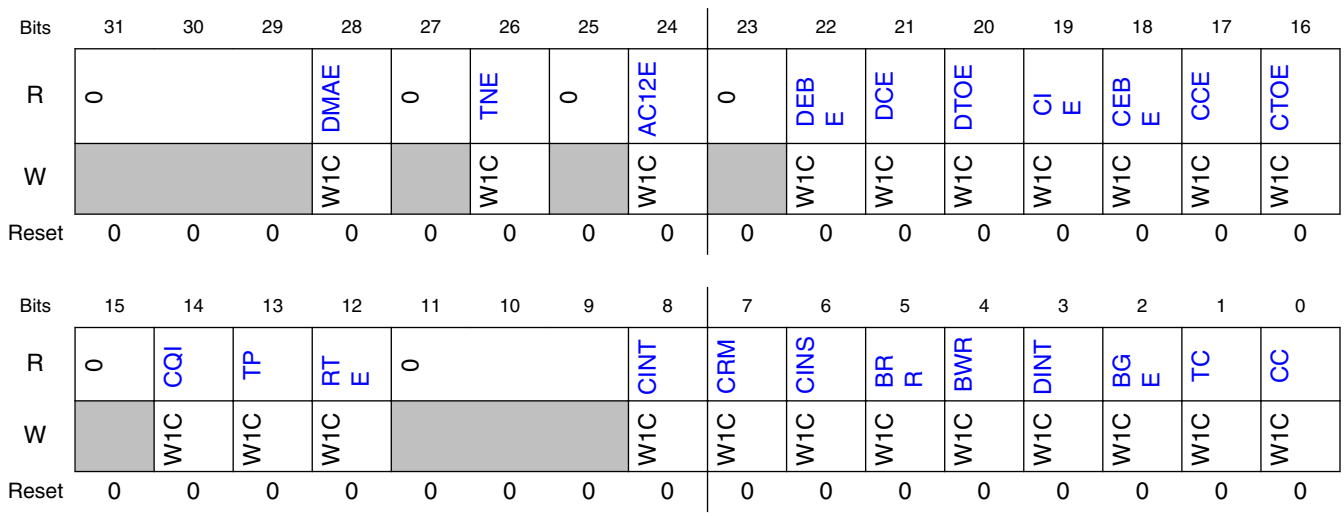
Command complete	Command timeout error	Meaning of the status
0	0	No error

Table continues on the next page...

Table 10-46. uSDHC status for command CRC error/command timeout error bit combinations (continued)

Command complete	Command timeout error	Meaning of the status
0	1	Response timeout error
1	0	Response CRC error
1	1	CMD line conflict

10.3.7.1.14.3 Diagram



10.3.7.1.14.4 Fields

Field	Function
31-29 —	Reserved
28 DMAE	DMA error Occurs when an Internal DMA transfer has failed. This field is set to 1, when some error occurs in the data transfer. This error can be caused by either simple DMA or ADMA, depending on which DMA is in use. The value in DMA System Address register is the next fetch address where the error occurs. Because any error corrupts the whole data block, the host driver restarts the transfer from the corrupted block boundary. The address of the block boundary can be calculated either from the current DS_ADDR value or from the remaining number of blocks and the block size. 0b - No error 1b - Error
27 —	Reserved
26 TNE	Tuning error: (only for SD3.0 SDR104 mode and EMMC HS200 mode)

Table continues on the next page...

Field	Function
	This field is set when an unrecoverable error is detected in a tuning circuit. By detecting Tuning Error, host driver needs to abort a command executing and perform tuning.
25 —	Reserved
24 AC12E	Auto CMD12 error Occurs when detecting that one of the fields in the Auto CMD12 Error Status register has changed from 0 to 1. This field is set to 1, not only when the errors in Auto CMD12 occur, but also, when the Auto CMD12 is not executed due to the previous command error. 0b - No error 1b - Error
23 —	Reserved
22 DEBE	Data end bit error Occurs either when detecting 0 at the end field position of read data that uses the DATA line, or at the end field position of the CRC. This field is not asserted in tuning process. 0b - No error 1b - Error
21 DCE	Data CRC error Occurs when detecting a CRC error when transferring read data that uses the DATA line, or when detecting the Write CRC status having a value other than 010. This field is not asserted in tuning process. 0b - No error 1b - Error
20 DTOE	Data timeout error Occurs when detecting one of following time-out conditions. • Busy time-out for R1b, R5b type • Busy time-out after Write CRC status • Read Data time-out. This field is not asserted in tuning process. 0b - No error 1b - Time out
19 CIE	Command index error Occurs if a command index error occurs in the command response. This field is not asserted in tuning process. 0b - No error 1b - Error
18 CEBE	Command end bit error Occurs when detecting that the end field of a command response is 0. This field is not asserted in tuning process. 0b - No error 1b - End bit error generated
17	Command CRC error

Table continues on the next page...

Field	Function
CCE	Command CRC Error is generated in two cases. • If a response is returned and the Command Timeout Error is set to 0 (indicating no time-out), this field is set when detecting a CRC error in the command response. • The uSDHC module detects a CMD line conflict by monitoring the CMD line when a command is issued. If uSDHC drives the CMD line to 1, but detects 0 on the CMD line at the next SDCLK edge, then uSDHC aborts the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error should also be set to 1 to distinguish CMD line conflict. This field is not asserted in tuning process. 0b - No error 1b - CRC error generated
16 CTOE	Command timeout error Occurs only if no response is returned within 64 SDCLK cycles from the end field of the command. If uSDHC detects a CMD line conflict, in which case a Command CRC Error is also be set (as shown in Interrupt Status (INT_STATUS)), this field is set without waiting for 64 SDCLK cycles. This is because the command is aborted by uSDHC. This field is not asserted in tuning process. 0b - No error 1b - Time out
15 —	Reserved
14 CQI	Command queuing interrupt This interrupt is asserted when at least one of the bits in CQIS register is set. This interrupt is cleared only by clearing the source interrupt in CQIS register.
13 TP	Tuning pass:(only for SD3.0 SDR104 mode and EMMC HS200 mode) Current CMD19 transfer is done successfully. That is, current sampling point is correct.
12 RTE	Re-tuning event: (only for SD3.0 SDR104 mode and EMMC HS200 mode) This status is set if Re-Tuning Request in the Present State register changes from 0 to 1. host controller requests host driver to perform re-tuning for next data transfer. Current data transfer (not large block count) can be completed without re-tuning. 0b - Re-tuning is not required. 1b - Re-tuning should be performed.
11-9 —	Reserved
8 CINT	Card interrupt This status field is set when an interrupt signal is detected from the external card. In 1-bit mode, uSDHC detects the Card Interrupt without the SD clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so the interrupt from card can only be sampled during interrupt cycle, introducing some delay between the interrupt signal from the SDIO card and the interrupt to the host system. Writing this field to 1 can clear this field, but as the interrupt source from the SDIO card does not clear, this field is set again. to clear this field, it is required to reset the interrupt source from the external card followed by a writing 1 to this field. When this status has been set, and the host driver needs to service this interrupt, the Card Interrupt Signal Enable in the Interrupt Signal Enable register should be 0 to stop driving the interrupt signal to the host system. After completion of the card interrupt service (It should reset the interrupt sources in the SDIO card and the interrupt signal might not be asserted), write 1 to clear this field, set the Card Interrupt Signal Enable to 1, and start sampling the interrupt signal again. 0b - No card interrupt

Table continues on the next page...

Field	Function
	1b - Generate card interrupt
7 CRM	Card removal This status field is set if the Card Inserted field in the Present State register changes from 1 to 0. When the host driver writes this field to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card state might possibly be changed when the host driver clears this field and the interrupt event might not be generated. When this field is cleared, it is set again if no card is inserted. to leave it cleared, clear the Card Removal Status Enable field in Interrupt Status Enable register. 0b - Card state unstable or inserted 1b - Card removed
6 CINS	Card insertion This status field is set if the Card Inserted field in the Present State register changes from 0 to 1. When the host driver writes this field to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card state might possibly be changed when the host driver clears this field and the interrupt event might not be generated. When this field is cleared, it is set again if a card is inserted. to leave it cleared, clear the Card Inserted Status Enable field in Interrupt Status Enable register. 0b - Card state unstable or removed 1b - Card inserted
5 BRR	Buffer read ready This status field is set if the Buffer Read Enable field, in the Present State register, changes from 0 to 1. See the Buffer Read Enable field in the Present State register for additional information. This field indicates that cmd19 is finished in tuning process. 0b - Not ready to read buffer 1b - Ready to read buffer
4 BWR	Buffer write ready This status field is set if the Buffer Write Enable field, in the Present State register, changes from 0 to 1. See the Buffer Write Enable field in the Present State register for additional information. 0b - Not ready to write buffer 1b - Ready to write buffer
3 DINT	DMA interrupt Occurs only when the internal DMA finishes the data transfer successfully. Whenever errors occur during data transfer, this field does not be set. Instead, the DMAE field is set. Either Simple DMA or ADMA finishes data transferring, this field is set. 0b - No DMA interrupt 1b - DMA interrupt is generated.
2 BGE	Block gap event If the Stop At Block Gap Request field in the Protocol Control register is set, this field is set when a read or write transaction is stopped at a block gap. If Stop At Block Gap Request is not set to 1, this field is not set to 1. In the case of a Read Transaction: This field is set at the falling edge of the DATA Line Active Status (When the transaction is stopped at SD bus timing). The Read Wait must be supported to use this function. In the case of Write Transaction: This field is set at the falling edge of Write Transfer Active Status (After getting CRC status at SD Bus timing). 0b - No block gap event 1b - Transaction stopped at block gap

Table continues on the next page...

Field	Function
1 TC	Transfer complete This field is set when a read or write transfer is completed. In the case of a Read Transaction: This field is set at the falling edge of the Read Transfer Active Status. There are two cases in which this interrupt is generated. The first is when a data transfer is completed as specified by the data length (after the last data has been read to the host system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request field in the Protocol Control register (after valid data has been read to the host system). In the case of a Write Transaction: This field is set at the falling edge of the DATA Line Active Status. There are two cases in which this interrupt is generated. The first is when the last data is written to the SD card as specified by the data length and the busy signal is released. The second is when data transfers are stopped at the block gap, by setting the Stop At Block Gap Request field in the Protocol Control register, and the data transfers are completed. (after valid data is written to the SD card and the busy signal released). In the case of a command with busy, this field is set when busy is deasserted. This field is not asserted in tuning process. 0b - Transfer does not complete 1b - Transfer complete
0 CC	Command complete This field is set when you receive the end field of the command response (except auto CMD12). See the Command Inhibit (CMD) in the Present State register. This field is not asserted in tuning process. 0b - Command not complete 1b - Command complete

10.3.7.1.15 Interrupt Status Enable (INT_STATUS_EN)

10.3.7.1.15.1 Offset

Register	Offset
INT_STATUS_EN	34h

10.3.7.1.15.2 Function

Setting the fields in this register to 1 enables the corresponding Interrupt Status to be set by the specified event. If any field is cleared, the corresponding Interrupt Status field is also cleared (that is, when the field in this register is cleared, the corresponding field in Interrupt Status register is always 0).

- Depending on IABG field setting, uSDHC might be programmed to sample the card interrupt signal during the interrupt period and hold its value in the flip-flop. There

are some delays on the Card Interrupt, asserted from the card, to the time the host system is informed.

- To detect a CMD line conflict, the host driver must set both Command Timeout Error Status Enable and Command CRC Error Status Enable to 1.

10.3.7.1.17 Auto CMD12 Error Status (AUTOCMD12_ERR_STATUS)

10.3.7.1.17.1 Offset

Register	Offset
AUTOCMD12_ERR_STATUS	3Ch

10.3.7.1.17.2 Function

When the Auto CMD12 Error Status field in the Status register is set, the host driver checks this register to identify what kind of error the Auto CMD12 / CMD 23 indicated. Auto CMD23 errors are indicated in field 04-01. This register is valid only when the Auto CMD12 Error status field is set.

The table below shows the relationship between the Auto CMGD12 CRC Error and the Auto CMD12 Command Timeout Error.

Table 10-47. Relationship between command CRC error and command timeout error for auto CMD12

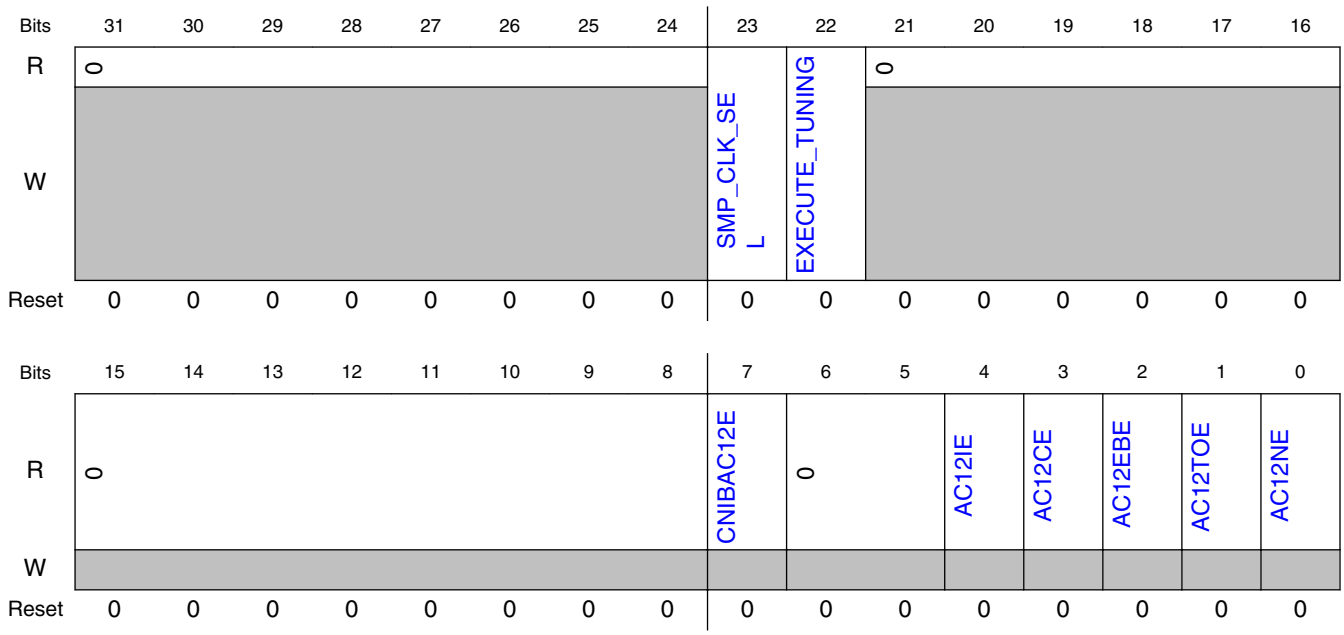
Auto CMD12 CRC error	Auto CMD12 timeout error	Type of error
0	0	No error
0	1	Response timeout error
1	0	Response CRC error
1	1	CMD line conflict

Changes in Auto CMD12 Error Status register can be classified in three scenarios:

- When uSDHC is going to issue an Auto CMD12
  - Set field 0 to 1 if the Auto CMD12 cannot be issued due to an error in the previous command
  - Set field 0 to 0 if the Auto CMD12 is issued
- At the end field of an Auto CMD12 response
  - Check errors correspond to fields 1-4
  - Set fields 1-4 corresponding to detected errors
  - Clear fields 1-4 corresponding to detected errors
- Before reading the Auto CMD12 Error Status field 7
  - Set field 7 to 1 if there is a command that can't be issued
  - Clear field 7 if there is no command to issue

The timing for generating the Auto CMD12 Error and writing to the Command register are asynchronous. After that, field 7 is sampled when the driver is not writing to the Command register. So, it is suggested to read this register only when the AC12E field in Interrupt Status register is set. An Auto CMD12 Error Interrupt is generated when one of the error fields (0-4) is set to 1. The Command Not Issued By Auto CMD12 Error does not generate an interrupt.

10.3.7.1.17.3 Diagram



10.3.7.1.17.4 Fields

Field	Function
31-24 —	Reserved
23 SMP_CLK_SEL	Sample clock select When std_tuning_en field is set, this field is used to select sampling clock to receive CMD and DATA. Otherwise, this field is reserved. This field is set by ty tuning procedure and valid after the completion of tuning(When Execute Tuning is cleared). Setting 1 means that tuning is completed successfully and setting 0 means that tuning is failed. Writing 1 to this field is meaningless and ignored. A tuning circuit is reset by writing to 0. This field can be cleared with setting Execute Tuning. Once the tuning circuit is reset, it takes time to complete tuning sequence. Therefore, host driver should keep this field to 1 to perform re-tuning sequence to complete re-tuning sequence in a short time. Change of this field is not allowed while the Host controller us receiving response or a read data block. 0b - Fixed clock is used to sample data 1b - Tuned clock is used to sample data
22 EXECUTE_TUNING	Execute tuning When std_tuning_en field is set, this field is used to start tuning procedure. Otherwise, this field is reserved. This field is set to start tuning procedure and automatically cleared when runing procedure is completed. The result of tuning is indicated to sam_clk_sel field. Tuning procedure is aborted by writing 0.
21-8 —	Reserved
7 CNIBAC12E	Command not issued by Auto CMD12 error Setting this field to 1 means CMD_wo_DAT is not executed due to an Auto CMD12 error (D04-D01) in this register.

Table continues on the next page...

Field	Function
	0b - No error 1b - Not issued
6-5 —	Reserved
4 AC12IE	Auto CMD12 / 23 index error Occurs if the command index error occurs in response to a command. 0b - No error 1b - Error, the CMD index in response is not CMD12/23
3 AC12CE	Auto CMD12 / 23 CRC error Occurs when detecting a CRC error in the command response. 0b - No CRC error 1b - CRC error met in Auto CMD12/23 response
2 AC12EBE	Auto CMD12 / 23 end bit error Occurs when detecting that the end field of command response is 0 which should be 1. 0b - No error 1b - End bit error generated
1 AC12TOE	Auto CMD12 / 23 timeout error Occurs if no response is returned within 64 SDCLK cycles from the end field of the command. If this field is set to1, the other error status fields (2-4) have no meaning. 0b - No error 1b - Time out
0 AC12NE	Auto CMD12 not executed If memory multiple block data transfer is not started, due to a command error, this field is not set because it is not necessary to issue an Auto CMD12. Setting this field to 1 means uSDHC cannot issue the Auto CMD12 to stop a memory multiple block data transfer due to some error. If this field is set to 1, other error status fields (1-4) have no meaning. 0b - Executed 1b - Not executed

10.3.7.1.18 Host Controller Capabilities (HOST_CTRL_CAP)

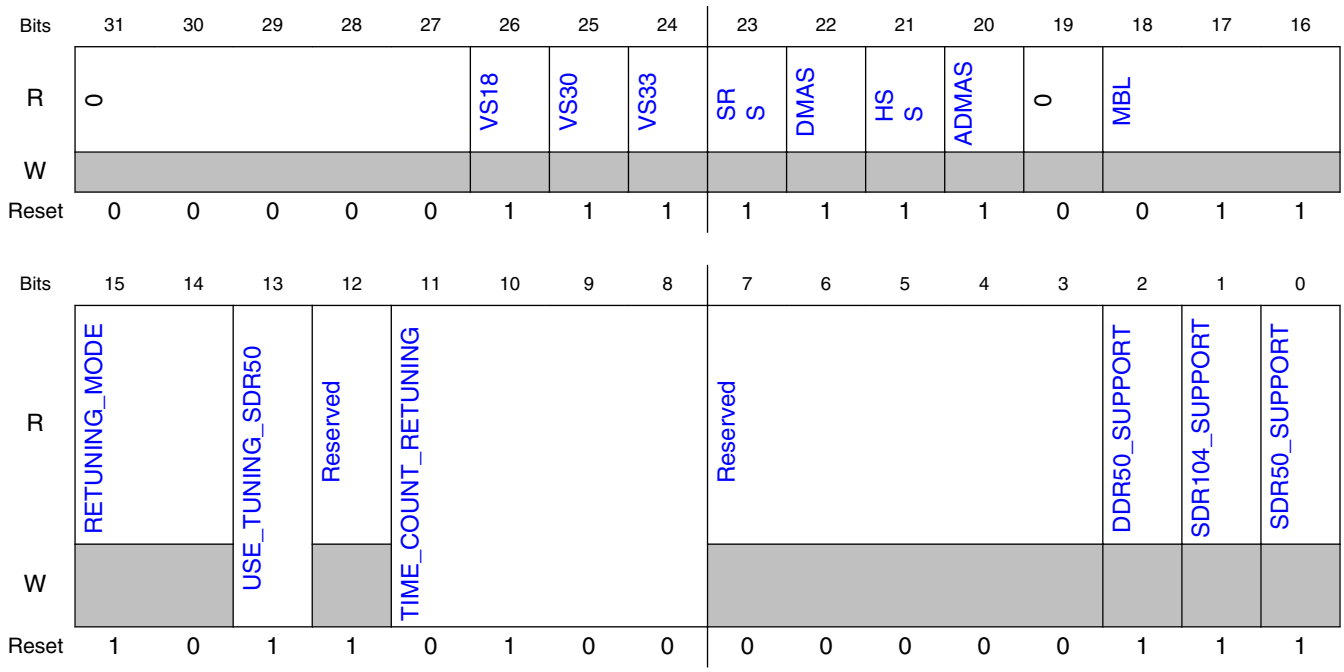
10.3.7.1.18.1 Offset

Register	Offset
HOST_CTRL_CAP	40h

10.3.7.1.18.2 Function

This register provides the host driver with information specific to uSDHC implementation. The value in this register is the power-on-reset value and does not change with a software reset.

10.3.7.1.18.3 Diagram



10.3.7.1.18.4 Fields

Field	Function
31-27 —	Reserved
26 VS18	Voltage support 1.8 V This field depends on the host system ability. 0b - 1.8 V not supported 1b - 1.8 V supported
25 VS30	Voltage support 3.0 V This field depends on the host system ability. 0b - 3.0 V not supported 1b - 3.0 V supported
24 VS33	Voltage support 3.3 V This field depends on the host system ability. 0b - 3.3 V not supported 1b - 3.3 V supported
23 SRS	Suspend / resume support This field indicates whether uSDHC supports Suspend / Resume functionality. If this field is 0, the Suspend and Resume mechanism, as well as the read wait, are not supported, and the host driver does not issue either Suspend or Resume commands. 0b - Not supported

Table continues on the next page...

Field	Function
	1b - Supported
22 DMAS	DMA support This field indicates whether uSDHC is capable of using the internal DMA to transfer data between system memory and the data buffer directly. 0b - DMA not supported 1b - DMA supported
21 HSS	High speed support This field indicates whether uSDHC supports High Speed mode and the host system can supply a SD clock frequency from 25 MHz to 50 MHz. 0b - High speed not supported 1b - High speed supported
20 ADMAS	ADMA support This field indicates whether uSDHC supports the ADMA feature. 0b - Advanced DMA not supported 1b - Advanced DMA supported
19 —	Reserved
18-16 MBL	Max block length This value indicates the maximum block size that the host driver can read and write to the buffer in uSDHC. The buffer transfers block size without wait cycles. 000b - 512 bytes 001b - 1024 bytes 010b - 2048 bytes 011b - 4096 bytes
15-14 RETUNING_MODE	Retuning Mode This field selects retuning method. 00b - Mode 1 01b - Mode 2 10b - Mode 3 11b - Reserved
13 USE_TUNING_SDR50	Use Tuning for SDR50 This field is set to 1. Host controller requires tuning to operate SDR50. 0b - SDR does not require tuning. 1b - SDR50 requires tuning.
12 —	Reserved
11-8 TIME_COUNT_RETUNING	Time counter for retuning This field indicates an initial value of the Retuning Timer for Re-Tuning Mode1 and 3.Setting to 0 disables Retuning Timer.
7-3 —	Reserved
2 DDR50_SUPPORT	DDR50 support This field indicates support of DDR50 mode.

Table continues on the next page...

Field	Function
1 SDR104_SUPPORT	SDR104 support This field indicates support of SDR104 mode.
0 SDR50_SUPPORT	SDR50 support This field indicates support of SDR50 mode.

10.3.7.1.19 Watermark Level (WTMK_LVL)

10.3.7.1.19.1 Offset

Register	Offset
WTMK_LVL	44h

10.3.7.1.19.2 Function

Both write and read watermark levels (FIFO threshold) are configurable. Their value can range from 1 to 128 words. Both write and read burst lengths are also Configurable. There value can range from 1 to 31 words.

10.3.7.1.19.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	1	0	0	0	0	0	0	1	0	0	0	0

10.3.7.1.19.4 Fields

Field	Function
31-29 —	Reserved

Table continues on the next page...

Field	Function
28-24 WR_BRST_LEN	Write burst length due to system restriction, the actual burst length might not exceed 16 The number of words uSDHC writes in a single burst. The write burst length must be less than or equal to the write watermark level, and all bursts within a watermark level transfer is in back-to-back mode. On reset, this field is 8. Writing 0 to this field results in '01000' (that is, it is not able to clear this field).
23-16 WR_WML	Write watermark level The number of words used as the watermark level (FIFO threshold) in a DMA write operation. Also, the number of words as a sequence of write bursts in back-to-back mode. The maximum legal value for the write watermark level is 128.
15-13 —	Reserved
12-8 RD_BRST_LEN	Read burst length due to system restriction, the actual burst length might not exceed 16 The number of words uSDHC reads in a single burst. The read burst length must be less than or equal to the read watermark level, and all bursts within a watermark level transfer is in back-to-back mode. On reset, this field is 8. Writing 0 to this field results in '01000' (that is, it is not able to clear this field).
7-0 RD_WML	Read watermark level The number of words used as the watermark level (FIFO threshold) in a DMA read operation. Also, the number of words as a sequence of read bursts in back-to-back mode. The maximum legal value for the read water mark level is 128.

10.3.7.1.20 Mixer Control (MIX_CTRL)

10.3.7.1.20.1 Offset

Register	Offset
MIX_CTRL	48h

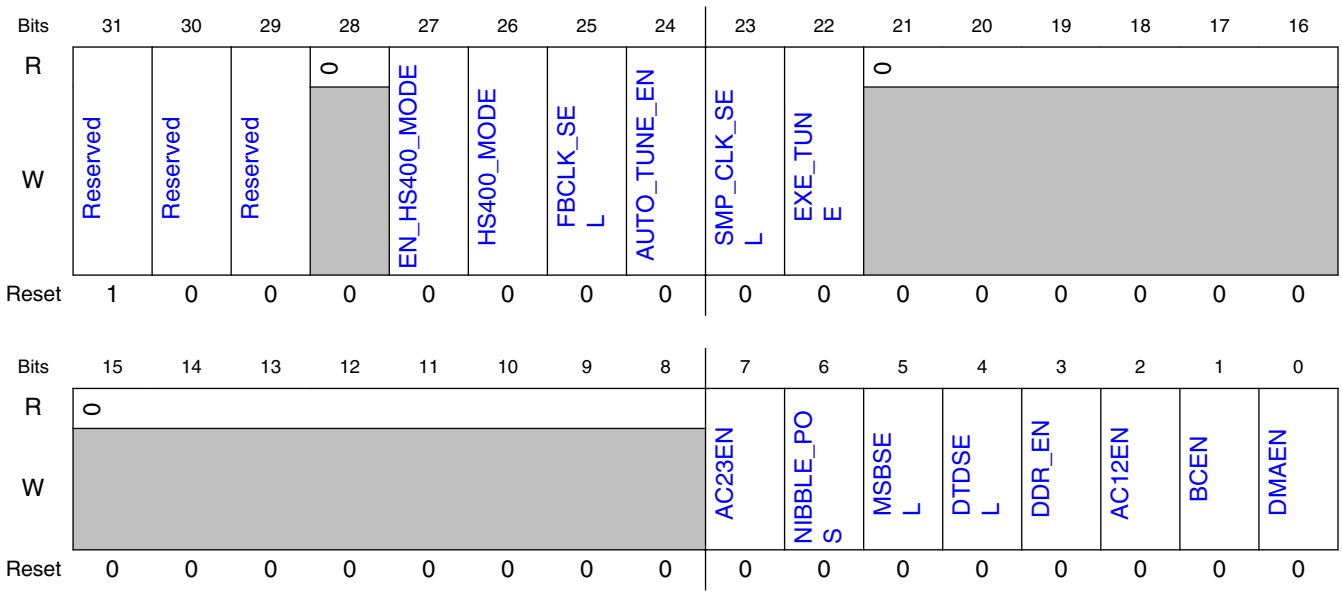
10.3.7.1.20.2 Function

This register is used to DMA and data transfer. To prevent data loss, The software should check if data transfer is active before writing this register. These fields are DPSEL, MBSEL, DTDSEL, AC12EN, BCEN, and DMAEN.

Table 10-48. Transfer type register setting for various transfer types

Multi/single block select	Block count enable	Block count	Function
0	Do not care	Do not care	Single transfer
1	0	Do not care	Infinite transfer
1	1	Positive number	Multiple transfer
1	1	Zero	No data transfer

10.3.7.1.20.3 Diagram



10.3.7.1.20.4 Fields

Field	Function
31 —	Reserved Always write as 1.
30 —	Reserved Always write as 0.
29 —	Reserved Always write as 0.
28 —	Reserved
27 EN_HS400_MODE	Enable enhance HS400 mode Enhance HS400 enable
26 HS400_MODE	Enable HS400 mode HS400 Enable
25 FBCLK_SEL	Feedback clock source selection (Only used for SD3.0, SDR104 mode and EMMC HS200 mode) 0b - Feedback clock comes from the loopback CLK 1b - Feedback clock comes from the ipp_card_clk_out
24 AUTO_TUNE_EN	Auto tuning enable (Only used for SD3.0, SDR104 mode and and EMMC HS200 mode) 0b - Disable auto tuning 1b - Enable auto tuning
23 SMP_CLK_SEL	Clock selection When STD_TUNING_EN is 0, this field is used to select Tuned clock or Fixed clock to sample data / cmd (Only used for SD3.0, SDR104 mode and EMMC HS200 mode)

Table continues on the next page...

Field	Function
	0b - Fixed clock is used to sample data / cmd 1b - Tuned clock is used to sample data / cmd
22 EXE_TUNE	Execute tuning: (Only used for SD3.0, SDR104 mode and EMMC HS200 mode) When STD_TUNING_EN is 0, this field is set to 1 to indicate the host driver is starting tuning procedure. Tuning procedure is aborted by writing 0. 0b - Not tuned or tuning completed 1b - Execute tuning
21-8 —	Reserved
7 AC23EN	Auto CMD23 enable When this field is set to 1, the host controller issues a CMD23 automatically before issuing a command specified in the Command Register.
6 NIBBLE_POS	Nibble position indication In DDR 4-bit mode nibble position indication. 0- the sequence is 'odd high nibble -> even high nibble -> odd low nibble -> even low nibble'; 1- the sequence is 'odd high nibble -> odd low nibble -> even high nibble -> even low nibble'.
5 MSBSEL	Multi / Single block select This field enables multiple block DATA line data transfers. For any other commands, this field can be set to 0. If this field is 0, it is not necessary to set the Block Count register. See Command Transfer Type (CMD_XFR_TYP). 0b - Single block 1b - Multiple blocks
4 DTDSEL	Data transfer direction select This field defines the direction of DATA line data transfers. The field is set to 1 by the host driver to transfer data from the SD card to uSDHC and is set to 0 for all other commands. 0b - Write (Host to card) 1b - Read (Card to host)
3 DDR_EN	Dual data rate mode selection
2 AC12EN	Auto CMD12 enable Multiple block transfers for memory require a CMD12 to stop the transaction. When this field is set to 1, uSDHC issues a CMD12 automatically when the last block transfer has completed. The host driver is not set this field to issue commands that do not require CMD12 to stop a multiple block data transfer. In particular, secure commands defined in File Security Specification (see reference list) do not require CMD12. In single block transfer, uSDHC ignores this field no matter it is set or not. 0b - Disable 1b - Enable
1 BCEN	Block count enable This field is used to enable the Block Count register, which is only relevant for multiple block transfers. When this field is 0, the internal counter for block is disabled, which is useful in executing an infinite transfer. 0b - Disable 1b - Enable
0 DMAEN	DMA enable

Field	Function
	This field enables DMA functionality. If this field is set to 1, a DMA operation begins when the host driver sets the DPSEL field of this register. Whether the simple DMA or the advanced DMA is active depends on the DMA Select field of the Protocol Control register. 0b - Disable 1b - Enable

10.3.7.1.21 Force Event (FORCE_EVENT)

10.3.7.1.21.1 Offset

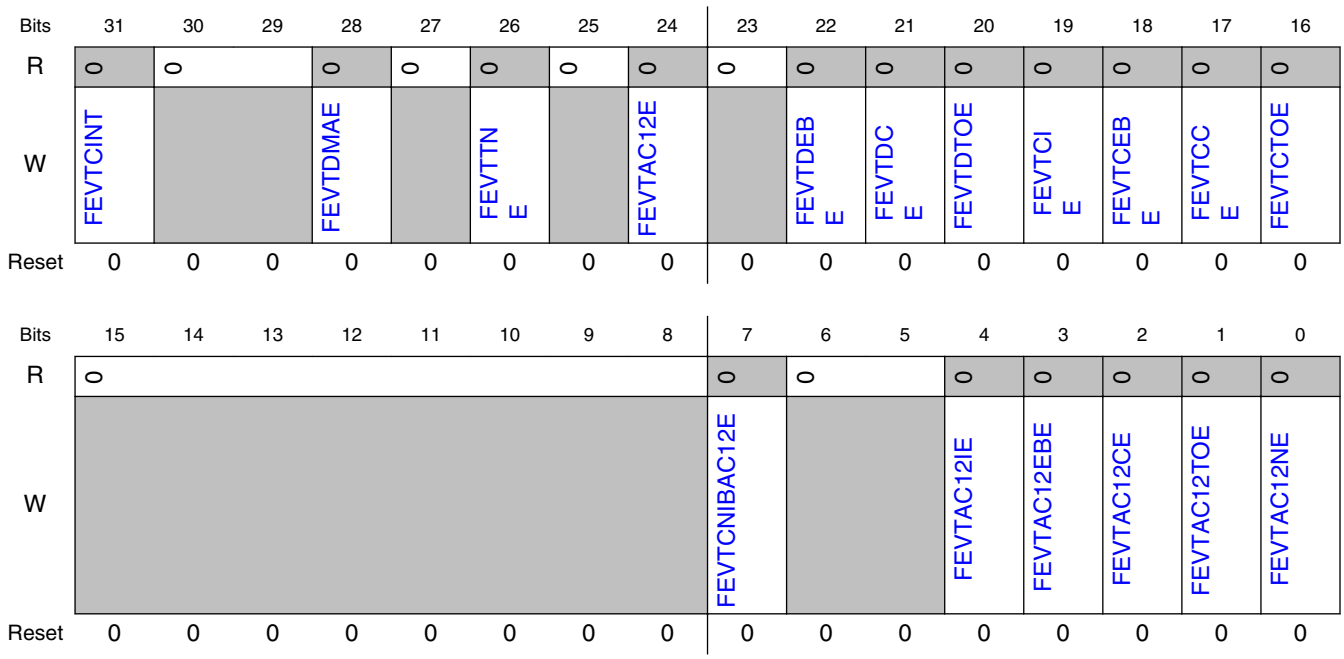
Register	Offset
FORCE_EVENT	50h

10.3.7.1.21.2 Function

The Force Event Register is not a physically implemented register. Rather, it is an address at which the Interrupt Status register can be written if the corresponding field of the Interrupt Status Enable Register is set. This register is a write only register and writing 0 to it has no effect. Writing 1 to this register actually sets the corresponding field of Interrupt Status register. A read from this register always results in 0's. to change the corresponding status fields in the Interrupt Status register, make sure to set IPGEN field in System Control Register so that peripheral clock is always active.

Forcing a card interrupt generates a short pulse on the DATA1 line, and the driver might treat this interrupt as a normal interrupt. The interrupt service routine might skip polling the card interrupt factor as the interrupt is self cleared.

10.3.7.1.21.3 Diagram



10.3.7.1.21.4 Fields

Field	Function
31 FEVTCINT	Force event card interrupt Writing 1 to this field generates a short low-level pulse on the internal DATA1 line, as if a self clearing interrupt was received from the external card. If enabled, the CINT field is set and the interrupt service routine might treat this interrupt as a normal interrupt from the external card.
30-29 —	Reserved
28 FEVTDMAE	Force event DMA error Forces the DMAE field of Interrupt Status register to be set.
27 —	Reserved
26 FEVTTNE	Force tuning error Forces the TNE field of Interrupt Status register to be set.
25 —	Reserved
24 FEVTAC12E	Force event Auto Command 12 error Forces the AC12E field of Interrupt Status register to be set.
23 —	Reserved
22	Force event data end bit error

Table continues on the next page...

Field	Function
FEVTDEBE	Forces the DEBE field of Interrupt Status register to be set.
21 FEVTDCE	Force event data CRC error Forces the DCE field of Interrupt Status register to be set.
20 FEVTDTOE	Force event data time out error Force the DTOE field of Interrupt Status register to be set.
19 FEVTCIE	Force event command index error Forces the CCE field of Interrupt Status register to be set.
18 FEVTCEBE	Force event command end bit error Forces the CEBE field of Interrupt Status register to be set.
17 FEVTCCE	Force event command CRC error Forces the CCE field of Interrupt Status register to be set.
16 FEVTCTOE	Force event command time out error Forces the CTOE field of Interrupt Status register to be set.
15-8 —	Reserved
7 FEVTCNIBAC12E	Force event command not executed by Auto Command 12 error Forces the CNIBAC12E field in the Auto Command12 Error Status register to be set.
6-5 —	Reserved
4 FEVTAC12IE	Force event Auto Command 12 index error Forces the AC12IE field in the Auto Command12 Error Status register to be set.
3 FEVTAC12EBE	Force event Auto Command 12 end bit error Forces the AC12EBE field in the Auto Command12 Error Status register to be set.
2 FEVTAC12CE	Force event auto command 12 CRC error Forces the AC12CE field in the Auto Command12 Error Status register to be set.
1 FEVTAC12TOE	Force event auto command 12 time out error Forces the AC12TOE field in the Auto Command12 Error Status register to be set.
0 FEVTAC12NE	Force event auto command 12 not executed Forces the AC12NE field in the Auto Command12 Error Status register to be set.

10.3.7.1.22 ADMA Error Status (ADMA_ERR_STATUS)

10.3.7.1.22.1 Offset

Register	Offset
ADMA_ERR_STATUS	54h

10.3.7.1.22.2 Function

When an ADMA Error Interrupt has occurred, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address register holds the address around the error descriptor.

For recovering from this error, the host driver requires the ADMA state to identify the error descriptor address as follows:

- ST_STOP: Previous location set in the ADMA System Address register is the error descriptor address.
- ST_FDS: Current location set in the ADMA System Address register is the error descriptor address.
- ST_CADR: This state is never set because it only increments the descriptor pointer and does not generate an ADMA error.
- ST_TFR: Previous location set in the ADMA System Address register is the error descriptor address.

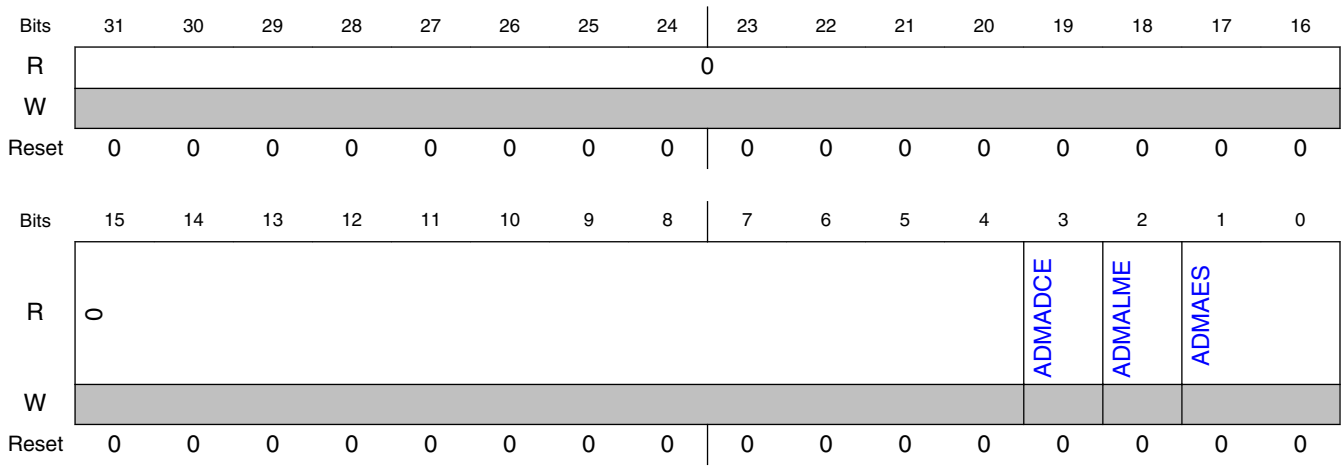
In case of a write operation, the host driver should use the ACMD22 to get the number of the written block, rather than using this information, because unwritten data might exist in the host controller.

The host controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) in the ST_FDS state. The host driver can distinguish this error by reading the Valid field of the error descriptor.

Table 10-49. ADMA error state coding

D01-D00	ADMA error state (when error has occurred)	Contents of ADMA System Address register
00	ST_STOP (Stop DMA)	Holds the address of the next executable descriptor command
01	ST_FDS (Fetch descriptor)	Holds the valid descriptor address
10	ST_CADR (Change address)	No ADMA error is generated
11	ST_TFR (Transfer data)	Holds the address of the next executable descriptor command

10.3.7.1.22.3 Diagram



10.3.7.1.22.4 Fields

Field	Function
31-4 —	Reserved
3 ADMADCE	ADMA descriptor error This error occurs when invalid descriptor fetched by ADMA. 0b - No error 1b - Error
2 ADMALME	ADMA length mismatch error This error occurs in the following two cases: • While the block count enable is being set, the total data length specified by the descriptor table is different from that specified by the block count and block length. • Total data length cannot be divided by the block length. 0b - No error 1b - Error
1-0 ADMAES	ADMA error state (when ADMA error is occurred) This field indicates the state of the ADMA when an error has occurred during an ADMA data transfer. See ADMA Error Status (ADMA_ERR_STATUS) for more details.

10.3.7.1.23 ADMA System Address (ADMA_SYS_ADDR)

10.3.7.1.23.1 Offset

Register	Offset
ADMA_SYS_ADDR	58h

10.3.7.1.23.2 Function

This register contains the physical system memory address used for ADMA transfers.

10.3.7.1.23.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	ADS_ADDR															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADS_ADDR														0	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

10.3.7.1.23.4 Fields

Field	Function
31-2 ADS_ADDR	ADMA system address This register holds the word address of the executing command in the Descriptor table. At the start of ADMA, the host driver sets the start address of the Descriptor table. The ADMA engine increments this register address whenever fetching a Descriptor command. When the ADMA is stopped at the Block Gap, this register indicates the address of the next executable Descriptor command. When the ADMA Error Interrupt is generated, this register holds the valid Descriptor address depending on the ADMA state. The lower 2 bits of this register is tied to '0' so the ADMA address is always word aligned. Because this register supports dynamic address reflecting, when TC field is set, it automatically alters the value of internal address counter, so the software cannot change this register when TC field is set. Such restriction is also listed in Software restrictions.
1-0 —	Reserved

10.3.7.1.24 DLL (Delay Line) Control (DLL_CTRL)

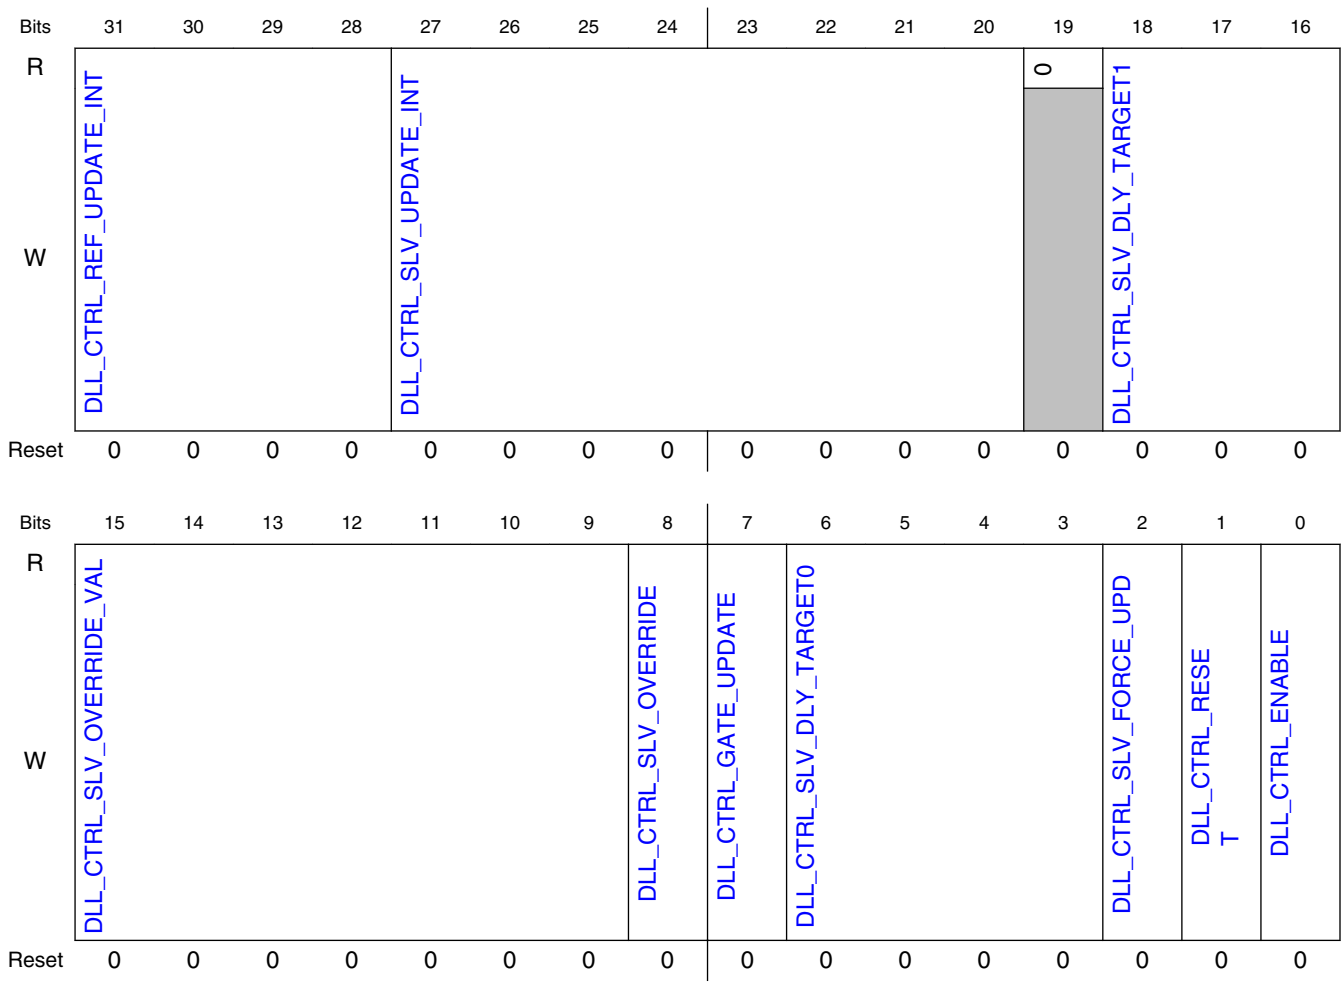
10.3.7.1.24.1 Offset

Register	Offset
DLL_CTRL	60h

10.3.7.1.24.2 Function

This register contains control fields for DLL.

10.3.7.1.24.3 Diagram



10.3.7.1.24.4 Fields

Field	Function
31-28 DLL_CTRL_REF_UPDATE_INT	DLL control loop update interval The interval cycle is (2 + REF_UPDATE_INT) * REF_CLOCK. By default, the DLL control loop updates every two REF_CLOCK cycles. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that might effect the delay (such as voltage and temperature)
27-20	Slave delay line update interval

Table continues on the next page...

Field	Function
DLL_CTRL_SLV_UPDATE_INT	If default 0 is used, it means 256 cycles of REF_CLOCK. A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line also updates automatically when the reference DLL transitions to a locked state (from an un-locked state).
19 —	Reserved
18-16 DLL_CTRL_SLV_DLY_TARGET1	DLL slave delay target1 See DLL_CTRL_SLV_DLY_TARGET0 below.
15-9 DLL_CTRL_SLV_OVERRIDE_VAL	DLL slave override val When SLV_OVERRIDE = 1, this field is used to select 1 of 128 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 128.
8 DLL_CTRL_SLV_OVERRIDE	DLL slave override Set this field to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to be enabled using the ENABLE field. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE = 0
7 DLL_CTRL_GATE_UPDATE	DLL gate update Set this field to 1 to prevent the DLL from updating (because when clock_in exists, glitches might appear during DLL updates). This field might be used by software if such a condition occurs. Clear the bit to 0 to allow the DLL to update automatically.
6-3 DLL_CTRL_SLV_DLY_TARGET0	DLL slave delay target0 The delay target for uSDHC loopback read clock can be programmed in 1/16th increments of an ref_clock half-period. The delay is (({DLL_CTRL_SLV_DLY_TARGET1,DLL_CTRL_SLV_DLY_TARGET0} +1)* REF_CLOCK / 2) / 16 So the input read-clock can be delayed relative input data from (REF_CLOCK / 2) / 16 to REF_CLOCK * 4.
2 DLL_CTRL_SLV_FORCE_UPD	DLL slave delay line Setting this field to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line updates automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered). Be sure to use it when uSDHC is idle. This function might not work when uSDHC is working on data / cmd / response.
1 DLL_CTRL_RESET	DLL reset Setting this field to 1 force a reset on DLL. This causes the DLL to lose lock and re-calibrate to detect an REF_CLOCK half period phase shift. This signal is used by the DLL as edge-sensitive, so to create a subsequent reset, RESET must be taken low and then asserted again.
0 DLL_CTRL_ENABLE	DLL and delay chain Set this field to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE VAL, the DLL does not need to be enabled.

10.3.7.1.25 DLL Status (DLL_STATUS)

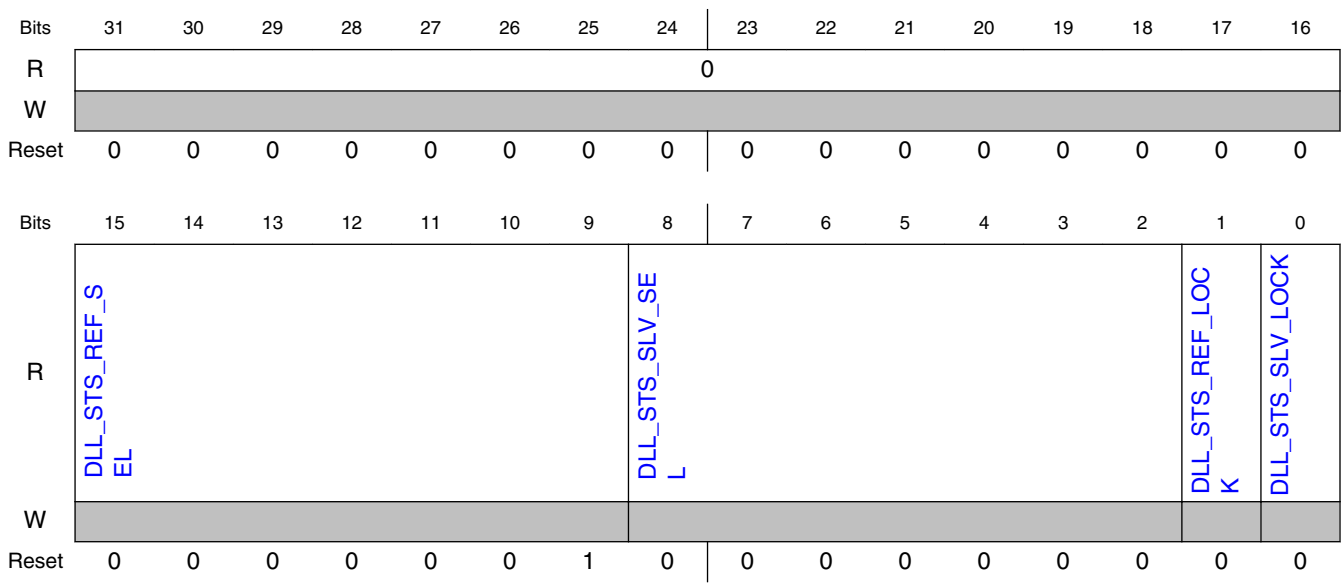
10.3.7.1.25.1 Offset

Register	Offset
DLL_STATUS	64h

10.3.7.1.25.2 Function

This register contains the DLL status information. All fields are read only and reads the same as the power-reset value.

10.3.7.1.25.3 Diagram



10.3.7.1.25.4 Fields

Field	Function
31-16 —	Reserved
15-9 DLL_STS_REF_SEL	Reference delay line select taps This is encoded by 7 fields for 127 taps.
8-2 DLL_STS_SLV_SEL	Slave delay line select status This is the instant value generated from reference chain. Because the reference chain can only be updated when REF_CLOCK is detected, this value should be the right value to be updated when the reference is locked.
1	Reference DLL lock status

Table continues on the next page...

Field	Function
DLL_STS_REF_LOCK	This signifies that the DLL has detected and locked to a half-phase ref_clock shift, allowing the slave delay-line to perform programmed clock delays
0	Slave delay-line lock status
DLL_STS_SLV_LOCK	This signifies that a valid calibration has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value

10.3.7.1.26 CLK Tuning Control and Status (CLK_TUNE_CTRL_STATUS)

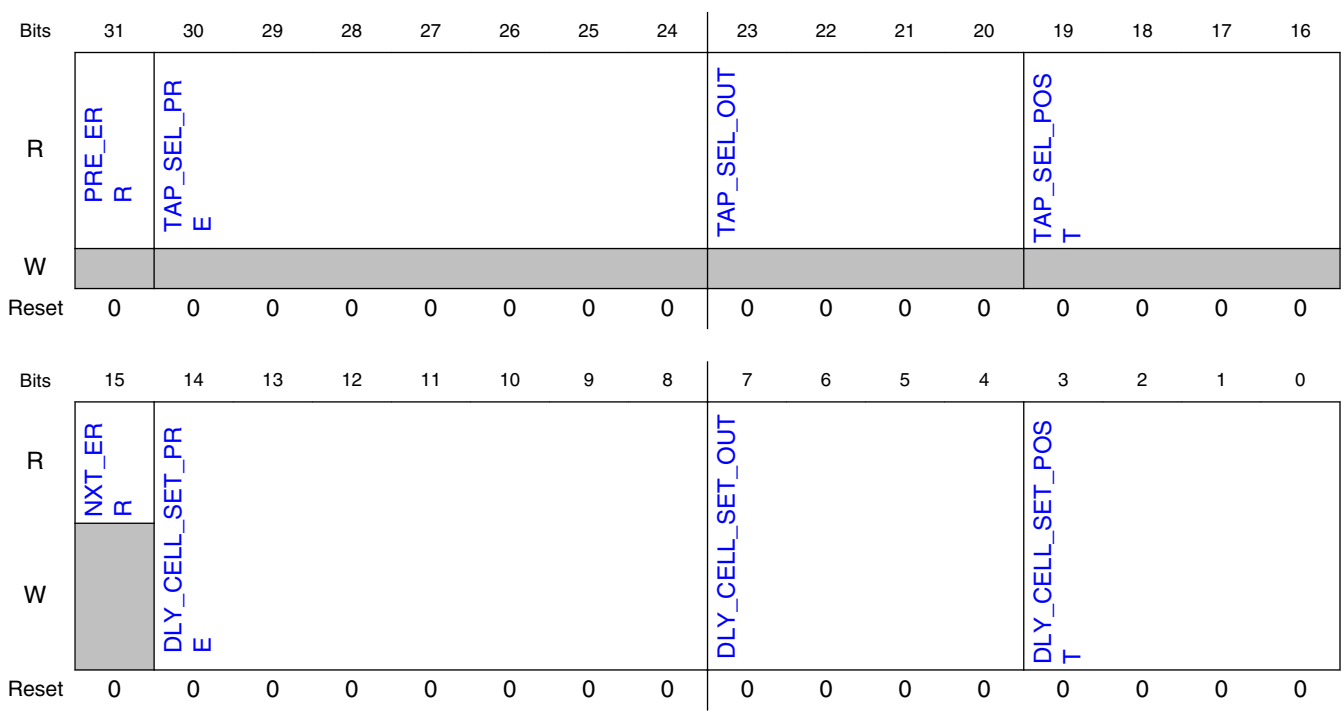
10.3.7.1.26.1 Offset

Register	Offset
CLK_TUNE_CTRL_STATUS	68h

10.3.7.1.26.2 Function

This register contains the Clock Tuning Control status information. All fields are read only and reads the same as the power-reset value. This register is added to support SD3.0 UHS-I SDR104 mode and EMMC HS200 mode.

10.3.7.1.26.3 Diagram



10.3.7.1.26.4 Fields

Field	Function
31 PRE_ERR	PRE error PRE error which means the number of delay cells added on the feedback clock is too small. It is valid only when SMP_CLK_SEL of Mix control register (bit23 of 0x48) is enabled.
30-24 TAP_SEL_PRE	TAP_SEL_PRE Reflects the number of delay cells added on the feedback clock between the feedback clock and CLK_PRE. When AUTO_TUNE_EN (bit24 of 0x48) is disabled, TAP_SEL_PRE is always equal to DLY_CELL_SET_PRE. When AUTO_TUNE_EN (bit24 of 0x48) is enabled, TAP_SEL_PRE is updated automatically according to the status of the auto tuning circuit to adjust the sample clock phase.
23-20 TAP_SEL_OUT	Delay cells added on the feedback clock between CLK_PRE and CLK_OUT Reflects the number of delay cells added on the feedback clock between CLK_PRE and CLK_OUT.
19-16 TAP_SEL_POST	Delay cells added on the feedback clock between CLK_OUT and CLK_POST Reflects the number of delay cells added on the feedback clock between CLK_OUT and CLK_POST.
15 NXT_ERR	NXT error NXT error which means the number of delay cells added on the feedback clock is too large. It's valid only when SMP_CLK_SEL of Mix control register (bit23 of 0x48) is enabled.
14-8 DLY_CELL_SET_PRE	delay cells on the feedback clock between the feedback clock and CLK_PRE Set the number of delay cells on the feedback clock between the feedback clock and CLK_PRE.
7-4 DLY_CELL_SET_OUT	Delay cells on the feedback clock between CLK_PRE and CLK_OUT Set the number of delay cells on the feedback clock between CLK_PRE and CLK_OUT.
3-0 DLY_CELL_SET_POST	Delay cells on the feedback clock between CLK_OUT and CLK_POST Set the number of delay cells on the feedback clock between CLK_OUT and CLK_POST.

10.3.7.1.27 Strobe DLL control (STROBE_DLL_CTRL)

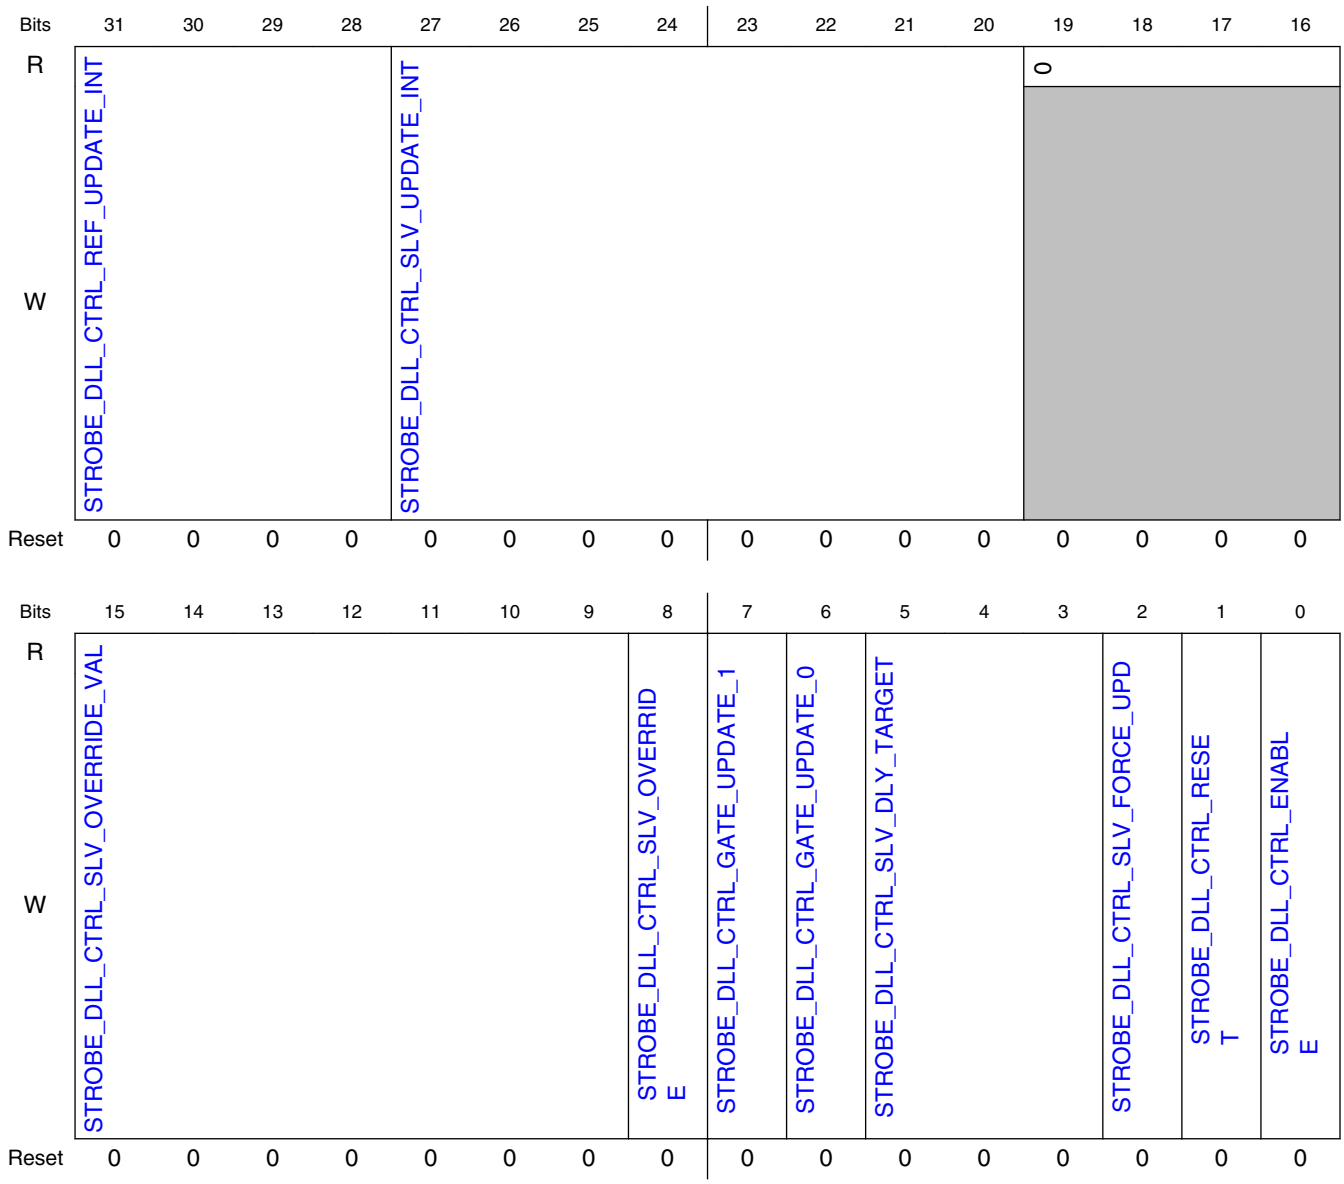
10.3.7.1.27.1 Offset

Register	Offset
STROBE_DLL_CTRL	70h

10.3.7.1.27.2 Function

This register contains the strobe DLL control information.

10.3.7.1.27.3 Diagram



10.3.7.1.27.4 Fields

Field	Function
31-28 STROBE_DLL_CTRL_REF_UPDATE_INT	Strobe DLL control reference update interval The interval cycle is (2 + STROBE_REF_UPDATE_INT) * STROBE_REF_CLOCK. By default, the DLL control loop updates every two STROBE_REF_CLOCK cycles.

Table continues on the next page...

Field	Function
	NOTE: Increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that might effect the delay (such as voltage and temperature)
27-20 STROBE_DLL_CTRL_SLV_UPDATE_INT	Strobe DLL control slave update interval Slave delay line update interval. If default 0 is used, it means 256 cycles of STROBE_REF_CLOCK. A value of 0x0F results in 15 cycles and so on. **NOTE:** software can always cause an update of the slave-delay line using the STROBE_SLV_FORCE_UPDATE register. The slave delay line also updates automatically when the reference DLL transitions to a locked state (from an un-locked state).
19-16 —	This field is reserved. This read-only field is reserved and always has the value 0.
15-9 STROBE_DLL_CTRL_SLV_OVERRIDE_VAL	Strobe DLL control slave Override value When STROBE_SLV_OVERRIDE = 1, this field is used to manually select one of 128 physical taps. A value of 0 selects tap 1, and a value of 0x7F selects tap 128.
8 STROBE_DLL_CTRL_SLV_OVERRIDE	Strobe DLL control slave override Set this field to 1 to Enable manual override for slave delay chain using STROBE_SLV_OVERRIDE_VAL; set this field to 0 to disable manual override. This feature does not require the DLL to be enabled using the ENABLE field. In fact to reduce power, if STROBE_SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE = 0.
7 STROBE_DLL_CTRL_GATE_UPDATE_1	Strobe DLL control gate update Set this field to 1 to prevent the DLL from updating (because when STROBE_CLOCK_IN exists, glitches might appear during DLL updates). This field can be used by software if such a condition occurs. Clear the field to 0 to allow the DLL to update automatically.
6 STROBE_DLL_CTRL_GATE_UPDATE_0	Strobe DLL control gate update Set this field to 1 to prevent the DLL from updating (because when STROBE_CLOCK_IN exists, glitches might appear during DLL updates). This field can be used by software if such a condition occurs. Clear the field to 0 to allow the DLL to update automatically.
5-3 STROBE_DLL_CTRL_SLV_DLY_TARGET	Strobe DLL Control Slave Delay Target The delay target for uSDHC loopback read clock can be programmed in 1/16th increments of an STROBE_REF_CLOCK half-period. The delay is ((STROBE_DLL_CTRL_SLV_DLY_TARGET + 1) * STROBE_REF_CLOCK / 2) / 16, So the input read-clock can be delayed relative input data from (STROBE_REF_CLOCK / 2) / 16 to (STROBE_REF_CLOCK *4)/16.
2 STROBE_DLL_CTRL_SLV_FORCE_UPD	Strobe DLL control slave force updated Setting this field to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line should automatically update the STROBE_SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if STROBE_SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered). Be sure to use it when uSDHC is idle. This function might not work when uSDHC is working on data / cmd / response.
1 STROBE_DLL_CTRL_RESET	Strobe DLL control reset Setting this field to 1 to force a reset on DLL. This causes the DLL to lose lock and re-calibrate to detect an REF_CLOCK half period phase shift. This signal is used by the DLL as edge-sensitive, to create a subsequent reset, RESET must be taken low and then asserted again.
0 STROBE_DLL_CTRL_ENABLE	Strobe DLL control enable Set this field to 1 to enable the DLL and delay chain; otherwise, set to 0 to bypasses DLL. **NOTE:** Using the slave delay line override feature with STROBE_SLV_OVERRIDE and STROBE_SLV_OVERRIDE VAL, the DLL does not need to be enabled.

10.3.7.1.28 Strobe DLL status (STROBE_DLL_STATUS)

10.3.7.1.28.1 Offset

Register	Offset
STROBE_DLL_STATUS	74h

10.3.7.1.28.2 Function

This register contains the strobe DLL status information. All fields are read only and read the same as the power-reset value.

10.3.7.1.28.4 Fields

Field	Function
31-16	This field is reserved.
—	This read-only field is reserved and always has the value 0.
15-9	Strobe DLL status reference select

Table continues on the next page...

Field	Function
STROBE_DLL_STS_REF_SEL	Reference delay line select taps. This is encoded by 7 fields for 127 taps.
8-2 STROBE_DLL_STS_SLV_SEL	Strobe DLL status slave select Slave delay line select status. This is the instant value generated from reference chain. Because the reference chain can only be updated when STROBE_REF_CLOCK is detected, this value can be updated with the right value when the reference is locked.
1 STROBE_DLL_STS_REF_LOCK	Strobe DLL status reference lock This signifies that the DLL has detected and locked to a half-phase REF_CLOCK shift, it allows the slave delay-line to perform programmed clock delays.
0 STROBE_DLL_STS_SLV_LOCK	Strobe DLL status slave lock Slave delay-line lock status. This signifies that a valid calibration has been set to the slave-delay line, and the slave-delay line is implementing the programmed delay value.

31 CMD_BYTE_EN	Byte access This bit controls the byte access. 0b - Disable 1b - Enable
30 —	Reserved Always write as 0.
29 —	Reserved Always write as 1
28 —	Reserved Always write as 0.
27-24 —	Reserved Always write as 4'b0000.
23-16 —	Reserved Always write as 8'h00.
15 CRC_CHK_DIS	CRC Check Disable 0b - Check CRC16 for every read data packet and check CRC fields for every write data packet 1b - Ignore CRC16 check for every read data packet and ignore CRC fields check for every write data packet
14-11	Reserved

Table continues on the next page...

Field	Function
—	Reserved
10 —	Reserved Always write as 0.
9 —	Reserved Always write as 0.
8 FRC_SDCLK_ON	Force CLK Force CLK output active 0b - CLK active or inactive is fully controlled by the hardware. 1b - Force CLK active
7-4 —	Reserved
3 AC12_WR_CHKBUSY_EN	Check busy enable Check busy enable after auto CMD12 for write data packet 0b - Do not check busy after auto CMD12 for write data packet 1b - Check busy after auto CMD12 for write data packet
2 CONFLICT_CHK_EN	Conflict check enable It is not implemented in uSDHC IP. 0b - Conflict check disable 1b - Conflict check enable
1 VSELECT	Voltage selection Change the value of output signal VSELECT, to control the voltage on pads for external card. There must be a control circuit out of uSDHC to change the voltage on pads. 0b - Change the voltage to high voltage range, around 3.0 V 1b - Change the voltage to low voltage range, around 1.8 V
0 EXT_DMA_EN	External DMA request enable Enable the request to external DMA. When the internal DMA (either Simple DMA or Advanced DMA) is not in use, and this field is set, uSDHC sends out DMA request when the internal buffer is ready. This field is particularly useful when transferring data by Arm platform polling mode, and it is not allowed to send out the external DMA request. By default, this field is set. 0b - In any scenario, uSDHC does not send out external DMA request. 1b - When internal DMA is not active, the external DMA request is sent out.

Chapter 11
Connectivity

11.1 Universal Serial Bus Controller (USB)

11.1.1 Overview

The USB module is a USB 3.0-compliant serial interface engine for implementing a USB interface. This module may be connected to an external port. Collectively the module and external port are called the USB 3.0 interface. USB 3.0 supports super-speed (SS), high-speed (HS), full-speed (FS), and low-speed (LS) operations.

NOTE

Synopsys Proprietary. Used with permission.

- The upper layer is common for USB 2.0 and USB 3.0 operation. This has the bus interface, buffer management block, list processor for scheduling, and control and status register (CSR) functions
- USB 2.0 PHY and MAC layers
- USB 3.0 PHY, LINK, and MAC layers

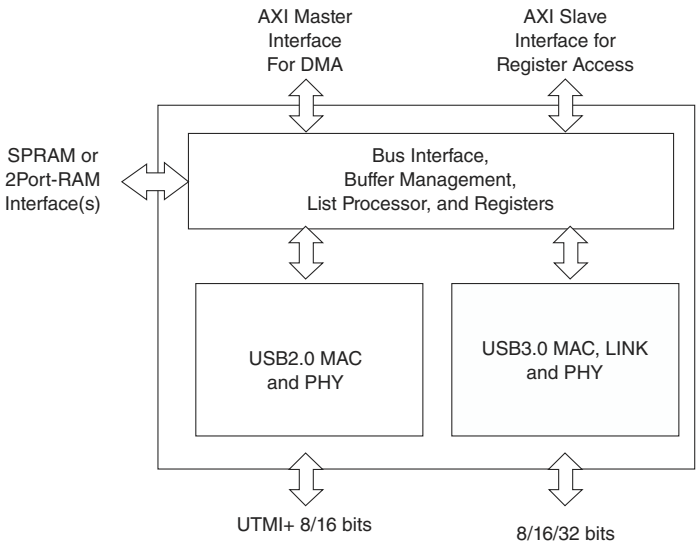

Figure 11-1. USB interface block diagram

11.1.1.1 Features

The USB 3.0 module includes the following features:

- Complies with USB specification rev 3.0 (xHCI compatible)
- Supports operation as a standalone USB host controller
- USB dual-role operation and can be configured as host or device
- Super-speed (5 Gbit/s), high-speed (480 Mbit/s), full-speed (12 Mbit/s), and low-speed (1.5 Mbit/s) operations.
- Supports operation as a standalone single port USB
- Supports four programmable, bidirectional USB endpoints
- OTG (on-the-go) 2.0 compliant, which includes both device and host capability. Super-speed operation is not supported when OTG is enabled.
- Supports system memory interface with -bit addressing capability

11.1.1.2 Modes of Operation

The USB 3.0 module operates in following modes.

- Host Mode: SS/HS/FS/LS
- Device Mode: SS/HS/FS
- OTG: HS/FS/LS

11.1.1.3 External Signals

This section contains detailed descriptions of all the USB 3.0 controller signals. Many of the signals for the PHY interfaces are muxed onto the same pins in order to reduce pin count. The following table shows the USB signals, indicating which interface supports each signal.

Table 11-1. USB 3.0 External Signals

Signal	I/O	Description
USB1_D_P	IO	USB PHY Data Plus
USB1_D_M	IO	USB PHY Data Minus
USB1_VBUS	IO	USB PHY VBUS
USB1_ID	IO	USB PHY ID Detect
USB1_TX_P	O	USB PHY 3.0 Transmit Data (positive)
USB1_TX_M	O	USB PHY 3.0 Transmit Data (negative)
USB1_RX_P	I	USB PHY 3.0 Receive Data (positive)
USB1_RX_M	I	USB PHY 3.0 Receive Data (negative)
USB1_RESREF	IO	USB PHY Impedance Calibration
USB1_DRVVBUS	O	VBus power enable.
USB1_PWRFAULT	I	Indicates that a Vbus fault has occurred.

11.1.2 Functional Description

11.1.2.1 System memory descriptor and data buffers

The software creates transfer request blocks (TRBs), and four DWORDs each, that point to the data buffers. Normally, the TRBs are allocated consecutively in system memory; only the data buffers can be scattered. In the case of a circular buffer, the link-TRB points to the next TRB. Once the TRBs and data buffers are set up in the system memory, the software driver issues a start transfer command that points to the location of the first TRB in the system memory to start the DMA operation. TRBs, though small (only four DWORDs), provide a rich set of features for the software to schedule transfers, isochronous, control, interrupt moderation, and so on.

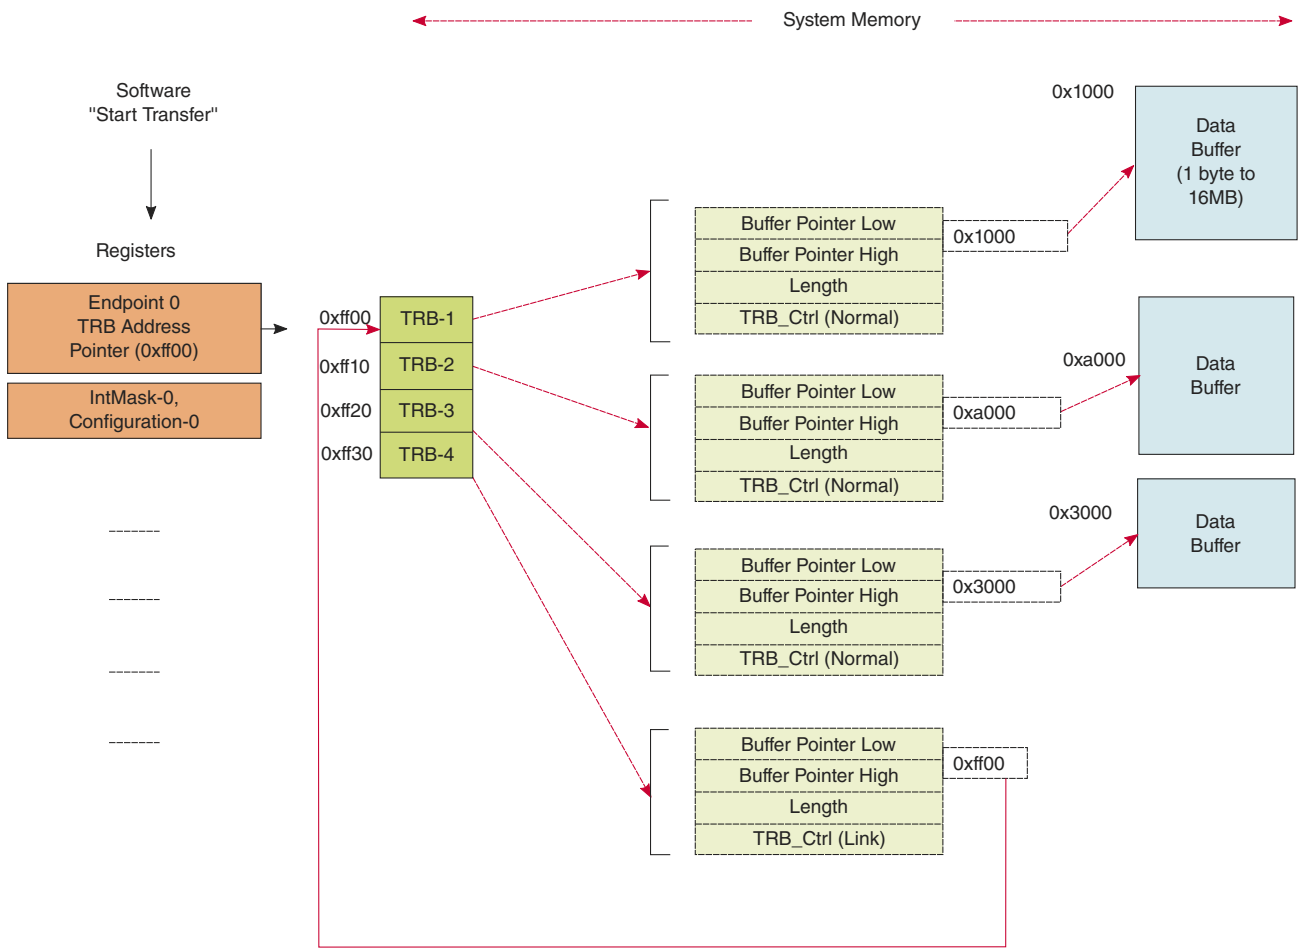

Figure 11-2. System Memory Descriptor and Data Buffers

11.1.2.2 Device descriptor structures

Device mode transfer request blocks (TRBs) are small 4 DWORDs and at the same time provide a rich set of features so that the software can efficiently manage the USB core, memory buffers, and MIPS requirements.

The following is a list of device mode TRB characteristics:

- TRBs provide support for scattered data structures. The scattered data buffers can be zero bytes to 16 MB in length.
- TRBs must be placed in system memory aligned to a 16-byte boundary.
- TRBs are kept in linear memory to enhance descriptor caching performance. If the data buffers are small (as in an Ethernet application) the core can efficiently collect the scattered data to build USB packets without wasting bus efficiency that collecting scattered descriptors requires.

- Supports TRB linking. This allows software to set up a circular ring of TRBs with the last TRB linking to the first one.
- Supports system memory interface with -bit addressing capability
- Supports byte-aligned buffers for each TRB of a transfer. This feature prevents the need for buffer copying in cases where the USB device driver receives unaligned data buffers from other applications (for example, Ethernet). Whenever the application controls buffer allocation, it must allocate SoC bus width and burst-aligned buffers to facilitate efficient bus and memory utilization. For transmitting, the core supports byte-aligned buffers on all TRBs.

  For example: To use 16 bursts in a 64-bit system, you must try to allocate buffers that are 16 * 8 = 128 bytes aligned. This is the normal buffer structure because Linux-like OSs allocate 4 KB buffers. SDR/DDR memory controllers also provide better performance when requests are burst aligned.

- Supports software queueing of multiple USB transfers (LST bit for IN/OUT transfers and CSP bit for OUT transfers control this function).
- Provides interrupt moderation capability, allowing software to selectively enable events on TRB completion, as controlled by the IOC (Interrupt on completion) bit. The IOC event is also used by software to reallocate the released buffers, allowing software to re-use just a few buffers in a circular fashion. This helps when the memory is limited but have enough MIPS to process interrupts. Larger buffers can be allocated to reduce the number of interrupts.
  - In USB 3.0 larger transfers are recommended because the raw transfer rate is almost 10 times faster, unlike USB 2.0, where drivers set up only 64 KB or 128 KB transfers. For example, a 64 KB transfer that takes 1.3 ms in USB 2.0 requires only 164 s in USB 3.0. If you set up buffers of 64 KB and enable the transfer completion event, then you receive an interrupt every 164 sec.
- Supports streaming (Stream ID field used for this purpose).

11.1.2.2.1 Structures

This figure shows the control and status field of a transfer request block.

Figure 11-3. TRB control and status fields

Table 11-2. Device descriptor structure field definitions

Field	Description	Hardware access
DW 03-00		
31:0	Buffer pointer low (BPTRL)	R/W

Table continues on the next page...

Table 11-2. Device descriptor structure field definitions (continued)

Field	Description	Hardware access
	Data buffer pointer to low 32 bit address (BPTR[31:0]). Hardware may also update this field (implementation specific).	
DW 07-04		
31:0	Buffer pointer high (BPTRH) Data buffer pointer to high 32-bit address (BPTR[63:32]).	R/W
DW 0B-08		
31:28	TRB status (TRBSTS) Hardware updates this field with transfer status information before releasing the TRB. • 4'h0: OK • 4'h1: MissedIsoc: Isochronous interval missed or incomplete • 4'h2: SetupPending - During the current control transfer data/status phase, another SETUP was received. • 4'h4: TransferInProgress - During the current transfer, an end transfer command was received.	R/W
25:24	Packet count M1 (PCM1) For high-speed, High bandwidth isochronous IN endpoints, this field in an Isoc-First TRB represents the total number of packets in the Buffer Descriptor minus 1.	R/W
23:0	Buffer size (BUFSIZ) If CHN=0 and HWO=0 for the TRB, this field represents the total remaining Buffer Descriptor buffer size in bytes. Valid Range: 0 bytes to (16 MB - 1 byte). The hardware decrements this field to represent the remaining buffer size after data is transferred. For a Link TRB, the buffer size should be "0".	R/W
DW 0F-0C		
31:30	Reserved.	R/W
29:14	Stream ID / SOF Number For stream-based bulk endpoints: The Stream ID of the transfer this TRB is associated with. Stream ID must be the same in all TRBs (R/W). For isochronous endpoints: The (micro)frame number in which the last packet of this TRB's buffer was transmitted or received (debug purposes only) (RO).	R/W
13:12	Reserved.	R/W
11	Interrupt on Complete (IOC) When IOC is set in a TRB, and once the transfer for this buffer is completed, the core will issue XferInProgress event with IOC bit set in the event's status. This indicates the buffer is available for software to reuse or release.	R
10	Interrupt on Short Packet / Interrupt on Missed ISOC (ISP/IMI) Applicable to OUT endpoints when a short packet is received, and CSP=1 and LST=0. If this bit is 1, the core generates an XferInProgress event. For Isochronous endpoints: If this bit is 1, the core generates an XferInProgress event when the interval represented by the Buffer Descriptor completes with a "Missed Isoc" status.	R
9:4	TRB Control (TRBCTL) Indicates the type of TRB:	R

Table continues on the next page...

Table 11-2. Device descriptor structure field definitions (continued)

Field	Description	Hardware access
	1: Normal (Control-Data-2+ / Bulk / Interrupt) - Set TRBCTL to 1 for all TRBs used in data stage except the first TRB 2: Control-Setup 3: Control-Status-2 - Set TRBCTL to 3 for a SETUP request without data stage 4: Control-Status-3 - Set TRBCTL to 4 for a SETUP request with data stage 5: Control-Data - Set TRBCTL to 5 for the first TRB of a data stage 6: Isochronous-First - Set TRBCTL to 6 for the first TRB of a Service Interval 7: Isochronous 8: Link TRB Others: Reserved	
3	Continue on Short Packet (CSP) Applicable to OUT endpoints only when a short packet is received. If this bit is 1, the core will continue to the next Buffer Descriptor. This setting is required for isochronous endpoints. If this bit is 0, the core will generate an XferComplete event and remove the stream.	R
2	Chain Buffers (CHN) Applicable to IN and OUT endpoints. Set to 1 by software to associate this TRB with the next TRB. A Buffer Descriptor is defined as one or more TRBs. The CHN bit is used to identify the TRBs that comprise a Buffer Descriptor. The CHN bit is always 0 in the last TRB of a Buffer Descriptor and when the LST field is set to 1.	R
1	Last TRB (LST) Indicates this is the last TRB in a list. After completing the transfer for the associated buffer the core will stop the transfer for the endpoint / bulk-stream and issues an XferComplete event. The stream is automatically removed by the hardware.	R
0	Hardware Owner of Descriptor (HWO) Indicates that hardware owns the TRB. Software sets this bit to 1 when it creates the TRB, and cannot modify it until hardware resets this bit to 0. However, there are exceptions for short packets on OUT endpoints and Link TRBs. Because the hardware autonomously checks this bit to determine if the entire TRB is valid, software must set this field to '1' after preparing the other three DWORDs of the TRB with valid information.	R/W

11.1.2.2.1.1 Normal (Control-Data/Bulk/Interrupt), Isochronous, and Status Transfer Request Block Structure

The Normal TRB is used for Bulk/Control-Data/Interrupt endpoint transfers. The data buffers can be scattered anywhere and each may have different sizes. The TRB Buffer Pointer and the Buffer Size fields point to buffer address and size respectively. The Stream ID for bulk endpoints will be programmed by the application.

For isochronous endpoints, the first TRB in a service interval must have the Isoc-First type, the last TRB in a service interval must have CHN=0, and any other TRBs have CHN=1. The starting (micro)frame time is communicated via the Start Transfer command, and the core tracks the (micro)frame times of the subsequent Buffer Descriptors.

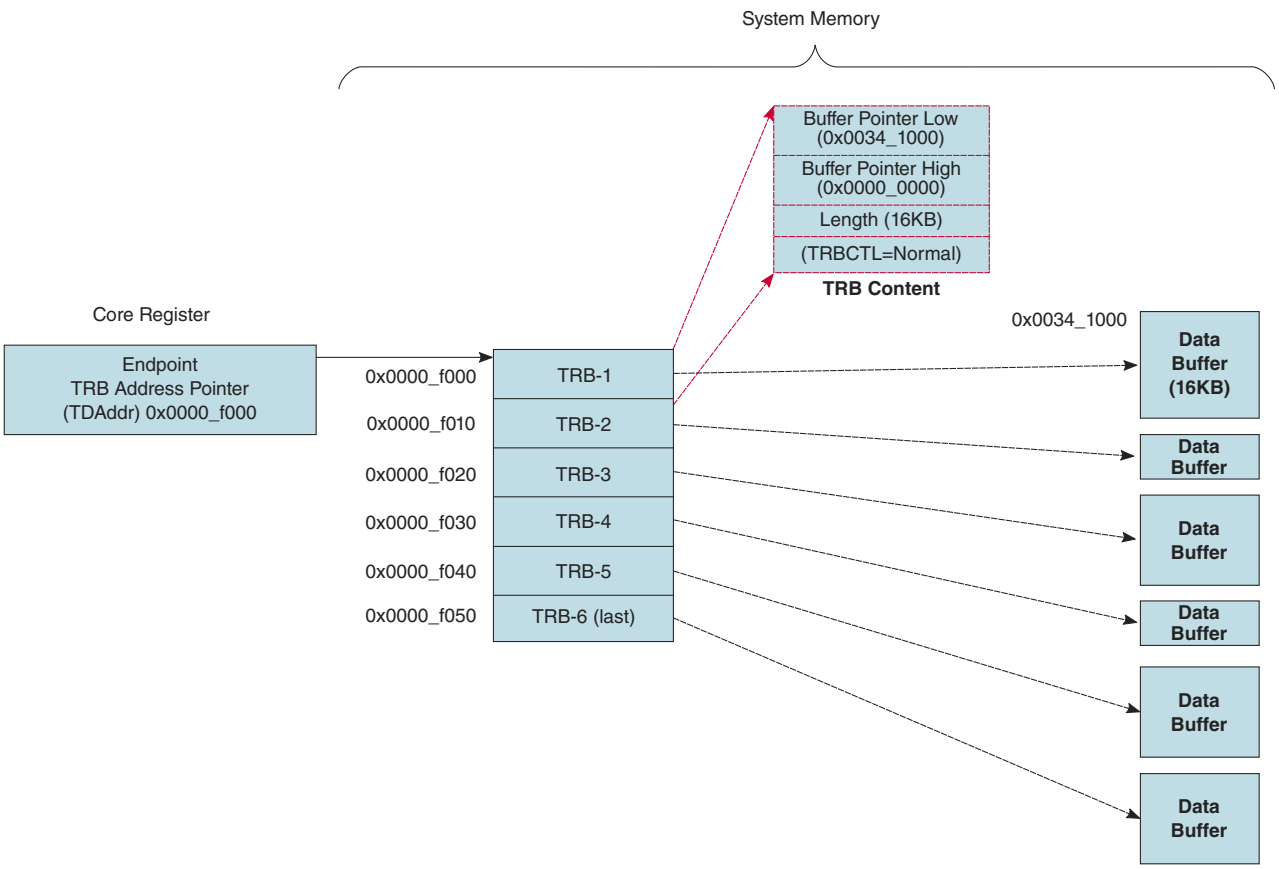

Figure 11-4. Normal (Control-Data/Bulk/Interrupt) Descriptor Structure

11.1.2.2.1.2 Setup and Status TRB Structure

To receive a SETUP packet, the driver queues up a single Setup TRB, whose buffer pointer value may be set to any address, including the address of the TRB. The buffer size must be set to 8. The core will write the 8 bytes of the received SETUP to the address requested. If the address of the TRB is used, there is no need for a separate data buffer to receive a SETUP packet. After completing Setup stage, driver will schedule Data stage and Status stage transfers. For more information, see Control transfer programming model

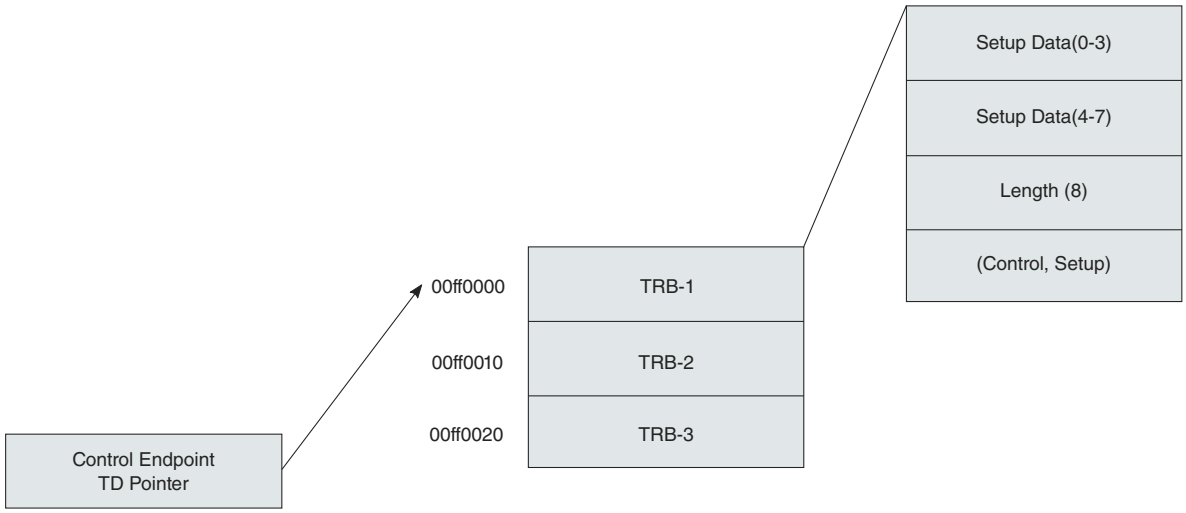

Figure 11-5. SETUP Descriptor Structure with Buffer Pointing to Setup TRB

After interpreting the SETUP bytes, software will determine if the next stage of the control transfer is a data stage or status stage.

If the SETUP bytes require a 3-stage control transfer, the TRB type used in the Data stage must be Control- Data for the first TRB of the Buffer Descriptor. When the host moves on to the Status stage, the TRB Type must be Control-Status-3.

If the SETUP bytes require a 2-stage control transfer, the TRB Type must be Control-Status-2.

The Status TRB is a zero-length TRB, with an unspecified Buffer Pointer value and a Buffer Size of zero. There is no data buffer associated with a Status TRB.

11.1.2.2.1.3 Link TRB Structure

The Link TRB is used to link back to the starting TRB for reusing TRBs in a circular fashion.

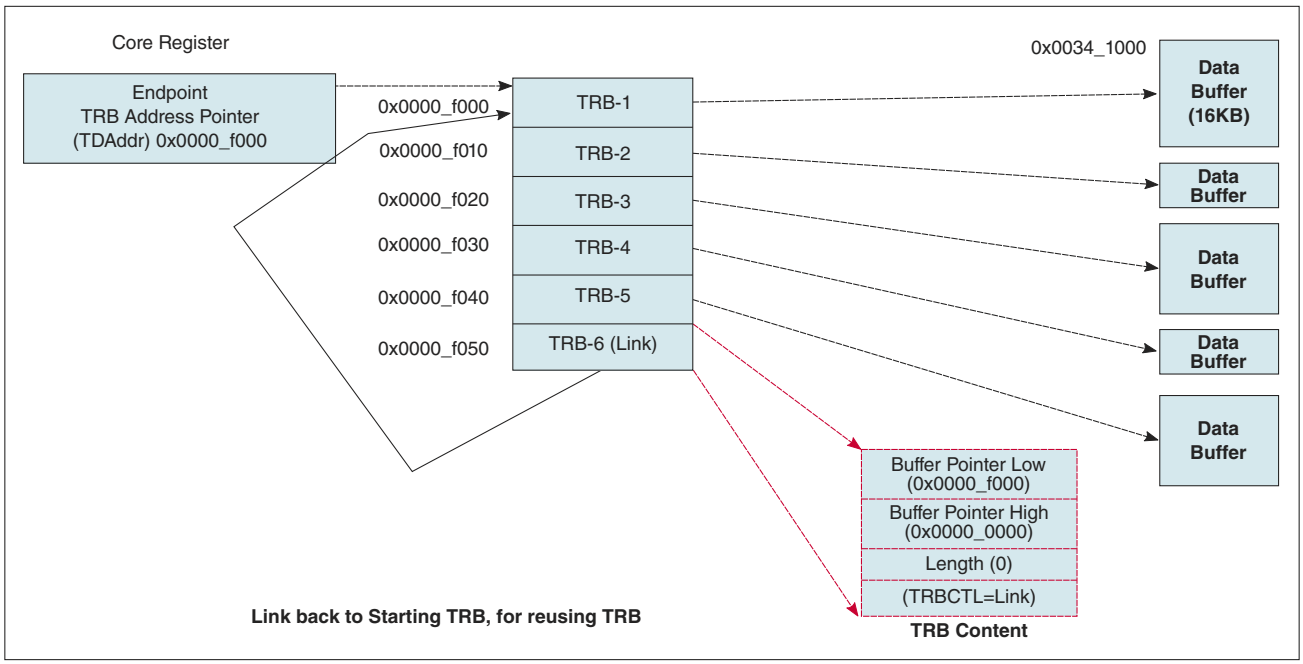

Figure 11-6. Link TRB Structure

If software prepares a circular TRB list which is shorter than the number of cached TRBs (four), the core automatically detects the loop and will not re-fetch a TRB that has already been fetched. For example, for four cached TRBs the software setup three TRBs in the following way:

- TRB-1: Normal, HWO=1
- TRB-2: Normal, HWO=1
- TRB-3: Link to TRB 1

The core will fetch TRBs 1, 2, and 3. Then the core will follow the link to TRB-1, note that its address is the same as the TRB-1 that has already been fetched into the cache, and will temporarily stop fetching TRBs. When TRB-1 completes due to traffic on the USB, the core will write TRB-1 back to memory with the HWO field set to '0', generate a XferInProgress event if necessary, and will automatically attempt to fetch TRB-1 again. In most cases, the core will see the HWO field set to '0' and will stop fetching until software updates the TRB, sets the HWO field back to '1', and issues an Update Transfer command.

11.1.2.2.1.4 Chaining buffers (CHN) and interrupt on completion (IOC) usage

This figure shows a chaining buffer example for an isochronous IN and a bulk IN transaction.

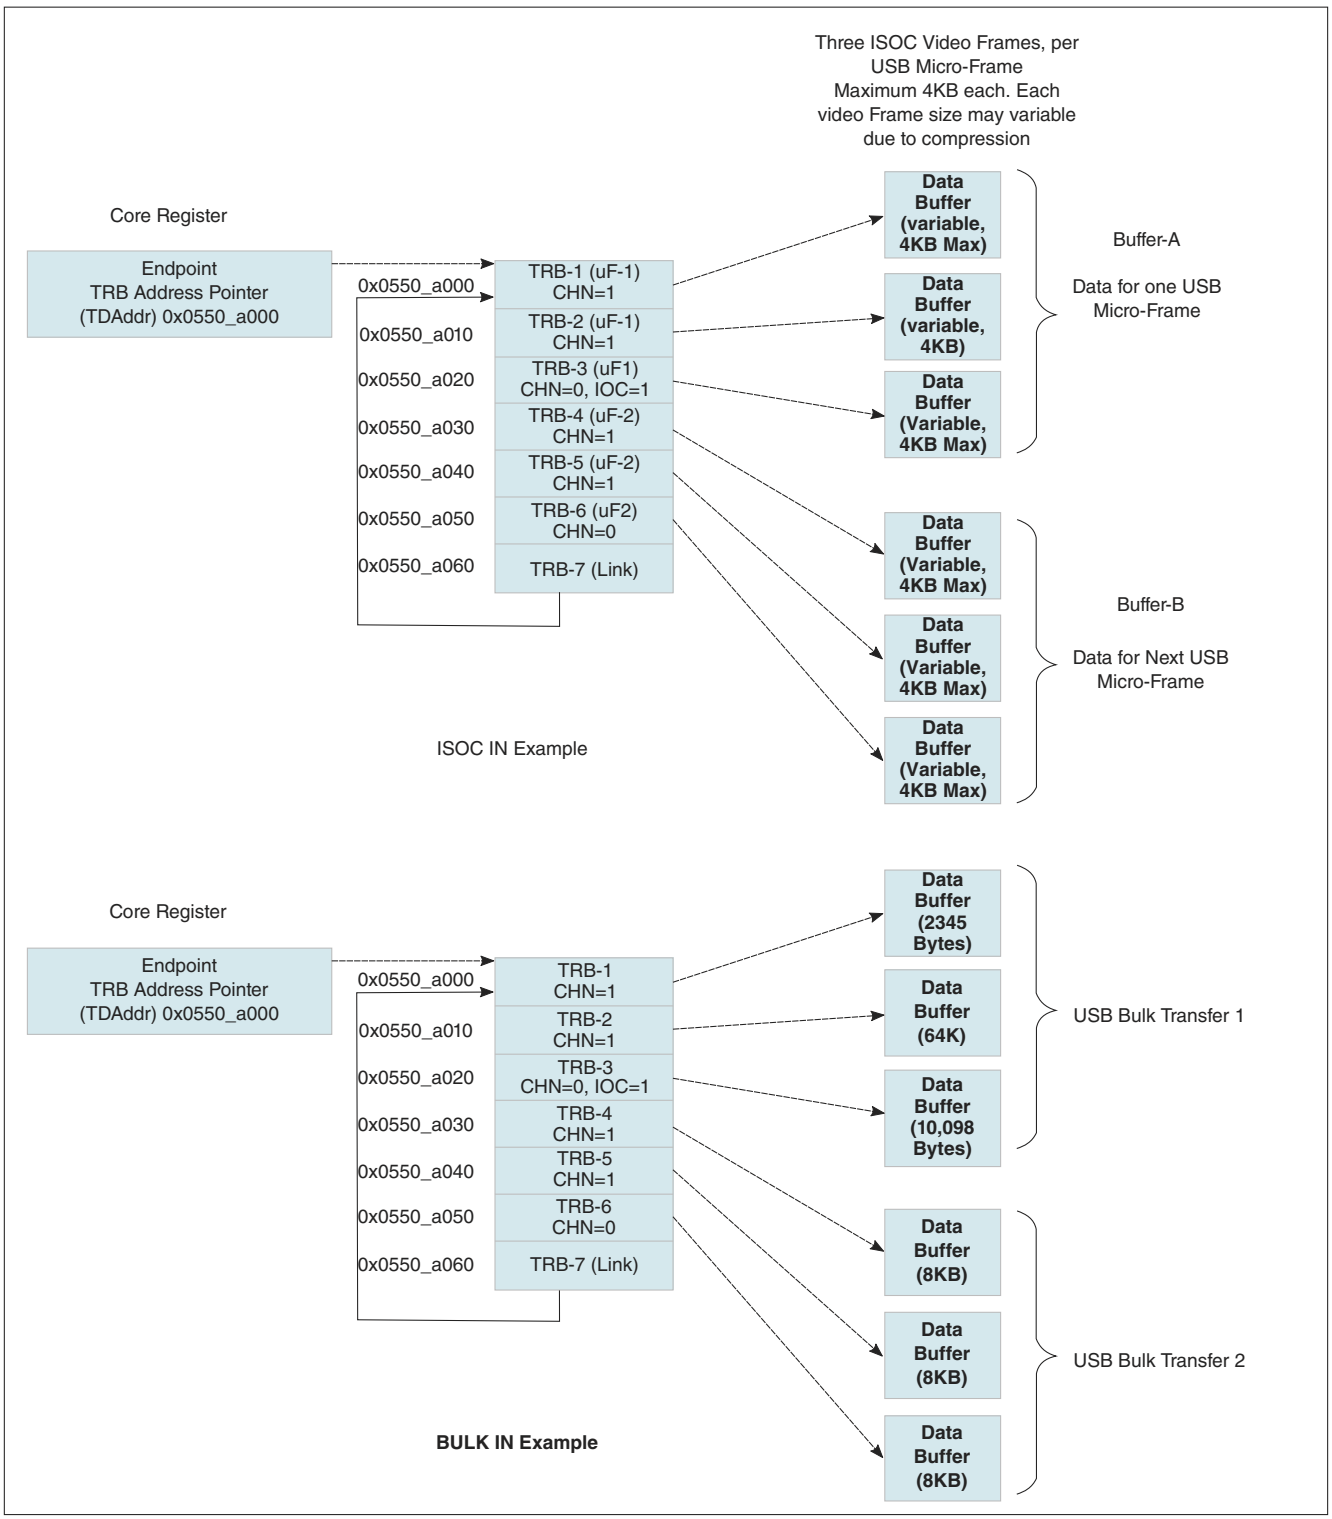

Figure 11-7. Chaining buffers for isochronous and bulk IN

In the isochronous IN application shown in the above figure, there are three video frames to be sent to the host in each microframe. Each video buffer size is maximum of 4 KB and the size may vary for each microframe depending on the compression. The CHN bit

in the TRB-3 is 0, which indicates this is the last buffer of a transfer for the given microframe. The device schedules TRB-1, 2, and 3 in the first bInterval. Similarly, TRB-6 indicates (CHN=0) microframe boundary, and TRB-4, 5, and 6 will be sent during the next bInterval.

For the last packet of last transfer in a microframe, the device internally sets last packet flag when responding at SuperSpeed for isochronous IN transfers.

The application can also use the IOC bit to receive an interrupt when the buffer-A transfer is completed, so it can use buffer-A to send data on the bInterval following the next bInterval. As long as the driver can service the interrupt and set up data before another bInterval, the USB transfers can continue without interruption. Depending upon the system interrupt latency, the buffer size can be adjusted.

If interrupt latency is high occasionally, the software may not have time to set up the linked TRB before the next bInterval. In this case, the core, on seeing HWO bit set to 0 in the TRB, stops processing further TRBs of this endpoint. When hardware receives the Update Transfer command from software, it will re-fetch the TRB. In the case of bulk application, the core will issue the NRDY signal. In isochronous transfers, zero- length packets are sent to the host until software enables the transfer again.

In the bulk IN example, the CHN bit indicates USB Transfer boundary. During a TRB transfer, CHN indicates whether to send the bytes from next TRB buffer as part of the current transfer. For example, even though TRB-1 has 2,345 bytes, the last 297 (2345 - 2 * 1024 = 297) bytes will be combined with the data in TRB-2 and sent as a 1,024 byte packet on the USB since CHN=1. On the other hand, when there is a short packet left in TRB-3, the short packet will be sent separately, since CHN=0.

The device writes data into TRB-1 and TRB-2 for the first transfer. The CHN bit (CHN=0) in TRB-2 indicates that this is the last buffer of the transfer, then TRB-3 and TRB-4 are written for the second transfer. Similarly, the CHN bit (CHN=0) in TRB-4 indicates the second transfer boundary.

If an interrupt latency is high, software may not have time to set up the TRB. In this case, the core, on seeing the HWO bit set to 0 in the TRB, will stop processing further TRBs for the endpoint. Hardware will re-fetch the TRB when software issues the update transfer command. In the case of bulk, control, or interrupt endpoints, the core will issue NRDY. In the case of isochronous endpoints, packets will be dropped until software enables the transfer again.

In the bulk OUT example below, when a short packet is received for TRB-1, TRB-3 will be used for the next OUT transfer and TRB-2 will be closed.

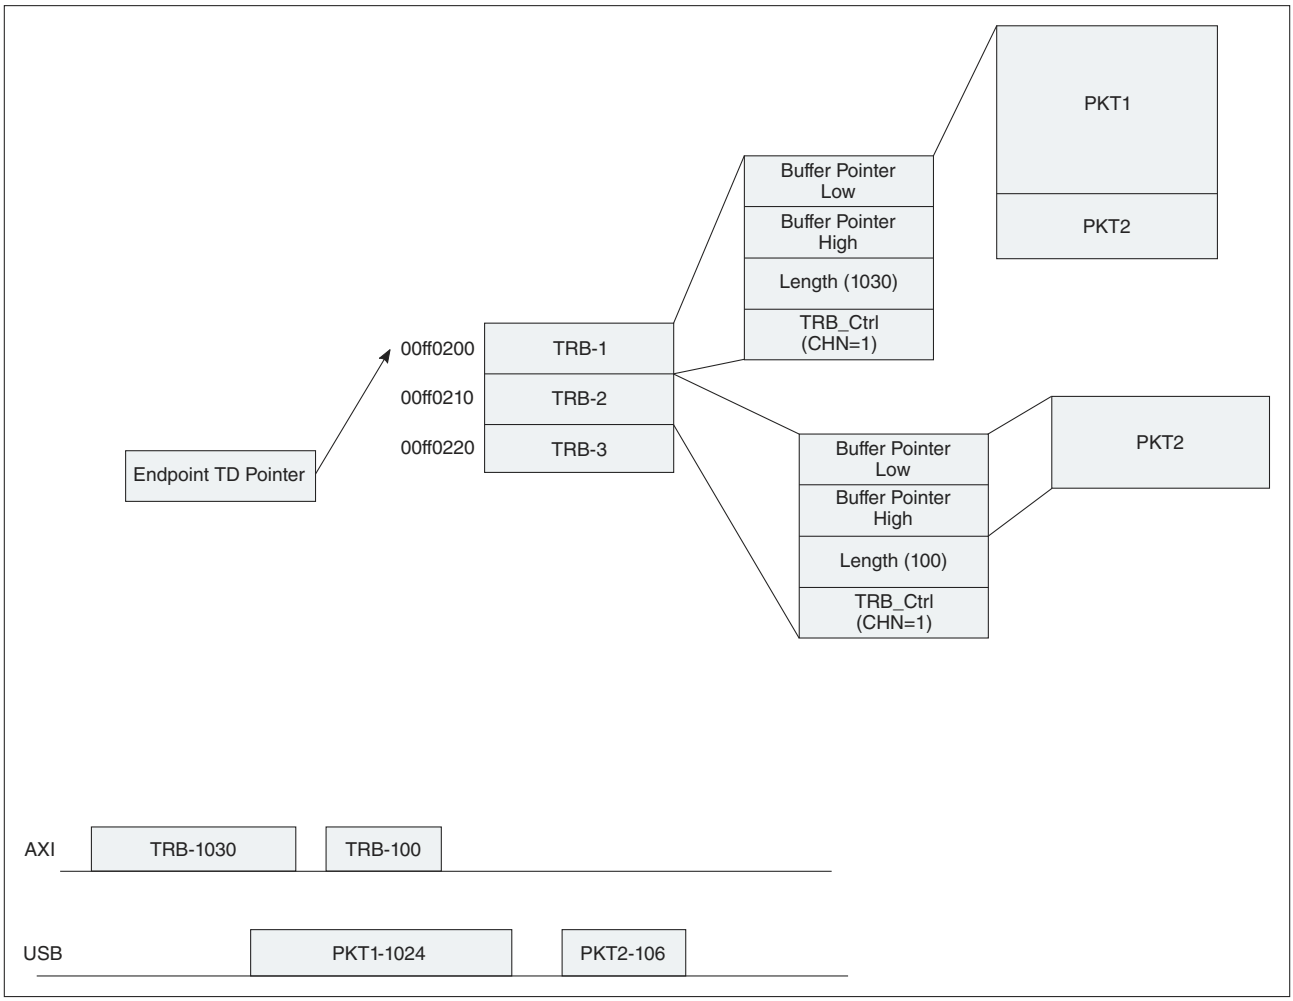

Figure 11-8. Chaining buffers, example 1

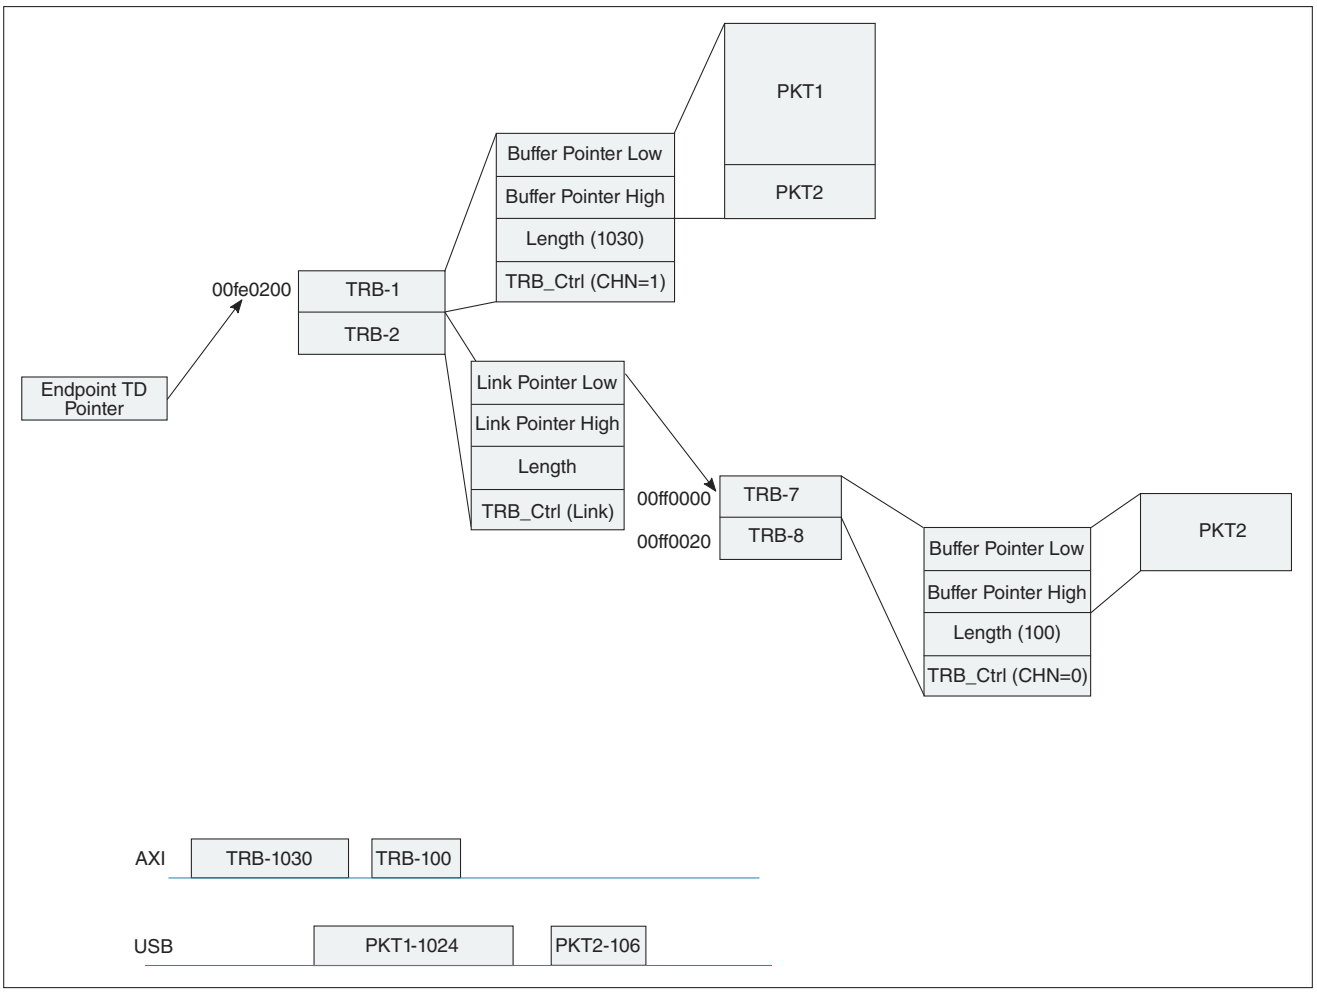

Figure 11-9. Chaining buffers, example 2

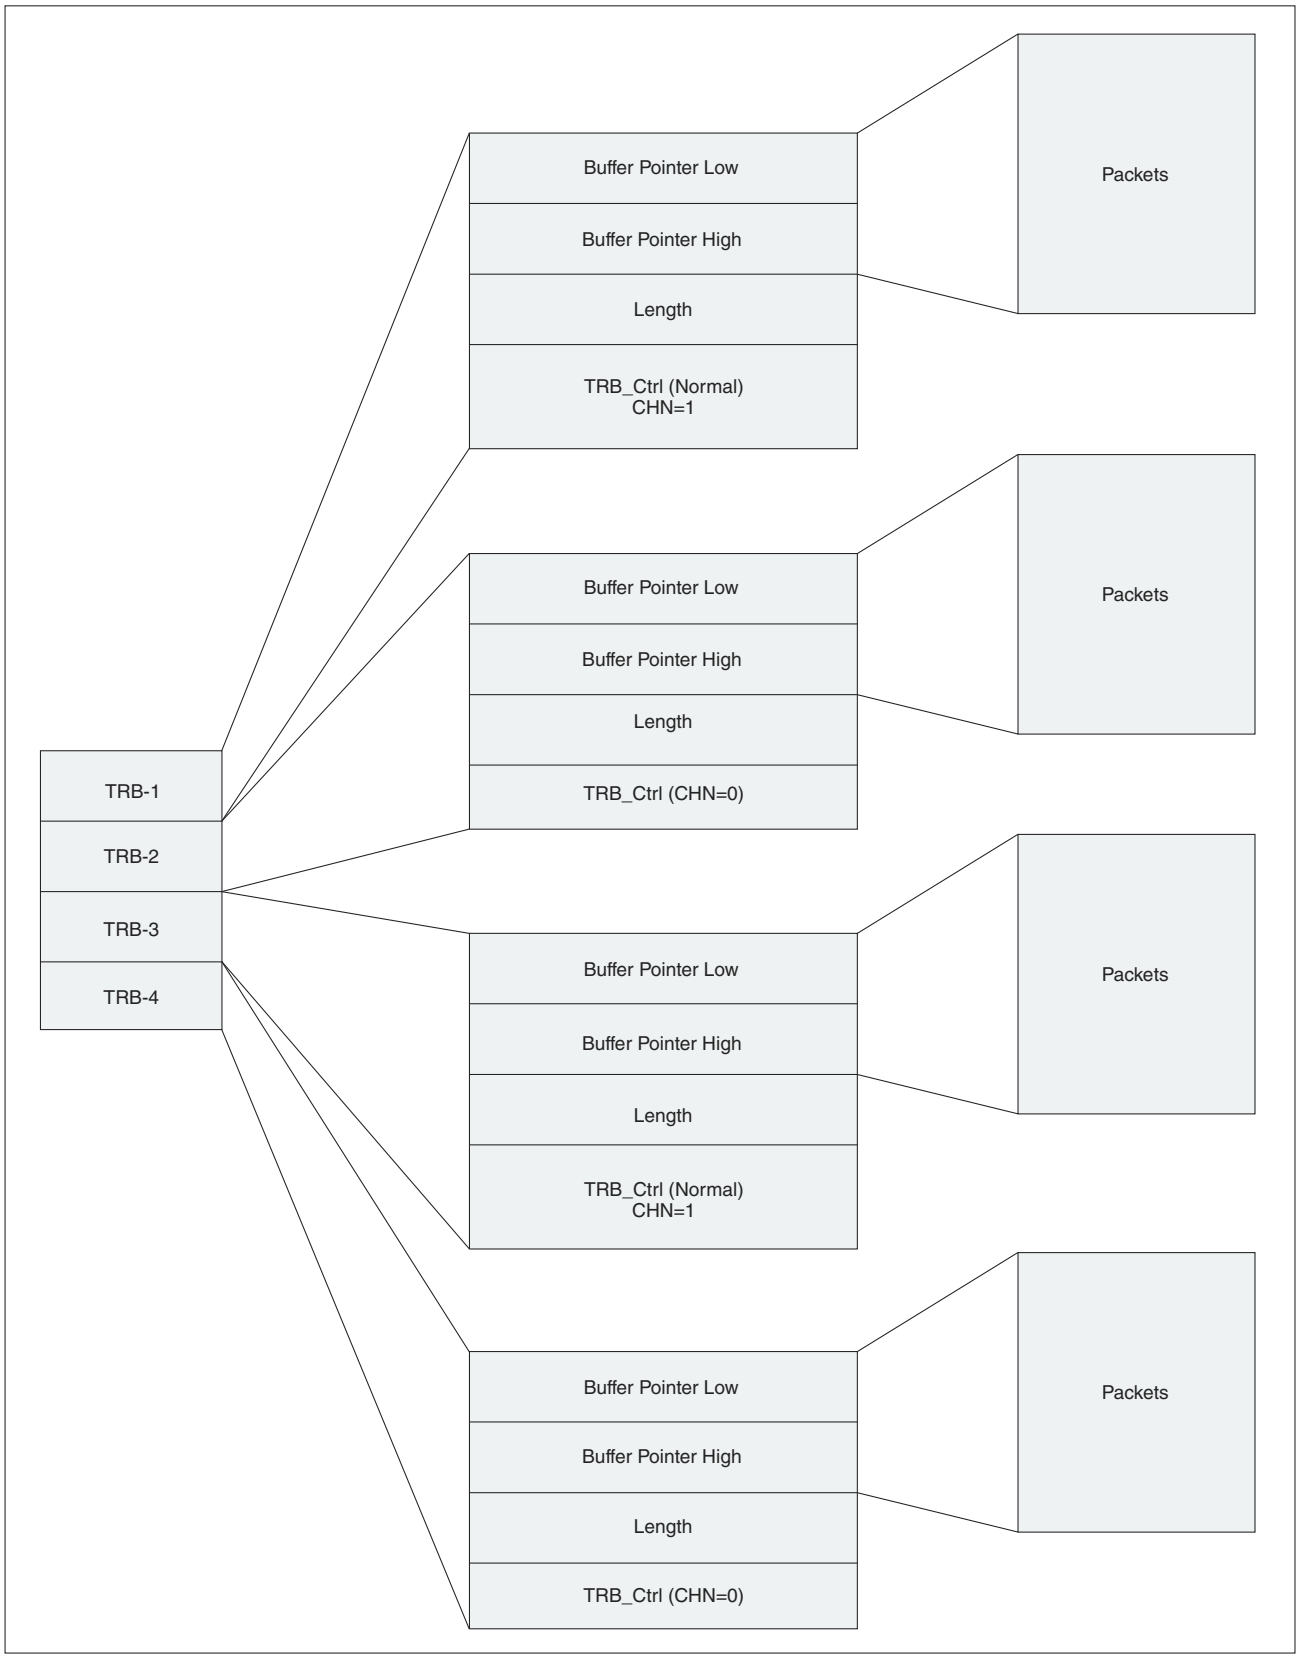

Figure 11-10. Bulk OUT with two transfers

11.1.2.2.1.5 Interrupt on Short Packet (ISP) and Continue on Short Packet (CSP) Usage

These two bits are used to schedule single or multiple OUT transfer. In most applications where only one OUT transfer per endpoint is scheduled, the software always sets ISP=1 and CSP=0. If the device receives a short packet, then it indicates a USB transfer completion through XferComplete events.

In an Ethernet-over-USB application, where software knows it is going to receive short packets, it can set up multiple transfer size buffers in one step by setting CSP=1 in all the TRBs. On a short packet, the device will update the byte count and move to next TRB. Software can also set ISP once in n number of TRBs to receive an XferInProgress event so it can process the previous short packets.

The following example shows software setting multiple 1500-byte Ethernet transfers and enabling the XferInProgress event once for four Ethernet packets to reduce the number of interrupts.

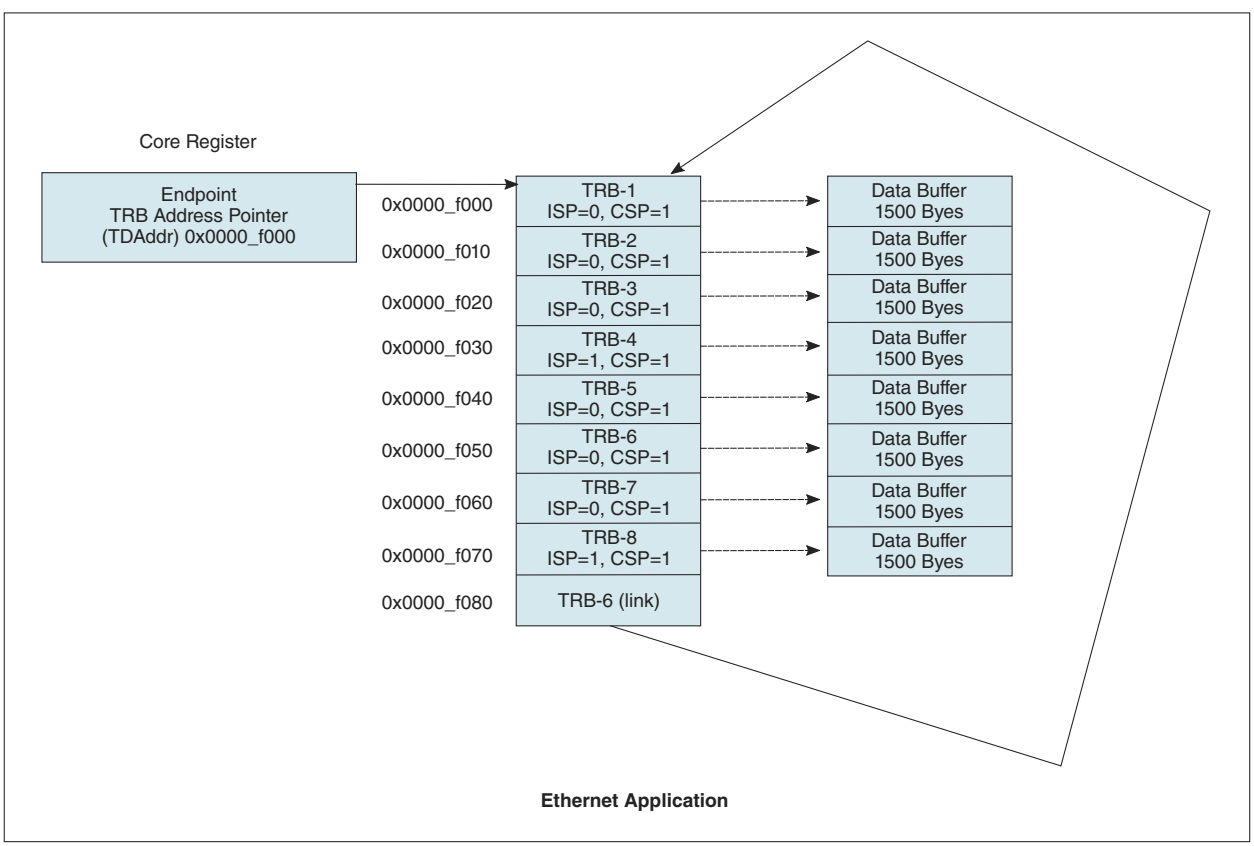

Figure 11-11. ISP and CSP Usage

11.1.2.3 Device Programming Model

11.1.2.3.1 Register Initialization

The USB3 core contains global registers (prefixed by G*) and device registers (prefixed by D*) that are programmed to start operation and handle certain events. This section describes which registers must be accessed depending on the event that software is attempting to handle:

- Power-On or Soft Reset
- USB Reset Event
- Connect Done Event

- SetAddress Device Request
- SetConfiguration Device Request
- Disconnect Event
- Device-Initiated Disconnect and Reconnect

11.1.2.3.1.1 Device Power-On or Soft Reset

This section explains device core initialization after power-on or soft reset. The application must follow this initialization sequence for device mode operation.

When the core is first powered on, software initializes the following registers. The order of operations is not important, except for the first and last steps (DCTL[CSFTRST]=1 and DCTL[RUN_STOP]=1).

Table 11-3. Power-On or Soft Reset Register Initialization

Register	Description
DCTL	Set the CSftRst field to '1' and wait for a read to return '0'. This resets the device core.
GSBUSCFG0/1	Leave the default values, refer Global SoC Bus Configuration Register 0 (GSBUSCFG0) and Global SoC Bus Configuration Register 1 (GSBUSCFG1)
GTXTHRCFG/ GRXTHRCFG	This is required only if threshold is enabled.
GUSB2PHYCFG	Program PHY as per Global USB2 PHY Configuration Register (GUSB2PHYCFG) or leave the default values if the correct power-on values were selected. Note: The PHY must not be enabled for auto-resume in device mode.
GUSB3PIPECTL	Program the following PHY [DatWidth] or leave the default values if the correct power-on values were selected.
GTXFIFOSIZn	Write these registers to allocate prefetch buffers for each Tx endpoint. Unless the packet sizes of the endpoints are application-specific, it is recommended to use the default value.
GRXFIFOSIZ0	Write this register to allocate the receive buffer for all endpoints. Unless the packet sizes of the endpoints are application-specific, it is recommended to use the default value.
GEVNTADR/ GEVNTSIZ/ GEVNTCOUNT	Depending on the number of interrupts allocated, program the Event Buffer Address and Size registers to point to the Event Buffer locations in system memory, the sizes of the buffers, and unmask the interrupt. Note: USB operation stops if the Event Buffer memory is insufficient, because the core stops receiving/ transmitting packets.
GCTL	Program this register to override scaledown, RAM clock select, and clock gating parameters.
DCFG	Program device speed and periodic frame interval
DEVTEN	At a minimum, enable USB Reset, Connection Done, and USB/Link State Change events
DEPCMD0	Issue a DEPSTARTCFG command with DEPEVT.XferRscIdx set to 0 and CmdIOC set to 0 to initialize the transfer resource allocation. Poll CmdAct for completion.
DEPCMD0/ DEPCMD1	Issue a DEPCFG command for physical endpoints 0 & 1 with the following characteristics, and poll CmdAct for completions: USB Endpoint Number = 0 or 1 (for physical endpoint 0 or 1) FIFONum= 0 XferNRdyEn and XferCmplEn = 1

Table continues on the next page...

Table 11-3. Power-On or Soft Reset Register Initialization (continued)

Register	Description
	Maximum Packet Size = 512 Burst Size = 0 EPType = 2'b00 (Control)
DEPCMD0/ DEPCMD1	Issue a DEPXFERCFG command for physical endpoints 0 & 1 with DEPCMDPAR0_0/1 set to 1, and poll CmdAct for completions
DEPCMD0	Prepare a buffer for a setup packet, initialize a setup TRB, and issue a DEPSTRTXFER command for physical endpoint 0, pointing to the setup TRB. Poll CmdAct for completion. Note: The core attempts to fetch the setup TRB via the master interface after this command completes.
DALEPENA	Enable physical endpoints 0 & 1 by writing 0x3 to this register
DCTL	Set DCTL[RunStop] to '1' to allow the device to attach to the host. At this point, the device is ready to receive SOF packets, respond to control transfers on control endpoint 0, and generate events.

After the controller has been started, wait for the following events:

- Wait for a DEVT.USBReset event. This indicates that a reset is detected on the USB.
- Wait for a DEVT.ConnectionDone event. This event indicates the end of the reset on the USB. On this event, read the DSTS register to get the connection speed.

11.1.2.3.1.2 Initialization on USB reset

To initialize the core as a device, during USB Reset, the application must perform the following steps:

Table 11-4. Initialization on USB reset

Register	Description
DEPCMD0	If a control transfer is still in progress, complete it and get the core into the "Setup a Control-Setup TRB / Start Transfer" state
DEPCMDn	Issue a DEPENDXFER command for any active transfers (except for the default control endpoint 0)
DEPCMDn	Issue a DEPCSTALL (ClearStall) command for any endpoint in STALL mode prior to the USB Reset (excluding control endpoints)
DCFG	Set DevAddr to '0'

NOTE

- Special Reset Considerations for Default Control Endpoint 0: The default control endpoint is not affected by a USB Reset, so software must continue following the software flow for control transfers explained in "Control Transfer Programming Model" even across a USB Reset event. Resources can only be assigned to the default control endpoint once after a power on or soft reset.

11.1.2.3.1.3 Initialization on connect done

When this event is received, software must perform the following steps:

Table 11-5. Initialization on connect done

Register	Description
DSTS	Read this register to obtain the connection speed
GCTL	Program the RAMClkSel field to select the correct clock for the RAM clock domain. This field is reset to 0 after USB reset, so it must be reprogrammed each time on Connect Done.
DEPCMD0/ DEPCMD1	Issue a DEPCFG command (with Config Action set to "Modify") for physical endpoints 0 & 1 using the same endpoint characteristics from Power-On Reset, but set MaxPacketSize to 512 (SuperSpeed), 64 (High-Speed), 8/16/32/64 (Full-Speed), or 8 (Low-Speed).
GUSB2CFG/ GUSB3PIPECTL	Depending on the connected speed, write to the other PHY's control register to suspend it
GTXFIFOSIZn	(optional) Based on the new MaxPacketSize of IN endpoint 0, software may choose to re-allocate the TXFIFO sizes by writing to these registers.

11.1.2.3.1.4 Initialization on SetAddress request

When the application receives a SetAddress request in a SETUP packet, it performs the following steps:

Table 11-6. Initialization on SetAddress request

Register	Description
DCFG	Program the DCFG register with the device address received as part of the SetAddress request when SETUP packet is decoded.
DEPCMD1	After receiving the XferNotReady(Status) event, acknowledge the status stage by issuing a DEPSTRTXFER command pointing to a Status TRB. This step must be done after the DCFG register is programmed with the new device address.

At this point, the device is ready to receive micro-SOF/ITP and is configured to receive control transfers on control endpoint 0 with a new address assigned.

11.1.2.3.1.5 Initialization on SetConfiguration or SetInterface Request

When the application receives a SetConfiguration or SetInterface request in a SETUP packet, it performs the following steps:

Table 11-7. Initialization on SetConfiguration or SetInterface Request

Register	Description
DALEPENA	Set this register to 0x3 to disable all endpoints other than the default control endpoint 0.
DEPCMDn	Issue a DEPENDXFER command for any active transfers (except for the default control endpoint 0).
DEPCMD1	Issue a DEPCFG command (with Config Action field set to "Modify") for physical endpoint 1 using the current endpoint characteristics to re-initialize the TXFIFO allocation.
DEPCMD0	Issue a DEPSTARTCFG command with DEPCMD0.XferRscIdx set to 2 to re-initialize the transfer resource allocation.
DEPCMDn	Issue a DEPCFG command (with the Config Action field set to "Initialize") for each endpoint that is present in the new configuration (except for the default control endpoint). Note: Control endpoints are bi-directional and must use consecutive even/odd physical endpoint numbers for the OUT/IN direction (such as 2/3, or 4/5), and the FIFONum must be configured to the same value in both directions.
DEPCMDn	Issue a DEPXFERCFG command for each endpoint that is present in the new configuration (except for the default control endpoint 0).
GTXFIFOSIZn	(optional) Based on the new configuration of IN endpoints, software may choose to re-allocate the TXFIFO sizes by writing to these registers.
DALEPENA	Enable the logical endpoints that are active in the new configuration.
DEPCMD1	After receiving the XferNotReady(Status) event, acknowledge the status stage by issuing a DEPSTRTXFER command pointing to a Status TRB. This step must be done after the previous steps to ensure the host does not access any other endpoints that are being set up.

At this point, the core is prepared to accept Start Transfer commands for the newly-configured endpoints. For information on how to set up transfers, see the Operational Model.

11.1.2.3.1.6 Alternate initialization on SetInterface request

When handling a SetInterface device request, another possibility is that software may reconfigure existing endpoints instead of starting the configuration from the beginning. This is only possible if no TXFIFOs need to be reassigned. This flow also assumes that the endpoints that are being removed or reconfigured in the new interface have halted their traffic prior to the host issuing the SetInterface request.

Table 11-8. Alternate initialization on SetInterface request

Register	Description
DEPCMDn	Make sure there are no transfers still active on the endpoints that are changing in the new interface. This is normally ensured by the host prior to issuing the SetInterface, but if not, issue an End Transfer command for the transfer on each endpoint that is changing.
DEPCMDn	Issue a DEPCFG command (with the Config Action field set to "Initialize") for each endpoint that is changing in the new configuration. The side effect of the DEPCFG command is that the endpoint's sequence number is automatically set to 0.
DALEPENA	Write this register with all the endpoints that are enabled (including the ones that are not changing).
DEPCMDn	Using the StartXfer command, acknowledge the status stage response for the SetInterface request.

11.1.2.3.1.7 Initialization on Disconnect Event

When the application receives a Disconnect event, it must set DCTL[ULSTCHNGREQ] to 5. Other than this, the core does not require any initialization. Because the DCTL[RUN_STOP] bit is still '1', the device attempts to reconnect to the host, at which time a USB Reset and Connect Done event occurs. However, if the application does not want to attempt to reconnect to the host, it should perform the steps in the next section.

NOTE

When DCFG[DEVSPD] is programmed for 2.0 only mode (such as, High-Speed or Full-Speed), and if the application wants to issue any commands to clear any pending transfers during a Disconnect interrupt, then it has to disable USB_GUSB2PHYCFG[SUSPENDUSB20] before issuing any commands and re-enable it after the commands have completed.

11.1.2.3.1.8 Device-initiated disconnect

If the application wants to disconnect from the host, it should perform the following actions:

Table 11-9. Initialization on device-initiated disconnect

Register	Description
DEPCMD0	If a control transfer is still in progress, complete it and get the core into the "Setup a Control-Setup TRB / Start Transfer" state
DEPCMDn	Issue a DEPENDXFER command for any active transfers (except for the default control endpoint 0)
DCTL	Set DCTL[RUN_STOP] to '0' to disconnect from the host
DSTS	Poll [DEVCTRLHLT] until it is '1'

At this point, the device is disconnected from the host and will not attempt to reconnect.

11.1.2.3.1.9 Reconnect after Device-Initiated Disconnect

If the application decides to reconnect to the host, it must follow the steps in Device Power-On or Soft Reset.

11.1.2.3.2 Operational Model

The following sections describes the processes and data structures that the core uses to implement the USB 3.0 specification.

11.1.2.3.2.1 USB and Physical Endpoints

Endpoints are referred to in two ways:

- As a USB endpoint number: USB endpoints are defined in the USB specification.
- As a physical endpoint resource number: The hardware has a fixed number of physical endpoint resources. Each resource is unidirectional and can be configured to refer to either direction of any USB endpoint.

The software always works on physical endpoints and it knows how physical endpoint corresponds to USB endpoints. DALEPENA is the only register that has one enable bit per USB endpoint.

During SetConfiguration, software maps physical endpoint resources to the required USB endpoints. When a USB request comes in, the USB endpoint number gets converted to a physical endpoint number in the core. Similarly, when a USB packet is sent out, the physical endpoint number is converted to the USB endpoint and sent out.

A USB control endpoint requires two physical endpoints. One physical endpoint is mapped to the OUT direction of the Control endpoint, and the other one is mapped to the IN direction of the Control endpoint. Specifically the two physical endpoints are used as the following:

- The Setup stage of any control transfer uses the OUT direction physical endpoint.
- For a control write or 2-stage transfer, the Data stage (if present) uses the OUT direction physical endpoint and the Status stage uses the IN direction physical endpoint.
- For a control read transfer, the Data stage uses the IN direction physical endpoint and the Status stage uses the OUT direction physical endpoint.

11.1.2.3.2.2 Event Buffers

Hardware passes command completion, transfer progress, and asynchronous events to software through one or more Event Buffers.

To configure an Event Buffer, the software performs the following steps:

1. Sets up an empty buffer in system memory.

2. Writes the address of the beginning of the buffer into GEVNTADR. This address must be aligned to the Event Buffer size.
3. Writes the size of the buffer and interrupt mask into GEVNTSIZ. Depending on your system interrupt latency, enough Event Buffer space must be allocated to avoid lost interrupts or reduced performance.
4. Write a 0 into the GEVNTCOUNT register. This must be the last step, as it enables the Event Buffer. After the Event Buffer has been configured, software must not change the size or address.

There is one interrupt line per Event Buffer that indicates there are one or more events present. Software reads one or more events out of the buffer and indicates to hardware how many events it processed by writing the byte count to the GEVNTCOUNT register.

Clock crossing delays may result in the interrupt's continual assertion after software acknowledges the last event. Therefore, when the interrupt line is asserted, software must read the GEVNTCOUNT register and only process events if the GEVNTCOUNT is greater than 0.

The first event produced by the core after the Event Buffer is configured will be written to the address specified in GEVNTADR. Most events are 32 bits, and subsequent events will be written to the address (PreviousEventAddress + 4). When that address exceeds the sum of GEVNTADR and GEVNTSIZ, the core wraps around to the first GEVNTADR value. In this way, the Event Buffer operates like a circular buffer with hardware writing to the "tail" of the buffer and software reading from the "head."

Most events are exactly 4 bytes in size, but there is one exception: The Vendor Device Test LMP Received Event (VndrDevTstRcved) is a 12 byte event that includes a header in the first 4 bytes and the contents of the LMP in the following 8 bytes.

When an event occurs within the core, hardware checks the enable bit that corresponds to the event to decide whether the event will be written to the Event Buffer or not. The Event Buffer contains one of the following types of information, depending on the value of the lower bits of the event:

- Device Endpoint-Specific Event (DEPEVT) (Event[0] = 0x0)
  - The DEPCFG endpoint-specific command specifies the bits that are enabled and which Event Buffer to use for these events.
- Device-Specific Event (DEVT) (Event[0] = 0x1, Event[7:1] = 0x00)
  - The Generic Command Complete event is enabled through the DGCMD[CmdIOC] field when the command is issued.
  - The Event Buffer Overflow Event cannot be disabled and is written to the Event Buffer that encounters the overflow.

- The rest of the Device-Specific events are enabled through the DEVTEN register.
- Except for the Event Buffer Overflow Event, these events are written to the Event Buffer specified in the DCFG[IntrNum] field.

The core always leaves one entry free in each Event Buffer. When the Event Buffer is almost full, hardware writes the Event Buffer Overflow event and the USB will eventually get stalled when endpoints start responding NRDY or the link layer will stop returning credits (in SuperSpeed). This event is an indication to software that it is not processing events quickly enough. During this time, events will be queued up internally. When software frees up Event Buffer space, the queued up events will be written out and the USB will return to normal operation.

Event Buffer Content for Device Endpoint-Specific Events (DEPEVT)

Table 11-10. Device Endpoint-n Events: DEPEVT

Field	Description
31–16	Event Parameters (EventParam) For XferNotReady, XferComplete, and Stream events on Bulk Endpoints: [31-16]StreamID. Applies only to bulk endpoints that support streams. This indicates the Stream ID [1] of the transfer for which the event is generated For XferInProgress: [31-16] Isochronous Microframe Number (IsocMicroFrameNum). Indicates the microframe number of the beginning of the interval that generated the XferInProgress event (debug purposes only) For XferNotReady events on Isochronous Endpoints: [31-16] Isochronous Microframe Number (IsocMicroFrameNum). Indicates the microframe number during which the endpoint was not ready **NOTE:** USB 3.0 core represents USB bus time as a 14-bit value on the bus and also in the DSTS register (DSTS[SOFFN]), but as a 16-bit value in the XferNotReady event. Use the 16-bit value to interact with Isochronous endpoints via the StartXfer command. The extra two bits that the USB 3.0 core produces will be necessary for handling wrap-around conditions in the interaction between software and hardware. EPCmdCmplt events For all EPCmdCmplt events [27-24]- Command Type. The command type that completed (Valid only in a DEPEVT event. Undefined when read from the DEPCMD.EventParam field). For EPCmdCmplt event in response to Start Transfer command. [22-16] Transfer Resource Index (XferRscIdx). The internal hardware transfer resource index assigned to this transfer. This index must be used in all Update Transfer and End Transfer commands.
15–12	Event Status (EventStatus) Within an XferNotReady event- [15]: Indicates the reason why the XferNotReady event is generated: 0- XferNotActive- Host initiated a transfer, but the requested transfer is not present in the hardware 1- XferActive- Host initiated a transfer, the transfer is present, but no valid TRBs are available

Table continues on the next page...

Table 11-10. Device Endpoint-n Events: DEPEVT (continued)

Field	Description
	[14]: Not Used [13:12]: For control endpoints, indicates what stage was requested when the transfer was not ready: 2'b01- Control Data Request 2'b10- Control Status Request Within an XferComplete or XferInProgress event- [15]: LST bit of the completed TRB (XferComplete only) [15]: MissedIsoc: Indicates the interval did not complete successfully (XferInProgress only) [14]: IOC bit of the TRB that completed [13]: Indicates the TRB completed with a short packet reception or the last packet of an isochronous interval [12]: Reserved If the host aborts the data stage of a control transfer, software may receive a XferComplete event with the EventStatus field equal to '0'. This is a valid event that must be processed as a part of the Control transfer programming model. Within a Stream Event- [15:12]: - 4'h2- StreamNotFound- This stream event is issued when the stream-capable endpoint performed a search in its transfer resource cache, but could not find an active and ready stream. - 4'h1- StreamFound- This stream event is issued when the stream-capable endpoint found an active and ready stream in its transfer resource cache, and initiated traffic for that stream to the host. The ID of the selected Stream is in the EventParam field. In response to a Start Transfer command- 4'h2- Indicates expiry of the bus time reflected in the Start Transfer command. 4'h1- Indicates there is no transfer resource available on the endpoint. In response to a Set Transfer Resource (DEPXFERCFG) command- 4'h1- Indicates an error has occurred because software is requesting more transfer resources to be assigned than have been configured in the hardware. In response to a End Transfer command- 4'h1- Indicates an invalid transfer resource was specified.
11–10	This field is reserved.
9–6	4'h7- Endpoint Command Complete (EPCmdCmplt) Indicates software may issue another Device Endpoint command to the endpoint. When issued in response to an End Transfer command, indicates that DMA stopped for the endpoint. For all other commands, this event does not imply that all effects of the commandtook place. The DEPCMD register contains the same status information present in the Event Status Bits field. 4'h6- Stream Event (StreamEvt) Indicates that a stream-capable endpoint initiated a search within its transfer resource cache. The result of the search is in the EventStatus field (Found or NotFound). 4'h5- Reserved 4'h4 - Reserved

Table continues on the next page...

Table 11-10. Device Endpoint-n Events: DEPEVT (continued)

Field	Description
	4'h3- XferNotReady Event (XferNotReady) Indicates receipt of a transaction when no TRBs are available for the endpoint. For isochronous IN endpoints, a zero-length packet is automatically sent by hardware and NRDY for non-isochronous endpoints. The application must enable this event if it plans to issue Start Transfer on demand. This event can happen when software issues a Start Transfer or Update Transfer. In this case, software must ignore this event because it has already issued the Start Transfer or Update Transfer. XferNotReady is generated when the core responds NRDY to the host on the USB. It is useful in the beginning of a transfer when software wants to wait for the host to start polling the endpoint before setting up TRBs, but it is not efficient to use this event to determine when the core has run out of TRBs. For determining when the core has processed TRBs and needs software to setup more, use the IOC field in a TRB along with the XferInProgress event that is generated when the core completes a TRB with IOC=1. For non-stream-capable endpoints, the hardware filters multiple events if the host continues transactions, even after the core responds with NRDY. This internal filter is reset after software issues any endpoint command to this endpoint. For stream-capable endpoints, this event is generated each time the host attempts a transaction, even if the core responds with NRDY. For isochronous endpoints, this event is generated only once prior to the Start Transfer command to communicate the current bus time. For additional information, see the Event Status field. 4'h2- XferInProgress Event (XferInProgress) Applies to IN and OUT endpoints. Indicates an EP/Stream specific event happened and it is continuing the transfer. For additional information, see the Device Programming Model. 4'h1- XferComplete Event (XferComplete) Applies to IN and OUT endpoints. Indicates that a EP/Stream transfer completed and the core stopped the transfer. For additional information, see the Device Programming Model. 4'h0- Reserved
5–1	Physical Endpoint Number (0-31)
0	1'b0- Indicates that this is an endpoint-specific event.

1. Note that term Stream ID used in USB chapter is different from Arm SMMU terminology.

Event Buffer Content for Device-Specific Events (DEVT)

Table 11-11. Device-specific events: DEVT

Field	Description
31-25	Reserved
24-16	Event Information Bits (EvtInfo) For a USB/Link State change Event, this field indicates the state of the link- EvtInfo[8:5] - HIRD value received from the LPM token (valid for a Hibernation Request Event) EvtInfo[4] - SuperSpeed event. Set to 1 for SS; Set to 0 for non-SS.

Table continues on the next page...

Table 11-11. Device-specific events: DEVT (continued)

Field	Description
	EvtInfo[3:0] - Link State. Indicates link state at the time of the event. Follows same encoding as DSTS link state bits.
15-12	Reserved
11-8	11- Event Buffer Overflow Event (EvntOverflow) The core writes this event to indicate there is no space in the event buffer, and one or more Device-specific events may have been dropped after this event. Endpoint-Specific events will not be dropped, but they will be delayed which can cause a drop in performance on the USB. Software uses this event as a warning that the Event Buffer is too small and the core should be reconfigured with a larger Event Buffer or software needs to process events more quickly. In order to avoid repeated Event Buffer Overflow Events, software must free up space in the Event Buffer by acknowledging more than 1 event (writing a value greater than 4 to the GEVNTCOUNT register). This event cannot be disabled, and is always written to the Event Buffer that encounters the overflow. 10- Generic Command Complete Event (CmdCmplt) The core writes this event to indicate the generic command is complete. 9- Erratic Error Event (ErrticErr) The core writes this event to report erratic errors (phy_rxvalid_i/phy_rxvldh_i or phy_rxactive_i is asserted for at least 2 ms, due to PHY error) seen on the UTMI+. Due to erratic errors, the USB 3.0 core goes into Suspended state and a USB/Link state change event (ULStChng) is generated to the application. If the early suspend is asserted due to an erratic error, the application can only perform a soft disconnect recover. For SuperSpeed operation, the PHY erratic error event indicates that the PIPE is not responding to the PHY command (for example, pipe3_PowerDown change or receiver detection). After the core requested any PHY command, if it did not receive pipe3_PhyStatus within 100ms, the core will timeout and generate the erratic error event. After generating the erratic error, the core assumes that the PHY command is completed successfully and proceeds with the next pending PHY command. Software must reset the controller on receiving the erratic error. 8- Reserved 7- Start of (micro)Frame (Sof) 6- USB Suspend Entry Event This event provides a notification that the link has gone to a suspend state (L2, U3, or L1). This event is generated when hibernation mode is disabled. The existing Link State Change event (3) provides the same information, but is generated for every link state change. 5- Hibernation Request Event This event provides a notification that the link has gone to a suspend state where hibernation is supported (L2, U3, or L1) and requires software intervention - When DCTL.KeepConnect=1 and L1HibernationEn=0, this event is generated only when the link goes to L2 or U3 - When DCTL.KeepConnect=1, L1HibernationEn=1, and the core is configured to support LPM (DCTL.LPMCap=1 and DCTL.HIRD_Thres[4]=1), this event is generated when the link goes to L2, U3, or L1 with an HIRD value greater than the DCTL.HIRD_Thres[3-0] value The existing Link State Change event (3) provides the same information, but is generated for every link state change. If both events are enabled, only the Hibernation Request event will be generated if the conditions are met. When this event occurs, software is required to start the hibernation process

Table continues on the next page...

Table 11-11. Device-specific events: DEVT (continued)

Field	Description
	EvtInfo[4:0] indicates the Link State and Speed which caused the Hibernation Event (using the same encoding as the Link State Change event. Suspend is 3, and L1 is 2)EvtInfo[8:5] provides the HIRD value from the host's LPM tokenFor L2 and U3, this event is only generated when DCTL.KeepConnect=1For L1, this event is only generated when DCTL.L1HibernationEn=1 and DCTL.KeepConnect=1In addition to the suspend states that trigger this event, hibernation is also supported when the link is disconnected. See 'Device-Initiated Disconnect and Low Power While Disconnected' for details. 4- Resume/Remote Wakeup Detected Event (WkUpEvt) This event is generated when the host initiates a resume condition on the USB bus. This event is not generated by the device initiating a remote wakeup to the host. 3- USB/Link State Change (ULStChng) The core writes this event to indicate a change of USB or Link state. Bits 23-16 (EvtInfo) of this event indicate the Link Status. The event is generated in SuperSpeed when the link LTSSM state changes, except when LTSSM exits from HOT_RESET, POLL or LTSSM enters into RECOVERY. 2- Connection Done (ConnectDone) 1- USB Reset (USBRst) 0- Disconnect Detected Event (DisconnEvt) Note: This event is generated only if VBUS is off.
7-1	7'h00 - Device Specific Event
0	1'b1 - Non-Endpoint-Specific Event

11.1.2.3.2.3 Transfer and Buffer Rules

Buffers that are used to transfer data to and from an endpoint are defined using a Buffer Descriptor, which consists of one or more Transfer Request Blocks (TRBs). A CHN flag in the TRB is used to identify the TRBs that comprise a Buffer Descriptor. Therefore, a Buffer Descriptor refers to a consecutive set of TRB data structures where the CHN flag is set in all TRBs, except the last. Note that a Buffer Descriptor may consist of a single TRB, whose CHN flag will not be set.

Software communicates the location of the first TRB by using the Start Transfer command on an endpoint. Even endpoints that are not stream-capable use this command.The core fetches TRBs from external memory starting at the address provided in the Start Transfer command parameters, continuing in a linear fashion and following the Link TRB until a TRB is encountered that has its LST bit set to '1' or HWO bit set to '0'. Therefore, software must ensure that it has valid TRBs prepared before issuing the Start Transfer command to prevent the core from reading uninitialized memory.

Descriptor fetch requests are buffered within the hardware and handled separately from the progress of the current transfer. Therefore, it is possible that the core completes a transfer with XferComplete but still continues reading TRBs that it has not cached yet. If

software is immediately de-allocating the memory for TRBs based on the XferComplete event, it is recommended that software issue an End Transfer command for the endpoint/transfer resource prior to de-allocating the memory. The completion of the End Transfer command flushes out any pipelined descriptor fetches and avoids a potential bus error.

While processing TRBs, two conditions may cause the core to write out an event and raise an interrupt line:

- TRB Complete:
  - For OUT endpoints, a packet is received which reduces the remaining byte count in the TRB buffer to zero.
  - For IN endpoints, an acknowledgement is received for a transmitted packet which reduces the remaining byte count in the TRB buffer to zero.
- Short Packet Received:
  - For OUT endpoints only. While writing to a TRB buffer, the endpoint receives a packet that is smaller than the endpoint's MaxPacketSize.

This table shows the USB 3.0 Core Actions Based on TRB Control Bits.

Table 11-12. USB 3.0 Core Actions Based on TRB Control Bits

Direction	TRB Complete Packet	ISP	IOC	CHN	LST	CSP	Action
IN	Yes	-	X	0	1	-	XferComplete event
IN	Yes	-	0	X	0	-	No event
IN	Yes	-	1	X	0	-	XferInProgress event
OUT	Yes No	-	X	0	1	-	XferComplete event
OUT	Yes No	-	0	X	0	-	No event
OUT	Yes No	-	1	X	0	-	XferInProgress event
OUT	X Yes	X	X	X	X	0	XferComplete event [1]
OUT	X Yes	X	X	0	1	1	XferComplete event
OUT	X Yes	X	X	1	0	1	Search for CHN=0, accumulate IOC and ISP, then follow CHN=0 rules [2]
OUT	X Yes	X	1	0	0	1	XferInProgress event
OUT	X Yes	0	0	0	0	1	No event
OUT	X Yes	1	0	0	0	1	XferInProgress event

1. When a TRB receives whose CSP bit is 0 and CHN bit is 1 receives a short packet, the chained TRBs that follow it are not written back (for example, the BUFSIZ and HWO fields remain the same as the software-prepared value)
2. In the case of an OUT endpoint, if the CHN bit is set (and CSP is also set), and a short packet is received, the core retires the TRB in progress and skip past the TRB where CHN=0, accumulating the ISP and IOC bits from each TRB. If ISP or IOC is set in any TRB, the core generates an XferInProgress event. Hardware does not set the HWO bit to 0 in skipped TRBs. If the endpoint type is isochronous, the CHN=0 TRB will also be retired and its buffer size field updated with the total number of bytes remaining in the BD.

On XferComplete and XferInProgress events, status bits in the event indicate LST, IOC, Short Packet Received, or Bus Error status. In the "fast-forward" case, the IOC status is accumulated from the skipped TRBs, not just the TRB that received the short packet.

When the hardware writes back the TRBs, it updates the BUFSIZ field to represent the remaining unused buffer.

11.1.2.3.2.3.1 Number of TRBs Rule

- Software must set up only one TRB for a control setup or status stage.
- If software is preparing multiple transfers for an IN endpoint, it may be necessary to place a 0-length TRB between transfers that are MaxPacketSize aligned to indicate transfer boundaries to the host. This is not necessary, if the class driver and the host can handle bursting between transfers.
- If software is preparing multiple transfers for an OUT endpoint, it needs to place a MaxPacketSize TRB between transfers, if it expects the host to transmit a 0-length packet between transfers.

11.1.2.3.2.3.2 TRB Control Bit Rules

Transfer control bits must conform to the following restrictions:

For OUT endpoints, the CSP bit must be the same in every TRB within a Buffer Descriptor (either set or clear).

- The core autonomously checks the HWO field of a TRB to determine if the entire TRB is valid.
- Therefore, software must ensure that the rest of the TRB is valid before setting the HWO field to '1'. In most systems, this means that software must update the fourth DWORD of a TRB last. Every time software validates a TRB by setting HWO=1, it must also issue an Update Transfer command to the core.
- Software sets the HWO bit to 1 when it creates the TRB, and cannot modify it until hardware resets it to 0. However,
  - Software must detect when a "fast-forward" occurs on an OUT endpoint that receives a short packet, since some TRBs in a chain may still have their HWO bit set to 1 while belonging to software.
  - Hardware will not clear the HWO bit of a Link TRB. Therefore, software can only modify a Link TRB if the TRB prior to the Link TRB has its HWO bit set to 0.
- The LST bit must not be set to 1 for isochronous endpoints.
- For a Setup or Status TRB, set CHN=0, LST=1, and CSP=0.
- For the data stage of a control transfer, set CSP=0 in all TRBs and LST=1 in the last TRB of the data stage.

- For Link TRBs, the LST, CHN, IOC, ISP, CSP, and Stream ID fields are ignored and must be set to 0.
- The Link TRB's chain bit is implicitly equal to the chain bit of the TRB before it. If the TRB before it has CHN=1, then the Link acts as if it's CHN=1. If the TRB before it has CHN=0, then the Link acts as if it's CHN=0. A Link TRB cannot be the last TRB in a Buffer Descriptor.
- When CSP=1 and the core receives a short packet, it searches for the end of the Buffer Descriptor by finding the Normal TRB that has CHN=0. Therefore, it is illegal to setup a circular buffer with all Normal TRBs with CHN=1.

11.1.2.3.2.3.3 Buffer size rules and zero-length packets

The hardware contains a cache that holds four TRBs per transfer.

For IN endpoints, the following rules apply:

- The number of chained TRBs necessary to construct a single packet must never exceed 3 . A maximum of one link TRB can be present in the chain.
- If software wants to indicate a transfer completion to the host by sending a zero-length packet after a multiple of MAXPACKETSIZE, it must set up a zero-length TRB following the last TRB in the transfer.

For OUT endpoints, the following rules apply:

- If the first TRB has CHN=1, its buffer size must be ≥ 1 byte
- The total size of a buffer descriptor must be a multiple of MAXPACKETSIZE
- A received zero-length packet still requires a MAXPACKETSIZE buffer. Therefore, if the expected amount of data to be received is a multiple of MAXPACKETSIZE, software should add MAXPACKETSIZE bytes to the buffer to sink a possible zero-length packet at the end of the transfer.

For IN and OUT endpoints, the following rule applies:

- The BUFSIZ field in a link TRB must be set to 0.

11.1.2.3.2.3.4 Transfer setup recommendations

Software can either set up transfers before the host attempts to move data on an endpoint ("preset" transfers) or can set up transfers on demand ("on-demand" transfers). When using preset transfers, software can safely disable the XferNotReady event in the endpoint configuration. However, when using on-demand transfers, the XferNotReady event must be enabled and software may not use the "No Response" variant of the Update Transfer command. The XferNotReady event is issued when the host attempts to move data on an endpoint when one of the following conditions is present:

- No previous transfer was started with Start Transfer.
- Not enough hardware-owned (HWO=1) TRBs are available to handle the requested data movement. The XferNotReady event must not be disabled for control endpoints because the event is an integral part ofcontrol transfer handling.

Although there are many valid ways to set up transfers, it is recommended that you choose one of three general mechanisms:

- When software wants to set up one transfer at a time and has the entire buffer available for transfer, it must set up TRBs that point to the data buffers and in the last TRB it must set the LST bit and issue Start Transfer, which points to the first TRB location.
  - When the USB transfer completes, the core will notify the software through the XferComplete event. The LST bit will be set in the status field of the event. The XferComplete will also release the Transfer Resource.
  - A premature XferComplete event can happen before all the data buffers are exhausted, if there is a Bus Error or, in an OUT transfer a short packet has been received and CSP=0. During these conditions the TRB will have an updated BUFSIZ field which represents the amount of buffer remaining after the successful part of data transfer.
  - Software can also set up an IOC bit TRB, so that it gets notified when data buffers are used up and can free them up sooner than waiting for the entire transfer to complete. On completing a TRB with IOC set, and not the last one, the core will issue an XferInProgress event with IOC set in the status field of the event.
- When software wants to set up one transfer at a time, but it has fewer data buffers available than the full transfer size, it must set up circular TRBs (using a Link TRB), and also set up IOC bits in the TRBs. Depending on buffer allocation and interrupt frequency it can set IOC for once in "x" number of TRBs.
  - As soon as the USB transfer for a TRB is completed, and if IOC is set, the core will generate an XferInProgress event with IOC set in the status field.
  - On seeing the event, software reuses the TRB and updates it with the next data buffer. It also issues an Update Transfer command, indicating it has updated a TRB.
  - If software is slow and hardware finds a TRB with HWO reset to 0, it waits for an Update Transfer command. Upon seeing the Update Transfer, it prefetches the TRB and continues the transfer.
  - When software reaches the end of the transfer, it sets the TRB LST bit. When hardware completes the TRB, it issues an XferComplete event and releases the Transfer Resource.
- When the Device software has multiple transfers to set up, it must set up circular TRBs and also set up CHN bits in all TRBs, except the last of each transfer. For

OUT endpoints, multiple transfers can be supported when the CSP field is set to '0' if each transfer has a multiple of MaxPacketSize bytes, since a short packet will end the transfer. If multiple transfers may contain short packets, the CSP field must be set to '1' to enable the next transfer to continue even if a short packet is received. Depending on buffer allocation and interrupt frequency, it can either set the IOC for once in "x" number of TRBs or in the last TRB of each transfer.

- For OUT endpoints, the transfer can finish prematurely due to a short packet from the host. In this case, the core processes the remaining TRBs, skipping the updates to these TRBs until it reaches TRB of the next transfer. While skipping these TRBs, if any of the TRB it encounters the interrupt setting of ISP or IOC, it will generate the corresponding event once and ignore the interrupt settings of the remaining TRBs until a TRB of next transfer is reached.
- Device software can reclaim these skipped TRBs even though the HWO still indicates 1 (hardware-owned).
- For IN endpoints, software cannot stop providing transfers while it is ending transfers with CHN=0 and LST=0, otherwise it is possible that the endpoint is left in a flow-controlled state on the USB.

11.1.2.3.2.4 Transfer Resource Usage and Transfer State

Software allocates one Transfer Resource for an endpoint during initialization. When software issues a Start Transfer command, this Transfer Resource is used. When an XferComplete event happens, the Transfer Resource is released back to software. Similarly, when End Transfer completes, the Transfer Resource is released.

Following is a typical transfer usage summary (not complete usage model):

- Software sets up data buffer(s) and TRB(s) in external memory with the TRB(s) pointing to the buffer(s).
- Software issues Start Transfer with the pointer to the first TRB in the command parameters.
- If software sets up all the buffers and TRBs at the same time (Host and Device Software negotiate the transfer size), then just one Start Transfer is enough, and software waits for a XferComplete event.
- If software did not set up all the TRBs, then every time software adds a new TRB (by setting HWO=1) it must issue an Update Transfer command. The hardware will fetch the TRB again and continue the transfer.
- The End Transfer command is used only during error conditions and not used during normal transfers. For example, if software has set up multiple transfers and if a USB Reset event happens, it must remove all the transfers from the queue using End Transfer with the ForceRM bit set 1.

- A transfer is completed when all the data has been transferred or a short packet has been received. If software is queuing in only single transfers at a time (normal method for mass storage - for ethernet over USB, software can set up multiple transfers using the Chain bit and Continue on Short Packet bit), once XferComplete interrupt has happened, the transfer is completed. When starting a new transfer, software now needs to issue the Start Transfer command.
- An OUT transfer's transfer size (Total TRB buffer allocation) must be a multiple of MaxPacketSize even if software is expecting a fixed non-multiple of MaxPacketSize transfer from the Host.

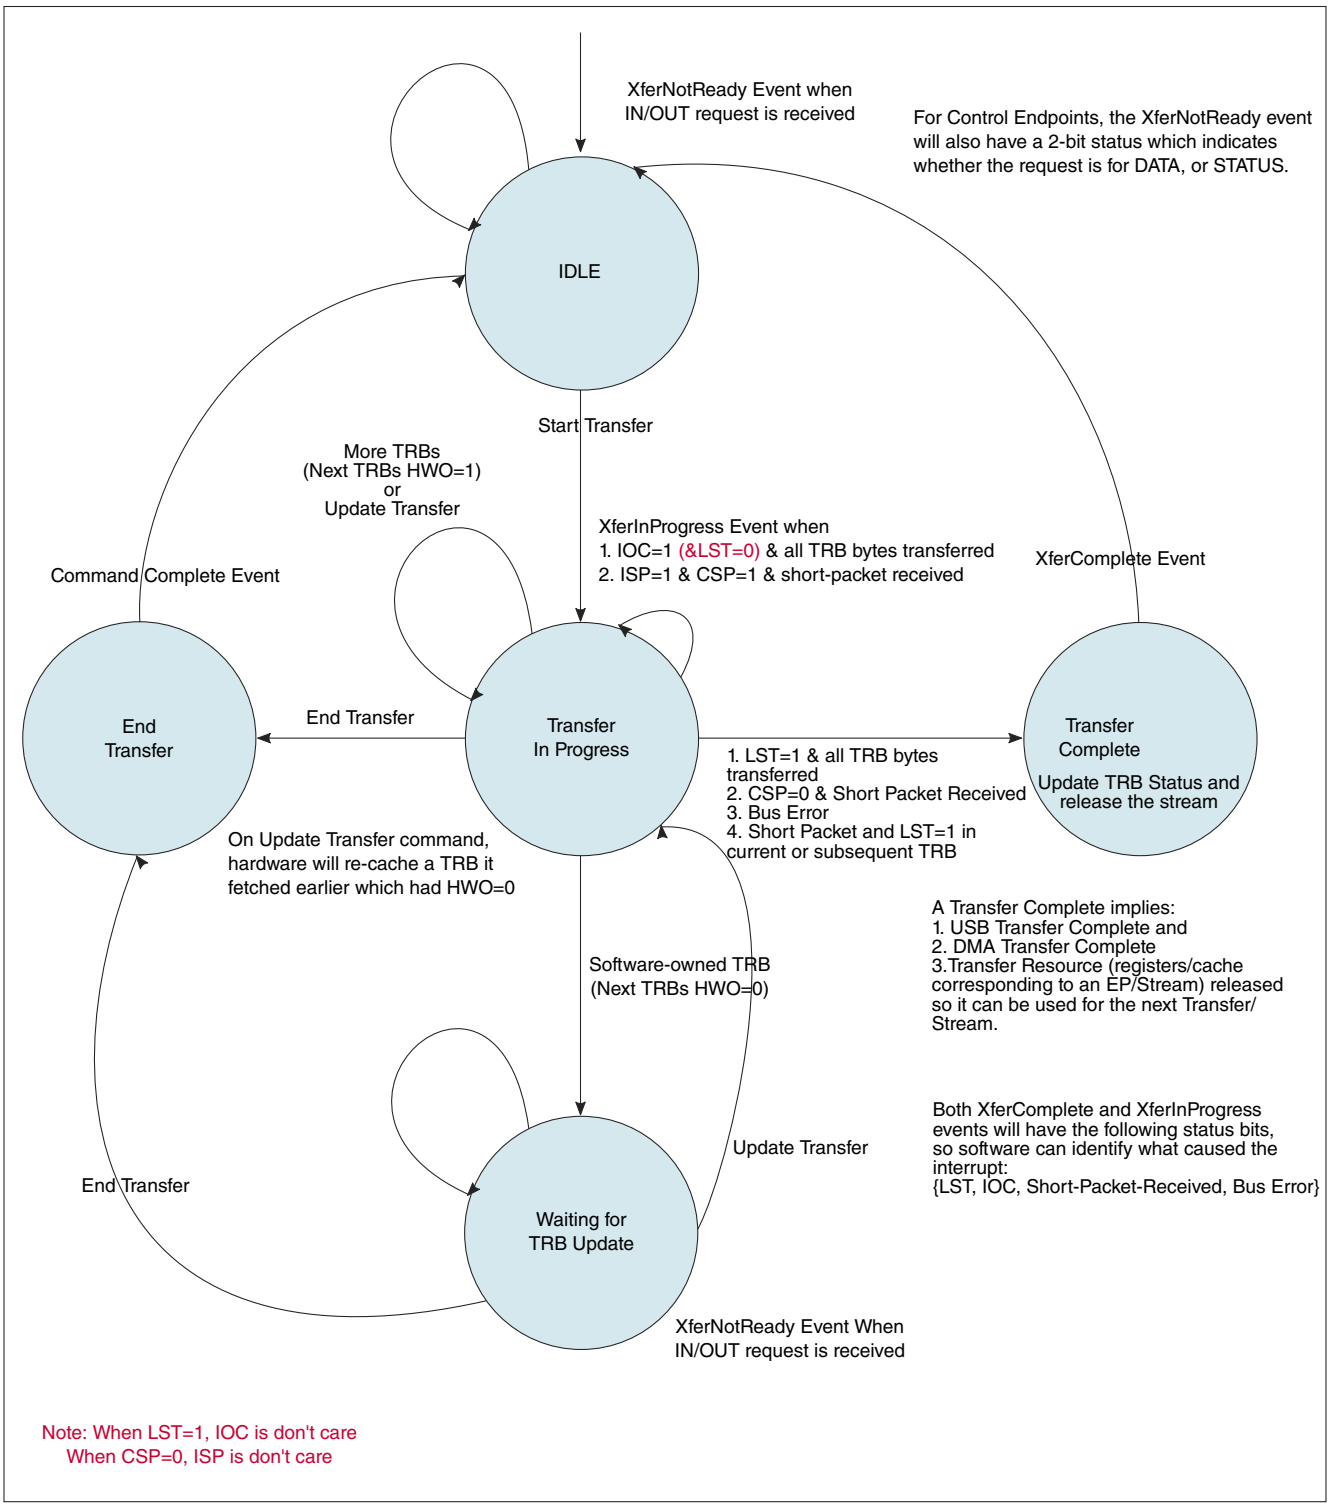

Figure 11-16. Transfer Usage State Machine.

11.1.2.3.2.5 Transfer Descriptions

The following sections describe typical transfer processes.

11.1.2.3.2.5.1 Non-Isochronous OUT Transfers

The sequence below describes a regular, non-isochronous OUT transfer (control-data/ bulk/interrupt).

Table 11-13. Non-Isochronous OUT Transfer Sequence

Steps	Host	Device Core	Device Software
Software sets up data buffers before a host request			
Step 1	-	-	Software sets up Normal TRBs and enables DMA by issuing Start Transfer.
Step 2	-	Device fetches the TRB and caches it.	-
Step 3	Host sends data packets	-	-
Step 4	-	Core receives the packets in RXFIFO and stores them in to TRB data buffers through DMAs. While the RXFIFO has space and the BUS DMA keeps up with the host data transfers, the device receives all the packets. Once all the data is received, the core updates the TRB status and then generates a XferComplete event. In SS mode, if GRXTHRCFG.USBRxPktCntSel is set to, • 0: the NumP sent depends on the DCFG.NumP and bMaxBurstSize • 1: the NumP sent depends on the RXFIFO space available when the packet is received When DMA is slow or CRC fails: • If the RXFIFO overruns or CRC error is detected, device times out in Non-SS mode or asks for the same data packet (through ACK/SeqNumber/Retry Bit) in SS mode. • In HS mode, on NAK the host will issue PING and device will ACK it (if there is enough space in the RXFIFO) and the host resumes with data again. In SS mode, the host will send the requested data. If the device receives any packet with other than the requested data sequence, it will ignore it.	-
Step 5	-	-	Software processes the XferComplete event.
Software sets up data buffers after the host request.			
Step 6	Host sends data packets.	-	-
Step 7	-	Since DMA is not set up, the device will send NAK in Non-SS mode and will send NRDY in SS mode to the host. It also generates an XferNotReady event.	-
Step 8	-	-	On seeing the XferNotReady event, Software sets up TRBs and enables DMA by issuing Start Transfer.
Step 9	-	Steps 2-5 are followed.	-

Table continues on the next page...

Table 11-13. Non-Isochronous OUT Transfer Sequence (continued)

Steps	Host	Device Core	Device Software
Step 10	-	If the core encounters a short packet before the transfer size data programmed in the TRB is received, it skips the remaining TRBs of the transfer. If the core encounters control bits LST, IOC, or ISP it will generate events and, in the case of an LST TRB, the stream will be completed. Software has to reclaim any TRBs skipped with HWO=1.	On detecting a skipped TRB condition, software reclaims the TRBs with HWO=1.

11.1.2.3.2.5.2 Isochronous OUT Transfers

This section describes the difference between isochronous and non-isochronous OUT transfers referring to the sequence in Non-Isochronous OUT Transfers

- In Step 2, if the TRB is not fetched in time, the core discards the packet. In addition subsequent packets in the service interval also will be dropped.
- In Step 4, if DMA is enabled and if RXFIFO overrun happens or CRC fails, the core discards the packet. In addition subsequent packets in the service interval also will be dropped.
- In Step 7, if DMA is not enabled, the core drops the data and generates XferNotReady event.

In general, the TRB chain of a service interval will be released if the core receives DATA0 PID in HS USB 2.0 mode or receives a packet with LPF set in SuperSpeed mode.

Special scenarios are:

- If the core misses this last packet indication, it releases TRB at the service interval boundary.
- If the core encounters a short packet before the transfer size data programmed in TRB is received, it skips the remaining TRBs of the transfer.
- If the core encounters control bits 'LST' or 'IOC' or "ISP" it will generate event and, in the case of LST TRB, the stream will be completed, but software has to reclaim TRBs if any TRBs skipped with HWO=1.

11.1.2.3.2.5.3 Non-isochronous IN transfers

The sequence below describes a regular, non-isochronous IN data transfer (control-data/ bulk/interrupt).

Table 11-14. Non-isochrnous IN transfers

Steps	Host	Device Core	Device Software

Table continues on the next page...

Table 11-14. Non-isochrnous IN transfers (continued)

	Software sets up data buffers before a host request		
Step 1	-	-	Software sets up TRBs and enables DMA by issuing Start Transfer.
Step 2	-	Device fetches the TRB, caches it, and prefetches the data into TXFIFO. Only in SS mode, the core sends ERDY (Async ERDY, even before host requesting data provided endpoint is in flow controlled state. LSP flow is same regardless of if the host asked for it.)	-
Step 3	Non-SS host issues a token request, SS host issues ACK TP to request data.	-	-
Step 4	-	If DMA fetches keep up with host requests, the device sends all the data, updates the TRB status, and then generates an XferComplete event when ACKs for all the packets are received. When DMA is slow: • If the TXFIFO becomes empty on a host data request, the device sends a NAK in Non-SS mode. In SS mode, the device sends NRDY, and when data is available in TXFIFO it sends ERDY and waits for the host request again. • If the TXFIFO becomes empty in the middle of a packet transfer (happens only in Threshold mode), in Non-SS mode the device will invert the CRC. In SS mode, it terminates with EDB after appending the corrupted CRC. The core waits for the host to retry the packet before fetching the data again. If the host retries a packet: • In Non-SS mode, a transmitted packet is kept in the TXFIFO until the ACK arrives (this is immediate in Non-SS mode). If the host retries a packet, it is immediately sent out from the TXFIFO. • In SS mode, before ACK can be received, the core could have sent additional packets in a burst. When a retry happens, NRDY is sent to the host and the TXFIFO is flushed. A DMA command is issued on the master bus to prefetch data from where the host is asking. Once data is fetched into the TXFIFO, the device sends ERDY and waits for host request again. • In Threshold mode, when the TX threshold amount of data is fetched, the device sends ERDY to the host.	-
Step 5	-	-	Software processes XferComplete event.
	Software sets up data buffers after a host request.		

Table continues on the next page...

Table 11-14. Non-isochrnous IN transfers (continued)

Step 6	Non-SS host issues a token request. SS host issues ACK TP to request data.	-	-
Step 7	-	Since DMA is not set up, the device sends s NAK in Non- SS mode, or NRDY in SS mode, to the host. The core also generates an XferNotReady event	-
Step 8	-	-	On seeing the XferNotReady event, software sets up Normal TRBs and enables DMA by issuing Start Transfer.
Step 9	-	Steps 2-5 are followed.	-
Step 10	-	When software knows it is talking to a host that always ends transfers with short packets, and therefore always requires a zero-byte packet to end a transfer, it includes a zero-byte TRB (CHN=0) after the last TRB which is an even multiple of MaxPacketSize. When software does not know if the host is going to do another IN token after receiving the exact number of bytes it expected (and it was a multiple of MPS), it does not include a zero-byte TRB, and sets LST in the last TRB. If the host returns with another IN for a zero-byte packet, it uses the XferNotReady/Start Transfer mechanism to add one zero-byte TRB. This is called "On- Demand."	-

11.1.2.3.2.5.4 Isochronous IN Transfers

This section describes the difference between isochronous and non-isochronous IN transfers referring to the sequence in Non-isochronous IN transfers.

- In Step 4, if the TXFIFO is empty when host IN request arrives, the core returns a zero length packet in both Non-SS and SS modes.
- In Step 7, the device returns zero length packet and generates an XferNotReady event.

Special scenarios:

- When data is fetched and there is no request from the host (possibly due to a missing request or corrupted request) the data will be flushed at the end of the service interval (corresponding Micro- Frame) boundary and the core moves onto fetching next service interval data. If there are some TRBs that are not serviced in the service interval, the core will skip these TRBs.
- If the core encounters control bits LST or IOC, it will generate an event, and in the case of LST TRB, the stream will be completed, but has to reclaim TRBs if any TRBs skipped with HWO=1.

11.1.2.3.2.6 Handling ENDPOINT_HALT

On receiving a SetFeature (ENDPOINT_HALT) control transfer, software issues a Set Stall command on the endpoint. Because of the delay from when software issues the command and when it is recognized by the core, other transfer events (XferInProgress, XferComplete) may be received prior to the endpoint being halted. For a description of the Set Stall endpoint command and its effects, see Commands 4 and 5: Set Stall and Clear Stall (DEPSSTALL, DEPCSTALL).

On ClearFeature (ENDPOINT_HALT), software must first remove all pending transfers for the endpoint through the End Transfer command. It may then issue a Clear Stall command on the endpoint followed by Start Transfer to start transfers again. For a description of the Clear Stall endpoint command and its effects, see Commands 4 and 5: Set Stall and Clear Stall (DEPSSTALL, DEPCSTALL).

11.1.2.3.2.7 Handling L1 Event During a Transfer

This section discusses the scenario in which the software already issued the Start Transfer command but the LPM occurred before or during the data transfer.

When an IN transfer is in progress, (that is, started and not completed yet), and the software sees a link state change event to L1, then the software can use the GDBGFIFOSPACE register (write followed by a read) to determine if the TXFIFO is empty or not. If the TXFIFO is not empty, it can initiate a remote wakeup.

NOTE

- The GDBGFIFOSPACE register is a debug register which gives the 'Space Available" for the endpoint selected with a write prior to the read. If this space available is less than the particular TXFIFO's maximum size, then the TXFIFO is not empty.
- Software can enable the Link State change event for USB 2.0 as there are not a lot of events compared to SS.

11.1.2.3.3 Isochronous Transfer Programming Model

Isochronous endpoints get guaranteed service by the host during a "Service Interval". The service interval for an endpoint is communicated to the host via the endpoint descriptor, and it is configured in the hardware through the DEPCFG command. However, unexpected behavior on the bus may prevent the host from servicing the endpoint as frequently as expected.

Although the endpoint receives "guaranteed" service during the interval, there are no bus-level acknowledgments, which means that there is no guarantee that the host (IN endpoints) or the device (OUT endpoints) receives correct data.

Therefore, the isochronous programming model differs from the bulk programming model to accommodate these two factors:

- No bus-level acknowledgement of packet transmission or reception
- No guarantee that all the data setup for an interval has been transmitted or received

For isochronous endpoints, software has the following responsibilities:

- Set up enough TRBs to keep up with the rate of data transmission or reception
- For FIFO-based IN endpoints, guarantee the validity of the TX data at least 1 micro Frame before the beginning of the interval that the data will be transmitted

Hardware has the following responsibilities:

- Transmit or receive data at the appropriate bus time
- For FIFO-based IN endpoints, delay fetching until 1 micro Frame before the beginning of the interval that the data will be transmitted
- Maintain a 1-to-1 correspondence between Buffer Descriptors and the intervals on the bus
- Report missed isoc intervals and update the buffer sizes in TRBs to reflect the amount of data moved

11.1.2.3.3.1 Definitions

- bInterval: The field in an endpoint descriptor used to communicate the service interval of the device. Its value ranges from 1 to 16, however, the USB 3.0 core supports a range of 1 to 14.
- Service interval: An integral number of microframes (2^[bInterval-1]) during which the host will poll the device to move data.
- Beginning of interval: The interval begins when the least significant (bInterval-1) bits of the bus time are all 0's.
- End of interval: The interval ends when the least significant (bInterval-1) bits of the bus time are all 1's.
- Data payload: The number of bytes to be moved during the service interval. It will be transmitted using MaxPacketSize packets.
- Buffer descriptor: A set of one or more TRBs with CHN=1 and the last one having CHN=0. The group of TRBs represents the data buffers for one service interval.
- Last TRB of a Buffer Descriptor: The TRB within a Buffer Descriptor that has CHN=0. When an interval has completed, this TRB will contain the total remaining buffer size of the Buffer Descriptor andus also the completion status of the interval.

- Microframe (μF): A unit of time on the USB that lasts 125 μs.
- Start of Frame (SOF): The beginning of a microframe.
- FIFO-Based Isoc IN: A sub-type of Isoc IN endpoints that has the characteristic of always assuming the HWO bit in a TRB is '1' and delays fetching of transmit data.
- Prefetch delta: For FIFO-based IN endpoints, TX data may be prefetched as early as 1 μF before the beginning of a Service Interval, but never earlier.
- Retire a TRB: When HW sets the HWO bit to 0 in a TRB and writes it back.
- Retire a Buffer Descriptor: When HW retires at least the first and last TRB of a Buffer Descriptor.
  - Other TRBs of the Buffer Descriptor may not be retired if an interval was missed (IN or OUT) or if a short packet/last packet is received (OUT). In this case, software may reclaim those TRBs even though HWO=1.
- Missed interval: When the device does not move all the data in an interval. This may occur when the host does not poll for all the data, or because of application-side delays that prevent all the data from being moved.
  - For IN endpoints, this occurs when the host does not request all the data prepared in the Buffer Descriptor, or not all the data is fetched from the system bus in time.
  - For OUT endpoints, this occurs when the host does not send a packet, a packet is dropped due to CRC error, or the system bus is too busy to accept the data.

11.1.2.3.3.2 Endpoint configuration

An isochronous endpoint is setup in much the same way as a bulk endpoint, with the following exceptions:

- The bInterval_m1 value in DEPCFG Parameter 1 must be set to the value reported in the endpoint descriptor minus 1. When the core is operating in Full Speed, bInterval_m1 must be set to 0.
- The MaxPacketSize value in DEPCFG Parameter 0 must be set to the same value reported in the endpoint descriptor.
- The "FIFO-based" bit in DEPCFG Parameter 1, bit 31, must be set for FIFO-based isochronous endpoints.
- For the best performance, set the TXFIFOs corresponding to Isochronous IN endpoints to a high priority.

After the endpoint is configured, it can be enabled by setting the appropriate bit in the DALEPENA register.

11.1.2.3.3.3 Transfer configuration

Software describes isochronous transfers through a series of Buffer Descriptors. Each Buffer Descriptor corresponds directly to one service interval of data. The fields within an isochronous TRB are the same as bulk TRBs with the following exceptions:

- The SOF field in an IN endpoint TRB is a don't care. For an OUT endpoint, the core will write this field with the timestamp of the last packet received into the TRB's buffer. This information is not needed for normal operation, only for debug purposes.
- For High-Speed, High-Bandwidth IN endpoints, a maximum of 3 packets can be sent during an interval. The PktCntM1 field ([25:24] of the 3rd DWORD) must be set to the (number of packets in the Buffer Descriptor - 1). For example, if 3 packets are to be transmitted during the interval, this field must be set to 2. For Super-Speed and OUT endpoints, this field is a don't care.
- The first TRB in a Buffer Descriptor must have the TRBCTL field set to the "Isochronous-First" type while all others have this field set to "Isochronous".
- The ISP bit is renamed IMI (Interrupt on Missed Interval) and should be set if software wants to receive an XferInProgress event when at least 1 packet is missed within an interval.
- The IMI bit should be set to the same value in all TRBs of a Buffer Descriptor.
- The CSP bit must be set to 1 (short packets cause the hardware to move to the next Buffer Descriptor, they do not end an isochronous transfer).
- The LST bit should be set to 0 (isochronous transfers normally continue until the endpoint is removed entirely, at which time an End Transfer command is used to stop the transfer).

All other bits and fields (IOC, HWO, CHN, BPTR, BUFSIZ) retain the same behavior as they have for bulk endpoints. If software needs to receive an interrupt after every service interval, it should set the IOC bit to '1' in each TRB. However, if software wants to reduce the interrupt frequency and the application can tolerate some latency, the IOC bit can be set to '0' and the core will not generate a XferInProgress event when the TRB is completed.

For OUT endpoints, the Buffer Descriptor must describe a total buffer size of:

```
(Mult+1)*MaxBurst*MaxPacketSize
```

11.1.2.3.3.4 Starting a Transfer

The hardware will report the bus time that the host starts polling the endpoint inside the XferNotReady event. Software will use this value as a reference when issuing the Start Transfer command to serve as time synchronization with the host.

1. Set up TRBs and data buffer for the endpoint.

2. After configuring and enabling the endpoint, wait for an XferNotReady event.

   The XferNotReady event will contain the time that the host started polling the endpoint in the upper 16 bits.

3. Issue the Start Transfer command to the endpoint with a future microframe time written into the upper 16 bits of the DEPCMD register. The future microframe time must be a value that is an integral multiple of intervals after the time reported in the XferNotReady event and aligned to the beginning of an interval. For example, if bInterval is 3 (4 microframes), and the XferNotReady time is 2, the value can be 4, 8, 12, and so on. The future microframe time must also be no greater than 4 seconds past the time reported in the XferNotReady event.
4. If the future microframe time has already passed when the command is received, the core will respond with an error (bit 13 in the Command Complete event).

In this case, software must issue End Transfer, then wait for another XferNotReady event and attempt the command again with a time that is further in the future.Otherwise, the first Buffer Descriptor will be used for the interval starting with the microframe time specified in the Start Transfer command.

11.1.2.3.3.5 Core Behavior During an Interval

After a transfer has been started, the hardware will perform the following functions for IN endpoints:

1. Fetch TX data as early as one interval prior to the beginning of the interval (call it A) if the HWO bit is set to one in the TRB.
2. Decrement the buffer size of each TRB as packets are transmitted.
3. Retire TRBs when their buffer size has reached 0, issuing an XferInProgress event if the IOC bit is set.
4. If the next interval (B) starts before all the packets have been transmitted for interval A:
   a. Flush the TXFIFO.
   b. Retire the Buffer Descriptor of interval A with a "Missed Isochronous" status.
   c. Retire the Buffer Descriptor of interval B with a "Missed Isochronous" status.
   d. See Checking interval status for a description of how software can determine that an interval ended unexpectedly.
   e. Go to step 1 to prepare for interval C
5. Otherwise, if all the TRBs of interval A are completed, the hardware will prepare for interval B.
6. If the host completes an interval by polling for all the data, but then it polls the endpoint again during the same interval, the hardware will respond with a zero-length packet and no interrupt will be made to software.

7. If the host polls the endpoint prior to the time specified in the Start Transfer command, the hardware will respond with a zero-length packet and no interrupt will be made to software.
8. If the host polls the endpoint during the expected interval and the hardware has no data prepared, the core will respond with a zero-length packet, but no XferNotReady event will be generated because the transfer is active. When the next interval starts, the XferInProgress event is generated (based on ISP and IMI) with the "Missed Isochronous" status, which is the way software finds out that this occurred.

For OUT endpoints, the hardware performs the following functions:

1. If a packet is received for the correct interval represented by the Buffer Descriptor (call it A).
   a. Write the packet into the buffer.
   b. Decrement the buffer size of the TRB.
   c. Write the timestamp of the received packet into the TRB.
   d. Retire a TRB when its buffer size reaches 0, issuing an XferInProgress event if the IOC bit is set.
2. If a short packet or packet with the last packet flag (lpf) is received for the correct interval.
   a. Write the packet into the buffer.
   b. Retire the Buffer Descriptor of interval A with the TRBSTS set to 0.
   c. If the IOC bit is set in the last TRB of the Buffer Descriptor, issue an XferInProgress event with bit [13] set.
   d. Go to step 1 to prepare for interval B.
3. If a packet is received for the correct interval but it has an error (CRC error, RXFIFO overflow), the core will not increment its expected sequence number value which causes future packets within the same interval to be dropped.
4. If a packet is received at a bus time prior to the time specified in the Start Transfer command, it will be dropped.
5. If a packet is received for the correct interval (A), but not enough buffer space is available for the core to write the packet (due to the HWO bit still '0' in one or more of the TRBs of the Buffer Descriptor), no XferNotReady event will be generated. The core will behave as follows:
   a. Wait until software sets the HWO bit to '1' and issues an Update Transfer command
   b. Retire the Buffer Descriptor of interval A with a "Missed Isochronous" status
   c. Go to step 1 to prepare for interval B.
6. If a packet is received for the next interval (B) before all the packets have been received for interval A:
   a. Retire the Buffer Descriptor of interval A with a "Missed Isochronous" status.
   b. Retire the Buffer Descriptor of interval B with a "Missed Isochronous" status.

c. See section Checking interval status for a description of how software can determine that an interval ended unexpectedly.
d. Go to step 1 to prepare for interval C.

Special Considerations for Isochronous OUT Endpoints

For OUT isochronous endpoints, the hardware detects a missed interval when the host sends a data packet in a future interval. It does not detect the missed interval at the exact interval boundary. Therefore, if the host abruptly stops sending isochronous OUT packets, there will be no interrupt or event indicating this to software. Software should use one of the following mechanisms to detect the interruption of isochronous OUT traffic:

1. The ultimate consumer of the isochronous OUT data will detect an underflow.
2. The device driver can use a timer detect that no XferInProgress events have been received for multiple intervals.

If this occurs, software should issue an End Transfer command to the endpoint and wait for a XferNotReady event which signals that the host is ready to resume isochronous traffic.

11.1.2.3.3.6 Checking interval status

As packets are transmitted or received during an interval, the buffer size of each TRB will be decremented. When the host is operating normally and polling for all the interval data, the buffer size of all the TRBs of an IN endpoint Buffer Descriptor will be zero after the interval has completed. For OUT endpoints, if the host sends less data than the Buffer Descriptor was setup for, the remaining buffer size may be greater than 0.

When the interval completes, the final remaining buffer size and missed isoc status is written to the last TRB of the Buffer Descriptor. If MissedIsoc is set, then it means the BUFSIZ is not accurate and may indicate that more data was transmitted or received than in reality. If the MissedIsoc is not set, it means the BUFSIZ field is correct.

When hardware detects the end of an interval (including normal and abnormal ends), it performs the following:

- If it has not already been retired, the first TRB of the Buffer Descriptor will be retired.
- Any non-first TRBs with CHN=1 that had not already been retired will not be written back. HWO will still be 1, and software can reclaim them for another transfer.
- The last TRB of the Buffer Descriptor will be retired with:
  - HWO = 0.

    - BUFSIZ = The total remaining buffer size of the Buffer Descriptor.
    - TRBSTS = "Missed Isoc" if any packets were missed, zero otherwise.
- If the IOC bit is set in the last TRB, or the IMI bit is set and packets were missed, hardware will issue an XferInProgress event

Software can get notification of an interval completing by setting the IOC bit in the last TRB of the Buffer Descriptor. The IOC bit may also be set in any other TRB of the Buffer Descriptor if software wants earlier notification that a TRB has completed. Software can also get only a notification of an interval completing unexpectedly by setting the IMI (Interrupt on Missed Isoc) bit in the last TRB of the Buffer Descriptor. When an interval completes unexpectedly and either the IOC or IMI bit is set in the TRB, the MissedIsoc bit (15) of the XferInProgress event will be set. The following table shows which events are generated in each scenario:

Table 11-15. TRB event generation events

Scenario	IOC	IMI	Action
TRB completed with a MaxPacketSize packet	0	0	No interrupt
	0	1	No interrupt
	1	0	XferInProgress (IOC=1)
	1	1	XrefInProgress (IOC=1)
TRB completed with a short packet	0	0	No interrupt
	0	1	No interrupt
	1	0	XferInProgress (Short=1, IOC=1)
	1	1	XrefInProgress (Short=1, IOC=1)
Interval completed due to missed packet (missed isoc)	0	0	No interrupt
	0	1	XferInProgress (MissedIsoc=1, IOC=1)
	1	0	XferInProgress (MissedIsoc=1, IOC=1)
	1	1	XrefInProgress (MissedIsoc=1, IOC=1)

It is normal to lose two intervals at a time when an error occurs during one interval. One interval is lost because of the host (which may not be polling enough) and the second interval is dropped because the device needs time to synchronize up to the next (third) interval.

11.1.2.3.3.7 Adding intervals to a transfer

Because isochronous endpoints represent a stream of data, the TRBs of an isochronous endpoint will normally be setup in a circular list, such as:

- TRB 1 (CHN=0, IOC=1)

- TRB 2 (CHN=0, IOC=1)
- Link (to TRB 1)

Example: Assume TRB 1 represents the data for the first interval and TRB 2 represents the data for the second interval. Because IOC=1, when the core completes the first interval, it will issue an XferInProgress event which indicates to software that TRB 1 can be analyzed to retrieve the results from interval 1. TRB 1 can the be re-used to represent the data for the third interval by setting HWO=1 and issuing an Update Transfer command.

Each time software sets up TRBs for a new interval, it must follow the guidelines in the Transfer Configuration section. Software will set up TRBs for future intervals when it obtains those buffers from another software layer or when TRBs are retired by the core.

11.1.2.3.3.8 Moderating Events

During a transfer, software may enable or disable any endpoint-specific event by re-issuing the DEPCFG command with the "Config Action" set to "Modify" and a modified DEPEVTEN field. All other field. All other fields in all other parameters must remain the same as the initial endpoint configuration.

11.1.2.3.3.9 Other Types of Isochronous Endpoints

The above description of the isochronous endpoint programming model assumes that software is setting up buffers in external memory that apply to certain intervals of data. This is called a "buffer-based" isochronous endpoint.

However, there is another mode that the hardware supports to accommodate other mechanisms of sourcing or sinking isochronous data, called "FIFO-based" and the types are defined by bits [31:30] of DEPCFG Parameter 1. This table illustrates the differences between the models:

Table 11-16. Isochronous Endpoints Models

Type	FIFO-Based [31]	Bulk-based [30]	TRB Fetch	TRB Write back	TX DMA	Retire Buffer Descriptor at passed interval
Buffer-based	0	0	When HWO=1	Yes	When HWO=1, no earlier than one interval ahead of time.	Yes
FIFO-based	1	0	When internal cache space available	No	No earlier than 1 µF before the interval	Yes
Invalid	1	1				

11.1.2.3.3.9.1 FIFO-based isochronous IN Endpoints

The software of some applications is unable to keep up with the short latency and high bandwidth of isochronous traffic and require the data to be sourced and done a sync through external FIFOs. One example is that there are two external TXFIFOs, one for each interval, and an address-to-FIFO-pop logic is implemented so that when the core attempts to read from interval 1's address, the translation logic converts this into a pop signal for interval 1's TXFIFO. When the core attempts to read from interval 2's address, the translation logic converts this into a pop signal for interval 2's TXFIFO.

To describe a FIFO-based implementation, software sets up an endpoint with the "FIFO-based" configuration bit set. This type of endpoint ignores the HWO bit in all TRBs, assuming that the TRB is always valid, and that the core should never write it back. Software chooses the buffer pointers within the TRBs to correspond to the address needed by the translation logic to specify which FIFO should be popped. By also using the CHN bit, headers and payload can be concatenated from different FIFOs. For example, if there are 4 external FIFOs: HA, PA, HB, PB, where HA/HB contain the 4 byte header for 2 intervals and PA/PB contain the 512 byte payload for 2 intervals, this can be described by using the following 5 TRBs:

1. BUFPTR=HA, IOC=0, CHN=1, BUFSIZ=4
2. BUFPTR=PA, IOC=1, CHN=0, BUFSIZ=512
3. BUFPTR=HB, IOC=0, CHN=1, BUFSIZ=4
4. BUFPTR=PB, IOC=1, CHN=0, BUFSIZ=512
5. Link to (1)

Every interval, the core will be creating a 516 byte packet that consists of 4 bytes from the header FIFO and 512 bytes from the payload FIFO. However, if the host does not poll for the packet, the core will skip 1 or 2 intervals of popping, depending on whether it has already started reading the next interval. External logic (or software) is responsible for flushing and refilling alternate FIFOs so that the core is always reading the correct data for the next interval. In normal intervals, the FIFOs will be empty, but when an interval is missed, there may still be data present in the FIFOs.

Software Requirements:

- The "FIFO-based" bit must be set in the DEPCFG when configuring the endpoint.
- No field within any TRB may be changed after the Start Transfer command is issued.
- Data must be valid in the external FIFO at least 1 uF before the beginning of the interval for which the data is intended.

Core Behavior:

- The earliest the core will read from the FIFO will be 1 µF before the beginning of the interval for which the data is intended.
- The core will not write back the TRB after it has completed it.
- The core will re-read the TRB from external memory even though it is not allowed to change.
- The only indication of missed intervals is the XferInProgress event if IOC or IMI is set in the TRBs. No indication will be made of how much data was actually transmitted.

11.1.2.3.3.9.2 FIFO-based isochronous OUT Endpoints

The FIFO-based model is also supported for OUT endpoints. In this case, core writes to specific addresses will be translated into external FIFO pushes. The same example from above (4 byte headers and 512 byte payloads) can be applied to OUT endpoints where the headers are split from the payload as the core receives 516 byte packets. The same software requirements and core behavior apply (for example, no writebacks and no indication of how much data was received). External logic assumes that if less than the expected amount of data is pushed into an interval's FIFO, the interval is invalid.

11.1.2.3.3.10 End a Transfer

Since isochronous endpoints have no bus-level acknowledgements, it is not necessary to set LST=1 in a TRB to gracefully end an isochronous transfer. Software can issue an End Transfer command to end an isochronous transfer. The core will wait until it can complete operations for the endpoint before returning the Command Complete event in response.

11.1.2.3.4 Control transfer programming model

Control transfers follow a flow of setup/data/status. On the USB bus, there are many error scenarios that can disrupt this flow. The hardware has a special mechanism that automatically recovers from these scenarios as long as software follows this single control transfer programming model.

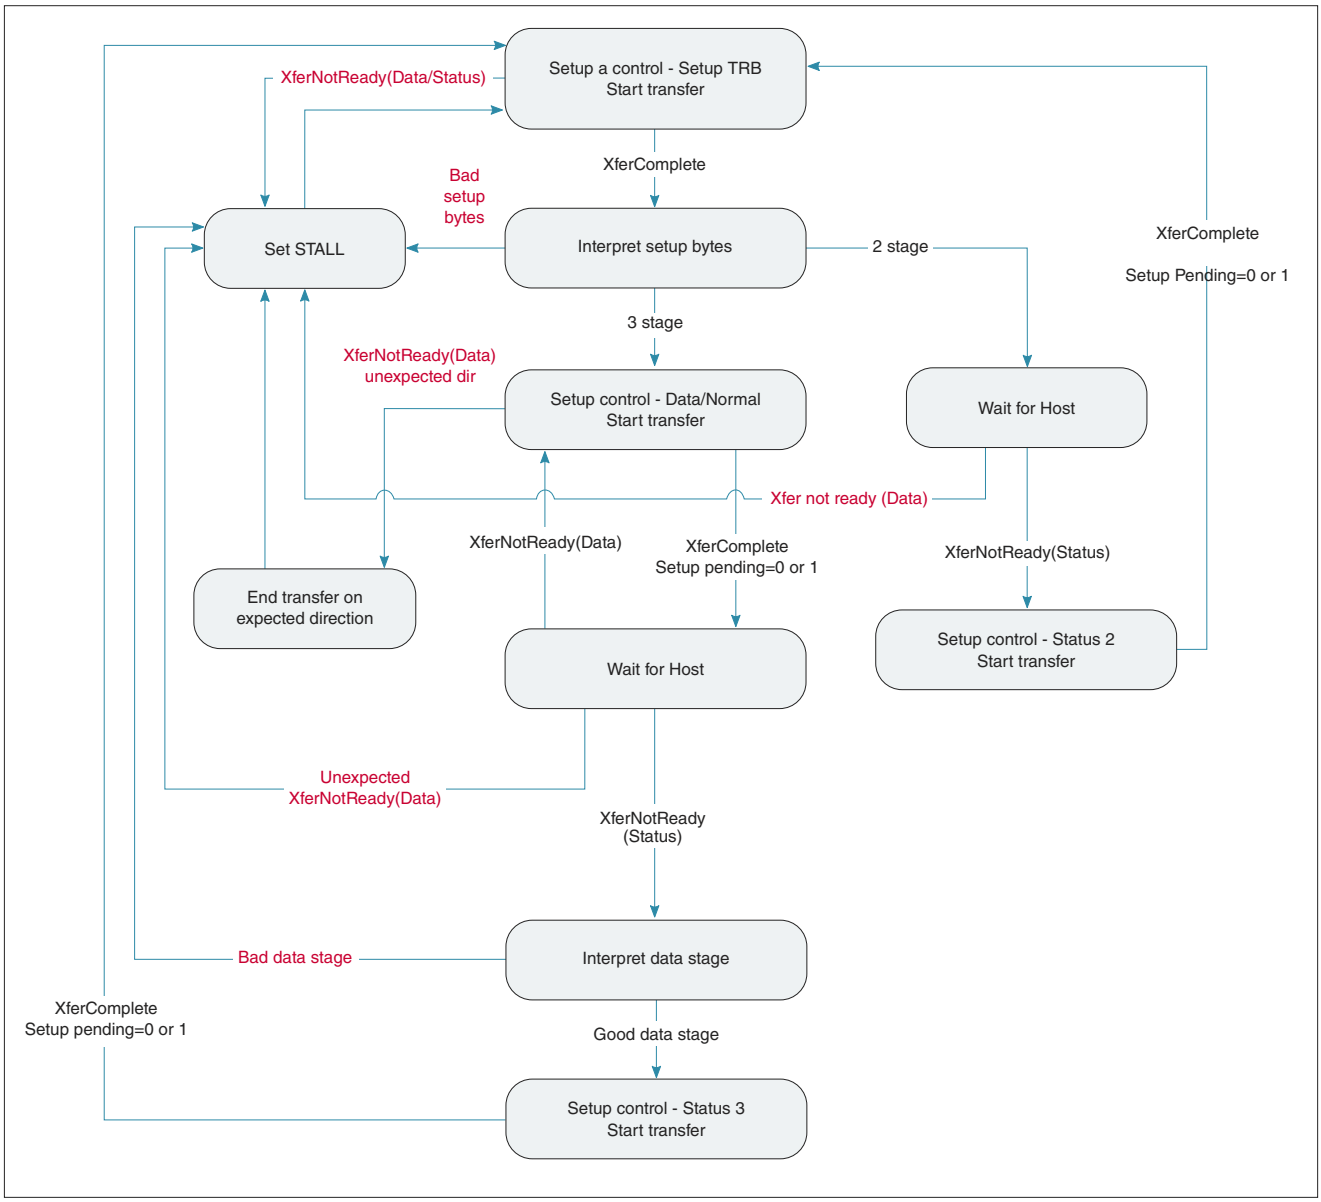

Figure 11-17. Software flow for control transfers

If hardware does not receive a setup packet, it discards the unexpected data and status stages. It does not issue XferNotReady to the application. The hardware will also not generate a XferNotReady event if it receives a setup packet before a TRB is prepared for it. As control endpoints are bi-directional, the IN and OUT directions of the endpoint are used for the different stages as follows:

Control read:

- EP0 - Setup OUT
- EP1 - Data IN
- EP0 - Status OUT/Status TP

Control write or 2-stage transfer:

- EP0 - Setup OUT
- EP0 - Data OUT (if present)
- EP1 - Status IN/Status TP

Set STALL is always issued on EP0, and the XferComplete/XferNotReady events are generated on the correct direction. For other control endpoints, substitute EP0 with the OUT direction (such as, 2, 4, 6) and EP1 with the IN direction (such as, 3, 5, 7). The same programming model is used for USB 2.0 and USB 3.0 control transfers.

11.1.2.3.4.1 Two-stage control transfer programming model

1. Software sets up a Setup TRB and issues Start Transfer on EP0 pointing to the Setup TRB.
2. After XferComplete is received, software interprets the setup bytes. If they are bad, issue Set Stall on EP0 and go back to the step 1. If a XferNotReady (Data/Status) event is received before the XferComplete event for the Setup stage, issue Set Stall. This is an error case where the host is attempting to move data or start the status stage for a previous control transfer that has already completed.
3. Wait for an XferNotReady event for the Status stage which will occur on EP1. If an XferNotReady event for the Data stage is received (either direction), issue Set Stall on EP0 and go back to the step 1. This is an error case where the host is attempting to start the data stage when the setup bytes did not indicate a data stage was present.
4. After XferNotReady (Status) is received, start the status stage by issuing Start Transfer on EP1 pointing to a valid Status-2 TRB.
5. After XferComplete is received on EP1, go back to the step 1.

Although not required, software may look at the Status TRB and examine the Setup Pending bit in the TRB status field. If it is set, it means that this control transfer was aborted on the USB bus and that the host did not receive the Status stage ACK.

11.1.2.3.4.2 Three-stage control transfer programming model

1. Software sets up a Setup TRB and issues Start Transfer on EP0 pointing to the Setup TRB.
2. After XferComplete is received, software interprets the setup bytes. If they are bad, issue Set Stall on EP0 and go back to the step 1. If a XferNotReady (Data/Status) event is received before the XferComplete event for the Setup stage, issue Set Stall. This is an error case where the host is attempting to move data or start the status stage for a previous control transfer that has already completed.
3. Start the data stage by issuing Start Transfer on EP0 (control write) or EP1 (control read) pointing to a valid Control-Data TRB.

   a. If an XferNotReady (Data) event is received for the incorrect direction, software must issue an End Transfer for the data stage it has already started, then issue Set Stall. This is an error case where the host is attempting to move data in the wrong direction.
   b. If a XferNotReady (Data) event is received for the correct direction, ignore the event and continue to wait for a XferComplete event.
4. After the XferComplete event is received, software waits for an XferNotReady event. Although not required, software may look at the completed Data TRB(s) and examine the Setup Pending bit in the TRB status field and the BUFSIZ. If the Setup Pending bit is set or the BUFSIZ is non-zero, it means that this control transfer was aborted on the USB bus and that the host did not complete the data stage.
5. If a XferNotReady (Data) event is received after the XferComplete for the Data stage, it could mean one of two things:
   a. This host is trying to complete the data stage by moving a 0-length packet. This can occur if the data stage was an exact multiple of max packet size. If this is the case, software sets up an extra TRB (with a BUFSIZ of max packet size for control writes, or 0 for control reads), issues Start Transfer, and goes back to the step 4.
   b. This host is trying to move more data than specified in the wLength field of the setup bytes. In this case, software issues Set Stall on EP0 and goes back to the step 1.
6. When the XferNotReady (Status) event is received, software interprets the data stage (for example, number of bytes transferred, content of the control write buffer) and decides if the data stage was successful. If not, it issues Set Stall on EP0 and goes back to the step 1.
7. Start the status stage by issuing Start Transfer on EP1 (control write) or EP0 (control read), pointing to a valid Status-3 TRB.
8. After XferComplete is received, go back to the step 1.

Although not required, software may look at the Status TRB and examine the Setup Pending bit in the TRB status field. If it is set, it means that this control transfer was aborted on the USB bus and that the host did not actually receive the Status stage ACK. When device software sets STALL with the Set Stall command, it is possible that this command can be delayed on the chip bus due to latency or the chip bus servicing other agents. In this case, software can receive an XferNotReady event if the core detects no TRB active before it detected the Set Stall. Software must service these events knowing that it stalled the control command.

11.1.2.3.4.3 Handling fewer requests than wLength

In a control IN transfer, if the host asks for less data than wLength, the core skips the TRBs of the data stage and generates an XferComplete event after encountering the TRB that has LST=1. Hardware sets HWO to 0 in those TRBs that it skipped and in the last TRB. In a control OUT transfer, if the host sends less data than wLength, the core treats this like a short packet received into a TRB with CSP=0. It immediately generates a XferComplete event, not setting the HWO bit in the remaining TRBs to 0. Software needs to reclaim those TRBs that still have HWO=1.

11.1.2.3.4.4 Control OUT transfer examples

The sequence in the following table describes two and three stage control OUT transfers.

Table 11-17. Control OUT transfer

Steps	Host	Device core	Device software
	Setup stage		
1	-	-	Software sets up the Setup TRB and enables DMA by issuing Start Transfer to EP0 (endpoint 0, OUT direction).
2	-	Device fetches the TRB and caches it.	-
3	Host sends SETUP packet.	-	-
4	-	SETUP packet is received in the RXFIFO. There are 24 bytes allocated for each control endpoint, which guarantees reception of the three back-to-back SETUP packets. An ACK handshake is returned in non-SS mode. An ACK TP with NumP=1 is returned in SS mode. After SETUP, bytes are transferred through the DMA, and the core issues an XferComplete event.	-
5	-	If the host starts a Data/Status stage, the core returns NAK in Non-SS mode or NRDY TP in SS mode. If the SETUP request is invalid, core returns STALL (when software sets STALL) in non-SS mode. In SS mode the core returns ERDY, and when the Data/Status stage is received it returns STALL.	Software processes the XferComplete event and decodes the SETUP bytes. If a Data stage is required, it will set up one Control-Data TRB and possibly subsequent Normal TRBs, then issue Start Transfer to EP0 (endpoint 0, OUT direction). If a Data stage is not needed, it will skip to the Status stage. If the SETUP request is invalid, software instead sets the STALL bit by issuing Set Stall command for EP0 (OUT direction).
	Data stage		
6	-	Device fetches the TRB and caches it. In SS mode only, the core will send ERDY.	-

Table continues on the next page...

Table 11-17. Control OUT transfer (continued)

Steps	Host	Device core	Device software
7	Host sends data packets.	-	-
8	-	The NumP for control transfer will be 1. In addition, if another SETUP is received before the data transfer happens on USB, the core will skip the data transfer that software sets up without waiting for it to happen on the USB bus, and send XferComplete (when LST=1 TRB encountered) with the SetupPndg status bit set. Software has to reclaim the TRBs with HWO=1 in the skipped TRBs.	-
9	-	If the host starts a Status stage, the core returns NAK in Non-SS mode or NRDY TP in SS mode.	On seeing the event: • Software decodes the control write data. If the Data stage is OK, then it will wait for XferNotReady with "Control Status Request" set, set up a Control-Status-3 TRB (0-bytes), and enable DMA by issuing Start Transfer to EP1 (endpoint 0, IN direction). • If the Data stage is not OK, then software sets STALL by issuing Set Stall command to EP0.
	Status stage		
10	-	Device fetches the TRB and caches it. In SS mode only, the core will send ERDY	Software sets up a Status stage TRB only after the Data stage of a three-stage control transfer is completed and an XferNotReady event occurred.
11	Host requests status packets.	-	-
12	-	In Non-SS mode, the device will send a zero-length packet if STALL is not set; otherwise, it will send STALL. In SS mode, if STALL is not set, then it sends ACK TP with NUMP=1 else it sends STALL. If another SETUP is received before the status transfer on USB, the core will send XferComplete with the SetupPndg status bit set. The STALL bit will be cleared by the core whenever it receives a SETUP packet. SETUPs are always accepted.	-
13	-	-	On seeing the event: • If there are no other errors, then the transfer has completed successfully.

11.1.2.3.4.5 Control IN transfer examples

The sequence in the following table describes two and three stage control IN transfers.

Table 11-18. Control IN transfer

Steps	Host	Device Core	Device Software
	Setup stage		
1-5	Steps 1-5 are same as Control OUT transfer examples, except that software sets up Tx buffers and Start Transfer is issued to EP1 (endpoint 0, IN direction).		
	Data stage		
6	-	Device fetches the TRB and caches it. It prefetches the data and puts it in the TXFIFO. The core sends ERDY only in SS mode.	-
7	Host requests data packets	-	-
8	-	This step is similar to the step 4 of Non-isochronous IN transfers. The NumP for control transfer is 1. In addition, if another SETUP is received before the data transfer happens on USB, the core will skip the data transfer software has set up without waiting for it to happen on the USB bus and send XferComplete (when LST=1 TRB encountered) with the SetupPndg status bit set. Software has to reclaim the TRBs with HWO=1 in the skipped TRBs and flush the TXFIFO.	-
9	-	If the host starts the Status stage, the core returns NAK in non-SS mode or NRDY TP in SS mode.	On seeing the event: • If the Data stage is OK, then it sets up Control-Status-3 TRB (zero-bytes) and enables DMA by issuing Start Transfer to EP0 (endpoint 0, OUT direction). • If the Data stage is not OK, then software will set a STALL by issuing Set Stall command to EP0 (OUT direction).
	Status stage		
	Same as in Control OUT transfer examples.		

11.1.2.3.5 Stream handling in SuperSpeed

The SuperSpeed stream protocol consists of a negotiation between the host and device concerning the selection of a stream, followed by data movement on the selected stream. The core automatically handles the stream protocol by initiating stream selection and also taking into account streams initiated by the host.

NOTE

This section is not applicable for USB 2.0 mode.

11.1.2.3.5.1 Stream IDs and transfer resources

A stream ID is a 16-bit value which represents an individual flow of data between host and device. For stream-capable endpoints, the stream ID must be non-zero and is used in:

- The Command Parameter field in the DEPCMD register used when issuing a Start Transfer command.
- The Stream ID field in a TRB.
- The EventParam field in an endpoint-specific event (DEPEVT): XferComplete, XferInProgress, XferNotReady, and StreamEvt.

It is necessary to allocate 1 Transfer Resource per endpoint. The cost of each transfer resource is (32 + N_TRBS_PER_XFER x 16) bytes of memory in the descriptor cache. Core can cache maximum four TRBs per transfer.

After the Start Transfer command completes, the hardware returns the 7-bit Transfer Resource Index in the command complete event (and Device Physical Endpoint-n Command Register (DEPCMD)). This index is used only for the Update Transfer and End Transfer commands. In all other places, the Stream ID is used.

11.1.2.3.5.2 Stream selection and stream programming model

Referring to the USB 3.0 Device Stream Protocol State Machine, the Idle state is the state where a device does not have a current stream to work on. When the hardware detects that it is in the Idle state, it will attempt to initiate and move data on a stream by transmitting ERDY to the host.

In order for this to occur, the endpoint must be "primed" and the stream must be both active and ready.

- **Primed**: After a stream-capable endpoint is configured, it is in the disabled state, which prevents the device from initiating any stream selection. After the host performs a Prime transaction, the endpoint is moved into the "Primed" state where it is eligible to initiate stream selection.
- **Active**: Software makes a stream active by issuing a Start Transfer command for the stream. A stream becomes inactive after an XferComplete event or after software issues an End Transfer command.
- **Ready**: After a stream is added via the Start Transfer command, its default state is "ready." The hardware will label the stream as "not ready" if the host gives a NoStream rejection to the hardware's attempt to initiate the stream. If the host

performs a Prime, all currently active streams are automatically set to the "ready" state by hardware.

In the Idle state, the hardware selects a stream from its cache to initiate. Once the core has chosen an active stream, it attempts to initiate and move data on that stream until the endpoint enters the Idle state, which occurs when the host rejects the stream selection (NoStream) or the stream is terminated (PP=0) by the host or device. Therefore, software is required to prepare enough HWO=1 TRBs for at least one packet prior to issuing the StartXfer command.

In device-oriented stream selection class drivers (such as UASP), the host will not reject the device's stream selection. However, other class drivers may be developed in which the host initiates stream selection. In this situation, software will not start any transfers and will wait for a XferNotReady event. When that event is received, software will look at the StreamID in the event and start the transfer associated with the given Stream ID. If for some reason the class driver allows the host to reject a stream that has already been initiated by the host or device, software will receive a Stream (NotFound) event. If this occurs, software may replace the existing stream by issuing End Transfer for it and then issuing Start Transfer for another stream.

Some host implementation scenarios exist where the host and device become out of sync in the stream protocol, creating a deadlock condition where the device waits for the host to issue a Prime transaction while the host waits for the device to issue an ERDY. To resolve potential deadlock conditions, software should perform the following:

1. Implement a time out for stalled transfers on stream-capable endpoints.
2. When the timeout elapses with no data transfer for any stream after a StreamEvent (NotFound) event, restart one of the streams by issuing an End Transfer command followed by a Start Transfer command.

This places the stream in the Ready state and causes the core to transmit an ERDY to the host.

11.1.2.3.5.3 Data movement within a stream

Data movement within a stream is the same as data movement using the Bulk endpoint type (Start Transfer, Update Transfer, and updating TRBs). The XferInProgress, XferComplete, and XferNotReady events are issued as data is transferred between host and device. The Stream ID field in the events indicate which stream within the endpoint is generating the events. If software receives an XferNotReady event with the EventStatus field indicating XferNotActive, it means that the host is attempting to initiate a stream that has not been added to the hardware's cache through Start Transfer. In response to this event, software should add the requested stream if it is available.

11.1.2.3.6 Low power operation

11.1.2.3.6.1 Low power operation of USB

The USB 3.0 protocol allows a SuperSpeed host and device to negotiate with each other and decide when to bring their link into a lower power state (U1 or U2). This is accomplished by each side making individual decisions about whether they have any traffic currently pending or if they expect any traffic soon. The device requests low power entry by transmitting an LGO_U1 (or LGO_U2) Link Command and exits low power by using an LFPS handshake. The USB 3.0 Device Controller uses information from the host (bus side) and from software (application side) to decide when the best time to request low power entry is and when to exit from low power. The same calculation is used when the controller decides whether to accept a low power request from the host. The controller maintains state information about each endpoint and whether it is "active" or "paused". If all enabled endpoints are paused from either the application side or the bus side, low power entry is allowed. If at least one endpoint is not paused, low power entry is not allowed. To indicate that it does not have any pending traffic and allow the link to go into a low power state, the software may pause all enabled endpoints using one of the following mechanisms:

- Allow transfers to complete and not start any new ones
- Not setting the HWO bit in the TRBs to '1'

Exception: Software may prepare a Setup TRB for control endpoints without affecting the ability of the link going into low power. Otherwise, an endpoint is considered active on the application side. For these endpoints, the host indicates that it is paused in one of the following ways:

- Setting the Packet Pending (PP) flag to '0' in the DPH
- Setting the PP flag to '0' and NumP to '0' in the ACK TP
- For interrupt endpoints, by not polling the endpoint for two service intervals
- Note: After an endpoint is configured using the DEPCFG command and before the host sends any packets to it, the endpoint is considered to be paused on the bus side

Exception: If the data packet payload has a CRC error, the core responds with an ACK (Retry=1), and the endpoint is not paused. Otherwise, if PP=1 or Deferred=1, the endpoint is considered to be active on the bus side. Control endpoints have an additional condition as follows:

The core does not allow low power entry during a control transfer (starting from the reception of setup packet and ending at the completion of the status stage).If the core is configured for isochronous support, the following additional rules apply:

- The controller enters U0 at SystemExitLatency microseconds prior to the beginning of every microframe to receive the Isochronous Timestamp Packet (ITP).
- A PING causes every isochronous endpoint to wake up and be considered active, preventing low power entry.
- An isochronous endpoint is paused automatically when it transmits or receives the last packet of its interval (lpf=1) or if two intervals pass and the endpoint has not transmitted or received its last packet. In this way, after the PING, the core does not enter low power until all isochronous endpoints have moved their last packet or two intervals pass without another PING.

If all enabled endpoints are paused by software or the host, the core issues an LGO_U1 (or LGO_U2) link command or it responds with an LAU link command to the low power request of the host or hub. Otherwise, the core rejects the low power requests with an LXU link command.

Additionally,

- For bulk endpoints, the USB 3.0 specification says that the device may go to U1/U2 500ms (tERDYTimeout) after transmitting ERDY. It is the responsibility of the software to detect no activity on a bulk endpoint for 500ms or more and issue End Transfer if there is no activity. When the transfer is removed, the endpoint allows U1/U2 entry again.
- Because U1/U2 entry is based on the presence of packets in the TX FIFO and not based on the TRBs that are available to the core, it is possible that an IN endpoint responds with a NRDY, goes to U1, then U0, then transmits an ERDY if the timing and TXFIFO size works out such that the core cannot keep at least one packet in the TXFIFO at all times.
- In addition, before the final decision made to either initiate or accept low power state, device checks the state of DCTL[INITU2ENA][ACCEPTU2ENA][INITU1ENA] [ACCEPTU1ENA]. If the device receives Set Link Function LMP with Force_LinkPM_Accept bit asserted, the device accepts low power request from its link partner independent of endpoints state and DCTL Power control settings.

11.1.2.3.6.2 Low power operation of core

When the link is in the U1, U2, U3, SS.Inactive, SS.Rxdetect, or SS.Disabled state (for USB 3.0) or the USB is in Sleep, Suspend, or V_{BUS}-off mode (for USB 2.0), the core can be put into a low power mode to save power. The core supports the following low power mode:

- **Clock-gating mode**: In this mode, the clocks connected to most of the core modules are gated off. Modules that still get clocks in the low power mode detect wakeup conditions and remove clock gating to other modules when a wakeup condition is

detected. Clock-Gating mode can be used when the USB is in any low power state. Clock-Gating mode is enabled by setting the Disable Clock Gating bit in GCTL to 0.

11.1.2.3.6.2.1 Clock-Gating Mode

Clock-Gating mode is enabled if the Disable Clock Gating bit in the GCTL is set to 0. When the USB/link is in a low power state, the clocks to most of the core modules are gated off automatically by the core. When a wakeup condition is detected by the core, or when the software schedules new work to the core (in U1 or U2 states) or changes the USB/Link state, the core turns on clocks and the entire core goes into active mode.

11.1.2.4 Host programming model

Please refer xHCI specification for detailed information.

11.1.2.4.1 Initializing host registers

In order to initialize the core as a host, the application should perform the steps described in the xHCI specification. Global registers need to be re-initialized as described in Initializing global registers.

11.1.2.4.2 Host controller capability registers

For register definition, refer to Capability registers length and Host Controller Operational Registers (CAPLENGTH) to Runtime Register Space Offset Register (RTSOFF).

11.1.2.4.3 xHCI implementation details

This section discusses xHCI implementation details specific to the USB 3.0 controller.

11.1.2.4.3.1 LHCRST behavior

The xHCI Specification does not describe the programming model of light reset. It only specifies that the Operational and Runtime Registers that are not contained in the Aux Power well are at their default values.

Light reset must only be applied when USB_DCTL[Run_Stop] is equal to '0' to ensure that there is no discrepancy between hardware and software states. If light reset is applied during a transfer, the behavior on the USB is undefined, and may cause a packet to be terminated abruptly.

On light reset, the hardware resets all non-Aux registers to their default values which means that the port state (which is contained in PORTSC) does not change, but USB_DCTL[Run_Stop] is immediately set to '0' and all the context information about connected devices is lost. It is the responsibility of software to re-initialize the controller.

11.1.2.4.3.2 ENT requirements

In the xHCI Specification, the rules about when the ENT (Evaluate Next TRB) flag in a TRB must be set or cleared are not very strict. However, it states that the ENT flag must be set to '1' in the last Normal TRB when a TD ends with an Event Data TRB.

The controller requires software to follow these rules:

1. Regardless of whether the endpoint is stream-capable or not, if a TD ends with an Event Data TRB, the Normal TRB that precedes it must have ENT set to '1'. This Normal TRB may be separated from the Event Data TRB by a Link TRB
2. In all other cases, the ENT flag must be set to '0' Failure to follow these rules results in undefined behavior.

11.1.2.4.3.3 Behavior on babble error

If a babble error is detected and the received data passes all integrity checks, the host controller may write the received data (up to the expected data length) to the data buffer, and the value of the TRB transfer length field in the babble detected error transfer event shall be consistent with the number of data bytes written to the buffer.

The controller does not write the received data to the data buffer. The entire packet is discarded and the residual byte count is written to the TRB transfer length field.

11.1.2.4.3.4 Max_exit_latency_too_large message

If periodic transfers are on every microframe (Binterval 1), the controller reports max_exit_latency_too_large if PING scheduling is enabled. The xHCI scheduler must prefetch data from the system memory ahead of next microframe, manage non-periodic transfer, and schedule PING before ISOC. Because the system memory access and USB responses are not predictable Quality of Service (QoS) is not guaranteed if the xHCI host needs to perform all of the above for every microframe when U1/U2 is enabled. Therefore, the expectation is to disable U1/U2 if periodic data needs to be scheduled every microframe. In addition, because the U1 exit latency is in the order of 10usec, only very low system-level power saving is achieved even if the scheduler allows U1 transition by reducing QoS.

U1, U2, and U3 link states and exit time observed during lab testing:

- U1: Lowest power saving
  - In this state the chip is active, USB controller is inactive, only the Tx transmitter of the PHY is inactive.
  - U1 exit time per link partner: ~10 - 19 usec
- U2: Higher power saving than U1
  - In this state the chip is active, USB controller is inactive, both the Rx and Tx transceivers of the PHY are inactive.
  - U2 exit time per link partner: ~85 - 115 usec
- U3: Highest power saving
  - In this state, the chip and USB controller/PHY are inactive.
  - U3 exit time per link partner: 200 - 450 usec

Following are the recommendations for driver to handle periodic endpoints and "max_exit_latency_too_large" message:

- If Binterval of any endpoint is '1', then disable U1/U2 and do not schedule PING ("max_exit_latency" set to 0).
- If periodic scheduling is expected on every microframe, then disable U1/U2 and do not schedule PING.
- If periodic scheduling is expected only on every other microframe, then disable U2 and use U1 exit latency for "max_exit_latency" calculation.
- If ((number of hubs +1) * U2 exit latency) >= (2**(Binterval-1) * 125 usec), then disable U2.
- For all other periodic scheduling use U2 exit latency for "max_exit_latency" calculation.
- If the "max_exit_latency_too_large" error is sent to software, then disable U2 and re-issue ep- config with U1 exit latency.
- If "max_exit_latency_too_large" still happens, then disable U1 and re-issue ep_config with max_exit_latency set to 0 (no PING).

11.1.2.5 Device physical endpoint-specific commands

11.1.2.5.1 Command 1: Set endpoint configuration: DEPCFG

This command sets the physical endpoint configuration information.

NOTE

If GUSB2PHYCFG[6] is set to '1', it must be set to '0' prior to issuing this command and may be set to '1' after the command completes.

Table 11-19. Command 1: Set endpoint configuration parameters: DEPCFG

Field	Description
Parameter 2	
31-0	Set to endpoint state when the Config Action field of Parameter 0 is 1. Otherwise, this is Reserved.
Parameter 1	
31	FIFO-based Set to '1' if this isochronous endpoint represents a FIFO-based data stream where TRBs have fixed values and are never written back by the core.
30	Bulk-based Set to '1' if this isochronous endpoint represents a bulk data stream that ignores the relationship of bus time to the intervals programmed in TRBs.
29-25	USB Endpoint Number bit[29:26]: Endpoint number bit[25]: Endpoint direction: 0 OUT 1 IN Physical endpoint 0 (EP0) must be allocated for control endpoint 0 OUT. Physical endpoint 1 (EP1) must be allocated for control endpoint 0 IN.
24	Stream Capable (StrmCap) Indicates this endpoint is stream-capable (MaxStreams != 0).
23-16	bInterval_m1 Set to the bInterval value minus 1. The valid values for this field are 0 through 13. The bInterval value is reported in the endpoint descriptor. When the core is operating in Full-Speed mode, this field must be set to 0.
15	Set to '1' if this bulk endpoint utilizes the External Buffer Control (EBC) mode. This limits the number of outstanding DMA transfers to one read and one write. This is a requirement for the EBC to operate properly. Using EBC without setting this bit to '1' results in undefined behavior.
14	Reserved
13-8	Bits 13-8 are used for Device Endpoint Specific Event Enable (DEPEVTEN). If an enable bit is set to 0, the corresponding event is not generated. Bit 13 Stream Event Enable (StreamEvtEn) Bit 12 Reserved Bit 11 Reserved Bit 10 XferNotReady Enable (XferNRdyEn) Bit 9 XferInProgress Enable (XferInProgEn) Bit 8 XferComplete Enable (XferCmplEn)
7-5	Reserved
4:0	Interrupt number (IntrNum) Applies to IN and OUT endpoints.

Table continues on the next page...

Table 11-19. Command 1: Set endpoint configuration parameters: DEPCFG (continued)

Field	Description
	Indicates interrupt/Event Buffer number on which endpoint related interrupts for this endpoint are generated. This must be set to 0.
	Parameter 0
31-30	Config Action 0 Initialize endpoint state: This action is used when an endpoint is configured the first time. It will cause the data sequence number and flow control state to be reset. DEPCMDPAR2 will be ignored. The encoding of this action is backward compatible with software that previously set "Ignore Sequence Number" to 0. 1 Restore endpoint state: This action is used when reconfiguring an endpoint with saved state after hibernation. It will cause the data sequence number and flow control state to be restored from DEPCMDPAR2. 2 Modify endpoint state: This action is used when modifying an existing endpoint configuration, such as changing the DEPEVTEN event enable bits, interrupt number, or MaxPacketSize. The data sequence number and flow control state will be unchanged, and DEPCMDPAR2 will be ignored. The encoding of this action is backward compatible with software that previously set "Ignore Sequence Number" to 1. When issuing a Endpoint Configuration command with Config Action=Restore, Parameter 2 must be filled in with the same value returned by the Get Endpoint State command prior to hibernation.
29-26	Reserved
25-22	Burst Size (BrstSiz) When field is set to- 0 Burst length = 1 1 Burst length = 2, and so on, up to, 15 Burst length = 16 For IN transfers, this value represents the maximum length of the burst that the device attempts when the Host initiates an IN transfer with a TP_ACK. If BrstSiz < the NumP value in the initiating TP_ACK, then the device controller limits the burst length to BrstSiz. If BrstSiz >= the NumP value in the initiating TP_ACK, then the device controller attempts a burst length of NumP. For OUT transfers, this value represents the NumP value utilized in the response TP_ACK from the device controller. The NumP value indicates (to the host) the burst length the device desires. Note: In the special case of BrstSiz=0 (burst length = 1), the TP_ACK from the device controller has NumP=0; which is a flow-control condition. If this value is utilized, then the endpoint enters flow control for each DP received and a subsequent ERDY is transmitted (according to the USB Specification). However, this may have an undesirable impact on the system throughput. To avoid this impact, it is recommended to set BrstSize=1 to prevent the flow-control condition. The trade-off is that the host could potentially burst two OUT data packets to the device, resulting in an ACK for the first packet, and an NRDY for the second packet.
21-17	FIFO Number (FIFONum) Indicates which transmit FIFO is assigned to this endpoint. For control endpoints, the FIFONum value in the OUT direction must be programmed to the same value as the IN direction. This field should be set to 0 for all other OUT endpoints. Even though there may be more than 16 TXFIFOs in DRD mode, the device mode must use lower 16 TXFIFOs.
16-14	Reserved

Table continues on the next page...

Table 11-19. Command 1: Set endpoint configuration parameters: DEPCFG (continued)

Field	Description
13-3	Maximum Packet Size (MPS) Applies to IN and OUT endpoints. The application must program this field with the maximum packet size (in bytes) for the current USB endpoint. USB 3.0 supports up to 1024 bytes.
2-1	Endpoint Type (EPType) This is the transfer type supported by this USB endpoint. 00 Control 01 Isochronous 10 Bulk 11 Interrupt
0	Reserved

11.1.2.5.2 Command 2: Set endpoint transfer resource configuration (DEPXFERCFG)

There must be only one transfer resource allocated per endpoint. Start transfer causes the use of the transfer resource. End Transfer or an XferComplete event releases the transfer resource. If software attempts to allocate more transfer resources than have been configured in the hardware, this command will return an error in the CmdStatus/ EventStatus field.

NOTE

If GUSB2PHYCFG[SUSPENDUSB20] is set to '1', it must be set to '0' prior to issuing this command and may be set to '1' after the command completes.

Table 11-20. Command 2: Set endpoint transfer resource configuration parameters: DEPXFERCFG

Field	Description
Parameter 2	
31-0	Reserved
Parameter 1	
31-0	Reserved
Parameter 0	
31-16	Reserved
15-0	Number of Transfer Resources (NumXferRes) Defines the number of Transfer Resources allocated to this endpoint. This field must be set to 1.

11.1.2.5.3 Command 3: Get endpoint state (DEPGETSTATE)

After Get Endpoint State (DEPGETSTATE) command completes, the 32 bits in DEPCMDPAR2 represent the endpoint state to be saved. This includes the current data sequence number, flow control state, and control transfer state (for control endpoints).

This command is only used when the controller enters hibernation. The controller requires the 32 bits of state information when exiting hibernation as part of the DEPCFG command with the Config Action field set to "Restore endpoint state".

NOTE

If GUSB2PHYCFG[6] is set to ‘1’, it must be set to '0' prior to issuing this command and may be set to ‘1’ after the command completes.

11.1.2.5.4 Commands 4 and 5: Set Stall and Clear Stall (DEPSSTALL, DEPCSTALL)

These commands apply to non-isochronous IN and OUT endpoints only.

The application issues a Set Stall command to stall all tokens from the USB host to this endpoint. If the endpoint is in the NRDY state, the STALL state takes priority.

If a transaction is currently in progress when the software issues Set Stall, the behavior depends on the direction of the endpoint:

- For OUT endpoints, the current packet will complete. The core will respond with STALL to the next OUT DP or token.
- For IN endpoints in SuperSpeed, the current burst transaction will complete, and the core will respond with STALL to the next ACK TP. For other speeds, the core will complete the current packet and respond STALL to the next IN token.

For non-control endpoints, the application is responsible for both setting and clearing STALL via the Set Stall/Clear Stall commands. When the application clears the STALL, the endpoint's data sequence number is reset to zero.

For control endpoints, the application issues only the Set Stall command, and only on the OUT direction of the control endpoint. The controller automatically clears the STALL when it receives a SETUP token for the endpoint.

The application must not issue the Clear Stall command on a control endpoint. If the endpoint is in flow control (NRDY) and also in the STALL state, it responds with a STALL for any packet. The only exception is that the controller always responds to SETUP data packets with an ACK handshake, independent of the STALL state.

NOTE

- If GUSB2PHYCFG[6] is '1', it must be set to '0' prior to issuing this command and may be set to ‘1’ after the command completes.
- When issuing Clear Stall command for IN endpoints in SuperSpeed mode, the software must set the "ClearPendIN" bit to '1' to clear any pending IN transcations, so that the device does not expect any ACK TP from the host for the data sent earlier.

11.1.2.5.5 Command 6: Start transfer (DEPSTRTXFER)

This command applies to IN and OUT endpoints.

A Transfer Descriptor (TD) in Device mode is a list of TRBs that comprises one or more transfers. The pointer to a TD is added to the core's cache by the Start Transfer command and removed by an XferComplete event or by the End Transfer command.

Software issues this command indicating that a descriptor is ready to be processed and DMA can start for this endpoint/stream combination. For IN endpoints, this causes the descriptor to be processed, and data is moved from the corresponding memory buffer to corresponding transmit FIFO when the transfer is started. For OUT endpoints, this causes the descriptor to be processed and data is moved from the receive FIFO to corresponding memory buffer.

In response to the Start Transfer command, the hardware assigns this transfer a resource index number (XferRscIdx) and returns the index in the DEPCMDn register and in the Command Complete event. This index must be used in subsequent Update and End Transfer commands.

It is illegal to issue a Start Transfer command for the same TD if it is already present in the core's cache.

Non-stream capable endpoints rules:

- The Stream ID field must be set to 0.
- The HighPri field is reserved.

Stream-capable endpoint rules:

- The Stream ID field must be set to non-zero and match the Stream ID passed into the Start Transfer endpoint command associated with this transfer. In all the TRBs of a transfer, the Stream ID fields must be the same.
- The HighPri field is reserved.

NOTE

- If GUSB2PHYCFG[6] is set to '1', it must be set to '0' prior to issuing this command and may be set to '1' after the command completes.
- Before issuing a start transfer command, software needs to verify whether the link is in U0. If the link is not in U0, software needs to bring the link to U0 by performing a remote wakeup. This is applicable to both SS and USB 2.0 speeds.
- When an IN transfer is in progress, (that is, started and not completed yet), and the software sees a link state change event to L1, then the software can use the GDBGFIFOSPACE register (write followed by a read) to determine if the TXFIFO is empty or not. If the TXFIFO is not empty, it can initiate a remote wakeup.

Table 11-21. Command 6: Start transfer parameters: DEPSTRTXFER

Field	Description
Parameter 2	
31-0	Reserved
Parameter 1	
31-0	Transfer Descriptor Address (TDAddr Low) Indicates the lower 32 bits of the external memory's start address for the transfer descriptor. Because TRBs must be aligned to a 16-byte boundary, the lower 4 bits of this address must be 0.
Parameter 0	
31-0	Transfer Descriptor Address (TDAddr High) Indicates the higher 32 bits of the external memory's start address for the transfer descriptor.

11.1.2.5.6 Command 7: Update transfer (DEPUPDXFER)

If software uses circular TRB buffers and updates a TRB, whose Hardware Owner (HWO) bit was 0, by setting HWO=1, it must execute the Update Transfer command, specifying the transfer resource index of the TRB in the DEPCMD register. The hardware uses this information to re-cache the TRB.

Software may issue a special “No Response Update Transfer” command by setting CmdAct=0 and CmdIOC=0. In this case, the hardware does not generate a Command Complete event, does not set the CmdAct bit to '0' (because it will be '0'), and software may immediately issue another command to the same endpoint following this one. This

special type of Update Transfer may not be used when software depends on the XferNotReady event to setup TRBs (see “On Demand” transfers in Transfer setup recommendations).

Software may issue an Update Transfer command for a transfer resource that has already completed (either due to XferComplete event or an End Transfer command), and the core will detect that the Update Transfer is unnecessary. However, software must not issue an Update Transfer command for a transfer resource index that has never been started.

NOTE

If GUSB2PHYCFG[6] is set to '1', it must be set to '0' prior to issuing this command and may be set to '1' after the command completes.

11.1.2.5.7 Command 8: End transfer (DEPENDXFER)

This command applies to IN and OUT endpoints. Software issues this command requesting DMA to stop for the endpoint/stream specifying the transfer resource index of the TRB and the ForceRM parameter to be set to 1 in the DEPCMD register.

When issuing an End Transfer command, software must set the CmdIOC bit (field 8) so that an Endpoint Command Complete event is generated after the transfer ends. This is necessary to synchronize the conclusion of system bus traffic before the End Transfer command is completed.

For IN endpoints, this command causes descriptor processing to stop and the core stops fetching new data for the endpoint and stops transfers on the USB. The core may truncate a packet being transmitted with the DPPABORT ordered set, does not wait for any pending ACKs from the USB, and does not update the TRB status. For OUT endpoints, this command causes descriptor processing to stop. If there is currently data, it is moved from the receive FIFO to corresponding memory buffer and completed at packet boundary. The core does not update the TRB status.

Use this command under the following conditions:

- When handling USBReset or SetConfiguration, endpoints are closed using this command.
- After receiving a ClearFeature (STALL) control transfer, software issues End Transfer followed by Clear Stall, followed by Start Transfer.
- After an XferInProgress event when the TRB after the one that caused the XferInProgress event has its HWO bit set to '0', this command can be used.
- For isochronous endpoints, if the host stops moving data for many intervals, software may force the end of the transfer and wait for the host to restart.

The hardware does not issue a XferComplete event on End Transfer, but only issues a CommandComplete event.

NOTE

If GUSB2PHYCFG[6] is set to '1', it must be set to '0' prior to issuing this command and may be set to '1' after the command completes.

Table 11-22. Command 8: End Transfer Parameters: DEPENDXFER

Field	Description
Parameter 2	
31-0	Reserved
Parameter 1	
31-0	Reserved
Parameter 0	
31-0	Reserved

End Transfer Command With Hibernation Enabled The following applies only when hibernation is enabled. Prior to hibernation, software will set ForceRM to '0' when it issues End Transfer commands for active transfers. This command may cause a TRB to be written back with intermediate state.When software issues an End Transfer command with the ForceRM bit set to 0, and the core has at least one valid current TRB, it will perform the following:

- Write back the TRB updating the Buffer Pointer and Buffer Size fields to reflect the current state of the TRB.
- Write the value '4' (TRBInProgress) into the TRBSTS field to indicate that this TRB may have been partially used and is still active. This is an indication to software that the original buffer pointer field may have been changed by hardware.
- Set the HWO bit to '0' unless it is a Link TRB. The HWO bit in a Link TRB will be unchanged.

After the state is restored, software may restart a transfer from a partially completed TRB by setting TRBSTS to '0', setting the HWO bit back to '1', and issuing the Start Transfer command.Software is not required to perform any special manipulation on partially completed TRBs. When the core completes a restarted partially complete TRB, it will set TRBSTS back to '0'.

11.1.2.5.8 Command 9: Start new configuration (DEPSTARTCFG)

Software issues this command under the following conditions:

- After power-on-reset with XferRscIdx=0 before starting to configure Endpoints 0 and 1. CmdIOC must be set to '0' and software must poll the CmdAct bit to determine when the command is complete because Endpoint 0 is not yet configured with a valid interrupt number.
- With XferRscIdx=2 when it receives SetConfiguration before starting to configure Endpoints > 1. CmdIOC may be set to '0' or '1'.

This command should always be issued to Endpoint 0 (DEPCMD0).

Hardware resets the transfer resource allocation to the value in the XferRscIdx parameter (must be 0 or 2) upon receiving this command.

NOTE

If GUSB2PHYCFG[6] is set to '1', it must be set to '0' prior to issuing this command and may be set to '1' after the command completes.

11.1.2.6 OTG

This section describes OTG for USB 3.0, and the programming requirements for the USB 3.0 core in OTG mode.

11.1.2.6.1 OTG 2.0 for USB 3.0 Functionality

The following sections describe the OTG 2.0 functions for USB 3.0.

11.1.2.6.1.1 Core OTG functions

The OTG Interface block within the U2MAC handles the core OTG functions: Session Request Protocol (SRP) and Host Negotiation Protocol (HNP). These OTG protocols are implemented through the regular UTMI+ OTG interface.

The MAC handles HNP for host and peripheral role swapping.

The MAC also handles SRP, which allows an A-Device to turn off VBUS to save power when the USB is not used, and provides a means for a B-Device to monitor VBUS and request the A-Device to activate VBUS.

It includes the following logic necessary to achieve SRP and HNP:

- Control of VBUS through Vbus drive enable (utmiotg_drvvbus) as A-Device
- Control of IDDIG line sampling enable control output (utmiotg_idpullup)

- Control of D+/D- pull-down resistor enables (utmiotg_dppulldown/ utmiotg_dmpulldown)
- Generates SRP (data line pulsing) as B-Device when the session is off.

NOTE

- When the application programs the USB_GCTL[PRTCAPDIR] as 2'b11 to enable OTG mode, then in the A- Device mode, the core will only enumerate as a HS device and hence will not support any SS-capable device to be connected. This restriction is not valid when the USB_GCTL[PRTCAPDIR] is programmed to 2'b01 or 2'b10.
- The utmisrp_chrgvbus and utmisrp_dischrgvbus outputs are provided for legacy PHY connections but they are both set to 1'b0 from the core since VBUS charging is not supported in OTG 2.0 specifications.
- The application should not program GCTL[0] as 1'b0 when it wants to do a ADP or HNP. In such a case, the application should disable the Clock Gating feature by programming GCTL[0] as 1'b1. The application should re-enable the Clock Gating feature only when the core returns to its original role of operation.

11.1.2.6.1.1.1 HNP Polling and Enable

This HNP Polling activity involves an OTG device acting as the current host to periodically poll the remote device to check if the remote device wishes to take the host role. It will then grant the role swap opportunity at the earliest opportunity. Being a software activity, HNP Polling is expected to be implemented through software timers and periodic exchange of SetFeature.SetHNPEnable packets.

The core is then informed of successful exchange of these packets to Enable HNP activity within the core.

11.1.2.6.1.2 ADP functions

The ADP functions involve the following two processes:

- ADP sensing
- ADP probing

ADP probing capability is required in both A and B devices, while sensing is a must only for B-Device. The main functional unit is the ADP controller. You can choose to have the ADP controller logic supplied along with the USB 3.0 core or can choose to implement proprietary ADP controller logic.

11.1.2.6.1.2.1 Internal ADP controller

In this option, ADP controller logic is supplied alongside the USB 3.0 controller by enabling DWC_USB3_EN_ADP coreConsultant parameter. ADP controller logic is inferred along with outside USB 3.0 core functions within the controller.

- All ADP timers are maintained in pwrm (Power) module and generate the enable and disable signaling to PHY for ADP probing and sensing.
- PHY contains the following circuitry related to ADP functionality:
  - Comparators for PRB and SNS
  - I_ADP_SRC and I_ADP_SNK
  - Vbus circuitry
- Application software programs the ADP timing registers residing in the pwrm module.
- pwrm module provides a mechanism to application through the interrupts to log and report events pertaining to ADP probing and sensing.
- Only pwrm module needs to be always powered on in this option. USB 3.0 controller may or may not be powered on.
- As a product, both the ADP controller logic and OTG controller are packaged into USB3 core. In the USB3 core, ADP sensing and probing is loosely coupled with the rest of the logic and is directly under software control. This achieves maximum flexibility to interact with OTG core functions.

The ADP controller in the block diagram is a fully digital controller. This has mainly timers inside it to help ADP operation. All ADP related timers are part of pwrm module.

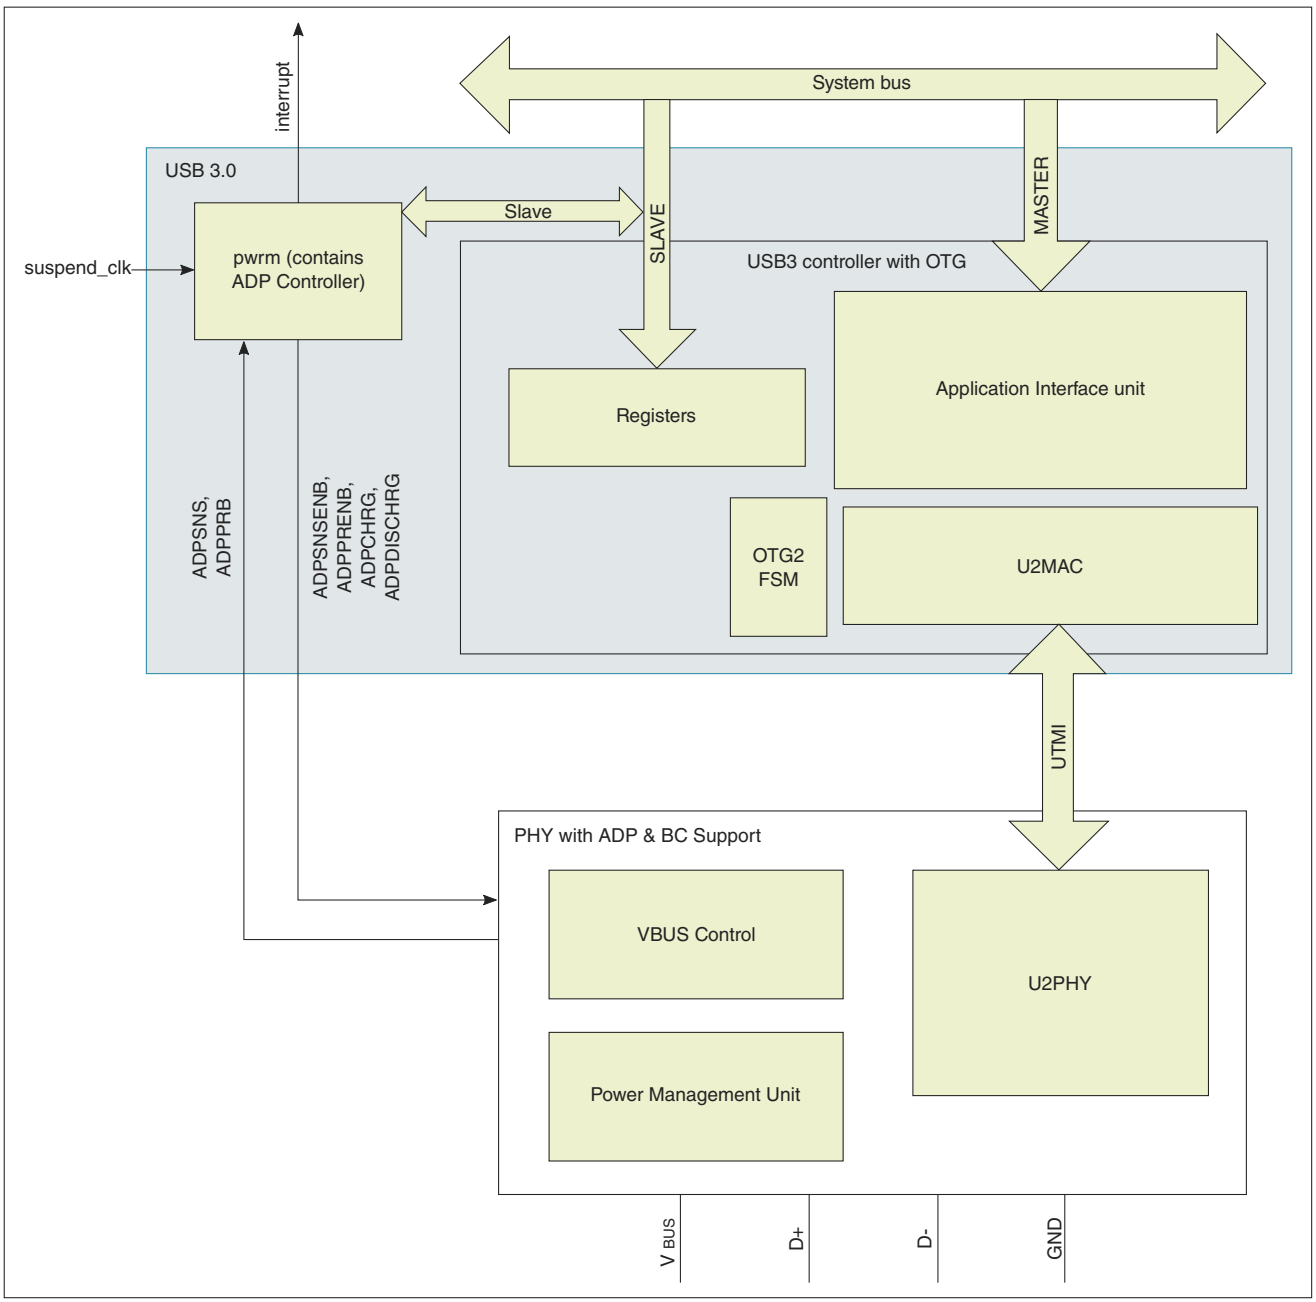

Figure 11-18. Internal ADP controller

For the PHY to generate ADPPRB and ADPSNS, the PHY needs to know the value to compare with VADP_PRB and VADP_SNS respectively. These values can be hardcoded in the PHY or the PHY can have a limited programmable option by which these reference voltage values can be changed. It is assumed that the PHY takes care of this. The pwrm module also implements SRP detection in A-Device mode. This is required if pwrdwn module of the USB 3.0 controller is powered down completely while ADP is in progress and B-Device initiates SRP.

NOTE

- The ADP block works with the suspend clock.
- The ADP timers run with the suspend clock along with the programmed USB_GCTL[PWRDNSCALE] value. The USB_GCTL[PWRDNSCALE] value is used internally to generate 32 KHz pulse for the timers.

11.1.2.6.1.2.2 External ADP Controller Option

In this option, ADP controller logic supplied with USB 3.0 controller is not required. The following points apply:

- ADP logic is controlled directly by software.
- Application software controls ADP probe/sense enable and disable directly. The USB 3.0 controller can be completely powered off during this period.
- All ADP timers programmed are programmed by application through a dedicated interface to the ADP controller.
- Any ADP_CHANGE status from the external ADP controller is handled by the application directly.

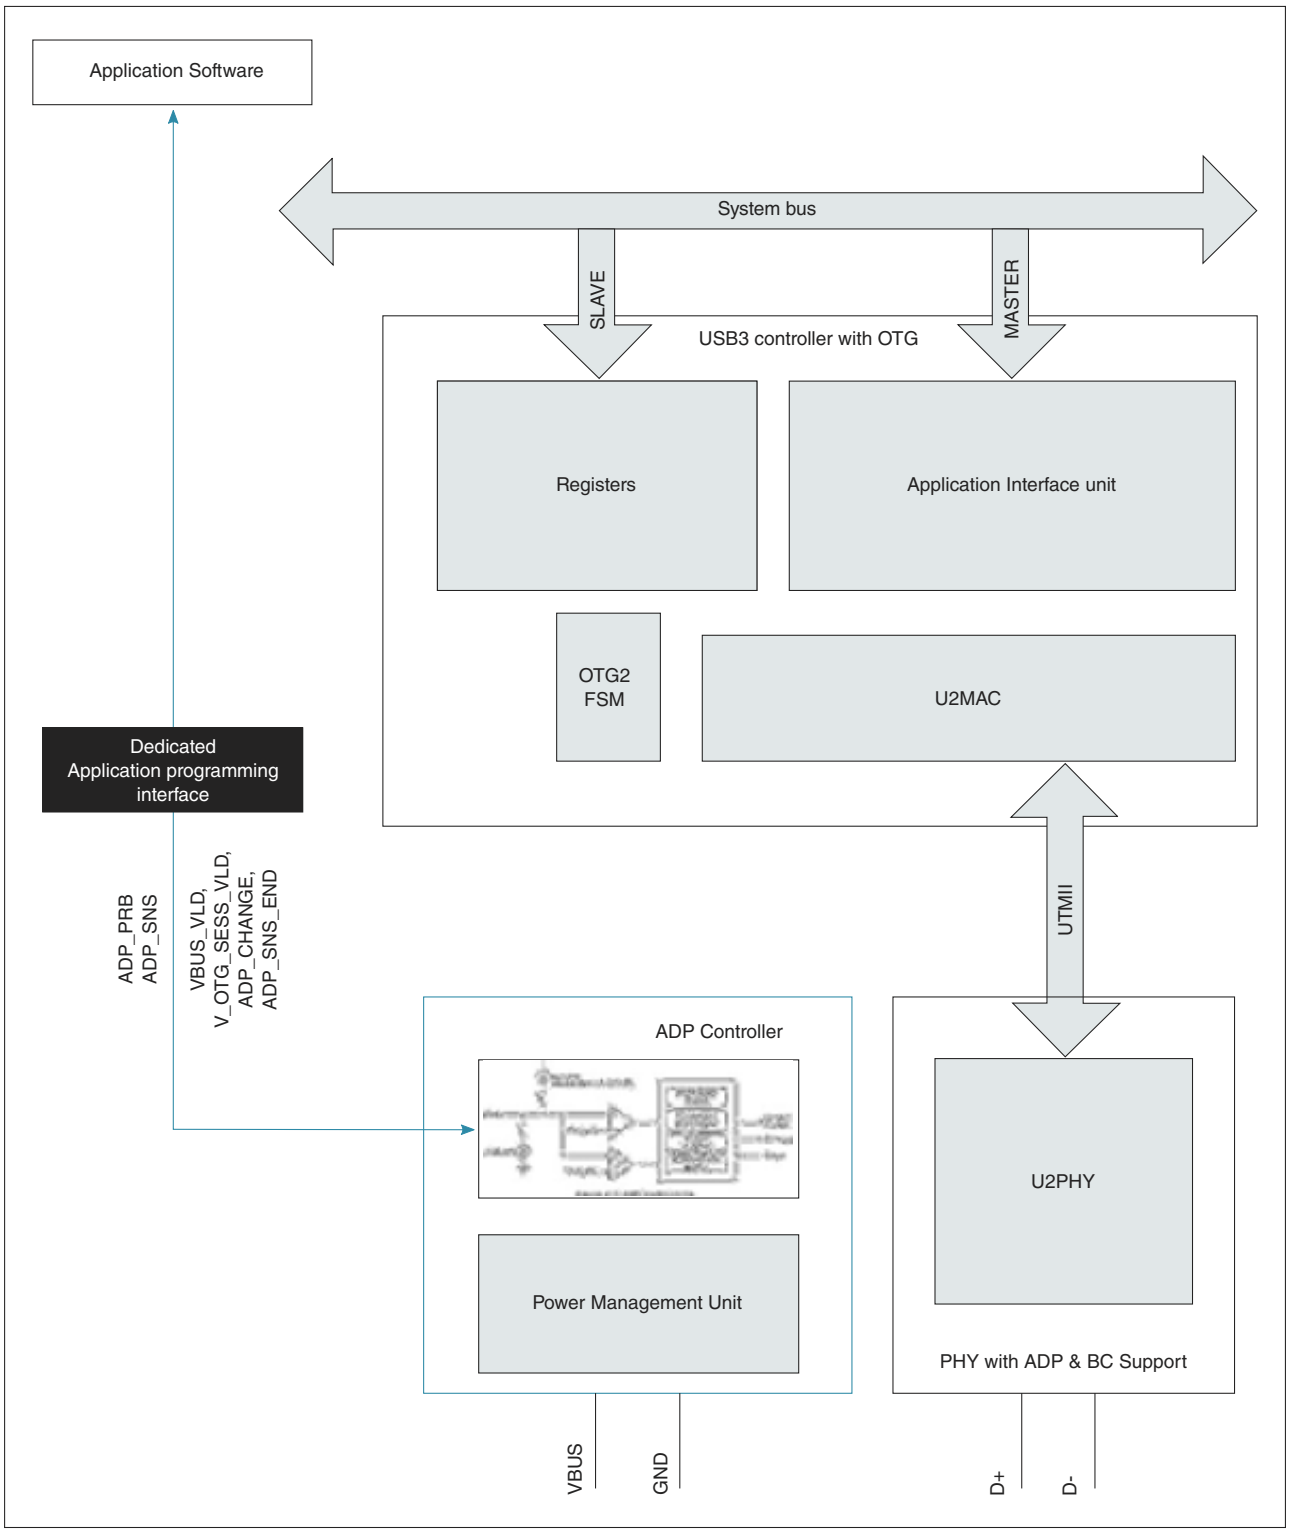

Figure 11-19. External ADP Controller Option

11.1.2.6.1.3 Software flow

The software flow diagram is illustrated in the following figure.

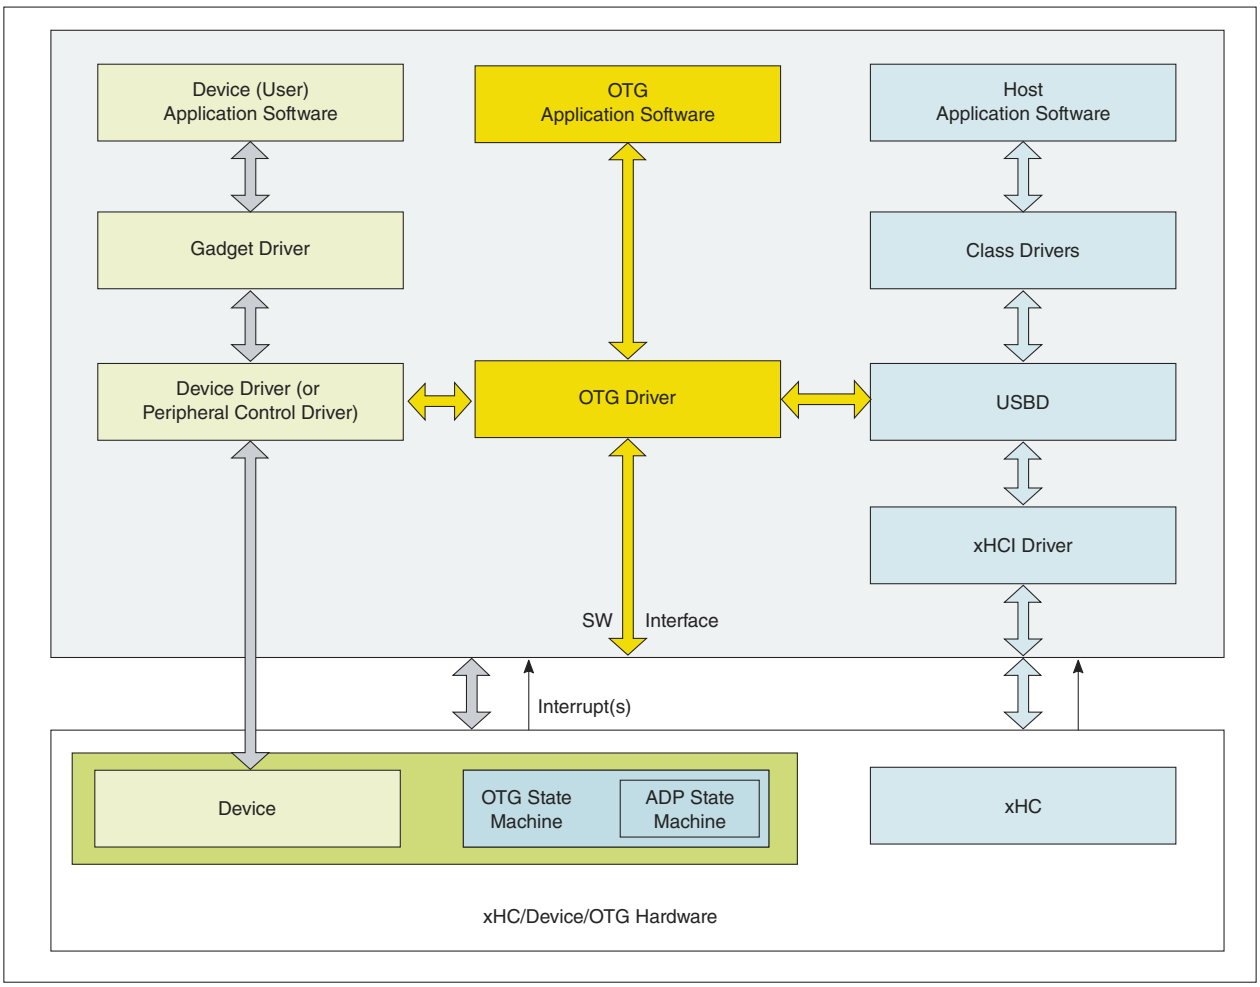

Figure 11-20. Software flow diagram

The following two sections describe the A-device and B-device flows briefly with respect to the above flow diagram.

NOTE

The following concise flows are not very detailed, and are provided here to help understand at an abstract level.

11.1.2.6.1.3.1 A-device activity concise flow

- Power-on-reset
- Only the OTG driver is active after power-on-reset. The host and device drivers are inactive after power-on-reset since at this point of time it is unsure what role the device assumes.
- The OTG driver initializes ADP and waits until a successful ADP event is received.

- The OTG driver senses ID pin = 0 and initializes the OTG registers.
- The OTG driver waits until a successful SRP event is received and turns on the VBUS.
- The OTG driver requests the USBD (USB driver) to bring up the xHC.
- After successful xHC bring up, device enumeration (and data transfers) occurs during which the device capabilities are exchanged for determining a possible role switch.
- In the event where a role switch is possible, the OTG application software or the B-device may initiate a role switch (The OTG application software may request via the Host application software to create favorable conditions for a role switch).
- The xHC is shut down and the control is passed on to the OTG driver.
- The OTG driver requests the PCD (Peripheral driver) to bring up the Peripheral.
- After successful Peripheral bring-up, device enumeration (and data transfers) occurs.
- In an event where a role switch is possible, OTG application software may initiate a role switch (The OTG application software may request via the Device application software for a role switch).
- The PCD is shut down and the control is passed on to the OTG driver.
- The OTG driver requests the USBD to bring-up the xHC, thus reverting to the original roles.

11.1.2.6.1.3.2 B-device activity concise flow

- Power-on-reset
- Only the OTG driver is active after power-on-reset. The host and device drivers are inactive after power-on-reset since at this point of time it is unsure what role the device assumes.
- The OTG driver initializes ADP and waits until a successful ADP event is received.
- The OTG driver senses ID pin = 1 and initializes the OTG registers.
- The OTG driver initiates a SRP and waits for the VBUS to be turned on by the A-device.
- The OTG driver requests the PCD to bring up the peripheral.
- After successful peripheral bring up, device enumeration (and data transfers) occurs during which the device capabilities are exchanged for determining a possible role switch.
- In an event where a role switch is possible, the OTG application software or the A-device may initiate a role switch (The OTG application software may request through the device application software for a role switch).
- The PCD is shut down and the control is passed on to the OTG driver.
- The OTG driver requests the USBD to bring up the xHC.
- After successful xHC bring-up, device enumeration (and data transfers) occurs.
- In an event where a role switch is possible, the OTG application software or A-device may initiate a role switch (The OTG application software may request the host application software for a role switch).

- The xHC is shut down and the control is passed on to the OTG driver.
- The OTG driver requests the PCD to bring-up the Peripheral, thus reverting to the original roles.

11.1.2.6.1.4 Programming model

This section describes the programming requirements for the USB 3.0 core in OTG mode. The core can be configured either as a DRD-device or an OTG, based on bit [13:12] of the Global Control Register's (GCTL) Power-On Initialization Value. If power-on configuration option is chosen as DRD-device, then PrtCapDir has to be explicitly programmed to 2'b11 for operating as an OTG device. The premise for the programming model is as follows.

1. The OTG driver is expected to run concurrently and independently with the PCD and xHCI drivers.
2. The OTG driver doesn't get involved in the actual data transfers but is responsible for communicating messages between the xHCI driver and PCD during role changes.
3. The OTG driver is responsible for handling the HNP, SRP and ADP (internal) events from the core. After power on, the OTG driver is responsible for loading, starting and switching between the xHCI driver and PCD. When started, the xHCI driver initializes the xHCI register set before enumerating the connected device. Similarly, when started, the PCD initializes the device register set and waits for the USB reset event to continue. Once the connection is established between the xHCI driver or the PCD by the OTG driver, the corresponding driver takes over for data transfers.

After every successful HNP switching, it is necessary that the active driver is changed from the xHCI driver to PCD or vice-versa. In such cases, the application may also unload the active driver from the memory and re-use the same memory area for loading the next active driver. The subsequent flow described in this section assumes that the core can get enumerated in any of the speeds (SS or HS/FS) and bases its discussion accordingly. For example, if the core enumerates in HS/FS, follow the OTG 2.0 flow.

11.1.2.6.1.4.1 Initializing global registers

The global registers of the USB 3.0 core are shared between the device and host modes. It is the responsibility of the individual driver to initialize the core's global register specific to its functions. This is not explicitly mentioned in the flows described in this chapter. This specifically includes initializing the GTXTHRCFG/GRXTHRCFG, GEVNTEN, and GPRTBIMAP registers, and the Global FIFO Size and Global Event Buffer Registers. For more details, refer to Global registers in the register content. However, these global registers that are programmed once at power on can be initialized in the global initialization routine in the OTG driver. Examples of one-time programmable

registers are GSBUSCFG, GCTL, GSNPSID, and GUCTL. Examples of fields that are one-time programmable are the PHY interface (UTMI), AXI parameters like burst size, and so on. The standard xHCI host driver does not get involved in the core-specific global register programming, and therefore, needs to be handled by the Board Support Package software.

11.1.2.6.1.4.2 Initializing host registers

In order to initialize the core as a host, the application should perform the steps described in the xHCI specification. Global registers need to be re-initialized as described in Initializing global registers.

11.1.2.6.1.4.3 Initializing device registers

In order to initialize the core as a device, the application should perform the steps described in the section Device Programming Model. Global registers need to be re-initialized as described in Initializing global registers. For specific registers, refer to Device Programming Model.

11.1.2.6.1.4.4 Initializing OTG registers

The application should initialize the OTG registers based on the initial value of the OSTS.ConIDSts after power on. The following sections depict the programming flow for the OTG application in detail.

11.1.2.6.1.4.5 Programming flow for OTG in USB 3.0

The following figure shows the programming flow after power-on reset.

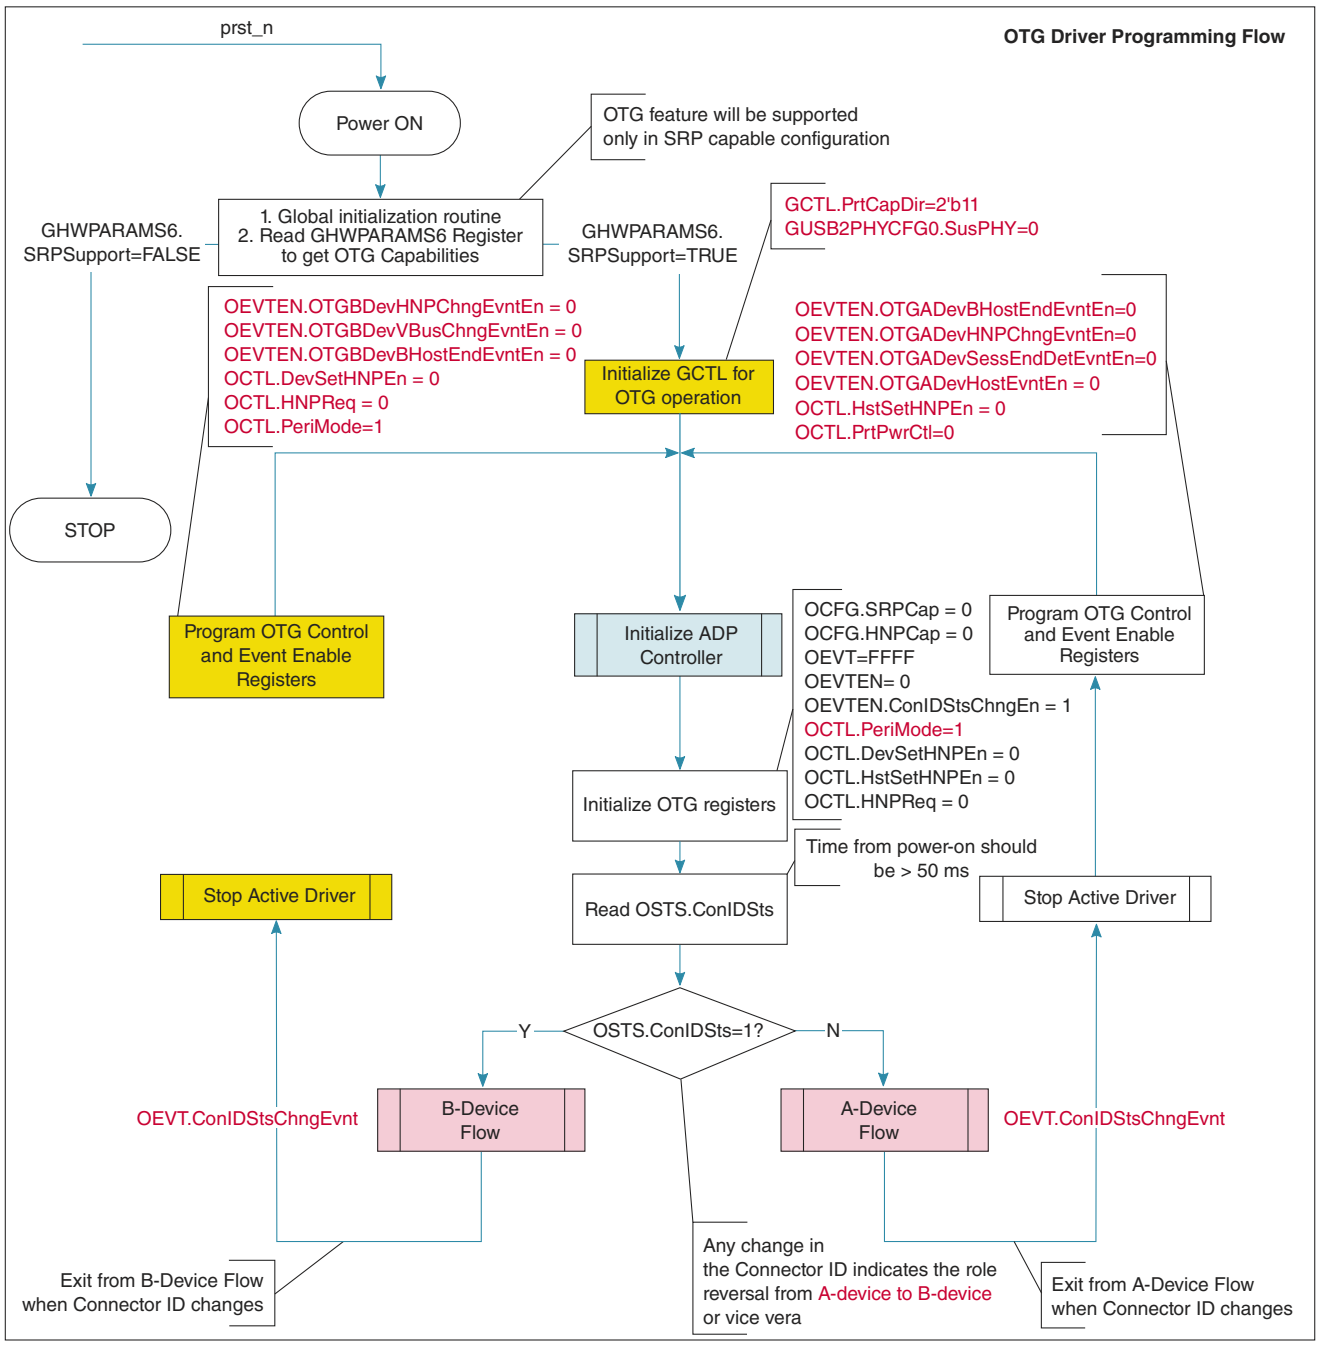

Figure 11-21. OTG driver overall programming flow

Following steps describe overall programming flow:

1. During global initialization, read the GHWPARAMS6 register to see if SRP support is enabled in the configured core. If SRP support is enabled, then proceed with the OTG programming flow by programming USB_GCTL[PRTCAPDIR] as 2'b11. If SRP support is not enabled, do not proceed further in the OTG programming flow. The configured device must at least support SRP for cable connection-based (Connector ID) role of operation.

2. Initialize the ADP controller as explained in ADP programming flow.
3. The OTG 2.0 state machine is initially in B-IDLE if IDDIG is 1, or A-IDLE if IDDIG is 0. Enable USB_OEVTEN[ConIDStsChngEvntEn] for any change in the Connector ID status.
4. Initialize the OTG control and configuration register to default values.
5. Read the OSTS register to find out the current status of the Connector ID (ConIDSts). After power-on or soft reset, the ConIDSts will be valid only after the PHY delay from IDPULL=1 to IDDIG active and any filter delay for IDDIG inside or outside the USB 3.0 core.
6. If USB_OSTS[ConIDSts] is 1, the OTG 2.0 state machine is in B-IDLE, follow the B-Device flow. Otherwise, if OTG 2.0 state machine is in A-IDLE, follow the A-Device flow.
7. When there is any connector ID (IDDIG) change resulting in USB_OEVT[ConIDStsChngEvnt], then exit the A-Device/B-Device flow. Stop the active driver and re-initialize the OTG control and status registers.

11.1.2.6.1.5 Common driver tasks

The common tasks for both A-Device and B-Device flow are as follows:

- Start xHCI driver
- Start peripheral control driver (PCD)
- Switch peripheral
- Switch host
- Stop active driver
- Enable HNP change

The Stop Active Driver is already introduced in the common flow diagram. Other tasks are useful for the A-Device/B-Device flows.

Start xHCI driver

The OTG driver, being responsible for starting the xHCI driver, executes this task. The OTG driver loads the xHCI driver after initializing the global registers, and the xHCI driver is responsible for all the functions thereafter.

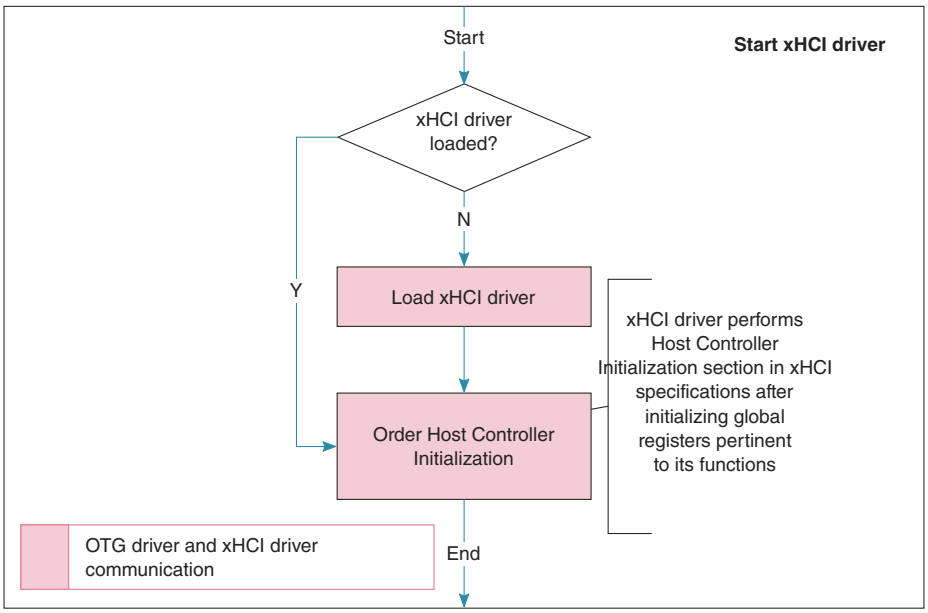

Figure 11-22. Start xHCI driver task

Start peripheral control driver

The OTG driver, being responsible for starting the Peripheral Control Driver (PCD), executes this task. The OTG driver only loads the PCD, which is responsible for all the functions thereafter, including the global registers initialization specific to the USB 3.0 core. Note that except the GTXFIFOSIZ and GEVNTADR, none of the other global registers need to be potentially re-programmed with different values.

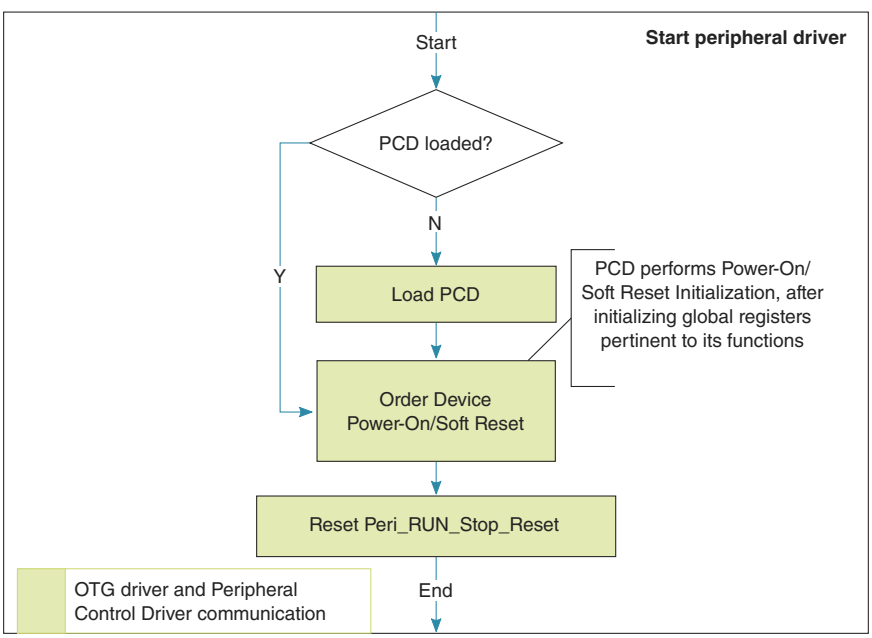

Figure 11-23. Start peripheral driver task

Stop active driver

This task checks which driver is currently active and stops the active driver. Optionally, it may unload the driver if the OS supports dynamic loading of drivers.

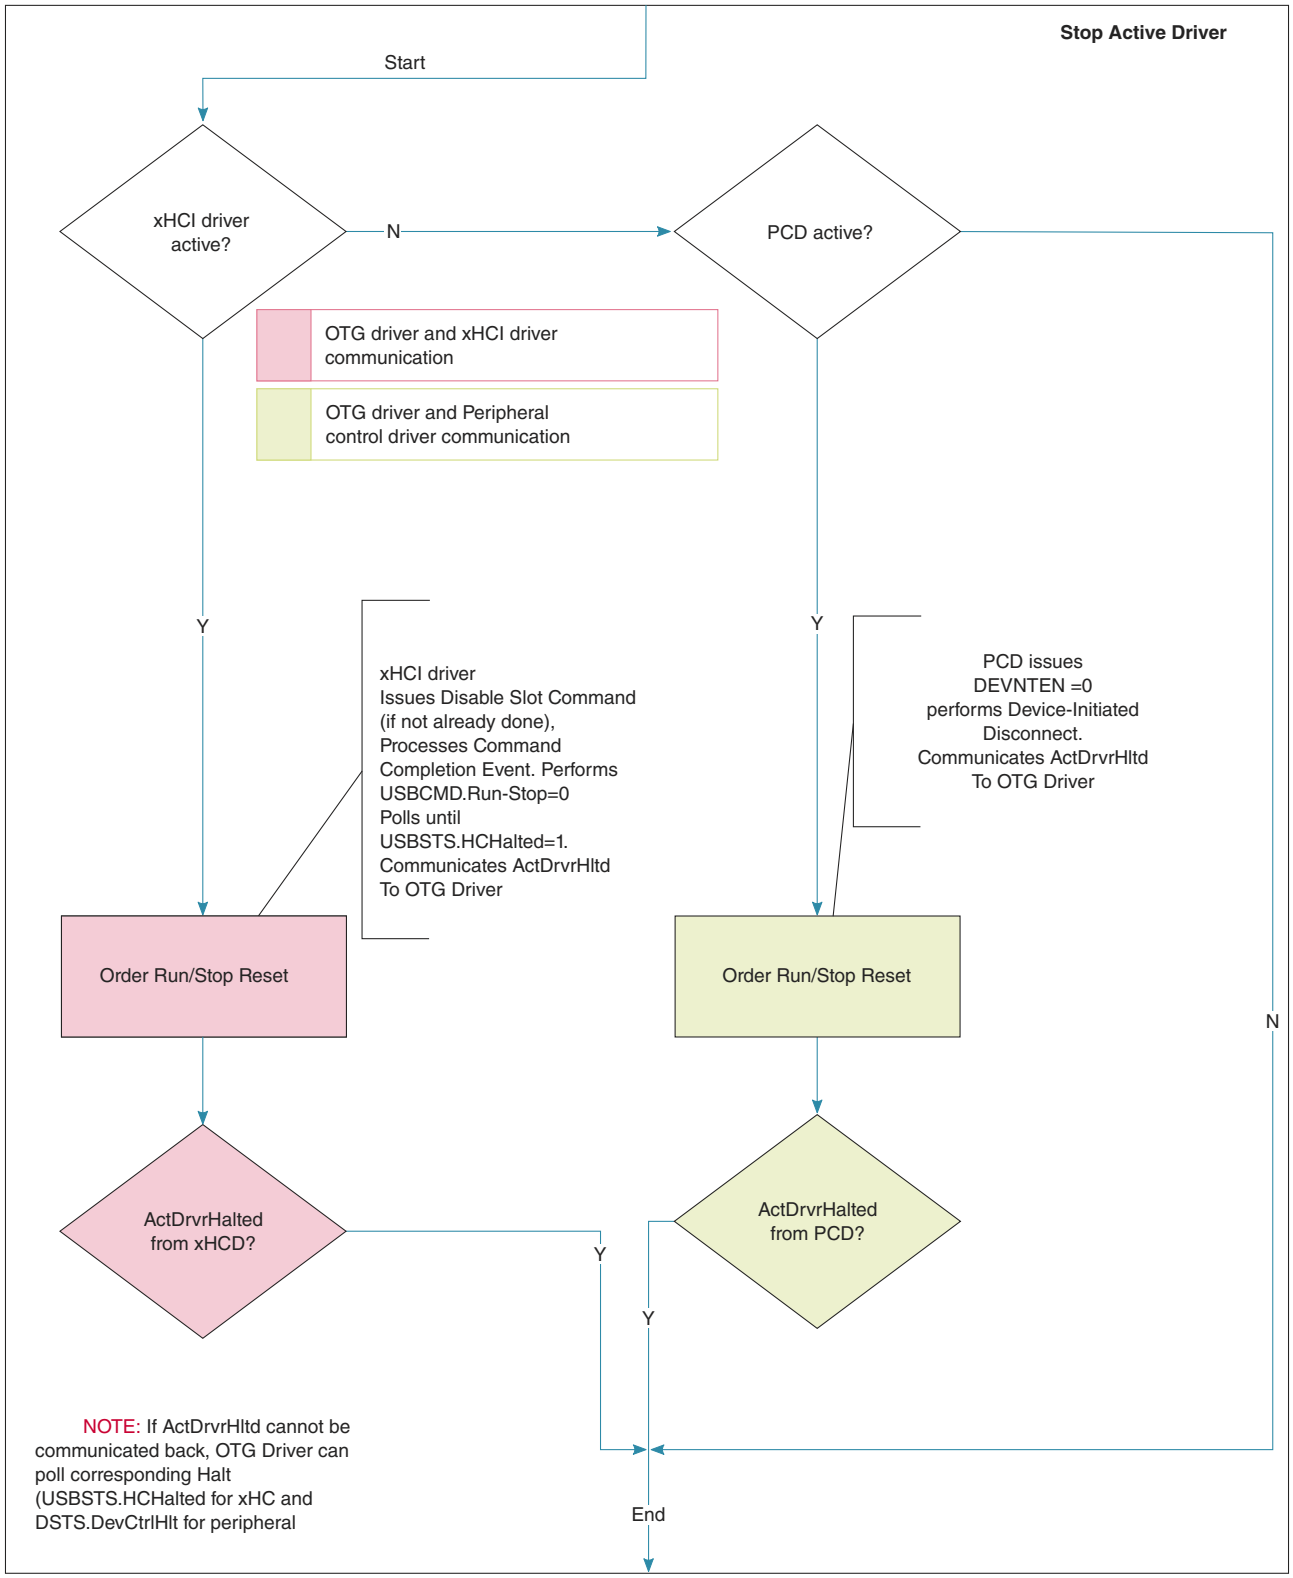

Figure 11-24. Stop active driver task

Switch peripheral and switch host

These tasks are used during HNP and each consists of two individual tasks.

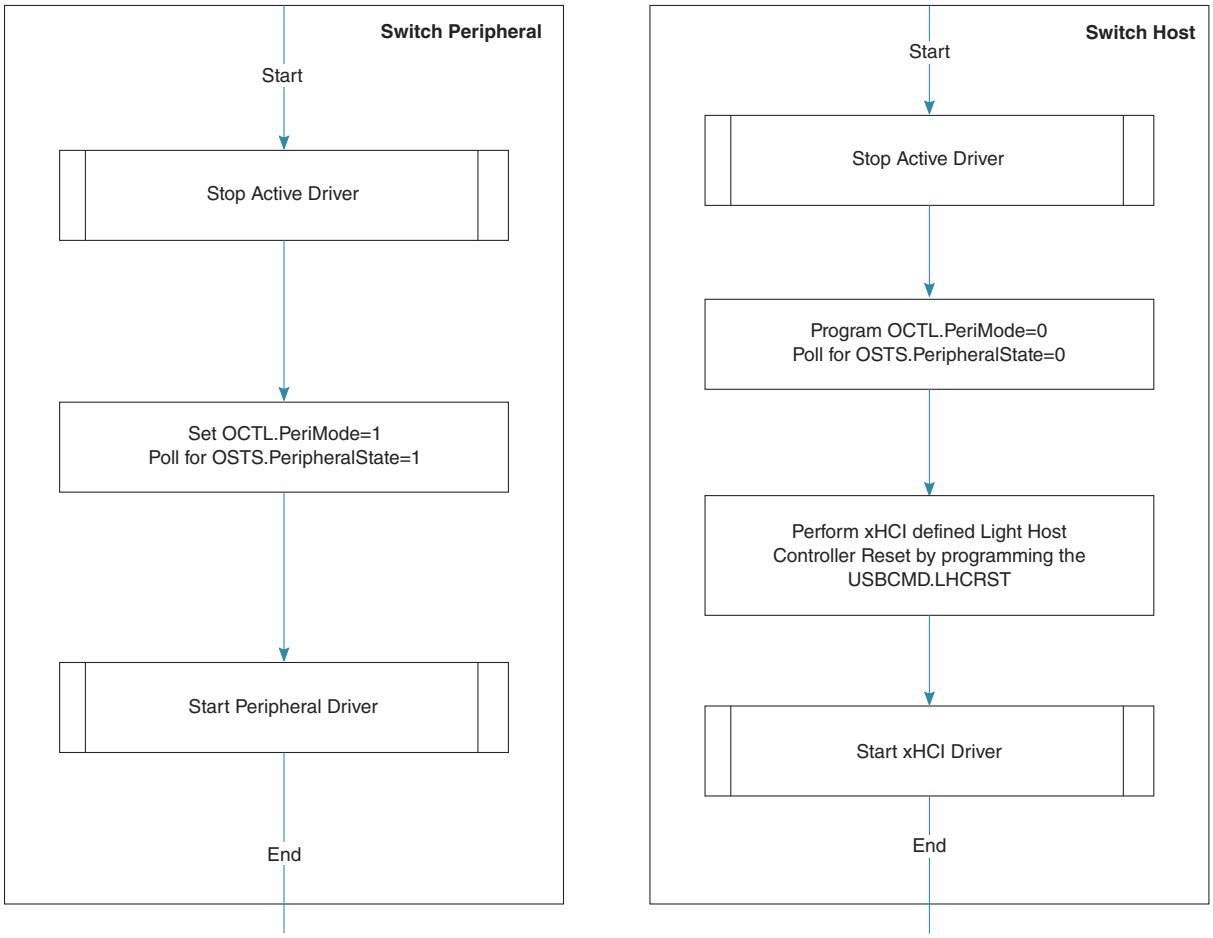

Figure 11-25. Switch peripheral task and switch host task

Programming flow for switch peripheral in SS mode:

This programming flow indicates the steps to be followed by the software when Host to Peripheral role change is intended. Note that the handover of control from the xHCI driver to PCD is accomplished using the OTG driver. The OTG driver plays the role of a mediator here. The steps indicated below is the sequence in which the xHCI driver stops its operation.

1. The xHCI driver decides to end all data transfers.
2. The xHCI driver services all pending interrupts.
3. The xHCI driver issues disable slot command.
4. The xHCI driver waits for the successful completion of disable slot command.
5. The xHCI driver clears the connect status change and port enabled status change bits of the PORTSC0 register.
6. The xHCI driver programs run/stop as 1'b0.
7. The xHCI driver waits for the HCH bit to be set in the USBSTS register.

8. When the HCH bit is set, the xHCI driver hands over the control to the OTG driver.

Programming flow for switch host in SS mode:

This programming flow indicates the steps to be followed by the software when Peripheral to Host role change is intended. Note that the handover of control from the PCD to xHCI driver is accomplished using the OTG driver. The OTG driver plays the role of a mediator here. The steps indicated below is the sequence in which the PCD stops its operation.

1. The PCD sends a Device Notification packet for role swap.
2. The PCD services all pending interrupts.
3. The PCD programs DCTL.Run bit to 1'b0.
4. The PCD waits for DevCtrlHlt = 1'b1.
5. When the DevCtrlHlt bit is set, the PCD hands over the control to the OTG driver.

Enable HNP change

For HS/FS, this task is called when SetFeature.SetHNP is successfully exchanged between the host and the device. The set Peri_Run_Stop_Reset indicates to the device driver to automatically disable all events and perform a peripheral-initiated disconnect when the host puts the device in Suspend. Program the OCTL.DevSetHNPEn as 1, and OCTL.DevSetHNPReq as 1 immediately after the successful completion of SetFeature.SetHNP on the USB. This ensures the HNP attempt from the OTG core in the following Suspend state.

NOTE

By default, at power-on, program GUSB2PHYCFG.SusPHY as 1 to ensure that the PHY enters low power mode during normal suspend/resume without role switch.

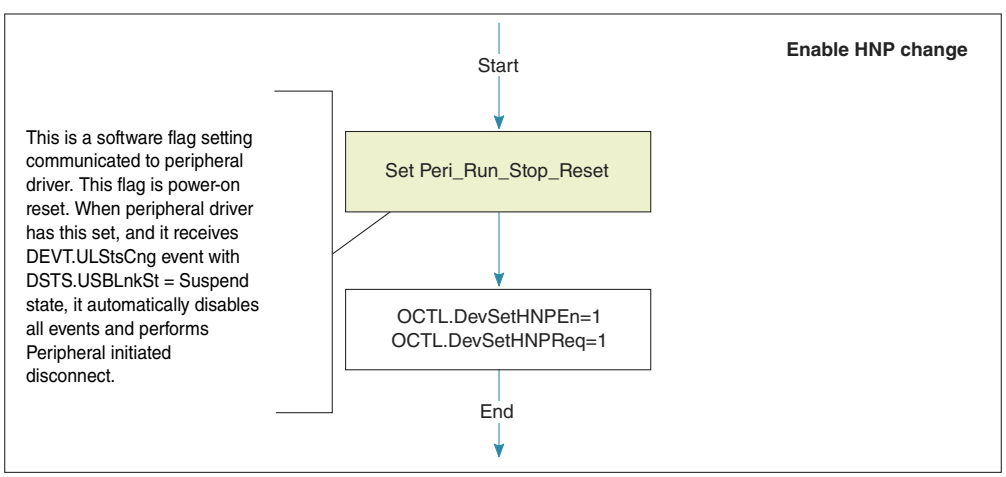

Figure 11-26. Enable HNP change

11.1.2.6.1.6 A-device flow

The following figure shows the A-device flow.

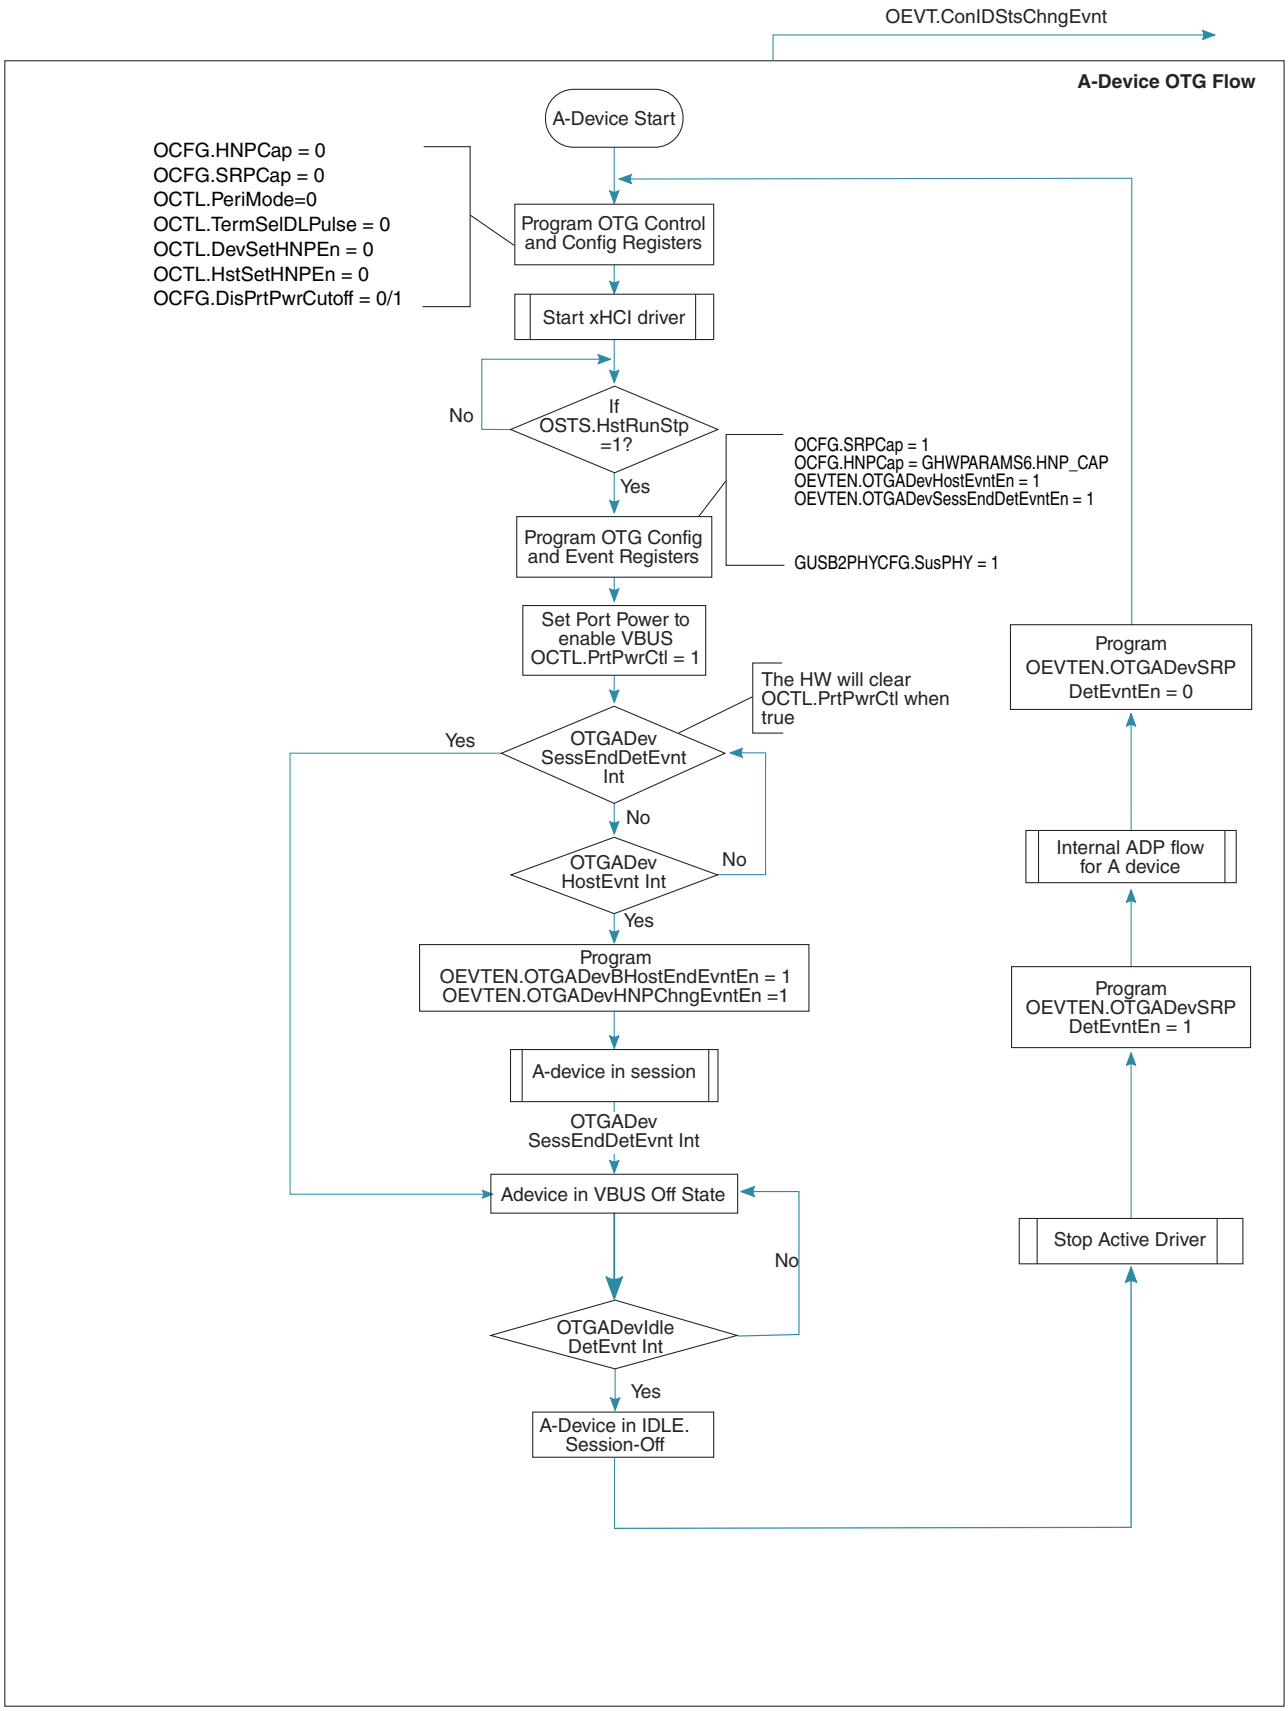

Figure 11-27. A-Device flow diagram

A-device flow:

1. At Start, the A-device core will be in A_IDLE VBUS off state.
2. The OTG software should program the OTG control and configuration registers for A-device operation:
   - OCFG[HNPCAP] = 0
   - OCFG[SRPCAP] = 0
   - OCTL[PERIMODE] = 0
   - OCTL[TERMSELDLPULSE] = 0
   - OCTL[DEVHNPEN] = 0
   - OCTL[HSTSETHNPEN] = 0
   - OCFG[DISPRTPWRCUTOFF] = 0 or 1, based on whether the application requires the core disable the feature to automatically switch off VBUS after 1 second if port is disconnected.
3. Start the xHCI driver.
4. The OTG software should wait for OSTS[HSTRUNSTP] to become 1 to continue. If OSTS[HSTRUNSTP] is 0, the OTG Software should wait for a software event that indicates the change in the xHCI RUN_STOP bit to continue. Alternatively, the OTG Software can poll for OSTS[HSTRUNSTP] bit to be set.
5. OTG Software should program the OTG configuration and event registers to enable A-device events to detect peripheral connect and session end. Refer to A-device flow diagram.
6. Program GUSB2PHYCFG0[SUSPHY] = 1 to enable the core to switch off the PHY clock in the possible non-HNP suspend scenarios.
7. Set OCTL[PRTPWRCTL] when OSTS[XHCIPRTPOWER] is 1. This enables driving of VBUS to the B-device.
8. The A-device may enumerate in HS/FS based on the device signaling.
9. The OTG 2.0 state machine enters a3_ds_host/A-host for HS (FS) if there is a successful B-device connect (ADEVHOSTEVNT).
10. The OTG software should enable the ADEVHNPCHNG and ADEVBHOSTEND events to detect the transition from A-host to A-peripheral and the end of A-peripheral events.
11. If there is an ADEVSESSENDDETEVNT interrupt indicating that the core has now stopped driving the VBUS, the software should wait for ADEVIDLEDETEVNT interrupt and then disable all the OTG events.
12. The Software can enable the ADP flow.
13. After an ADEVHOSTEVNT interrupt, the core is in session. The flow for the A-device in session is shown in earlier in this chapter.

NOTE

- At any step, if CONIDSTSCHNGEVNT occurs, A-device flow is terminated as per the figure "OTG Driver Overall Programming Flow".
- Over current is not detected by the OTG state machine. The xHCI controller detects it, and the OTG driver in turn sees an ADEVSESSENDDETEVNT (from PORTSC[PP] = 0) due to an overcurrent.

OTG state machine mapping to the software flow

- Steps 1-5 are A-IDLE.
- Step 7 is A_WAIT_VRISE in which A-device has detected SRP and therefore waits for VBUS to stabilize.
- Step 8 and step 10 are primarily A_HOST through A_WAIT_VRISE and A_WAIT_BCON. If there is an error in either A_WAIT_VRISE or A_WAIT_BCON, ADEVSESSENDDETEVNT occurs making the state-machine fall back to A-IDLE.

Handling over-current in OTG mode of operation

- When the core is operating in USB 2.0 mode, an over-current condition causes PORTSC[OCA] = 1 and PORTSC[OCC] = 1 on the corresponding USB 2.0 port number. The core also updates a port status change event TRB for the corresponding USB 2.0 port number.
- When the core is operating in USB 3.0 mode, an over-current condition causes PORTSC[OCA] = 1 and PORTSC[OCC] = 1 on the corresponding USB 2.0 and USB 3.0 port numbers. The core also updates a port status change event TRB, one each for the corresponding USB 2.0 port number and the corresponding USB 3.0 port number.
- Note that PORTSC[OCA] may transition quickly from 0 to 1 and 1 to 0 before xHCI driver can see two distinct interrupts. This may occur due to over-current condition being removed quickly. In such a case, the xHCI driver will receive a single interrupt (PORTSC[OCC]) for over-current.

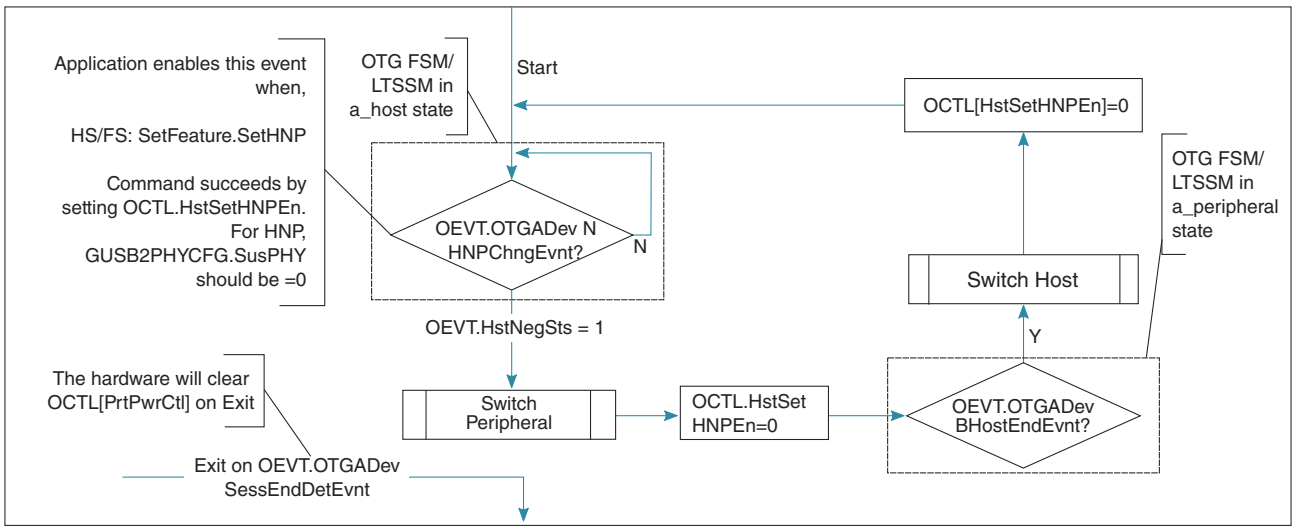

Figure 11-28. A-host -> A-peripheral -> A-host flow diagram

For HS/FS mode:

1. When the core starts the session with A-device as host, the application may periodically exchange SetFeature.SetHNPEnable packets. If B-device wants to become the host, this packet exchange results in the host application knowing about B-Device's intent to become the host, and it directs the OTG driver to set OCTL[HSTSETHNPEN]. This enables the core to cater for HNP from B-device when suspend is initiated. During suspend, ADEVHNPCHNGEVNT is set.
2. If ADEVHNPCHNGEVNT is set, the OTG driver reads OEVT[HSTNEGSTS]. If OEVT[HSTNEGSTS] is set, then the core transitions to A-Peripheral state by executing Switch Peripheral task. Otherwise, wait for ADEVSESSENDDETEVNT and go to ADP probing.
3. When in A-peripheral state, if there is ADEVBHOSTENDEVNT, it signifies that the B-device no longer wants to be the host. Therefore, the driver goes back to Step 1 by executing the switch host task and assumes an A-host role.

   Alternatively, if there is an xHCI[PRTPOWER] de-assertion, the state machine goes to start ADP probing due to the occurrence of ADEVSESSENDDETEVNT.

4. If ADEVBHOSTENDEVNT is set, then the core would be in A-host state by executing switch host task. Otherwise, perform either of the following:
   a. Drop VBUS and go to ADP probing.

      If the role change is successful, the OTG driver hands over the control to the xHCI driver.

Internal ADP flow for A-device

The internal ADP flow of A-device is as follows:

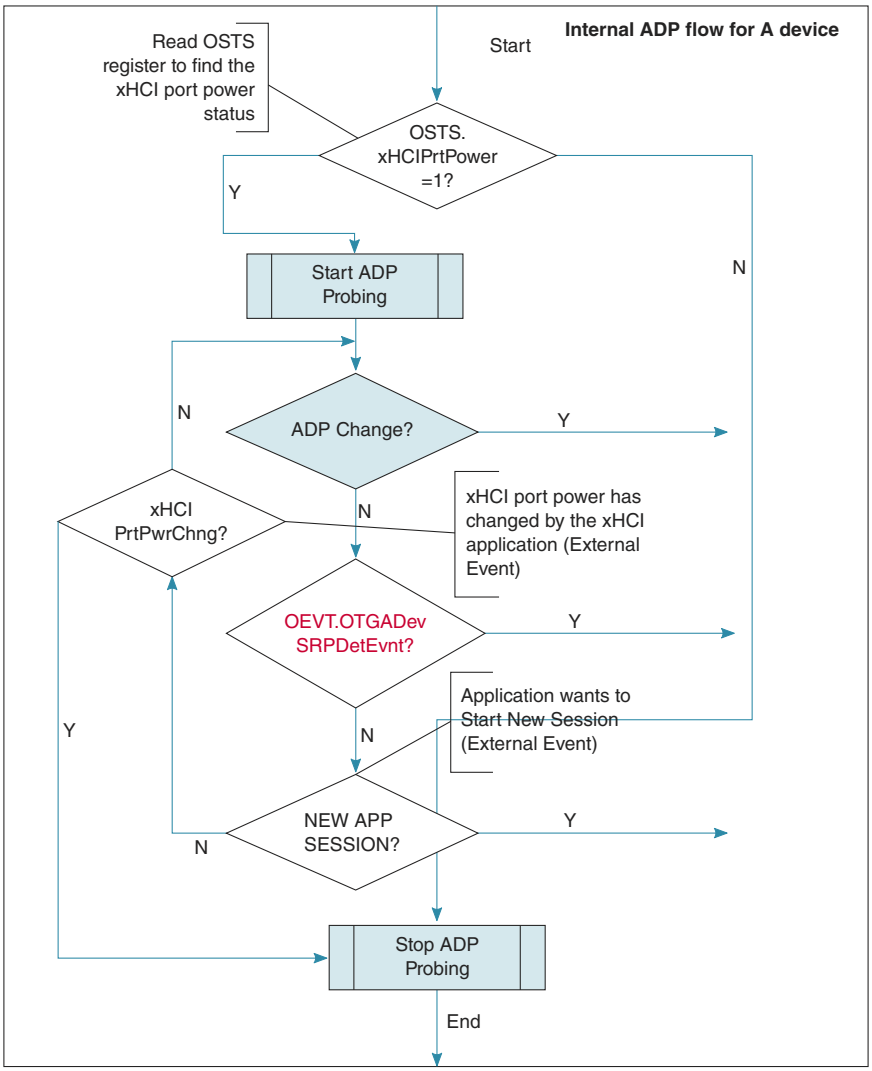

Figure 11-29. Internal ADP flow for A-device

- ADEVSESSENDDETEVNT occurs due to:
  - PORTSC[PRTPOWER] = 1'b0
  - OTG driver stopping VBUS due to:
    - BCON_TOUT when in A_WAIT_BCON
    - A_AIDL_BDIS_TOUT when in A_SUSPEND
- At any step, if ADEVSESSENDDETEVNT occurs, the software starts with ADP probing.
- Once the ADP probing (both external and internal) is started, the software should wait for one of the following events to occur (to stop ADP probing and proceed to Step 2 in A-device flow) to continue.
  - ADP change event
  - SRP detect event
  - New session event from A-device application
  - xHCI port power change event from A-device application

11.1.2.6.1.7 SRP detection by the core (Timeline for ADevSRPDetEvnt)

ADevSRPDetEvnt is triggered by a valid DLINE pulsing on the USB D+ line by B-Device. The A-Device looks at both the positive and negative edge transition occurrence for a valid data-line pulse time before detecting SRP.

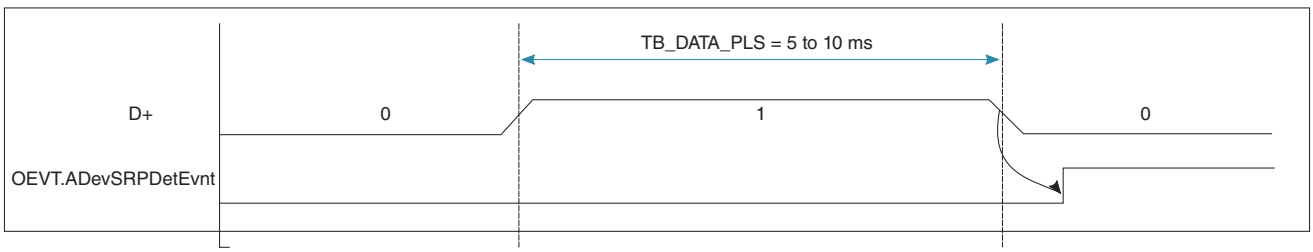

Figure 11-30. Timeline for ADevSRPDetEvnt

11.1.2.6.1.8 VBUS turned ON by the core (Timeline for ADevBSessEndEvnt)

When the A-device turns on the VBUS, it is unsure at this point of time at what speed the USB enumerates to. So, both the LTSSM and the OTG 2.0 FSMs start concurrently. The LTSSM proceeds with the training sequence after Rx_detect and the OTG 2.0 FSM waits for A_WAIT_BCON.

SS Mode: Before entering a3_ds_host, the training sequence is started. If the training sequence fails, the core automatically falls back to operate in HS/FS mode.

HS/FS Mode: Before entering A-Host, there is a check done in the OTG state machine to ensure B-Device is connected. If B-Device is not connected within TA_WAIT_BCON, ADevBSessEndDetEvnt is set. The core resets OCTL.PrtPwrCtl, and the OTG state machine enters A_WAIT_VFALL. Then VBUS to B-Device is removed and this results in ADevSessEndEvnt. Note that the A_WAIT_VFALL transition can occur due to over current, which is not depicted in the following figure.

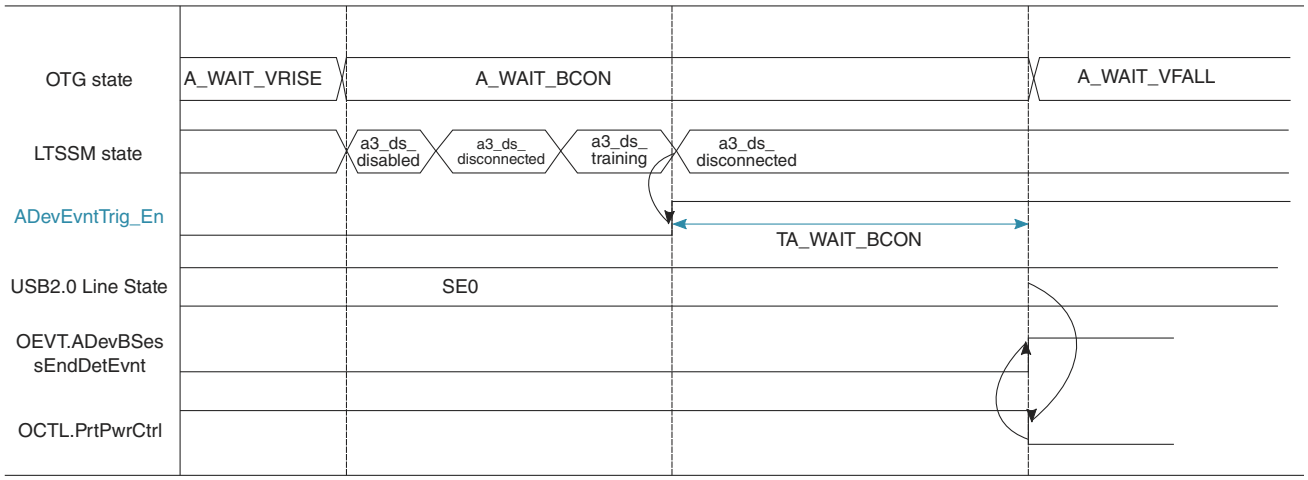

Figure 11-31. Timeline for ADevBSessEndEvnt

11.1.2.6.1.9 Core entering a3_ds_host in SS mode or A-Host in HS/FS mode (Timeline for ADevBHostEvnt)

The core gives the first chance to connect in SS mode. If SS connection times out (2 ms of polling timeout in LTSSM), the core enables the OTG 2.0 FSM to detect any connect on D+ line (TA_WAIT_BCON).

SS Mode: ADevHostEvnt is not set while operating in SS mode.

HS/FS Mode: If the B-Device is connected within TA_WAIT_BCON, ADevBHostEvnt is set.

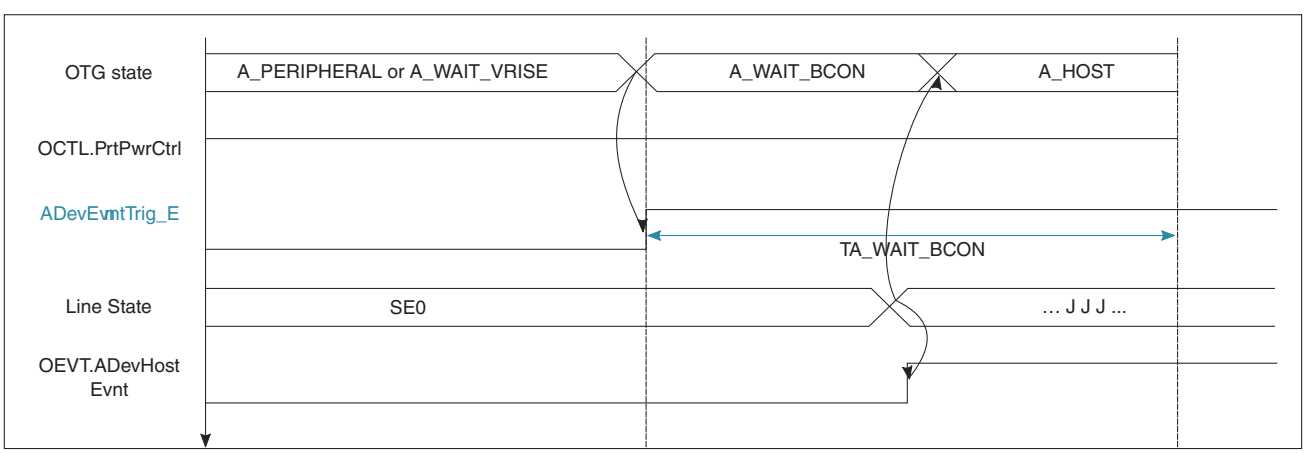

Figure 11-32. Timeline for ADevBHostEvnt

11.1.2.6.1.10 B-device flow

The following figure shows the B-device flow.

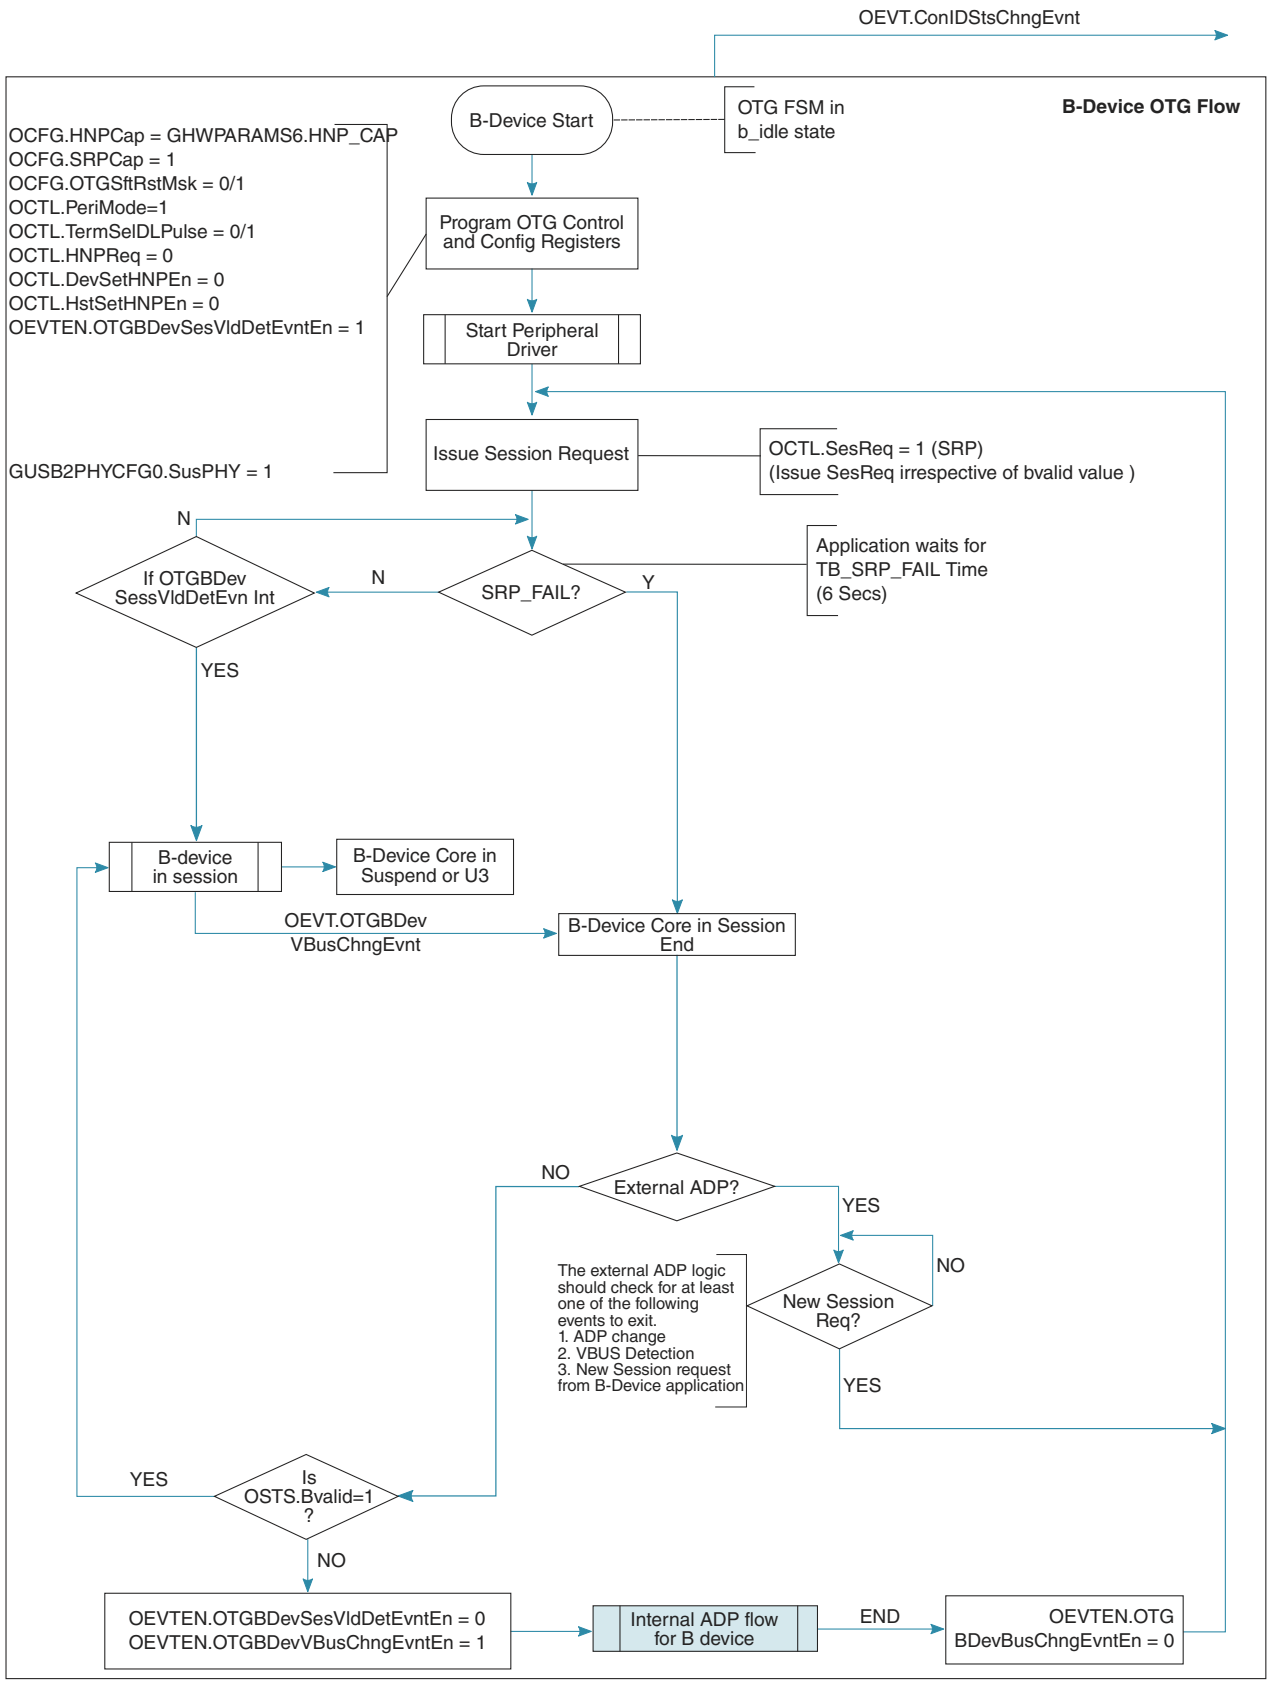

Figure 11-33. B-device flow diagram

1. At start, the core is in B-IDLE state. Note that for OTG functionality in peripheral mode, DCTL[RUN_STOP] should be set, otherwise the core as B-peripheral does not initiate SRP pulsing. Also, it is important for the device driver to program the speed of operation as B-peripheral (DCFG[SPD]).
2. The OTG software should program the following OTG control registers for B-device operation:
   - OCFG[HNPCAP] = GHWPARAMS6[HNPSUPPORT]
   - OCFG[SRPCAP] = 1
   - OCTL[PERIMODE] = 1
   - OCTL[TERMSELDLPULSE] = 0
   - OCTL[HNPREQ] = 0
   - OCTL[DEVHNPEN] = 0
   - OCTL[HSTSETHNPEN] = 0
   - OEVTEN[OTGBDEVSESVLDEVNTEN] = 1
   - GUSB2PHYCFG0[SUSPHY] = 1
   - GCTL[GBLHIBERNATIONEN] = 0 to prevent hibernation entry so that the OTG software can perform SRP.
3. Start peripheral driver.
4. Program OCTL[SESREQ] = 1 to initiate SRP by D-line pulsing. The core initiates SRP and waits for a valid VBUS (BVALID).
5. The B-device core continues to wait for BVALID if the A-device does not respond. The application should timeout if SESSVLDDETEVNT does not come within the SRP fail time (TB_SRP_FAIL is 6 seconds).

   If hibernation feature is enabled, the OTG Software can program the GCTL[GBLHIBERNATIONEN] = 1 to enable hibernation entry.

6. When SRP fails, the application should enable ADP probing.

   If the core had entered Hibernation after SRP Failure, the OTG Software should direct the power management software to exit hibernation if the OTG software decides to perform internal ADP. On hibernation exit, the OTG software should program the GCTL[GBLHIBERNATIONEN] = 0 before starting the internal ADP Flow.

7. If the A-device asserts a valid VBUS in response to SRP, the core reports an BDEVSESSVLDDETEVNT to indicate the start of a session.
8. If there is a BDEVSESSVLDDETEVNT, the core enters a session on state. For HNP flows in B-peripheral -> B-host -> B-peripheral flow diagram.
9. If there is a BDEVVBUSCHNGEVNT anytime, indicating VBUS is no longer valid, the core enters session-end state.

If hibernation feature is enabled, the OTG Software can program the GCTL[GBLHIBERNATIONEN] = 1 to enable hibernation entry.

NOTE

- For OTG 2.0, during HNP process where the B-device is going to assume the role of a host, the B-device application needs to ensure that a USB reset process is programmed within 150 ms (TB_ACON_BSE0) of getting a device connect interrupt.
- At any step, if CONIDSTSCHNGEVNT occurs, the A-device flow is terminated as per "A-device Flow Diagram".

The OTG state machine mapping to the software flow is as follows:

- Steps 1-3 and 6 are B-IDLE
- Step 4 is B-SRP-INIT
- Step 7 and 8 are B-PERIPHERAL

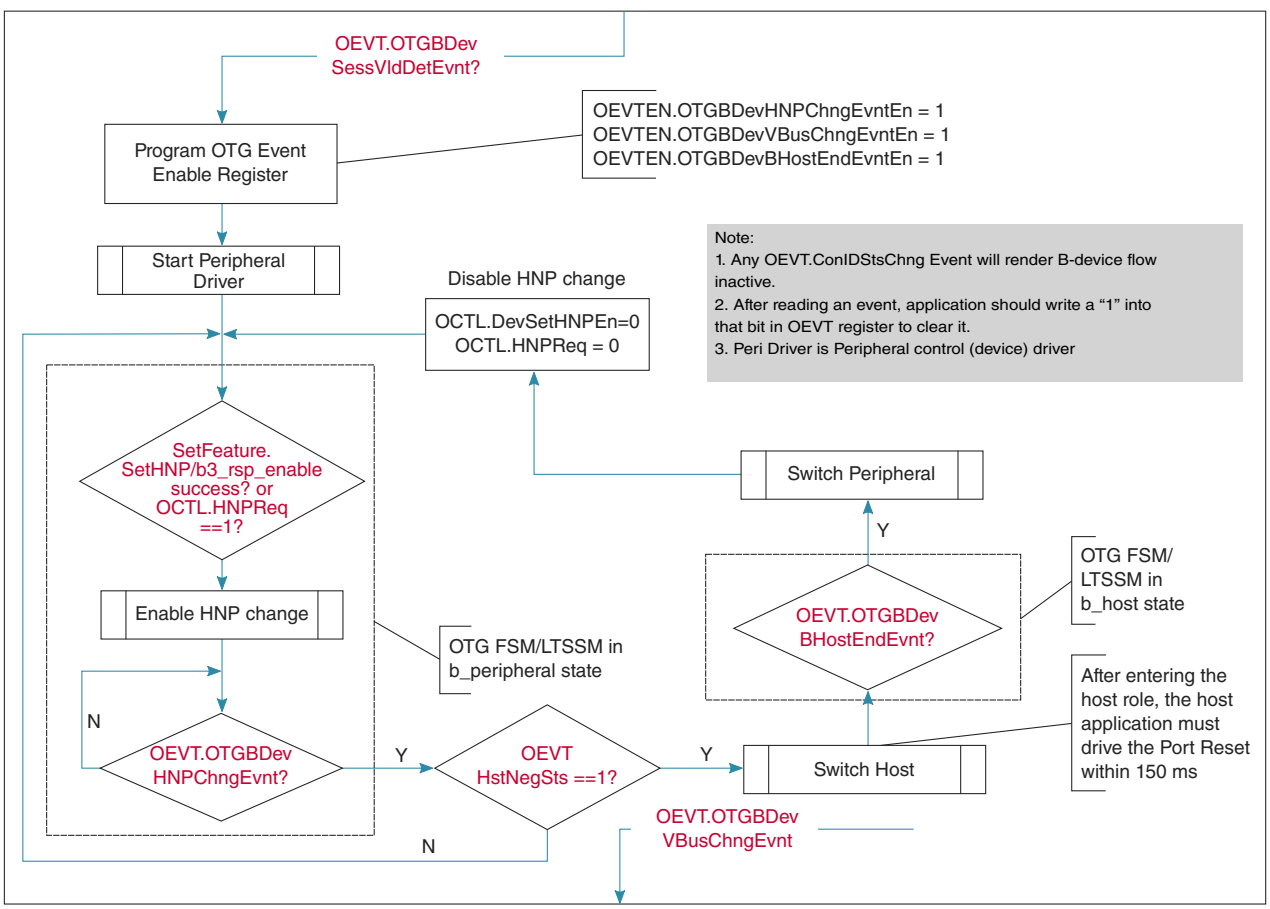

Figure 11-34. B-peripheral -> B-host -> B-peripheral flow diagram

For HS/FS mode:

1. The OTG state machine starts operation as a B-peripheral. The following events are enabled.
   - OEVTEN[OTGBDEVHNPCHNGEVNTEN] = 1
   - OEVTEN[OTGBDEVVBUSCHNGEVNTEN] = 1
   - OEVTEN[OTGBDEVBHOSTENDEVNTEN] = 1

   In this state, the application periodically exchanges SetFeature.SetHNPEnable packets. If the B-device wants to become host, this packet exchange results in a device application sending an ACK to this packet, and it directs the OTG driver to execute Enable HNP change. Ensure that GUSB2PHYCFG0[SUSPHY] is 1'b0 when SetFeature.SetHNP command succeeds. This enables the core to initiate HNP from B-device when a suspend is initiated. During a suspend, BDEVHNPCHNGEVNT is set. OTGBDEVHNPCHNGEVNT starts the transition from B-peripheral ->B-WAIT-ACON to either B-host or B-peripheral.
2. If BDEVHNPCHNGEVNT is set, the OTG driver reads OEVT[HSTNEGSTS]. If OEVT[HSTNEGSTS] is set, it indicates successful connection of A-device as peripheral, the core therefore transitions to B-host state. After entering the host role, the host application must drive the port reset within 150 ms. If OEVT[HSTNEGSTS] is not set, it indicates failure of HNP and it stays as B-peripheral.
3. When in B-host state, if there is BDEVBHOSTENDEVNT, it signifies that the B-device no longer wants to be the host, therefore suspended the bus and A-device has stopped signaling connect. Therefore, the driver goes back to step 1 and assumes B-peripheral role.
4. The core generates BDEVBHOSTENDEVNT.

NOTE

- Step 3 above is B-host and B-host to B-peripheral.
- OTGBDEVVBUSCHNGEVNT indicates transition back to B-IDLE.

For SS mode:

1. The OTG state machine starts operation as b3_us_peripheral. The following events are enabled.
   - OEVTEN[OTGBDEVHNPCHNGEVNTEN] = 1
   - OEVTEN[OTGBDEVVBUSCHNGEVNTEN] = 1
   - OEVTEN[OTGBDEVBHOSTENDEVNTEN] = 1

   a. The A-device (host) should send a SET_FEATURE with NTF_HOST_REL feature selector. This SET_FEATURE needs to be sent by the A-device within TRSP_ACK. The core receives this information and is passed onto PCD. If this SET_FEATURE is not received within TRSP_ACK_ERR the OTG driver needs to program OCTL[OTG3_GOERR] bit for instructing the core's LTSSM to go to

b3_us_error state. The TRSP_ACK_ERR timer needs to be maintained in software.

b. As a response, the PCD programs the device generic command register (command value = 07h). For programming the device generic command register, refer to "Device Programming Model". The PCD should program the core to send this device notification packet within TRSP_CNF.
c. The PCD programs OCTL[DEVSETHNPEN] = 1 as a result of the above step.
d. The core is responsible for internally detecting warm reset and generating OTGBDEVHNPCHNGEVNT. If the warm reset is not received within TRSP_WRST, the core doesn't generate OTGBDEVHNPCHNGEVNT and hence the PCD should program OCTL[OTG3_GOERR] which will direct the core to b3_us_error state.
e. As a result of above step and if OTGBDEVHNPEVNT is generated, the OTG driver informs the PCD and in turn, the PCD completes its activities, programs the core to stop the activities as a peripheral and hands over the control to OTG driver. The OTG driver programs OCTL[PERIMODE] as 0. Ensure that GCTL[DSBLCLKGTNG] is 1 before role change.

2. If BDEVHNPCHNGEVNT is set, it indicates that the core has transitioned to b3_ds_disconnected state. The OTG driver now hands over the control to xHCI driver. Note that after xHCI driver has taken control, if there is a transition to b3_ds_error state by the A-device, this error handling is performed by the xHCI driver.
3. When in b3_ds_host_state
4. The core generates BDEVBHOSTENDEVNT.

NOTE

- Step 3 above is B-host and B-host to B-peripheral.
- OTGBDEVVBUSCHNGEVNT indicates transition back to B-IDLE.
- If there is any unexpected error scenario like VBUS drop after the OCTL[DEVSETHNPEN] bit is set, the OTG driver must clear the OCTL[DEVSETHNPEN] bit.

Internal ADP flow for B-device

The internal ADP flow of B-device is as follows:

Figure 11-35. Internal ADP flow for B-device

While probing, the application should wait for one of the following events to exit probing and start SRP request again.

- ADP change
- VBus detection
- New session request from B-device application

While sensing, the application should wait for one of the following events to exit sensing.

- ADP sensed failed
- VBUS detection
- New session request from B-device application

The application should continue with ADP probing if ADP sense failed. Else, the application should exit sensing and start SRP request again

11.1.2.6.1.11 Core entering b3_us_peripheral in SS mode or B-Peripheral in HS/FS mode (Timeline for BDevSessVldDetEvnt)

The PCD decides the speed in which the USB3 core needs to operate by programming DCFG.DevSpd bits. Accordingly, the core decides to operate either in SS or FS to start with.

SS Mode: OEVT.BDevSessVldDetEvnt is triggered when the LTSSM enters b3_us_disconnected state after detecting VBUS turned on by the A-device

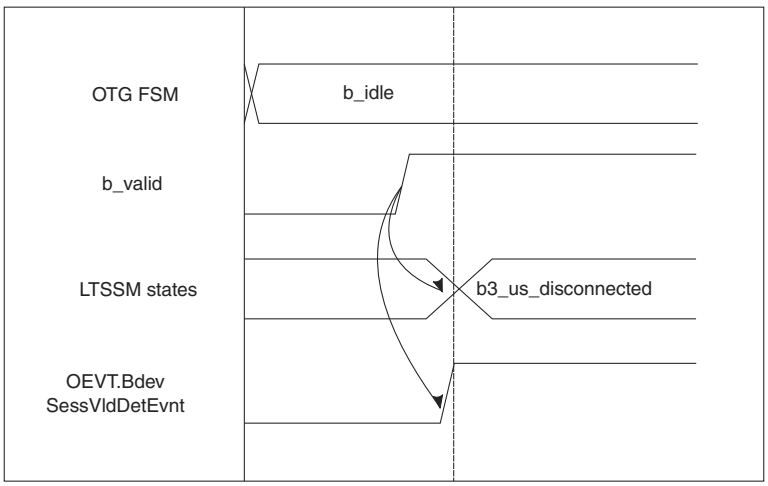

Figure 11-36. Timeline for BDevSessVldDetEvnt in SS mode

HS/FS Mode: BDevSessVldDetEvnt is triggered by a valid VBUS detection by B-Device in B-IDLE state. The B-Device will transition to B-PERIPHERAL state before triggering this event. Note that this is common to both SS and HS(FS).

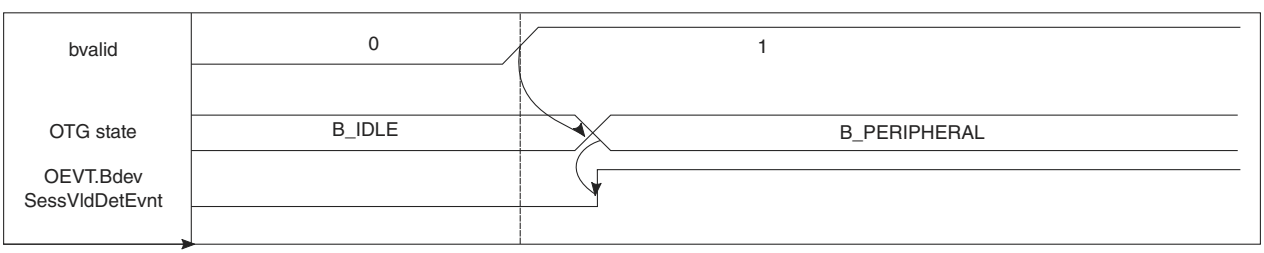

Figure 11-37. Timeline for BDevSessVldDetEvnt in HS/FS mode

11.1.2.6.1.12 VBUS change detected on USB (Timeline for BDevVBusChngEvnt)

BDevVBusChngEvnt is triggered when a change in bvalid is detected irrespective of OTG state machine.

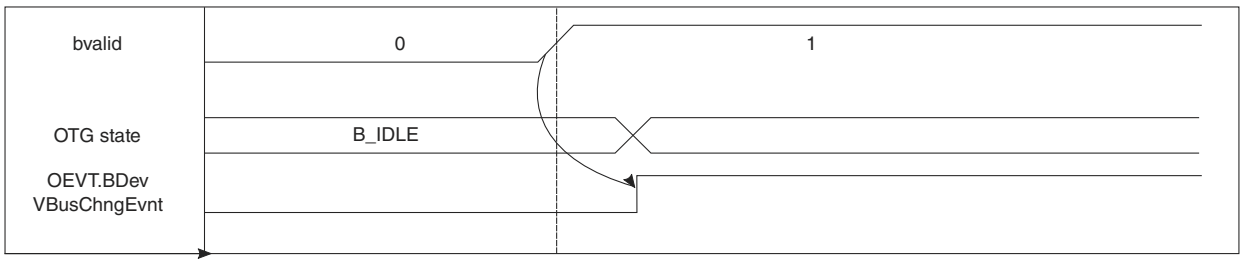

Figure 11-38. Timeline for BDevVBusChngEvnt

11.1.2.6.1.13 Internal ADP controller logic

The ADP controller has timers that assist in ADP operation. The ADP-related registers are a part of the pwrm_otgif module. For the PHY to generate ADPPRB and ADPSNS, the PHY needs to know the value to compare with VADP_PRB and VADP_SNS, respectively. These values can be hardcoded in the PHY or the PHY can have limited programmable option by which these reference voltage values can be changed. The "Wakeup Logic" module implements SRP detection in A-Device mode. This is required if the USB 3.0 controller is powered down completely while ADP is still in progress and B-Device initiates SRP.

NOTE

ADP controller logic is inferred along with, but outside USB 3.0 controller.

- As a product, both ADP controller logic and OTG controller are packaged into USB 3.0 core.
- All ADP timers are maintained in the ADP controller module, which generates the enable and disable signaling to the PHY for ADP probing and sensing.
- PHY contains the following circuitry related to ADP functionality:
  - Comparators for PRB and SNS
  - I_ADP_SRC and I_ADP_SNK
  - V_{BUS} circuitry
- Application software programs the ADP timing registers that resides in the pwrm_otgif module.
- The pwrm_otgif module provides a mechanism to the application via interrupts to log and report events pertaining to ADP probing and sensing.
- In this operation, only the pwrm module needs to be always powered on. The pwrdwn module can be either powered on or off.

11.1.2.6.1.14 Initializing ADP Controller

Initializing the ADP controller comprises of the following steps:

1. Set ADPEVTEN.ADPRstCmpltEvntEn to 1'b1.
2. Set ADPCTL.ADPRes to 1'b1. This initiates reset of the ADP controller.
3. Wait for ADPEVT.ADPRstCmpltEvnt to ensure that the reset process is complete.
4. Program the appropriate ADPCFG.PrbDschg (Discharge time), ADPCFG.PrbDelta (Resolution unit), and ADPCFG.PrbPer (Probe period) values.
5. Read the ADPCTL register to see if the ADPCFG values have been written into the ADP controller (Suspend clock domain) by looking at the ADPCTL.WB bit. Wait for the ADPCTL.WB bit to be cleared by the hardware to confirm that the write operation is complete.
6. Clear ADPEVTEN.ADPRstCmpltEvntEn to 1'b0 in order to complete the ADP initialization sequence.

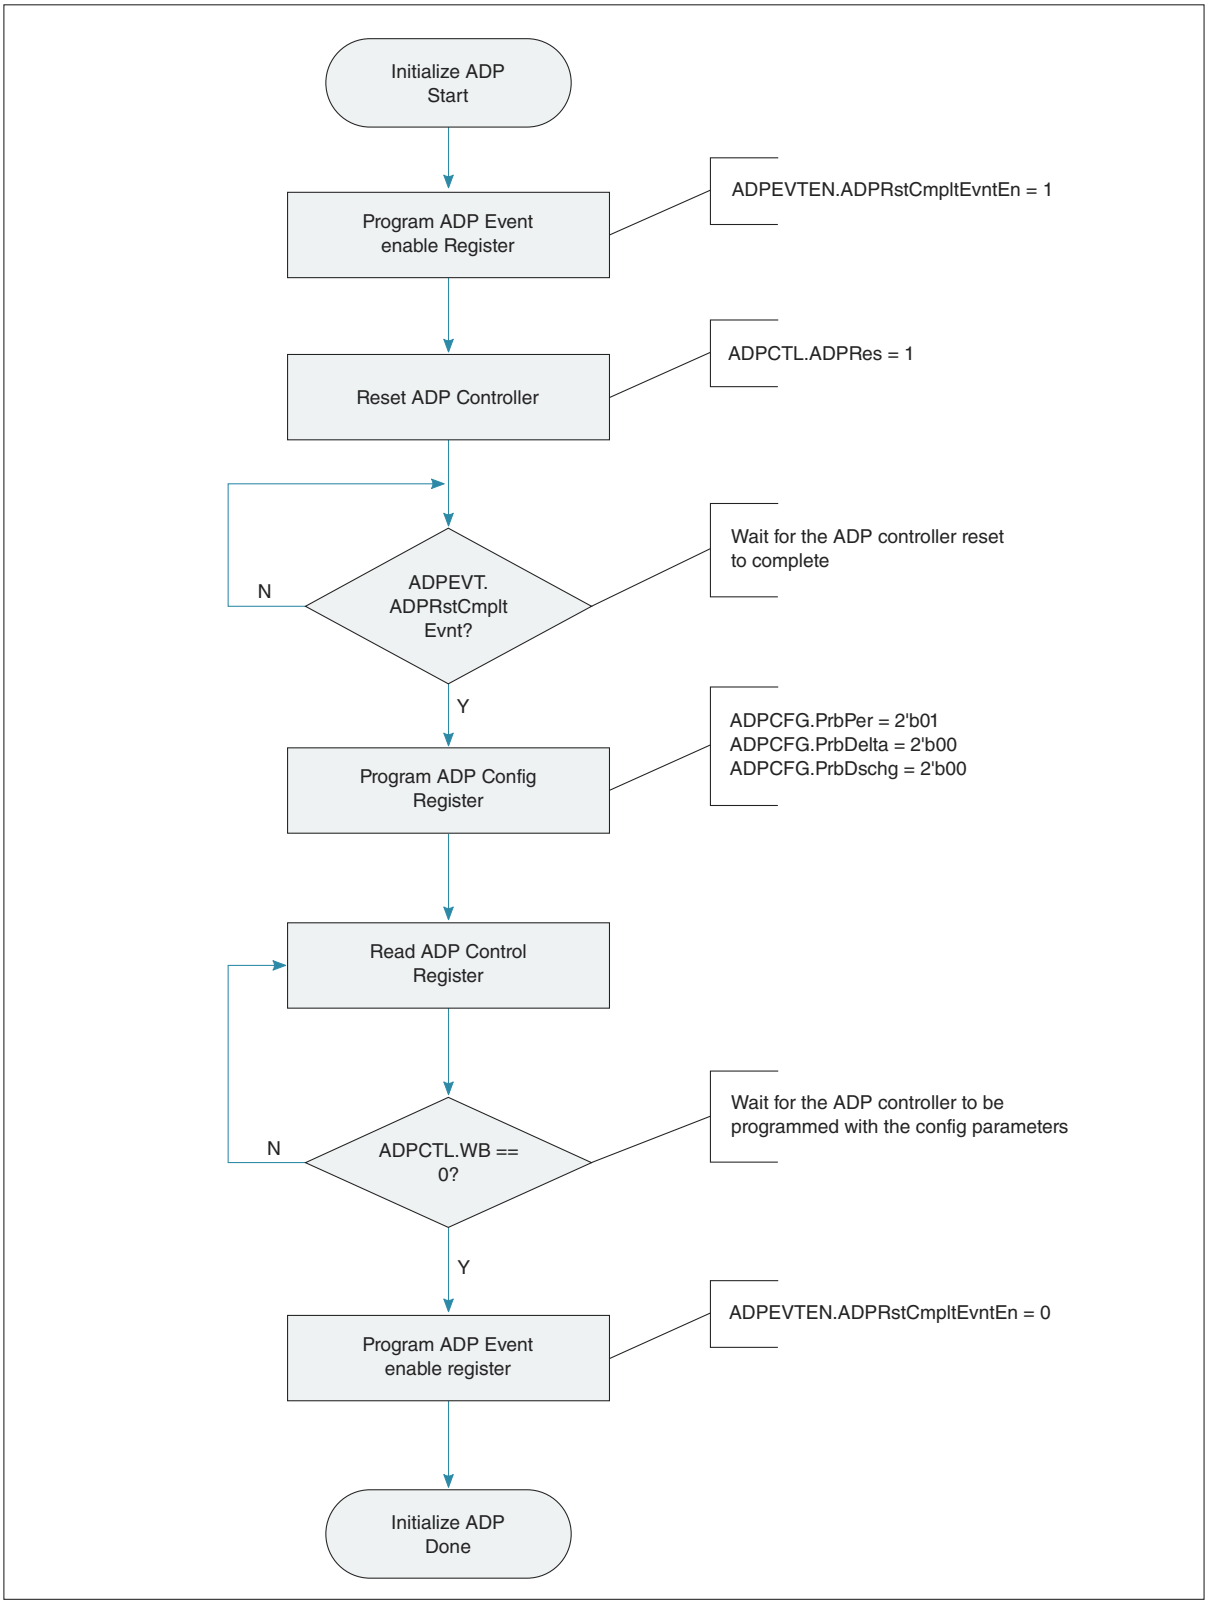

Figure 11-39. Flow Diagram for Initializing ADP

11.1.2.6.1.15 ADP sensing

ADP sensing is allowed only when operating as a B-device and not allowed when operating as an A-device. ADP sensing is done with the following three steps:

1. Start ADP sense
2. Detect ADP sense
3. Stop ADP sense

Start ADP sense

To start ADP sensing, perform the following steps:

1. Set ADPEVTEN[ADPSNSEVNTEN] to 1'b1.
2. Set ADPCTL[ADPEN] and ADPCTL[ENASNS] to 1'b1.
3. Read the ADPCTL register to see if the ADPCTL values have been written into the ADP controller (Suspend clock domain) by looking at the ADPCTL[WB] bit. Wait for the ADPCTL[WB] bit to be cleared by the hardware to confirm that the write operation is complete. Now the core starts an ADP sense to the PHY.

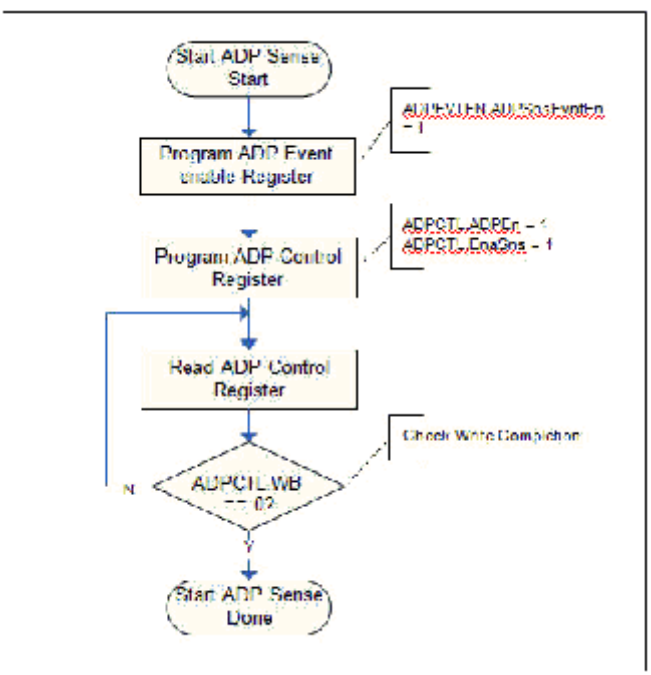

Figure 11-40. Start ADP sense

Detect ADP sense

To detect ADP sensing, perform the following steps:

1. Wait for ADPEVTEN[ADPSNSEVNT] to conclude that A-host is performing ADP probing. After starting the ADP sense, ADPEVTEN[ADPSNSEVNT] should occur at every probe period of A-host.

2. If ADPEVTEN[ADPSNSEVNT] is not detected within TB_ADP_DETACH time (3 seconds), conclude that the ADP sense has failed.

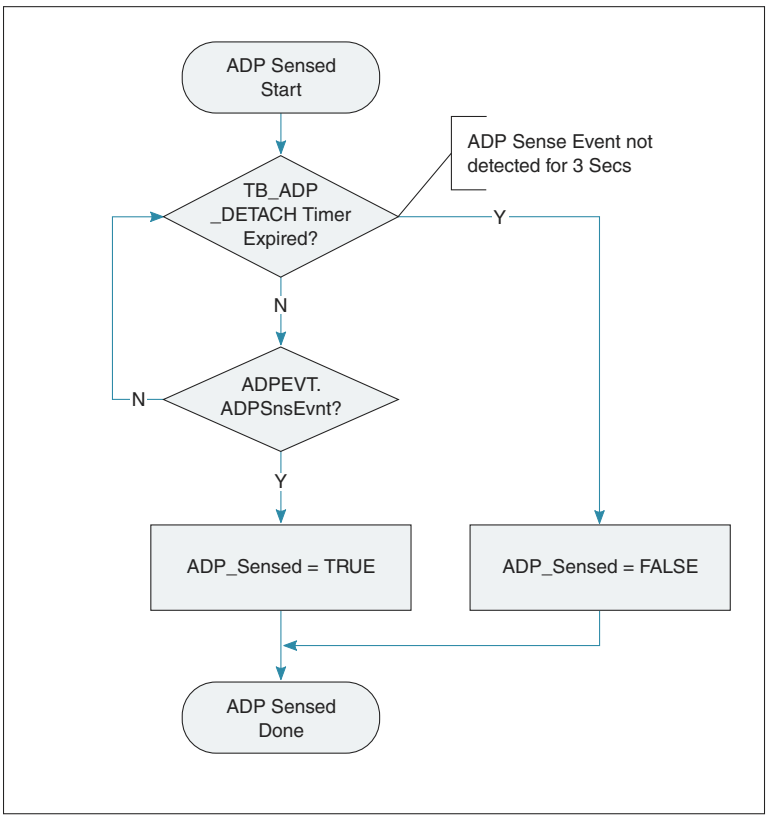

Figure 11-41. Flow diagram to detect ADP sense

Stop ADP sense

To stop ADP sensing, perform the following steps:

1. Clear ADPEVTEN[ADPSNSEVNTEN] to 1'b0.
2. CLEARADPCTL[ADPEN] and ADPCTL[ENASNS] to 1'b0.
3. Read the ADPCTL register to see if the ADPCTL values have been written into the ADP controller (Suspend clock domain) by looking at the ADPCTL[WB] bit. Wait for the hardware to clear the ADPCTL[WB] bit to confirm that the write operation is complete. Now the core will stop ADP sense to PHY.

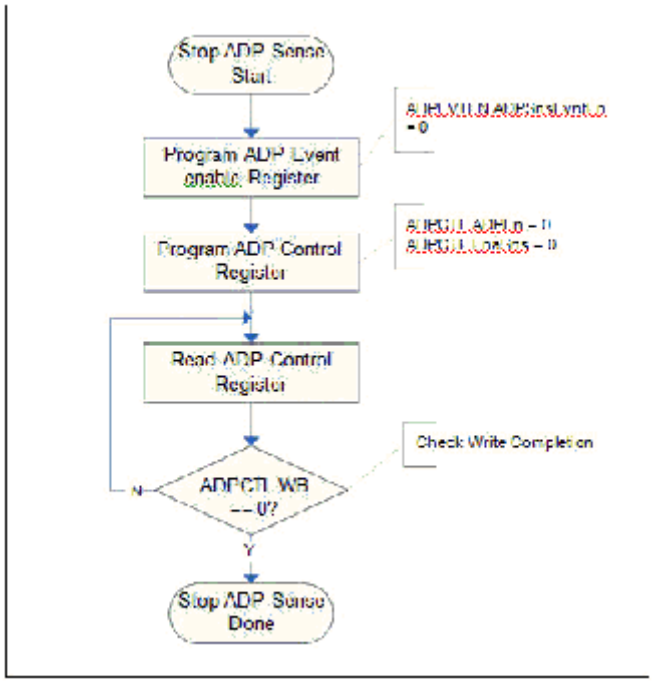

Figure 11-42. Stop ADP sense

11.1.2.6.1.16 ADP probing

ADP probing is allowed in both A-device and B-device. ADP probing is handled with the following three steps:

1. Start ADP probe
2. Detect ADP change
3. Stop ADP probe

Start ADP probe

To start ADP probing, perform the following steps:

1. Set ADPEVTEN[ADPPRBEVNTEN] and ADPEVTEN[ADPTMOUTEVNTEN] to 1'b1.
2. Set ADPCTL[ADPEN] and ADPCTL[ENAPRB] to 1'b1.
3. Read the ADPCTL register to see if the ADPCTL values have been written into the ADP controller (suspend clock domain) by looking at the ADPCTL[WB] bit. Wait for the hardware to clear the ADPCTL[WB] bit to confirm that the write operation is complete. Now the core will start ADP probing to PHY.

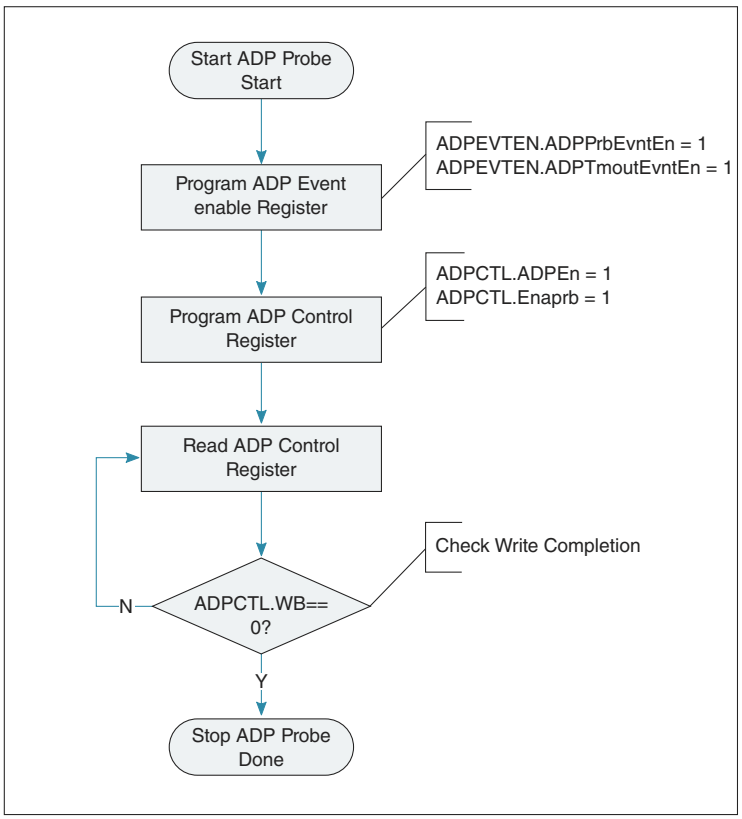

Figure 11-43. Flow diagram for start ADP probe

Detect ADP change

To detect ADP change, perform the following steps:

1. Wait for ADPEVT[ADPPRBEVNT].
2. Read the Ramp Time (RTIM) value and compare it with the previous read value. If the difference is greater than the minimum ramp value of attach/detach (including the noise delta), then report ADP change = TRUE, else report ADP change = FALSE.

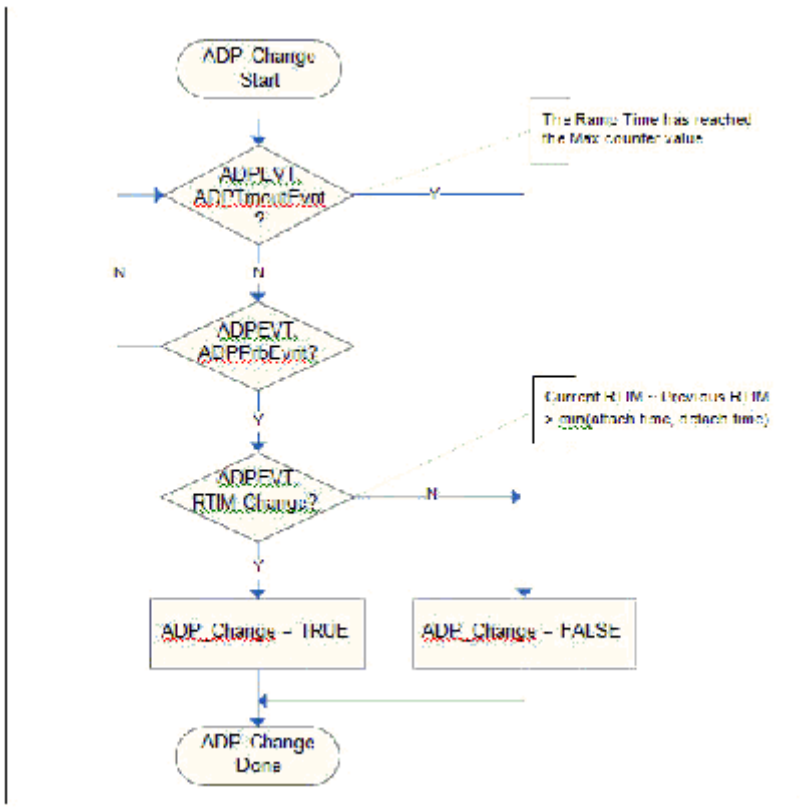

Figure 11-44. Detect ADP change

Table 11-23. Cause of interrupt

Status bit values	Explanation
ADP_PRB_INT=0, ADP_TMOUT_INT=0	Not applicable
ADP_PRB_INT=0, ADP_TMOUT_INT=1	During an ADP probe, the ADPEVT[RTIM] has reached the terminal value (while trying to charge VBUS) and the VADP PRB value has not been reached. The application software must note down the ADPEVT[RTIM] value for this charging cycle.
ADP_PRB_INT=1, ADP_TMOUT_INT=0	VADP PRB voltage has been reached on VBUS. The application software can note down the intermediate ADPEVT[RTIM] value. The timer value indicates the time taken for the ramp to reach VADP PRB voltage.
ADP_PRB_INT=1, ADP_TIMOUT_INT=1	The ramp time has reached the terminal value (0x7FF) and VADP PRB voltage is also reached. The application must note down the RTIM value.

Stop ADP probe

To stop ADP probing, perform the following steps:

1. Clear ADPEVTEN[ADPPRBEVNTEN] and ADPEVTEN[ADPTMOUTEVNTEN] to 1'b0.
2. Clear ADPCTL[ADPEN] and ADPCTL[ENAPRB] to 1'b0.

3. Read the ADPCTL register to see if the ADPCTL values have been written into the ADP controller (Suspend clock domain) by looking at the ADPCTL[WB] bit. Wait for the hardware to clear the ADPCTL[WB] bit to confirm that the write operation is complete. Now the core stops ADP probing to PHY.

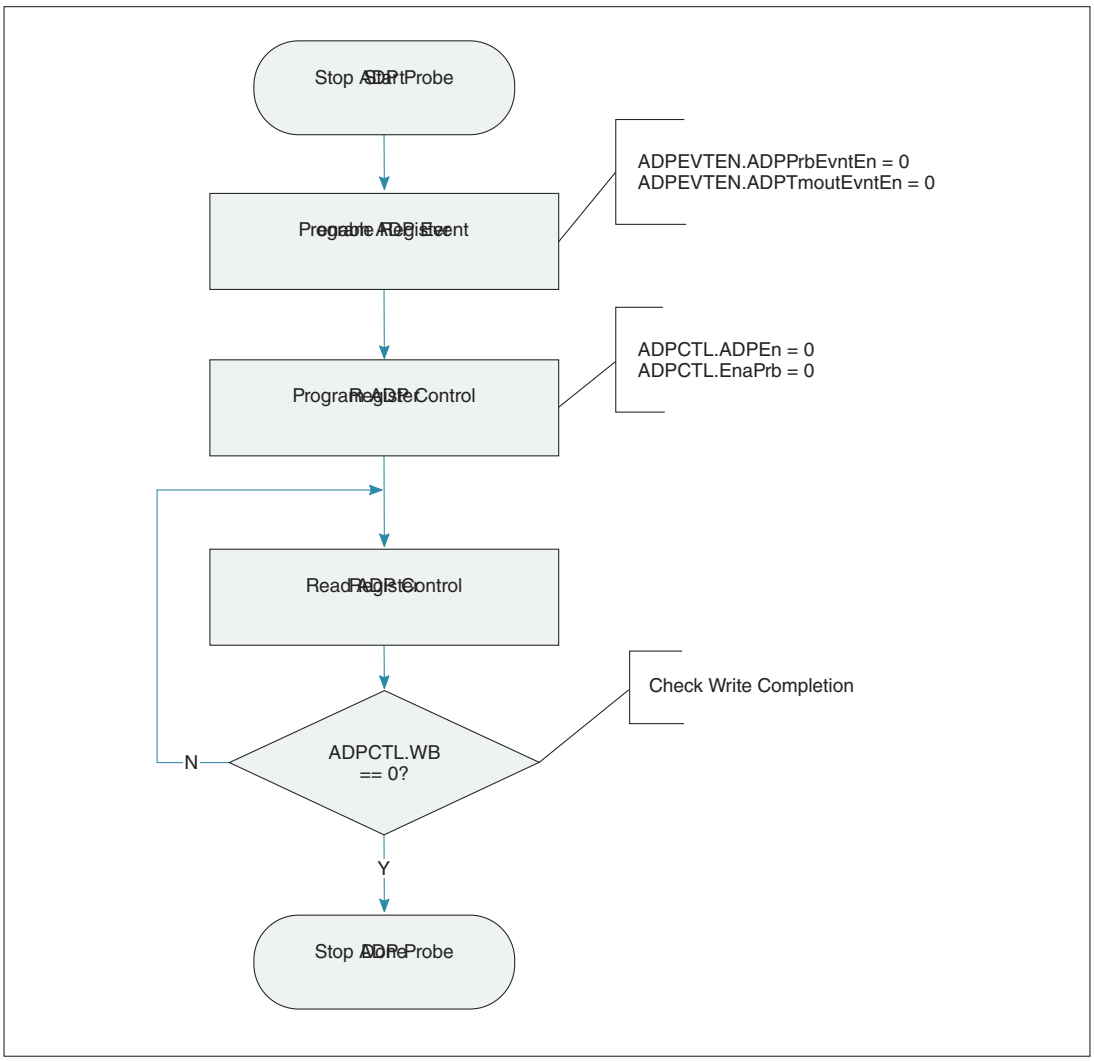

Figure 11-45. Flow diagram to stop ADP probe

11.1.2.7 Initialization/application information

The PHY can be configured for fixed equalization by programming relevant control registers in the USB 3.0 PHY.

In order to initialize the USB 3.0 PHY, software should perform the following steps:

1. Write 1'b0 to RX_OVRD_IN_HI.RX_EQ_EN [address 16'h1006: bit 6].

2. Write 1'b1 to RX_OVRD_IN_HI.RX_EQ_EN_OVRD [address 16'h1006: bit 7].
3. Write a fixed value to RX_OVRD_IN_HI.RX_EQ [address 16'h1006: bits 10–8] [equalization setting] (generally 2–4, based on testing in customer environment).
4. Write 1'b1 to RX_OVRD_IN_HI.RX_EQ_OVRD [address 16'h1006: bit 11].

11.1.2.8 Power management overview

The following power management features are available in the USB 3.0 core:

- Hibernation (save/restore) in device (L1, L2, U3, Disconnected) and host (U3, Disconnected)
- Hardware-controlled LPM in USB 2.0 host
- Clock gating in device (U1/U2/U3) and host (U1/U2/U3)

When hibernation is supported, the core saves some of its internal state to an external location and allows the USB3 core to be powered off. Small modules, namely the PMUs, detect wakeup conditions and request power be reapplied to the core, at which time the external state is brought back into the core.

Since the PMU modules are not inside the USB 3.0 core, the PMUs can easily be placed anywhere in the chip during floor-planning, adding isolation cell/voltage shifter cells. The PMU modules can be placed in the always ON power domain which could be operating at a different voltage than the USB 3.0 power domain.

Hibernation is described in the xHCI Specification as an optional feature that can be supported.

In addition, this feature is also added to the device controller.

NOTE

- The PMU does not support the following features in Hibernation mode:
  - ADP
  - BC
  - SRP signalling
- It is required that the SuperSpeed PHY must support receiver detection in P3 PowerDown mode.
- Hibernation is not supported in OTG mode when the roles are reversed.

- In the host mode, the USB 3.0 core does not support clock gating and hibernation when the Debug Capability is enabled during runtime (DCCTRL.DCE=1).
- During the normal host mode of operation, the USB 3.0 core supports clock gating and hibernation features when the Debug Capability is not enabled by the software (DCCTRL.DCE=0).

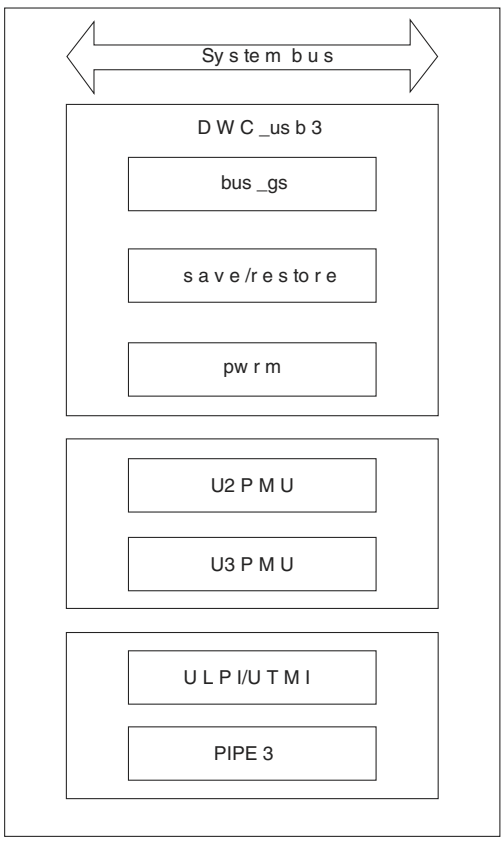

Figure 11-46. Power management hibernation architecture

The second power saving mechanism is hardware-controlled LPM. This is a USB 2.0 host-only feature where the host controller automatically detects the downstream port is idle for a certain amount of time and autonomously initiates an LPM token to the connected device. If the device accepts, the link is put into the standard USB 2.0 Suspend state.

Finally, clock gating is also supported in the host controller as well as in the device controller. The following table gives the list of power saving mechanisms available in USB 3.0 core.

Table 11-24. Power savings support

USB 3.0 State	USB 2.0 State	Device Power Savings	Host Power Savings
U1 (Hardware Initiated)	None	Core: Clock Gating PHY: P1	Core: Clock Gating PHY: P1
U2 (Hardware Initiated)	LPM-L1 (Hardware Initiated)	Core: Clock Gating, LPM-L1 Hibernation PHY: P2/Sleep	Core: Clock Gating, PHY: P2/ Sleep
U3 (Software Initiated)	Suspend (Software Initiated)	Core: Clock Gating, Hibernation PHY: P3/Suspend	Core: Clock Gating, Hibernation PHY: P3/Suspend
Rx.Detect (Software Initiated)	None	None	Core: Clock Gating, Hibernation PHY: P3/Suspend
SS.Disabled (Software Initiated)	None	Core: Clock Gating, Hibernation PHY: P3/Suspend	None

11.1.2.8.1 Clock gating

The core implements clock gating in the following situations:

- In USB 2.0 device mode
  - When the UTMI suspend or l1_suspend signal is asserted and the core is idle
- In USB 3.0 device mode, when the link is in U1, U2 or U3 state and the core is idle.

In host mode, clock gating is enabled in the following situations:

- When all USB 2.0 ports are in the suspend or L1 Suspend state, and all USB 3.0 ports are in the U1/U2/U3 state, and the core is idle.

Internal clock gating will apply to:

- Modules that use the ram_clk
- Some modules that use bus_clk

Internal clock gating will not apply to:

- Modules that use mac3_clk: When the USB 3.0 PHY is suspended, these modules switch to using suspend_clk, so their power consumption is reduced but the clock is not completely stopped.
- Modules that use mac2_clk: When the USB 2.0 PHY is suspended, these modules switch to using suspend_clk, so their power consumption is reduced but the clock is not completely stopped.
- The bus_gs module, which uses bus_clk. This module detects wakeup on the slave interface and thus needs a non-gated clock.

Clock gating can be enabled or disabled using the GCTL register. The GCTL register is "sticky," it retains its value across soft resets and hibernation.

11.1.2.8.2 Hardware-Controlled LPM

In USB 2.0, the main link power management mechanism was for the host to suspend the link. However, suspending the link requires a long period of idle and was wasteful of power, especially because the host knows ahead of time whether it is going to schedule any traffic. It also required a long period of resume signaling.

The USB 2.0 Link Power Management Addendum [LPM-ECN] added a new token to the USB 2.0 specification, the LPM token. The host has the option of suspending the link quickly instead of waiting for a long period of idle, and communicates its desire to the device by sending an LPM token. The ECN also introduced a terminology for different link states. This new link state was called L1. The traditional USB 2.0 suspend was called L2. The L1 state requires a much shorter resume signaling period too.

An xHCI driver can initiate LPM by writing '2' to the PORTSC.PLS field. However, there is a lot of overhead for an xHCI driver to be constantly trying to keep the link in a low power state. Because of this, the xHCI specification also allows a compatible xHC to be enabled with "Hardware-Controlled LPM" by setting PORTPMSC.HLE as 1. When this happens, the xHC is expected to automatically send LPM tokens when it has no pending transfers and thinks that the link is idle enough to enter L1. This feature is supported by the host core.

11.1.2.8.2.1 Special consideration for OTG

When the core is configured as an OTG device, it will not initiate LPM when acting in a reverse role as a B- Host. This is because suspend on the link is treated as a request to switch back to its original role.

11.1.2.8.3 USB PHY power gating

The USB PHY power gating is used to save the leakage power of PHY if it is not required. Follow the steps given below to take PHY into power gating state:

1. Assert PHY_RESET by writing 1'b0 to the USB_PHY_CTRL[RST] bit.
2. Set the USB_PHY_CTRL[PDN_SSP] and USB_PHY_CTRL[PDN_HSP] to 2'b11.

NOTE

Both the above steps must have separate writes.

11.1.3 Memory Map and Register Definition

This section includes the memory map and detailed descriptions of all registers.

Field	Function
31-13 reserved_31_13	Reserved
12 HCE	Host Controller Error (HCE) - RO Default = 0. '0' = No internal xHC error conditions exist and '1' = Internal xHC error condition. This flag must be set to indicate that an internal error condition has been detected which requires software to reset and reinitialize the xHC. Refer to section 4.24.1 of the DesignWare Cores SuperSpeed USB 3.0 Controller Databookfor more information.
11 CNR	Controller Not Ready (CNR) - RO Default = '1'. '0' = Ready and '1' = Not Ready. Software must not write to thes Doorbell or Operational register of the xHC, other than the USBSTS register, until CNR = '0'. This flag is set by the xHC after a Chip Hardware Reset and cleared when the xHC is ready to begin accepting register writes. This flag remains cleared ('0') until the next Chip Hardware Reset.
10 SRE	Save/Restore Error This bit is currently not supported.
9 RSS	Restore State Status This bit is similar to the USBSTS.RSS in host mode. When the controller has finished the restore process, it completes the command by setting DSTS.RSS to '0'.
8 SSS	Save State Status This bit is similar to the USBSTS.SSS in host mode. When the controller has finished the save process, it completes the command by setting DSTS.SSS to '0'.

11.1.3.1.20.4 Fields

Field	Function
31-28 PRTTSTCTRL	Port Test Control . When this field is '0', the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. A non-zero Port Test Control value is only valid to a port that is in the Powered-Off state (PLS = Disabled). If the port is not in this state, the xHC shall respond with the Port Test Control field set to Port Test Control Error. Refer to 'Operational Model' topic for using these test modes. The encoding of the Test Mode bits for a USB2 protocol port are: 0: Test mode not enabled 1: Test J_STATE 2: Test K_STATE 3: Test SE0_NAK 4: Test Packet 5: Test FORCE_ENABLE 6-14: Reserved. 15: Port Test Control Error.

11 DATBIGEND	Data Access is Big Endian This bit controls the endian mode for data accesses. - Little-endian (default); - Big-endian; In big-endian mode, DMA access (both read and write) for packet data a Byte Invariant Big-Endian mode (see "Little-Endian and Big-Endian" section in the DWC SuperSpeed USB 3.0 Controller User Guide). Note: Since AXI requires byte invariant endianness, setting DescBigend and DatBigEnd to one causes an address invariant transform to be applied, which is not appropriate. See section 9.3 and 9.4 of the AMBA AXI Specification. Hence for an AXI master (DWC_USB3_MBUS_TYPE=1), this bit must be set to zero.
10 DESBIGEND	Descriptor Access is Big Endian This bit controls the endian mode for descriptor accesses. - Little-endian (default) - Big-endian In big-endian mode, DMA access (both read and write) for descriptors uses a Byte Invariant Big-Endian mode (see "Little-Endian and Big-Endian" section in the DWC SuperSpeed USB 3.0

Table continues on the next page...

Field	Function
	Controller User Guide. Data is considered as 'embedded data' in the descriptors in the following cases: - Device mode: The buffer pointer of a Setup TRB points to the Setup TRB itself. - Host mode: The Immediate Data (IDT) bit in a Transfer TRB is set to 1. In device mode, if the system uses different endian modes for descriptor and data, software must not use 'embedded' data. In host mode, if the system uses different endian modes for data and descriptors, the controller treats 'embedded data' as descriptor (not as data) in terms of endian mode handling. If this is not the expectation of the system, the software must manipulate the 'embedded data' accordingly. Note: Since AXI requires byte invariant endianness, setting DescBigend and DatBigEnd to one causes an address invariant transform to be applied, which is not appropriate. See section 9.3 and 9.4 of the AMBA AXI Specification. Hence for an AXI master (DWC_USB3_MBUS_TYPE=1), this bit must be set to zero.
9-8 reserved_9_8	Reserved
7 INCR256BRSTENA	INCR256 Burst Type Enable Input to BUS-GM. For the AHB/AXI configuration, if software set this bit to 1, the AHB/AXI master uses INCR to do the 256-beat burst.
6 INCR128BRSTENA	INCR128 Burst Type Enable Input to BUS-GM; For the AHB/AXI configuration, if software set this bit to 1, the AHB/AXI master uses INCR to do the 128-beat burst.
5 INCR64BRSTENA	INCR64 Burst Type Enable - Input to BUS-GM; For the AHB/AXI configuration, if software set this bit to 1, the AHB/AXI master uses INCR to do the 64-beat burst.
4 INCR32BRSTENA	INCR32BRSTENA INCR32 Burst Type Enable Input to BUS-GM; For the AHB/AXI configuration, if software set this bit to 1, the AHB/AXI master uses INCR to do the 32-beat burst.
3 INCR16BRSTENA	INCR16BRSTENA INCR16 Burst Type Enable Input to BUS-GM. For the AHB/AXI configuration, if software set this bit to '1', the AHB/AXI master uses INCR to do the 16-beat burst.
2 INCR8BRSTENA	INCR8BRSTENA INCR8 Burst Type Enable Input to BUS-GM; For the AHB/AXI configuration, if software set this bit to "1", the AHB/AXI master uses INCR to do the 8-beat burst.
1 INCR4BRSTENA	INCR4BRSTENA INCR4 Burst Type Enable Input to BUS-GM; For the AXI configuration, when this bit is enabled the controller is allowed to do bursts of beat length 1, 2, 3, and 4. It is highly recommended that this bit is enabled to prevent descriptor reads and writes from being broken up into separate transfers.
0 INCRBRSTENA	INCRBRSTENA Undefined Length INCR Burst Type Enable (INCRBrstEna) Input to BUS-GM; This bit determines the set of burst lengths the master interface uses. It works in conjunction with the GSBUSCFG0[7:1] enables (INCR256/128/64/32/16/8/4). 0: INCRX burst mode HBURST (for AHB configurations) and ARLEN/ AWLEN (for AXI configurations) do not use INCR except in case of non-aligned burst transfers. In the case of address-aligned transfers, they use only the following burst lengths: - 1 - 4 (if GSBUSCFG0.INCR4BrstEna = 1) - 8 (if GSBUSCFG0.INCR8BrstEna = 1) - 16 (if GSBUSCFG0.INCR16BrstEna = 1) - 32 (if GSBUSCFG0.INCR32BrstEna = 1) - 64 (if GSBUSCFG0.INCR64BrstEna = 1) - 128 (if GSBUSCFG0.INCR128BrstEna = 1) - 256 (if GSBUSCFG0.INCR256BrstEna = 1) Note: - In case of non-address-aligned transfers, INCR may get generated at the beginning and end of the transfers to align the address boundaries, even though INCR is disabled. - In AHB mode, if INCRX burst mode is enabled, but none of the supported INCRx bursts bits are enabled, then the controller will perform (undefined length) INCR bursts. 1: INCR (undefined length) burst mode - AHB configurations: HBURST uses SINGLE or INCR of any length with handling 1KB boundary breakup. - AXI configurations: ARLEN/AWLEN uses any length less than or equal to the

Field	Function
	largest-enabled burst length of INCR32/64/128/256. For cache line-aligned applications, this bit is typically set to 0 to ensure that the master interface uses only power-of-2 burst lengths (as enabled via GSBUSCFG0[7:0]).

29 UsbTxPktCntSel	USB Transmit Packet Count Enable This field enables/disables the USB transmission multi-packet thresholding: - 0: USB transmission multi-packet thresholding is disabled; the core can start transmission on the USB after the entire (one full) packet has been fetched into the corresponding TXFIFO. - 1: USB transmission multi-packet thresholding is enabled. The core can only start transmission on the USB after USB Transmit Packet Count amount of packets for the USB transaction (burst) are already in the corresponding TXFIFO. This mode is valid in both host and device modes. It is only used for SuperSpeed operation.
28 reserved_28	Reserved
27-24 UsbTxPktCnt	USB Transmit Packet Count This field specifies the number of packets that must be in the TXFIFO before the core can start transmission for the corresponding USB transaction (burst). This field is only valid when the USB Transmit Packet Count Enable field is set to one. Valid values are from 1 to 15. Note: - In device mode, if device controller does not have the TRBs for the number of packets or if it cannot fetch the TRBs because of high latency or switching between other endpoints, then it does not wait for the threshold number of packets. The threshold number of packets will be honored only when the TRBs are available in the controller for the number of packets before it starts the data fetch. - This field must be less than or equal to the USB Maximum TX Burst Size field.

Table continues on the next page...

Field	Function
23-16 UsbMaxTxBurstSize	USB Maximum TX Burst Size When UsbTxPktCntSel is one, this field specifies the Maximum Bulk OUT burst the core can do. When the system bus is slower than the USB, TX FIFO can underrun during a long burst. User can program a smaller value to this field to limit the TX burst size that the core can do. Host mode: It only applies to SS Bulk, Isochronous, and Interrupt OUT endpoints. Device mode: This value is not used in device mode, but users need to program a value when using the TX threshold feature to make sure that the value programmed in UsbTxPktCnt is less than this value. Valid values are from 1 to 16.
15 reserved_15	Reserved_15
14 reserved_14	Reserved1(Rsvd/Rs) Register field must write only 0 by the application. The read value must be treated as X (unknown).
13-11 reserved_13_11	Reserved (Rsvd/Rs) The register field must write only 0 by the application. The read value must be treated as X (unknown).
10-0 reserved_10_0	Reserved for future use

11.1.3.1.49 Global Rx Threshold Control Register (GRXTHRCFG)

11.1.3.1.49.1 Offset

Register	Offset
GRXTHRCFG	C10Ch

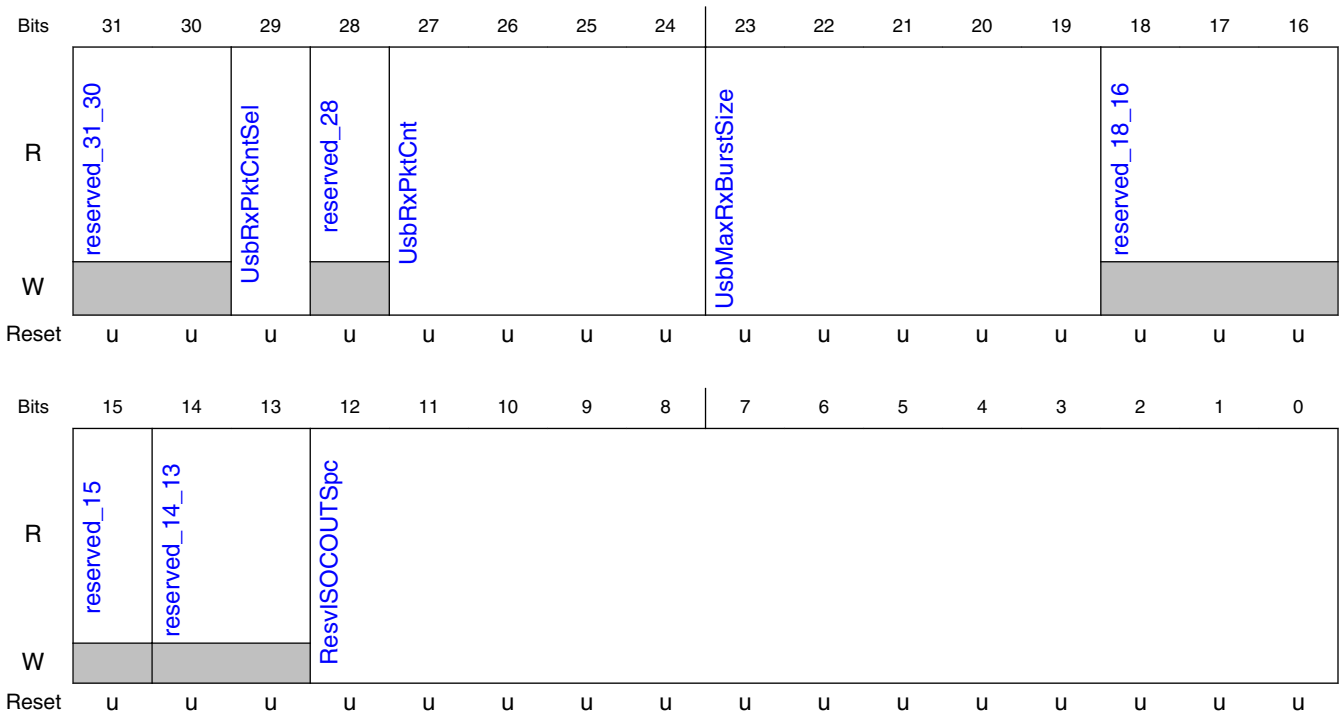
11.1.3.1.49.2 Function

This register is not applicable for debug target and USB 2.0-only mode. In a normal case, a Tx burst starts as soon as one packet is prefetched; an Rx burst starts as soon as 1-packet space is available.

Reset Mask:0xD007E000

Reset Default Value:0x0

11.1.3.1.49.3 Diagram



11.1.3.1.49.4 Fields

Field	Function
31-30 reserved_31_30	Reserved
29 UsbRxPktCntSel	USB Receive Packet Count Enable This field enables/disables the USB reception multi-packet thresholding: - 0: The core can only start reception on the USB when the RX FIFO has space for at least one packet. - 1: The core can only start reception on the USB when the RX FIFO has space for at least UsbRxPktCnt amount of packets. This mode is valid in both host and device mode. It is only used for SuperSpeed. In device mode, - Setting this bit to 1 also enables the functionality of reporting NUMP in the ACK TP based on the RX FIFO space instead of reporting a fixed NUMP derived from DCFG.NUMP for non-control endpoints. - If you are using external buffer control (EBC) feature, disable this mode by setting UsbRxPktCntSel to 0.
28 reserved_28	Reserved
27-24 UsbRxPktCnt	USB Receive Packet Count In host mode, this field specifies the space (in terms of the number of packets) that must be available in the RX FIFO before the core can start the corresponding USB RX transaction (burst). In device mode, this field specifies the space (in terms of the number of packets) that must be available in the RX FIFO before the core can send ERDY for a flow-controlled endpoint. This field is valid only when the USB Receive Packet Count Enable field is set to 1. The valid values for this field are from 1 to 15. Note: This field must be less than or equal to the USB Maximum Receive Burst Size field.
23-19	USB Maximum Receive Burst Size In host mode, this field specifies the Maximum Bulk IN burst the DWC_usb3 core can perform. When the system bus is slower than the USB, RX FIFO can overrun during a long burst. You can program a smaller value to this field to limit the RX burst size that the core can

Table continues on the next page...

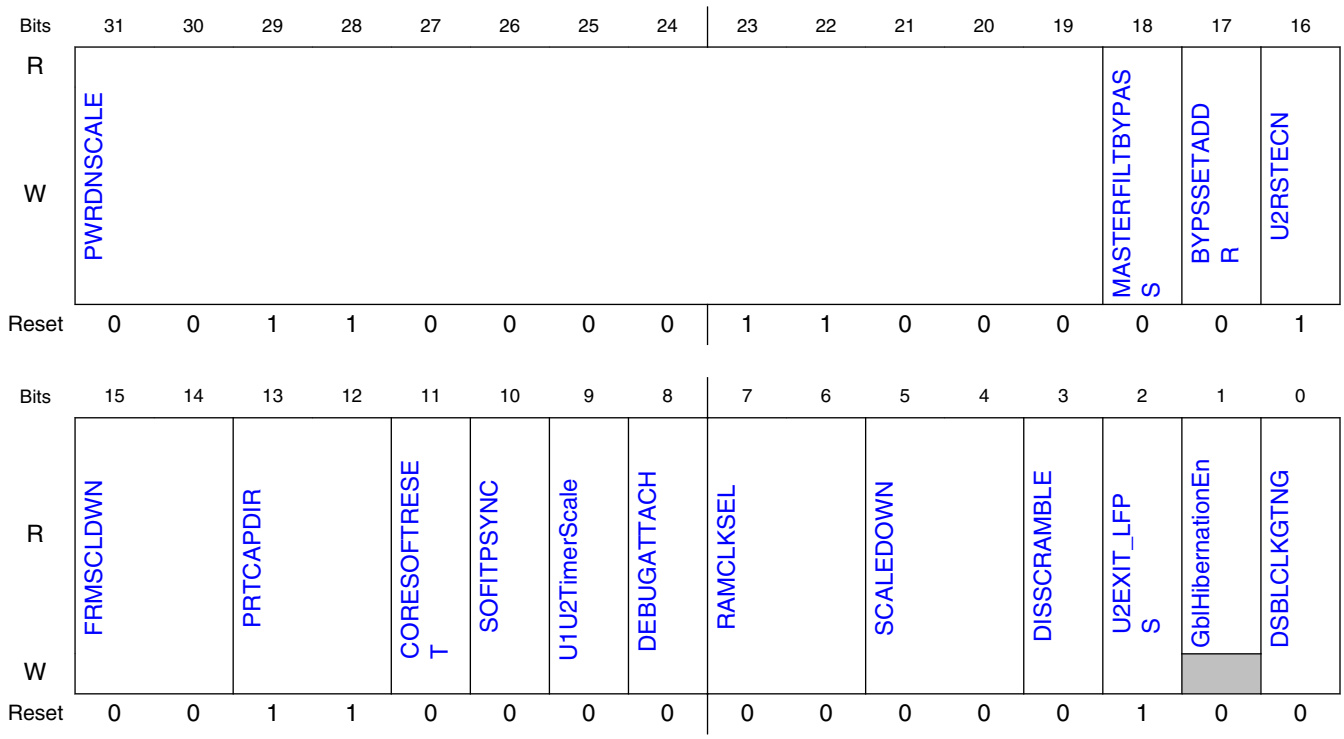
Field	Function
UsbMaxRxBurstSize	perform. It only applies to SS Bulk, Isochronous, and Interrupt IN endpoints in the host mode. In device mode, this field specifies the NUMP value that is sent in ERDY for an OUT endpoint. The programmed value should not exceed the RXFIFO size. This field is valid only when UsbRxPktCntSel is one. The valid values for this field are from 1 to 16.
18-16 reserved_18_16	Reserved
15 reserved_15	Reserved
14-13 reserved_14_13	Reserved
12-0 ResvISOCOUTSpc	Space reserved in Rx FIFO for ISOC OUT In host mode, this field is not applicable and must be programmed to 0. In device mode, this value represents the amount of space to be reserved for ISOC OUT packets. The value to be programmed should be chosen so as to ensure that non ISOC packets are not completely dropped. If no space needs to be reserved for ISOC OUT packets, program this field to 0. This field is valid only in device mode. The maximum configurable depth of RX FIFO is 8192. Therefore, this field is 13 bits wide. The value of space reserved is in terms of DWC_USB3_MDWIDTH. For SS, the space reservation is always rounded off to the nearest packet boundary. Therefore, it is always recommended to program a value corresponding to MPS or its multiples. For HS/FS, the space reservation is the actual value. Note: For SS, reserve space for ISOC when the Rx FIFO space can accommodate two MPS or more. Otherwise, this may result in degraded performance for non-ISOC packets. If the space is entirely allocated for ISOC, the non-ISOC packets will be completely dropped. To help you decide during the time of configuring the core, refer to the section "Device-Mode Receive Path" in Chapter 3.

11.1.3.1.50 Global Core Control Register (GCTL)

11.1.3.1.50.1 Offset

Register	Offset
GCTL	C110h

11.1.3.1.50.2 Diagram



11.1.3.1.50.3 Fields

Field	Function
31-19 PWRDNSCALE	Power Down Scale (PwrDnScale) The USB3 suspend_clk input replaces pipe3_rx_pclk as a clock source to a small part of the USB3 core that operates when the SS PHY is in its lowest power (P3) state, and therefore does not provide a clock. The Power Down Scale field specifies how many suspend_clk periods fit into a 16 kHz clock period. When performing the division, round up the remainder. For example, when using an 8-bit/16-bit/32-bit PHY and 25-MHz Suspend clock, Power Down Scale = 25000 kHz/16 kHz = 13'd1563 (rounder up) Note: - Minimum Suspend clock frequency is 32 kHz - Maximum Suspend clock frequency is 125 MHz The LTSSM uses Suspend clock for 12-ms and 100-ms timers during suspend mode. According to the USB 3.0 specification, the accuracy on these timers is 0% to +50%. - 12 ms + 0~+50% accuracy = 18 ms (Range is 12 ms - 18 ms) - 100 ms + 0~+50% accuracy = 150 ms (Range is 100 ms - 150 ms). The suspend clock accuracy requirement is: - (12,000/62.5) * (GCTL[31:19]) * actual suspend_clk_period must be between 12,000 and 18,000 - (100,0000/62.5) * (GCTL[31:19]) * actual suspend_clk_period must be between 100,000 and 150,000 For example, if your suspend_clk frequency varies from 7.5 MHz to 10.5MHz, then the value needs to programmed is: Power Down Scale = 10500/16 = 657 (rounded up; and fastest frequency used).
18 MASTERFILTBYPASS	Master Filter Bypass When this bit is set to 1'b1, irrespective of the parameter `DWC_USB3_EN_BUS_FILTERS chosen, all the filters in the DWC_usb3_filter module are bypassed. The double synchronizers to mac_clk preceding the filters are also bypassed. For enabling the filters, this bit must be 1'b0.
17 BYPSSETADDR	Bypass SetAddress in Device Mode. When BYPSSETADDR bit is set, the device core uses the value in the DCFG[DevAddr] bits directly for comparing the device address in the tokens. For simulation, you can use this feature to avoid sending an actual SET ADDRESS control transfer on the USB, and make the device core respond to a new address. When the xHCI Debug capability is enabled and this bit is set, the Debug Target immediately enters the configured state without requiring the Debug Host to send a

Table continues on the next page...

Field	Function
	SetAddress or SetConfig request. Note: You can set this bit for simulation purposes only. In the actual hardware, this bit must be set to 1'b0.
16 U2RSTECN	U2RSTECN If the SuperSpeed connection fails during POLL or LMP exchange, the device connects at non-SS mode. If this bit is set, then device attempts three more times to connect at SS, even if it previously failed to operate in SS mode. For each attempt, the device checks receiver termination eight times. From 2.60a release, this bit controls whether to check for Rx.Detect eight times or one time for every attempt. Device controller on USB 2.0 reset checks for receiver termination eight times per attempt if this bit is set to zero, or only once per attempt if the bit is set to one. Note: This bit is applicable only in device mode.
15-14 FRMSCLDWN	FRMSCLDWN This field scales down device view of a SOF/USOF/ITP duration. For SS/HS mode: - Value of 2'h3 implements interval to be 15.625 us - Value of 2'h2 implements interval to be 31.25 us - Value of 2'h1 implements interval to be 62.5 us - Value of 2'h0 implements interval to be 125us For FS mode, the scale-down value is multiplied by 8. When xHCI Debug Capability is enabled, this field also scales down the MaxPacketSize of the IN and OUT bulk endpoint to allow more traffic during simulation. It can only be changed from a non-zero value during simulation. - 2'h0: 1024 bytes - 2'h1: 512 bytes - 2'h2: 256 bytes - 2'h3: 128 bytes
13-12 PRTCAPDIR	PRTCAPDIR: Port Capability Direction (PrtCapDir) - 2'b01: for Host configurations - 2'b10: for Device configurations - 2'b11: for OTG configurations When DWC_USB3_EN_OTG is 0, then the core acts as a DRD. When DWC_USB3_EN_OTG is 1, - If PrtCapDir is 2'b11, it acts as an OTG 2.0 device with A-device or B-device determined by the IDDIG input, and Host or Peripheral role based on HNP. - If PrtCapDir is 2'b01, it acts as a DRD in host mode. - If PrtCapDir is 2'b10, it acts as a DRD in device mode. The OTG device can be programmed to enable/disable SRP and HNP by using the fields present in OCFG register. When DWC_USB3_EN_OTG is 2, - If PrtCapDir is 2'b11, it acts as an OTG 3.0 device with A-device or B-device determined by the IDDIG input, and Host or Peripheral role based on HNP/ RSP. - If PrtCapDir is 2'b01, it acts as a DRD in host mode. In this mode, the VBUS is driven immediately after power-on reset. When the DWC_usb3 controller is plugged into a PC and the application configures the device later on, VBUS is driven on the USB from both sides of the cable. This will potentially damage the PC host. - If PrtCapDir is 2'b10, it acts as a DRD in device mode. The OTG device can be programmed to enable/disable SRP and HNP/RSP using the fields present in the OCFG register. Note: For static Host-only/Device-only applications, use DRD Host or DRD Device mode. The combination of GCTL.PrtCapDir=2'b11 with SRP and HNP/RSP disabled is not recommended for these applications. The sequence for switching modes in DRD configuration is as follows: Switching from Device to Host: 1. Reset the controller using GCTL[11] (CoreSoftReset). 2. Set GCTL[13:12] (PrtCapDir) to 2'b01 (Host mode). 3. Reset the host using USBCMD.HCRESET. 4. Follow the steps in "Initializing Host Registers" section of the databook. Switching from Host to Device: 1. Reset the controller using GCTL[11] (CoreSoftReset). 2. Set GCTL[13:12] (PrtCapDir) to 2'b10 (Device mode). 3. Reset the device by setting DCTL[30] (CSftRst). 4. Follow the steps in "Register Initialization" section of the databook. Programming this field with random data causes the core to keep toggling between the host mode and the device mode . Bit Bash register testing is not recommended.
11 CORESOFTRESET	Core Soft Reset (CoreSoftReset) - 1'b0 - No soft reset - 1'b1 - Soft reset to core Clears the interrupts and all the CSRs except the following registers: - GCTL - GUCTL - GSTS - GSNPSID - GGPIO - GUID - GUSB2PHYCFGn registers - GUSB3PIPECTLn registers - DCFG - DCTL - DEVTEN - DSTS When you reset PHYs (using GUBS3PHYCFG or GUSB3PIPECTL registers), you must keep the core in reset state until PHY clocks are stable. This controls the bus, ram, and mac domain resets. Refer to the "Reset Generation" section in the Architecture Details chapter in the DesignWare Cores SuperSpeed USB 3.0 Controller Databook. Note: This bit is for debug purposes only. Use USBCMD.HCRESET in xHCI Mode and DCTL.SoftReset in device mode for soft reset. Programming this field with random data will reset the internal logic of the host controller. Due to this side effect Bit Bash register testing is not recommended.
10 SOFITPSYNC	SOFITPSYNC If this bit is set to '0' operating in host mode, the core keeps the UTMI/ULPI PHY on the first port in a non-suspended state whenever there is a SuperSpeed port that is not in Rx.Detect, SS.Disable and U3. If this bit is set to '1' operating in host mode, the core keeps the UTMI/ULPI PHY on the first port in a non-suspended state whenever the other non-SuperSpeed ports are not in a suspended state. This feature is useful because it saves power by suspending UTMI/ULPI when SuperSpeed only is active, and it helps resolve when the PHY does not transmit a host resume unless it is placed in suspend state. This bit must be programmed as a part of initialization at power-on reset, and must not be

Table continues on the next page...

Field	Function
	dynamically changed afterwards. Note: - USB2PHYCFGn[6].PhySusp eventually decides to put the UTMI/ULPI PHY in to suspend state. In addition, when this bit is set to '1', the core generates ITP from the ref_clk based counter. Otherwise, ITP and SOF are generated from utmi/ulpi_clk[0] based counter. To program the reference clock period inside the core, refer to GUCTL[31:22].REFCLKPER. - This feature is valid in Host and DRD/OTG configurations and used only in Host mode operation. - If you never use this feature or the GFLADJ.GFLADJ_REFCLK_LPM_SEL, the minimum frequency for the ref_clk can be as low as 32KHz. You can connect the suspend_clk (as low as 32 KHz) to the ref_clk. - If you plan to enable hardware-based LPM or software-based LPM (PORTPMSC. HLE=1), then you cannot use this feature. Turn off this feature by setting this bit to '0' and use the GFLADJ.GFLADJ_REFCLK_LPM_SEL feature. - If you set this bit to '1', the GUSB2PHYCFG.U2_FREECLK_EXISTS bit and the DWC_USB3_FREECLK_USB2_EXIST parameter must be set to '0'. Program this bit to 0 if the core is intended to be operated in USB 3.0 mode.
9 U1U2TimerScale	Disable U1/U2 timer Scaledown (U1U2TimerScale). If set to '1' along with GCTL[5:4] (ScaleDown) = 2'bX1, disables the scale down of U1/U2 inactive timer values. This is for simulation mode only.
8 DEBUGATTACH	Debug Attach When this bit is set, - SS Link proceeds directly to the Polling link state (after RUN/STOP in the DCTL register is asserted) without checking remote termination; - Link LFPS polling timeout is infinite; - Polling timeout during TS1 is infinite (in case link is waiting for TXEQ to finish).
7-6 RAMCLKSEL	RAM Clock Select (RAMClkSel) - 2'b00: bus clock - 2'b01: pipe clock (Only used in device mode) - 2'b10: In device mode , pipe/2 clock.In Host mode, controller switches ram_clk between pipe/2 clock, mac2_clk and bus_clk based on the status of the U2/U3 ports - 2'b11: In device mode, selects mac2_clk as ram_clk (when 8-bit UTMI or ULPI used. Not supported in 16-bit UTMI mode) In Host mode, controller switches ram_clk between pipe_clk, mac2_clk and bus_clk based on the status of the U2/U3 ports. In device mode, upon a USB reset and USB disconnect, the hardware clears these bits to 2'b00. For more information on how to select the RAM clock, see "Clock Generation and Clock Tree Synthesis (CTS) Requirements" in the Architectural Details chapter in the DesignWare Cores SuperSpeed USB 3.0 Controller Databook. Note: - In device mode, if you set RAMClkSel to 2'b11 (mac2_clk), the controller internally switches the ram_clk to bus_clk when the link state changes to Suspend (L2 or L3), and switches the ram_clk back to mac2_clk when the link state changes to resume or U2. - In host mode, if a value of 2/3 is chosen, then controller switches ram_clk between bus_clk, mac2_clk and pipe_clk, pipe_clk/2, based on the state of the U2/U3 ports. For example if only the U2 port is active and the U3 ports are suspended, then the ram_clk is swicthed to mac2_clk. When only the U3 ports are active and the U2 ports are suspended, then the core internally swicth the ram_clk to pipe3 clock and when all U2 and U3 ports are suspended, it switch the ram_clk to bus_clk. This allows de coupling the ram_clk from the bus_clk and depending on the bandwidth requiredmnet allows the bus_clk to be run at a lower frequency than the ram_clk requirements. bus_clk frequency still cannot go below 60Mhz in host mode, and this is not verified. A value of 2 can be chosen only if the pipe data width is 8 or 16 bits. In this case the when the ram_clk is switched to pipe_clk, it uses pipe_clk/2 instead of pipe_clk. If a value of 3 is chosen for RAMClkSel, then when ram_clk is switched to pipe_clk, then pipe_clk is used without any divider. - In device mode, when RAMClkSel != 2'b00, the bus_clk_early frequency can be a minimum of 1 MHz. This is tested in simulation and also in hardware with Linux, Microsoft Windows 8, and MCCI Windows7 host drivers. Only control and non periodic transfers are supported when bus_clk is 1 MHz. For periodic applications, the bus_clk_early minimum frequency is higher depending on your application and SoC bus. Even though 1 MHz has been tested with standard host drivers, Synopsys recommends 5 MHz minimum for ASIC designs to provide a margin or at least have a backup option to increase the bus_clk frequency to 5 MHz if needed. Programming this field with random data will cause side effect. Bit Bash register testing is not recommended.
5-4 SCALEDOWN	Scale-Down Mode (ScaleDown) When Scale-Down mode is enabled for simulation, the core uses scaled-down timing values, resulting in faster simulations. When Scale-Down mode is disabled, actual timing values are used. This is required for hardware operation. HS/FS/LS Modes - 2'b00: Disables all scale-downs. Actual timing values are used. - 2'b01: Enables scale-down of all timing values except Device mode suspend and resume. These include Speed enumeration, HNP/SRP, and Host mode suspend and resume - 2'b10: Enables scale-down of Device mode suspend and resume timing values only. - 2'b11: Enables bit 0 and bit 1 scale-down timing values. SS Mode - 2'b00: Disables all scale-downs. Actual timing values are used. - 2'b01: Enables scaled down SS timing and repeat values including: (1) Number

Table continues on the next page...

Field	Function
	of TxEq training sequences reduce to 8; (2) LFPS polling burst time reduce to 256 nS; (3) LFPS warm reset receive reduce to 30 uS. Refer to the rtl_vip_scaledown_mapping.xls file under <workspace>/sim/SoC_sim directory for the complete list. - 2'b10: No TxEq training sequences are sent. Overrides Bit 4. - 2'b11: Enables bit 0 and bit 1 scale-down timing values.
3 DISSCRAMBLE	Disable Scrambling (DisScramble) Transmit request to Link Partner on next transition to Recovery or Polling.
2 U2EXIT_LFPS	U2EXIT_LFPS If this bit is, - 0: the link treats 248ns LFPS as a valid U2 exit. - 1: the link waits for 8us of LFPS before it detects a valid U2 exit. This bit is added to improve interoperability with a third-party host/device controller. This host/device controller in U2 state while performing receiver detection generates an LFPS glitch of about 4ms duration. This causes the host/device to exit from U2 state because the LFPS filter value is 248ns. With the new functionality enabled, the host/device can stay in U2 while ignoring this glitch from the host/device controller. This bit is applicable for both host and device controller. This bit is added to improve interoperability with a third party host controller. This host controller in U2 state while performing receiver detection generates an LFPS glitch of about 4ms duration. This causes the device to exit from U2 state because the LFPS filter value is 248ns. With the new functionality enabled, the device can stay in U2 while ignoring this glitch from the host controller.
1 GblHibernationEn	GblHibernationEn This bit enables hibernation at the global level. If hibernation is not enabled through this bit, the PMU immediately accepts the D0->D3 and D3->D0 power state change requests, but does not save or restore any core state. In addition, the PMUs never drive the PHY interfaces and let the core continue to drive the PHY interfaces.
0 DSBLCLKGTNG	Disable Clock Gating (DsblClkGtng) This bit is set to 1 and the core is in Low Power mode, internal clock gating is disabled. You can set this bit to 1'b1 after Power On Reset.

11.1.3.1.52.4 Fields

Field	Function
31 DEV_DECOUPLE_L1L2_EVT	DEV_DECOUPLE_L1L2_EVT - 0: Default behavior, no change in device events L1/L2U3 events are not decoupled (old behavior of v2.90a and before) - 1: Feature enabled, L1 and L2 events are separated when operating in 2.0 mode. Separate event enable bits for L1 suspend and wake events. This bit is applicable for device mode only. If this feature is enabled, L1 suspend and wake events have individual controls to enable/mask them. Enable this feature if you want to get L1 (LPM) events separtely and not combined with L2 events when operating in 2.0 speeds.
30 DS_RXDET_MAX_TOUT_CTRL	DS_RXDET_MAX_TOUT_CTRL This bit is used to control the tRxDetectTimeoutDFP timer for the SuperSpeed link. - 0: Default behavior; 12ms is used as tRxDetectTimeoutDFP. - 1: 120ms is used as the tRxDetectTimeoutDFP. This bit is used only in host mode. For more details, refer to ECN020 for USB 3.0 Specification.
29	FILTER_SE0_FSLS_EOP - 0: Default behavior, no change in Linestate check for SE0 detection in FS/LS - 1: Feature enabled, FS/LS SE0 is filtered for 2 clocks for detecting EOP This bit is applicable for FS/LS operation. If this feature is enabled, then SE0 on the linestate is validated for 2 consecutive utmi/ulpi

Table continues on the next page...

Field	Function
FILTER_SE0_FSLS_EOP	clock edges for EOP detection. This feature is applicable only in FS in device mode and FS/LS mode of operation in host mode. Device mode: FS - If GUCTL1.FILTER_SE0_FSLS_EOP is set, then for device LPM handshake, the core will ignore single SE0 glitch on the linestate during transmit. Only 2 or more SE0 is considered as a valid EOP on FS. Host mode: FS/LS - If GUCTL1.FILTER_SE0_FSLS_EOP is set, then the core will ignore single SE0 glitch on the linestate during transmit. Only 2 or more SE0 is considered as a valid EOP on FS/LS port. Enable this feature if the LineState has SE0 glitches during transmission. This bit is quasi-static, that is, it must not be changed during device operation.
28 TX_IPGAP_LINECHECK_DIS	TX_IPGAP_LINECHECK_DIS - 0: Default behavior, no change in Linestate check - 1: Feature enabled, 2.0 MAC disables Linestate check during HS transmit This bit is applicable for HS operation of u2mac. If this feature is enabled, then the 2.0 mac operating in HS ignores the UTMI/ULPI Linestate during the transmit of a token (during token-to-token and token-to-data IPGAP). When enabled, the controller implements a fixed 40-bit TxEndDelay after the packet is given on UTMI and ignores the Linestate during this time. This feature is applicable only in HS mode of operation. Device mode: If GUCTL1.TX_IPGAP_LINECHECK_DIS is set, then for device LPM handshake, the core will ignore the linestate after TX and wait for fixed clocks (40 bit times equivalent) after transmitting ACK on utmi. Host mode: If GUCTL1.TX_IPGAP_LINECHECK_DIS is set, then the ipgap between (tkn to tkn/data) is added by 40 bit times of TXENDDELAY, and linestate is ignored during this 40 bit times delay. Enable this bit if the LineState will not reflect the expected line state (J) during transmission. This bit is quasi-static, that is, it must not be changed during device operation.
27 DEV_TRB_OUT_SPR_IND	DEV_TRB_OUT_SPR_IND - 0: Default behavior, no change in TRB status dword - 1: Feature enabled, OUT TRB status indicates Short Packet This bit is applicable for device mode only (and ignored in host mode). If the device application (software/hardware) wants to know if a short packet was received for an OUT in the TRB status itself, then this feature can be enabled, so that a bit is set in the TRB writeback in the buf_size dword. Bit[26] - SPR of the {trbstatus, RSVD, SPR, PCM1, bufsize} dword will be set during an OUT transfer TRB write back if this is the last TRB used for that transfer descriptor. This bit is quasi-static, that is, it must not be changed during device operation.
26 DEV_FORCE_20_CLK_FOR_30_CLK	DEV_FORCE_20_CLK_FOR_30_CLK - 0: Default behavior, Uses 3.0 clock when operating in 2.0 mode - 1: Feature enabled This bit is applicable (and to be set) for device mode (DCFG.Speed != SS) only. In the 3.0 device core, if the core is programmed to operate in 2.0 only (that is, Device Speed is programmed to 2.0 speeds in DCFG[Speed]), then setting this bit makes the internal 2.0 (utmi/ulpi) clock to be routed as the 3.0 (pipe) clock. Enabling this feature allows the pipe3 clock to be not-running when forcibly operating in 2.0 device mode. Note: - When using this feature, all pipe3 inputs must be in inactive mode. In particular, the pipe3 clocks must not be running and the pipe3_phystatus_async must be tied to 0. This bit should not be set if the core is programmed to operate in SuperSpeed mode (even when it falls back to 2.0). - This bit is quasi-static, that is, it must not be changed during operation. - If the parameter "DWC_USB3_REMOVE_PIPE_CLK_MUX_FOR_20_MODE" is enabled, then muxing 2.0 clock/signals to pipe_clk/signals have to be done outside the controller for this feature to work.
25 P3_IN_U2	P3_IN_U2 - 0: Default behavior, When SuperSpeed link is in U2, PowerState P2 is attempted on the PIPE Interface. - 1: When SuperSpeed link is in U2, PowerState P3 is attempted if GUSB3PIPECTL[17] is set. Setting this bit enables P3 Power State when the SuperSpeed link is in U2. Another Power Saving option. Check with your PHY vendor before enabling this option.When setting this bit to 1 to enable P3 in P2, GUSB3PIPECTL[27] should be set to 0 to make sure that the U2 exit is attempted in P0. This bit should be set only when GCTL.SOFITPSYNC=1 or GFLADJ.GFLADJ_REFCLK_LPM_SEL=1.
24 DEV_L1_EXIT_BY_HW	DEV_L1_EXIT_BY_HW - 0: Default behavior, disables device L1 hardware exit logic - 1: feature enabled This bit is applicable for device mode (2.0) only. This field enables device controller sending remote wakeup for L1 if the device becomes ready for sending/accepting data when in L1 state. If the host expects the device to send remote wakeup signaling to resume after going into L1 in flow controlled state, then this bit can be set to send the remote wake signal automatically when the device controller becomes ready. This hardware remote wake feature is applicable only to bulk and interrupt transfers, and not for Isoch/Control - When control transfers are in progress, the LPM will be rejected (NYET response). Only after control transfers are completed (either with ACK/STALL), LPM will be accepted - For Isoch transfers, the host needs to do the wake-up and start the transfer. Device controller will not do remote-wakeup when Isoch endpoints get ready. The device SW needs to keep the GUSB2PHYCFG[EnblSlpM] reset in order to keep the PHY clock to be running for keeping track of SOF intervals. - When L1

Table continues on the next page...

Field	Function
	hibernation is enabled, the controller will not do automatic exit for hibernation requests thru L1. This bit is quasi-static, that is, it must not be changed during device operation.
23-21 IP_GAP_ADD_ON	This register field is used to add on to the default inter packet gap setting in the USB 2.0 MAC. This should be programmed to a non zero value only in case where you need to increase the default inter packet delay calculations in the USB 2.0 MAC module DWC_usb3_u2mac.v
20 DEV_LSP_TAIL_LOCK_DIS	DEV_LSP_TAIL_LOCK_DIS - 0: Default behavior, enables device lsp lock logic for tail TRB update - 1: Fix disabled This is a bug fix for STAR 9000716195 that affects the CSP mode for OUT endpoints in device mode. The issue is that tail TRB index is not synchronized with the cache Scratchpad bytecount update. If the fast-forward request comes in-between the bytecount update on a newly fetched TRB and the tail-index write update in TPF, the RDP works on an incorrect tail index and misses the byte count decrement for the newly fetched TRB in the fast-forwarding process. This fix needs to be present all the times.
19 NAK_PER_ENH_FS	NAK_PER_ENH_FS - 1: Enables performance enhancement for FS async endpoints in the presence of NAKs - 0: Enhancement not applied If a periodic endpoint is present , and if a bulk endpoint which is also active is being NAKed by the device, then this could result in a decrease in performance of other Full Speed bulk endpoint which is ACked by the device. Setting this bit to 1, will enable the host controller to schedule more transactions to the async endpoints (bulk/ control) and hence will improve the performance of the bulk endpoint. This control bit should be enabled only if the existing performance with the default setting is not sufficient for your FullSpeed application. Setting this bit will only control, and is only required for Full Speed transfers.
18 NAK_PER_ENH_HS	NAK_PER_ENH_HS - 1: Enables performance enhancement for HS async endpoints in the presence of NAKs - 0: Enhancement not applied If a periodic endpoint is present, and if a bulk endpoint which is also active is being NAKed by the device, then this could result in decrease in performance of other High Speed bulk endpoint which is ACked by the device. Setting this bit to 1, will enable the host controller to schedule more transactions to the async endpoints (bulk/ control) and hence will improve the performance of the bulk endpoint. This control bit should be enabled only if the existing performance with the default setting is not sufficient for your HighSpeed application. Setting this bit will only control, and is only required for High Speed transfers.
17 PARKMODE_DISABLE_SS	PARKMODE_DISABLE_SS This bit is used only in host mode, and is for debug purpose only. When this bit is set to '1' all SS bus instances in park mode are disabled.
16 PARKMODE_DISABLE_HS	PARKMODE_DISABLE_HS This bit is used only in host mode. When this bit is set to '1' all HS bus instances park mode are disabled. To improve performance in park mode, the xHCI scheduler queues in three requests of 4 packets each for High Speed asynchronous endpoints in a micro-frame. But if a device is slow and if it NAKs more than 3 times, then it is rescheduled only in the next micro-frame. This could decrease the performance of a slow device even further. In a few high speed devices (such as Sandisk Cruzer Blade 4GB VID:1921, PID:21863 and Flex Drive VID:3744, PID:8552) when an IN request is sent within 900ns of the ACK of the previous packet, these devices send a NAK. When connected to these devices, if required, the software can disable the park mode if you see performance drop in your system. When park mode is disabled, pipelining of multiple packet is disabled and instead one packet at a time is requested by the scheduler. This allows up to 12 NAKs in a micro-frame and improves performance of these slow devices.
15 PARKMODE_DISABLE_FSLS	PARKMODE_DISABLE_FSLS This bit is used only in host mode, and is for debug purpose only. When this bit is set to '1' all FS/LS bus instances in park mode disabled.
14-11 reserved_14_11	Reserved
10 RESUME_OPMODE_HS_HOST	RESUME_OPMODE_HS_HOST This bit is used only in host mode, and is for USB 2.0 opmode behavior in HS Resume. - When this bit is set to '1', the UTMI/ULPI opmode will be changed to "normal" along with HS terminations after EOR. This option is to support certain legacy UTMI/ULPI PHYs. - When this bit is set to '0', the UTMI/ULPI opmode will be changed to "normal" 2us after HS terminations change after EOR. This is the default behavior.

Table continues on the next page...

Field	Function
9 DEV_HS_NYET_BULK_SPR	DEV_HS_NYET_BULK_SPR - 0: Default behavior, no change in device response - 1: Feature enabled, HS bulk OUT short packet gets NYET response This bit is applicable for device mode only (and ignored in host mode) to be used in 2.0 operation. If this bit is set, the device core sends NYET response instead of ACK response for a successfully received bulk OUT short packet. If NYET is sent after receiving short packet, then the host would PING before sending the next OUT; this improves the performance as well as clears up the buffer/cache on the host side. Internal to the device core, short packet (SPR=1) processing takes some time, and during this time, the USB is flow controlled. With NYET response instead of ACK on short packet, the host does not send another OUT-DATA without pinging in HS mode. This bit is quasi-static, that is, it must not be changed during device operation.
8 L1_SUSP_THRLD_EN_FOR_HOST	L1_SUSP_THRLD_EN_FOR_HOST This bit is used only in host mode. The host controller asserts the utmi_l1_suspend_n and utmi_sleep_n output signals (see "LPM Interface Signals" table in the Databook) as follows: The controller asserts the utmi_l1_suspend_n signal to put the PHY into deep low-power mode in L1 when both of the following are true: - The HIRD/BESL value used is greater than or equal to the value in L1_SUSP_THRLD_FOR_HOST field. - The L1_SUSP_THRLD_EN_FOR_HOST bit is set to 1'b1. The controller asserts utmi_sleep_n on L1 when one of the following is true: - The HIRD/BESL value used is less than the value in L1_SUSP_THRLD_FOR_HOST field. - The L1_SUSP_THRLD_EN_FOR_HOST bit is set to 1'b0.
7-4 L1_SUSP_THRLD_FOR_HOST	L1_SUSP_THRLD_FOR_HOST This field is effective only when the L1_SUSP_THRLD_EN_FOR_HOST bit is set to 1. For more details, refer to the description of the L1_SUSP_THRLD_EN_FOR_HOST bit.
3 HC_ERRATA_ENABLE	Host ELD Enable (HELDEn) When this bit is set to 1, it enables the Exit Latency Delta (ELD) support defined in the xHCI 1.0 Errata. This bit is used only in the host mode. This bit has to be set to 1 in Host mode.
2 HC_PARCHK_DISABLE	Host Parameter Check Disable (HParChkDisable) When this bit is set to '0' (by default), the xHC checks that the input slot/EP context fields comply to the xHCI Specification. Upon detection of a parameter error during command execution, the xHC generates an event TRB with completion code indicating 'PARAMETER ERROR'. When the bit is set to '1', the xHC does not perform parameter checks and does not generate 'PARAMETER ERROR' completion code.
1 OVRLD_L1_SUSP_COM	OVRLD_L1_SUSP_COM If this bit is set, the utmi_l1_suspend_com_n is overloaded with the utmi_sleep_n signal. This bit is usually set if the PHY stops the port clock during L1 sleep condition. Note: The recommended connection for the SUSPENDM/SLEEPM signals to the PHY with respect to this bit is as follows. For non-zero ports: Connect: - utmi_sleep_n[n] to SLEEPM[n] - (utmi_suspend_n[n] & utmi_l1_suspend_n[n]) to SUSPENDM[n] - USB2 PHYCLK[n] to utmi_clk[n] GUCTL1.OVRLD_L1_SUSP_COM impacts only Port0. For Port0: For Synopsys PHY, GUSB2PHYCFGn.U2_FREECLK_EXISTS=1; With this connection, the PHY keeps PLL active so that FREECLK is always available irrespective of suspend/sleep. - Connect USB2 PHY COMMONONN to 0. - Connect utmi_sleep_n[0] to SLEEPM[0]. - Connect (utmi_suspend_n[0] & utmi_l1_suspend_n[0]) to SUSPENDM[0]. - Connect USB2 PHY FREECLK to utmi_clk[0]. - Leave utmi_suspend_com_n, utmi_l1_suspend_com_n unconnected. - GUCTL1.OVRLD_L1_SUSP_COM can be set to any value. For Third Party PHY, GUSB2PHYCFGn.U2_FREECLK_EXISTS=0; With this connection the PHY can shut off all the clocks when the required conditions are met (like, GUSB2PHYCFGn[8,6], GUCTL1[1], GFLADJ[23], GCTL[10], Suspend condition, HW LPM enable etc). - Connect -utmi_suspend_com_n to SUSPENDM[0] (or equivalent). - Connect -utmi_l1_suspend_com_n to SLEEPM[0] (or equivalent). - Connect PHYCLK0 (first port clock) to utmi_clk[0]. - Leave utmi_suspend_n[0], utmi_l1_suspend_ n[0], utmi_sleep_n[0] unconnected. - Set GUCTL1.OVRLD_L1_SUSP_COM to 1'b1.
0 LOA_FILTER_EN	LOA_FILTER_EN If this bit is set, the USB 2.0 port babble is checked at least three consecutive times before the port is disabled. This prevents false triggering of the babble condition when using low quality cables. Note: This bit is valid only in host mode.

11.1.3.1.53 Global User ID Register (GUID)

11.1.3.1.53.4 Fields

Field	Function
31-0 USERID	USERID Application-programmable ID field.

11.1.3.1.54 Global User Control Register (GUCTL)

11.1.3.1.54.1 Offset

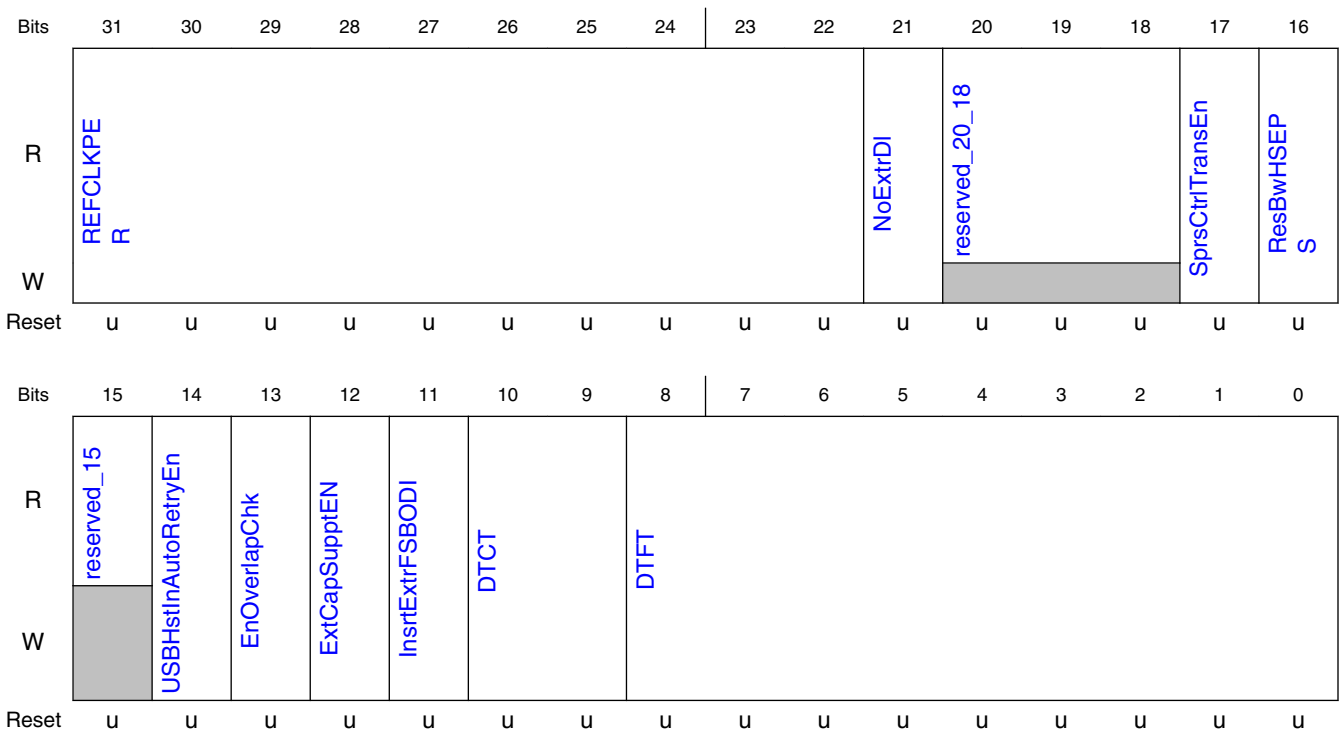
Register	Offset
GUCTL	C12Ch

11.1.3.1.54.2 Function

This register provides a few options for the software to control the core behavior in the Host mode.

Reset Mask: 0x1C8000

11.1.3.1.54.3 Diagram



11.1.3.1.54.4 Fields

Field	Function
31-22 REFCLKPER	REFCLKPER This field indicates in terms of nano seconds the period of ref_clk. The default value of this register is set to 'h8 (8ns/125 MHz). This field needs to be updated during power-on initialization, if GCTL.SOFITPSYNC or GFLADJ.GFLADJ_REFCLK_LPM_SEL is set to '1'. The programmable maximum value is 62ns, and the minimum value is 8ns. You must use a reference clock with a period that is an integer multiple, so that ITP can meet the jitter margin of 32ns. The allowable ref_clk frequencies whose period is not integer multiples are 16/17/19.2/24/39.7MHz. This field must not be set to '0' at any time. If you never plan to use this feature, then set this field to 'h8, the default value.
21 NoExtrDl	No Extra Delay Between SOF and the First Packet(NoExtrDl) Some HS devices misbehave when the host sends a packet immediately after a SOF. However, adding an extra delay between a SOF and the first packet can reduce the USB data rate and performance. This bit is used to control whether the host must wait for 2 microseconds before it sends the first packet after a SOF, or not. User can set this bit to one to improve the performance if those problematic devices are not a concern in the user's host environment. - 1'b0: Host waits for 2 microseconds after a SOF before it sends the first USB packet. - 1'b1: Host doesn't wait after a SOF before it sends the first USB packet.

Table continues on the next page...

Field	Function
20-18 reserved_20_18	Reserved
17 SprsCtrlTransEn	Sparse Control Transaction Enable Some devices are slow in responding to Control transfers. Scheduling multiple transactions in one microframe/frame can cause these devices to misbehave. If this bit is set to 1'b1, the host controller schedules transactions for a Control transfer in different microframes/frames.
16 ResBwHSEPS	Reserving 85% Bandwidth for HS Periodic EPs (ResBwHSEPS) By default, HC reserves 80% of the bandwidth for periodic EPs. If this bit is set, the bandwidth is relaxed to 85% to accommodate two high speed, high bandwidth ISOC EPs. USB 2.0 required 80% bandwidth allocated for ISOC traffic. If two High-bandwidth ISOC devices (HD Webcams) are connected, and if each requires 1024-bytes X 3 packets per Micro-Frame, then the bandwidth required is around 82%. If this bit is set, then it is possible to connect two Webcams of 1024bytes X 3 paylod per Micro-Frame each. Otherwise, you may have to reduce the resolution of the Webcams. This bit is valid in Host and DRD configuration and is used in host mode operation only. Ignore this bit in device mode.
15 reserved_15	Reserved
14 USBHstInAutoRetryEn	Host IN Auto Retry (USBHstInAutoRetryEn) When set, this field enables the Auto Retry feature. For IN transfers (non-isochronous) that encounter data packets with CRC errors or internal overrun scenarios, the auto retry feature causes the Host core to reply to the device with a non-terminating retry ACK (that is, an ACK transaction packet with Retry = 1 and NumP != 0). If the Auto Retry feature is disabled (default), the core will respond with a terminating retry ACK (that is, an ACK transaction packet with Retry = 1 and NumP = 0). - 1'b0: Auto Retry Disabled - 1'b1: Auto Retry Enabled Note: When enabling Auto Retry feature, if the system latency is large enough to cause the internal PSQ full (PSQ can be full as the result of messages not being processed because of pending fetches before flushing the TxQ due to NRDY/ERDY conditions), then the host controller can generate a transaction error.
13 EnOverlapChk	Enable Check for LFPS Overlap During Remote Ux Exit: If this bit is set to, - 1'b1: The SuperSpeed link when exiting U1/U2/U3 waits for either the remote link LFPS or TS1/TS2 training symbols before it confirms that the LFPS handshake is complete. This is done to handle the case where the LFPS glitch causes the link to start exiting from the low power state. Looking for the LFPS overlap makes sure that the link partner also sees the LFPS. - 1'b0: When the link exists U1/U2/U3 because of a remote exit, it does not look for an LFPS overlap.
12 ExtCapSupptEN	External Extended Capability Support Enable (ExtCapSuptEN) When set, this field enables extended capabilities to be implemented outside the core. When the ExtCapSupEN is set and the Debug Capability is enabled, the Next Capability pointer in "Debug Capability" returns 16. A read to the first DWORD of the last internal extended capability (the "xHCI Supported Protocol Capability for USB 3.0" when the Debug Capability is not enabled) returns a value of 4 in the Next Capability Pointer field. This indicates to software that there is another capability four DWORDs after this capability (for example, at address N+16 where N is the address of this DWORD). If enabled, an external address decoder that snoops the xHC slave interface must be implemented. If it sees an access to N+16 or greater, the slave access is re-routed to a piece of hardware which returns the external capability pointer register of the new capability and also handles reads/writes to this new capability and the side effects. If disabled, a read to the first DWORD of the last internal extended capability returns 0 in the 'Next Capability Pointer field. This indicates there are no more capabilities.
11 InsrtExtrFSBODI	Insert Extra Delay Between FS Bulk OUT Transactions (InsrtExtrFSBODl). Some FS devices are slow to receive Bulk OUT data and can get stuck when there are consecutive Bulk OUT transactions with short inter-transaction delays. This bit is used to control whether the host inserts extra delay between consecutive Bulk OUT transactions to a FS Endpoint. - 1'b0: Host doesn't insert extra delay between consecutive Bulk OUT transactions to a FS Endpoint. - 1'b1: Host inserts about 12us extra delay between consecutive Bulk OUT transactions to a FS Endpoint to work around the device issue. Note: Setting this bit to one will reduce the Bulk OUT transfer performance for most of the FS devices.
10-9 DTCT	Device Timeout Coarse Tuning (DTCT) This field is a Host mode parameter which determines how long the host waits for a response from device before considering a timeout. The core first checks the DTCT value. If it is 0, then the timeout value is defined by the DTFT. If it is non-zero, then it uses the following timeout values: - 2'b00: 0 usec -> use DTFT value instead - 2'b01: 500 usec - 2'b10: 1.5 msec - 2'b11:

Table continues on the next page...

Field	Function
	6.5 msec Note: When the system latency is larger than the programmed DTCT/DTFT value, if the host controller is not able to accept certain transactions on the bus (because of system bus delays), the controller may not release header credits which in turn can cause the host to report a transaction error. Therefore, program this value to be larger than your system delay.
8-0 DTFT	Device Timeout Fine Tuning (DTFT) This field is a Host mode parameter which determines how long the host waits for a response from device before considering a timeout. For the DTFT field to take effect, DTCT must be set to 2'b00. The DTFT value is the number of 125 MHz clocks * 256 to count before considering a device timeout. The minimum value of DTFT is 2. For example, if the mac3_clk is 125 MHz clk (8 ns period), this is calculated as follows: (DTFT value) * 256 * (8 ns) Quick Reference: - if DTFT = 0x2, 2*256*8 = 4usec timeout - if DTFT = 0x5, 5*256*8 = 10usec timeout - if DTFT = 0xA, 10*256*8 = 20usec timeout - if DTFT = 0x10, 16*256*8 = 32usec timeout - if DTFT = 0x19, 25*256*8 = 51usec timeout - if DTFT = 0x31, 49*256*8 = 100usec timeout - if DTFT = 0x62, 98*256*8 = 200usec timeout Note: - When SSIC is enabled, in HS_G1_G2_G3 mode when ssic_soc_pa_clk_freq = 2'b01, then DTFT value must be calculated for 156.25 MHz clock, for example, for equivalent delay of 32usec DTFT value must be 9'h14. - When the system latency is larger than the programmed DTCT/DTFT value, if the host controller is not able to accept certain transactions on the bus (because of system bus delays), the controller may not release header credits which in turn can cause the host to report a transaction error. Therefore, program this value to be larger than your system delay.

11.1.3.1.55 Gobal SoC Bus Error Address Register - Low (GBUSERRADDRLO)

11.1.3.1.55.1 Offset

Register	Offset
GBUSERRADDRLO	C130h

11.1.3.1.55.2 Function

This is an alternate register for the GBUSERRADDR register.

11.1.3.1.71.1 Offset

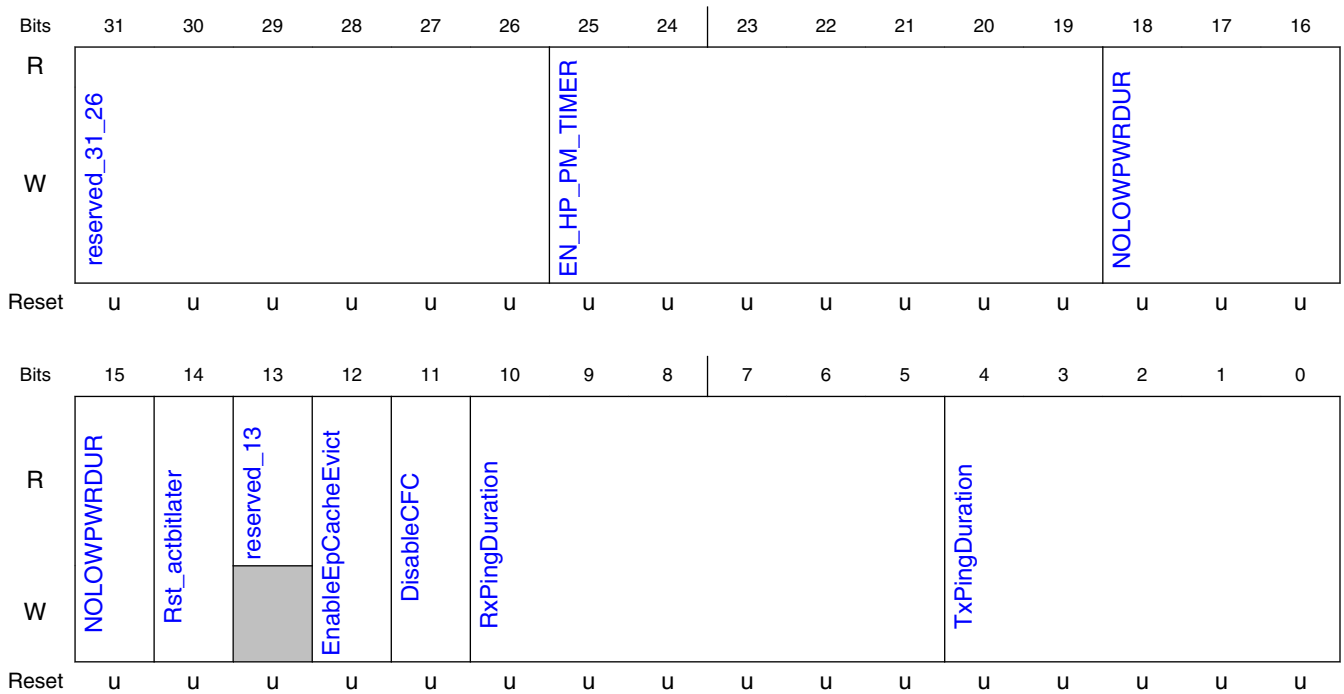
Register	Offset
GUCTL2	C19Ch

11.1.3.1.71.2 Function

This register provides a few options for the software to control the core behavior in the Host and device mode.

Reset Mask: 0x3FC008000

11.1.3.1.71.3 Diagram



11.1.3.1.71.4 Fields

Field	Function
31-26 reserved_31_26	Reserved
25-19 EN_HP_PM_TIMER	This register field is used to set new HP and PM timers. - To enable PM timer, set GUCTL2[19] bit as 1. - To enable HP timer, set GUCTL2[20] bit as 1. Default value is 4us, when new HP timer is enabled default value is 11us. Use GUCTL2[25:21] to specify HP timer value in microseconds.
18-15 NOLOWPWRDUR	No Low Power Duration (NOLOWPWRDUR) This bit is applicable for device mode only and is ignored in host mode. After starting a transfer on an ESS ISOC endpoint, the application must program these bits. Each count represents the duration in terms of milli seconds. For example, a value of 3 represents 3 ms.
14 Rst_actbitlater	Enable clearing of the command active bit for the ENDXFER command after the command execution is completed. This bit is valid in device mode only.
13 reserved_13	Reserved for future use
12 EnableEpCacheEvict	Enable Evicting Endpoint cache after Flow Control for bulk endpoints. In 3.00a release, a performance enhancement was done to keep the non-stream capable bulk IN endpoint in cache after flow control. Setting this bit will disable this enhancement. This should be set only for debug purpose.
11 DisableCFC	Disable xHCI Errata Feature Contiguous Frame ID Capability This field controls the xHCI Errata feature Contiguous FrameID capability. When set, the xHCI HCCPARAMS1 bit 11 will be set to 0 indicating that CFC is not supported. Disable this feature only if your application cannot tolerate Misssed Service Error events for Isoc transfers, and your system latencies are large to cause Missed Service errors even if the software is following the Isochronous Thresholding rules.

Table continues on the next page...

Field	Function
10-5 RxPingDuration	Recieve Ping Maximum Duration This field is relevant to Host mode and controls the maximum duration of received LFPS to be treated as a Ping LFPS. The Max duration of the Ping LFPS is controlled by programming this value and is in terms of 8 ns granularity. Eg: A value of 32 indicates 256 ns.
4-0 TxPingDuration	Transmit Ping Maximum Duration This field is relevant to Device mode and controls the maximum duration for which the controller should instruct the PHY to transmit a Ping LFPS. The duration of the Ping LFPS is controlled by programming this value and is in terms of 8 ns granularity. Eg: A value of 13 indicates 104 ns.

11.1.3.1.72 Global USB2 PHY Configuration Register (GUSB2PHYCFG)

11.1.3.1.72.1 Offset

Register	Offset
GUSB2PHYCFG	C200h

11.1.3.1.72.2 Function

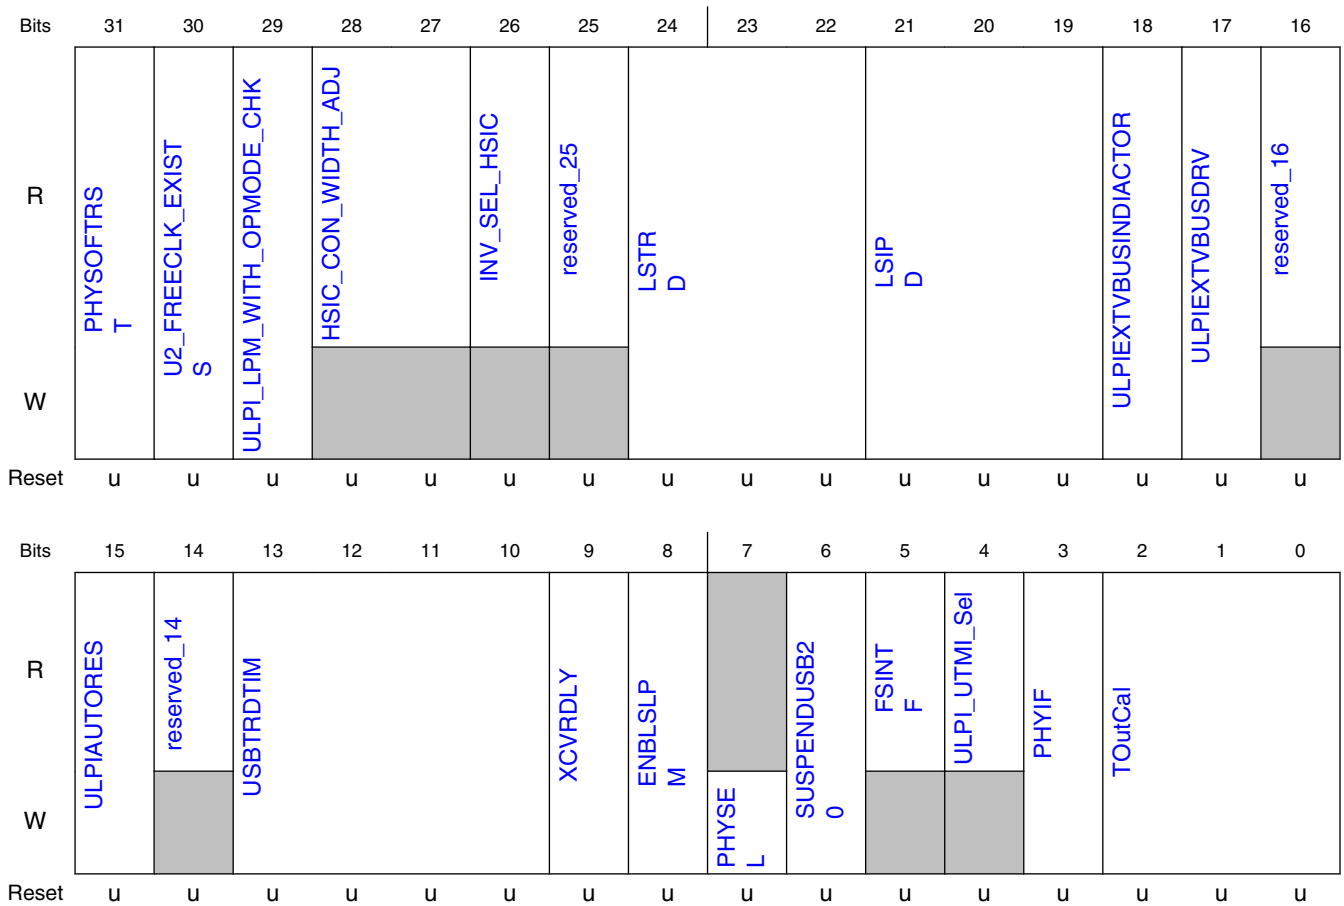
The application must program this register before starting any transactions on either the SoC bus or the USB.

Reset Mask:0x2014000

this register before starting any transactions on either the SoC bus or the USB. In

registers are implemented.

11.1.3.1.72.3 Diagram



11.1.3.1.72.4 Fields

Field	Function
31 PHYSOFTRST	UTMI PHY Soft Reset (PHYSoftRst) Causes the usb2phy_reset signal to be asserted to reset a UTMI PHY.
30 U2_FREECLK_EXISTS	U2_FREECLK_EXISTS Specifies whether your USB 2. free-running PHY clock, which is active when the clock control input is active. If your USB 2.0 PHY provides a free-running PHY clock, it must be connected to the utmi_clk[0] input. The remaining utmi_clk[n] must be connected to the respective port clocks. The core uses the Port-0 clock for generating the internal mac2 clock. - 1'b0: USB 2.0 free clock does not exist - 1'b1: USB 2.0 free clock exists Note: When the core is configured as device-only (DWC_USB3_MODE = 0), do not set this bit to 1.
29 ULPI_LPM_WITH_OPMODE_CHK	ULPI_LPM_WITH_OPMODE_CHK Support the LPM over ULPI without NOPID token to the ULPI PHY. token to the ULPI PHY. If this bit is set, the ULPI PHY is expected to qualify the EXT PID with OPMODE=2'b00 for LPM and not treat it as a NOPID. Check with your PHY vendor about your PHY behavior. This bit is valid only when the DWC_USB3_HSPHY_INTERFACE parameter is 2 or 3. - 1'b0: A

Table continues on the next page...

Field	Function
	NOPID is sent before sending an EXTPID for LPM; - 1'b1: An EXTPID is sent without previously sending a NOPID; Note: This bit is valid only in host mode. This bit should be '0' for Synopsys PHY.
28-27 HSIC_CON_WIDTH_ADJ	HSIC_CON_WIDTH_ADJ This bit is used in the HSIC device mode of operation.
26 INV_SEL_HSIC	INV_SEL_HSIC The application driver uses this bit to control the HSIC enable/disable function.
25 reserved_25	Reserved
24-22 LSTRD	LS Turnaround Time (LSTRDTIM) This field indicates the value of the Rx-to-Tx packet gap for LS devices.
21-19 LSIPD	LS Inter-Packet Time (LSIPD) This field indicates the value of Tx-to-Tx packet gap for LS devices.
18 ULPIEXTVBUSINDIACTOR	ULPI External VBUS Indicator (ULPIExtVbusIndicator) Indicates the ULPI PHY VBUS over-current indicator.
17 ULPIEXTVBUSDRV	ULPI External VBUS Drive (ULPIExtVbusDrv) Selects supply source to drive 5V on VBUS, in the ULPI PHY.
16 reserved_16	Reserved
15 ULPIAUTORES	ULPI Auto Resume (ULPIAutoRes) Sets the AutoResume bit in Interface Control register on the ULPI PHY.
14 reserved_14	Reserved
13-10 USBTRDTIM	USB 2.
9 XCVRDLY	Transceiver Delay: Enables a delay between the assertion of the UTMI/ULPI Transceiver Select signal (for HS) and the assertion of the TxValid signal during a HS Chirp.
8 ENBLSLPM	Enable utmi_sleep_n and utmi_l1_suspend_n (EnblSlpM) The application uses this bit to control utmi_sleep_n and utmi_l1_suspend_n assertion to the PHY in the L1 state.
7 PHYSEL	USB 2.
6 SUSPENDUSB20	Suspend USB2.
5 FSINTF	Full-Speed Serial Interface Select (FSIntf) The application uses this bit to select a unidirectional or bidirectional USB 1.
4	ULPI or UTMI+ Select (ULPI_UTMI_Sel) The application uses this bit

Table continues on the next page...

Field	Function
ULPI_UTMI_Sel	to select a UTMI+ or ULPI Interface.
3 PHYIF	PHY Interface (PHYIf) If UTMI+ is selected, the application uses this bit to configure the core to support a UTMI+ PHY with an 8- or 16-bit interface.
2-0 TOutCal	HS/FS Timeout Calibration (TOutCal) The number of PHY clocks, as indicated by the application in this field, is multiplied by a bit-time factor; this factor is added to the high-speed/full-speed interpacket timeout duration in the core to account for additional delays introduced by the PHY.

11.1.3.1.73 Global USB 2.0 UTMI PHY vendor control register (GUSB2PHYACC_ULPI)

11.1.3.1.73.4 Fields

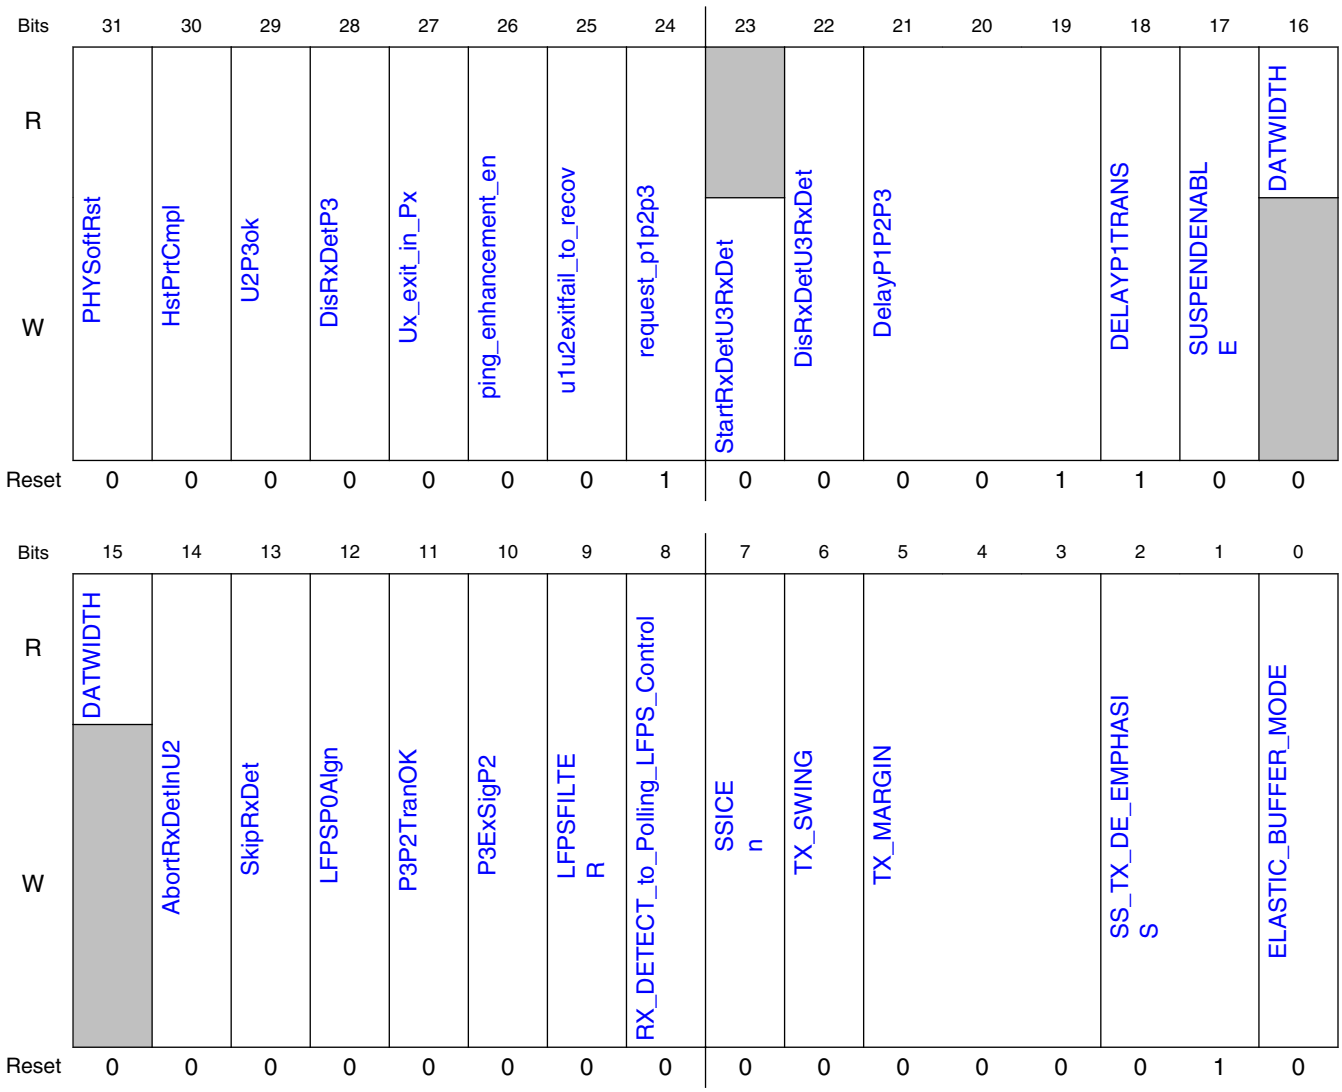
Field	Function
31-27 reserved_31_27	Reserved
26 DISUIPIDRVR	DISUIPIDRVR
25 NEWREGREQ	New Register Request The application sets this bit for a new vendor control access.
24 VSTSDONE	VSTSDONE
23 VSTSBSY	VSTSBSY
22 REGWR	Register Write The application sets this bit for register writes and clears it for register reads. clears it for register reads. Note: This bit is applicable for ULPI register read/write access only.
21-16 REGADDR	Register Address The 6-bit PHY register address for immediate PHY Register Set access. Register Set access. Set to 6'h2F for Extended PHY Register Set access. Note: These bits are applicable for ULPI only.
15-8 EXTREGADDR	EXTREGADDR
7-0 REGDATA	REGDATA

11.1.3.1.74 Global USB 3.0 PIPE control register (GUSB3PIPECTL)

11.1.3.1.74.1 Offset

Register	Offset
GUSB3PIPECTL	C2C0h

11.1.3.1.74.2 Diagram



11.1.3.1.74.3 Fields

Field	Function
31 PHYSoftRst	USB3 PHY Soft Reset After setting this bit to '1', the software needs to clear this bit.
30 HstPrtCmpl	HstPrtCmpl This feature tests the PIPE PHY compliance patterns without having to have a test fixture on the USB 3.
29 U2P3ok	P3 OK for U2 (u2P3ok) - 0: During link state U2/SS.
28 DisRxDetP3	Disabled receiver detection in P3 (DisRxDetP3) - 0: If PHY is in P3 and Core needs to perform receiver detection, The core performs receiver detection in

Table continues on the next page...

Field	Function
	P3.
27 Ux_exit_in_Px	Ux Exit in Px (Ux_exit_in_Px) - 0: The core does U1/U2/U3 exit in PHY power state P0 (default behavior).
26 ping_enhancement_en	Ping Enhancement Enable (ping_enhancement_en) When set, the Downstream port U1 ping receive timeout becomes 500 ms instead of 300 ms.
25 u1u2exitfail_to_recov	U1U2exitfail to Recovery (u1u2exitfail_to_recov) When set, and U1/U2 LFPS handshake fails, the LTSSM transitions from U1/U2 to Recovery instead of SS Inactive.
24 request_p1p2p3	Always Request P1/P2/P3 for U1/U2/U3 (request_p1p2p3) When set, the core always requests PHY power change from P0 to P1/P2/P3 during U0 to U1/U2/U3 transition.
23 StartRxDetU3RxDet	Start Receiver Detection in U3/Rx.
22 DisRxDetU3RxDet	Disable Receiver Detection in U3/Rx.
21-19 DelayP1P2P3	Delay P1P2P3 Delay P0 to P1/P2/P3 request when entering U1/U2/U3 until (DWC_USB3_GUSB3PIPECTL_INIT[21:19]*8) 8B10B error occurs, or Pipe3_RxValid drops to 0.
18 DELAYP1TRANS	Delay PHY power change from P0 to P1/P2/P3 when link state changing from U0 to U1/U2/U3 respectively.
17 SUSPENDENABLE	Suspend USB3.
16-15 DATWIDTH	PIPE Data Width (DatWidth) - 2'b00: 32 bits - 2'b01: 16 bits - 2'b10: 8 bits One clock after reset, these bits receive the value seen on the pipe3_DataBusWidth.
14 AbortRxDetInU2	Abort Rx Detect in U2 (AbortRxDetInU2) When set, and the link state is U2, then the core will abort receiver detection if it receives U2 exit LFPS from the remote link partner.
13 SkipRxDet	Skip Rx Detect: When set, the core skips Rx Detection if pipe3_RxElecIdle is low.
12 LFPSP0Algn	LFPS P0 Align: When set, - The core deasserts LFPS transmission on the clock edge that it requests Phy power state 0 when exiting U1, U2, or U3 low power states.
11 P3P2TranOK	P3 P2 Transitions OK (P3P2TranOK) When set, the core transitions directly from Phy power state P2 to P3 or from state P3 to P2.
10	P3 Exit Signal in P2 (P3ExSigP2) When this bit is set, the core

Table continues on the next page...

Field	Function
P3ExSigP2	always changes the PHY power state to P2, before attempting a U3 exit handshake.
9 LFPSFILTER	LFPS Filter (LFPSFilt) When set, filter LFPS reception with pipe3_RxValid in PHY power state P0, that is, ignore LFPS reception from the PHY unless both pipe3_Rxelecidle and pipe3_RxValid are deasserted.
8 RX_DETECT_to_Polling_LFPS_Control	RX_DETECT to Polling.
7 SSICEn	USB3 SSIC Enable (SSICEn) This bit is valid only when coreConsultant parameter DWC_USB3_EN_SSIC=1 else this bit needs to be set to 1'b0.
6 TX_SWING	Tx Swing (TxSwing) Refer to the PIPE3 specification.
5-3 TX_MARGIN	Tx Margin[2:0] (TxMargin) Refer to Table 5-3 of the PIPE3 Specification.
2-1 SS_TX_DE_EMPHASIS	Tx Deemphasis (TxDeemphasis) The value driven to the PHY is controlled by the LTSSM during USB3 Compliance mode.
0 ELASTIC_BUFFER_MODE	Elastic Buffer Mode (ElasticBufferMode) (Refer to Table 5-3 of the PIPE3 specification.

11.1.3.1.75 Global transmit FIFO size register (GTXFIFOSIZ0 - GTXFIFOSIZ7)

11.1.3.1.75.1 Offset

For a = 0 to 7:

Register	Offset
GTXFIFOSIZa	C300h + (a × 4h)

11.1.3.1.75.2 Function

This register specifies the RAM start address and depth (both in MDWIDTH-bit words) for each implemented TxFIFO.

11.1.3.1.75.3 Diagram

11.1.3.1.78.4 Fields

Field	Function
31-0 EVNTADRHI	Event Buffer Address (EvntAdrHi) Holds the higher 32 bits of start address of the external memory for the Event Buffer.

11.1.3.1.79 Global event buffer size register (GEVNTSIZ)

11.1.3.1.79.1 Offset

Register	Offset
GEVNTSIZ	C408h

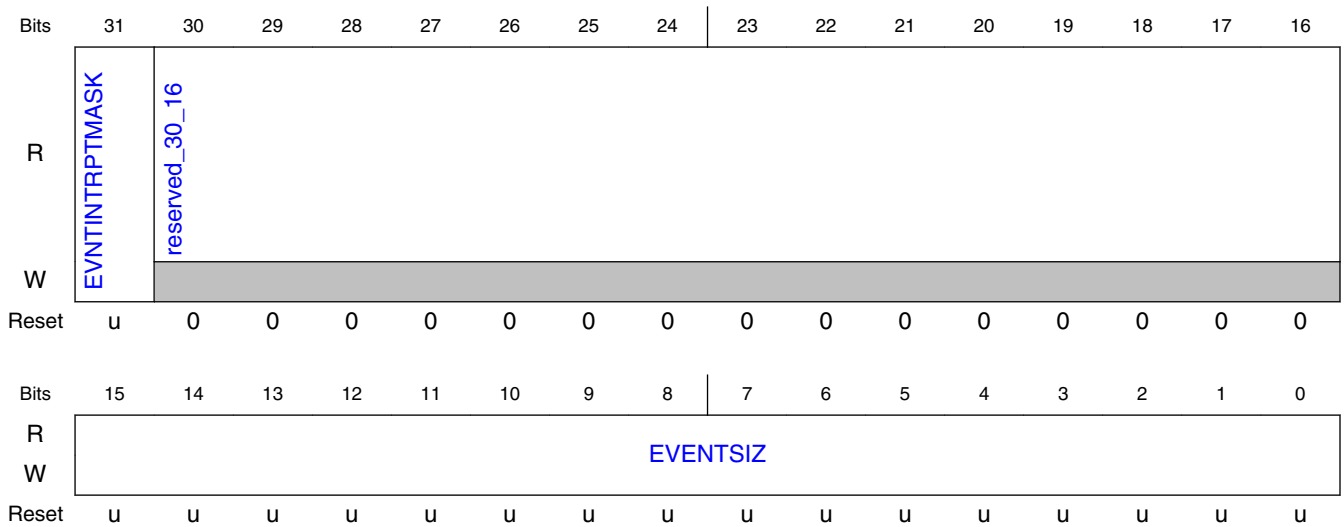
11.1.3.1.79.2 Function

This register holds the Event Buffer Size and the Event Interrupt Mask bit.

Reset Mask:0x7FFF0000

Global Event Buffer Size Register This register holds the Event Buffer Size and the Event Interrupt Mask bit. During power-on initialization, software must initialize the size with the number of bytes allocated for the Event Buffer. The Event Interrupt Mask will mask the interrupt, but events are still queued. After configuration, software must preserve the Event Buffer Size value when changing the Event Interrupt Mask.

11.1.3.1.79.3 Diagram



11.1.3.1.79.4 Fields

Field	Function
31 EVNTINTRPTMASK	Event Interrupt Mask (EvntIntMask).
30-16 reserved_30_16	Reserved
15-0 EVENTSIZ	Event Buffer Size in bytes (EVNTSiz) Holds the size of the Event Buffer in bytes; must be a multiple of four.

11.1.3.1.80 Global event buffer count register (GEVNTCOUNT)

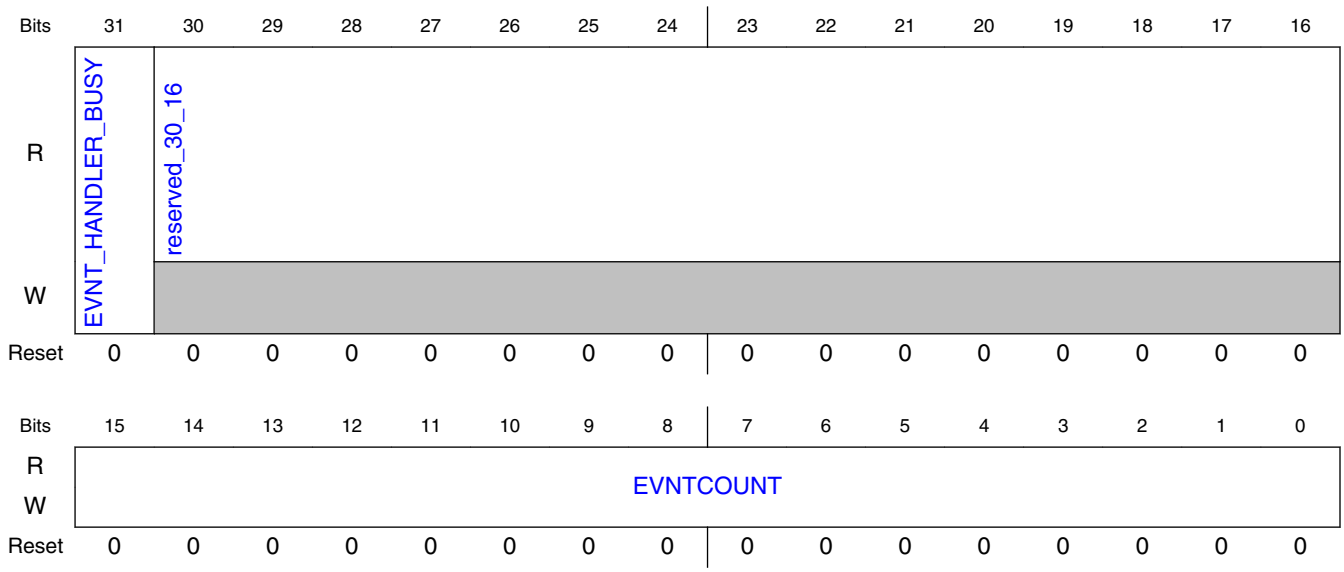
11.1.3.1.80.1 Offset

Register	Offset
GEVNTCOUNT	C40Ch

11.1.3.1.80.2 Function

This register holds the number of valid bytes in the Event Buffer.

11.1.3.1.80.3 Diagram



11.1.3.1.80.4 Fields

Field	Function
31 EVNT_HANDLER_BUSY	Event Handler Busy Device software event handler busy indication.
30-16 reserved_30_16	Reserved
15-0 EVNTCOUNT	Event Count (EVNTCount) When read, returns the number of valid events in the Event Buffer (in bytes).

11.1.3.1.81 Global Hardware Parameters Register 8 (GHWPARAMS8)

11.1.3.1.81.1 Offset

Register	Offset
GHWPARAMS8	C600h

11.1.3.1.81.2 Function

This register contains the hardware configuration options that you can select in the coreConsultant GUI.

11.1.3.1.81.3 Diagram

11.1.3.1.87.4 Fields

Field	Function
31 GFLADJ_REFCLK_240MHZDECR_PLS1	GFLADJ_REFCLK_240MHZDECR_PLS1 This field indicates that the decrement value that the controller applies for each ref_clk must be GFLADJ_REFCLK_240MHZ_DECR and GFLADJ_REFCLK_240MHZ_DECR +1 alternatively on each ref_clk. Set this bit to a '1' only if GFLADJ_REFCLK_LPM_SEL is set to '1' and the fractional component of 240/ref_frequency is greater

Table continues on the next page...

Field	Function
	than or equal to 0.5. Examples: If the ref_clk is 19.2 MHz then - GUCTL.REF_CLK_PERIOD = 52 - GFLADJ.GFLADJ_REFCLK_240MHZ_DECR = (240/19.2) = 12.5 - GFLADJ.GFLADJ_REFCLK_240MHZDECR_PLS1 = 1 If the ref_clk is 24 MHz then - GUCTL.REF_CLK_PERIOD = 41 - GFLADJ.GFLADJ_REFCLK_240MHZ_DECR = (240/24) = 10 - GFLADJ.GFLADJ_REFCLK_240MHZDECR_PLS1 = 0
30-24 GFLADJ_REFCLK_240MHZ_DECR	This field indicates the decrement value that the controller applies for each ref_clk in order to derive a frame timer in terms of a 240-MHz clock. This field must be programmed to a non-zero value only if GFLADJ_REFCLK_LPM_SEL is set to '1'. The value is derived as follows: GFLADJ_REFCLK_240MHZ_DECR = 240/ref_clk_frequency Examples: If the ref_clk is 24 MHz then - GUCTL.REF_CLK_PERIOD = 41 - GFLADJ.GFLADJ_REFCLK_240MHZ_DECR = 240/24 = 10 If the ref_clk is 48 MHz then - GUCTL.REF_CLK_PERIOD = 20 - GFLADJ.GFLADJ_REFCLK_240MHZ_DECR = 240/48 = 5 If the ref_clk is 17 MHz then - GUCTL.REF_CLK_PERIOD = 58 - GFLADJ.GFLADJ_REFCLK_240MHZ_DECR = 240/17 = 14
23 GFLADJ_REFCLK_LPM_SEL	This bit enables the functionality of running SOF/ITP counters on the ref_clk. This bit must not be set to '1' if GCTL.SOFITPSYNC bit is set to '1'. Similarly, if GFLADJ_REFCLK_LPM_SEL set to '1', GCTL.SOFITPSYNC must not be set to '1'. When GFLADJ_REFCLK_LPM_SEL is set to '1' the overloading of the suspend control of the USB 2.0 first port PHY (UTMI/ULPI) with USB 3.0 port states is removed. For example, for Synopsys PHY, the COMMONONN signal can be tied to '1'. Note that the ref_clk frequencies supported in this mode are 16/17/19.2/20/24/39.7/40 MHz. The utmi_clk[0] signal of the core must be connected to the FREECLK of the PHY. Note: If you set this bit to '1', the GUSB2PHYCFG.U2_FREECLK_EXISTS bit must be set to '0'.
22 reserved_22	Reserved for future use
21-8 GFLADJ_REFCLK_FLADJ	This field indicates the frame length adjustment to be applied when SOF/ITP counter is running on the ref_clk. This register value is used to adjust the ITP interval when GCTL[SOFITPSYNC] is set to '1'; SOF and ITP interval when GLADJ.GFLADJ_REFCLK_LPM_SEL is set to '1'. This field must be programmed to a non-zero value only if GFLADJ_REFCLK_LPM_SEL is set to '1' or GCTL.SOFITPSYNC is set to '1'. The value is derived as follows: FLADJ_REF_CLK_FLADJ=((125000/ref_clk_period_integer)-(125000/ref_clk_period)) * ref_clk_period where - the ref_clk_period_integer is the integer value of the ref_clk period got by truncating the decimal (fractional) value that is programmed in the GUCTL.REF_CLK_PERIOD field. - the ref_clk_period is the ref_clk period including the fractional value. Examples: If the ref_clk is 24 MHz then - GUCTL.REF_CLK_PERIOD = 41 - GFLADJ.GLADJ_REFCLK_FLADJ = ((125000/41)-(125000/41.6666))*41.6666 = 2032 (ignoring the fractional value) If the ref_clk is 48 MHz then - GUCTL.REF_CLK_PERIOD = 20 - GFLADJ.GLADJ_REFCLK_FLADJ = ((125000/20)-(125000/20.8333))*20.8333 = 5208 (ignoring the fractional value)
7 GFLADJ_30MHZ_SDBND_SEL	GFLADJ_30MHZ_SDBND_SEL This field selects whether to use the input signal fladj_30mhz_reg or the GFLADJ.GFLADJ_30MHZ to adjust the frame length for the SOF/ITP. When this bit is set to, - 1, the controller uses the register field GFLADJ.GFLADJ_30MHZ value - 0, the controller uses the input signal fladj_30mhz_reg value
6 reserved_6	Reserved for future use
5-0 GFLADJ_30MHZ	GFLADJ_30MHZ This field indicates the value that is used for frame length adjustment instead of considering from the sideband input signal fladj_30mhz_reg. This enables post-silicon frame length adjustment in case the input signal fladj_30mhz_reg is connected to a wrong value or is not valid. For details on how to set this value, refer to section 5.2.4, "Frame Length Adjustment Register (FLADJ)," of the xHCI Specification.

11.1.3.1.88 Device Configuration Register (DCFG)

11.1.3.1.88.1 Offset

11.1.3.1.88.4 Fields

Field	Function
31-25 reserved_31_25	Reserved
24	reserved

Table continues on the next page...

Field	Function
reserved_24	
23 IgnStrmPP	IgnoreStreamPP This bit only affects stream-capable bulk endpoints. When this bit is set to '0' and the controller receives a Data Packet with the Packet Pending (PP) bit set to 0 for OUT endpoints, or it receives an ACK with the NumP field set to 0 and PP set to 0 for IN endpoints, the core attempts to search for another stream (CStream) to initiate to the host. However, there are two situations where this behavior is not optimal: - When the host is setting PP=0 even though it has not finished the stream, or - When the endpoint on the device is configured with one transfer resource and therefore does not have any other streams to initiate to the host. When this bit is set to '1', the core ignores the Packet Pending bit for the purposes of stream selection and does not search for another stream when it receives DP(PP=0) or ACK(NumP=0, PP=0). This can enhance the performance when the device system bus bandwidth is low or the host responds to the core's ERDY transmission very quickly.
22 LPMCAP	LPM Capable The application uses this bit to control the DWC_usb3 core LPM capabilities. If the core operates as a non-LPM-capable device, it cannot respond to LPM transactions. - 1'b0: LPM capability is not enabled. - 1'b1: LPM capability is enabled.
21-17 NUMP	Number of Receive Buffers. This bit indicates the number of receive buffers to be reported in the ACK TP. The DWC_usb3 controller uses this field for non-control endpoints if GRXTHRCFG.UsbRxPktCntSel is set to '0'. The application can program this value based on RxFIFO size, buffer sizes programmed in descriptors, and system latency. For an OUT endpoint, this field controls the number of receive buffers reported in the NumP field of the ACK TP transmitted by the core. Note: This bit is used in host mode when Debug Capability is enabled.
16-12 INTRNUM	Interrupt number Indicates interrupt/EventQ number on which non-endpoint-specific device-related interrupts (see DEVT) are generated.
11-10 reserved_10_11	Reserved
9-3 DEVADDR	Device Address. The application must perform the following: - Program this field after every SetAddress request. - Reset this field to zero after USB reset.
2-0 DEVSPD	Device Speed. Indicates the speed at which the application requires the core to connect, or the maximum speed the application can support. However, the actual bus speed is determined only after the chirp sequence is completed, and is based on the speed of the USB host to which the core is connected. - 3'b100: SuperSpeed (USB 3.0 PHY clock is 125 MHz or 250 MHz) - 3'b000: High-speed (USB 2.0 PHY clock is 30 MHz or 60 MHz) - 3'b001: Full-speed (USB 2.0 PHY clock is 30 MHz or 60 MHz) 000b - 001b - 100b -

11.1.3.1.89 Device control register (DCTL)

11.1.3.1.89.1 Offset

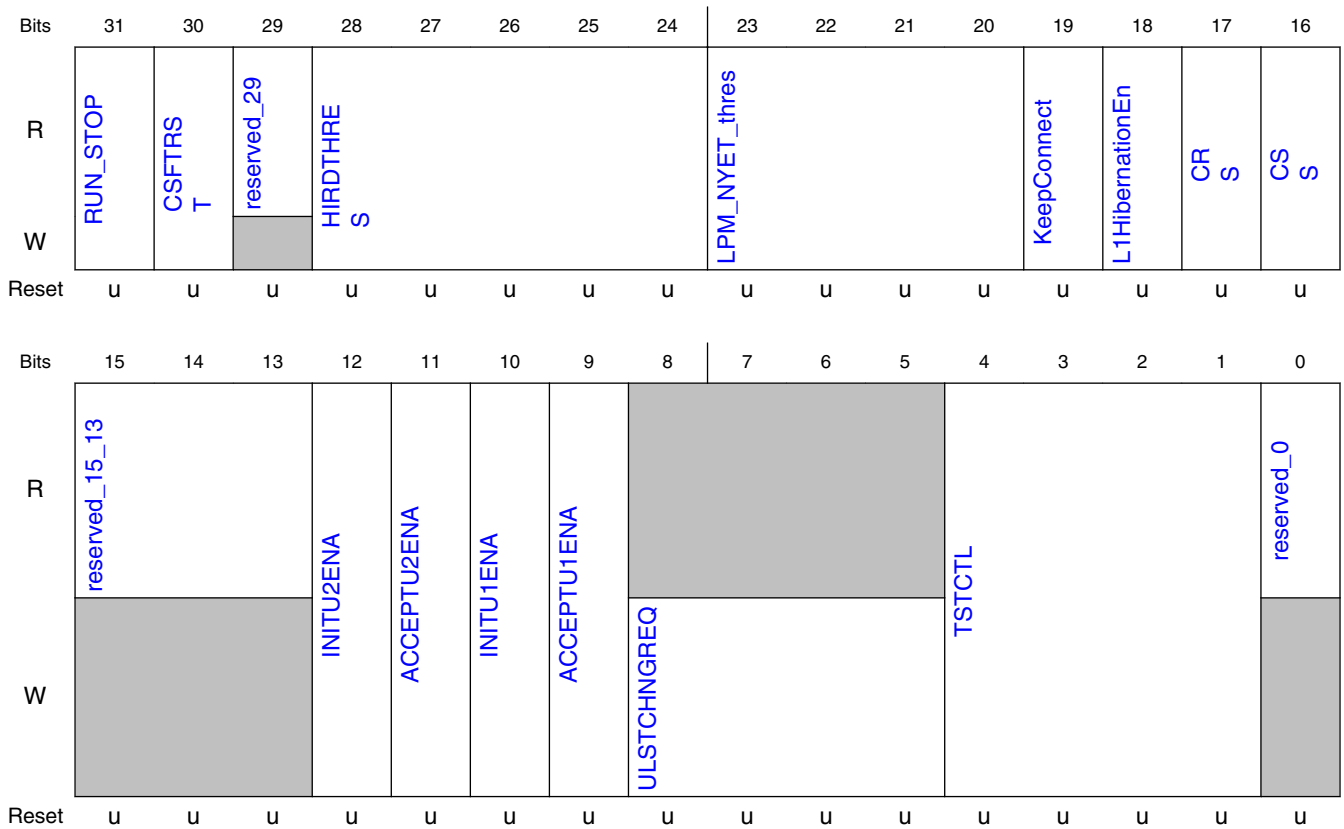
Register	Offset
DCTL	C704h

11.1.3.1.89.2 Function

When hibernation is not enabled using GCTL[GBLHIBERNATIONEN] bit,

- Any value can be written to CSS, CRS, L1HIBERNATIONEN, and KEEPCONNECT bits
- L1HIBERNATIONEN and KEEPCONNET bits always return 0 when read in this hibernation-disabled state

11.1.3.1.89.3 Diagram



11.1.3.1.89.4 Fields

Field	Function
31 RUN_STOP	Run/Stop The software writes 1 to this bit to start the device controller operation. To stop the device controller operation, the software must remove any active transfers and write 0 to this bit. When the controller is stopped, it sets the DSTS.DevCtrlHlt bit when the core is idle and the lower layer finishes the disconnect process. The Run/Stop bit must be used in following cases as specified: - After power-on reset and CSR initialization, the software must write 1 to this bit to start the device controller. The controller does not signal connect to the host until this bit is set. - The software uses this bit to control the device controller to perform a soft disconnect. When the software writes 0 to this bit, the host does not see that the device is connected. The device controller stays in the disconnected state until the software writes 1 to this bit. The minimum duration of keeping this bit cleared is specified in the Note below. If the software attempts a connect after the soft disconnect or detects a disconnect event, it must set DCTL[8:5] to 5 before reasserting the Run/Stop bit. - When the USB or Link is in a lower power state and the Two Power Rails configuration is selected, software writes 0 to this bit to indicate that it is going to turn off the Core Power Rail. After the software turns on the Core Power Rail again and re-initializes the device

Table continues on the next page...

Field	Function
	controller, it must set this bit to start the device controller. For more details, see "Low Power Operation" section of the Databook. Note: The following is the minimum duration under various conditions for which the soft disconnect (SftDiscon) bit must be set for the USB host to detect a device disconnect: 30ms: - For SuperSpeed, when the device state is Suspended, Idle, Transmit, or Receive. 10ms: - For high-speed, when the device state is Suspended, Idle, or not Idle/Suspended (performing transactions) - For full-speed/low-speed, when the device state is Suspended, Idle, or not Idle/Supended (performing transactions) To accommodate clock jitter, it is recommended that the application add extra delay to the specified minimum duration.
30 CSFTRST	Core Soft Reset Resets the all clock domains as follows: - This bit clears the interrupts and all the CSRs except GSTS, GSNPSID, GGPIO, GUID, GUSB2PHYCFGn registers, GUSB3PIPECTLn registers, DCFG, DCTL, DEVTEN, and DSTS registers. - All module state machines (except the SoC Bus Slave Unit) are reset to the IDLE state, and all the TxFIFOs and the RxFIFO are flushed. - Any transactions on the SoC bus Master are terminated as soon as possible, after gracefully completing the last data phase of a SoC bus transfer. Any transactions on the USB are terminated immediately. The application can write this bit at any time to reset the core. This is a self-clearing bit; the core clears this bit after all necessary logic is reset in the core, which may take several clocks depending on the core's current state. Once this bit is cleared, the software must wait at least 3 PHY clocks before accessing the PHY domain (synchronization delay). Typically, software reset is used during software development and also when you dynamically change the PHY selection bits in the USB configuration registers listed above. When you change the PHY, the corresponding clock for the PHY is selected and used in the PHY domain. Once a new clock is selected, the PHY domain must be reset for proper operation. Note: Programming this field with random data causes side effect . Bit Bash register testing is not recommended.
29 reserved_29	Reserved1
28-24 HIRDTHRES	HIRD Threshold (HIRD_Thres) The core asserts output signals utmi_l1_suspend_n and utmi_sleep_n (see "LPM Interface Signals" table in the Databook) on the basis of this signal: The core asserts utmi_l1_suspend_n to put the PHY into Deep Low-Power mode in L1 when both of the following are true: - HIRD value is greater than or equal to the value in DCTL.HIRD_Thres[3:0] - HIRD_Thres[4] is set to 1'b1. The core asserts utmi_sleep_n on L1 when one of the following is true: - If the HIRD value is less than HIRD_Thres[3:0] or - HIRD_Thres[4] is set to 1'b0. Note: This field must be set to '0' during SuperSpeed mode of operation.
23-20 LPM_NYET_thres	LPM NYET Threshold When LPM Errata is enabled: Bits [23:20]: LPM NYET Response Threshold (LPM_NYET_thres) Handshake response to LPM token specified by device application. Response depends on DCFG.LPMCap. - DCFG.LPMCap is 1'b0 - The core always responds with Timeout (that is, no response). - DCFG.LPMCap is 1'b1 - The core responds with an ACK on successful LPM transaction, which requires that all of the following are satisfied: - There are no PID or CRC5 errors in both the EXT token and the LPM token (if not true, inactivity results in a timeout ERROR). - No data is pending in the TxFIFO and RxFIFO is empty (else NYET). - The BESL value in the LPM token is less than or equal to LPM_NYET_thres[3:0]
19 KeepConnect	Keep Connect When '1', this bit enables the save and restore programming model by preventing the core from disconnecting from the host when DCTL.RunStop is set to '0'. It also enables the Hibernation Request Event to be generated when the link goes to U3 or L2. The device core disconnects from the host when DCTL.RunStop is set to '0'. This bit indicates whether to preserve this behavior ('0'), or if the core must not disconnect when RunStop is set to 0 ('1'). This bit also prevents the LTSSM from automatically going to U0/L0 when the host requests resume from U3/L2. Note: If Hibernation is disabled, that is, GCTL[1].GblHibernationEn = 0, this bit is tied to zero.
18 L1HibernationEn	L1HibernationEn When this bit is set along with KeepConnect, the device core generates a Hibernation Request Event if L1 is enabled and the HIRD value in the LPM token is larger than the threshold programmed in DCTL.HIRD_Thres. The core does not exit the LPM L1 state until software writes Recovery into the DCTL.ULStChngReq field. This prevents corner cases where the device is entering hibernation at the same time the host is attempting to exit L1. Note: If Hibernation is disabled, that is, GCTL[1].GblHibernationEn = 0, this bit is tied to zero.
17	Controller Restore State (CRS) This command is similar to the USBCMD.CRS bit in host mode and initiates the restore process. When software sets this bit to '1', the controller immediately sets DSTS.RSS

Table continues on the next page...

Field	Function
CRS	to '1'. When the controller has finished the restore process, it sets DSTS.RSS to '0'. Note: When read, this field always returns '0'.
16 CSS	Controller Save State (CSS) This command is similar to the USBCMD.CSS bit in host mode and initiates the save process. When software sets this bit to '1', the controller immediately sets DSTS.SSS to '1'. When the controller has finished the save process, it sets DSTS.SSS to '0'. Note: When read, this field always returns '0'.
15-13 reserved_15_13	Reserved
12 INITU2ENA	Initiate U2 Enable - 1'b0: May not initiate U2 (default) - 1'b1: May initiate U2 On USB reset, hardware clears this bit to 0. Software sets this bit after receiving SetFeature(U2_ENABLE), and clears this bit when ClearFeature(U2_ENABLE) is received. If DCTL[11] (AcceptU2Ena) is 0, the link immediately exits U2 state.
11 ACCEPTU2ENA	Accept U2 Enable - 1'b0: Reject U2 except when Force_LinkPM_Accept bit is set (default) - 1'b1: Core accepts transition to U2 state if nothing is pending on the application side. On USB reset, hardware clears this bit to 0. Software sets this bit after receiving a SetConfiguration command.
10 INITU1ENA	Initiate U1 Enable - 1'b0: May not initiate U1 (default); - 1'b1: May initiate U1. On USB reset, hardware clears this bit to 0. Software sets this bit after receiving SetFeature(U1_ENABLE), and clears this bit when ClearFeature(U1_ENABLE) is received. If DCTL[9] (AcceptU1Ena) is 0, the link immediately exits U1 state.
9 ACCEPTU1ENA	Accept U1 Enable - 1'b0: Core rejects U1 except when Force_LinkPM_Accept bit is set (default) - 1'b1: Core accepts transition to U1 state if nothing is pending on the application side. On USB reset, hardware clears this bit to 0. Software sets this bit after receiving a SetConfiguration command.
8-5 ULSTCHNGREQ	ULSTCHNGREQ Software writes this field to issue a USB/Link state change request. A change in this field indicates a new request to the core. If software wants to issue the same request back-to-back, it must write a 0 to this field between the two requests. The result of the state change request is reflected in the USB/Link State in DSTS. These bits are self-cleared on the MAC Layer exiting suspended state. If software is updating other fields of the DCTL register and not intending to force any link state change, then it must write a 0 to this field. SS Compliance mode is normally entered and controlled by the remote link partner. Refer to the USB 3.0 specification. Alternatively, you can force the local link directly into compliance mode, by resetting the SS link with the RUN/STOP bit set to zero. If you then write '10' to the USB/Link State Change field and '1' to RUN/STOP, the link goes to compliance mode. Once you are in compliance, you may alternately write zero and '10' to this field to advance the compliance pattern. In SS mode: - Value Requested Link State Transition/Action - 0 No Action - 4 SS.Disabled - 5 Rx.Detect - 6 SS.Inactive - 8 Recovery - 10 Compliance - Others: Reserved In HS/FS/LS mode: - ValueRequested USB state transition - 8 Remote wakeup request - Others: Reserved The Remote wakeup request must be issued 2us after the device goes into suspend state (DSTS[21:18] is 3 - refer to Table "Fields for Register: DSTS" in the Databook). Note: After coming out of hibernation, software must write 8 (Recovery) into this field to confirm exit from the suspended state.
4-1 TSTCTL	Test Control - 4'b000: Test mode disabled - 4'b001: Test_J mode - 4'b010: Test_K mode - 4'b011: Test_SE0_NAK mode - 4'b100: Test_Packet mode - 4'b101: Test_Force_Enable - Others: Reserved
0 reserved_0	Reserved

Field	Function
31-17 reserved_31_17	Reserved
16 ECCERREN	ECC Error Enable. If this bit is set to 1, the controller reports an ECC error to the software when an uncorrectable ECC occurs internally.

Table continues on the next page...

Field	Function
15 reserved_15	Reserved
14 L1WKUPEVTEN	L1 Resume Detected Event Enable. Note: If GUCTL1[DEV_DECOUPLE_L1L2_EVT] is enabled, then this bit is for L1 Resume Detected Event Enable.
13 —	Reserved
12 VENDEVTSTRCVDEN	Vendor Device Test LMP Received Event (VndrDevTstRcvedEn)
11 reserved_11	Reserved
10 reserved_10	Reserved
9 ERRTICERREVTEN	Erratic Error Event Enable
8 L1SUSPEN	L1 Suspend Event Enable Note: Only if GUCTL1[DEV_DECOUPLE_L1L2_EVT] is enabled, this bit is for L1 Suspend Event Enable.
7 SOFTEVTEN	Start of (u)frame
6 U3L2L1SuspEn	U3/L2 or U3/L2L1 Suspend Event Enable. Note: - If GUCTL1[DEV_DECOUPLE_L1L2_EVT] is enabled, then this bit is for U3/L2 Suspend Event Enable. - If GUCTL1[DEV_DECOUPLE_L1L2_EVT] is not enabled, then this bit is for U3/L2L1 Suspend Event Enable.
5 HibernationReqEvtEn	This bit enables/disables the generation of the Hibernation Request Event.
4 WKUPEVTEN	U3/L2 or U3/L2L1 Resume Detected Event Enable. Note: - If GUCTL1[DEV_DECOUPLE_L1L2_EVT] is enabled, then this bit is for U3/L2 Resume Detected Event Enable. - If GUCTL1[DEV_DECOUPLE_L1L2_EVT] is not enabled, then this bit is for U3/L2L1 Resume Detected Event Enable.
3 ULSTCNGEN	USB/Link State Change Event Enable
2 CONNECTDONEEVTEN	Connection Done Enable
1 USBRSTEVTEN	USB Reset Enable
0 DISSCONNEVTEN	Disconnect Detected Event Enable

11.1.3.1.91 Device Status Register (DSTS)

11.1.3.1.91.1 Offset

Register	Offset
DSTS	C70Ch

11.1.3.1.91.2 Function

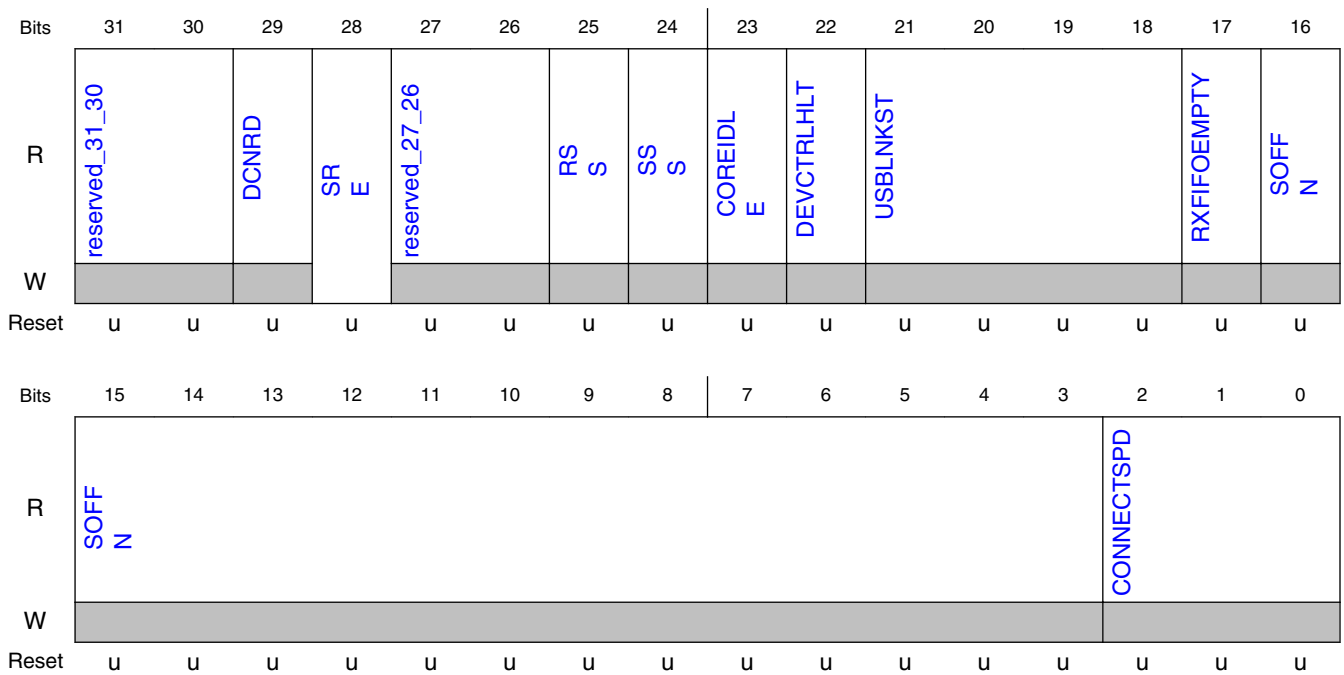
Device Status Register This register indicates the status of the device controller with respect to USB-related events.

Reset Mask:0xDC000000

NOTE

When hibernation is not enabled, RSS and SSS bits always return 0 when read.

11.1.3.1.91.3 Diagram



11.1.3.1.91.4 Fields

Field	Function
31-30 reserved_31_30	Reserved
29 DCNRD	Device Controller Not Ready The bit indicates that the core is in the process of completing the state transitions after exiting from hibernation. To complete the state transitions, it takes 256 bus clock cycles from the time DCTL[31].Run/Stop is set. During hibernation, if the UTMI/ULPI PHY is in suspended state, then the 256-bus clock cycle delay starts after the PHY exited suspended state. Software must set DCTL[31].Run/Stop to '1' and wait for this bit to be de-asserted to zero before processing DSTS.USBLnkSt. This bit is valid only when DWC_USB3_EN_PWROPT is set to 2 and GCTL[1].GblHibernationEn =1.
28 SRE	Save Restore Error. Currently not supported.
27-26 reserved_27_26	Reserved
25 RSS	RSS Restore State Status This bit is similar to the USBSTS.RSS in host mode. When the controller finishes the restore process, it completes the command by setting DSTS.RSS to '0'.
24 SSS	SSS Save State Status This bit is similar to the USBSTS.SSS in host mode. When the controller has finished the save process, it completes the command by setting DSTS.SSS to '0'.
23 COREIDLE	Core Idle The bit indicates that the core finished transferring all RxFIFO data to system memory, writing out all completed descriptors, and all Event Counts are zero. Note: While testing for Reset values, mask out the read value. This bit represents the changing state of the core and does not hold a static value.
22 DEVCTRLHLT	Device Controller Halted This bit is set to 0 when the Run/Stop bit in the DCTL register is set to 1. The core sets this bit to 1 when, after SW sets Run/Stop to 0, the core is idle and the lower layer finishes the disconnect process. When Halted=1, the core does not generate Device events. Note: - The core does not set this bit to 1 if GEVNTCOUNTn has some valid value. Software needs to acknowledge the events that are generated (by writing to GEVNTCOUNTn) while it is waiting for this bit to be set to 1. - When Interrupt Moderation is enabled, there could be delay in raising the interrupt line when the event count is non-zero. Software should read the GEVNTCOUNT register directly and acknowledge them.
21-18 USBLNKST	USBLNKST. USB/Link State In SS mode: LTSSM State - 4'h0: U0 - 4'h1: U1 - 4'h2: U2 - 4'h3: U3 - 4'h4: SS_DIS - 4'h5: RX_DET - 4'h6: SS_INACT - 4'h7: POLL - 4'h8: RECOV - 4'h9: HRESET - 4'ha: CMPLY - 4'hb: LPBK - 4'hf: Resume/Reset In HS/FS/LS mode: - 4'h0: On state - 4'h2: Sleep (L1) state - 4'h3: Suspend (L2) state - 4'h4: Disconnected state (Default state) - 4'h5: Early Suspend state (valid only when Hibernation is disabled, GCTL[1].GblHibernationEn = 0) - 4'he: Reset (valid only when Hibernation is enabled, GCTL[1].GblHibernationEn = 1) - 4'hf: Resume (valid only when Hibernation is enabled, GCTL[1].GblHibernationEn = 1) The link state Resume/Reset indicates that the core received a resume or USB reset request from the host while the link was in hibernation. Software must write '8' (Recovery) to the DCTL.ULStChngReq field to acknowledge the resume/reset request. When Hibernation is enabled, GCTL[1].GblHibernationEn = 1, this field USBLnkSt is valid only when DCTL[31].Run/Stop set to '1' and DSTS[29].DCNRD = 0. Note: If SSIC is enabled, while exiting a low power state, the USBLnkSt field indicates Resume/Reset even for a disconnect condition because a resume precedes the disconnect.
17 RXFIFOEMPTY	RxFIFO Empty.
16-3 SOFFN	Frame/Microframe Number of the Received SOF. When the core is operating at SuperSpeed, - [16:3] indicates the uframe/ITP number When the core is operating at high-speed, - [16:6] indicates the frame number - [5:3] indicates the microframe number When the core is operating at full-speed, - [16:14] is not used. Software can ignore these 3 bits - [13:3] indicates the frame number
2-0 CONNECTSPD	Connected Speed (ConnectSpd) Indicates the speed at which the DWC_usb3 core has come up after speed detection through a chirp sequence. - 3'b100: SuperSpeed (PHY clock is running at 125 or 250

Field	Function
	MHz) - 3'b000: High-speed (PHY clock is running at 30 or 60 MHz) - 3'b001: Full-speed (PHY clock is running at 30 or 60 MHz) Low-speed is not supported for devices using a UTMI+ PHY. 000b - 001b - 100b -

Field	Function
31-0 USBACTEP	USB active endpoints This bit indicates if a USB endpoint is active in the current configuration and interface.

Field	Function
	Bit[0]: USB EP0-OUT Bit[1]: USB EP0-IN Bit[2]: USB EP1-OUT Bit[3]: USB EP1-IN Bit[4]: USB EP2-OUT Bit[5]: USB EP2-IN Bit[6]: USB EP3-OUT Bit[7]: USB EP3-IN The entity programming this register must set bits 0 and 1 because they enable control endpoints that map to physical endpoints (resources) after USB reset. Hardware clears these bits for all endpoints (other than EP0-OUT and EP0-IN) after detecting a USB reset event. After receiving SetConfiguration and SetInterface requests, the application must program endpoint registers accordingly and set these bits.

11.1.3.1.95 Device physical endpoint-n command parameter 2 register (DEPCMDPAR2)

11.1.3.1.95.1 Offset

Register	Offset
DEPCMDPAR2	C800h

11.1.3.1.95.2 Function

This register indicates the physical endpoint command Parameter 2.

11.1.3.1.100.4 Fields

Field	Function
31-6 reserved_31_6	Reserved
5 DisPrtPwrCutoff	OTG Disable Port Power Cut Off (DisPrtPwrCutoff) - 0: The core automatically turns off the VBUS by clearing the OCTL.PrtPwrCtl after A_WAIT_BCON Timeout whenever the port is disconnected in disconnected state. If Hibernation is enabled and when a hibernation request is received in disconnected state, the core switches off VBUS instantly by clearing the OCTL.PrtPwrCtl. - 1: The core maintains VBUS ON even after A_WAIT_BCON Timeout when port is in disconnected state. The core is in a A_WAIT_BCON state continuously waiting for a Connect. If hibernation is enabled and when hibernation

Table continues on the next page...

Field	Function
	request is received in disconnected state, the core maintains VBUS ON and continues to drive VBUS even in hibernation.
4 OTGHibDisMask	OTG Hibernation Disable Mask. - 0 - Any change in PHY input signals relevant to OTG (ID, Vbus-valid, B-Valid) are masked from generating a corresponding event when the core receives Hibernation Save request from Host or Device Driver. The change in signals is masked until the Host or Device Run/Stop is programmed to 1. - 1 - The PHY input signals are not masked even after the core receives the Hibernation Save request from Host or Device Driver. For normal functionality, this bit must be 1'b0.
3 OTGSftRstMsk	OTG Soft Reset Mask. This bit is used to mask specific soft resets from affecting the OTG functionality of the core. When set, the xHCI-based USBCMD.HCRST in host mode and DCTL.CSftRst in device mode is masked from affecting reset signal outputs sent to the PHY, the OTG FSM logic of the core and also the resets to the VBUS filters inside the core. - 1'b0: The xHCI-based USBCMD.HCRST and DCTL.CSftRst resets the OTG logic of the core. - 1'b1: The xHCI-based USBCMD.HCRST and DCTL.CSftRst is masked from the OTG logic of the core. This bit can be programmed to allow existing xHCI flows (with USBCMD.HCRST programming) to function in OTG scenarios without any software changes. This bit must be programmed only when GCTL.PrtCapDir = 2'b11. Otherwise it must be set at 1'b0. Note: When using the core for OTG2 or OTG3 applications, it is not recommended to program USBCMD.HCRST during role switch.
2 OTG_Version	This is a debug bit and it must always be set to 1'b0.
1 HNPCap	RSP/HNP Capability. The terminology RSP is used when the core is operating in SS mode, and HNP is used when the core is operating in non-SS mode. The application uses this bit to control the DWC_usb3 core's RSP/HNP capabilities. - 1'b0: RSP/HNP capability is not enabled. - 1'b1: RSP/HNP capability is enabled. Note: This bit is writable only if RSP/HNP mode is specified for Mode of Operation in coreConsultant, that is when DWC_USB3_EN_OTG != 0 and DWC_USB3_MODE = DRD. If RSP/HNP mode is not specified, this bit is Read Only, and is set to 1'b0.
0 SRPCap	SRP capability The application uses this bit to control the USB 3.0 core's SRP capabilities. If this bit is not set for B-device, it cannot request the connected A-device (host) to activate VBUS and start a session. If this bit is not set for A-device, it cannot detect the SRP from B-device (device) to activate VBUS and start a session. **NOTE:** This bit is writable only if OTG is enabled. If OTG is not enabled, then this bit is Read Only and is set to 1'b0.

11.1.3.1.101 OTG Control Register (OCTL)

11.1.3.1.101.1 Offset

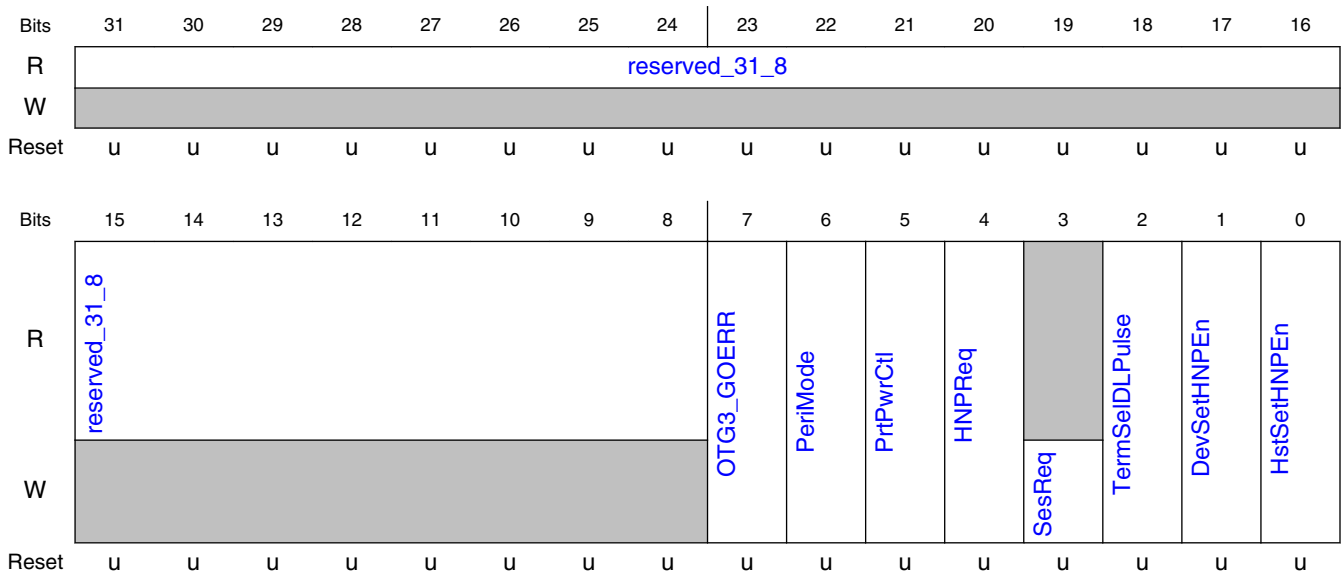
Register	Offset
OCTL	CC04h

11.1.3.1.101.2 Function

The OTG Control register controls the behavior of the OTG function of the core.

Reset Mask:0xFFFFFFA0

11.1.3.1.101.3 Diagram



11.1.3.1.101.4 Fields

Field	Function
31-8 reserved_31_8	Reserved
7 OTG3_GOERR	OTG3_GOERR When set, this instructs the core's LTSSM to go to the error state during OTG 3.0 RSP. The software must set this bit when TRSP_ACK_ERR, TRSP_CNF_ERR, or TRSP_WRST_ERR timeout occurs. This bit is self-cleared by the core when the LTSSM moves to the error state.
6 PeriMode	Peripheral Mode The application uses this bit to program the core to work as a peripheral or as a host. - 1'b0: The OTG device acts as a host - 1'b1: The OTG device acts as a peripheral
5 PrtPwrCtl	Port Power Control Application sets this bit to initiate Vbus drive when it is an A-device. The application must clear this bit only if it wants to switch off the Vbus to B-device. The core clears this bit in the following conditions: Transition from any state to A-IDLE state defined in OTG2.0 state machine: - When AIDL_BDIS_TOUT occurs in A_SUSPEND; - When A_WAIT_BCON_TOUT occurs in A_WAIT_BCON; - Transition to any B- state defined in OTG2.0 state machine;
4 HNPReq	HNP Request - 1'b0: No HNP request - 1'b1: HNP request The application sets this bit to initiate a HNP request to the connected USB host. The application clears this bit by writing a 1'b0 when either of the following is detected: - OEVT.OTGBDevBHostEndEvnt - OEVT.OTGBDevVBusChngEvnt
3 SesReq	Session Request - 1'b0: No session request - 1'b1: Session request The application sets this bit to initiate a session request on the USB. Writing 1'b1 to this field triggers the core to send SRP (data line pulsing) on the PHY interface. In the absence of OEVT.OTGBDevSessVldDetEvnt after a session request, the application must wait for atleast TB_SRP_FAIL time (6 secs) before initiating another session request. This field returns 1'b0 when read.
2 TermSelDLPulse	TermSel DLine Pulsing Selection This bit selects utmi_termselect to drive data line pulse during SRP. - 1'b0: Data line pulsing using utmi_txvalid (default). - 1'b1: Data line pulsing using utmi_termsel.

Table continues on the next page...

Field	Function
1 DevSetHNPEn	Device Set RSP/HNP Enable - 1'b0: RSP/HNP is not enabled in the application. - 1'b1: RSP/HNP is enabled in the application. The application sets this bit in the following scenario: - In HS/FS mode, when it successfully receives a SetFeature.SetHNPEnable command from the connected USB host. - In SS mode, when it has sent a b3_ntf_hst_rel to the A-device, or the A-device has sent an a3_ntf_host_req. Note: The terminology RSP is used when the core is operating in SS mode, and HNP is used when the core is operating in non-SS mode.
0 HstSetHNPEn	Host Set RSP/HNP Enable. - 1'b0: Host Set RSP/HNP is not enabled; - 1'b1: Host Set RSP/HNP is enabled; The application sets this bit in the following scenario: - In HS/FS mode, when it has successfully enabled HNP (using the SetFeature.SetHNPEnable command) from the connected device. - In SS mode, when it has successfully enabled the b3_rsp_enable feature in RSP-capable Device using SetFeature command while operating as an A-Host, or when it has received a b3_ntf_hst_rel through the SetFeature command while operating as A-peripheral. Note: The terminology RSP is used when the core is operating in SS mode, and HNP is used when the core is operating in non-SS mode.

11.1.3.1.102 OTG Events Register (OEVT)

11.1.3.1.102.1 Offset

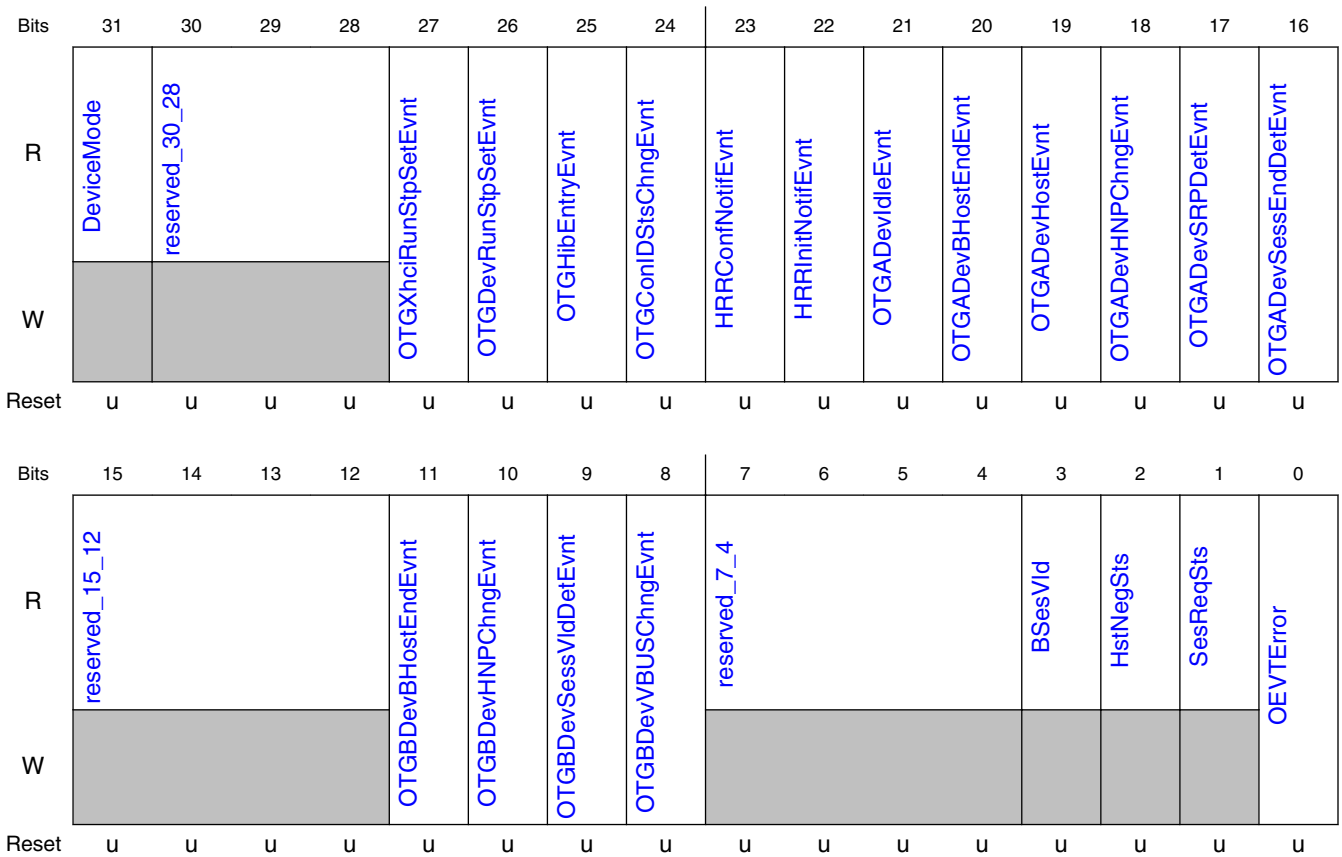
Register	Offset
OEVT	CC08h

11.1.3.1.102.2 Function

Any event set in this register will cause otg_interrupt signal to go high.

Reset Mask:0x7FDFFFF1

11.1.3.1.102.3 Diagram



11.1.3.1.102.4 Fields

Field	Function
31 DeviceMode	Device Mode Indicates whether the device is in A-device or B-device mode based on utmiotg_iddig - 1'b0: A-Device mode - 1'b1: B-Device mode The rest of the OTG Event Information bits (OTGxxxxEvtInfo) in OEVT register is based on the contents of this field.
30-28 reserved_30_28	Reserved
27 OTGXhciRunStpSetEvnt	OTG Host Run Stop Set Event This event is set when the Host Driver programs the USBCMD.Run/Stop to 1'b1. Note: - During Hibernation Exit, upon receiving this event, the OTG Driver can start register accesses to the core. - This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
26 OTGDevRunStpSetEvnt	OTG Device Run Stop Set Event This event is set when the Device Driver programs the DCTL.Run/Stop to 1'b1. Note: During Hibernation Exit, upon receiving this event, the OTG Driver can start register accesses to the core.
25 OTGHibEntryEvnt	OTG Hibernation Entry Event: - A-Device mode: This event is set when there is hibernation save request from the Host Driver by programming USBCMD.CSS bit to 1 when USBCMD.RunStp is 0. - B-Device mode: This event is set when there the Device Driver by programming DCTL.RunStp bit to 0. When this event is generated, the OTG Driver must disable all register accesses to the core.

Table continues on the next page...

Field	Function
24 OTGConIDStsChngEvnt	Connector ID Status Change Event Set in both A-Dev/B-Dev Mode. This event is generated when there is a change in connector ID status. When this bit is set, OEVT.OTGConIDStsChngEvnt is enabled. If not, the event is disabled.
23 HRRConfNotifEvnt	Host Role Request Confirm Notifier Event The core sets this bit after receiving a Host Role Request Device Notification TP with Confirm field set while operating as either an A-host or a B-host. Note: - This bit is applicable only when operating in SS mode. - This bit is applicable only for OTG 3.0 mode of operation.
22 HRRInitNotifEvnt	Host Role Request Initiate Notifier Event The core sets this bit after receiving a Host Role Request Device Notification TP with Initiate field set while operating as either an A-host or a B-host.
21 OTGADevIdleEvnt	A-device A-IDLE Event Set in A-device Mode Only. The event is generated when A-device enters A-IDLE state. This event is set when the OTG 2.0 FSM of the core enters A-IDLE state from any other OTG state. A-device A-IDLE Event When this bit is set, OEVT.OTGADevIdleEvnt is enabled. If not, the event is disabled.
20 OTGADevBHostEndEvnt	A-device B-Host End Event Set in A-device Mode Only. The event is generated when B-device has completed its host role. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. When this bit is set, OEVT.OTGADevBHostEndEvnt is enabled. If not, the event is disabled.
19 OTGADevHostEvnt	A-device host event Set in A-device Mode Only. This event is generated when A-device enters host role. In HS/FS mode, it occurs after the initial connect to a B-device as A-host as well as when there is a role change from A-peripheral to A-host. Note: This bit is applicable only for OTG 2.0 mode of operation.
18 OTGADevHNPChngEvnt	A-Dev HNP Change Event Set in A-device Mode Only. The event is generated when there is an HNP attempt. Note: This bit is applicable only for OTG 2.0 mode of operation. A-Dev HNP Change EventEn (OTGADevHNPChngEvntEn) When this bit is set, OEVT.OTGADevHNPChngEvnt is enabled. If not, the event is disabled
17 OTGADevSRPDetEvnt	SRP Detect Event Set in A-device Mode Only. This event is asserted when a session request from the B-device is detected via SRP. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. A-Dev HNP Change EventEn (OTGADevHNPChngEvntEn) When this bit is set, OEVT.OTGADevHNPChngEvnt is enabled. If not, the event is disabled.
16 OTGADevSessEndDetEvnt	Session End Detected Event Set in A-device Mode Only. This event is asserted when the utmiotg_vbusvalid signal goes low indicating the end of a session. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. When this bit is set, OEVT.OTGADevSessEndEvnt is enabled. If not, the event is disabled.
15-12 reserved_15_12	Reserved
11 OTGBDevBHostEndEvnt	B-Device B-Host End Event Set in B-device Mode Only. This event is generated when B-device has completed its host role. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. When this bit is set, OEVT.OTGBDevHostEndEvnt is enabled. If not, the event is disabled.
10 OTGBDevHNPChngEvnt	B-Dev HNP Change Event: Set in B-Device Mode only. This event is generated when there is a Success or Failure of an HNP attempt. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. When this bit is set, OEVT.OTGBDevHNPChngEvnt is enabled. If not, the event is disabled.
9 OTGBDevSessVldDetEvnt	Session Valid Detected Event Set in B-device Mode Only. This event is asserted when there is a valid Vbus from A-device and B-device succeeds in starting a session. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
8 OTGBDevVBUSChngEvnt	Vbus Change Event Set in B-device Mode Only. This event is asserted when the utmisrp_bvalid signal goes low (indicating the end of a session), or goes high. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. When this bit is set, OEVT.OTGBDevVBUSChngEvnt is enabled. If not, the event is disabled.

Table continues on the next page...

Field	Function
7-4 reserved_7_4	Reserved
3 BSesVld	Indicates the Device mode transceiver status. Indicates the Device mode transceiver status. The core updates this bit when: OEVTEN.OTGBDevVBUSChngEvnt is set. - 1'b0: B-session is not valid - 1'b1: B-session is valid Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
2 HstNegSts	Host Negotiation Status The core updates this bit when any of the following bits is set: - OEVTEN.OTGADevHNPChngEvnt - OEVTEN.OTGBDevHNPChngEvnt This bit indicates Host Negotiation Success or Failure. 1'b0: Host negotiation failure. - In A-device, for HS/FS, this indicates an imminent end of session indication from the core. - In B-device, for HS/LS, it indicates that the timer used to wait for an A-device to signal a connection (b_ase0_brst_tmout in OTG 2.0) timed out resulting in B-device staying as B-peripheral. 1'b1: Host negotiation success. - This indicates that the host negotiation was successful. Note: This bit is applicable only for OTG 2.0 mode of operation.
1 SesReqSts	Session Request Status Ignore this field. It is used only for Synopsys internal testing.
0 OEVTError	OTG Event Error There are no errors currently defined.

11.1.3.1.103 OTG Events Enable Register (OEVTEN)

11.1.3.1.103.1 Offset

Register	Offset
OEVTEN	CC0Ch

11.1.3.1.103.2 Function

Setting a bit in this register enables the generation of corresponding events in OEVT and assertion of otg_interrupt due to this event.

11.1.3.2 USB3_GLUE register descriptions

Between USB3.0 Core and USB PHY, there is a GLUE architecture to make the connection more configurable.

11.1.3.2.1 GLUE_usb3 memory map

Base Address for GLUE registers - USB1: 381F_0000, and USB2: 382F_0000

USB GLUE architecture makes the connection between Core and PHY more configurable. USB GLUE contains some configurable registers and status signal monitoring to Core/PHY. There are two GLUE blocks and each has its own configurable registers.

Offset	Register	Width (In bits)	Access	Reset value

21-20 TXRISETUNE0	HS Transmitter Rise/Fall Time Adjustment Adjusts the rise/fall times of the high-speed waveform. To enable tuning at the board level, connect this bit to a register. **NOTE:** A positive binary bit setting change results in a –4% incremental change in the HS rise/fall time. A negative binary bit setting change results in a +4% incremental change in the HS rise/fall time.
19-18	USB Source Impedance Adjustment

Table continues on the next page...

Field	Function
TXRESTUNE0	Some applications require additional devices to be added on the USB, such as a series switch, which can add significant series resistance. This bus adjusts the driver source impedance to compensate for added series resistance on the USB. **NOTE:** Any setting other than the default can result in source impedance variation across process, voltage, and temperature conditions that does not meet USB 2.0 specification limits. If this bus is not used, leave it at the default setting 00b - Source impedance is increased by approximately 1.5 Ω 01b - Design default 10b - Source impedance is decreased by approximately 2 Ω 11b - Source impedance is decreased by approximately 4 Ω
17 TXPREEMPULSETUNE0	HS Transmitter Pre-Emphasis Duration Control This signal controls the duration for which the HS pre-emphasis current is sourced onto DP or DM. The HS Transmitter pre-emphasis duration is defined in terms of unit amounts. One unit of pre-emphasis duration is approximately 580 ps and is defined as 1X pre-emphasis duration. This signal is valid only if either TXPREEMPMPTUNE[1] or TXPREEMPMPTUNE[0] is set to 1'b1. 0b - 2X (design default), long pre-emphasis current duration If TXPREEMPULSETUNE is not used, set it to 1'b0 1b - 1X, short pre-emphasis current duration

11.2 Universal Serial Bus PHY (USB_PHY)

11.2.1 Overview

The USB 3.0 PHY is designed for USB 3.0 SuperSpeed applications connecting to a USB OTG controller. The USB 3.0 PHY supports the USB 3.0 SuperSpeed (5 Gbps) protocol and data rate and is backward compatible with USB 2.0 high-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) protocols and data rates. This block guide provides an introduction to the USB 3.0 PHY and its features.

NOTE

The information within this block guide is Synopsys Proprietary. Used with permission.

11.2.1.1 Block Diagram

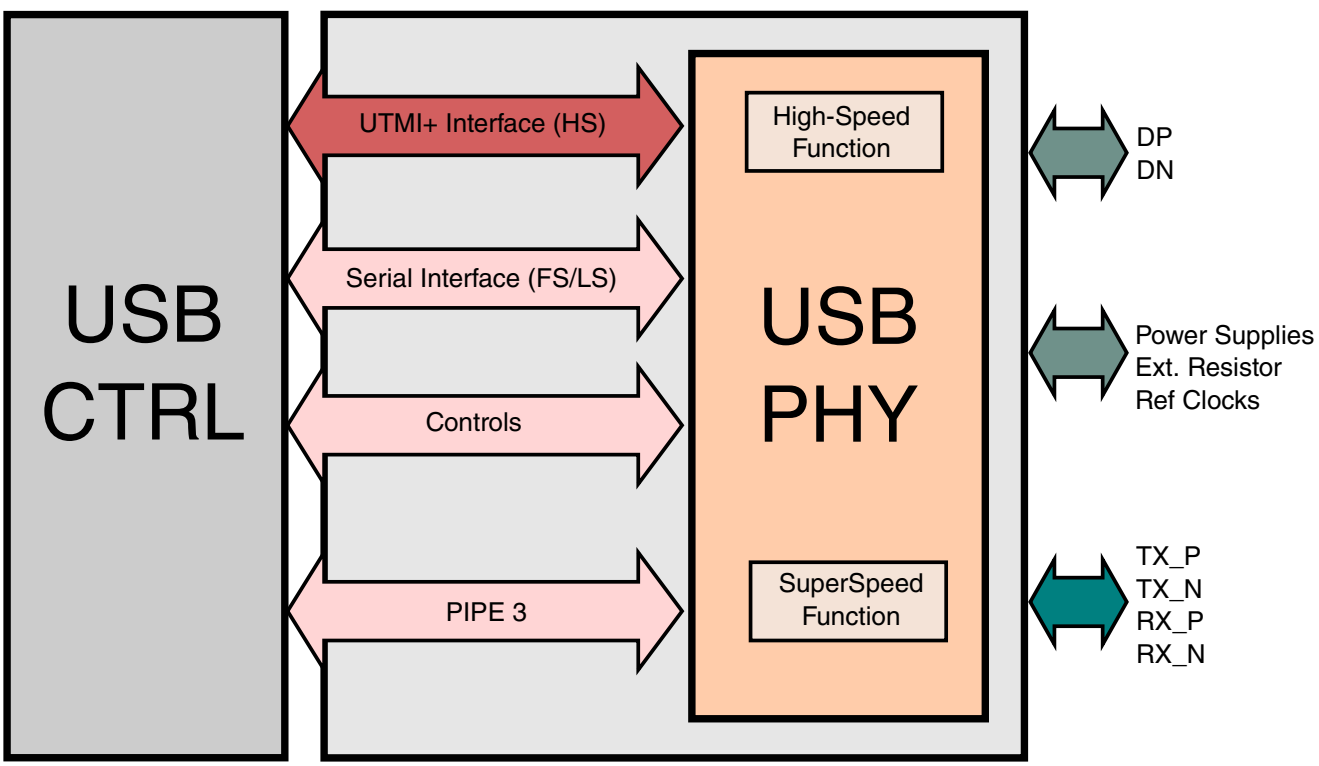

Figure 11-47. USB PHY Block Diagram

11.2.1.2 Features

The USB 3.0 PHY provides the following general features:

- Built-in VBUS threshold comparators;
- Single reference clock input for both USB 3.0 and USB 2.0 operating modes
- Integrated 3.3-V-to-1.8-V regulator in the PHY

The USB 3.0 PHY provides the following USB 3.0 features:

- 5-Gbps SuperSpeed data transmission rate through 3-m USB 3.0 cable
- PIPE 3-compliant SuperSpeed USB 3.0 Transceiver interface
- Integrated PHY includes transmitter, receiver, SSC generation, PLL, digital core, and ESD
- Adaptive Rx equalization
- Low-jitter PLL technology with excellent supply isolation

The USB 3.0 PHY provides the following USB 2.0 features:

- Built-in VBUS threshold comparators;
- 480-Mbps high-speed, 12-Mbps full-speed, and 1.5-Mbps low-speed serial (Host mode only) data transmission rates
- Supports high-speed power modes: suspend, resume, and remote wakeup
- 45-Ω termination, 1.5-kΩ pull-up and 15-kΩ pull-down resistors with support for independence control of the pull-down resistors
- 8/16-bit unidirectional parallel interfaces for HS, FS, and LS (Host mode only) modes of operation in accordance with the UTMI+ specification
- Dual (HS/FS) mode host/device support
- Data recovery from serial data on the USB connector
- SYNC/End-of-Packet (EOP) generation and checking
- Bit stuffing and unstuffing, and bit-stuffing error detection
- Non Return to Zero Invert (NRZI) encoding and decoding
- Bit serialization and deserialization
- VBUS threshold comparators

11.2.1.3 Standards Compliance

The USB 3.0 PHY is fully compliant with all the required features of the following standards:

- Universal Serial Bus 3.0 Specification, Revision 1.0
  - Supports 5.0-Gbps SuperSpeed (SS) through 3-m cable, 480-Mbps high-speed (HS), 12-Mbps fullspeed (FS), and 1.5-Mbps low-speed (LS) serial (Host mode only) data transmission rates, with a high-speed (HS) transmit-to-receive interpacket delay requirement of 38 bit-times as implied by the UTMI specification, version 1.05.

    - Supports beaconing, receiver detection, and electrical idle
    - Four-wire SuperSpeed connection (two Tx and two Rx unidirectional) with built-in Tx and Rx equalization
- PIPE 3-compliant USB 3.0 SuperSpeed interface
- On-The-Go Supplement to the USB 2.0 Specification, Revision 2.0
- UTMI+ Specification, Revision 1.0 (Level 3)
- Battery Charging Specification, Revision 1.2

11.2.2 Functional Description

11.2.2.1 PIPE Interface

The datapath of the USB 3.0 PHY is through the standard PIPE 3 interface. This interface can connect directly to any USB 3.0 controller. For more information about the PIPE 3 interface signals, refer to PHY Interface For the PCI Express and USB 3.0 Architectures.

11.2.2.2 Termination Tuning

The PHY uses an external resistor to calibrate the termination impedances of the PHY's high-speed inputs and outputs. The resistor is shared between the USB 2.0 high-speed outputs and the SuperSpeed I/O. Each time the PHY is taken out of a reset, a termination calibration is performed. The termination calibration is continuous for USB 2.0 operation except when the USB 2.0 port is suspended. The termination calibration is performed only when coming out of a reset in SuperSpeed operation.

A resistor calibration on the SuperSpeed link cannot be performed while the link is operational. At no point is a request for calibrating the SuperSpeed link using rtune_req required; this feature is provided only for completeness.

11.2.2.3 Battery Charging

The USB 3.0 PHY supports battery charger detection to enable devices to draw increased current from VBUS for charging and/or powering up from dedicated charging ports or charging downstream ports.

11.2.2.4 Dead Battery Provision

The dead battery provision enables a device to draw increased current (up to 100 mA) from VBUS in certain conditions. This function can be used only if all power supplies are stable and at their respective, normal, valid operating levels.

11.2.2.5 Data Contact Detect

Prior to a device performing battery charger detection, DCD is performed to determine if the D+ and D– pins in the device have made contact with those in the host or charger.

11.2.2.6 UART / Autoresume

The USB 3.0 PHY's single-ended receivers are used for UART and Autoresume data reception, while the full-speed drivers are used for data transmission. UART and Autoresume signaling levels are the same as signaling levels for USB 2.0 FS mode.

In this mode of operation, the driver source impedance is not calibrated; however, the driver retains the settings of the last calibration. In addition, the rise/fall time control is disabled, so changes in the state of DP and DN driven by this mode are not expected to meet the rise and fall times as defined in the USB 2.0 specification.

11.2.2.7 Serial Interface

The serial interface supports full-speed and low-speed data transmission rates to and from a USB 1.1 controller.

11.2.3 Clocks

The USB 3.0 PHY supports a wide range of input reference clocks from both external and on-chip clock sources. To support both SuperSpeed and high-speed operations, one of the following must be provided:

- A compatible, shared reference clock frequency
- Separate clock sources to support SuperSpeed operation and high-speed operation

11.2.4 External Signals

This section describes the USB 3.0 PHY signals that go to pins:

- External reference resistor: resref

- Receive pins: RX_N, RX_P
- Transmit pins: TX_N, TX_P
- USB 2.0 D+/D– lines: DN, DP
- USB mini-receptacle identifier: ID
- USB 5-V power supply pin: VBUS

11.3 PCI Express (PCIe)

11.3.1 Overview

This PCI Express dual mode (DM) controller provides a solution to implement a PCI Express port for a PCI Express root complex or endpoint application. A complete PCI Express port solution includes the controller, an analog PHY macro, and application logic to source and sink data.

NOTE

The information within this block guide is Synopsys Proprietary. Used with permission.

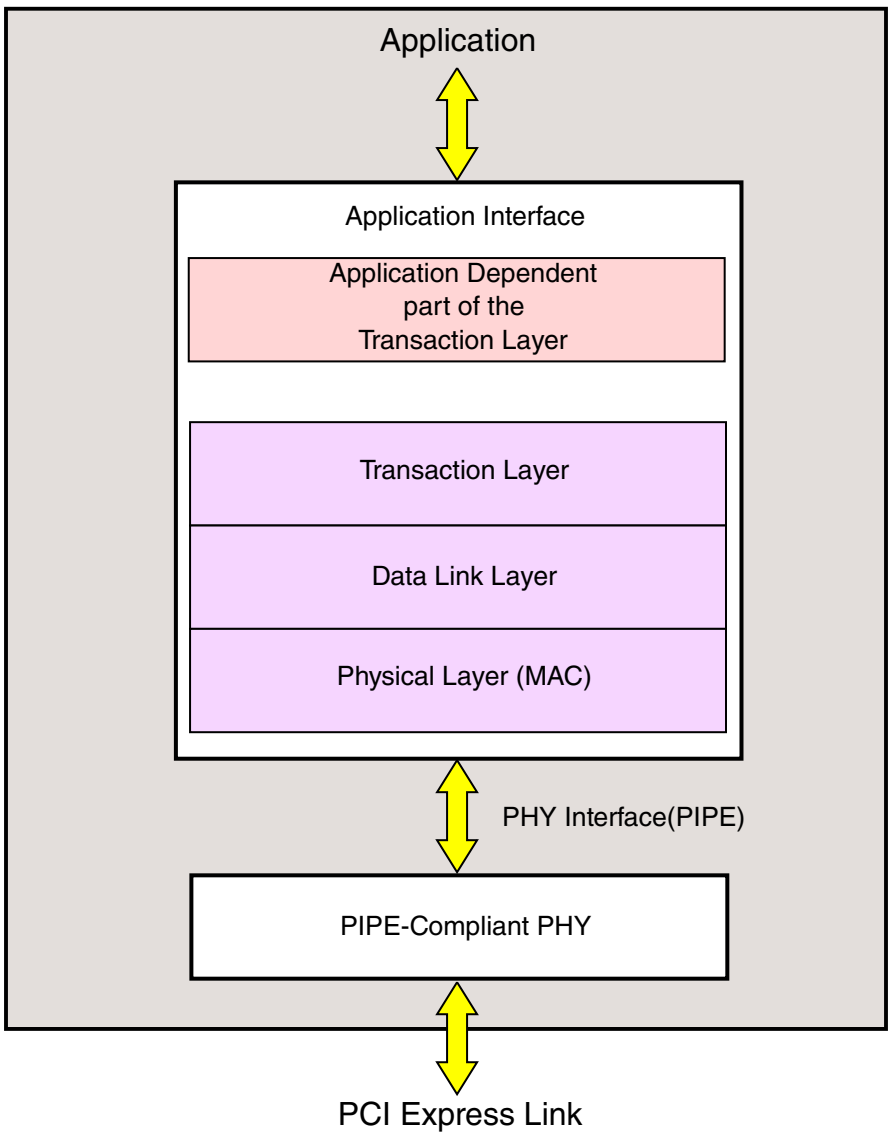

Figure 11-48. PCIe Application

11.3.1.1 Features

The PCI Express DM controller supports:

- Latency Tolerance Reporting (LTR)
- Address Translation Services (ATS) by your application
- Page Request Services (PRS) by your application
- Completion Timeout Ranges
- ID-Based Ordering (IDO) by your application
- M-PCIe
- PASID

- L1 Substates (L1SS)
- Extended Tag Support
- Resizable BAR (RBAR) with Expanded RBAR support,
- Separate Refclk with Independent Spread Spectrum Clocking (SRIS)
- Lightweight Notifications (LN)
- Readiness Notifications (RN)
- PCI Express Active State Power Management (ASPM)
- PCI Express Advanced Error Reporting (AER) with Multiple Header Logging
- PCI Express Advanced Error Reporting (AER)
- Vital Product Data (VPD)
- x1 lane
- Power Gating (UPF) Support
- Advanced Power and Clock Management
- Internal Address Translation Unit
- Internal MSI-X Generation Module
- AXI3
- Embedded DMA
- Upconfigure Support
- ECRC Generation and Checking
- Supports two Virtual Channels (VC)
- Max_Payload_Size (128 bytes)
- Configurable Filtering Rules for Posted, Non-posted, and Completion Traffic
- Configurable BAR Filtering, I/O Filtering, Configuration Filtering and Completion Lookup/Timeout
- MSI and MSI-X with Per-Vector Masking (PVM), Extended message data for MSI
- Type 1 Configuration Space
- Application-initiated Manual Lane Reversal/flip for situations where controller does not detect Lane 0
- Type 0 Configuration space

11.3.1.2 Standards

The PCIe controller implements the following standards:

- *PCI Express Base Specification, Revision 4.0, Version 0.7*
- Access to this specification requires membership in PCI-SIG.
- PCI Local Bus Specification, Revision 3.0
- Access to this specification requires membership in PCI-SIG.
- PCI Bus Power Management Specification, Revision 1.2 Access to this specification requires membership in PCI-SIG.
- PCI Express Card Electromechanical Specification, Revision 1.1 Access to this specification requires membership in PCI-SIG.

11.3.2 Functional Description

11.3.2.1 Link Establishment

The controller implements the LTSSM function according to the *PCI Express Base Specification, Revision 4.0, Version 0.7. .*

11.3.2.1.1 Transmit TLP Processing

The following section describe the flow of transmit TLPs through the controller.

NOTE

The controller does not check the TLP for errors.

The PCIe controller ensures transmitted TLP Payload sizes are less than or equal to the maximum payload size limit.

11.3.2.1.1.1 Transmit TLP Arbitration

TLPs and DLLPs have equal priorities during transmit arbitration as shown in the figure below. The priority of TLP types and DLLP types are shown in tables below.

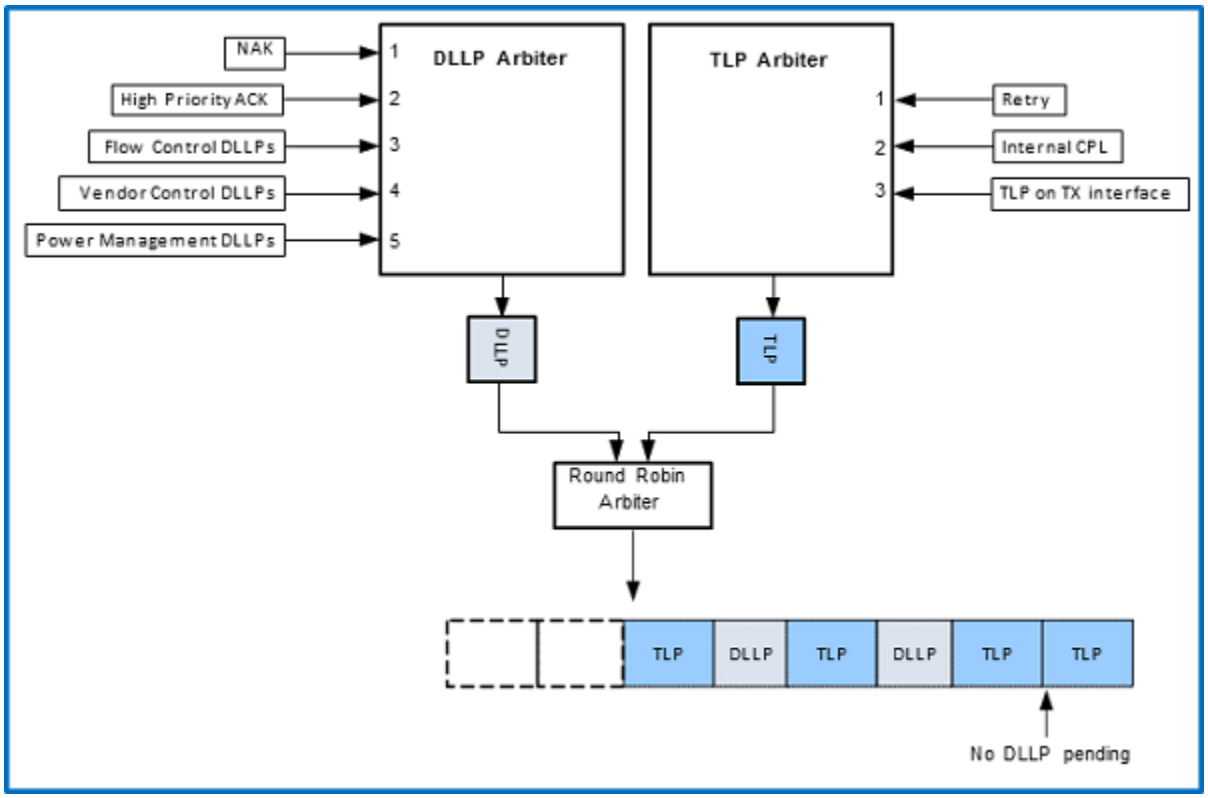

Figure 11-49. Transmit TLP/DLLP Arbitration

Table 11-25. TLP Arbitration Priority (1= Highest, 4= Lowest)

Priority	TLP Type
1	Completion of any TLP currently in progress
2	Retry buffer retransmissions
3	TLPs from the transaction layer (in the following order of priority): • Messages generated by the controller (including by your application through the MSI interface) • Upstream ports: Completions generated by the controller (including memory or I/O mapped application register space) for Type 0 configuration read and write requests, or responses to error conditions (unsupported requests) • Downstream ports: Completions generated by the controller for unsupported requests or completer aborts
4	TLPs on the AXI Master/Slave interface

Table 11-26. DLLP Arbitration Priority (1= Highest, 6 = Lowest)

Priority	DLLP Type
1	Completion of any DLLP currently in progress
2	NAK DLLP

Table continues on the next page...

Table 11-26. DLLP Arbitration Priority (1= Highest, 6 = Lowest) (continued)

3	High Priority ACK DLLP
4	Flow Control DLLP
5	Vendor Specific Message DLLP
6	Power management or any other Low Priority DLLP

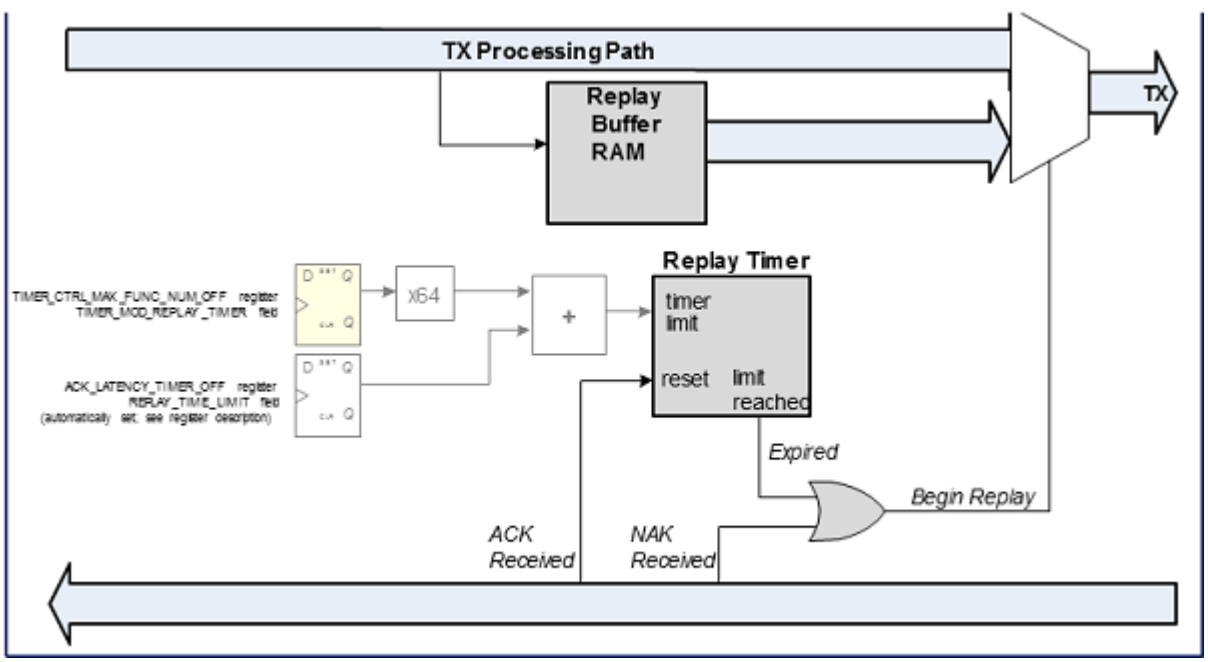
11.3.2.1.1.1.1 Effects of Flow Control Credits On Transmit Client Arbitration

The controller checks that enough flow control (FC) credits are available in the remote device for the specific type of transaction (posted, non-posted, completion) before allowing a transmission of a TLP. TLPs that passed the credit check are arbitrated according to the supported arbitration method. Internally generated completions and messages are also gated by the arbitration logic, though at highest priority, and must also pass the FC credit test before they are accepted for transmission.

11.3.2.1.1.2 Transmit Replay

You can modify the time-out value of the replay buffer as shown in the figure below. For a typical system, you do not have to modify the default settings, unless the remote device is executing unexpected replays.

Figure 11-50. Replay Buffer And Time (Representative)



11.3.2.1.2 Receive TLP Processing

This section describes the flow of received TLPs through the controller.

11.3.2.1.2.1 Receive Filtering

The controller contains a filter module that is responsible for the following tasks:

- Determine the status of a received TLP using filtering rules.
- Determine the destination of a received TLP based on the filtering status.
- Indicate the status of the received TLP using outputs.
- Report Errors to AER registers based on filter results. When more than one type of error is detected, Error Pollution, of the *PCI Express Base Specification, Revision 4.0, Version 0.7* is followed.
- The controller filters and routes received TLPs according to a set of rules determined by the TLP type based on the *PCI Express Base Specification, Revision 4.0, Version 0.7* and user-configurable filtering options.

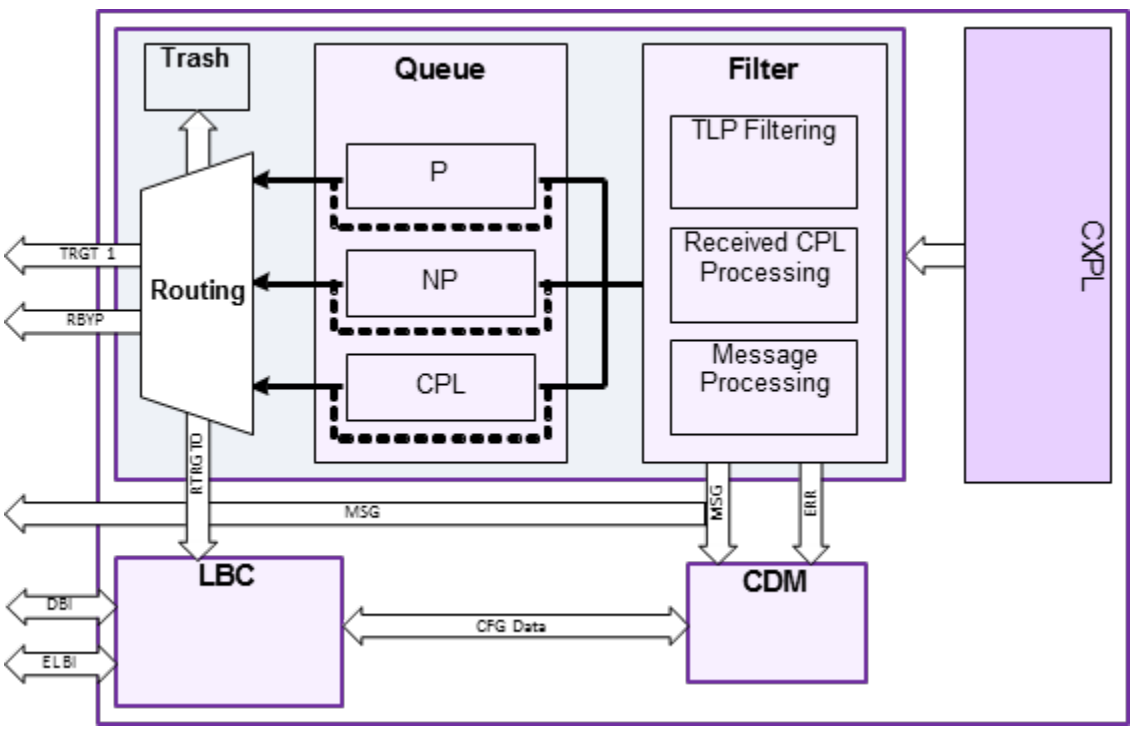


Figure 11-51. RADM Block Diagram

The following general rules apply to all incoming TLPs that are not malformed. For details on what happens to malformed TLPs, see "Error Detection for Received TLPs" By default:

- For a function in device power states D1, D2, and D3hot, the controller only accepts CFG and MSG requests TLPs for that function. All other incoming request types for that function are treated as unsupported requests (UR).
- When the controller detects an error in a received TLP, it normally performs the following:
  - Discards the TLP
  - Generates a completion (for non-posted requests) with the completion status set to CA or UR
  - Sets the status in the PCI-compatible Status register
  - Sets the status in the AER registers
  - Generates an error message (upstream port only)

All error-free MSG requests are decoded internally, signaled on the SII interface and then dropped. When you want to have the decoded message also sent to the application interface, then see “Routing of Received Messages”.

11.3.2.1.2.2 Receive Routing

This section discusses how the RADM routes different TLP types to different receive interfaces depending on TLP type and filter result. TRGT1 refers to the AXI interface. TRGT0 refers to the internal interface used to access the CDM registers or the ELBI in an upstream port.

11.3.2.1.2.2.1 EP Mode Routing Overview

The possible destinations of a posted or non-posted request TLP are TRGT1 interface, TRGT0 interface and Discard. By default:

- CFG requests are routed to TRGT0 and then to CDM through the LBC.
- BAR-matched MEM and I/O requests are routed to TRGT1.
- MSG requests are decoded internally, signaled on the SII interface, and then terminated.

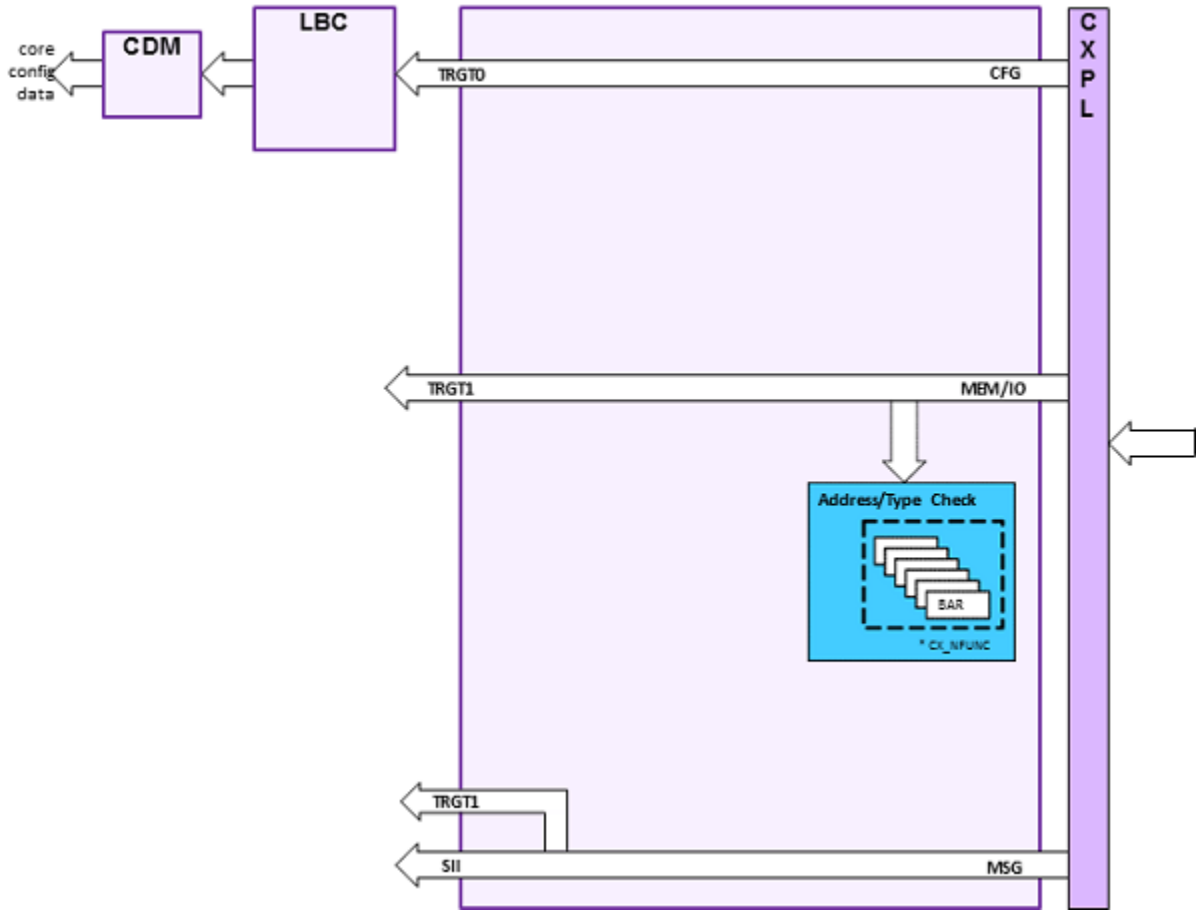

Figure 11-52. EP Mode Routing

11.3.2.1.2.2.2 RC Mode Routing Overview

The possible destinations of a posted or non-posted request are TRGT1 and Discard. By default:

- MEM requests outside of the memory range and prefetchable memory range as determined by the corresponding Base and Limit fields in the Type-1 header are routed to TRGT1.
- MSG requests are decoded internally, signaled on the SII interface, and then terminated.
- An RC does not expect to receive CFG or I/O requests.
- BARs should be disabled and not used.

The possible destinations of a completion TLP are TRGT1 and Discard.

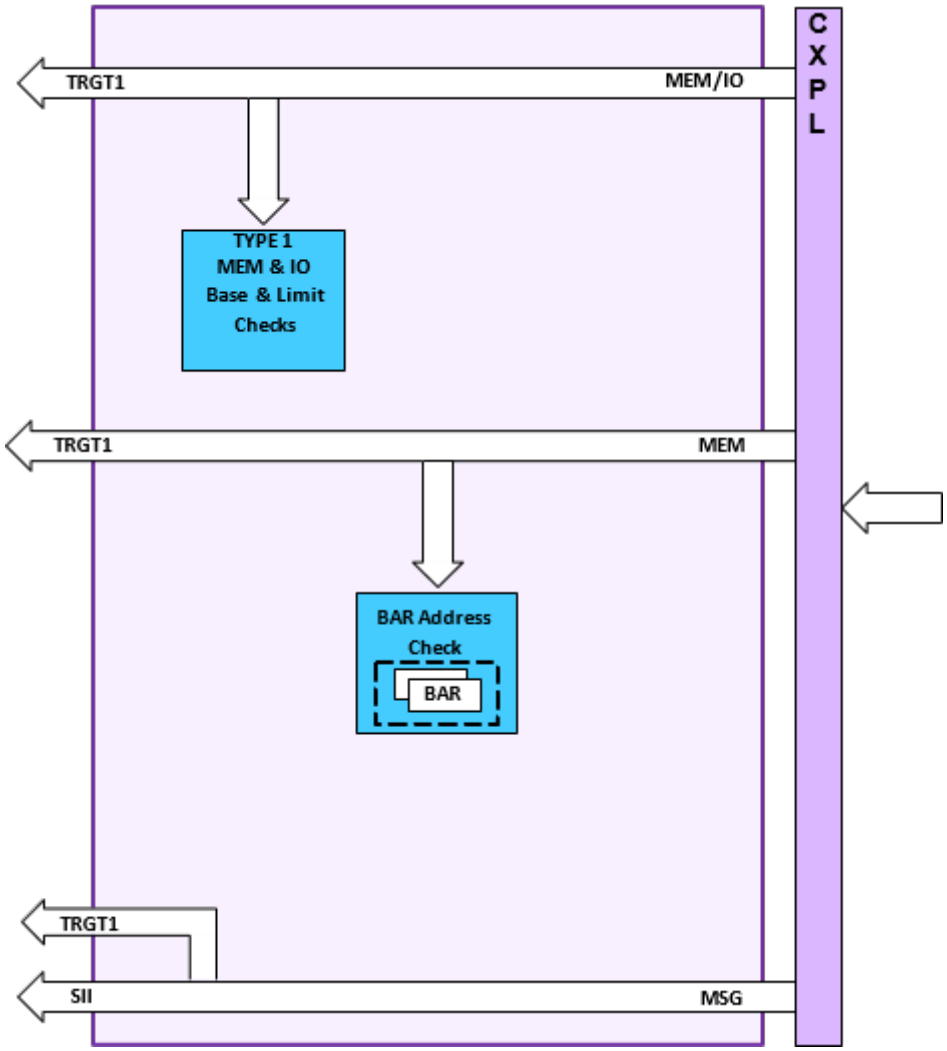

Figure 11-53. Default Request TLP Routing (Assuming no TLPs with CA/CRS/UR Error Status)

11.3.2.1.2.3 Error Handling

The controller supports the Baseline Capabilities, AER capabilities, and Advisory Non-Fatal Error Messaging as specified in section "Error Signaling and Logging" of the *PCI Express Base Specification, Revision 4.0, Version 0.7*. These include Correctable and Uncorrectable (Fatal and Non-Fatal) errors. For an RC port, the reporting of most errors is internal to the root port. No external error notifications are generated. One exception to this (for example) is unsupported request (UR) completion status.

11.3.2.1.2.3.1 Error Detection for Received TLPs

The controller performs all mandatory error detections, the error reporting mechanism based on the PCI Express Base Specification, Revision 4.0, Version 0.7. When the controller detects an error in a received TLP, it normally performs the following:

- Discards the TLP
- Generates a completion (for non-posted requests) with the completion status set to CA or UR
- Sets the status in the PCI-compatible status register
- Sets the status in the AER registers
- Generates an error MSG (upstream port only)

11.3.2.1.2.3.2 AER Multiple Header Logging

The controller supports the AER multiple header logging as specified in Section, "Multiple Error Handling (Advanced Error Reporting Capability)" of the *PCI Express Base Specification, Revision 4.0, Version 0.7*.

11.3.2.1.2.3.3 Physical Functions

By default, each physical function only logs the first header that caused an error. Per physical function, the controller implements a FIFO queue that interfaces with the AER Header Log registers (HDR_LOG_i_OFF). A valid queue entry is never overwritten. When the queue is full and your software does not read the header log registers fast enough, new header log information will be missed.

11.3.2.1.2.3.4 Virtual Functions

By default, each virtual function only logs the first header that caused an error. Each VF in each physical function has the exact same header log queue depth. Per VF, the controller implements a queuethat interfaces with the AER Header Log registers (VF_HDR_LOG_i_OFF). A valid queue entry is never overwritten. When the queue is full and your software does not read the header log registers fast enough, new header log information will be missed.

The depth of each shared queue is identical for all PFs . The queue is not a FIFO, it is just a resource-saving mechanism, and each VF can randomly access it’s own header logs independently of other VFs.

Table 11-27. Shared VF Header Log Full Behavior

VF First Error Pointer Status	VF Shared Header Log Status	Core Actions

Table continues on the next page...

Table 11-27. Shared VF Header Log Full Behavior (continued)

Invalid	Full	• A read to the Header Log returns all 1's. • A read to the "TLP Prefix Log Present" bit indicates ‘0’. • The controller sets the Uncorrectable Error Status Register according to the First Error Pointer.
Valid	Full	• The controller sets the Uncorrectable Error Status Register according to the First Error Pointer that is associated with the rejected TLP. • The Header log can be cleared or updated to the next stored header log, if one exists, by writing to the bit of the Uncorrectable Status Error Register pointed to by the First Error Pointer. • This applies to both when a normally displayed TLP Header is present in the Header Log Register or when an overflow condition is shown on the Uncorrectable Status Error Register.

11.3.2.1.3 Register Module and Data Bus Interface (DBI)

11.3.2.1.3.1 Overview

The Local Bus Controller (LBC) module provides a mechanism for a link partner (in upstream mode) or a local CPU (through the DBI) to access:

- Internal registers (in the CDM)
- External application registers connected externally to the ELBI
- In RC mode:
- There is no PCIe wire access to the CDM registers and ELBI.
- There is full DBI access to the CDM registers and ELBI.
- The controller has 4096 bytes of register PCIe configuration and port logic space per function. The controller also has a common iATU and DMA configuration register space for all functions. The controller register space is fully accessible from the DBI without any restrictions.

NOTE

Please refer to the Memory Map for the assigned space for the PCIe controller.

Table 11-28. EP Mode Port Region Access

Register Location		CDM					ELBI
Register Type		PCI-SIG		Port Logic			User
		Normal	Shadow	Misc	IATU	DMA	User
Access Details	CDM/ELBI Selector Bit[1] Value	0	0	0	1	1	1
	CS2 Selector Bit Value	0	1	0	1	1	0
DBI/Wire Access Allowed							
DBI		Y	Y	Y	Y	Y	Y
Wire	**CFG Request**	Y	-	Y	-	-	Y
	BAR Matched MEM Request	-	-	Y[2]	Y	Y	Y[-1]

1. Selector bit locations are configuration-dependent.
2. IO request also supported.

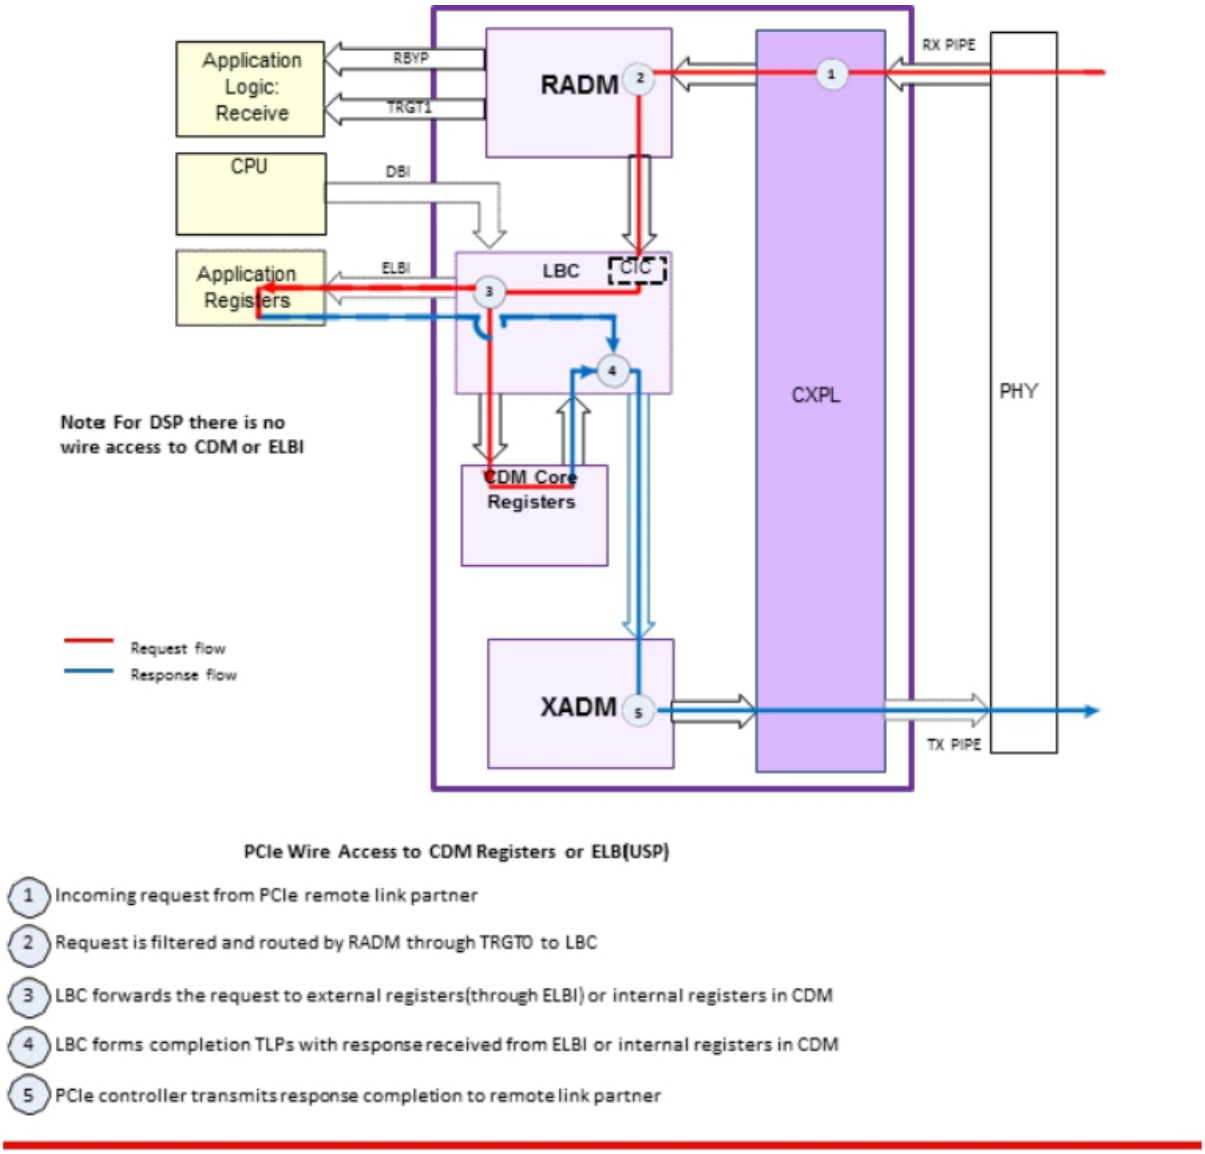

Figure 11-54. PCIe Wire Access to CDM Registers or ELB

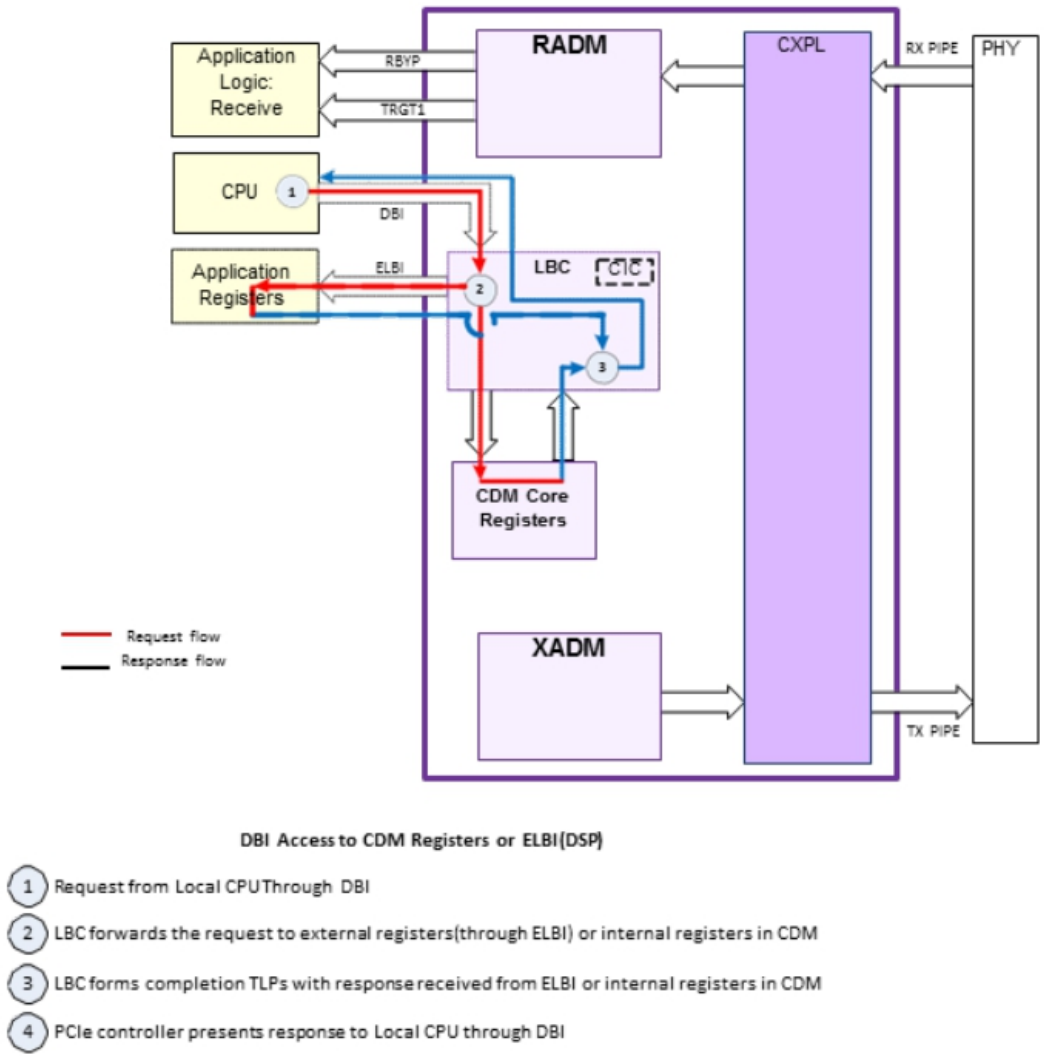

Figure 11-55. DBI Access to CDM Registers or ELBI

11.3.2.1.3.2 CDM Register Space Layout

11.3.2.1.3.2.1 Overview

The controller has 4096(0x1000) bytes of register PCIe configuration and port logic space per function. The controller also has a common iATU and DMA configuration register space for all functions. The controller register space is fully accessible from the DBI without any restrictions. Please see the Memory Map for the register base address assignment.

Table 11-29. Port Region Access

Register Location	CDM	ELBI

Table continues on the next page...

Table 11-29. Port Region Access (continued)

Register Type		PCI-SIG		Port Logic			User
		Normal	Shadow	Misc	IATU	DMA	User
Access Details	CDM/ELBI Selector Bit[1] Value	0	0	0	1	1	1
	CS2 Selector Bit Value	0	1	0	1	1	0
DBI/Wire Access Allowed							
DBI		Y	Y	Y	Y	Y	Y
Wire	**CFG Request**	Y	-	Y	-	-	Y
	BAR Matched MEM Request	-	-	Y[2]	Y	Y	Y[-1]

1. Selector bit locations are configuration-dependent.
2. IO request also supported.

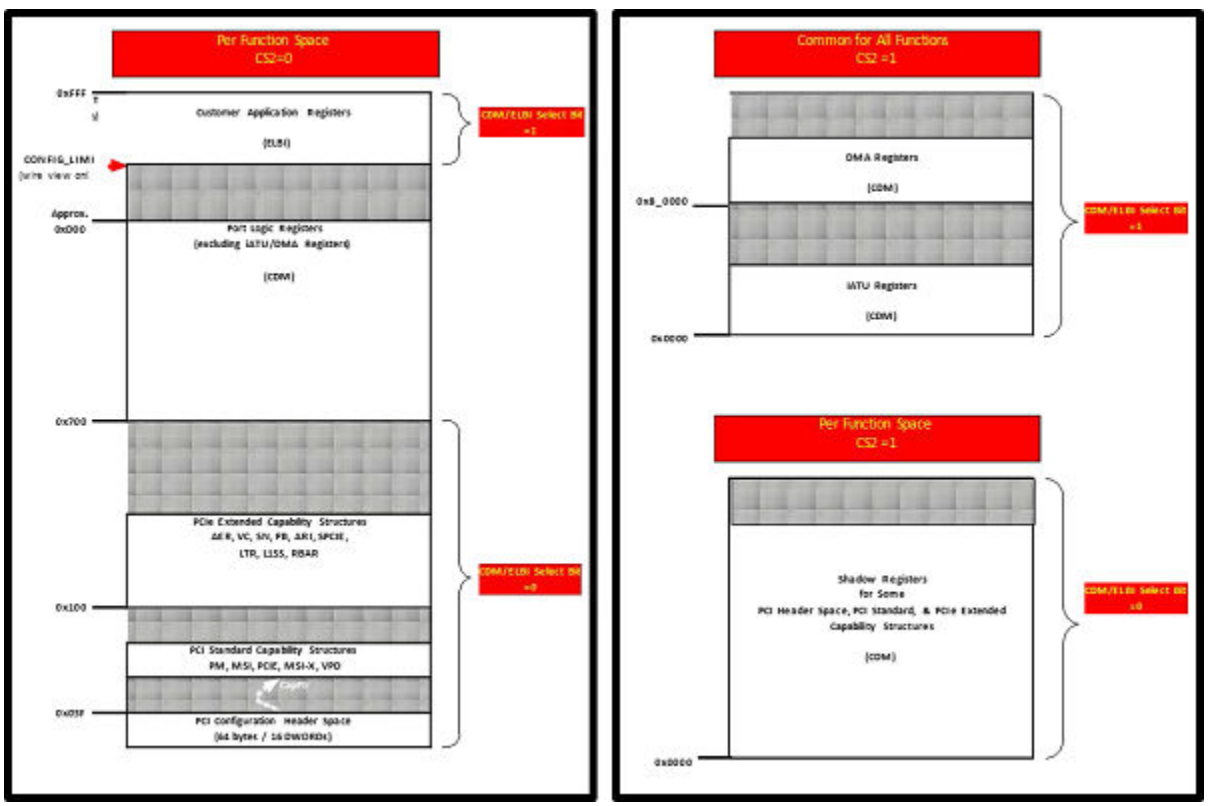

Figure 11-56. Controller Configuration Space Layout (EP Mode)

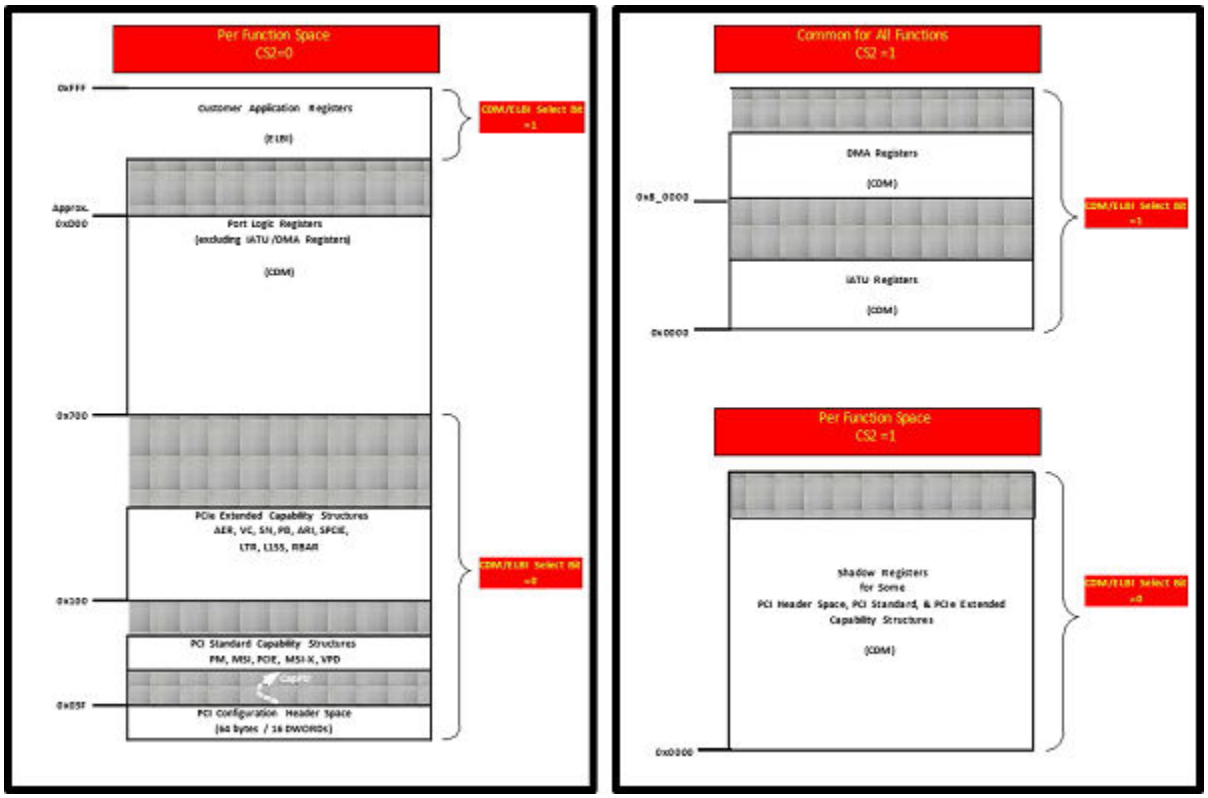

Figure 11-57. Controller Configuration Space Layout: (RC Mode)

Wire Access (Upstream Ports Only):

- Any CFG > CONFIG_LIMIT goes to TRGT1 or ELBI
- Any MEM/IO captured by a BAR whose interface target is TRGT0 goes to ELBI
- Any MEM captured by BAR*n* (*n* =UNROLL_BAR_NUM) when
- ENABLE_MEM_MAP_UNROLL_{DMA|ATU}_REG=1, whose interface target is TRGT0, and whose address falls into the range defined in "Memory Mapping iATU and DMA Port Logic Registers" goes to the IATU/DMA registers.

DBI Access (Upstream and Downstream Ports):

- No concept of MEM/IO/CFG
- Uses the specified address bit to route the access to ELBI or CDM
- No restrictions regarding what spaces can be accessed or not

11.3.2.1.3.2.2 Core Configuration Space Registers

- CDM Registers
  - PCI Configuration Header and Capability Registers:
    - The *PCI configuration header and capability registers* in the previous diagrams are PCIe controller configuration registers specified by the *PCI Express Base Specification, Revision 4.0, Version 0.7*. Access from the PCIe wire is possible with CFG requests (upstream ports). These registers are fully accessible from the DBI without any restrictions.

- Port Logic Registers:
  - The port logic (PL) registers are configuration registers which are not specified by the *PCI Express Base Specification, Revision 4.0, Version 0.7*. Access from the PCIe wire is normally with CFG requests. These registers are fully accessible from the DBI without any restrictions.
- iATU and DMA Port Logic Registers:
  - This memory space is dedicated for iATU and DMA configuration registers. Access from the PCIe wire is with specific BAR matched MEM requests. These registers are fully accessible from the DBI without any restrictions.

11.3.2.1.3.3 Data Bus Interface (DBI)

11.3.2.1.3.3.1 Overview

The DBI can access all 4096 bytes (1024 DWORDs) of the PCI Express configuration space per function. DBI can also access iATU and DMA configuration space. This address space is fully accessible from the DBI without any restrictions.

11.3.2.1.3.4 Features and Limitations

The following limitations exist for the LBC.

- CDM Access Restrictions:
  - Maximum payload Length =1 DWORD.
  - PCIe MEM requests with Length > 1 are processed as completer abort.
  - PCIe MEM requests with Length =0 are processed as completer abort.
  - PCIe IO or CFG requests with Length !=1 are processed as malformed TLPs.
- ELBI Access Restrictions:
  - CS2 bit must be 1’b0.
  - PCIe MEM requests with Length =0 are processed as completer abort.
  - PCIe IO or CFG requests with Length !=1 are processed as malformed TLPs.
  - Does not support "Atomic Operations (AtomicOps)"
  - Does not support TPH. Core does not forward the TPH bits to the ELBI.
  - Data (Read)
- DBI Data/Address Port Widths (with no AXI bridge):
  - Data: 32 bit
  - Address: 32 bit

11.3.2.1.3.4.1 Additional AXI DBI Limitations

The following limitations exist when you configure the controller to use the AXI bridge module.

- The DBI address must be a DWORD address.
- AXI transfer widths of 8, 16, and 32 bits are supported. The AXI dedicated/shared DBI interface returns an error response to requests with width greater than 32 bits. The type of error response is programmable through AMBA_ERROR_RESPONSE_DEFAULT_OFF register1.
- For AHB you get an error response whenever the size is not equal to 32 bits.
- The CDM only supports 32-bit data access. The AXI dedicated/shared DBI interface returns an error response to multi beat requests. The type of error response is programmable through AMBA_ERROR_RESPONSE_DEFAULT_OFF register.
- Byte access within a DWORD for DBI requests is not possible for AHB.
- Byte access within a DWORD for DBI WRITE requests is possible for AXI (not for AHB)
  - Dedicated DBI: The write strobes dbi_wstrb[3:0] are sent to the LBC.
  - Shared DBI: The relevant four strobes from slv_wstrb are sent to the LBC

A zero-byte write over DBI is processed as a read and should never be issued. The AXI dedicated/shared DBI slave drops a zero-byte write before it reaches the internal (native controller) DBI and returns an error response. The type of error response is programmable through AMBA_ERROR_RESPONSE_DEFAULT_OFF register.

The type of error response returned by the AXI dedicated/shared DBI slave is the same as that programmed for UR completions in the AMBA_ERROR_RESPONSE_DEFAULT_OFF register.

11.3.2.1.4 Flow Control

The flow control mechanism is divided into two phases: initialization and update. The controller automatically performs both of these phases with minimal support required from your application. By default the RADM is responsible for returning flow control credits when it reads data out of the receive queues.

11.3.2.1.5 Completion Timeout Ranges

Timeout ranges are supported as defined in the *PCI Express Base Specification, Revision 4.0, Version 0.7*. The controller supports all ranges. The Device Control 2 Register has a default equal to the default in the specification: 0000b Default range: 50 us to 50 ms. When the default is used, then the timeout is in Range B: 0101b: 16 ms to 55 ms. This range was chosen for the default because the *PCI Express Base Specification, Revision*

4.0, Version 0.7 states, "It is strongly recommended that the completion Timeout mechanism not expire in less than 10 ms". The table below illustrates the specification values versus the PCI Express controller values for the ranges.

NOTE

As the PCIe specification states, This mechanism is intended to be activated only when there is no reasonable expectation that the completion is returned, and should never occur under normal operating conditions.

Table 11-30. Comparison of PCIe Specification and PCIe Core Completion Timeout Ranges

Range	Encoding	Spec Minimum	Spec Maximum	PCIe controller Minimum	PCIe controller Maximum
Default	0000b	50 us	50 ms	28 ms	45 ms
A	0001b	50 us	100 us	65 us	99 ms
A	0010b	1 ms	10 ms	4.1 ms	6.2 ms
B	0101b	16 ms	55 ms	28 ms	44 ms
B	0110b	65 ms	210 ms	86 ms	131 ms
C	1001b	260 ms	900 ms	260 ms	390 ms
C	1010b	1s	3.5 s	1.8 s	2.8 s
D	1101b	4s	13 s	5.4 s	8.2 s
D	1110b	17s	64 s	38 s	58 s

11.3.2.1.6 Crosslink

Crosslink allows a downstream port to be connected to another downstream port or an upstream port to be connected to another upstream port. When a crosslink capable port negotiates a crosslink connection, the port changes its behavior accordingly. For this reason crosslink is supported in the DM controller because it contains the functionality for both upstream and downstream support.

Crosslink provides more than simply the ability to connect two like ports together. For instance, a DM operating in EP mode that negotiates a crosslink connection switches to RC mode and follows all of the *PCI Express Base Specification, Revision 4.0, Version 0.7* rules for an RC.

11.3.2.2 DMA Controller

This section describes the embedded multichannel DMA controller.

11.3.2.2.1 DMA Overview

The RC system CPU, or the EP application CPU, can offload the transferring of large blocks of data to the embedded DMA controller, leaving the CPU free to perform other tasks. It can simultaneously perform the following types of memory transactions (as shown in the figure 'System Level View of DMA'):

DMA write: Transfer (copy) of a block of data from local (application) memory to remote (link partner) memory.

DMA read: Transfer (copy) of a block of data from remote (link partner) memory to local (application) memory.

Therefore the DMA supports full duplex operation, processing read and write transfers at the same time, and in parallel with normal (non-DMA) traffic. Upon completion of a DMA transfer or an error, the DMA optionally interrupts the local CPU or sends an interrupt MWr (IMWr) to the remote CPU.

In linked list mode, the DMA fetches the transfer control information (called channel context) for each transfer (block), from a list of DMA elements that you have constructed in local memory.

11.3.2.2.2 DMA Architecture

This section describes the architecture of the DMA.

11.3.2.2.2.1 Architecture Overview

A DMA write and read channel operate independently to maximize the performance of the DMA read and write data transfers over the PCIe link. DMA with multiple read channels uses a weighted round robin (WRR) arbitration scheme to select the next read channel to be serviced. The same applies for multiple write channels.

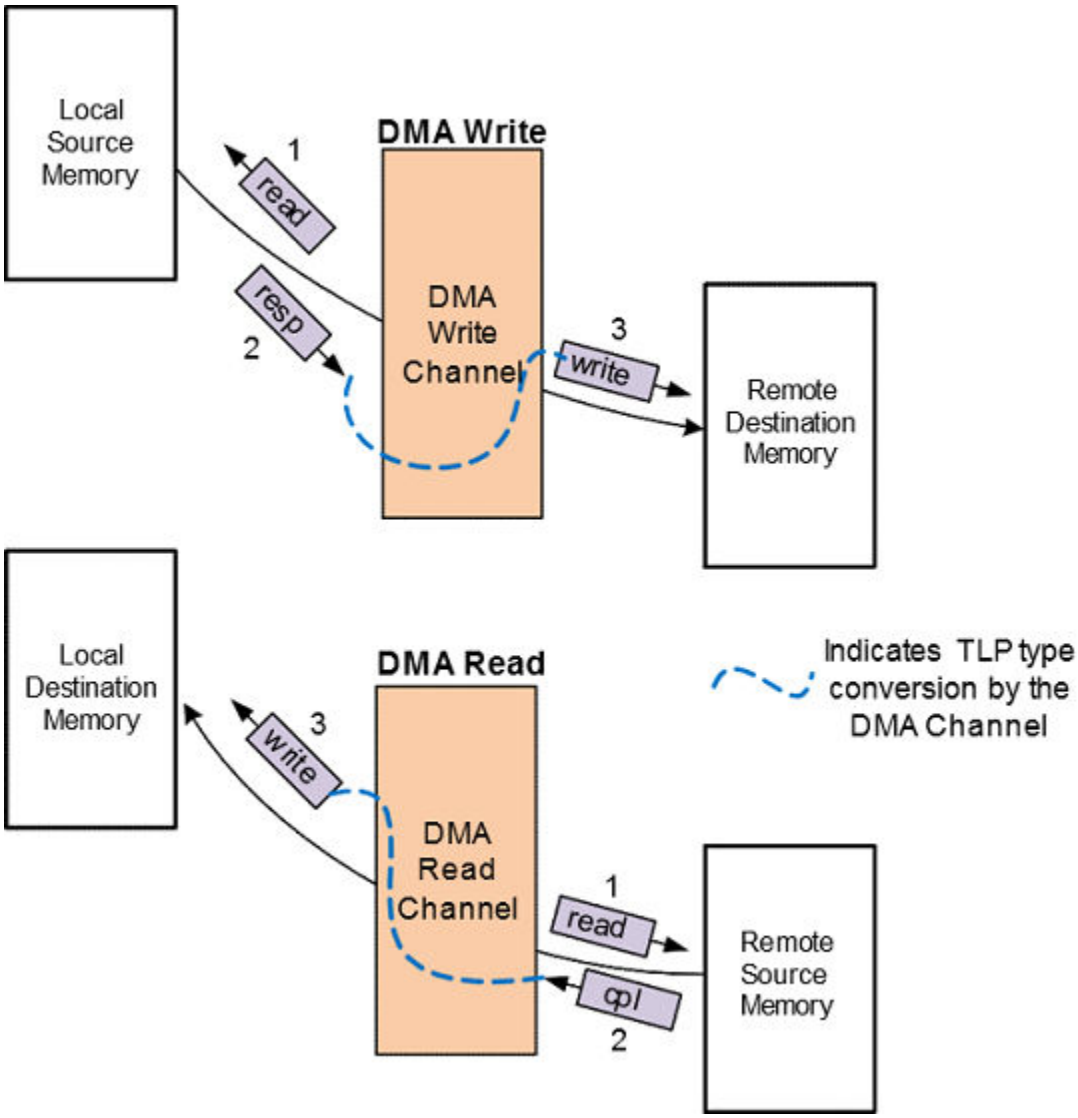

Figure 11-58. System Level View of DMA

11.3.2.2.2.1.1 DMA Read Transfer

The DMA injects multiple MRd requests of size less than or equal to the minimum of {Max Read Request Size, Max Payload Size} into the outbound request path, directed toward the remote link partner. The DMA converts the read responses into write requests, that it then transmits to the local application. When the DMA data transfer is complete, the CPU is notified. For a read transfer, the SAR is the address of the remote memory, and the DAR is the address of the local memory.

11.3.2.2.2.1.2 DMA Write Transfer

The DMA injects multiple MRd requests of size less than or equal to Max_Payload_Size into the inbound request path, directed toward the local application. The DMA converts the read responses into MWr TLPs, that it then transmits to the remote link partner. When the DMA data transfer is complete, the CPU is notified. For a write transfer, the SAR is the address of the local memory, and the DAR is the address of the remote memory.

11.3.2.2.2.2 Interrupts and Error Handling

11.3.2.2.2.2.1 Interrupt Handling

The DMA generates two interrupts per channel:

Done: The DMA successfully completes the transfer.

Abort: The DMA fails to complete the transfer, or an error occurs during the transfer.

The interrupt handling mechanism is different for linked list (LL) mode (than non LL mode), and there are also some differences between the read and write channels.

11.3.2.2.2.2.2 Non Linked List Mode

You enable the local and remote interrupts through the local and remote interrupt enable (LIE and RIE) bits:

DMA_CH_CONTROL1_OFF_WRCH_0.lie and
DMA_CH_CONTROL1_OFF_WRCH_0.rie.

In the write channel, there is only one error condition that results in an abort interrupt. For more details, see "Linked List Mode". You mask, clear, and read the status of each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in figure 'Write Interrupt Generation - Non Linked List Mode - Shown For Write Channel #0'.

In the read channel, there are five error conditions that results in an abort interrupt. For more details, see "Linked List Mode". You mask and clear each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in figure 'Read Interrupt Generation - Non Linked List Mode - Shown For Read Channel #0'. However, you can read the status of each of the five abort errors (that contribute to the abort interrupt) through DMA_READ_ERR_STATUS_LOW_OFF and DMA_READ_ERR_STATUS_HIGH_OFF.

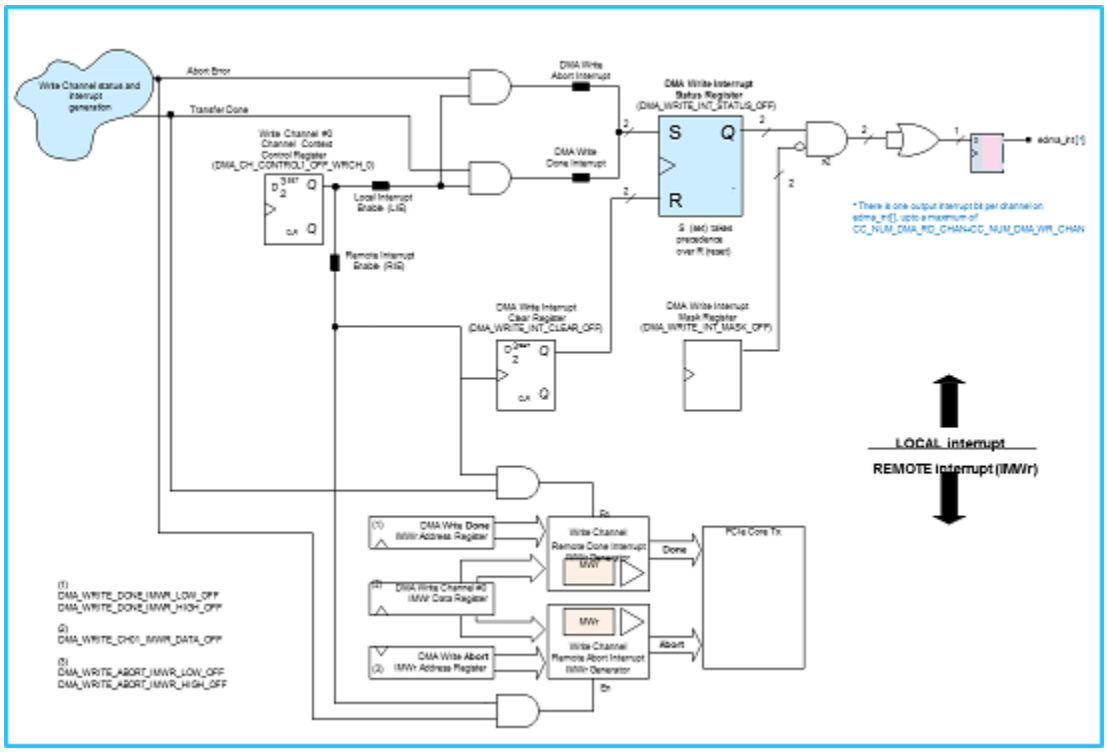

Figure 11-59. Write Interrupt Generation - Non Linked List Mode - Shown For Write Channel #0

If you want a remote interrupt and not a local interrupt then:

- Set LIE and RIE
- Mask the local interrupt using the mask register

This will allow you to poll the status register to distinguish a DONE from an ABORT

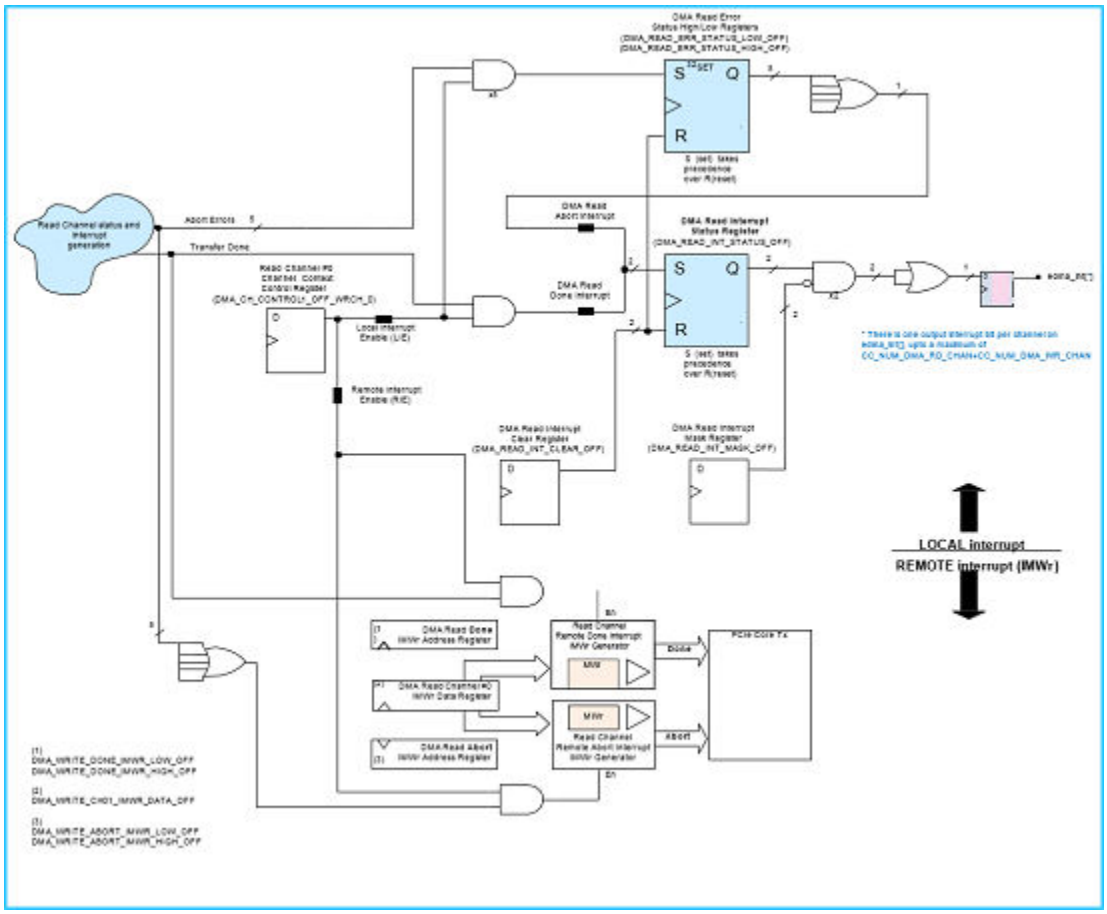

Figure 11-60. Read Interrupt Generation - Non Linked List Mode - Shown For Read Channel #0

11.3.2.2.2.2.3 Linked List Mode

The LIE and RIE bits in the LL element enable the channel done interrupts (local and remote). The LLLAIE and LLRAIE bits of the DMA_WRITE_LINKED_LIST_ERR_EN_OFF/ DMA_READ_LINKED_LIST_ERR_EN_OFF registers enable the channel abort interrupts (local and remote). In the write channel, there are two error conditions that results in an abort interrupt. For more details, see "Linked List Mode". You mask and clear each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in the figure below. You can read the status of each of the two abort errors (that contribute to the abort interrupt) through the DMA_WRITE_ERR_STATUS_OFF register.

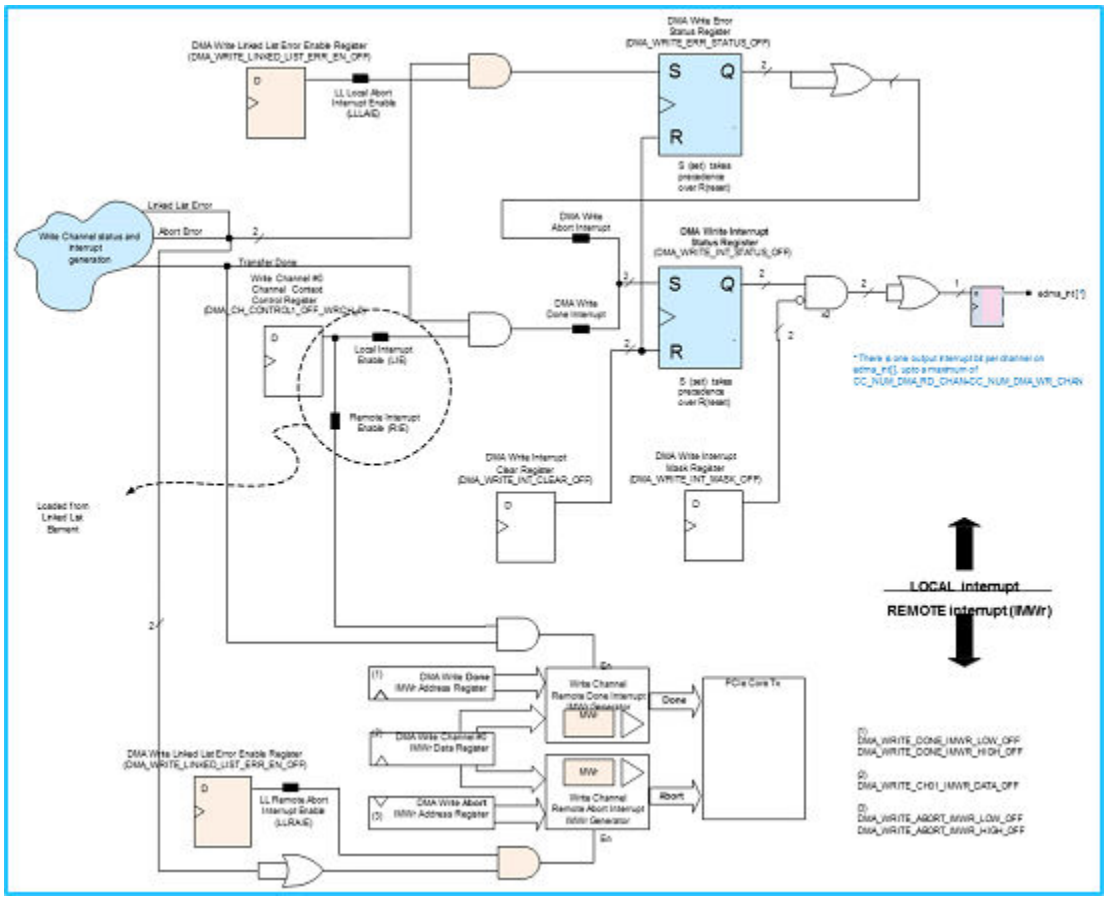

Figure 11-61. Write Interrupt Generation - Linked List Mode - Shown For Write Channel #0

In the read channel, there are six error conditions that results in an abort interrupt. For more details, see "Linked List Mode". You mask and clear each of the two interrupts (done and abort) through the DMA interrupt registers as indicated in the figure below. You can read the status of each of the six abort errors (that contribute to the abort interrupt) through the DMA_READ_ERR_STATUS_LOW_OFF and DMA_READ_ERR_STATUS_HIGH_OFF registers.

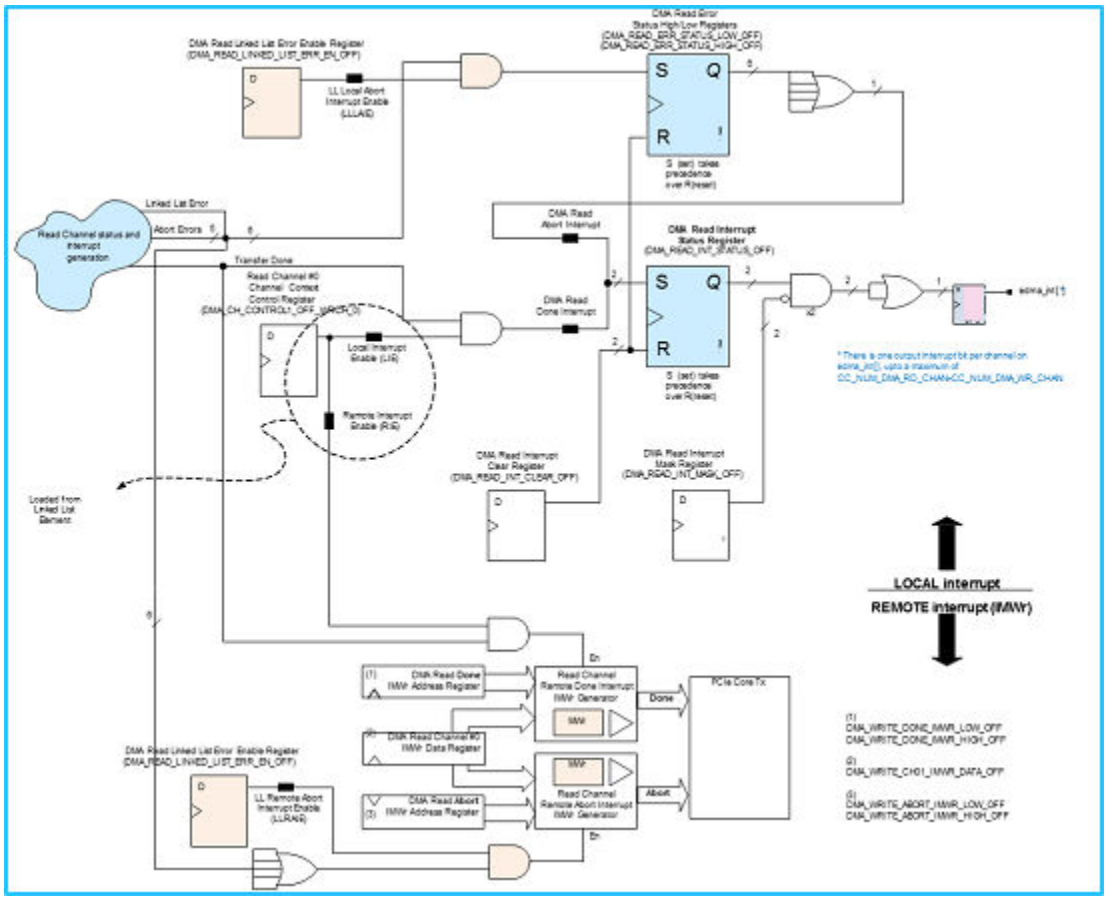

Figure 11-62. Read Interrupt Generation - Linked List Mode - Shown For Read Channel #0

NOTE

In non-linked list mode, LIE acts as a global switch. However when in linked list mode, LIE is just local to the current linked list element and the global switch is LLLAIE.

NOTE

If the DMA driver is running on the host and the interrupt service routine is reading local interrupts to determine if the transfer is successful, then you must set LIE and RIE in the same element and you should mask or ignore the local interrupt pin. Setting RIE and LIE in element A followed by RIE (only) in element B is not a verified usage scenario.

11.3.2.2.2.3 Linked List Mode

The DMA provides a linked list (LL) mode to efficiently move data from source to destination with minimal intervention from the local CPU. This mode provides an alternative to programming the DMA multiple times to transfer multiple blocks of data. The programming information (address, size, and so on) for each block of memory is pre-programmed by your software into a LL element (also known as a descriptor) in local memory. Each element (called a data element) in the LL structure (called a transfer list) can transfer up to 4 GB of data. You enable LL operation for a channel, by setting the LLE field of the DMA_CH_CONTROL1_OFF_WRCH_0 (Replace WRCH with RDCH for a read channel) register to 1. You can enable LL mode independently for each channel. When you enable LL for more than one channel, then you must have a separate LL structure in local memory for each channel. Your application must produce the LL element structure in local memory as shown in the figure below. Normally, all of the elements are contiguous (one after the other) in memory, and each element has six DWORDs containing the information about the block of data to be transferred. You program the channel context registers (DMA_LLP_LOW_REG_WRCH_0 and DMA_LLP_HIGH_OFF_WRCH_0) with the location of where you have placed the LL element structure in local memory.

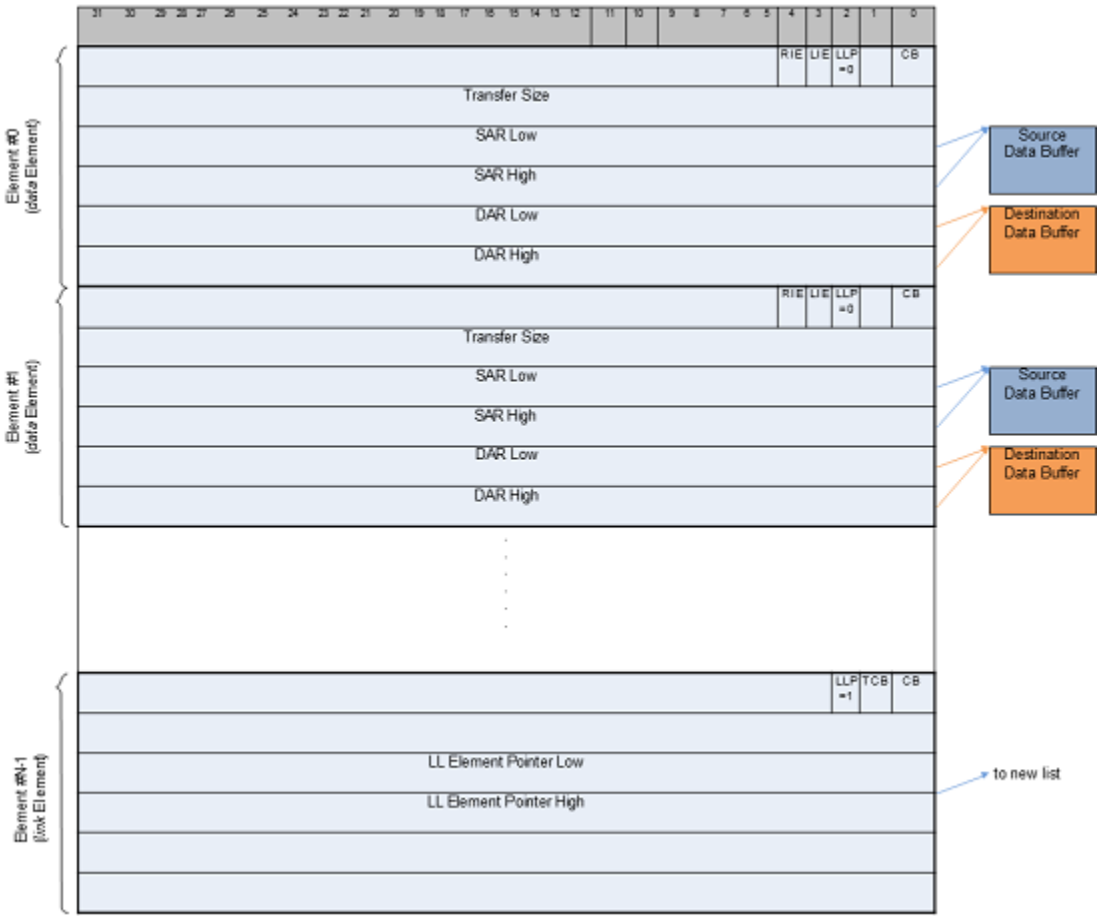

Figure 11-63. Linked List Element/Descriptor Structure in Local Memory with N Elements

When you start the DMA transfer (by writing to the DMA Write Doorbell Register DMA_WRITE_DOORBELL_OFF or DMA Read Doorbell Register DMA_READ_DOORBELL_OFF), the DMA reads (consumes) each element from local memory, and loads the information (SAR, DAR, size, and so on) from that element into the channel context registers in the DMA. These channel context registers determine the operation of the channel that the DMA controller is currently servicing. The DMA then proceeds to transfer the block of data (as defined by the element), and when it is finished, reads the next element from local memory. Normally, all of the elements are contiguous (one after the other) in memory, with the starting address defined in the channel context DMA Linked List Pointer Low Register DMA_LLP_LOW_OFF_WRCH_0. When you want to jump in local memory to another element list (or recycle the consumed elements), then you set the LLP bit in the element (for example, link element #N-1 in figure shown)), specify the location of the next element structure using the LL Element Pointer DWORDs (as indicated in the figure), and, set TCB to 1 (for recycling) or to 0 (to jump to another list).

11.3.2.2.2.3.1 Relationship Between Element DWORDs and Channel Context Registers

Notice the similarity between a data element and the DMA Channel Context registers for each channel. Each element has six DWORDs as in figure 'Linked List Element/ Descriptor Structure in Local Memory with N Elements'. There are eight channel context registers (DWORDs) for a channel. The DMA loads the six element DWORDs into the following channel context:

- CB, LLP, LIE, and RIE fields of the DMA Channel Control 1 register.
- DMA Transfer Size
- DMA SAR Low and DMA SAR High
- DMA DAR Low and DMA DAR High

The definitions of the element DWORD bit fields are the same as the DMA Channel Context registers described in the "DMA Software Register Map", with the exception of the LIE and RIE bits. The LIE and RIE bits in a LL element, only enable the done interrupt. In non-LL mode, the RIE and LIE bits (in the channel context registers) enable the done and abort interrupts.

When the LLP field of the first DWORD in the element is set to 1, the element is a link element. The DMA only loads the following information into the channel context registers:

- CB, TCB, and LLP bits of the first DWORD. The LIE and RIE bits are not defined in a link element.
- LL Element Pointer (3rd and 4th DWORDs) into the DMA Linked List Pointer registers (DMA_LL- P_LOW_REG_WRCH_0 and DMA_LLP_HIGH_OFF_WRCH_0).

Linked List Operation

- When you enable linked list operation (DMA_CH_CONTROL1_OFF_WRCH_0.lle =1b1), then the DMA overwrites the following DMA channel context registers with the following information from linked list data elements:
  - The CB, LLP, LIE, and RIE fields of the DMA Channel Control 1 register.
  - DMA Transfer Size
  - DMA SAR Low & High
  - DMA DAR Low & High
- The structure of a link element is different to that of the data element. A data element has no TCB field. A link element has no LIE or RIE fields. It has no SAR, DAR, or Transfer Size DWORDs, but has LL Element Pointer DWORDs instead of the SAR DWORDs.
- The LIE and RIE bits in a LL element, only enable the done interrupt. In non-LL mode, the RIE and LIE bits enable the done and abort interrupts. For more information, see "Interrupts and Error Handling".

11.3.2.2.3 Using the DMA

This section describes how to use the DMA. It can simultaneously perform the following types of memory transactions:

- DMA write : Transfer (copy) of a block of data from local memory to remote memory
- DMA read :Transfer (copy) of a block of data from remote memory to local memory

Therefore the DMA supports full duplex operation, processing read and write transfers at the same time, and in parallel with normal (non-DMA) traffic. Upon completion of a DMA transfer or an error, the DMA sends an interrupt MWr (IMWr).

The channels are named read channel 7..0 and write channel 7..0. Each channel is programmed using a number of registers.

11.3.2.2.3.1 Source and Destination Address Registers (SAR, DAR)

The DMA channel context SAR and DAR registers (DMA_SAR_LOW_OFF_WRCH_01 / DMA_SAR_HIGH_OFF_WRCH_0 / DMA_DAR_LOW_OFF_WRCH_0 / DMA_DAR_HIGH_OFF_WRCH_0) provide support for remote-to-local, and local-to-remote PCIe address mapping. You program the start of the local and remote data buffers using these registers, and the DMA increments the SAR and DAR as the DMA transfer progresses. For a write transfer, the SAR is the address of the local memory, and the DAR is the address of the remote memory, as shown in Figure 'Write Transfer: SAR and DAR for Write Channel 0'.

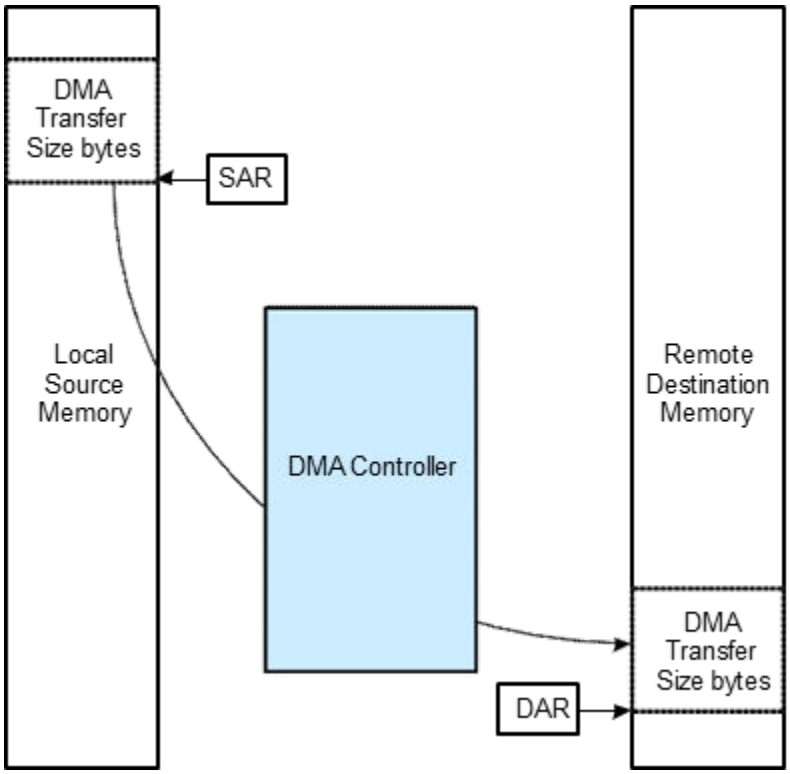

Figure 11-64. Write Transfer: SAR and DAR for Write Channel 0

For a read transfer, the SAR is the address of the remote memory, and the DAR is the address of the local memory, as shown in the figure below.

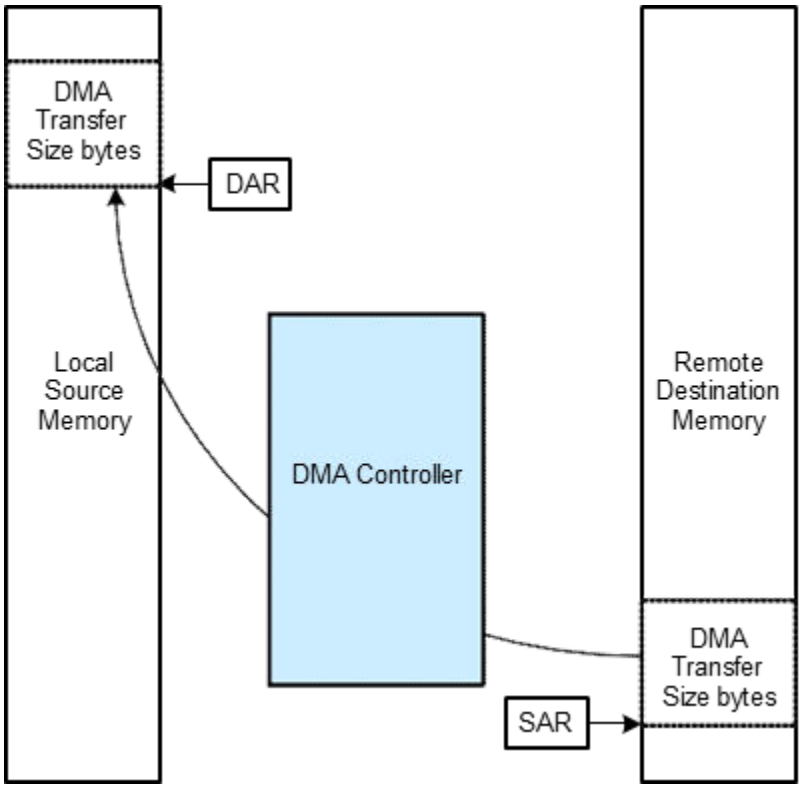

Figure 11-65. Read Transfer: SAR and DAR for Read Channel 0

The presence of the DMA controller does not affect:

- Normal filtering rules for inbound TLPs (for example, BAR checking in an Endpoint, as described in as described in “Receive Filtering”
- The operation of any internal or external address translation as described in “Internal Address Translation Unit (iATU)”).

NOTE

When you do not want the iATU to translate outbound requests that are generated by the internal DMA module, then you must implement one of the following approaches:

- Ensure that the combination of DMA channel programming and iATU control register programming, causes no translation of DMA traffic to be done in the iATU.
- Activate the DMA bypass mode to allow request TLPs which are initiated by the DMA controller to pass through the iATU untranslated. You can activate DMA bypass mode by setting the DMA Bypass field of the iATU Control 2 Register (IATU_REGION_C-TRL_OFF_2_OUTBOUND_0).

11.3.2.2.3.2 DMA Transfer Size Register

You program the DMA transfer size using the DMA Transfer Size Register (DMA_TRANSFER_SIZE_OFF_WRCH_0). The DMA decrements the value in this register as the DMA transfer progresses. You can read this register at any time to determine the number of bytes remaining to be transferred. When all bytes are successfully transferred, the result is zero. The DMA transfer size can be of any value from one byte, up to a maximum of 4 GB.

11.3.2.2.3.3 Starting The DMA Transfer

After you program the DMA controller registers (including writing to the DMA Read Engine Enable or DMA Write Engine Enable register), you start a DMA transfer by writing the channel number to the Doorbell Number field of the DMA Write Doorbell Register (DMA_WRITE_DOORBELL_OFF) or DMA Read Doorbell Register (DMA_READ_DOORBELL_OFF). You can program and start both a read and a write transfer at the same time. The DMA supports full duplex operation, processing read and write transfers at the same time and in parallel with normal (non-DMA) traffic. You can program and start any number of channels in the DMA controller sequentially or simultaneously.

Sequentially: configure and start a channel, and then configure and start another channel

Simultaneously: configure multiple channels, and then start multiple channels

NOTE

You must not write to any of the context registers for a particular channel after you start the channel by writing the channel number to the Doorbell Number field of the DMA Write Doorbell Register (DMA_WRITE_DOORBELL_OFF) or DMA Read Doorbell Register (DMA_READ_DOORBELL_OFF).

11.3.2.2.3.4 Detecting the End of The DMA Transfer

If a DMA transfer proceeds without any errors, it stops automatically when finished.

11.3.2.2.3.4.1 Detecting End of Transfer without Errors

The normal end of a DMA transfer is detected by any of the following methods:

- Done local interrupt (pin) asserted.
- Done remote interrupt (IMWr) received.

- Channel status field of the Channel Control 1 register is Stopped, and the DMA Transfer Size register is 0x0.
- Polling of the DMA Write Interrupt Status Register (DMA_WRITE_INT_STATUS_OFF) or DMA Read Interrupt Status Register (DMA_READ_INT_STATUS_OFF).

11.3.2.2.3.4.2 Detecting End of Transfer with Errors

The abnormal end of a DMA transfer is detected by any of the following methods:

- Abort local interrupt (pin) asserted.
- Abort remote interrupt (IMWr) received.
- Polling of the DMA Write Interrupt Status Register (DMA_WRITE_INT_STATUS_OFF) or DMA Read Interrupt Status Register (DMA_READ_INT_STATUS_OFF).
- Channel Status field of the Channel Control 1 register is halted. When the DMA controller detects an error, it forces the DMA to stop issuing requests for the channel. It also sets the channel status field of the Channel Control 1 register to halted, generates an abort interrupt (if enabled), and sends an abort IMWr (if enabled). The DMA Transfer Size register indicates the remaining number bytes to be transferred, except when there is an AXI write error during a DMA read transfer. For more details, see table 'Possible Sources of an Error during a DMA Read Transfer'.
- Channel Status field of the Channel Control 1 register is Stopped, and the DMA Transfer Size register is not 0x0. You have prematurely stopped this channel as described in “Stopping the DMA Transfer (Software Stop)”.

11.3.2.2.3.5 Stopping the DMA Transfer (Software Stop)

You can manually abort (stop) the DMA transfer by writing the channel number to the Doorbell Number field and writing 1 to the Stop field in DMA_WRITE_DOORBELL_OFF. This causes the DMA to:

- Place the channel in a Stopped state.
- The channel Status field in DMA_CH_CONTROL1_OFF_WRCH_0 is Stopped and the value in DMA_TRANS- FER_SIZE_OFF_WRCH_0 will not be 0x0.
- Wait for all outstanding pending transactions.
- Assert the abort interrupt (if it is enabled) in DMA_WRITE_INT_STATUS_OFF.

You might do this as part of error handling which is described in “Error Handling Assistance by Remote Software”, which is only necessary during software development if you incorrectly program the DMA write channel DAR. You might also do this as part of a function level reset (FLR). FLR does not directly affect the DMA transfer so you must manually stop the DMA transfer before initiating an FLR.

Use This Feature With Caution in Linked List Mode

You should not use the STOP feature in operational mode. It is only a debug feature and has associated hazards.

- Before setting the Stop bit, you must read the channel status field (CS) of the DMA Channel Control 1 register to ensure that the corresponding channel is Running (transferring data). To eliminate the possibility of a race condition between these two actions (read and write), you should confirm the presence of the abort bit in the DMA Write Interrupt Status Register (DMA_WRITE_INT_STATUS_OFF) or DMA Read Interrupt Status Register (DMA_READ_INT_STATUS_OFF) and check the status of any fatal error if some other event has occurred.
- After a Stop event, you cannot seamlessly resume the transfer again because the DMA will not carry on exactly from the point that it was stopped at. Therefore you must setup and start the complete channel context again, including the
  - linked list pointer
  - linked list structure in memory
  - related PCS and CCS values

11.3.2.2.3.6 TLP Generator Header Control

You must program bits [31:12] of the DMA Channel Control 1 Register (DMA_CH_CONTROL1_REG_ WRCH_0/DMA_CH_CONTROL1_OFF_RDCH_0), so that the DMA TLP generator correctly sets the TC, RO, NS, AT, and FN TLP header fields for any TLPs that it generates. When SRIOV is enabled, then you must also program DMA_CH_CONTROL2_OFF_WRCH_0/ DMA_CH_CONTROL2_OFF_RDCH_0.

11.3.2.2.3.7 DMA Software Register Map

This section discusses the grouping and access methods of the DMA registers. The following registers are present when the DMA is enabled.

The DMA Global Registers control the global settings

Table 11-31. DMA Global Registers

Name	Description
0x8_0000 +0x000	DMA Arbitration Scheme for TRGT1 Interface
+0x008	Number of DMA Channels
+0x00C	DMA Write Engine Enable
+0x010	DMA Write Doorbell
+0x018	DMA Write Engine Channel Arbitration Weight Low
+0x01C	DMA Write Engine Channel Arbitration Weight High
+0x02C	DMA Read Engine Enable
+0x030	DMA Read Doorbell
+0x034	DMA Global Read Control
+0x038	DMA Read Engine Channel Arbitration Weight Low
+0x03C	DMA Read Engine Channel Arbitration Weight High

The DMA Interrupt Registers control the generation of local interrupts and remote IMWr. The IMWr addresses and data are stored in RAM.

Table 11-32. DMA Interrupt Registers

Byte Offset	Description
0x8_0000 +0x4C	DMA Write Interrupt Status
+0x50	Not used (RsvdP).
+0x54	DMA Write Interrupt Mask
+0x58	DMA Write Interrupt Clear
+0x5C	DMA Write Error Status
+0x60	DMA Write Done IMWr Address Low
+0x64	DMA Write Done IMWr Address High
+0x68	DMA Write Abort IMWr Address Low
+0x6C	DMA Write Abort IMWr Address High
+0x70	DMA Write Channels 1 and 0 IMWr Data
+0x84	DMA Write Channels 3 and 2 IMWr Data
+0x88	DMA Write Channels 5 and 4 IMWr Data
+0x8C	DMA Write Channels 7 and 6 IMWr Data
+0x90	DMA Write Linked List Error Enable
up to +0x9C	Not used (RsvdP).
+0xA0	DMA Read Interrupt Status
+0xA4	Not used (RsvdP).
+0xA8	DMA Read Interrupt Mask
+0xAC	DMA Read Interrupt Clear
+0xB0	Not used (RsvdP).
+0xB4	DMA Read Error Status Low
+0xB8	DMA Read Error Status High

Table continues on the next page...

Table 11-32. DMA Interrupt Registers (continued)

up to +0xC0	Not used (RsvdP).
+0xC4	DMA Read Linked List Error Enable
+0xC8	Not used (RsvdP).
+0xCC	DMA Read Done IMWr Address Low
+0xD0	DMA Read Done IMWr Address High
+0xD4	DMA Read Abort IMWr Address Low
+0xD8	DMA Read Abort IMWr Address High
+0xDC	DMA Read Channels 1 and 0 IMWr Data
+0xE0	DMA Read Channels 3 and 2 IMWr Data
+0xE4	DMA Read Channels 5 and 4 IMWr Data
+0xE8	DMA Read Channels 7 and 6 IMWr Data

DMA Channel Context Registers: these registers (which are stored in RAM) are for the control and status information that is specific to each channel. There is a set of registers for each channel.

Table 11-33. DMA Channel Context Registers for Each Channel

Byte Offset	Description
DMA Channel Context	
0x8_0000 + 0x200*ia + 0x100*(WR|RD)b	DMA Channel Control 1 Register
+0x004*i + 0x200*i + 0x100 *(WR|RD)	DMA Channel Control 2 Register
+0x008*i + 0x200*i + 0x100 *(WR|RD)	DMA Transfer Size
+0x00C*i +0x200*i + 0x100 *(WR|RD)	DMA SAR Low
+0x010*i + 0x200*i + 0x100 *(WR|RD)	DMA SAR High
+0x014*i + 0x200*i + 0x100 *(WR|RD)	DMA DAR Low
+0x018*i + 0x200*i + 0x100 *(WR|RD)	DMA DAR High
+0x01C*i + 0x200*i + 0x100 *(WR|RD)	DMA Linked List Pointer Low
+0x020*i + 0x200*i + 0x100 *(WR|RD)	DMA Linked List Pointer High

a. i is the number of channels

b. WR=0 | RD=1

11.3.2.2.3.7.1 Implementation of Channel Context Registers

- The channel context registers are stored in RAM whose contents are automatically initialized after power-on.
  - Therefore, you must program every “register” value as the default is undefined

  - You must program all fields marked Reserved to 1’b0
  - These registers are not affected by any of the reset signals
- You must not write to any of the context registers for a particular channel after you start the channel by writing the channel number to the Doorbell Number field of the DMA Write Door- bell Register (DMA_WRITE_DOORBELL_OFF) or DMA Read Doorbell Register (DMA_READ_DOORBELL_OFF).

Linked List Operation

When you enable linked list operation (Linked List Enable field of DMA Channel Control 1 Register (DMA_CH_CONTROL1_OFF_WRCH_0) t o 1b1), the DMA overwrites the following DMA channel context registers with the following information from linked list data elements:

- The CB, LLP, LIE, and RIE fields of the DMA Channel Control 1 register.
- DMA Transfer Size
- DMA SAR Low
- DMA SAR High
- DMA DAR Low
- DMA DAR High

NOTE

- The structure of a link element is different to that of the data element. A data element has no TCB field. A link element has no LIE or RIE fields. It has no SAR, DAR, or Transfer Size DWORDs, but has LL Element Pointer DWORDs instead of the SAR DWORDs. For more details, see Relationship Between Element DWORDs and Channel Context Registers.
- The LIE and RIE bits in a LL element, only enable the Done interrupt. In non-LL mode, the RIE and LIE bits enable the Done and Abort interrupts. For more information, see Interrupts and Error Handling.

11.3.2.2.3.8 Programming Examples

This section provides a programming and operation flow for each of the following scenarios:

- 1 MB Write Transfer On Write Channel #0 Initiated by Local CPU (Non LL mode)
- 1 MB Read Transfer On Read Channel #0 Initiated by Local CPU (Non LL mode)
- 1 MB Write Transfer On Write Channel #5 Initiated by Remote CPU (Non LL mode)

- 1 MB Read Transfer On Read Channel #5 Initiated by Remote CPU (Non LL mode)
- Linked List Mode Programming Example (Write Channel #0)

NOTE

The order in which the registers in the following examples are programmed is not important, except for the Doorbell register, which initiates the DMA transfer. Therefore, to start both a "1 MB Write Transfer On Write Channel #0 Initiated by Local CPU (Non LL mode)" and a "1 MB Read Transfer On Read Channel #0 Initiated by Local CPU (Non LL mode)" by executing the commands on the table. If, as mentioned in "Starting The DMA Transfer" , you want both channels to start at (approximately) the same time, then do not execute the last command (at 0x280) in the table 'DMA Register Setup' until after you have executed all the commands in table.

NOTE

You must enable the DMA before you start a DMA channel. Therefore you must write ‘1’ to DMA Read Engine Enable or DMA Write Engine Enable register before you write ‘1’ to the DMA Read Doorbell or DMA Write Doorbell register.

11.3.2.2.3.8.1 1 MB Write Transfer On Write Channel #0 Initiated by Local CPU (Non LL mode)

In this example, the IMWr generation is disabled, as the local CPU initiates the DMA transfer. The local CPU is interrupted using the edma_int bus. The SAR is the address of the local memory, and the DAR is the address of the remote memory, as shown in the figure below. The table below provides the programming details for this example transfer.

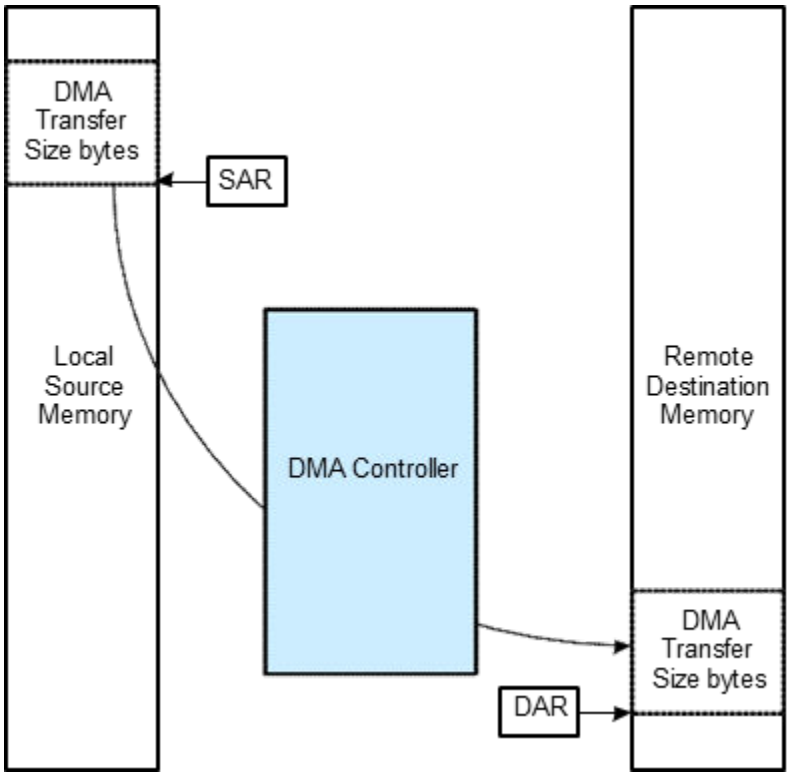

Figure 11-66. 1 MB Write DMA Transfer from 0xBEEF_BEE0 to 0xCAFE_CAF0

Table 11-34. 1 MB Write DMA Transfer from 0xBEEF_BEE0 to 0xCAFE_CAF0

Address (0x8_0000+)	Name	Value
0x00C	DMA Write Engine Enable You must not write 0 to this register. Even temporarily writing 0 to this register resets the DMA logic. For more details, see DMA Write Engine Enable Register (DMA_WRITE_ENGINE_EN_OFF).	0x1
0x054	DMA Write Interrupt Mask	0x0

0x214	DMA DAR Low	0xCAFE_CAF0
0x218	DMA DAR High	0x0000_0000
0x010	DMA Write Doorbell	0x0

11.3.2.2.3.8.2 1 MB Read Transfer On Read Channel #0 Initiated by Local CPU (Non LL mode)

In this example, the IMWr generation is disabled, as the local CPU initiates the DMA transfer. The local CPU is interrupted using the edma_int bus. The SAR is the address of the remote memory, and the DAR is the address of the local memory, as shown in the figure below. The table below provides the programming details for this example transfer.

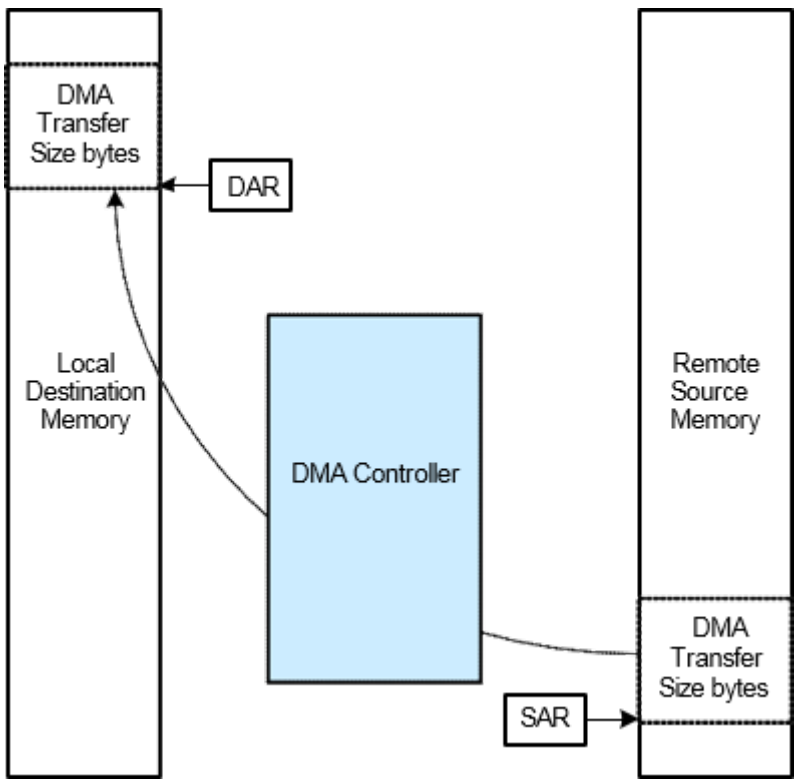

Figure 11-67. 1 MB Read DMA Transfer from 0xBEEF_BEE0 to 0xCAFE_CAF0

Table 11-35. DMA Register Setup

Address (0x8_0000+)	Name	Value
0x02C	DMA Read Engine Enable You must not write 0 to this register. Even temporarily writing 0 to this register resets the DMA logic. For more details, see DMA Read Engine Enable Register (DMA_READ_ENGINE_EN_OFF).	0x1

0x308	DMA Transfer Size	0x00100000
0x30C	DMA SAR Low	0xBEEF_BEE0
0x310	DMA SAR High	0x0000_0000
0x314	DMA DAR Low	0xCAFE_CAF0
0x318	DMA DAR High	0x0000_0000
0x030	DMA Read Doorbell	0x0

11.3.2.2.3.8.3 1 MB Write Transfer On Write Channel #5 Initiated by Remote CPU (Non LL mode)

In this example, the local interrupt generation is disabled, as the remote CPU initiates the DMA transfer. The remote CPU is interrupted using an IMWr. The SAR is the address of the local memory, and the DAR is the address of the remote memory, as shown in the figure below. The table below provides the programming details for this example transfer.

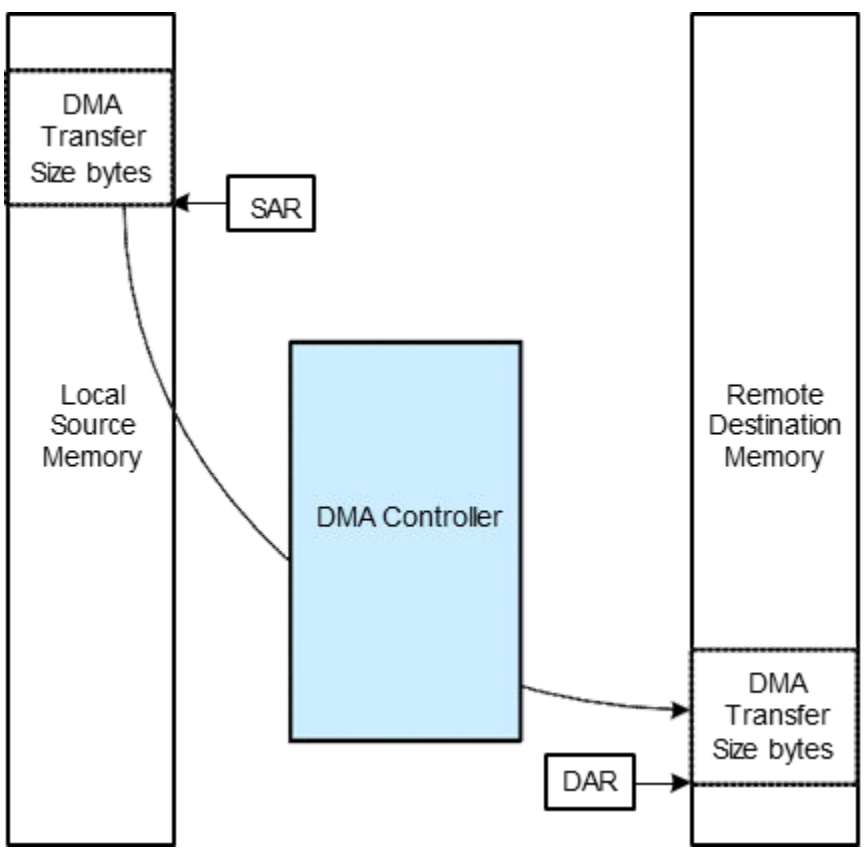

Figure 11-68. 1 MB Write DMA Transfer from 0xBEEF_BEE0 to 0xCAFE_CAF0

Table 11-36. DMA Register Setup

Address (0x8_0000+)	Name	Value

0xA10	DMA SAR High	0x0000_0000
0xA14	DMA DAR Low	0xCAFE_CAF0
0xA18	DMA DAR High	0x0000_0000

11.3.2.2.3.8.4 1 MB Read Transfer On Read Channel #5 Initiated by Remote CPU (Non LL mode)

In this example, the local interrupt generation is disabled, as the remote CPU initiates the DMA transfer. The remote CPU is interrupted using an IMWr. The SAR is the address of the remote memory, and the DAR is the address of the local memory, as shown in Figure below. The table below provides the programming details for this example transfer.

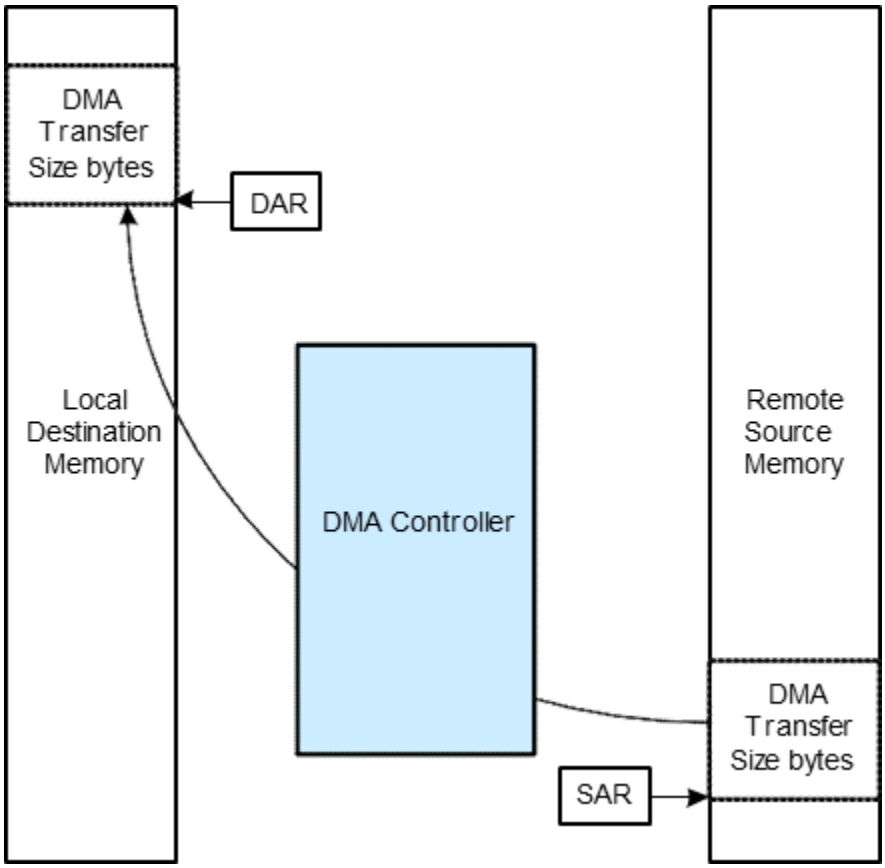

Figure 11-69. 1 MB Read DMA Transfer from 0xBEEF_BEE0 to 0xCAFE_CAF0

11.3.2.2.3.8.5 Linked List Mode Programming Example (Write Channel #0)

This write channel example corresponds to figure 'Example Producer (Software) - Consumer (DMA) Synchronization Flow', with the following features:

- Recycled linked list (LL) of nine data elements1and one link element.
- Transfer is initiated by local CPU.
- Each data element corresponds to a 1 MB (0x0010_0000) write transfer.
- The SARs for each element are separated by 2 MB (0x0020_0000). The DAR for each element are sepa- rated by 16 MB (0x0100_0000). The SAR is the address of the local memory, and the DAR is the address of the remote memory, as shown in the figure below.
- The LL transfer list is located at address 0x0000_0200 in local memory.
- No remote interrupt is generated so the IMWr generation is disabled, as the local CPU initiates the DMA transfer. The local CPU is interrupted using the edma_int bus.
- There is a Watermark interrupt at element #5, and an Empty interrupt at element #8. Both of these interrupts are done interrupts (as opposed to abort interrupts).

You should familiarize yourself with the Linked List Flow for Producer and Consumer as shown in Figure 'Linked List Flow for Producer and Consumer'. These are the main steps for this process in this example:

Step 1: Create TL in local memory:

- Create the 10 elements as per Table 'Linked List Element Initial Setup'.
  - For elements 0, 1, 2, 3, 4, 6, 7: RIE, LIE, LLP, CB =0,0,0,1
  - For element 5: RIE, LIE, LLP, CB =0,1,0,1 ❑For element 8: RIE, LIE, LLP, CB =0,1,0,1 ❑For element 9: LLP, TCB, CB =1,1,0
- For more details, see “PCS-CCS-CB-TCB Producer-Consumer Synchronization” and “Linked List Mode”

Step 2: Program and Start DMA:

- Configure and start the DMA registers as per Table 'DMA Register Setup'.

Step 4: Wait for done interrupt and recycle TL

- For more details, see “Using Interrupts for Linked List Producer-Consumer Synchronization”
- When recycling elements, consider “Element Recycling”

NOTE

If the DMA driver is running on the host and the interrupt service routine is reading local interrupts to determine if the transfer is successful, then you must set LIE and RIE in the same element and you should mask or ignore the local interrupt pin. Setting RIE and LIE in element A followed by RIE (only) in element B is not a verified usage scenario.

11.3.2.2.4 Advanced DMA Information and Operation

This section discusses advanced features and operation of the DMA.

11.3.2.2.4.1 Overview

The DMA write and read channels operate independently to maximize the performance of the DMA read and write data transfers over the PCIe link.

The DMA can simultaneously perform the following types of memory transactions:

- DMA write: transfer (copy) of a block of data from local memory to remote memory
- DMA read: transfer (copy) of a block of data from remote memory to local memory

After you have programmed and started a DMA transfer (see "Using the DMA"), the DMA transfers the data as described in "**DMA Write Transfer"** and "**DMA Read Transfer"**

11.3.2.2.4.2 DMA Ordering

The DMA assumes that all DMA read channel data must be written to the local application memory in strict address order. For a DMA read transfer, each original outgoing request has a unique PCIe tag. The remote link partner or intermediate switch does not have to preserve the order of CPLs corresponding to such individual requests. When the DMA receives the CPLs out of order, it reorders that data in the "Read Buffer" as described in "**DMA Read Transfer"** . DMA write transfer data is sourced from the local application memory and sent to the remote memory in address order.

11.3.2.2.4.3 Error Handling

The DMA supports full AXI and PCIe error handling in conjunction with the PCIe controller. The tables below list the possible sources of an error for DMA read and write transfers.

Table 11-40. Possible Sources of an Error during a DMA Read Transfer

Source	Type	Description
Application Write Error Detected	Fatal	The DMA read channel has received an error response from the AXI bus at the bridge master interface (or TRGT1 interface when the AXI bridge is not used) while writing posted data to it. This error is fatal. • You must restart the transfer from the beginning because the channel context is corrupted.

Table continues on the next page...

Table 11-40. Possible Sources of an Error during a DMA Read Transfer (continued)

		• The MWr is not rolled back. • The AXI bridge master does not report this error to software through error logging or MSG. **NOTE:** During linked list mode, the Application Write Error only corrupts the current element in the linked list. This is because the DMA does not fetch the next element from local memory until it has completely finished transferring the current block of data (as defined by the current linked list element). Finished implies that your application has successfully acknowledged (without ERROR) all of the MWr requests.
Unsupported Request (UR)	Non-fatal	The DMA read channel has received a PCIe UR CPL status from the remote device in response to the MRd request.
Completer Abort (CA)	Non-fatal	The DMA read channel has received a PCIe CA CPL status from the remote device in response to the MRd request.
CPL Time Out	Non-fatal	The DMA read channel has timed-out while waiting for the remote device to respond to the MRd request, or a malformed CplD has been received.
Data Poisoning	Fatal	The DMA read channel has detected data poisoning in the CPL from the remote device in response to the MRd request. The DMA read channel will drop the completion and then be halted.
Linked List Element Fetch Error Detected	Fatal	The DMA read channel has received an error response from the AXI bus (or TRGT1 interface when the AXI bridge is not used) while reading a linked list element from local memory.

Table 11-41. Possible Sources of an Error during a DMA Write Transfer

Source	Type	Description
Application Read Error Detected	Fatal	The DMA write channel has received an error response from the AXI bus at the bridge master interface (or TRGT1 interface when the AXI bridge is not used) while reading data from it. • The response TLP is discarded by the DMA and is not converted to an outbound MWr TLP.

Table continues on the next page...

Table 11-41. Possible Sources of an Error during a DMA Write Transfer (continued)

		• The UR or CA CPL status TLP generated by the bridge is discarded by the DMA. • The AXI bridge master does not report this error to software through error logging or MSG.
Linked List Element Fetch Error Detected	Fatal	The DMA write channel has received an error response from the AXI bus at the bridge master interface (or TRGT1 interface when the AXI bridge is not used) while reading a linked list element from local memory. • The UR or CA CPL status TLP generated by the bridge is discarded by the DMA. • The AXI bridge master1 does not report this (or for non-DMA traffic) error to software through error logging or MSG.

When the DMA detects an error, it performs the following actions (for the channel with the error):

- Stops issuing new requests to the remote link partner.
- Stops issuing new requests.
  - All data in the “Read Buffer”, that was received before the error was detected, is valid. In the case of a non-fatal error, this is reflected in the DMA Transfer Size Register DMA_TRANSFER_SIZE_OFF_WRCH_0.
  - All data in the read buffer (for that channel), that was received after the error was detected, is discarded.
- Places the DMA channel in a halted state (channel status field of the DMA Channel Control 1 Register is halted).
- Waits for all outstanding requests and CPLs to complete.
- Generates the abort interrupt or IMWr, if enabled, as outlined in “Interrupt Handling”.

For a DMA read transfer, you can read the DMA Read Error Status High Register (DMA_READ_ERR_ STATUS_HIGH_OFF) and DMA Read Error Status Low Register (DMA_READ_ERR_STATUS_LOW_OFF) to identify the source of the error. For a DMA write transfer (in linked list mode only), you can read the DMA Write Error Status Register (DMA_WRITE_ERR_STATUS_OFF) to identify the source of the error. After your software has finished error and interrupt routine handling for Non-Fatal errors, you can request the DMA to continue processing (for the channel with the error) by:

1. Reprogramming the SAR based on the number of bytes remaining in the DMA Transfer Size register
2. Writing the channel number to the Doorbell Number field of the DMA Write Doorbell Register (DMA_WRITE_DOORBELL_OFF) or DMA Read Doorbell Register (DMA_READ_DOORBELL_REG).

NOTE

You cannot continue after a Fatal Error is detected, as the channel context is corrupted. Any actions that were in progress are not rolled back. To exit from this condition, you need to Soft Reset the complete DMA controller, as described in DMA Write Engine Enable Register (DMA_WRITE_ENGINE_EN_OFF) and DMA Read Engine Enable Register (DMA_READ_ENGINE_EN_OFF).

When an error occurs in linked list mode, the next LL element is not fetched from local memory. DMA Linked List Pointer Low Register (DMA_LLP_LOW_OFF_WRCH_0) is not incremented by the DMA, but remains pointing to the element that caused the error.

11.3.2.2.4.3.1 Error Handling Assistance by Remote Software

During a DMA write transfer, the DMA is not aware of MWr errors that are detected in the remote device, because an MWr is a posted request and has no corresponding completion TLP. In these cases, your remote CPU must manually abort the DMA transfer by writing the channel number to the Doorbell Number field, and 1 to the Stop field of the DMA Write Doorbell Register (DMA_WRITE_DOORBELL_OFF). This causes the DMA to:

- Place the channel in a stopped state. The channel Status field of the DMA Channel Control 1 Register (DMA_CH_CONTROL1_OFF_WRCH_0) is stopped and the DMA Transfer Size register is not 0x0.
- Wait for all outstanding pending transactions.
- Assert the abort interrupt if it is enabled

11.3.2.2.4.4 Linked List Operation

This section describes the detailed operation of the DMA in linked list (LL) mode. It also discusses how the software should produce LL elements1, and how the DMA and software maintain synchronization.

11.3.2.2.4.4.1 LL Operation Overview

You should first read "Linked List Mode" for an overview of LL mode. In this section, a normal LL operation called recycling2 is described in detail. The process is described for a write channel, but it is possible to have duplicate processes running in parallel for other write or read channels. In this process interrupts are used to trigger the producer (software) to recycle elements. Typically a Watermark interrupt (positioned near the middle of the transfer list (TL)) and an Empty interrupt (in the last data element) are used by setting LIE in these two elements to '1'.

The steps in this process are:

1. Software creates a LL element structure called a TL in local memory consisting of N-1 data elements and one link element.

   The link elements "LL Element Pointer Low/High DWORDs"(as shown in Linked List Element figure in Linked List Mode topic) are programmed to point back to the beginning of the first data element.

   One of the data elements (near the middle of the TL) is programmed to generate a "Watermark" interrupt.

   The last data element is programmed to generate an "Empty" interrupt.

2. Software programs the DMA with the location of the TL. This is done by writing to the DMA Linked List Pointer Low Register (DMA_LLP_LOW_OFF_WRCH_0) and DMA Linked List Pointer High Register (DMA_LLP_HIGH_OFF_WRCH_0).
3. Software starts the DMA process by ringing the write channel Doorbell. This is done by writing to the DMA Write Doorbell Register (DMA_WRITE_DOORBELL_OFF).

   The solid purple loop L1 in Figure 11-71 corresponds to steps 1-3.

4. The DMA reads (**consumes**) each data element from local memory, and if the CB and CCS bits match, loads the information (SAR, DAR, size, and so on) from that data element into the channel context registers. These context registers determine the operation of the channel that the DMA is currently servicing. The DMA executes the check for the CB/CCS match after it has evaluated TCB and toggled CCS. The DMA always loads link elements into the channel context.

NOTE

If the DMA stops on a link element, then your software must set the DMA Linked List Pointer registers, and restart the DMA process by ringing the doorbell.

With recycling, the same LL structure is used over and over again. Another mode of operation would be to jump to a new LL element structure when the current one is consumed.

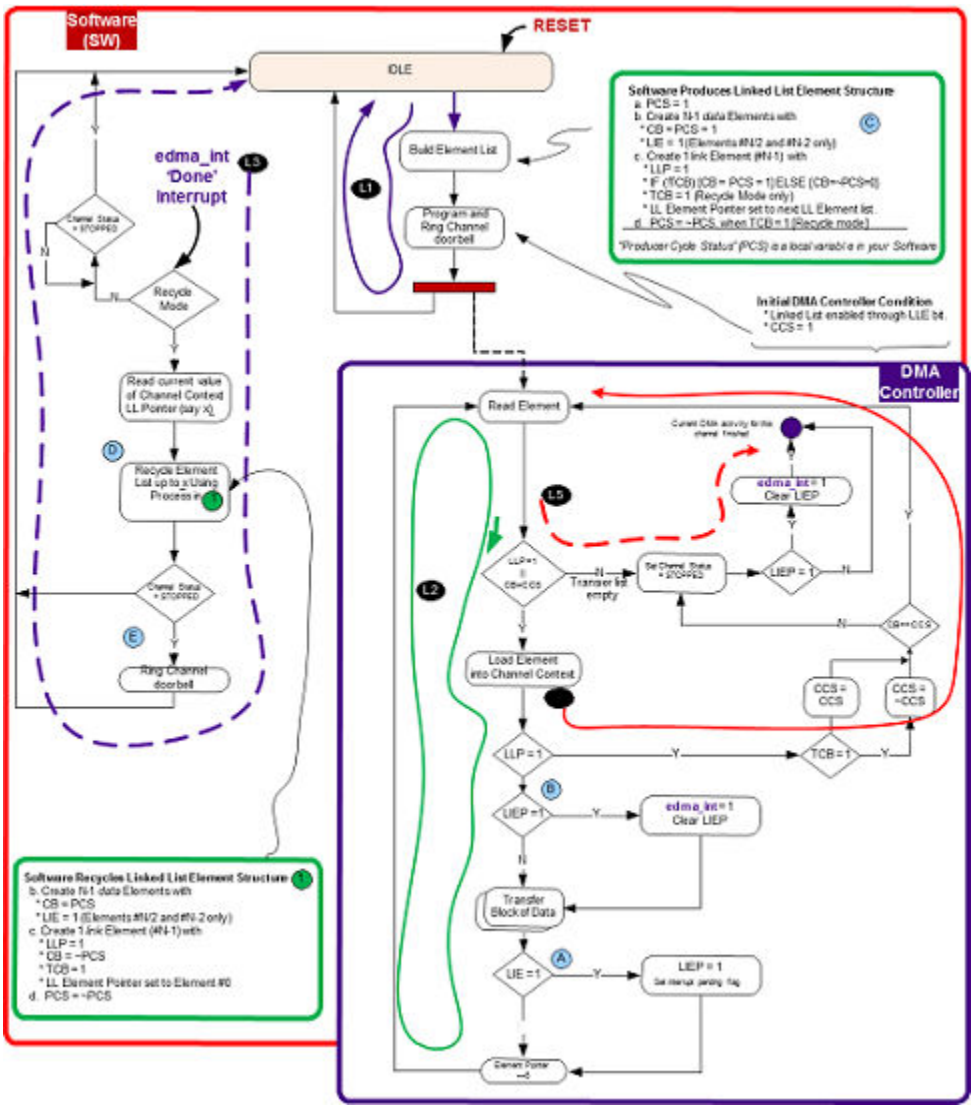

Figure 11-71. Linked List Flow for Producer and Consumer

5. The DMA then proceeds to transfer the block of data (as defined by the element), and when it is finished, reads the next element from local memory.

   The solid green loop L2 in Figure 11-71 corresponds to steps 4-5.

6. The last element in the list (called a link element, and indicated by having its LLP field set to 1) is not used to transfer a block of data.

   It causes the DMA to effectively repeat the task in step 4.

Its TCB is typically set to 1. This causes the DMA to toggle its CCS bit, and the software to toggle its PCS bit. The software and DMA use the "PCS-CCS-CB-TCB" producer-consumer synchronization mechanism to ensure that:

Software does not recycle elements that have not yet being consumed by the DMA

DMA correctly recognizes and consumes recycled elements. The solid red loop L4 in Figure 11-71 corresponds to step 6.

7. Upon reception of the interrupt (mentioned in step 1), the software starts to recycle the TL.

   Software reprograms each data element with new DMA transfer information.

   The software and DMA use the "PCS-CCS-CB-TCB" producer-consumer synchronization mecha- nism described later in this section.

   The dashed purple loop L3 in Figure 11-71 corresponds to step 7.

8. As some point, the software wants to terminate the complete DMA process, by not recycling any more elements. The DMA recognizes this condition when CB !=CCS, and sets the channel status to stopped

   The dashed red loop L5 in Figure 11-71 corresponds to step 8.

11.3.2.2.4.4.2 Using Interrupts for Linked List Producer-Consumer Synchronization

When the DMA is finished with an element, the DMA checks the LIE bit, before reading the next LL element. For more details, see circled step A in Figure 11-71. When the LIE is set, then the DMA does not assert the "done" interrupt immediately, but sets an internal interrupt pending flag (LIEP). It asserts the actual done interrupt after the next data element has been read from system memory. For more details, see circled step B in Figure 11-71. This automatic internal process of delaying the interrupt avoids a race condition between the DMA and software when the LIE bit is set in an element.

Your software should set the "Watermark" interrupt early to schedule the recycling of the consumed elements. Placing the Watermark interrupt too far down in the list, combined with a slow element recycling process in your application; ensures that the DMA returns to the start of the LL before your software has recycled it. The DMA channel STOPs, and you have to restart it by writing to its Doorbell. Typically a "Watermark interrupt" (positioned near the middle of the TL) and an Empty interrupt (in the last data element) are used by setting LIE in these two elements to 1b1. Upon reception of the interrupt, the software starts to recycle the TL.

Operational interrupts are always "done" interrupts. For more details, see "Interrupts and Error Handling"

NOTE

The DMA processes the remote interrupt enable (RIE) bit in the LL element in the same way as the LIE. Therefore, everywhere that LIE and edma_int are mentioned in this section can be interpreted to mean LIE and edma_int, or RIE and IMWr.

11.3.2.2.4.4.3 PCS-CCS-CB-TCB Producer-Consumer Synchronization

The software and DMA use the "PCS-CCS-CB-TCB" producer-consumer synchronization mechanism to ensure that software does not recycle elements that have not yet being consumed by the DMA, and that the DMA correctly recognizes and consumes recycled elements. This process, which is shared between the DMA and the software, is illustrated through an example producer-consumer flow in the figure below.

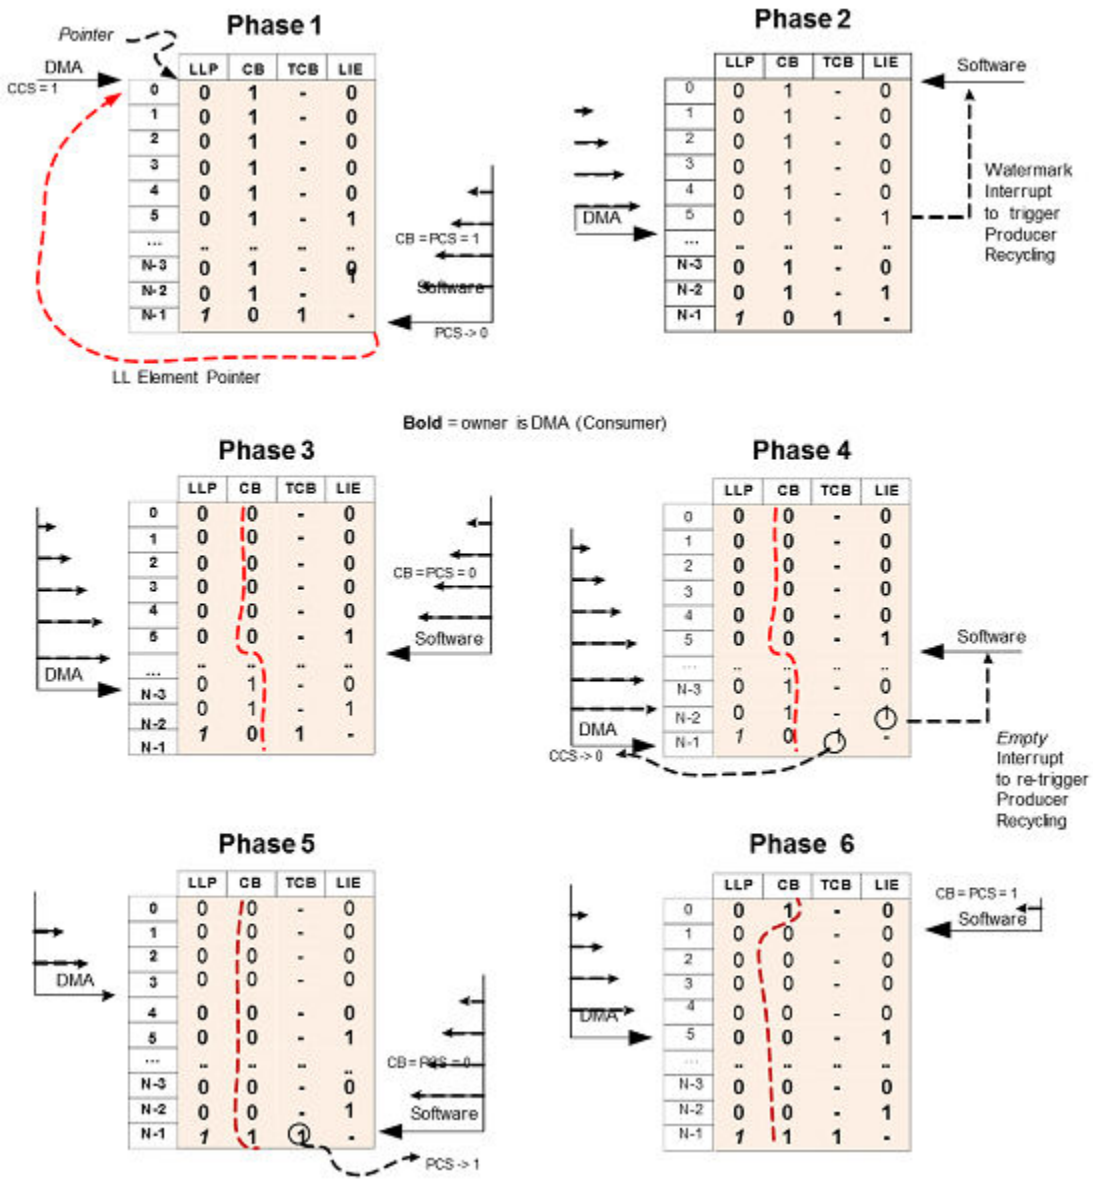

Figure 11-72. Example Producer (Software) - Consumer (DMA) Synchronization Flow

Before looking at the example in detail, it is useful to note that the DMA performs the following two tests as part of this process:

- Consumer-Owned Element, or Transfer List (TL) Empty Test

  The solid red loop L4 in the Figure 11-71 corresponds to this test. The Cycle Bit (CB) of DMA Channel Control 1 Register (DMA_CH_CONTROL1_OFF_WRCH_0) (which was loaded from the LL element) is tested against the DMA Consumer Cycle State (CCS) bit of the same register. When CB =CCS, the element is owned by the consumer (DMA) and the data transfer

is executed. When CB !=CCS, the TL is empty and the DMA sets channel Status (CS) in DMA Channel Control 1 Register (DMA_CH_CONTROL1_OFF_WRCH_0) to "Stopped".

- Toggle Cycle Bit (TCB) Test

  The Dashed Red Loop Marked L5 in Figure 11-71 corresponds to this test. When the Toggle Cycle Bit (TCB) of the DMA Channel Control 1 Register (DMA_CH_CONTROL1_OFF_WRCH_0) (which was loaded from the LL element) is set to 1, the DMA toggles the CCS bit of the DMA Channel Control 1 Register (DMA_CH_CONTROL1_OFF_WRCH_0) to be ~CB. The producer (software) also performs a similar action on its local variable "Producer Cycle Status" (PCS), as it sets PCS =~PCS. The TCB field is only valid in the last LL element (the link element). Toggling the PCS and CCS flags in this manner synchronizes the consumer to the producer.

The example in Figure 11-72 has the following six phases:

1. The software builds the transfer list for the write (or read) channel, according to the steps outlined in the circled step C in Figure 11-71. For each element, CB =PCS =CCS =1. The exception to this is the link element where CB is set to the next iteration value because the link element is always loaded into the channel context.
   - The link element points to the start of the TL and its TCB bit is 1. Software toggles its PCS variable.
   - Software writes the location of the TL into the channel context LL Pointer register.
   - Software rings the write channel Doorbell.
2. The DMA starts processing elements. After processing element 5 (and fetching the next element), the DMA asserts a Watermark “done” interrupt to signal the software to start recycling elements.
3. The software is recycling elements. It reads the channel context DMA Linked List Pointer Low Register (DMA_LLP_LOW_OFF_WRCH_0) and DMA Linked List Pointer High Register (DMA_LL- P_HIGH_OFF_WRCH_0), and recycles elements up to this location1in the TL. It sets CB for each element to be PCS. The Dashed Purple Loop Marked L3 in Figure 11-71 corresponds to this activity. The DMA continues processing (consuming) elements as before.
4. The DMA then asserts an Empty “done” interrupt (from the LIE bit in the last data element at the end of TL that was set in the previous phase) to indicate to the software, to start recycling elements again. The DMA reaches the end of the TL, and as the TCB is set to 1, it toggles its CCS bit to 0 (~CB). For more details, see circled step D in Figure 11-71.
5. The software reads the channel context DMA Linked List Pointer Low Register (DMA_LLP_LOW_REG_WRCH_0) and DMA Linked List Pointer High Register

(DMA_LLP_HIGH_OFF_WRCH_0), and recycles elements up to this location in the TL. It sets CB for each element to be PCS. As it recycles the link element, it detects that TCB is set to 1. It toggles its internal variable PCS to 0, and the initial TL has been fully recycled. The DMA starts processing the recycled elements.

6. The DMA continues processing (consuming) elements as before. Software did not have to ring the Doorbell, as the first element was already recycled before the DMA started processing it. The software might continue recycling from the top of the list, if the DMA had already returned to the top of the list when the software read the channel context DMA Linked List Pointer Low Register (DMA_LLP_LOW_OFF_WRCH_0) and DMA Linked List Pointer High Register (DMA_LL-P_HIGH_OFF_WRCH_0), in step 5. If not, it starts recycling again when the DMA processes element 4 and the DMA asserts a Watermark “done” interrupt.

11.3.2.2.4.4.4 Element Recycling

When your software is recycling elements, it should program the first DWORD (control bits) in the Figure 11-63 only after the other DWORDs have been programmed. In addition, it should set the CB bit (to ~PCS) within this DWORD only after the other bits in this DWORD have been set. This programming sequence avoids the DMA incorrectly fetching an element that software is currently recycling.

When the software is finished recycling it must check the channel context status (CS). When CS is "Stopped", the software must ring the channel Doorbell again. For more details, see circled step E in Figure 11-59. If your element recycling process was fast enough, then the DMA will seamlessly move from processing the last old element to the first new element, without the need for the software to ring the channel Doorbell again. To eliminate the possibility of a race condition between these two actions (read and write), you should first confirm the presence of the "done" interrupt bit in the DMA Write Interrupt Status Register (DMA_WRITE_INT_STATUS_OFF) or DMA Read Interrupt Status Register (DMA_READ_INT_ STATUS_OFF) and also check the DMA Linked List Pointer Low Register (DMA_LLP_LOW_REG_WRCH_0) to confirm that it is pointing to the correct location.

11.3.2.2.4.4.5 Link Down Recovery

During normal operation when the link goes down, the controller generates a "link reset" request. A

high-to-low transition on link_req_rst_not indicates that the PCIe controller is requesting external logic to reset the PCIe controller because the PHY link is down. For more details, see "Hot Reset". To determine the progress of the linked list operation when the

link went down, you can read the contents of the channel context DMA Linked List Pointer Low Register (DMA_LLP_LOW_OFF_WRCH_0) and DMA Linked List Pointer High Register (DMA_LLP_HIGH_OFF_WRCH_0).

11.3.2.3 M-PCIe

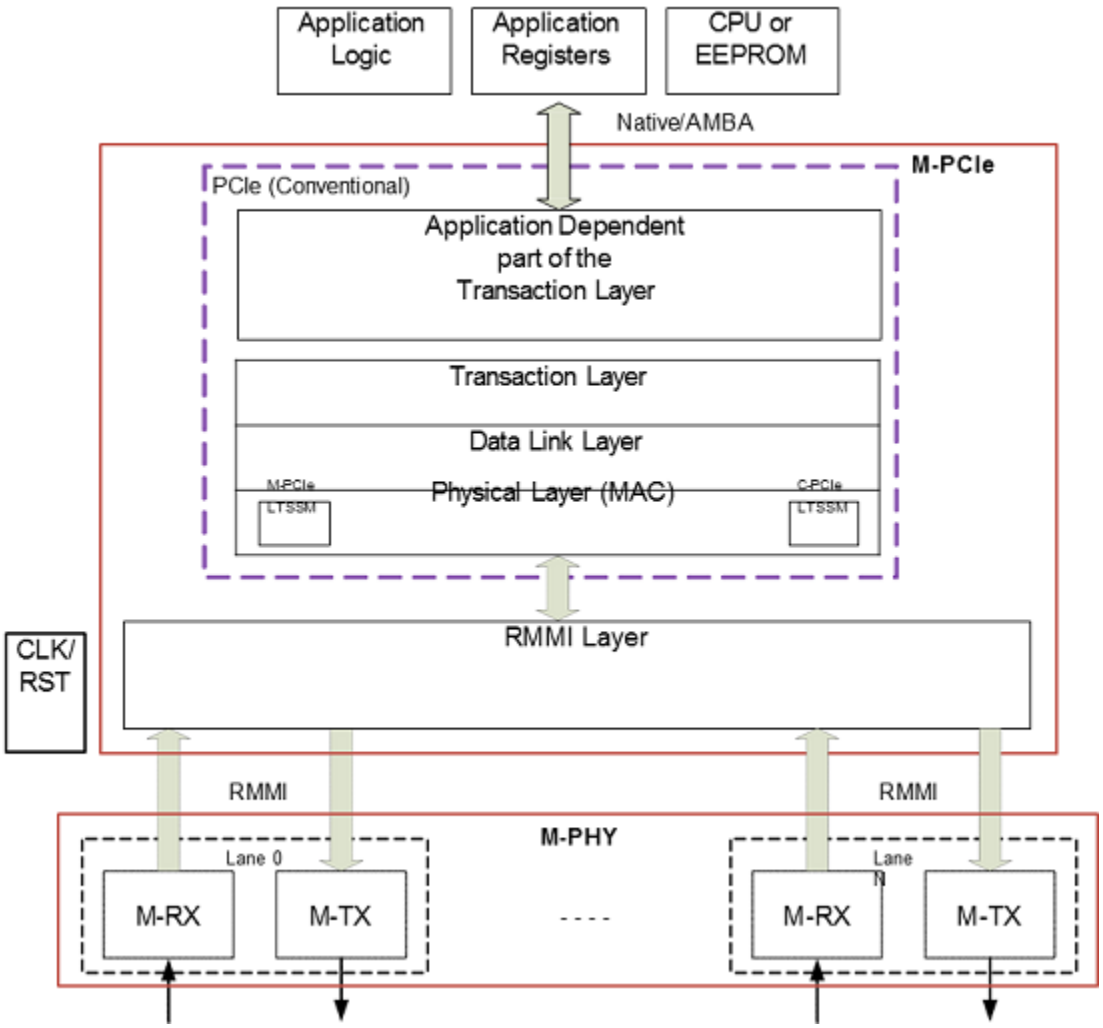
This section describes the optional M-PCIe feature.

11.3.2.3.1 Feature Description

The new M-PCIe specification enables the PCIe controller to operate over the low-power MIPI M-PHY physical layer technology, extending the benefits of PCIe to mobile devices including thin laptops, tablets and smartphones. The M-PCIe controller is compliant with the M-PCIe ECN1 specification. The interface between the controller and the PHY is compliant with the RMMI (Reference M-PHY MODULE Interface) specified in Annex A of the M-PHY Specification.

A complete M-PCIe port solution includes the controller, an analog PHY macro, and application logic to source and sink data. The physical layer is split across the RMMI such that the MAC functionality (LTSSM, lane-to-lane deskew) is in the controller and the PHY functionality is implemented in the RMMI-compliant PHY. The PHY module resides outside of the controller, interfacing through the standard RMMI. For more details, see Integrating with the PHY in the User Guide.

Figure 11-1 Complete M-PCIe Port Solution



a. HS=high-speed. LS=low-speed.

11.3.2.3.1.1 Features

This release supports the following features: **Table 11-1M- PCIe Features**

M-PCIe Feature	Supported
HSa-Gear Link Speeds	HS-Gear1 HS-Gear2 HS-Gear3
HS-Gear1 Base RATE-A Frequencies	31.2 MHz 62.4 MHz 124.8 MHz
Elastic Buffer Maximum Frequency Difference Compensation Between Link Partners • HS-Mode: • LS-Mode:	+/- 2000 ppm +/- 300 %

11.3.2.3.1.2 Limitations

Table 11-2 identifies the temporary limitations when using the M-PCIe module.

Table 11-2 M-PCIe Limitations

Limitation	Note
Limited Analog Loopback Support	Analog loopback requires the M-PHY to autonomously loop and re-transmit the Rx data. However, the RMMI specification does not define the entry mechanism for analog loopback. • If you are using the M-PHY (which has no input to accept the cores pa_rx_analog_loopback output), the analog loopback path must

Table continues on the next page...

	pass through the controller involving the elastic buffer. The Tx lanes in the controller use the Tx (and not the Rx) clock. The elastic buffer cannot operate indefinitely under this condition. If there is a frequency difference between the Rx and Tx clocks, there will be some data overflow or underflow. • If you are using a third party M-PHY, the M-PHY enters analog loop- back mode when the controller asserts pa_rx_analog_loopback. If the M-PHY does not support such an input, you can instruct the M- PCIe controller to do loopback from Rx to Tx through the elastic buffer.
Verilog Testbench (VTB) VIP not Included	M-PCIe configurations currently have no M-PCIe VIP and connect instead to an RTL DUT of the opposite port type.
No Midstream De-assertion of TX_PhyDIRDY	The controller does not support midstream de-assertion of phy_mac_tx_phydirdy during burst mode. This is not an M-PCIe or RMMI requirement. However, the tx_symbolclk is derived from the same clock that the M-PHY TX path uses, and there is no reason for the M-PHY to insert wait cycles.
Midstream De-assertion of RX_PhyDORDY	The rx_symbolclk is the recovered clock and there is no elastic buffer in the M-PHY. Therefore, there is no reason for the M-PHY to insert de-assertion of mac_phy_rx_phydordy during burst mode. If your M-PHY de-asserts mac_phy_rx_phydordy during burst mode, there is a risk of underflowing the elastic buffer in the controller.
TLP in 2K+ PPM System with Payload Greater than 2 KB not Supported.	The controller can handle a clock difference of 2K PPM only. When clock compensation greater than 2K PPM is required, the elastic buffer overflows or underflows on receiving a TLP with payload greater than 2 KB.
M-PHY RX Registers Cannot be set when LTSSM Exits L1 or L2.	The controller cannot set M-PHY RX registers when: • LTSSM exits L1 in a downstream or upstream port • LTSSM exits L2 in a downstream port.

11.3.2.3.1.3 Frequency, Speed, and Width Support

To set the M-PCIe frequency, datapath width, and speed modes of the controller, use the following configuration parameters in the coreConsultant GUI:

■ Controller Base Frequency (CM_FREQ)

■ PHY Base Frequency (CM_PHY_FREQ)

■ Controller Gear2 and Gear3 Modes (CM_GEAR2_MODE and CM_GEAR3_MODE)

■ PHY Gear2 and Gear3 Modes (CM_PHY_GEAR2_MODE and CM_PHY_GEAR3_MODE)

■ Maximum Tx and Rx Link Width (CM_TXNL_GUI and CM_RXNL_GUI)

❑CX_NL = max {CM_TXNL_GUI, CM_RXNL_GUI}

❑ CX_NB = (CM_FREQ == 124.8) ? 1 : (CM_FREQ == 62.4) ? 2 : 4

■CM_FREQ_STEP_DOWN_EN. This is the enable for the “Frequency Step Module”

11.3.2.3.1.4 Gear2/Gear3 Modes

For Dynamic Frequency (DF) configurations, the number of active symbols on the RMMI is constant; the frequency of the controller doubles each time as the controller transitions from Gear1 -> Gear2 -> Gear3 rates. For Dynamic Width (DW) configurations, the frequency of the controller is constant; the number of active symbols on the RMMI doubles each time as the controller transitions from Gear1 -> Gear2 -> Gear3 rates. The controller cannot have different Gear2 and Gear3 modes. For example, you cannot configure the controller for Dynamic Width in Gear2 mode, and at the same time configure it for Dynamic Frequency in Gear3 mode. For more details, see Figure 11-3.

Figure 11-3 Gear2/Gear3 Speed Changing Paths

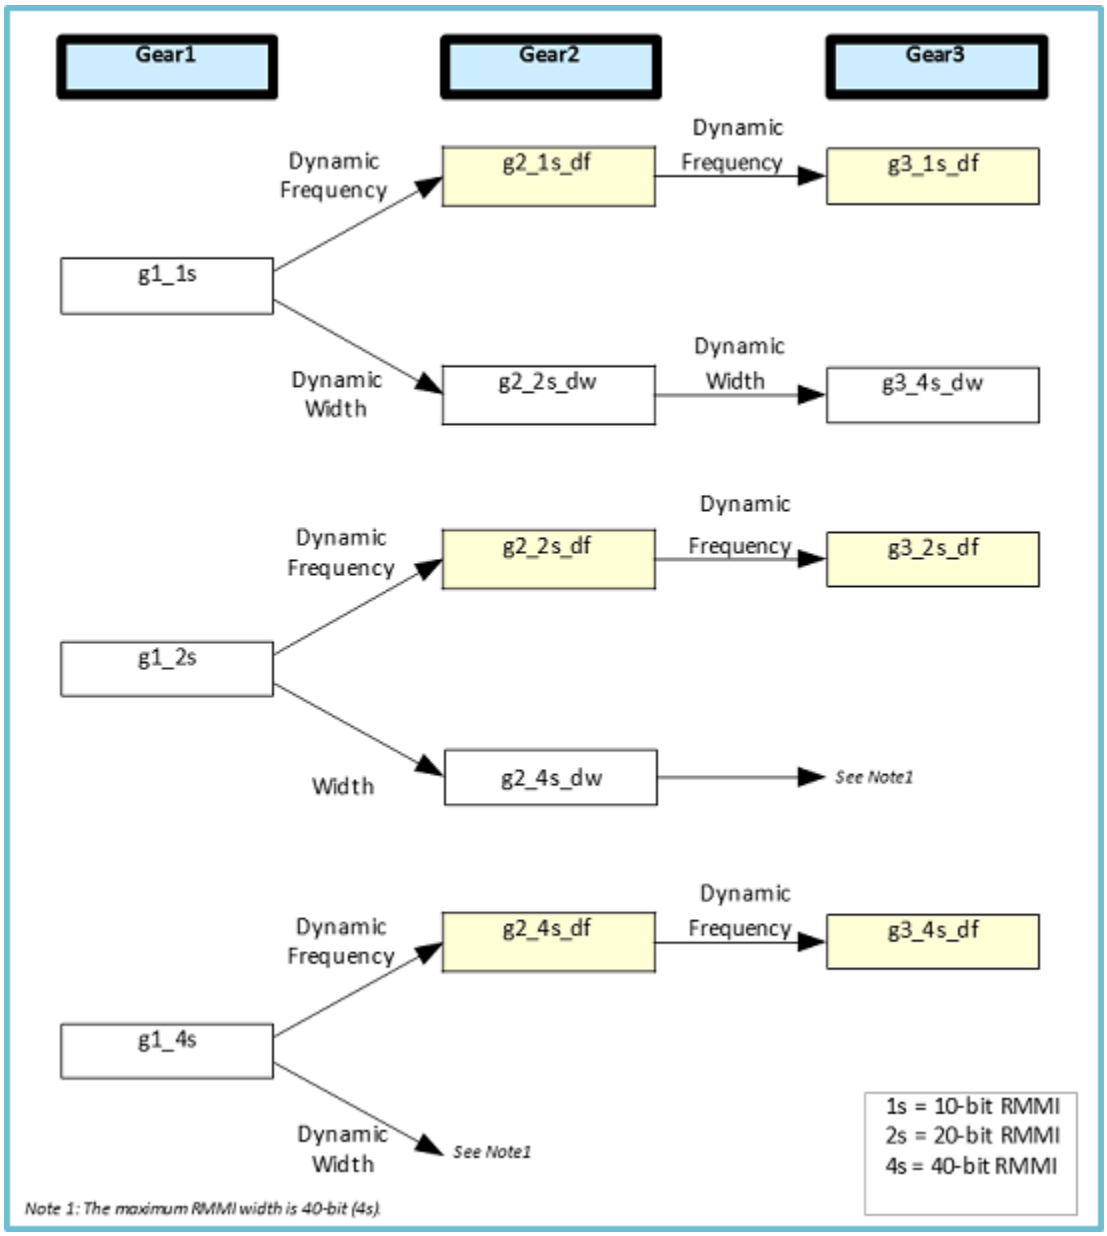

Table 11-3 Supported Controller Configurations in Standard M-PCIe Mode

				Maxa Link Width							
Gear1 RATE A Frequencyb (CM_FREQ)	**Gear2 Mode**	**Gear3 Mode**	**RMMI Widthc**	**For 32-bit datapath**	**For 64-bit datapathd**	**For 128-bit datapath**	**For 256-bit datapath**	**Maximum core_clk Frequency (x CM_FREQ)**	**Gear1 Speed Modee**	**Gear2 Speed Mode**	**Gear3 Speed Mode**

31.2	DF		40-bit	x1	x2	x4	x8	x2	g1_4s	g2_4s_df	
124.8	DW	DW	40-bit	x1	x2	x4	x8	x1	g1_1s	g2_2s_dw	g3_4s_dw
124.8	DF	DF	10-bit	x4	x8	x16	-	x4	g1_1s	g2_1s_df	g3_1s_df
62.4	DF	DF	20-bit	x2	x4	x8	x16	x4	g1_2s	g2_2s_df	g3_2s_df
31.2	DF	DF	40-bit	x1	x2	x4	x8	x4	g1_4s	g2_4s_df	g3_4s_df

a. The value in each cell indicates the maximum link width supported. You can configure the controller with a link width up to this value, and coreConsul- tant automatically calculates the datapath width.

b. Corresponding RATE B frequencies are 145.76, 72.88, and 36.44 MHz.

c. The actual physical RMMI interface I/O width is 10*CM_NB bits per lane. The coreConsultant tool automatically calculates this width from CM_GEAR2_MODE, CM_GEAR3_MODE, and CM_FREQ. In a DW configuration, the number of active bits in the RMMI interface increases as the controller transitions to a higher Gear speed.

d. A 64-bit datapath requires a 32-bit/64-bit license. You cannot create a 32-bit or 64-bit configuration with a 128-bit/256-bit license

e. The ‘g’ value indicates the speed mode. The ‘s’ value indicates the number of 10-bit symbols processed per clock cycle per lane by the controller RMMI I/F, in the indicated speed mode. The ‘dw/df’ value indicates how the speed change to that mode is achieved

11.3.2.3.1.5 Controller PHY Compatibility

The following tables indicate which combinations of controller configurations from Table 11-3 and PHYs are supported. In Table 11-4, the triplet of values for each row indicates how the controller moves from Gear1 to Gear2 speed mode and from Gear2 to Gear3 speed mode. The triplet of values also identifies the particular controller configuration in Table 11-3. The controller always uses the same mechanism (DF or DW) to go from Gear1 to Gear2 and from Gear2 to Gear3.

Table 11-4 Gear3 Controller-PHY Combinations Supported

		PHY

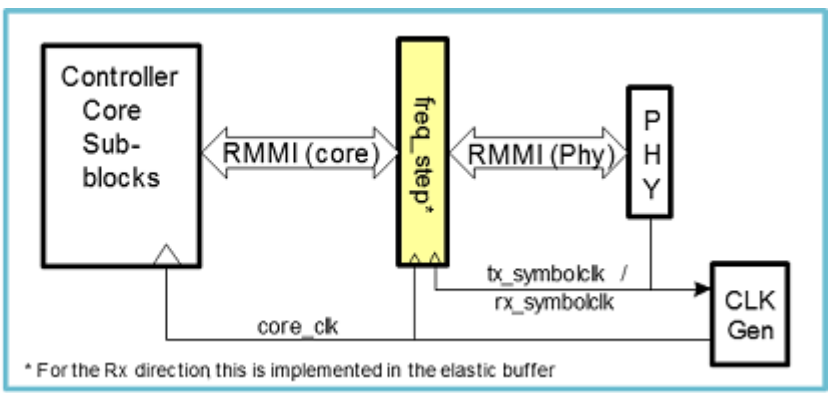
11.3.2.3.1.6 Frequency Step Module

When the controller RMMI lane width (CM_NB) and M-PHY RMMI lane width (CM_PHY_NB) are different, or when the controller and the PHY have different Gear2 speed changing modes, the automatically-derived CM_FREQ_STEP_DOWN_EN parameter is defined, and a RMMI adapter module1 is added between the controller RMMI and the PHY RMMI.

Figure 11-4 Location of freq_step RMMI Adapter Module



This module steps up/down the signals to/from the RMMI interface and adapts (x2,x4, x0.5, x0.25) the controller RMMI width to the PHY RMMI width when the controller clock frequency is slower or faster than the RMMI clock frequency.

11.3.3 Memory Map and Register Definition

This section includes the PCIe module memory map and detailed descriptions of all registers.

11.3.3.1.2.3 Fields

Field	Function
31-16 DEVICE_ID	Device ID. The Device ID register identifies the particular Function. This identifier is allocated by the vendor. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
15-0 VENDOR_ID	Vendor ID. The Vendor ID register identifies the manufacturer of the Function. Valid vendor identifiers are allocated by the PCI-SIG to ensure uniqueness. It is not permitted to populate this register with a value of FFFFh, which is an invalid value for Vendor ID. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.

11.3.3.1.3.3 Fields

Field	Function
31 DETECTED_PARITY_ERROR	Detected Parity Error. This bit is set by a Function whenever it receives a Poisoned TLP, regardless of the state the Parity Error Response bit in the Command register. The bit is set when the Poisoned TLP is received by a Function's primary side.
30 SIGNALED_SYS_ERROR	Signaled System Error. This bit is set when a Function sends an ERR_FATAL or ERR_NONFATAL Message, and the SERR# Enable bit in the Command register is 1b.
29 RCVD_MASTER_ABORT	Received Master Abort. This bit is set when a Requester receives a Completion with Unsupported Request Completion status. The bit is set when the Unsupported Request is received by a Function's primary side.
28 RCVD_TARGET_ABORT	Received Target Abort. This bit is set when a Requester receives a Completion with Completer Abort Completion status. The bit is set when the Completer Abort is received by a Function's primary side.
27 SIGNALED_TARGET_ABORT	Signaled Target Abort. This bit is set when a Function completes a Posted or Non-Posted Request as a Completer Abort error. This applies to a Function when the Completer Abort was generated by its primary side.
26-25 DEV_SEL_TIMING	DEVSEL Timing. This field was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires it to 00b.
24 MASTER_DPE	Master Data Parity Error. This bit is set by a Function if the Parity Error Response bit in the Command register is 1b and either of the following two conditions occurs: - Port receives a Poisoned Completion going downstream - Port transmits a Poisoned Request upstream If the Parity Error Response bit is 0b, this bit is never set.
23 FAST_B2B_CAP	Fast Back-to-Back Transactions Capable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b.
22 RSVDP_22	Reserved for future use.
21 FAST_66MHZ_CAP	66 MHz Capable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b.
20 CAP_LIST	Capabilities List. Indicates the presence of an Extended Capability list item. Since all PCI Express device Functions are required to implement the PCI Express Capability structure, the controller hardwires this bit to 1b.
19 INT_STATUS	Interrupt Status. When set, indicates that an INTx emulation interrupt is pending internally in the Function. INTx emulation interrupts forwarded by Functions from the secondary side are not reflected in this bit. Setting the Interrupt Disable bit has no effect on the state of this bit. For Functions that do not generate INTx interrupts, the controller hardwires this bit to 0b.
18-17 RSVDP_17	Reserved for future use.
16 —	Reserved.
15-11	Reserved.

Table continues on the next page...

Field	Function
RESERV	
10 INT_EN	Interrupt Disable. Controls the ability of a Function to generate INTx emulation interrupts. When set, Functions are prevented from asserting INTx interrupts. Note: - Any INTx emulation interrupts already asserted by the Function must be deasserted when this bit is set. INTx interrupts use virtual wires that must, if asserted, be deasserted using the appropriate Deassert_INTx message(s) when this bit is set. - Only the INTx virtual wire interrupt(s) associated with the Function(s) for which this bit is set are affected. - For Functions that generate INTx interrupts on their own behalf, this bit is required. This bit has no effect on interrupts forwarded from the secondary side. For Functions that do not generate INTx interrupts on their own behalf this bit is optional. If this bit is not implemented, the controller hardwires it to 0b.
9 RSVDP_9	Reserved for future use.
8 SERREN	SERR# Enable. When set, this bit enables reporting upstream of Non-fatal and Fatal errors detected by the Function. Note: The errors are reported if enabled either through this bit or through the PCI Express specific bits in the Device Control register. For more details see the "Error Registers" section of the PCI Express Specification. In addition, this bit controls transmission by the primary interface of ERR_NONFATAL and ERR_FATAL error Messages forwarded from the secondary interface. This bit does not affect the transmission of forwarded ERR_COR messages.
7 IDSEL	IDSEL Stepping/Wait Cycle Control. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b.
6 PERREN	Parity Error Response. This bit controls the logging of poisoned TLPs in the Master Data Parity Error bit in the Status register. For more details see the "Error Registers" section of the PCI Express Specification.
5 VGAPS	VGA Palette Snoop. This bit was originally described in the PCI Local Bus Specification and the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b.
4 MWI_EN	Memory Write and Invalidate. This bit was originally described in the PCI Local Bus Specification and the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. For PCI Express to PCI/PCI-X Bridges, refer to the PCI Express to PCI/PCI-X Bridge Specification for requirements for this register.
3 SCO	Special Cycle Enable. This bit was originally described in the PCI Local Bus Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b.
2 BME	Bus Master Enable. This bit controls forwarding of Memory or I/O requests by a port in the Upstream direction. When this bit is 0b, Memory and I/O Requests received at a Root Port must be handled as Unsupported Requests (UR) For Non-Posted Requests a Completion with UR completion status must be returned. This bit does not affect forwarding of Completions in either the Upstream or Downstream direction. The forwarding of Requests other than Memory or I/O Requests is not controlled by this bit.
1 MSE	Memory Space Enable. This bit controls a Function's response to Memory Space accesses received on its primary side. - When set, the Function is enabled to decode the address and further process Memory Space accesses. - When clear, all received Memory Space accesses are caused to be handled as Unsupported Requests. You cannot write to this register if your configuration has no MEM bars; that is, the internal signal has_mem_bar =0. Note: The access attributes of this field are as follows: - Dbi: ! has_mem_bar ? RO : RW
0 IO_EN	IO Space Enable. This bit controls a Function's response to I/O Space accesses received on its primary side. - When set, the Function is enabled to decode the address and further process I/O Space accesses. - When clear, all received I/O accesses are caused to be handled as Unsupported Requests. You cannot write to this register if your configuration has no IO bars; that is, the internal signal has_io_bar =0. Note: The access attributes of this field are as follows: - Dbi: !has_io_bar ? RO : RW

11.3.3.1.4.3 Fields

Field	Function
31-24 BASE_CLASS_CODE	Base Class Code. A code that broadly classifies the type of operation the Function performs. Encodings for base class, are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are reserved. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
23-16 SUBCLASS_CODE	Sub-Class Code. Specifies a base class sub-class, which identifies more specifically the operation of the Function. Encodings for sub-class are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are reserved. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
15-8 PROGRAM_INTERFACE	Programming Interface. This field identifies a specific register level programming interface (if any) so that device independent software can interact with the Function. Encodings for interface are provided in the PCI Code and ID Assignment Specification. All unspecified encodings are reserved. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
7-0 REVISION_ID	Revision ID. The value of this field specifies a Function specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. The Revision ID should be viewed as a vendor defined extension to the Device ID. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.

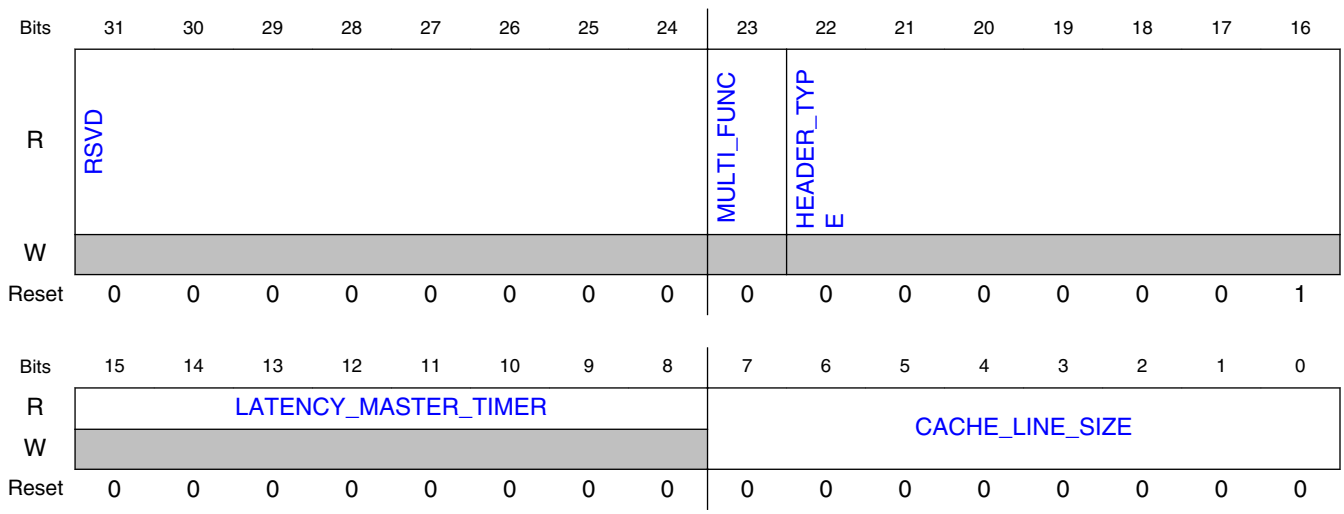
11.3.3.1.5.2 Diagram



11.3.3.1.5.3 Fields

Field	Function
31-24 —	Reserved.
23 MULTI_FUNC	Multi-Function Device. - When set, indicates that the device may contain multiple Functions, but not necessarily. Software is permitted to probe for Functions other than Function 0. - When clear, software must not probe for Functions other than Function 0 unless explicitly indicated by another mechanism, such as an ARI or SR-IOV Capability structure. Except where stated otherwise, it is recommended that this bit be set if there are multiple Functions, and clear if there is only one Function. Note: This register field is sticky.
22-16 HEADER_TYPE	Header Layout. This field identifies the layout of the second part of the predefined header. The controller uses 000 0001b encoding. The encoding 000 0010b is reserved. This encoding was originally described in the PC Card Standard Electrical Specification and is used in previous versions of the programming model. Careful consideration should be given to any attempt to repurpose it.

Table continues on the next page...

Field	Function
15-8 LATENCY_MASTER_TIMER	Latency Timer. This register is also referred to as Primary Latency Timer. The Latency Timer was originally described in the PCI Local Bus Specification and the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this register to 00h.
7-0 CACHE_LINE_SIZE	Cache Line Size. The Cache Line Size register is programmed by the system firmware or the operating system to system cache line size. However, legacy conventional PCI software may not always be able to program this register correctly especially in the case of Hot-Plug devices. This read-write register is implemented for legacy compatibility purposes but has no effect on any PCI Express device behavior.

11.3.3.1.6 Secondary Latency Timer, Subordinate Bus Number, Secondary Bus Number, and Primary Bus Number Register. (SEC_LAT_TIMER_SUB_BUS_SEC_BUS_PRI_BUS_REG)

11.3.3.1.6.3 Fields

Field	Function
31-24 SEC_LAT_TIMER	Secondary Latency Timer. This register does not apply to PCI Express. The controller hardwires it to 00h.
23-16	Subordinate Bus Number. The Subordinate Bus Number register is used to record the bus number of the highest numbered PCI bus segment which is behind (or subordinate to) the bridge. Configuration

Table continues on the next page...

Field	Function
SUB_BUS	software programs the value in this register. The bridge uses this register in conjunction with the Secondary Bus Number register to determine when to respond to and pass on a Type 1 configuration transaction on the primary interface to the secondary interface.
15-8 SEC_BUS	Secondary Bus Number. The Secondary Bus Number register is used to record the bus number of the PCI bus segment to which the secondary interface of the bridge is connected. Configuration software programs the value in this register. The bridge uses this register to determine when to respond to and convert a Type 1 configuration transaction on the primary interface into a Type 0 transaction on the secondary interface.
7-0 PRIM_BUS	Primary Bus Number. This register is not used by PCI Express Functions. It is implemented for compatibility with legacy software.

11.3.3.1.7 Secondary Status, and I/O Limit and Base Register. (SEC_STAT _IO_LIMIT_IO_BASE_REG)

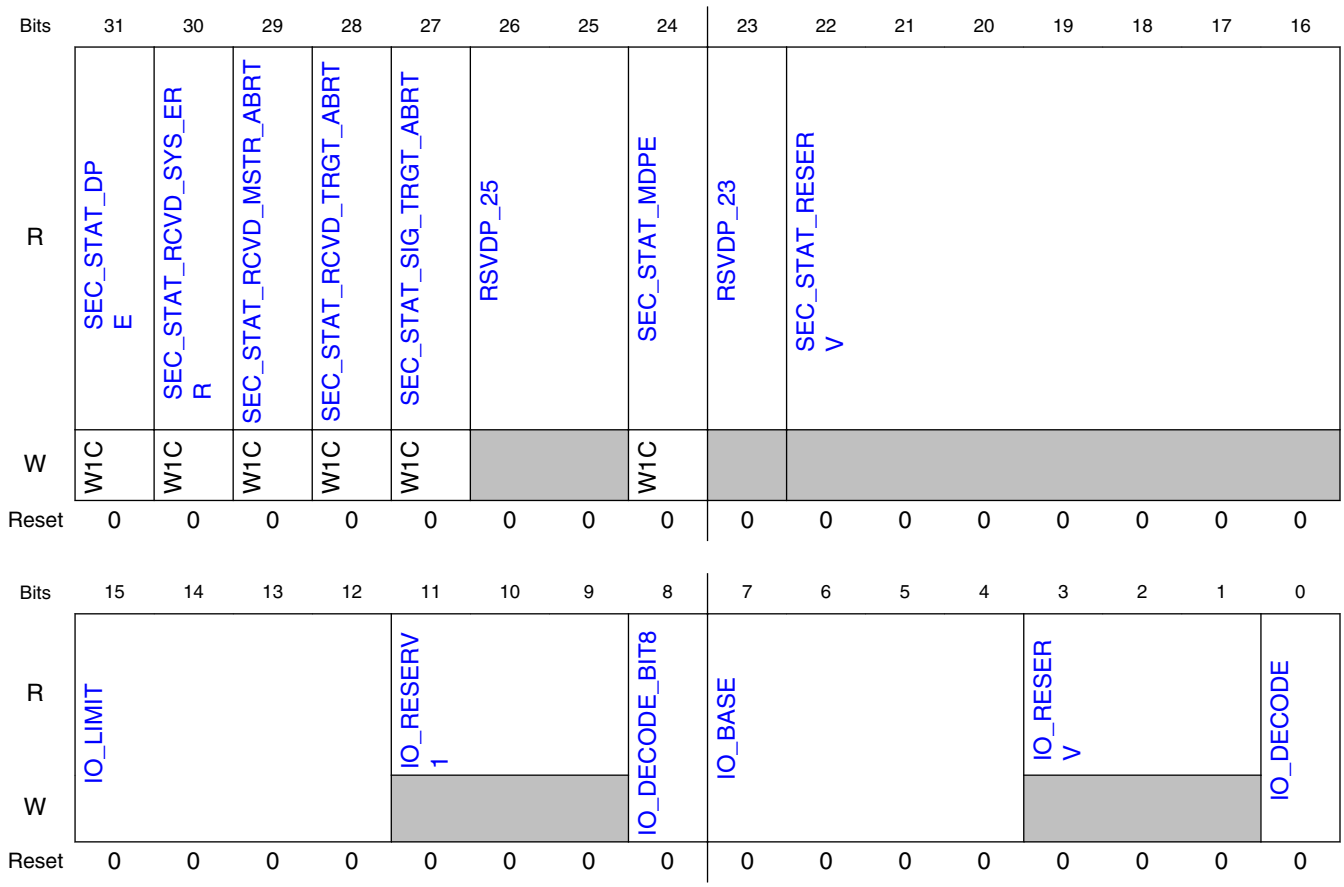
11.3.3.1.7.1 Offset

Register	Offset
SEC_STAT_IO_LIMIT_ IO_BASE_REG	1Ch

11.3.3.1.7.2 Function

Secondary Status, and I/O Limit and Base Register. The I/O Limit and I/O Base registers are optional and define an address range that is used by the bridge to determine when to forward I/O transactions from one interface to the other. If a bridge does not implement an I/O address range, then both the I/O Limit and I/O Base registers must be implemented as read-only registers that return zero when read. If a bridge supports an I/O address range, then these registers must be initialized by configuration software so default states are not specified.

11.3.3.1.7.3 Diagram



11.3.3.1.7.4 Fields

Field	Function
31 SEC_STAT_DPE	Detected Parity Error. This bit is set by a Function when a Poisoned TLP is received by its secondary side, regardless of the state the Parity Error Response Enable bit in the Bridge Control register.
30 SEC_STAT_RCVD_SYS_ERR	Received System Error. This bit is set when the secondary side of a Function receives an ERR_FATAL or ERR_NONFATAL message.
29 SEC_STAT_RCVD_MSTR_ABRT	Received Master Abort. This bit is set when the secondary side of a Function (for requests initiated by the Type 1 header Function itself) receives a Completion with Unsupported Request Completion status.
28 SEC_STAT_RCVD_TRGT_ABRT	Received Target Abort. This bit is set when the secondary side of a Function (for requests initiated by the Type 1 header Function itself) receives a Completion with Completer Abort Completion status.

Table continues on the next page...

Field	Function
27 SEC_STAT_SIG_TRGT_ABRT	Signaled Target Abort. This bit is set when the secondary side of the Function (for Requests completed by the Type 1 header Function itself) completes a Posted or Non-Posted request as a Completer Abort error.
26-25 RSVDP_25	Reserved for future use.
24 SEC_STAT_MDPE	Master Data Parity Error. This bit is set by a Function if the Parity Error Response Enable bit in the Bridge Control register is set, and either of the following two conditions occurs: - Port receives a Poisoned Completion coming Upstream - Port transmits a Poisoned Request Downstream If the Parity Error Response Enable bit is clear, this bit is never set.
23 RSVDP_23	Reserved for future use.
22-16 SEC_STAT_RESERV	Reserved.
15-12 IO_LIMIT	I/O Limit Address. These bits correspond to the address[15:12] of IO address range. For the purpose of address decoding, the bridge assumes that the lower 12 address bits, address[11:0], of the I/O limit address (not implemented in the I/O Limit register) are FFFh. The I/O Limit register can be programmed to a smaller value than the I/O Base register, if there are no I/O addresses on the secondary side of the bridge. In this case, the bridge will not forward any I/O transactions from the primary bus to the secondary and will forward all I/O transactions from the secondary bus to the primary bus.
11-9 IO_RESERV1	Reserved.
8 IO_DECODE_BIT8	I/O Addressing Encode (IO Limit Address). This bit encodes the IO addressing capability of the bridge. IO_DECODE_BIT8 indicates the following: - 0h: The bridge supports only 16-bit I/O addressing (for ISA compatibility). For the purpose of address decoding, the bridge assumes that the upper 16 address bits, Address[31:16], of the I/O limit address (not implemented in I/O Limit register) are zero. Note: The bridge must still perform a full 32-bit decode of the I/O address (that is, check that Address[31:16] are 0000h). In this case, the I/O address range supported by the bridge will be restricted to the first 64 KB of I/O Space (0000 0000h to 0000 FFFFh). - 01h: The bridge supports 32-bit I/O address decoding, and the I/O Limit Upper 16 Bits hold the upper 16 bits, corresponding to Address[31:16], of the 32-bit Limit address. In this case, system configuration software is permitted to locate the I/O address range supported by the bridge anywhere in the 4-GB I/O Space. Note: The 4-KB alignment and granularity restrictions still apply when the bridge supports 32-bit I/O addressing. Note: The access attributes of this field are as follows: - Dbi: R
7-4 IO_BASE	I/O Base Address. These bits correspond to the address[15:12] of IO address range. For the purpose of address decoding, the bridge assumes that the lower 12 address bits, address[11:0], of the I/O base address (not implemented in the I/O Base register) are zero.
3-1 IO_RESERV	Reserved.
0 IO_DECODE	I/O Addressing Encode (IO Base Address) This bit encodes the IO addressing capability of the bridge. IO_DECODE indicates the following: - 0h: The bridge supports only 16-bit I/O addressing (for ISA compatibility). For the purpose of address decoding, the bridge assumes that the upper 16 address bits, Address[31:16], of the I/O base address (not implemented in I/O base register) are zero. Note: The bridge must still perform a full 32-bit decode of the I/O address (that is, check that Address[31:16] are 0000h). In this case, the I/O address range supported by the bridge will be restricted to the first 64 KB of I/O Space (0000 0000h to 0000 FFFFh). - 01h: The bridge supports 32-bit I/O address decoding, and the I/O Base Upper 16 Bits hold the upper 16 bits, corresponding to Address[31:16], of the 32-bit Base address. In this case, system configuration software is permitted to locate the I/O address range supported by the bridge anywhere in the 4-GB I/O Space. Note: The 4-KB alignment and granularity restrictions still apply when the bridge supports 32-bit I/O addressing. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R

11.3.3.1.8 Memory Limit and Base Register. (MEM_LIMIT_MEM_BASE_REG)

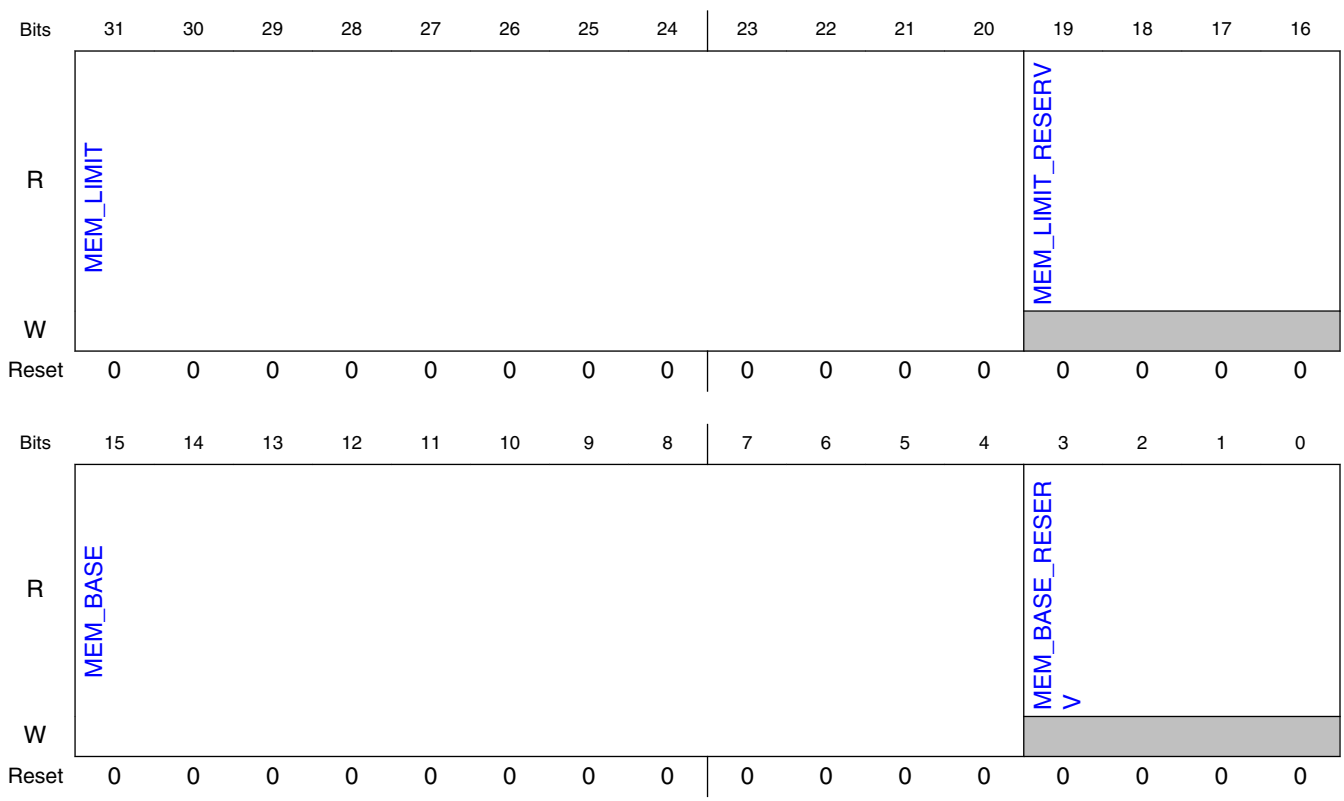
11.3.3.1.8.1 Offset

Register	Offset
MEM_LIMIT_MEM_BASE_REG	20h

11.3.3.1.8.2 Function

Memory Limit and Base Register. The Memory Limit and Memory Base registers define a memory mapped address range which is used by the bridge to determine when to forward memory transactions from one interface to the other. If there is no prefetchable memory space, and there is no memory-mapped space on the secondary side of the bridge, then the bridge will not forward any memory transactions from the primary bus to the secondary bus and will forward all memory transactions from the secondary bus to the primary bus.

11.3.3.1.8.3 Diagram



11.3.3.1.8.4 Fields

Field	Function
31-20 MEM_LIMIT	Memory Limit Address. These bits correspond to the upper 12 address bits, Address[31:20], of 32-bit addresses. For the purpose of address decoding, the bridge assumes that the lower 20 address bits, Address[19:0], of the memory limit address (not implemented in the Memory Limit register) are F FFFFh. The Memory Limit register must be programmed to a smaller value than the Memory Base register if there is no memory-mapped address space on the secondary side of the bridge.
19-16 MEM_LIMIT_RESERV	Reserved.
15-4 MEM_BASE	Memory Base Address. These bits correspond to the upper 12 address bits, Address[31:20], of 32-bit addresses. For the purpose of address decoding, the bridge assumes that the lower 20 address bits, Address[19:0], of the memory base address (not implemented in the Memory Base register) are zero.
3-0 MEM_BASE_RESERV	Reserved.

11.3.3.1.9 Prefetchable Memory Limit and Base Register. (PREF_MEM_LIMIT_PREF_MEM_BASE_REG)

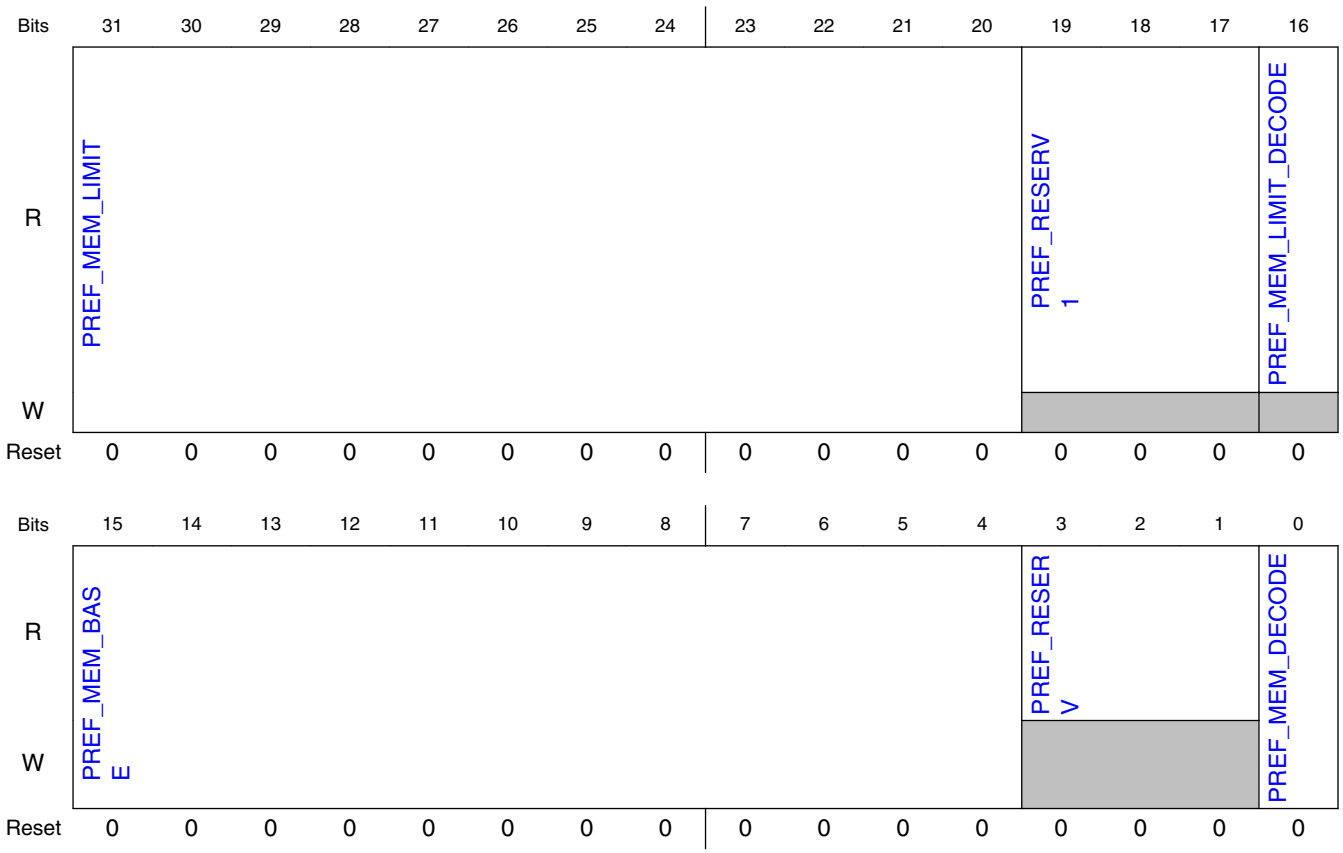
11.3.3.1.9.1 Offset

Register	Offset
PREF_MEM_LIMIT_PREF_MEM_BASE_REG	24h

11.3.3.1.9.2 Function

Prefetchable Memory Limit and Base Register. The Prefetchable Memory Limit and Prefetchable Memory Base registers must indicate that 64-bit addresses are supported, as defined in PCI-to-PCI Bridge Architecture Specification. The Prefetchable Memory Limit and Prefetchable Memory Base registers are optional. They define a prefetchable memory address range which is used by the bridge to determine when to forward memory transactions from one interface to the other (see the PCI-to-PCI Bridge Architecture Specification for additional details).

11.3.3.1.9.3 Diagram



11.3.3.1.9.4 Fields

Field	Function
31-20 PREF_MEM_LIMIT	Prefetchable Memory Limit Address. If the Prefetchable Memory Limit register indicates support for 32-bit addressing, then the Prefetchable Limit Upper 32 Bits register is implemented as a read-only register that returns zero when read. If the Prefetchable Memory Limit registers indicate support for 64-bit addressing, then the Prefetchable Limit Upper 32 Bits register is implemented as a read/write register which must be initialized by configuration software. If a 64-bit prefetchable memory address range is supported, the Prefetchable Limit Upper 32 Bits register specifies the upper 32 bits, corresponding to Address[63:32], of the 64-bit limit addresses which specify the prefetchable memory address range.
19-17 PREF_RESERV 1	Reserved.
16 PREF_MEM_LIMIT_DECODE	Prefetchable Memory Limit Decode. This bit encodes whether or not the bridge supports 64-bit addresses. The value of PREF_MEM_LIMIT_DECODE indicates the following: - 0b: Indicates that the bridge supports only 32 bit addresses - 1b: Indicates that the bridge supports 64 bit addresses. Prefetchable Limit Upper 32 Bits registers holds the rest of the 64-bit prefetchable limit address.
15-4 PREF_MEM_BASE	Prefetchable Memory Base Address. If the Prefetchable Memory Base register indicates support for 32-bit addressing, then the Prefetchable Base Upper 32 Bits register is implemented as a read-only register that returns zero when read. If the Prefetchable Memory Base register indicates support for 64-bit addressing, then the Prefetchable Limit Upper 32 Bits register is implemented as a read/write register

Table continues on the next page...

Field	Function
	two bits are Reserved and must be set to 00b. Software must mask these bits off before using this register as a pointer in Configuration Space to the first entry of a linked list of new capabilities. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.

11.3.3.1.14 Expansion ROM Base Address Register. (TYPE1_EXP_ROM_BASE_REG)

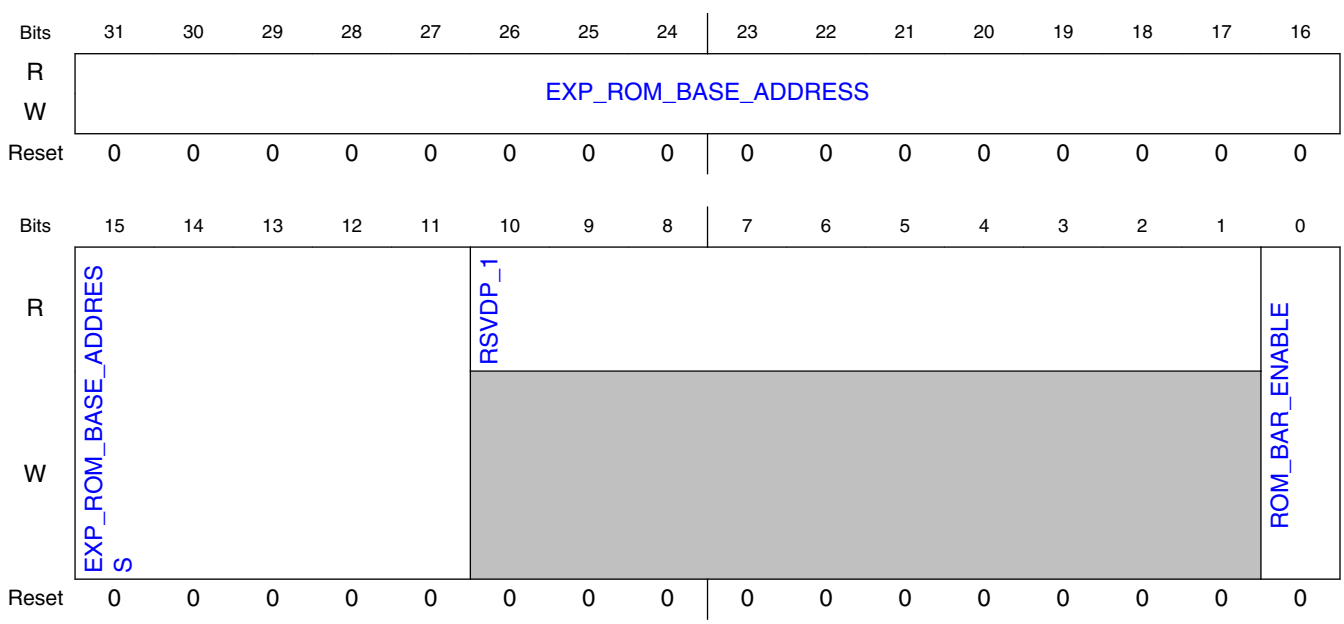
11.3.3.1.14.1 Offset

Register	Offset
TYPE1_EXP_ROM_BASE_REG	38h

11.3.3.1.14.2 Function

Expansion ROM Base Address Register. This register is defined to handle the base address and size information for this expansion ROM. The mask for this ROM BAR exists (if implemented) as a shadow register at this address. The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the second register at this address.

11.3.3.1.14.3 Diagram



11.3.3.1.14.4 Fields

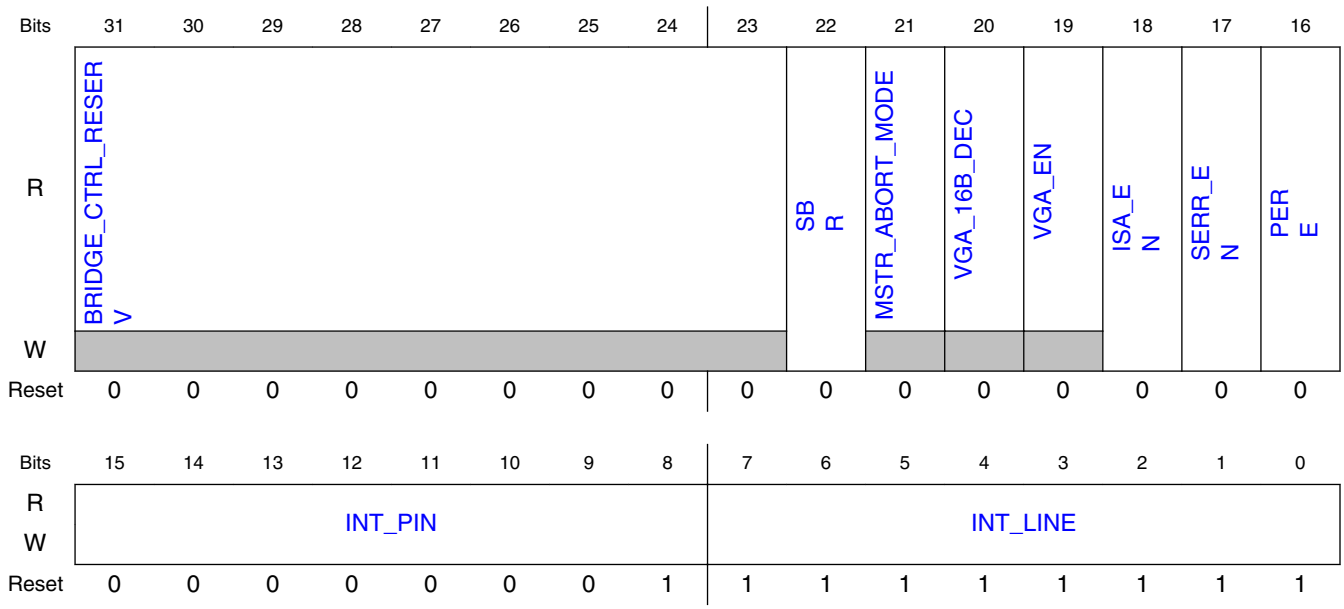
Field	Function
31-11 EXP_ROM_BASE_ADDRESS	Expansion ROM Base Address. Upper 21 bits of the Expansion ROM base address. The number of bits (out of these 21) that a Function actually implements depends on how much address space the Function requires. The mask for this ROM BAR exists (if implemented) as a shadow register at this address. The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the second register at this address. Note: The access attributes of this field are as follows: - Dbi: R/W
10-1 RSVDP_1	Reserved for future use.
0 ROM_BAR_ENABLE	Expansion ROM Enable. This bit controls whether or not the Function accepts accesses to its expansion ROM. When this bit is 0b, the Function's expansion ROM address space is disabled. When the bit is 1b, address decoding is enabled using the parameters in the other part of the Expansion ROM Base Address register. The Memory Space Enable bit in the Command register has precedence over the Expansion ROM Enable bit. A Function must claim accesses to its expansion ROM only if both the Memory Space Enable bit and the Expansion ROM Enable bit are set. Note: The access attributes of this field are as follows: - Dbi: R/W

11.3.3.1.15 Bridge Control, Interrupt Pin, and Interrupt Line Register. (BRIDGE_CTRL_INT_PIN_INT_LINE_REG)

11.3.3.1.15.1 Offset

Register	Offset
BRIDGE_CTRL_INT_PIN_INT_LINE_REG	3Ch

11.3.3.1.15.2 Diagram



11.3.3.1.15.3 Fields

Field	Function
31-23 BRIDGE_CTRL_RESERV	Reserved.
22 SBR	Secondary Bus Reset. Setting this bit triggers a hot reset on the corresponding PCI Express Port. Software must ensure a minimum reset duration (Trst) as defined in the PCI Local Bus Specification. Software and systems must honor first-access-following-reset timing requirements, unless the Readiness Notifications mechanism is used or if the Immediate Readiness bit in the relevant Function's Status Register register is set. Port configuration registers must not be changed, except as required to update Port status.
21 MSTR_ABORT_MODE	Master Abort Mode. This bit was originally described in the PCI-to-PCI Bridge Architecture Specification. Its functionality does not apply to PCI Express. The controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Dbi: R/W
20 VGA_16B_DEC	VGA 16 bit decode. This bit only has meaning if VGA Enable bit is set. This bit enables system configuration software to select between 10-bit and 16-bit I/O address decoding for all VGA I/O register accesses that are forwarded from primary to secondary. The following actions are taken based on the value of the VGA_16B_DEC bit: - 0b: Execute 10-bit address decodes on VGA I/O accesses - 1b: Execute 16-bit address decodes on VGA I/O accesses For Functions that do not support VGA, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Dbi: R
19 VGA_EN	VGA Enable. Modifies the response by the bridge to VGA compatible addresses. If the VGA Enable bit is set, the bridge will positively decode and forward the following accesses on the primary interface to the secondary interface (and, conversely, block the forwarding of these addresses from the secondary to primary interface): - Memory accesses in the range 000A 0000h to 000B FFFFh - I/O addresses in the first 64 KB of the I/O address space (Address[31:16] are 0000h) where Address[9:0] are in the ranges 3B0h to 3BBh and 3C0h to 3DFh (inclusive of ISA address aliases determined by the setting of VGA 16-bit Decode) If the VGA Enable bit is set, forwarding of these accesses is independent of the I/O address range and memory address ranges defined by the I/O Base and Limit registers, the Memory Base and

Table continues on the next page...

Field	Function
	Limit registers, and the Prefetchable Memory Base and Limit registers of the bridge. (Forwarding of these accesses is also independent of the setting of the ISA Enable bit (in the Bridge Control register) when the VGA Enable bit is set. Forwarding of these accesses is qualified by the I/O Space Enable and Memory Space Enable bits in the Command register.) The following actions are taken based on the value of the VGA_EN bit: - 0b: Do not forward VGA compatible memory and I/O addresses from the primary to the secondary interface (addresses defined above) unless they are enabled for forwarding by the defined I/O and memory address ranges - 1b: Forward VGA compatible memory and I/O addresses (addresses defined above) from the primary interface to the secondary interface (if the I/O Space Enable and Memory Space Enable bits are set) independent of the I/O and memory address ranges and independent of the ISA Enable bit For Functions that do not support VGA, the controller hardwires this bit to 0b. Note: The access attributes of this field are as follows: - Dbi: R
18 ISA_EN	ISA Enable. Modifies the response by the bridge to ISA I/O addresses. This applies only to I/O addresses that are enabled by the I/O Base and I/O Limit registers and are in the first 64 KB of I/O address space (0000 0000h to 0000 FFFFh). If this bit is set, the bridge will block any forwarding from primary to secondary of I/O transactions addressing the last 768 bytes in each 1-KB block. In the opposite direction (secondary to primary), I/O transactions will be forwarded if they address the last 768 bytes in each 1-KB block. The following actions are taken based on the value of the ISA_EN bit: - 0b: Forward downstream all I/O addresses in the address range defined by the I/O Base and I/O Limit registers - 1b: Forward upstream ISA I/O addresses in the address range defined by the I/O Base and I/O Limit registers that are in the first 64 KB of PCI I/O address space (top 768 bytes of each 1-KB block.
17 SERR_EN	SERR# Enable. This bit controls forwarding of ERR_COR, ERR_NONFATAL and ERR_FATAL from secondary to primary.
16 PERE	Parity Error Response Enable. This bit controls the logging of poisoned TLPs in the Master Data Parity Error bit in the Secondary Status register.
15-8 INT_PIN	Interrupt PIN. The Interrupt Pin register register that identifies the legacy interrupt Message(s) the Function uses. Valid values are: - 01h, 02h, 03h, and 04h: map to legacy interrupt Messages for INTA, INTB, INTC, and INTD respectively. - 00h: indicates that the Function uses no legacy interrupt Message(s). - 05h through FFh: Reserved. PCI Express defines one legacy interrupt Message for a single Function device and up to four legacy interrupt Messages for a multi-Function device. For a single Function device, only INTA may be used. Any Function on a multi-Function device can use any of the INTx Messages. If a device implements a single legacy interrupt Message, it must be INTA; if it implements two legacy interrupt Messages, they must be INTA and INTB; and so forth. For a multi-Function device, all Functions may use the same INTx Message or each may have its own (up to a maximum of four Functions) or any combination thereof. A single Function can never generate an interrupt request on more than one INTx Message. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
7-0 INT_LINE	Interrupt Line. The Interrupt Line register communicates interrupt line routing information. The register must be implemented by any Function that uses an interrupt pin. Values in this register are programmed by system software and are system architecture specific. The Function itself does not use this value; rather the value in this register is used by device drivers and operating systems.

11.3.3.1.16 Power Management Capabilities Register. (CAP_ID_NXT_PTR_REG)

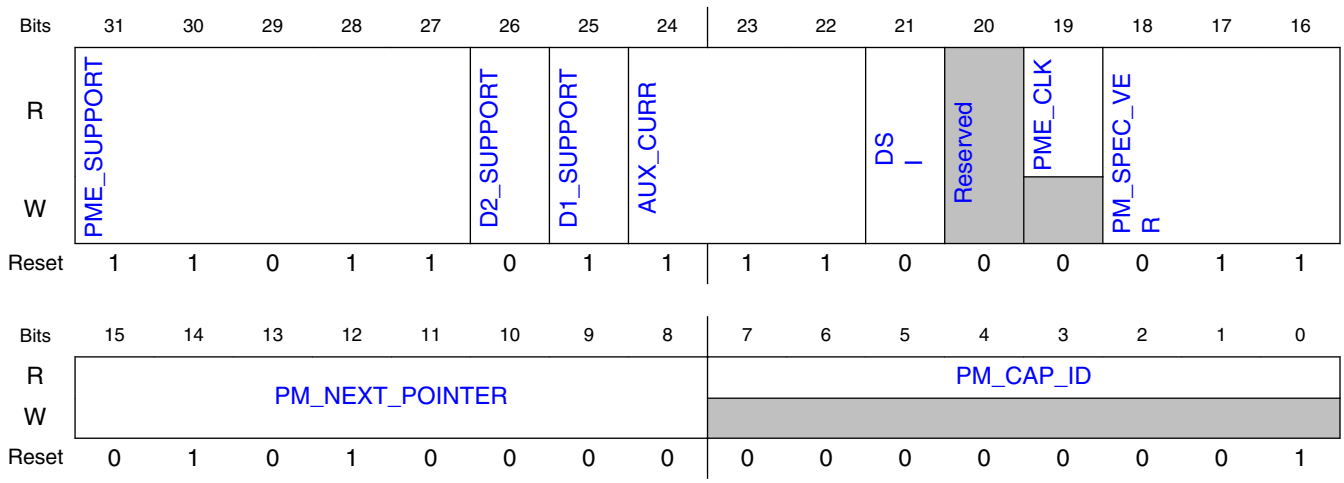
11.3.3.1.16.1 Offset

Register	Offset
CAP_ID_NXT_PTR_REG	40h

11.3.3.1.16.2 Function

Power Management Capabilities Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.16.3 Diagram



11.3.3.1.16.4 Fields

Field	Function
31-27 PME_SUPPORT	Power Management Event Support. For a description of this standard PCIe register field, see the PCI Express Specification. The read value from this field is the write value && (sys_aux_pwr_det, 1'b1, D2_SUPPORT, D1_SUPPORT, 1'b1), where D1_SUPPORT and D2_SUPPORT are fields in this register. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
26 D2_SUPPORT	D2 State Support. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
25 D1_SUPPORT	D1 State Support. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
24-22 AUX_CURR	Auxiliary Current Requirements. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
21 DSI	Device Specific Initialization Bit. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
20 —	Reserved.
19 PME_CLK	PCI Clock Requirement. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.

Table continues on the next page...

Field	Function
18-16 PM_SPEC_VER	Power Management Spec Version. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
15-8 PM_NEXT_POINTER	Next Capability Pointer. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
7-0 PM_CAP_ID	Power Management Capability ID. For a description of this standard PCIe register field, see the PCI Express Specification.

11.3.3.1.17 Power Management Control and Status Register. (CON_STATUS_REG)

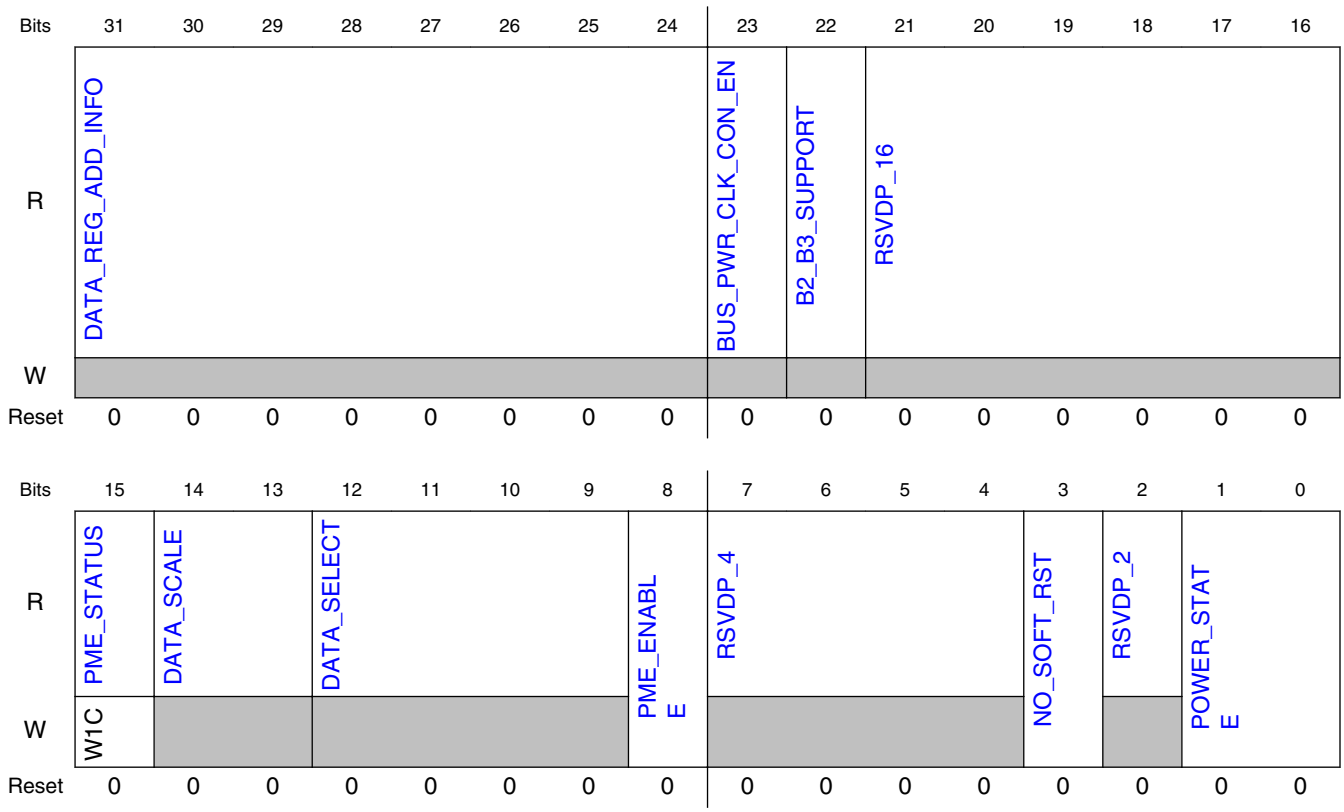
11.3.3.1.17.1 Offset

Register	Offset
CON_STATUS_REG	44h

11.3.3.1.17.2 Function

Power Management Control and Status Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.17.3 Diagram



11.3.3.1.17.4 Fields

Field	Function
31-24 DATA_REG_ADD_INFO	Power Data Information Register. For a description of this standard PCIe register field, see the PCI Express Specification.
23 BUS_PWR_CLK_CON_EN	Bus Power/Clock Control Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
22 B2_B3_SUPPORT	B2B3 Support for D3hot. For a description of this standard PCIe register field, see the PCI Express Specification.
21-16 RSVDP_16	Reserved for future use.
15 PME_STATUS	PME Status. For a description of this standard PCIe register field, see the PCI Express Specification.
14-13 DATA_SCALE	Data Scaling Factor. For a description of this standard PCIe register field, see the PCI Express Specification.
12-9	Data Select. For a description of this standard PCIe register field, see the PCI Express Specification.

Table continues on the next page...

Field	Function
DATA_SELECT	
8 PME_ENABLE	PME Enable. For a description of this standard PCIe register field, see the PCI Express Specification. The PMC registers this value under aux power. Sometimes it might remember the old value, even if you try to clear it by writing '0'. Note: This register field is sticky.
7-4 RSVDP_4	Reserved for future use.
3 NO_SOFT_RST	No soft Reset. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
2 RSVDP_2	Reserved for future use.
1-0 POWER_STATE	Power State. For a description of this standard PCIe register field, see the PCI Express Specification. You can write to this register. However, the read-back value is the actual power state, not the write value. Note: The access attributes of this field are as follows: - Dbi: R/W

11.3.3.1.18 MSI Capability ID, Next Pointer, Capability/Control Registers. (PCI_MSI_CAP_ID_NEXT_CTRL_REG)

11.3.3.1.18.1 Offset

Register	Offset
PCI_MSI_CAP_ID_NEXT_CTRL_REG	50h

11.3.3.1.18.2 Function

MSI Capability ID, Next Pointer, Capability/Control Registers. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.26.4 Fields

Field	Function
31-22 RSVDP_22	Reserved for future use.

Table continues on the next page...

Field	Function
21 PCIE_CAP_TRANS_PENDING	Transactions Pending Status. For a description of this standard PCIe register field, see the PCI Express Specification.
20 PCIE_CAP_AUX_POWER_DETECTED	Aux Power Detected Status. For a description of this standard PCIe register field, see the PCI Express Specification. This bit is derived by sampling the sys_aux_pwr_det input.
19 PCIE_CAP_UNSUPPORTED_REQ_DETECTED	Unsupported Request Detected Status. For a description of this standard PCIe register field, see the PCI Express Specification.
18 PCIE_CAP_FATAL_ERR_DETECTED	Fatal Error Detected Status. For a description of this standard PCIe register field, see the PCI Express Specification.
17 PCIE_CAP_NON_FATAL_ERR_DETECTED	Non-Fatal Error Detected Status. For a description of this standard PCIe register field, see the PCI Express Specification.
16 PCIE_CAP_CORR_ERR_DETECTED	Correctable Error Detected Status. For a description of this standard PCIe register field, see the PCI Express Specification.
15 PCIE_CAP_INITIATE_FLR	Initiate Function Level Reset (for endpoints). For a description of this standard PCIe register field, see the PCI Express Specification.
14-12 PCIE_CAP_MAX_READ_REQ_SIZE	Max Read Request Size. For a description of this standard PCIe register field, see the PCI Express Specification.
11 PCIE_CAP_EN_NO_SNOOP	Enable No Snoop. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: R
10 PCIE_CAP_AUX_POWER_PM_EN	Aux Power PM Enable. For a description of this standard PCIe register field, see the PCI Express Specification. This bit is derived by sampling the sys_aux_pwr_det input. Note: This register field is sticky.
9 PCIE_CAP_PHANTOM_FUNC_EN	Phantom Functions Enable. For a description of this standard PCIe register field, see the PCI Express Specification. The write value is gated with the PCIE_CAP_PHANTOM_FUNC_SUPPORT field of DEVICE_CAPABILITIES_REG. Note: The access attributes of this field are as follows: - Dbi: DEVICE_CAPABILITIES_REG.PCIE_CAP_PHANTOM_FUNC_SUPPORT ? RW : RO
8 PCIE_CAP_EXT_TAG_EN	Extended Tag Field Enable. For a description of this standard PCIe register field, see the PCI Express Specification. The write value is gated with the PCIE_CAP_EXT_TAG_SUPP field of DEVICE_CAPABILITIES_REG. Note: The access attributes of this field are as follows: - Dbi: DEVICE_CAPABILITIES_REG.PCIE_CAP_EXT_TAG_SUPP ? RW : RO

Table continues on the next page...

Field	Function
7-5 PCIE_CAP_MAX_PAYLOAD_SIZE_CS	Max Payload Size. Max_Payload_Size . This field sets maximum TLP payload size for the Function. Permissible values that can be programmed are indicated by the Max_Payload_Size Supported field (PCIE_CAP_MAX_PAYLOAD_SIZE) in the Device Capabilities register (DEVICE_CAPABILITIES_REG).
4 PCIE_CAP_EN_REL_ORDER	Enable Relaxed Ordering. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: R/W
3 PCIE_CAP_UNSUPPORT_REQ_REP_EN	Unsupported Request Reporting Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
2 PCIE_CAP_FATAL_ERR_REPORT_EN	Fatal Error Reporting Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
1 PCIE_CAP_NON_FATAL_ERR_REPORT_EN	Non-fatal Error Reporting Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
0 PCIE_CAP_CORR_ERR_REPORT_EN	Correctable Error Reporting Enable. For a description of this standard PCIe register field, see the PCI Express Specification.

11.3.3.1.27 Link Capabilities Register. (LINK_CAPABILITIES_REG)

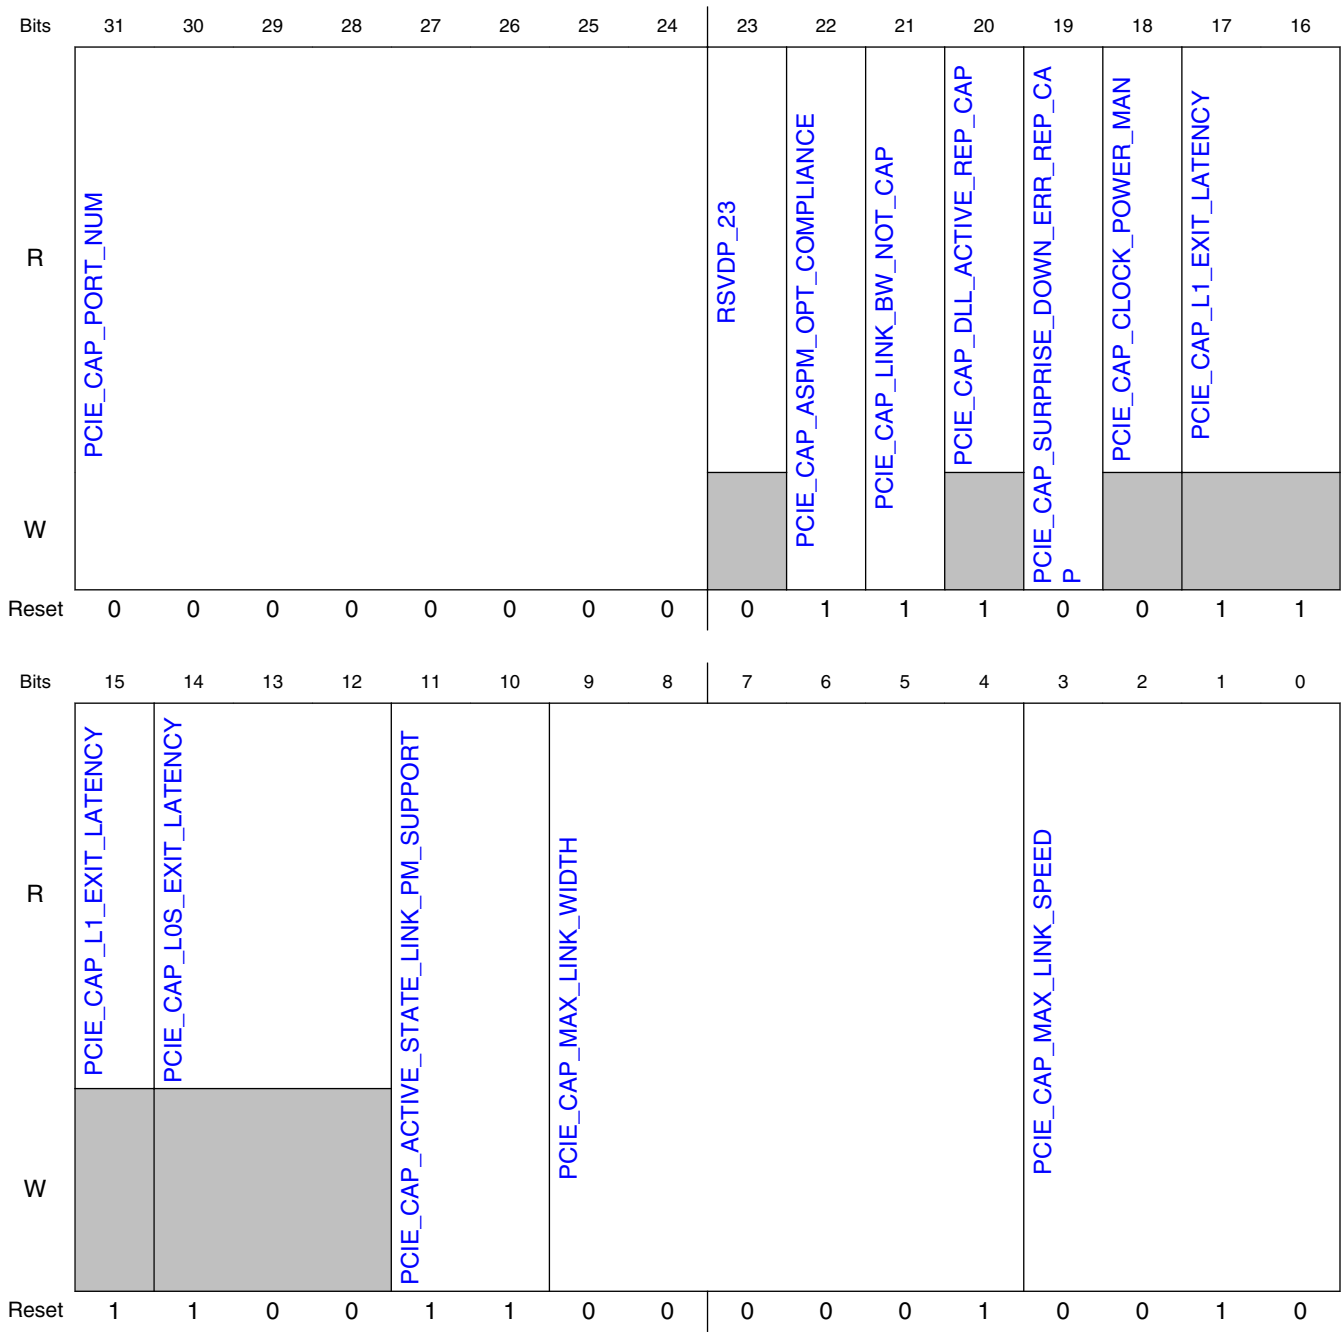
11.3.3.1.27.1 Offset

Register	Offset
LINK_CAPABILITIES_REG	7Ch

11.3.3.1.27.2 Function

Link Capabilities Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.27.3 Diagram



11.3.3.1.27.4 Fields

Field	Function
31-24 PCIE_CAP_PORT_NUM	Port Number. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R

Table continues on the next page...

Field	Function
23 RSVDP_23	Reserved for future use.
22 PCIE_CAP_ASPM_OPT_COMPLIANCE	ASPM Optionality Compliance. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
21 PCIE_CAP_LINK_BW_NOT_CAP	Link Bandwidth Notification Capable. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
20 PCIE_CAP_DLL_ACTIVE_REP_CAP	Data Link Layer Link Active Reporting Capable. For a description of this standard PCIe register field, see the PCI Express Specification.
19 PCIE_CAP_SURPRISE_DOWN_ERR_REP_CAP	Surprise Down Error Reporting Capable. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
18 PCIE_CAP_CLOCK_POWER_MAN	Clock Power Management. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
17-15 PCIE_CAP_L1_EXIT_LATENCY	L1 Exit Latency. For a description of this standard PCIe register field, see the PCI Express Specification. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
14-12 PCIE_CAP_L0S_EXIT_LATENCY	LOs Exit Latency. For a description of this standard PCIe register field, see the PCI Express Specification. There are two each of these register fields, this one and a shadow one at the same address. The Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG) determines which one is used by the controller and which one is accessed by a read request. Common Clock operation is enabled in the controller when you set the Common Clock bit (PCIE_CAP_COMMON_CLK_CONFIG) of the Link Control Register (LINK_CONTROL_LINK_STATUS_REG). The assertion of CS2 (that is, assert the dbi_cs2 input, or the CS2 address bit for the AXI bridge) is required to write to the shadow field at this location. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
11-10 PCIE_CAP_ACTIVE_STATE_LINK_PM_SUPPORT	Level of ASPM (Active State Power Management) Support. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
9-4	Maximum Link Width. For a description of this standard PCIe register field, see the PCI Express Specification. In M-PCIe mode, the reset and dynamic values of this field are calculated by the controller.

Table continues on the next page...

Field	Function
PCIE_CAP_MAX_LINK_WIDTH	Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.
3-0 PCIE_CAP_MAX_LINK_SPEED	Maximum Link Speed. For a description of this standard PCIe register field, see the PCI Express Specification. In M-PCIe mode, the reset and dynamic values of this field are calculated by the controller. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R Note: This register field is sticky.

11.3.3.1.28 Link Control and Status Register. (LINK_CONTROL_LINK_STATUS_REG)

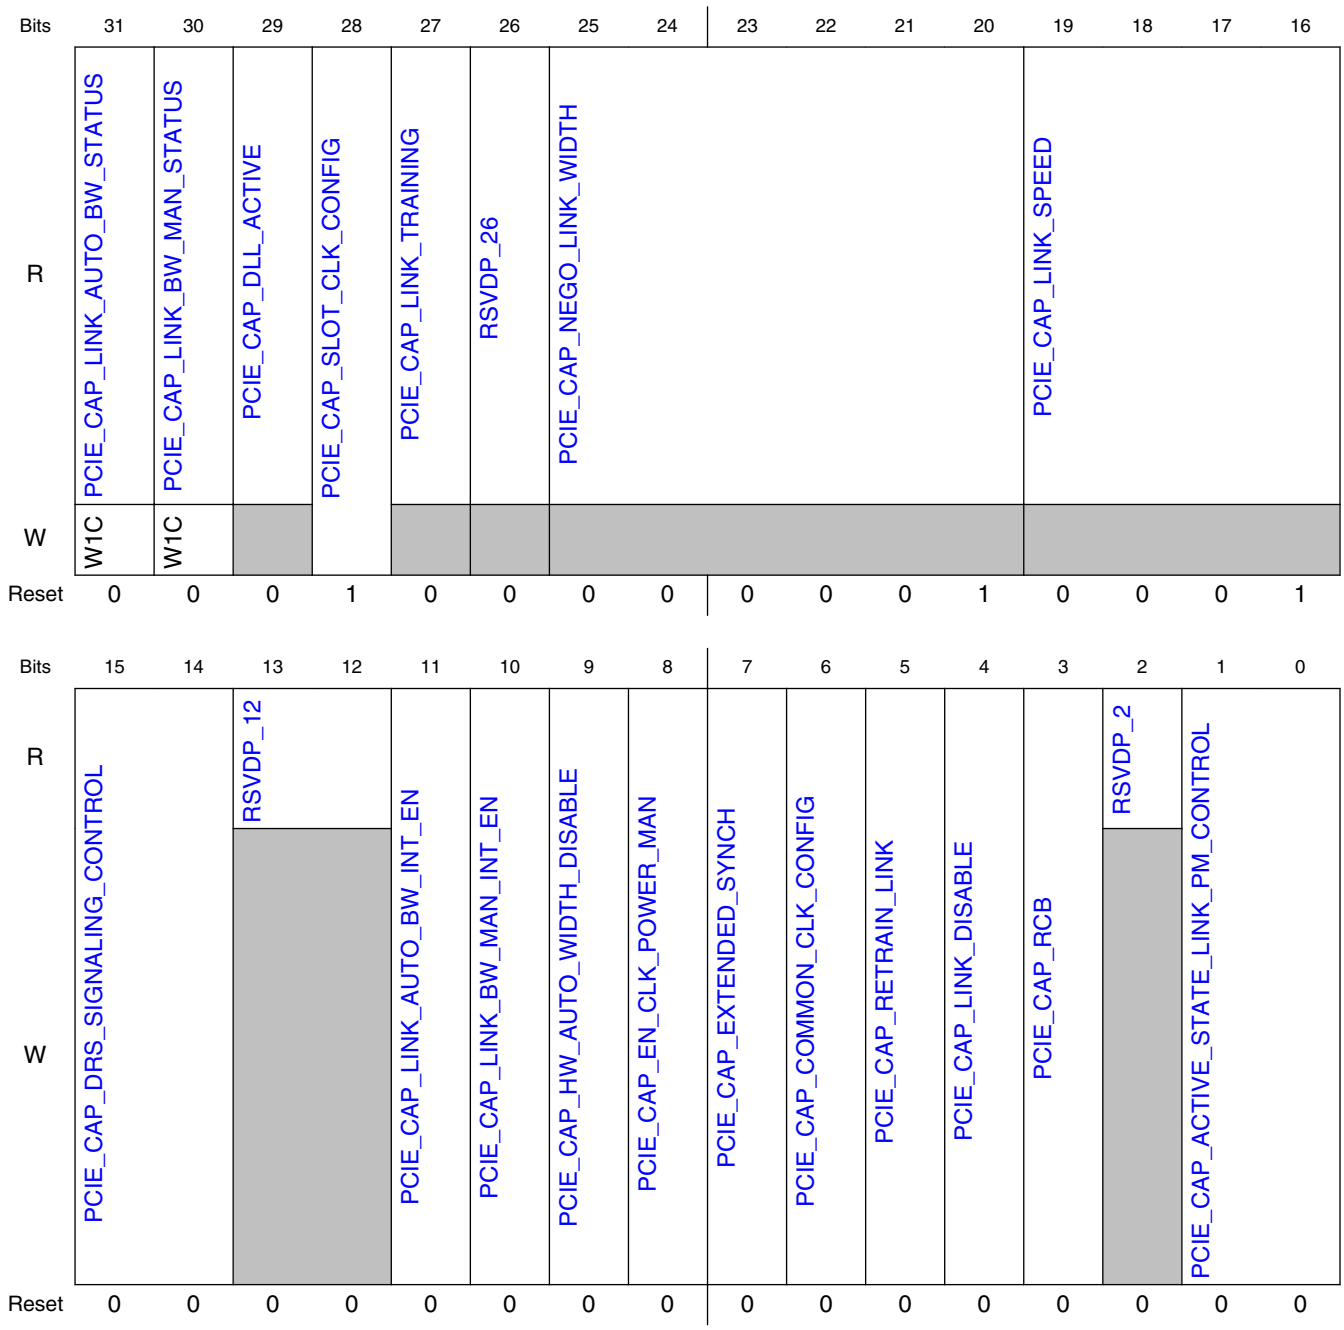
11.3.3.1.28.1 Offset

Register	Offset
LINK_CONTROL_LINK_STATUS_REG	80h

11.3.3.1.28.2 Function

Link Control and Status Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.28.3 Diagram



11.3.3.1.28.4 Fields

Field	Function
31	Link Autonomous Bandwidth Status. For a description of this standard PCIe register field, see the PCI Express Specification. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG.

Table continues on the next page...

Field	Function
PCIE_CAP_LINK_AUTO_BW_STATUS	
30 PCIE_CAP_LINK_BW_MAN_STATUS	Link Bandwidth Management Status. For a description of this standard PCIe register field, see the PCI Express Specification. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG.
29 PCIE_CAP_DLL_ACTIVE	Data Link Layer Active. For a description of this standard PCIe register field, see the PCI Express Specification.
28 PCIE_CAP_SLOT_CLK_CONFIG	Slot Clock Configuration. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
27 PCIE_CAP_LINK_TRAINING	LTSSM is in Configuration or Recovery State. For a description of this standard PCIe register field, see the PCI Express Specification.
26 RSVDP_26	Reserved for future use.
25-20 PCIE_CAP_NEGO_LINK_WIDTH	Negotiated Link Width. For a description of this standard PCIe register field, see the PCI Express Specification.
19-16 PCIE_CAP_LINK_SPEED	Current Link Speed. For a description of this standard PCIe register field, see the PCI Express Specification.
15-14 PCIE_CAP_DRS_SIGNALING_CONTROL	DRS Signaling Control. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: LINK_CAPABILITIES2_REG.DRS_SUPPORTED ? RW : RO
13-12 RSVDP_12	Reserved for future use.
11 PCIE_CAP_LINK_AUTO_BW_INT_EN	Link Autonomous Bandwidth Management Interrupt Enable. For a description of this standard PCIe register field, see the PCI Express Specification. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG. Note: The access attributes of this field are as follows: - Dbi: LINK_CAPABILITIES_REG.PCIE_CAP_LINK_BW_NOT_CAP ? RW : RO
10 PCIE_CAP_LINK_BW_MAN_INT_EN	Link Bandwidth Management Interrupt Enable. For a description of this standard PCIe register field, see the PCI Express Specification. The write value is gated with the PCIE_CAP_LINK_BW_NOT_CAP field in LINK_CAPABILITIES_REG. Note: The access attributes of this field are as follows: - Dbi: LINK_CAPABILITIES_REG.PCIE_CAP_LINK_BW_NOT_CAP ? RW : RO
9 PCIE_CAP_HW_AUTO_WIDTH_DISABLE	Hardware Autonomous Width Disable. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: R/W
8	Enable Clock Power Management. For a description of this standard PCIe register field, see the PCI Express Specification. The write value is gated with the PCIE_CAP_CLOCK_POWER_MAN field in

Table continues on the next page...

Field	Function
PCIE_CAP_EN_CLK_POWER_MAN	LINK_CAPABILITIES_REG. Note: The access attributes of this field are as follows: - Dbi: LINK_CAPABILITIES_REG.PCIE_CAP_CLOCK_POWER_MAN ? RWS : ROS Note: This register field is sticky.
7 PCIE_CAP_EXTENDED_SYNCH	Extended Synch. For a description of this standard PCIe register field, see the PCI Express Specification.
6 PCIE_CAP_COMMON_CLK_CONFIG	Common Clock Configuration. For a description of this standard PCIe register field, see the PCI Express Specification.
5 PCIE_CAP_RETRAIN_LINK	Initiate Link Retrain. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: see description
4 PCIE_CAP_LINK_DISABLE	Initiate Link Disable. For a description of this standard PCIe register field, see the PCI Express Specification. In a DSP that supports crosslink, the controller gates the write value with the CROSS_LINK_EN field in PORT_LINK_CTRL_OFF.
3 PCIE_CAP_RCB	Read Completion Boundary (RCB). Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
2 RSVDP_2	Reserved for future use.
1-0 PCIE_CAP_ACTIVE_STATE_LINK_PM_CONTROL	Active State Power Management (ASPM) Control. Software must not enable L0s in either direction on a given Link unless components on both sides of the Link each support L0s; otherwise, the result is undefined. For a description of this standard PCIe register field, see the PCI Express Specification.

11.3.3.1.29 Slot Capabilities Register. (SLOT_CAPABILITIES_REG)

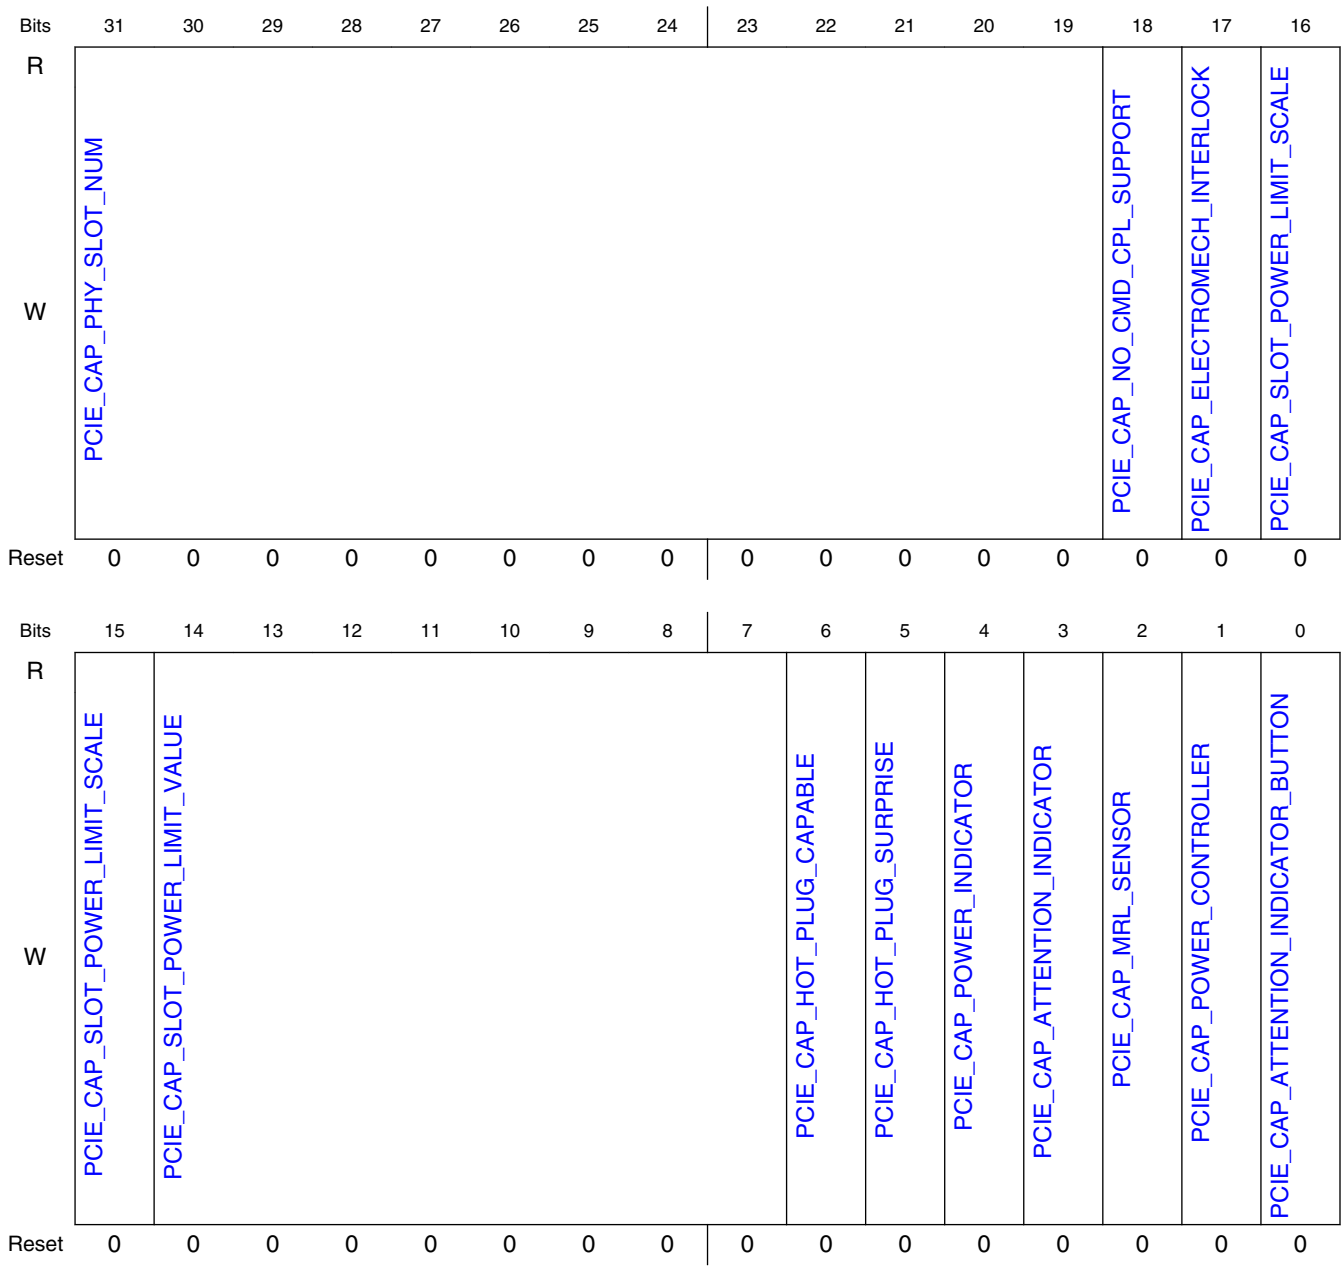
11.3.3.1.29.1 Offset

Register	Offset
SLOT_CAPABILITIES_REG	84h

11.3.3.1.29.2 Function

Slot Capabilities Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.29.3 Diagram



11.3.3.1.29.4 Fields

Field	Function
31-19 PCIE_CAP_PHY_SLOT_NUM	Physical Slot Number. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R

Table continues on the next page...

Field	Function
18 PCIE_CAP_NO_CMD_CPL_SUPPORT	No Command Completed Support. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
17 PCIE_CAP_ELECTROMECH_INTERLOCK	Electromechanical Interlock Present. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
16-15 PCIE_CAP_SLOT_POWER_LIMIT_SCALE	Slot Power Limit Scale. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
14-7 PCIE_CAP_SLOT_POWER_LIMIT_VALUE	Slot Power Limit Value. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
6 PCIE_CAP_HOT_PLUG_CAPABLE	Hot Plug Capable. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
5 PCIE_CAP_HOT_PLUG_SURPRISE	Hot Plug Surprise possible. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
4 PCIE_CAP_POWER_INDICATOR	Power Indicator Present. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
3 PCIE_CAP_ATTENTION_INDICATOR	Attention Indicator Present. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
2 PCIE_CAP_MRL_SENSOR	MRL Present. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
1 PCIE_CAP_POWER_CONTROLLER	Power Controller Present. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R
0 PCIE_CAP_ATTENTION_INDICATOR_BUTTON	Attention Button Present. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W else R

11.3.3.1.30 Slot Control and Status Register. (SLOT_CONTROL_SLOT_STATUS)

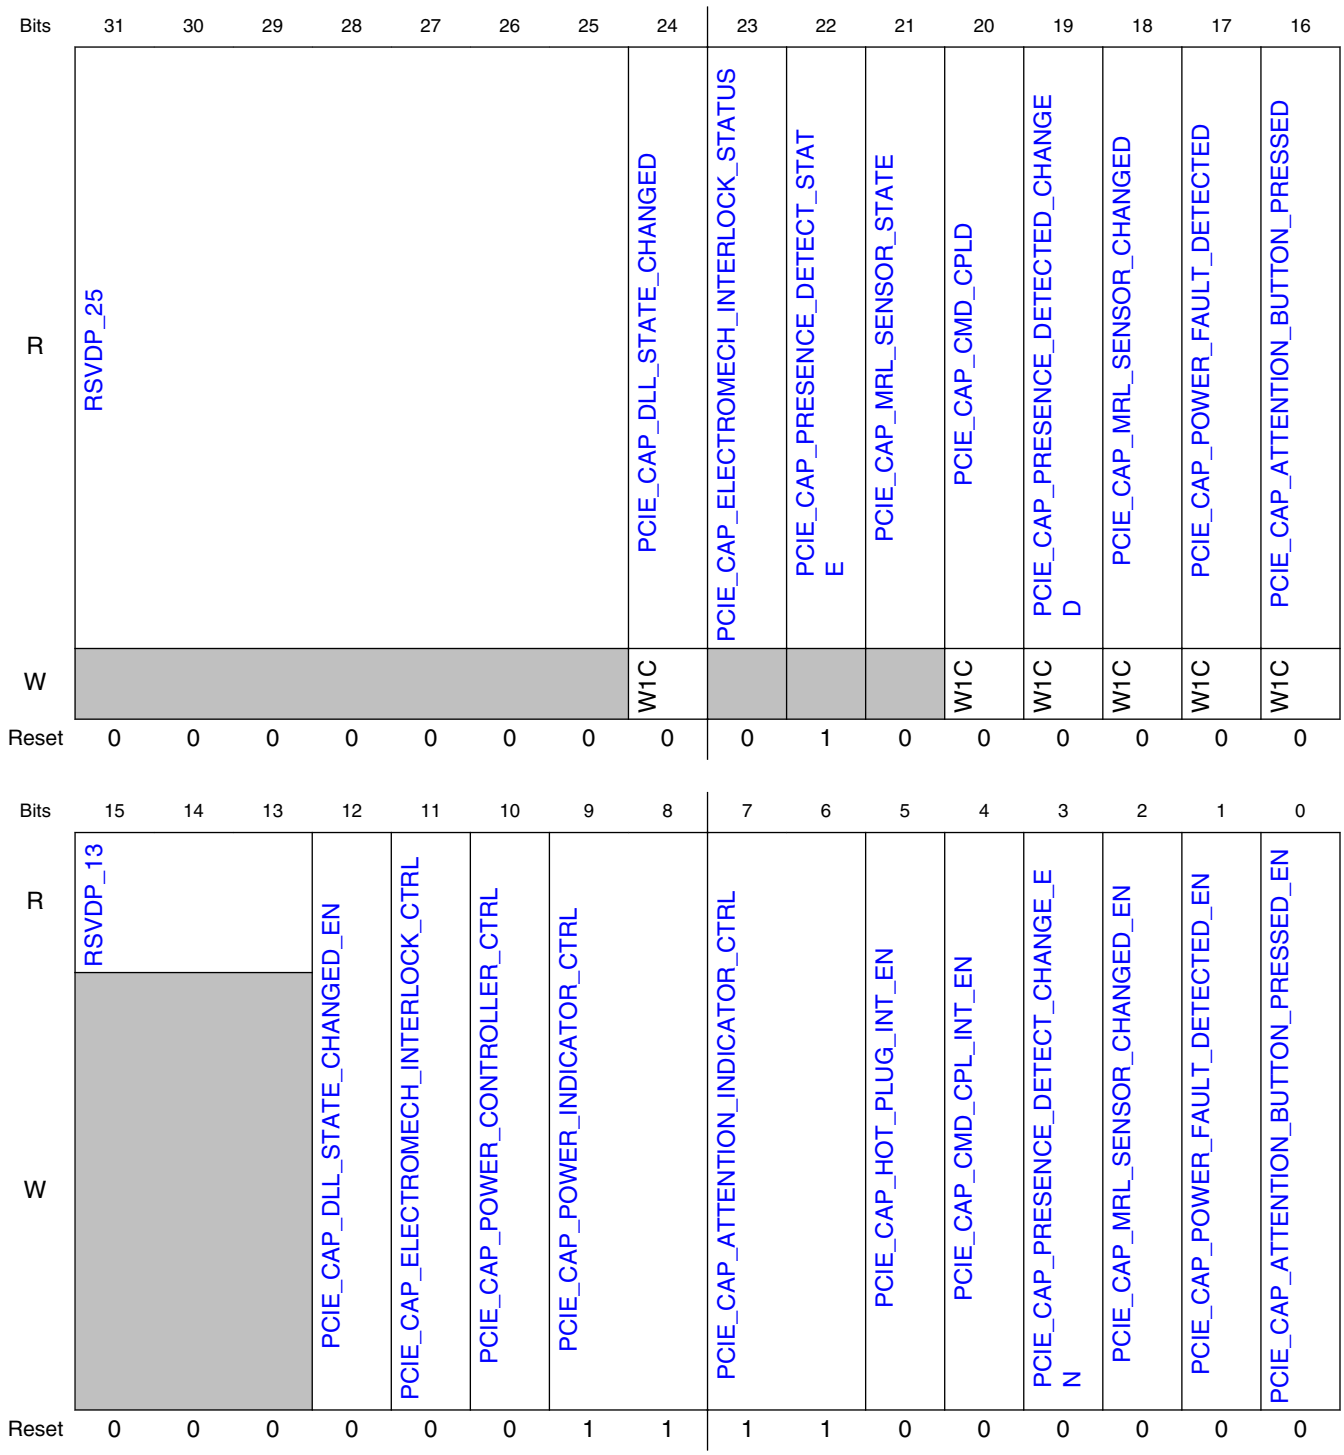
11.3.3.1.30.1 Offset

Register	Offset
SLOT_CONTROL_SLOT_STATUS	88h

11.3.3.1.30.2 Function

Slot Control and Status Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.30.3 Diagram



11.3.3.1.30.4 Fields

Field	Function
31-25	Reserved for future use.

Table continues on the next page...

Field	Function
RSVDP_25	
24 PCIE_CAP_DLL_STATE_CHANGED	Data Link Layer State Changed. For a description of this standard PCIe register field, see the PCI Express Specification.
23 PCIE_CAP_ELECTROMECH_INTERLOCK_STATUS	Electromechanical Interlock Status. For a description of this standard PCIe register field, see the PCI Express Specification.
22 PCIE_CAP_PRESENCE_DETECT_STATE	Presence Detect State. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: R
21 PCIE_CAP_MRL_SENSOR_STATE	MRL Sensor State. For a description of this standard PCIe register field, see the PCI Express Specification.
20 PCIE_CAP_CMD_CPLD	Command Completed. For a description of this standard PCIe register field, see the PCI Express Specification.
19 PCIE_CAP_PRESENCE_DETECTED_CHANGED	Presence Detect Changed. For a description of this standard PCIe register field, see the PCI Express Specification.
18 PCIE_CAP_MRL_SENSOR_CHANGED	MRL Sensor Changed. For a description of this standard PCIe register field, see the PCI Express Specification.
17 PCIE_CAP_POWER_FAULT_DETECTED	Power Fault Detected. For a description of this standard PCIe register field, see the PCI Express Specification.
16 PCIE_CAP_ATTENTION_BUTTON_PRESSED	Attention Button Pressed. For a description of this standard PCIe register field, see the PCI Express Specification.
15-13 RSVDP_13	Reserved for future use.
12 PCIE_CAP_DLL_STATE_CHANGED_EN	Data Link Layer State Changed Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
11	Electromechanical Interlock Control. For a description of this standard PCIe register field, see the PCI Express Specification.

Table continues on the next page...

Field	Function
PCIE_CAP_ELECTROMECH_INTERLOCK_CTRL	
10 PCIE_CAP_POWER_CONTROLLER_CTRL	Power Controller Control. For a description of this standard PCIe register field, see the PCI Express Specification.
9-8 PCIE_CAP_POWER_INDICATOR_CTRL	Power Indicator Control. For a description of this standard PCIe register field, see the PCI Express Specification.
7-6 PCIE_CAP_ATTENTION_INDICATOR_CTRL	Attention Indicator Control. For a description of this standard PCIe register field, see the PCI Express Specification.
5 PCIE_CAP_HOT_PLUG_INT_EN	Hot Plug Interrupt Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
4 PCIE_CAP_CMD_CPL_INT_EN	Command Completed Interrupt Enable. For a description of this standard PCIe register field, see the PCI Express Specification. Write value is gated with PCIE_CAP_NO_CMD_CPL_SUPPORT field in SLOT_CAPABILITIES_REG. Note: The access attributes of this field are as follows: - Dbi: SLOT_CAPABILITIES_REG.PCIE_CAP_NO_CMD_CPL_SUPPORT ? RO : RW
3 PCIE_CAP_PRESENCE_DETECT_CHANGE_EN	Presence Detect Changed Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
2 PCIE_CAP_MRL_SENSOR_CHANGED_EN	MRL Sensor Changed Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
1 PCIE_CAP_POWER_FAULT_DETECTED_EN	Power Fault Detected Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
0 PCIE_CAP_ATTENTION_BUTTON_PRESSED_EN	Attention Button Pressed Enable. For a description of this standard PCIe register field, see the PCI Express Specification.

11.3.3.1.31 Root Control and Capabilities Register. (ROOT_CONTROL_ROOT_CAPABILITIES_REG)

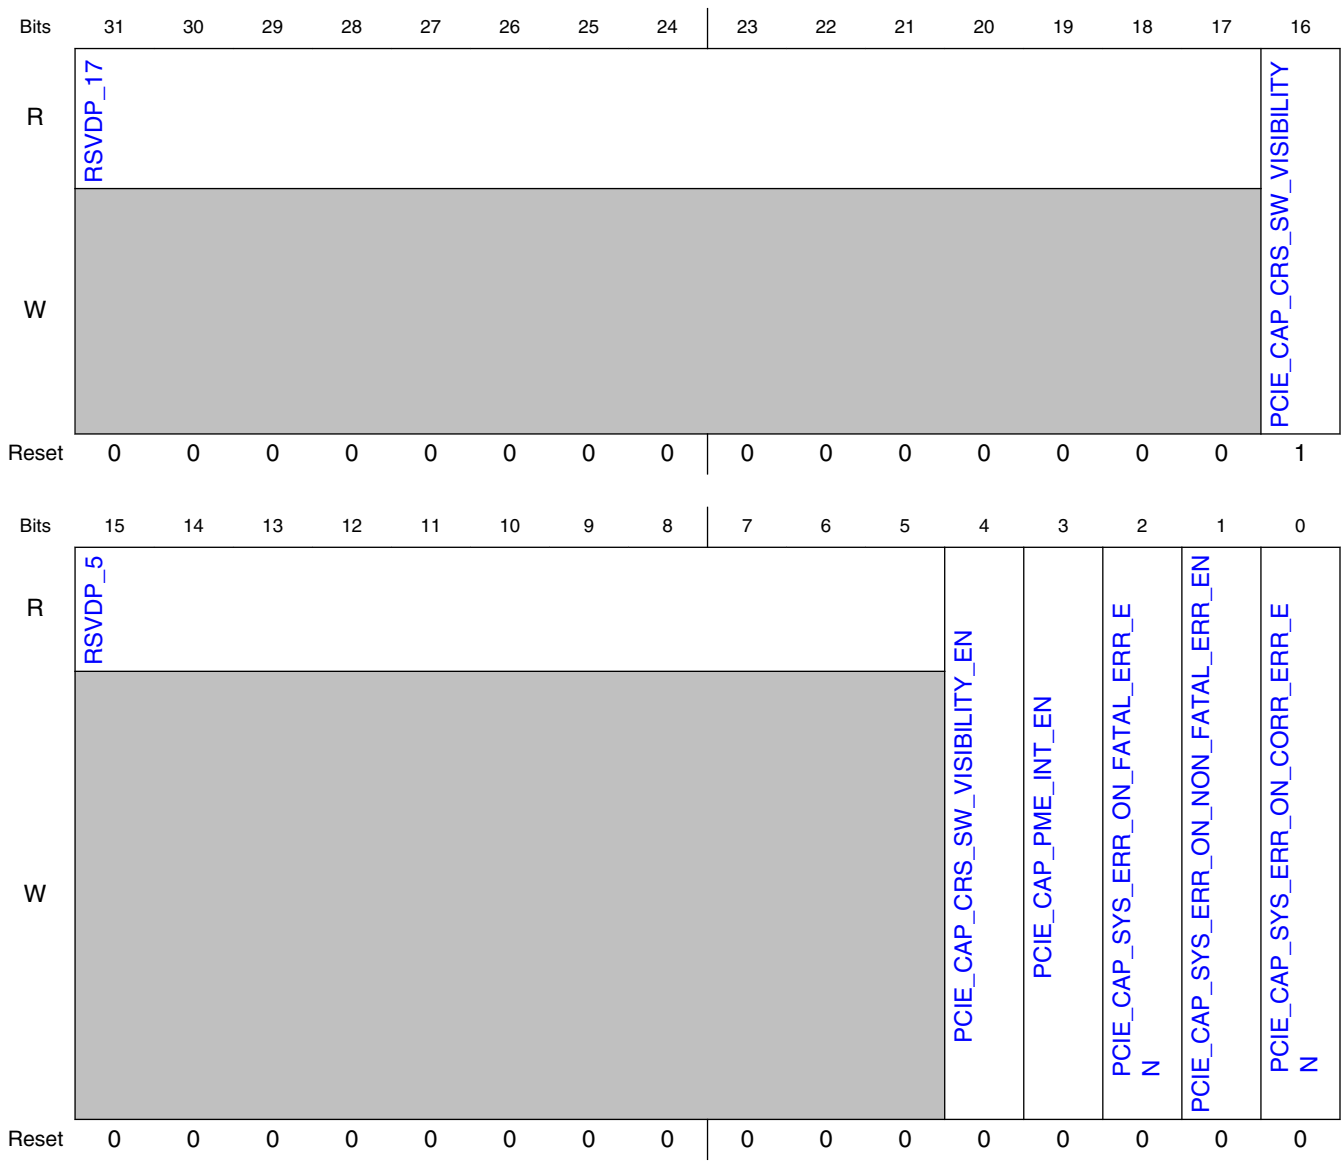
11.3.3.1.31.1 Offset

Register	Offset
ROOT_CONTROL_ROOT_CAPABILITIES_REG	8Ch

11.3.3.1.31.2 Function

Root Control and Capabilities Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.31.3 Diagram



11.3.3.1.31.4 Fields

Field	Function
31-17 RSVDP_17	Reserved for future use.
16 PCIE_CAP_CRS_SW_VISIBILITY	CRS Software Visibility Capable. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W (Sticky) else R (Sticky) Note: This register field is sticky.
15-5 RSVDP_5	Reserved for future use.
4 PCIE_CAP_CRS_SW_VISIBILITY_EN	Configuration Request Retry Status (CRS) Software Visibility Enable. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: ROOT_CONTROL_ROOT_CAPABILITIES_REG.PCIE_CAP_CRS_SW_VISIBILITY ? RW : RO
3 PCIE_CAP_PME_INT_EN	PME Interrupt Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
2 PCIE_CAP_SYS_ERR_ON_FATAL_ERR_EN	System Error on Fatal Error Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
1 PCIE_CAP_SYS_ERR_ON_NON_FATAL_ERR_EN	System Error on Non-fatal Error Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
0 PCIE_CAP_SYS_ERR_ON_CORR_ERR_EN	System Error on Correctable Error Enable. For a description of this standard PCIe register field, see the PCI Express Specification.

11.3.3.1.32 Root Status Register. (ROOT_STATUS_REG)

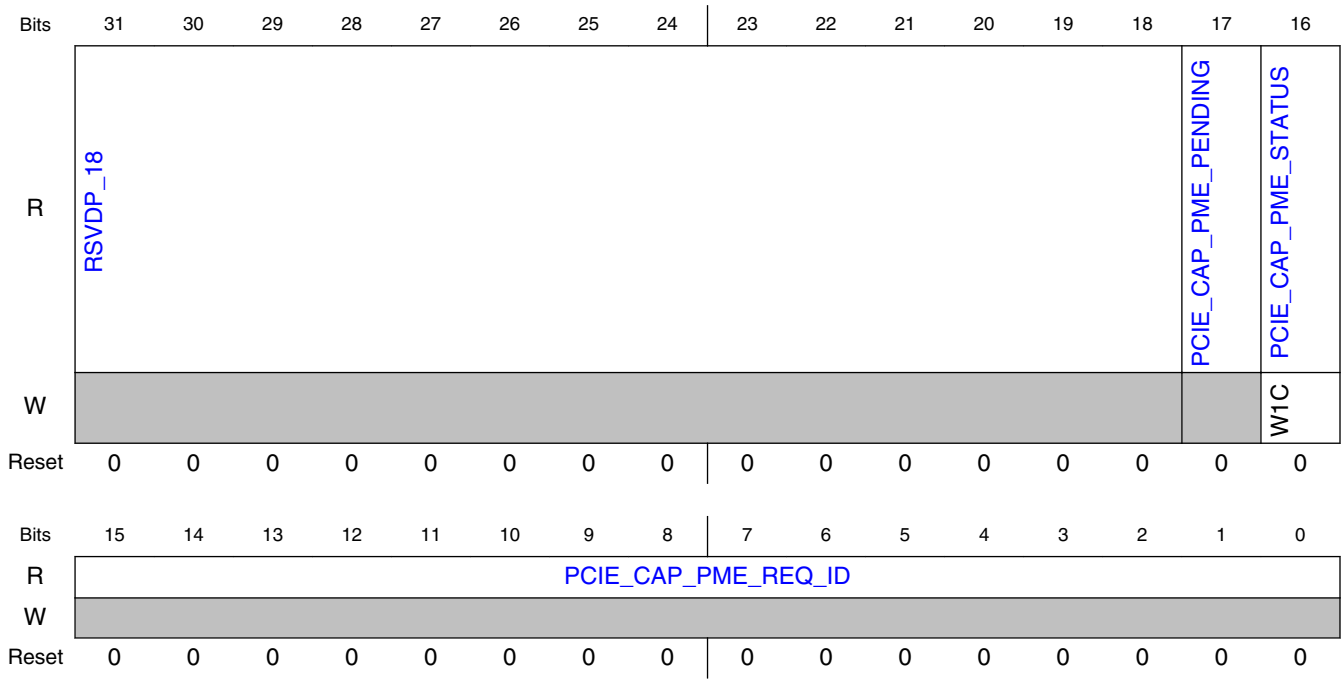
11.3.3.1.32.1 Offset

Register	Offset
ROOT_STATUS_REG	90h

11.3.3.1.32.2 Function

Root Status Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.32.3 Diagram



11.3.3.1.32.4 Fields

Field	Function
31-18 RSVDP_18	Reserved for future use.
17 PCIE_CAP_PME_PENDING	PME Pending. For a description of this standard PCIe register field, see the PCI Express Specification.
16 PCIE_CAP_PME_STATUS	PME Status. For a description of this standard PCIe register field, see the PCI Express Specification.
15-0 PCIE_CAP_PME_REQ_ID	PME Requester ID. For a description of this standard PCIe register field, see the PCI Express Specification.

11.3.3.1.33 Device Capabilities 2 Register. (DEVICE_CAPABILITIES2_REG)

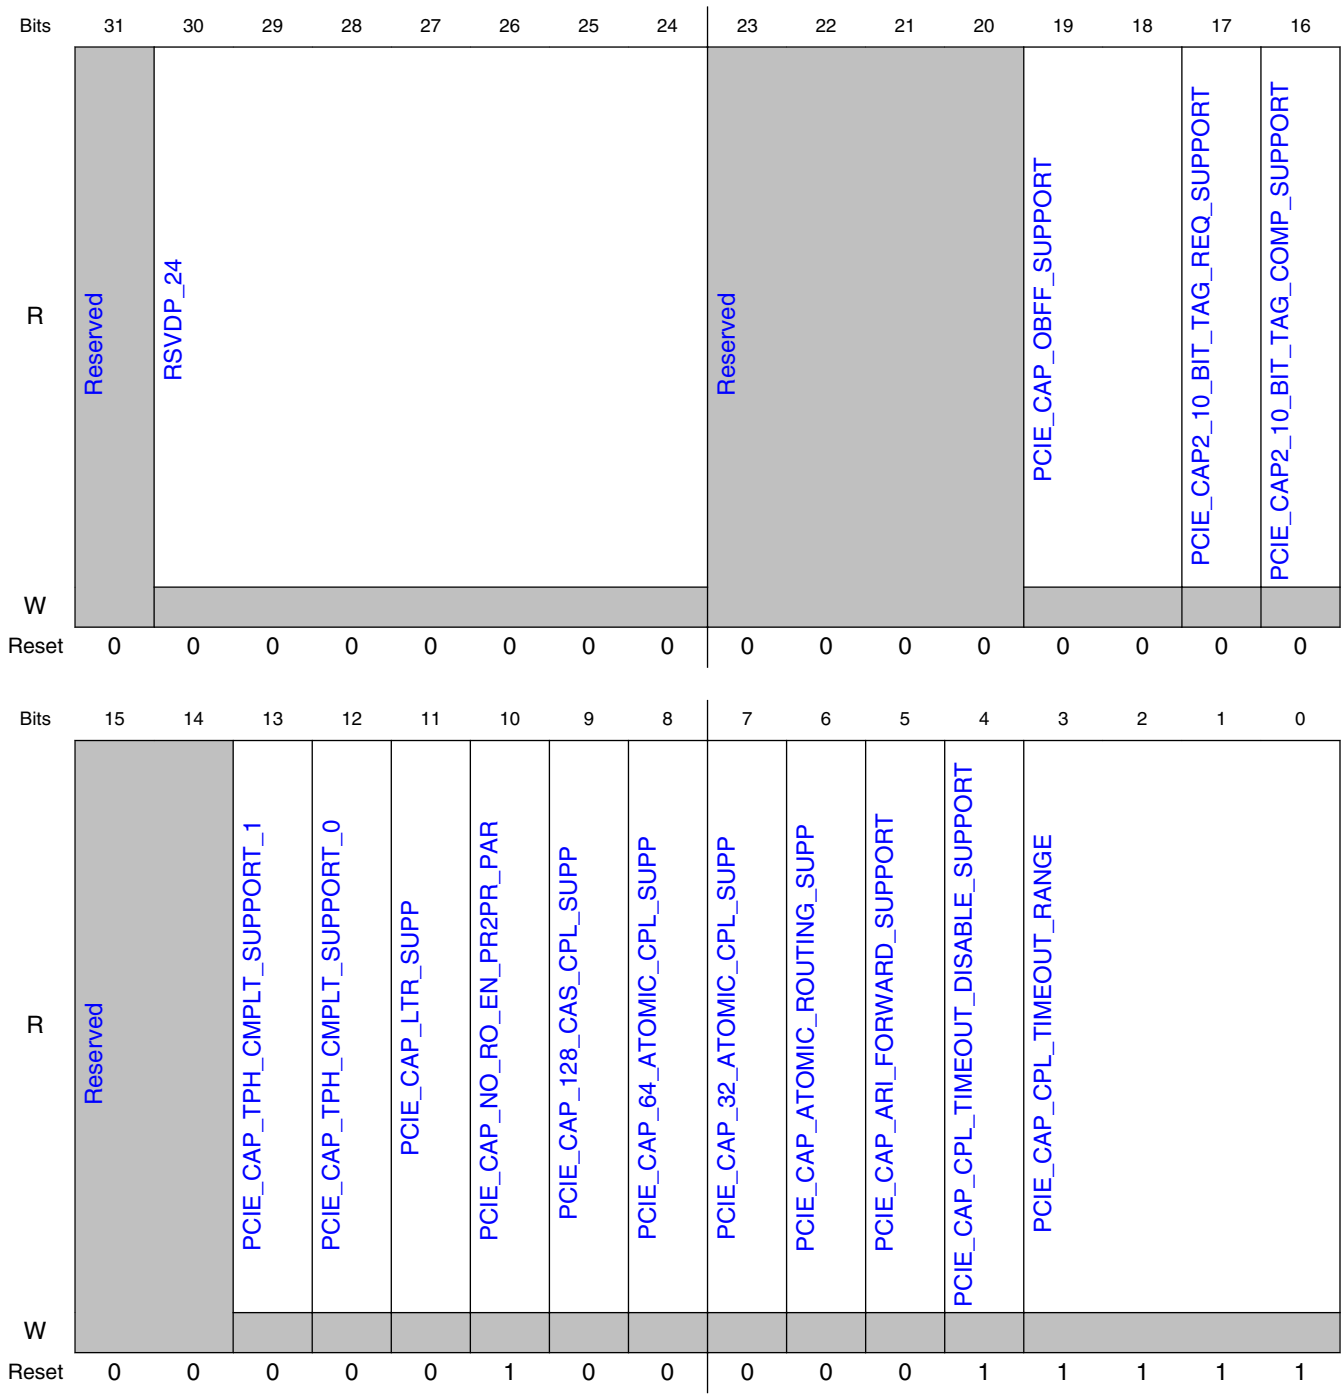
11.3.3.1.33.1 Offset

Register	Offset
DEVICE_CAPABILITIES2_REG	94h

11.3.3.1.33.2 Function

Device Capabilities 2 Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.33.3 Diagram



11.3.3.1.33.4 Fields

Field	Function
31	Reserved.

Table continues on the next page...

Field	Function
—	
30-24 RSVDP_24	Reserved for future use.
23-20 —	Reserved.
19-18 PCIE_CAP_OBFF_SUPPORT	(OBFF) Optimized Buffer Flush/fill Supported. For a description of this standard PCIe register field, see the PCI Express Specification.
17 PCIE_CAP2_10_BIT_TAG_REQ_SUPPORT	10-Bit Tag Requester Supported. For a description of this standard PCIe register field, see the PCI Express Base Specification 4.0.
16 PCIE_CAP2_10_BIT_TAG_COMP_SUPPORT	10-Bit Tag Completer Supported. For a description of this standard PCIe register field, see the PCI Express Base Specification 4.0.
15-14 —	Reserved.
13 PCIE_CAP_TPH_CMPLT_SUPPORT_1	TPH Completer Supported Bit 1. For a description of this standard PCIe register field, see the PCI Express Specification.
12 PCIE_CAP_TPH_CMPLT_SUPPORT_0	TPH Completer Supported Bit 0. For a description of this standard PCIe register field, see the PCI Express Specification.
11 PCIE_CAP_LTR_SUPP	LTR Mechanism Supported. For a description of this standard PCIe register field, see the PCI Express Specification.
10 PCIE_CAP_NO_RO_EN_PR2PR_PAR	No Relaxed Ordering Enabled PR-PR Passing. For a description of this standard PCIe register field, see the PCI Express Specification.
9 PCIE_CAP_128_CAS_CPL_SUPP	128 Bit CAS Completer Supported. For a description of this standard PCIe register field, see the PCI Express Specification.
8 PCIE_CAP_64_ATOMIC_CPL_SUPP	64 Bit AtomicOp Completer Supported. For a description of this standard PCIe register field, see the PCI Express Specification.
7 PCIE_CAP_32_ATOMIC_CPL_SUPP	32 Bit AtomicOp Completer Supported. For a description of this standard PCIe register field, see the PCI Express Specification.

Table continues on the next page...

Field	Function
6 PCIE_CAP_ATOMIC_ROUTING_SUPP	Atomic Operation Routing Supported. For a description of this standard PCIe register field, see the PCI Express Specification.
5 PCIE_CAP_ARI_FORWARD_SUPPORT	ARI Forwarding Supported. For a description of this standard PCIe register field, see the PCI Express Specification.
4 PCIE_CAP_CPL_TIMEOUT_DISABLE_SUPPORT	Completion Timeout Disable Supported. For a description of this standard PCIe register field, see the PCI Express Specification.
3-0 PCIE_CAP_CPL_TIMEOUT_RANGE	Completion Timeout Ranges Supported. For a description of this standard PCIe register field, see the PCI Express Specification.

11.3.3.1.34 Device Control 2 and Status 2 Register. (DEVICE_CONTROL2_DEVICE_STATUS2_REG)

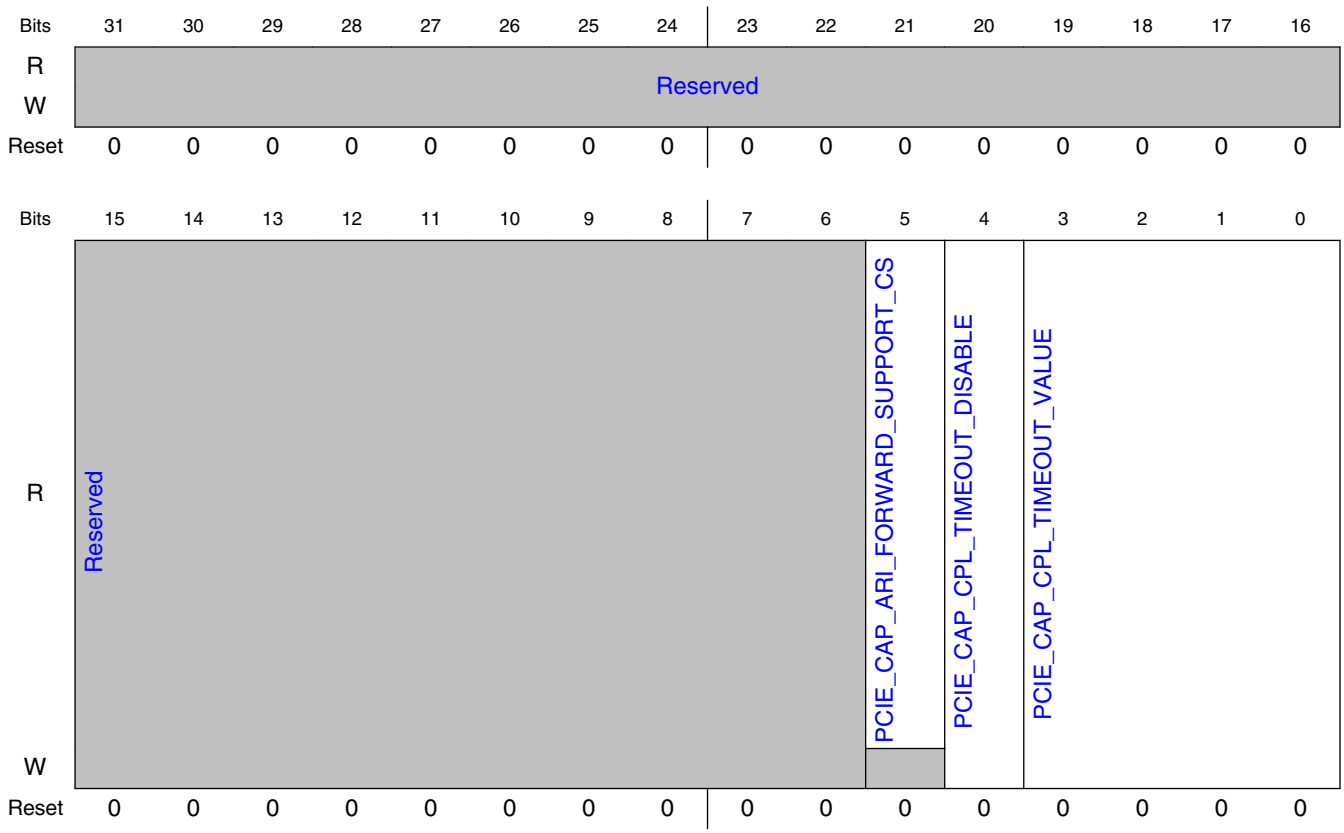
11.3.3.1.34.1 Offset

Register	Offset
DEVICE_CONTROL2_DEVICE_STATUS2_REG	98h

11.3.3.1.34.2 Function

Device Control 2 and Status 2 Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.34.3 Diagram



11.3.3.1.34.4 Fields

Field	Function
31-6 —	Reserved.
5 PCIE_CAP_ARI_FORWARD_SUPPORT_CS	ARI Forwarding Enable. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: R/W
4 PCIE_CAP_CPL_TIMEOUT_DISABLE	Completion Timeout Disable. For a description of this standard PCIe register field, see the PCI Express Specification.
3-0 PCIE_CAP_CPL_TIMEOUT_VALUE	Completion Timeout Value. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: R/W

11.3.3.1.35 Link Capabilities 2 Register. (LINK_CAPABILITIES2_REG)

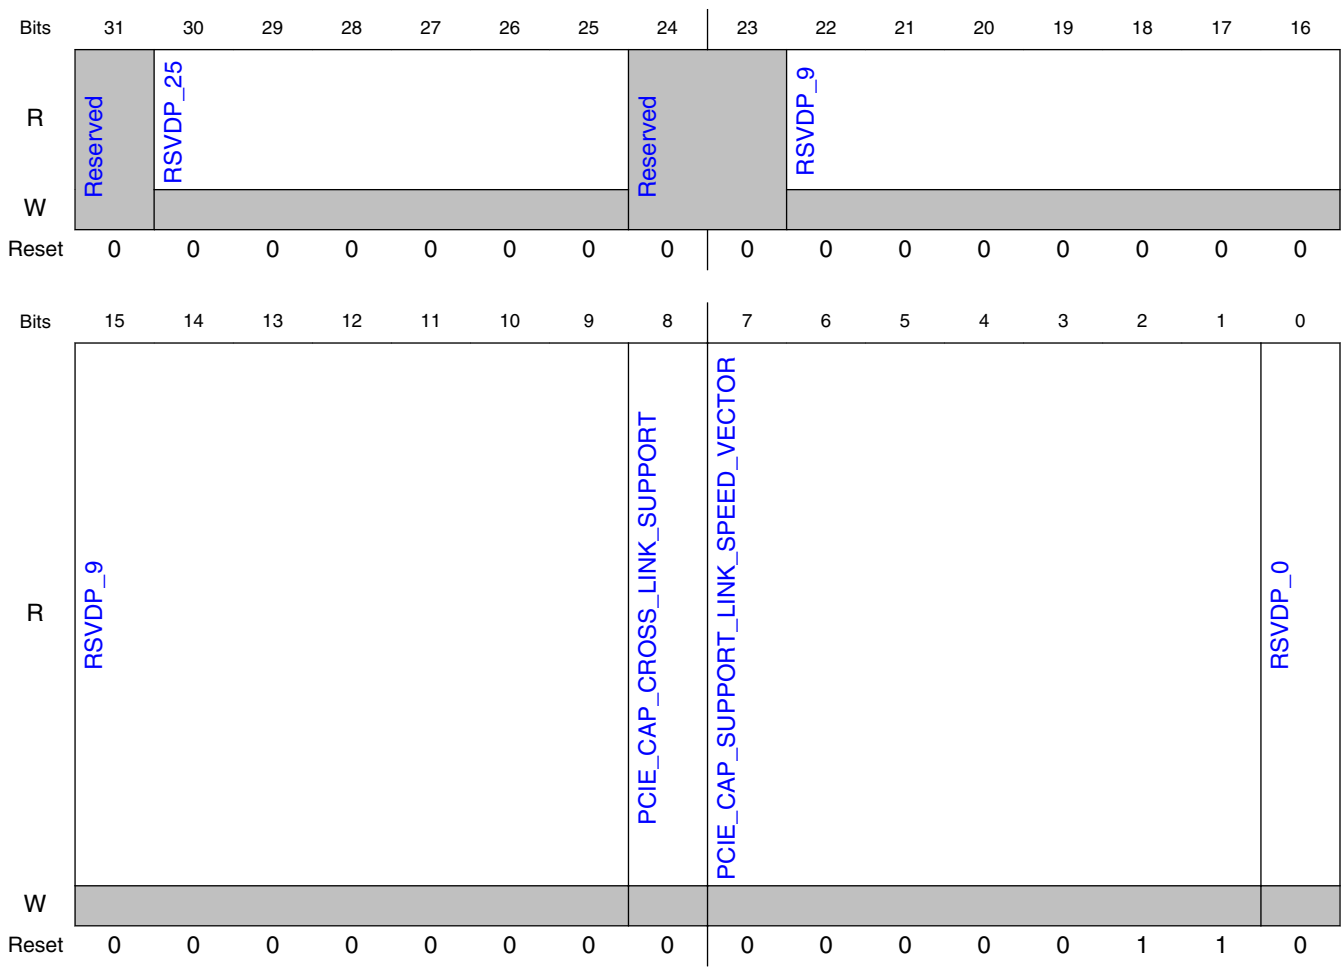
11.3.3.1.35.1 Offset

Register	Offset
LINK_CAPABILITIES2_REG	9Ch

11.3.3.1.35.2 Function

Link Capabilities 2 Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.35.3 Diagram



11.3.3.1.35.4 Fields

Field	Function
31 —	Reserved.
30-25 RSVDP_25	Reserved for future use.
24-23 —	Reserved.
22-9 RSVDP_9	Reserved for future use.
8 PCIE_CAP_CROSS_LINK_SUPPORT	Cross Link Supported. For a description of this standard PCIe register field, see the PCI Express Specification.
7-1 PCIE_CAP_SUPPORT_LINK_SPEED_VECTOR	Supported Link Speeds Vector. For a description of this standard PCIe register field, see the PCI Express Specification. This field has a default of (PCIE_CAP_MAX_LINK_SPEED == 0100) ? 0001111 : (PCIE_CAP_MAX_LINK_SPEED == 0011) ? 0000111 : (PCIE_CAP_MAX_LINK_SPEED == 0010) ? 0000011 : 0000001 where PCIE_CAP_MAX_LINK_SPEED is a field in the LINK_CAPABILITIES_REG register.
0 RSVDP_0	Reserved for future use.

11.3.3.1.36 Link Control 2 and Status 2 Register. (LINK_CONTROL2_LINK_STATUS2_REG)

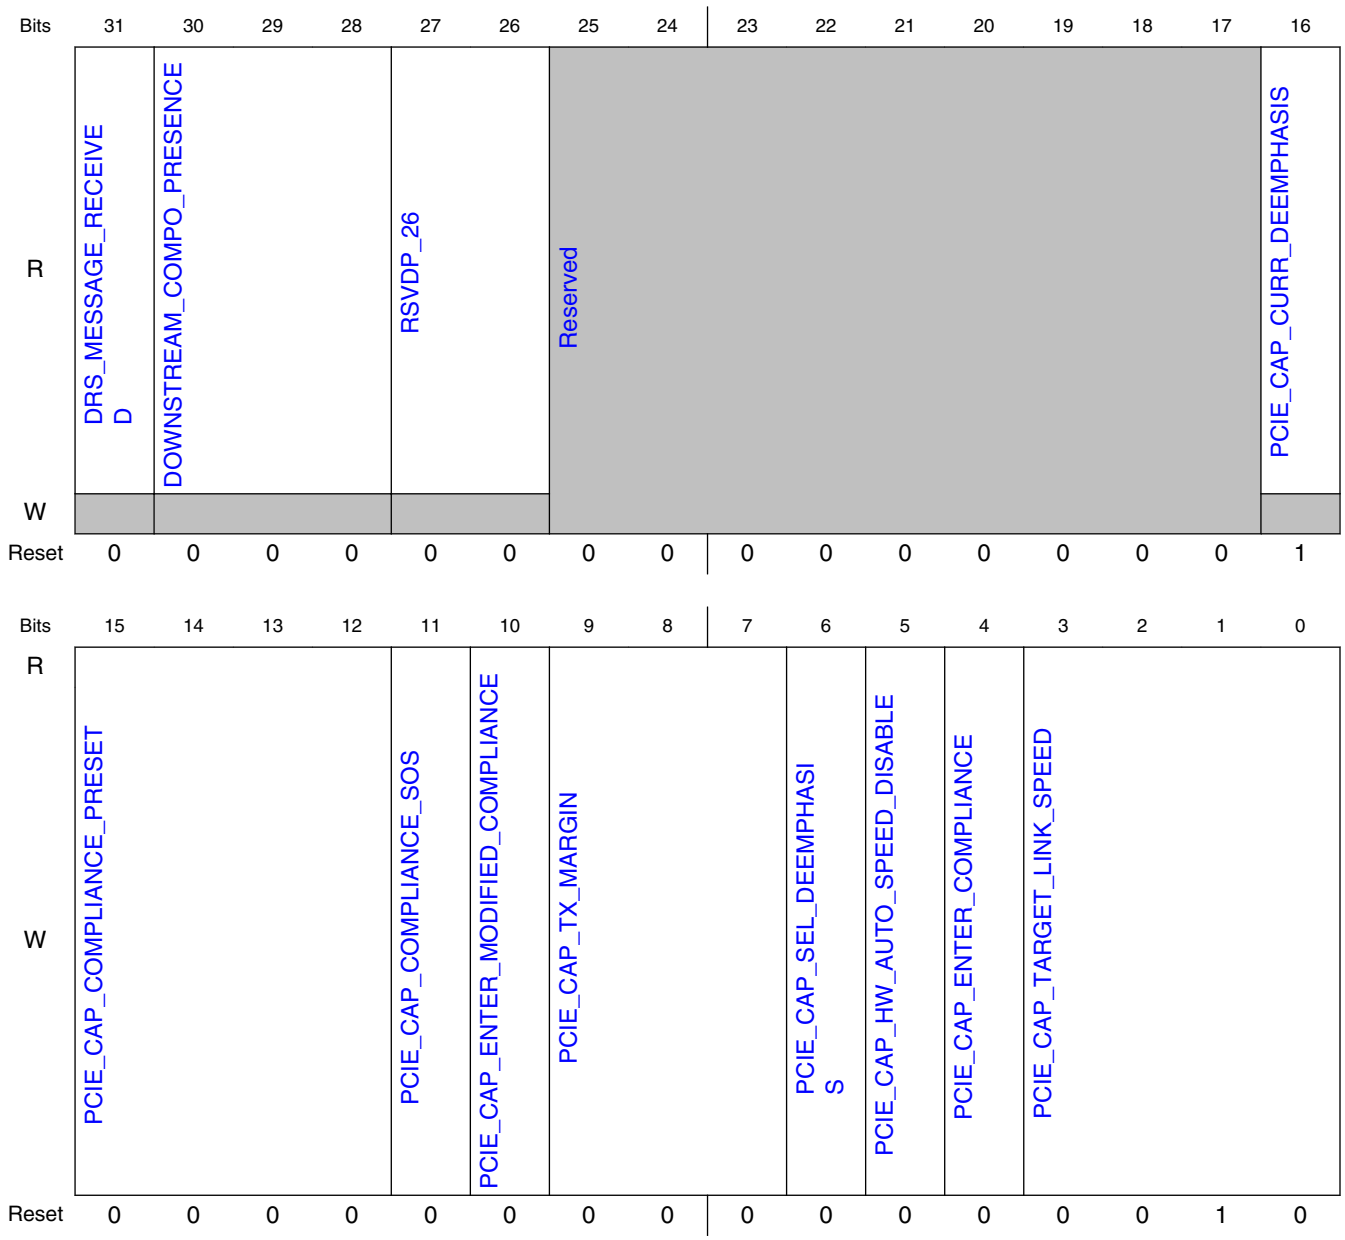
11.3.3.1.36.1 Offset

Register	Offset
LINK_CONTROL2_LINK_STATUS2_REG	A0h

11.3.3.1.36.2 Function

Link Control 2 and Status 2 Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.36.3 Diagram



11.3.3.1.36.4 Fields

Field	Function
31 DRS_MESSAGE_RECEIVED	DRS Message Received. For a description of this standard PCIe register field, see the PCI Express Base Specification 4.0. Note: The access attributes of this field are as follows: - Dbi: RW1C
30-28	Downstream Component Presence. For a description of this standard PCIe register field, see the PCI Express Base Specification 4.0.

Table continues on the next page...

Field	Function
DOWNSTREAM_COMPO_PRESENCE	
27-26 RSVDP_26	Reserved for future use.
25-17 —	Reserved.
16 PCIE_CAP_CURR_DEEMPHASIS	Current De-emphasis Level. For a description of this standard PCIe register field, see the PCI Express Specification. In M-PCIe mode this register is always 0x0. In C-PCIe mode, its contents are derived by sampling the PIPE
15-12 PCIE_CAP_COMPLIANCE_PRESET	Sets Compliance Preset/De-emphasis for 5 GT/s and 8 GT/s. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.
11 PCIE_CAP_COMPLIANCE_SOS	Sets Compliance Skip Ordered Sets transmission. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.
10 PCIE_CAP_ENTER_MODIFIED_COMPLIANCE	Enter Modified Compliance. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.
9-7 PCIE_CAP_TX_MARGIN	Controls Transmit Margin for Debug or Compliance. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
6 PCIE_CAP_SEL_DEEMPHASIS	Controls Selectable De-emphasis for 5 GT/s. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
5 PCIE_CAP_HW_AUTO_SPEED_DISABLE	Hardware Autonomous Speed Disable. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.
4 PCIE_CAP_ENTER_COMPLIANCE	Enter Compliance Mode. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
3-0 PCIE_CAP_TARGET_LINK_SPEED	Target Link Speed. For a description of this standard PCIe register field, see the PCI Express Specification. In M-PCIe mode, the contents of this field are derived from other registers. Note: This register field is sticky.

11.3.3.1.37 Advanced Error Reporting Extended Capability Header. (AER_EXT_CAP_HDR_OFF)

11.3.3.1.37.1 Offset

Register	Offset
AER_EXT_CAP_HDR_OFF	100h

11.3.3.1.37.2 Function

Advanced Error Reporting Extended Capability Header. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.37.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R W	CAP_ID															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

11.3.3.1.37.4 Fields

Field	Function
31-20 NEXT_OFFSET	Next Capability Offset. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
19-16 CAP_VERSION	Capability Version. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
15-0 CAP_ID	AER Extended Capability ID. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.

11.3.3.1.38 Uncorrectable Error Status Register. (UNCORR_ERR_STATUS_OFF)

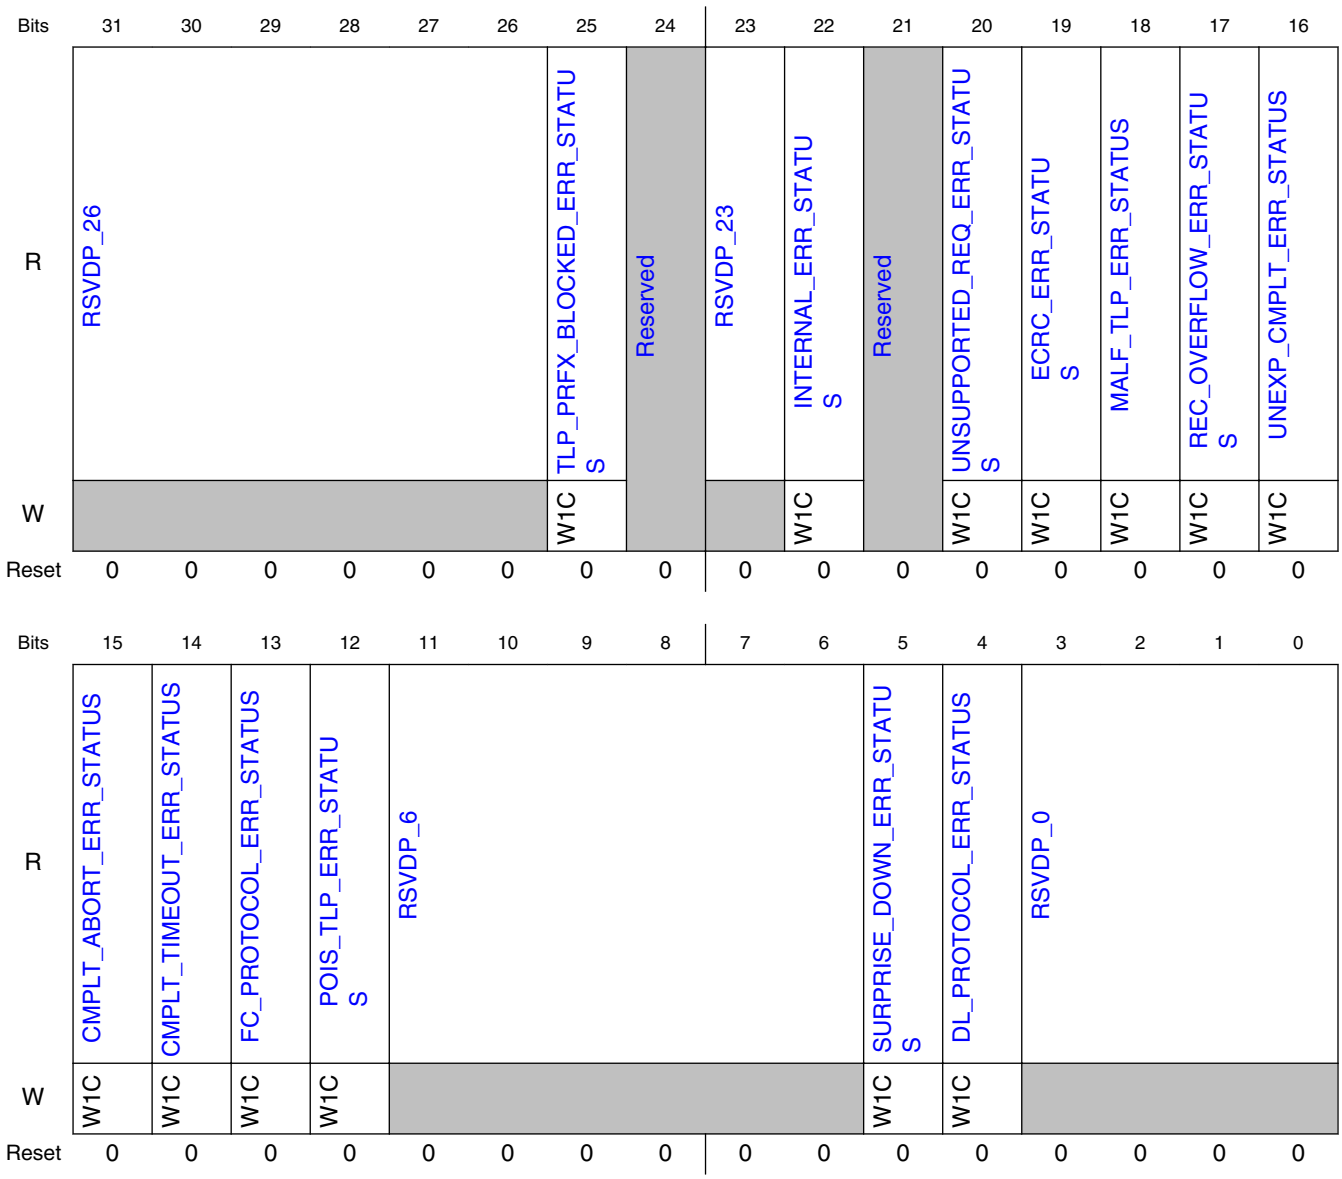
11.3.3.1.38.1 Offset

Register	Offset
UNCORR_ERR_STATUS_OFF	104h

11.3.3.1.38.2 Function

Uncorrectable Error Status Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.38.3 Diagram



11.3.3.1.38.4 Fields

Field	Function
31-26 RSVDP_26	Reserved for future use.
25 TLP_PRFX_BLOCKED_ERR_STATUS	TLP Prefix Blocked Error Status. For a description of this standard PCIe register field, see the PCI Express Specification. Note: Not supported.
24	Reserved.

Table continues on the next page...

Field	Function
—	
23 RSVDP_23	Reserved for future use.
22 INTERNAL_ERR_STATUS	Uncorrectable Internal Error Status. For a description of this standard PCIe register field, see the PCI Express Specification. The controller sets this bit when your application asserts app_err_bus[9]. It does not set this bit when it detects internal uncorrectable internal errors such as parity and ECC failures. You should use the outputs from these errors to drive the app_err_bus[9] input. For more details, see the "Data Integrity (Wire, Datapath, and RAM Protection)" section in the Databook.
21 —	Reserved.
20 UNSUPPORTED_REQ_ERR_STATUS	Unsupported Request Error Status. For a description of this standard PCIe register field, see the PCI Express Specification.
19 ECRC_ERR_STATUS	ECRC Error Status. For a description of this standard PCIe register field, see the PCI Express Specification.
18 MALF_TLP_ERR_STATUS	Malformed TLP Status. For a description of this standard PCIe register field, see the PCI Express Specification.
17 REC_OVERFLOW_ERR_STATUS	Receiver Overflow Status. For a description of this standard PCIe register field, see the PCI Express Specification.
16 UNEXP_CMPLT_ERR_STATUS	Unexpected Completion Status. For a description of this standard PCIe register field, see the PCI Express Specification.
15 CMPLT_ABORT_ERR_STATUS	Completer Abort Status. For a description of this standard PCIe register field, see the PCI Express Specification.
14 CMPLT_TIMEOUT_ERR_STATUS	Completion Timeout Status. For a description of this standard PCIe register field, see the PCI Express Specification.
13 FC_PROTOCOL_ERR_STATUS	Flow Control Protocol Error Status. For a description of this standard PCIe register field, see the PCI Express Specification.
12 POIS_TLP_ERR_STATUS	Poisoned TLP Status. For a description of this standard PCIe register field, see the PCI Express Specification.
11-6 RSVDP_6	Reserved for future use.
5	Surprise Down Error Status (Optional). For a description of this standard PCIe register field, see the PCI Express Specification.

Table continues on the next page...

Field	Function
SURPRISE_DOWN_ERR_STATUS	
4 DL_PROTOCOL_ERR_STATUS	Data Link Protocol Error Status. For a description of this standard PCIe register field, see the PCI Express Specification.
3-0 RSVDP_0	Reserved for future use.

11.3.3.1.39 Uncorrectable Error Mask Register. (UNCORR_ERR_MASK_OFF)

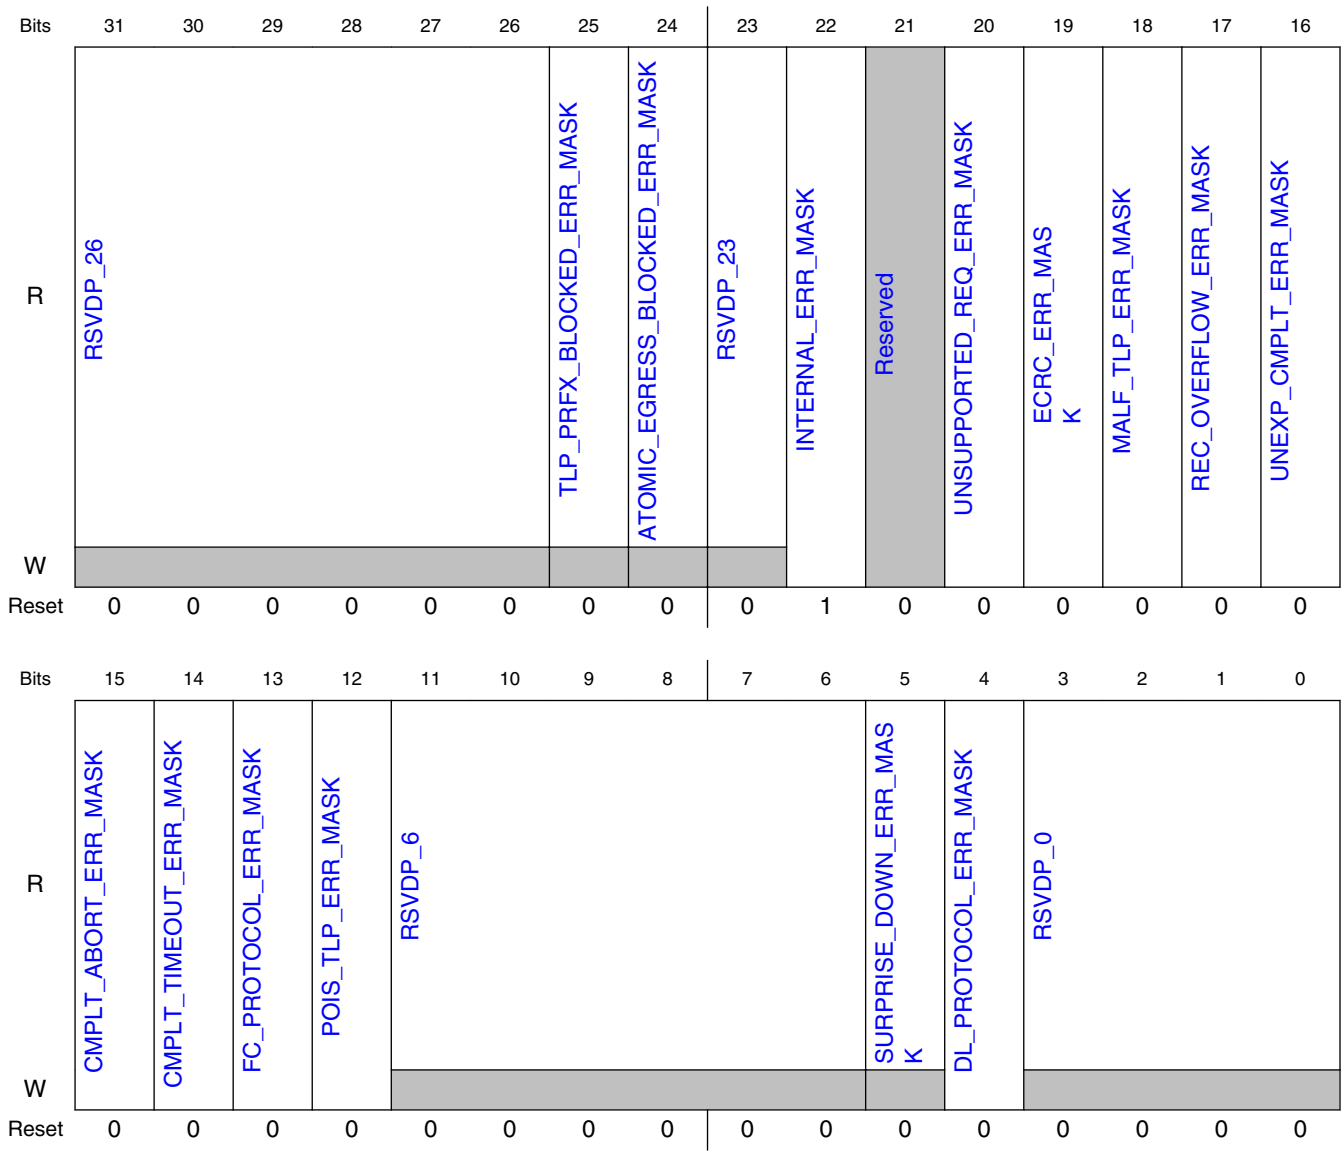
11.3.3.1.39.1 Offset

Register	Offset
UNCORR_ERR_MASK_OFF	108h

11.3.3.1.39.2 Function

Uncorrectable Error Mask Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.39.3 Diagram



11.3.3.1.39.4 Fields

Field	Function
31-26 RSVDP_26	Reserved for future use.
25 TLP_PRFX_BLOCKED_ERR_MASK	TLP Prefix Blocked Error Mask. For a description of this standard PCIe register field, see the PCI Express Specification. Note: Not supported. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.

Table continues on the next page...

Field	Function
24 ATOMIC_EGRESS_BLOCKED_ERR_MASK	AtomicOp Egress Block Mask (Optional). For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.
23 RSVDP_23	Reserved for future use.
22 INTERNAL_ERR_MASK	Uncorrectable Internal Error Mask (Optional). For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
21 —	Reserved.
20 UNSUPPORTED_REQ_ERR_MASK	Unsupported Request Error Mask. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
19 ECRC_ERR_MASK	ECRC Error Mask (Optional). For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.
18 MALF_TLP_ERR_MASK	Malformed TLP Mask. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
17 REC_OVERFLOW_ERR_MASK	Receiver Overflow Mask (Optional). For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
16 UNEXP_CMPLT_ERR_MASK	Unexpected Completion Mask. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
15 CMPLT_ABORT_ERR_MASK	Completer Abort Error Mask (Optional). For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
14 CMPLT_TIMEOUT_ERR_MASK	Completion Timeout Error Mask. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
13 FC_PROTOCOL_ERR_MASK	Flow Control Protocol Error Mask. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
12 POIS_TLP_ERR_MASK	Poisoned TLP Error Mask. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
11-6 RSVDP_6	Reserved for future use.
5	Surprise Down Error Mask. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi:

11.3.3.1.47.4 Fields

Field	Function
31-24 FOURTH_DWORD_FOURTH_BYTE	Byte 3 of Header log register of Fourth 32 bit Data Word. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
23-16 FOURTH_DWORD_THIRD_BYTE	Byte 2 of Header log register of Fourth 32 bit Data Word. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
15-8 FOURTH_DWORD_SECOND_BYTE	Byte 1 of Header log register of Fourth 32 bit Data Word. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.
7-0 FOURTH_DWORD_FIRST_BYTE	Byte 0 of Header log register of Fourth 32 bit Data Word. For a description of this standard PCIe register field, see the PCI Express Specification. Note: This register field is sticky.

11.3.3.1.48 Root Error Command Register. (ROOT_ERR_CMD_OFF)

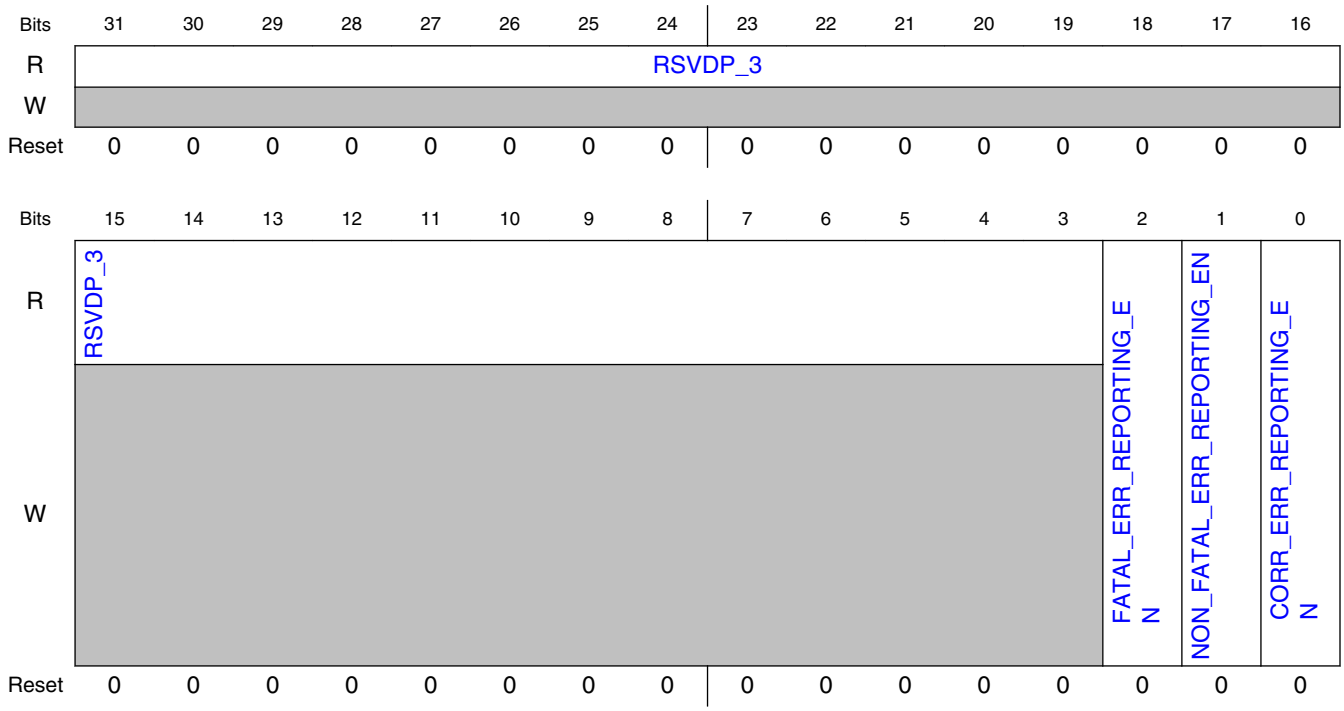
11.3.3.1.48.1 Offset

Register	Offset
ROOT_ERR_CMD_OFF	12Ch

11.3.3.1.48.2 Function

Root Error Command Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.48.3 Diagram



11.3.3.1.48.4 Fields

Field	Function
31-3 RSVDP_3	Reserved for future use.
2 FATAL_ERR_REPORTING_EN	Fatal Error Reporting Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
1 NON_FATAL_ERR_REPORTING_EN	Non-Fatal Error Reporting Enable. For a description of this standard PCIe register field, see the PCI Express Specification.
0 CORR_ERR_REPORTING_EN	Correctable Error Reporting Enable. For a description of this standard PCIe register field, see the PCI Express Specification.

11.3.3.1.49 Root Error Status Register. (ROOT_ERR_STATUS_OFF)

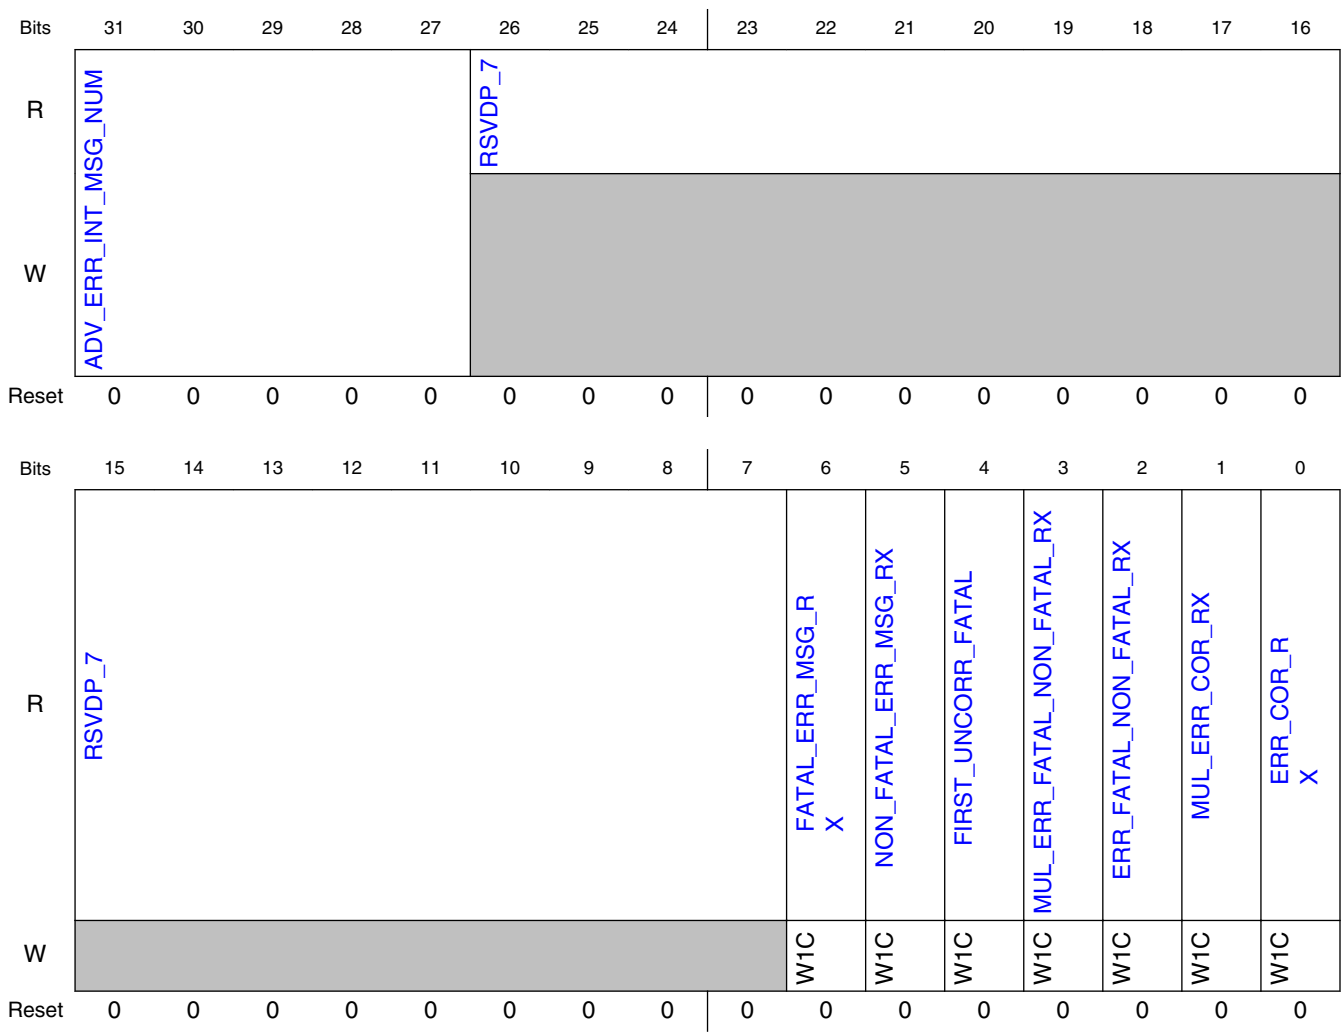
11.3.3.1.49.1 Offset

Register	Offset
ROOT_ERR_STATUS_OFF	130h

11.3.3.1.49.2 Function

Root Error Status Register. For a description of this standard PCIe register, see the PCI Express Specification.

11.3.3.1.49.3 Diagram



11.3.3.1.49.4 Fields

Field	Function
31-27 ADV_ERR_INT_MSG_NUM	Advanced Error Interrupt Message Number. For a description of this standard PCIe register field, see the PCI Express Specification. Note: The access attributes of this field are as follows: - Dbi: if (DBI_RO_WR_EN == 1) then R/W(sticky) else R(sticky) Note: This register field is sticky.
26-7 RSVDP_7	Reserved for future use.
6 FATAL_ERR_MSG_RX	One or more Fatal Error Messages Received. For a description of this standard PCIe register field, see the PCI Express Specification.
5 NON_FATAL_ERR_MSG_RX	One or more Non-Fatal Error Messages Received. For a description of this standard PCIe register field, see the PCI Express Specification.
4 FIRST_UNCOR_FATAL	First Uncorrectable Error is Fatal. For a description of this standard PCIe register field, see the PCI Express Specification.
3 MUL_ERR_FATAL_NON_FATAL_RX	Multiple Fatal or Non-Fatal Errors Received. For a description of this standard PCIe register field, see the PCI Express Specification.
2 ERR_FATAL_NON_FATAL_RX	Fatal or Non-Fatal Error Received. For a description of this standard PCIe register field, see the PCI Express Specification.
1 MUL_ERR_COR_RX	Multiple Correctable Errors Received. For a description of this standard PCIe register field, see the PCI Express Specification.
0 ERR_COR_RX	Correctable Error Received. For a description of this standard PCIe register field, see the PCI Express Specification.

11.3.3.1.50 Error Source Identification Register. (ERR_SRC_ID_OFF)

11.3.3.1.50.1 Offset

Register	Offset
ERR_SRC_ID_OFF	134h

11.3.3.1.50.2 Function

Error Source Identification Register. For a description of this standard PCIe register, see the PCI Express Specification.

RSVDP_8	
7-3 T_POWER_ON_VALUE	T Power On Value. For a description of this standard PCIe register field, see the PCI Express Specification.
2 RSVDP_2	Reserved for future use.
1-0 T_POWER_ON_SCALE	T Power On Scale. For a description of this standard PCIe register field, see the PCI Express Specification.

11.3.3.1.59 Ack Latency Timer and Replay Timer Register. (ACK_LATENCY_TIMER_OFF)

11.3.3.1.59.1 Offset

Register	Offset
ACK_LATENCY_TIMER_OFF	700h

11.3.3.1.59.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	REPLAY_TIME_LIMIT															
Reset	0	0	0	1	1	0	0	0	0	1	0	0	0	1	1	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ROUND_TRIP_LATENCY_TIME_LIMIT															
Reset	0	0	0	0	1	0	0	0	0	0	0	1	0	1	1	1

11.3.3.1.59.3 Fields

Field	Function
31-16 REPLAY_TIME_LIMIT	Replay Timer Limit. The replay timer expires when it reaches this limit. The controller initiates a replay upon reception of a NAK or when the replay timer expires. For more details, see "Transmit Replay". You can modify the effective timer limit with the TIMER_MOD_REPLAY_TIMER field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. After reset, the controller updates the default according to the Negotiated Link Width, Max_Payload_Size, and speed. The value is determined from Tables 3-4,

Table continues on the next page...

Field	Function
	3-5, and 3-6 of the PCIe 3.0 specification. If there is a change in the payload size or link speed, the controller will override any value that you have written to this register field, and reset the field back to the specification-defined value. It will not change the value in the TIMER_MOD_REPLAY_TIMER field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register.
15-0 ROUND_TRIP_LATENCY_TIME_LIMIT	Ack Latency Timer Limit. The Ack latency timer expires when it reaches this limit. For more details, see "Ack Scheduling". You can modify the effective timer limit with the TIMER_MOD_ACK_NAK field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register. After reset, the controller updates the default according to the Negotiated Link Width, Max_Payload_Size, and speed. The value is determined from Tables 3-7, 3-8, and 3-9 of the PCIe 3.0 specification. The limit must reflect the round trip latency from requester to completer. If there is a change in the payload size or link width, the controller will override any value that you have written to this register field, and reset the field back to the specification-defined value. It will not change the value in the TIMER_MOD_ACK_NAK field of the TIMER_CTRL_MAX_FUNC_NUM_OFF register.

11.3.3.1.60 Vendor Specific DLLP Register. (VENDOR_SPEC_DLLP_OFF)

11.3.3.1.60.1 Offset

Register	Offset
VENDOR_SPEC_DLLP_OFF	704h

11.3.3.1.60.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	VENDOR_SPEC_DLLP															
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

11.3.3.1.60.3 Fields

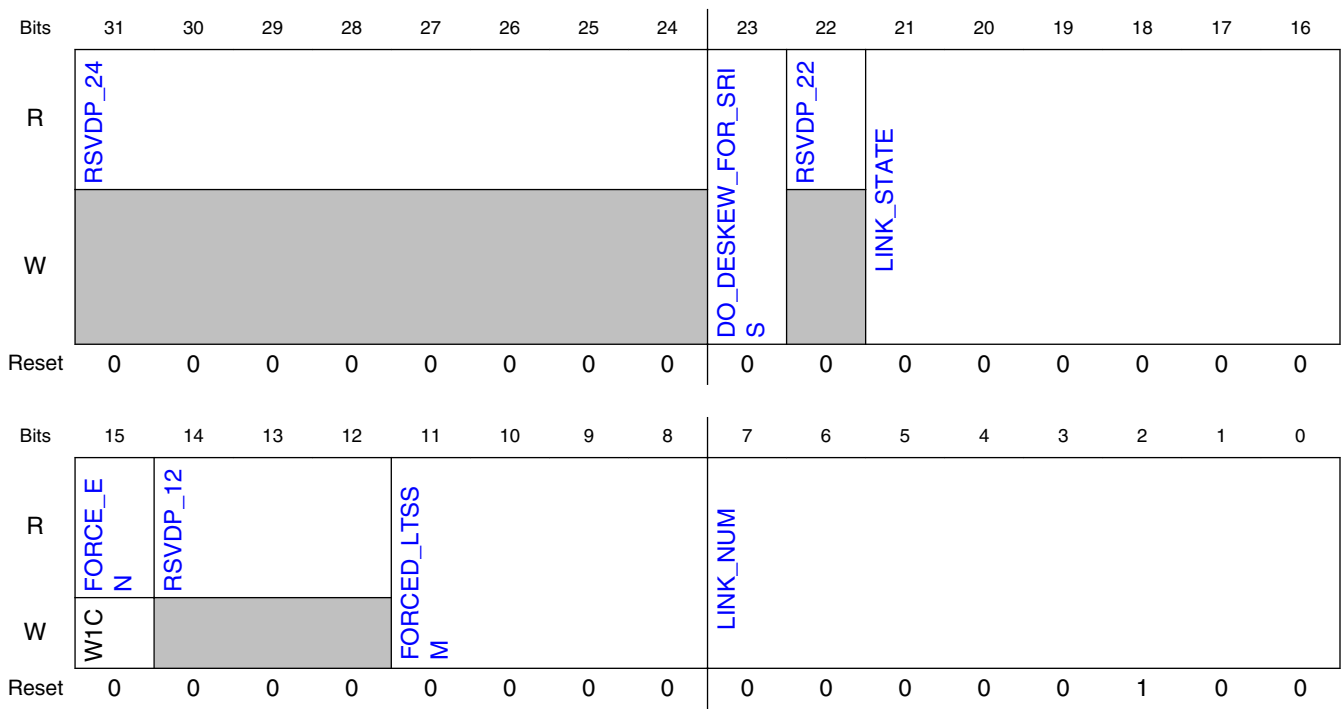
Field	Function
31-0 VENDOR_SPEC_DLLP	Vendor Specific DLLP Register. Used to send a specific PCI Express DLLP. Your application writes the 8-bit DLLP Type and 24-bits of Payload data into this register, then sets the field VENDOR_SPECIFIC_DLLP_REQ of PORT_LINK_CTRL_OFF to send the DLLP. - [7:0] = Type - [31:8] = Payload (24 bits) The dllp type is in bits [7:0] while the remainder is the vendor defined payload. Note: This register field is sticky.

11.3.3.1.61 Port Force Link Register. (PORT_FORCE_OFF)

11.3.3.1.61.1 Offset

Register	Offset
PORT_FORCE_OFF	708h

11.3.3.1.61.2 Diagram



11.3.3.1.61.3 Fields

Field	Function
31-24 RSVDP_24	Reserved for future use.
23 DO_DESKEW_FOR_SRIS	Use the transitions from TS2 to Logical Idle Symbol, SKP OS to Logical Idle Symbol, and FTS Sequence to SKP OS to do deskew for SRIS instead of using received SKP OS if DO_DESKEW_FOR_SRIS is set to 1. Note: This register field is sticky.
22 RSVDP_22	Reserved for future use.

Table continues on the next page...

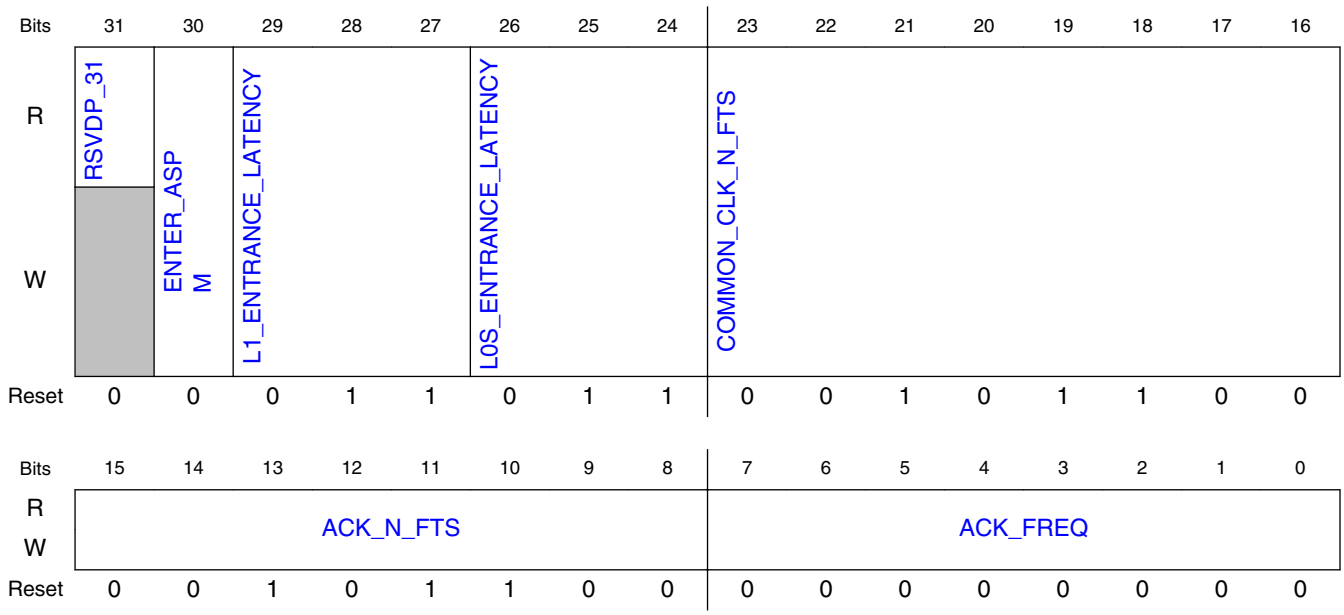
Field	Function
21-16 LINK_STATE	Forced LTSSM State. The LTSSM state that the controller is forced to when you set the FORCE_EN bit (Force Link). LTSSM state encoding is defined by the lts_state variable in workspace/src/Layer1/smlh_ltssm.v. Note: This register field is sticky.
15 FORCE_EN	Force Link. The controller supports a testing and debug capability to allow your software to force the LTSSM state machine into a specific state, and to force the controller to transmit a specific Link Command. Asserting this bit triggers the following actions: - Forces the LTSSM to the state specified by the Forced LTSSM State field. - Forces the controller to transmit the command specified by the Forced Link Command field. This is a self-clearing register field. Reading from this register field always returns a "0".
14-12 RSVDP_12	Reserved for future use.
11-8 FORCED_LTSSM	Forced Link Command. The link command that the controller is forced to transmit when you set FORCE_EN bit (Force Link). Link command encoding is defined by the ltssm_cmd variable in workspace/src/Layer1/smlh_ltssm.v. Note: This register field is sticky.
7-0 LINK_NUM	Link Number. Not used for endpoint. Not used for M-PCIe. Note: This register field is sticky.

11.3.3.1.62 Ack Frequency and L0-L1 ASPM Control Register. (ACK_F_ASPM_CTRL_OFF)

11.3.3.1.62.1 Offset

Register	Offset
ACK_F_ASPM_CTRL_OFF	70Ch

11.3.3.1.62.2 Diagram



11.3.3.1.62.3 Fields

Field	Function
31 RSVDP_31	Reserved for future use.
30 ENTER_ASPM	ASPM L1 Entry Control. - 1: Core enters ASPM L1 after a period in which it has been idle. - 0: Core enters ASPM L1 only after idle period during which both receive and transmit are in L0s. Note: This register field is sticky.
29-27 L1_ENTRANCE_LATENCY	L1 Entrance Latency. Value range is: - 000: 1 us - 001: 2 us - 010: 4 us - 011: 8 us - 100: 16 us - 101: 32 us - 110 or 111: 64 us Note: Programming this timer with a value greater that 32us has no effect unless extended sync is used, or all of the credits are infinite. Note: This register field is sticky.
26-24 L0S_ENTRANCE_LATENCY	L0s Entrance Latency. Values correspond to: - 000: 1 us - 001: 2 us - 010: 3 us - 011: 4 us - 100: 5 us - 101: 6 us - 110 or 111: 7 us This field is applicable to STALL while in L0 for M-PCIe. Note: This register field is sticky.
23-16 COMMON_CLK_N_FTS	Common Clock N_FTS. This is the N_FTS when common clock is used. The number of Fast Training Sequence ordered sets to be transmitted when transitioning from L0s to L0. The maximum number of FTS ordered-sets that a component can request is 255. The controller does not support a value of zero; a value of zero can cause the LTSSM to go into the recovery state when exiting from L0s. This field is reserved (fixed to '0') for M-PCIe. Note: The access attributes of this field are as follows: - Dbi: R
15-8 ACK_N_FTS	N_FTS. The number of Fast Training Sequence ordered sets to be transmitted when transitioning from L0s to L0. The maximum number of FTS ordered-sets that a component can request is 255. The controller does not support a value of zero; a value of zero can cause the LTSSM to go into the recovery state when exiting from L0s. This field is reserved (fixed to '0') for M-PCIe. Note: This register field is sticky.
7-0 ACK_FREQ	Ack Frequency. The controller accumulates the number of pending ACKs specified here (up to 255) before sending an ACK DLLP. - 0: Indicates that this Ack frequency control feature is turned off. The controller schedules a low-priority ACK DLLP for every TLP that it receives. - 1-255: Indicates that the

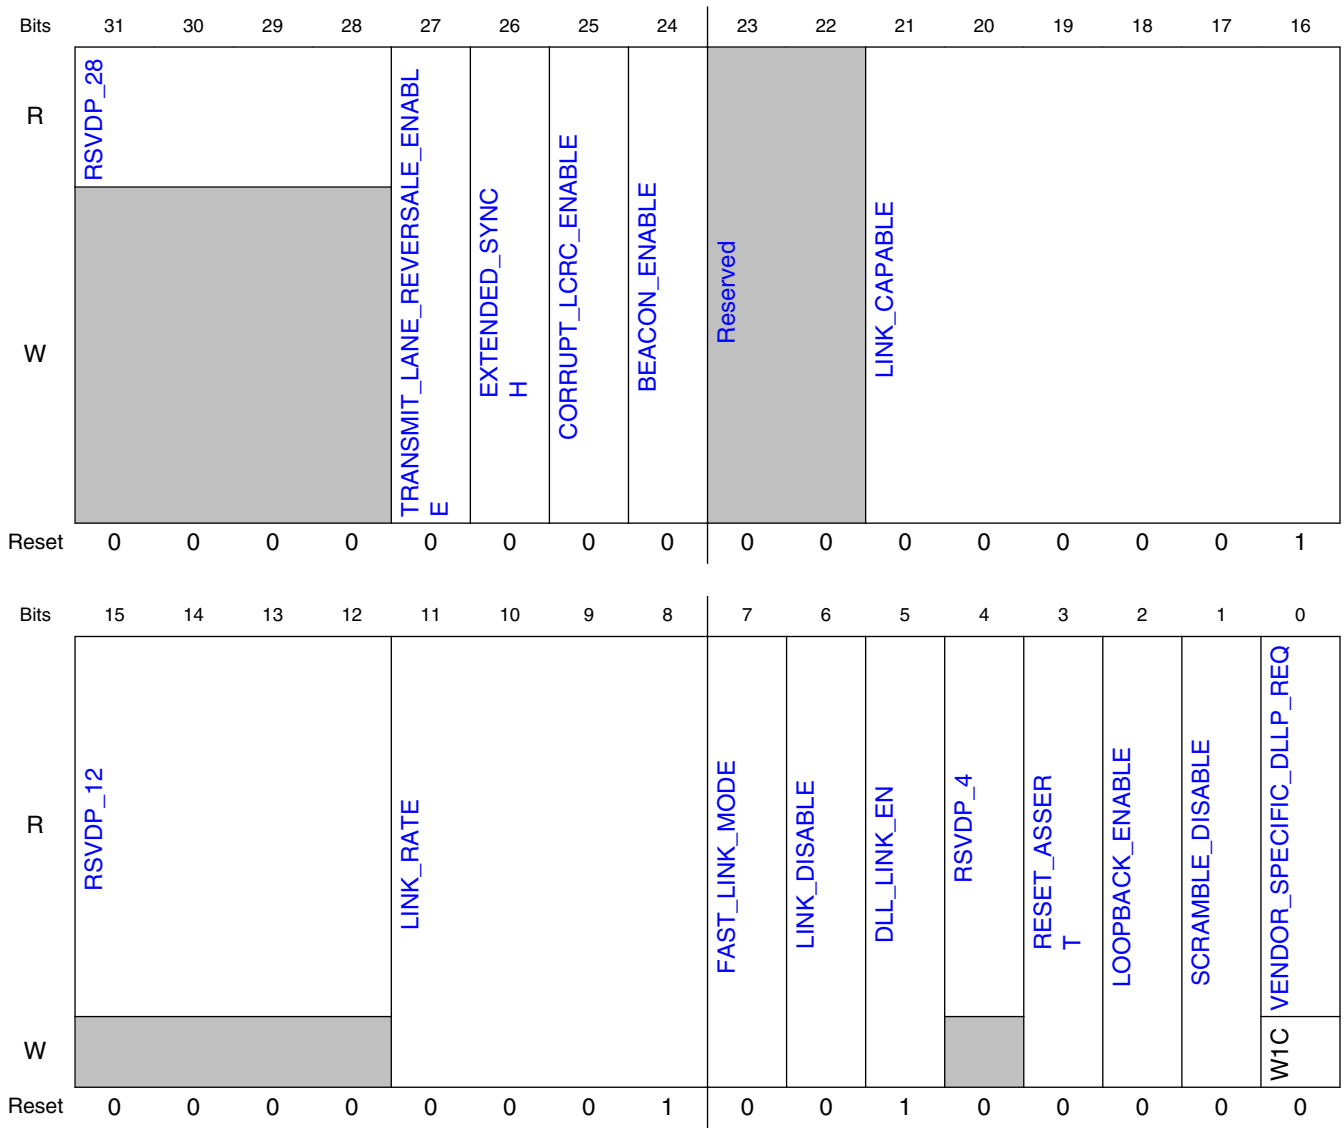
Field	Function
	controller will schedule a high-priority ACK after receiving this number of TLPs. It might schedule the ACK before receiving this number of TLPs, but never later. For a typical system, you do not have to modify the default setting. For more details, see "ACK/NAK Scheduling". Note: This register field is sticky.

11.3.3.1.63 Port Link Control Register. (PORT_LINK_CTRL_OFF)

11.3.3.1.63.1 Offset

Register	Offset
PORT_LINK_CTRL_OFF	710h

11.3.3.1.63.2 Diagram



11.3.3.1.63.3 Fields

Field	Function
31-28 RSVDP_28	Reserved for future use.
27 TRANSMIT_LANE_REVERSALE_ENABLE	TRANSMIT_LANE_REVERSALE_ENABLE is an internally reserved field. Do not use. Note: This register field is sticky.
26	EXTENDED_SYNCH is an internally reserved field. Do not use. Note: This register field is sticky.

Table continues on the next page...

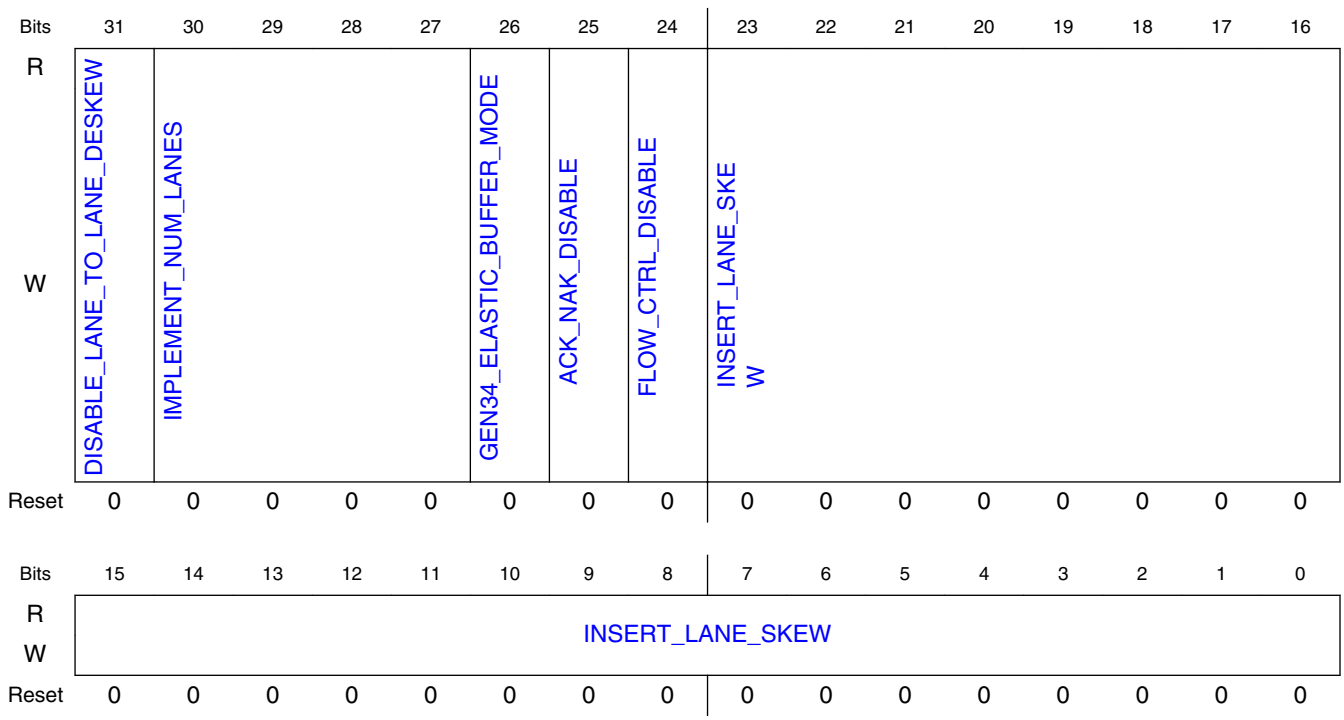
Field	Function
EXTENDED_SYNCH	
25 CORRUPT_LCRC_ENABLE	CORRUPT_LCRC_ENABLE is an internally reserved field. Do not use. Note: This register field is sticky.
24 BEACON_ENABLE	BEACON_ENABLE is an internally reserved field. Do not use. Note: This register field is sticky.
23-22 —	Reserved.
21-16 LINK_CAPABLE	Link Mode Enable. Sets the number of lanes in the link that you want to connect to the link partner. When you have unused lanes in your system, then you must change the value in this register to reflect the number of lanes. You must also change the value in the "Predetermined Number of Lanes" field of the "Link Width and Speed Change Control Register". For more information, see "How to Tie Off Unused Lanes". For information on upsizing and downsizing the link width, see "Link Establishment". - 000001: x1 - 000011: x2 - 000111: x4 - 001111: x8 - 011111: x16 - 111111: x32 (not supported) This field is reserved (fixed to '0') for M-PCIe. Note: This register field is sticky.
15-12 RSVDP_12	Reserved for future use.
11-8 LINK_RATE	LINK_RATE is an internally reserved field. Do not use. Note: This register field is sticky.
7 FAST_LINK_MODE	Fast Link Mode. Sets all internal LTSSM millisecond timers to Fast Mode for speeding up simulation. Forces the LTSSM training (link initialization) to use shorter time-outs and to link up faster. The default scaling factor can be changed through the FAST_LINK_SCALING_FACTOR field in the TIMER_CTRL_MAX_FUNC_NUM_OFF register. If this bit is set to '1', tRRAPInitiatorResponse is set to 1.88 ms(60 ms/32). Note: This register field is sticky.
6 LINK_DISABLE	LINK_DISABLE is an internally reserved field. Do not use. Note: This register field is sticky.
5 DLL_LINK_EN	DLL Link Enable. Enables link initialization. When DLL Link Enable =0, the controller does not transmit InitFC DLLPs and does not establish a link. Note: This register field is sticky.
4 RSVDP_4	Reserved for future use.
3 RESET_ASSERT	Reset Assert. Triggers a recovery and forces the LTSSM to the hot reset state (downstream port only). Note: This register field is sticky.
2 LOOPBACK_ENABLE	Loopback Enable. Turns on loopback. For more details, see "Loopback". For M-PCIe, to force the master to enter Digital Loopback mode, you must set this field to "1" during Configuration.start state(initial discovery/configuration). M-PCIe doesn't support loopback mode from L0 state - only from Configuration.start. Note: This register field is sticky.
1 SCRAMBLE_DISABLE	Scramble Disable. Turns off data scrambling. Note: This register field is sticky.
0 VENDOR_SPECIFIC_DLLP_REQ	Vendor Specific DLLP Request. When software writes a '1' to this bit, the controller transmits the DLLP contained in the VENDOR_SPEC_DLLP field of VENDOR_SPEC_DLLP_OFF. Reading from this self-clearing register field always returns a '0'.

11.3.3.1.64 Lane Skew Register. (LANE_SKEW_OFF)

11.3.3.1.64.1 Offset

Register	Offset
LANE_SKEW_OFF	714h

11.3.3.1.64.2 Diagram



11.3.3.1.64.3 Fields

Field	Function
31 DISABLE_LANE_TO_LANE_DESKEW	Disable Lane-to-Lane Deskew. Causes the controller to disable the internal Lane-to-Lane deskew logic. Note: This register field is sticky.
30-27 IMPLEMENT_NUM_LANES	Implementation-specific Number of Lanes. Set the implementation-specific number of lanes. Allowed values are: - 4'b0000: 1 lane - 4'b0001: 2 lanes - 4'b0011: 4 lanes - 4'b0111: 8 lanes - 4'b1111: 16 lanes The number of lanes to be used when in Loopback Master. The number of lanes programmed must be equal to or less than the valid number of lanes set in LINK_CAPABLE field. You must configure this field before initiating Loopback by writing in the LOOPBACK_ENABLE field. The controller will transition from Loopback.Entry to Loopback.Active after receiving two consecutive TS1 Ordered Sets with the Loopback

Table continues on the next page...

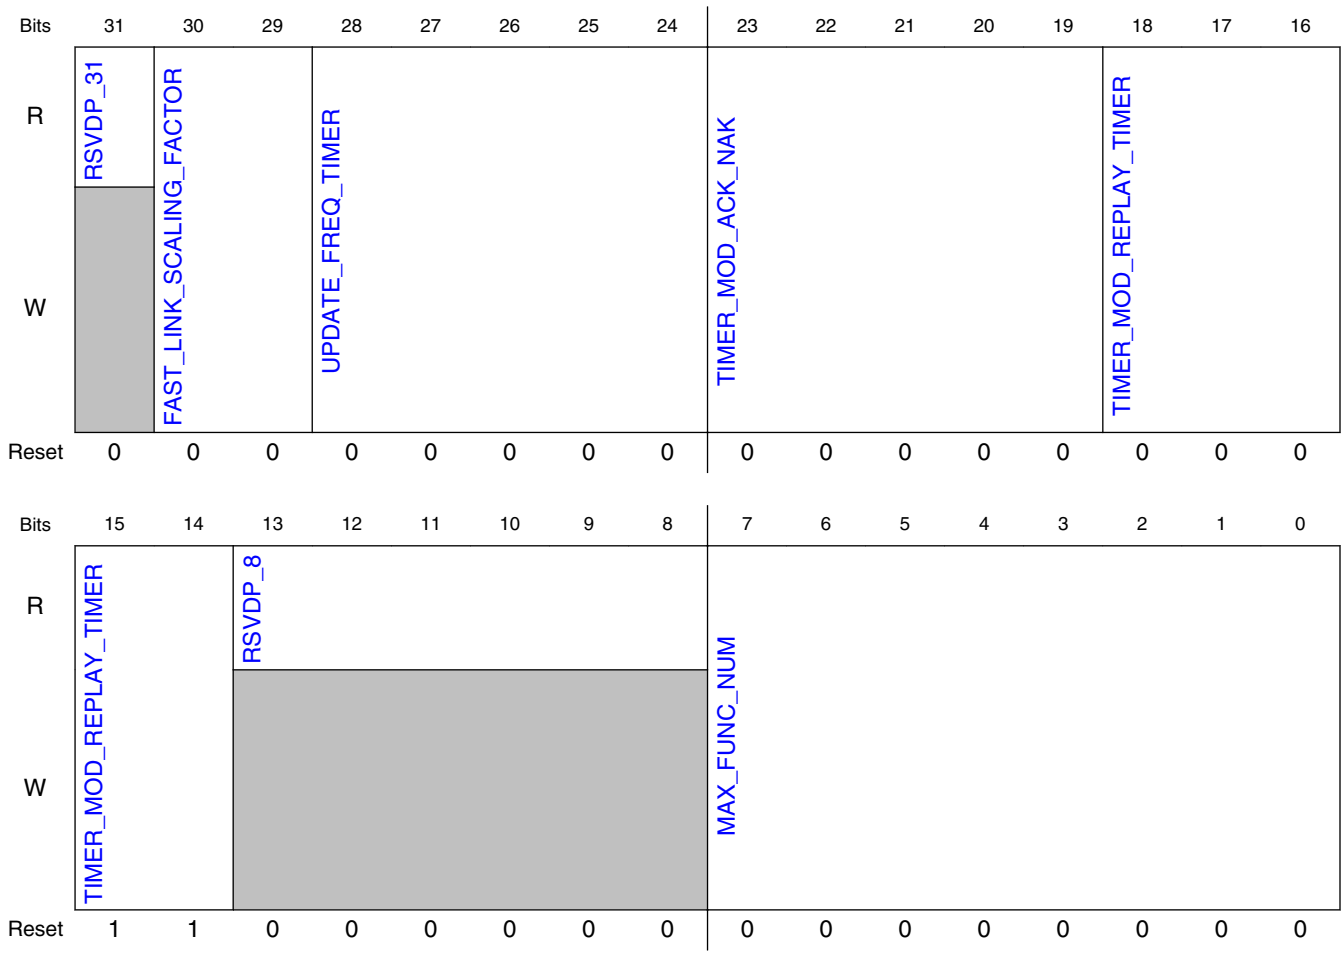
Field	Function
	bit asserted on the implementation specific number of lanes configured in this field. Note: This register field is sticky.
26 GEN34_ELASTIC_BUFFER_MODE	Selects Elasticity Buffer operating mode in Gen3 or Gen4 rate: 0: Nominal Half Full Buffer mode 1: Nominal Empty Buffer Mode This register bit only affects Gen3 or Gen4 operating rate. For Gen1 or Gen2 operating rate the Elasticity Buffer operating mode is always the Nominal Half Full Buffer mode. Note: This register field is sticky.
25 ACK_NAK_DISABLE	Ack/Nak Disable. Prevents the controller from sending ACK and NAK DLLPs. Note: This register field is sticky.
24 FLOW_CTRL_DISABLE	Flow Control Disable. Prevents the controller from sending FC DLLPs. Note: This register field is sticky.
23-0 INSERT_LANE_SKEW	INSERT_LANE_SKEW is an internally reserved field. Do not use. Note: This register field is sticky.

11.3.3.1.65 Timer Control and Max Function Number Register. (TIMER_CTRL_MAX_FUNC_NUM_OFF)

11.3.3.1.65.1 Offset

Register	Offset
TIMER_CTRL_MAX_FUNC_NUM_OFF	718h

11.3.3.1.65.2 Diagram



11.3.3.1.65.3 Fields

Field	Function
31 RSVDP_31	Reserved for future use.
30-29 FAST_LINK_SCALING_FACTOR	Fast Link Timer Scaling Factor. Sets the scaling factor of LTSSM timer when FAST_LINK_MODE field in PORT_LINK_CTRL_OFF is set to '1'. - 0: Scaling Factor is 1024 (1ms is 1us) - 1: Scaling Factor is 256 (1ms is 4us) - 2: Scaling Factor is 64 (1ms is 16us) - 3: Scaling Factor is 16 (1ms is 64us). Not used for M-PCIe. Note: This register field is sticky.
28-24 UPDATE_FREQ_TIMER	UPDATE_FREQ_TIMER is an internally reserved field. Do not use. Note: This register field is sticky.
23-19 TIMER_MOD_ACK_NAK	Ack Latency Timer Modifier. Increases the timer value for the Ack latency timer in increments of 64 clock cycles. A value of "0" represents no modification to the timer value. For more details, see the ROUND_TRIP_LATENCY_TIME_LIMIT field of the ACK_LATENCY_TIMER_OFF register. Note: This register field is sticky.

Table continues on the next page...

Field	Function
18-14 TIMER_MOD_REPLAY_TIMER	Replay Timer Limit Modifier. Increases the time-out value for the replay timer in increments of 64 clock cycles at Gen1 or Gen2 speed, and in increments of 256 clock cycles at Gen3 speed. A value of "0" represents no modification to the timer limit. For more details, see the REPLAY_TIME_LIMIT field of the ACK_LATENCY_TIMER_OFF register. At Gen3 speed, the controller automatically changes the value of this field to DEFAULT_GEN3_REPLAY_ADJ. For M-PCIe, this field increases the time-out value for the replay timer in increments of 64 clock cycles at HS-Gear1, HS-Gear2, or HS-Gear3 speed. Note: This register field is sticky.
13-8 RSVDP_8	Reserved for future use.
7-0 MAX_FUNC_NUM	Maximum function number that can be used in a request. Configuration requests targeted at function numbers above this value are returned with UR (unsupported request). Note: This register field is sticky.

11.3.3.1.66 Symbol Timer Register and Filter Mask 1 Register. (SYMBOL_TIMER_FILTER_1_OFF)

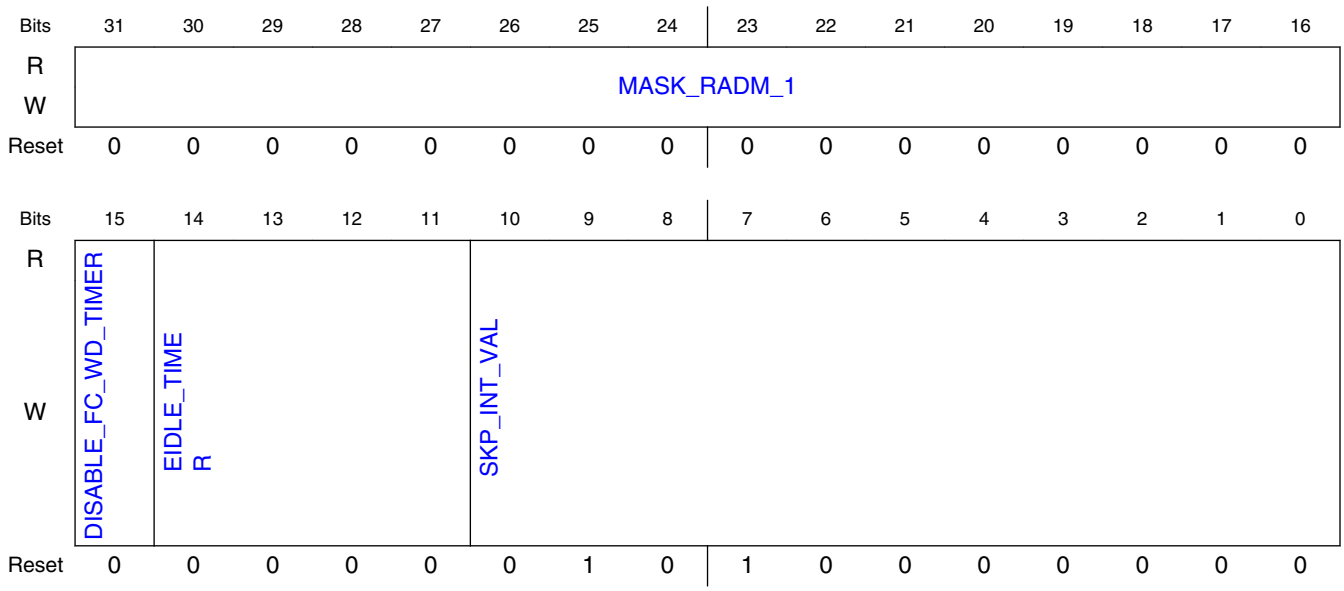
11.3.3.1.66.1 Offset

Register	Offset
SYMBOL_TIMER_FILTER_1_OFF	71Ch

11.3.3.1.66.2 Function

Symbol Timer Register and Filter Mask 1 Register. The Filter Mask 1 Register modifies the RADM filtering and error handling rules. For more details, see the "Receive Filtering" section. In each case, '0' applies the associated filtering rule and '1' masks the associated filtering rule.

11.3.3.1.66.3 Diagram



11.3.3.1.66.4 Fields

Field	Function
31-16 MASK_RADM_1	Filter Mask 1. The Filter Mask 1 Register modifies the RADM filtering and error handling rules. For more details, see the "Receive Filtering" section. In each case, '0' applies the associated filtering rule and '1' masks the associated filtering rule. Note: This register field is sticky.
15 DISABLE_FC_WD_TIMER	Disable FC Watchdog Timer. Note: This register field is sticky.
14-11 EIDLE_TIMER	EIDLE_TIMER is an internally reserved field. Do not use. Note: This register field is sticky.
10-0 SKP_INT_VAL	SKP Interval Value. The number of symbol times to wait between transmitting SKP ordered sets. Note that the controller actually waits the number of symbol times in this register plus 1 between transmitting SKP ordered sets. Your application must program this register accordingly. For example, if 1536 were programmed into this register (in a 250 MHz controller), then the controller actually transmits SKP ordered sets once every 1537 symbol times. The value programmed to this register is actually clock ticks and not symbol times. In a 125 MHz controller, programming the value programmed to this register should be scaled down by a factor of 2 (because one clock tick = two symbol times in this case). Note: This value is not used at Gen3 speed; the skip interval is hardcoded to 370 blocks. Note: This register field is sticky.

11.3.3.1.67 Filter Mask 2 Register. (FILTER_MASK_2_OFF)

11.3.3.1.67.1 Offset

Register	Offset
FILTER_MASK_2_OFF	720h

11.3.3.1.67.2 Function

Filter Mask 2 Register. This register modifies the RADM filtering and error handling rules. For more details, see the "Receive Filtering" section. In each case, '0' applies the associated filtering rule and '1' masks the associated filtering rule.

11.3.3.1.67.3 Diagram

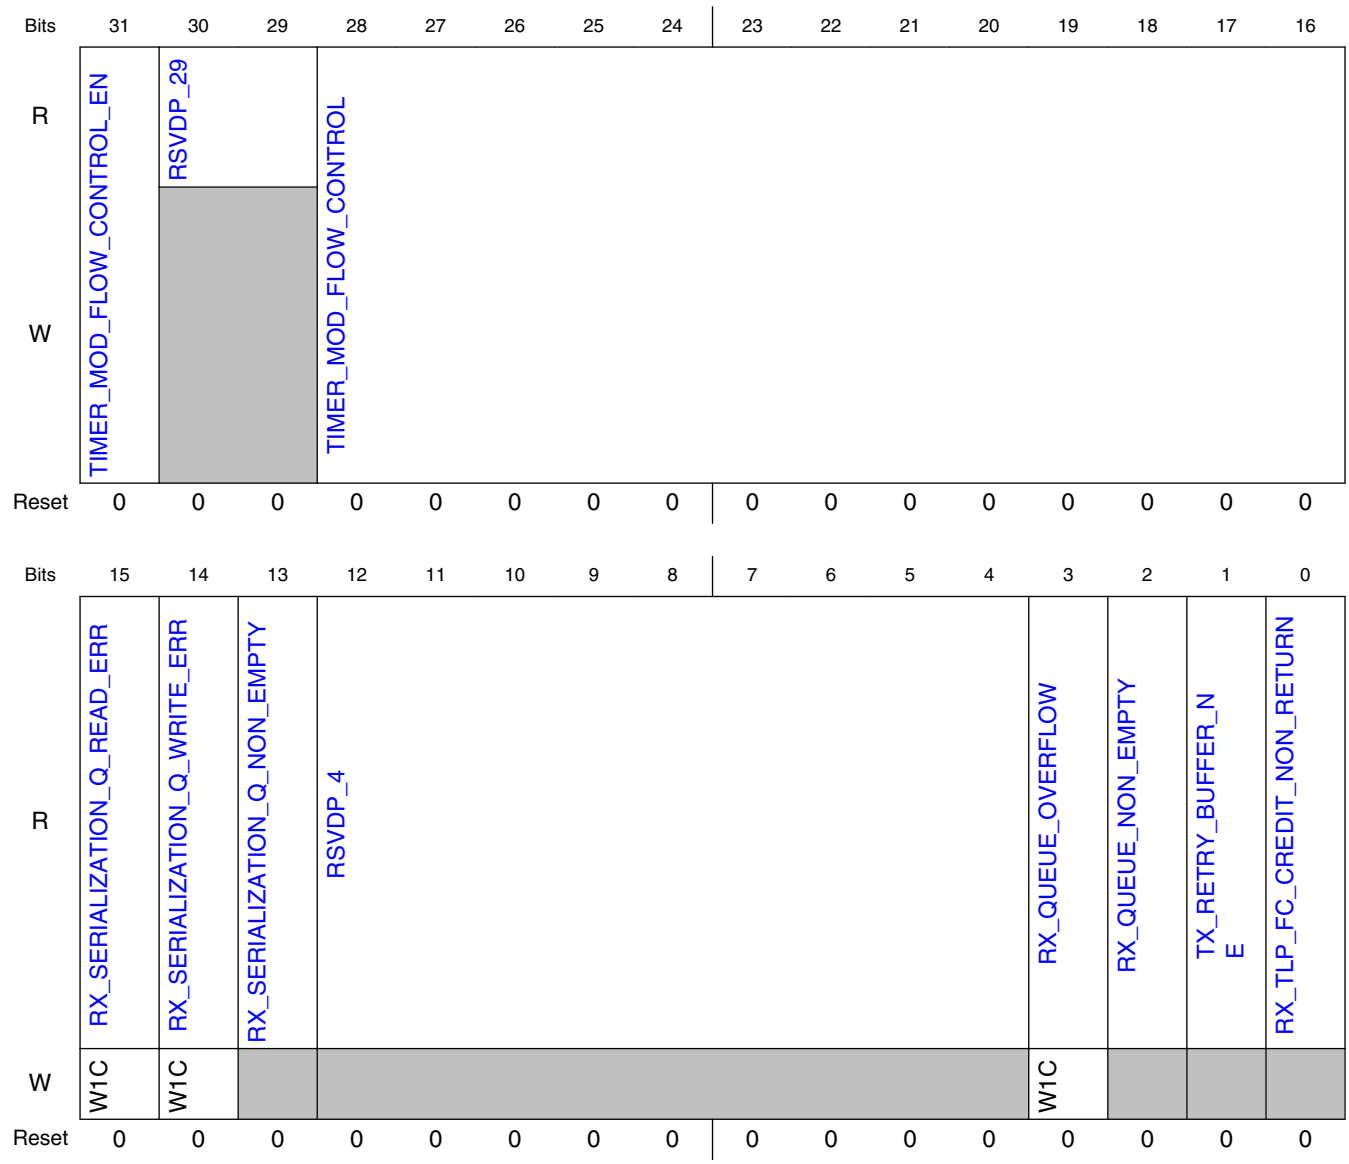
QUEUE_STATUS_OFF	73Ch

11.3.3.1.74.2 Diagram



11.3.3.1.74.3 Fields

Field	Function
31 TIMER_MOD_FLOW_CONTROL_EN	FC Latency Timer Override Enable. When this bit is set, the value from the "FC Latency Timer Override Value" field in this register will override the FC latency timer value that the controller calculates according to the PCIe specification. Note: This register field is sticky.
30-29 RSVDP_29	Reserved for future use.

Table continues on the next page...

Field	Function
28-16 TIMER_MOD_FLOW_CONTROL	FC Latency Timer Override Value. When you set the "FC Latency Timer Override Enable" in this register, the value in this field will override the FC latency timer value that the controller calculates according to the PCIe specification. For more details, see "Flow Control". Note: This register field is sticky.
15 RX_SERIALIZATION_Q_READ_ERR	Receive Serialization Read Error. Indicates the serialization queue has attempted to read an incorrectly formatted TLP.
14 RX_SERIALIZATION_Q_WRITE_ERR	Receive Serialization Queue Write Error. Indicates insufficient buffer space available to write to the serialization queue.
13 RX_SERIALIZATION_Q_NON_EMPTY	Receive Serialization Queue Not Empty. Indicates there is data in the serialization queue.
12-4 RSVDP_4	Reserved for future use.
3 RX_QUEUE_OVERFLOW	Receive Credit Queue Overflow. Indicates insufficient buffer space available to write to the P/NP/CPL credit queue.
2 RX_QUEUE_NON_EMPTY	Receive Credit Queue Not Empty. Indicates there is data in one or more of the receive buffers.
1 TX_RETRY_BUFFER_NE	Transmit Retry Buffer Not Empty. Indicates that there is data in the transmit retry buffer.
0 RX_TLP_FC_CREDIT_NON_RETURN	Received TLP FC Credits Not Returned. Indicates that the controller has received a TLP but has not yet sent an UpdateFC DLLP indicating that the credits for that TLP have been restored by the receiver at the other end of the link.

Field	Function
31-22 RSVDP_22	Reserved for future use.
21 GEN1_EI_INFERENCE	Electrical Idle Inference Mode at Gen1 Rate. Programmable mode to determine inferred electrical idle (EI) in Recovery.Speed or Loopback.Active (as slave) state at Gen1 speed by looking for a "1" value on RxElecIdle instead of looking for a "0" on RxValid. If the PHY fails to deassert the RxValid signal in Recovery.Speed or Loopback.Active (because of corrupted EIOS for example), then EI cannot be inferred successfully in the controller by just detecting the condition RxValid=0. - 0: Use RxElecIdle signal to infer Electrical Idle - 1: Use RxValid signal to infer Electrical Idle Note: This register field is sticky.
20 SEL_DEEMPHASIS	Used to set the de-emphasis level for upstream ports. This bit selects the level of de-emphasis the link operates at. - 0: -6 dB - 1: -3.5 dB This field is reserved (fixed to '0') for M-PCIe. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.
19 CONFIG_TX_COMP_RX	Config Tx Compliance Receive Bit. When set to 1, signals LTSSM to transmit TS ordered sets with the compliance receive bit assert (equal to "1"). This field is reserved (fixed to '0') for M-PCIe. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.
18 CONFIG_PHY_TX_CHANGE	Config PHY Tx Swing. Controls the PHY transmitter voltage swing level. The controller drives the mac_phy_txswing output from this register bit field. - 0: Full Swing - 1: Low Swing This field is reserved (fixed to '0') for M-PCIe. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.
17 DIRECT_SPEED_CHANGE	Directed Speed Change. Writing "1" to this field instructs the LTSSM to initiate a speed change to Gen2 or Gen3 after the link is initialized at Gen1 speed. When the speed change occurs, the controller will clear the contents of this field; and a read to this field by your software will return a "0". To manually initiate the speed change: - Write to LINK_CONTROL2_LINK_STATUS2_REG[PCIE_CAP_TARGET_LINK_SPEED] in the local device, deassert this field, and then assert this field. This field is reserved (fixed to '0') for M-PCIe. Note: The access attributes of this field are as follows: - Dbi: R/W
16 AUTO_LANE_FLIP_CTRL_EN	Enable Auto flipping of the lanes. This field is reserved (fixed to '0') for M-PCIe. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.
15-13 PRE_DET_LANE	Predetermined Lane for Auto Flip. This field defines which physical lane is connected to logical Lane0 by the flip operation performed in Detect. Allowed values are: - 3'b000: Connect logical Lane0 to physical lane 0 - 3'b001: Connect logical Lane0 to physical lane 1 - 3'b010: Connect logical Lane0 to physical lane 3 - 3'b011: Connect logical Lane0 to physical lane 7 - 3'b100: Connect logical Lane0 to physical lane 15 This field is used to restrict the receiver detect procedure to a particular lane when the default detect and polling procedure performed on all lanes cannot be successful. A notable example of when it is useful to program this field to a value different from the default, is when a lane is asymmetrically broken, that is, it is detected in Detect LTSSM state but it cannot exit Electrical Idle in Polling LTSSM state. Note: This field is reserved (fixed to '0') for M-PCIe. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.
12-8 NUM_OF_LANES	Predetermined Number of Lanes. Defines the number of lanes which are connected and not bad. Used to limit the effective link width to ignore 'broken" or "unused" lanes that detect a receiver. Indicates the number of lanes to check for exit from Electrical Idle in Polling.Active and L2.Idle. It is possible that the LTSSM might detect a receiver on a bad or broken lane during the Detect Substate. However, it is also possible that such a lane might also fail to exit Electrical Idle and therefore prevent a valid link from being configured. This value is referred to as the "Predetermined Number of Lanes" in section 4.2.6.2.1 of the PCI Express Base 3.0 Specification, revision 1.0. Encoding is as follows: - 0x01: 1 lane - 0x02: 2 lanes - 0x03: 3 lanes - .. When you have unused lanes in your system, then you must change the value in this register to reflect the number of lanes. You must also change the value in the "Link Mode Enable" field of PORT_LINK_CTRL_OFF. The value in this register is normally the same as the encoded value in

Table continues on the next page...

Field	Function
	PORT_LINK_CTRL_OFF. If you find that one of your used lanes is bad then you must reduce the value in this register. For more information, see "How to Tie Off Unused Lanes." For information on upsizing and downsizing the link width, see "Link Establishment." This field is reserved (fixed to '0') for M-PCIe. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.
7-0 FAST_TRAINING_SEQ	Sets the Number of Fast Training Sequences (N_FTS) that the controller advertises as its N_FTS during Gen2 or Gen3 link training. This value is used to inform the link partner about the PHY's ability to recover synchronization after a low power state. The number should be provided by the PHY vendor. Do not set N_FTS to zero; doing so can cause the LTSSM to go into the recovery state when exiting from L0s. This field is reserved (fixed to '0') for M-PCIe. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.

11.3.3.1.81 PHY Status Register. (PHY_STATUS_OFF)

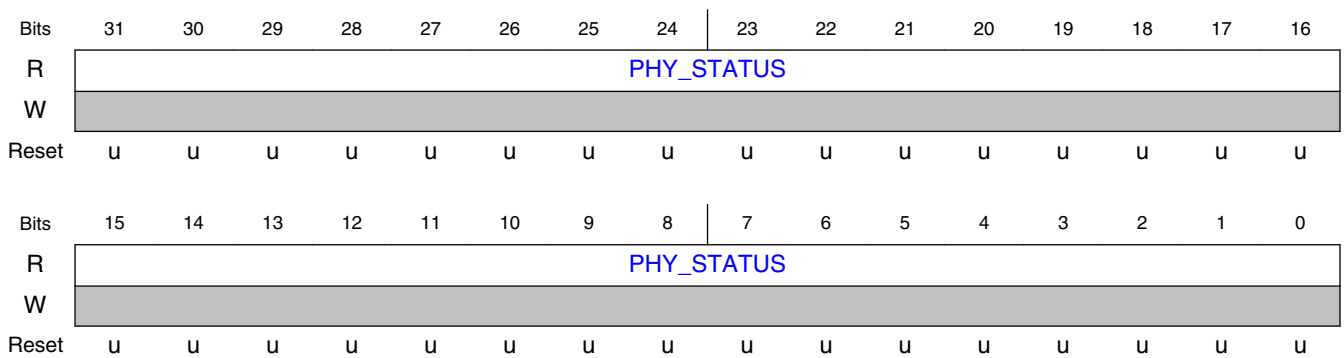
11.3.3.1.81.1 Offset

Register	Offset
PHY_STATUS_OFF	810h

11.3.3.1.81.2 Function

PHY Status Register. Memory mapped register from phy_cfg_status GPIO input pins.

11.3.3.1.81.3 Diagram



11.3.3.1.81.4 Fields

Field	Function
31-0 PHY_STATUS	PHY Status. Data received directly from the phy_cfg_status bus. These is a GPIO register reflecting the values on the static phy_cfg_status input signals. The usage is left completely to the user and does not in any way influence controller functionality. You can use it for any static sideband status signalling

Field	Function
	requirements that you have for your PHY. This field is reserved (fixed to '0') for M-PCIe. Note: This register field is sticky.

11.3.3.1.82 PHY Control Register. (PHY_CONTROL_OFF)

11.3.3.1.82.1 Offset

Register	Offset
PHY_CONTROL_OFF	814h

11.3.3.1.82.2 Function

PHY Control Register. Memory mapped register to cfg_phy_control GPIO output pins.

11.3.3.1.82.3 Diagram

11.3.3.1.82.4 Fields

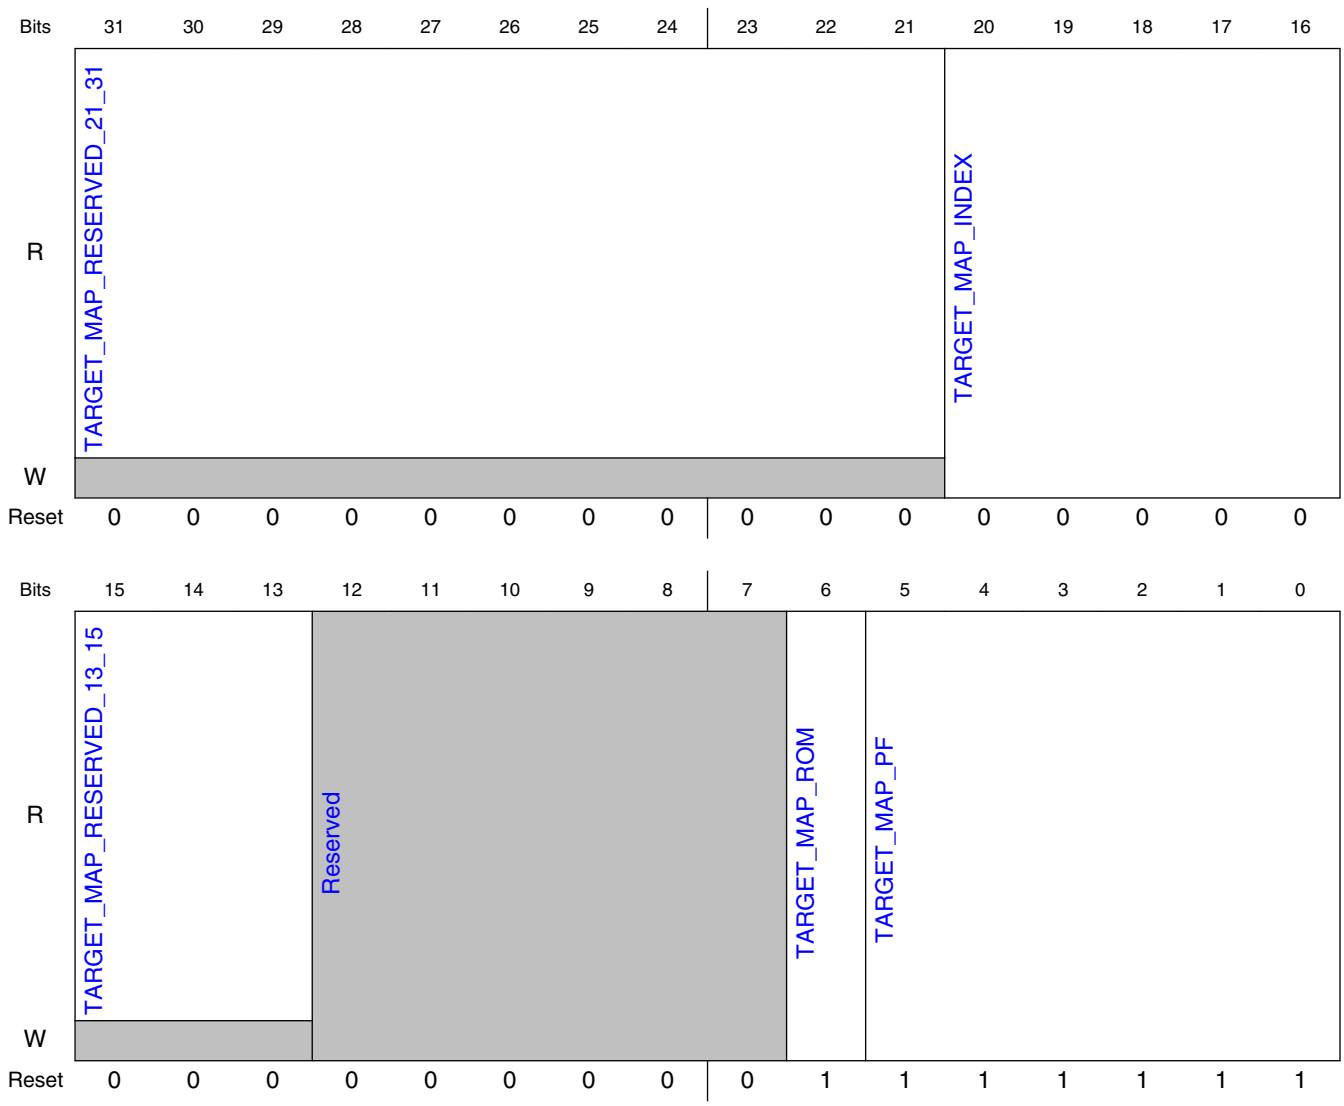
Field	Function
31-0 PHY_CONTROL	PHY Control. Data sent directly to the cfg_phy_control bus. These is a GPIO register driving the values on the static cfg_phy_control output signals. The usage is left completely to the user and does not in any way influence controller functionality. You can use it for any static sideband control signalling requirements that you have for your PHY. This field is reserved (fixed to '0') for M-PCIe. Note: This register field is sticky.

11.3.3.1.83 Programmable Target Map Control Register. (TRGT_MAP_CTRL_OFF)

11.3.3.1.83.1 Offset

Register	Offset
TRGT_MAP_CTRL_OFF	81Ch

11.3.3.1.83.2 Diagram



11.3.3.1.83.3 Fields

Field	Function
31-21 TARGET_MAP_RESERVED_21_31	Reserved. Note: The access attributes of this field are as follows: - Dbi: R (sticky)
20-16 TARGET_MAP_INDEX	The number of the PF Function on which the Target Values are set. This register does not respect the Byte Enable setting. any write will affect all register bits.
15-13 TARGET_MAP_RESERVED_13_15	Reserved. Note: The access attributes of this field are as follows: - Dbi: R (sticky)
12-7 —	Reserved.
6 TARGET_MAP_ROM	Target Value for the ROM page of the PF Function selected by the index number. This register does not respect the Byte Enable setting. any write will affect all register bits.
5-0 TARGET_MAP_PF	Target Values for each BAR on the PF Function selected by the index number. This register does not respect the Byte Enable setting. any write will affect all register bits.

11.3.3.1.84 Integrated MSI Reception Module (iMRM) Address Register. (MSI_CTRL_ADDR_OFF)

11.3.3.1.84.1 Offset

Register	Offset
MSI_CTRL_ADDR_OFF	820h

11.3.3.1.84.3 Fields

Field	Function
31-0 MSI_CTRL_ADDR	Integrated MSI Reception Module Address. System specified address for MSI memory write transaction termination. Within the AXI Bridge, every received Memory Write request is examined to see if it targets the MSI Address that has been specified in this register; and also to see if it satisfies the definition of an MSI interrupt request. When these conditions are satisfied the Memory Write request is marked as an MSI request. Note: This register field is sticky.

11.3.3.1.85 Integrated MSI Reception Module Upper Address Register. (MSI_CTRL_UPPER_ADDR_OFF)

11.3.3.1.85.1 Offset

Register	Offset
MSI_CTRL_UPPER_ADDR_OFF	824h

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

11.3.3.1.110.3 Fields

Field	Function
31-0 MSI_GPIO_REG	MSI GPIO Register. The contents of this register drives the top-level GPIO msi_ctrl_io[31:0] Note: This register field is sticky.

11.3.3.1.111 RADM clock gating enable control register. (CLOCK_GATING_CTRL_OFF)

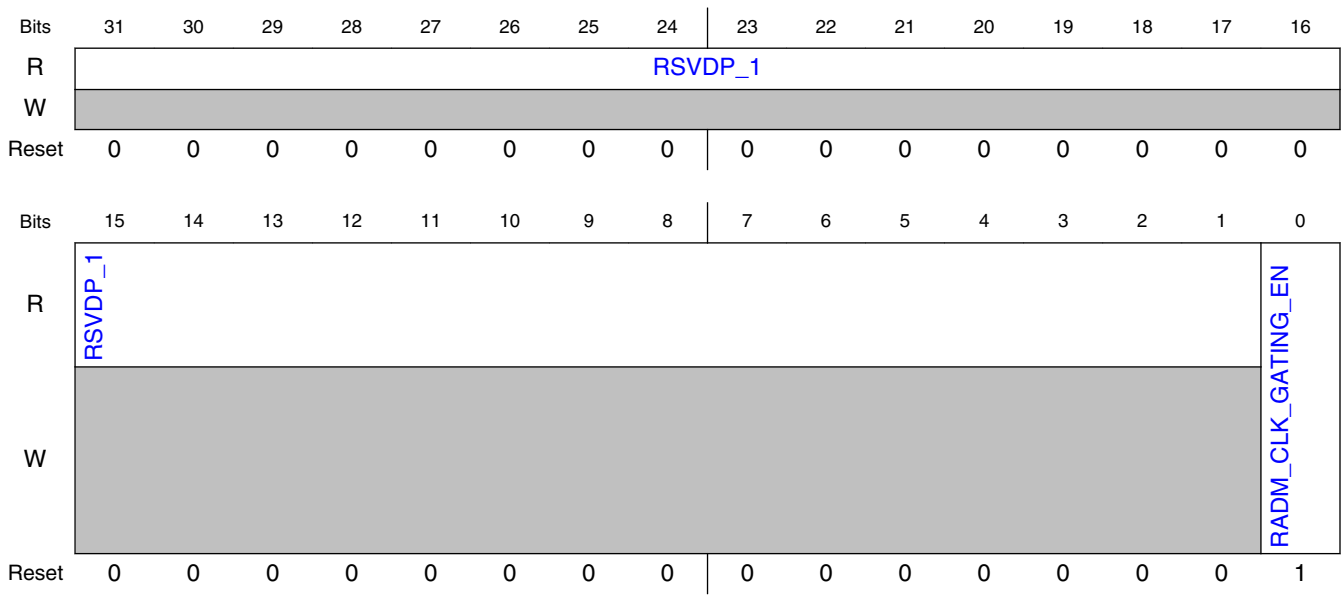
11.3.3.1.111.1 Offset

Register	Offset
CLOCK_GATING_CTRL_OFF	88Ch

11.3.3.1.111.2 Function

RADM clock gating enable control register. Using this register you can disable the RADM clock gating feature. The DWC_pcie_clk_rst.v modules uses the en_radm_clk_g output to gate core_clk and create the radm_clk_g clock input. The controller de-asserts the en_radm_clk_g output when there is no Rx traffic, Rx queues and pre/post-queue pipelines are empty, RADM completion LUT is empty, and there are no FLR actions pending. You must set the RADM_CLK_GATING_EN field to enable this functionality; otherwise the en_radm_clk_g output will always be set to '1'.

11.3.3.1.111.3 Diagram



11.3.3.1.111.4 Fields

Field	Function
31-1 RSVDP_1	Reserved for future use.
0 RADM_CLK_GATING_EN	Enable Radm clock gating feature. - 0: Disable - 1: Enable(default)

11.3.3.1.112 Order Rule Control Register. (ORDER_RULE_CTRL_OFF)

11.3.3.1.112.1 Offset

Register	Offset
ORDER_RULE_CTRL_OFF	8B4h

11.3.3.1.112.3 Fields

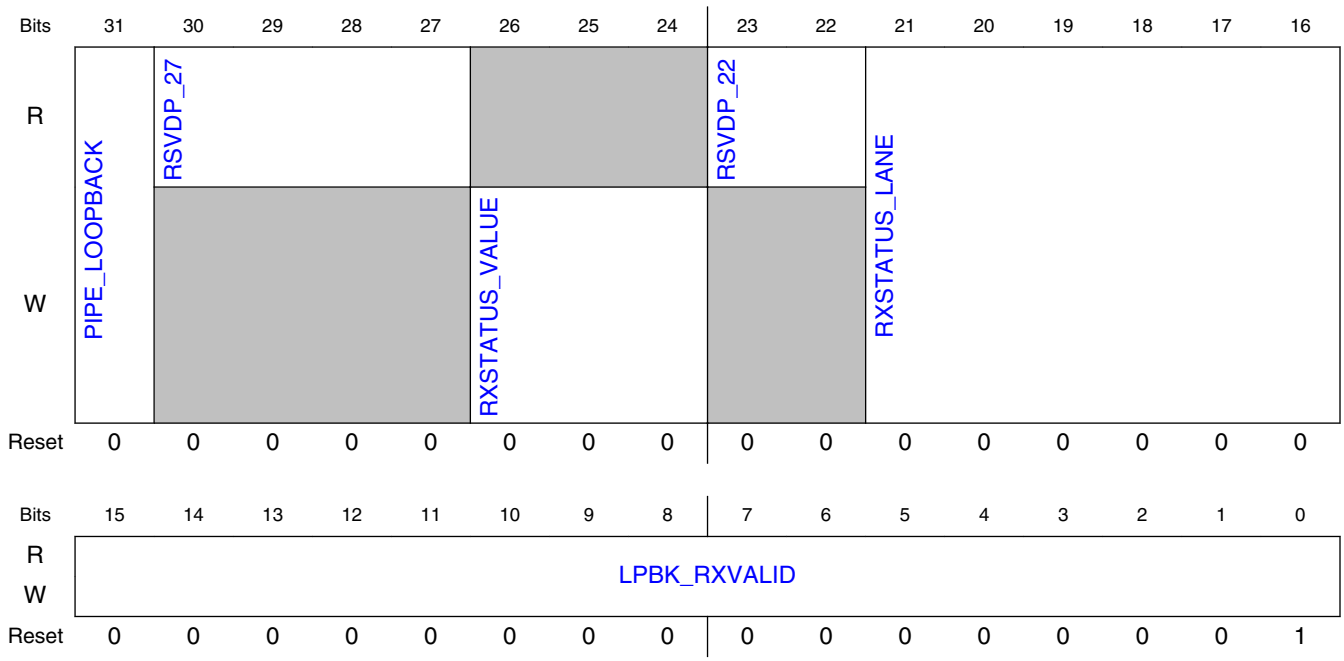
Field	Function
31-16 RSVDP_16	Reserved for future use.
15-8 CPL_PASS_P	Completion Passing Posted Ordering Rule Control. Determines if CPL can pass halted P queue. - 0: CPL can not pass P (recommended) - 1: CPL can pass P
7-0 NP_PASS_P	Non-Posted Passing Posted Ordering Rule Control. Determines if NP can pass halted P queue. - 0 : NP can not pass P (recommended). - 1 : NP can pass P

11.3.3.1.113 PIPE Loopback Control Register. (PIPE_LOOPBACK_CONTROL_OFF)

11.3.3.1.113.1 Offset

Register	Offset
PIPE_LOOPBACK_CONTROL_OFF	8B8h

11.3.3.1.113.2 Diagram



11.3.3.1.113.3 Fields

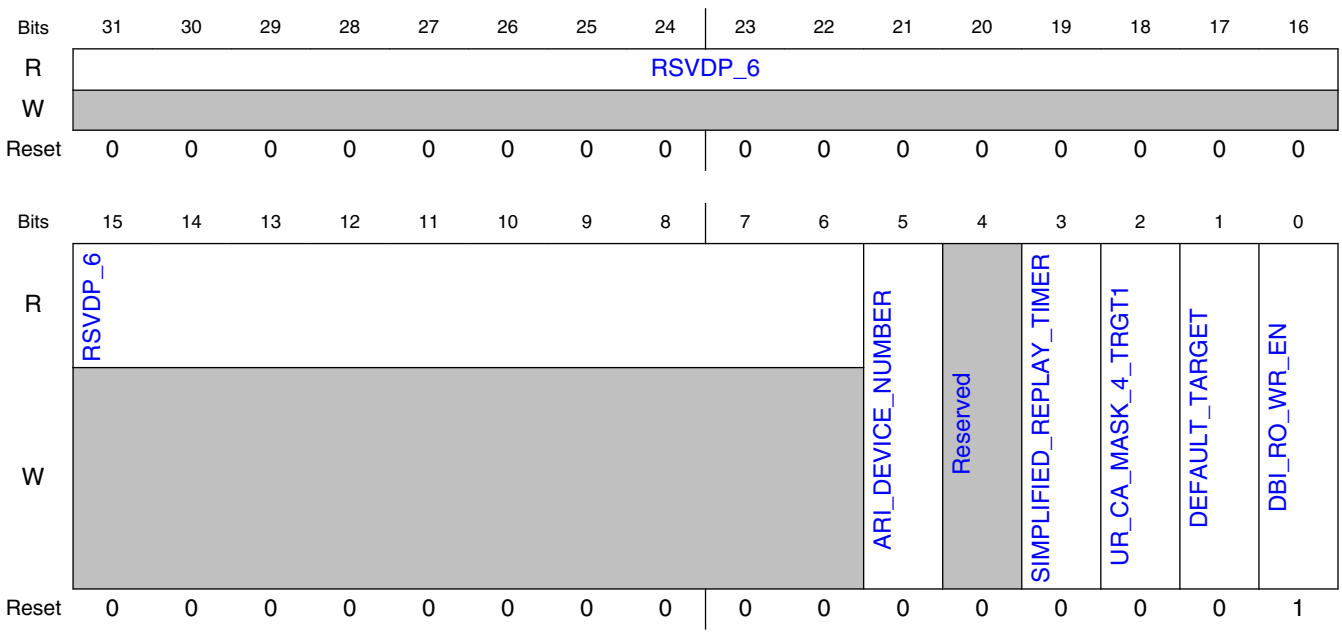
Field	Function
31 PIPE_LOOPBACK	PIPE Loopback Enable. Indicates RMMI Loopback if M-PCIe. Note: This register field is sticky.
30-27 RSVDP_27	Reserved for future use.
26-24 RXSTATUS_VALUE	RXSTATUS_VALUE is an internally reserved field. Do not use.
23-22 RSVDP_22	Reserved for future use.
21-16 RXSTATUS_LANE	RXSTATUS_LANE is an internally reserved field. Do not use. Note: This register field is sticky.
15-0 LPBK_RXVALID	LPBK_RXVALID is an internally reserved field. Do not use. Note: This register field is sticky.

11.3.3.1.114 DBI Read-Only Write Enable Register. (MISC_CONTROL_1_OFF)

11.3.3.1.114.1 Offset

Register	Offset
MISC_CONTROL_1_OFF	8BCh

11.3.3.1.114.2 Diagram



11.3.3.1.114.3 Fields

Field	Function
31-6 RSVDP_6	Reserved for future use.
5 ARI_DEVICE_NUMBER	When ARI is enabled, this field enables use of the device ID. Note: This register field is sticky.
4 —	Reserved.
3	Enables Simplified Replay Timer (Gen4). For more details, see "Transmit Replay" in the Controller Operations chapter of the Databook. Simplified Replay Timer Values are: - A value from 24,000 to 31,000

Table continues on the next page...

Field	Function
SIMPLIFIED_REPLAY_TIMER	Symbol Times when Extended Synch is 0b. - A value from 80,000 to 100,000 Symbol Times when Extended Synch is 1b. Must not be changed while link is in use. Note: This register field is sticky.
2 UR_CA_MASK_4_TRGT1	This field only applies to request TLPs (with UR filtering status) that you have chosen to forward to the application (when you set DEFAULT_TARGET in this register). - When you set this field to '1', the core suppresses error logging, Error Message generation, and CPL generation (for non-posted requests). Note: This register field is sticky.
1 DEFAULT_TARGET	Default target a received IO or MEM request with UR/CA/CRS is sent to by the controller. - 0: The controller drops all incoming I/O or MEM requests (after corresponding error reporting). A completion with UR status will be generated for non-posted requests. - 1: The controller forwards all incoming I/O or MEM requests with UR/CA/CRS status to your application. Note: This register field is sticky.
0 DBI_RO_WR_EN	Write to RO Registers Using DBI. When you set this field to "1", then some RO and HwInit bits are writable from the local application through the DBI. Note: This register field is sticky.

11.3.3.1.115 UpConfigure Multi-lane Control Register. (MULTI_LANE_CONTROL_OFF)

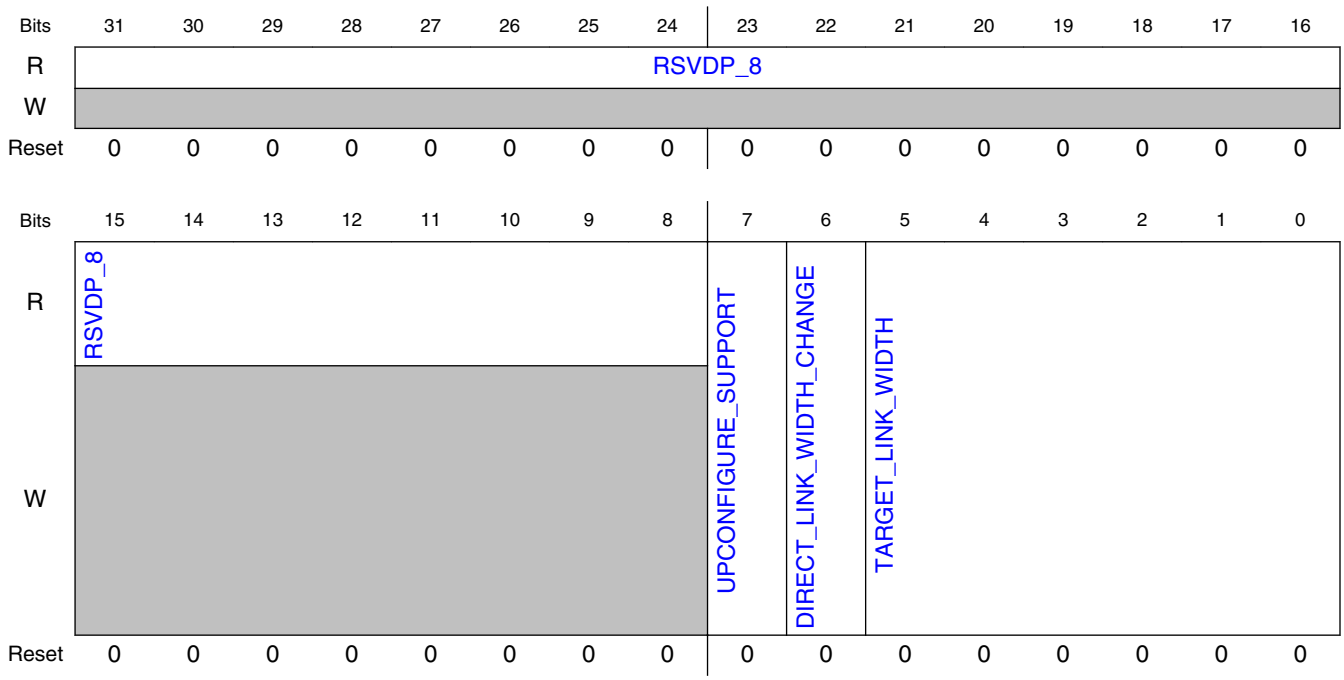
11.3.3.1.115.1 Offset

Register	Offset
MULTI_LANE_CONTROL_OFF	8C0h

11.3.3.1.115.2 Function

UpConfigure Multi-lane Control Register. Used when upsizing or downsizing the link width through Configuration state without bringing the link down. For more details, see the "Link Establishment" section in the "Controller Operations" chapter of the Databook.

11.3.3.1.115.3 Diagram



11.3.3.1.115.4 Fields

Field	Function
31-8 RSVDP_8	Reserved for future use.
7 UPCONFIGURE_SUPPORT	Upconfigure Support. The controller sends this value as the Link Upconfigure Capability in TS2 Ordered Sets in Configuration.Complete state. This field is reserved (fixed to '0') for M-PCIe. Note: This register field is sticky.
6 DIRECT_LINK_WIDTH_CHANGE	Directed Link Width Change. The controller always moves to Configuration state through Recovery state when this bit is set to '1'. - If the upconfigure_capable variable is '1' and the PCIE_CAP_HW_AUTO_WIDTH_DISABLE bit in LINK_CONTROL_LINK_STATUS_REG is '0', the controller starts upconfigure or autonomous width downsizing (to the TARGET_LINK_WIDTH value) in the Configuration state. - If TARGET_LINK_WIDTH value is 0x0, the controller does not start upconfigure or autonomous width downsizing in the Configuration state. The controller self-clears this field when the controller accepts this request. This field is reserved (fixed to '0') for M-PCIe.
5-0 TARGET_LINK_WIDTH	Target Link Width. Values correspond to: - 6'b000000: Core does not start upconfigure or autonomous width downsizing in the Configuration state. - 6'b000001: x1 - 6'b000010: x2 - 6'b000100: x4 - 6'b001000: x8 - 6'b010000: x16 - 6'b100000: x32 This field is reserved (fixed to '0') for M-PCIe.

11.3.3.1.116 PHY Interoperability Control Register. (PHY_INTEROP_CTRL_OFF)

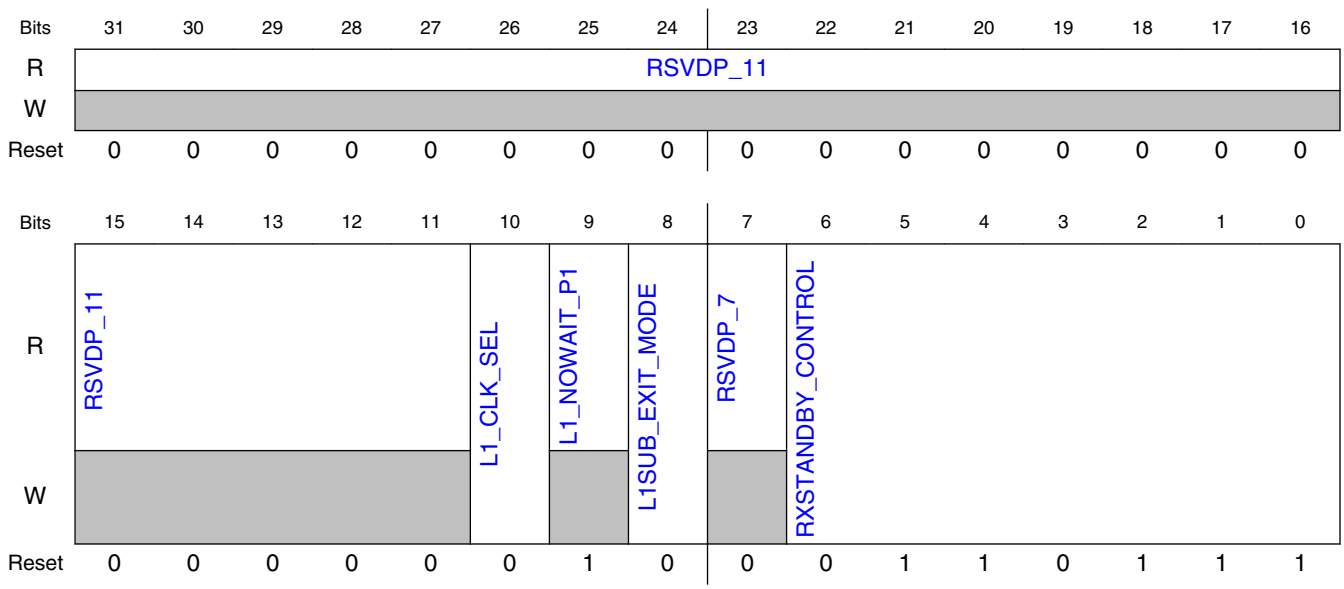
11.3.3.1.116.1 Offset

Register	Offset
PHY_INTEROP_CTRL_OFF	8C4h

11.3.3.1.116.2 Function

PHY Interoperability Control Register. This register is reserved for internal use. You should not write to this register and change the default unless specifically instructed by Synopsys support.

11.3.3.1.116.3 Diagram



11.3.3.1.116.4 Fields

Field	Function
31-11 RSVDP_11	Reserved for future use.
10 L1_CLK_SEL	L1 Clock control bit. - 1: Controller does not request aux_clk switch and core_clk gating in L1. - 0: Controller requests aux_clk switch and core_clk gating in L1. Note: This register field is sticky.
9 L1_NOWAIT_P1	L1 entry control bit. - 1: Core does not wait for PHY to acknowledge transition to P1 before entering L1. - 0: Core waits for the PHY to acknowledge transition to P1 before entering L1. Note: The access attributes of this field are as follows: - Dbi: R/W (sticky) Note: This register field is sticky.

Table continues on the next page...

Field	Function
8 L1SUB_EXIT_MODE	L1 Exit Control Using phy_mac_pclkack_n. - 1: Core exits L1 without waiting for the PHY to assert phy_mac_pclkack_n. - 0: Core waits for the PHY to assert phy_mac_pclkack_n before exiting L1. Note: This register field is sticky.
7 RSVDP_7	Reserved for future use.
6-0 RXSTANDBY_CONTROL	Rxstandby Control. Bits 0..5 determine if the controller asserts the RxStandby signal (mac_phy_rxstandby) in the indicated condition. Bit 6 enables the controller to perform the RxStandby/ RxStandbyStatus handshake. - [0]: Rx EIOS and subsequent T TX-IDLE-MIN - [1]: Rate Change - [2]: Inactive lane for upconfigure/downconfigure - [3]: PowerDown=P1orP2 - [4]: RxL0s.Idle - [5]: EI Infer in L0 - [6]: Execute RxStandby/RxStandbyStatus Handshake This field is reserved (fixed to '0') for M-PCIe. Note: This register field is sticky.

11.3.3.1.117 TRGT_CPL_LUT Delete Entry Control register. (TRGT_CPL_LUT_DELETE_ENTRY_OFF)

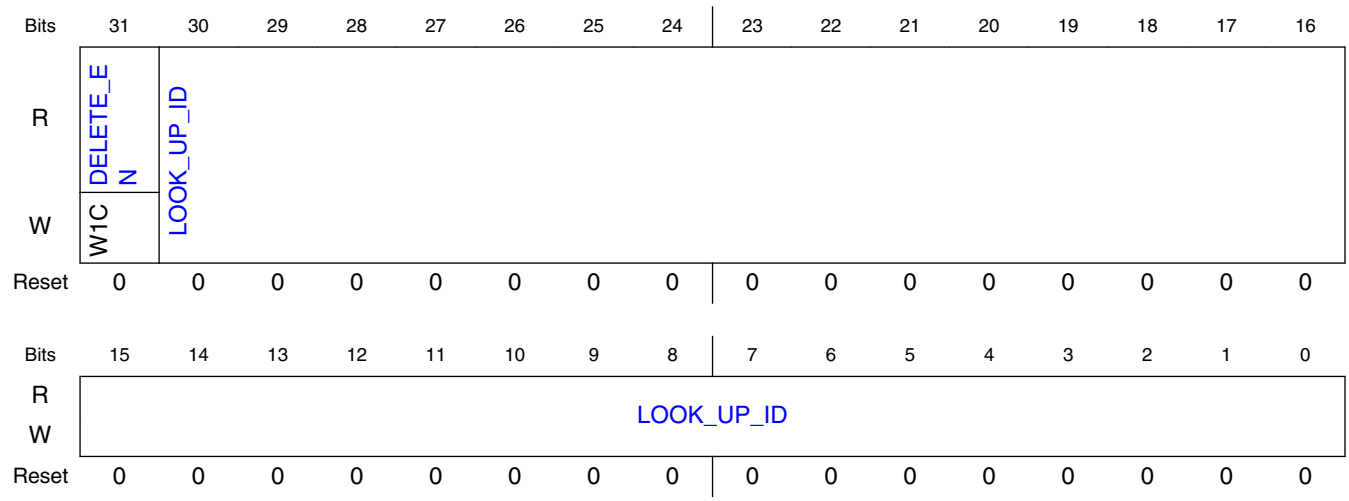
11.3.3.1.117.1 Offset

Register	Offset
TRGT_CPL_LUT_DELETE_ENTRY_OFF	8C8h

11.3.3.1.117.2 Function

TRGT_CPL_LUT Delete Entry Control register. Using this register you can delete one entry in the target completion LUT. You should only use this register when you know that your application will never send the completion because of an FLR or any other reason. Note:: The target completion LUT (and associated target completion timeout event) is watching for completions (from your application on XALI0/1/2 or AXI master read channel) corresponding to previously received non-posted requests from the PCIe wire.

11.3.3.1.117.3 Diagram



11.3.3.1.117.4 Fields

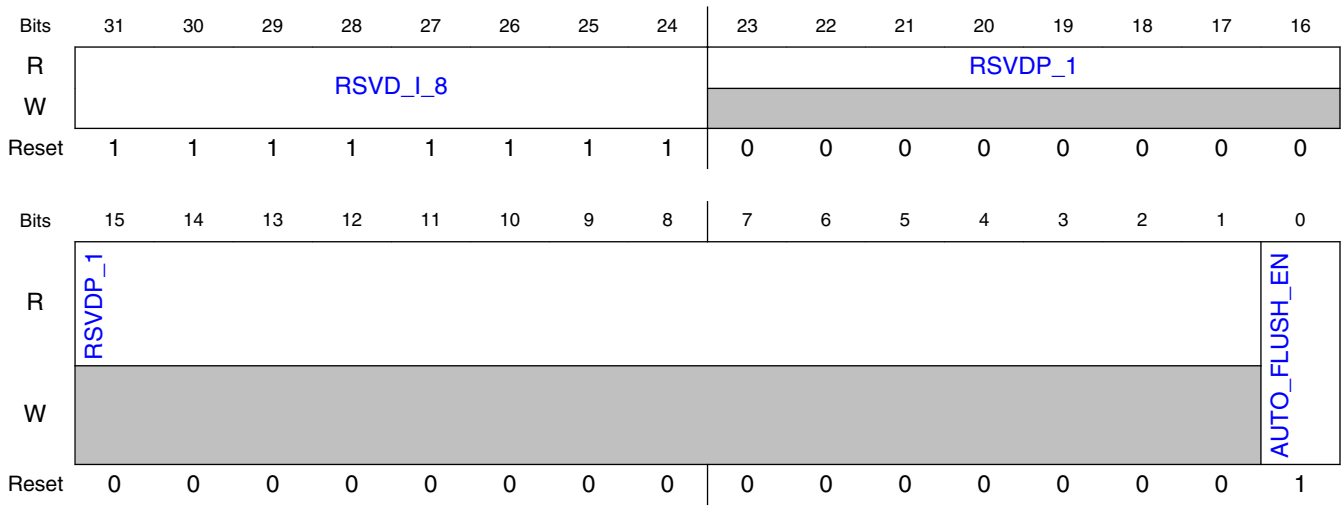
Field	Function
31 DELETE_EN	This is a one-shot bit. A '1' write to this bit triggers the deletion of the target completion LUT entry that is specified in the LOOK_UP_ID field. This is a self-clearing register field. Reading from this register field always returns a '0'.
30-0 LOOK_UP_ID	This number selects one entry to delete of the TRGT_CPL_LUT.

11.3.3.1.118 Link Reset Request Flush Control Register. (LINK_FLUSH_CONTROL_OFF)

11.3.3.1.118.1 Offset

Register	Offset
LINK_FLUSH_CONTROL_OFF	8CCh

11.3.3.1.118.2 Diagram



11.3.3.1.118.3 Fields

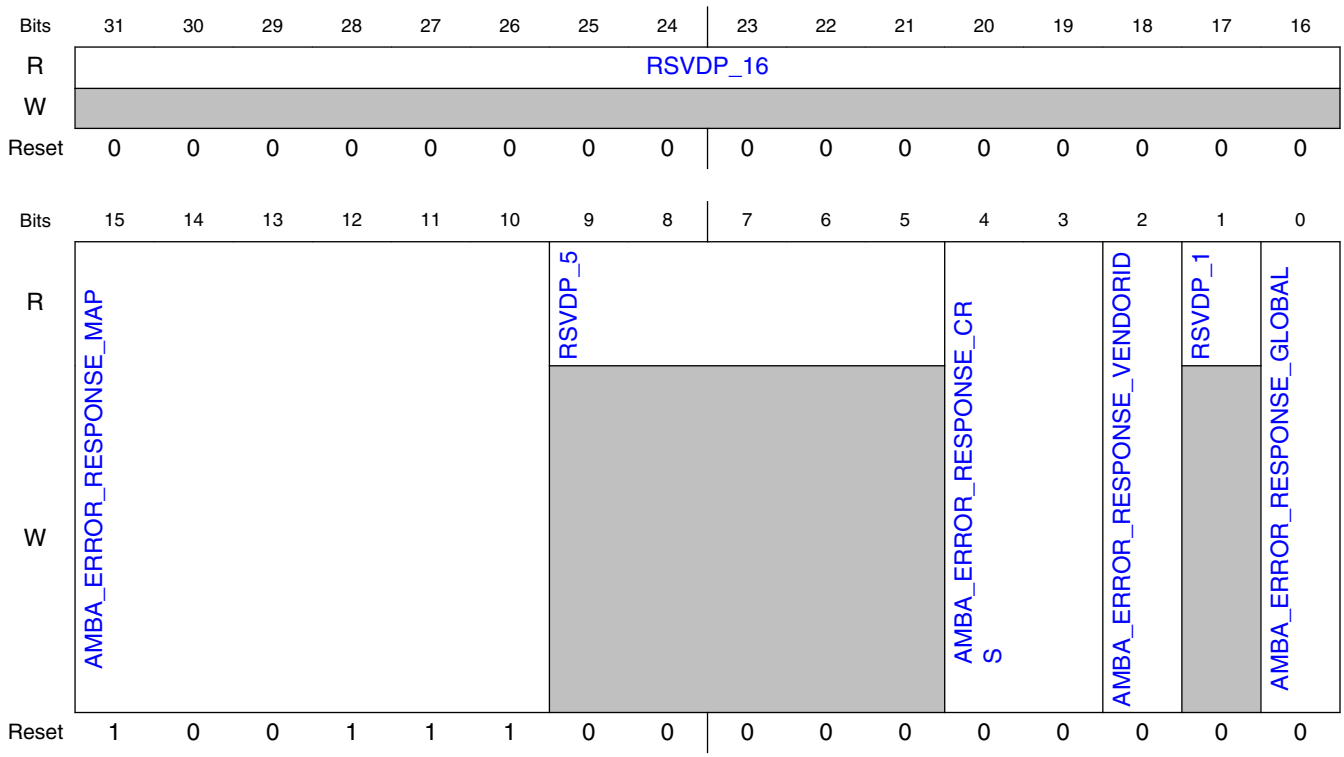
Field	Function
31-24 RSVD_I_8	This is an internally reserved field. Do not use. Note: This register field is sticky.
23-1 RSVDP_1	Reserved for future use.
0 AUTO_FLUSH_EN	Enables automatic flushing of pending requests before sending the reset request to the application logic to reset the PCIe controller and the AXI Bridge. The flushing process is initiated if any of the following events occur: - Hot reset request. A downstream port (DSP) can "hot reset" an upstream port (USP) by sending two consecutive TS1 ordered sets with the hot reset bit asserted. - Warm (Soft) reset request. Generated when exiting from D3 to D0 and cfg_pm_no_soft_rst=0. - Link down reset request. A high to low transition on smlh_req_rst_not indicates the link has gone down and the controller is requesting a reset. If you disable automatic flushing, your application is responsible for resetting the PCIe controller and the AXI Bridge. For more details see "Warm and Hot Resets" section in the Architecture chapter of the Databook. Note: This register field is sticky.

11.3.3.1.119 AXI Bridge Slave Error Response Register. (AMBA_ERROR_RESPONSE_DEFAULT_OFF)

11.3.3.1.119.1 Offset

Register	Offset
AMBA_ERROR_RESPONSE_DEFAULT_OFF	8D0h

11.3.3.1.119.2 Diagram



11.3.3.1.119.3 Fields

Field	Function
31-16 RSVDP_16	Reserved for future use.
15-10 AMBA_ERROR_RESPONSE_MAP	AXI Slave Response Error Map. Allows you to selectively map the errors received from the PCIe completion (for non-posted requests) to the AXI slave responses, slv_rresp or slv_bresp. The recommended setting is SLVERR. CRS is always mapped to OKAY. - [0] -- 0: UR (unsupported request) -> DECERR -- 1: UR (unsupported request) -> SLVERR - [1] -- 0: CRS (configuration retry status) -> DECERR -- 1: CRS (configuration retry status) -> SLVERR - [2] -- 0: CA (completer abort) -> DECERR -- 1: CA (completer abort) -> SLVERR - [3]: Reserved - [4]: Reserved - [5]: -- 0: Completion Timeout -> DECERR -- 1: Completion Timeout -> SLVERR The AXI bridge internally drops (processes internally but not passed to your application) a completion that has been marked by the Rx filter as UC or MLF, and does not pass its status directly down to the slave interface. It waits for a timeout and then signals "Completion Timeout" to the slave interface. The controller sets the AXI slave read databus to 0xFFFF for all error responses. Note: This register field is sticky.
9-5 RSVDP_5	Reserved for future use.
4-3 AMBA_ERROR_RESPONSE_CRS	CRS Slave Error Response Mapping. Determines the AXI slave response for CRS completions. For more details see "Error Handling" in the AXI chapter of the Databook. AHB: - always returns OKAY AXI: - 00: OKAY - 01: OKAY with all FFFF_FFFF data for all CRS completions - 10: OKAY with FFFF_0001 data for CRS completions to vendor ID read requests, OKAY with FFFF_FFFF data for all other CRS completions - 11: SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) Note: This register field is sticky.

Table continues on the next page...

Field	Function
2 AMBA_ERROR_RESPONSE_VENDORID	Vendor ID Non-existent Slave Error Response Mapping. Determines the AXI slave response for errors on reads to non-existent Vendor ID register. For more details see "Error Handling" in the AXI chapter of the Databook. AHB: - 0: OKAY (with FFFF data). The controller ignores the setting in the bit when bit 0 of this register is '0'. - 1: ERROR AXI: - 0: OKAY (with FFFF data). - 1: SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) Note: This register field is sticky.
1 RSVDP_1	Reserved for future use.
0 AMBA_ERROR_RESPONSE_GLOBAL	Global Slave Error Response Mapping. Determines the AXI slave response for all error scenarios on non-posted requests. For more details see "Error Handling" in the AXI chapter of the Databook. AHB: - 0: OKAY (with FFFF data for non-posted requests) and ignore the setting in bit [2] of this register. - 1: ERROR for normal link (data) accesses and look at bit [2] for other scenarios. AXI: - 0: OKAY (with FFFF data for non-posted requests) - 1: SLVERR/DECERR (the AXI_ERROR_RESPONSE_MAP field determines the PCIe-to-AXI Slave error response mapping) The error response mapping is not applicable to Non-existent Vendor ID register reads. Note: This register field is sticky.

11.3.3.1.120 Link Down AXI Bridge Slave Timeout Register. (AMBA_LINK_TIMEOUT_OFF)

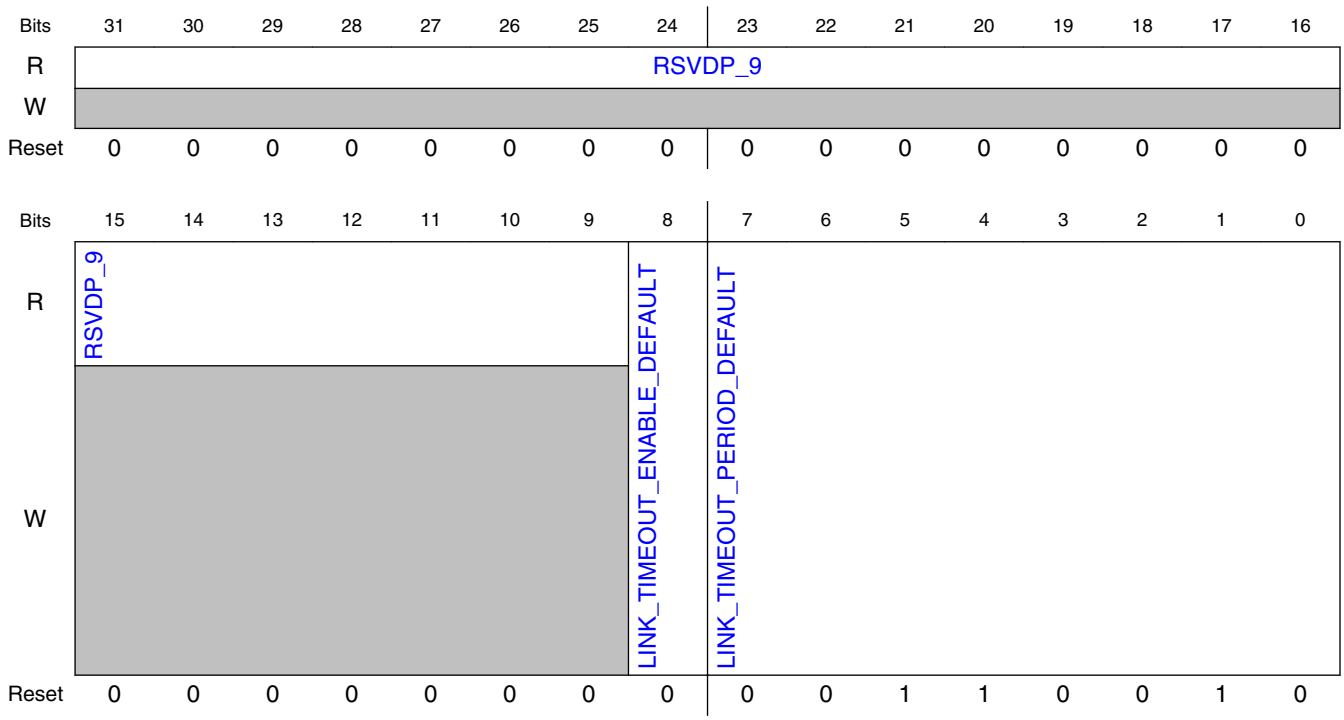
11.3.3.1.120.1 Offset

Register	Offset
AMBA_LINK_TIMEOUT_OFF	8D4h

11.3.3.1.120.2 Function

Link Down AXI Bridge Slave Timeout Register. If your application AXI master issues outbound requests to the AXI bridge slave interface before the PCIe link is operational, the controller starts a "flush" timer. The timeout value of the timer is set by this register. The timer will timeout and then flush the bridge TX request queues after this amount of time. The timer counts when there are pending outbound AXI slave interface (or DMA) requests and the PCIe TX link is not transmitting any of these requests. For more details, see the "AXI Bridge Initialization, Clocking and Reset" section in the AXI chapter of the Databook.

11.3.3.1.120.3 Diagram



11.3.3.1.120.4 Fields

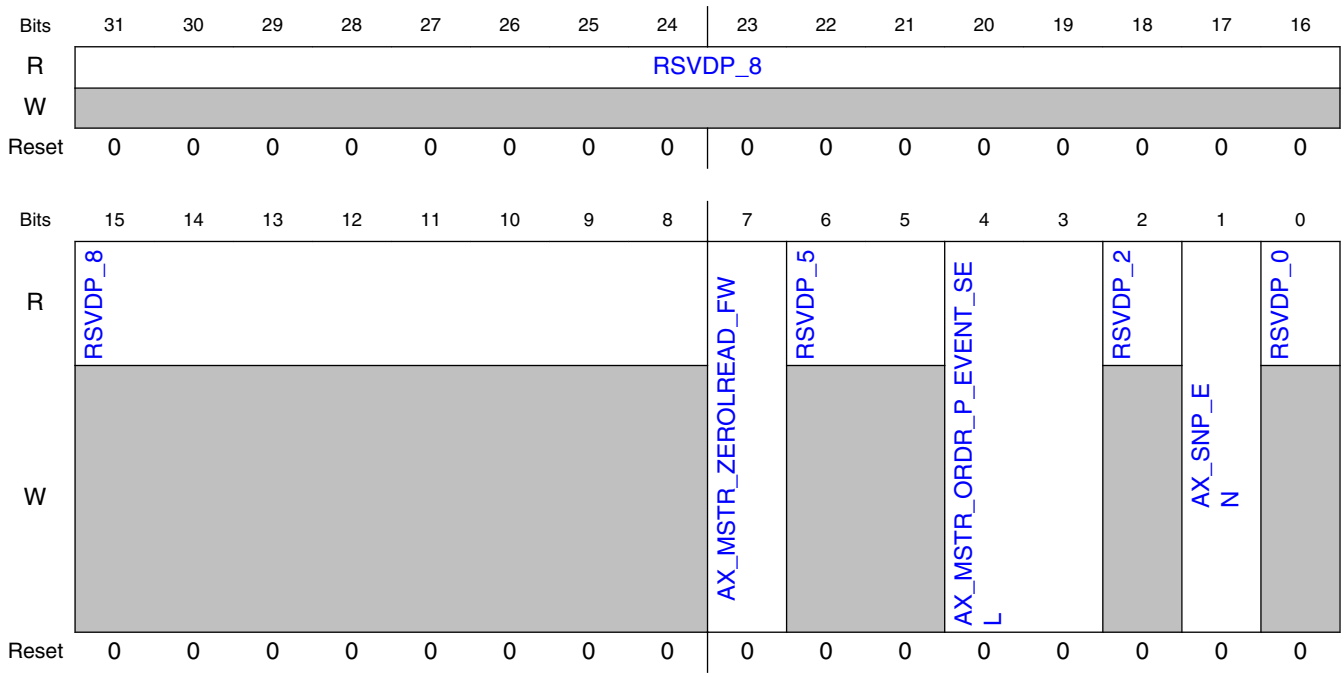
Field	Function
31-9 RSVDP_9	Reserved for future use.
8 LINK_TIMEOUT_ENABLE_DEFAULT	Disable Flush. You can disable the flush feature by setting this field to "1". Note: This register field is sticky.
7-0 LINK_TIMEOUT_PERIOD_DEFAULT	Timeout Value (ms). The timer will timeout and then flush the bridge TX request queues after this amount of time. The timer counts when there are pending outbound AXI slave interface requests and the PCIe TX link is not transmitting any of these requests. The timer is clocked by core_clk. For an M-PCIe configuration: - Time unit of this field is 4 ms. - Margin of error for RateA clock is < 1%. - Margin of error for RateB clock is between 16% and 17%. Note: This register field is sticky.

11.3.3.1.121 AMBA Ordering Control. (AMBA_ORDERING_CTRL_OFF)

11.3.3.1.121.1 Offset

Register	Offset
AMBA_ORDERING_CTRL_OFF	8D8h

11.3.3.1.121.2 Diagram



11.3.3.1.121.3 Fields

Field	Function
31-8 RSVDP_8	Reserved for future use.
7 AX_MSTR_ZEROLREAD_FW	AXI Master Zero Length Read Forward to the application. The DW PCIe controller AXI bridge is able to terminate in order with the Posted transactions the zero length read, implementing the PCIe express flush semantics of the Posted transactions. - 0x0: The zero length Read is terminated at the DW PCIe AXI bridge master - 0x1: The zero length Read is forward to the application.
6-5 RSVDP_5	Reserved for future use.
4-3 AX_MSTR_ORDR_P_EVENT_SEL	AXI Master Posted Ordering Event Selector. This field selects how the master interface determines when a P write is completed when enforcing the PCIe ordering rule, "NP must not pass P" at the AXI Master Interface. The AXI protocol does not support ordering between channels. Therefore, NP reads can pass P on your AXI bus fabric. This can result in an ordering violation when the read overtakes a P that is going to the same address. Therefore, the bridge master does not issue any NP requests until all outstanding P writes reach their destination. It does this by waiting for the all of the write responses on

Table continues on the next page...

Field	Function
	the B channel. This can affect the performance of the master read channel. For scenarios where the interconnect serializes the AXI master "AW", "W" and "AR" channels,you can increase the performance by reducing the need to wait until the complete Posted transaction has effectively reached the application slave. - 00: B'last event: wait for the all of the write responses on the B channel thereby ensuring that the complete Posted transaction has effectively reached the application slave (default). - 01: AW'last event: wait until the complete Posted transaction has left the AXI address channel at the bridge master. - 10: W'last event: wait until the complete Posted transaction has left the AXI data channel at the bridge master. - 11: Reserved Note 2: This setting will not affect: - MSI interrupt catcher and P data ordering. This is always driven by the B'last event. - DMA read engine TLP ordering. This is always driven by the B'last event. - NP write transactions which are always serialized with P write transactions.
2 RSVDP_2	Reserved for future use.
1 AX_SNP_EN	AXI Serialize Non-Posted Requests Enable. This field enables the AXI Bridge to serialize same ID Non-Posted Read/Write Requests on the wire. Serialization implies one outstanding same ID NP Read or Write on the wire and used to avoid AXI RAR and WAW hazards at the remote link partner. For more details, see the "Optional Serialization of AXI Slave Non-posted Requests" section in the AXI chapter of the Databook.
0 RSVDP_0	Reserved for future use.

30-27 CFG_MSTR_AWCACHE_VALUE	Master Write CACHE Signal Value. Value of the individual bits in mstr_awcache when CFG_MSTR_AWCACHE_MODE is '1'. Note: not applicable to message requests; for message requests the value of mstr_awcache is always "0000" Note: This register field is sticky.
26-23 —	Reserved.
22-19 CFG_MSTR_ARCACHE_VALUE	Master Read CACHE Signal Value. Value of the individual bits in mstr_arcache when CFG_MSTR_ARCACHE_MODE is '1'. Note: This register field is sticky.
18-15	Reserved.

Table continues on the next page...

Field	Function
—	
14-11 CFG_MSTR_AWCACHE_MODE	Master Write CACHE Signal Behavior. Defines how the individual bits in mstr_awcache are controlled: - 0: set automatically by the AXI master - 1: set by the value of the corresponding bit of the CFG_MSTR_AWCACHE_VALUE field Note: for message requests the value of mstr_awcache is always "0000" regardless of the value of this bit Note: This register field is sticky.
10-7 —	Reserved.
6-3 CFG_MSTR_ARCACHE_MODE	Master Read CACHE Signal Behavior. Defines how the individual bits in mstr_arcache are controlled: - 0: set automatically by the AXI master - 1: set by the value of the corresponding bit of the CFG_MSTR_ARCACHE_VALUE field Note: This register field is sticky.
2-0 —	Reserved.

11.3.3.1.125 Lower 20 bits of the programmable AXI address where Messages coming from wire are mapped to. (AXI_MSTR_MSG_ADDR_LOW_OFF)

11.3.3.1.125.1 Offset

Register	Offset
AXI_MSTR_MSG_ADDR_LOW_OFF	8F0h

11.3.3.1.125.2 Function

Lower 20 bits of the programmable AXI address where Messages coming from wire are mapped to. Bits [11:0] of the register are tied to zero for the address to be 4k-aligned. In previous releases, the third and fourth DWORDs of a message (Msg/MsgD) TLP header were delivered though the AXI master address bus (mstr_awaddr). These DWORDS are now supplied through the mstr_awmisc_info_hdr_34dw[63:0] output; and the value on mstr_awaddr is driven to the value you have programmed into the AXI_MSTR_MSG_ADDR_LOW_OFF and AXI_MSTR_MSG_ADDR_HIGH_OFF registers.

11.3.3.1.129.3 Fields

Field	Function
31-10 RSVDP_10	Reserved for future use.
9-0 AUX_CLK_FREQ	The aux_clk frequency in MHz. This value is used to provide a 1 us reference for counting time during low-power states with aux_clk when the PHY has removed the pipe_clk. Frequencies lower than 1 MHz are possible but with a loss of accuracy in the time counted. If the actual frequency (f) of aux_clk does not exactly match the programmed frequency (f_prog), then there is an error in the time counted by the controller that can be expressed in percentage as: err% = (f_prog/f-1)*100. For example if f=2.5 MHz and f_prog=3 MHz, then err% =(3/2.5-1)*100 =20%, meaning that the time counted by the controller on aux_clk will be 20% greater than the time in us programmed in the corresponding time register (for example T_POWER_ON). Note: This register field is sticky.

11.3.3.1.130 L1 Substates Timing Register. (L1_SUBSTATES_OFF)

11.3.3.1.130.1 Offset

Register	Offset
L1_SUBSTATES_OFF	B44h

R W	TAG								MSG_CODE							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

11.3.3.1.132.3 Fields

Field	Function
31 REGION_EN	Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky.
30 —	Reserved.
29 INVERT_MODE	Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). Note: This register field is sticky.
28 CFG_SHIFT_MODE	CFG Shift Mode. The iATU uses bits [27:12] of the untranslated address (on the XALI0/1/2 interface or AXI slave interface address) to form the BDF number of the outgoing CFG TLP. This supports the Enhanced Configuration Address Mapping (ECAM) mechanism (Section 7.2.2 of the PCI Express Base 3.1 Specification, revision 1.0) by allowing all outgoing I/O and MEM TLPs (that have been translated to CFG) to be mapped from memory space into any 256 MB region of the PCIe configuration space. Note: This register field is sticky.
27 DMA_BYPASS	DMA Bypass Mode. Allows request TLPs which are initiated by the DMA controller to pass through the iATU untranslated. Note: This field is reserved for the SW product. You must set it to '0'. Note: This register field is sticky.
26-24 —	Reserved.
23 HEADER_SUBSTITUTE_EN	Header Substitute Enable. When enabled and region address is matched, the iATU fully substitutes bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header with the contents of the LWR_TARGET_RW field in IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i. - 1: LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register is used to fill bytes 8-to-11 (for 3 DWORD header) or bytes 12-to-15 (for 4 DWORD header) of the translated TLP header. - 0: LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register forms the new address of the translated region. Note: This register field is sticky.
22 INHIBIT_PAYLOAD	Inhibit TLP Payload Data for TLP's in Matched Region; assign iATU region to be TLP without data. When enabled and region address is matched, the iATU marks all TLPs as having no payload data by forcing the TLP header Fmt[1] bit =0, regardless of the application inputs such as slv_wstrb. - 1: Fmt[1] =0 so that only TLP type without data is sent. For example, a Msg instead of MsgD will be sent. - 0: Fmt[1] =0/1 so that TLPs with or without data can be sent. Note: This register field is sticky.
21 —	Reserved.
20 SNP	Serialize Non-Posted Requests. In this mode, when the AXI Bridge is populated, same AXI ID Non-Posted Read/Write Requests are transmitted on the wire if there are no other same ID Non-Posted Requests outstanding. Note: This register field is sticky.
19 FUNC_BYPASS	Function Number Translation Bypass. In this mode, the function number of the translated TLP is taken from your application transmit interface and not from the CTRL_1_FUNC_NUM field of the "iATU Control 1 Register" or the VF_NUMBER field of the "iATU Control 3 Register." Note: This register field is sticky.
18-17 —	Reserved.
16 TAG_SUBSTITUTE_EN	TAG Substitute Enable. When enabled and region address is matched, the iATU substitutes the TAG field of the outbound TLP header with the contents of the TAG field in this register. The expected usage scenario is translation from AXI MWr to Vendor Defined Msg/MsgD. Note: This register field is sticky.
15-8 TAG	TAG. The substituted TAG field (byte 6) in the outgoing TLP header when TAG_SUBSTITUTE_EN is set. Note: This register field is sticky.

Table continues on the next page...

Field	Function
7-0 MSG_CODE	MSG TLPs (Message Code). When the address of an outbound TLP is matched to this region, and the translated TLP TYPE field is Msg or MsgD; then the message field of the TLP is changed to the value in this register. Memory TLPs: (ST;Steering Tag). When the ST field of an outbound TLP is matched to this region, and the translated TLP TYPE field targets memory space; then the ST field of the TLP is changed to the value in this register. Note: This register field is sticky.

11.3.3.1.133 iATU Lower Base Address Register. (IATU_LWR_BASE_ADDR_OFF_OUTBOUND_0)

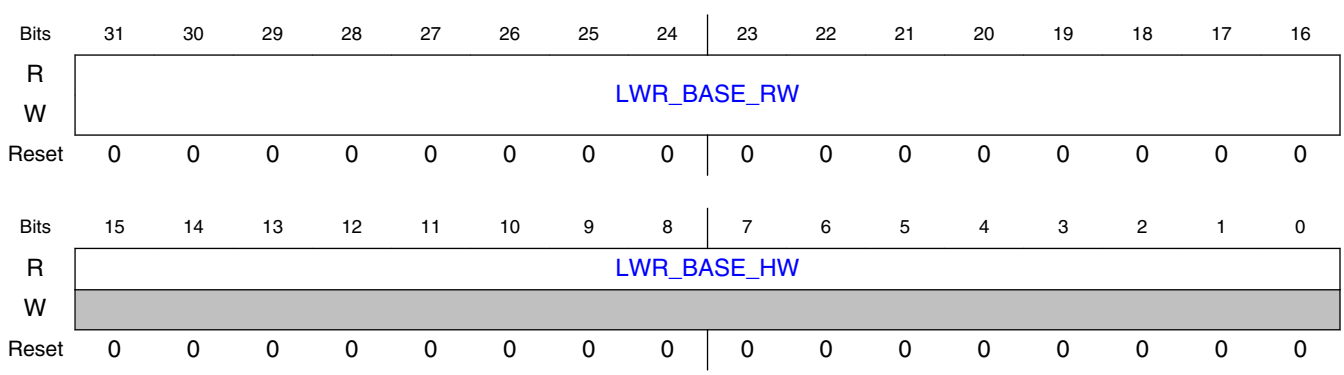
11.3.3.1.133.1 Offset

Register	Offset
IATU_LWR_BASE_ADDR_OFF_OUTBOUND_0	8000_0008h

11.3.3.1.133.2 Function

iATU Lower Base Address Register. The Minimum Size of iATU Region (Value Range: 4 kB, 8 kB, 16 kB, 32 kB, 64 kB defaults to 64 kB) specifies the minimum size of an address translation region. For example, if set to 64 kB; the lower 16 bits of the Base, Limit and Target registers are zero and all address regions are aligned on 64 kB boundaries. More precisely, the lower log2(Minimum Size of iATU Region) bits are zero.

11.3.3.1.133.3 Diagram



11.3.3.1.133.4 Fields

Field	Function
31-16 LWR_BASE_RW	Forms bits [31:n] of the start address of the address region to be translated. n is log2(Minimum Size of iATU Region) Note: This register field is sticky.
15-0 LWR_BASE_HW	Forms bits [n-1:0] of the start address of the address region to be translated. The start address must be aligned to the Minimum Size of iATU Region kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller. n is log2(Minimum Size of iATU Region)

11.3.3.1.134 iATU Upper Base Address Register. (IATU_UPPER_BASE_ADDR_OFF_OUTBOUND_0)

11.3.3.1.134.1 Offset

Register	Offset
IATU_UPPER_BASE_ADDR_OFF_OUTBOUND_0	8000_000Ch

11.3.3.1.134.2 Diagram

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

11.3.3.1.136.3 Fields

Field	Function
31-0 LWR_TARGET_RW_OUTBOUND	When HEADER_SUBSTITUTE_EN in IATU_REGION_CTRL_2_OFF_OUTBOUND_ is '0' (normal operation): - LWR_TARGET_RW[31:n] forms MSB's of the Lower Target part of the new address of the translated region; - LWR_TARGET_RW[n-1:0] are not used. (The start address must be aligned to the Minimum Size of iATU Region kB boundary, so the lower bits of the start address of the new address of the translated region (bits n-1:0) are always '0'). - n is log2(Minimum Size of iATU Region). When HEADER_SUBSTITUTE_EN in IATU_REGION_CTRL_2_OFF_OUTBOUND_i is '1': - LWR_TARGET_RW[31:0] forms bytes 8-11 (for 3 dword header) or bytes 12-15 (for 4 dword header) of the outbound TLP header. Usage scenarios include the transmission of Vendor Defined Messages where the controller determines the content of bytes 12 to 15 of the TLP header. Note: This register field is sticky.

11.3.3.1.137 iATU Upper Target Address Register. (IATU_UPPER_TARGET_ADDR_OFF_OUTBOUND_0)

11.3.3.1.137.3 Fields

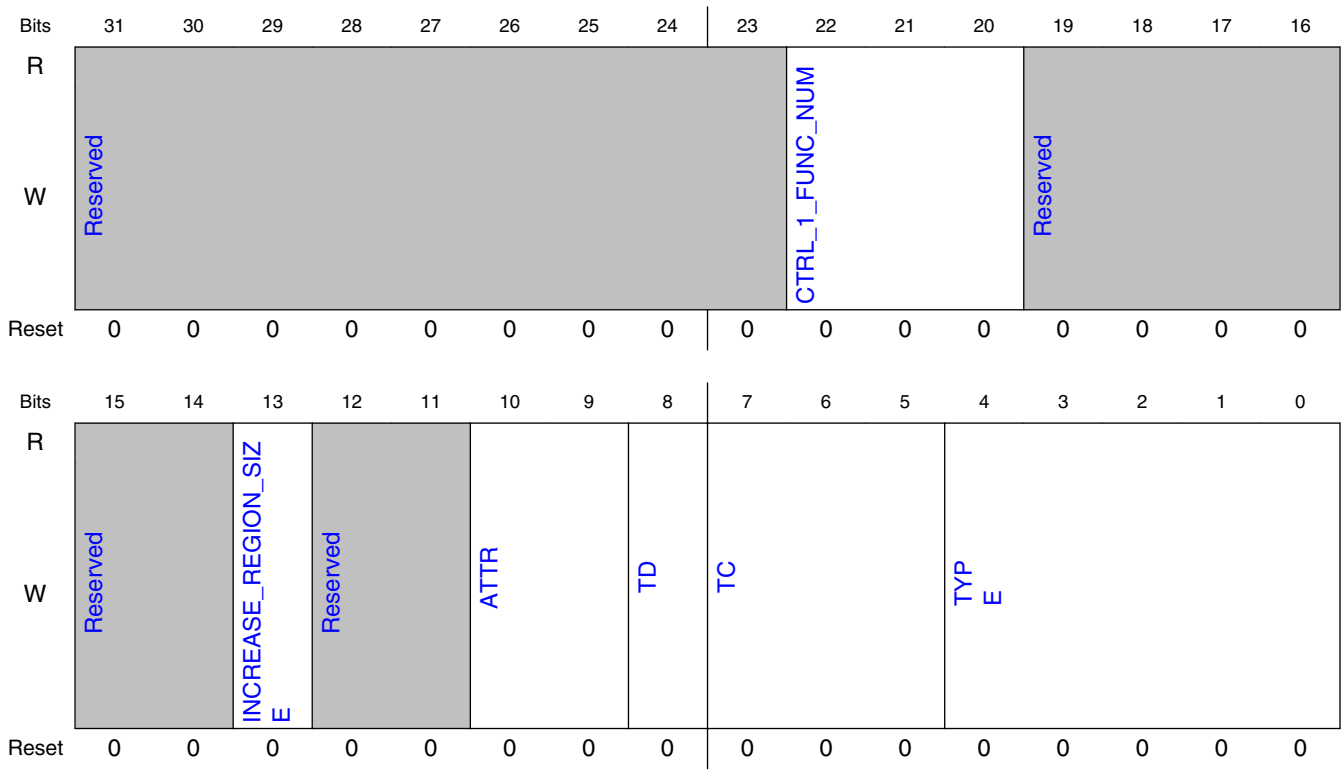
Field	Function
31-0 UPPER_TARGET_RW	Forms bits [63:32] of the start address (Upper Target part) of the new address of the translated region. Note: This register field is sticky.

11.3.3.1.138 iATU Region Control 1 Register. (IATU_REGION_CTRL_1_OFF_INBOUND_0)

11.3.3.1.138.1 Offset

Register	Offset
IATU_REGION_CTRL_1_OFF_INBOUND_0	8000_0100h

11.3.3.1.138.2 Diagram



11.3.3.1.138.3 Fields

Field	Function
31-23 —	Reserved.
22-20 CTRL_1_FUNC_NUM	Function Number. - MEM-I/O: When the Address and BAR matching logic in the controller indicate that a MEM-I/O transaction matches a BAR in the function corresponding to this value, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "iATU Control 2 Register" is set. - CFG0/CFG1: When the destination function number as specified in the routing ID of the TLP header matches the function, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
19-14 —	Reserved.
13 INCREASE_REGION_SIZE	Increase the maximum ATU Region size. When set, the size is determined by the Maximum Size of iATU Region. When clear, the maximum ATU Region size is 4 GB (default). Note: This register field is sticky.
12-11 —	Reserved.
10-9 ATTR	When the ATTR field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "ATTR Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.

Table continues on the next page...

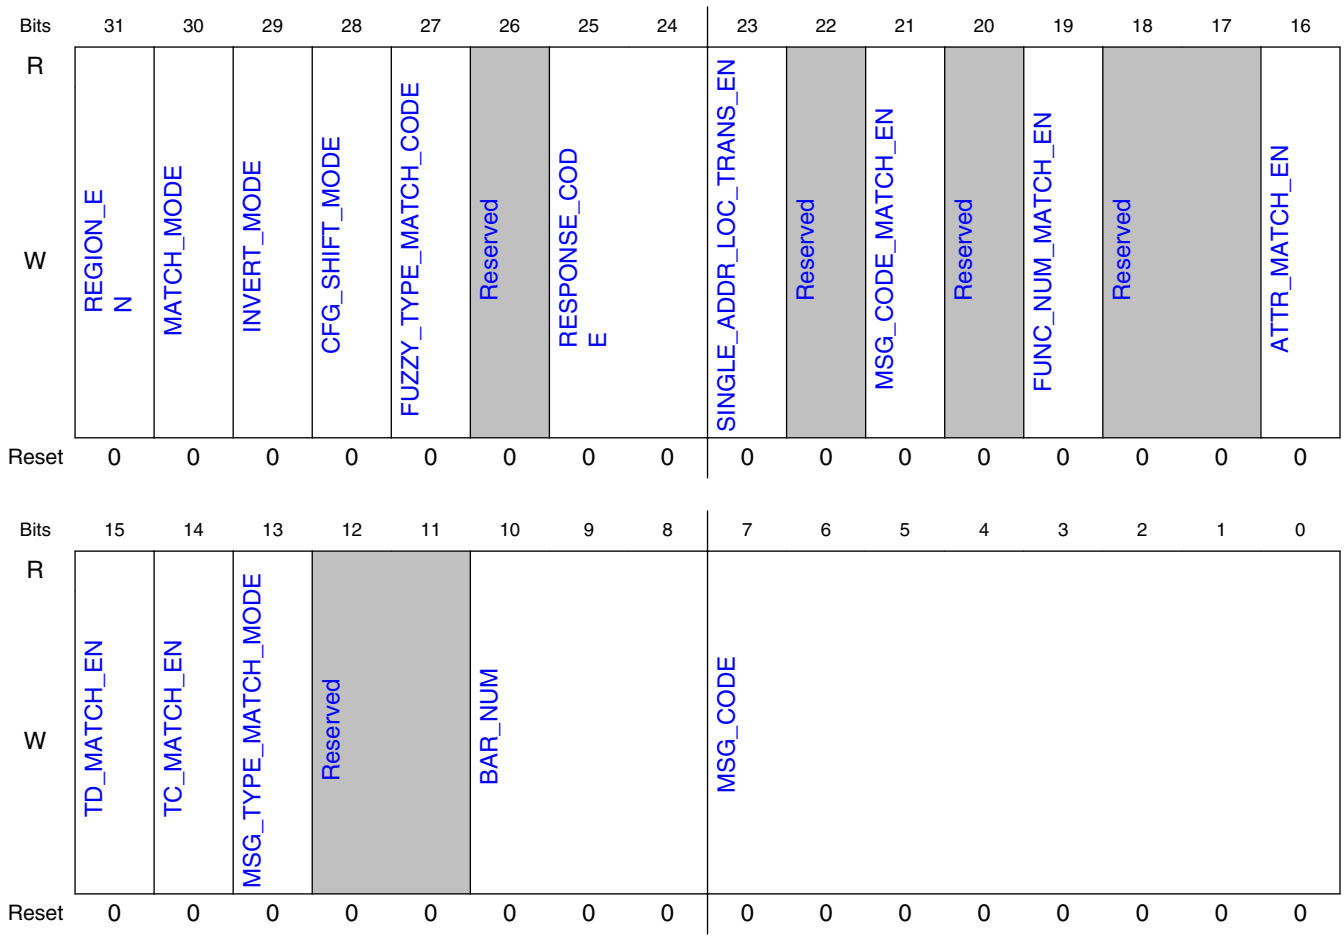
Field	Function
8 TD	When the TD field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TD Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
7-5 TC	When the TC field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TC Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
4-0 TYPE	When the TYPE field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). Note: This register field is sticky.

11.3.3.1.139 iATU Region Control 2 Register. (IATU_REGION_CTRL_2_OFF_INBOUND_0)

11.3.3.1.139.1 Offset

Register	Offset
IATU_REGION_CTRL_2_OFF_INBOUND_0	8000_0104h

11.3.3.1.139.2 Diagram



11.3.3.1.139.3 Fields

Field	Function
31 REGION_EN	Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky.
30 MATCH_MODE	Match Mode. Determines Inbound matching mode for TLPs. The mode depends on the type of TLP that is received as follows: For MEM-I/O TLPs, this field is interpreted as follows: - 0: Address Match Mode. The iATU operates using addresses as in the outbound direction. The Region Base and Limit Registers must be setup. - 1:BAR Match Mode. BAR matching is used. The "BAR Number" field is relevant. Not used for RC. For CFG0 TLPs, this field is interpreted as follows: - 0: Routing ID Match Mode. The iATU interprets the Routing ID (Bytes 8 to 11 of TLP header) as an address. This corresponds to the upper 16 bits of the address in MEM-I/O transactions. The Routing ID of the TLP must be within the base and limit of the iATU region for matching to proceed. - 1: Accept Mode. The iATU accepts all CFG0 transactions as address matches. The routing ID in the CFG0 TLP is ignored. This is useful as all received CFG0 TLPs should be processed regardless of the Bus number. For MSG/MSGD TLPs, this field is interpreted as follows: - 0: Address Match Mode. The iATU treats the third dword and fourth dword of the inbound MSG/MSGD TLP as an address and it is matched against the Region Base and Limit Registers. - 1: Vendor ID Match Mode. This mode is relevant for ID-routed Vendor Defined Messages. The iATU ignores the Routing ID (Bus, Device, Function) in bits [31:16] of the third dword of the TLP header, but matches

Table continues on the next page...

Field	Function
	against the Vendor ID in bits [15:0] of the third dword of the TLP header. Bits [15:0] of the Region Upper Base register should be programmed with the required Vendor ID. The lower Base and Limit Register should be programmed to translate TLPs based on vendor specific information in the fourth dword of the TLP header. - If SINGLE_ADDRESS_LOCATION_TRANSLATE_EN = 1 AND MSG_TYPE_MATCH_MODE = 1, then Match Mode is ignored. Note: This register field is sticky.
29 INVERT_MODE	Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). Note: This register field is sticky.
28 CFG_SHIFT_MODE	CFG Shift Mode. This is useful for CFG transactions where the PCIe configuration mechanism maps bits [27:12] of the address to the bus/device and function number. This allows a CFG configuration space to be located in any 256MB window of your application memory space using a 28-bit effective address. Shifts bits [31:16] of the untranslated address to form bits [27:12] of the translated address. Note: This register field is sticky.
27 FUZZY_TYPE_MATCH_CODE	Fuzzy Type Match Mode. When enabled, the iATU relaxes the matching of the TLP TYPE field against the expected TYPE field so that - CfgRd0 and CfgRd1 TLPs are seen as identical. Similarly with CfgWr0 and CfgWr1. - MWr, MRd and MRdLk TLPs are seen as identical - The Routing field of Msg/MsgD TLPs is ignored - FetchAdd, Swap and CAS are seen as identical. For example, CFG0 in the TYPE field in the "iATU Control 1 Register" matches against an inbound CfgRd0, CfgRd1, CfgWr0 or CfgWr1 TLP. Note: This register field is sticky.
26 —	Reserved.
25-24 RESPONSE_CODE	Response Code. Defines the type of response to give for accesses matching this region. This overrides the normal RADM filter response. Note that this feature is not available for any region where Single Address Location Translate is enabled. - 00 - Normal RADM filter response is used. - 01 - Unsupported request (UR) - 10 - Completer abort (CA) - 11 - Not used / undefined / reserved. Note: This register field is sticky.
23 SINGLE_ADDR_LOC_TRANS_EN	Single Address Location Translate Enable. When enabled, Rx TLPs can be translated to a single address location as determined by the target address register of the iATU region. The main usage scenario is translation of Messages (such as Vendor Defined or ATS Messages) to MWr TLPs when the AXI bridge is enabled. Note: This register field is sticky.
22 —	Reserved.
21 MSG_CODE_MATCH_EN	Message Code Match Enable (Msg TLPS). Ensures that a successful message Code TLP field comparison match (see Message Code field of the "iATU Control 2 Register") occurs (in MSG transactions) for address translation to proceed. ST Match Enable (Mem TLPs). Ensures that a successful ST TLP field comparison match (see ST field of the "iATU Control 2 Register") occurs (in MEM transactions) for address translation to proceed. Note: This register field is sticky.
20 —	Reserved.
19 FUNC_NUM_MATCH_EN	Function Number Match Enable. Ensures that a successful Function Number TLP field comparison match (see Function Number field of the "iATU Control 1 Register") occurs (in MEM-I/O and CFG0/CFG1 transactions) for address translation to proceed. Note: This register field is sticky.
18-17 —	Reserved.
16 ATTR_MATCH_EN	ATTR Match Enable. Ensures that a successful ATTR TLP field comparison match (see ATTR field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.

Table continues on the next page...

Field	Function
15 TD_MATCH_EN	TD Match Enable. Ensures that a successful TD TLP field comparison match (see TD field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.
14 TC_MATCH_EN	TC Match Enable. Ensures that a successful TC TLP field comparison match (see TC field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.
13 MSG_TYPE_MATCH_MODE	Message Type Match Mode. When enabled, and if single address location translate enable is set, then inbound TLPs of type MSG/MSGd which match the type field of the iatu_region_ctrl_1_OFF_inbound register (=>TYPE[4:3]=2'b10) will be translated. Message type match mode overrides any value of MATCH_MODE field in this register. Usage scenarios for this are translation of VDM or ATS messages when AXI bridge is configured on client interface. Note: This register field is sticky.
12-11 —	Reserved.
10-8 BAR_NUM	BAR Number. When the BAR number of an inbound MEM or IO TLP " that is matched by the normal internal BAR address matching mechanism " is the same as this field, address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Match Mode" bit of the "iATU Control 2 Register" is set. - 000b - BAR0 - 001b - BAR1 - 010b - BAR2 - 011b - BAR3 - 100b - BAR4 - 101b - BAR5 - 110b - ROM - 111b - reserved - IO translation would require either 00100b or 00101b in the inbound TLP TYPE; the BAR Number set in the range 000b - 101b and that BAR configured as an IO BAR. Note: This register field is sticky.
7-0 MSG_CODE	MSG TLPs: (Message Code). When the TYPE field of an inbound Msg/MsgD TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Message Code Match Enable" bit of the "iATU Control 2 Register" is set. Memory TLPs: (ST;Steering Tag). When the ST field of an inbound TLP is matched to this value, then address translation proceeds. This check is only performed if the "ST Match Enable" bit of the "iATU Control2 Register" is set. The setting is independent of the setting of the TH field. Note: This register field is sticky.

11.3.3.1.140 iATU Lower Base Address Register. (IATU_LWR_BASE_ADDR_OFF_INBOUND_0)

11.3.3.1.140.1 Offset

Register	Offset
IATU_LWR_BASE_ADDR_OFF_INBOUND_0	8000_0108h

11.3.3.1.140.2 Function

iATU Lower Base Address Register. The Minimum Size of iATU Region (Value Range: 4 kB, 8 kB, 16 kB, 32 kB, 64 kB defaults to 64 kB) specifies the minimum size of an address translation region. For example, if set to 64 kB; the lower 16 bits of the Base, Limit and Target registers are zero and all address regions are aligned on 64 kB boundaries. More precisely, the lower log2(Minimum Size of iATU Region) bits are zero.

11.3.3.1.142.3 Fields

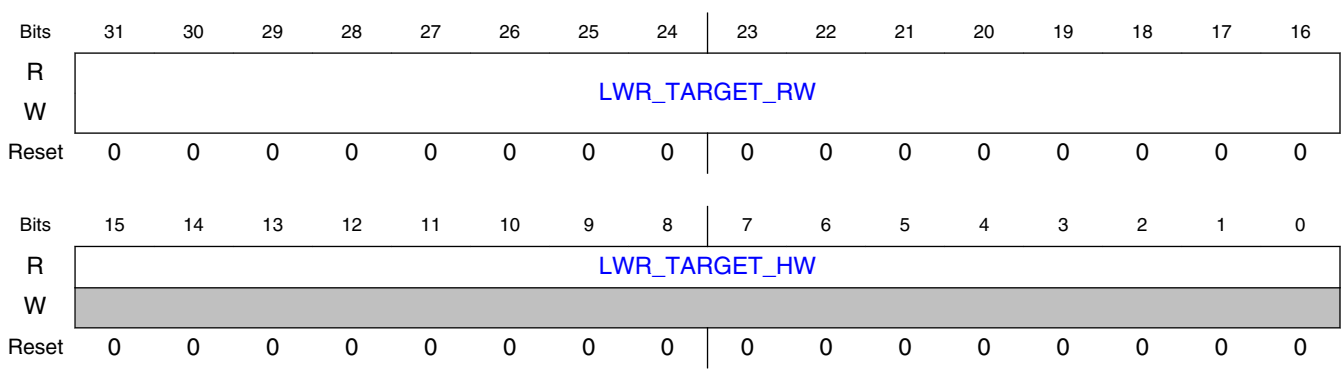
Field	Function
31-16 LIMIT_ADDR_RW	Forms upper bits of the end address of the address region to be translated. The end address must be aligned to the Minimum Size of iATU Region kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller. Note: This register field is sticky.
15-0 LIMIT_ADDR_HW	Forms lower bits of the end address of the address region to be translated. The end address must be aligned to the Minimum Size of iATU Region kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller.

11.3.3.1.143 iATU Lower Target Address Register. (IATU_LWR_TARGET_ADDR_OFF_INBOUND_0)

11.3.3.1.143.1 Offset

Register	Offset
IATU_LWR_TARGET_ADDR_OFF_INBOUND_0	8000_0114h

11.3.3.1.143.2 Diagram



11.3.3.1.143.3 Fields

Field	Function
31-16 LWR_TARGET_RW	Forms MSB's of the Lower Target part of the new address of the translated region. These bits are always '0'. - Field size depends on log2(Minimum Size of iATU Region) in address match mode. - Field size depends on log2(BAR_MASK+1) in BAR match mode. Note: This register field is sticky.

Table continues on the next page...

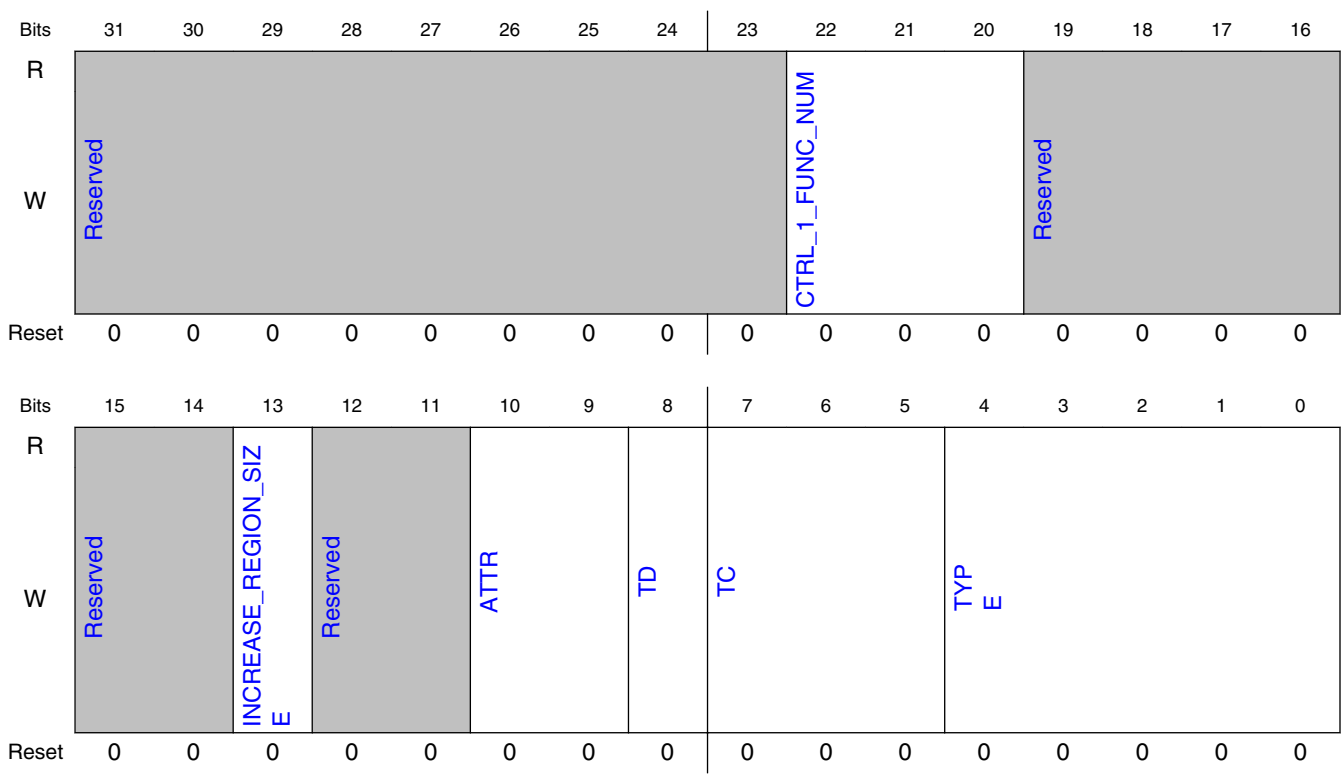
Field	Function
15-0 LWR_TARGET_HW	Forms the LSB's of the Lower Target part of the new address of the translated region. The start address must be aligned to the Minimum Size of iATU Region kB boundary (in address match mode); and to the Bar size boundary (in BAR match mode) so that these bits are always '0'. If the BAR is smaller than the iATU region size, then the iATU target address must align to the iATU region size; otherwise it must align to the BAR size. A write to this location is ignored by the PCIe controller. - Field size depends on log2(Minimum Size of iATU Region) in address match mode. - Field size depends on log2(BAR_MASK +1) in BAR match mode.

11.3.3.1.144 iATU Region Control 1 Register. (IATU_REGION_CTRL_1_OFF_OUTBOUND_1)

11.3.3.1.144.1 Offset

Register	Offset
IATU_REGION_CTRL_1_OFF_OUTBOUND_1	8000_0200h

11.3.3.1.144.2 Diagram



11.3.3.1.144.3 Fields

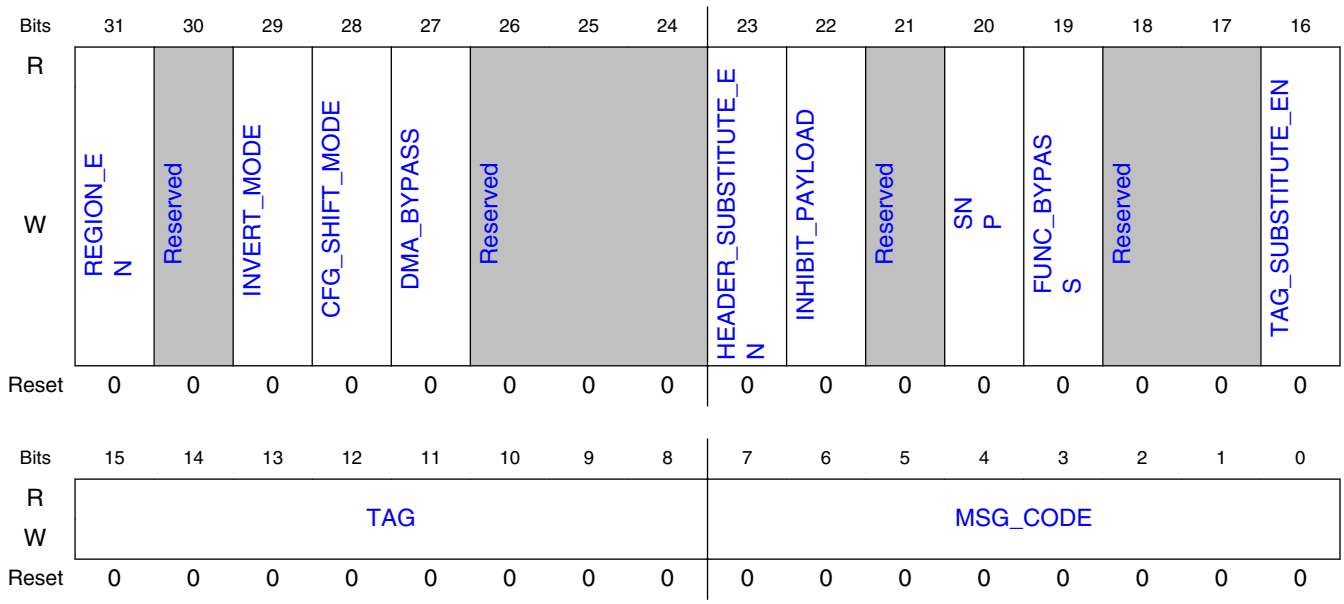
Field	Function
31-23 —	Reserved.
22-20 CTRL_1_FUNC_NUM	Function Number. - When the address of an outbound TLP is matched to this region and the FUNC_BYPASS field in the "iATU Control 2 Register" is '0', then the function number used in generating the function part of the requester ID (RID) field of the TLP is taken from this 5-bit register. When you are using the AXI Bridge, then this field is swapped before AXI decomposition occurs so that the correct "Max_Read_Request_Size" and "Max_Payload_Size" values are used. Note: This register field is sticky.
19-14 —	Reserved.
13 INCREASE_REGION_SIZE	Increase the maximum ATU Region size. When set, the size is determined by the Maximum Size of iATU Region. When clear, the maximum ATU Region size is 4 GB (default). Note: This register field is sticky.
12-11 —	Reserved.
10-9 ATTR	When the address of an outbound TLP is matched to this region, then the ATTR field of the TLP is changed to the value in this register. Note: This register field is sticky.
8 TD	When the address of an outbound TLP is matched to this region, then the TD field of the TLP is changed to the value in this register. Note: This register field is sticky.
7-5 TC	When the address of an outbound TLP is matched to this region, then the TC field of the TLP is changed to the value in this register. Note: This register field is sticky.
4-0 TYPE	When the address of an outbound TLP is matched to this region, then the TYPE field of the TLP is changed to the value in this register. Note: This register field is sticky.

11.3.3.1.145 iATU Region Control 2 Register. (IATU_REGION_CTRL_2_OFF_OUTBOUND_1)

11.3.3.1.145.1 Offset

Register	Offset
IATU_REGION_CTRL_2_OFF_OUTBOUND_1	8000_0204h

11.3.3.1.145.2 Diagram



11.3.3.1.145.3 Fields

Field	Function
31 REGION_EN	Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky.
30 —	Reserved.
29 INVERT_MODE	Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). Note: This register field is sticky.
28 CFG_SHIFT_MODE	CFG Shift Mode. The iATU uses bits [27:12] of the untranslated address (on the XALI0/1/2 interface or AXI slave interface address) to form the BDF number of the outgoing CFG TLP. This supports the Enhanced Configuration Address Mapping (ECAM) mechanism (Section 7.2.2 of the PCI Express Base 3.1 Specification, revision 1.0) by allowing all outgoing I/O and MEM TLPs (that have been translated to CFG) to be mapped from memory space into any 256 MB region of the PCIe configuration space. Note: This register field is sticky.
27 DMA_BYPASS	DMA Bypass Mode. Allows request TLPs which are initiated by the DMA controller to pass through the iATU untranslated. Note: This field is reserved for the SW product. You must set it to '0'. Note: This register field is sticky.
26-24 —	Reserved.
23 HEADER_SUBSTITUTE_EN	Header Substitute Enable. When enabled and region address is matched, the iATU fully substitutes bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header with the contents of the LWR_TARGET_RW field in IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i. - 1: LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register is used to fill bytes 8-to-11 (for 3 DWORD header) or bytes 12-to-15 (for 4 DWORD header) of the translated TLP header. - 0: LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register forms the new address of the translated region. Note: This register field is sticky.

Table continues on the next page...

Field	Function
22 INHIBIT_PAYLOAD	Inhibit TLP Payload Data for TLP's in Matched Region; assign iATU region to be TLP without data. When enabled and region address is matched, the iATU marks all TLPs as having no payload data by forcing the TLP header Fmt[1] bit =0, regardless of the application inputs such as slv_wstrb. - 1: Fmt[1] =0 so that only TLP type without data is sent. For example, a Msg instead of MsgD will be sent. - 0: Fmt[1] =0/1 so that TLPs with or without data can be sent. Note: This register field is sticky.
21 —	Reserved.
20 SNP	Serialize Non-Posted Requests. In this mode, when the AXI Bridge is populated, same AXI ID Non-Posted Read/Write Requests are transmitted on the wire if there are no other same ID Non-Posted Requests outstanding. Note: This register field is sticky.
19 FUNC_BYPASS	Function Number Translation Bypass. In this mode, the function number of the translated TLP is taken from your application transmit interface and not from the CTRL_1_FUNC_NUM field of the "iATU Control 1 Register" or the VF_NUMBER field of the "iATU Control 3 Register." Note: This register field is sticky.
18-17 —	Reserved.
16 TAG_SUBSTITUTE_EN	TAG Substitute Enable. When enabled and region address is matched, the iATU substitutes the TAG field of the outbound TLP header with the contents of the TAG field in this register. The expected usage scenario is translation from AXI MWr to Vendor Defined Msg/MsgD. Note: This register field is sticky.
15-8 TAG	TAG. The substituted TAG field (byte 6) in the outgoing TLP header when TAG_SUBSTITUTE_EN is set. Note: This register field is sticky.
7-0 MSG_CODE	MSG TLPs (Message Code). When the address of an outbound TLP is matched to this region, and the translated TLP TYPE field is Msg or MsgD; then the message field of the TLP is changed to the value in this register. Memory TLPs: (ST;Steering Tag). When the ST field of an outbound TLP is matched to this region, and the translated TLP TYPE field targets memory space; then the ST field of the TLP is changed to the value in this register. Note: This register field is sticky.

11.3.3.1.146 iATU Lower Base Address Register. (IATU_LWR_BASE_ADDR_OFF_OUTBOUND_1)

11.3.3.1.146.1 Offset

Register	Offset
IATU_LWR_BASE_ADDR_OFF_OUTBOUND_1	8000_0208h

11.3.3.1.146.2 Function

iATU Lower Base Address Register. The Minimum Size of iATU Region (Value Range: 4 kB, 8 kB, 16 kB, 32 kB, 64 kB defaults to 64 kB) specifies the minimum size of an address translation region. For example, if set to 64 kB; the lower 16 bits of the Base, Limit and Target registers are zero and all address regions are aligned on 64 kB boundaries. More precisely, the lower log2(Minimum Size of iATU Region) bits are zero.

11.3.3.1.146.3 Diagram

11.3.3.1.151.3 Fields

Field	Function
31-23 —	Reserved.
22-20 CTRL_1_FUNC_NUM	Function Number. - MEM-I/O: When the Address and BAR matching logic in the controller indicate that a MEM-I/O transaction matches a BAR in the function corresponding to this value, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "iATU Control 2 Register" is set. - CFG0/CFG1: When the destination function number as specified in the routing ID of the TLP header matches the function, then address translation proceeds. This check is only performed if the

Table continues on the next page...

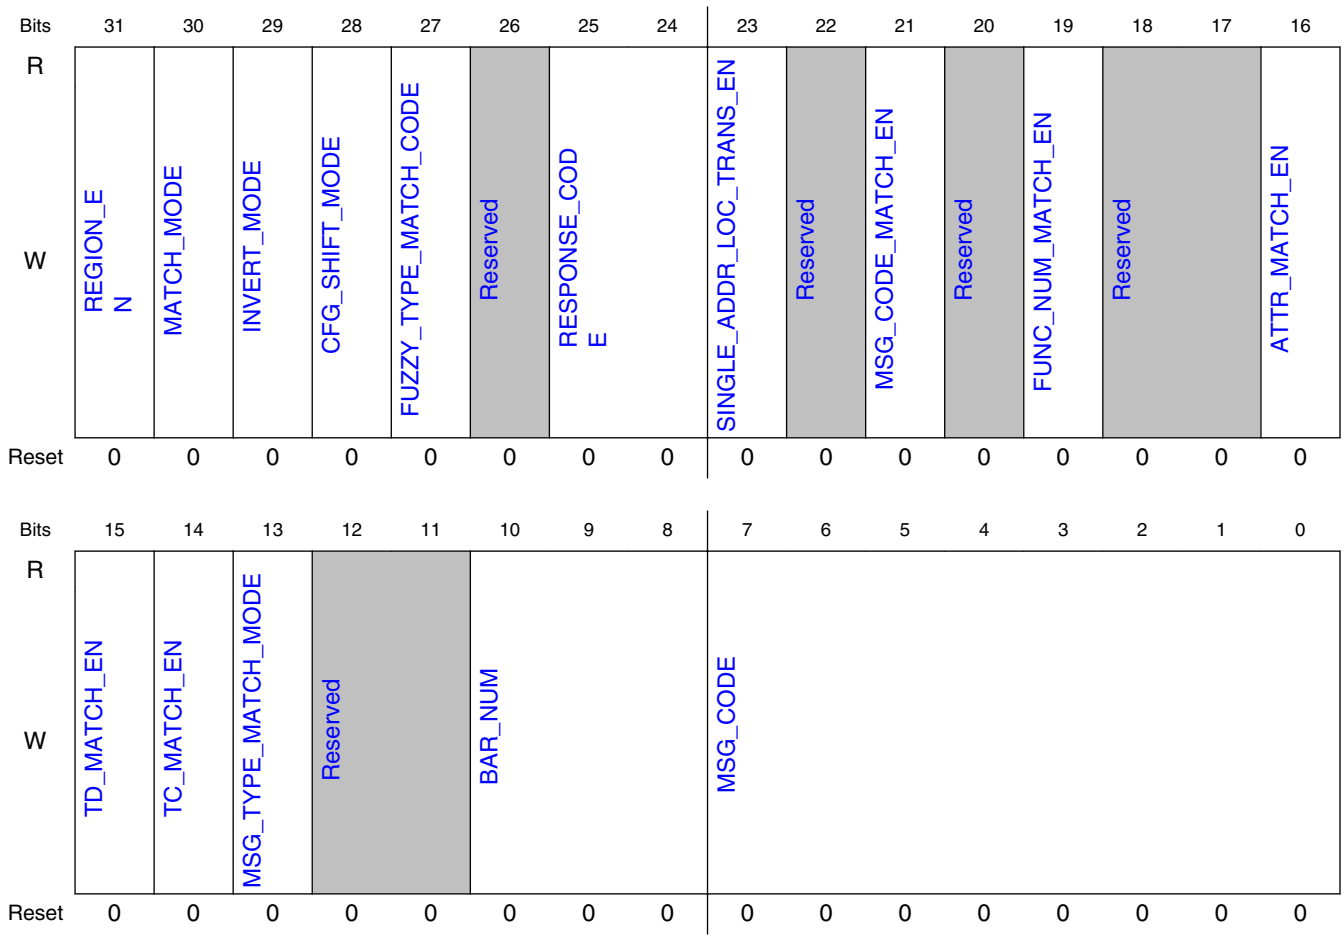
Field	Function
	"Function Number Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
19-14 —	Reserved.
13 INCREASE_REGION_SIZE	Increase the maximum ATU Region size. When set, the size is determined by the Maximum Size of iATU Region. When clear, the maximum ATU Region size is 4 GB (default). Note: This register field is sticky.
12-11 —	Reserved.
10-9 ATTR	When the ATTR field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "ATTR Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
8 TD	When the TD field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TD Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
7-5 TC	When the TC field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TC Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
4-0 TYPE	When the TYPE field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). Note: This register field is sticky.

11.3.3.1.152 iATU Region Control 2 Register. (IATU_REGION_CTRL_2_OFF_INBOUND_1)

11.3.3.1.152.1 Offset

Register	Offset
IATU_REGION_CTRL_2_OFF_INBOUND_1	8000_0304h

11.3.3.1.152.2 Diagram



11.3.3.1.152.3 Fields

Field	Function
31 REGION_EN	Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky.
30 MATCH_MODE	Match Mode. Determines Inbound matching mode for TLPs. The mode depends on the type of TLP that is received as follows: For MEM-I/O TLPs, this field is interpreted as follows: - 0: Address Match Mode. The iATU operates using addresses as in the outbound direction. The Region Base and Limit Registers must be setup. - 1:BAR Match Mode. BAR matching is used. The "BAR Number" field is relevant. Not used for RC. For CFG0 TLPs, this field is interpreted as follows: - 0: Routing ID Match Mode. The iATU interprets the Routing ID (Bytes 8 to 11 of TLP header) as an address. This corresponds to the upper 16 bits of the address in MEM-I/O transactions. The Routing ID of the TLP must be within the base and limit of the iATU region for matching to proceed. - 1: Accept Mode. The iATU accepts all CFG0 transactions as address matches. The routing ID in the CFG0 TLP is ignored. This is useful as all received CFG0 TLPs should be processed regardless of the Bus number. For MSG/MSGD TLPs, this field is interpreted as follows: - 0: Address Match Mode. The iATU treats the third dword and fourth dword of the inbound MSG/MSGD TLP as an address and it is matched against the Region Base and Limit Registers. - 1: Vendor ID Match Mode. This mode is relevant for ID-routed Vendor Defined Messages. The iATU ignores the Routing ID (Bus, Device, Function) in bits [31:16] of the third dword of the TLP header, but matches

Table continues on the next page...

Field	Function
	against the Vendor ID in bits [15:0] of the third dword of the TLP header. Bits [15:0] of the Region Upper Base register should be programmed with the required Vendor ID. The lower Base and Limit Register should be programmed to translate TLPs based on vendor specific information in the fourth dword of the TLP header. - If SINGLE_ADDRESS_LOCATION_TRANSLATE_EN = 1 AND MSG_TYPE_MATCH_MODE = 1, then Match Mode is ignored. Note: This register field is sticky.
29 INVERT_MODE	Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). Note: This register field is sticky.
28 CFG_SHIFT_MODE	CFG Shift Mode. This is useful for CFG transactions where the PCIe configuration mechanism maps bits [27:12] of the address to the bus/device and function number. This allows a CFG configuration space to be located in any 256MB window of your application memory space using a 28-bit effective address. Shifts bits [31:16] of the untranslated address to form bits [27:12] of the translated address. Note: This register field is sticky.
27 FUZZY_TYPE_MATCH_CODE	Fuzzy Type Match Mode. When enabled, the iATU relaxes the matching of the TLP TYPE field against the expected TYPE field so that - CfgRd0 and CfgRd1 TLPs are seen as identical. Similarly with CfgWr0 and CfgWr1. - MWr, MRd and MRdLk TLPs are seen as identical - The Routing field of Msg/MsgD TLPs is ignored - FetchAdd, Swap and CAS are seen as identical. For example, CFG0 in the TYPE field in the "iATU Control 1 Register" matches against an inbound CfgRd0, CfgRd1, CfgWr0 or CfgWr1 TLP. Note: This register field is sticky.
26 —	Reserved.
25-24 RESPONSE_CODE	Response Code. Defines the type of response to give for accesses matching this region. This overrides the normal RADM filter response. Note that this feature is not available for any region where Single Address Location Translate is enabled. - 00 - Normal RADM filter response is used. - 01 - Unsupported request (UR) - 10 - Completer abort (CA) - 11 - Not used / undefined / reserved. Note: This register field is sticky.
23 SINGLE_ADDR_LOC_TRANS_EN	Single Address Location Translate Enable. When enabled, Rx TLPs can be translated to a single address location as determined by the target address register of the iATU region. The main usage scenario is translation of Messages (such as Vendor Defined or ATS Messages) to MWr TLPs when the AXI bridge is enabled. Note: This register field is sticky.
22 —	Reserved.
21 MSG_CODE_MATCH_EN	Message Code Match Enable (Msg TLPS). Ensures that a successful message Code TLP field comparison match (see Message Code field of the "iATU Control 2 Register") occurs (in MSG transactions) for address translation to proceed. ST Match Enable (Mem TLPs). Ensures that a successful ST TLP field comparison match (see ST field of the "iATU Control 2 Register") occurs (in MEM transactions) for address translation to proceed. Note: This register field is sticky.
20 —	Reserved.
19 FUNC_NUM_MATCH_EN	Function Number Match Enable. Ensures that a successful Function Number TLP field comparison match (see Function Number field of the "iATU Control 1 Register") occurs (in MEM-I/O and CFG0/CFG1 transactions) for address translation to proceed. Note: This register field is sticky.
18-17 —	Reserved.
16 ATTR_MATCH_EN	ATTR Match Enable. Ensures that a successful ATTR TLP field comparison match (see ATTR field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.

Table continues on the next page...

Field	Function
15 TD_MATCH_EN	TD Match Enable. Ensures that a successful TD TLP field comparison match (see TD field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.
14 TC_MATCH_EN	TC Match Enable. Ensures that a successful TC TLP field comparison match (see TC field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.
13 MSG_TYPE_MATCH_MODE	Message Type Match Mode. When enabled, and if single address location translate enable is set, then inbound TLPs of type MSG/MSGd which match the type field of the iatu_region_ctrl_1_OFF_inbound register (=>TYPE[4:3]=2'b10) will be translated. Message type match mode overrides any value of MATCH_MODE field in this register. Usage scenarios for this are translation of VDM or ATS messages when AXI bridge is configured on client interface. Note: This register field is sticky.
12-11 —	Reserved.
10-8 BAR_NUM	BAR Number. When the BAR number of an inbound MEM or IO TLP " that is matched by the normal internal BAR address matching mechanism " is the same as this field, address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Match Mode" bit of the "iATU Control 2 Register" is set. - 000b - BAR0 - 001b - BAR1 - 010b - BAR2 - 011b - BAR3 - 100b - BAR4 - 101b - BAR5 - 110b - ROM - 111b - reserved - IO translation would require either 00100b or 00101b in the inbound TLP TYPE; the BAR Number set in the range 000b - 101b and that BAR configured as an IO BAR. Note: This register field is sticky.
7-0 MSG_CODE	MSG TLPs: (Message Code). When the TYPE field of an inbound Msg/MsgD TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Message Code Match Enable" bit of the "iATU Control 2 Register" is set. Memory TLPs: (ST;Steering Tag). When the ST field of an inbound TLP is matched to this value, then address translation proceeds. This check is only performed if the "ST Match Enable" bit of the "iATU Control2 Register" is set. The setting is independent of the setting of the TH field. Note: This register field is sticky.

11.3.3.1.153 iATU Lower Base Address Register. (IATU_LWR_BASE_ADDR_OFF_INBOUND_1)

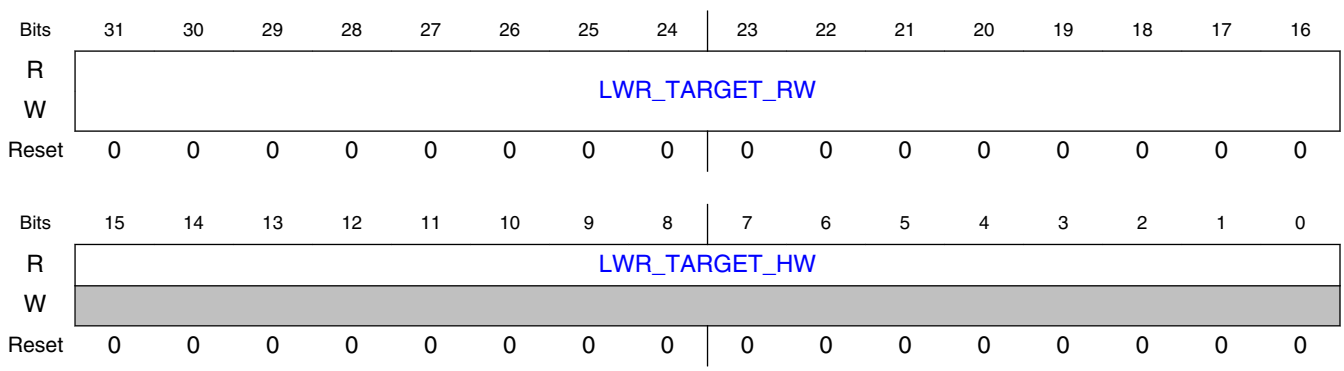
IATU_LWR_TARGET_ADDR_OFF_INBOUND_1	8000_0314h

11.3.3.1.156.2 Diagram



11.3.3.1.156.3 Fields

Field	Function
31-16 LWR_TARGET_RW	Forms MSB's of the Lower Target part of the new address of the translated region. These bits are always '0'. - Field size depends on log2(Minimum Size of iATU Region) in address match mode. - Field size depends on log2(BAR_MASK+1) in BAR match mode. Note: This register field is sticky.

Table continues on the next page...

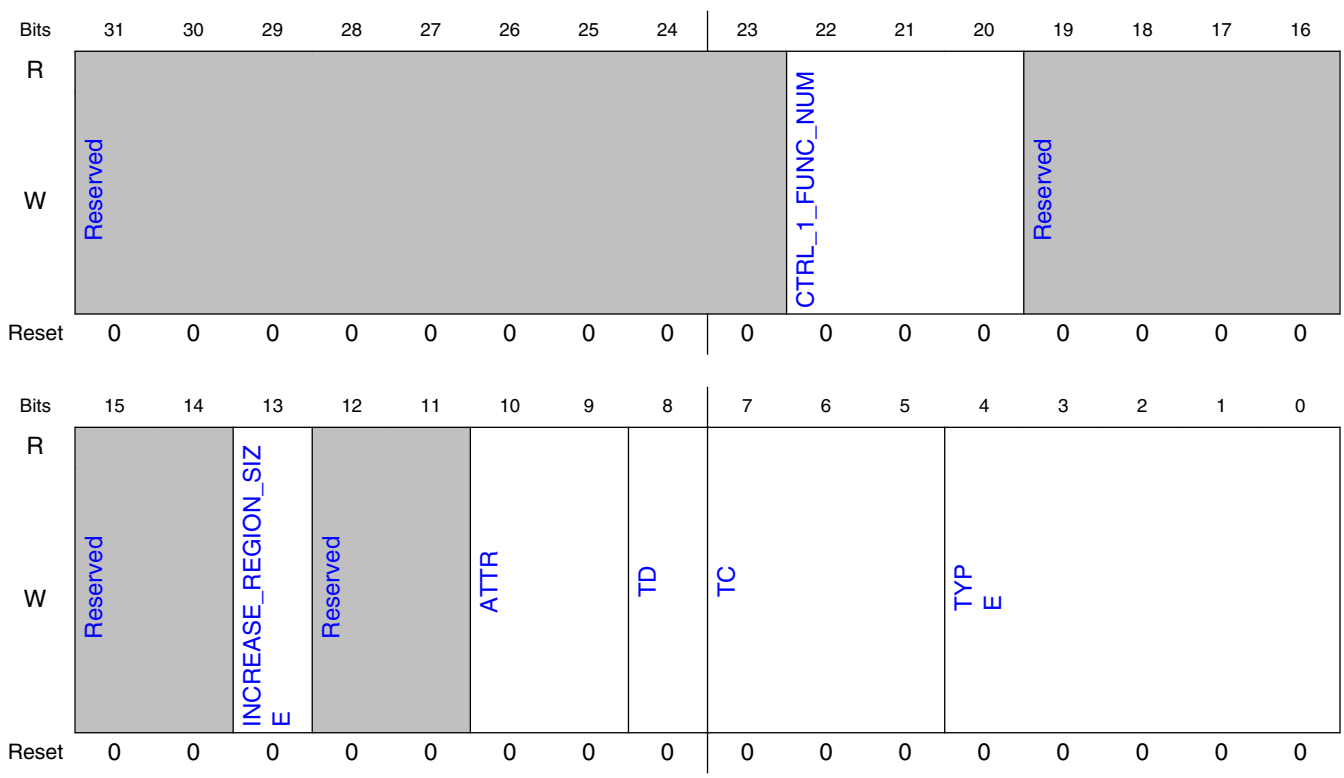
Field	Function
15-0 LWR_TARGET_HW	Forms the LSB's of the Lower Target part of the new address of the translated region. The start address must be aligned to the Minimum Size of iATU Region kB boundary (in address match mode); and to the Bar size boundary (in BAR match mode) so that these bits are always '0'. If the BAR is smaller than the iATU region size, then the iATU target address must align to the iATU region size; otherwise it must align to the BAR size. A write to this location is ignored by the PCIe controller. - Field size depends on log2(Minimum Size of iATU Region) in address match mode. - Field size depends on log2(BAR_MASK +1) in BAR match mode.

11.3.3.1.157 iATU Region Control 1 Register. (IATU_REGION_CTRL_1_OFF_OUTBOUND_2)

11.3.3.1.157.1 Offset

Register	Offset
IATU_REGION_CTRL_1_OFF_OUTBOUND_2	8000_0400h

11.3.3.1.157.2 Diagram



11.3.3.1.157.3 Fields

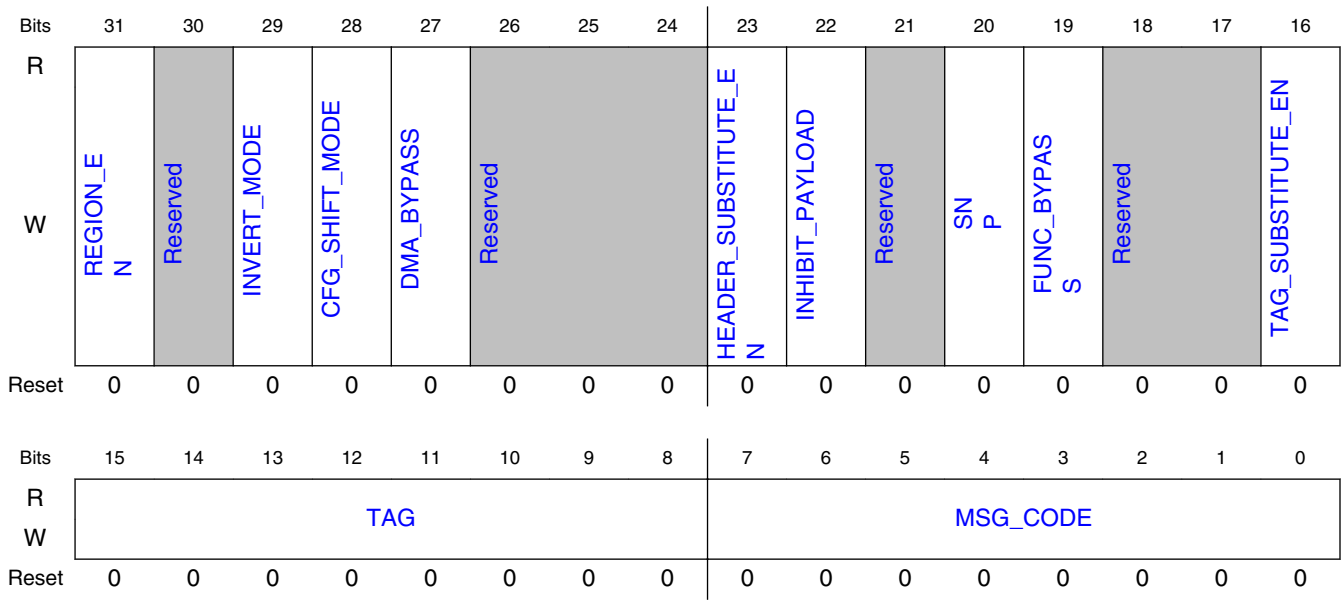
Field	Function
31-23 —	Reserved.
22-20 CTRL_1_FUNC_NUM	Function Number. - When the address of an outbound TLP is matched to this region and the FUNC_BYPASS field in the "iATU Control 2 Register" is '0', then the function number used in generating the function part of the requester ID (RID) field of the TLP is taken from this 5-bit register. When you are using the AXI Bridge, then this field is swapped before AXI decomposition occurs so that the correct "Max_Read_Request_Size" and "Max_Payload_Size" values are used. Note: This register field is sticky.
19-14 —	Reserved.
13 INCREASE_REGION_SIZE	Increase the maximum ATU Region size. When set, the size is determined by the Maximum Size of iATU Region. When clear, the maximum ATU Region size is 4 GB (default). Note: This register field is sticky.
12-11 —	Reserved.
10-9 ATTR	When the address of an outbound TLP is matched to this region, then the ATTR field of the TLP is changed to the value in this register. Note: This register field is sticky.
8 TD	When the address of an outbound TLP is matched to this region, then the TD field of the TLP is changed to the value in this register. Note: This register field is sticky.
7-5 TC	When the address of an outbound TLP is matched to this region, then the TC field of the TLP is changed to the value in this register. Note: This register field is sticky.
4-0 TYPE	When the address of an outbound TLP is matched to this region, then the TYPE field of the TLP is changed to the value in this register. Note: This register field is sticky.

11.3.3.1.158 iATU Region Control 2 Register. (IATU_REGION_CTRL_2_OFF_OUTBOUND_2)

11.3.3.1.158.1 Offset

Register	Offset
IATU_REGION_CTRL_2_OFF_OUTBOUND_2	8000_0404h

11.3.3.1.158.2 Diagram



11.3.3.1.158.3 Fields

Field	Function
31 REGION_EN	Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky.
30 —	Reserved.
29 INVERT_MODE	Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). Note: This register field is sticky.
28 CFG_SHIFT_MODE	CFG Shift Mode. The iATU uses bits [27:12] of the untranslated address (on the XALI0/1/2 interface or AXI slave interface address) to form the BDF number of the outgoing CFG TLP. This supports the Enhanced Configuration Address Mapping (ECAM) mechanism (Section 7.2.2 of the PCI Express Base 3.1 Specification, revision 1.0) by allowing all outgoing I/O and MEM TLPs (that have been translated to CFG) to be mapped from memory space into any 256 MB region of the PCIe configuration space. Note: This register field is sticky.
27 DMA_BYPASS	DMA Bypass Mode. Allows request TLPs which are initiated by the DMA controller to pass through the iATU untranslated. Note: This field is reserved for the SW product. You must set it to '0'. Note: This register field is sticky.
26-24 —	Reserved.
23 HEADER_SUBSTITUTE_EN	Header Substitute Enable. When enabled and region address is matched, the iATU fully substitutes bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header with the contents of the LWR_TARGET_RW field in IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i. - 1: LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register is used to fill bytes 8-to-11 (for 3 DWORD header) or bytes 12-to-15 (for 4 DWORD header) of the translated TLP header. - 0: LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register forms the new address of the translated region. Note: This register field is sticky.

Table continues on the next page...

Field	Function
22 INHIBIT_PAYLOAD	Inhibit TLP Payload Data for TLP's in Matched Region; assign iATU region to be TLP without data. When enabled and region address is matched, the iATU marks all TLPs as having no payload data by forcing the TLP header Fmt[1] bit =0, regardless of the application inputs such as slv_wstrb. - 1: Fmt[1] =0 so that only TLP type without data is sent. For example, a Msg instead of MsgD will be sent. - 0: Fmt[1] =0/1 so that TLPs with or without data can be sent. Note: This register field is sticky.
21 —	Reserved.
20 SNP	Serialize Non-Posted Requests. In this mode, when the AXI Bridge is populated, same AXI ID Non-Posted Read/Write Requests are transmitted on the wire if there are no other same ID Non-Posted Requests outstanding. Note: This register field is sticky.
19 FUNC_BYPASS	Function Number Translation Bypass. In this mode, the function number of the translated TLP is taken from your application transmit interface and not from the CTRL_1_FUNC_NUM field of the "iATU Control 1 Register" or the VF_NUMBER field of the "iATU Control 3 Register." Note: This register field is sticky.
18-17 —	Reserved.
16 TAG_SUBSTITUTE_EN	TAG Substitute Enable. When enabled and region address is matched, the iATU substitutes the TAG field of the outbound TLP header with the contents of the TAG field in this register. The expected usage scenario is translation from AXI MWr to Vendor Defined Msg/MsgD. Note: This register field is sticky.
15-8 TAG	TAG. The substituted TAG field (byte 6) in the outgoing TLP header when TAG_SUBSTITUTE_EN is set. Note: This register field is sticky.
7-0 MSG_CODE	MSG TLPs (Message Code). When the address of an outbound TLP is matched to this region, and the translated TLP TYPE field is Msg or MsgD; then the message field of the TLP is changed to the value in this register. Memory TLPs: (ST;Steering Tag). When the ST field of an outbound TLP is matched to this region, and the translated TLP TYPE field targets memory space; then the ST field of the TLP is changed to the value in this register. Note: This register field is sticky.

11.3.3.1.159 iATU Lower Base Address Register. (IATU_LWR_BASE_ADDR_OFF_OUTBOUND_2)

11.3.3.1.159.1 Offset

Register	Offset
IATU_LWR_BASE_ADDR_OFF_OUTBOUND_2	8000_0408h

11.3.3.1.159.2 Function

iATU Lower Base Address Register. The Minimum Size of iATU Region (Value Range: 4 kB, 8 kB, 16 kB, 32 kB, 64 kB defaults to 64 kB) specifies the minimum size of an address translation region. For example, if set to 64 kB; the lower 16 bits of the Base, Limit and Target registers are zero and all address regions are aligned on 64 kB boundaries. More precisely, the lower log2(Minimum Size of iATU Region) bits are zero.

11.3.3.1.159.3 Diagram

11.3.3.1.164.3 Fields

Field	Function
31-23 —	Reserved.
22-20 CTRL_1_FUNC_NUM	Function Number. - MEM-I/O: When the Address and BAR matching logic in the controller indicate that a MEM-I/O transaction matches a BAR in the function corresponding to this value, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "iATU Control 2 Register" is set. - CFG0/CFG1: When the destination function number as specified in the routing ID of the TLP header matches the function, then address translation proceeds. This check is only performed if the

Table continues on the next page...

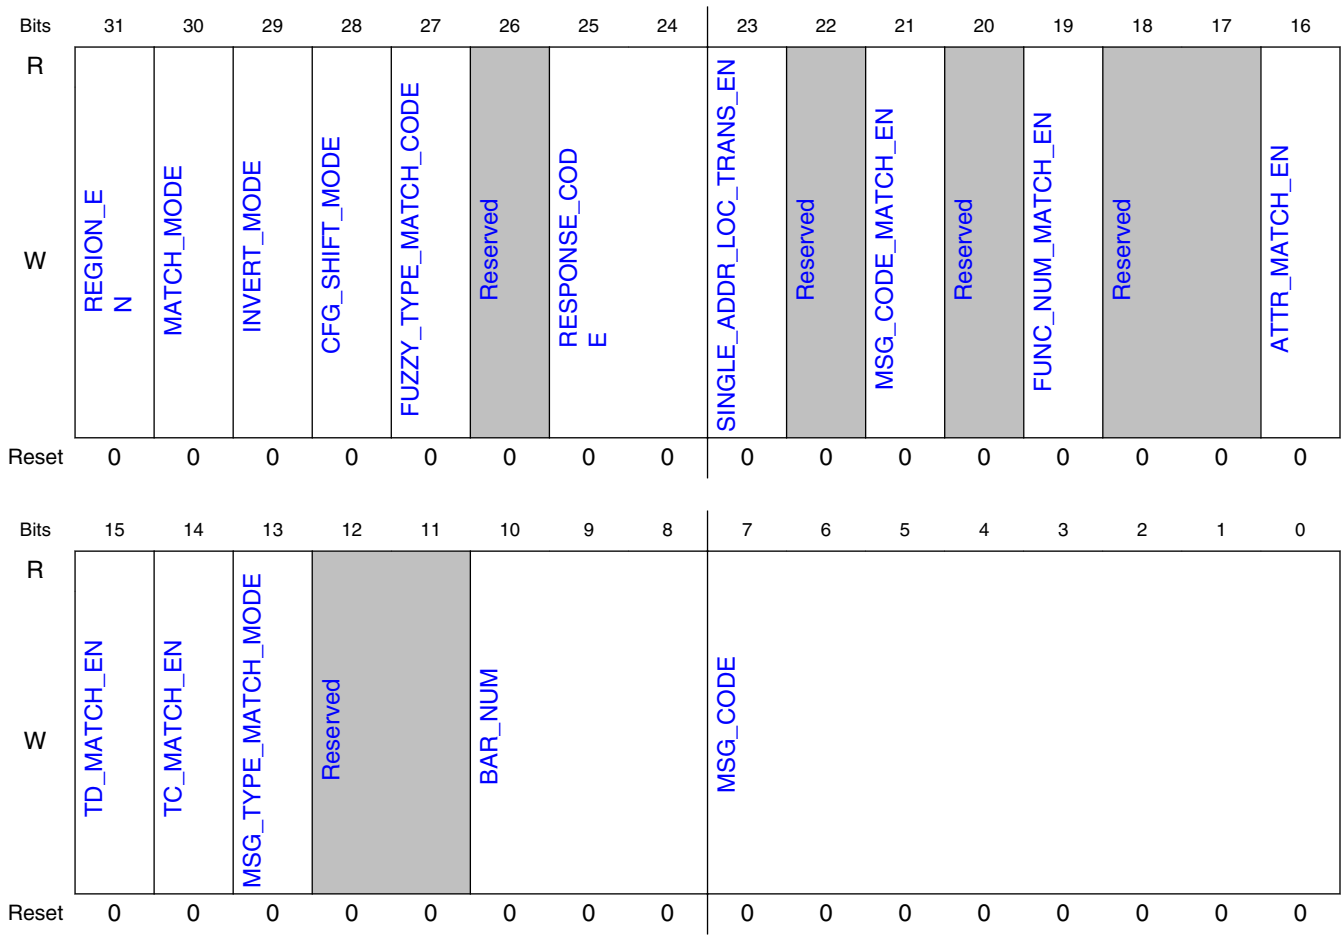
Field	Function
	"Function Number Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
19-14 —	Reserved.
13 INCREASE_REGION_SIZE	Increase the maximum ATU Region size. When set, the size is determined by the Maximum Size of iATU Region. When clear, the maximum ATU Region size is 4 GB (default). Note: This register field is sticky.
12-11 —	Reserved.
10-9 ATTR	When the ATTR field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "ATTR Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
8 TD	When the TD field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TD Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
7-5 TC	When the TC field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TC Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
4-0 TYPE	When the TYPE field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). Note: This register field is sticky.

11.3.3.1.165 iATU Region Control 2 Register. (IATU_REGION_CTRL_2_OFF_INBOUND_2)

11.3.3.1.165.1 Offset

Register	Offset
IATU_REGION_CTRL_2_OFF_INBOUND_2	8000_0504h

11.3.3.1.165.2 Diagram



11.3.3.1.165.3 Fields

Field	Function
31 REGION_EN	Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky.
30 MATCH_MODE	Match Mode. Determines Inbound matching mode for TLPs. The mode depends on the type of TLP that is received as follows: For MEM-I/O TLPs, this field is interpreted as follows: - 0: Address Match Mode. The iATU operates using addresses as in the outbound direction. The Region Base and Limit Registers must be setup. - 1:BAR Match Mode. BAR matching is used. The "BAR Number" field is relevant. Not used for RC. For CFG0 TLPs, this field is interpreted as follows: - 0: Routing ID Match Mode. The iATU interprets the Routing ID (Bytes 8 to 11 of TLP header) as an address. This corresponds to the upper 16 bits of the address in MEM-I/O transactions. The Routing ID of the TLP must be within the base and limit of the iATU region for matching to proceed. - 1: Accept Mode. The iATU accepts all CFG0 transactions as address matches. The routing ID in the CFG0 TLP is ignored. This is useful as all received CFG0 TLPs should be processed regardless of the Bus number. For MSG/MSGD TLPs, this field is interpreted as follows: - 0: Address Match Mode. The iATU treats the third dword and fourth dword of the inbound MSG/MSGD TLP as an address and it is matched against the Region Base and Limit Registers. - 1: Vendor ID Match Mode. This mode is relevant for ID-routed Vendor Defined Messages. The iATU ignores the Routing ID (Bus, Device, Function) in bits [31:16] of the third dword of the TLP header, but matches

Table continues on the next page...

Field	Function
	against the Vendor ID in bits [15:0] of the third dword of the TLP header. Bits [15:0] of the Region Upper Base register should be programmed with the required Vendor ID. The lower Base and Limit Register should be programmed to translate TLPs based on vendor specific information in the fourth dword of the TLP header. - If SINGLE_ADDRESS_LOCATION_TRANSLATE_EN = 1 AND MSG_TYPE_MATCH_MODE = 1, then Match Mode is ignored. Note: This register field is sticky.
29 INVERT_MODE	Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). Note: This register field is sticky.
28 CFG_SHIFT_MODE	CFG Shift Mode. This is useful for CFG transactions where the PCIe configuration mechanism maps bits [27:12] of the address to the bus/device and function number. This allows a CFG configuration space to be located in any 256MB window of your application memory space using a 28-bit effective address. Shifts bits [31:16] of the untranslated address to form bits [27:12] of the translated address. Note: This register field is sticky.
27 FUZZY_TYPE_MATCH_CODE	Fuzzy Type Match Mode. When enabled, the iATU relaxes the matching of the TLP TYPE field against the expected TYPE field so that - CfgRd0 and CfgRd1 TLPs are seen as identical. Similarly with CfgWr0 and CfgWr1. - MWr, MRd and MRdLk TLPs are seen as identical - The Routing field of Msg/MsgD TLPs is ignored - FetchAdd, Swap and CAS are seen as identical. For example, CFG0 in the TYPE field in the "iATU Control 1 Register" matches against an inbound CfgRd0, CfgRd1, CfgWr0 or CfgWr1 TLP. Note: This register field is sticky.
26 —	Reserved.
25-24 RESPONSE_CODE	Response Code. Defines the type of response to give for accesses matching this region. This overrides the normal RADM filter response. Note that this feature is not available for any region where Single Address Location Translate is enabled. - 00 - Normal RADM filter response is used. - 01 - Unsupported request (UR) - 10 - Completer abort (CA) - 11 - Not used / undefined / reserved. Note: This register field is sticky.
23 SINGLE_ADDR_LOC_TRANS_EN	Single Address Location Translate Enable. When enabled, Rx TLPs can be translated to a single address location as determined by the target address register of the iATU region. The main usage scenario is translation of Messages (such as Vendor Defined or ATS Messages) to MWr TLPs when the AXI bridge is enabled. Note: This register field is sticky.
22 —	Reserved.
21 MSG_CODE_MATCH_EN	Message Code Match Enable (Msg TLPS). Ensures that a successful message Code TLP field comparison match (see Message Code field of the "iATU Control 2 Register") occurs (in MSG transactions) for address translation to proceed. ST Match Enable (Mem TLPs). Ensures that a successful ST TLP field comparison match (see ST field of the "iATU Control 2 Register") occurs (in MEM transactions) for address translation to proceed. Note: This register field is sticky.
20 —	Reserved.
19 FUNC_NUM_MATCH_EN	Function Number Match Enable. Ensures that a successful Function Number TLP field comparison match (see Function Number field of the "iATU Control 1 Register") occurs (in MEM-I/O and CFG0/CFG1 transactions) for address translation to proceed. Note: This register field is sticky.
18-17 —	Reserved.
16 ATTR_MATCH_EN	ATTR Match Enable. Ensures that a successful ATTR TLP field comparison match (see ATTR field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.

Table continues on the next page...

Field	Function
15 TD_MATCH_EN	TD Match Enable. Ensures that a successful TD TLP field comparison match (see TD field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.
14 TC_MATCH_EN	TC Match Enable. Ensures that a successful TC TLP field comparison match (see TC field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.
13 MSG_TYPE_MATCH_MODE	Message Type Match Mode. When enabled, and if single address location translate enable is set, then inbound TLPs of type MSG/MSGd which match the type field of the iatu_region_ctrl_1_OFF_inbound register (=>TYPE[4:3]=2'b10) will be translated. Message type match mode overrides any value of MATCH_MODE field in this register. Usage scenarios for this are translation of VDM or ATS messages when AXI bridge is configured on client interface. Note: This register field is sticky.
12-11 —	Reserved.
10-8 BAR_NUM	BAR Number. When the BAR number of an inbound MEM or IO TLP " that is matched by the normal internal BAR address matching mechanism " is the same as this field, address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Match Mode" bit of the "iATU Control 2 Register" is set. - 000b - BAR0 - 001b - BAR1 - 010b - BAR2 - 011b - BAR3 - 100b - BAR4 - 101b - BAR5 - 110b - ROM - 111b - reserved - IO translation would require either 00100b or 00101b in the inbound TLP TYPE; the BAR Number set in the range 000b - 101b and that BAR configured as an IO BAR. Note: This register field is sticky.
7-0 MSG_CODE	MSG TLPs: (Message Code). When the TYPE field of an inbound Msg/MsgD TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Message Code Match Enable" bit of the "iATU Control 2 Register" is set. Memory TLPs: (ST;Steering Tag). When the ST field of an inbound TLP is matched to this value, then address translation proceeds. This check is only performed if the "ST Match Enable" bit of the "iATU Control2 Register" is set. The setting is independent of the setting of the TH field. Note: This register field is sticky.

11.3.3.1.166 iATU Lower Base Address Register. (IATU_LWR_BASE_ADDR_OFF_INBOUND_2)

11.3.3.1.168.3 Fields

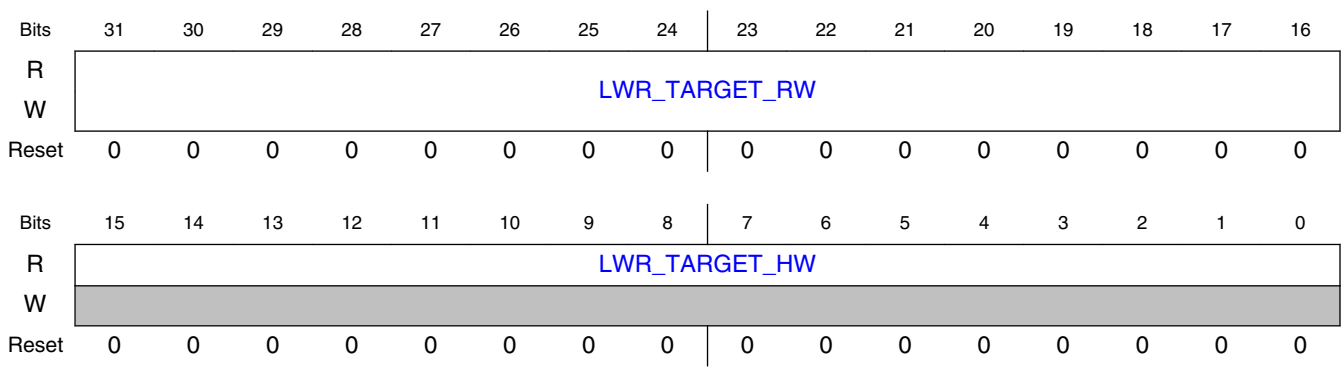
Field	Function
31-16 LIMIT_ADDR_RW	Forms upper bits of the end address of the address region to be translated. The end address must be aligned to the Minimum Size of iATU Region kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller. Note: This register field is sticky.
15-0 LIMIT_ADDR_HW	Forms lower bits of the end address of the address region to be translated. The end address must be aligned to the Minimum Size of iATU Region kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller.

11.3.3.1.169 iATU Lower Target Address Register. (IATU_LWR_TARGET_ADDR_OFF_INBOUND_2)

11.3.3.1.169.1 Offset

Register	Offset
IATU_LWR_TARGET_ADDR_OFF_INBOUND_2	8000_0514h

11.3.3.1.169.2 Diagram



11.3.3.1.169.3 Fields

Field	Function
31-16 LWR_TARGET_RW	Forms MSB's of the Lower Target part of the new address of the translated region. These bits are always '0'. - Field size depends on log2(Minimum Size of iATU Region) in address match mode. - Field size depends on log2(BAR_MASK+1) in BAR match mode. Note: This register field is sticky.

Table continues on the next page...

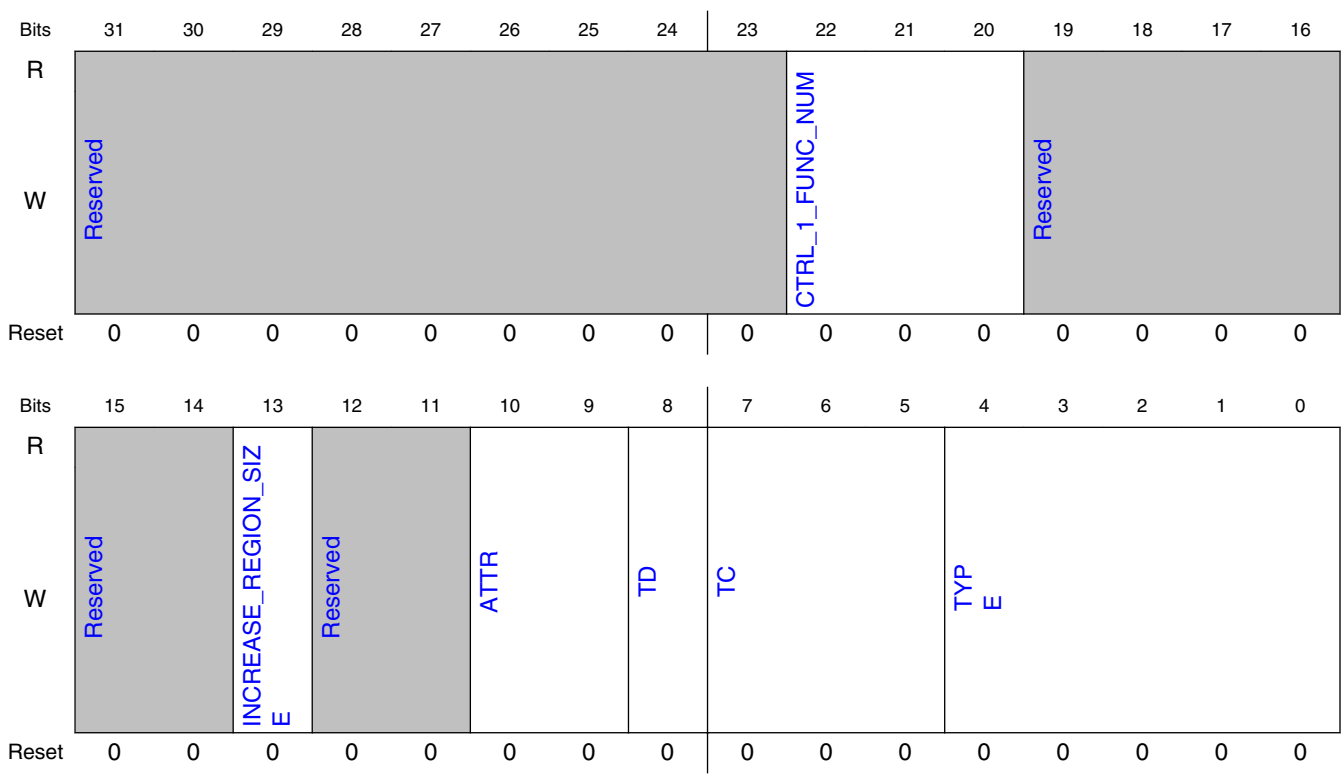
Field	Function
15-0 LWR_TARGET_HW	Forms the LSB's of the Lower Target part of the new address of the translated region. The start address must be aligned to the Minimum Size of iATU Region kB boundary (in address match mode); and to the Bar size boundary (in BAR match mode) so that these bits are always '0'. If the BAR is smaller than the iATU region size, then the iATU target address must align to the iATU region size; otherwise it must align to the BAR size. A write to this location is ignored by the PCIe controller. - Field size depends on log2(Minimum Size of iATU Region) in address match mode. - Field size depends on log2(BAR_MASK +1) in BAR match mode.

11.3.3.1.170 iATU Region Control 1 Register. (IATU_REGION_CTRL_1_OFF_OUTBOUND_3)

11.3.3.1.170.1 Offset

Register	Offset
IATU_REGION_CTRL_1_OFF_OUTBOUND_3	8000_0600h

11.3.3.1.170.2 Diagram



11.3.3.1.170.3 Fields

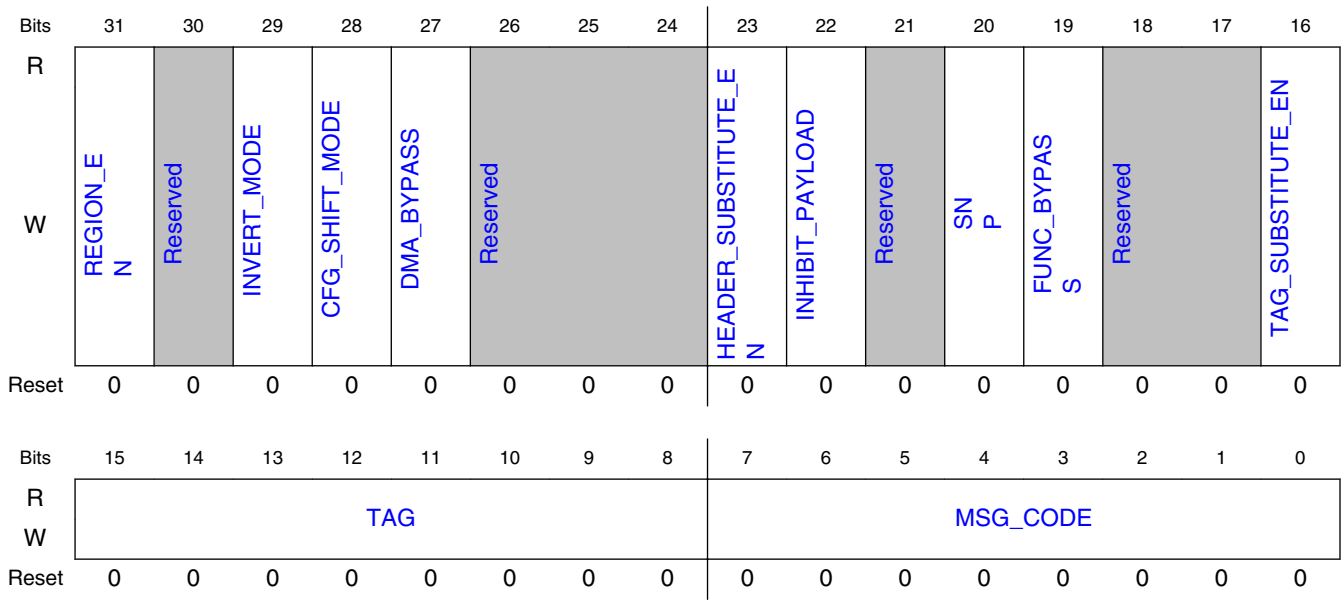
Field	Function
31-23 —	Reserved.
22-20 CTRL_1_FUNC_NUM	Function Number. - When the address of an outbound TLP is matched to this region and the FUNC_BYPASS field in the "iATU Control 2 Register" is '0', then the function number used in generating the function part of the requester ID (RID) field of the TLP is taken from this 5-bit register. When you are using the AXI Bridge, then this field is swapped before AXI decomposition occurs so that the correct "Max_Read_Request_Size" and "Max_Payload_Size" values are used. Note: This register field is sticky.
19-14 —	Reserved.
13 INCREASE_REGION_SIZE	Increase the maximum ATU Region size. When set, the size is determined by the Maximum Size of iATU Region. When clear, the maximum ATU Region size is 4 GB (default). Note: This register field is sticky.
12-11 —	Reserved.
10-9 ATTR	When the address of an outbound TLP is matched to this region, then the ATTR field of the TLP is changed to the value in this register. Note: This register field is sticky.
8 TD	When the address of an outbound TLP is matched to this region, then the TD field of the TLP is changed to the value in this register. Note: This register field is sticky.
7-5 TC	When the address of an outbound TLP is matched to this region, then the TC field of the TLP is changed to the value in this register. Note: This register field is sticky.
4-0 TYPE	When the address of an outbound TLP is matched to this region, then the TYPE field of the TLP is changed to the value in this register. Note: This register field is sticky.

11.3.3.1.171 iATU Region Control 2 Register. (IATU_REGION_CTRL_2_OFF_OUTBOUND_3)

11.3.3.1.171.1 Offset

Register	Offset
IATU_REGION_CTRL_2_OFF_OUTBOUND_3	8000_0604h

11.3.3.1.171.2 Diagram



11.3.3.1.171.3 Fields

Field	Function
31 REGION_EN	Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky.
30 —	Reserved.
29 INVERT_MODE	Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). Note: This register field is sticky.
28 CFG_SHIFT_MODE	CFG Shift Mode. The iATU uses bits [27:12] of the untranslated address (on the XALI0/1/2 interface or AXI slave interface address) to form the BDF number of the outgoing CFG TLP. This supports the Enhanced Configuration Address Mapping (ECAM) mechanism (Section 7.2.2 of the PCI Express Base 3.1 Specification, revision 1.0) by allowing all outgoing I/O and MEM TLPs (that have been translated to CFG) to be mapped from memory space into any 256 MB region of the PCIe configuration space. Note: This register field is sticky.
27 DMA_BYPASS	DMA Bypass Mode. Allows request TLPs which are initiated by the DMA controller to pass through the iATU untranslated. Note: This field is reserved for the SW product. You must set it to '0'. Note: This register field is sticky.
26-24 —	Reserved.
23 HEADER_SUBSTITUTE_EN	Header Substitute Enable. When enabled and region address is matched, the iATU fully substitutes bytes 8-11 (for 3 DWORD header) or bytes 12-15 (for 4 DWORD header) of the outbound TLP header with the contents of the LWR_TARGET_RW field in IATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i. - 1: LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register is used to fill bytes 8-to-11 (for 3 DWORD header) or bytes 12-to-15 (for 4 DWORD header) of the translated TLP header. - 0: LWR_TARGET_RW in the iATU_LWR_TARGET_ADDR_OFF_OUTBOUND_i register forms the new address of the translated region. Note: This register field is sticky.

Table continues on the next page...

Field	Function
22 INHIBIT_PAYLOAD	Inhibit TLP Payload Data for TLP's in Matched Region; assign iATU region to be TLP without data. When enabled and region address is matched, the iATU marks all TLPs as having no payload data by forcing the TLP header Fmt[1] bit =0, regardless of the application inputs such as slv_wstrb. - 1: Fmt[1] =0 so that only TLP type without data is sent. For example, a Msg instead of MsgD will be sent. - 0: Fmt[1] =0/1 so that TLPs with or without data can be sent. Note: This register field is sticky.
21 —	Reserved.
20 SNP	Serialize Non-Posted Requests. In this mode, when the AXI Bridge is populated, same AXI ID Non-Posted Read/Write Requests are transmitted on the wire if there are no other same ID Non-Posted Requests outstanding. Note: This register field is sticky.
19 FUNC_BYPASS	Function Number Translation Bypass. In this mode, the function number of the translated TLP is taken from your application transmit interface and not from the CTRL_1_FUNC_NUM field of the "iATU Control 1 Register" or the VF_NUMBER field of the "iATU Control 3 Register." Note: This register field is sticky.
18-17 —	Reserved.
16 TAG_SUBSTITUTE_EN	TAG Substitute Enable. When enabled and region address is matched, the iATU substitutes the TAG field of the outbound TLP header with the contents of the TAG field in this register. The expected usage scenario is translation from AXI MWr to Vendor Defined Msg/MsgD. Note: This register field is sticky.
15-8 TAG	TAG. The substituted TAG field (byte 6) in the outgoing TLP header when TAG_SUBSTITUTE_EN is set. Note: This register field is sticky.
7-0 MSG_CODE	MSG TLPs (Message Code). When the address of an outbound TLP is matched to this region, and the translated TLP TYPE field is Msg or MsgD; then the message field of the TLP is changed to the value in this register. Memory TLPs: (ST;Steering Tag). When the ST field of an outbound TLP is matched to this region, and the translated TLP TYPE field targets memory space; then the ST field of the TLP is changed to the value in this register. Note: This register field is sticky.

11.3.3.1.172 iATU Lower Base Address Register. (IATU_LWR_BASE_ADDR_OFF_OUTBOUND_3)

11.3.3.1.177.3 Fields

Field	Function
31-23 —	Reserved.
22-20 CTRL_1_FUNC_NUM	Function Number. - MEM-I/O: When the Address and BAR matching logic in the controller indicate that a MEM-I/O transaction matches a BAR in the function corresponding to this value, then address translation proceeds. This check is only performed if the "Function Number Match Enable" bit of the "iATU Control 2 Register" is set. - CFG0/CFG1: When the destination function number as specified in the routing ID of the TLP header matches the function, then address translation proceeds. This check is only performed if the

Table continues on the next page...

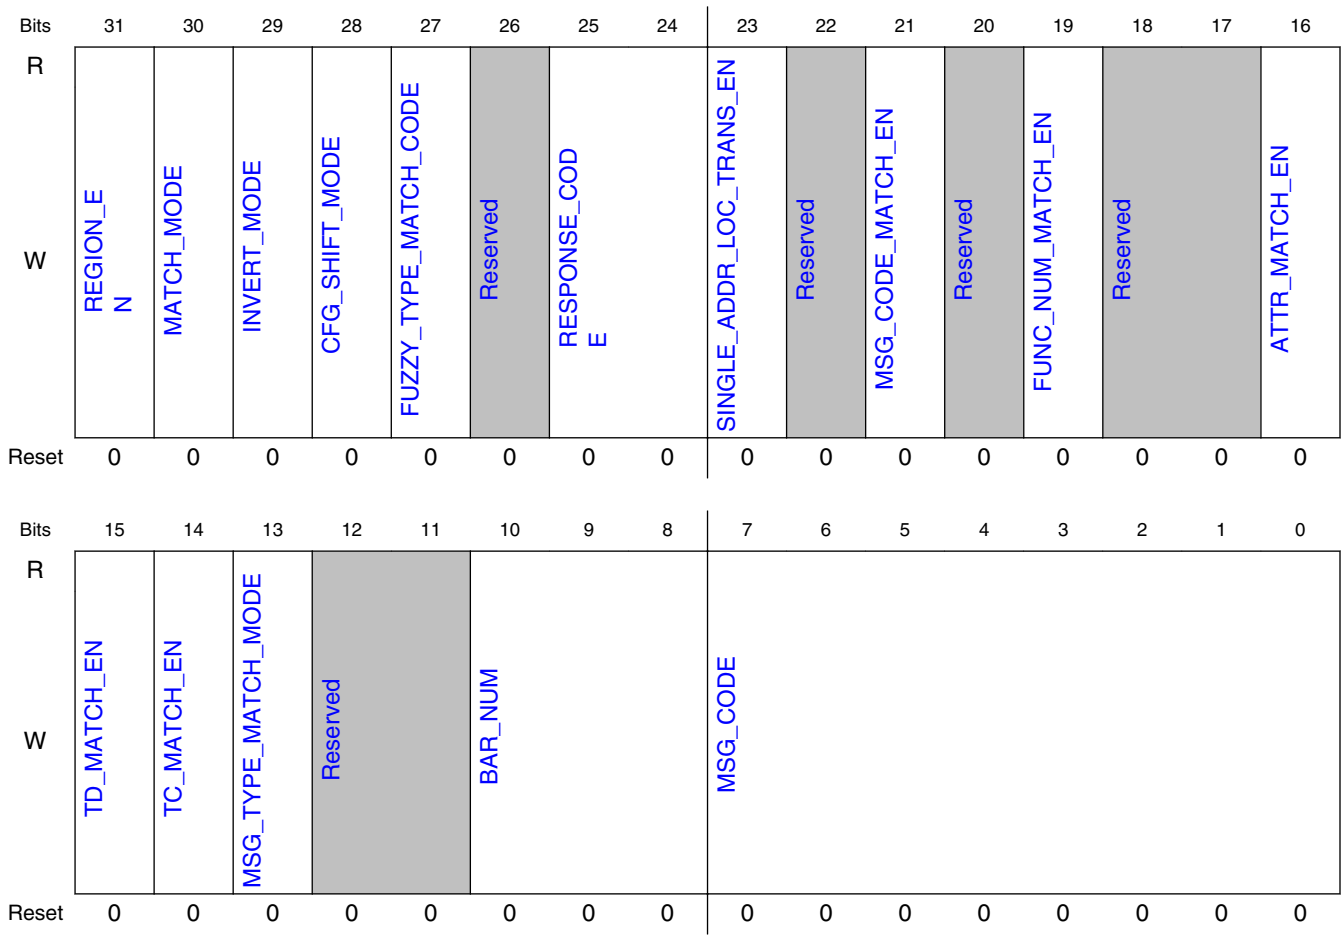
Field	Function
	"Function Number Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
19-14 —	Reserved.
13 INCREASE_REGION_SIZE	Increase the maximum ATU Region size. When set, the size is determined by the Maximum Size of iATU Region. When clear, the maximum ATU Region size is 4 GB (default). Note: This register field is sticky.
12-11 —	Reserved.
10-9 ATTR	When the ATTR field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "ATTR Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
8 TD	When the TD field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TD Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
7-5 TC	When the TC field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "TC Match Enable" bit of the "iATU Control 2 Register" is set. Note: This register field is sticky.
4-0 TYPE	When the TYPE field of an inbound TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). Note: This register field is sticky.

11.3.3.1.178 iATU Region Control 2 Register. (IATU_REGION_CTRL_2_OFF_INBOUND_3)

11.3.3.1.178.1 Offset

Register	Offset
IATU_REGION_CTRL_2_OFF_INBOUND_3	8000_0704h

11.3.3.1.178.2 Diagram



11.3.3.1.178.3 Fields

Field	Function
31 REGION_EN	Region Enable. This bit must be set to '1' for address translation to take place. Note: This register field is sticky.
30 MATCH_MODE	Match Mode. Determines Inbound matching mode for TLPs. The mode depends on the type of TLP that is received as follows: For MEM-I/O TLPs, this field is interpreted as follows: - 0: Address Match Mode. The iATU operates using addresses as in the outbound direction. The Region Base and Limit Registers must be setup. - 1:BAR Match Mode. BAR matching is used. The "BAR Number" field is relevant. Not used for RC. For CFG0 TLPs, this field is interpreted as follows: - 0: Routing ID Match Mode. The iATU interprets the Routing ID (Bytes 8 to 11 of TLP header) as an address. This corresponds to the upper 16 bits of the address in MEM-I/O transactions. The Routing ID of the TLP must be within the base and limit of the iATU region for matching to proceed. - 1: Accept Mode. The iATU accepts all CFG0 transactions as address matches. The routing ID in the CFG0 TLP is ignored. This is useful as all received CFG0 TLPs should be processed regardless of the Bus number. For MSG/MSGD TLPs, this field is interpreted as follows: - 0: Address Match Mode. The iATU treats the third dword and fourth dword of the inbound MSG/MSGD TLP as an address and it is matched against the Region Base and Limit Registers. - 1: Vendor ID Match Mode. This mode is relevant for ID-routed Vendor Defined Messages. The iATU ignores the Routing ID (Bus, Device, Function) in bits [31:16] of the third dword of the TLP header, but matches

Table continues on the next page...

Field	Function
	against the Vendor ID in bits [15:0] of the third dword of the TLP header. Bits [15:0] of the Region Upper Base register should be programmed with the required Vendor ID. The lower Base and Limit Register should be programmed to translate TLPs based on vendor specific information in the fourth dword of the TLP header. - If SINGLE_ADDRESS_LOCATION_TRANSLATE_EN = 1 AND MSG_TYPE_MATCH_MODE = 1, then Match Mode is ignored. Note: This register field is sticky.
29 INVERT_MODE	Invert Mode. When set the address matching region is inverted. Therefore, an address match occurs when the untranslated address is in the region outside the defined range (Base Address to Limit Address). Note: This register field is sticky.
28 CFG_SHIFT_MODE	CFG Shift Mode. This is useful for CFG transactions where the PCIe configuration mechanism maps bits [27:12] of the address to the bus/device and function number. This allows a CFG configuration space to be located in any 256MB window of your application memory space using a 28-bit effective address. Shifts bits [31:16] of the untranslated address to form bits [27:12] of the translated address. Note: This register field is sticky.
27 FUZZY_TYPE_MATCH_CODE	Fuzzy Type Match Mode. When enabled, the iATU relaxes the matching of the TLP TYPE field against the expected TYPE field so that - CfgRd0 and CfgRd1 TLPs are seen as identical. Similarly with CfgWr0 and CfgWr1. - MWr, MRd and MRdLk TLPs are seen as identical - The Routing field of Msg/MsgD TLPs is ignored - FetchAdd, Swap and CAS are seen as identical. For example, CFG0 in the TYPE field in the "iATU Control 1 Register" matches against an inbound CfgRd0, CfgRd1, CfgWr0 or CfgWr1 TLP. Note: This register field is sticky.
26 —	Reserved.
25-24 RESPONSE_CODE	Response Code. Defines the type of response to give for accesses matching this region. This overrides the normal RADM filter response. Note that this feature is not available for any region where Single Address Location Translate is enabled. - 00 - Normal RADM filter response is used. - 01 - Unsupported request (UR) - 10 - Completer abort (CA) - 11 - Not used / undefined / reserved. Note: This register field is sticky.
23 SINGLE_ADDR_LOC_TRANS_EN	Single Address Location Translate Enable. When enabled, Rx TLPs can be translated to a single address location as determined by the target address register of the iATU region. The main usage scenario is translation of Messages (such as Vendor Defined or ATS Messages) to MWr TLPs when the AXI bridge is enabled. Note: This register field is sticky.
22 —	Reserved.
21 MSG_CODE_MATCH_EN	Message Code Match Enable (Msg TLPS). Ensures that a successful message Code TLP field comparison match (see Message Code field of the "iATU Control 2 Register") occurs (in MSG transactions) for address translation to proceed. ST Match Enable (Mem TLPs). Ensures that a successful ST TLP field comparison match (see ST field of the "iATU Control 2 Register") occurs (in MEM transactions) for address translation to proceed. Note: This register field is sticky.
20 —	Reserved.
19 FUNC_NUM_MATCH_EN	Function Number Match Enable. Ensures that a successful Function Number TLP field comparison match (see Function Number field of the "iATU Control 1 Register") occurs (in MEM-I/O and CFG0/CFG1 transactions) for address translation to proceed. Note: This register field is sticky.
18-17 —	Reserved.
16 ATTR_MATCH_EN	ATTR Match Enable. Ensures that a successful ATTR TLP field comparison match (see ATTR field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.

Table continues on the next page...

Field	Function
15 TD_MATCH_EN	TD Match Enable. Ensures that a successful TD TLP field comparison match (see TD field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.
14 TC_MATCH_EN	TC Match Enable. Ensures that a successful TC TLP field comparison match (see TC field of the "iATU Control 1 Register") occurs for address translation to proceed. Note: This register field is sticky.
13 MSG_TYPE_MATCH_MODE	Message Type Match Mode. When enabled, and if single address location translate enable is set, then inbound TLPs of type MSG/MSGd which match the type field of the iatu_region_ctrl_1_OFF_inbound register (=>TYPE[4:3]=2'b10) will be translated. Message type match mode overrides any value of MATCH_MODE field in this register. Usage scenarios for this are translation of VDM or ATS messages when AXI bridge is configured on client interface. Note: This register field is sticky.
12-11 —	Reserved.
10-8 BAR_NUM	BAR Number. When the BAR number of an inbound MEM or IO TLP " that is matched by the normal internal BAR address matching mechanism " is the same as this field, address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Match Mode" bit of the "iATU Control 2 Register" is set. - 000b - BAR0 - 001b - BAR1 - 010b - BAR2 - 011b - BAR3 - 100b - BAR4 - 101b - BAR5 - 110b - ROM - 111b - reserved - IO translation would require either 00100b or 00101b in the inbound TLP TYPE; the BAR Number set in the range 000b - 101b and that BAR configured as an IO BAR. Note: This register field is sticky.
7-0 MSG_CODE	MSG TLPs: (Message Code). When the TYPE field of an inbound Msg/MsgD TLP is matched to this value, then address translation proceeds (when all other enabled field-matches are successful). This check is only performed if the "Message Code Match Enable" bit of the "iATU Control 2 Register" is set. Memory TLPs: (ST;Steering Tag). When the ST field of an inbound TLP is matched to this value, then address translation proceeds. This check is only performed if the "ST Match Enable" bit of the "iATU Control2 Register" is set. The setting is independent of the setting of the TH field. Note: This register field is sticky.

11.3.3.1.179 iATU Lower Base Address Register. (IATU_LWR_BASE_ADDR_OFF_INBOUND_3)

11.3.3.1.179.1 Offset

Register	Offset
IATU_LWR_BASE_ADDR_OFF_INBOUND_3	8000_0708h

11.3.3.1.179.2 Function

iATU Lower Base Address Register. The Minimum Size of iATU Region (Value Range: 4 kB, 8 kB, 16 kB, 32 kB, 64 kB defaults to 64 kB) specifies the minimum size of an address translation region. For example, if set to 64 kB; the lower 16 bits of the Base, Limit and Target registers are zero and all address regions are aligned on 64 kB boundaries. More precisely, the lower log2(Minimum Size of iATU Region) bits are zero.

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	LIMIT_ADDR_HW															
W																
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

11.3.3.1.181.3 Fields

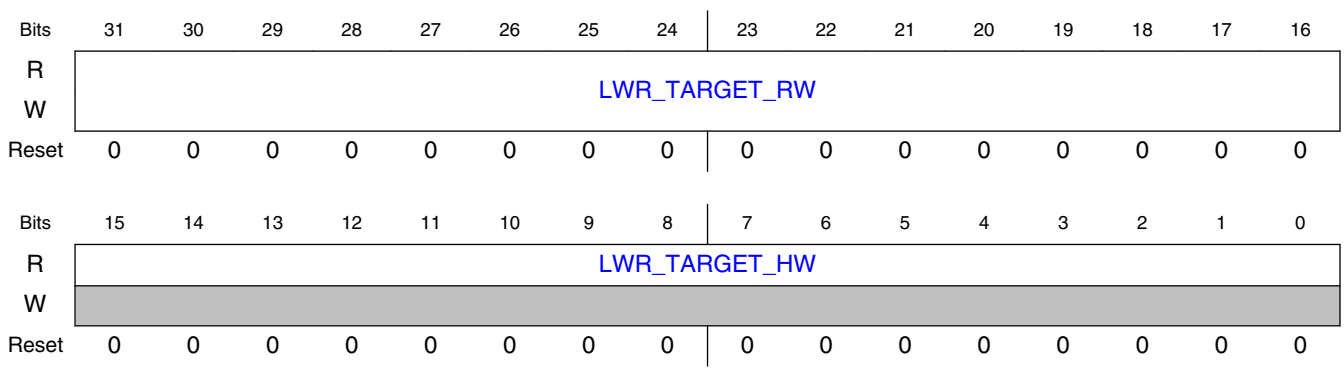
Field	Function
31-16 LIMIT_ADDR_RW	Forms upper bits of the end address of the address region to be translated. The end address must be aligned to the Minimum Size of iATU Region kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller. Note: This register field is sticky.
15-0 LIMIT_ADDR_HW	Forms lower bits of the end address of the address region to be translated. The end address must be aligned to the Minimum Size of iATU Region kB boundary, so these bits are always 0. A write to this location is ignored by the PCIe controller.

11.3.3.1.182 iATU Lower Target Address Register. (IATU_LWR_TARGET_ADDR_OFF_INBOUND_3)

11.3.3.1.182.1 Offset

Register	Offset
IATU_LWR_TARGET_ADDR_OFF_INBOUND_3	8000_0714h

11.3.3.1.182.2 Diagram



11.3.3.1.182.3 Fields

Field	Function
31-16 LWR_TARGET_RW	Forms MSB's of the Lower Target part of the new address of the translated region. These bits are always '0'. - Field size depends on log2(Minimum Size of iATU Region) in address match mode. - Field size depends on log2(BAR_MASK+1) in BAR match mode. Note: This register field is sticky.

Table continues on the next page...

Field	Function
15-0 LWR_TARGET_HW	Forms the LSB's of the Lower Target part of the new address of the translated region. The start address must be aligned to the Minimum Size of iATU Region kB boundary (in address match mode); and to the Bar size boundary (in BAR match mode) so that these bits are always '0'. If the BAR is smaller than the iATU region size, then the iATU target address must align to the iATU region size; otherwise it must align to the BAR size. A write to this location is ignored by the PCIe controller. - Field size depends on log2(Minimum Size of iATU Region) in address match mode. - Field size depends on log2(BAR_MASK +1) in BAR match mode.

11.3.3.1.183 DMA Arbitration Scheme for TRGT1 Interface. (DMA_CTRL_DATA_ARB_PRIOR_OFF)

11.3.3.1.183.1 Offset

Register	Offset
DMA_CTRL_DATA_ARB_PRIOR_OFF	8008_0000h

11.3.3.1.183.2 Function

DMA Arbitration Scheme for TRGT1 Interface. This register is used to control traffic priorities among various sources that are delivered to your application through TRGT1 where 0x0 represents the highest priority. - Non-DMA Rx Requests - DMA Write Channel MRd Requests (DMA data requests and LL element/descriptor access) - DMA Read Channel MRd Requests (LL element/descriptor access) - DMA Read Channel MWr Requests Concurrent traffic from channels with same priority are sorted according to Round-Robin arbitration rules. The arbitration priority defaults to Non-DMA requests (highest), Write Channel MRd, Read Channel MRd, Read Channel MWr.

24 DIS_C2W_CACHE_WR	Disable DMA Write Channels "completion to memory write" context cache pre-fetch function. Note: For internal debugging only. Note: The access attributes of this field are as follows: - Dbi: R/W

Table continues on the next page...

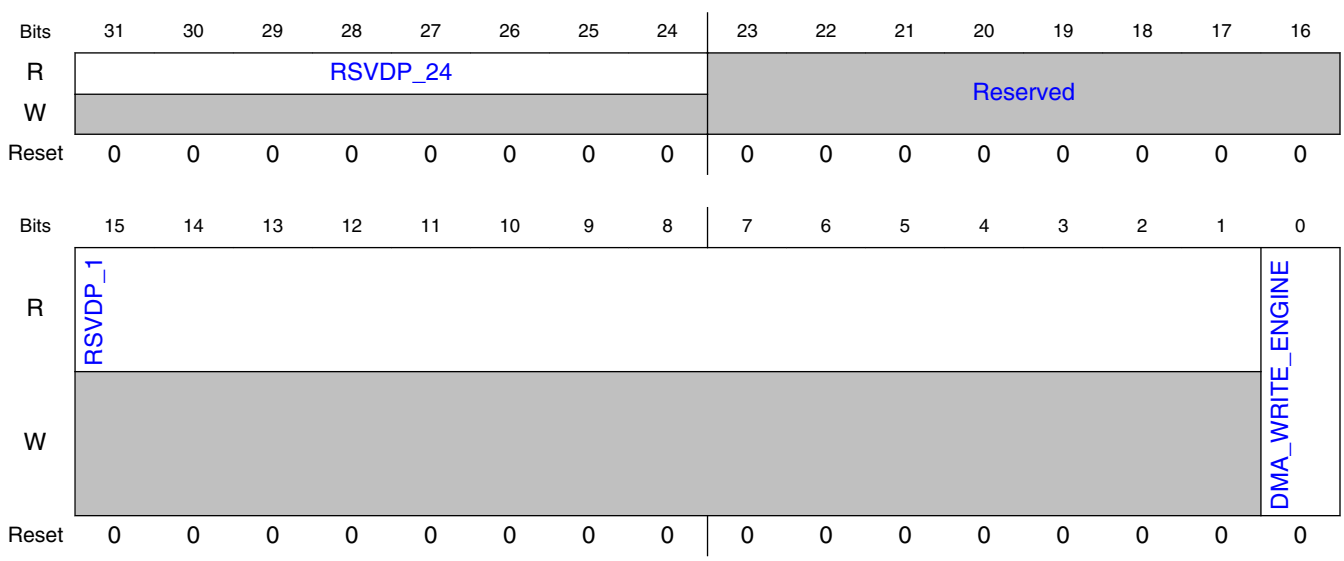
Field	Function
23-20 RSVDP_20	Reserved for future use.
19-16 NUM_DMA_RD_CHAN	Number of Read Channels. You can read this register to determine the number of read channels the DMA controller has been configured to support.
15-4 RSVDP_4	Reserved for future use.
3-0 NUM_DMA_WR_CHAN	Number of Write Channels. You can read this register to determine the number of write channels the DMA controller has been configured to support.

11.3.3.1.185 DMA Write Engine Enable Register. (DMA_WRITE_ENGINE_EN_OFF)

11.3.3.1.185.1 Offset

Register	Offset
DMA_WRITE_ENGINE_EN_OFF	8008_000Ch

11.3.3.1.185.2 Diagram



11.3.3.1.185.3 Fields

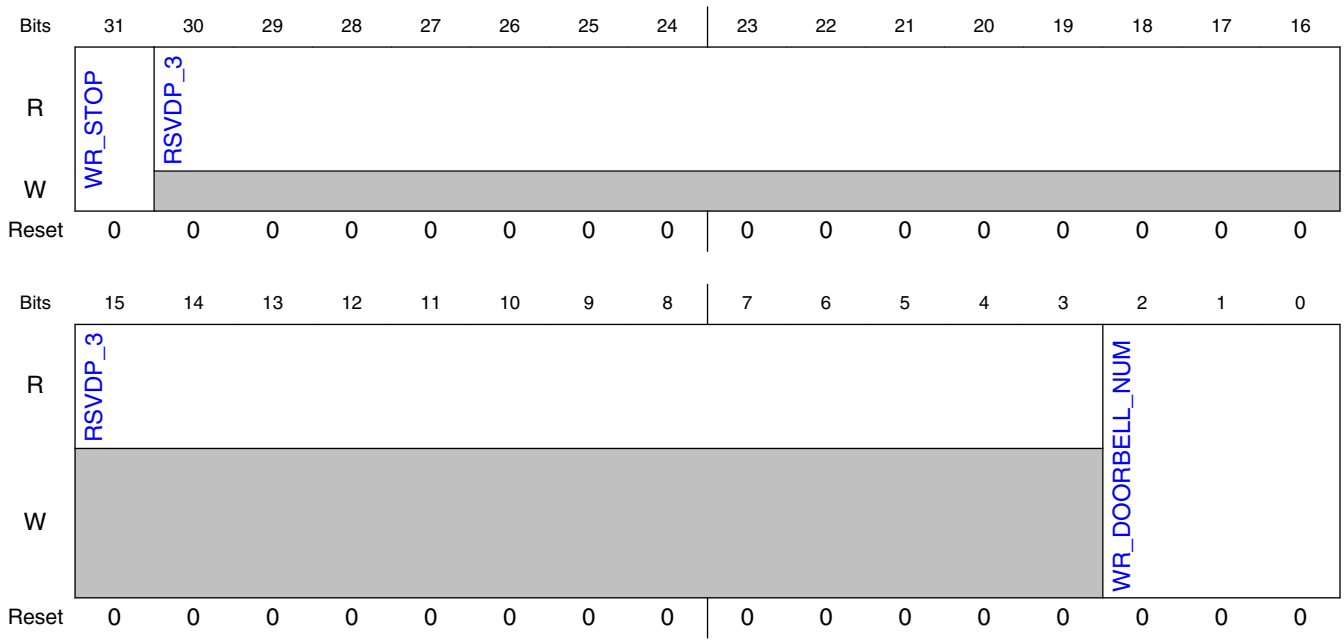
Field	Function
31-24 RSVDP_24	Reserved for future use.
23-16 —	Reserved.
15-1 RSVDP_1	Reserved for future use.
0 DMA_WRITE_ENGINE	DMA Write Engine Enable. - 1: Enable - 0: Disable (Soft Reset) For normal operation, you must initially set this bit to "1", before any other software setup actions. You do not need to toggle or rewrite to this bit during normal operation. You should set this bit to "0" when you want to "Soft Reset" the DMA controller write logic. There are three possible reasons for resetting the DMA controller write logic: - The "Abort Interrupt Status" bit is set (in the "DMA Write Interrupt Status Register" DMA_WRITE_INT_STATUS_OFF), and any of the bits is in the "DMA Write Error Status Register" (DMA_WRITE_ERR_STATUS_OFF) are set. Resetting the DMA controller write logic re-initializes the control logic, ensuring that the next DMA write transfer is executed successfully. - You have executed the procedure outlined in "Stop Bit" , after which, the "Abort Interrupt Status" bit is set and the Channel Status field (CS) of the DMA write "DMA Channel Control 1 Register " (DMA_CH_CONTROL1_OFF_WRCH_0) is set to "Stopped." Resetting the DMA controller write logic re-initializes the control logic ensuring that the next DMA write transfer is executed successfully. - During software development, when you incorrectly program the DMA write engine. To "Soft Reset" the DMA controller write logic, you must: - De-assert the DMA write engine enable bit. - Wait for the DMA to complete any in-progress TLP transfer, by waiting until a read on the DMA write engine enable bit returns a "0". - Assert the DMA write engine enable bit. This "Soft Reset" does not clear the DMA configuration registers. The DMA write transfer does not start until you write to the "DMA Write Doorbell Register" (DMA_WRITE_DOORBELL_OFF). Note: The access attributes of this field are as follows: - Dbi: R/W

11.3.3.1.186 DMA Write Doorbell Register. (DMA_WRITE_DOORBELL_OFF)

11.3.3.1.186.1 Offset

Register	Offset
DMA_WRITE_DOORBELL_OFF	8008_0010h

11.3.3.1.186.2 Diagram



11.3.3.1.186.3 Fields

Field	Function
31 WR_STOP	Stop. Set in conjunction with the Doorbell Number field. The DMA write channel stops issuing requests, sets the channel status to "Stopped", and asserts the "Abort" interrupt if it is enabled. Before setting the Stop bit, you must read the channel Status field (CS) of the "DMA Channel Control 1 Register " (DMA_CH_CONTROL1_OFF_WRCH_0) to ensure that the write channel is "Running" (transferring data). For more information, see "Stopping the DMA Transfer (Software Stop)." Note: The access attributes of this field are as follows: - Dbi: R/W
30-3 RSVDP_3	Reserved for future use.
2-0 WR_DOORBELL_NUM	Doorbell Number. You must write the channel number to this register to start the DMA write transfer for that channel. The DMA detects a write to this register field even if the value of this field does not change. You do not need to toggle or write any other value to this register to start a new transfer. The range of this field is 0x0 to 0x7, and 0x0 corresponds to channel 0. Also note that a write to this field triggers the controller to exit L1 substates. Note: The access attributes of this field are as follows: - Dbi: R/W

11.3.3.1.187 DMA Write Engine Channel Arbitration Weight Low Register. (DMA_WRITE_CHANNEL_ARB_WEIGHT_LOW_OFF)

11.3.3.1.187.1 Offset

Register	Offset
DMA_WRITE_CHANNEL_ARB_WEIGHT_LOW_OFF	8008_0018h

11.3.3.1.187.2 Function

DMA Write Engine Channel Arbitration Weight Low Register. The 5-bit channel weight (for write channels 0-3) specifies the maximum number of TLP requests that the DMA can issue for that channel before it must return to the arbitration routine. When the channel weight count is reached or DMA channel request transfer size reaches zero, the WWR arbiter selects the next channel to be processed. Your software must initialize this register before ringing the doorbell. For more details, see "Multichannel Arbitration". Value range is (0-0x1F) corresponding to (1-32) transaction requests.

23-16 LINKLIST_ELEMENT_FETCH_ERR_DETECT	Linked List Element Fetch Error Detected. The DMA write channel has received an error response from the AXI bus (or TRGT1 interface when the AXI Bridge is not used) while reading a linked list element from local memory. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. - Enabling: For details, see "Interrupts and Error Handling". - Masking: The DMA write interrupt Mask register has no effect on this register. - Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Write Interrupt Clear Register" (DMA_WRITE_INT_CLEAR_OFF) to clear this error bit.
15-8 RSVDP_8	Reserved for future use.
7-0 APP_READ_ERR_DETECT	Application Read Error Detected. The DMA write channel has received an error response from the AXI bus (or TRGT1 interface when the AXI Bridge is not used) while reading data from it. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. - Enabling: For details, see "Interrupts and Error Handling". - Masking: The DMA write interrupt Mask register has no effect on this register. - Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Write Interrupt Clear Register" (DMA_WRITE_INT_CLEAR_OFF) to clear this error bit.

11.3.3.1.197 DMA Write Done IMWr Address Low Register. (DMA_WRITE_DONE_IMWR_LOW_OFF)

11.3.3.1.197.1 Offset

11.3.3.1.204.3 Fields

Field	Function
31-16 WR_CHANNEL_7_DATA	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 7. Note: The access attributes of this field are as follows: - Dbi: R/W
15-0 WR_CHANNEL_6_DATA	The DMA uses this field to generate the data field for the Done or Abort IMWr TLPs it generates for write channel 6. Note: The access attributes of this field are as follows: - Dbi: R/W

11.3.3.1.205 DMA Write Linked List Error Enable Register. (DMA_WRITE_LINKED_LIST_ERR_EN_OFF)

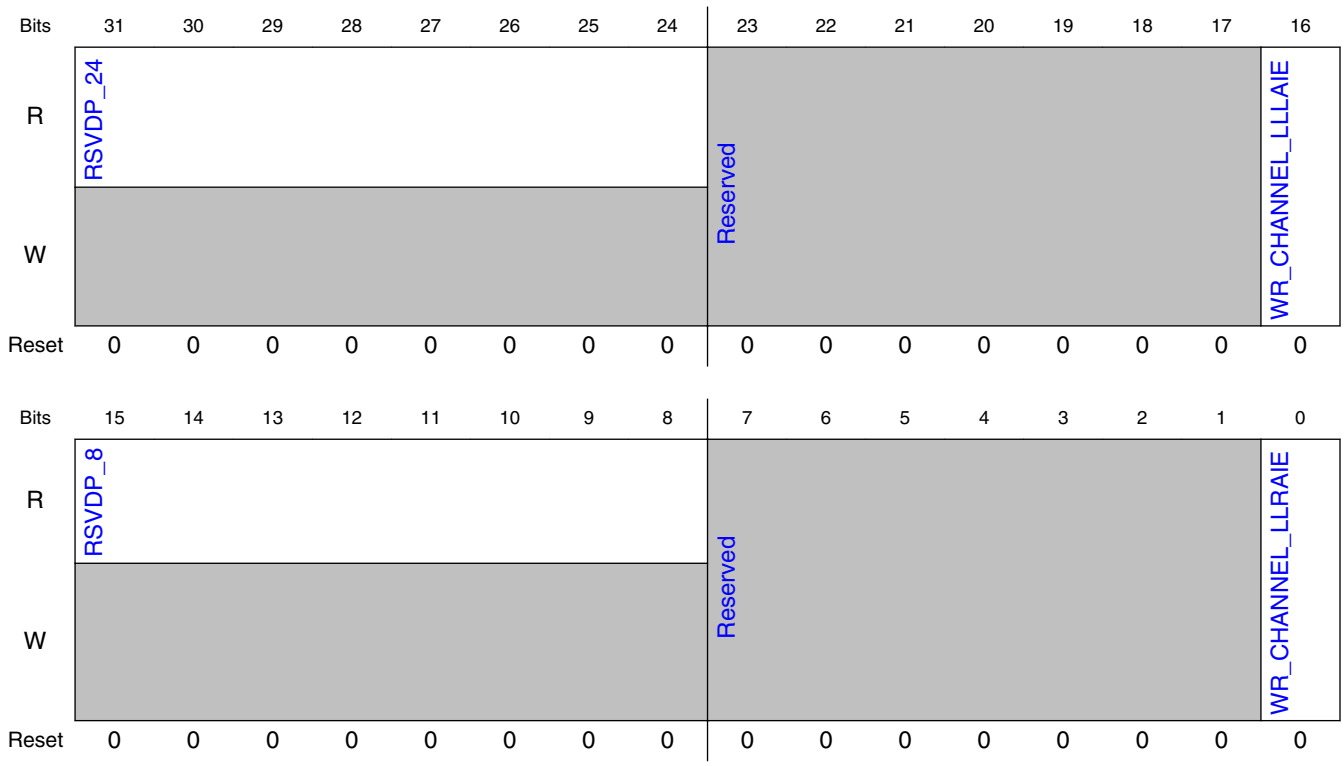
11.3.3.1.205.1 Offset

Register	Offset
DMA_WRITE_LINKED_LIST_ERR_EN_OFF	8008_0090h

11.3.3.1.205.2 Function

DMA Write Linked List Error Enable Register. The LIE and RIE bits in the LL element enable the channel "done" interrupts (local and remote). The LLLAIE and LLRAIE bits enable the channel "abort" interrupts (local and remote).

11.3.3.1.205.3 Diagram



11.3.3.1.205.4 Fields

Field	Function
31-24 RSVDP_24	Reserved for future use.
23-17 —	Reserved.
16 WR_CHANNEL_LLLAIE	Write Channel LL Local Abort Interrupt Enable (LLLAIE). You enable the write channel local abort interrupt through this bit. The LIE and RIE bits in the LL element enable the write channel done interrupts. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Used in linked list mode only. For more details, see "Interrupt Handling". Note: The access attributes of this field are as follows: - Dbi: R/W
15-8	Reserved for future use.

Table continues on the next page...

Field	Function
RSVDP_8	
7-1 —	Reserved.
0 WR_CHANNEL_LLRAIE	Write Channel LL Remote Abort Interrupt Enable (LLRAIE). You enable the write channel remote abort interrupt through this bit. The LIE and RIE bits in the LL element enable the write channel done interrupts. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Used in linked list mode only. For more details, see "Interrupt Handling". Note: The access attributes of this field are as follows: - Dbi: R/W

11.3.3.1.206 DMA Read Interrupt Status Register. (DMA_READ_INT_STATUS_OFF)

11.3.3.1.206.1 Offset

Register	Offset
DMA_READ_INT_STATUS_OFF	8008_00A0h

11.3.3.1.206.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

11.3.3.1.206.3 Fields

Field	Function
31-24 RSVDP_24	Reserved for future use.
23-16 RD_ABORT_INT_STATUS	Abort Interrupt Status. The DMA read channel has detected an error, or you manually stopped the transfer as described in "Stopping the DMA Transfer (Software Stop)". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. You can read the "DMA Read Error Status Low Register" (DMA_READ_ERR_STATUS_LOW_OFF) and "DMA Read Error Status High Register"

Table continues on the next page...

Field	Function
	(DMA_READ_ERR_STATUS_HIGH_OFF) to determine the source of the error. - Enabling: For details, see "Interrupts and Error Handling". - Masking: The DMA read interrupt Mask register has no effect on this register. - Clearing: You must write a 1'b1 to the corresponding channel bit in the DMA read interrupt Clear register to clear this interrupt bit. Note: You can write to this register to emulate interrupt generation, during software or hardware testing. A write to the address triggers an interrupt, but the DMA does not set the Done or Abort bits in this register. Note: The access attributes of this field are as follows: - Dbi: R/W
15-8 RSVDP_8	Reserved for future use.
7-0 RD_DONE_INT_STATUS	Done Interrupt Status. The DMA read channel has successfully completed the DMA read transfer. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. - Enabling: For details, see "Interrupts and Error Handling". - Masking: The DMA read interrupt Mask register has no effect on this register. - Clearing: You must write a 1'b1 to the corresponding channel bit in the DMA read interrupt Clear register to clear this interrupt bit. Note: You can write to this register to emulate interrupt generation, during software or hardware testing. A write to the address triggers an interrupt, but the DMA does not set the Done or Abort bits in this register. Note: The access attributes of this field are as follows: - Dbi: R/W

11.3.3.1.207 DMA Read Interrupt Mask Register. (DMA_READ_INT_MASK_OFF)

11.3.3.1.209.3 Fields

Field	Function
31-24 RSVDP_24	Reserved for future use.
23-16 LINK_LIST_ELEMENT_FETCH_ERR_DETECT	Linked List Element Fetch Error Detected. - The DMA read channel has received an error response from the AXI bus while reading a linked list element from local memory. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. - Enabling: For details, see "Interrupts and Error Handling". - Masking: The DMA read interrupt Mask register has no effect on this register. - Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Read Interrupt Clear Register" (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this clears all bits in this register, and also the DMA Read Error Status High register (DMA_READ_ERR_STATUS_HIGH_OFF).

Table continues on the next page...

Field	Function
15-8 RSVDP_8	Reserved for future use.
7-0 APP_WR_ERR_DETECT	Application Write Error Detected. The DMA read channel has received an error response from the AXI bus (or TRGT1 interface when the AXI Bridge is not used) while writing data to it. This error is fatal. You must restart the transfer from the beginning, as the channel context is corrupted, and the transfer is not rolled back. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. - Enabling: For details, see "Interrupts and Error Handling". - Masking: The DMA read interrupt Mask register has no effect on this register. - Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Read Interrupt Clear Register" (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this clears all bits in this register, and also the DMA Read Error Status High register (DMA_READ_ERR_STATUS_HIGH_OFF).

11.3.3.1.210 DMA Read Error Status High Register. (DMA_READ_ERR_STATUS_HIGH_OFF)

11.3.3.1.210.1 Offset

11.3.3.1.210.3 Fields

Field	Function
31-24 DATA_POISIONING	Data Poisoning. The DMA read channel has detected data poisoning in the completion from the remote device (in response to the MRd request). The DMA read channel will drop the completion and then be halted. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. - Enabling: For details, see "Interrupts and Error Handling". - Masking: The DMA read interrupt Mask register has no effect on this register. - Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field

Table continues on the next page...

Field	Function
	of the "DMA Read Interrupt Clear Register" (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register.
23-16 CPL_TIMEOUT	Completion Time Out. The DMA read channel has timed-out while waiting for the remote device to respond to the MRd request, or a malformed CplD has been received. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. - Enabling: For details, see "Interrupts and Error Handling" . - Masking: The DMA read interrupt Mask register has no effect on this register. - Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Read Interrupt Clear Register" (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register.
15-8 CPL_ABORT	Completer Abort. The DMA read channel has received a PCIe completer abort completion status from the remote device in response to the MRd request. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. - Enabling: For details, see "Interrupts and Error Handling". - Masking: The DMA read interrupt Mask register has no effect on this register. - Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Read Interrupt Clear Register" (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register.
7-0 UNSUPPORTED_REQ	Unsupported Request. The DMA read channel has received a PCIe unsupported request completion status from the remote device in response to the MRd request. For more details, see "Linked List Mode". Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. - Enabling: For details, see "Interrupts and Error Handling". - Masking: The DMA read interrupt Mask register has no effect on this register. - Clearing: You must write a 1'b1 to the corresponding channel bit in the Abort interrupt field of the "DMA Read Interrupt Clear Register" (DMA_READ_INT_CLEAR_OFF) to clear this error bit. Note, this also clears the other error bits for the same channel in this register and in the DMA Read Error Status Low register.

11.3.3.1.211 DMA Read Linked List Error Enable Register. (DMA_READ_LINKED_LIST_ERR_EN_OFF)

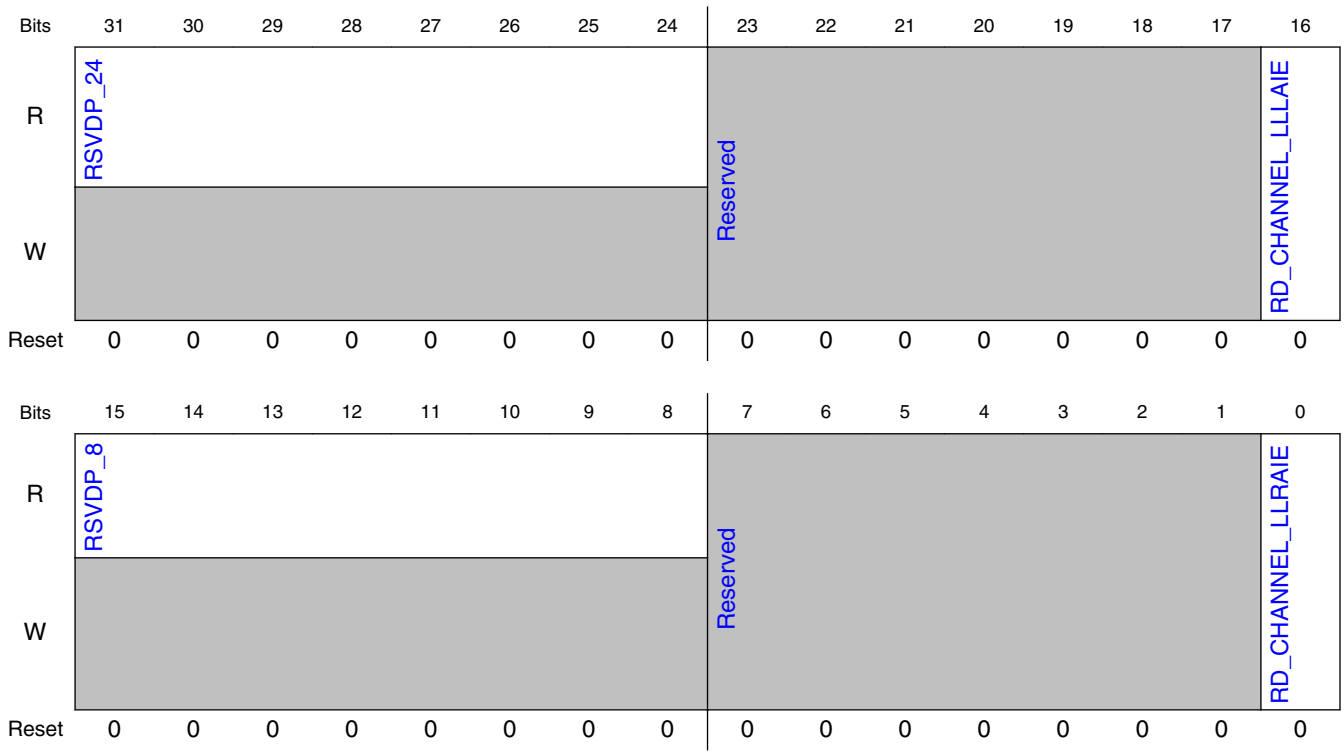
11.3.3.1.211.1 Offset

Register	Offset
DMA_READ_LINKED_LIST_ERR_EN_OFF	8008_00C4h

11.3.3.1.211.2 Function

DMA Read Linked List Error Enable Register. The LIE and RIE bits in the LL element enable the channel "done" interrupts (local and remote). The LLLAIE and LLRAIE bits enable the channel "abort" interrupts (local and remote).

11.3.3.1.211.3 Diagram



11.3.3.1.211.4 Fields

Field	Function
31-24 RSVDP_24	Reserved for future use.
23-17 —	Reserved.
16 RD_CHANNEL_LLLAIE	Read Channel LL Local Abort Interrupt Enable (LLLAIE). You enable the read channel Local Abort interrupt through this bit. The LIE and RIE bits in the LL element enable the read channel done interrupts. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Used in linked list mode only. For more details, see "Interrupt Handling". Note: The access attributes of this field are as follows: - Dbi: R/W
15-8 RSVDP_8	Reserved for future use.
7-1 —	Reserved.
0 RD_CHANNEL_LLRAIE	Read Channel LL Remote Abort Interrupt Enable (LLRAIE). You enable the read channel Remote Abort interrupt through this bit. The LIE and RIE bits in the LL element enable the read channel done interrupts. Each bit corresponds to a DMA channel. Bit [0] corresponds to channel 0. Used in linked list mode only. For more details, see "Interrupt Handling". Note: The access attributes of this field are as follows: - Dbi: R/W

11.3.3.1.220.3 Fields

Field	Function
31-30 DMA_AT	Address Translation TLP Header Bit (AT) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: - Dbi: R/W
29-27 DMA_TC	Traffic Class TLP Header Bit (TC) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: - Dbi: R/W
26 DMA_RESERVED5	Reserved. Note: The access attributes of this field are as follows: - Dbi: R/W
25 DMA_RO	Relaxed Ordering TLP Header Bit (RO) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: - Dbi: R/W
24 DMA_NS_SRC	Source No Snoop TLP Header Bit (DMA_NS_SRC). The DMA uses this TLP header field when generating MRd (SAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: - Dbi: R/W
23 DMA_NS_DST	Destination No Snoop TLP Header Bit (DMA_NS_DST). The DMA uses this TLP header field when generating MWr (DAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: - Dbi: R/W
22-17 DMA_RESERVED2	Reserved. Note: The access attributes of this field are as follows: - Dbi: R/W
16-12	Function Number (FN). The controller uses this field when generating the requester ID for the MRd/MWr DMA TLP. When you have enabled SR-IOV, then this field is ignored if you have set the VFE field in the

Table continues on the next page...

Field	Function
DMA_FUNC_NUM	"DMA Write Channel Control 2 Register" (DMA_CH_CONTROL2_OFF_WRCH_0). Note: The access attributes of this field are as follows: - Dbi: R/W
11-10 DMA_RESERVED1	Reserved. Note: The access attributes of this field are as follows: - Dbi: R/W
9 LLE	Linked List Enable (LLE). - 0: Disable linked list operation - 1: Enable linked list operation Note: The access attributes of this field are as follows: - Dbi: R/W
8 CCS	Consumer Cycle State (CCS). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". You must initialize this bit. The DMA updates this bit during linked list operation. Note: The access attributes of this field are as follows: - Dbi: R/W
7 DMA_RESERVED0	Reserved. Note: The access attributes of this field are as follows: - Dbi: R/W
6-5 CS	Channel Status (CS). The channel status bits identify the current operational state of the DMA channel. The operation state encoding for each DMA channel is a s follows: - 00: Reserved - 01: Running. This channel is active and transferring data. - 10: Halted. An error condition has been detected, and the DMA has stopped this channel. - 11: Stopped. The DMA has transferred all data for this channel, or you have prematurely stopped this channel by writing to the Stop field of the "DMA Write Doorbell Register" (DMA_WRITE_DOORBELL_OFF) or "DMA Read Doorbell Register" (DMA_READ_DOORBELL_OFF).
4 RIE	Remote Interrupt Enable (RIE). You must set this bit to enable the generation of the Done or Abort Remote interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the RIE of the LL element. The RIE bit in a LL element only enables the Done interrupt. In non-LL mode, the RIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: - Dbi: R/W
3 LIE	Local Interrupt Enable (LIE). You must set this bit to enable the generation of the Done or Abort Local interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the LIE of the LL element. The LIE bit in a LL element only enables the Done interrupt. In non-LL mode, the LIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: - Dbi: R/W
2 LLP	Load Link Pointer (LLP). Used in linked list mode only. Indicates that this linked list element is a link element, and its LL element pointer dwords are pointing to the next (non-contiguous) element. The DMA loads this field with the LLP of the linked list element. Note: The access attributes of this field are as follows: - Dbi: R/W
1 TCB	Toggle Cycle Bit (TCB). Indicates to the DMA to toggle its interpretation of the CB. Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the TCB of the linked list element. this field is not defined in a data LL element. Note: The access attributes of this field are as follows: - Dbi: R/W
0 CB	Cycle Bit (CB). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the CB of the linked list element. Note: The access attributes of this field are as follows: - Dbi: R/W

11.3.3.1.221 DMA Write Transfer Size Register. (DMA_TRANSFER_SIZE_OFF_WRCH_0)

11.3.3.1.221.1 Offset

Register	Offset
DMA_TRANSFER_SIZE_OFF_WRCH_0	8008_0208h

11.3.3.1.221.2 Diagram

R W	DMA_TRANSFER_SIZE															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

11.3.3.1.221.3 Fields

Field	Function
31-0 DMA_TRANSFER_SIZE	DMA Transfer Size. You program this register with the size of the DMA transfer. The maximum DMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). This field is automatically decremented by the DMA as the DMA write channel transfer progresses. This field indicates the number bytes remaining to be transferred. When all bytes are successfully transferred the current transfer size is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element. You can read this register to monitor the transfer progress, however in some scenarios this register is updated after a delay. For example, when less than 3 channels are doorbelled, this register is updated only after a descriptor finishes(linked list mode), or the transfer ends (non-linked list mode). Note: The access attributes of this field are as follows: - Dbi: R/W

11.3.3.1.222 DMA Write SAR Low Register. (DMA_SAR_LOW_OFF_WRCH_0)

11.3.3.1.228.3 Fields

Field	Function
31-30 DMA_AT	Address Translation TLP Header Bit (AT) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: - Dbi: R/W
29-27 DMA_TC	Traffic Class TLP Header Bit (TC) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: - Dbi: R/W
26 DMA_RESERVED5	Reserved. Note: The access attributes of this field are as follows: - Dbi: R/W
25 DMA_RO	Relaxed Ordering TLP Header Bit (RO) The DMA uses this TLP header field when generating MRd/MWr (not IMWr) TLPs. Note: The access attributes of this field are as follows: - Dbi: R/W
24 DMA_NS_SRC	Source No Snoop TLP Header Bit (DMA_NS_SRC). The DMA uses this TLP header field when generating MRd (SAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: - Dbi: R/W
23 DMA_NS_DST	Destination No Snoop TLP Header Bit (DMA_NS_DST). The DMA uses this TLP header field when generating MWr (DAR addressing space) (not IMWr) TLPs. Note: The access attributes of this field are as follows: - Dbi: R/W
22-17 DMA_RESERVED2	Reserved. Note: The access attributes of this field are as follows: - Dbi: R/W
16-12 DMA_FUNC_NUM	Function Number (FN). The controller uses this field when generating the requester ID for the MRd/MWr DMA TLP. When you have enabled SR-IOV, then this field is ignored if you have set the VFE field in the "DMA Read Channel Control 2 Register" (DMA_CH_CONTROL2_OFF_RDCH_0). Note: The access attributes of this field are as follows: - Dbi: R/W
11-10 DMA_RESERVED1	Reserved. Note: The access attributes of this field are as follows: - Dbi: R/W
9 LLE	Linked List Enable (LLE). - 0: Disable linked list operation - 1: Enable linked list operation Note: The access attributes of this field are as follows: - Dbi: R/W
8 CCS	Consumer Cycle State (CCS). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". You must initialize this bit. The DMA updates this bit during linked list operation. Note: The access attributes of this field are as follows: - Dbi: R/W
7 DMA_RESERVED0	Reserved. Note: The access attributes of this field are as follows: - Dbi: R/W
6-5 CS	Channel Status (CS). The channel status bits identify the current operational state of the DMA channel. The operation state encoding for each DMA channel is a s follows: - 00: Reserved - 01: Running. This channel is active and transferring data. - 10: Halted. An error condition has been detected, and the DMA has stopped this channel. - 11: Stopped. The DMA has transferred all data for this channel, or you have prematurely stopped this channel by writing to the Stop field of the "DMA Read Doorbell Register" (DMA_WRITE_DOORBELL_OFF) or "DMA Read Doorbell Register" (DMA_READ_DOORBELL_OFF).
4 RIE	Remote Interrupt Enable (RIE). You must set this bit to enable the generation of the Done or Abort Remote interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the RIE of the LL element. The RIE bit in a LL element only enables the Done interrupt. In non-LL mode, the RIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: - Dbi: R/W

Table continues on the next page...

Field	Function
3 LIE	Local Interrupt Enable (LIE). You must set this bit to enable the generation of the Done or Abort Local interrupts. For more details, see "Interrupts and Error Handling". In LL mode, the DMA overwrites this with the LIE of the LL element. The LIE bit in a LL element only enables the Done interrupt. In non-LL mode, the LIE bit enables the Done and Abort interrupts. This field is not defined in a link LL element. Note: The access attributes of this field are as follows: - Dbi: R/W
2 LLP	Load Link Pointer (LLP). Used in linked list mode only. Indicates that this linked list element is a link element, and its LL element pointer dwords are pointing to the next (non-contiguous) element. The DMA loads this field with the LLP of the linked list element. Note: The access attributes of this field are as follows: - Dbi: R/W
1 TCB	Toggle Cycle Bit (TCB). Indicates to the DMA to toggle its interpretation of the CB. Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the TCB of the linked list element. this field is not defined in a data LL element. Note: The access attributes of this field are as follows: - Dbi: R/W
0 CB	Cycle Bit (CB). Used in linked list mode only. It is used to synchronize the producer (software) and the consumer (DMA). For more details, see "PCS-CCS-CB-TCB Producer-Consumer Synchronization". The DMA loads this field with the CB of the linked list element. Note: The access attributes of this field are as follows: - Dbi: R/W

11.3.3.1.229 DMA Read Transfer Size Register. (DMA_TRANSFER_SIZE_OFF_RDCH_0)

11.3.3.1.229.1 Offset

Register	Offset
DMA_TRANSFER_SIZE_OFF_RDCH_0	8008_0308h

11.3.3.1.229.3 Fields

Field	Function
31-0 DMA_TRANSFER_SIZE	DMA Transfer Size. You program this register with the size of the DMA transfer. The maximum DMA transfer size is 4Gbytes. The minimum transfer size is one byte (0x1). This field is automatically decremented by the DMA as the DMA read channel transfer progresses. This field indicates the number bytes remaining to be transferred. When all bytes are successfully transferred the current transfer size is zero. In LL mode, the DMA overwrites this register with the corresponding dword of the LL element. You can read this register to monitor the transfer progress, however in some scenarios this register is updated after a delay. For example, when less than 3 channels are doorbelled, this register is updated only after a descriptor finishes(linked list mode), or the transfer ends (non-linked list mode). Note: The access attributes of this field are as follows: - Dbi: R/W

11.3.3.1.230 DMA Read SAR Low Register. (DMA_SAR_LOW_OFF_RDCH_0)

11.3.3.1.230.1 Offset

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	LLP_HIGH															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

11.3.3.1.235.3 Fields

Field	Function
31-0 LLP_HIGH	Upper 32 bits of the address of the linked list transfer list in local memory. Used in linked list mode only. Updated by the DMA to point to the next element in the transfer list as elements are consumed. Note: The access attributes of this field are as follows: - Dbi: R/W

11.4 PCI Express PHY (PCIe_PHY)

11.4.1 Overview

This block provides information regarding PCIe PHY and its features. PCIe PHY supports 6.0 Gbps data rate and complies to PCI Express base specification 2.1. The functions that are performed by the transceiver include serializing the 8B/10B encoded data for transmission, de-serializing received code groups, and word alignment.

When transmitting, the transceiver accepts two or four 10-bit 8B/10B encoded transmit characters, latches them and serializes the data onto the PCIE_TX_P/PCIE_TX_N differential outputs at 1.5 / 2.5 / 3.0 / 5.0 / 6.0 Gbps. It also performs 8B/10B encoding for 8-bit data from the PIPE interface.

When receiving, the transceiver also samples received serial data on the PCIE_RX_P / PCIE_RX_N differential inputs, deserializes it into two or four 10-bit received characters and detects the K28.5 character (0011111010 or 1100000101) for word alignment. It also applies 8B/10B decoding for 8-bit data to the PIPE interface. PCIe PHY core contains on-chip PLL circuitry for synthesis of the baud-rate transmitting clocks, and extraction of the retimed clocks from the received serial stream.

11.4.1.1 Block Diagram

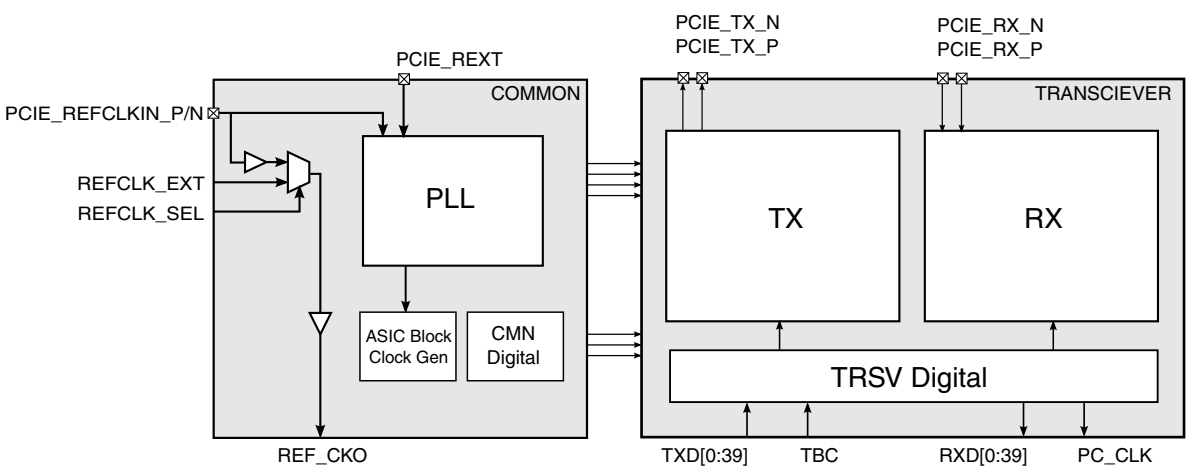

Figure 11-73. Block Diagram

11.4.1.2 Features

The following list the key features of the PCIe PHY:

- 1.5 / 2.5 / 3.0 / 5.0 / 6.0 Gbps Serializer / Deserializer
- Compliant with PCI Express Base Specification 2.1
- Compliant with PIPE Specification 2.0
- 8 / 16 / 20 / 40-bit CMOS Interface for Transmitter and Receiver
- 25 / 100 MHz Reference Clock
- K28.5 Detection for Word Alignment
- 8B/10B Encoding / Decoding
- Receiver Detection
- 28 nm CMOS Process (LN28LPP)
- Supports Spread Spectrum Clocking in Transmitter and Receiver

11.4.2 PCIe PHY Signals

11.4.2.1 Interface Signals

This section describes the interface signals to PCIe PHY.

Table 11-42. Interface Signals Description

Signal	Description
REF_CKO	Buffered Reference Clock Output. REF_CKO is 25 or 100 MHz according to the reference clock input frequency.
REFCLK_SEL	Internal Reference Clock Enable. When driven high, REFCLK_EXT is the reference clock of PHY.
REFCLK_EXT	Internal Reference Clock Input. REFCLK_EXT is the reference clock from logic. The nominal frequency is 25 / 100 MHz.
HIGH_SPEED	Maximum Speed Selection. When driven high, the maximum data rate is Gen2 PCIe. When driven low, the maximum data rate Gen1 PCIe.
TXD	*Transmit Data*
RXD	*Receive Data*

Table continues on the next page...

Table 11-42. Interface Signals Description (continued)

Signal	Description
TBC	*PIPE Interface Input Data Clock* TBC is the transmit byte clock used to latch all input data on the PIPE interface. Transitions of TXD and other inputs occur at rising edge of TBC. TBC is 250 MHz both 2.5 Gbps and 5.0 Gbps, when HIGH_SPEED is high. TBC is required to be frequency locked to reference clock from PCIE_REFCLKIN_P/N or REFCLK_EXT. The exact timing relationship between TBC and reference clock is not tightly specified, however the TBC should be derived from the PC_CLK (PCLK) clock.
RBC	*Receive Byte Clock.* RBC is locked to the received data. RBC is 75 MHz at 1.5 Gbps, 150 MHz at 3.0 Gbps, and 300 MHz at 6.0 Gbps. The parallel output data are valid on the rising edge of RBC.
PC_CLK	*PIPE Interface Output Data Clock.* All output data movement across the parallel interface is synchronized to this clock. This clock operates at 250 MHz regardless of the Rate control input. The rising edge of the clock is the reference for all output signals. Spread spectrum modulation on this clock is allowed.

11.4.2.2 Reference Clock

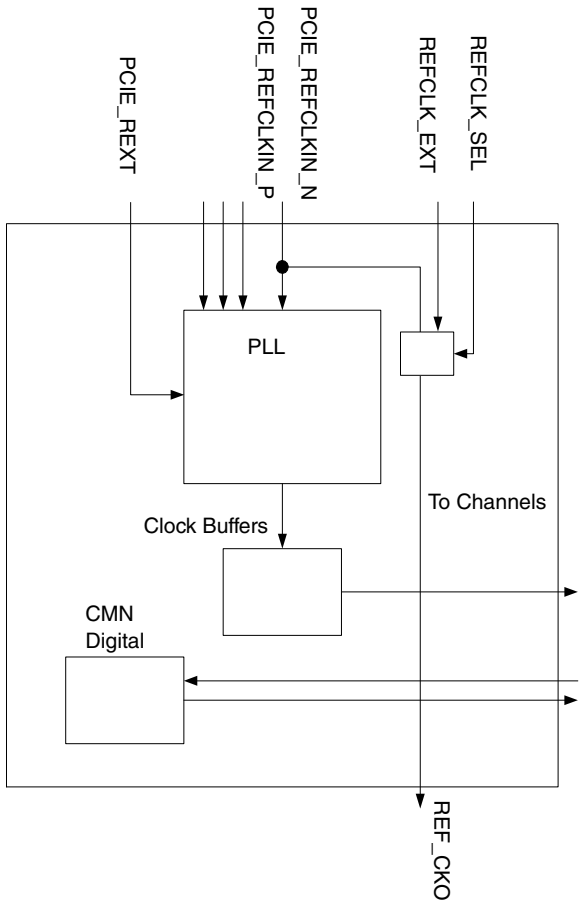
Reference Clock input jitter should be tightly controlled to ensure very high-speed clock operation and its jitter characteristics. Jitter performance of the PCIe PHY is dependent on a low-jitter reference clock source. It can use Crystal Oscillator input, PCIE_REFCLKIN_P/N, or internal clock input, REFCLK_EXT as a Reference Clock input. For more detail, please refer to the datasheet. When the REFCLK_EXT is used, the external IO pin of PCIE_REFCLKIN_P/N cannot be floating and proper powerdown control should be considered.

For the reference clock differential output for the PCIe PHY (PCIE_REFCLKOUT_P and PCIE_REFCLKOUT_N), the external resistors should be connected to ground in the PCB board. It is open drain structure.

11.4.3 Functional Description

11.4.3.1 Common Block

Figure 11-74. Common Block Diagram

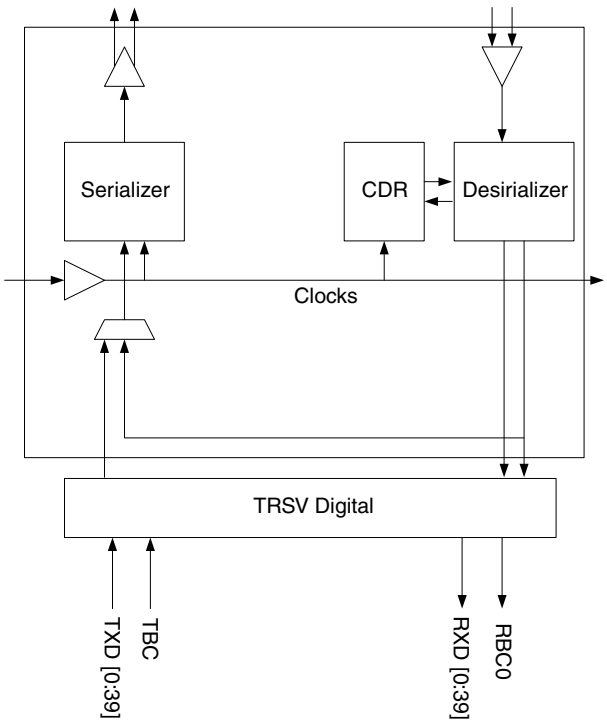


11.4.3.1.1 Phase Locked Loop (PLL)

In the PCIe PHY core, the PLL is locked at the multiple frequency of reference clock (PCIE_REFCLKIN_P/N) and generates all internal multi-phase clocks for transceiver. These clocks are based on the supplied PCIE_REFCLKIN_P/N.

11.4.3.2 Transceiver block

Figure 11-75. Transceiver Block Diagram



11.4.3.2.1 Serializer

The PCIe PHY core accepts two or four 10-bit parallel characters from the link layer on the TXD[0:19] or TXD[0:39] bus which are latched into the input latch. This data will be serialized and transmitted on the PCIE_TX_P / PCIE_TX_N differential outputs at 1.5 / 3.0 / 6.0 Gbps, with bit TXD [0] transmitted first.

11.4.3.2.2 Clock and Data Recovery (CDR)

The PCIe PHY core accepts high-speed differential serial inputs on the PCIE_RX_P / PCIE_RX_N pins, extracts the retimed clocks and recovers the data. The serial bit stream should be encoded so as to provide DC balance and limited run length using 8B/10B encoding. The PCIe PHY core clock recovery circuitry is completely monolithic and requires no external components. For proper operation, the baud rate of the data stream to be recovered should meet the PCIe specification.

The retimed serial bit stream is converted into two or four 10-bit parallel output characters on the RXD[0:19] or RXD[0:39] of which the RXD[0] is received first. The PCIe PHY core provides retimed clock, RBC. The RBC is generated from one of the high-speed clocks which is phase locked to the reference clock. The serial data is retimed by the internal high-speed clocks, and deserialized.

Even if serial input data is not present, or does not meet the required baud rate, the PCIe PHY core will continue to produce retimed clock, RBC, which locks to the REF_CK, reference clock.

11.4.3.2.3 Word Alignment

The PCIe PHY core provides K28.5 character recognition and data word alignment. When synchronization is enabled, the PCIe PHY core constantly examines the serial data for the presence of the K28.5 character (0011111010 / 1100000101).

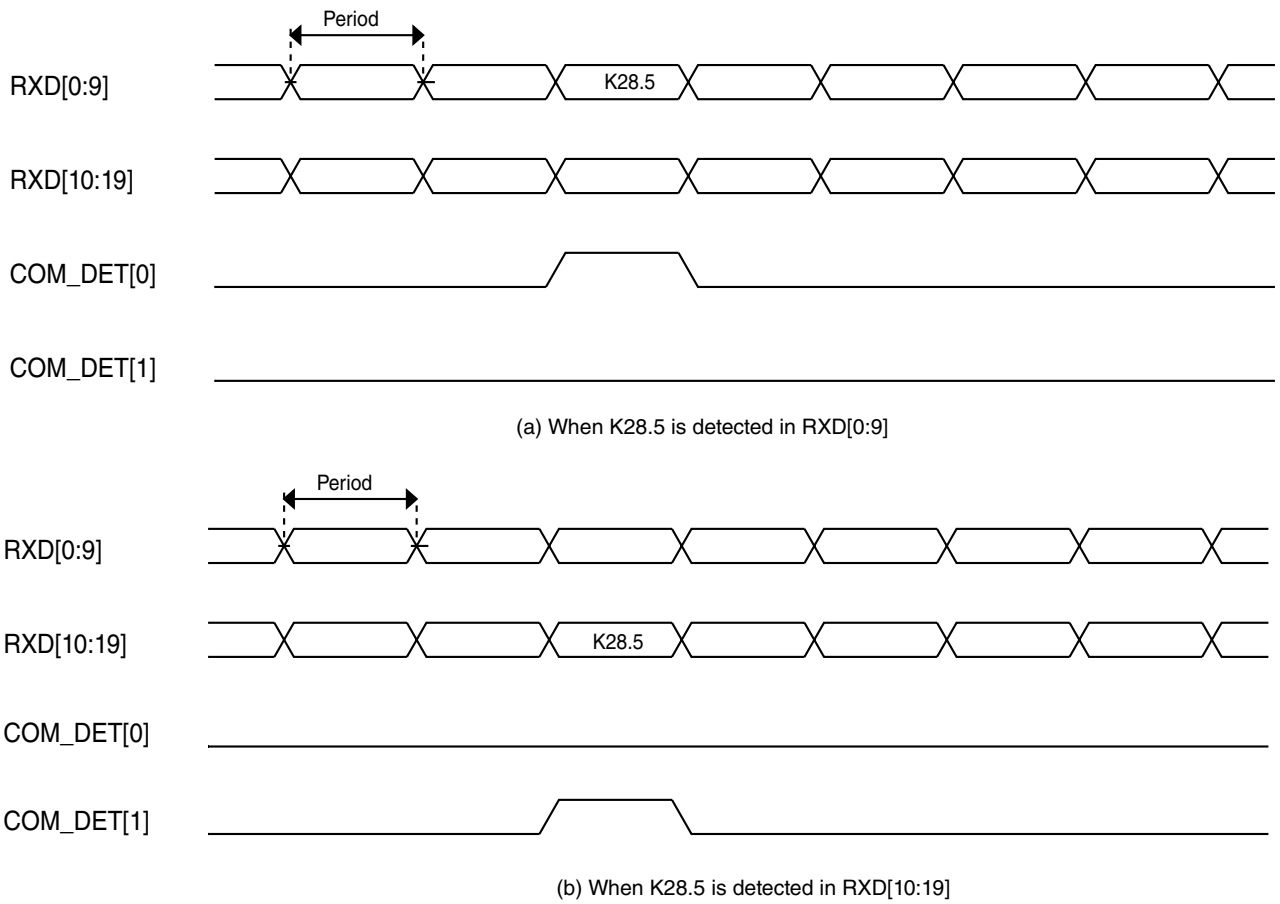


Figure 11-76. Detection of a K28.5 Character

11.4.3.2.4 Driver

Driver amplifies the level of received signal from Serializer to the level that is enough to drive the transmission line. The launch amplitude can be controlled by DRV_LVL [2:0]. Driver features the pre-emphasis that is effective to reduce ISI jitter caused by the loss of transmission line. The pre-emphasis level can be controlled by EMP_LVL [3:0].

11.4.3.3 Start-up sequence

To start PCIe PHY operation, RESET (G_RST) should be invoked at the power up. G_RST should be pulsed after the power-up following by REFCLK input and setting the asynchronous control inputs. The PHY powerdown and up sequences could be added after G_RST sequence for the initialization. The timing restrictions for RESET signal and the typical timing information for the related output signals are shown in the following figure.

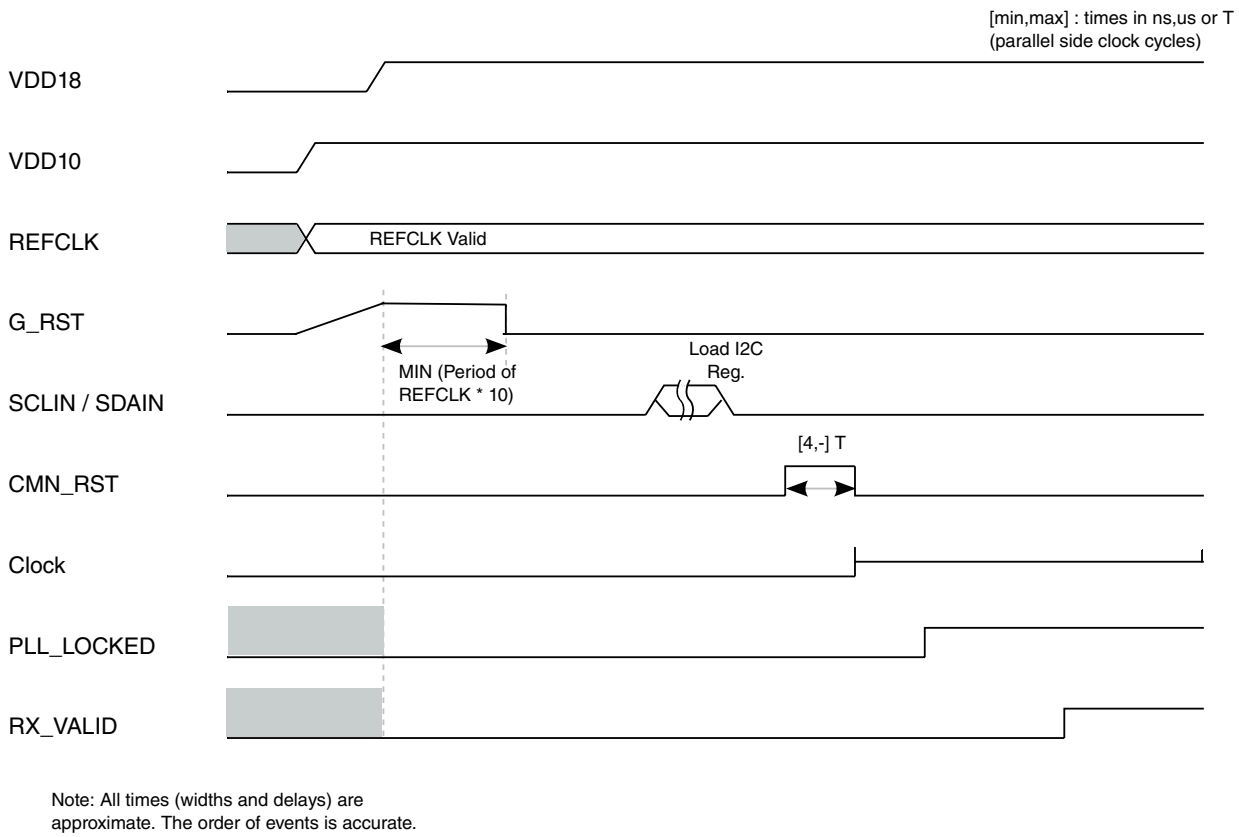

Figure 11-77. Start-up Sequence

NOTE

Before the PHY initialization sequences, all the input signals including REFCLK and power / ground for the PHY should be active and stable. After the PHY initialization sequences (for example, after RX_VALID = 1), the Link controller initialization including reset could be started (for example, PHY signals to the LINK controller must be neglected before the PHY initialization sequences is fully completed.

11.4.3.4 Interface power states

The interface power states are defined as described in the following table. For the power states such as Partial or Slumber, greater power savings can be achieved at a cost of increased exit latency.

Table 11-43. Interface Power States

State	Description
PHYRDY (or L0)	The Phy logic and main PLL are both on and active. The interface is synchronized and capable of receiving and sending data.
Partial (or L1)	The Phy logic is powered, but is in a reduced power state. This state allows an additional power savings over normal mode at the cost of additional resume latency. The exit latency from this state shall be no longer than 10 µs (Usually less than 2 µs in Samsung PCIe PHY). However, when Automatic Partial to Slumber Transitions are enabled the exit latency from this state shall be no longer than the maximum Slumber exit latency.
Slumber (or L2)	The Phy logic is powered but is in a reduced power state. Power can be aggressively conserved in this mode. Most of the Transmitter and Receiver may be shut off. Main power and clocks are not guaranteed, but REF_CLK is available. The exit latency from this state shall be no longer than 10 ms (Usually less than 500 µs in PCIe PHY).

NOTE

For the PCIe interface, recommended L0s Exit Latency and L1 Exit Latency is less than 64 ns and between 1 µs and 2 µs respectively. L0s state in the PCIe application is intended as a power savings state between L0 and L1.

11.4.3.5 Multi-channel support

- When the PCIe PHY is implemented to support four channels. Register map demonstrates how this 4-channel PCIe PHY is configured. One CMU block includes the main PLL, bias generator, termination calibration, and the reference clock I/O buffer. 4-channel TRSV block contains the full TX and RX parts including serializer, deserializer, clock and data recovery and high-speed I/Os. This SoC only support one channel phy.
- For the logic sides, interface signal ports are provided for each channel and named with channel number such as "*_CH[n]" (For example, *_CH0, *_CH1, *_CH2, and *_CH3).

- VDD10 power has to turn on first and then VDD18 power turns on. It is needed to protect damage of thin transistor from unknown situation when 1.8 V power supply only applied to the PHY.
- VDD18 turn on time has to wait at least 0.1 μs after VDD10 turns on. But if ramp up time of VDD10 is much slower than 0.1 μs, waiting time also has to be increased to meet following figure.

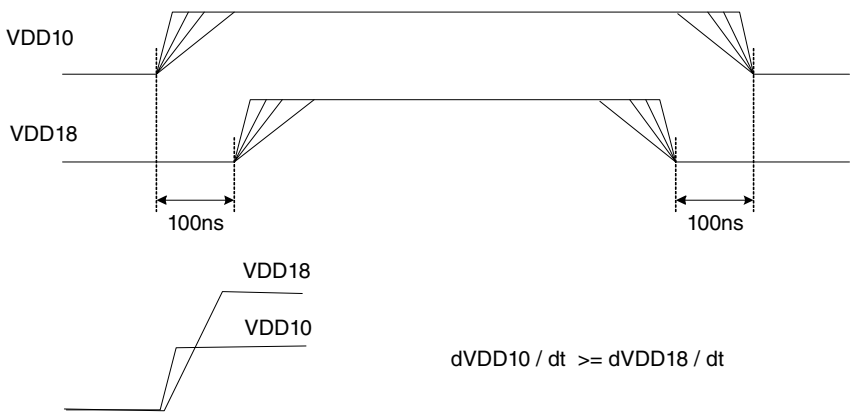

Figure 11-78. Power Up Sequence

11.4.4 PCIe PHY Register

The PCIe PHY has programmable test features that are controlled by registers. These internal registers can be accessible through the APB or I2C interface. The PHY comprises CMU part and TRSV part. Only one CMU block exists for the PHY, and one or more TRSV blocks can be implemented according to the system requirements.

This phy only has channel 0 (CH0). Address is word address, SOC Address = Base Address + 4 * (word address). For each word only byte0 is useful, byte3 ~ 1 are all read zero.

11.4.4.1 PHY Register for CMN Block

The PCIe PHY share a common (CMN) block for the clock and bias generation. The following tables list the capabilities implemented by the PHY design team for internal use.

PCIE_PHY_CMN memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
4	PCIE_PHY_CMN_REG01	32	R/W	0000_0000h	11.4.4.1.1/ 3441
8	PCIE_PHY_CMN_REG02	32	R/W	0000_0014h	11.4.4.1.2/ 3442
12	PCIE_PHY_CMN_REG03	32	R/W	0000_00E1h	11.4.4.1.3/ 3443
16	PCIE_PHY_CMN_REG04	32	R/W	0000_0035h	11.4.4.1.4/ 3444
20	PCIE_PHY_CMN_REG05	32	R/W	0000_0029h	11.4.4.1.5/ 3445
24	PCIE_PHY_CMN_REG06	32	R/W	0000_0083h	11.4.4.1.6/ 3446
28	PCIE_PHY_CMN_REG07	32	R/W	0000_003Ch	11.4.4.1.7/ 3447

11.4.4.2 PHY Register for Transceiver Block

The PCIe PHY has a common (CMN) block and multi-lanes of transceiver (TRSV) can be supported for the application for the high-speed serial data transmission and clock-data recovery. The following descriptions list the capabilities implemented by the PHY design team for internal use. The addresses of register in this chapter are for the transceiver ch0 and addition offset is required for another channel such as ch1 ~ 3.

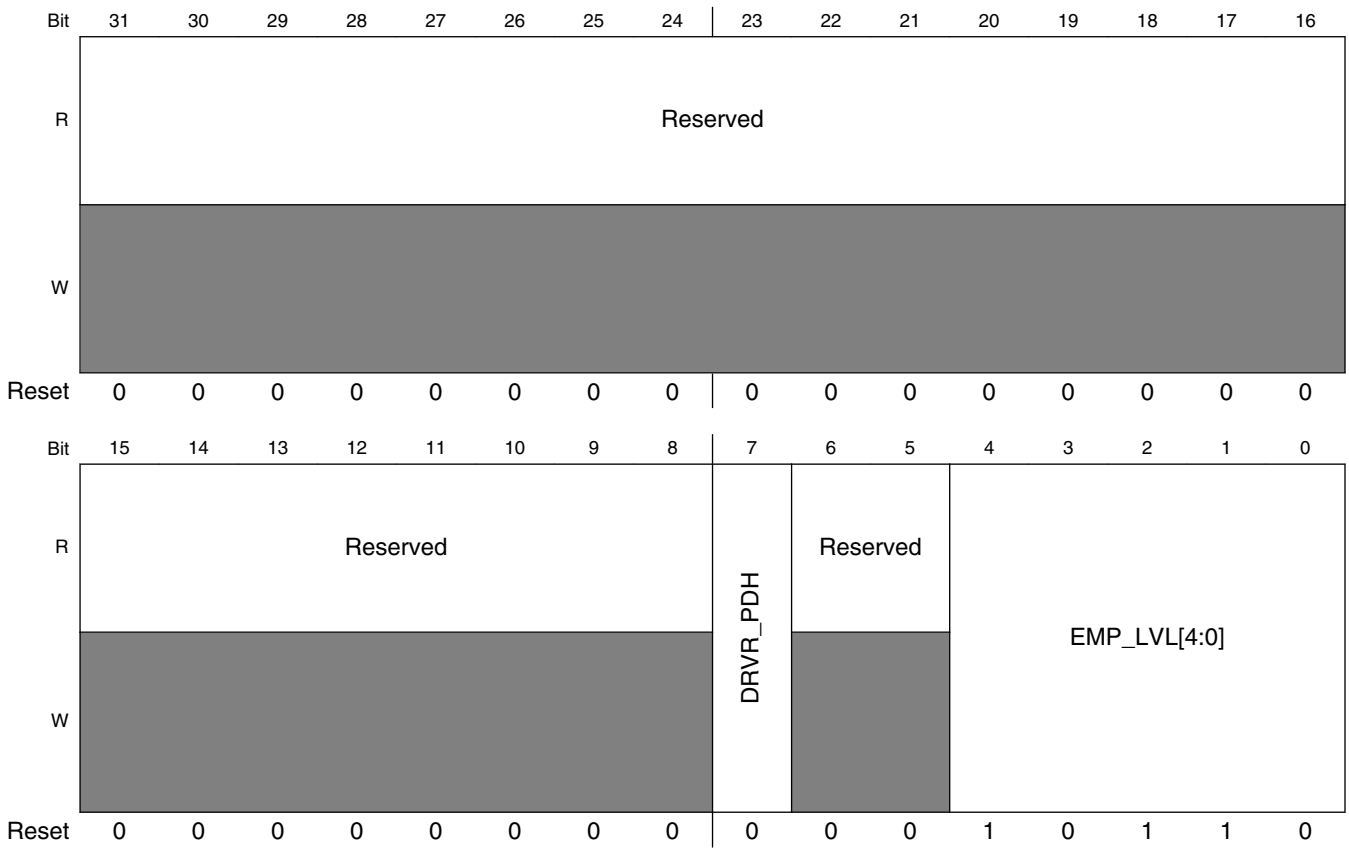
11.4.4.2.1 PCIE_PHY_TRSV_REG21

Address: 0h base + 84h offset = 84h



PCIE_PHY_TRSV_REG21 field descriptions

Field	Description
31–8 Reserved	This field is reserved.
7 DRVR_PDH	TX Driver Option 0 Default for PCIe 1 Reduce Power consumption
6–5 Reserved	This field is reserved.
EMP_LVL[4:0]	TX De-emphasis Level Control **NOTE:** • For the TX properties such as amplitude and de-emphasis, please use default setting for the first time evaluation. If the PHY is connected through a long cable, (or media), generally high pre-emphasis level setting would be better. But there would be optimization setting points according to the cable length. • TX amplitude and de-emphasis ratio can be calculated as follows. Vtx-noemp-pkpk means differential peak to peak amplitude when there is no de-emphasis. Vtx-diff-pkpk means differential peak to peak amplitude which is included de-emphasis. And Vtx-deemp-pkpk means differential inner flatted peak to peak amplitude which is reduced by de-emphasis.

Table continues on the next page...

PCIE_PHY_TRSV_REG21 field descriptions (continued)

Field	Description
	• Vtx-noemp-pkpk = (7.5 * bit(DRV_LVL[5]) + 3.75 * bit (DRV_LVL[4]) + 2 * bit(DRV_LVL[3]) + 1 * bit (DRV_LVL[2]) + 0.5 * bit (DRV_LVL[1]) + 0.25 * bit (DRV_LVL[0]) + 7.5) * 5.32 • Vtx-diff-pkpk = ((7.5 * bit (DRV_LVL[5]) + 3.75 * bit (DRV_LVL[4]) + 2 * bit (DRV_LVL[3]) + 1 * bit (DRV_LVL[2]) + 0.5 * bit (DRV_LVL[1]) + 0.25 * bit (DRV_LVL[0]) + 7.5) + (3.75 * bit (EMP_LVL[4]) + 2 * bit (EMP_LVL[3]) + 1 * bit (EMP_LVL[2]) + 0.5 * bit (EMP_LVL[1]) + 0.25 * bit (EMP_LVL[0])) * 0.7) * 5.32 • Vtx-deemp-pkpk = ((7.5 * bit (DRV_LVL[5]) + 3.75 * bit (DRV_LVL[4]) + 2 * bit (DRV_LVL[3]) + 1 * bit (DRV_LVL[2]) + 0.5 * bit (DRV_LVL[1]) + 0.25 * bit (DRV_LVL[0]) + 7.5) - (3.75 * bit (EMP_LVL[4]) + 2 * bit (EMP_LVL[3]) + 1 * bit (EMP_LVL[2]) + 0.5 * bit (EMP_LVL[1]) + 0.25 * bit (EMP_LVL[0]))) * 5.32 • TX De-emphasis can be calculated as follows:  De – emphasis = –20 log ((Vtx - deemp - pkpk) / (Vtx - diff - pkpk)) (dB) • For example DRV_LVL[5:0] = 100000 and EMP_LVL[4:0] = 01000.Vtx – diff – pkpk = 7.5 + 0 + 0 + 0 + 0 + 0 + 7.5 + 0.7 * 0 + 2 + 0 + 0 + 0 * 5.32 = 872 mVpkpk De – emphasis = –20 log (7.5 + 0 + 0 + 0 + 0 + 0 + 7.5 – (0 + 2 + 0 + 0 + 0)) / (7.5 + 0 + 0 + 0 + 0 + 0 + 7.5 + 0.7 * (0 + 2 + 0 + 0 + 0)) = 2 dB 00000 No de-emphasis 00100 Default for SATA 10100 3.5 dB de-emphasis ~ 11110 -6 dB dB de-emphasis ~ 11111 Max de-emphasis

NOTE

- For the RX squelch detector threshold votlage, this threshold voltage can be changed intentionally for debug purpose. In the noisy application, the threshold voltage of squelch detector might be increased for better detection although it could cause the violation in the specification.
- RX equalizer setting might be changed to have better signal quality. For example, RX input jitter from ISI (Inter Symbol Interference) can be improved with RX equalization feature.

NOTE

- TX and RX parallel data also can have bit and / or byte order change to be flexible with connection errors between the PHY and the LINK controller.
- This BIST mode would be used for ATE test and addition features such as loopback mode can be controlled with the proper register settings. Make sure the powerdown mode control pins are not enabled. (i.e. these powerdown mode pins should be controllable by register in the SoC). These loopback mode are not Compliance mode which is usually implemented in the LINK controller side.When LB_EN is "high", Loopback mode works. This LB_EN is used with LB_MODE[1:0]. If you would like to use TX to RX serial loopback, you should set LB_EN = "1" and LB_MODE = "00'.

11.5 Ethernet MAC (ENET)

11.5.1 Introduction

The MAC-NET core, in conjunction with a 10/100/1000-Mbit/s MAC, implements layer 3 network acceleration functions. These functions are designed to accelerate the processing of various common networking protocols, such as IP, TCP, UDP, and ICMP, providing wire speed services to client applications.

11.5.2 Overview

The core implements a triple-speed 10/100/1000-Mbit/s Ethernet MAC compliant with the IEEE802.3-2002 standard. The MAC layer provides compatibility with half- or full-duplex 10/100-Mbit/s and full-duplex gigabit Ethernet LANs.

The MAC operation is fully programmable and can be used in Network Interface Card (NIC), bridging, or switching applications. The core implements the remote network monitoring (RMON) counters according to IETF RFC 2819.

The core also implements a hardware acceleration block to optimize the performance of network controllers providing TCP/IP, UDP, and ICMP protocol services. The acceleration block performs critical functions in hardware, which are typically implemented with large software overhead.

The core implements programmable embedded FIFOs that can provide buffering on the receive path for lossless flow control.

Advanced power management features are available with magic packet detection and programmable power-down modes.

A unified DMA (uDMA), internal to the ENET module, optimizes data transfer between the ENET core and the SoC, and supports an enhanced buffer descriptor programming model to support IEEE 1588 functionality.

The programmable Ethernet MAC with IEEE 1588 integrates a standard IEEE 802.3 Ethernet MAC with a time-stamping module. The IEEE 1588 standard provides accurate clock synchronization for distributed control nodes for industrial automation applications.

11.5.2.1 Features

The MAC-NET core includes the following features.

11.5.2.1.1 Ethernet MAC features

- Implements the full 802.3 specification with preamble/SFD generation, frame padding generation, CRC generation and checking
- Supports zero-length preamble
- Dynamically configurable to support 10/100-Mbit/s and gigabit operation
- Supports 10/100 Mbit/s full-duplex and configurable half-duplex operation
- Supports gigabit full-duplex operation
- Compliant with the AMD magic packet detection with interrupt for node remote power management
- Seamless interface to commercial ethernet PHY devices via one of the following:
  - a 4-bit Media Independent Interface (MII) operating at 2.5/25 MHz.
  - a 4-bit non-standard MII-Lite (MII without the CRS and COL signals) operating at 2.5/25 MHz.
  - a 2-bit Reduced MII (RMII) operating at 50 MHz.
  - a (double data rate) 4-bit Reduced GMII (RGMII) operating at 125 MHz.
- Simple 64-Bit FIFO user-application interface
- CRC-32 checking at full speed with optional forwarding of the frame check sequence (FCS) field to the client
- CRC-32 generation and append on transmit or forwarding of user application provided FCS selectable on a per-frame basis
- In full-duplex mode:
  - Implements automated pause frame (802.3 x31A) generation and termination, providing flow control without user application intervention
  - Pause quanta used to form pause frames — dynamically programmable
  - Pause frame generation additionally controllable by user application offering flexible traffic flow control
  - Optional forwarding of received pause frames to the user application
  - Implements standard flow-control mechanism
- In half-duplex mode: provides full collision support, including jamming, backoff, and automatic retransmission
- Supports VLAN-tagged frames according to IEEE 802.1Q
- Programmable MAC address: Insertion on transmit; discards frames with mismatching destination address on receive (except broadcast and pause frames)
- Programmable promiscuous mode support to omit MAC destination address checking on receive
- Multicast and unicast address filtering on receive based on 64-entry hash table, reducing higher layer processing load

- Programmable frame maximum length providing support for any standard or proprietary frame length
- Statistics indicators for frame traffic and errors (alignment, CRC, length) and pause frames providing for IEEE 802.3 basic and mandatory management information database (MIB) package and remote network monitoring (RFC 2819)
- Simple handshake user application FIFO interface with fully programmable depth and threshold levels
- Provides separate status word for each received frame on the user interface providing information such as frame length, frame type, VLAN tag, and error information
- Multiple internal loopback options
- MDIO master interface for PHY device configuration and management supports two programmable MDIO base addresses, and standard (IEEE 802.3 Clause 22) and extended (Clause 45) MDIO frame formats
- Supports legacy FEC buffer descriptors
- Interrupt coalescing reduces the number of interrupts generated by the MAC, reducing CPU loading
- Traffic-shaping bandwidth distribution supports credit-based and round-robin-based policies. Either policy can be combined with time-based shaping.
- AVB (Audio Video Bridging, IEEE 802.1Qav) features:
  - Credit-based bandwidth distribution policy can be combined with time-based shaping
  - AVB endpoint talker and listener support
  - Support for arbitration between different priority traffic (for example, AVB class A, AVB class B, and non-AVB)

11.5.2.1.2 IP protocol performance optimization features

- Operates on TCP/IP and UDP/IP and ICMP/IP protocol data or IP header only
- Enables wire-speed processing
- Supports IPv4 and IPv6
- Transparent passing of frames of other types and protocols
- Supports VLAN tagged frames according to IEEE 802.1q with transparent forwarding of VLAN tag and control field
- Automatic IP-header and payload (protocol specific) checksum calculation and verification on receive
- Automatic IP-header and payload (protocol specific) checksum generation and automatic insertion on transmit configurable on a per-frame basis
- Supports IP and TCP, UDP, ICMP data for checksum generation and checking

- Supports full header options for IPv4 and TCP protocol headers
- Provides IPv6 support to datagrams with base header only — datagrams with extension headers are passed transparently unmodifed/unchecked
- Provides statistics information for received IP and protocol errors
- Configurable automatic discard of erroneous frames
- Configurable automatic host-to-network (RX) and network-to-host (TX) byte order conversion for IP and TCP/UDP/ICMP headers within the frame
- Configurable padding remove for short IP datagrams on receive
- Configurable Ethernet payload alignment to allow for 32-bit word-aligned header and payload processing
- Programmable store-and-forward operation with clock and rate decoupling FIFOs

11.5.2.1.3 IEEE 1588 features

- Supports all IEEE 1588 frames.
- Allows reference clock to be chosen independently of network speed.
- Software-programmable precise time-stamping of ingress and egress frames
- Timer monitoring capabilities for system calibration and timing accuracy management
- Precise time-stamping of external events with programmable interrupt generation
- Programmable event and interrupt generation for external system control
- Supports hardware- and software-controllable timer synchronization.
- Provides a 4-channel IEEE 1588 timer. Each channel supports input capture and output compare using the 1588 counter.

11.5.2.2 Block diagram

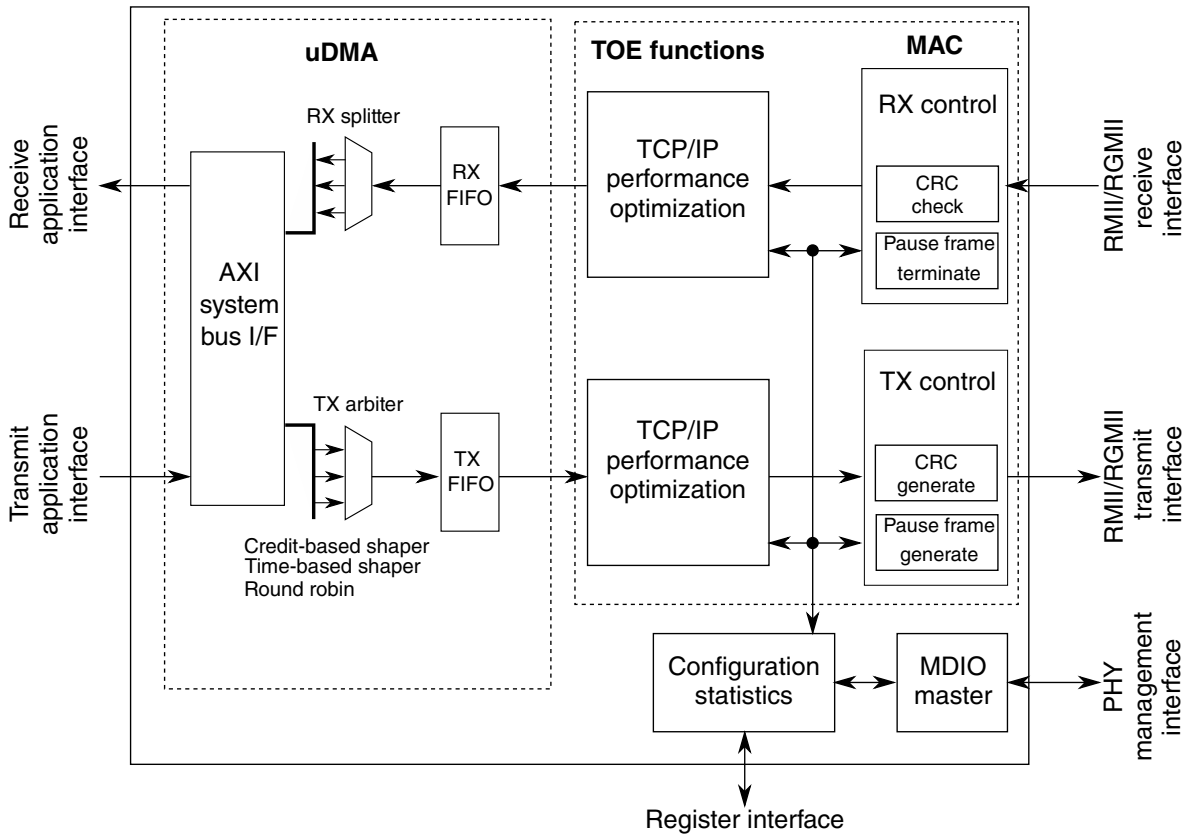

Figure 11-79. Ethernet MAC-NET core block diagram

11.5.3 External Signals and Clocks

The table found here describes the external signals of ENET.

Table 11-44. ENET External Signals

Signal	Description	Mode	Pad Name	Alt Mode	Direction
ENET1_MDC	Output clock provides a timing reference to the PHY for data transfers on the MDIO signal.	RMII/RGMII	ENET_MDC	ALT0	O
			GPIO1_IO06	ALT1	
			I2C1_SCL	ALT1	
ENET1_MDIO	Transfers control information between the external PHY and the media-access controller. Data is synchronous to MDC. This signal is an input after reset.	RMII/RGMII	ENET_MDIO	ALT0	I/O
			GPIO1_IO07	ALT1	
			I2C1_SDA	ALT1	
RGMII_TD3	Serial output Ethernet data. Only valid during TX_EN assertion. Only used for RGMII.	RGMII	ENET_TD3	ALT0	O
RGMII_TD2	Used as RGMII data.	RGMII	ENET_TD2	ALT0	O

Table continues on the next page...

Table 11-44. ENET External Signals (continued)

Signal	Description	Mode	Pad Name	Alt Mode	Direction
ENET1_TX_CLK	Used as RMII clock. There are two RGMII clock schemes. 1. MAC generates output 50M reference clock for PHY, and MAC also uses this 50M clock. 2. MAC uses external 50M clock.	RMII	ENET_TD2	ALT1	I/O
RGMII_TD1	Serial output Ethernet data. Only valid during TX_EN assertion.	RMII/RGMII	ENET_TD1	ALT0	O
RGMII_TD0	Serial output Ethernet data. Only valid during TX_EN assertion.	RMII/RGMII	ENET_TD0	ALT0	O
RGMII_TX_CTL	In RGMII mode, contains TX_EN on the rising edge of RGMII_TXC, and a logical derivative of TX_EN and TX_ER (TX_EN XOR TX_ER) on the falling edge of RGMII_TXC. (RMII_TX_EN).	RMII/RGMII	ENET_TX_CTL	ALT0	O
RGMII_TXC	For RGMII, ENET_TXC works as RGMII_TXC in ALT0 mode.	RGMII	ENET_TXC	ALT0	O
ENET1_TX_ER	For RMII, ENET_TXC works as ENET1_TX_ER in ALT1 mode.	RMII	ENET_TXC	ALT1	O
RGMII_RX_CTL	In RGMII mode, contains RX_EN on the rising edge of RGMII_RXC, and a logical derivative of RX_EN and RX_ER (RX_EN XOR RX_ER) on the falling edge of RGMII_RXC. (RMII_RX_EN (CRS_DV)).	RMII/RGMII	ENET_RX_CTL	ALT0	I
RGMII_RXC	For RGMII, ENET_RXC works as RGMII_RXC in ALT0 mode.	RGMII	ENET_RXC	ALT0	I
ENET1_RX_ER	For RMII, ENET_RXC works as ENET1_RX_ER in ALT1 mode.	RMII	ENET_RXC	ALT1	I
RGMII_RD0	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	RMII/RGMII	ENET_RD0	ALT0	I
RGMII_RD1	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	RMII/RGMII	ENET_RD1	ALT0	I
RGMII_RD2	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	RGMII	ENET_RD2	ALT0	I
RGMII_RD3	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	RGMII	ENET_RD3	ALT0	I
ENET1_1588_EVENT0_IN	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is	RMII/RGMII	GPIO1_IO08	ALT1	I

Table continues on the next page...

Table 11-44. ENET External Signals (continued)

Signal	Description	Mode	Pad Name	Alt Mode	Direction
	latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.				
ENET1_1588_EVENT0_OUT	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set. Note: ENET_1588_EVENT0_OUT has a programmable output width, see IOMUXC_GPR0[CLK_STRETCH], delayed one clock cycle in relation to all other EVENTx_OUT signals.	RMII/RGMII	GPIO1_IO09	ALT1	O
ENET1_1588_EVENT1_IN	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.	RMII/RGMII	I2C2_SCL	ALT1	I
ENET1_1588_EVENT1_OUT	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is	RMII/RGMII	I2C2_SDA	ALT1	O

Table continues on the next page...

Table 11-44. ENET External Signals (continued)

Signal	Description	Mode	Pad Name	Alt Mode	Direction
	detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.				
ENET_PHY_REF_CLK_ROOT	Reference clock for PHY.	RGMII	GPIO1_IO00	ALT1	O

The table below describes the clock sources for ENET. See Clock Controller Module (CCM) for clock setting, configuration, and gating information.

Table 11-45. ENET Clocks

Clock name	Clock Root	Description
ipp_ind_mac0_txclk	ENET_REF_CLK_ROOT	rmii/rgmii interface clock
ipg_clk_time	ENET_TIMER_CLK_ROOT	Time stamp clock

11.5.4 External signal description

NOTE

The MII column pertains only to devices that support MII.

MII	RMII	RGMII	Description	I/O
MII_COL	—	—	Asserted upon detection of a collision and remains asserted while the collision persists. This signal is not defined for full-duplex mode.	I
MII_CRS	—	—	Carrier sense. When asserted, indicates transmit or receive medium is not idle.	I

Table continues on the next page...

MII	RMII	RGMII	Description	I/O
			In RMII mode, this signal is present on the RMII_CRS_DV pin.	
MII_MDC	RMII_MDC	RGMII_MDC	Output clock provides a timing reference to the PHY for data transfers on the MDIO signal.	O
MII_MDIO	RMII_MDIO	RGMII_MDIO	Transfers control information between the external PHY and the media-access controller. Data is synchronous to MDC. This signal is an input after reset.	I/O
MII_RXCLK	—	RGMII_RXC	In MII mode, provides a timing reference for RXDV, RXD[3:0], and RXER. In RGMII mode, provides a timing reference for RGMII_RXD[3:0] and RGMII_RX_CTL.	I
MII_RXDV	RMII_CRS_DV	RGMII_RX_CTL	Asserting this input indicates the PHY has valid nibbles present on the MII. RXDV must remain asserted from the first recovered nibble of the frame through to the last nibble. Asserting RXDV must start no later than the SFD and exclude any EOF. In RMII mode, this pin also generates the CRS signal. In RGMII mode, contains RXDV on the rising edge of RGMII_RXC, and a logical derivative of RXDV and RXERR (RXDV XOR RXERR) on the falling edge of RGMII_RXC.	I
MII_RXD[3:0]	RMII_RXD[1:0]	RGMII_RXD[3:0]	Contains the Ethernet input data transferred from the PHY to the media-access controller when RXDV is asserted.	I

Table continues on the next page...

MII	RMII	RGMII	Description	I/O
MII_RXER	RMII_RXER	—	When asserted with RXDV, indicates the PHY detects an error in the current frame.	I
MII_TXCLK	—	—	Input clock, which provides a timing reference for TXEN, TXD[3:0], and TXER.	I
—	—	RGMII_TXC	Provides a timing reference for RGMII_TXD[3:0] and RGMII_TX_CTL. **NOTE:** This is an output signal.	O
MII_TXD[3:0]	RMII_TXD[1:0]	RGMII_TXD[3:0]	Serial output Ethernet data. Only valid during TXEN assertion.	O
MII_TXEN	RMII_TXEN	RGMII_TX_CTL	Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TXCLK following the final nibble of the frame. In RGMII mode, contains TXEN on the rising edge of RGMII_TXC, and a logical derivative of TXEN and TXERR (TXEN XOR TXERR) on the falling edge of RGMII_TXC.	O
MII_TXER	—	—	When asserted for one or more clock cycles while TXEN is also asserted, PHY sends one or more illegal symbols.	O
—	RMII_REF_CLK	—	In RMII mode, this signal is the reference clock for receive, transmit, and the control interface.	I
1588_TMR*n*	1588_TMR*n*	1588_TMR*n*	Capture/Compare block input/output event bus. When configured for capture and a rising edge is detected, the current timer value is	I/O

11.5.5 Functional description

This section provides a complete functional description of the MAC-NET core.

11.5.5.1 Ethernet MAC frame formats

The IEEE 802.3 standard defines the Ethernet frame format as follows:

- Minimum length of 64 bytes
- Maximum length of 1518 bytes excluding the preamble and the start frame delimiter (SFD) bytes

An Ethernet frame consists of the following fields:

- Seven bytes preamble
- Start frame delimiter (SFD)
- Two address fields
- Length or type field
- Data field
- Frame check sequence (CRC value)
- Extension field is defined only for Gigabit Ethernet half-duplex implementations and is not supported by the MAC core

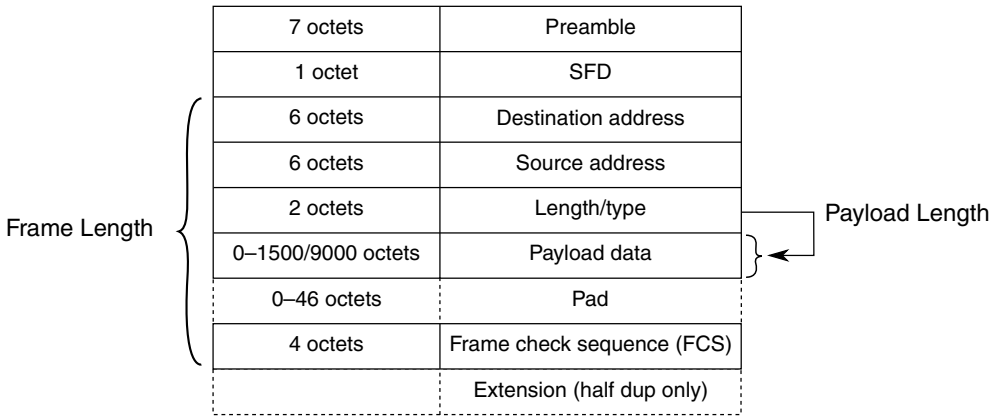

Figure 11-80. MAC frame format overview

Optionally, MAC frames can be VLAN-tagged with an additional four-byte field inserted between the MAC source address and the type/length field. VLAN tagging is defined by the IEEE P802.1q specification. VLAN-tagged frames have a maximum length of 1522 bytes, excluding the preamble and the SFD bytes.

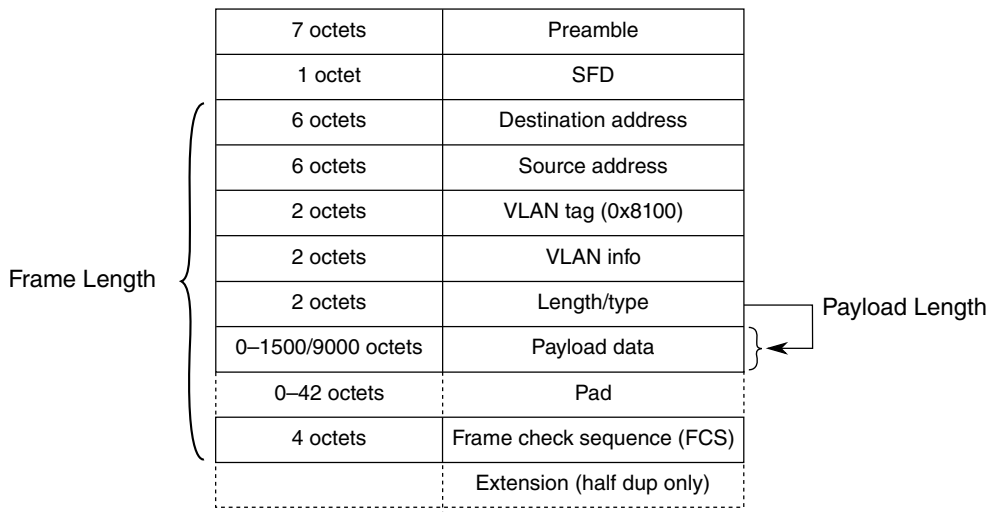

Figure 11-81. VLAN-tagged MAC frame format overview

Table 11-47. MAC frame definition

Term	Description
Frame length	Defines the length, in octets, of the complete frame without preamble and SFD. A frame has a valid length if it contains at least 64 octets and does not exceed the programmed maximum length.
Payload length	The length/type field indicates the length of the frame's payload section. The most significant byte is sent/received first. • If the length/type field is set to a value less than 46, the payload is padded so that the minimum frame length requirement (64 bytes) is met. For VLAN-tagged frames, a value less than 42 indicates a padded frame. • If the length/type field is set to a value larger than the programmed frame maximum length (e.g. 1518) it is interpreted as a type field.

Table continues on the next page...

Table 11-47. MAC frame definition (continued)

Term	Description
Destination and source address	48-bit MAC addresses. The least significant byte is sent/received first and the first two least significant bits of the MAC address distinguish MAC frames, as detailed in MAC address check.

Note

Although the IEEE specification defines a maximum frame length, the MAC core provides the flexibility to program any value for the frame maximum length.

11.5.5.1.1 Pause Frames

The receiving device generates a pause frame to indicate a congestion to the emitting device, which should stop sending data.

Pause frames are indicated by the length/type set to 0x8808. The two first bytes of a pause frame following the type, defines a 16-bit opcode field set to 0x0001 always. A 16-bit pause quanta is defined in the frame payload bytes 2 (P1) and 3 (P2) as defined in the following table. The P1 pause quanta byte is the most significant.

Table 11-48. Pause Frame Format (Values in Hex)

1	2	3	4	5	6	7	8	9	10	11	12	13	14
55	55	55	55	55	55	55	D5	01	80	C2	00	00	01
Preamble							SFD	Multicast Destination Address					
15	16	17	18	19	20	21	22	23	24	25	26	27 –68	
00	00	00	00	00	00	88	08	00	01	hi	lo	00	
Source Address						Type		Opcode		P1	P2	pad (42)	
69	70	71	72										
26	6B	AE	0A										
CRC-32													

There is no payload length field found within a pause frame and a pause frame is always padded with 42 bytes (0x00).

If a pause frame with a pause value greater than zero (XOFF condition) is received, the MAC stops transmitting data as soon the current frame transfer is completed. The MAC stops transmitting data for the value defined in pause quanta. One pause quanta fraction refers to 512 bit times.

If a pause frame with a pause value of zero (XON condition) is received, the transmitter is allowed to send data immediately (see Full-duplex flow control operation for details).

11.5.5.1.2 Magic packets

A magic packet is a unicast, multicast, or broadcast packet, which carries a defined sequence in the payload section.

Magic packets are received and inspected only under specific conditions as described in Magic packet detection.

The defined sequence to decode a magic packet is formed with a synchronization stream which consists of six consecutive 0xFF bytes, and is followed by sequence of sixteen consecutive unicast MAC addresses of the node to be awakened.

This sequence can be located anywhere in the magic packet payload. The magic packet is formed with a standard Ethernet header, optional padding, and CRC.

11.5.5.2 IP and higher layers frame format

The following sections use the term datagram to describe the protocol specific data unit that is found within the payload section of its container entity.

For example, an IP datagram specifies the payload section of an Ethernet frame. A TCP datagram specifies the payload section within an IP datagram.

11.5.5.2.1 Ethernet types

IP datagrams are carried in the payload section of an Ethernet frame. The Ethernet frame type/length field discriminates several datagram types.

The following table lists the types of interest:

Table 11-49. Ethernet type value examples

Type	Description
0x8100	VLAN-tagged frame. The actual type is found 4 octets later in the frame.
0x0800	IPv4
0x0806	ARP
0x86DD	IPv6

11.5.5.2.2 IPv4 datagram format

The following figure shows the IP Version 4 (IPv4) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words. The first byte sent/received is the leftmost byte of the first word (in other words, version/IHL field).

The IP header can contain further options, which are always padded if necessary to guarantee the payload following the header is aligned to a 32-bit boundary.

The IP header is immediately followed by the payload, which can contain further protocol headers (for example, TCP or UDP, as indicated by the protocol field value). The complete IP datagram is transported in the payload section of an Ethernet frame.

Table 11-50. IPv4 header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Version	IHL	TOS		Length			
Fragment ID				Flags	Fragment offset		
TTL		Protocol		Header checksum			
Source address							
Destination address							
Options							

Table 11-51. IPv4 header fields

Field name	Description
Version	4-bit IP version information. 0x4 for IPv4 frames.
IHL	4-bit Internet header length information. Determines number of 32-bit words found within the IP header. If no options are present, the default value is 0x5.
TOS	Type of service/DiffServ field.
Length	Total length of the datagram in bytes, including all octets of header and payload.
Fragment ID, flags, fragment offset	Fields used for IP fragmentation.
TTL	Time-to-live. In effect, is decremented at each router arrival. If zero, datagram must be discarded.
Protocol	Identifier of protocol that follows in the datagram.
Header checksum	Checksum of IP header. For computational purposes, this field's value is zero.
Source address	Source IP address.
Destination address	Destination IP address.

11.5.5.2.3 IPv6 datagram format

The following figure shows the IP version 6 (IPv6) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words and has a fixed length of ten words (40 bytes). The next header field identifies the type of the header that follows the IPv6 header. It is defined similar to the protocol identifier within IPv4, with new definitions for identifying extension headers. These headers can be inserted between the IPv6 header and the protocol header, which will shift the protocol header accordingly.The accelerator currently only supports IPv6 without extension headers (in other words, the next header specifies TCP, UDP, or IMCP).

The first byte sent/received is the leftmost byte of the first word (in other words, version/ traffic class fields).

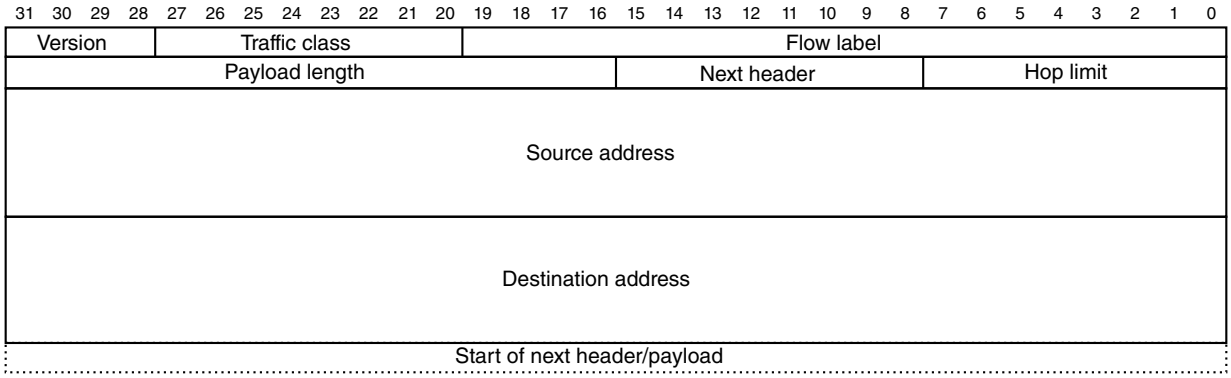

Figure 11-82. IPv6 header format

Table 11-52. IPv6 header fields

Field name	Description
Version	4-bit IP version information. 0x6 for all IPv6 frames.
Traffic class	8-bit field defining the traffic class.
Flow label	20-bit flow label identifying frames of the same flow.
Payload length	16-bit length of the datagram payload in bytes. It includes all octets following the IPv6 header.
Next header	Identifies the header that follows the IPv6 header. This can be the protocol header or any IPv6 defined extension header.
Hop limit	Hop counter, decremented by one by each station that forwards the frame. If hop limit is 0 the frame must be discarded.
Source address	128-bit IPv6 source address.
Destination address	128-bit IPv6 destination address.

11.5.5.2.4 Internet Control Message Protocol (ICMP) datagram format

An internet control message protocol (ICMP) is found following the IP header, if the protocol identifier is 1. The ICMP datagram has a four-octet header followed by additional message data.

Table 11-53. ICMP header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Type		Code		Checksum			
ICMP message data							

Table 11-54. IP header fields

Field name	Description
Type	8-bit type information
Code	8-bit code that is related to the message type
Checksum	16-bit one's complement checksum over the complete ICMP datagram

11.5.5.2.5 User Datagram Protocol (UDP) datagram format

A user datagram protocol header is found after the IP header, when the protocol identifier is 17.

The payload of the datagram is after the UDP header. The header byte order follows the conventions given for the IP header above.

Table 11-55. UDP header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source port				Destination port			
Length				Checksum			

Table 11-56. UDP header fields

Field name	Description
Source port	Source application port
Destination port	Destination application port
Length	Length of user data which immediately follows the header, including the UDP header (that is, minimum value is 8)
Checksum	Checksum over the complete datagram and some IP header information

11.5.5.2.6 TCP datagram format

A TCP header is found following the IP header, when the protocol identifier has a value of 6.

The TCP payload immediately follows the TCP header.

Table 11-57. TCP header format

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source port				Destination port			
Sequence number							
Acknowledgement number							

Table continues on the next page...

Table 11-57. TCP header format (continued)

Offset	Reserved	Flags	Window	
Checksum			Urgent pointer	
Options				

Table 11-58. TCP header fields

Field name	Description
Source port	Source application port
Destination port	Destination application port
Sequence number	Transmit sequence number
Ack. number	Receive sequence number
Offset	Data offset, which is number of 32-bit words within TCP header — if no options selected, defaults to value of 5
Flags	URG, ACK, PSH, RST, SYN, FIN flags
Window	TCP receive window size information
Checksum	Checksum over the complete datagram (TCP header and data) and IP header information
Options	Additional 32-bit words for protocol options

11.5.5.3 IEEE 1588 message formats

The following sections describe the IEEE 1588 message formats.

11.5.5.3.1 Transport encapsulation

The precision time protocol (PTP) datagrams are encapsulated in Ethernet frames using the UDP/IP transport mechanism, or optionally, with the newer 1588v2 directly in Ethernet frames (layer 2).

Typically, multicast addresses are used to allow efficient distribution of the synchronization messages.

11.5.5.3.1.1 UDP/IP

The 1588 messages (v1 and v2) can be transported using UDP/IP multicast messages.

Table 11-59 shows IP multicast groups defined for PTP. The table also shows their respective MAC layer multicast address mapping according to RFC 1112 (last three octets of IP follow the fixed value of 01-00-5E).

Table 11-59. UDP/IP multicast domains

Name	IP Address	MAC Address mapping
DefaultPTPdomain	224.0.1.129	01-00-5E-00-01-81
AlternatePTPdomain1	224.0.1.130	01-00-5E-00-01-82
AlternatePTPdomain2	224.0.1.131	01-00-5E-00-01-83
AlternatePTPdomain3	224.0.1.132	01-00-5E-00-01-84

Table 11-60. UDP port numbers

Message type	UDP port	Note
Event	319	Used for SYNC and DELAY_REQUEST messages
General	320	All other messages (for example, follow-up, delay-response)

11.5.5.3.1.2 Native Ethernet (PTPv2)

In addition to using UDP/IP frames, IEEE 1588v2 defines a native Ethernet frame format that uses ethertype = 0x88F7. The payload of the Ethernet frame immediately contains the PTP datagram, starting with the PTPv2 header.

Besides others, version 2 adds a peer delay mechanism to allow delay measurements between individual point-to-point links along a path over multiple nodes. The following multicast domains are also defined in PTPv2.

Table 11-61. PTPv2 multicast domains

Name	MAC address
Normal messages	01-1B-19-00-00-00
Peer delay messages	01-80-C2-00-00-0E

11.5.5.3.2 PTP header

All PTP frames contain a common header that determines the protocol version and the type of message, which defines the remaining content of the message.

All multi-octet fields are transmitted in big-endian order (the most significant byte is transmitted/received first).

The last four bits of versionPTP are at the same position (second byte) for PTPv1 and PTPv2 headers. This allows accurate identification by inspecting the first two bytes of the message.

11.5.5.3.2.1 PTPv1 header

Table 11-62. Common PTPv1 message header

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	2	versionPTP = 0x0001							
2	2	versionNetwork							
4	16	subdomain							
20	1	messageType							
21	1	sourceCommunicationTechnology							
22	6	sourceUuid							
28	2	sourcePortId							
30	2	sequenceId							
32	1	control							
33	1	0x00							
34	2	flags							
36	4	reserved							

The type of message is encoded in the messageType and control fields as shown in Table 11-63 :

Table 11-63. PTPv1 message type identification

messageType	control	Message Name	Message
0x01	0x0	SYNC	Event message
0x01	0x1	DELAY_REQ	Event message
0x02	0x2	FOLLOW_UP	General message
0x02	0x3	DELAY_RESP	General message
0x02	0x4	MANAGEMENT	General message
other	other	—	Reserved

The field sequenceId is used to non-ambiguously identify a message.

11.5.5.3.2.2 PTPv2 header

Table 11-64. Common PTPv2 message header

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	1	transportSpecific				messageId			
1	1	reserved				versionPTP = 0x2			
2	2	messageLength							
4	1	domainNumber							
5	1	reserved							
6	2	flags							
8	8	correctionField							
16	4	reserved							
20	10	sourcePortIdentity							
30	2	sequenceId							
32	1	control							
33	1	logMeanMessageInterval							

The type of message is encoded in the field messageId as follows:

Table 11-65. PTPv2 message type identification

messageId	Message name	Message
0x0	SYNC	Event message
0x1	DELAY_REQ	Event message
0x2	PATH_DELAY_REQ	Event message
0x3	PATH_DELAY_RESP	Event message
0x4–0x7	—	Reserved
0x8	FOLLOW_UP	General message
0x9	DELAY_RESP	General message
0xa	PATH_DELAY_FOLLOW_UP	General message
0xb	ANNOUNCE	General message
0xc	SIGNALING	General message
0xd	MANAGEMENT	General message

The PTPv2 flags field contains further details on the type of message, especially if one-step or two-step implementations are used. The one- or two-step implementation is controlled by the TWO_STEP bit in the first octet of the flags field as shown below. Reserved bits are cleared.

Table 11-66. PTPv2 message flags field definitions

Bit	Name	Description
0	ALTERNATE_MASTER	See IEEE 1588 Clause 17.4
1	TWO_STEP	1 Two-step clock 0 One-step clock
2	UNICAST	1 Transport layer address uses a unicast destination address 0 Multicast is used
3	—	Reserved
4	—	Reserved
5	Profile specific	
6	Profile specific	
7	—	Reserved

11.5.5.4 MAC receive

The MAC receive engine performs the following tasks:

- Check frame framing
- Remove frame preamble and frame SFD field
- Discard frame based on frame destination address field
- Terminate pause frames
- Check frame length
- Remove payload padding if it exists
- Calculate and verify CRC-32
- Write received frames in the core receive FIFO

If the MAC is programmed to operate in half-duplex mode, it will also check if the frame is received with a collision.

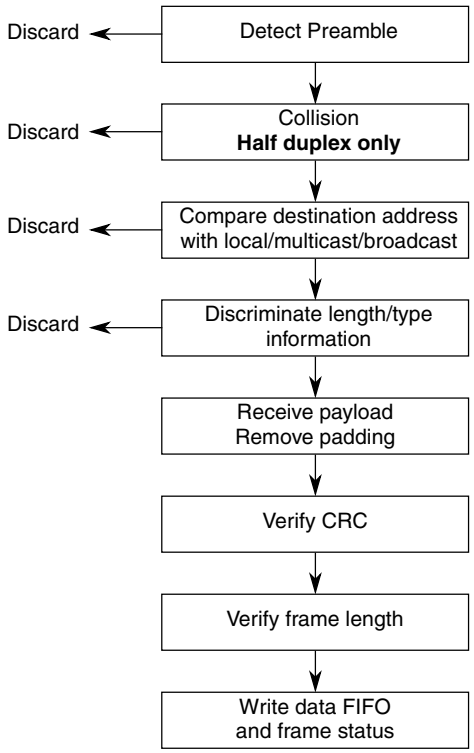

Figure 11-83. MAC receive flow

11.5.5.4.1 Collision detection in half-duplex mode

If the packet is received with a collision detected during reception of the first 64 bytes, the packet is discarded (if frame size was less than ~14 octets) or transmitted to the user application with an error and RxBD[CE] set.

11.5.5.4.2 Preamble processing

The IEEE 802.3 standard allows a maximum size of 56 bits (seven bytes) for the preamble, while the MAC core allows any preamble length, including zero length preamble.

The MAC core checks for the start frame delimiter (SFD) byte. If the next byte of the preamble, which is different from 0x55, is not 0xD5, the frame is discarded.

Although the IEEE specification dictates that the inner-packet gap should be at least 96 bits, the MAC core is designed to accept frames separated by only 64 10/100-Mbit/s operation (MII) bits.

The MAC core removes the preamble and SFD bytes.

11.5.5.4.3 MAC address check

The destination address bit 0 differentiates between multicast and unicast addresses.

- If bit 0 is 0, the MAC address is an individual (unicast) address.
- If bit 0 is 1, the MAC address defines a group (multicast) address.
- If all 48 bits of the MAC address are set, it indicates a broadcast address.

11.5.5.4.3.1 Unicast address check

If a unicast address is received, the destination MAC address is compared to the node MAC address programmed by the host in the PADDR1/2 registers.

If the destination address matches any of the programmed MAC addresses, the frame is accepted.

If Promiscuous mode is enabled (RCR[PROM] = 1) no address checking is performed and all unicast frames are accepted.

11.5.5.4.3.2 Multicast and unicast address resolution

The hash table algorithm used in the group and individual hash filtering operates as follows.

- The 48-bit destination address is mapped into one of 64 bits, represented by 64 bits in ENET*n*_GAUR/GALR (group address hash match) or ENET*n*_IAUR/IALR (individual address hash match).
- This mapping is performed by passing the 48-bit address through the on-chip 32-bit CRC generator and selecting the six most significant bits of the CRC-encoded result to generate a number between 0 and 63.
- The msb of the CRC result selects ENET*n*_GAUR (msb = 1) or ENET*n*_GALR (msb = 0).
- The five lsbs of the hash result select the bit within the selected register.
- If the CRC generator selects a bit set in the hash table, the frame is accepted; else, it is rejected.

For example, if eight group addresses are stored in the hash table and random group addresses are received, the hash table prevents roughly 56/64 (or 87.5%) of the group address frames from reaching memory. Those that do reach memory must be further filtered by the processor to determine if they truly contain one of the eight desired addresses.

The effectiveness of the hash table declines as the number of addresses increases.

The user must initialize the hash table registers. Use this CRC32 polynomial to compute the hash:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^{8} + x^{7} + x^{5} + x^{4} + x^{2} + x^{1} + 1$

If Promiscuous mode is enabled (ENET*n*_RCR[PROM] = 1) all unicast and multicast frames are accepted regardless of ENET*n*_GAUR/GALR and ENET*n*_IAUR/IALR settings.

11.5.5.4.3.3 Broadcast address reject

All broadcast frames are accepted if BC_REJ is cleared or ENET*n*_RCR[PROM] is set. If PROM is cleared when ENET*n*_RCR[BC_REJ] is set, all broadcast frames are rejected.

Table 11-67. Broadcast address reject programming

PROM	BC_REJ	Broadcast frames
0	0	Accepted
0	1	Rejected
1	0	Accepted
1	1	Accepted

11.5.5.4.3.4 Miss-bit implementation

For higher layer filtering purposes, RxBD[M] indicates an address miss when the MAC operates in promiscuous mode and accepts a frame that would otherwise be rejected.

If a group/individual hash or exact match does not occur and Promiscuous mode is enabled (RCR[PROM] = 1), the frame is accepted and the M bit is set in the buffer descriptor; otherwise, the frame is rejected.

This means the status bit is set in any of the following conditions during Promiscuous mode:

- A broadcast frame is received when BC_REJ is set
- A unicast is received that does not match either:

- Node address (PALR[PADDR1] and PAUR[PADDR2])
- Hash table for unicast (IAUR[IADDR1] and IALR[IADDR2])

- A multicast is received that does not match the GAUR[GADDR1] and GALR[GADDR2] hash table entries

11.5.5.4.4 Frame length/type verification: payload length check

If the length/type is less than 0x600 and NLC is set, the MAC checks the payload length and reports any error in the frame status word and interrupt bit PLR.

If the length/type is greater than or equal to 0x600, the MAC interprets the field as a type and no payload length check is performed.

The length check is performed on VLAN and stacked VLAN frames. If a padded frame is received, no length check can be performed due to the extended frame payload because padded frames can never have a payload length error.

11.5.5.4.5 Frame length/type verification: frame length check

When the receive frame length exceeds MAX_FL bytes, the BABR interrupt is generated and the RxBD[LG] bit is set.

The frame is not truncated unless the frame length exceeds the value programmed in ENET*n*_FTRL[TRUNC_FL]. If the frame is truncated, RxBD[TR] is set. In addition, a truncated frame always has the CRC error indication set (RxBD[CR]).

11.5.5.4.6 VLAN frames processing

VLAN frames have a length/type field set to 0x8100 immediately followed by a 16-Bit VLAN control information field.

VLAN-tagged frames are received as normal frames because the VLAN tag is not interpreted by the MAC function, and are pushed complete with the VLAN tag to the user application. If the length/type field of the VLAN-tagged frame, which is found four octets later in the frame, is less than 42, the padding is removed. In addition, the frame status word (RxBD[NO]) indicates that the current frame is VLAN tagged.

11.5.5.4.7 Pause frame termination

The receive engine terminates pause frames and does not transfer them to the receive FIFO. The quanta is extracted and sent to the MAC transmit path via a small internal clock rate decoupling asynchronous FIFO.

The quanta is written only if a correct CRC and frame length are detected by the control state machine. If not, the quanta is discarded and the MAC transmit path is not paused.

Good pause frames are ignored if ENET*n*_RCR[FCE] is cleared and are forwarded to the client interface when ENET*n*_RCR[PAUFWD] is set.

11.5.5.4.8 CRC check

The CRC-32 field is checked and forwarded to the core FIFO interface if ENET*n*_RCR[CRCFWD] is cleared and ENET*n*_RCR[PADEN] is cleared. When CRCFWD is set (regardless of PADEN), the CRC-32 field is checked and terminated (not transmitted to the FIFO).

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^{8} + x^{7} + x^{5} + x^{4} + x^{2} + x^{1} + 1$

The 32 bits of the CRC value are placed in the frame check sequence (FCS) field with the x^{31} term as right-most bit of the first octet. The CRC bits are thus received in the following order: x^{31}, x^{30},..., x^{1}, x^{0}.

If a CRC error is detected, the frame is marked invalid and RxBD[CR] is set.

11.5.5.4.9 Frame padding removal

When a frame is received with a payload length field set to less than 46 (42 for VLAN-tagged frames and 38 for frames with stacked VLANs), the zero padding can be removed before the frame is written into the data FIFO depending on the setting of ENET*n*_RCR[PADEN].

Note

If a frame is received with excess padding (in other words, the length field is set as mentioned above, but the frame has more than 64 octets) and padding removal is enabled, then the padding is removed as normal and no error is reported if the frame is otherwise correct (for example: good CRC, less than maximum length, and no other error).

11.5.5.4.10 Frame classification (AVB)

To support protocols such as Audio Video Bridging (AVB, IEEE 802.1Qav), normal traffic is separated from time-sensitive traffic immediately at the application interface to allow storing them in different queues for further processing. For every frame received, a

classification based on VLAN priority can be performed. When a frame is received, and it contains a VLAN tag, the priority is compared against the values set in the classification match registers (see Receive Classification Match Register for Class n (ENET_RCMR*n*)) and the following figure.

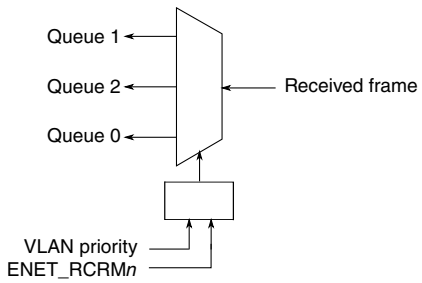

Figure 11-84. AVB frame classification

11.5.5.4.11 Receive flushing

RX flushing prevents frames in the RX FIFO from being blocked. Blocking can occur if the frame at the head of the RX FIFO cannot be forwarded because the ring it is associated with cannot accept it. This situation occurs when either the ring's RxBD[EMPTY] is not set or ENET_RDAR*n* is not set. When RX flushing is enabled, via QOS Scheme (ENET_QOS), the blocking frame will be flushed (discarded).

11.5.5.5 MAC transmit

Frame transmission starts when the transmit FIFO holds enough data.

After a transfer starts, the MAC transmit function performs the following tasks:

- Generates preamble and SFD field before frame transmission
- Generates XOFF pause frames if the receive FIFO reports a congestion or if ENET*n*_TCR[TFC_PAUSE] is set with ENET*n*_OPD[PAUSE_DUR] set to a non-zero value
- Generates XON pause frames if the receive FIFO congestion condition is cleared or if TFC_PAUSE is set with PAUSE_DUR cleared
- Suspends Ethernet frame transfer (XOFF) if a non-zero pause quanta is received from the MAC receive path
- Adds padding to the frame if required

- Calculates and appends CRC-32 to the transmitted frame
- Sends the frame with correct inter-packet gap (IPG) (deferring)

When the MAC is configured to operate in half-duplex mode, the following additional tasks are performed:

- Collision detection
- Frame retransmit after back-off timer expires

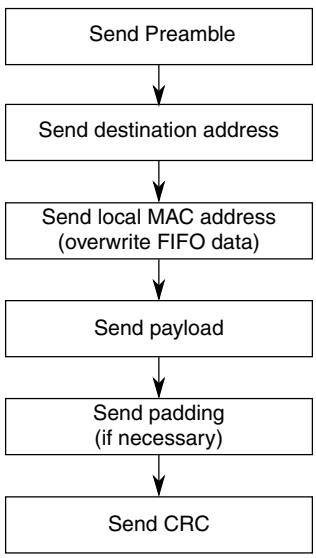

Figure 11-85. Frame transmit overview

11.5.5.5.1 Frame payload padding

The IEEE specification defines a minimum frame length of 64 bytes.

If the frame sent to the MAC from the user application has a size smaller than 60 bytes, the MAC automatically adds padding bytes (0x00) to comply with the Ethernet minimum frame length specification. Transmit padding is always performed and cannot be disabled.

If the MAC is not allowed to append a CRC (TxBD[TC] = 1), the user application is responsible for providing frames with a minimum length of 64 octets.

11.5.5.5.2 MAC address insertion

On each frame received from the core transmit FIFO interface, the source MAC address is either:

- Replaced by the address programmed in the PADDR1/2 fields (ENET*n*_TCR[ADDINS] = 1)
- Transparently forwarded to the Ethernet line (ENET*n*_TCR[ADDINS] = 0)

11.5.5.5.3 CRC-32 generation

The CRC-32 field is optionally generated and appended at the end of a frame.

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^{8} + x^{7} + x^{5} + x^{4} + x^{2} + x^{1} + 1$

The 32 bits of the CRC value are placed in the FCS field so that the x^{31} term is the right-most bit of the first octet. The CRC bits are thus transmitted in the following order: x^{31}, x^{30},..., x^{1}, x^{0}.

11.5.5.5.4 Inter-packet gap (IPG)

In full-duplex mode, after frame transmission and before transmission of a new frame, an IPG (programmed in ENET*n*_TIPG) is maintained. The minimum IPG can be programmed between 8 and 26 byte-times (64 and 208 bit-times).

In half-duplex mode, the core constantly monitors the line. Actual transmission of the data onto the network occurs only if it has been idle for a 96-bit time period, and any back-off time requirements have been satisfied. In accordance with the standard, the core begins to measure the IPG from CRS/GMII_CRS de-assertion.

11.5.5.5.5 Collision detection and handling — half-duplex operation only

A collision occurs on a half-duplex network when concurrent transmissions from two or more nodes take place. During transmission, the core monitors the line condition and detects a collision when the PHY device asserts COL.

When the core detects a collision while transmitting, it stops transmission of the data and transmits a 32-bit jam pattern. If the collision is detected during the preamble or the SFD transmission, the jam pattern is transmitted after completing the SFD, which results in a minimum 96-bit fragment. The jam pattern is a fixed pattern that is not compared to the actual frame CRC, and has a very low probability (0.532) of having a jam pattern identical to the CRC.

If a collision occurs before transmission of 64 bytes (including preamble and SFD), the MAC core waits for the backoff period and retransmits the packet data (stored in a 64-byte re-transmit buffer) that has already been sent on the line. The backoff period is generated from a pseudo-random process (truncated binary exponential backoff).

If a collision occurs after transmission of 64 bytes (including preamble and SFD), the MAC discards the remainder of the frame, optionally sets the LC interrupt bit, and sets TxBD[LCE].

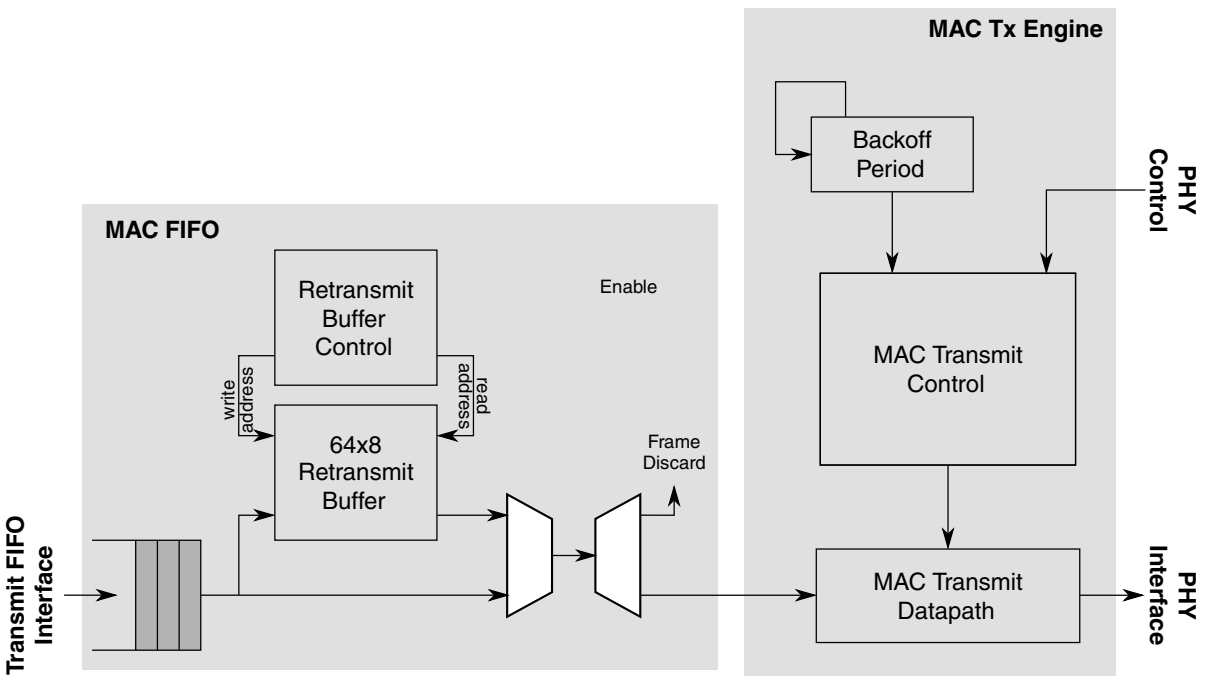

Figure 11-86. Packet re-transmit overview

The backoff time is represented by an integer multiple of slot times. One slot is equal to a 512-bit time period. The number of the delay slot times, before the n^{th} re-transmission attempt, is chosen as a uniformly-distributed random integer in the range:

- $0 < r < 2^k$
- $k = \min(n, N)$; where n is the number of retransmissions and $N = 10$

For example, after the first collision, the backoff period is 0 or 1 slot time. If a collision occurs on the first retransmission, the backoff period is 0, 1, 2, or 3, and so on.

The maximum backoff time (in 512-bit time slots) is limited by N = 10 as specified in the IEEE 802.3 standard.

If a collision occurs after 16 consecutive retransmissions, the core reports an excessive collision condition (ENET*n*_EIR[RL] interrupt field and TxBD[EE]) and discards the current packet from the FIFO.

In networks violating the standard requirements, a collision may occur after transmission of the first 64 bytes. In this case, the core stops the current packet transmission and discards the rest of the packet from the transmit FIFO. The core resumes transmission with the next packet available in the core transmit FIFO.

warning

Ethernet PHYs that support the SQE Test, or "heartbeat," feature must disable this feature. When this feature is enabled, the PHY asserts the collision signal after a frame is transmitted to indicate to the ENET that the PHY's collision logic is working. This may cause data corruption in the next frame from the ENET. This corrupted frame contains up to 21 zero bytes which start somewhere within the MAC destination address field. The ENET, however, will still generate a good FCS (CRC-32) but with corrupted data.

11.5.5.5.6 Rate limiting / traffic shaping support

The MAC-NET supports two methods to optimize frame traffic for either time-sensitive AVB frames (Class A and Class B) or best-effort non-AVB frames:

- Round-robin scheme
- Credit-based traffic shaping

To ensure that sufficient bandwidth is allocated for the AVB frames, the credit-based shaper must be used. Either method can be combined with a time-based shaper to ensure that a frame is always transmitted in its correct time slot.

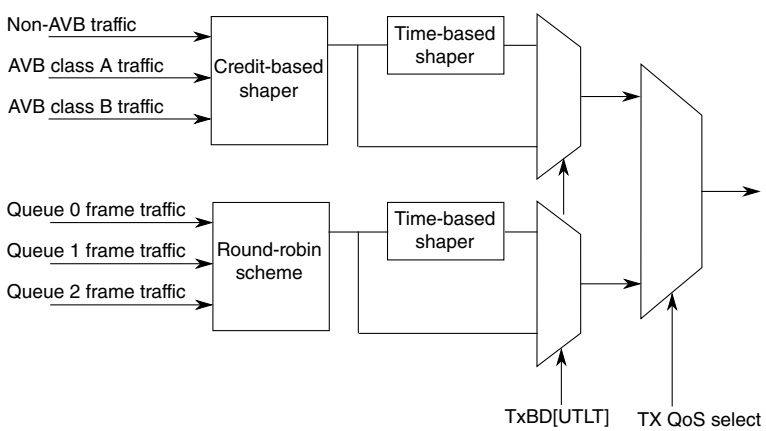

Figure 11-87. Transmit arbitration schemes

11.5.5.5.6.1 Round-robin policy

In the round-robin QoS scheme, each queue is given an equal opportunity to transmit one frame. For example, if queue *n* has a frame to transmit, the queue transmits its frame. After queue *n* has transmitted its frame, or if queue *n* does not have a frame to transmit, queue *n*+1 is then allowed to transmit its frame, and so on.

11.5.5.5.6.2 Credit-based shaper

The AVB credit based shaper acts independently, per class, to control the bandwidth distribution between normal traffic and time-sensitive traffic with respect to the total link bandwidth available. As per the IEEE 802.1Q, the maximum bandwidth distribution that can be allocated for the time-sensitive frames is 75%. The following example uses 70% for AVB frames and 30% for non-AVB frames:

Table 11-68. Bandwidth allocation example

AVB Class A	50%
AVB Class B	20%
non-AVB frames	30%
Total	100%

See DMA Class Based Configuration (ENET_DMA*n*CFG) for information on how to allocate bandwidth. The following figure shows how frame traffic is controlled within the MAC-NET core.

11.5.5.5.6.3 Time-based shaper

The time-based shaper enables the user to specify when a frame can be transmitted. It is always used in combination with either the round-robin scheme or the credit-based shaper. Use of the time-based shaper can ensure that frames are always transmitted in the correct time slot.

11.5.5.5.6.3.1 Time-based shaper example

Time-based shaping involves the following procedure:

1. Read the current value of the timer. See Timer Value Register (ENET_ATVR) and Adjustable Timer Control Register (ENET_ATCR).
2. Calculate the frame launch time and write this value to the TLT field of the frame's TxBD. See Enhanced transmit buffer descriptor.
3. Instruct the ENET to use the TLT by setting TxBD[UTLT].

The frame will be fetched and transmitted only if TxBD[TLT] is less than the current value of the timer. In other words, the timer must be past, that is, be greater than, the transmit launch time before the frame will be fetched and transmitted.

The transmit launch time must be not be greater than the current value of ENET_ATVR + (0.5 × ENET_ATPER). This means the application can not prepare frames with launch times beyond ENET_ATVR + (0.5 × ENET_ATPER). Because ENET_ATVR wraps, calculate TLT using the equation

(ENET_ATVR + (0.5 × ENET_ATPER)) mod ENET_ATPER

For example, if ENET_ATPER is set to the recommended value of 1,000,000,000 ns (one second), then the user must not prepare future frames with launch times greater than (500,000,000 + ENET_ATVR).

As a specific example, if the current value of ENET_ATVR is 100,000, then you can prepare the following frames:

1. Frame 1 TxBD[TLT] = 100,000ns + 125,000ns
2. Frame 2 TxBD[TLT] = 100,000ns + 250,000ns
3. And so on

11.5.5.6 Full-duplex flow control operation

Three conditions are handled by the core's flow control engine:

- Remote device congestion — The remote device connected to the same Ethernet segment as the core reports congestion and requests that the core stop sending data.
- Core FIFO congestion — When the core's receive FIFO reaches a user-programmable threshold (RX section empty), the core sends a pause frame back to the remote device requesting the data transfer to stop.
- Local device congestion — Any device connected to the core can request (typically, via the host processor) the remote device to stop transmitting data.

11.5.5.6.1 Remote device congestion

When the MAC transmit control gets a valid pause quanta from the receive path and if ENET*n*_RCR[FCE] is set, the MAC transmit logic:

- Completes the transfer of the current frame.

- Stops sending data for the amount of time specified by the pause quanta in 512 bit time increments.
- Sets ENET*n*_TCR[RFC_PAUSE].

Frame transfer resumes when the time specified by the quanta expires and if no new quanta value is received, or if a new pause frame with a quanta value set to 0x0000 is received. The MAC also resets RFC_PAUSE to zero.

If ENET*n*_RCR[FCE] cleared, the MAC ignores received pause frames.

Optionally and independent of ENET*n*_RCR[FCE], pause frames are forwarded to the client interface if PAUFWD is set.

11.5.5.6.2 Local device/FIFO congestion

The MAC transmit engine generates pause frames when the local receive FIFO is not able to receive more than a pre-defined number of words (FIFO programmable threshold) or when pause frame generation is requested by the local host processor.

- To generate a pause frame, the host processor sets ENET*n*_TCR[TFC_PAUSE]. A single pause frame is generated when the current frame transfer is completed and TFC_PAUSE is automatically cleared. Optionally, an interrupt is generated.
- An XOFF pause frame is generated when the receive FIFO asserts its section empty flag (internal). An XOFF pause frame is generated automatically, when the current frame transfer completes.
- An XON pause frame is generated when the receive FIFO deasserts its section empty flag (internal). An XON pause frame is generated automatically, when the current frame transfer completes.

When an XOFF pause frame is generated, the pause quanta (payload byte P1 and P2) is filled with the value programmed in ENET*n*_OPD[PAUSE_DUR].

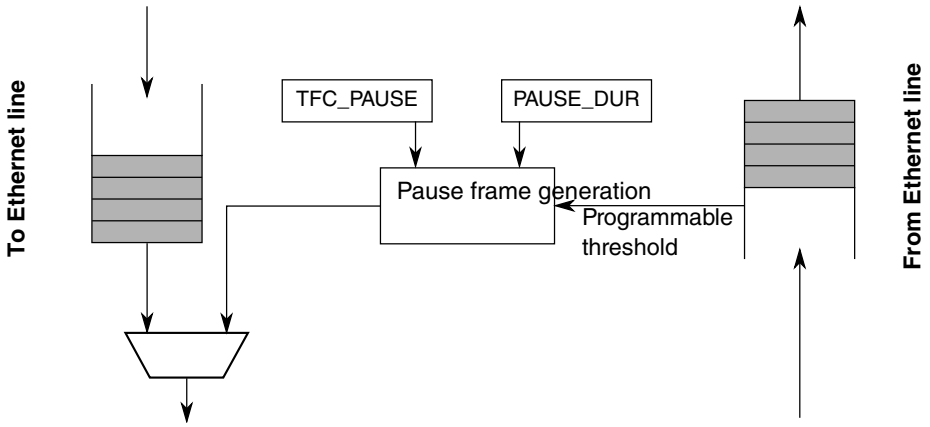

Figure 11-88. Pause frame generation overview

Note

Although the flow control mechanism should prevent any FIFO overflow on the MAC core receive path, the core receive FIFO is protected. When an overflow is detected on the receive FIFO, the current frame is truncated with an error indication set in the frame status word. The frame should subsequently be discarded by the user application.

11.5.5.7 Magic packet detection

Magic packet detection wakes a node that is put in power-down mode by the node management agent. Magic packet detection is supported only if the MAC is configured in sleep mode.

11.5.5.7.1 Sleep mode

To put the MAC in Sleep mode, set ENET*n*_ECR[SLEEP]. At the same time ENET*n*_ECR[MAGICEN] should also be set to enable magic packet detection.

In addition, if ENET is enabled, write 1 to ENET*n*_ECR[SLEEP] before entering into low power mode.

When the MAC is in Sleep mode:

- The transmit logic is disabled.
- The FIFO receive/transmit functions are disabled.
- The receive logic is kept in Normal mode, but it ignores all traffic from the line except magic packets. They are detected so that a remote agent can wake the node.

11.5.5.7.2 Magic packet detection

The core is designed to detect magic packets (see Magic packets) with the destination address set to:

- Any multicast address
- The broadcast address
- The unicast address programmed in PADDR1/2

When a magic packet is detected, EIR[WAKEUP] is set and none of the statistic registers are incremented.

11.5.5.7.3 Wakeup

When a magic packet is detected, indicated by ENET*n*_EIR[WAKEUP], ENET*n*_ECR[SLEEP] should be cleared to resume normal operation of the MAC. Clearing the SLEEP bit automatically masks ENET*n*_ECR[MAGICEN], disabling magic packet detection.

11.5.5.8 IP accelerator functions

The following sections describe the IP accelerator functions.

11.5.5.8.1 Checksum calculation

The IP and ICMP, TCP, UDP checksums are calculated with one's complement arithmetic summing up 16-bit values.

- For ICMP, the checksum is calculated over the complete ICMP datagram, in other words without IP header.
- For TCP and UDP, the checksums contain the header and data sections and values from the IP header, which can be seen as a pseudo-header that is not actually present in the data stream.

Table 11-69. IPv4 pseudo-header for checksum calculation

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source address							
Destination address							
Zero		Protocol		TCP/UDP length			

Table 11-70. IPv6 pseudo-header for checksum calculation

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Source address							
Destination address							
TCP/UDP length							
Zero						Next header	

The TCP/UDP length value is the length of the TCP or UDP datagram, which is equal to the payload of an IP datagram. It is derived by subtracting the IP header length from the complete IP datagram length that is given in the IP header (IPv4), or directly taken from the IP header (IPv6). The protocol field is the corresponding value from the IP header. The Zero fields are all zeroes.

For IPv6, the complete 128-bit addresses are considered. The next header value identifies the upper layer protocol as either TCP or UDP. It may differ from the next header value of the IPv6 header if extension headers are inserted before the protocol header.

The checksum calculation uses 16-bit words in network byte order: The first byte sent/received is the MSB, and the second byte sent/received is the LSB of the 16-bit value to add to the checksum. If the frame ends on an odd number of bytes, a zero byte is appended for checksum calculation only, and is not actually transmitted.

11.5.5.8.2 Additional padding processing

According to IEEE 802.3, any Ethernet frame must have a minimum length of 64 octets.

The MAC usually removes padding on receive when a frame with length information is received. Because IP frames have a type value instead of length, the MAC does not remove padding for short IP frames, as it is not aware of the frame contents.

The IP accelerator function can be configured to remove the Ethernet padding bytes that might follow the IP datagram.

On transmit, the MAC automatically adds padding as necessary to fill any frame to a 64-byte length.

11.5.5.8.3 32-bit Ethernet payload alignment

The data FIFOs allow inserting two additional arbitrary bytes in front of a frame. This extends the 14-byte Ethernet header to a 16-byte header, which leads to alignment of the Ethernet payload, following the Ethernet header, on a 32-bit boundary.

This function can be enabled for transmit and receive independently with the corresponding SHIFT16 bits in the ENET*n*_TACC and ENET*n*_RACC registers.

When enabled, the valid frame data is arranged as shown in Table 11-71.

Table 11-71. 64-bit interface data structure with SHIFT16 enabled

63 56	55 48	47 40	39 32	31 24	23 16	15 8	7 0
Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0	Any value	Any value
Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8	Byte 7	Byte 6
...							

11.5.5.8.3.1 Receive processing

When ENET*n*_RACC[SHIFT16] is set, each frame is received with two additional bytes in front of the frame.

The user application must ignore these first two bytes and find the first byte of the frame in bits 23–16 of the first word from the RX FIFO.

Note

SHIFT16 must be set during initialization and kept set during the complete operation, because it influences the FIFO write behavior.

11.5.5.8.3.2 Transmit processing

When ENET*n*_TACC[SHIFT16] is set, the first two bytes of the first word written (bits 15–0) are discarded immediately by the FIFO write logic.

The SHIFT16 bit can be enabled/disabled for each frame individually if required, but can be changed only between frames.

11.5.5.8.4 Received frame discard

Because the receive FIFO must be operated in store and forward mode (ENET*n*_RSFL cleared), received frames can be discarded based on the following errors:

- The MAC function receives the frame with an error:
  - The frame has an invalid payload length
  - Frame length is greater than MAX_FL

- Frame received with a CRC-32 error
- Frame truncated due to receive FIFO overflow
- Frame is corrupted as PHY signaled an error (RX_ERR asserted during reception)

- An IP frame is detected and the IP header checksum is wrong
- An IP frame with a valid IP header and a valid IP header checksum is detected, the protocol is known but the protocol-specific checksum is wrong

If one of the errors occurs and the IP accelerator function is configured to discard frames (ENET*n*_RACC), the frame is automatically discarded. Statistics are maintained normally and are not affected by this discard function.

11.5.5.8.5 IPv4 fragments

When an IPv4 IP fragment frame is received, only the IP header is inspected and its checksum verified. 32-bit alignment operates the same way on fragments as it does on normal IP frames, as specified above.

The IP fragment frame payload is not inspected for any protocol headers. As such, a protocol header would only exist in the very first fragment. To assist in protocol-specific checksum verification, the one's-complement sum is calculated on the IP payload (all bytes following the IP header) and provided with the frame status word.

The frame fragment status field (RxBD[FRAG]) is set to indicate a fragment reception, and the one's-complement sum of the IP payload is available in RxBD[Payload checksum].

Note

After all fragments have been received and reassembled, the application software can take advantage of the payload checksum delivered with the frame's status word to calculate the protocol-specific checksum of the datagram.

For example, if a TCP payload is delivered by multiple IP fragments, the application software can calculate the pseudo-header checksum value from the first fragment, and add the payload checksums delivered with the status for all fragments to verify the TCP datagram checksum.

11.5.5.8.6 IPv6 support

The following sections describe the IPv6 support.

11.5.5.8.6.1 Receive processing

An Ethernet frame of type 0x86DD identifies an IP Version 6 frame (IPv6) frame. If an IPv6 frame is received, the first IP header is inspected (first ten words), which is available in every IPv6 frame.

If the receive SHIFT16 function is enabled, the IP header is aligned on a 32-bit boundary allowing more efficient processing (see 32-bit Ethernet payload alignment).

For TCP and UDP datagrams, the pseudo-header checksum calculation is performed and verified.

To assist in protocol-specific checksum verification, the one's-complement sum is always calculated on the IP payload (all bytes following the IP header) and provided with the frame status word. For example, if extension headers were present, their sums can be subtracted in software from the checksum to isolate the TCP/UDP datagram checksum, if required.

11.5.5.8.6.2 Transmit processing

For IPv6 transmission, the SHIFT16 function is supported to process 32-bit aligned datagrams.

IPv6 has no IP header checksum; therefore, the IP checksum insertion configuration is ignored.

The protocol checksum is inserted only if the next header of the IP header is a known protocol (TCP, UDP, or ICMP). If a known protocol is detected, the checksum over all bytes following the IP header is calculated and inserted in the correct position.

The pseudo-header checksum calculation is performed for TCP and UDP datagrams accordingly.

11.5.5.9 Resets and stop controls

The following sections describe the resets and stop controls.

11.5.5.9.1 Hardware reset

To reset the Ethernet module, set ENET*n*_ECR[RESET].

11.5.5.9.2 Soft reset

When ENET*n*_ECR[ETHER_EN] is cleared during operation, the following occurs:

- uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.
- A currently ongoing transmit is terminated by asserting GMII/TXER to the PHY.
- A currently ongoing transmit FIFO write from the application is terminated by stopping the write to the FIFO, and all further data from the application is ignored. All subsequent writes are ignored until re-enabled.
- A currently ongoing receive FIFO read is terminated. The RxBD has arbitrary values in this case.

11.5.5.9.3 Hardware freeze

When the processor enters debug mode and ECR[DBGEN] is set, the MAC enters a freeze state where it stops all transmit and receive activities gracefully.

The following happens when the MAC enters hardware freeze:

- A currently ongoing receive transaction on the receive application interface is completed as normal. No further frames are read from the FIFO.
- A currently ongoing transmit transaction on the transmit application interface is completed as normal (in other words, until writing end-of-packet (EOP)).
- A currently ongoing frame receive is completed normally, after which no further frames are accepted from the MII/GMII.
- A currently ongoing frame transmit is completed normally, after which no further frames are transmitted.

11.5.5.9.4 Graceful stop

During a graceful stop, any currently ongoing transactions are completed normally and no further frames are accepted. The MAC can resume from a graceful stop without the need for a reset (for example, clearing ETHER_EN is not required).

The following conditions lead to a graceful stop of the MAC transmit or receive datapaths.

11.5.5.9.4.1 Graceful transmit stop (GTS)

When gracefully stopped, the MAC is no longer reading frame data from the transmit FIFO and has completed any ongoing transmission.

In any of the following conditions, the transmit datapath stops after an ongoing frame transmission has been completed normally.

- ENET*n*_TCR[GTS] is set by software.
- ENET*n*_TCR[TFC_PAUSE] is set by software requesting a pause frame transmission. The status (and register bit) is cleared after the pause frame has been sent.
- A pause frame was received stopping the transmitter. The stopped situation is terminated when the pause timer expires or a pause frame with zero quanta is received.
- MAC is placed in Sleep mode by software or the processor entering Stop mode (see Sleep mode).
- The MAC is in Hardware Freeze mode.

When the transmitter has reached its stopped state, the following events occur:

- The GRA interrupt is asserted, when transitioned into stopped.
- In Hardware Freeze mode, the GRA interrupt does not wait for the application write completion and asserts when the transmit state machine (in other words, line side of TX FIFO) reaches its stopped state.

11.5.5.9.4.2 Graceful receive stop (GRS)

When gracefully stopped, the MAC is no longer writing frames into the receive FIFO.

The receive datapath stops after any ongoing frame reception has been completed normally, if any of the following conditions occur:

- MAC is placed in Sleep mode either by the software or the processor is in Stop mode). The MAC continues to receive frames and search for magic packets if enabled (see Magic packet detection). However, no frames are written into the receive FIFO, and therefore are not forwarded to the application.
- The MAC is in Hardware Freeze mode. The MAC does not accept any frames from the MII/GMII.

When the receive datapath is stopped, the following events occur:

- If the RX is in the stopped state, RCR[GRS] is set
- The GRA interrupt is asserted when the transmitter and receiver are stopped
- Any ongoing receive transaction to the application (RX FIFO read) continues normally until the frame end of package (EOP) is reached. After this, the following occurs:
  - When Sleep mode is active, all further frames are discarded, flushing the RX FIFO
  - In Hardware Freeze mode, no further frames are delivered to the application and they stay in the receive FIFO.

Note

The assertion of GRS does not wait for an ongoing FIFO read transaction on the application side of the FIFO (FIFO read).

11.5.5.9.4.3 Graceful stop interrupt (GRA)

The graceful stopped interrupt (GRA) is asserted for the following conditions:

- In Sleep mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- In Hardware Freeze mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- The MAC transmit datapath is stopped for any other condition (GTS, TFC_PAUSE, pause received).

The GRA interrupt is triggered only once when the stopped state is entered. If the interrupt is cleared while the stop condition persists, no further interrupt is triggered.

11.5.5.10 IEEE 1588 functions

To allow for IEEE 1588 or similar time synchronization protocol implementations, the MAC is combined with a time-stamping module to support precise time-stamping of incoming and outgoing frames. Set ENET*n*_ECR[EN1588] to enable 1588 support.

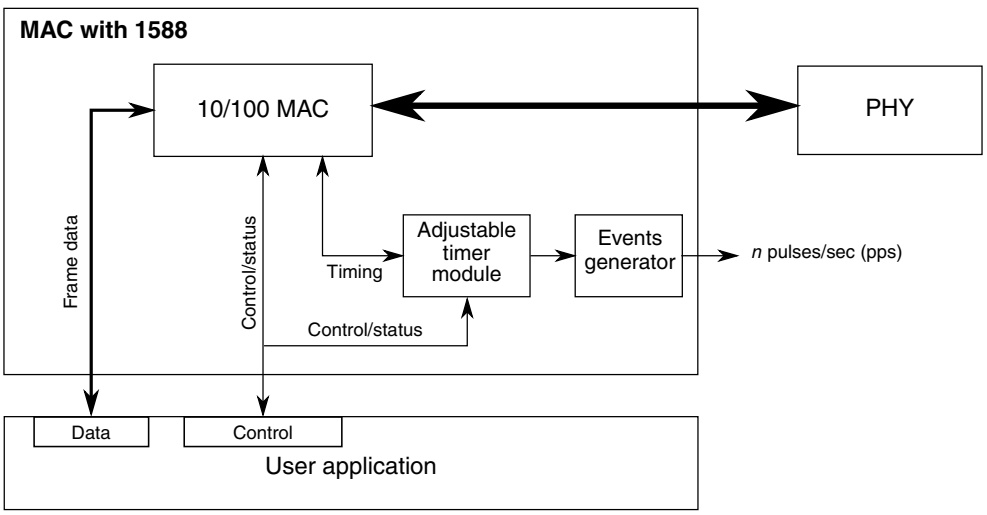

Figure 11-89. IEEE 1588 functions overview

11.5.5.10.1 Adjustable timer module

The adjustable timer module (TSM) implements the free-running counter (FRC), which generates the timestamps. The FRC operates with the time-stamping clock, which can be set to any value depending on your system requirements.

Through dedicated correction logic, the timer can be adjusted to allow synchronization to a remote master and provide a synchronized timing reference to the local system. The timer can be configured to cause an interrupt after a fixed time period, to allow synchronization of software timers or perform other synchronized system functions.

The timer is typically used to implement a period of one second; hence, its value ranges from 0 to (1×10^9)-1. The period event can trigger an interrupt, and software can maintain the seconds and hours time values as necessary.

11.5.5.10.1.1 Adjustable timer implementation

The adjustable timer consists of a programmable counter/accumulator and a correction counter. The periods of both counters and their increment rates are freely configurable, allowing very fine tuning of the timer.

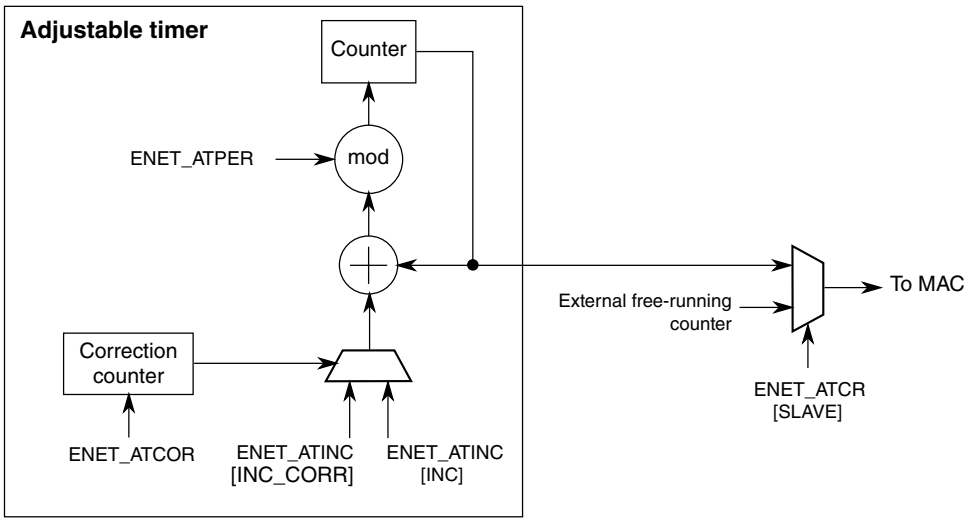

Figure 11-90. Adjustable timer implementation detail

The counter produces the current time. During each time-stamping clock cycle, a constant value is added to the current time as programmed in ENET*n*_ATINC. The value depends on the chosen time-stamping clock frequency. For example, if it operates at 125 MHz, setting the increment to eight represents 8 ns.

The period, configured in ENET*n*_ATPER, defines the modulo when the counter wraps. In a typical implementation, the period is set to 1×10^9 so that the counter wraps every second, and hence all timestamps represent the absolute nanoseconds within the one second period. When the period is reached, the counter wraps to start again respecting the period modulo. This means it does not necessarily start from zero, but instead the counter is loaded with the value (Current + Inc $-(1 \times 10^9)$), assuming the period is set to 1×10^9.

The correction counter operates fully independently, and increments by one with each time-stamping clock cycle. When it reaches the value configured in ENET*n*_ATCOR, it restarts and instructs the timer once to increment by the correction value, instead of the normal value.

The normal and correction increments are configured in ENET*n*_ATINC. To speed up the timer, set the correction increment more than the normal increment value. To slow down the timer, set the correction increment less than the normal increment value.

The correction counter only defines the distance of the corrective actions, not the amount. This allows very fine corrections and low jitter (in the range of 1 ns) independent of the chosen clock frequency.

By enabling slave mode (ENET*n*_ATCR[SLAVE] = 1), the timer is ignored and the current time is externally provided from one of the external modules. See the Chip Configuration details for which clock source is used. This is useful if multiple modules

within the system must operate from a single timer. When slave mode is enabled, you still must set ENET*n*_ATINC[INC] to the value of the master, since it is used for internal comparisons.

11.5.5.10.2 Transmit timestamping

Only 1588 event frames need to be time-stamped on transmit. The client application (for example, the MAC driver) should detect 1588 event frames and set TxBD[TS] together with the frame.

If TxBD[TS] is set, the MAC records the timestamp for the frame in ENET*n*_ATSTMP. ENET*n*_EIR[TS_AVAIL] is set to indicate that a new timestamp is available.

Software implements a handshaking procedure by setting TxBD[TS] when it transmits the frame for which a timestamp is needed, and then waits for ENET*n*_EIR[TS_AVAIL] to determine when the timestamp is available. The timestamp is then read from ENET*n*_ATSTMP. This is done for all event frames. Other frames do not use TxBD[TS] and, therefore, do not interfere with the timestamp capture.

11.5.5.10.3 Receive timestamping

When a frame is received, the MAC latches the value of the timer when the frame's start of frame delimiter (SFD) field is detected, and provides the captured timestamp on RxBD[1588 timestamp]. This is done for all received frames.

11.5.5.10.4 Time synchronization

The adjustable timer module is available to synchronize the local clock of a node to a remote master. It implements a free running 32-bit counter, and also contains an additional correction counter.

The correction counter increases or decreases the rate of the free running counter, enabling very fine granular changes of the timer for synchronization, yet adding only very low jitter when performing corrections.

The application software implements, in a slave scenario, the required control algorithm, setting the correction to compensate for local oscillator drifts and locking the timer to the remote master clock on the network.

The timer and all timestamp-related information should be configured to show the true nanoseconds value of a second (in other words, the timer is configured to have a period of one second). Hence, the values range from 0 to (1×10^9)–1. In this application, the seconds counter is implemented in software using an interrupt function that is executed when the nanoseconds counter wraps at 1×10^9.

11.5.5.10.5 Input Capture and Output Compare

The Input Capture Output Compare block can be used to provide precise hardware timing for input and output events.

11.5.5.10.5.1 Input capture

The TCCR*n* capture registers latch the time value when the corresponding external event occurs. An event can be a rising-, falling-, or either-edge of one of the 1588_TMR*n* signals. An event will cause the corresponding TCSR*n*[TF] timer flag to be set, indicating that an input capture has occurred. If the corresponding interrupt is enabled with the TCSR*n*[TIE] field, an interrupt can be generated.

11.5.5.10.5.2 Output compare

The TCCR*n* compare registers are loaded with the time at which the corresponding event should occur. When the ENET free-running counter value matches the output compare reference value in the TCCR*n* register, the corresponding flag, TCSR*n*[TF], is set, indicating that an output compare has occurred. The corresponding interrupt, if enabled by TCSR*n*[TIE], will be generated.The corresponding 1588_TMR*n* output signal will be asserted according to TCSR*n*[TMODE].

NOTE

If TSCR*n*[TMODE] is set to 10X1b or 1010b then the timer output pin toggle-on-overflow will occur only when PINPER, PEREN, and EN bits of the ATCR register are one.

11.5.5.10.5.3 DMA requests

A DMA request can be enabled by setting TCSR*n*[TDRE]. The corresponding DMA request is generated when the TCSR*n*[TF] timer flag is set. When the DMA has completed, the corresponding TCSRn[TF] flag is cleared.

11.5.5.11 FIFO thresholds

The core FIFO thresholds are fully programmable to dynamically change the FIFO operation.

For example, store and forward transfer can be enabled by a simple change in the FIFO threshold registers.

The thresholds are defined in 64-bit words.

The receive and transmit FIFOs both have a depth of 1024 words.

11.5.5.11.1 Receive FIFO

Four programmable thresholds are available, which can be set to any value to control the core operation as follows.

Table 11-72. Receive FIFO thresholds definition

Register	Description
ENET*n*_RSFL [RX_SECTION_FULL]	When the FIFO level reaches the ENET*n*_RSFL value, the MAC status signal is asserted to indicate that data is available in the receive FIFO (cut-through operation). Once asserted, if the FIFO empties below the threshold set with ENET*n*_RAEM and if the end-of-frame is not yet stored in the FIFO, the status signal is deasserted again. If a frame has a size smaller than the threshold (in other words, an end-of-frame is available for the frame), the status is also asserted. To enable store and forward on the receive path, clear ENET*n*_RSFL. The MAC status signal is asserted only when a complete frame is stored in the receive FIFO. When programming a non-zero value to ENET*n*_RSFL (cut-through operation) it should be greater than ENET*n*_RAEM.
ENET*n*_RAEM [RX_ALMOST_EMPTY]	When the FIFO level reaches the ENET*n*_RAEM value, and the end-of-frame has not been received, the core receive read control stops the FIFO read (and subsequently stops transferring data to the MAC client application). It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO. Set ENET*n*_RAEM to a minimum of six.
ENET*n*_RAFL [RX_ALMOST_FULL]	When the FIFO level approaches the maximum and there is no more space remaining for at least ENETn_RAFL number of words, the MAC control logic stops writing data in the FIFO and truncates the receive frame to avoid FIFO overflow. The corresponding error status is set when the frame is delivered to the application. Set ENET*n*_RAFL to a minimum of 4.
ENET*n*_RSEM [RX_SECTION_EMPTY]	When the FIFO level reaches the ENET*n*_RSEM value, an indication is sent to the MAC transmit logic, which generates an XOFF pause frame. This indicates FIFO congestion to the remote Ethernet client. When the FIFO level goes below the value programmed in ENET*n*_RSEM, an indication is sent to the MAC transmit logic, which generates an XON pause frame. This indicates the FIFO congestion is cleared to the remote Ethernet client. Clearing ENET*n*_RSEM disables any pause frame generation.

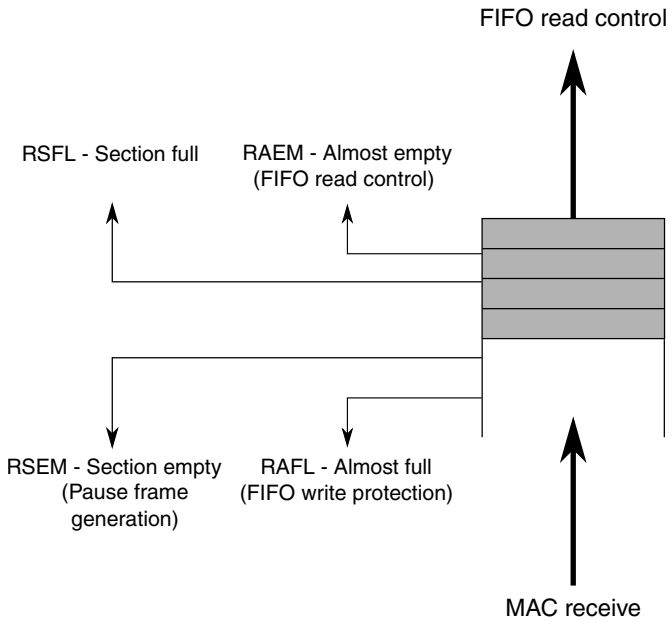

Figure 11-91. Receive FIFO overview

11.5.5.11.2 Transmit FIFO

Four programmable thresholds are available which control the core operation as described below.

Table 11-73. Transmit FIFO thresholds definition

Register	Description
ENET*n*_TAEM [TX_ALMOST _EMPTY]	When the FIFO level reaches the ENET*n*_TAEM value and no end-of-frame is available for the frame, the MAC transmit logic avoids a FIFO underflow by stopping FIFO reads and transmitting the Ethernet frame with an MII error indication. Set ENET*n*_TAEM to a minimum of 4.
ENET*n*_TAFL [TX_ALMOST _FULL]	When the FIFO level approaches the maximum, so that there is no more space for at least ENET*n*_TAFL number of words, the MAC deasserts its control signal to the application. If the application does not react on this signal, the FIFO write control logic avoids FIFO overflow by truncating the current frame and setting the error status. As a result, the frame is transmitted with an GMII/MII error indication. Set ENET*n*_TAFL to a minimum of 4. Larger values allow more latency for the application to react on the MAC control signal deassertion, before the frame is truncated. A typical setting is 8, which offers 3–4 clock cycles of latency to the application to react on the MAC control signal deassertion.
ENET*n*_TSEM [TX_SECTION _EMPTY]	When the FIFO level reaches the ENET*n*_TSEM value, a MAC status signal is deasserted to indicate that the transmit FIFO is getting full. This gives the ENET module an indication to slow or stop its write transaction to avoid a buffer overflow. This is a pure indication function to the application. It has no effect within the MAC. When ENET*n*_TSEM is 0, the signal is never deasserted.
ENET*n*_TFWR	When the FIFO level reaches the ENET*n*_TFWR value and when STRFWD is cleared, the MAC transmit control logic starts frame transmission before the end-of-frame is available in the FIFO (cut-through operation).

Table 11-73. Transmit FIFO thresholds definition

Register	Description
	If a complete frame has a size smaller than the ENET*n*_TFWR threshold, the MAC also transmits the frame to the line. To enable store and forward on the transmit path, set STRFWD. In this case, the MAC starts to transmit data only when a complete frame is stored in the transmit FIFO.

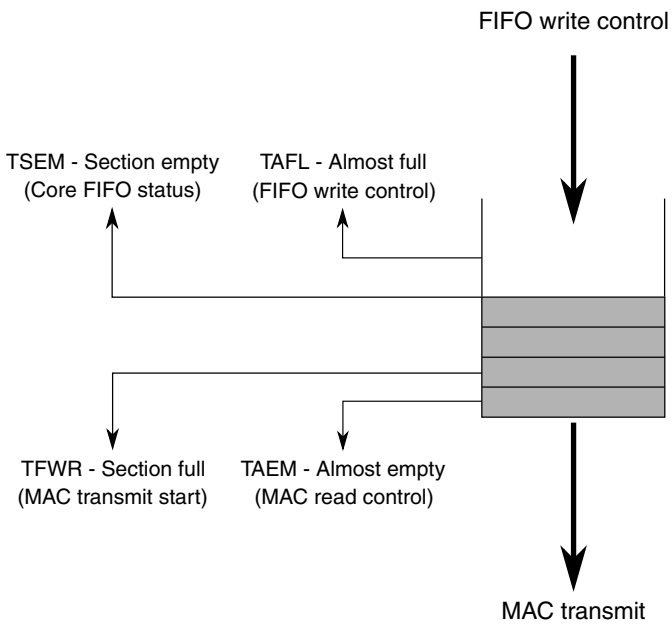

Figure 11-92. Transmit FIFO overview

11.5.5.12 Loopback options

The core implements external and internal loopback options, which are controlled by the ENET*n*_RCR register fields found here.

The core implements external and internal loopback options, which are controlled by the following ENET*n*_RCR register fields:

Table 11-74. Loopback options

Register field	Description
LOOP	Internal MII loopback. The MAC transmit is returned to the MAC receive. No data is transmitted to the external interfaces. In MII internal loopback, MII_TXCLK and MII_RXCLK must be provided with a clock signal (2.5 MHz for 10 Mbit/s, and 25 MHz for 100 Mbit/s))

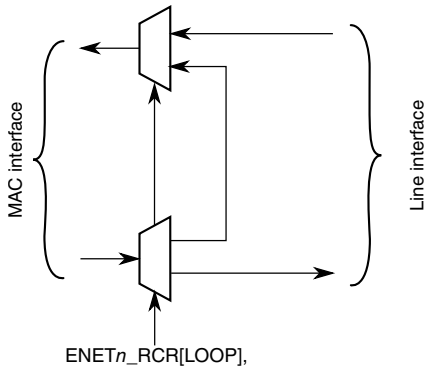

Figure 11-93. Loopback options

11.5.5.13 Legacy buffer descriptors

To support the Ethernet controller on previous chips, legacy FEC buffer descriptors are available. To enable legacy support, write 0 to ENET*n*_ECR[1588EN].

NOTE

- Legacy buffer descriptors are used in single-ring mode, that is, when DMA*n*CFG[DMA_CLASS_EN] are zero. In multi-ring mode, legacy TxBDs are used only with the round-robin scheme.
- The legacy buffer descriptor tables show the byte order for big-endian chips. DBSWP must be set to 0 after reset to enable big-endian mode.

11.5.5.13.1 Legacy receive buffer descriptor

The following table shows the legacy FEC receive buffer descriptor. Table 11-78 contains the descriptions for each field.

Table 11-75. Legacy FEC receive buffer descriptor (RxBD)

	Byte 0								Byte 1							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Offset + 0	E	RO1	W	RO2	L	—	—	M	BC	MC	LG	NO	—	CR	OV	TR
Offset + 2	Data length															
Offset + 4	Rx data buffer pointer — high halfword															
Offset + 6	Rx data buffer pointer — low halfword															

11.5.5.13.2 Legacy transmit buffer descriptor

The following table shows the legacy FEC transmit buffer descriptor. Table 11-80 contains the descriptions for each field.

Table 11-76. Legacy FEC transmit buffer descriptor (TxBD)

	Byte 0								Byte 1							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Offset + 2	Data Length															
Offset + 4	Tx Data Buffer Pointer — high halfword															
Offset + 6	Tx Data Buffer Pointer — low halfword															

1. This field is not supported by the uDMA.

11.5.5.14 Enhanced buffer descriptors

This section provides a description of the enhanced operation of the driver/uDMA via the buffer descriptors.

It is followed by a detailed description of the receive and transmit descriptor fields. To enable the enhanced features, set ENET*n*_ECR[1588EN].

NOTE

The enhanced buffer descriptor tables show the byte order for big-endian chips. DBSWP must be set to 0 after reset to enable big-endian mode.

11.5.5.14.1 Enhanced receive buffer descriptor

The following table shows the enhanced uDMA receive buffer descriptor. Table 11-78 contains the descriptions for each field.

Table 11-77. Enhanced uDMA receive buffer descriptor (RxBD)

Table 11-78. Receive buffer descriptor field definitions

Word	Field	Description
Offset + 0	15 E	Empty. Written by the MAC (= 0) and user (= 1). 0 The data buffer associated with this BD is filled with received data, or data reception has aborted due to an error condition. The status and length fields have been updated as required. 1 The data buffer associated with this BD is empty, or reception is currently in progress.
Offset + 0	14 RO1	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 0	13 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location. 1 The next buffer descriptor is found at the location defined in ENET*n*_RDSR.
Offset + 0	12 RO2	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 0	11 L	Last in frame. Written by the uDMA. 0 The buffer is not the last in a frame. 1 The buffer is the last in a frame.
Offset + 0	10–9	Reserved, must be cleared.
Offset + 0	8 M	Miss. Written by the MAC. This field is set by the MAC for frames accepted in promiscuous mode, but flagged as a miss by the internal address recognition. Therefore, while in promiscuous mode, you can use this field to quickly determine whether the frame was destined to this station. This field is valid only if the L and PROM fields are set to 1. 0 The frame was received because of an address recognition hit. 1 The frame was received because of promiscuous mode. The information needed for this field comes from the promiscuous_miss(ff_rx_err_stat[26]) sideband signal.
Offset + 0	7 BC	Set if the DA is broadcast (FFFF_FFFF_FFFF).
Offset + 0	6 MC	Set if the DA is multicast and not BC.

Table continues on the next page...

Table 11-78. Receive buffer descriptor field definitions (continued)

Word	Field	Description
Offset + 0	5 LG	Receive frame length violation. Written by the MAC. A frame length greater than RCR[MAX_FL] was recognized. This field is valid only if the L field is set. The receive data is not altered in any way unless the length exceeds TRUNC_FL bytes.
Offset + 0	4 NO	Receive non-octet aligned frame. Written by the MAC. A frame that contained a number of bits not divisible by 8 was received, and the CRC check that occurred at the preceding byte boundary generated an error or a PHY error occurred. This field is valid only if the L field is set. If this field is set, the CR field is not set.
Offset + 0	3	Reserved, must be cleared.
Offset + 0	2 CR	Receive CRC or frame error. Written by the MAC. This frame contains a PHY or CRC error and is an integral number of octets in length. This field is valid only if the L field is set.
Offset + 0	1 OV	Overrun. Written by the MAC. A receive FIFO overrun occurred during frame reception. If this field is set, the other status fields, M, LG, NO, and CR, lose their normal meaning and are zero. This field is valid only if the L field is set.
Offset + 0	0 TR	Set if the receive frame is truncated (frame length >TRUNC_FL). If the TR field is set, the frame must be discarded and the other error fields must be ignored because they may be incorrect.
Offset + 2	15–0 Data Length	Data length. Written by the MAC. Data length is the number of octets written by the MAC into this BD's data buffer if L is cleared (the value is equal to EMRBR), or the length of the frame including CRC if L is set. It is written by the MAC once as the BD is closed.
0ffset + 4	15–0 Data buffer pointer high	Receive data buffer pointer, high halfword[1]
Offset + 6	15–0 Data buffer pointer low	Receive data buffer pointer, low halfword
Offset + 8	15 ME	MAC error. This field is written by the uDMA. This field means that the frame stored in the system memory was received with an error (typically, a receive FIFO overflow). This field is only valid when the L field is set.
Offset + 8	14–11	Reserved, must be cleared.
Offset + 8	10 PE	PHY Error. This field is written by the uDMA. Set to "1"when the frame was received with an Error character on the PHY interface. The frame is invalid. This field is valid only when the L field is set.
Offset + 8	9 CE	Collision. This field is written by the uDMA. Set when the frame was received with a collision detected during reception. The frame is invalid and sent to the user application. This field is valid only when the L field is set.
Offset + 8	8 UC	Unicast. This field is written by the uDMA, and means that the frame is unicast. This field is valid regardless of whether the L field is set.
Offset + 8	7 INT	Generate RXB/RXF interrupt. This field is set by the user to indicate that the uDMA is to generate an interrupt on the *dma_int_rxb* / *dma_int_rxfevent*.
Offset + 8	6–0	Reserved, must be cleared.
Offset + A	15–13 VPCP	VLAN priority code point. This field is written by the uDMA to indicate the frame priority level. Valid values are from 0 (best effort) to 7 (highest). This value can be used to prioritize different classes of traffic (e.g., voice, video, data). This field is only valid if the L field is set.
Offset + A	12–6	Reserved, must be cleared.

Table continues on the next page...

Table 11-78. Receive buffer descriptor field definitions (continued)

Word	Field	Description
Offset + A	5 ICE	IP header checksum error. This is an accelerator option. This field is written by the uDMA. Set when either a non-IP frame is received or the IP header checksum was invalid. An IP frame with less than 3 bytes of payload is considered to be an invalid IP frame. This field is only valid if the L field is set.
Offset + A	4 PCR	Protocol checksum error. This is an accelerator option. This field is written by the uDMA. Set when the checksum of the protocol is invalid or an unknown protocol is found and checksumming could not be performed. This field is only valid if the L field is set.
Offset + A	3	Reserved, must be cleared.
Offset + A	2 VLAN	VLAN. This is an accelerator option. This field is written by the uDMA. It means that the frame has a VLAN tag. This field is valid only if the L field is set.
Offset + A	1 IPV6	IPV6 Frame. This field is written by the uDMA. This field indicates that the frame has an IPv6 frame type. If this field is not set it means that an IPv4 or other protocol frame was received. This field is valid only if the L field is set.
Offset + A	0 FRAG	IPv4 Fragment.This is an accelerator option.This field is written by the uDMA. It indicates that the frame is an IPv4 fragment frame. This field is only valid when the L field is set.
Offset + C	15–11 Header length	Header length. This is an accelerator option. This field is written by the uDMA. This field is the sum of 32-bit words found within the IP and its following protocol headers. If an IP datagram with an unknown protocol is found, then the value is the length of the IP header. If no IP frame or an erroneous IP header is found, the value is 0. The following values are minimum values if no header options exist in the respective headers: • ICMP/IP: 6 (5 IP header, 1 ICMP header) • UDP/IP: 7 (5 IP header, 2 UDP header) • TCP/IP: 10 (5 IP header, 5 TCP header) This field is only valid if the L field is set.
Offset + C	10–8	Reserved, must be cleared.
Offset + C	7–0 Protocol type	Protocol type. This is an accelerator option. The 8-bit protocol field found within the IP header of the frame. It is valid only when ICE is cleared. This field is valid only when the L field is set.
Offset + E	15–0 Payload checksum	Internet payload checksum. This is an accelerator option. It is the one's complement sum of the payload section of the IP frame. The sum is calculated over all data following the IP header until the end of the IP payload. This field is valid only when the L field is set.
Offset + 10	15 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 10	14–0	Reserved, must be cleared.
Offset + 12	15–0	Reserved, must be cleared.
Offset + 14	15–0 1588 timestamp	This value is written by the uDMA. It is only valid if the L field is set.
Offset + 16		
Offset + 18 – Offset + 1E	15–0	Reserved, must be cleared.

1. The receive buffer pointer, containing the address of the associated data buffer, must always be evenly divisible by 64. The buffer must reside in memory external to the MAC. The Ethernet controller never modifies this value.

11.5.5.14.2 Enhanced transmit buffer descriptor

Table 11-79. Enhanced transmit buffer descriptor (TxBD)

	Byte 0								Byte 1							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Offset + 1C	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Offset + 1E	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 11-80. Enhanced transmit buffer descriptor field definitions

Word	Field	Description
Offset + 0	15 R	Ready. Written by the MAC and user. 0 The data buffer associated with this BD is not ready for transmission. You are free to manipulate this BD or its associated data buffer. The MAC clears this field after the buffer has been transmitted or after an error condition is encountered. 1 The data buffer, prepared for transmission by you, has not been transmitted or currently transmits. You may write no fields of this BD after this field is set.
Offset + 0	14 TO1	Transmit software ownership. This field is reserved for software use. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 0	13 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location 1 The next buffer descriptor is found at the location defined in ETDSR.
Offset + 0	12 TO2	Transmit software ownership. This field is reserved for use by software. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 0	11 L	Last in frame. Written by user. 0 The buffer is not the last in the transmit frame 1 The buffer is the last in the transmit frame

Table continues on the next page...

Table 11-80. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
Offset + 0	10 TC	Transmit CRC. Written by user, and valid only when L is set. 0 End transmission immediately after the last data byte 1 Transmit the CRC sequence after the last data byte This field is valid only when the L field is set.
Offset + 0	9 ABC	Append bad CRC. **Note:** This field is not supported by the uDMA and is ignored.
Offset + 0	8–0	Reserved, must be cleared.
Offset + 2	15–0 Data Length	Data length, written by user. Data length is the number of octets the MAC should transmit from this BD's data buffer. It is never modified by the MAC.
Offset + 4	15–0 Data buffer pointer high	Tx data buffer pointer, high halfword. The buffer must reside in memory external to the MAC. This value is never modified by the Ethernet controller. **NOTE:** For optimal performance, make the transmit buffer pointer evenly divisible by 64.
Offset + 6	15–0 Data buffer pointer low	Tx data buffer pointer, low halfword
Offset + 8	15	Reserved, must be cleared.
Offset + 8	14 INT	Generate interrupt flags. This field is written by the user. This field is valid regardless of the L field and must be the same for all EBD for a given frame. The uDMA does not update this value.
Offset + 8	13 TS	Timestamp. This field is written by the user. This indicates that the uDMA is to generate a timestamp frame to the MAC. This field is valid regardless of the L field and must be the same for all EBD for the given frame. The uDMA does not update this value.
Offset + 8	12 PINS	Insert protocol specific checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the protocol checksum and overwrites the corresponding checksum field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + 8	11 IINS	Insert IP header checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the IP header checksum and overwrites the corresponding header field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + 8	10-9	Reserved, must be cleared.
Offset + 8	8 UTLT	Use transmit launch time. If set to 1, TLT high and low values are used to determine if the frame can be transmitted. This field must only be set in the *first* BD of a frame. TLT is always used in combination with either the round-robin scheme or the credit-based shaper. TLT can be used with single a BD queue. However, at least one DMA class, DMA*n*CFG[DMA_CLASS_ EN] must be enabled. For example, to use TLT with only queue 0, enable one of the DMA*n*CFG[DMA_CLASS_EN] fields and clear both TDAR1 and TDAR2. Although this enables multi-queue, only the single queue 0 is used.

Table continues on the next page...

Table 11-80. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
Offset + 8	7–4 FTYPE	Type of frame to be transmitted. If a credit-based scheme is used, this field must match the BD ring queue. 0x0 – Non-AVB. Corresponds to ENET_TDSR. 0x1 – AVB Class A. Corresponds to ENET_TDSR1. 0x2 – AVB Class B. Corresponds to ENET_TDSR2. All other values are reserved.
Offset + 8	3–0	Reserved, must be cleared.
Offset + A	15 TXE	Transmit error occurred. This field is written by the uDMA. This field indicates that there was a transmit error of some sort reported with the frame. Effectively this field is an OR of the other error fields including UE, EE, FE, LCE, OE, and TSE. This field is valid only when the L field is set.
Offset + A	14	Reserved, must be cleared.
Offset + A	13 UE	Underflow error. This field is written by the uDMA. This field indicates that the MAC reported an underflow error on transmit. This field is valid only when the L field is set.
Offset + A	12 EE	Excess Collision error. This field is written by the uDMA. This field indicates that the MAC reported an excess collision error on transmit. This field is valid only when the L field is set.
Offset + A	11 FE	Frame with error. This field is written by the uDMA. This field indicates that the MAC reported that the uDMA reported an error when providing the packet. This field is valid only when the L field is set.
Offset + A	10 LCE	Late collision error. This field is written by the uDMA. This field indicates that the MAC reported that there was a Late Collision on transmit. This field is valid only when the L field is set.
Offset + A	9 OE	Overflow error. This field is written by the uDMA. This field indicates that the MAC reported that there was a FIFO overflow condition on transmit. This field is only valid when the L field is set.
Offset + A	8 TSE	Timestamp error. This field is written by the uDMA. This field indicates that the MAC reported a different frame type then a timestamp frame. This field is valid only when the L field is set.
Offset + A	7–0	Reserved, must be cleared.
Offset + C	15–0 TLT high	Transmit launch time high. Specifies when frame can by transmitted.
Offset + E	15–0 TLT low	Transmit launch time low. Specifies when frame can by transmitted.
Offset + 10	15 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 10	14–0	Reserved, must be cleared.
Offset + 12	15–0	Reserved, must be cleared.
Offset + 14	15–0 1588 timestamp	This value is written by the uDMA . It is valid only when the L field is set.
Offset + 16		
Offset + 18–Offset + 1E	15–0	Reserved, must be cleared.

11.5.5.15 Client FIFO application interface

The FIFO interface is completely asynchronous from the Ethernet line, and the transmit and receive interface can operate at a different clock rate.

All transfers to/from the user application are handled independently of the core operation, and the core provides a simple interface to user applications based on a two-signal handshake.

11.5.5.15.1 Data structure description

The data structure defined in the following tables for the FIFO interface must be respected to ensure proper data transmission on the Ethernet line. Byte 0 is sent to and received from the line first.

Table 11-81. FIFO interface data structure

	63 56	55 48	47 40	39 32	31 24	23 16	15 8	7 0
Word 0	Byte 7	Byte 6	Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0
Word 1	Byte 15	Byte 14	Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8
...	...							

The size of a frame on the FIFO interface may not be a modulo of 64-bit.

The user application may not care about the Ethernet frame formats in full detail. It needs to provide and receive an Ethernet frame with the following structure:

- Ethernet MAC destination address
- Ethernet MAC source address
- Optional 802.1q VLAN tag (VLAN type and info field)
- Ethernet length/type field
- Payload

Frames on the FIFO interface do not contain preamble and SFD fields, which are inserted and discarded by the MAC on transmit and receive, respectively.

- On receive, CRC and frame padding can be stripped or passed through transparently.
- On transmit, padding and CRC can be provided by the user application, or appended automatically by the MAC independently for each frame. No size restrictions apply.

Note

On transmit, if ENET*n*_TCR[ADDINS] is set, bytes 6–11 of each frame can be set to any value, since the MAC overwrites the bytes with the MAC address programmed in the ENET*n*_PAUR and ENET*n*_PALR registers.

Table 11-82. FIFO interface frame format

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–13	Length/type field
14–N	Payload data

VLAN-tagged frames are supported on both transmit and receive, and implement additional information (VLAN type and info).

Table 11-83. FIFO interface VLAN frame format

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–15	VLAN tag and info
16–17	Length/type field
18–N	Payload data

Note

The standard defines that the LSB of the MAC address is sent/received first, while for all the other header fields — in other words, length/type, VLAN tag, VLAN info, and pause quanta — the MSB is sent/received first.

11.5.5.15.2 Data structure examples

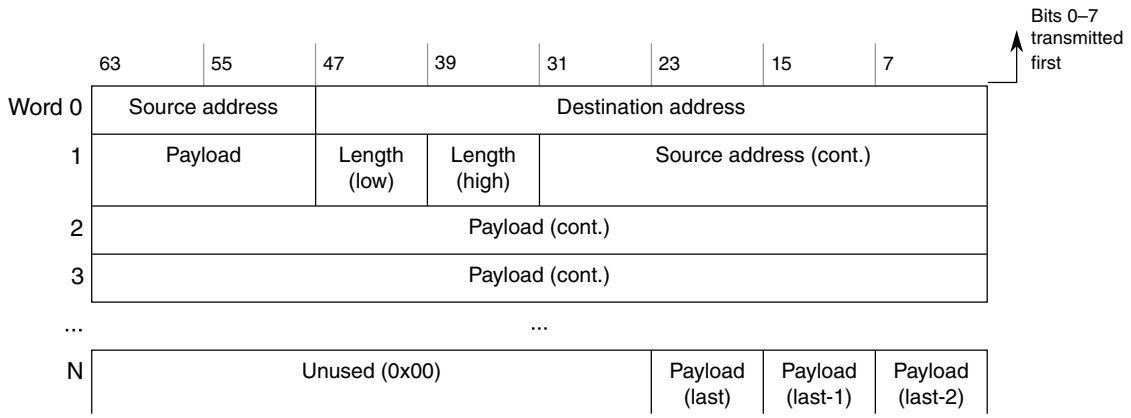

Figure 11-94. Normal Ethernet frame 64-bit mapping example

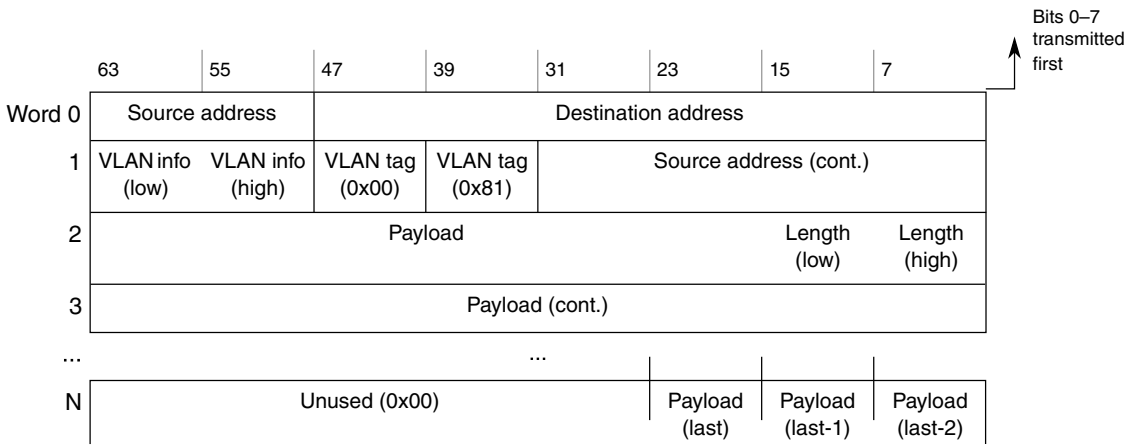

Figure 11-95. VLAN-tagged frame 64-bit mapping example

If CRC forwarding is enabled (CRCFWD = 0), the last four valid octets of the frame contain the FCS field. The non-significant bytes of the last word can have any value.

11.5.5.15.3 Frame status

A MAC layer status word and an accelerator status word is available in the receive buffer descriptor.

See Enhanced buffer descriptors for details.

The status is available with each frame with the last data of the frame.

If the frame status contains a MAC layer error (for example, CRC or length error), RxBD[ME] is also set with the last data of the frame.

11.5.5.16 FIFO protection

The following sections describe the FIFO protection mechanisms.

11.5.5.16.1 Transmit FIFO underflow

During a frame transfer, when the transmit FIFO reaches the almost empty threshold with no end-of-frame indication stored in the FIFO, the MAC logic:

- Stops reading data from the FIFO
- Asserts the MII error signal (MII_TXER) (1 in Figure 11-96) to indicate that the fragment already transferred is not valid
- Deasserts the MII transmit enable signal (MII_TXEN) to terminate the frame transfer (2)

After an underflow, when the application completes the frame transfer (3), the MAC transmit logic discards any new data available in the FIFO until the end of packet is reached (4) and sets the enhanced TxBD[UE] field.

The MAC starts to transfer data on the MII interface when the application sends a new frame with a start of frame indication (5).

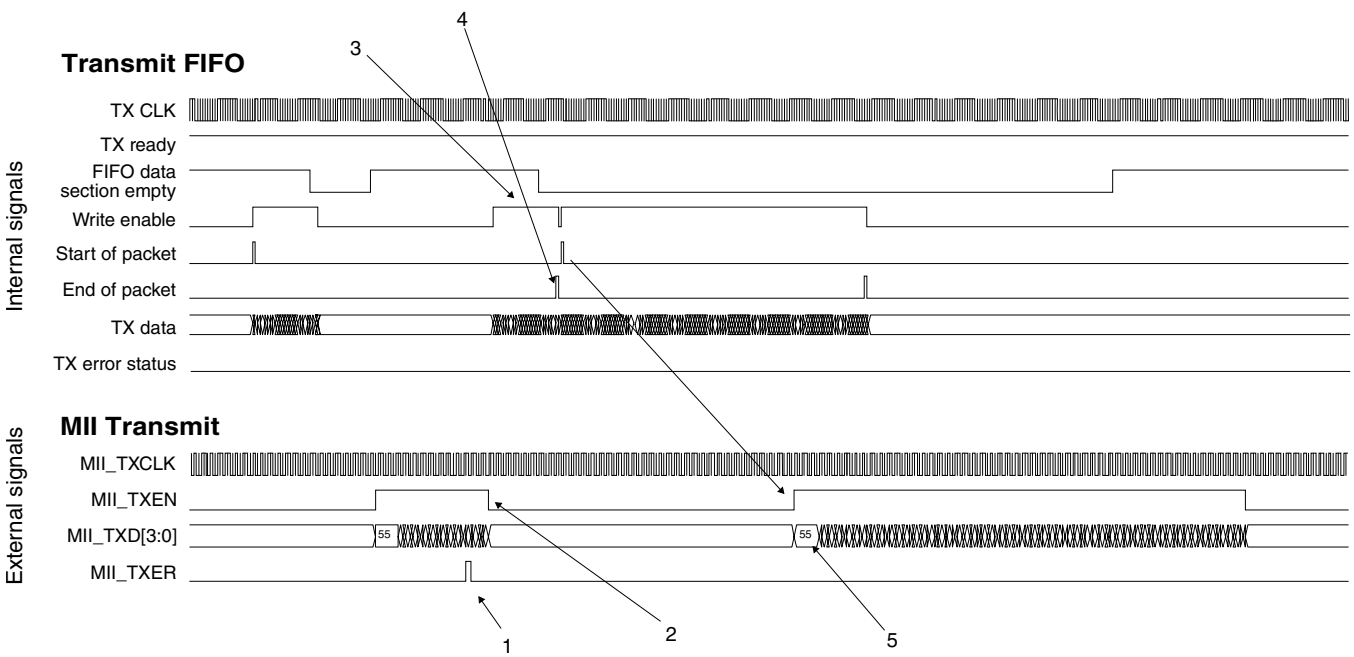

Figure 11-96. Transmit FIFO underflow protection

11.5.5.16.2 Transmit FIFO overflow

On the transmit path, when the FIFO reaches the programmable almost full threshold, the internal MAC ready signal is deasserted. The application should stop sending new data.

However, if the application keeps sending data, the transmit FIFO overflows, corrupting contents that were previously stored. The core logic sets the enhanced TxBD[OE] field for the next frame transmitted to indicate this overflow occurence.

Note

Overflow is a fatal error and must be addressed by resetting the core or clearing ENET*n*_ECR[ETHER_EN], to clear the FIFOs and prepare for normal operation again.

11.5.5.16.3 Receive FIFO overflow

During a frame reception, if the client application is not able to receive data (1), the MAC receive control truncates the incoming frame when the FIFO reaches the programmable almost-full threshold to avoid an overflow.

The frame is subsequently received on the FIFO interface with an error indication (enhanced RxBD[ME] field set together with receive end-of-packet) (2) with the truncation error status field set (3).

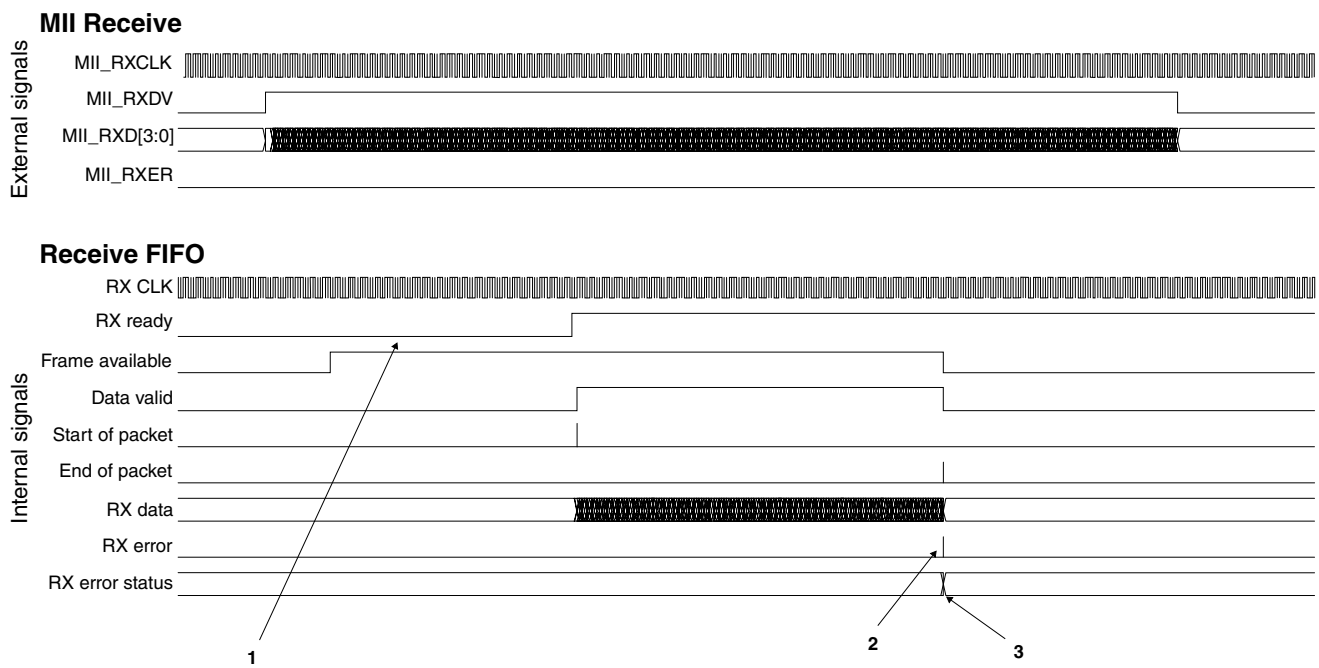

Figure 11-97. Receive FIFO overflow protection

11.5.5.17 PHY management interface

The MDIO interface is a two-wire management interface. The MDIO management interface implements a standardized method to access the PHY device management registers.

The core implements a master MDIO interface, which can be connected to up to 32 PHY devices.

11.5.5.17.1 MDIO clause 22 frame format

The core MDIO master controller communicates with the slave (PHY device) using frames that are defined in the following table.

A complete frame has a length of 64 bits made up of an optional 32-bit preamble, 14-bit command, 2-bit bus direction change, and 16-bit data. Each bit is transferred on the rising edge of the MDIO clock (MDC signal). The MDIO data signal is tri-stated between frames.

The core PHY management interface supports the standard MDIO specification (IEEE 802.3 Clause 22).

Table 11-84. MDIO clause 22 frame structure

ST	OP	PHYADR	REGADR	TA	DATA

Table 11-85. MDIO frame field descriptions

Field	Description
ST (2 bits)	Start indication field, programmed with ENET*n*_MMFR[ST] and equal to 01 for Standard MDIO (Clause 22).
OP (2 bits)	Opcode defines type of operation. Programmed with ENET*n*_MMFR[OP]. 01 Write operation 10 Read operation
PHYADR (5 bits)	Five-bit PHY device address, programmed with ENET*n*_MMFR[PA]. Up to 32 devices can be addressed.
REGADR (5 bits)	Five-bit register address, programmed with ENET*n*_MMFR[RA]. Each PHY can implement up to 32 registers.
TA (2 bits)	Turnaround time, programmed with ENET*n*_MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
Data (16 bits)	Data, set by ENET*n*_MMFR[DATA]. Written to or read from the PHY

11.5.5.17.2 MDIO clause 45 frame format

The extended MDIO frame structure defined in IEEE 802.3 Clause 45 introduces indirect addressing. First, a write transaction to an address register is done, followed by a write or read transaction which will put the 16-bit data in the register or retrieve the register contents respectively. A preamble of 32 bits of logical ones is sent prior to every transaction. The MDIO data signal is tri-stated between frames.

The extended MDIO defines four transactions, which are determined by the two-bit opcode field.

Table 11-86. MDIO clause 45 frame structure

ST	OP	PRTAD	DEVAD	TA	ADDR/DATA

All bits are transmitted from left to right (Preamble bits first) and all fields have their Most-Significant bit sent first (leftmost in above table). The complete frame has a length of 64 bits (32-bit preamble, 14-bit command, 2-bit bus direction change, 16-bit data). Each bit is transferred with the rising edge of the MDIO clock (MDC).

The fields and transactions are summarized in the following tables.

Table 11-87. MDIO clause 45 frame field descriptions

Field	Description
ST	Start indication. Indicates the end of the preamble and start of the frame. This value is 00 for extended MDIO (Clause 45) frames.
OP	Opcode defines if a read or write operation is performed and is programmed with ENET*n*_MMFR[OP]. See Table 11-88 for more information. 00 Address write 01 Write operation 10 Read inc. operation 11 Read operation
PRTAD	The port address specifies a MDIO port. Each Port can have up to 32 devices which each can have a separate set of registers.
DEVAD	Device address. Up to 32 devices can be addressed (within a port).
TA	Turnaround time, programmed with ENET*n*_MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
ADDR/DATA	16-bit address (for address write) or data, set by ENET*n*_MMFR[DATA], written to or read from the PHY.

Table 11-88. MDIO Clause 45 Transactions

Transaction Type	Description
Address	A write transaction to the internal address register of the device/port. The data section of the frame contains the value to be stored in the device's internal address "pointer" register for further transactions.
Write	Data write to a register. The 16 bit data will be written to the register identified by the device-internal address.
Read	Data is read from the register identified by the device-internal address.
Read inc.	Read with address postincrement. The register identified by the device-internal address is read. After this, the device-internal address is incremented. If the address register is all '1' (0xFFFF) no increment is done (i.e. increment does not wrap around).

11.5.5.17.3 MDIO clock generation

The MDC clock is generated from the internal bus clock (i.e., IPS bus clock) divided by the value programmed in ENET*n*_MSCR[MII_SPEED].

11.5.5.17.4 MDIO operation

To perform an MDIO access, set the MDIO command register (ENET*n*_MMFR) according to the description provided in MII Management Frame Register (ENETn_MMFR).

To check when the programmed access completes, read the ENET*n*_EIR[MII] field.

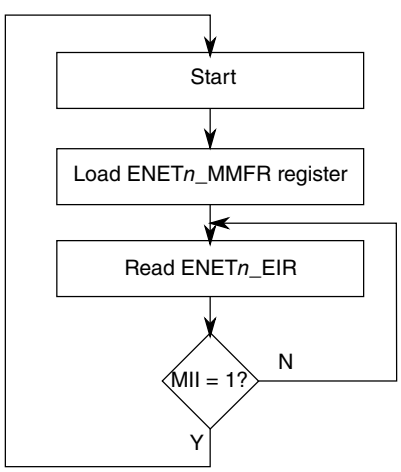

Figure 11-98. MDIO access overview

11.5.5.18 Ethernet interfaces

The following Ethernet interfaces are implemented:

- Fast Ethernet MII (Media Independent Interface)
- RMII 10/100 using interface converters/gaskets
- RGMII 10/100/1000 by way of interface converters/gaskets

The following table shows how to configure ENET registers to select each interface.

Mode	ECR[SPEED]	RCR[RMII_10T]	RCR[RMII_MODE]	RCR[RGMII_EN]
MII - 10 Mbit/s	0	—	0	0
MII - 100 Mbit/s	0	—	0	0
RMII - 10 Mbit/s	0	1	1	0
RMII - 100 Mbit/s	0	0	1	0
RGMII - 10 Mbit/s	0	1	0	1
RGMII - 100 Mbit/s	0	0	0	1
RGMII - 1000 Mbit/s	1	—	0	1

11.5.5.18.1 RMII interface

In RMII receive mode, for normal reception following assertion of CRS_DV, RXD[1:0] is 00 until the receiver determines that the receive event has a proper start-of-stream delimiter (SSD).

The preamble appears (RXD[1:0]=01) and the MACs begin capturing data following detection of SFD.

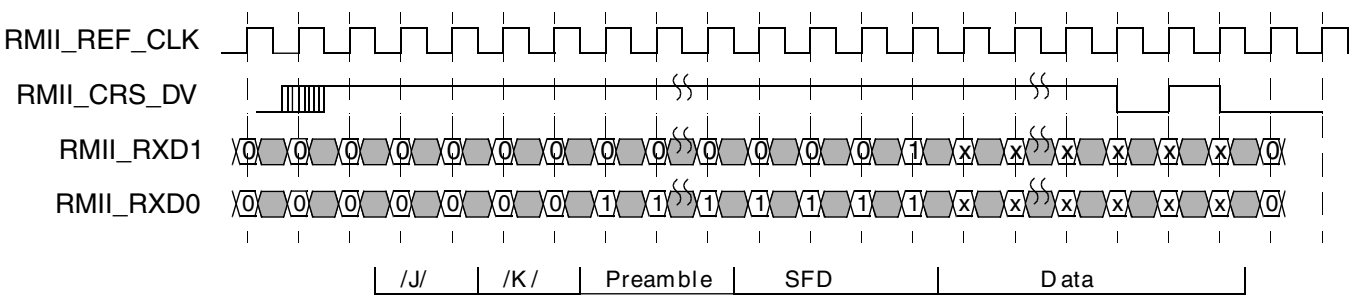

Figure 11-99. RMII receive operation

If a false carrier is detected (bad SSD), then RXD[1:0] is 10 until the end of the receive event. This is a unique pattern since a false carrier can only occur at the beginning of a packet where the preamble is decoded (RXD[1:0] = 01).

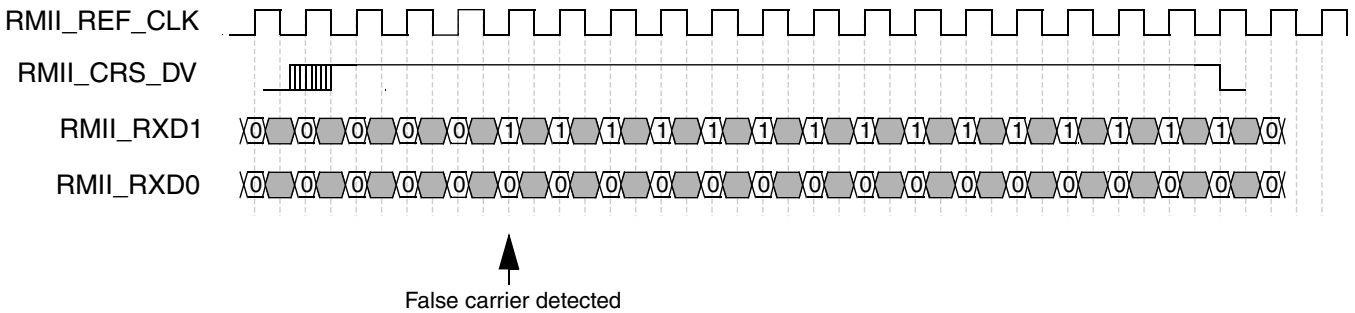

Figure 11-100. RMII receive operation with false carrier

In RMII transmit mode, TXD[1:0] provides valid data for each REF_CLK period while TXEN is asserted.

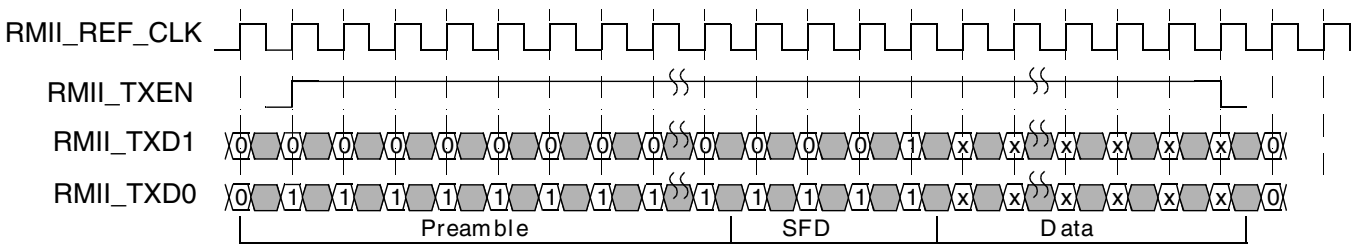

Figure 11-101. RMII transmit operation

11.5.5.18.2 RGMII interface

In RGMII modes, the data and control information is multiplexed by taking advantage of both edges of the reference clocks.

The data signals contain the lower four data bits on the rising edge and the upper four bits on the falling edge. The control signals are multiplexed into a single clock cycle using the same technique.

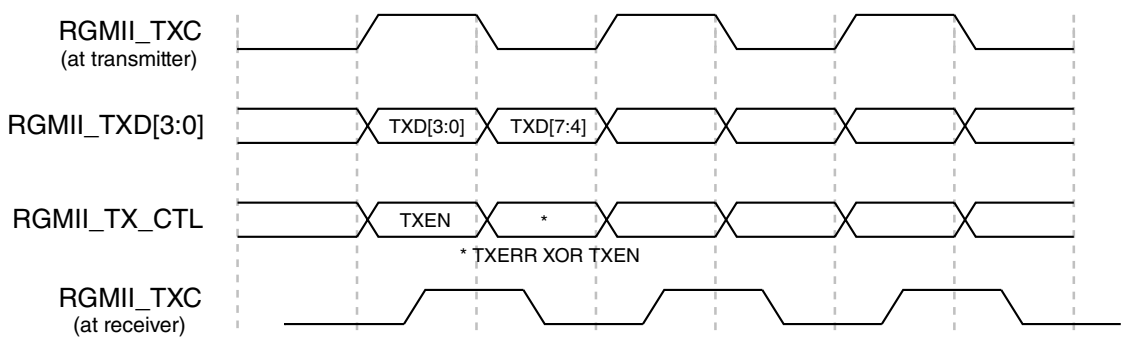

Figure 11-102. RGMII transmit operation

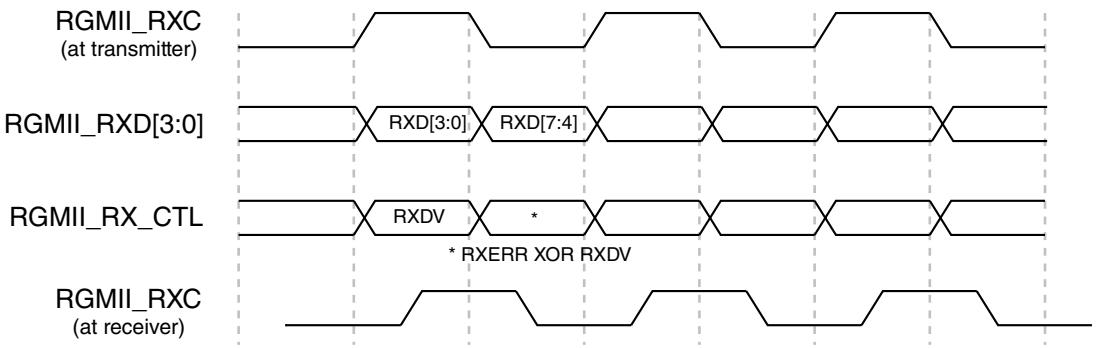

Figure 11-103. RGMII receive operation

11.5.5.18.3 MII Interface — transmit

On transmit, all data transfers are synchronous to MII_TXCLK rising edge. The MII data enable signal MII_TXEN is asserted to indicate the start of a new frame, and remains asserted until the last byte of the frame is present on the MII_TXD[3:0] bus.

Between frames, MII_TXEN remains deasserted.

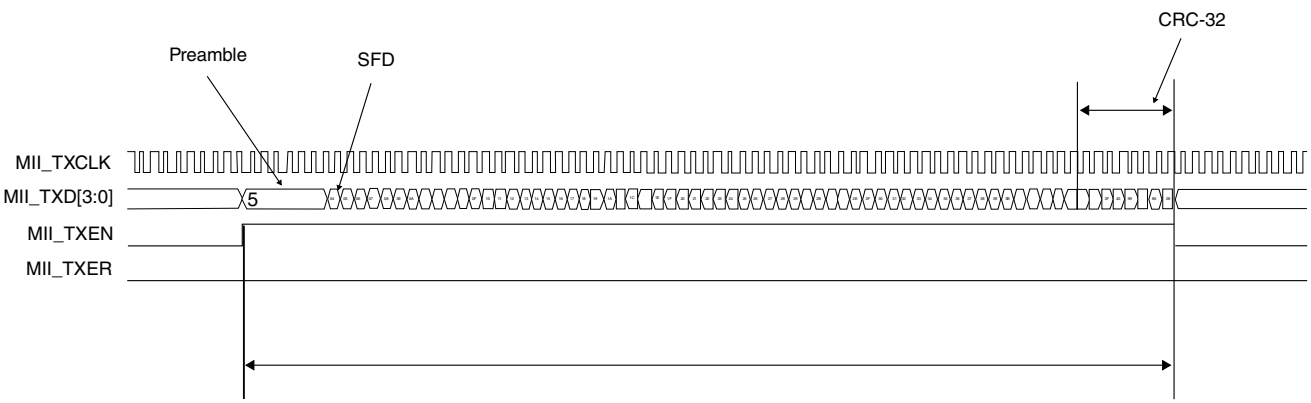

Figure 11-104. MII transmit operation

If a frame is received on the FIFO interface with an error (for example, RxBD[ME] set) the frame is subsequently transmitted with the MII_TXER error signal for one clock cycle at any time during the packet transfer.

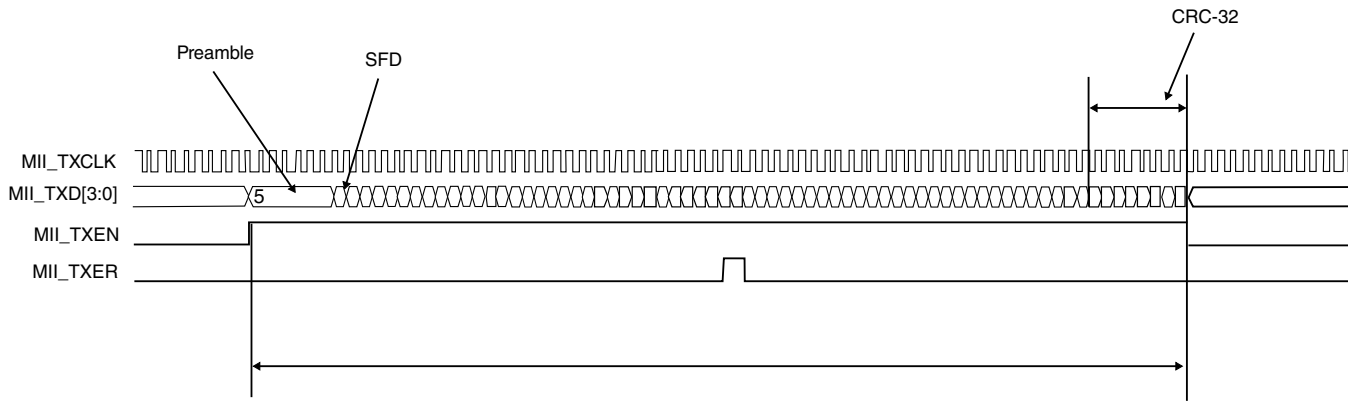

Figure 11-105. MII transmit operation — errored frame

11.5.5.18.3.1 Transmit with collision — half-duplex

When a collision is detected during a frame transmission (MII_COL asserted), the MAC stops the current transmission, sends a 32-bit jam pattern, and re-transmits the current frame.

(See Collision detection in half-duplex mode for details)

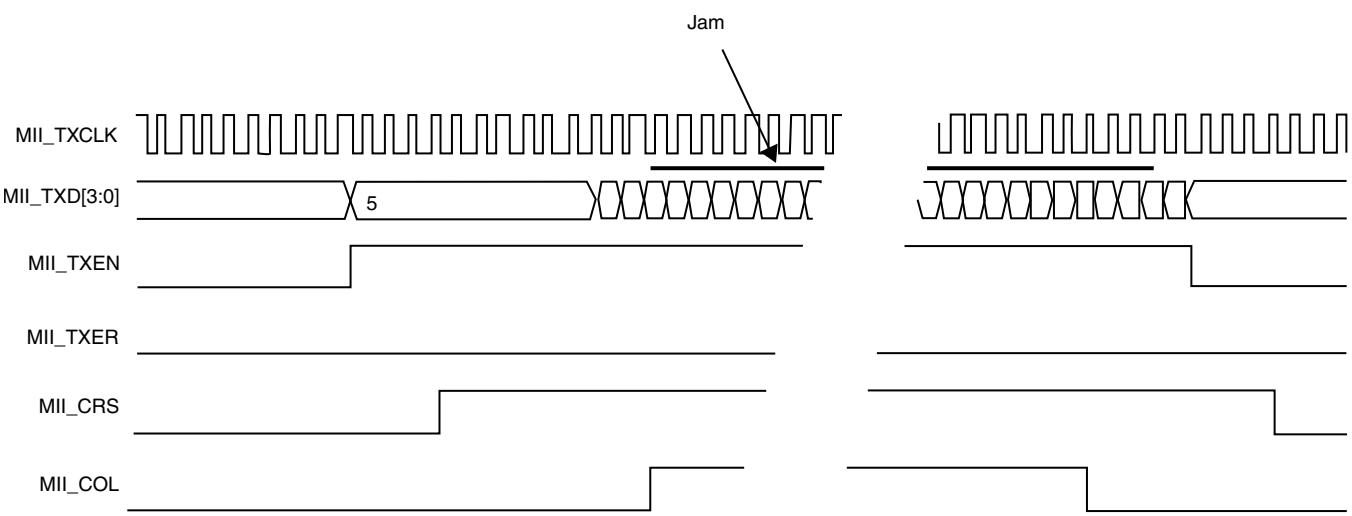

Figure 11-106. MII transmit operation — transmission with collision

11.5.5.18.4 MII interface — receive

On receive, all signals are sampled on the MII_RXCLK rising edge. The MII data enable signal, MII_RXDV, is asserted by the PHY to indicate the start of a new frame and remains asserted until the last byte of the frame is present on MII_RXD[3:0] bus.

Between frames, MII_RXDV remains deasserted.

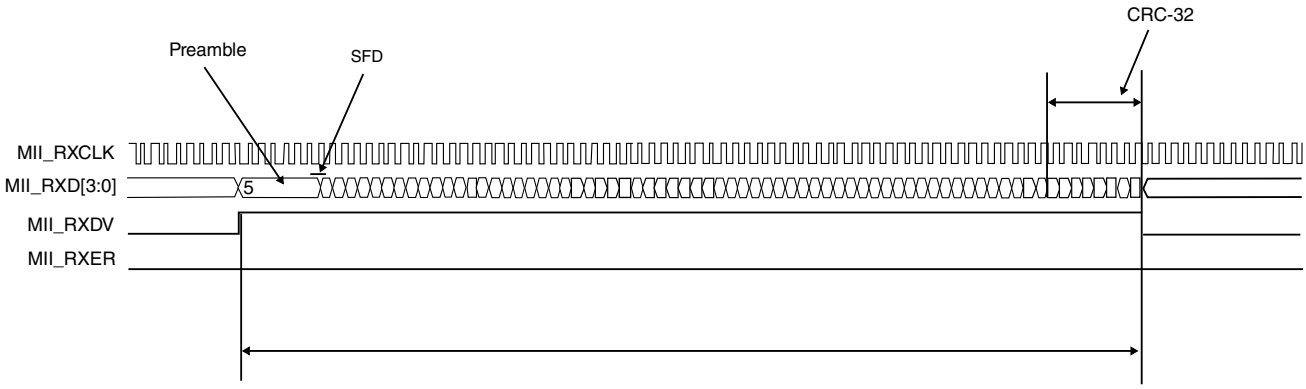

Figure 11-107. MII receive operation

If the PHY detects an error on the frame received from the line, the PHY asserts the MII error signal, MII_RXER, for at least one clock cycle at any time during the packet transfer.

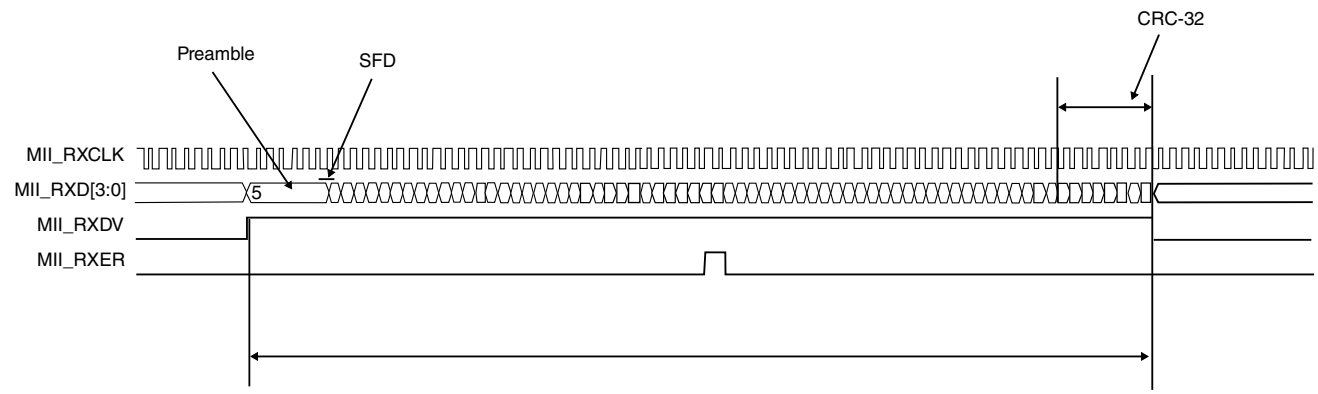

Figure 11-108. MII receive operation — errored frame

A frame received on the MII interface with a PHY error indication is subsequently transferred on the FIFO interface with RxBD[ME] set.

11.5.5.19 AVB configuration

The following steps give an example of how to initialize the ENET module for AVB.

1. Set up ENET_QOS:
   - Set TX_SCHEME to 000b, credit-based scheme.
   - Set RX_FLUSH0 to 1, enable RX flush for ring 0.
2. Set up TX BD ring and RX BD ring for each queue, 0-2.
   - Program ENET_MRBR, ENET_TDSR, and ENET_RDSR.
   - Program ENET_MRBR1, ENET_TDSR1, and ENET_RDSR1.

- Program ENET_MRBR2, ENET_TDSR2, and ENET_RDSR2.
- Program each TX and RX BD ring queue for all classes used in memory.

NOTE

If using credit-based scheme, ensure that enhanced transmit buffer descriptor FTYPE field matches BD ring queue, for example:
- FTYPE = 0h corresponds to ENET_TDSR
- FTYPE = 1h corresponds to ENET_TDSR1
- FTYPE = 2h corresponds to ENET_TDSR2

3. Program ENET_DMA1CFG and ENET_DMA2CFG for class 1 and class 2 corresponding to BD ring queue 1 and 2. DMA_CLASS_EN must be set to one for that class to be enabled. See DMA Class Based Configuration (ENET_DMA*n*CFG) for information on how to program IDLE_SLOPE.
4. Program ENET_RCMR1 and ENET_RCMR2 for class 1 and class 2 matching for receive.

NOTE

Even if a match occurs, if ENET_DMA*n*CFG[DMA_CLASS_EN] is zero for the corresponding class, the RX frame will be automatically forwarded to BD ring queue 0.

5. Program the other ENET registers according to application requirements.
6. Program ENET_RDAR, ENET_RDAR1, ENET_RDAR2, ENET_TDAR, ENET_TDAR1, and ENET_TDAR2 to 0100_0000h according to the classes used.
7. Set ENET_ECR[ETHEREN] to one.

11.5.5.20 Interrupt coalescence

The purpose of the interrupt coalescing is to reduce the number of interrupts generated by the MAC so as to reduce the CPU loading.

To facilitate this interrupt coalescing for each queue, these registers are available with the same control and configuration fields.

- Transmit Interrupt Coalescing Register (ENET_TXIC*n*) where n=0,1,2 for queue/class 0,1,2.
- Receive Interrupt Coalescing Register (ENET_RXIC*n*) where n=0,1,2 for queue/class 0,1,2.

When coalescing is enabled by asserting the corresponding ICEN field and such interrupt is also enabled by the corresponding interrupt mask of the EIMR register, the MAC generates an interrupt when the threshold number of frames is reached (defined by ICFT) or when the threshold timer expires (defined by ICTT).

When coalescing is disabled by de-asserting ICEN, but interrupt is enabled by the corresponding interrupt mask of the EIMR register, the MAC generates an interrupt as they are received without using coalescing. Interrupt coalescing is done for each transmit and receive queue/class independently.

11.5.5.20.1 Interrupt coalescence setup

Interrupt coalescence supports both legacy and enhanced BDs. The following guidelines are recommended when setting up interrupt coalescence.

- When the MAC is configured for enhanced (IEEE 1588) mode, that is, enhanced BDs:
  - Set the INT bit in the enhanced received buffer descriptor to one.
  - Set the INT bit in the enhanced transmit buffer descriptor(s) to one.
- Clear the RXB, RXB1, and RXB2 fields in the EIMR register.
- Clear the TXB, TXB1, and TXB2 fields in the EIMR register.

11.5.5.20.2 Updating the frame count threshold on-the-fly

To update the ICFT field in the RXIC*n* and TXIC*n* registers:

1. Disable interrupt coalescence by clearing the appropriate ICEN field. This will allow the internal interrupt coalescence counter to reset to zero.

NOTE

When disabling interrupt coalescence, if an interrupt event is pending, that is, the interrupt counter is not zero, then an interrupt will occur.

2. Write the new threshold value to the ICFT field.
3. Set ICEN to one.

NOTE

The ICFT field can be updated on-the-fly without disabling the ICEN field. The hardware interrupt will continue and there is a possibility that an interrupt will occur depending on the state of the hardware counter and the previous ICFT value.

11.5.5.20.3 Updating the timer threshold on-the-fly

To update the ICTT field in the RXIC*n* and TXIC*n* registers:

1. Disable interrupt coalescence by clearing the appropriate ICEN field. This will allow the internal interrupt coalescence counter to reset to zero.

NOTE

When disabling interrupt coalescence, if an interrupt event is pending, that is, the interrupt counter is not zero, then an interrupt will occur.

2. Write the new timer value to the ICTT field.
3. Set ICEN to one.

11.5.6 Memory map/register definition

ENET registers must be read or written with 32-bit accesses. Non-32 bit accesses will terminate with an error.

Reserved bits should be written with 0 and ignored on read. Unused registers read zero and a write has no effect.

This table shows Ethernet registers organization.

Table 11-89. Register map summary

Offset Address	Section	Description
0x0000 – 0x01FF	Configuration	Core control and status registers
0x0200 – 0x03FF	Statistics counters	MIB and Remote Network Monitoring (RFC 2819) registers
0x0400 – 0x0430	1588 control	1588 adjustable timer (TSM) and 1588 frame control
0x0600 – 0x07FC	Capture/Compare block	Registers for the Capture/Compare block

11.5.6.1 Interrupt Event Register (ENET_EIR)

When an event occurs that sets a bit in EIR, an interrupt occurs if the corresponding bit in the interrupt mask register (EIMR) is also set. Writing a 1 to an EIR bit clears it; writing 0 has no effect. This register is cleared upon hardware reset.

NOTE

TxBD[INT] and RxBD[INT] must be set to 1 to allow setting the corresponding EIR register flags in enhanced mode, ENET_ECR[EN1588] = 1. Legacy mode does not require these flags to be enabled.

Address: 30BE_0000h base + 4h offset = 30BE_0004h

ENET_EIR field descriptions

Field	Description
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
30 BABR	Babbling Receive Error Indicates a frame was received with length in excess of RCR[MAX_FL] bytes.
29 BABT	Babbling Transmit Error Indicates the transmitted frame length exceeds RCR[MAX_FL] bytes. Usually this condition is caused when a frame that is too long is placed into the transmit data buffer(s). Truncation does not occur.
28 GRA	Graceful Stop Complete This interrupt is asserted after the transmitter is put into a pause state after completion of the frame currently being transmitted. See Graceful Transmit Stop (GTS) for conditions that lead to graceful stop. **NOTE:** The GRA interrupt is asserted only when the TX transitions into the stopped state. If this bit is cleared by writing 1 and the TX is still stopped, the bit is not set again.
27 TXF	Transmit Frame Interrupt Indicates a frame has been transmitted and the last corresponding buffer descriptor has been updated.
26 TXB	Transmit Buffer Interrupt Indicates a transmit buffer descriptor has been updated.
25 RXF	Receive Frame Interrupt Indicates a frame has been received and the last corresponding buffer descriptor has been updated.
24 RXB	Receive Buffer Interrupt Indicates a receive buffer descriptor is not the last in the frame has been updated.
23 MII	MII Interrupt. Indicates that the MII has completed the data transfer requested.
22 EBERR	Ethernet Bus Error Indicates a system bus error occurred when a uDMA transaction is underway. When this bit is set, ECR[ETHEREN] is cleared, halting frame processing by the MAC. When this occurs, software must ensure proper actions, possibly resetting the system, to resume normal operation.

Table continues on the next page...

ENET_EIR field descriptions (continued)

Field	Description
21 LC	Late Collision Indicates a collision occurred beyond the collision window (slot time) in half-duplex mode. The frame truncates with a bad CRC and the remainder of the frame is discarded.
20 RL	Collision Retry Limit Indicates a collision occurred on each of 16 successive attempts to transmit the frame. The frame is discarded without being transmitted and transmission of the next frame commences. This error can only occur in half-duplex mode.
19 UN	Transmit FIFO Underrun Indicates the transmit FIFO became empty before the complete frame was transmitted. **NOTE:** In situations where the device has various masters generating high traffic, a FIFO underrun can occur on the transmit FIFO. To avoid transmit FIFO underrun, store and forward can be enabled in ENET_TFWR[STRFWD]. See STRFWD. Also, a higher priority can be set for ENET traffic using available means on the central bus fabric connecting the ENET module.
18 PLR	Payload Receive Error Indicates a frame was received with a payload length error. See Frame Length/Type Verification: Payload Length Check for more information.
17 WAKEUP	Node Wakeup Request Indication Read-only status bit to indicate that a magic packet has been detected. Will act only if ECR[MAGICEN] is set.
16 TS_AVAIL	Transmit Timestamp Available Indicates that the timestamp of the last transmitted timing frame is available in the ATSTMP register.
15 TS_TIMER	Timestamp Timer The adjustable timer reached the period event. A period event interrupt can be generated if ATCR[PEREN] is set and the timer wraps according to the periodic setting in the ATPER register. Set the timer period value before setting ATCR[PEREN].
14 RXFLUSH_2	RX DMA Ring 2 flush indication. This ring's RX frame has been flushed due to either RDAR2[RDAR] or RxBD[E] being clear and only if QOS[RXFLUSH_2] is enabled.
13 RXFLUSH_1	RX DMA Ring 1 flush indication. This ring's RX frame has been flushed due to either RDAR1[RDAR] or RxBD[E] being clear and only if QOS[RXFLUSH_1] is enabled.
12 RXFLUSH_0	RX DMA Ring 0 flush indication. . This ring's RX frame has been flushed due to either RDAR[RDAR] or RxBD[E] being clear and only if QOS[RXFLUSH_0] is enabled.
11–9 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
8 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
7 TXF2	Transmit frame interrupt, class 2 This bit indicates that a frame has been transmitted and the last corresponding buffer descriptor has been updated (ring/class 2).
6 TXB2	Transmit buffer interrupt, class 2 This field indicates that a transmit buffer descriptor has been updated (ring/class 2).

Table continues on the next page...

ENET_EIR field descriptions (continued)

Field	Description
5 RXF2	Receive frame interrupt, class 2 This field indicates that a frame has been received and the last corresponding buffer descriptor has been updated (ring/class 2).
4 RXB2	Receive buffer interrupt, class 2 This field indicates that a receive buffer descriptor, that not the last in the frame, has been updated (ring/class 2).
3 TXF1	Transmit frame interrupt, class 1 This bit indicates that a frame has been transmitted and the last corresponding buffer descriptor has been updated (ring/class 1).
2 TXB1	Transmit buffer interrupt, class 1 This field indicates that a transmit buffer descriptor has been updated (ring/class 1).
1 RXF1	Receive frame interrupt, class 1 This field indicates that a frame has been received and the last corresponding buffer descriptor has been updated (ring/class 1).
0 RXB1	Receive buffer interrupt, class 1 This field indicates that a receive buffer descriptor, that not the last in the frame, has been updated (ring/class 1).

11.5.6.2 Interrupt Mask Register (ENET_EIMR)

EIMR controls which interrupt events are allowed to generate actual interrupts. A hardware reset clears this register. If the corresponding bits in the EIR and EIMR registers are set, an interrupt is generated. The interrupt signal remains asserted until a 1 is written to the EIR field (write 1 to clear) or a 0 is written to the EIMR field.

Address: 30BE_0000h base + 8h offset = 30BE_0008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ENET_EIMR field descriptions

Field	Description
31 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
30 BABR	BABR Interrupt Mask Corresponds to interrupt source EIR[BABR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
29 BABT	BABT Interrupt Mask Corresponds to interrupt source EIR[BABT] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABT field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
28 GRA	GRA Interrupt Mask Corresponds to interrupt source EIR[GRA] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR GRA field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
27 TXF	TXF Interrupt Mask Corresponds to interrupt source EIR[TXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
26 TXB	TXB Interrupt Mask Corresponds to interrupt source EIR[TXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
25 RXF	RXF Interrupt Mask Corresponds to interrupt source EIR[RXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.

Table continues on the next page...

ENET_EIMR field descriptions (continued)

Field	Description
24 RXB	RXB Interrupt Mask Corresponds to interrupt source EIR[RXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXB field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
23 MII	MII Interrupt Mask Corresponds to interrupt source EIR[MII] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR MII field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
22 EBERR	EBERR Interrupt Mask Corresponds to interrupt source EIR[EBERR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR EBERR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
21 LC	LC Interrupt Mask Corresponds to interrupt source EIR[LC] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR LC field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
20 RL	RL Interrupt Mask Corresponds to interrupt source EIR[RL] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
19 UN	UN Interrupt Mask Corresponds to interrupt source EIR[UN] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR UN field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
18 PLR	PLR Interrupt Mask Corresponds to interrupt source EIR[PLR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR PLR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
17 WAKEUP	WAKEUP Interrupt Mask Corresponds to interrupt source EIR[WAKEUP] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR WAKEUP field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
16 TS_AVAIL	TS_AVAIL Interrupt Mask Corresponds to interrupt source EIR[TS_AVAIL] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting

Table continues on the next page...

ENET_EIMR field descriptions (continued)

Field	Description
	source. The corresponding EIR TS_AVAIL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
15 TS_TIMER	TS_TIMER Interrupt Mask Corresponds to interrupt source EIR[TS_TIMER] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_TIMER field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
14 RXFLUSH_2	Corresponds to interrupt source EIR[RXFLUSH_2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXFLUSH_2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
13 RXFLUSH_1	Corresponds to interrupt source EIR[RXFLUSH_1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXFLUSH_1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
12 RXFLUSH_0	Corresponds to interrupt source EIR[RXFLUSH_0] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXFLUSH_0] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
11–9 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
8 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
7 TXF2	Transmit frame interrupt, class 2 Corresponds to interrupt source EIR[TXF2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[TXF2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
6 TXB2	Transmit buffer interrupt, class 2 Corresponds to interrupt source EIR[TXB2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[TXB2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
5 RXF2	Receive frame interrupt, class 2 Corresponds to interrupt source EIR[RXF2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXF2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
4 RXB2	Receive buffer interrupt, class 2 Corresponds to interrupt source EIR[RXB2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXB2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
3 TXF1	Transmit frame interrupt, class 1 Corresponds to interrupt source EIR[TXF1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[TXF1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
2 TXB1	Transmit buffer interrupt, class 1

Table continues on the next page...

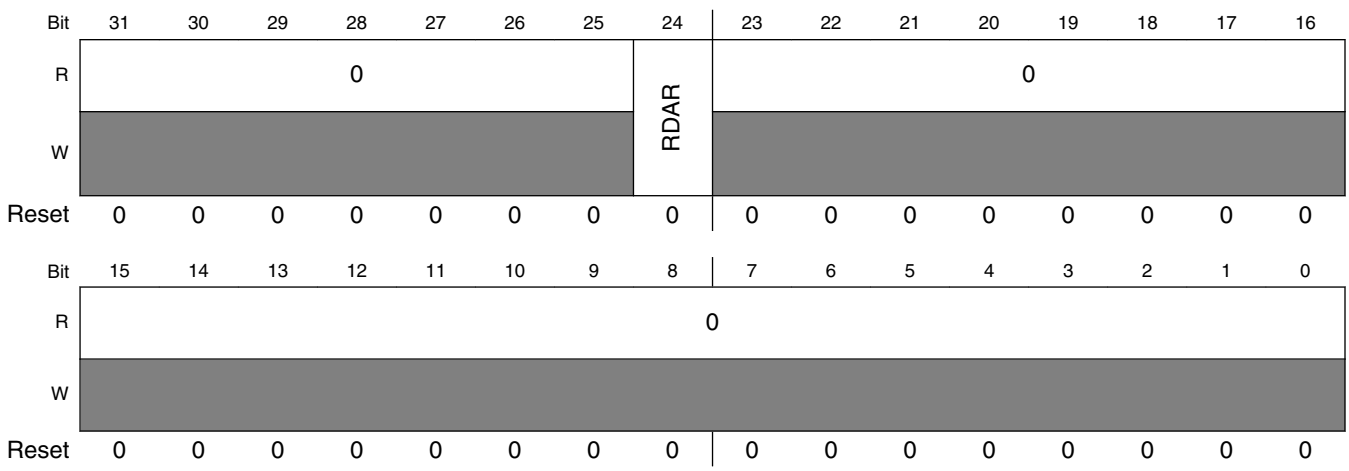
ENET_EIMR field descriptions (continued)

Field	Description
	Corresponds to interrupt source EIR[TXB1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[TXB1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
1 RXF1	Receive frame interrupt, class 1 Corresponds to interrupt source EIR[RXF1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXF1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
0 RXB1	Receive buffer interrupt, class 1 Corresponds to interrupt source EIR[RXB1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXB1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.

11.5.6.3 Receive Descriptor Active Register - Ring 0 (ENET_RDAR)

RDAR is a command register, written by the user, to indicate that the receive descriptor ring 0 has been updated, that is, that the driver produced empty receive buffers with the empty bit set.

Address: 30BE_0000h base + 10h offset = 30BE_0010h



ENET_RDAR field descriptions

Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 RDAR	Receive Descriptor Active

Table continues on the next page...

ENET_RDAR field descriptions (continued)

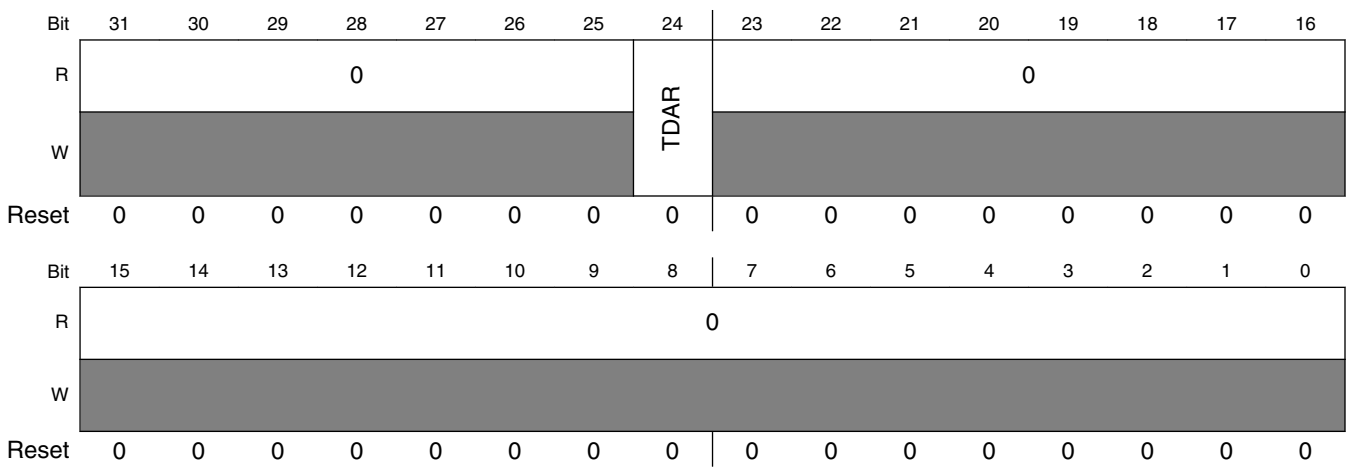
Field	Description
	Always set to 1 when this register is written, regardless of the value written. This field is cleared by the MAC device when no additional empty descriptors remain in the receive ring. It is also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

11.5.6.4 Transmit Descriptor Active Register - Ring 0 (ENET_TDAR)

The TDAR is a command register that the user writes to indicate that the transmit descriptor ring 0 has been updated, that is, that transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor.

The TDAR register is cleared at reset, when ECR[ETHEREN] transitions from set to cleared, or when ECR[RESET] is set.

Address: 30BE_0000h base + 14h offset = 30BE_0014h



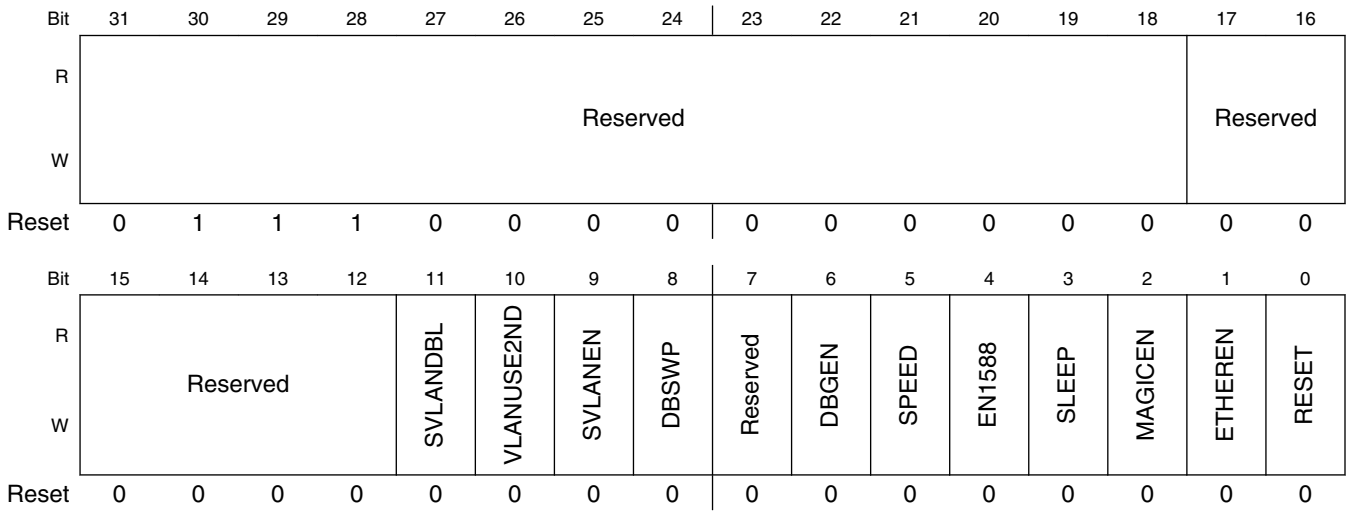
ENET_TDAR field descriptions

Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 TDAR	Transmit Descriptor Active Always set to 1 when this register is written, regardless of the value written. This bit is cleared by the MAC device when no additional ready descriptors remain in the transmit ring. Also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

11.5.6.5 Ethernet Control Register (ENET_ECR)

ECR is a read/write user register, though hardware may also alter fields in this register. It controls many of the high level features of the Ethernet MAC, including legacy FEC support through the EN1588 field.

Address: 30BE_0000h base + 24h offset = 30BE_0024h



ENET_ECR field descriptions

Field	Description
31–18 Reserved	This field is reserved. Always write 01110000000000b to this field.
17–12 Reserved	This field is reserved. Always write 0 to this field.
11 SVLANDBL	S-VLAN double tag If enabled, S-VLAN detection requires a double-tagged frame to define a frame as being a VLAN frame. The following rules apply: • If the first tag is the S-VLAN type, it must be followed by a second tag with the C-VLAN type to declare the frame as VLAN frame. • If the first tag is the S-VLAN type but no 2nd tag follows, it is not considered a VLAN frame but instead treated as an untagged frame. • If the first tag is the C-VLAN type, it is considered a VLAN frame as normal. **NOTE:** VLANUSE2ND can be used to determine from which tag the data should be extracted. This applies only if SVLAN_EN = 1, ignored otherwise.
10 VLANUSE2ND	VLAN use second tag 0 Always extract data from the first VLAN tag if it exists. 1 When a double-tagged frame is detected, the data of the second tag is extracted for further processing. A double-tagged frame is defined as: • The first tag can be a C-VLAN or a S-VLAN (if SVLAN_ENA = 1) • The second tag must be a C-VLAN

Table continues on the next page...

ENET_ECR field descriptions (continued)

Field	Description
9 SVLANEN	S-VLAN enable Enable additional detection of S-VLAN tag according to IEEE802.1Q. 0 Only the EtherType 0x8100 will be considered for VLAN detection. 1 The EtherType 0x88a8 will be considered in addition to 0x8100 (C-VLAN) to identify a VLAN frame in receive. When a VLAN frame is identified, the two bytes following the VLAN type are extracted and used by the classification match comparators, RCMRn.
8 DBSWP	Descriptor Byte Swapping Enable Swaps the byte locations of the buffer descriptors. **NOTE:** This field resets to 0 and must not be changed. 0 The buffer descriptor bytes are not swapped to support big-endian devices. 1 The buffer descriptor bytes are swapped to support little-endian devices.
7 Reserved	This field is reserved. Always write 0 to this field.
6 DBGEN	Debug Enable Enables the MAC to enter hardware freeze mode when the device enters debug mode. 0 MAC continues operation in debug mode. 1 MAC enters hardware freeze mode when the processor is in debug mode.
5 SPEED	Selects between 10/100-Mbit/s and 1000-Mbit/s modes of operation. 0 10/100-Mbit/s mode 1 1000-Mbit/s mode
4 EN1588	EN1588 Enable Enables enhanced functionality of the MAC. 0 Legacy FEC buffer descriptors and functions enabled. 1 Enhanced frame time-stamping functions enabled.
3 SLEEP	Sleep Mode Enable 0 Normal operating mode. 1 Sleep mode.
2 MAGICEN	Magic Packet Detection Enable Enables/disables magic packet detection. **NOTE:** MAGICEN is relevant only if the SLEEP field is set. If MAGICEN is set, changing the SLEEP field enables/disables sleep mode and magic packet detection. **NOTE:** EIMR[WAKEUP] must be written to one if Magic packet wakeup is programed to wake up the chip from low power mode. 0 Magic detection logic disabled. 1 The MAC core detects magic packets and asserts EIR[WAKEUP] when a frame is detected.
1 ETHEREN	Ethernet Enable

Table continues on the next page...

ENET_ECR field descriptions (continued)

Field	Description
	Enables/disables the Ethernet MAC. When the MAC is disabled, the buffer descriptors for an aborted transmit frame are not updated. The uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers. Hardware clears this field under the following conditions: • RESET is set by software • An error condition causes the EBERR field to set. **NOTE:** • ETHEREN must be set at the very last step during ENET configuration/setup/initialization, only *after* all other ENET-related registers have been configured. • If ETHEREN is cleared to 0 by software then next time ETHEREN is set, the EIR interrupts must cleared to 0 due to previous pending interrupts. 0 Reception immediately stops and transmission stops after a bad CRC is appended to any currently transmitted frame. 1 MAC is enabled, and reception and transmission are possible.
0 RESET	Ethernet MAC Reset When this field is set, it clears the ETHEREN field.

11.5.6.6 MII Management Frame Register (ENET_MMFR)

Writing to MMFR triggers a management frame transaction to the PHY device unless MSCR is programmed to zero.

If MSCR is changed from zero to non-zero during a write to MMFR, an MII frame is generated with the data previously written to the MMFR. This allows MMFR and MSCR to be programmed in either order if MSCR is currently zero.

If the MMFR register is written while frame generation is in progress, the frame contents are altered. Software must use the EIR[MII] interrupt indication to avoid writing to the MMFR register while frame generation is in progress.

Address: 30BE_0000h base + 40h offset = 30BE_0040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ENET_MMFR field descriptions

Field	Description
31–30 ST	Start Of Frame Delimiter See Table 11-84 (Clause 22) or Table 11-86 (Clause 45) for correct value.
29–28 OP	Operation Code

Table continues on the next page...

ENET_MMFR field descriptions (continued)

Field	Description
	See Table 11-84 (Clause 22) or Table 11-86 (Clause 45) for correct value.
27–23 PA	PHY Address See Table 11-84 (Clause 22) or Table 11-86 (Clause 45) for correct value.
22–18 RA	Register Address See Table 11-84 (Clause 22) or Table 11-86 (Clause 45) for correct value.
17–16 TA	Turn Around This field must be programmed to 10 to generate a valid MII management frame.
DATA	Management Frame Data This is the field for data to be written to or read from the PHY register.

11.5.6.7 MII Speed Control Register (ENET_MSCR)

MSCR provides control of the MII clock (MDC pin) frequency and allows a preamble drop on the MII management frame.

The MII_SPEED field must be programmed with a value to provide an MDC frequency of less than or equal to 2.5 MHz to be compliant with the IEEE 802.3 MII specification. The MII_SPEED must be set to a non-zero value to source a read or write management frame. After the management frame is complete, the MSCR register may optionally be cleared to turn off MDC. The MDC signal generated has a 50% duty cycle except when MII_SPEED changes during operation. This change takes effect following a rising or falling edge of MDC.

For example, if the internal module clock (that is, peripheral bus clock) is 25 MHz, programming MII_SPEED to 0x4 results in an MDC as given in the following equation:

MII clock frequency = 25 MHz / ((4 + 1) x 2) = 2.5 MHz

The following table shows the optimum values for MII_SPEED as a function of IPS bus clock frequency.

Table 11-90. Programming Examples for MSCR

Internal module clock frequency	MSCR [MII_SPEED]	MDC frequency
25 MHz	0x4	2.50 MHz
33 MHz	0x6	2.36 MHz
40 MHz	0x7	2.50 MHz
50 MHz	0x9	2.50 MHz
66 MHz	0xD	2.36 MHz

Address: 30BE_0000h base + 44h offset = 30BE_0044h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0					HOLDTIME			DIS_ PRE	MII_SPEED						0
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

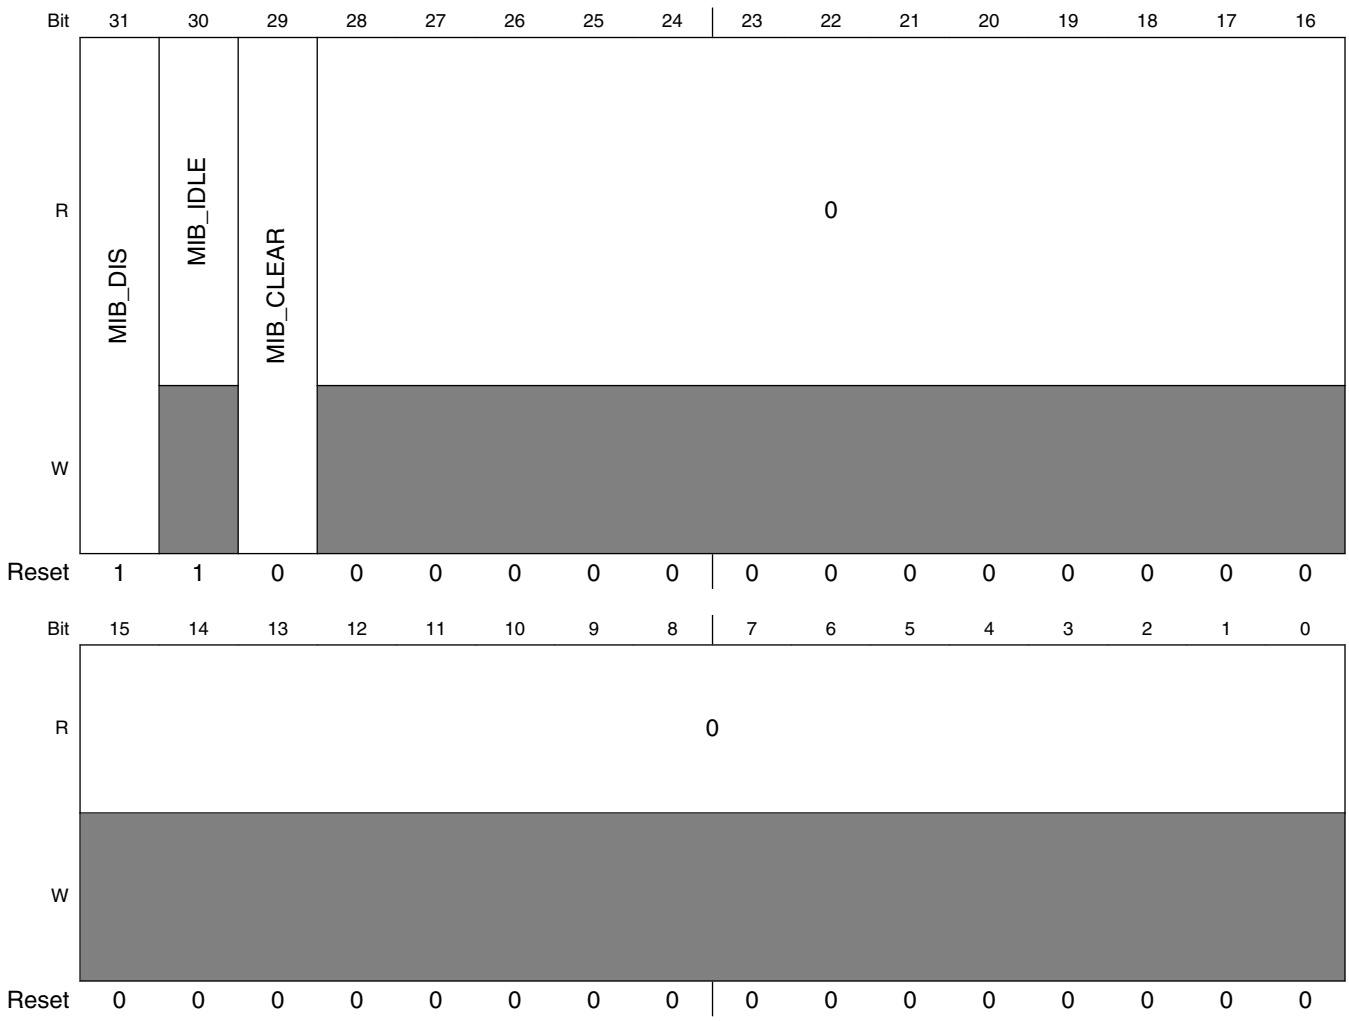
ENET_MSCR field descriptions

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–8 HOLDTIME	Hold time On MDIO Output IEEE802.3 clause 22 defines a minimum of 10 ns for the hold time on the MDIO output. Depending on the host bus frequency, the setting may need to be increased. 000 1 internal module clock cycle 001 2 internal module clock cycles 010 3 internal module clock cycles 111 8 internal module clock cycles
7 DIS_PRE	Disable Preamble Enables/disables prepending a preamble to the MII management frame. The MII standard allows the preamble to be dropped if the attached PHY devices do not require it. 0 Preamble enabled. 1 Preamble (32 ones) is not prepended to the MII management frame.
6–1 MII_SPEED	MII Speed Controls the frequency of the MII management interface clock (MDC) relative to the internal module clock. A value of 0 in this field turns off MDC and leaves it in low voltage state. Any non-zero value results in the MDC frequency of: 1/((MII_SPEED + 1) x 2) of the internal module clock frequency
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

11.5.6.8 MIB Control Register (ENET_MIBC)

MIBC is a read/write register controlling and observing the state of the MIB block. Access this register to disable the MIB block operation or clear the MIB counters. The MIB_DIS field resets to 1.

Address: 30BE_0000h base + 64h offset = 30BE_0064h



ENET_MIBC field descriptions

Field	Description
31 MIB_DIS	Disable MIB Logic If this control field is set, 0 MIB logic is enabled. 1 MIB logic is disabled. The MIB logic halts and does not update any MIB counters.

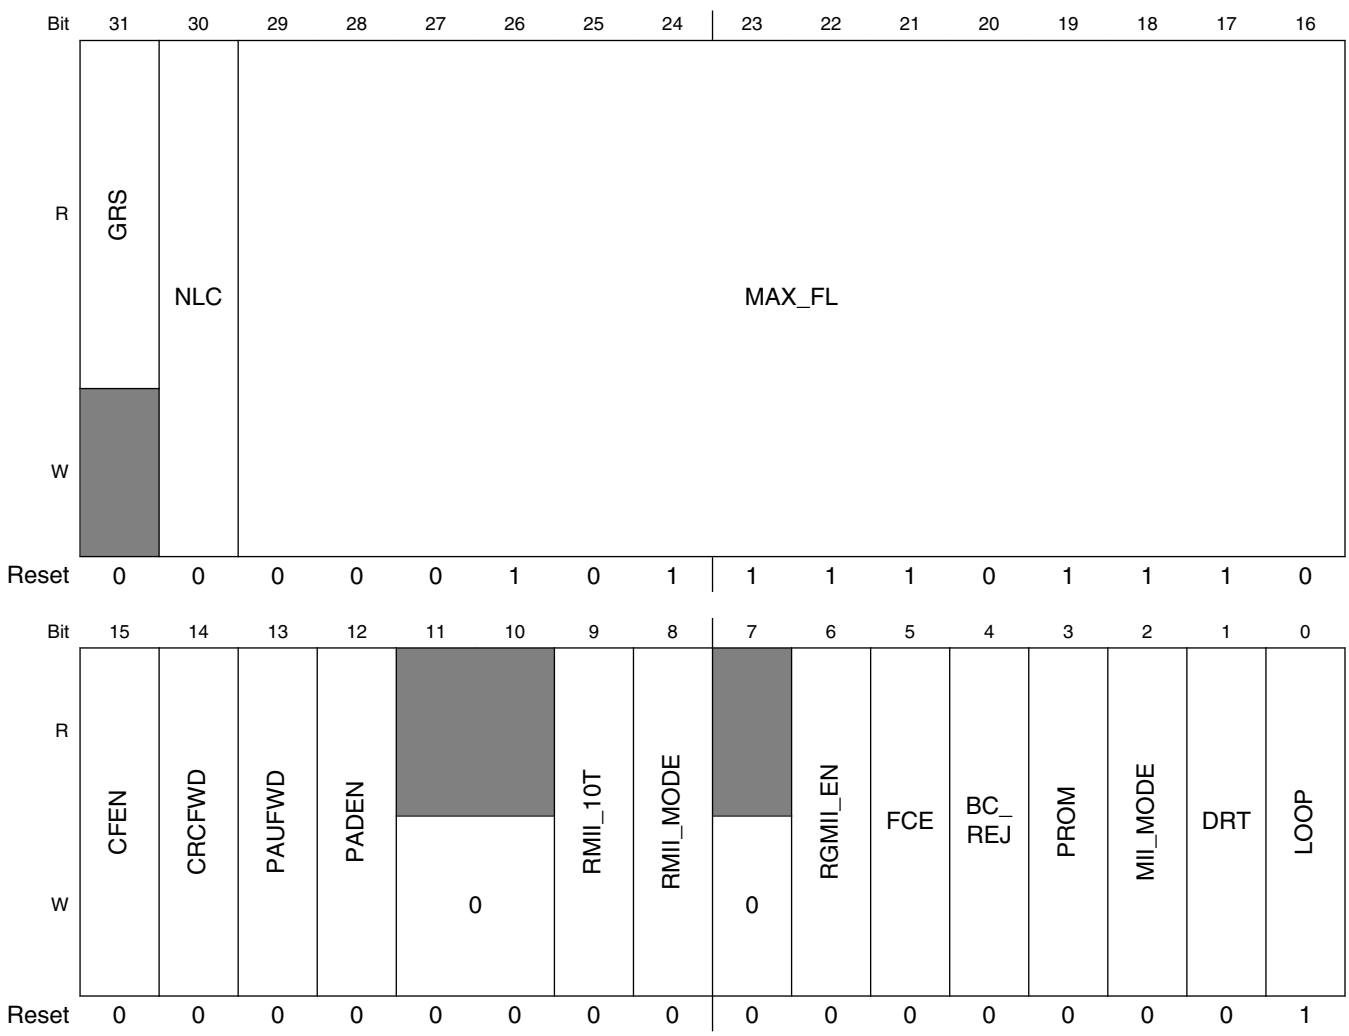
Table continues on the next page...

ENET_MIBC field descriptions (continued)

Field	Description
30 MIB_IDLE	MIB Idle 0 The MIB block is updating MIB counters. 1 The MIB block is not currently updating any MIB counters.
29 MIB_CLEAR	MIB Clear **NOTE:** This field is not self-clearing. To clear the MIB counters set and then clear this field. 0 See note above. 1 All statistics counters are reset to 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

11.5.6.9 Receive Control Register (ENET_RCR)

Address: 30BE_0000h base + 84h offset = 30BE_0084h



ENET_RCR field descriptions

Field	Description
31 GRS	Graceful Receive Stopped Read-only status indicating that the MAC receive datapath is stopped.
30 NLC	Payload Length Check Disable Enables/disables a payload length check. 0 The payload length check is disabled. 1 The core checks the frame's payload length with the frame length/type field. Errors are indicated in the EIR[PLR] field.
29–16 MAX_FL	Maximum Frame Length Resets to decimal 1518. Length is measured starting at DA and includes the CRC at the end of the frame. Transmit frames longer than MAX_FL cause the BABT interrupt to occur. Receive frames longer than MAX_FL cause the BABR interrupt to occur and set the LG field in the end of frame receive buffer descriptor. The recommended default value to be programmed is 1518 or 1522 if VLAN tags are supported.
15 CFEN	MAC Control Frame Enable Enables/disables the MAC control frame. 0 MAC control frames with any opcode other than 0x0001 (pause frame) are accepted and forwarded to the client interface. 1 MAC control frames with any opcode other than 0x0001 (pause frame) are silently discarded.
14 CRCFWD	Terminate/Forward Received CRC Specifies whether the CRC field of received frames is transmitted or stripped. **NOTE:** If padding function is enabled (PADEN = 1), CRCFWD is ignored and the CRC field is checked and always terminated and removed. 0 The CRC field of received frames is transmitted to the user application. 1 The CRC field is stripped from the frame.
13 PAUFWD	Terminate/Forward Pause Frames Specifies whether pause frames are terminated or forwarded. 0 Pause frames are terminated and discarded in the MAC. 1 Pause frames are forwarded to the user application.
12 PADEN	Enable Frame Padding Remove On Receive Specifies whether the MAC removes padding from received frames. 0 No padding is removed on receive by the MAC. 1 Padding is removed from received frames.
11–10 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
9 RMII_10T	Enables 10-Mbit/s mode of the RMII or RGMII . 0 100-Mbit/s operation. 1 10-Mbit/s operation.

Table continues on the next page...

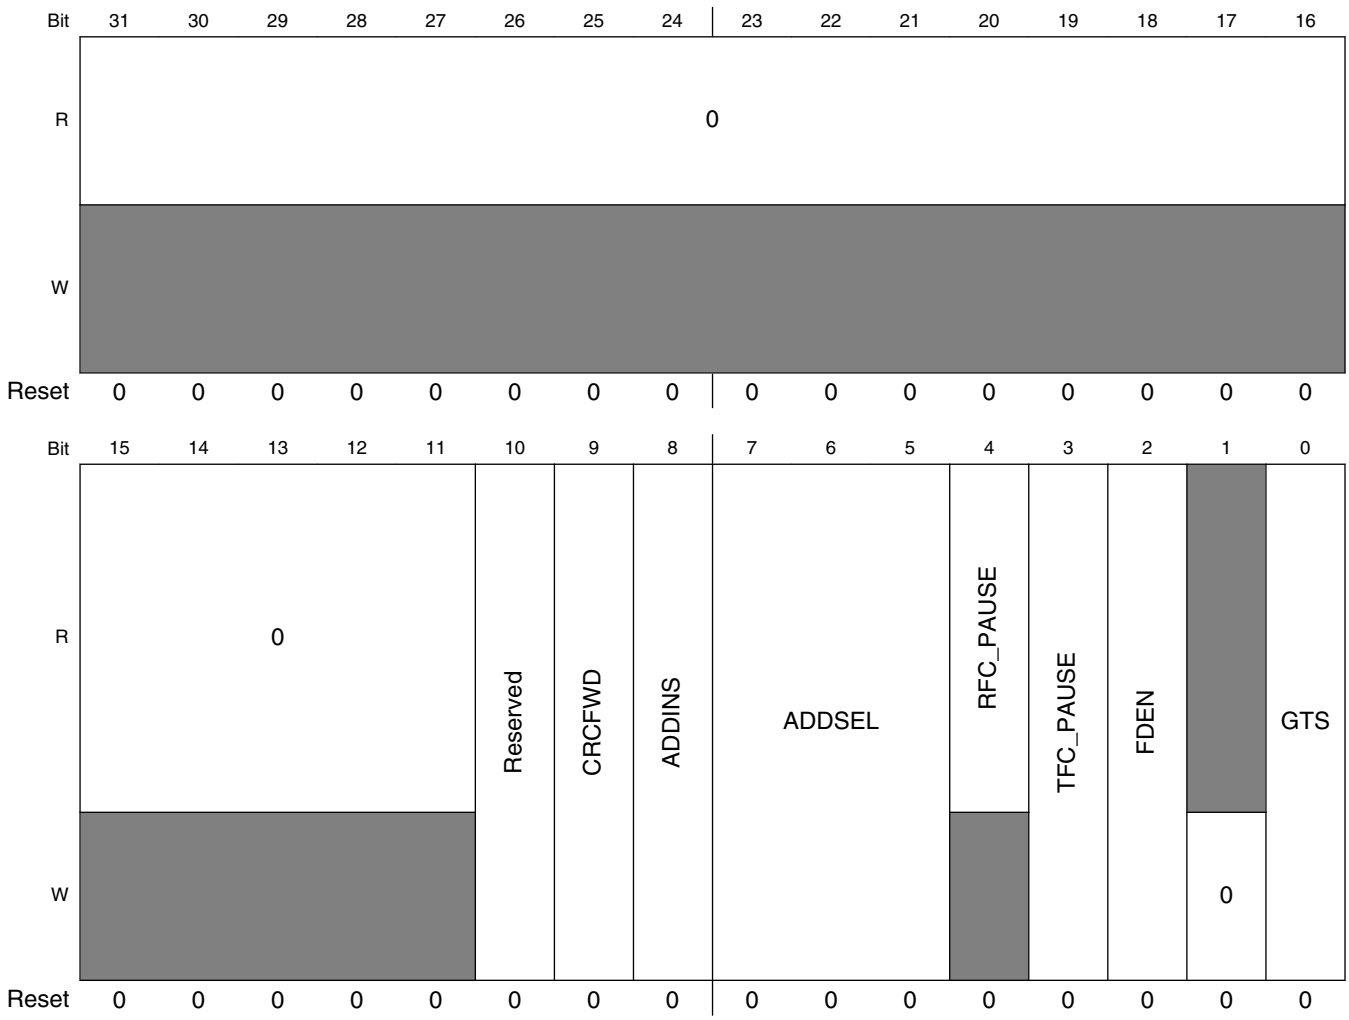
ENET_RCR field descriptions (continued)

Field	Description
8 RMII_MODE	RMII Mode Enable Specifies whether the MAC is configured for MII mode or RMII operation , when ECR[SPEED] is cleared . **NOTE:** Do not set both RCR[RGMII_EN] and RCR[RMII_MODE]. 0 MAC configured for MII mode. 1 MAC configured for RMII operation.
7 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
6 RGMII_EN	RGMII Mode Enable **NOTE:** Do not set both RCR[RGMII_EN] and RCR[RMII_MODE]. 0 MAC configured for non-RGMII operation 1 MAC configured for RGMII operation. If ECR[SPEED] is set, the MAC is in RGMII 1000-Mbit/s mode. If ECR[SPEED] is cleared, the MAC is in RGMII 10/100-Mbit/s mode.
5 FCE	Flow Control Enable If set, the receiver detects PAUSE frames. Upon PAUSE frame detection, the transmitter stops transmitting data frames for a given duration.
4 BC_REJ	Broadcast Frame Reject If set, frames with destination address (DA) equal to 0xFFFF_FFFF_FFFF are rejected unless the PROM field is set. If BC_REJ and PROM are set, frames with broadcast DA are accepted and the MISS (M) is set in the receive buffer descriptor.
3 PROM	Promiscuous Mode All frames are accepted regardless of address matching. 0 Disabled. 1 Enabled.
2 MII_MODE	Media Independent Interface Mode This field must always be set. 0 Reserved. 1 MII or RMII mode, as indicated by the RMII_MODE field.
1 DRT	Disable Receive On Transmit 0 Receive path operates independently of transmit (i.e., full-duplex mode). Can also be used to monitor transmit activity in half-duplex mode. 1 Disable reception of frames while transmitting. (Normally used for half-duplex mode.)
0 LOOP	Internal Loopback This is an MII internal loopback, therefore MII_MODE must be written to 1 and RMII_MODE must be written to 0. 0 Loopback disabled. 1 Transmitted frames are looped back internal to the device and transmit MII output signals are not asserted. DRT must be cleared.

11.5.6.10 Transmit Control Register (ENET_TCR)

TCR is read/write and configures the transmit block. This register is cleared at system reset. FDEN can only be modified when ECR[ETHEREN] is cleared.

Address: 30BE_0000h base + C4h offset = 30BE_00C4h



ENET_TCR field descriptions

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 Reserved	This field is reserved. This field is read/write and must be set to 0.
9 CRCFWD	Forward Frame From Application With CRC

Table continues on the next page...

ENET_TCR field descriptions (continued)

Field	Description
	0 TxBD[TC] controls whether the frame has a CRC from the application. 1 The transmitter does not append any CRC to transmitted frames, as it is expecting a frame with CRC from the application.
8 ADDINS	Set MAC Address On Transmit 0 The source MAC address is not modified by the MAC. 1 The MAC overwrites the source MAC address with the programmed MAC address according to ADDSEL.
7–5 ADDSEL	Source MAC Address Select On Transmit If ADDINS is set, indicates the MAC address that overwrites the source MAC address. 000 Node MAC address programmed on PADDR1/2 registers. 100 Reserved. 101 Reserved. 110 Reserved.
4 RFC_PAUSE	Receive Frame Control Pause This status field is set when a full-duplex flow control pause frame is received and the transmitter pauses for the duration defined in this pause frame. This field automatically clears when the pause duration is complete.
3 TFC_PAUSE	Transmit Frame Control Pause Pauses frame transmission. When this field is set, EIR[GRA] is set. With transmission of data frames stopped, the MAC transmits a MAC control PAUSE frame. Next, the MAC clears TFC_PAUSE and resumes transmitting data frames. If the transmitter pauses due to user assertion of GTS or reception of a PAUSE frame, the MAC may continue transmitting a MAC control PAUSE frame. 0 No PAUSE frame transmitted. 1 The MAC stops transmission of data frames after the current transmission is complete.
2 FDEN	Full-Duplex Enable If this field is set, frames transmit independent of carrier sense and collision inputs. Only modify this bit when ECR[ETHEREN] is cleared.
1 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
0 GTS	Graceful Transmit Stop When this field is set, MAC stops transmission after any frame currently transmitted is complete and EIR[GRA] is set. If frame transmission is not currently underway, the GRA interrupt is asserted immediately. After transmission finishes, clear GTS to restart. The next frame in the transmit FIFO is then transmitted. If an early collision occurs during transmission when GTS is set, transmission stops after the collision. The frame is transmitted again after GTS is cleared. There may be old frames in the transmit FIFO that transmit when GTS is reasserted. To avoid this, clear ECR[ETHEREN] following the GRA interrupt.

11.5.6.11 Physical Address Lower Register (ENET_PALR)

PALR contains the lower 32 bits (bytes 0, 1, 2, 3) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 0 through 3 of the six-byte source address field when transmitting PAUSE frames.

Address: 30BE_0000h base + E4h offset = 30BE_00E4h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ENET_PALR field descriptions

Field	Description
PADDR1	Pause Address Bytes 0 (bits 31:24), 1 (bits 23:16), 2 (bits 15:8), and 3 (bits 7:0) of the 6-byte individual address are used for exact match and the source address field in PAUSE frames.

11.5.6.12 Physical Address Upper Register (ENET_PAUR)

PAUR contains the upper 16 bits (bytes 4 and 5) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 4 and 5 of the six-byte source address field when transmitting PAUSE frames. Bits 15:0 of PAUR contain a constant type field (0x8808) for transmission of PAUSE frames.

Address: 30BE_0000h base + E8h offset = 30BE_00E8h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

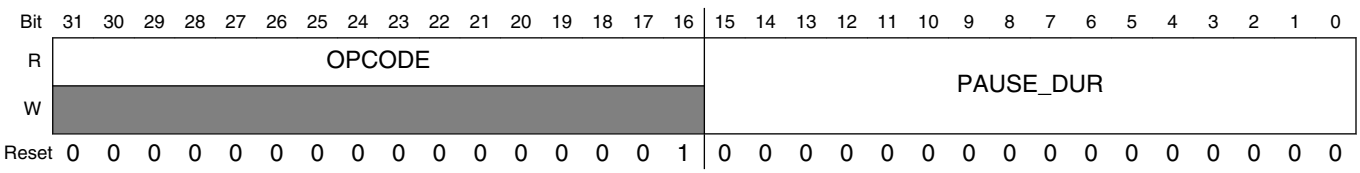
ENET_PAUR field descriptions

Field	Description
31–16 PADDR2	Bytes 4 (bits 31:24) and 5 (bits 23:16) of the 6-byte individual address used for exact match, and the source address field in PAUSE frames.
TYPE	Type Field In PAUSE Frames These fields have a constant value of 0x8808.

11.5.6.13 Opcode/Pause Duration Register (ENET_OPD)

OPD is read/write accessible. This register contains the 16-bit opcode and 16-bit pause duration fields used in transmission of a PAUSE frame. The opcode field is a constant value, 0x0001. When another node detects a PAUSE frame, that node pauses transmission for the duration specified in the pause duration field. The lower 16 bits of this register are not reset and you must initialize it.

Address: 30BE_0000h base + ECh offset = 30BE_00ECh



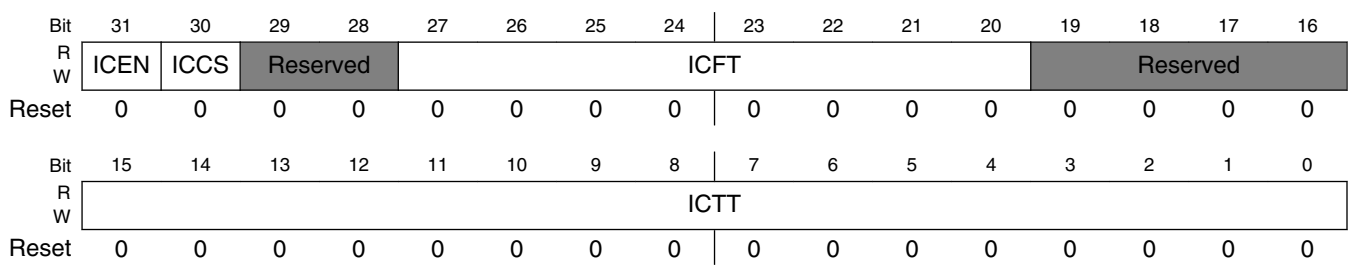
ENET_OPD field descriptions

Field	Description
31–16 OPCODE	Opcode Field In PAUSE Frames These fields have a constant value of 0x0001.
PAUSE_DUR	Pause Duration Pause duration field used in PAUSE frames.

11.5.6.14 Transmit Interrupt Coalescing Register (ENET_TXIC*n*)

See Interrupt coalescence for more information.

Address: 30BE_0000h base + F0h offset + (4d × i), where i=0d to 2d



ENET_TXIC*n* field descriptions

Field	Description
31 ICEN	Interrupt Coalescing Enable

Table continues on the next page...

ENET_TXIC*n* field descriptions (continued)

Field	Description
	0 Disable Interrupt coalescing. 1 Enable Interrupt coalescing.
30 ICCS	Interrupt Coalescing Timer Clock Source Select 0 Use MII/GMII TX clocks. 1 Use ENET system clock.
29–28 Reserved	This field must be set to 0. This field is reserved.
27–20 ICFT	Interrupt coalescing frame count threshold This value determines the number of frames needed to be transmitted for raising an interrupt. Frame counter restarts after reaching this threshold value or after the expiring of the coalescing timer. Must be greater than zero to avoid unpredictable behavior.
19–16 Reserved	This field must be set to 0. This field is reserved.
ICTT	Interrupt coalescing timer threshold Interrupt coalescing timer threshold in units of 64 clock periods. This value determines the maximum amount of time after transmitting a frame before raising an interrupt. The threshold timer is disabled after expiring or number of frame transmission defined by ICFT and starts again upon transmission of the next first frame. Must be greater than zero to avoid unpredictable behavior.

11.5.6.15 Receive Interrupt Coalescing Register (ENET_RXIC*n*)

See Interrupt coalescence for more information.

Address: 30BE_0000h base + 100h offset + (4d × i), where i=0d to 2d

ENET_GALR field descriptions

Field	Description
GADDR2	Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR2 contains hash index bit 31. Bit 0 of GADDR2 contains hash index bit 0.

11.5.6.20 Transmit FIFO Watermark Register (ENET_TFWR)

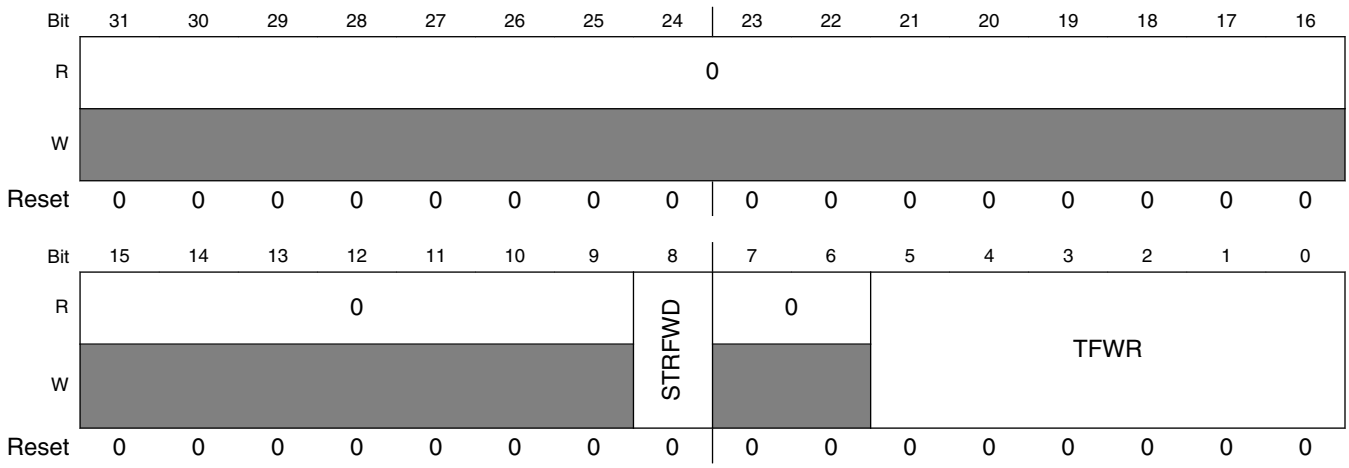
If TFWR[STRFWD] is cleared, TFWR[TFWR] controls the amount of data required in the transmit FIFO before transmission of a frame can begin. This allows you to minimize transmit latency (TFWR = 00 or 01) or allow for larger bus access latency (TFWR = 11) due to contention for the system bus. Setting the watermark to a high value minimizes the risk of transmit FIFO underrun due to contention for the system bus. The byte counts associated with the TFWR field may need to be modified to match a given system requirement, for example, worst-case bus access latency by the transmit data uDMA channel.

When the FIFO level reaches the value the TFWR field and when the STR_FWD is set to ‘0’, the MAC transmit control logic starts frame transmission even before the end-of-frame is available in the FIFO (cut-through operation).

If a complete frame has a size smaller than the threshold programmed with TFWR, the MAC also transmits the Frame to the line.

To enable store and forward on the Transmit path, set STR_FWD to ‘1’. In this case, the MAC starts to transmit data only when a complete frame is stored in the Transmit FIFO.

Address: 30BE_0000h base + 144h offset = 30BE_0144h



ENET_TFWR field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 STRFWD	Store And Forward Enable 0 Reset. The transmission start threshold is programmed in TFWR[TFWR]. 1 Enabled.
7–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TFWR	Transmit FIFO Write If TFWR[STRFWD] is cleared, this field indicates the number of bytes, in steps of 64 bytes, written to the transmit FIFO before transmission of a frame begins. **NOTE:** If a frame with less than the threshold is written, it is still sent independently of this threshold setting. The threshold is relevant only if the frame is larger than the threshold given. 000000 64 bytes written. 000001 64 bytes written. 000010 128 bytes written. 000011 192 bytes written. ... ... 111111 4032 bytes written.

11.5.6.21 Receive Descriptor Ring 1 Start Register (ENET_RDSR1)

RDSR1 points to the beginning of circular receive buffer descriptor queue 1 in external memory. This pointer must be 64-bit aligned (bits 2–0 must be zero); however, for optimal performance the pointer should be 512-bit aligned, that is, evenly divisible by 64.

NOTE

This register must be initialized prior to operation.

Address: 30BE_0000h base + 160h offset = 30BE_0160h

11.5.6.23 Maximum Receive Buffer Size Register - Ring 1 (ENET_MRBR1)

MRBR1 is a user-programmable register that dictates the maximum size of all ring-1 receive buffers. This value should take into consideration that the receive CRC is always written into the last receive buffer.

- To allow one maximum size frame per buffer, MRBR1 must be set to RCR[MAX_FL] or larger.
- R_BUF_SIZE is concatentated with the four least-significant bits of this register and are used as the maximum receive buffer size.
- To properly align the buffer, MRBR1 must be evenly divisible by 64. To ensure this, set the lower two bits of R_BUF_ZIZE to zero. The lower four bits are already set to zero by the device.
- To minimize bus usage (descriptor fetches), set MRBR1 greater than or equal to 256 bytes.

NOTE

This register must be initialized before operation.

31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–4 R_BUF_SIZE	Receive buffer size in bytes. This value, concatenated with the four least-significant bits of this register (which are always zero), is the effective maximum receive buffer size.
Reserved	This field, which is always zero, is the four least-significant bits of the maximum receive buffer size. This field is reserved. This read-only field is reserved and always has the value 0.

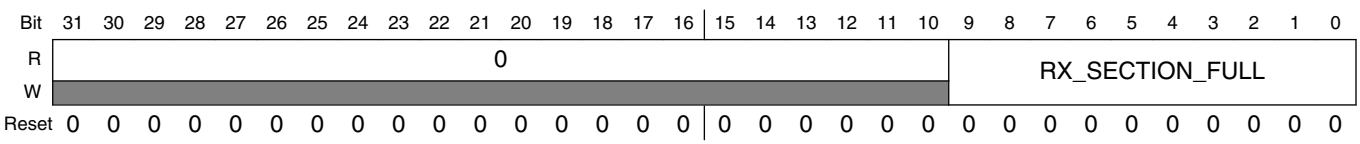
11.5.6.30 Receive FIFO Section Full Threshold (ENET_RSFL)

Address: 30BE_0000h base + 190h offset = 30BE_0190h

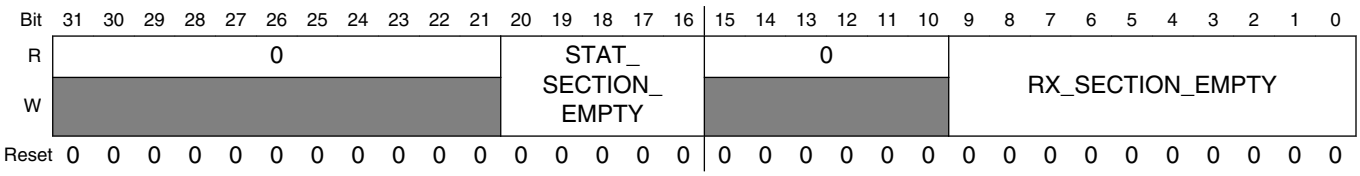


ENET_RSFL field descriptions

Field	Description
31–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_SECTION_ FULL	Value Of Receive FIFO Section Full Threshold Value, in 64-bit words, of the receive FIFO section full threshold. Clear this field to enable store and forward on the RX FIFO. When programming a value greater than 0 (cut-through operation), it must be greater than RAEM[RX_ALMOST_EMPTY]. When the FIFO level reaches the value in this field, data is available in the Receive FIFO (cut-through operation).

11.5.6.31 Receive FIFO Section Empty Threshold (ENET_RSEM)

Address: 30BE_0000h base + 194h offset = 30BE_0194h

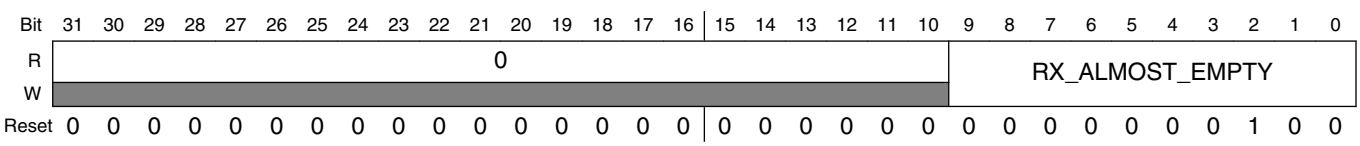


ENET_RSEM field descriptions

Field	Description
31–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20–16 STAT_ SECTION_ EMPTY	RX Status FIFO Section Empty Threshold Defines number of frames in the receive FIFO, independent of its size, that can be accepted. If the limit is reached, reception will continue normally, however a pause frame will be triggered to indicate a possible congestion to the remote device to avoid FIFO overflow. A value of 0 disables automatic pause frame generation
15–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_SECTION_ EMPTY	Value Of The Receive FIFO Section Empty Threshold Value, in 64-bit words, of the receive FIFO section empty threshold. When the FIFO has reached this level, a pause frame will be issued. A value of 0 disables automatic pause frame generation. When the FIFO level goes below the value programmed in this field, an XON pause frame is issued to indicate the FIFO congestion is cleared to the remote Ethernet client. **NOTE:** The section-empty threshold indications from both FIFOs are OR'ed to cause XOFF pause frame generation.

11.5.6.32 Receive FIFO Almost Empty Threshold (ENET_RAEM)

Address: 30BE_0000h base + 198h offset = 30BE_0198h



ENET_RAEM field descriptions

Field	Description
31–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

ENET_RAEM field descriptions (continued)

Field	Description
RX_ALMOST_EMPTY	Value Of The Receive FIFO Almost Empty Threshold Value, in 64-bit words, of the receive FIFO almost empty threshold. When the FIFO level reaches the value programmed in this field and the end-of-frame has not been received for the frame yet, the core receive read control stops FIFO read (and subsequently stops transferring data to the MAC client application). It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO. A minimum value of 4 should be set.

11.5.6.33 Receive FIFO Almost Full Threshold (ENET_RAFL)

Address: 30BE_0000h base + 19Ch offset = 30BE_019Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																						RX_ALMOST_FULL									
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

ENET_RAFL field descriptions

Field	Description
31–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_ALMOST_FULL	Value Of The Receive FIFO Almost Full Threshold Value, in 64-bit words, of the receive FIFO almost full threshold. When the FIFO level comes close to the maximum, so that there is no more space for at least RX_ALMOST_FULL number of words, the MAC stops writing data in the FIFO and truncates the received frame to avoid FIFO overflow. The corresponding error status will be set when the frame is delivered to the application. A minimum value of 4 should be set.

11.5.6.34 Transmit FIFO Section Empty Threshold (ENET_TSEM)

Address: 30BE_0000h base + 1A0h offset = 30BE_01A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																						TX_SECTION_EMPTY									
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_TSEM field descriptions

Field	Description
31–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_SECTION_EMPTY	Value Of The Transmit FIFO Section Empty Threshold

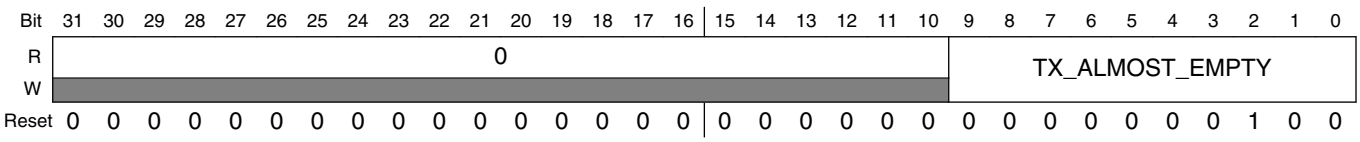
Table continues on the next page...

ENET_TSEM field descriptions (continued)

Field	Description
	Value, in 64-bit words, of the transmit FIFO section empty threshold. See Transmit FIFO for more information.

11.5.6.35 Transmit FIFO Almost Empty Threshold (ENET_TAEM)

Address: 30BE_0000h base + 1A4h offset = 30BE_01A4h

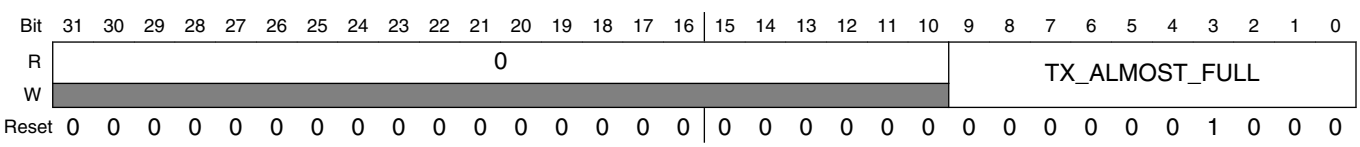


ENET_TAEM field descriptions

Field	Description
31–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_ALMOST_EMPTY	Value of Transmit FIFO Almost Empty Threshold Value, in 64-bit words, of the transmit FIFO almost empty threshold. When the FIFO level reaches the value programmed in this field, and no end-of-frame is available for the frame, the MAC transmit logic, to avoid FIFO underflow, stops reading the FIFO and transmits a frame with an MII error indication. See Transmit FIFO for more information. A minimum value of 4 should be set.

11.5.6.36 Transmit FIFO Almost Full Threshold (ENET_TAFL)

Address: 30BE_0000h base + 1A8h offset = 30BE_01A8h



ENET_TAFL field descriptions

Field	Description
31–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_ALMOST_FULL	Value Of The Transmit FIFO Almost Full Threshold Value, in 64-bit words, of the transmit FIFO almost full threshold. A minimum value of six is required . A recommended value of at least 8 should be set allowing a latency of two clock cycles to the application. If more latency is required the value can be increased as necessary (latency = TAFL - 5).

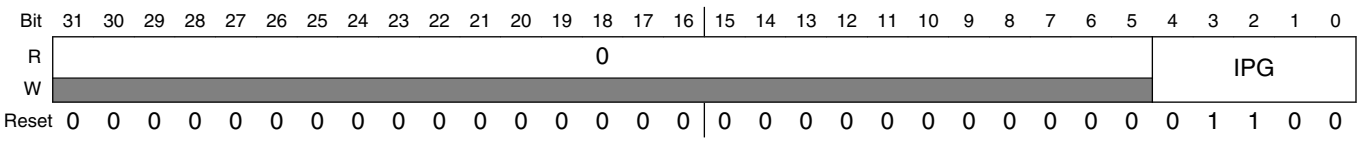
Table continues on the next page...

ENET_TAFL field descriptions (continued)

Field	Description
	When the FIFO level comes close to the maximum, so that there is no more space for at least TX_ALMOST_FULL number of words, the pin ff_tx_rdy is deasserted. If the application does not react on this signal, the FIFO write control logic, to avoid FIFO overflow, truncates the current frame and sets the error status. As a result, the frame will be transmitted with an GMII/MII error indication. See Transmit FIFO for more information. **NOTE:** A FIFO overflow is a fatal error and requires a global reset on the transmit datapath or at least deassertion of ETHEREN.

11.5.6.37 Transmit Inter-Packet Gap (ENET_TIPG)

Address: 30BE_0000h base + 1ACh offset = 30BE_01ACh

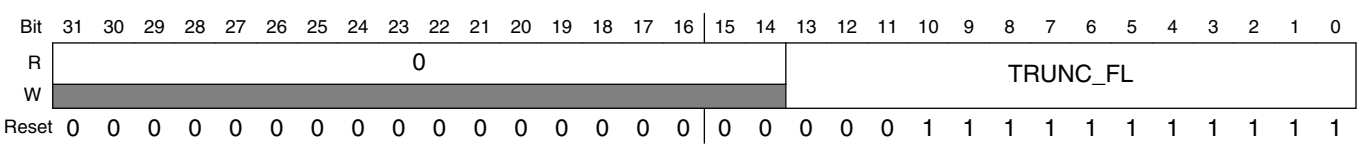


ENET_TIPG field descriptions

Field	Description
31–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
IPG	Transmit Inter-Packet Gap Indicates the IPG, in bytes, between transmitted frames. Valid values range from 8 to 26. If the written value is less than 8 or greater than 26, the internal (effective) IPG is 12. **NOTE:** The IPG value read will be the value that was written, even if it is out of range.

11.5.6.38 Frame Truncation Length (ENET_FTRL)

Address: 30BE_0000h base + 1B0h offset = 30BE_01B0h



ENET_FTRL field descriptions

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TRUNC_FL	Frame Truncation Length

Table continues on the next page...

ENET_FTRL field descriptions (continued)

Field	Description
	Indicates the value a receive frame is truncated, if it is greater than this value. Must be greater than or equal to RCR[MAX_FL]. **NOTE:** Truncation happens at TRUNC_FL. However, when truncation occurs, the application (FIFO) may receive less data, guaranteeing that it never receives more than the set limit.

11.5.6.39 Transmit Accelerator Function Configuration (ENET_TACC)

TACC controls accelerator actions when sending frames. The register can be changed before or after each frame, but it must remain unmodified during frame writes into the transmit FIFO.

The TFWR[STRFWD] field must be set to use the checksum feature.

Address: 30BE_0000h base + 1C0h offset = 30BE_01C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W								0								
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R												PROCHK	IPCHK			SHIFT16
W						0								0		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_TACC field descriptions

Field	Description
31–5 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
4 PROCHK	Enables insertion of protocol checksum. 0 Checksum not inserted. 1 If an IP frame with a known protocol is transmitted, the checksum is inserted automatically into the frame. The checksum field must be cleared. The other frames are not modified.
3 IPCHK	Enables insertion of IP header checksum. 0 Checksum is not inserted. 1 If an IP frame is transmitted, the checksum is inserted automatically. The IP header checksum field must be cleared. If a non-IP frame is transmitted the frame is not modified.

Table continues on the next page...

ENET_TACC field descriptions (continued)

Field	Description
2–1 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
0 SHIFT16	TX FIFO Shift-16 0 Disabled. 1 Indicates to the transmit data FIFO that the written frames contain two additional octets before the frame data. This means the actual frame begins at bit 16 of the first word written into the FIFO. This function allows putting the frame payload on a 32-bit boundary in memory, as the 14-byte Ethernet header is extended to a 16-byte header.

11.5.6.40 Receive Accelerator Function Configuration (ENET_RACC)

Address: 30BE_0000h base + 1C4h offset = 30BE_01C4h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W									0							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R									SHIFT16	LINEDIS				PRODIS	IPDIS	PADREM
W				0							0					
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_RACC field descriptions

Field	Description
31–8 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
7 SHIFT16	RX FIFO Shift-16 When this field is set, the actual frame data starts at bit 16 of the first word read from the RX FIFO aligning the Ethernet payload on a 32-bit boundary. **NOTE:** This function only affects the FIFO storage and has no influence on the statistics, which use the actual length of the frame received. 0 Disabled. 1 Instructs the MAC to write two additional bytes in front of each frame received into the RX FIFO.
6 LINEDIS	Enable Discard Of Frames With MAC Layer Errors 0 Frames with errors are not discarded. 1 Any frame received with a CRC, length, or PHY error is automatically discarded and not forwarded to the user application interface.

Table continues on the next page...

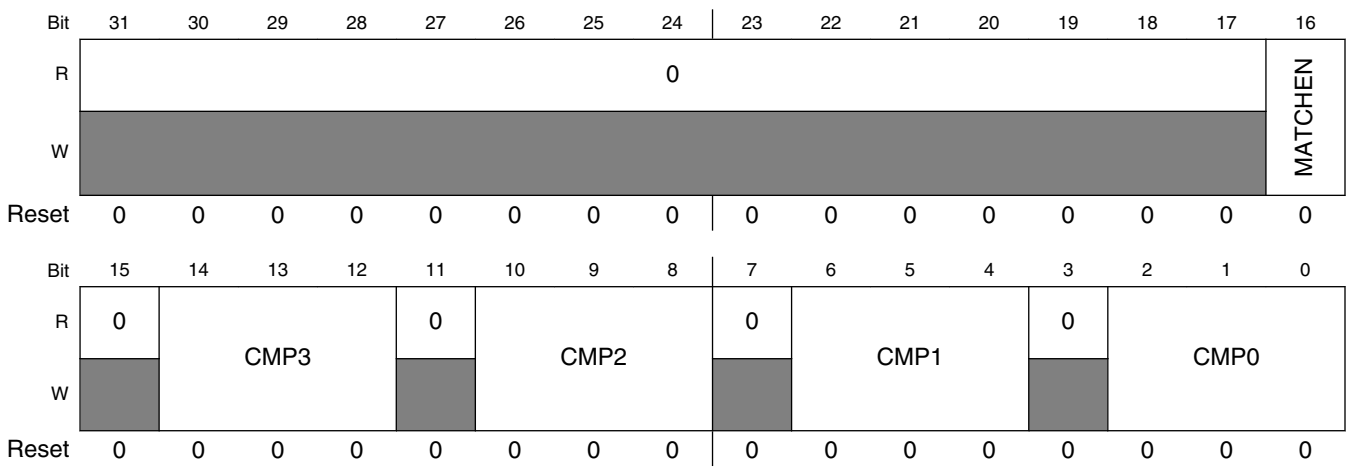
ENET_RACC field descriptions (continued)

Field	Description
5–3 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
2 PRODIS	Enable Discard Of Frames With Wrong Protocol Checksum 0 Frames with wrong checksum are not discarded. 1 If a TCP/IP, UDP/IP, or ICMP/IP frame is received that has a wrong TCP, UDP, or ICMP checksum, the frame is discarded. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
1 IPDIS	Enable Discard Of Frames With Wrong IPv4 Header Checksum 0 Frames with wrong IPv4 header checksum are not discarded. 1 If an IPv4 frame is received with a mismatching header checksum, the frame is discarded. IPv6 has no header checksum and is not affected by this setting. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
0 PADREM	Enable Padding Removal For Short IP Frames 0 Padding not removed. 1 Any bytes following the IP payload section of the frame are removed from the frame.

11.5.6.41 Receive Classification Match Register for Class n (ENET_RCMR*n*)

This match register allows specifying up to four priorities, which are tested (OR'ed) simultaneously. The match detection uses the extracted VLAN field according to the rules for VLAN detection configured through the ECR register. If both match registers, RCMR1 and RCMR2, report a match at the same time, only the class 1 match is indicated as the final result.

Address: 30BE_0000h base + 1C8h offset + (4d × i), where i=0d to 1d



ENET_RCMR*n* field descriptions

Field	Description
31–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 MATCHEN	Match Enable **NOTE:** A comparison is done only on incoming VLAN frames. If no VLAN frame is received no match will occur. If both match registers have overlapping compare values and hence can match both on the same frame, only class 1 will be indicated and the class 2 match is ignored. 0 Disabled (default): no compares will occur and the classification indicator for this class will never assert. 1 The register contents are valid and a comparison with all compare values is done when a VLAN frame is received.
15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14–12 CMP3	Compare 3 Fourth value to compare against. If unused it must be set to the same value as CMP0.
11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–8 CMP2	Compare 2 Third value to compare against. If unused it must be set to the same value as CMP0.
7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6–4 CMP1	Compare 1 Second value to compare against. If unused it must be set to the same value as CMP0.
3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
CMP0	Compare 0 A three-bit value that will be compared with the frame's VLAN priority field (if a VLAN frame is received). All four compare values, CMP0..3, will be used in parallel. If any of the values match, a match for the class is reported (if MATCHEN is 1). **NOTE:** To implement a single priority match, all four compare values must be set to the same value.

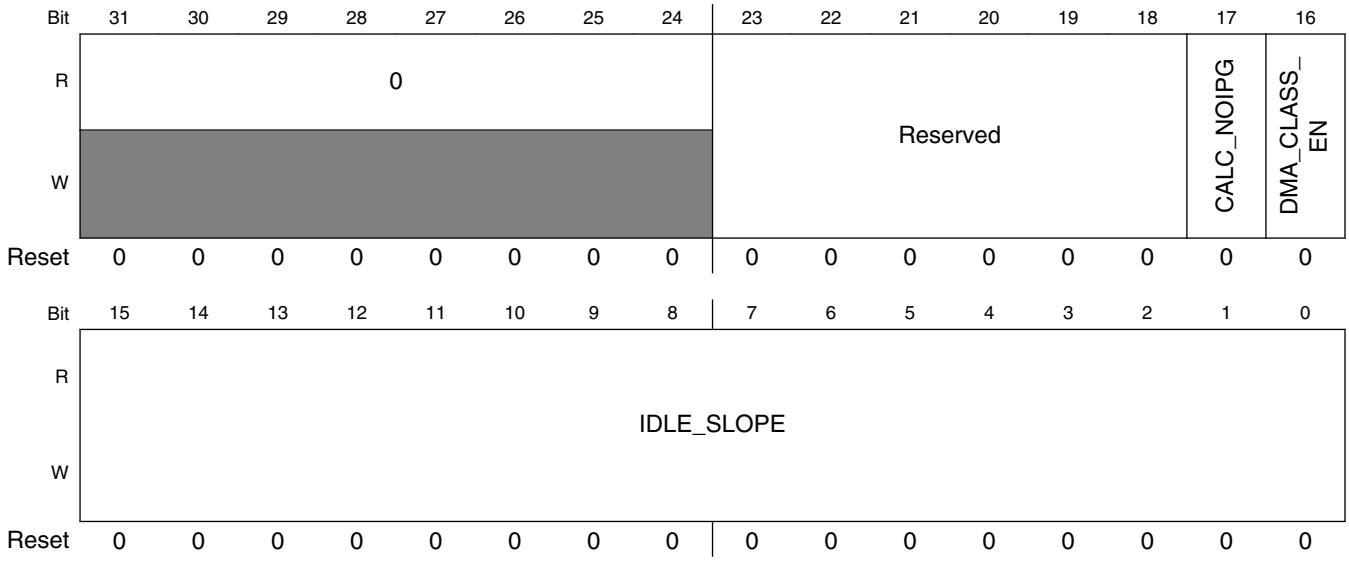
11.5.6.42 DMA Class Based Configuration (ENET_DMA*n*CFG)

The DMA class based configuration registers are used to configure the DMA controller interface to support the additional class 1 (buffer descriptor ring 1) and class 2 (buffer descriptor ring 2) traffic and define configuration options such as bandwidth allocation as needed.

NOTE

The registers are cleared when ECR[ETHEREN] becomes 0.

Address: 30BE_0000h base + 1D8h offset + (4d × i), where i=0d to 1d



ENET_DMA*n*CFG field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23–18 Reserved	This field is reserved. **NOTE:** Write only zeroes to this field.
17 CALC_NOIPG	Calculate no IPG Disable inclusion of IPG bytes for bandwidth calculations. 0 The traffic shaper function should consider 12 octets of IPG in addition to the frame data transferred for a frame when doing bandwidth calculations. This is the default. 1 Addition of 12 bytes for the IPG should be omitted when calculating the bandwidth (for traffic shaping, when writing a frame into the transmit FIFO, the shaper will usually consider 12 bytes of IPG for every frame as part of the bandwidth allocated by the frame. This addition can be suppressed, meaning short frames will become more bandwidth than large frames due to the relation of data to IPG overhead).
16 DMA_CLASS_EN	DMA class enable 0 The DMA controller's channel for the class is not used. **NOTE:** Disabling the DMA controller of a class also requires disabling the class match comparator for the class (see registers RCMRn). When class 1 and class 2 queues are disabled then their frames will be placed in queue 0. 1 Enable the DMA controller to support the corresponding descriptor ring for this class of traffic.
IDLE_SLOPE	Idle slope 16-bit value to define the per class idle slope setting used by the credit based shaper defining allocated bandwidth for the class. This value is used to calculate the BW (bandwidth) fraction, given by the equation, BW fraction = 1/(1+512/IDLE_SLOPE). Idle slope is restricted to certain values. For values less than 128, idle slope = 2^n, where n = 0, 1, 2, ...6. For values equal to or greater than 128, idle slope = 128×m, where m = 1, 2, 3, ...12.

Table continues on the next page...

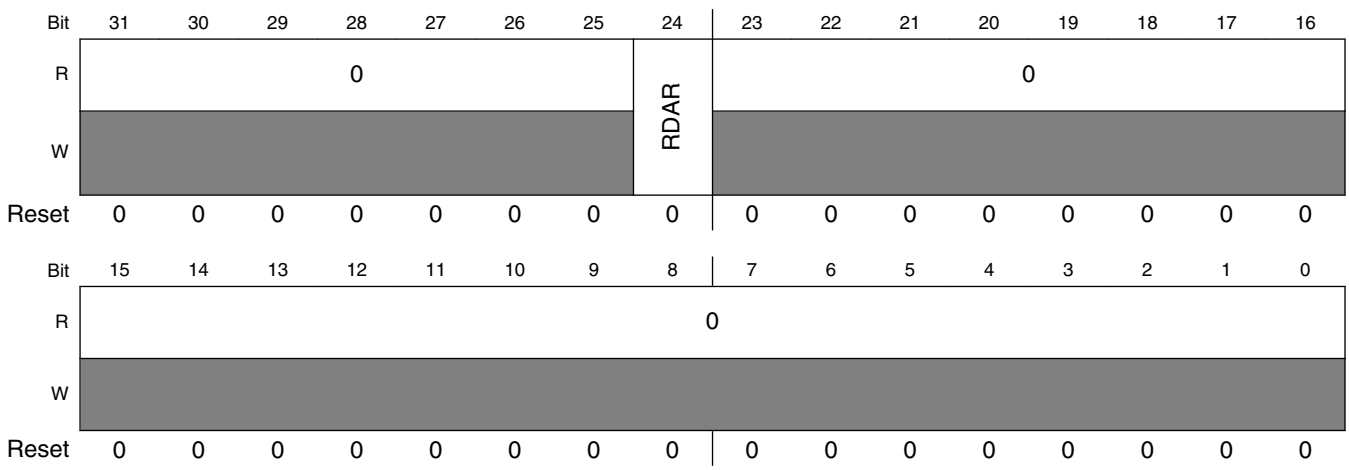
ENET_DMA*n*CFG field descriptions (continued)

Field	Description
	Example 1. BW fraction = 0.20 = 1/(1+(512/128)); therefore idleslope = 128. Example 2. BW fraction = 0.33 = 1/(1+(512/256)); therefore idleslope = 256. Example 3. BW fraction = 0.75 = 1/(1+(512/1536)); therefore idleslope = 1536. **NOTE:** For AVB applications, the BW fraction of class 1 and class 2 combined must not exceed .75.

11.5.6.43 Receive Descriptor Active Register - Ring 1 (ENET_RDAR1)

RDAR1 is a command register, written by the user, to indicate that the receive descriptor ring 1 has been updated, that is, that the driver produced empty receive buffers with the empty bit set.

Address: 30BE_0000h base + 1E0h offset = 30BE_01E0h



ENET_RDAR1 field descriptions

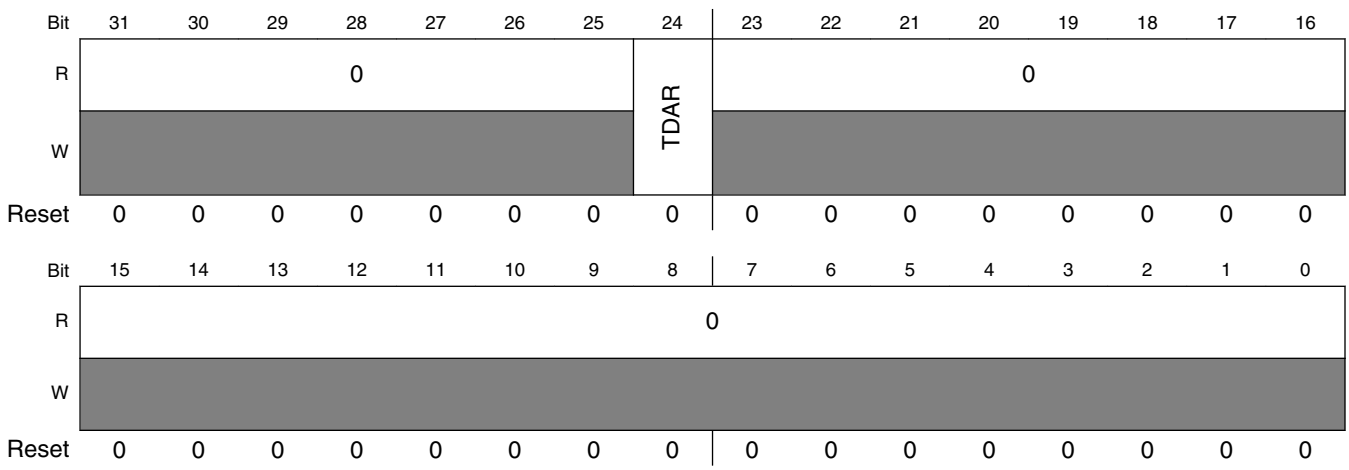
Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 RDAR	Receive Descriptor Active Always set to 1 when this register is written, regardless of the value written. This field is cleared by the MAC device when no additional empty descriptors remain in the receive ring. It is also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

11.5.6.44 Transmit Descriptor Active Register - Ring 1 (ENET_TDAR1)

TDAR1 is a command register that the user writes to indicate that transmit descriptor ring 1 has been updated, that is, that transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor.

The TDAR register is cleared at reset, when ECR[ETHEREN] transitions from set to cleared, or when ECR[RESET] is set.

Address: 30BE_0000h base + 1E4h offset = 30BE_01E4h



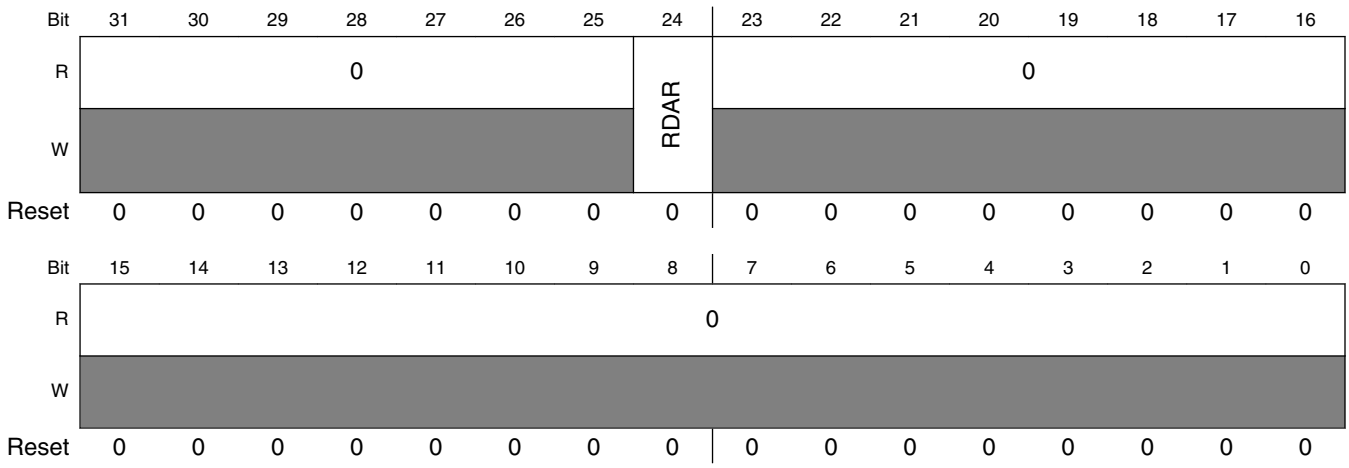
ENET_TDAR1 field descriptions

Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 TDAR	Transmit Descriptor Active Always set to 1 when this register is written, regardless of the value written. This bit is cleared by the MAC device when no additional ready descriptors remain in the transmit ring. Also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

11.5.6.45 Receive Descriptor Active Register - Ring 2 (ENET_RDAR2)

RDAR2 is a command register, written by the user, to indicate that the receive descriptor ring 2 has been updated, that is, that the driver produced empty receive buffers with the empty bit set.

Address: 30BE_0000h base + 1E8h offset = 30BE_01E8h



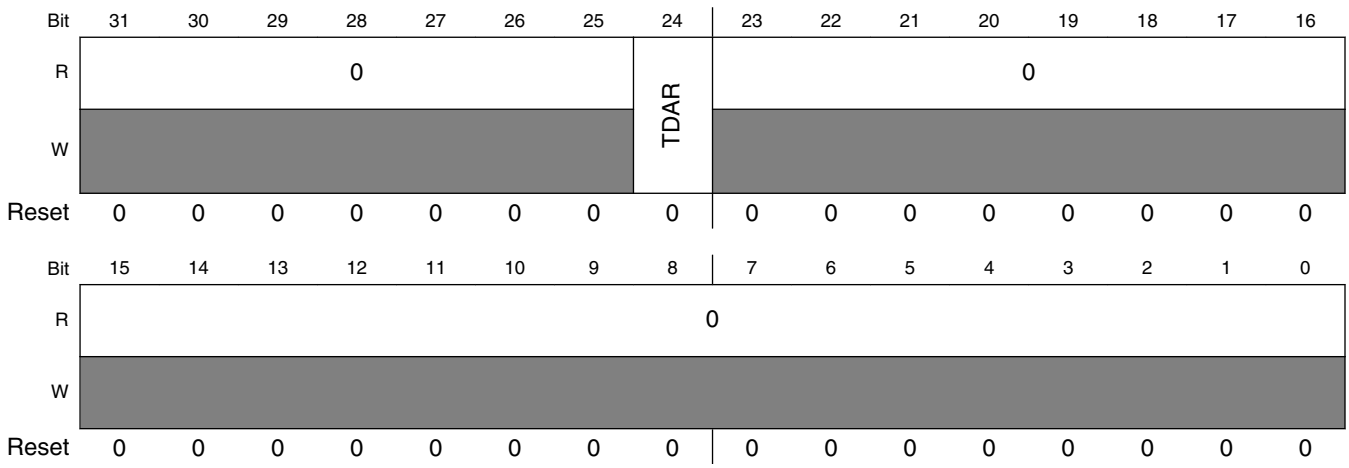
ENET_RDAR2 field descriptions

Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 RDAR	Receive Descriptor Active Always set to 1 when this register is written, regardless of the value written. This field is cleared by the MAC device when no additional empty descriptors remain in the receive ring. It is also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

11.5.6.46 Transmit Descriptor Active Register - Ring 2 (ENET_TDAR2)

TDAR2 is a command register that the user writes to indicate that transmit descriptor ring 2 has been updated, that is, that transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor.

Address: 30BE_0000h base + 1ECh offset = 30BE_01ECh



ENET_TDAR2 field descriptions

Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 TDAR	Transmit Descriptor Active Always set to 1 when this register is written, regardless of the value written. This bit is cleared by the MAC device when no additional ready descriptors remain in the transmit ring. Also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

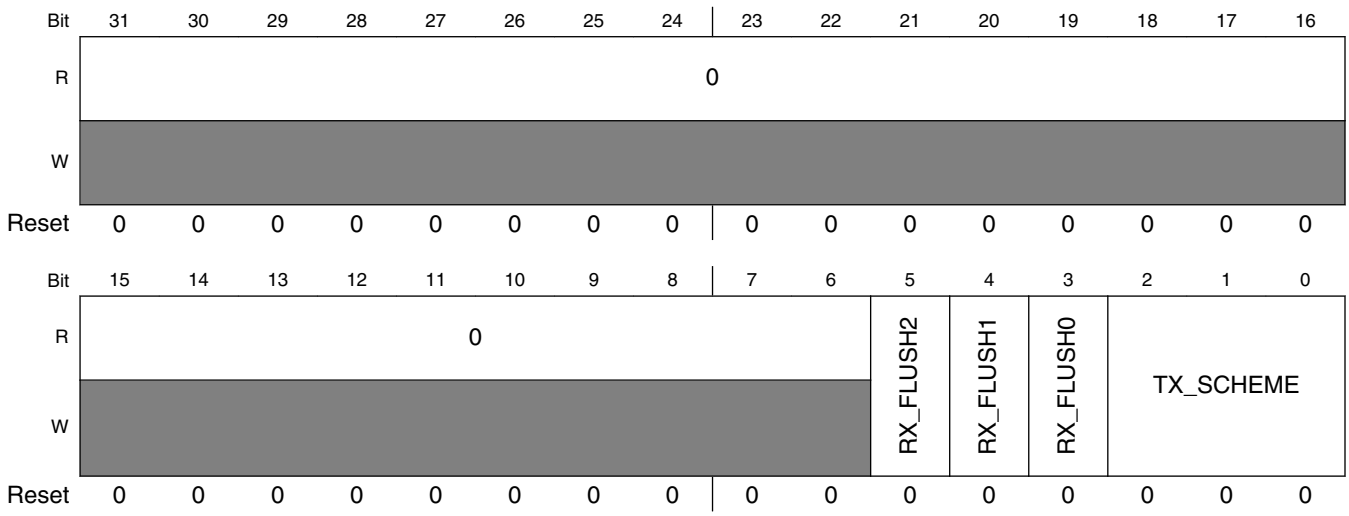
11.5.6.47 QOS Scheme (ENET_QOS)

This register sets the QOS scheme.

NOTE

When both class 1 and class 2 are disabled, RX flushing for these rings must also be disabled.

Address: 30BE_0000h base + 1F0h offset = 30BE_01F0h



ENET_QOS field descriptions

Field	Description
31–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5 RX_FLUSH2	RX Flush Ring 2 Enable or disable RX Flush for ring 2. See Receive flushing. 0 Disable 1 Enable
4 RX_FLUSH1	RX Flush Ring 1 Enable or disable RX Flush for ring 1. See Receive flushing. 0 Disable 1 Enable
3 RX_FLUSH0	RX Flush Ring 0 Enable or disable RX Flush for ring 0. See Receive flushing. 0 Disable 1 Enable
TX_SCHEME	TX scheme configuration Configuration information for DMA to select transmitter queue selection/arbitration scheme. 000 Credit-based scheme 001 Round-robin scheme 010-111 Reserved

11.5.6.48 Reserved Statistic Register (ENET_RMON_T_DROP)

31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
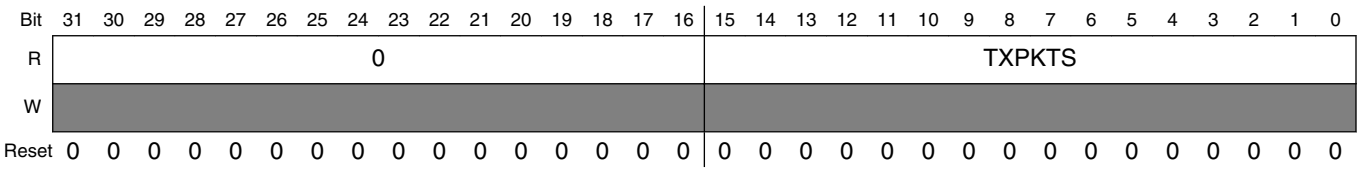
TXPKTS	Number of 1024- to 2047-byte transmit packets

11.5.6.64 Tx Packets Greater Than 2048 Bytes Statistic Register (ENET_RMON_T_P_GTE2048)

Address: 30BE_0000h base + 240h offset = 30BE_0240h

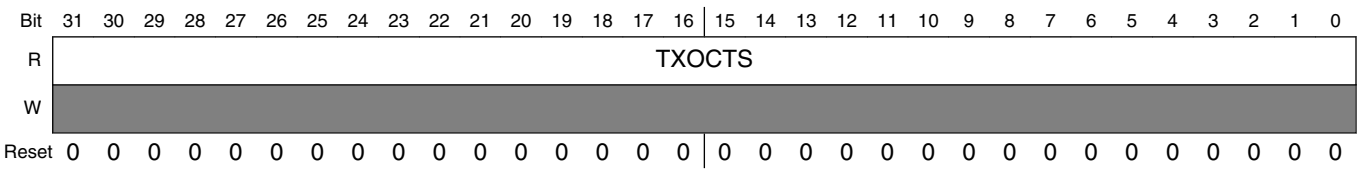


ENET_RMON_T_P_GTE2048 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Number of transmit packets greater than 2048 bytes

11.5.6.65 Tx Octets Statistic Register (ENET_RMON_T_OCTETS)

Address: 30BE_0000h base + 244h offset = 30BE_0244h

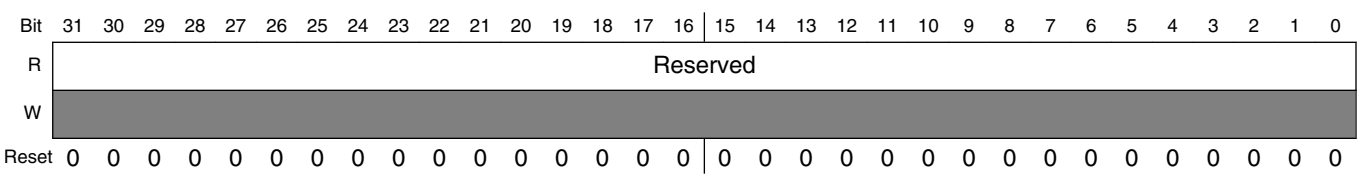


ENET_RMON_T_OCTETS field descriptions

Field	Description
TXOCTS	Number of transmit octets

11.5.6.66 Reserved Statistic Register (ENET_IEEE_T_DROP)

Address: 30BE_0000h base + 248h offset = 30BE_0248h

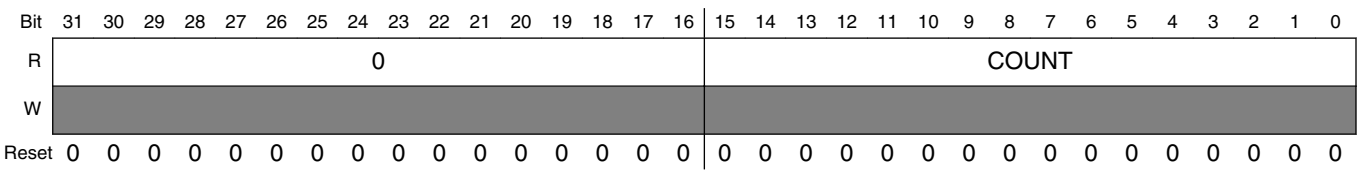


ENET_IEEE_T_DROP field descriptions

Field	Description
Reserved	This read-only field always has the value 0. This field is reserved.

11.5.6.67 Frames Transmitted OK Statistic Register (ENET_IEEE_T_FRAME_OK)

Address: 30BE_0000h base + 24Ch offset = 30BE_024Ch

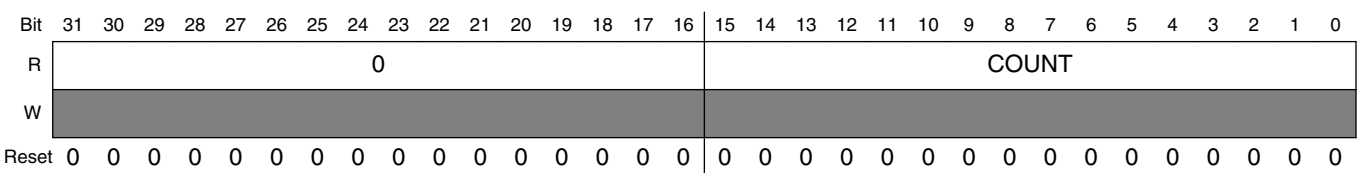


ENET_IEEE_T_FRAME_OK field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted OK **NOTE:** Does not increment for the broadcast frames when broadcast reject is enabled and promiscuous mode is disabled within the receive control register (RCR).

11.5.6.68 Frames Transmitted with Single Collision Statistic Register (ENET_IEEE_T_1COL)

Address: 30BE_0000h base + 250h offset = 30BE_0250h

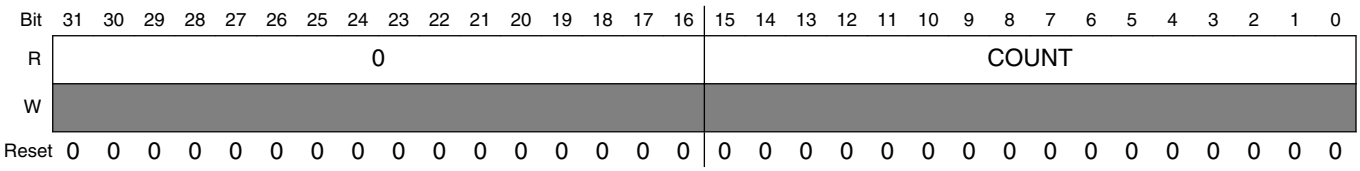


ENET_IEEE_T_1COL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with one collision

11.5.6.69 Frames Transmitted with Multiple Collisions Statistic Register (ENET_IEEE_T_MCOL)

Address: 30BE_0000h base + 254h offset = 30BE_0254h

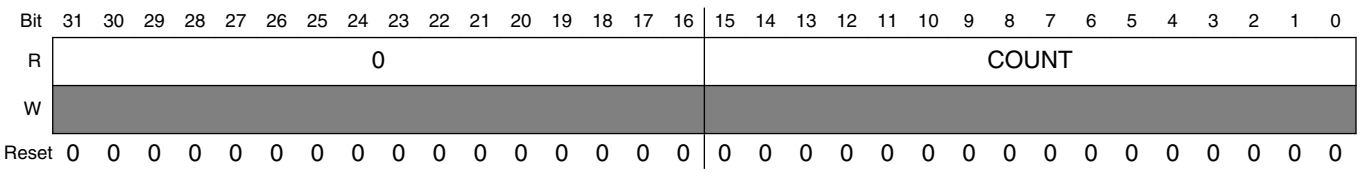


ENET_IEEE_T_MCOL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with multiple collisions

11.5.6.70 Frames Transmitted after Deferral Delay Statistic Register (ENET_IEEE_T_DEF)

Address: 30BE_0000h base + 258h offset = 30BE_0258h

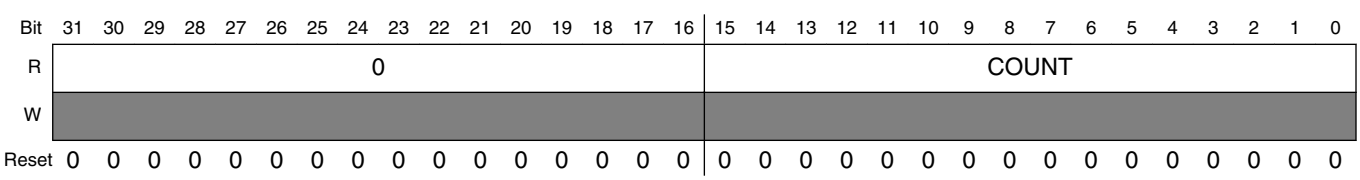


ENET_IEEE_T_DEF field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with deferral delay

11.5.6.71 Frames Transmitted with Late Collision Statistic Register (ENET_IEEE_T_LCOL)

Address: 30BE_0000h base + 25Ch offset = 30BE_025Ch



ENET_IEEE_T_LCOL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with late collision

11.5.6.72 Frames Transmitted with Excessive Collisions Statistic Register (ENET_IEEE_T_EXCOL)

Address: 30BE_0000h base + 260h offset = 30BE_0260h

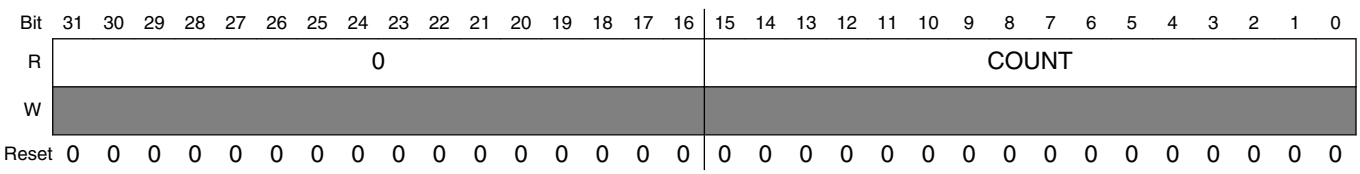
11.5.6.97 Frames Received with CRC Error Statistic Register (ENET_IEEE_R_CRC)

Address: 30BE_0000h base + 2D0h offset = 30BE_02D0h

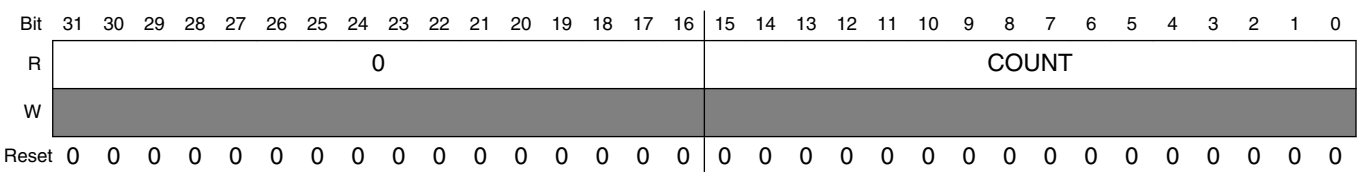


ENET_IEEE_R_CRC field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames received with CRC error

11.5.6.98 Frames Received with Alignment Error Statistic Register (ENET_IEEE_R_ALIGN)

Address: 30BE_0000h base + 2D4h offset = 30BE_02D4h

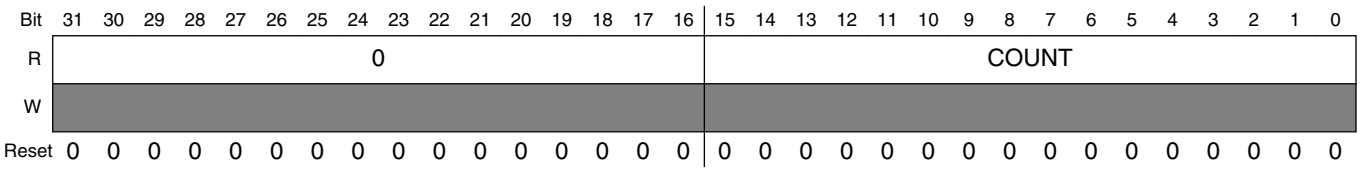


ENET_IEEE_R_ALIGN field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames received with alignment error

11.5.6.99 Receive FIFO Overflow Count Statistic Register (ENET_IEEE_R_MACERR)

Address: 30BE_0000h base + 2D8h offset = 30BE_02D8h

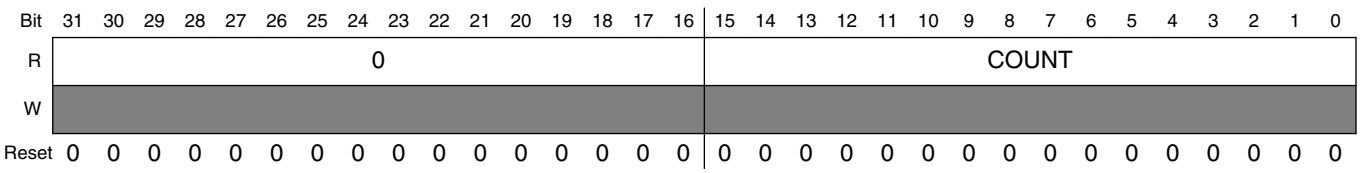


ENET_IEEE_R_MACERR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Receive FIFO overflow count

11.5.6.100 Flow Control Pause Frames Received Statistic Register (ENET_IEEE_R_FDXFC)

Address: 30BE_0000h base + 2DCh offset = 30BE_02DCh

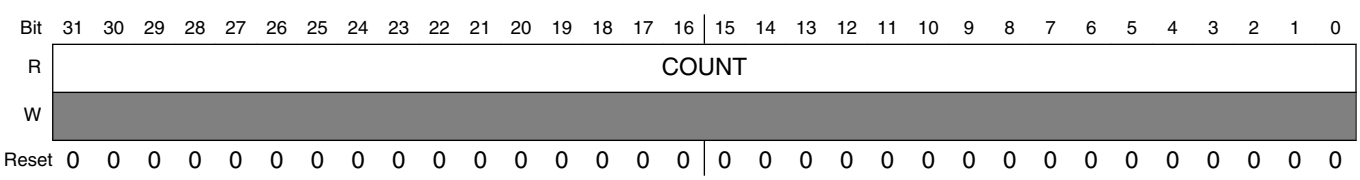


ENET_IEEE_R_FDXFC field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of flow-control pause frames received

11.5.6.101 Octet Count for Frames Received without Error Statistic Register (ENET_IEEE_R_OCTETS_OK)

Address: 30BE_0000h base + 2E0h offset = 30BE_02E0h



ENET_IEEE_R_OCTETS_OK field descriptions

Field	Description
COUNT	Number of octets for frames received without error **NOTE:** Counts total octets (includes header and FCS fields). Does not increment for the broadcast frames when broadcast reject is enabled and promiscuous mode is disabled within the receive control register (RCR).

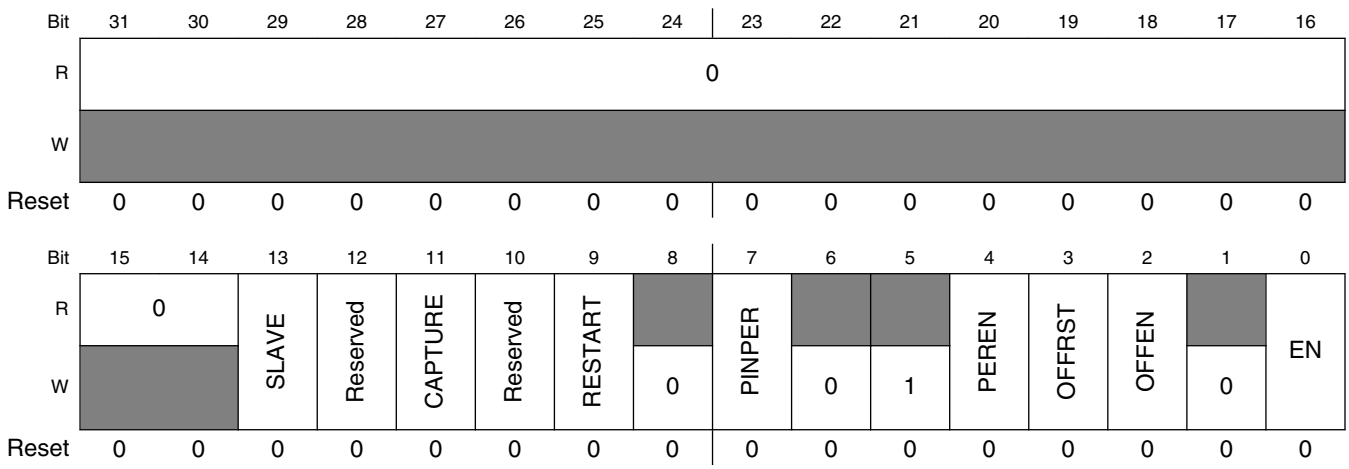
11.5.6.102 Adjustable Timer Control Register (ENET_ATCR)

ATCR command fields can trigger the corresponding events directly. It is not necessary to preserve any of the configuration fields when a command field is set in the register, that is, no read-modify-write is required.

NOTE

The CAPTURE and RESTART fields and bits 12 and 10 must be 0 in order to write to the other fields in this register.

Address: 30BE_0000h base + 400h offset = 30BE_0400h



ENET_ATCR field descriptions

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13 SLAVE	Enable Timer Slave Mode 0 The timer is active and all configuration fields in this register are relevant. 1 The internal timer is disabled and the externally provided timer value is used. All other fields, except CAPTURE, in this register have no effect. CAPTURE can still be used to capture the current timer value.

Table continues on the next page...

ENET_ATCR field descriptions (continued)

Field	Description
12 Reserved	This field is reserved. Always write 0 to this field.
11 CAPTURE	Capture Timer Value When this field is set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes. **NOTE:** To ensure that the correct time value is read from the ATVR register, a minimum amount of time must elapse from issuing this command to reading the ATVR register. This minimum time is defined by the greater of either six register clock cycles or six 1588/timestamp clock cycles. 0 No effect. 1 The current time is captured and can be read from the ATVR register.
10 Reserved	This field is reserved. Always write 0 to this field.
9 RESTART	Reset Timer Resets the timer to zero. This has no effect on the counter enable. If the counter is enabled when this field is set, the timer is reset to zero and starts counting from there. When set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes. RESTART should be used when the timer is enabled. **NOTE:** The Reset Timer command requires at least 6 clock cycles of either the register clock or the 1588/timestamp clock, whichever is greater, to complete.
8 Reserved	This field is reserved.
7 PINPER	Enables event signal output assertion on period event. **NOTE:** Not all devices contain the event signal output. See the chip configuration details. 0 Disable. 1 Enable.
6 Reserved	This field is reserved.
5 Reserved	This field is reserved. **NOTE:** This field must be written always with one.
4 PEREN	Enable Periodical Event 0 Disable. 1 A period event interrupt can be generated (EIR[TS_TIMER]) and the event signal output is asserted when the timer wraps around according to the periodic setting ATPER. The timer period value must be set before setting this bit. **NOTE:** Not all devices contain the event signal output. See the chip configuration details.
3 OFFRST	Reset Timer On Offset Event 0 The timer is not affected and no action occurs, besides clearing OFFEN, when the offset is reached. 1 If OFFEN is set, the timer resets to zero when the offset setting is reached. The offset event does not cause a timer interrupt.
2 OFFEN	Enable One-Shot Offset Event

Table continues on the next page...

ENET_ATCR field descriptions (continued)

Field	Description
	0 Disable. 1 The timer can be reset to zero when the given offset time is reached (offset event). The field is cleared when the offset event is reached, so no further event occurs until the field is set again. The timer offset value must be set before setting this field.
1 Reserved	This field is reserved.
0 EN	Enable Timer 0 The timer stops at the current value. 1 The timer starts incrementing.

11.5.6.103 Timer Value Register (ENET_ATVR)

Address: 30BE_0000h base + 404h offset = 30BE_0404h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ENET_ATVR field descriptions

Field	Description
ATIME	A write sets the timer. A read returns the last captured value. To read the current value, issue a capture command (i.e., set ATCR[CAPTURE]) prior to reading this register.

11.5.6.104 Timer Offset Register (ENET_ATOFF)

Address: 30BE_0000h base + 408h offset = 30BE_0408h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	OFFSET																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_ATOFF field descriptions

Field	Description
OFFSET	Offset value for one-shot event generation. When the timer reaches the value, an event can be generated to reset the counter. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds.

11.5.6.105 Timer Period Register (ENET_ATPER)

Address: 30BE_0000h base + 40Ch offset = 30BE_040Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	PERIOD																															
Reset	0	0	1	1	1	0	1	1	1	0	0	1	1	0	1	0	1	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0

ENET_ATPER field descriptions

Field	Description
PERIOD	Value for generating periodic events. Each instance the timer reaches this value, the period event occurs and the timer restarts. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds. The value should be initialized to 1,000,000,000 (1×10^9) to represent a timer wrap around of one second. The increment value set in ATINC should be set to the true nanoseconds of the period of clock ts_clk, hence implementing a true 1 second counter. **NOTE:** The value of PERIOD has the following constraint: 2^{32} – ENET_ATINC[INC_COR] – 3×ENET_ATINC[INC] ≥ PERIOD > 0.

11.5.6.106 Timer Correction Register (ENET_ATCOR)

Address: 30BE_0000h base + 410h offset = 30BE_0410h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0	COR														
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

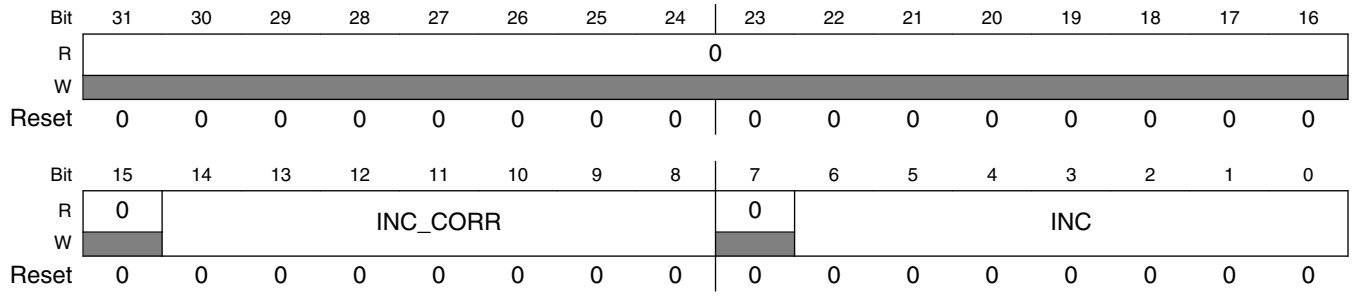
R W	COR															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENET_ATCOR field descriptions

Field	Description
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COR	Correction Counter Wrap-Around Value Defines after how many timer clock cycles (ts_clk) the correction counter should be reset and trigger a correction increment on the timer. The amount of correction is defined in ATINC[INC_CORR]. A value of 0 disables the correction counter and no corrections occur. **NOTE:** This value is given in clock cycles, not in nanoseconds as all other values.

11.5.6.107 Time-Stamping Clock Period Register (ENET_ATINC)

Address: 30BE_0000h base + 414h offset = 30BE_0414h

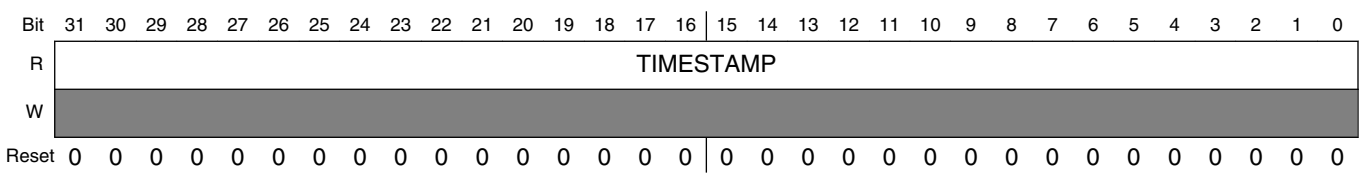


ENET_ATINC field descriptions

Field	Description
31–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14–8 INC_CORR	Correction Increment Value This value is added every time the correction timer expires (every clock cycle given in ATCOR). A value less than INC slows down the timer. A value greater than INC speeds up the timer.
7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
INC	Clock Period Of The Timestamping Clock (ts_clk) In Nanoseconds The timer increments by this amount each clock cycle. For example, set to 10 for 100 MHz, 8 for 125 MHz, 5 for 200 MHz. **NOTE:** For highest precision, use a value that is an integer fraction of the period set in ATPER.

11.5.6.108 Timestamp of Last Transmitted Frame (ENET_ATSTMP)

Address: 30BE_0000h base + 418h offset = 30BE_0418h

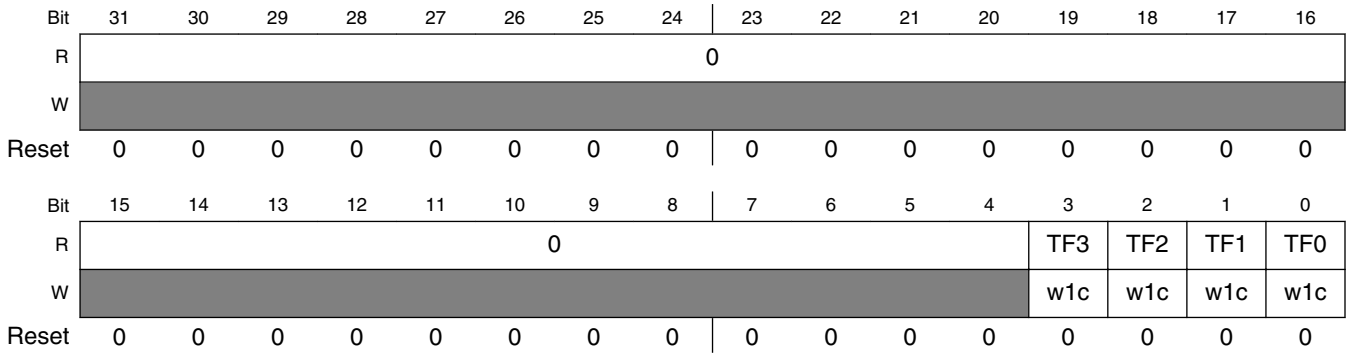


ENET_ATSTMP field descriptions

Field	Description
TIMESTAMP	Timestamp of the last frame transmitted by the core that had TxBD[TS] set . This register is only valid when EIR[TS_AVAIL] is set.

11.5.6.109 Timer Global Status Register (ENET_TGSR)

Address: 30BE_0000h base + 604h offset = 30BE_0604h

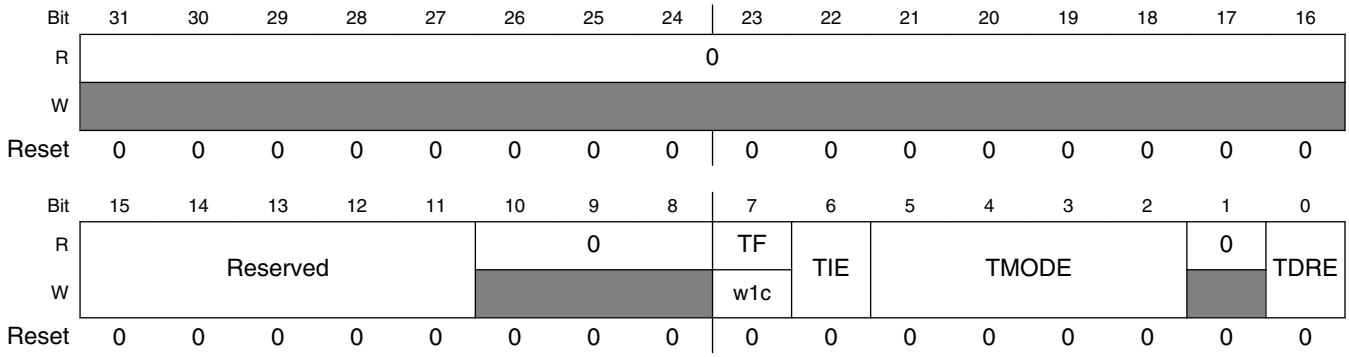


ENET_TGSR field descriptions

Field	Description
31–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
3 TF3	Copy Of Timer Flag For Channel 3 0 Timer Flag for Channel 3 is clear 1 Timer Flag for Channel 3 is set
2 TF2	Copy Of Timer Flag For Channel 2 0 Timer Flag for Channel 2 is clear 1 Timer Flag for Channel 2 is set
1 TF1	Copy Of Timer Flag For Channel 1 0 Timer Flag for Channel 1 is clear 1 Timer Flag for Channel 1 is set
0 TF0	Copy Of Timer Flag For Channel 0 0 Timer Flag for Channel 0 is clear 1 Timer Flag for Channel 0 is set

11.5.6.110 Timer Control Status Register (ENET_TCSR*n*)

Address: 30BE_0000h base + 608h offset + (8d × i), where i=0d to 3d



ENET_TCSR*n* field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
15–11 Reserved	This field is reserved. This field must be written with 0.
10–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 TF	Timer Flag Sets when input capture or output compare occurs. This flag is double buffered between the module clock and 1588 clock domains. When this field is 1, it can be cleared to 0 by writing 1 to it. 0 Input Capture or Output Compare has not occurred. 1 Input Capture or Output Compare has occurred.
6 TIE	Timer Interrupt Enable 0 Interrupt is disabled 1 Interrupt is enabled
5–2 TMODE	Timer Mode Updating the Timer Mode field takes a few cycles to register because it is synchronized to the 1588 clock. The version of Timer Mode returned on a read is from the 1588 clock domain. When changing Timer Mode, always disable the channel and read this register to verify the channel is disabled first. 0000 Timer Channel is disabled. 0001 Timer Channel is configured for Input Capture on rising edge. 0010 Timer Channel is configured for Input Capture on falling edge. 0011 Timer Channel is configured for Input Capture on both edges. 0100 Timer Channel is configured for Output Compare - software only. 0101 Timer Channel is configured for Output Compare - toggle output on compare. 0110 Timer Channel is configured for Output Compare - clear output on compare. 0111 Timer Channel is configured for Output Compare - set output on compare. 1000 Reserved

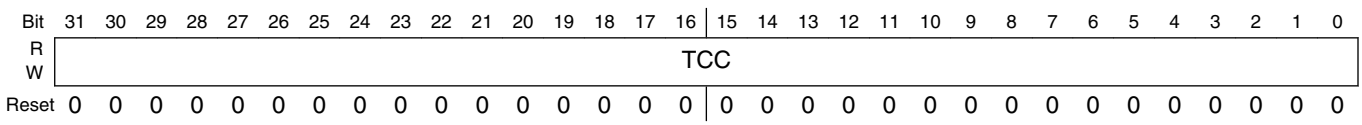
Table continues on the next page...

ENET_TCSR*n* field descriptions (continued)

Field	Description
	1010 Timer Channel is configured for Output Compare - clear output on compare, set output on overflow. 10X1 Timer Channel is configured for Output Compare - set output on compare, clear output on overflow. 110X Reserved 1110 Timer Channel is configured for Output Compare - pulse output low on compare for one 1588-clock cycle. 1111 Timer Channel is configured for Output Compare - pulse output high on compare for one 1588-clock cycle.
1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
0 TDRE	Timer DMA Request Enable 0 DMA request is disabled 1 DMA request is enabled

11.5.6.111 Timer Compare Capture Register (ENET_TCCR*n*)

Address: 30BE_0000h base + 60Ch offset + (8d × i), where i=0d to 3d



ENET_TCCR*n* field descriptions

Field	Description
TCC	Timer Capture Compare This register is double buffered between the module clock and 1588 clock domains. When configured for compare, the 1588 clock domain updates with the value in the module clock domain whenever the Timer Channel is first enabled and on each subsequent compare. Write to this register with the first compare value before enabling the Timer Channel. When the Timer Channel is enabled, write the second compare value either immediately, or at least before the first compare occurs. After each compare, write the next compare value before the previous compare occurs and before clearing the Timer Flag. The compare occurs one 1588 clock cycle after the IEEE 1588 Counter increments past the compare value in the 1588 clock domain. If the compare value is less than the value of the 1588 Counter when the Timer Channel is first enabled, then the compare does not occur until following the next overflow of the 1588 Counter. If the compare value is greater than the IEEE 1588 Counter when the 1588 Counter overflows, or the compare value is less than the value of the IEEE 1588 Counter after the overflow, then the compare occurs one 1588 clock cycle following the overflow. When configured for capture, the value of the IEEE 1588 Counter is captured into the 1588 clock domain and then updated into the module clock domain, provided the Timer Flag is clear. Always read the capture value before clearing the Timer Flag.

Chapter 12
Timers

12.1 General Purpose Timer (GPT)

12.1.1 Overview

This chapter describes the General Purpose Timer (GPT) module interface. It is also a reference for software driver programming. The GPT has a 32-bit up-counter. The timer counter value can be captured in a register using an event on an external pin. The capture trigger can be programmed to be a rising or/and falling edge. The GPT can also generate an event on the output compare pins and an interrupt when the timer reaches a programmed value. The GPT has a 12-bit prescaler, which provides a programmable clock frequency derived from multiple clock sources.

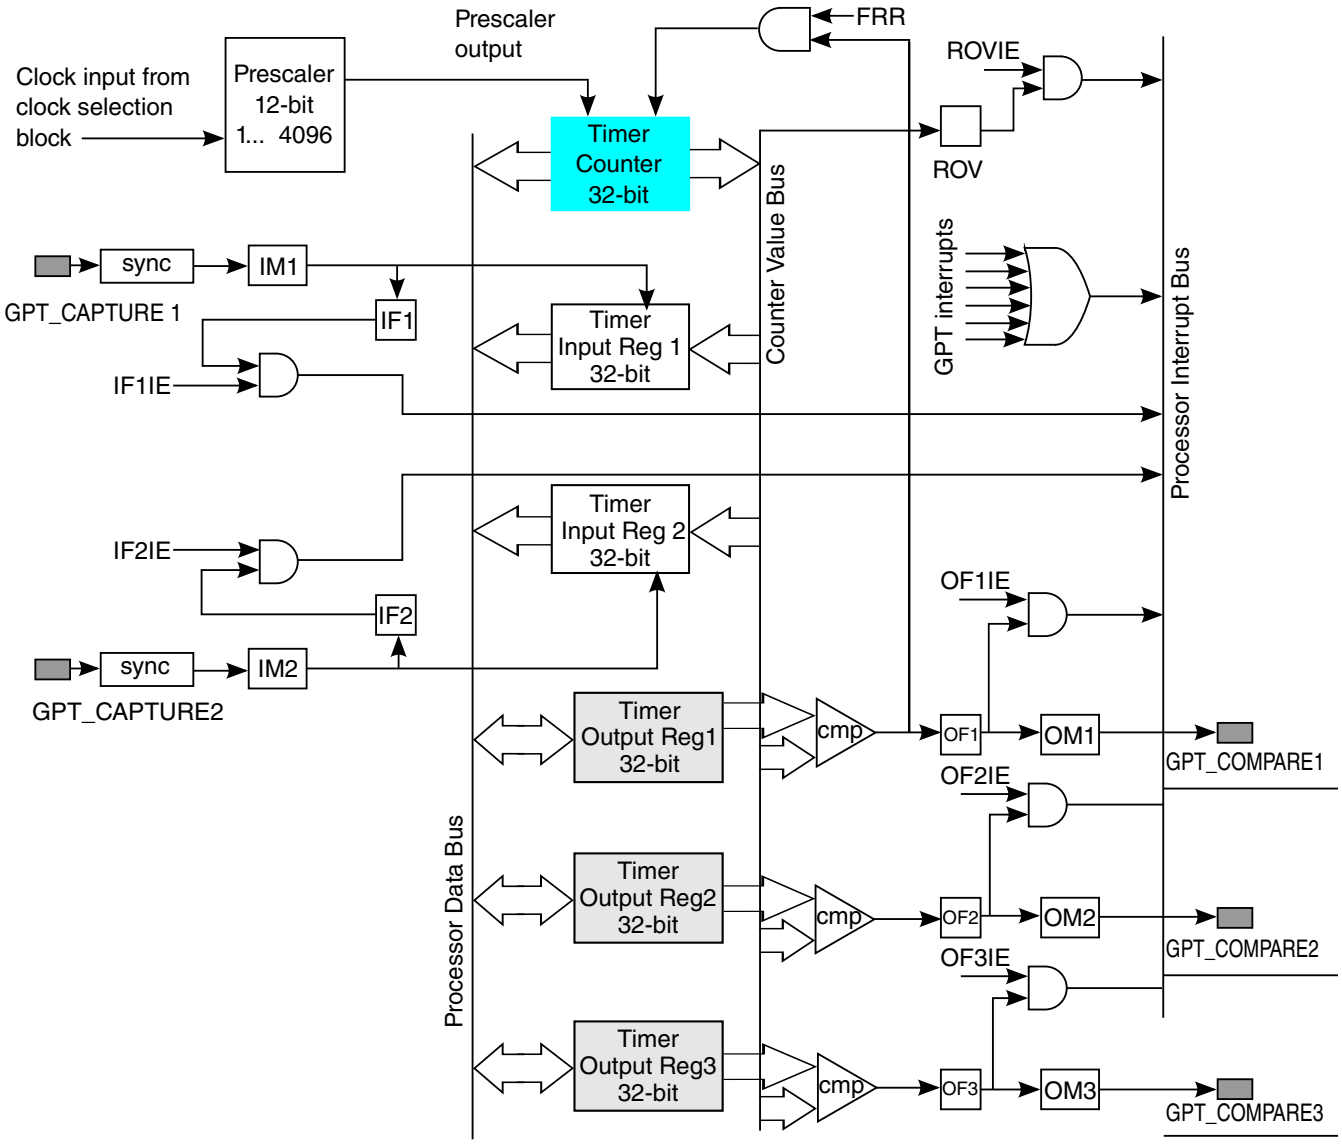


Figure 12-1. GPT Block Diagram

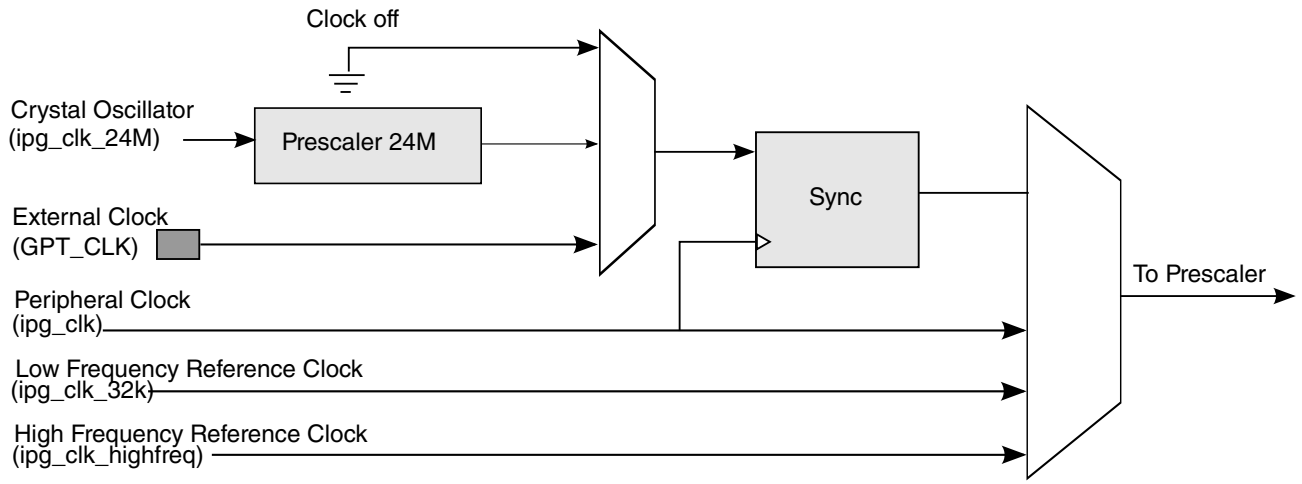

Figure 12-2. GPT Counter Clocks Diagram

12.1.1.1 Features

- One 32-bit up-counter with clock source selection, including external clock.
- Two input capture channels with a programmable trigger edge.
- Three output compare channels with a programmable output mode. A "forced compare" feature is also available.
- Can be programmed to be *active* in low power and debug modes.
- Interrupt generation at capture, compare, and rollover events.
- Restart or free-run modes for counter operations.

12.1.1.2 Modes and Operation

The GPT supports the modes described in the indicated sections:

- Operating Modes
  - Restart Mode
  - Free-Run Mode

12.1.2 External Signals

The GPT follows the IP Bus protocol for interfacing with the processor core. The GPT does not have *any interface signals with any other module inside the chip,* except for the clock and reset inputs (from the clock and reset controller module) and for the interrupt signals *to* the processor interrupt handler. There are functional and clock inputs, and functional output signals going outside the chip boundary.

There are six signals (three input, three output) in the GPT module that *can be* connected to the chip pads.

12.1.2.1 External Clock Input

The GPT counter can be operated using an external clock from outside the device, and this is the input pin used for that purpose. The external clock input (GPT_CLK) is treated as asynchronous to the peripheral clock (ipg_clk). To ensure proper operations of GPT, the external clock input frequency should be less than 1/4 of frequency of the peripheral clock (ipg_clk). Hysteresis characteristics on this pad will be required because this is a clock input.

12.1.2.2 Input Capture Trigger Signals

The GPT counter value can be stored in a register, triggered by an event from *outside the device*. A positive or/and negative edge on these signals GPT_CAPTURE1 , GPT_CAPTURE2 can trigger this capture event. These signals are treated as asynchronous to the peripheral clock (ipg_clk). Only those transitions which occur *at least a single clock cycle* (the clock selected to run the counter) *after the previous recorded transition* are guaranteed to trigger a capture event.

12.1.2.3 Output Compare Signals

The output compare signals: GPT_COMPARE1, GPT_COMPARE2, GPT_COMPARE3, indicate that output compare events have gone through a specified transition.

12.1.3 Clocks

The clock that is input to the prescaler can be selected from 4 clock sources. The following table describes the clock sources for GPT. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 12-1. GPT Clocks

Clock name	Clock Root	Description
ipg_clk		Peripheral clock
ipg_clk_32k		Low-frequency reference clock (32 kHz)

Table continues on the next page...

Table 12-1. GPT Clocks (continued)

Clock name	Clock Root	Description
ipg_clk_highfreq		High-frequency reference clock
ipg_clk_s		Peripheral access clock

- High-Frequency Clock (ipg_clk_highfreq)

  Provided by the Clock Controller Module (CCM), the High Frequency Clock is intended to be ON in Normal Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the High Frequency Clock *in Normal Power mode*. The CCM is expected to provide this clock *after* synchronizing it to the System Bus Clock (ahb_clk) in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the High Frequency Clock in a Low Power mode.

- Low-Reference Clock (ipg_clk_32k)

  This 32 kHz Low Reference Clock (provided by the CCM) is intended to be ON in Low Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the Low Reference Clock in Low Power mode. The CCM is expected to provide the Low Reference Clock *after* synchronizing it to the System Bus Clock (ahb_clk) in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the Low Reference Clock in a Low Power mode.

- Peripheral Clock (ipg_clk)

  If the Peripheral Clock (ipg_clk) or the External Clock (GPT_CLK) is selected (CLKSRC=001 or 011) as Clock Source, then the Peripheral Clock will be ON in normal GPT operations. In Low Power modes, if the GPT is programmed to be disabled (STOPEN or WAITEN or DOZEN=0), then the Peripheral Clock (ipg_clk) can be switched OFF.

- External Clock (GPT_CLK)

  The External Clock comes from *outside the device* and can be selected to run the GPT counter. The External Clock is treated as *asynchronous to the Peripheral Clock,* (ipg_clk) and is synchronized to the Peripheral Clock (ipg_clk), *inside* the module. Therefore, the External Clock frequency is limited to < 1/4 frequency of the Peripheral Clock (ipg_clk), for proper GPT operations. Note that in Low Power modes, *if* the Peripheral Clock (ipg_clk) is not available, then the External Clock *cannot be used* to run the counter.

- Crystal Oscillator Clock (ipg_clk_24M)

This 24 MHz Crystal Oscillator Clock (provided by the CCM) is intended to be used against frequency change of Peripheral Clock (ipg_clk) changes to provide a more accurate timer clock for operation system. The CCM is expected to provide the 24 MHz Crystal Oscillator Clock *without* synchronizing it to the System Bus Clock (ahb_clk) in Normal functional mode. Synchronization is done in GPT module. Before synchronization, the 24 MHz Crystal Oscillator Clock is divided by a 24 MHz clock prescaler, to make sure the clock frequency less than half of System Bus Clock (ahb_clk).

The clock input source is configured using the clock source field (CLKSRC, in the GPT_CR control register). The clock input to the prescaler can be disabled by programming the CLKSRC bits (of the GPT_CR control register) to 000. **The CLKSRC field value should be changed** *only after disabling the GPT* (by setting the EN bit in the GPT_CR to 0).

The PRESCALER field selects the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value (from 1 to 4096) and can be changed *at any time*. A change in the value of the PRESCALER field *immediately affects* the output clock frequency.

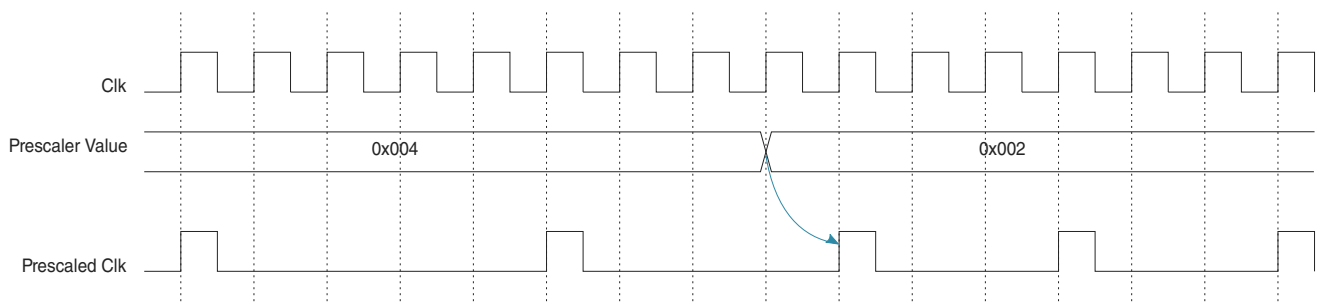

Figure 12-3. Prescaler Value Change Timing Diagram

12.1.4 Functional Description

This section provides a complete functional description of the GPT.

12.1.4.1 Operating Modes

The GPT counter can be programmed to work in either of two modes: Restart mode or Free-Run mode.

12.1.4.1.1 Restart Mode

In Restart mode (selectable through the GPT Control Register GPT_CR), when the counter reaches the compared value, the counter resets and starts again from 0x00000000. The Restart feature is associated only with Compare Channel 1.

Any write access to the Compare register of Channel 1 will reset the GPT counter. This is done to avoid possibly missing a compare event when compare value is changed from a higher value to lower value while counting is proceeding.

For the other two compare channels, when the compare event occurs the counter is *not reset*.

12.1.4.1.2 Free-Run Mode

In Free-Run mode, when compare events occur for all 3 channels, the counter is *not reset*; instead the counter continues to count until 0xffffffff, and then rolls over (to 0x00000000).

12.1.4.2 Operation

The General Purpose Timer (GPT) has a single counter (GPT_CNT) that is a 32-bit free-running *up-counter,* which starts counting *after it is enabled by software* (EN=1). The counter's clock source is the output of the prescaler labelled "Prescaler output" in Figure 12-1.

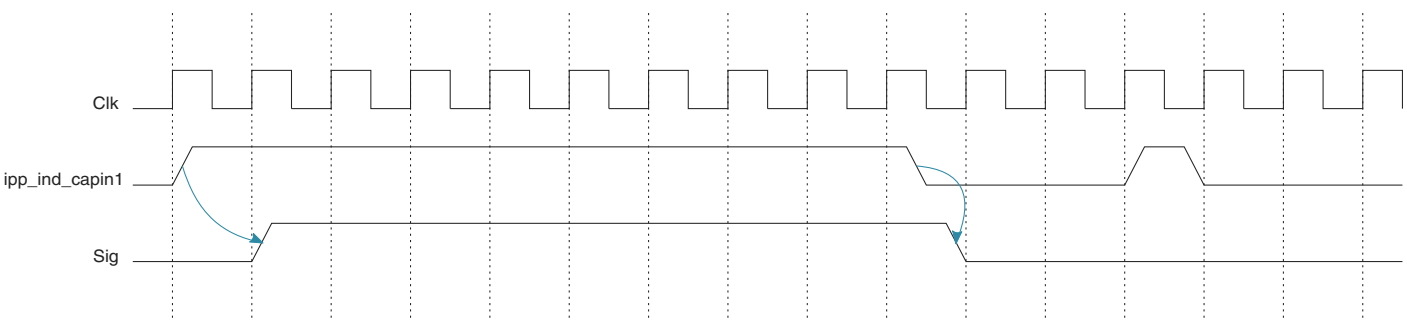
- If the GPT timer is disabled (EN=0), then the Main Counter *and* Prescaler Counter freeze their current count values. The ENMOD bit determines the value of the GPT counter when the EN bit is set and the Counter is enabled again.
  - If the ENMOD bit is set (=1), then the Main Counter and Prescaler Counter values are reset to 0, when GPT is enabled (EN=1).
  - If ENMOD bit is programmed to 0, then the Main Counter and Prescaler Counter restart counting from their frozen values, when GPT is enabled again (EN=1).
- If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter freeze at their current count values *when* GPT enters low power mode. When GPT exits a low power mode, the Main Counter and Prescaler Counter start counting from their frozen values *regardless* of the ENMOD bit value. Note that the GPT_CNT can be read *at any time* by the processor, and that *both* Input Capture Channels use the *same* counter (GPT_CNT).

- A hardware reset resets all the GPT registers to their respective reset values. All registers except the Output Compare Registers (OCR1, OCR2, OCR3) obtain a value of 0x0. The Compare registers are reset to 0xFFFF_FFFF.
- The software reset (SWR bit in the GPT_CR control register) resets *all* of the register bits *except* the EN, ENMOD, STOPEN, WAITEN, and DBGEN bits. The state of these bits is not affected by a software reset. Note that a software reset can be given *while the GPT is disabled*.

12.1.4.2.1 Input Capture

There are two Input Capture Channels, and each Input Capture Channel has a dedicated capture pin, capture register and input edge detection/selection logic. Each input capture function has an associated status flag, and can cause the processor to make an interrupt service request.

When a selected edge transition occurs on an Input Capture pin, the contents of the GPT_CNT is captured on the corresponding capture register and the appropriate interrupt status flag is set. An interrupt request can be generated when the transition is detected *if* its corresponding enable bit is set (in the Interrupt Register). The capture can be programmed to occur on the input pin's rising edge, falling edge, on both rising and falling edges, or the capture can be disabled. The events are synchronized with the clock that was selected to run the counter. Only those transitions that occur at least one clock cycle (clock selected to run the counter) *after* the previous recorded transition will be guaranteed to trigger a capture event. There can be up to one clock cycle of uncertainty in the latching of the input transition. The Input Capture registers can be read *at any time* without affecting their values.



Clk = The clock selected from CLKSRC bit field setting

ipp_ind_capin1 = Pad signal for capture channel 1

Sig = Capture signal as sensed by the module

Figure 12-4. Input Capture Event Timing

12.1.4.2.2 Output Compare

The three Output Compare Channels *use the same counter* (GPT_CNT) as the Input Capture Channels. When the programmed content of an Output Compare register matches the value in GPT_CNT, an output compare status flag is set and an interrupt is generated (if the corresponding bit is set in the interrupt register). Consequently, the Output Compare timer pin will be set, cleared, toggled, not affected at all or provide an active-low pulse for one input clock period (subject to the restriction on the maximum frequency allowed on the pad) according to the mode bits (that were programmed).

There is also a "forced-compare" feature that allows the software to generate a compare event when required, *without the condition of the counter value that is equal to the compare value*. The action taken as a result of a forced compare is the same as when an output compare match occurs, *except that the status flags are not set and no interrupt can be generated*. Forced channels take programmed action immediately after the write to the force-compare bits. These bits are self-negating and always read as zeros.

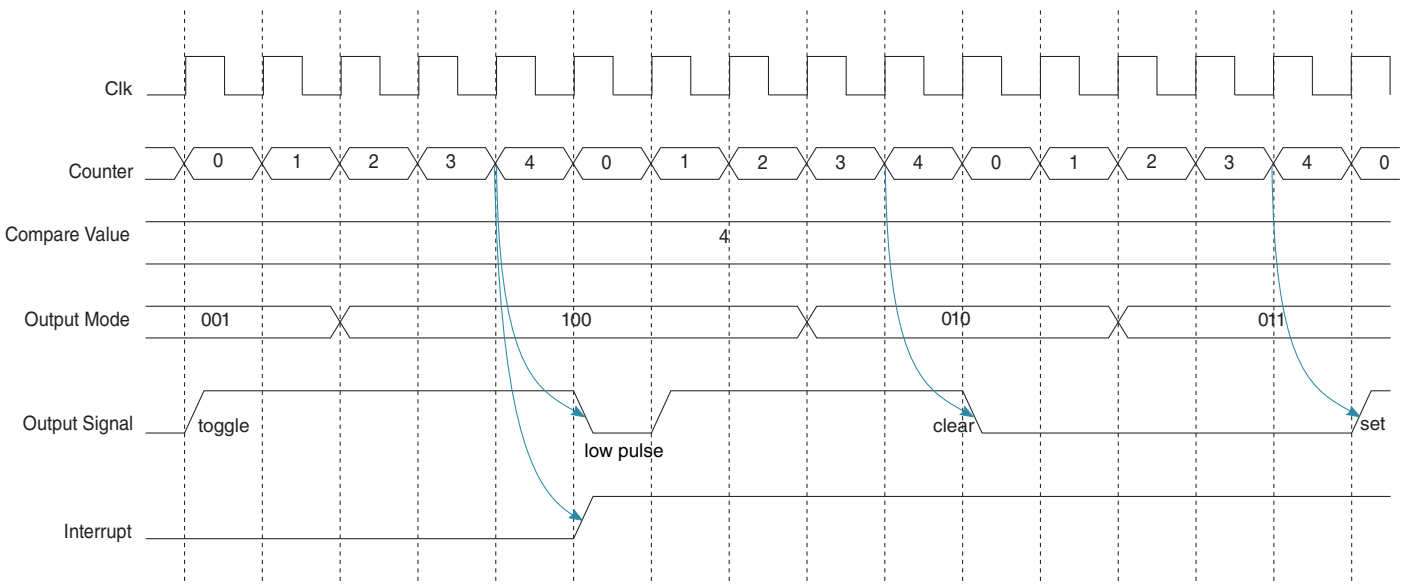


Figure 12-5. Output Compare and Interrupt Timing

12.1.4.2.3 Interrupts

There are 6 different interrupts that are generated by the GPT. If the selected clock for running the counter is available, then *all interrupts can be generated in Low Power and Debug modes*.

- Rollover Interrupt

The Rollover Interrupt is generated when the GPT counter reaches 0xffffffff, then resets to 0x00000000 and continues counting. The Rollover Interrupt is enabled by the ROVIE bit in the GPT_IR register; the associated status bit is the ROV bit in the GPT_SR register.

- Input Capture Interrupt 1, 2

  After a capture event occurs, the associated Input Capture Channel generates an interrupt. The "capture event" interrupts are enabled by the IF2IE and IF1IE bits (in the GPT_IR register); the associated status bits are IF2 and IF1 (in the GPT_SR register). The capture of the counter value because of a capture event is *not affected by a pending capture interrupt*. The Capture register is updated with a new counter value when a capture event occurs, regardless of whether that Capture Channels' interrupt has been serviced or not.

- Output Compare Interrupt 1, 2, 3

  After a compare event occurs, the associated Output Compare Channel generates an interrupt. The "compare event" interrupts are enabled by the OF3IE, OF2IE, and OF1IE bits (in the GPT_IR register); the associated status bits are OF3, OF2, and OF1 (in the GPT_SR register). A "forced compare" does not generate an interrupt.

A *cumulative* interrupt line is also present, which is asserted whenever any of the above interrupts are posted. The cumulative interrupt line has *no* associated enables or status bits.

12.1.4.2.4 Low Power Mode Behavior

In Low Power modes, if the clock from the selected clock source is available (except for the External Clock (GPT_CLK), which can be used *only if* the Peripheral Clock (ipg_clk) is available), the counter will continue to run depending on whether the control bit for that mode is set. If the clock is not present or if the corresponding low power bit in the GPT_CR control register is 0, the Main Counter and the Prescaler Counter freeze at their current values and resume counting (from their frozen values) when the Low Power mode is exited.

12.1.4.2.5 Debug Mode Behavior

In Debug mode, the modules in the device have the option of continuing to run or be halted.

- If the DBGEN bit is set, then the GPT timer will continue to run in Debug mode.
- If the DBGEN bit is not set (in the GPT_CR control register), then the GPT timer is halted.

12.1.5 Initialization/ Application Information

12.1.5.1 Selecting the Clock Source

The CLKSRC field in the GPT_CR register selects the clock source. The CLKSRC field value should be changed only after disabling the GPT (EN=0).

The software sequence to be followed while changing clock source is:

1. Disable GPT by setting EN=0 in GPT_CR register.
2. Disable GPT interrupt register (GPT_IR).
3. Configure Output Mode to unconnected/ disconnected—Write zeros in OM3, OM2, and OM1 in GPT_CR
4. Disable Input Capture Modes—Write zeros in IM1 and IM2 in GPT_CR
5. Change clock source CLKSRC to the desired value in GPT_CR register.
6. Assert the SWR bit in GPT_CR register.
7. Clear GPT status register (GPT_SR) (i.e., w1c).
8. Set ENMOD=1 in GPT_CR register, to bring GPT counter to 0x00000000.
9. Enable GPT (EN=1) in GPT_CR register.
10. Enable GPT interrupt register (GPT_IR).

12.1.6 GPT Memory Map/Register Definition

The GPT has 10 user-accessible 32-bit registers, which are used to configure, operate, and monitor the state of the GPT.

An IP bus write access to the GPT Control Register (GPT_CR) and the GPT Output Compare Register1 (GPT_OCR1) results in *one cycle of wait state*, while other valid IP bus accesses incur 0 wait states.

Irrespective of the Response Select signal value, a Write access to the GPT Status Registers (Read-only registers GPT_ICR1, GPT_ICR2, GPT_CNT) will generate a bus exception.

- If the Response Select signal is driven Low, then the Read/Write access to the *unimplemented* address space of GPT (*ips_addr* is greater than or equal to $BASE + $028) will generate a bus exception.
- If the Response Select is driven High, then the Read/Write access to the unimplemented address space of GPT will *not* generate any error response (like a bus exception).

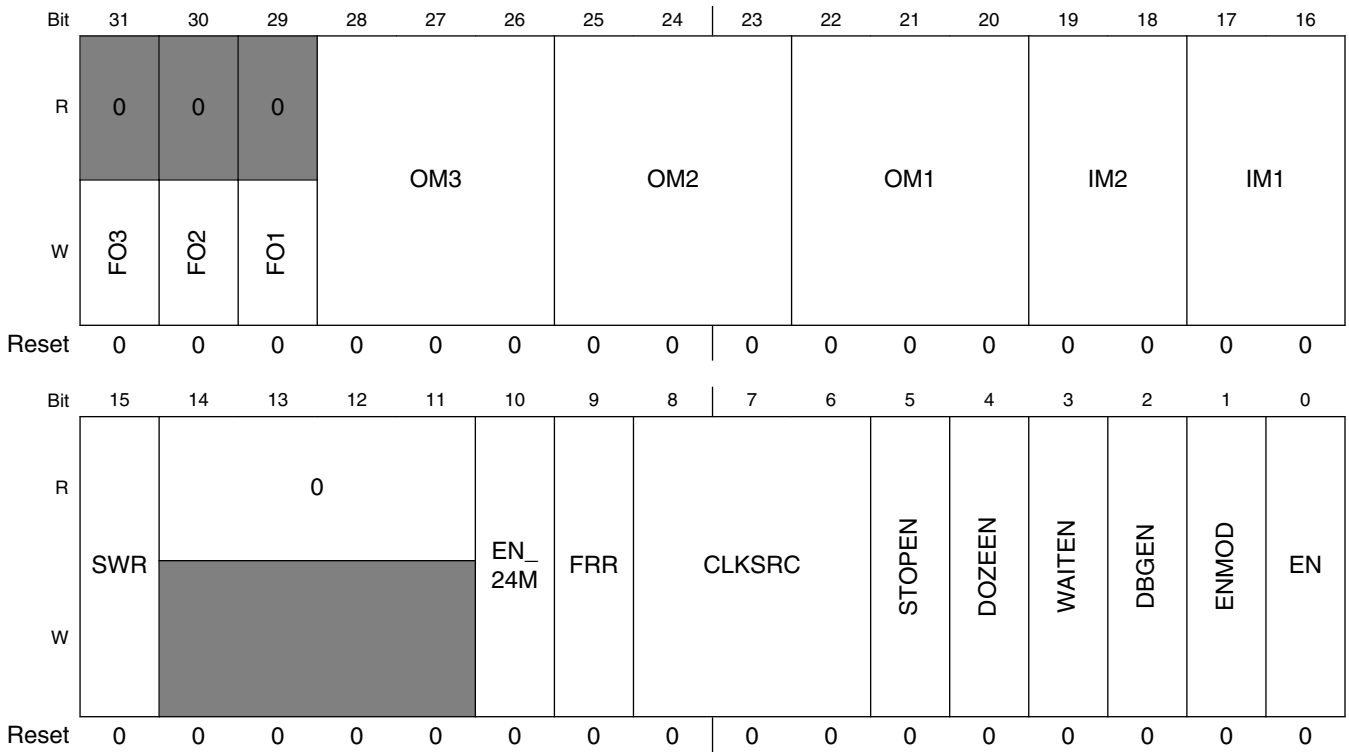
12.1.6.1 GPT Control Register (GPTx_CR)

The GPT Control Register (GPT_CR) is used to program and configure GPT operations. An IP Bus Write to the GPT Control Register occurs after one cycle of wait state, while an IP Bus Read occurs after 0 wait states.

Address: Base address + 0h offset



GPTx_CR field descriptions

Field	Description
31 FO3	FO3 Force Output Compare Channel 3 FO2 Force Output Compare Channel 2 FO1 Force Output Compare Channel 1 The FO*n* bit causes the pin action *programmed* for the timer Output Compare *n* pin (according to the OM*n* bits in this register). • The OF*n* flag (OF3, OF2, OF1) in the status register is **not affected**. • This bit is self-negating and always read as zero. 0 Writing a 0 has no effect. 1 Causes the programmed pin action on the timer Output Compare *n* pin; the OF*n* flag is not set.
30 FO2	See F03

Table continues on the next page...

GPTx_CR field descriptions (continued)

Field	Description
29 FO1	See F03
28–26 OM3	OM3 (bits 28-26) controls the Output Compare Channel 3 operating mode. OM2 (bits 25-23) controls the Output Compare Channel 2 operating mode. OM1 (bits 22-20) controls the Output Compare Channel 1 operating mode. The OM*n* bits specify the response that a compare event will generate on the output pin of Output Compare Channel *n*. • The toggle, clear, and set options cause a change on the output pin *only* if a compare event occurs. • When OM*n* is programmed as 1xx (active low pulse), the output pin is set to one immediately on the next input clock; a low pulse (that is an input clock in width) occurs when there is a compare event. Note that here, "input clock" refers to the clock selected by the CLKSRC bits of the GPT Control Register. 000 Output disconnected. No response on pin. 001 Toggle output pin 010 Clear output pin 011 Set output pin 1xx Generate an active low pulse (that is one input clock wide) on the output pin.
25–23 OM2	See OM3
22–20 OM1	See OM3
19–18 IM2	IM2 (bits 19-18, Input Capture Channel 2 operating mode) IM1 (bits 17-16, Input Capture Channel 1 operating mode) The IM*n* bit field determines the transition on the input pin (for Input capture channel *n*), which will trigger a capture event. 00 capture disabled 01 capture on rising edge only 10 capture on falling edge only 11 capture on both edges
17–16 IM1	See IM2
15 SWR	Software reset. This is the software reset of the GPT module. It is a self-clearing bit. • The SWR bit is set when the module is in reset state. • The SWR bit is cleared when the reset procedure finishes. • Setting the SWR bit resets **all of the registers** to their default reset values, except for the EN, ENMOD, STOPEN, DOZEEN, WAITEN, and DBGEN bits in the GPT Control Register (this control register). 0 GPT is not in reset state 1 GPT is in reset state
14–11 Reserved	This read-only field is reserved and always has the value 0.
10 EN_24M	Enable 24 MHz clock input from crystal.

Table continues on the next page...

GPTx_CR field descriptions (continued)

Field	Description
	• A hardware reset resets the EN_24M bit. • A software reset *does not affect* the EN_24M bit. 0 24M clock disabled 1 24M clock enabled
9 FRR	Free-Run or Restart mode. The FFR bit determines the behavior of the GPT when a compare event in channel 1 occurs. • In Restart mode, after a compare event, the counter resets to 0x00000000 and resumes counting (after the occurrence of a compare event). • In Free-Run mode, after a compare event, the counter continues counting until 0xFFFFFFFF and then rolls over to 0. 0 Restart mode 1 Free-Run mode
8–6 CLKSRC	Clock Source select. The CLKSRC bits select which clock will go to the prescaler (and subsequently be used to run the GPT counter). • The CLKSRC bit field value should only be changed after disabling the GPT by clearing the EN bit in this register (GPT_CR). • A software reset does not affect the CLKSRC bit. 000 No clock 001 Peripheral Clock (ipg_clk) 010 High Frequency Reference Clock (ipg_clk_highfreq) 011 External Clock 100 Low Frequency Reference Clock (ipg_clk_32k) 101 Crystal oscillator as Reference Clock (ipg_clk_24M) others Reserved
5 STOPEN	GPT Stop Mode enable. The STOPEN read/write control bit enables GPT operation *during Stop mode*. • A hardware reset resets the STOPEN bit. • A software reset *does not affect* the STOPEN bit. 0 GPT is disabled in Stop mode. 1 GPT is enabled in Stop mode.
4 DOZEEN	GPT Doze Mode Enable. • A hardware reset resets the DOZEEN bit. • A software reset *does not affect* the DOZEEN bit. 0 GPT is disabled in doze mode. 1 GPT is enabled in doze mode.
3 WAITEN	GPT Wait Mode enable. The WAITEN read/write control bit enables GPT operation *during Wait mode*. • A hardware reset resets the WAITEN bit. • A software reset *does not affect* the WAITEN bit. 0 GPT is disabled in wait mode. 1 GPT is enabled in wait mode.

Table continues on the next page...

GPTx_CR field descriptions (continued)

Field	Description
2 DBGEN	GPT debug mode enable. The DBGEN read/write control bit enables GPT operation *during Debug mode*. • A hardware reset resets the DBGEN bit. • A software reset *does not affect* the DBGEN bit. 0 GPT is disabled in debug mode. 1 GPT is enabled in debug mode.
1 ENMOD	GPT Enable mode. When the GPT is disabled (EN=0), then both the Main Counter and Prescaler Counter *freeze their current count values*. The ENMOD bit determines the value of the GPT counter when Counter is enabled again (if the EN bit is set). • If the ENMOD bit is 1, then the Main Counter and Prescaler Counter values are reset to 0 after GPT is enabled (EN=1). • If the ENMOD bit is 0, then the Main Counter and Prescaler Counter restart counting *from their frozen values* after GPT is enabled (EN=1). • If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter *freeze at their current count values* when the GPT enters low power mode. • When GPT exits low power mode, the Main Counter and Prescaler Counter start counting from their frozen values, regardless of the ENMOD bit value. • Setting the SWR bit will clear the Main Counter and Prescaler Counter values, regardless of the value of EN or ENMOD bits. • A hardware reset resets the ENMOD bit. • A software reset *does not affect* the ENMOD bit. 0 GPT counter will retain its value when it is disabled. 1 GPT counter value is reset to 0 when it is disabled.
0 EN	GPT Enable. The EN bit is the GPT module enable bit. **Before setting the EN bit**, we recommend that *all registers be properly programmed*. • A hardware reset resets the EN bit. • A software reset *does not affect* the EN bit. 0 GPT is disabled. 1 GPT is enabled.

12.1.6.2 GPT Prescaler Register (GPTx_PR)

The GPT Prescaler Register (GPT_PR) contains bits that determine the *divide value* of the clock that runs the counter.

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

12.1.6.5 GPT Output Compare Register 1 (GPTx_OCR1)

The GPT Compare Register 1 (GPT_OCR1) holds the value that determines when a compare event will be generated on Output Compare Channel 1. Any write access to the Compare register of Channel 1 while in Restart mode (FRR=0) will reset the GPT counter.

An IP Bus Write access to the GPT Output Compare Register1 (GPT_OCR1) occurs *after* one cycle of wait state; an IP Bus Read access occurs *immediately* (0 wait states).

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

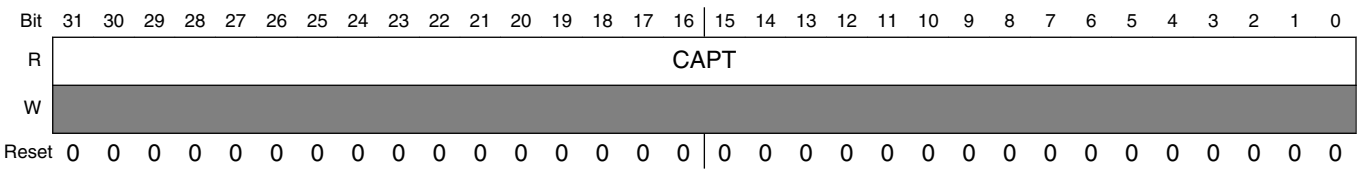
GPTx_OCR3 field descriptions

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 3.

12.1.6.8 GPT Input Capture Register 1 (GPTx_ICR1)

The GPT Input Capture Register 1 (GPT_ICR1) is a read-only register that holds the value *that was in the counter during the last capture event* on Input Capture Channel 1.

Address: Base address + 1Ch offset



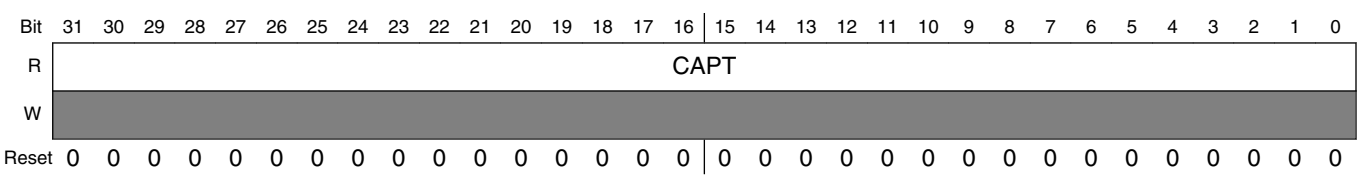
GPTx_ICR1 field descriptions

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 1 occurs, the current value of the counter is loaded into GPT Input Capture Register 1.

12.1.6.9 GPT Input Capture Register 2 (GPTx_ICR2)

The GPT Input capture Register 2 (GPT_ICR2) is a read-only register which holds the value that was in the counter during the last capture event on input capture channel 2.

Address: Base address + 20h offset



GPTx_ICR2 field descriptions

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 2 occurs, the current value of the counter is loaded into GPT Input Capture Register 2.

12.1.6.10 GPT Counter Register (GPTx_CNT)

The GPT Counter Register (GPT_CNT) is the main counter's register. GPT_CNT is a read-only register and can be read *without affecting the counting process* of the GPT.

Address: Base address + 24h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPTx_CNT field descriptions

Field	Description
COUNT	Counter Value. The COUNT bits show the current count value of the GPT counter.

12.2 Pulse Width Modulation (PWM)

12.2.1 Overview

The Pulse Width Modulation (PWM) has a 16-bit counter, and is optimized to generate sound from stored sample audio images and it can also generate tones. It uses 16-bit resolution and a 4 x 16 data FIFO.

This section presents an overview of the PWM. A block diagram of the PWM module is shown in the figure below.

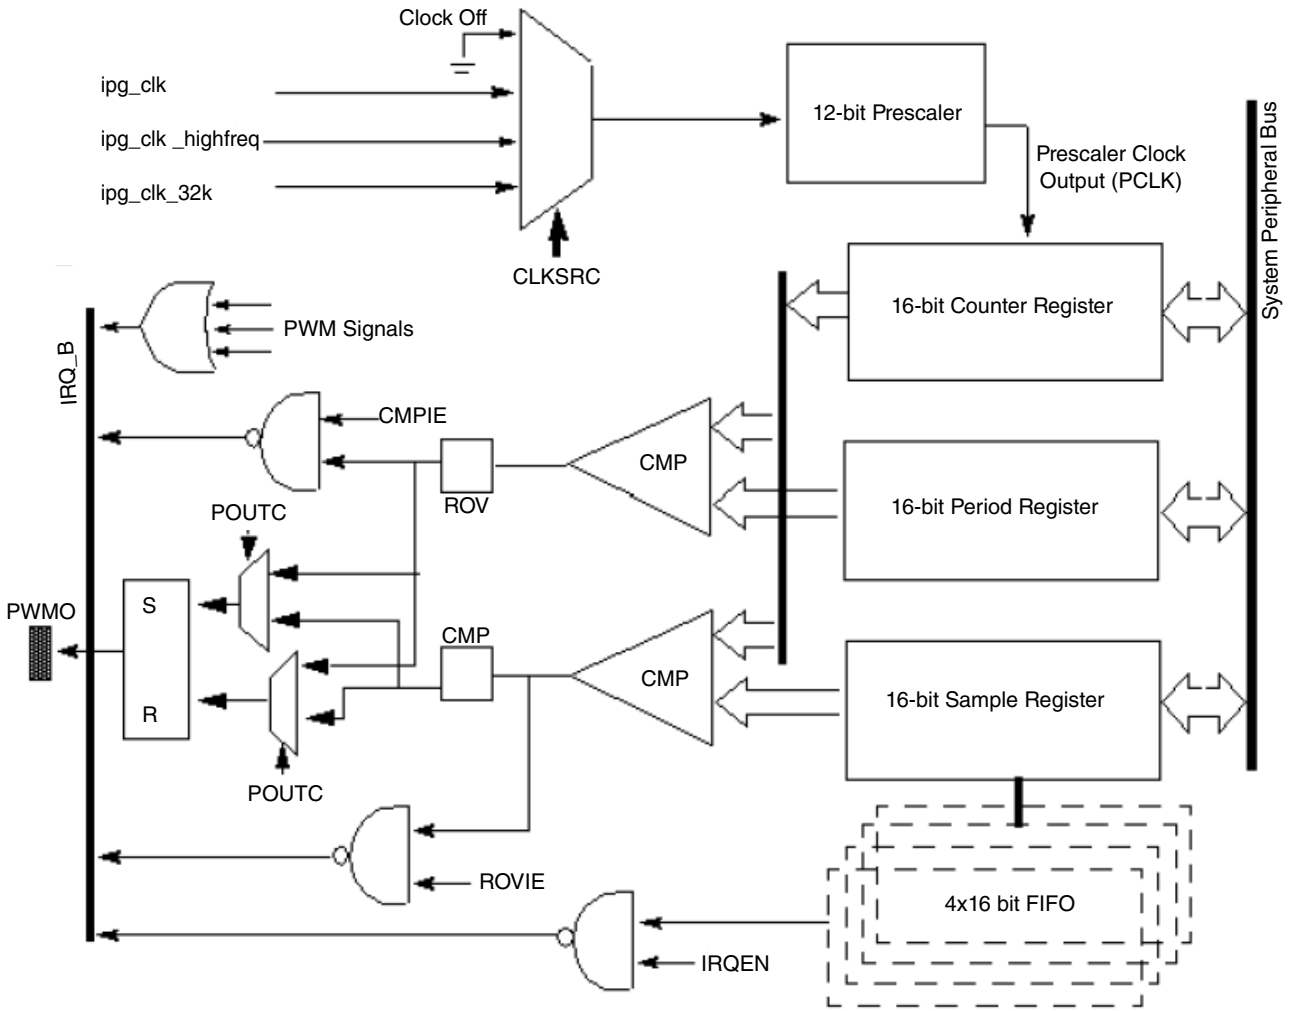

Figure 12-6. Pulse-Width Modulator Block Diagram

The following features characterize the PWM:

- 16-bit up-counter with clock source selection
- 4 x 16 FIFO to minimize interrupt overhead
- 12-bit prescaler for division of clock
- Sound and melody generation
- Active high or active low configured output
- Can be programmed to be active in low-power mode
- Can be programmed to be active in debug mode
- Interrupts at compare and rollover

12.2.2 External Signals

The PWM follows IP Bus protocol when interfacing with the processor core. PWM does not have any interface signals with any other block inside the chip except for clock and reset inputs from the Clock Control Module (CCM), System Reset Controller (SRC), and interrupt signals to the processor interrupt handler. There is a single output signal.

12.2.3 Clocks

The table found here describes the clock sources for PWM. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 12-2. PWM Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	low-frequency reference clock (32 kHz)
ipg_clk_highfreq	perclk_clk_root	high-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

The clock that feeds the prescaler can be selected from:

- High-frequency reference clock (ipg_clk_highfreq) pat_ref or CKIH

  This is a high frequency clock, provided by the Clock Control Module (CCM). This clock should be on in the low power mode when the ipg_clk is turned off. Thus, the PWM can be run on this clock in the low power mode. The CCM is expected to provide this clock after synchronizing it to ahb_clk in the normal functional mode and then switch to the unsynchronized version in the low power mode.

- Low-frequency reference clock (ipg_clk_32k, CKIL)

  This is the 32 KHz low reference clock which is provided by the CCM. This clock should be on in the low power mode when ipg_clk is turned off. Thus, PWM can be run on this clock in the low power mode. The CCM is expected to provide this clock after synchronizing it to ahb_clk in the normal functional mode and then switch to the unsynchronized version in the low power mode.

- Peripheral clock (ipg_clk)

  This clock should be on in normal operations. In low power mode, it can be switched off.

- Peripheral access clock (ipg_clk_s)

  This clock is used for register read/write.

The clock input source is determined by the PWM control register field PWM_CR[CLKSRC]. The CLKSRC value should only be changed when the PWM is disabled.

A change in the value of the PRESCALER field of the control register is immediately reflected on its output clock frequency.

12.2.4 Functional Description

The following sections detail the PWM operation and function.

12.2.4.1 Operation

The output of the PWM is a toggling signal whose frequency and duty cycle can be modulated by programming the appropriate registers. It has a 16-bit up counter which counts from 0x0000 until the counter value equals the PWM_PR + 1. After this match occurs the counter is reset to 0x0000.

At the beginning of a count period cycle, the PWMO pin is set to one (default) and the counter begins counting up from 0x0000. The sample value in the sample FIFO is compared on each count of prescaler clock. When the sample and count values match, the PWMO signal is cleared to zero (default). The counter continues counting until the period match occurs and subsequently another period cycle begins.

When the PWM is enabled, the counter starts running and generates an output with the reset values in the period and sample registers. It is recommended that the programming of these registers be done before PWM is enabled.

A hardware reset results in all the PWM count and sample registers being cleared and the FIFO being flushed. The control register shows that FIFO is empty and it can be written into, and the PWM is disabled. A software reset has the same results, however the state of the DBGEN, STOPEN, DOZEN, and WAITEN bits in the control register are not affected. Software reset can be asserted even when the PWM is in disabled state.

12.2.4.1.1 FIFO

Digital sample values can be loaded into the pulse-width modulator as 16-bit words. The endianess can be changed using the BCTR and HCTR bits of the control register. A 4-word (16-bit) FIFO minimizes interrupt overhead. A maskable interrupt is generated when the number of data words fall below the water level set by the FWM field in the control register.

A write to the PWM_SAR sample register results in the value being stored into the FIFO if it is not full. A write when the FIFO is full sets FWE (FIFO write error) bit in the status register and the FIFO contents remain unchanged. The FIFO can be written at any time, but can be read only when the PWM is enabled. The PWM_SR[FIFOAV] field shows how many data words are currently contained in the FIFO and whether or not it can be written into.

A read on the sample register yields the current FIFO value that is being used, or will be used, by the PWM for generation on the output signal. Therefore, a write and a subsequent read on the sample register may result in different values being obtained.

12.2.4.1.2 Rollover and Compare Event

The counter is reset to 0x0000 after its value equals the PWM_PR[PERIOD] + 1 and resumes counting thereafter. This event is referred to as a rollover. For example, if PWM_PR[PERIOD] = 0x0000, the counter is reset when it equals 0x0001. When PWM_PR[PERIOD] = 0xFFFF or 0xFFFE, the counter is reset when it equals 0xFFFF. For more information, see the PWM Period Register (PWM_PR) description.

During a rollover event the output is either set (default), reset or has no effect according to the programming of the POUTC field in the control register. This event can also generate an interrupt if the respective interrupt enable bit is set in the control register.

When the counter value reaches the sample value, the output of the PWM is reset (default), set or has no effect according to the programming of the POUTC field of control register. This event is referred to as a compare event. This event can also generate an interrupt if the respective interrupt enable bit is set in the control register.

If the rollover event sets the PWM output signal, the compare event will reset it and vice versa for a particular programming configuration of POUTC field.

12.2.4.1.3 Low Power Mode Behavior

In low power mode, if the clock from the selected clock source is available, the PWM counter continues to run and an output is produced, depending on whether the control bit for that mode is set or not. In the absence of the clock itself, or if the corresponding low power bit in the control register is 0, the counter is reset and resumes counting when it exits the low power mode.

12.2.4.1.4 Debug Mode Behavior

In debug mode, PWM has the option of continuing to run or be halted. If the DBGEN bit is not set in the PWM_PWMCR, the PWM is halted. If the DBGEN bit is set, then the PWM will continue to run in the debug mode.

12.2.5 Enable Sequence for the PWM

The sequence found here should be used to enable the PWM.

1. Configure the desired settings for the PWM Control Register (PWMx_PWMCR) while keeping the PWM disabled (PWMx_PWMCR[0]=0).
2. Enable the desired interrupts in the PWM Interrupt Register (PWMx_PWMIR).
3. One to three initial samples may be written to the PWM Sample Register (PWMx_PWMSAR). The initial sample values will be loaded into the PWM FIFO even if the PWM is not yet enabled. Do not write a 4th sample because the FIFO will become full and trigger a FIFO Write Error (FWE). This error will prevent the PWM from starting once it is enabled.
4. Check the FIFO Write Error status bit (FWE), the Compare status bit (CMP) and the Roll-over status bit (ROV) in the PWM Status Register (PWMx_PWMSR) to make sure they are all zero. Any non-zero status bits should be cleared by writing a 1 to them.
5. Write the desired period to the PWM Period Register (PWMx_PWMPR).
6. Enable the PWM by writing a 1 to the PWM Enable bit, PWMx_PWMCR[0], while maintaining the other register bits in their previously configured state.

12.2.6 Disable Sequence for the PWM

The PWM can be disabled at any time by clearing the PWM enable bit, PWMx_PWMCR[0] to 0.

Any data remaining in the FIFO will not be produced at the PWM output after the PWM has been disabled and will remain in the FIFO until the PWM is enabled again. A software reset (setting PWMx_PWMCR[3] to 1) or a hardware reset will clear the FIFO and any remaining data will be lost.

12.2.7 PWM Memory Map/Register Definition

The PWM includes six user-accessible 32-bit registers.

PWM memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

PWMx_PWMCR field descriptions

Field	Description
31–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27–26 FWM	FIFO Water Mark. These bits are used to set the data level at which the FIFO empty flag will be set and the corresponding interrupt generated 00 FIFO empty flag is set when there are more than or equal to 1 empty slots in FIFO 01 FIFO empty flag is set when there are more than or equal to 2 empty slots in FIFO 10 FIFO empty flag is set when there are more than or equal to 3 empty slots in FIFO 11 FIFO empty flag is set when there are more than or equal to 4 empty slots in FIFO
25 STOPEN	Stop Mode Enable. This bit keeps the PWM functional while in stop mode. When this bit is cleared, the input clock is gated off in stop mode. This bit is not affected by software reset. It is cleared by hardware reset.

Table continues on the next page...

PWMx_PWMCR field descriptions (continued)

Field	Description
	0 Inactive in stop mode 1 Active in stop mode
24 DOZEN	Doze Mode Enable. This bit keeps the PWM functional in doze mode. When this bit is cleared, the input clock is gated off in doze mode. This bit is not affected by software reset. It is cleared by hardware reset. 0 Inactive in doze mode 1 Active in doze mode
23 WAITEN	Wait Mode Enable. This bit keeps the PWM functional in wait mode. When this bit is cleared, the input clock is gated off in wait mode. This bit is not affected by software reset. It is cleared by hardware reset. 0 Inactive in wait mode 1 Active in wait mode
22 DBGEN	Debug Mode Enable. This bit keeps the PWM functional in debug mode. When this bit is cleared, the input clock is gated off in debug mode. This bit is not affected by software reset. It is cleared by hardware reset. 0 Inactive in debug mode 1 Active in debug mode
21 BCTR	Byte Data Swap Control. This bit determines the byte ordering of the 16-bit data when it goes into the FIFO from the sample register. 0 byte ordering remains the same 1 byte ordering is reversed
20 HCTR	Half-word Data Swap Control. This bit determines which half word data from the 32-bit IP Bus interface is written into the lower 16 bits of the sample register. 0 Half word swapping does not take place 1 Half words from write data bus are swapped
19–18 POUTC	PWM Output Configuration. This bit field determines the mode of PWM output on the output pin. 00 Output pin is set at rollover and cleared at comparison 01 Output pin is cleared at rollover and set at comparison 10 PWM output is disconnected 11 PWM output is disconnected
17–16 CLKSRC	Select Clock Source. These bits determine which clock input will be selected for running the counter. After reset the system functional clock is selected. The input clock can also be turned off if these bits are set to 00. This field value should only be changed when the PWM is disabled 00 Clock is off 01 ipg_clk 10 ipg_clk_highfreq 11 ipg_clk_32k
15–4 PRESCALER	Counter Clock Prescaler Value. This bit field determines the value by which the clock will be divided before it goes to the counter. 0x000 Divide by 1 0x001 Divide by 2 0xfff Divide by 4096
3 SWR	Software Reset. PWM is reset when this bit is set to 1. It is a self clearing bit. A write 1 to this bit is a single wait state write cycle. When the block is in reset state this bit is set and is cleared when the reset

Table continues on the next page...

PWMx_PWMCR field descriptions (continued)

Field	Description
	procedure is over. Setting this bit resets all the registers to their reset values except for the DBGEN, STOPEN, DOZEN, and WAITEN bits in this control register. 0 PWM is out of reset 1 PWM is undergoing reset
2–1 REPEAT	Sample Repeat. This bit field determines the number of times each sample from the FIFO is to be used. 00 Use each sample once 01 Use each sample twice 10 Use each sample four times 11 Use each sample eight times
0 EN	PWM Enable. This bit enables the PWM. If this bit is not enabled, the clock prescaler and the counter is reset. When the PWM is enabled, it begins a new period, the output pin is set to start a new period while the prescaler and counter are released and counting begins. To make the PWM work with softreset and disable/enable, users can do software reset by seting the SWR bit, wait software reset done, configure the registers, and then enable the PWM by setting this bit to "1" Users can also disable/enable the PWM if PWM would like to be stopped and resumed with same registers configurations . 0 PWM disabled 1 PWM enabled

12.2.7.2 PWM Status Register (PWMx_PWMSR)

The PWM status register (PWM_PWMSR) contains seven bits which display the state of the FIFO and the occurrence of rollover and compare events. The FIFOAV bit is read-only but the other four bits can be cleared by writing 1 to them. The FE, ROV, and CMP bits are associated with FIFO-Empty, Roll-over, and Compare interrupts, respectively.

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0

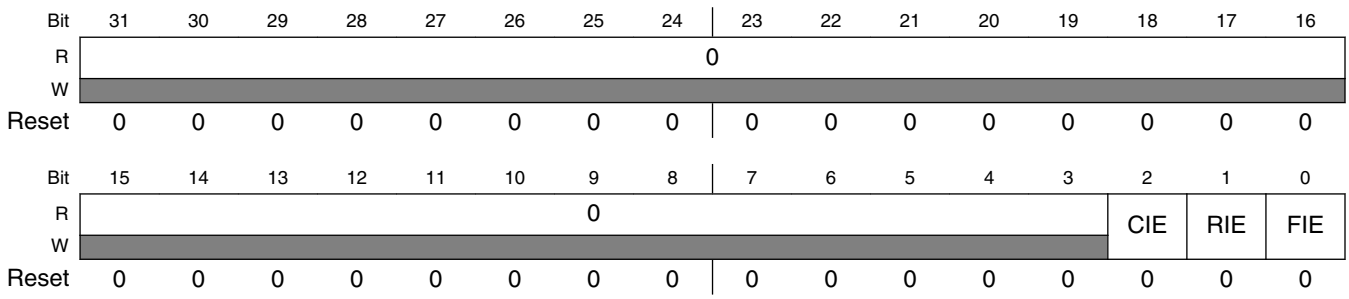
PWMx_PWMSR field descriptions

Field	Description
31–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6 FWE	FIFO Write Error Status. This bit shows that an attempt has been made to write FIFO when it is full. 0 FIFO write error not occurred 1 FIFO write error occurred
5 CMP	Compare Status. This bit shows that a compare event has occurred. 0 Compare event not occurred 1 Compare event occurred
4 ROV	Roll-over Status. This bit shows that a roll-over event has occurred. 0 Roll-over event not occurred 1 Roll-over event occurred
3 FE	FIFO Empty Status Bit. This bit indicates the FIFO data level in comparison to the water level set by FWM field in the control register. 0 Data level is above water mark 1 When the data level falls below the mark set by FWM field
FIFOAV	FIFO Available. These read-only bits indicate the data level remaining in the FIFO. An attempted write to these bits will not affect their value and no transfer error is generated. 000 No data available 001 1 word of data in FIFO 010 2 words of data in FIFO 011 3 words of data in FIFO 100 4 words of data in FIFO 101 unused 110 unused 111 unused

12.2.7.3 PWM Interrupt Register (PWMx_PWMIR)

The PWM Interrupt register (PWM_PWMIR) contains three bits which control the generation of the compare, rollover and FIFO empty interrupts.

Address: Base address + 8h offset



PWMx_PWMIR field descriptions

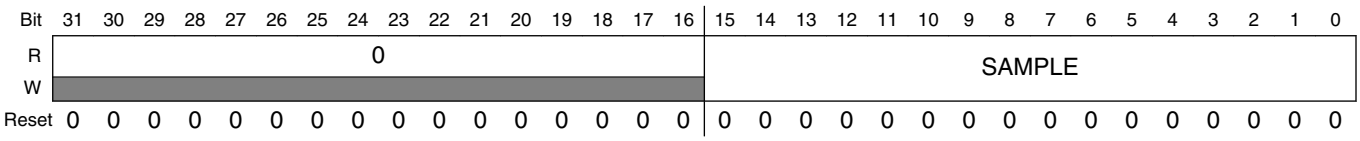
Field	Description
31–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 CIE	Compare Interrupt Enable. This bit controls the generation of the Compare interrupt. 0 Compare Interrupt not enabled 1 Compare Interrupt enabled
1 RIE	Roll-over Interrupt Enable. This bit controls the generation of the Rollover interrupt. 0 Roll-over interrupt not enabled 1 Roll-over Interrupt enabled
0 FIE	FIFO Empty Interrupt Enable. This bit controls the generation of the FIFO Empty interrupt. 0 FIFO Empty interrupt disabled 1 FIFO Empty interrupt enabled

12.2.7.4 PWM Sample Register (PWMx_PWMSAR)

The PWM sample register (PWM_PWMSAR) is the input to the FIFO. 16-bit words are loaded into the FIFO. The FIFO can be written at any time, but can be read only when the PWM is enabled. The PWM will run at the last set duty-cycle setting if all the values of the FIFO has been utilized, until the FIFO is reloaded or the PWM is disabled. When a new value is written, the duty cycle changes after the current period is over.

A value of zero in the sample register will result in the PWMO output signal always being low/high (POUTC = 00 it will be low and POUTC = 01 it will be high), and no output waveform will be produced. If the value in this register is higher than the PERIOD + 1, the output will never be set/reset depending on POUTC value.

Address: Base address + Ch offset



PWM*x*_PWMSAR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
SAMPLE	Sample Value. This is the input to the 4x16 FIFO. The value in this register denotes the value of the sample being currently used.

12.2.7.5 PWM Period Register (PWM*x*_PWMPR)

The PWM period register (PWM_PWMPR) determines the period of the PWM output signal. After the counter value matches PERIOD + 1, the counter is reset to start another period.

PWMO (Hz) = PCLK(Hz) / (period +2)

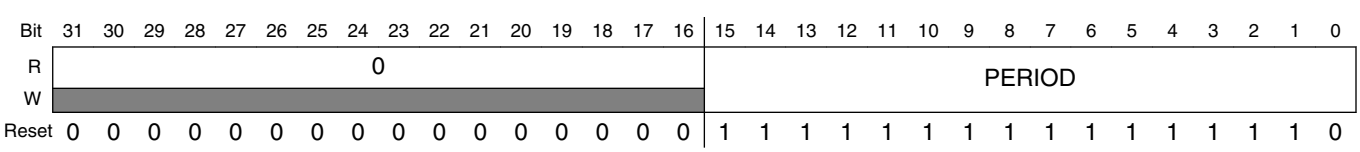
A value of zero in the PWM_PWMPR will result in a period of two clock cycles for the output signal. Writing 0xFFFF to this register will achieve the same result as writing 0xFFFE.

A change in the period value due to a write in PWM_PWMPR results in the counter being reset to zero and the start of a new count period.

NOTE

Settings PWM_PWMPR to 0xFFFF when PWMx_PWMCR REPEAT bits are set to non-zero values is not allowed.

Address: Base address + 10h offset



PWMx_PWMPR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
PERIOD	Period Value. These bits determine the Period of the count cycle. The counter counts up to [Period Value] +1 and is then reset to 0x0000.

12.2.7.6 PWM Counter Register (PWMx_PWMCNR)

The read-only pulse-width modulator counter register (PWM_PWMCNR) contains the current count value and can be read at any time without disturbing the counter.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PWMx_PWMCNR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Counter Value. These bits are the counter register value and denotes the current count state the counter register is in.

Chapter 13
Multimedia

13.1 Multimedia Overview

13.1.1 Multimedia Overview

13.1.1.1 Display Interface

Display Interface consists of the following:

- Enhanced LCD Interface (eLCDIF)
  - Support 8-bit / 16-bit / 18-bit / 24-bit / 32-bit pixel depth
  - Support DOTCLK mode for MIPI-DPI interface
  - Support MPU mode for MIPI-DBI interface
  - Support resolution up to 1920x1080p60 and 1800x1200p60
  - Support one base layer and one graphics overlay with alpha blending
- Display Controller (DCSS) - provides a mechanism to display frame buffers in memory out to UltraHD or HDTVs. It has the capability to combine up to 3 layers of graphics or video overlay to the HDMI output. The key features of the display controller includes:
  - Supports up to 3 layers of graphics or video
    - Arbitrary offset
    - One plane can be graphics with 8 bit alpha support
    - Upscale 1920x1080p60 video or graphics to 3840x2160p60
    - Downscale 3840x2160p30 video to 1920x1080p30 or 1280x720p30
  - HDR support:
    - HDR10 with 2084 and 2020
    - Dolby Vision single and dual layer formats
    - HLG
  - HDMI 2.0a supporting one display:
    - Resolutions of: 640x480p60, 720x480p60, 1280x720p60, 1920x1080p60, 3840x2160p60, 4096x2160p60

        - HDCP 2.2 and HDCP 1.4
        - Pixel clock up to 596 MHz
    - Audio support:
        - 32 channel audio output support
        - 1 S/PDIF audio ARC input support
    - Output can also go to MIPI DSI output
    - Frame Buffer Compression – Lossless compression of buffers
- HD Display Transmitter Controller (HDMI TX) - The HDMI firmware and HDCP keys are loaded by the boot core running ROM code. Once they are loaded, they need to be retained in the HDMI logic until next chip power-on reset. More information about the HDCP key handling can be found in the system boot chapter.
    - HDMI 2.0a complaint
    - HDCP 2.2 and HDCP 1.4 encryption
    - Support a maximum display resolution of 4096x2160@60Hz with a pixel clock frequency of 596MHz
- MIPI DSI Host Controlller (MIPI_DSI) - one 4-lane MIPI DSI display with pixels from either the DCSS HDR Display Controller or the eLCDIF. The key features of the MIPI DSI (controller and PHY) include:
    - Complaint to MIPI-DSI standard v1.1
    - Support up to 4 data lanes
    - Support 80Mbps - 1.5Gbps data rate in high speed operation
    - Support 10Mbps data rate in low power operation
- MIPI CSI Host Controller (MIPI_CSI) - two 4-lane MIPI CSI2 camera input. The key features of the MIPI CSI2 (controller and PHY) includes:
    - Complaint to MIPI-CSI2 standard
    - Support up to 4 data lanes
    - Support 80Mbps - 1.5Gbps data rate in high speed operation
    - Support 10Mbps data rate in low power operation
    - Support 5M pixel at 15 fps, 1080p30, 720p60, VGA at 60 fp

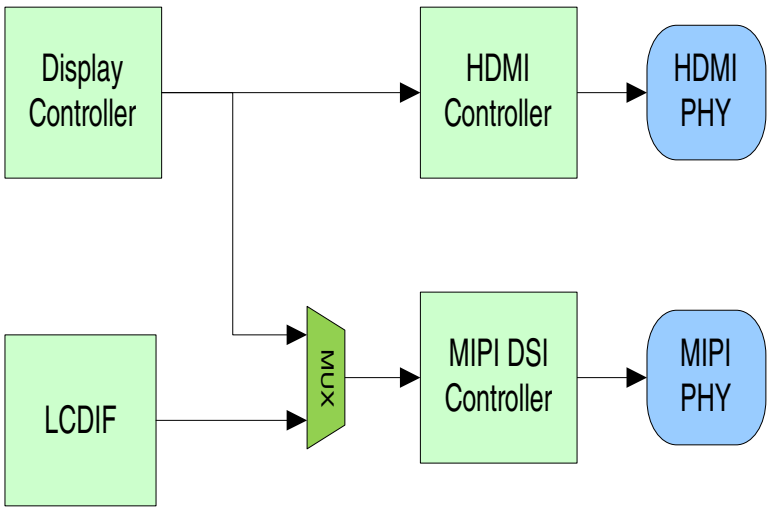

Figure 13-1. Display Interface

The following use cases are supported:

- Dual display: HDMI driven by Display Controller, with video playback support on HDMI; MIPI driven by LCDIF, without video playback support on MIPI
- Single display: HDMI driven by Display Controller, with video playback support on HDMI
- Single display: MIPI driven by Display Controller, with video playback support on MIPI
- Single display: MIPI driven by LCDIF, without video playback support on MIPI.

The i.MX 8M Dual/8M QuadLite/8M Quad do not support parallel display interface.

13.1.1.2 Graphics Processing Unit (GPU)

The chip utilizes a GPU to provide 2D/3D acceleration. Key features include:

- Run up to 800 MHz at 0.9V nominal voltage
- Support 267 million triangles/sec
- Support 1.6 Giga pixel/sec fill rate
- Support 25.6 GFLOPs 32-bit, 51.2 GFLOPs 16-bit
- Support OpenGL ES 1.1, 2.0, 3.0, 3.1
- Support OpenCL 1.1/1.2 FP
- TrustZone support using a local MMU to manage secure regions

For the best power and performance optimization, the GPU has following physical implementation:

- Independently powered with a dedicate power supply (VDD_GPU) to allow DVFS

- Support power down with internal power switch or its supply (VDD_GPU) shut off externally
- Dedicated PLL to allow most flexible clock frequency setting

13.1.1.3 Video Processing Unit (VPU)

The chip supports video decoding for various video format using the Hantro G2 + G1. Features include:

- 4Kp60 HEVC/H.265 Main, Main10 (Hantro G2) with best effort for 4Kp75
  - 4Kp75 is needed to support PiP (Picture in Picture) for live TV and dual layer Dolby Vision decoding one 4Kp60 stream and one 1080p60 stream
- 4Kp60 VP9 Profile 0, 2 (10 bit) (Hantro G2)
- 4Kp30 AVC/H.264 Baseline, Main, High decoder (Hantro G1)
- 1080p60 MPEG-2, MPEG-4p2, VC-1, VP8, RV9, AVS, MJPEG, H.263 decoder (Hantro G1)
- Lossless Frame Buffer Compression
- TrustZone support

For the best power and performance optimization, the VPU has following physical implementation:

- Independently powered with a dedicate power supply (VDD_VPU) to allow DVFS
- Support power down with internal power switch or its supply (VDD_VPU) shut off externally
- Dedicated PLL to allow most flexible clock frequency setting

13.1.1.4 Audio Interface

The device supports multiple audio interfaces as listed below:

Table 13-1. Audio Interface Summary

Interface	Function	RX Data Line	TX Data Line	Note
SAI-1	External audio	8	8	
SAI-2	External audio	1	1	
SAI-3	External audio	1	1	
SAI-4	HDMI-TX	0	4	Internal connection
SAI-5	External audio	4	4	
SAI-6	External audio	1	1	
SPDIF-1	External audio	1	1	
SPDIF-2	HDMI ARC	1	0	Internal connection

In addition to the general audio input/output functions, the audio interfaces support the following features:

- SAI-1 supports up to 16-channels TX (8 lanes) and 16-channels RX (8 lanes) at 384KHz/32-bit
- SAI-5 supports up to 8-channels TX (4 lanes) and 8-channels RX (4 lanes) at 384KHz/32-bit
- SAI-2/3/6 supports up to 2-channels TX (1 lanes) and 2-channels RX (1 lanes) at 384KHz/32-bit
- SAI-2/3/6 support up to 2-channels TX (1 lane) and 2-channels RX (1 lane) at 384KHz/32-bit
- SAI-1 supports glue-less switching between PCM and DSD operation for popular audio DACs
- SPDIF-1/2 supports raw capture mode that can save all incoming bits into an audio buffer

The SAI-1/2/3/5/6 and SPDIF-1 share GPIO pads on the chip through IOMUX. Common use cases supported by the audio interfaces are listed in the table below (many other configurations are possible). The number is the data lanes supported

Table 13-2. Audio Interface Use Cases

		UC 1	UC 2	UC 3	UC 4	UC 5	UC 6	UC 7	UC 8
SAI-1	TX	8 + DSD	8 + DSD	8 + DSD	8	8	8	4	4
	RX	8	8	8	8	8	8	4	4
SAI-2	TX	1		1		1	1		1
	RX	1		1		1	1		1
SAI-3	TX	1			1	1	1	1	1
	RX	1			1	1	1	1	1
SAI-5	TX		4		4	1		4	1
	RX		4	4	4	1	4	4	1
SAI-6	TX							1	1
	RX							1	1
SPDIF-1	TX	1	1	1	1	1	1	1	1
	RX	1	1	1	1	1	1	1	1

13.1.1.4.1 SAI Master Clock Inputs/Outputs

The MCLK pin on each SAI module can be configured as either an input or an output. When configured as an output, the SAIn_CLK_ROOT from the CCM is routed to the pad output. When configured as an input, the external input to the pad is routed to SAIn_MCLK, which can be used as master clock for SAI. Below is the diagram showing the both input/output options, by using SAI1 as the example.

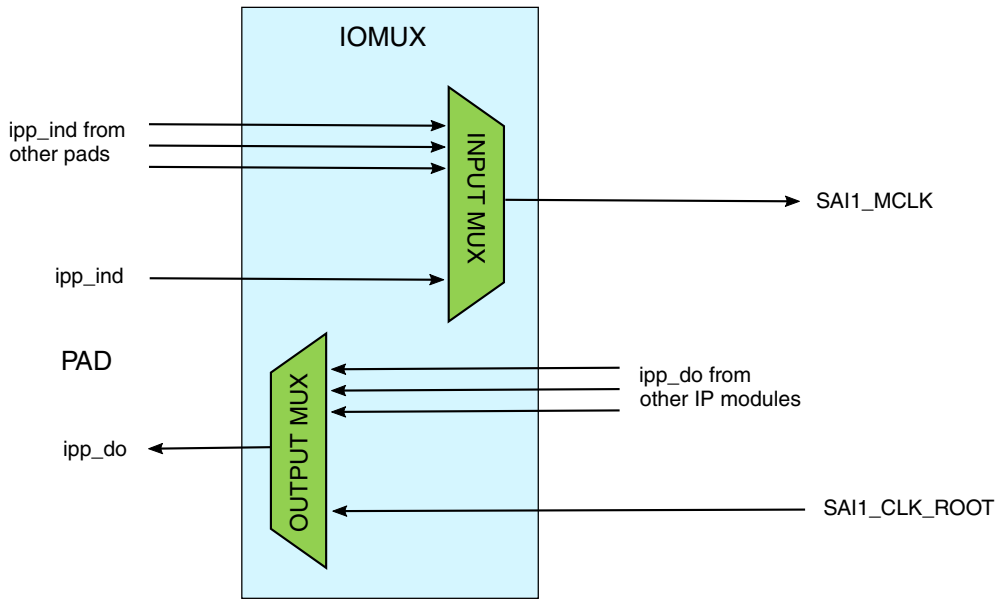

Figure 13-2. SAI MCLK Input and Output

Each SAI module supports up to 3 master clock inputs. The TX and RX sub-module inside each SAI can independently select one of the clock inputs as its master clock. This allows TX and RX of one SAI to run from different clock sources. The master clock inputs have the following options:

- SAIn_MCLK[1] can be selected from SAIn_CLK_ROOT from CCM or SAIn_MCLK from IOMUX. This is the most straight-forward clock routing in which SAIn only uses its own clock source from CCM or IO pad
- SAIn_MCLK[2] can be selected from the following clock sources:
  - Any of the SAIn_CLK_ROOT from CCM
  - Any of the SAIn_MCLK from IOMUX
  - Other clock sources from SPIDF
- SAIn_MCLK[3] has the same clock source options as SAIn_MCLK[2]. This allows both TX and RX to have access to all the options without any dependency between each other

The clock options for master clock on SAI are shown in the diagram blow, by using SAI-1 as an example.

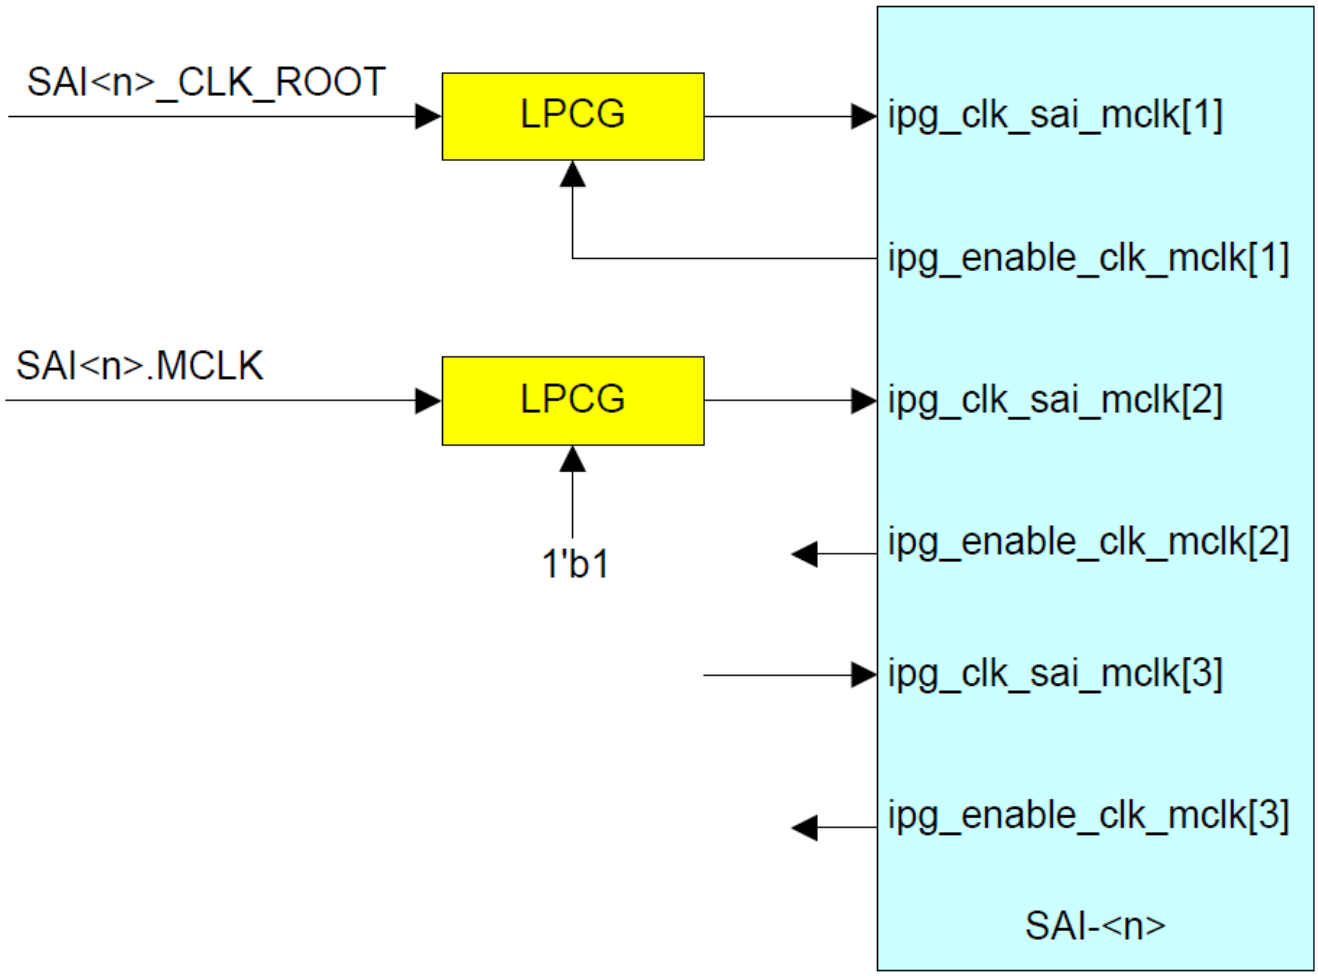

Figure 13-3. SAI Master Clock Options

The options on MCLK[1] are also available on MCLK[2] and MCLK[3]. This provides a similar SAI clock structure as i.MX6/i.MX7 processors.

The configuration of the MUX for master clock is controlled by IOMUXC_GPR registers. They should be configured before the SAI clock is enabled to avoid glitches on the clock.

13.1.1.4.2 SDMA Support

SDMA support is provided for SAI and SPDIF. In order to meet the audio data rate, two SDMA modules are used.

Because the SAI-2/3 and SPDIF-1/2 do not require high data throughput, they are assigned to SDMA-1, shared with other peripherals such as UART/SPI. SAI-1/4/5/6 need to support high sample rate and multi-channel audio, they are assigned to SDMA-2, which is a dedicated SDMA engine for audio. The SDMA-2 frequency is increased to 500/250 instead of 133/66 to make sure it has enough throughput.

Table 13-3. SDMA Assignment for Audio Interface

SDMA	Audio Interface	Note
SDMA-1 133MHz AHB, 66MHz IPG	SAI-2	1 TX + 1 RX
	SAI-3	1 TX + 1 RX
	SPDIF-1	TX + RX
	SPDIF-2	RX only, for HDMI ARC
SDMA-2 500MHz AHB, 250MHz IPG	SAI-1	8 TX + 8 RX
	SAI-4	4 TX only, for HDMI
	SAI-5	4 TX + 4 RX
	SAI-6	1 TX + 1 RX

13.2 Enhanced LCD Interface (eLCDIF)

13.2.1 Overview

The enhanced Liquid Crystal Display Interface (LCDIF) is a general purpose display controller used to drive a wide range of display devices varying in size and capability.

The LCDIF block supports the following:

- Displays with an asynchronous parallel MPU interface for command and data transfer to an integrated frame buffer.
- Displays that support moving pictures and require the RGB interface mode (DOTCLK interface).
- VSYNC mode for high-speed data transfers.
- Digital video encoders that accept ITU-R BT.656 format 4:2:2 YCbCr digital component video and convert it to analog TV signals.

The LCDIF provides fully programmable functionality to supported interfaces:

- Bus master interface to source frame buffer data for display refresh. This interface can also be used to drive data for "Smart" displays.
- PIO interface to manage data transfers between "Smart" displays and SoC.
- 8/16/18/24/32 bit LCD data bus support available depending on I/O mux options.
- Programmable timing and parameters for MPU, VSYNC, and DOTCLK LCD interfaces to support a wide variety of displays.
- ITU-R BT.656 mode (called Digital Video Interface or DVI mode here) including progressive-to-interlace feature and RGB to YCbCr 4:2:2 color space conversion to support 525/60 and 625/50 operation.

13.2.2 Clocks

The following table describes the clock sources for LCDIF. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 13-4. LCDIF Clocks

Clock name	Clock Root	Description
apb_clk	MAIN_AXI_CLK_ROOT	AXI clock
pix_clk	LCDIF_PIXEL_CLK_ROOT	Pixel clock

13.2.3 Functional Description

Bus Interface Mechanisms through Initializing the LCDIF, describe the internal pipeline for the LCDIF interfaces. Differences for each mode are then described in separate sections, as follows:

- MPU Interface
- VSYNC Interface
- DOTCLK Interface
- ITU-R BT.656 Digital Video Interface (DVI)

LCDIF pin usage by interface mode is described in LCDIF Pin Usage by Interface Mode.

Figure 13-4. Top-Level Block Diagram of LCDIF subsystem

13.2.3.1 Bus Interface Mechanisms

The LCDIF module has memory-mapped control, data and status registers. It provides several interfaces to transfer data between the display and SoC.

The bus master interface is used to initiate the requests to transfer data from external memory to the display. It is completely autonomous, or no CPU intervention is required, to manage the cyclical nature of refreshing standard display types. Bus mastering can also be used for MPU mode data writes.

The PIO interface is used to interface to "Smart" displays to transfer frame buffer data and control information to/from the external display. The host CPU executes display drivers to manage the display solution. The following sections describe the system bus interface mechanisms.

13.2.3.1.1 Bus Master Operation in Write/Display Modes

The LCDIF block has a bus master interface that initiates requests for data to drive the display. The LCDIF_MASTER bit must be set to 1 to enable the bus master interface. Software should program all control registers required to transfer the frame sequence.

In the MPU and VSYNC mode, single frames are transferred. When a complete frame is transferred, LCDIF enters idle and clears the RUN bit in the CTRL register. For subsequent frame transmission, the LCDIF setup sequence should be repeated.

The DOTCLK and DVI mode is used to refresh the display at the desired refresh rate and resolution, and drive displays that don't integrate a display buffer memory. When the display is refreshed, the LCDIF will automatically update the LCDIF_CUR_BUF_ADDR register with the value in LCDIF_NEXT_BUF_ADDR at the end of current frame and start fetching the next frame from the new address. If the LCDIF_NEXT_BUF_ADDR register was not updated within a frame refresh cycle, LCDIF will keep transmitting the last frame until a new value is programmed into that register.

LCDIF also provides the capability of interlacing a progressive frame by fetching odd lines in the first field and then fetching even lines in the second field. This feature can be used in the DVI mode and can be turned on by setting the INTERLACE_FIELDS bit in the LCDIF_CTRL1 register.

13.2.3.1.2 System Bus Master Performance

The performance of the LCDIF block can be controlled by changing the burst length and the outstanding cycle issuing capability depending on the memory bandwidth requirements. Two fields in the LCDIF_CTRL2 register will throttle system memory requests. The LCDIF_CTRL2_OUTSTANDING_REQS field will control how many requests the LCDIF can have in flight on any given clock cycle. This should be programmed based on the expected system bus latency for returned read data. Also, the LCDIF_CTRL2_BURST_LEN_8 bit will set the number of 64 bit words requested for each LCDIF system bus request to either 8 or 16 QWORDS. Generally, 4 outstanding requests of length 16 will provide enough performance to drive any standard display resolution. These configuration bits are intended to change the access pattern of the LCDIF to optimize system bus throughput when other system masters will contend for system memory resources.

The LCDIF_THRES register can also be used to optimize bus throughput and power consumption.

The LCDIF_THRES_PANIC value can be used to raise the priority of requests initiated by the LCDIF to alter how the LCDIF requests are arbitrated by the system bus infrastructure. The panic output control signal is raised when the number of 32bpp pixel equivalents in the LFIFO is less than this programmed value. Since the LFIFO is arranged as a 256x64bit quadword FIFO, it contains two 32bpp pixels per quadword, or 512 32bpp pixels total. To set the panic output when 3/4s of the LFIFO is empty, set the LCDIF_THRES_PANIC value to 3/4 * 512, or 128. The panic signal output is used to assess higher priority to LCDIF system requests to avoid LCDIF under run errors during periods of high system bandwidth utilization.

The features available with the LCDIF_THRES register require support from system clocking and dynamic priority control. Refer to the appropriate block documentation to assess the system support for these features.

13.2.3.2 Write Data Path

LCDIF supports raster based frame buffers and there is no support for tiled buffers.

There are several options to accommodate endianness of display buffers in memory before the data is processed for the external display. The LCDIF_CTRL[INPUT_DATA_SWIZZLE] field provides the following options for data word multiplexing:

```
00 (0): No swizzle (little-endian)
01 (1): Swap bytes 0 and 3, swap bytes 1 and 2 (big-endian)
10 (2): Swap half-words
11 (3): Swap bytes within each half-word
```

The LCDIF_CTRL[WORD_LENGTH] field indicates the input data/pixel format. LCDIF_TRANSFER_COUNT register denotes how much data is contained in each frame. The LCDIF_TRANSFER_COUNT[H_COUNT] field indicates the number of pixels per line and LCDIF_TRANSFER_COUNT[V_COUNT] indicates the total number of lines per frame. The LCDIF_CTRL1[BYTE_PACKING_FORMAT] field can be used to specify which bytes within the 32-bit word are going to be valid. For example, if the entire 32-bit word is valid, LCDIF_CTRL1[BYTE_PACKING_FORMAT] should be set to 0xF, if only lower 3 bytes of each word in the frame buffer are valid, then LCDIF_CTRL1[BYTE_PACKING_FORMAT] should be set to 0x7.

The LCDIF_CTRL[LCD_DATABUS_WIDTH] field suggests the width of the bus going to the display controller. There is an option to source all 32 bits of the input word and transfer it to the output I/O display interface. If the LCDIF_CTRL[LCD_DATABUS_WIDTH] is not the same as LCDIF_CTRL[WORD_LENGTH], LCDIF will perform RGB to RGB color space conversion. For example, if the input frame has fewer bits per pixel than the display, as in

a 16 bpp input frame going to 24 bpp LCD, LCDIF will pad the MSBs of each color to the LSBs of the same color for each pixel. If the input frame has more bits per pixel than the display, for example, 24 bpp input frame going to 16 bpp LCD, LCDIF will drop the LSBs of each color channel to convert to the lower color depth. LCDIF also has the capability to support delta pixel displays by swizzling the R, G and B colors of each pixel in the odd and even lines of the frame separately by programming the LCDIF_CTRL2[ODD_LINE_PATTERN] and the LCDIF_CTRL2[EVEN_LINE_PATTERN] bit fields. This operation occurs after the RGB-to-RGB color space conversion operation.

LCDIF also supports RGB to YCbCr 4:2:2 color space conversion. This is useful in the DVI mode since the TV encoder requires input in YCbCr 4:2:2 format. The LCDIF_CSC* registers have complete programmability over the CSC coefficients and offsets. The values must be written into these registers in the signed two's complement format.

The following list shows how the different input/output combinations can be obtained:

- LCDIF_CTRL[WORD_LENGTH]=1 indicates that the input is 8-bit data. This is most likely going to be used for sending commands in MPU interface, or maybe a gray scale image. Any combination of LCDIF_CTRL1[BYTE_PACKING_FORMAT] is permissible.

  Limitation: LCDIF_TRANSFER_COUNT[H_COUNT] must be a multiple of the sum of BYTE_PACKING_FORMAT [3], BYTE_PACKING_FORMAT [2], BYTE_PACKING_FORMAT [1] and BYTE_PACKING_FORMAT [0]. LCDIF_CTRL[LCD_DATABUS_WIDTH] must be 1, indicating an 8-bit data bus.

- LCDIF_CTRL[WORD_LENGTH]=0 implies the input frame buffer is RGB 16 bits per pixel. LCDIF_CTRL[DATA_FORMAT_16_BIT] field determines the pixels are RGB 555 or RGB 565.

  Limitation: LCDIF_CTRL1[BYTE_PACKING_FORMAT] should be 0x3 or 0xC if there is only one pixel per word. If there are two pixels per word, it should be 0xF and LCDIF_TRANSFER_COUNT[H_COUNT] will be restricted to be a multiple of 2 pixels.

- LCDIF_CTRL[WORD_LENGTH]=2 indicates that input frame buffer is RGB 18 bits per pixel, that is, RGB 666. The valid RGB values can be left-aligned or right-aligned within a 32-bit word. The alignment of the valid 18 bits within a word is indicated by the LCDIF_CTRL[DATA_FORMAT_18_BIT] bit.

  Limitation: LCDIF_CTRL1[BYTE_PACKING_FORMAT] can be 0x7, 0xE or 0xF. Packed pixels are not supported in this case. LCDIF_TRANSFER_COUNT[H_COUNT] can be any number.

- LCDIF_CTRL[WORD_LENGTH]=3 indicates that the input frame-buffer is RGB 24 bits per pixel (RGB 888). If LCDIF_CTRL1[BYTE_PACKING_FORMAT] is 0x7, it indicates that there is only one pixel per 32-bit word and there is no restriction on LCDIF_TRANSFER_COUNT[H_COUNT]. This is also the option that provides 32 bit output depending on the I/O muxing options available. The fourth byte, or bits [31:24], and connected to the I/Os if this muxing is available in the chip package.

  Limitation: If LCDIF_CTRL1[BYTE_PACKING_FORMAT] is 0xF, it indicates that the pixels are packed, that is, there are 4 pixels in 3 words or 12 bytes and LCDIF_TRANSFER_COUNT[H_COUNT] must be a multiple of 4 pixels.

- LCDIF_CTRL1[YCBCR422_INPUT]=1 implies that the input frame is in YCbCr 4:2:2 format. LCDIF_CTRL1[BYTE_PACKING_FORMAT] must be 0xF.

  Limitation: LCDIF_CTRL[LCD_DATABUS_WIDTH] must be 8-bit and LCDIF_TRANSFER_COUNT[H_COUNT] must be a multiple of 2 pixels.

  LCDIF_CTRL2[ODD_LINE_PATTERN] and LCDIF_CTRL2[EVEN_LINE_PATTERN] must be 0 when any of LCDIF_CTRL[RGB_TO_YCBCR422_CSC] or LCDIF_CTRL1[INTERLACE_FIELDS] or LCDIF_CTRL[YCBCR422_INPUT] bits is 1.

After the RGB to RGB or RGB to YCbCr 4:2:2 color space conversions, there is one more opportunity to swizzle the data before sending it out to the display or the encoder. This can be done with the LCDIF_CTRL[CSC_DATA_SWIZZLE] field, and it provides the same options as the LCDIF_CTRL[INPUT_DATA_SWIZZLE] register.

Finally, there is an option to shift the output data before sending it out to the display. This is done based on the LCDIF_CTRL[SHIFT_DIR] and LCDIF_CTRL[SHIFT_NUM_BITS] fields.

Figure 13-5. General Operations in Write Data Path

The examples in the following figures illustrate some different combinations of register programming for write mode. Assume that the data transferred over the system bus within a 32 bit word is organized as {A7-A0, B7-B0, C7-C0, D7-D0} in 8-bit mode and {A15-A0, B15-B0} in 16-bit mode.

In this example, all 32 bits of the input word are transferred out over an 8 bit display bus. Each byte within the 32 bit word is shifted to the right with zeros appended to bits D[7:6]. The input data bits [7:2] are shifted to the right by 2 bits and presented on the D[5:0].

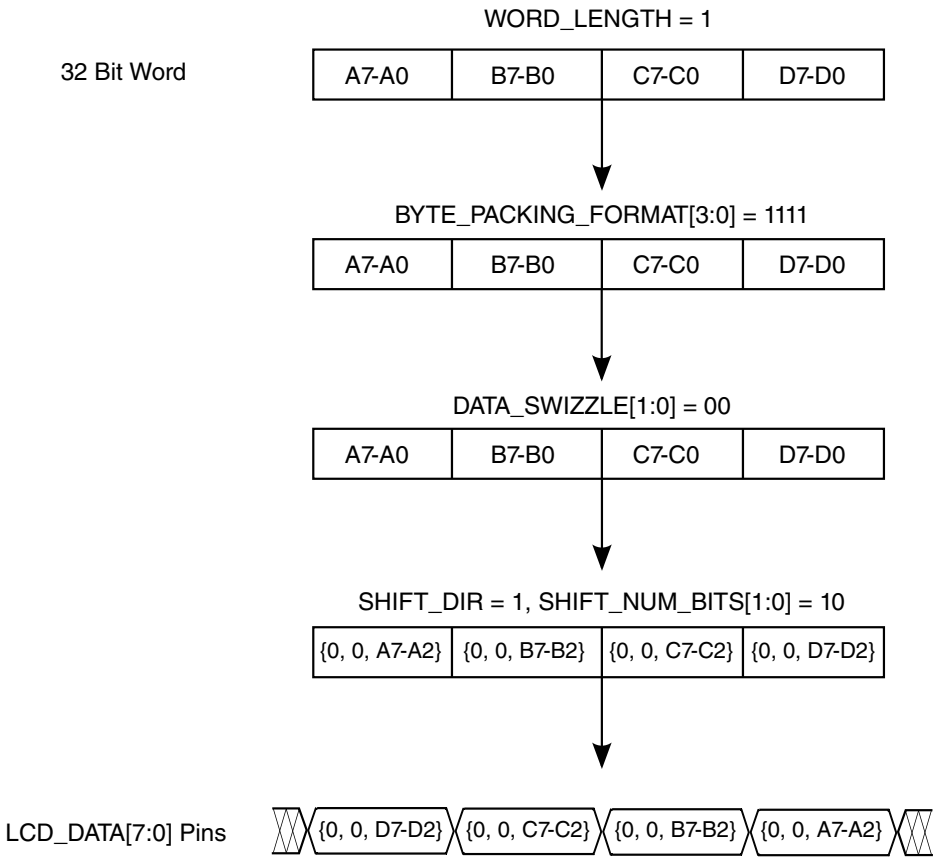

Figure 13-6. Register programming for write mode

In this 8 bit display interface example, one byte of the input word is deleted and not transferred over the external 8 bit display interface. This mode could be used to transfer 24bpp pixels over the 8 bit interface. In this case, the 4th unused byte is not transferred.

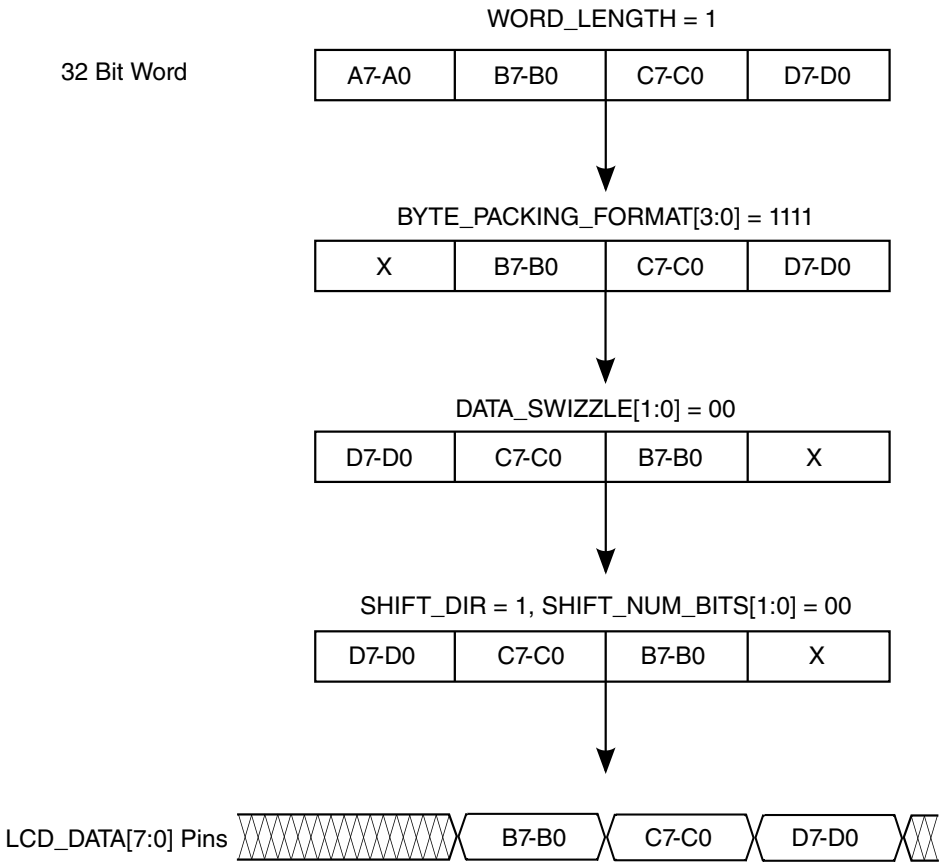

Figure 13-7. Register programming for write mode

The following example uses a 16 bit display interface. Each 16 bit half word is shifted to the right by two bits with zeros appended to the most significant two bits.

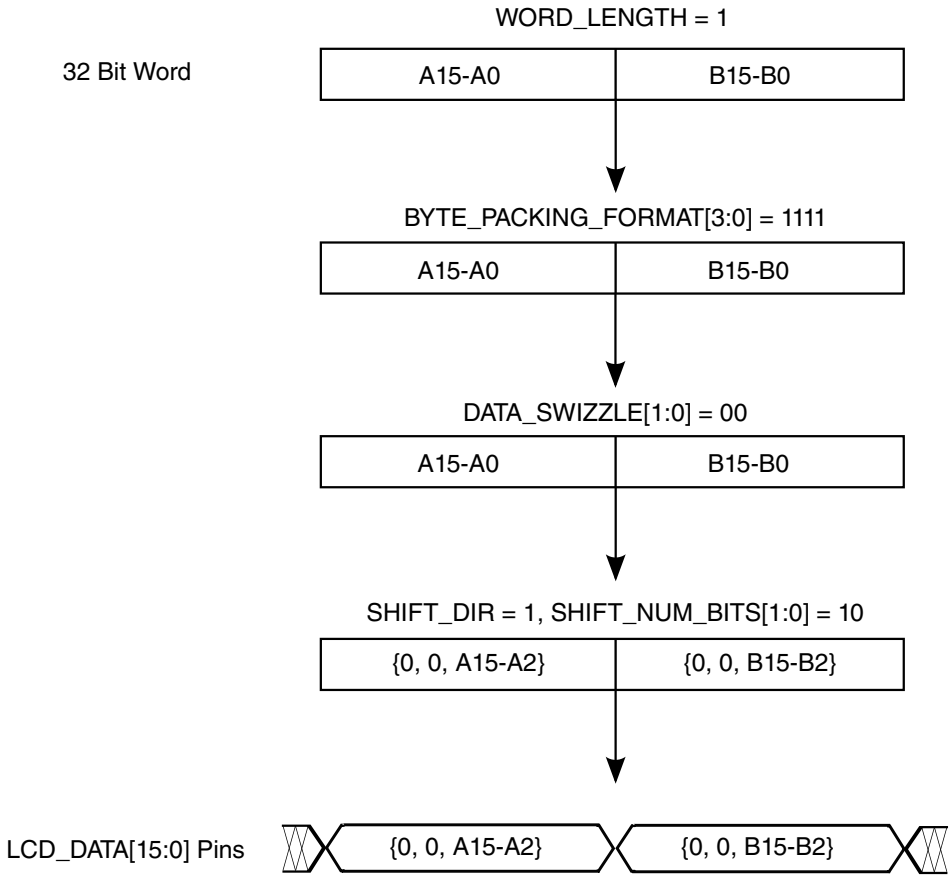

Figure 13-8. Register programming for write mode

This example indicates how an unpacked frame buffer can sourced for display. Only a single 16 bit half word within the 32 bit word is tranferred out via the 16 display bus.

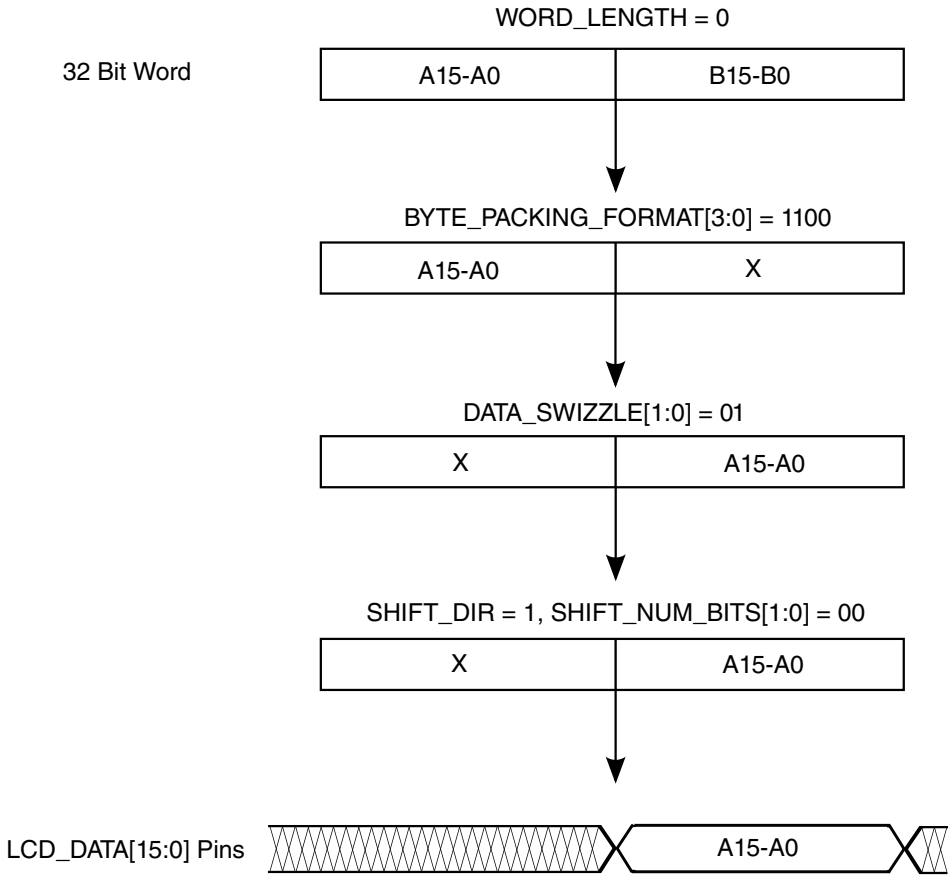

Figure 13-9. Register programming for write mode

13.2.3.3 Read Data Path

Figure 13-10 shows the MPU read data path in detail.

LCDIF can read from an external display that follows the 6800/8080 MPU protocol.

The display bus width is determined by the LCD_DATABUS_WIDTH bit field. The data sampled at every read strobe is called a subword and the number of subwords that can be packed in a 32-bit word is given by the READ_MODE_NUM_PACKED_SUBWORDS bit field. The INITIAL_DUMMY_READ bit field directs the LCDIF to skip the number of programmed subwords before starting to process read data. This feature is useful in the case of an LCD controller that returns the last written data the first time a read is issued, and then sends the correct data thereafter. SHIFT_DIR and SHIFT_NUM_BITS bit fields indicate whether the data needs to be shifted before getting stored in the internal registers. For example, a value of 2 in READ_MODE_NUM_PACKED_SUBWORDS if lcd databus width is 8 bits indicates two bytes should be packed in a 32-bit word, while if the lcd databus width is 16 bits, it indicates that two half words (or 4 bytes) should be packed.

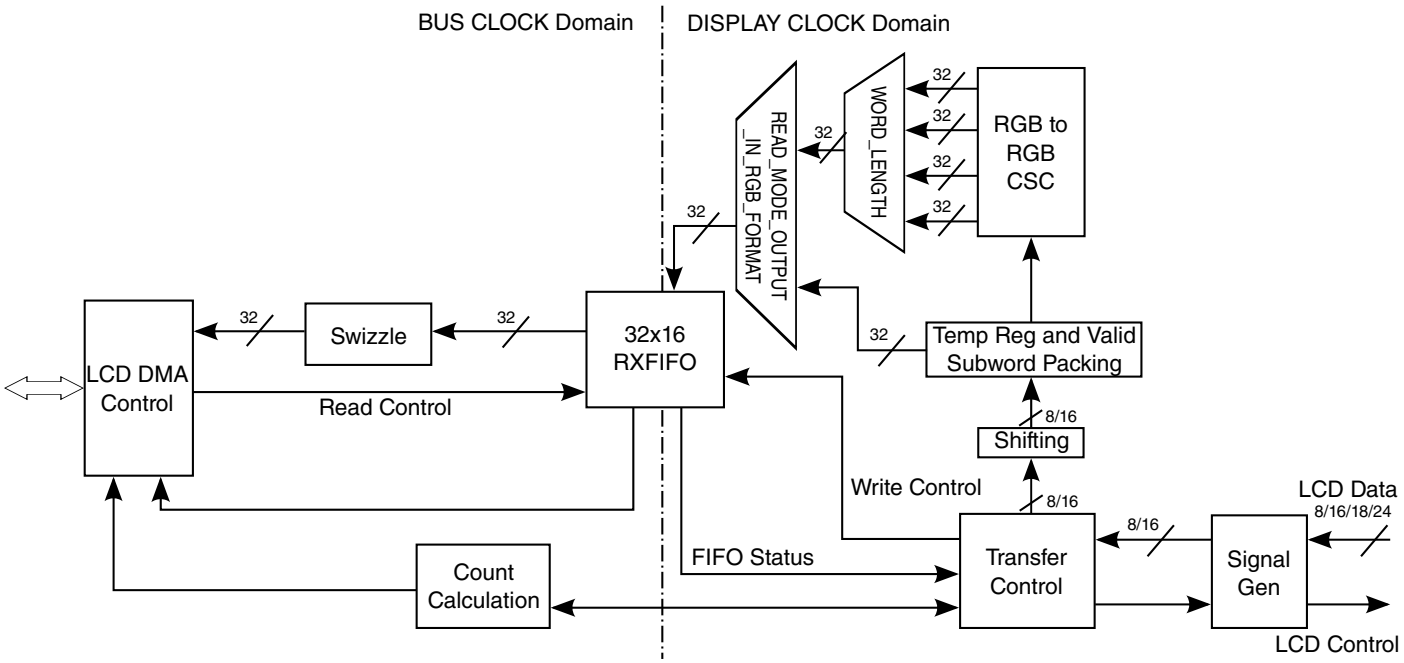

Figure 13-10. MPU Read Data Path

After the last subword within a word is reached, the block looks at the READ_PACK_DIR in the HW_LCDIF_CTRL2 register. If this bit is set, the block will swizzle the data, but only within the valid bytes, unlike in the write mode, where swizzle occurs across all 4 bytes. If the READ_MODE_OUTPUT_IN_RGB_FORMAT bit is set, LCDIF will convert the data obtained from the READ_PACK_DIR operation into 24-bit unpacked RGB and then re-convert it into 16/18/24 bpp RGB depending on the WORD_LENGTH field. The DATA_FORMAT_16/18/24_BIT bit fields are also considered while converting to 24-bit unpacked RGB format. For example, if DATA_FORMAT_18_BIT is 1, the RGB666 data will be packed in the upper bits [31:4]of a 32-bit word, and that bit is 0, the data will be packed in the lower bits [17:0]. After all these operations, the data gets written into the RXFIFO.

The following figures show some examples of how data is handled in different MPU read modes.

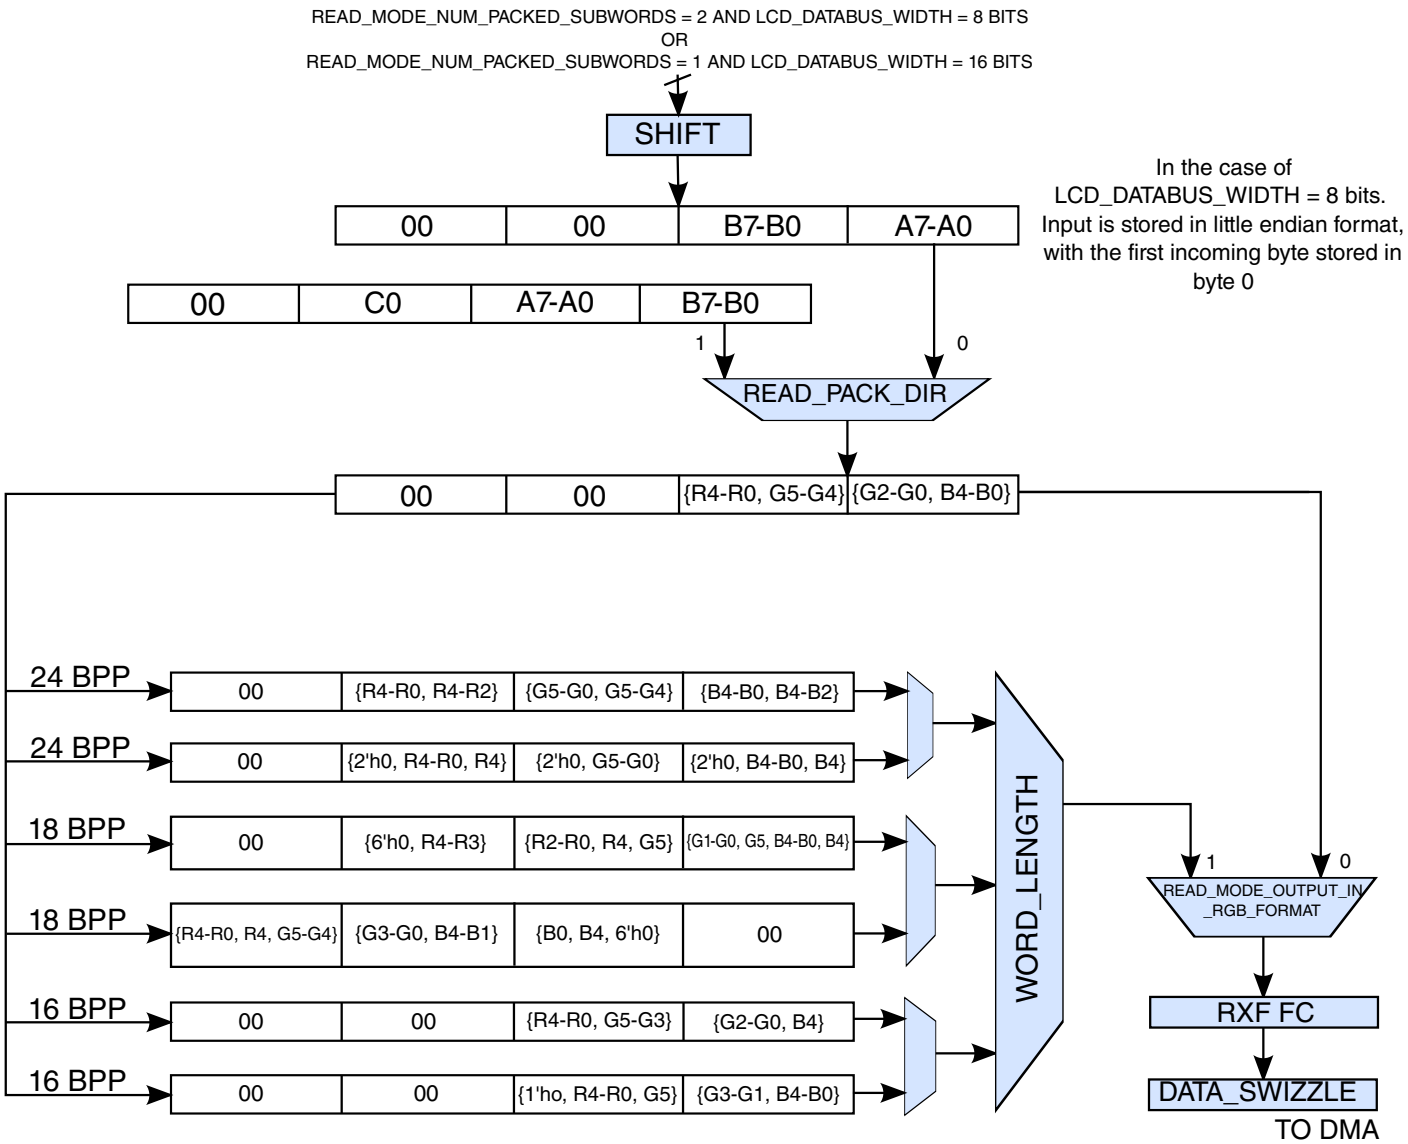

Figure 13-11. Data in MPU read mode

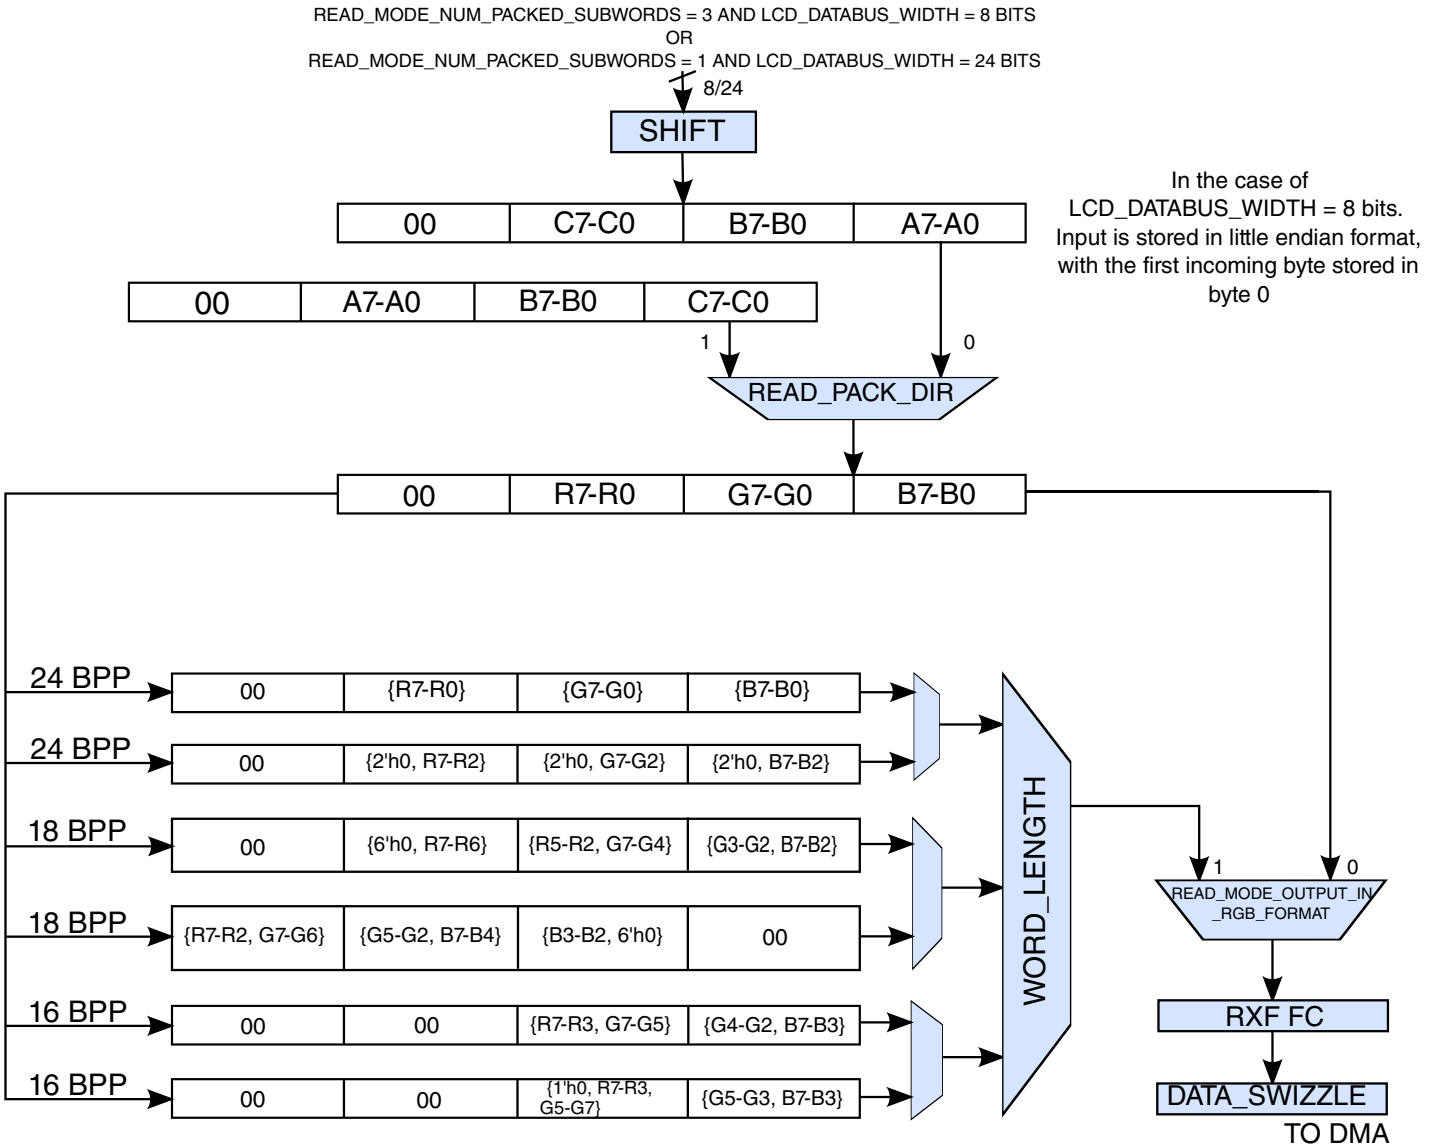

Figure 13-12. Data in MPU read mode

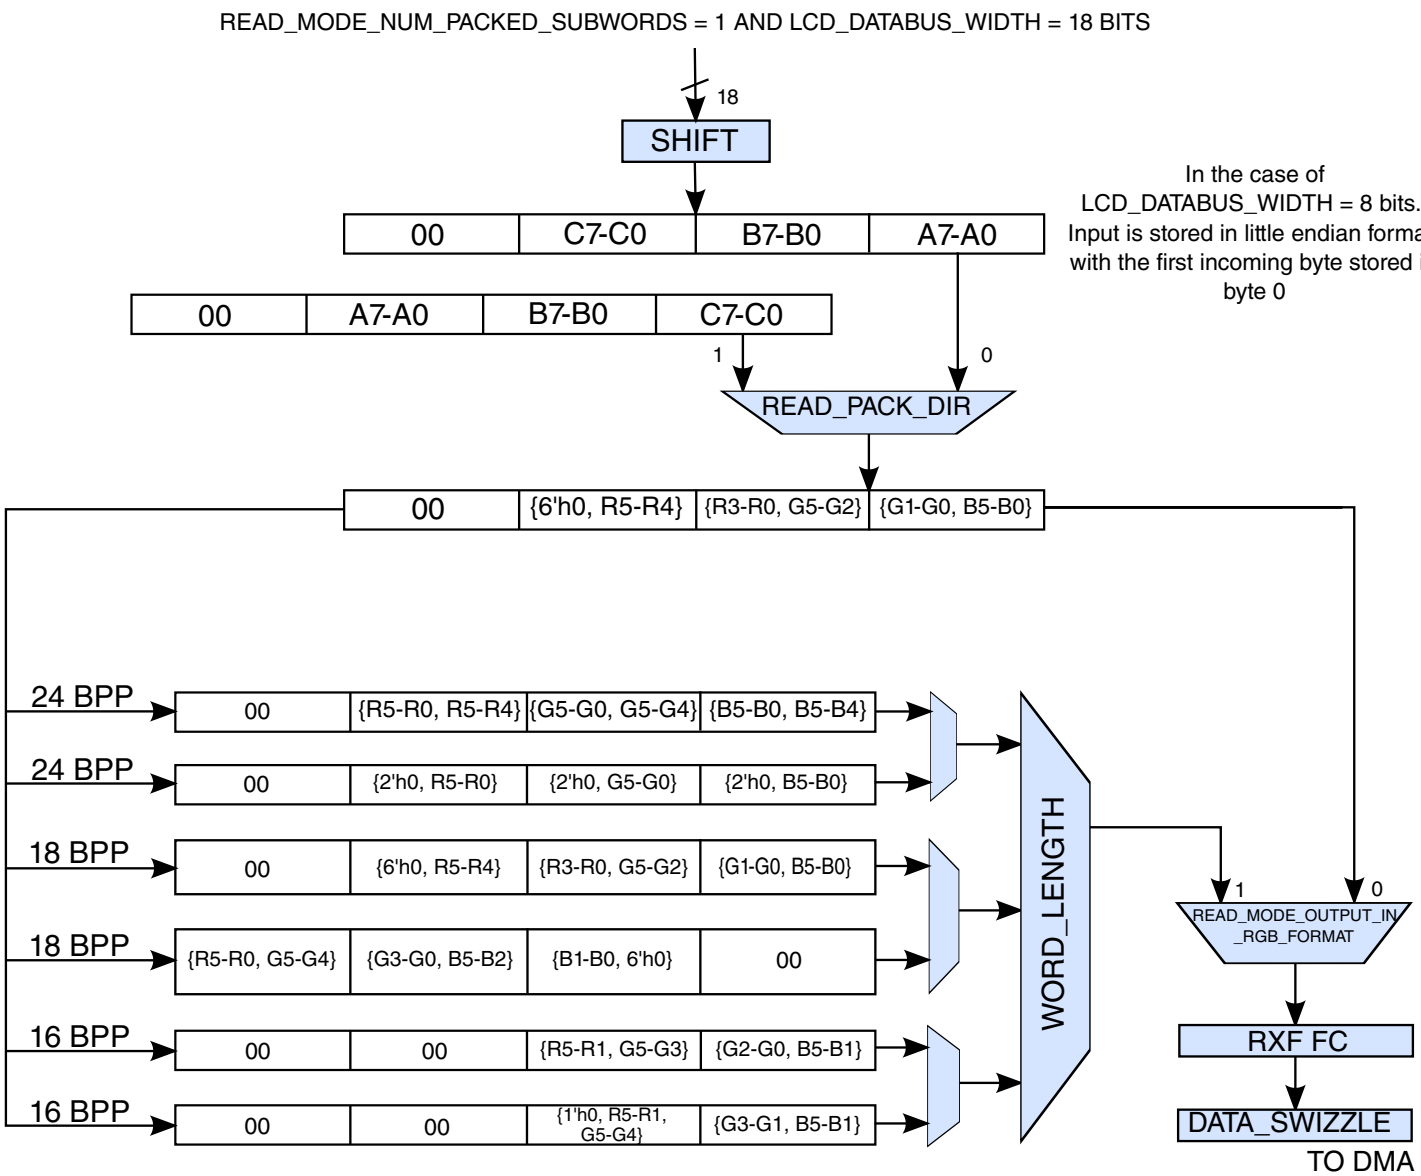

Figure 13-13. Data in MPU read mode

Restrictions:

READ_PACK_DIR should only be used if it is required to swizzle the subwords before doing RGB to RGB CSC, otherwise the DATA_SWIZZLE field should be used to swizzle across bytes.

READ_PACK_DIR must be 0 if LCD_DATABUS_WIDTH is 8 bits and READ_MODE_NUM_PACKED_SUBWORDS =1

If READ_MODE_OUTPUT_IN_RGB_FORMAT bit is set, the following restrictions should be followed:

- If LCD_DATABUS_WIDTH = 8 bits, then READ_MODE_NUM_PACKED_SUBWORDS <= 3.
- If LCD_DATABUS_WIDTH = 16/18/24 bits, then READ_MODE_NUM_PACKED_SUBWORDS = 1.

13.2.3.4 LCDIF Interrupts

LCDIF supports a number of interrupts to aid controlling and status reporting of the block.

All the interrupts have individual mask bits for enabling or disabling each of them. They all get funneled through a single interrupt line connected to the interrupt collector (ICOLL).

The following list describes the different interrupts supported by LCDIF:

- Underflow interrupt is asserted when the clock domain crossing FIFO (TXFIFO) becomes empty but the block is in active display portion during that time. Software should take corrective action to make sure that this does not happen.
- In the bus master mode, the overflow interrupt will be asserted if the block has requested more data than it's FIFOs could hold. In the read mode, it will be asserted if the RxFIFO becomes full and the block reads more data.
- VSYNC edge interrupt will be asserted every time a leading VSYNC edge occurs.
- Cur_frame_done interrupt occurs at the end of every frame in all modes except DVI. In DVI mode, if IRQ_ON_ALTERNATE_FIELDS bit is set, it will occur at the end of every frame, otherwise it will occur at the end of every field.

13.2.3.5 Initializing the LCDIF

This section describes write modes and MPU read mode.

13.2.3.5.1 Write Modes

The following initialization steps are common to all LCDIF write modes of operation before entering any particular mode.

Initialization steps:

1. Configure the external I/Os to correctly interface the external display, when required.
2. Start the DISPLAY CLOCK (pix_clk) clock and set the appropriate frequency by programming the registers in CCM.

3. Start the BUS CLOCK (apb_clk) and set the appropriate frequency by programming the registers in CCM.
4. Bring the LCDIF out of soft reset and disable the clock gate bit.
5. Reset the LCD controller by setting LCDIF_CTRL1[RESET] bit appropriately, being careful to observe the reset requirements of the controller. See Behavior During Reset for more information on Reset requirements.
6. Make sure LCDIF_CTRL[READ_WRITEB] bit is 0.
7. Set the transfer mode of operation to bus master. The LCDIF_CTRL[MASTER] bit determines the transfer mode selected. Bus master (LCDIF_CTRL[MASTER] =1), or PIO (LCDIF_CTRL[MASTER] =0) mode is the transfer mode to select.
8. Set the LCDIF_CTRL[INPUT_DATA_SWIZZLE] according to the endianness of the LCD controller. Also, set the LCDIF_CTRL[DATA_SHIFT_DIR] and LCDIF_CTRL[SHIFT_NUM_BITS] if it is required to shift the data left or right before it is output.
9. Set the LCDIF_CTRL[WORD_LENGTH] field appropriately: 0 = 16-bit input, 1 = 8-bit input, 2 = 18-bit input, 3 = 24/32-bit input. Also, select the correct 16/18/24 bit data format with the corresponding fields in LCDIF_CTRL register.
10. Set the LCDIF_CTRL1[BYTE_PACKING_FORMAT] field according to the input frame.
11. Set the LCDIF_CTRL[LCD_DATABUS_WIDTH] appropriately: 0 = 16-bit output, 1 = 8-bit output, 2 = 18-bit output, 3 = 24/32-bit output.
12. Enable the necessary IRQs.

13.2.3.5.2 MPU Read Mode

The following initialization steps should be done to enter the MPU read mode of operation:

Initialization steps:

1. Configure the external I/Os to correctly interface the external display.
2. Start the DISPLAY CLOCK (pix_clk) and set the appropriate frequency by programming the registers in CCM.
3. Start the BUS CLOCK (apb_clk) and set the appropriate frequency by programming the registers in CCM.
4. Bring the LCDIF out of soft reset and clock gate.
5. Reset the LCD controller by setting LCDIF_CTRL1_RESET bit appropriately, being careful to observe the reset requirements of the controller.
6. Set the READ_WRITEB bit in LCDIF_CTRL register to 1.
7. Set the LCDIF_MASTER bit in LCDIF_CTRL register to 0. Bus master mode is not supported for reading data from the display.

8. Also, set the DATA_SHIFT_DIR and SHIFT_NUM_BITS if it is required to shift the data left or right before it is output.
9. Indicate if the read data needs to color-space-converted and stored in a different RGB format by setting the READ_MODE_OUTPUT_IN_RGB_FORMAT field accordingly.
10. Set the WORD_LENGTH field appropriately: 0 = 16-bit input, 1 = 8-bit input, 2 = 18-bit input, 3 = 24-bit input if READ_MODE_OUTPUT_IN_RGB_FORMAT is required. Also, select the correct 16/18/24 bit data format with the corresponding fields in LCDIF_CTRL register.
11. Set the READ_MODE_NUM_PACKED_SUBWORDS field in LCDIF_CTRL2 according to the number of subwords per word required to be packed.
12. Set the READ_PACK_DIR to 1 if it is required to store the data in big-endian format.
13. Set the LCD_DATABUS_WIDTH appropriately: 0 = 16-bit output, 1 = 8-bit output, 2 = 18-bit output, 3 = 24-bit output.
14. Enable the necessary IRQs.

13.2.3.6 MPU Interface

The MPU interface is used to transfer data and commands between the SoC via the LCDIF and the external display at modest data rates.

Bus master or PIO transactions using the LCDIF_DATA register can be used for MPU mode write operations. For MPU mode read operations, only PIO can be used. LCDIF can support the 6800 as well as the 8080 MPU protocol. If DOTCLK_MODE, DVI_MODE and VSYNC_MODE bits in LCDIF_CTRL registers are 0, it implies that the block is in MPU interface mode of operation. The LCDIF MPU mode has four basic timing parameters: Setup and Hold for the Command/Data register selection (TCS, TCH) and Setup and Hold for the Data bus (TDS, TDH). These parameters are expressed in DISPLAY CLOCK (pix_clk) cycles. The LCD_WR signal is used as the write strobe while LCD_RS signal is typically used to switch between command and data modes.

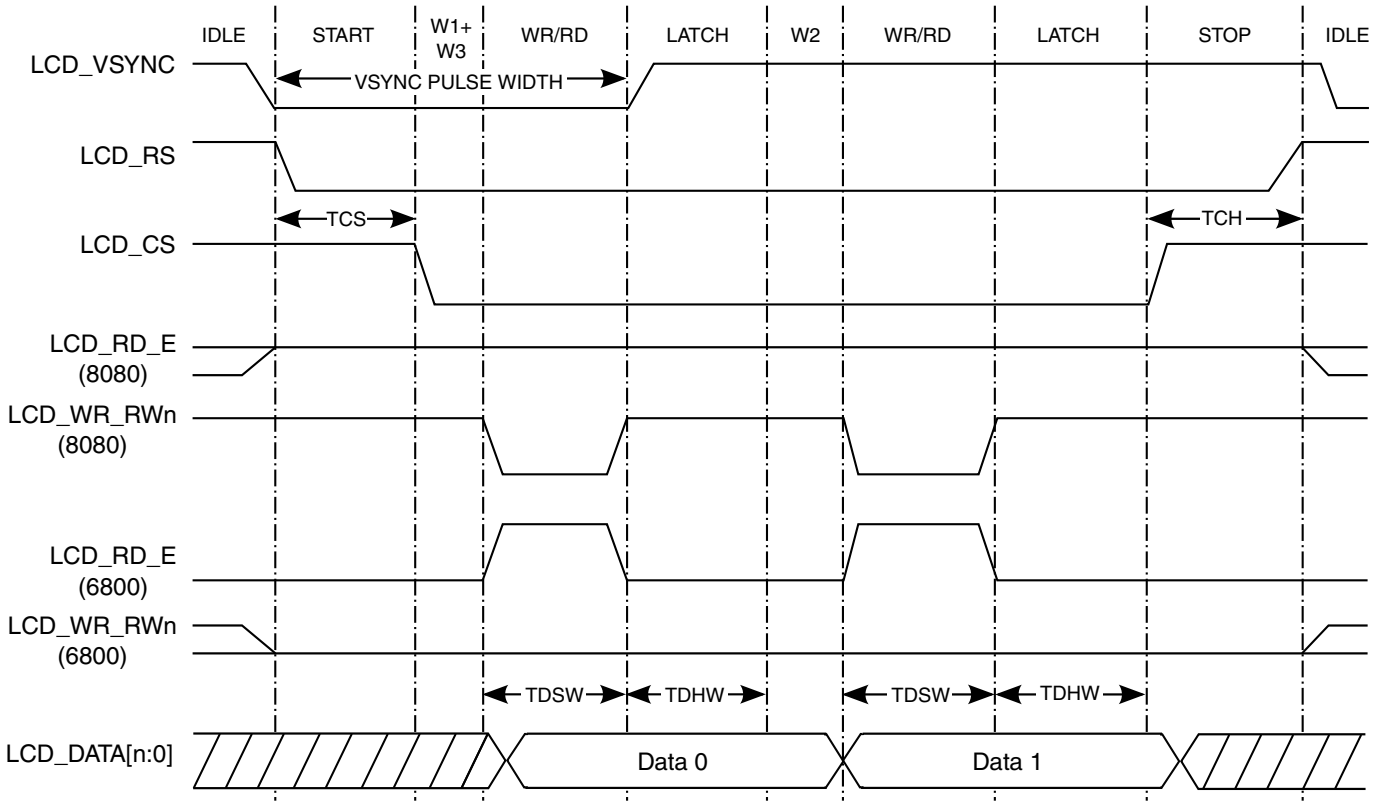

Figure 13-14. Timing in write mode of 6800 and 8080 protocols

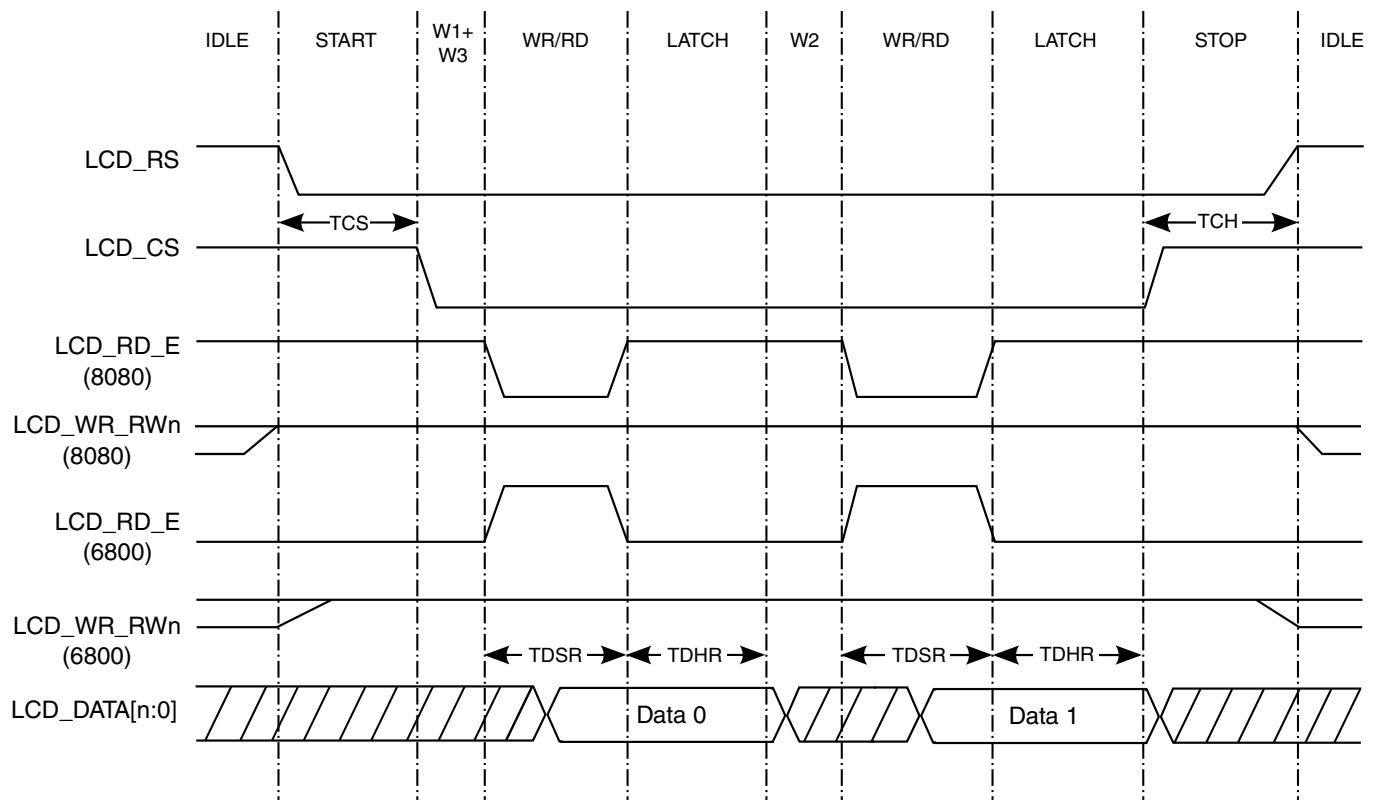

Figure 13-15. Read timing interface in 6800 and 8080 protocols

The LCDIF has flexible pin and strobe timings which enable it to optimally support a wide range of LCDs. The minimum cycle time is two DISPLAY CLOCK (pix_clk) cycles (TDS=TDH=1). For example, this results in a maximum LCD data rate of 12 MB/s when DISPLAY CLOCK (pix_clk) is 24 MHz. TDS and TDH are 8-bit values, so the minimum LCDIF period is 510 DISPLAY CLOCK (pix_clk) cycles (47 KHz with a 24 MHz DISPLAY CLOCK (pix_clk)). The timings are not automatically adjusted if the DISPLAY CLOCK (pix_clk) frequency changes, so it may be necessary to adjust the timings if DISPLAY CLOCK (pix_clk) changes.

In the MPU interface mode, the LCDIF_CTRL_ BYPASS_COUNT bit must be 0. The RUN bit is cleared automatically once the LCDIF has received/transmitted all the data as per the LCDIF_TRANSFER_COUNT register and has completed the transfer to the panel. The current transfer can be cancelled/aborted if the RUN bit is manually made 0.

13.2.3.6.1 Code Example to Initialize the LCDIF in MPU Write Mode

```
// Note: Common initialization steps in Initializing the LCDIF must also be
// executed along with the following code
BF_CS1(LCDIF_CTRL, DATA_SELECT, 1); // 0 if sending command, 1 if sending data. Note that the
                                    // idle state for LCD_RS signal is high, regardless of the
                                     // programming of the DATA_SELECT register.
BF_CS1 (LCDIF_CTRL, MODE86, 8080_MODE);
BF_CS1 (LCDIF_CTRL, READ_WRITEB, 0);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 0); //Must be 0 in MPU mode
BF_CS1 (LCDIF_CTRL1, BUSY_ENABLE, 1);//Only if LCD controller implements a busy line
BF_CS4 (LCDIF_TIMING, CMD_HOLD, 2, CMD_SETUP, 2, DATA_HOLD, 2, DATA_SETUP, 2);  //Values
based
                              // on DISPLAY CLOCK (pix_clk) frequency and timing requirements
of controller.
                             // Note that these register must be non-zero for correct
operation.
BF_CS2 (LCDIF_TRANSFER_COUNT, H_COUNT, 320, V_COUNT, 240); //For a 320 RGB x 240 display
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

The LCDIF is now ready to receive data via bus master PIO write transactions using the LCDIF_DATA register. Note that when using the PIO write operations to the LCDIF_DATA register, the software will need to poll the FIFO STATUS bits to ensure that it does not overflow the LCDIF data buffers. When LCDIF is done transmitting H_COUNT x V_COUNT pixels, it will stop, turn off the RUN bit and assert the cur_frame_done interrupt.

13.2.3.7 VSYNC Interface

The VSYNC interface uses the same protocol as the MPU interface, with an additional signal VSYNC at the frame rate of the display, as shown in the figure given in MPU Interface section.

It is used in the moving picture display mode where data has to be written to the internal LCD buffer at a speed higher than the display rate and displayed in synchronization with the VSYNC signal. This mode is selected by setting the VSYNC_MODE bit in LCDIF_CTRL register. The VSYNC signal is programmable for period, polarity and direction. Many other programmable parameters are shared with the MPU interface. The VSYNC_OEB bit in LCDIF_VDCTRL0 register indicates whether the display controller will send the VSYNC signal, or whether it should be generated by LCDIF. The timing of the VSYNC signal is based on the DISPLAY CLOCK (pix_clk) (make sure VSYNC_PULSE_WIDTH_UNIT = VSYNC_PERIOD_UNIT = 0 and VSYNC_ONLY = 1) and it is determined by the VSYNC_PERIOD, VSYNC_PULSE_WIDTH and VSYNC_POL fields in LCDIF_VDCTRL0-4 registers. The SYNC_SIGNALS_ON bit in LCDIF_VDCTRL4 register must be set if the target requires the VSYNC signal to be generated by LCDIF. If the WAIT_FOR_VSYNC_EDGE bit in LCDIF_CTRL register is set, it indicates that the hardware should wait until it sees the leading VSYNC edge before starting the data transfer. The VERITCAL_WAIT_CNT indicates the number of DISPLAY CLOCK (pix_clk) cycles from the leading VSYNC edge after which data transfer will be started on the interface.

In the VSYNC interface mode, the LCDIF_CTRL_ BYPASS_COUNT bit must be 0. The RUN bit is cleared automatically once the LCDIF has received/transmitted all the data as per the LCDIF_TRANSFER_COUNT register and has completed the transfer to the panel. The current transfer can be cancelled/aborted if the RUN bit is manually made 0.

13.2.3.7.1 Code Example to Initialize LCDIF in VSYNC Mode

```
// Note: Common initialization steps in Initializing the LCDIF must also be
// executed along with the following code
BF_CS1 (LCDIF_CTRL, DATA_SELECT, 1); // 0 if sending command, 1 if sending data. Note that
//the idle state for LCD_RS signal is high, regardless of the programming of the DATA_SELECT
//register.

BF_CS1 (LCDIF_CTRL, MODE86, 8080_MODE);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 0); //Must be 0 in MPU mode
BF_CS1 (LCDIF_CTRL1, BUSY_ENABLE, 0);
BF_CS4 (LCDIF_TIMING, CMD_HOLD, 2, CMD_SETUP, 2, DATA_HOLD, 2, DATA_SETUP, 2);  //Values
//based on DISPLAY CLOCK (pix_clk) frequency and timing requirements of controller. Note
that these
//register must be non-zero for the MPU and VSYNC modes.
BF_CS2 (LCDIF_TRANSFER_COUNT, H_COUNT, 320, V_COUNT, 240);//For a 320 RGB x 240 display
//The following section indicates setting up the VSYNC signal timing when VSYNC is an output
BF_CS1 (LCDIF_VDCTRL0, VSYNC_OEB, 0); //Making VSYNC signal an output
BF_CS1 (LCDIF_VDCTRL4, VSYNC_ONLY, 1); //Only need to generate VSYNC signal
BF_CS1 (VDCTRL0, VSYNC_POL, 0); //Setting the polarity of VSYNC signal to be low during
//VSYNC_PULSE_WIDTH time
BF_CS2 (LCDIF_VDCTRL0, VSYNC_PERIOD_UNIT, 0, VSYNC_PULSE_WIDTH_UNIT, 0);
BF_CS2 (LCDIF_VDCTRL1, VSYNC_PERIOD, 400000, VSYNC_PULSE_WIDTH, 100);//Frame display rate in
//terms of number of DISPLAY CLOCKS (pix_clk).
BF_CS2 (LCDIF_VDCTRL2, HSYNC_PULSE_WIDTH, 0, HSYNC_PERIOD, 0);
BF_CS1 (LCDIF_VDCTRL3, VERTICAL_WAIT_CNT, 50);
BF_CS1 (LCDIF_VDCTRL4, SYNC_SIGNALS_ON, 1);
BF_CS2 (LCDIF_CTRL, VSYNC_MODE, 1, WAIT_FOR_VSYNC_EDGE, 1); //set WAIT_FOR_VSYNC_EDGE if
```

```
//software wishes to transfer the next frame after the VSYNC edge occurs.
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

The LCDIF is now ready to receive data via bus master requests or PIO writes to the LCDIF_DATA register. When LCDIF is done transmitting H_COUNT x V_COUNT pixels, it will stop, turn off the RUN bit and assert the cur_frame_done interrupt.

13.2.3.8 DOTCLK Interface

The DOTCLK interface is another mode used in moving picture displays.

It includes the VSYNC, HSYNC, DOTCLK and (optional) ENABLE signals. The interface is popularly called the RGB interface if the ENABLE signal is present.

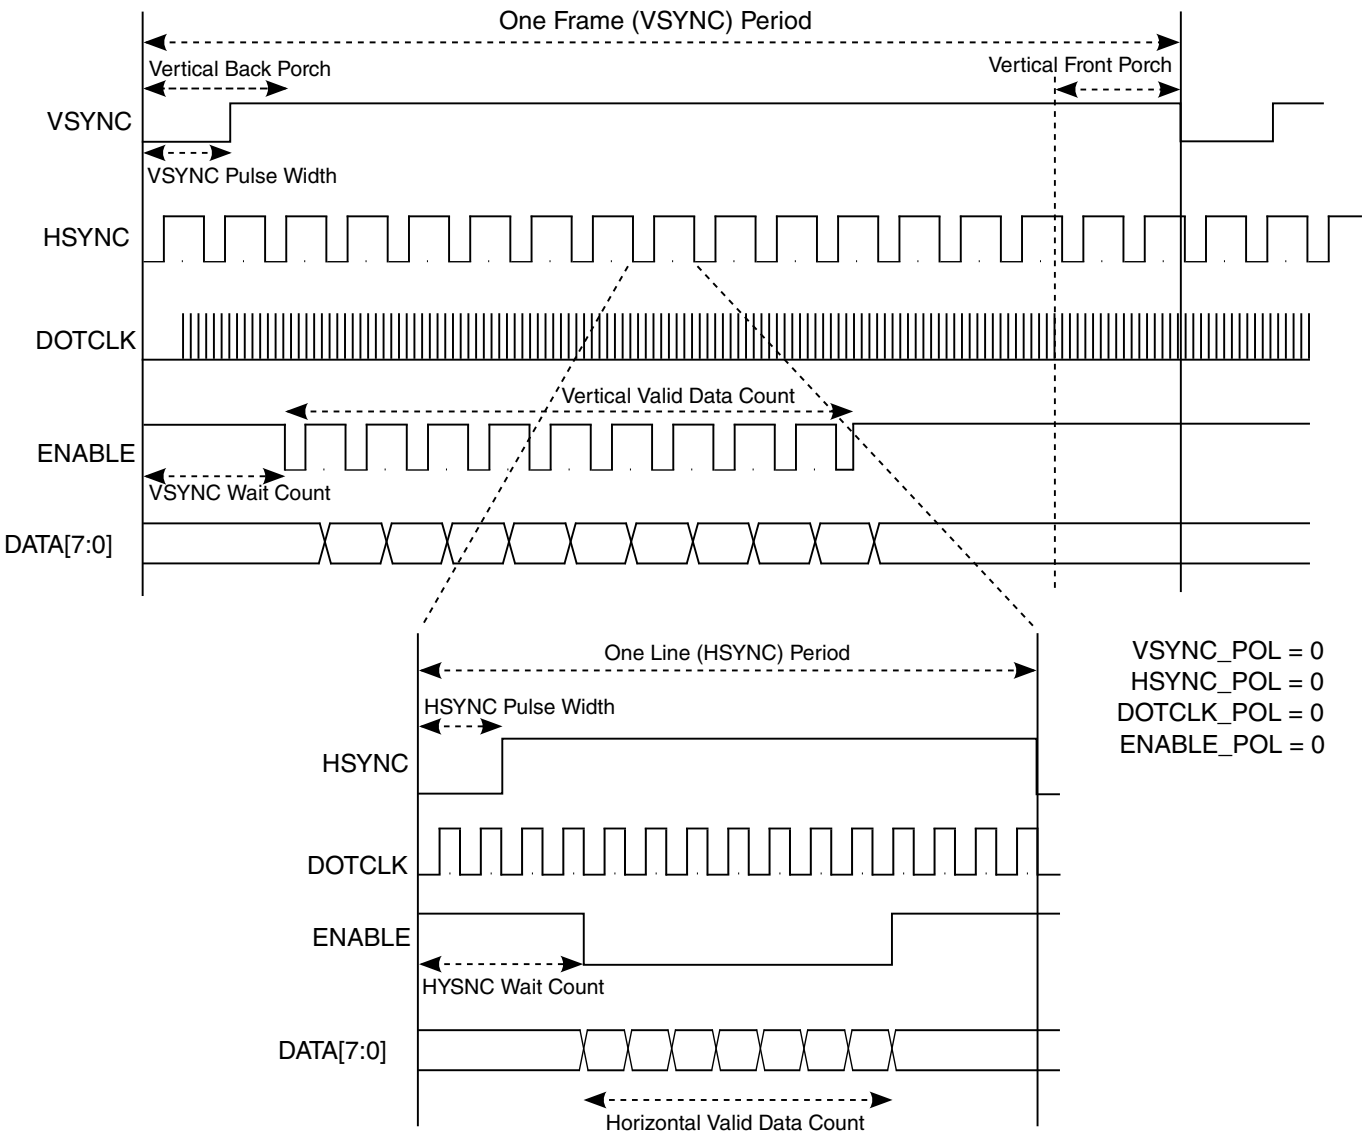

Figure 13-16. DOTCLK protocol with programmable parameters

The DOTCLK mode writes data at high speed to the LCD, and the display operation is synchronized with the VSYNC, HSYNC, ENABLE and DOTCLK signals. The polarities, periods and pulse-widths of the sync signals are programmable using the LCDIF_VDCTRL0-4 registers. The units for the VSYNC signal must be number of horizontal lines and can be selected using the VSYNC_PULSE_WIDTH_UNIT and VSYNC_PERIOD_UNIT bit fields. The VERTICAL_WAIT_CNT is by default given the same unit as the VSYNC_PERIOD. The DISPLAY CLOCK (pix_clk) frequency is managed by the CCM.

In DOTCLK mode, LCDIF_CTRL_BYPASS_COUNT bit must be set to 1. To end the current transfer, the software should make the DOTCLK_MODE bit 0, so that all data that is currently in the LCDIF LFIFO and TXFIFO is transmitted. Once that transfer is complete, the block will automatically clear the RUN bit and issue the cur_frame_done interrupt.

13.2.3.8.1 Code Example

The following code shows an example for programming a 320x240 display.

NOTE

Setting up the display must be done through the MPU mode or via SPI.

```
// Note: Common initialization steps in Initializing the LCDIF must also be
// executed along with the following code
BF_CS1 (LCDIF_CTRL, DOTCLK_MODE, 1);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 1); //Always for DOTCLK mode
BF_CS1 (LCDIF_VDCTRL0, VSYNC_OEB, 0); //Vsync is always an output in the DOTCLK mode
BF_CS4 (LCDIF_VDCTRL0, VSYNC_POL, 0, HSYNC_POL, 0, DOTCLK_POL, 0, ENABLE_POL, 0);
BF_CS1 (LCDIF_VDCTRL0, ENABLE_PRESENT, 1);
BF_CS2 (LCDIF_VDCTRL0, VSYNC_PERIOD_UNIT, 1, VSYNC_PULSE_WIDTH_UNIT, 1);
BF_CS1 (LCDIF_VDCTRL0, VSYNC_PULSE_WIDTH, 2);
BF_CS1 (LCDIF_VDCTRL1, VSYNC_PERIOD, 280);
BF_CS2 (LCDIF_VDCTRL2, HSYNC_PULSE_WIDTH, 10, HSYNC_PERIOD, 360); //Assuming
                                                    //  LCD_DATABUS_WIDTH is 24bit
BF_CS2 (LCDIF_VDCTRL3, VSYNC_ONLY, 0);
BF_CS2 (LCDIF_VDCTRL3, HORIZONTAL_WAIT_CNT, 20, VERTICAL_WAIT_CNT, 20);
BF_CS1 (LCDIF_VDCTRL4, DOTCLK_H_VALID_DATA_CNT, 320);//Note that DOTCLK_V_VALID_DATA_CNT is
                            //implicitly assumed to be HW_LCDIF_TRANSFER_COUNT_V_COUNT
BF_CS1 (LCDIF_VDCTRL4, SYNC_SIGNALS_ON, 1);
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

To stop the transfer completely, the ideal way is to make DOTCLK_MODE = 0. In that case, the block will transmit the contents in the FIFO and reset the RUN bit.

13.2.3.9 Alpha Blending Interface

The LCDIF have the capability to add an extra overlay on the normal display buffer,LCDIF can fetch data from two buffers and combine them before display,one buffer data can have the alpha value with the RGB pixels. With LCDIF_AS_CTRL[AS_ENABLE] is set, the LCDIF will start fetching alpha surface buffer data in bus master mode and combine it with another buffer.

The LCDIF_AS_CTRL[ALPHA_CTRL] bits determines how the alpha value is constructed for the alpha surface.

13.2.3.9.1 Alpha Blending/Color Key

Regardless of pixel input format, the PS and AS pixels are normalized to 32-bits, organized as one alpha and three data bytes. Alpha blending occurs in the RGB space, if blending is required, PS pixels should be converted to RGB space. If no alpha blending is required, then YUV pixels can bypass the alpha blending ALU without color space conversion.

13.2.3.9.2 Alpha Blend

The alpha value for an individual pixel represents a mathematical weighting factor applied to the AS pixel. An alpha value of 0x00 corresponds to a transparent pixel and a value of 0xFF corresponds to an opaque pixel.

The effective alpha value for an AS pixel is determined by the AS_CTRL[ALPHA] and AS_CTRL[ALPHA_CTRL] register fields. If AS_CTRL[ALPHA_CTRL] = ALPHA_OVERRIDE , the alpha value for the pixel is taken from the AS_CTRL[ALPHA] . This can be useful for applying a constant alpha to an entire image or for image formats that don't include an alpha value. If AS_CTRL[ALPHA_CTRL] = ALPHA_MULTIPLY, the pixel's alpha value will be multiplied by the pixel's ALPHA value in order to allow scaling of the pixel's alpha or to provide better control for pixel formats such as RGB1555, which only contains a single bit of alpha.

For each color channel, the equation used to blend two source pixels is defined below:

Gá = PIO programmed global alpha (8-bit value).
Eá = Embedded alpha associated with AS pixel.
á = Gá * Eá + 0x80

The result for the red channel as an example:

R[7:0] = (á * PS.r) + ((1 - á) * AS.r)

When á is 0xff, the PS pixel will not be blended with the AS pixel, but PS will be passed as the output pixel and will not be blended with AS. In this case, AS will be discarded. Likewise, if á is 0x00 for a given pixel, PS will be loaded as the output pixel.

AS_CTRL[ALPHA_INVERT] provides the option to invert the final alpha value. This essentially inverts the effect the alpha value has on the AS and PS blending operation.

13.2.3.9.3 Color Key

The color key function is provided to create transparent effects on the output pixel.

Color keying is applied on the input pixels after they are converted to 8-bits for each red, green, and blue color channels (color keys are not applied directly to 16-bit pixel formats but to their corresponding 24-bit representation). A color key range is programmable for both PS and AS pixels. If the PS 24-bit pixel is within the PS color key range, then AS is passed through the pixel pipeline. In this case, alpha blending does NOT occur. Conversely, if PS is within the AS color key range, then PS is passed via the LCDIF data pipeline. If both PS and AS color key tests pass, then the back ground color register is passed onto following LCDIF processing components in the pipeline.

The condition for color keying to be satisfied is:

CK0.r.low <= PS.r <= CK0.r.high

CK0.g.low <= PS.g <= CK0.g.high

CK0.b.low <= PS.b <= CK0.b.high

For example, if the "red" 8-bit value for the PS pixel (or PS.r) is between the color key low and high values (CK0.r.l and CK0.r.h), the condition is true for the red color plane. When ALL three color planes meet this condition, then only the PS pixel is loaded into the output register.

To disable color keying, program the low color key register value to 0xff and the high value to 0x00. This will guarantee that the color key range test will never be true.

13.2.3.9.4 Color Key Processing (AS_CTRL)

The AS_CTRL register also contains an ENABLE_COLORKEY bit that can be used to enable or disable color key substitution for the AS.

When enabled, the pixel values are compared to the ASCOLORKEYLOW and ASCOLORKEYHIGH registers to determine if a match has occurred. When an AS pixel matches the color key range, the pixel from the AS image is considered transparent and the corresponding PS pixel is rendered. If both the PS and AS pixels match their corresponding color key ranges, the AS pixel is displayed unmodified.

AS color keys are handled in a manner similar to PS color keys. The same images used in the PS color key example could be used with the images swapped. In this case, matches on the AS image to the ASCOLORKEY register would display the PS pixels.

13.2.3.10 ITU-R BT.656 Digital Video Interface (DVI)

ITU-R BT.656 Digital Video Interface shown below transmits 4:2:2 YCbCr digital component video to a digital video encoder that can translate it into 525/60 or 625/50 analog TV signal.

Unique timing codes (timing reference signals) are embedded within the video stream to indicate the different timing events that would have been otherwise indicated by VSYNC, HSYNC and BLANK signals. The hardware supports 8-bit data transfers; the pins are shared with the lower 8 bits of LCD data bus. The LCD_RS pin is shared with the clock signal of the interface (called CCIRCLK here for uniqueness). CCIRCLK also can be obtained on the LCD_DOTCLK pin. The mode shares the write FIFO with the LCD interface and the associated pipeline. The programmable parameters in registers LCDIF_DVICTRL0-3 allow setting the total number of horizontal lines per frame, vertical and horizontal blanking interval, odd and even field start and end positions, and so on. In short, these parameters are provided to ensure that the hardware has enough flexibility to generate the right 525/60 or 625/50 data streams. Most of the initialization steps in Initializing the LCDIF such as data shifting, swizzle, and so on, are applicable to DVI mode also. The register descriptions in the programmable registers section at the end of this chapter include example code for programming the DVICTRL0-3 registers.

In DVI mode, LCDIF_CTRL_BYPASS_COUNT bit must be set to 1. To end the current transfer, the software should make the DVI_MODE bit the value 0, so that all data that is currently in the LCDIF LFIFO and TXFIFO is transmitted. Once that transfer is complete, the block will automatically clear the RUN bit and assert the cur_frame_done interrupt.

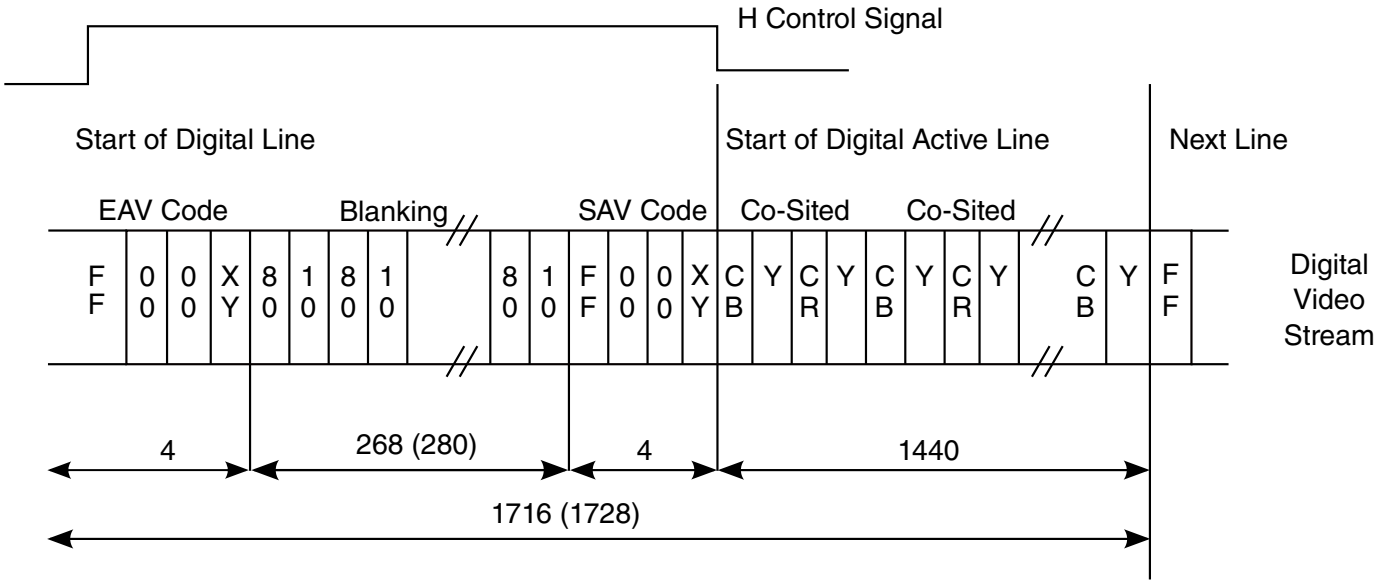

Figure 13-17. Digital Video Interface

13.2.3.11 LCDIF Pin Usage by Interface Mode

The following tables detail how the LCDIF level interface pins are used based on the desired mode of operation. The chip level I/Os should also be configured to be consistent with the desired LCDIF operating mode.

The VSYNC signal has been mapped onto two pins, LCD_BUSY and LCD_VSYNC. The pin multiplexing can be programmed to select either of those pins to function as VSYN.

NOTE

There is an option to internally mux the HSYNC, DOTCLK and ENABLE signals in the DOTCLK mode by setting the MUX_SYNC_SIGNALS bit in the VDCTRL0 register.

13.2.4 Behavior During Reset

BUS CLOCK (apb_clk) and DISPLAY CLOCK (pix_clk) must be running before making any changes to SFTRST or CLKGATE bits.

A soft reset (SFTRST) can take multiple clock periods to complete, so do not set CLKGATE when setting SFTRST.

The reset process gates the clocks automatically.

13.2.5 LCDIF Memory Map/Register Definition

Some of the LCDIF registers (XXX_SET, XXX_CLR, and XXX_TOG) allow direct bit field masking and access.

- When writing 1 to XXX_SET bit fields, these registers allow setting the masked 1 bit fields, while keeping unchanged all bit fields which remain on 0 logic state.

- When writing 1 to XXX_CLR bit fields, these registers allow clearing the masked 1 bit fields, while keeping unchanged all other bit fields which remained on 0 logic state.
- When writing 1 to XXX_TOG bit fields, these registers allow inverting the logic state of all masked 1 bit fields, while they keep unchanged the remaining bit fields which were kept on 0 logic state.

LCDIF Hardware Register Format Summary

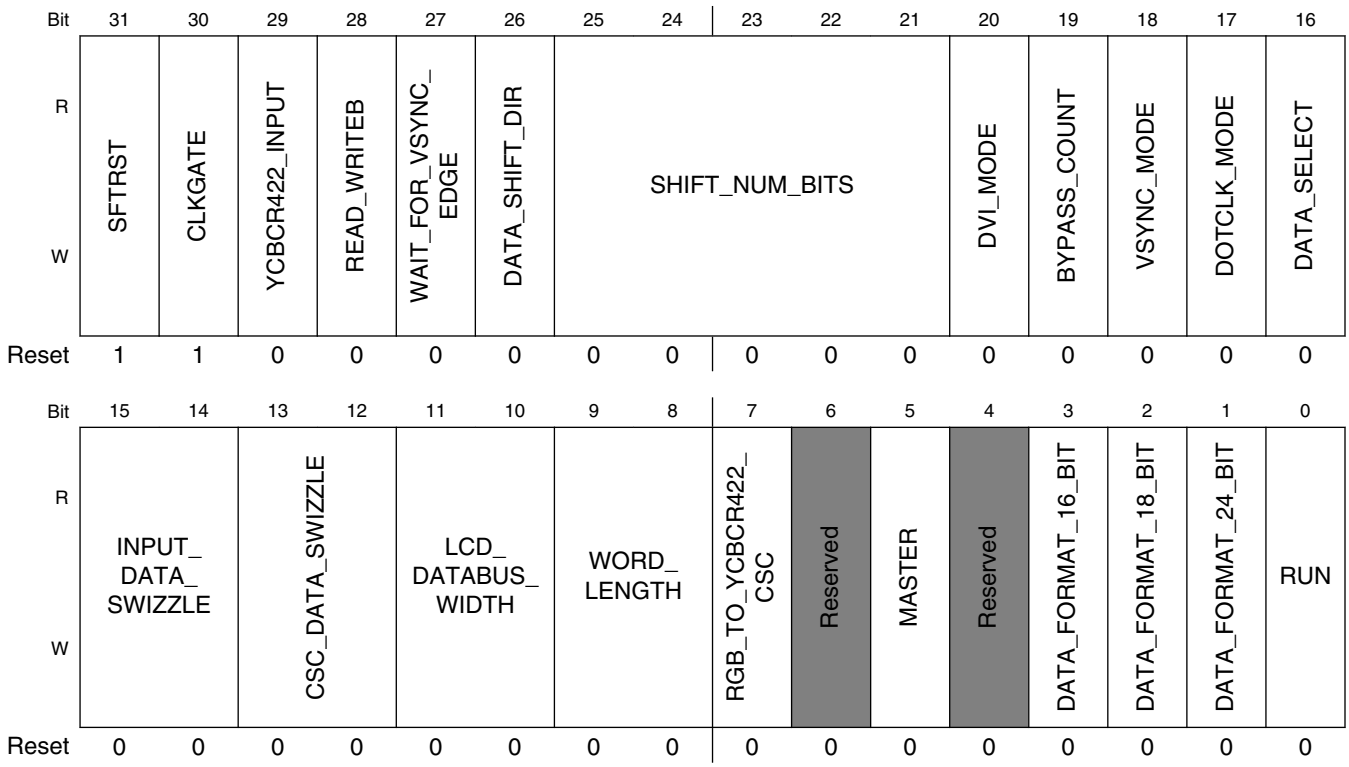
13.2.5.1 LCDIF General Control Register (LCDIF_CTRL*n*)

The LCD Interface Control Register provides overall control of the LCDIF block. The LCDIF Control Register provides a variety of control functions to the programmer. These functions allow the interface to be very flexible to work with a variety of LCD controllers, and to minimize overhead and increase performance of LCD programming. The register has been organized such that switching between the different LCD modes can be done with minimum PIO writes.

Address: 3032_0000h base + 0h offset + (4d × i), where i=0d to 3d



LCDIF_CTRL*n* field descriptions

Field	Description
31 SFTRST	This bit must be set to zero to enable normal operation of the LCDIF. When set to one, it forces a block level reset.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29 YCBCR422_INPUT	Zero implies input data is in RGB color space. One implies input data is in YCbCr 4:2:2 format, such that YCbYCr are packed in a 32-bit word. It also means that there are 2 pixels in 4 bytes. If this bit is set, software should program the H_COUNT field in the TRANSFER_COUNT register to the total number of pixels that will have to be fetched by the LCDIF block per line and the BYTE_PACKING_FORMAT should be 0xF. The WORD_LENGTH does not matter in this case.

Table continues on the next page...

LCDIF_CTRL*n* field descriptions (continued)

Field	Description
28 READ_WRITEB	By default, LCDIF is in the write mode. Setting this bit to 1 will make the hardware go into 6800/8080 MPU read mode. The LCDIF_MASTER bit must be 0, since bus master mode can only be used for writing the display.
27 WAIT_FOR_ VSYNC_EDGE	Setting this bit to 1 will make the hardware wait for the triggering VSYNC edge before starting write transfers to the LCD. Used only in the VSYNC mode of operation.
26 DATA_SHIFT_ DIR	Use this bit to determine the direction of shift of transmit data. In the DVI mode, it works only on the active data, not on the timing codes and ancillary data. 0x0 **TXDATA_SHIFT_LEFT** — Data to be transmitted is shifted LEFT by SHIFT_NUM_BITS bits. 0x1 **TXDATA_SHIFT_RIGHT** — Data to be transmitted is shifted RIGHT by SHIFT_NUM_BITS bits.
25–21 SHIFT_NUM_ BITS	The data to be transmitted is shifted left or right by this number of bits.
20 DVI_MODE	Set this bit to 1 to get into the ITU-R BT.656 digital video interface mode. Toggle this bit from 1 to 0 to make the hardware go out of DVI mode after completing all data transfer and after the RUN bit has been deasserted.
19 BYPASS_ COUNT	When this bit is 0, it means that LCDIF will stop the block operation and turn off the RUN bit after the amount of data indicated by the LCDIF_TRANSFER_COUNT register has been transferred out. When this bit is set to 1, the block will continue normal operation indefinitely until it is told to stop. This bit must be 0 in MPU and VSYNC modes, and must be 1 in DOTCLK and DVI modes of operation.
18 VSYNC_MODE	Setting this bit to 1 will make the LCDIF hardware go into VSYNC mode. WAIT_FOR_VSYNC_EDGE can be used only if this bit is set. If VSYNC signal is required to be an output from the block, SYNC_SIGNALS_ON bit in LCDIF_VDCTRL4 register must be set.
17 DOTCLK_MODE	Set this bit to 1 to make the hardware go into the DOTCLK mode, i.e. VSYNC/HSYNC/DOTCLK/ENABLE interface mode. ENABLE is optional, selected by the ENABLE_PRESENT bit. Toggle this bit from 1 to 0 to make the hardware go out of DOTCLK mode after completing all data transfer and deasserting the RUN bit.
16 DATA_SELECT	Command Mode polarity bit. This bit should only be changed when RUN is 0. 0x0 **CMD_MODE** — Command Mode. LCD_RS signal is Low. 0x1 **DATA_MODE** — Data Mode. LCD_RS signal is High.
15–14 INPUT_DATA_ SWIZZLE	This field specifies how to swap the bytes fetched by the bus master interface. The swizzle function is independent of the WORD_LENGTH bit. The supported swizzle configurations are: 0x0 **NO_SWAP** — No byte swapping.(Little endian) 0x0 **LITTLE_ENDIAN** — Little Endian byte ordering (same as NO_SWAP). 0x1 **BIG_ENDIAN_SWAP** — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 **SWAP_ALL_BYTES** — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 **HWD_SWAP** — Swap half-words. 0x3 **HWD_BYTE_SWAP** — Swap bytes within each half-word.
13–12 CSC_DATA_ SWIZZLE	This field specifies how to swap the bytes after the data has been converted into an internal representation of 24 bits per pixel and before it is transmitted over the LCD interface bus. The data is always transmitted with the least significant byte/hword (half word) first after the swizzle takes place. So, INPUT_DATA_SWIZZLE takes place first on the incoming data, and then CSC_DATA_SWIZZLE is applied. The swizzle function is independent of the WORD_LENGTH or the LCD_DATABUS_WIDTH fields. If RGB_TO_YCRCB422_CSC bit is set, the swizzle occurs on the Y, Cb, Cr values. The supported swizzle configurations are: 0x0 **NO_SWAP** — No byte swapping.(Little endian)

Table continues on the next page...

LCDIF_CTRL*n* field descriptions (continued)

Field	Description
	0x0 **LITTLE_ENDIAN** — Little Endian byte ordering (same as NO_SWAP). 0x1 **BIG_ENDIAN_SWAP** — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 **SWAP_ALL_BYTES** — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 **HWD_SWAP** — Swap half-words. 0x3 **HWD_BYTE_SWAP** — Swap bytes within each half-word.
11–10 LCD_DATABUS_WIDTH	LCD Data bus transfer width. 0x0 **16_BIT** — 16-bit data bus mode. 0x1 **8_BIT** — 8-bit data bus mode. 0x2 **18_BIT** — 18-bit data bus mode. 0x3 **24_BIT** — 24-bit data bus mode.
9–8 WORD_LENGTH	Input data format. 0x0 **16_BIT** — Input data is 16 bits per pixel. 0x1 **8_BIT** — Input data is 8 bits wide. 0x2 **18_BIT** — Input data is 18 bits per pixel. 0x3 **24_BIT** — Input data is 24 bits per pixel.
7 RGB_TO_YCBCR422_CSC	Set this bit to 1 to enable conversion from RGB to YCbCr colorspace. See the LCDIF_CSC_ registers for further details.
6 -	This field is reserved. Reserved
5 MASTER	Set this bit to make the LCDIF act as a bus master.
4 RSRVD0	This field is reserved. Reserved bits. Write as 0.
3 DATA_FORMAT_16_BIT	When this bit is 1 and WORD_LENGTH = 0, it implies that the 16-bit data is in ARGB555 format. When this bit is 0 and WORD_LENGTH = 0, it implies that the 16-bit data is in RGB565 format. When WORD_LENGTH is not 0, this bit does not care.
2 DATA_FORMAT_18_BIT	Used only when WORD_LENGTH = 2, i.e. 18-bit. 0x0 **LOWER_18_BITS_VALID** — Data input to the block is in 18 bpp format, such that lower 18 bits contain RGB 666 and upper 14 bits do not contain any useful data. 0x1 **UPPER_18_BITS_VALID** — Data input to the block is in 18 bpp format, such that upper 18 bits contain RGB 666 and lower 14 bits do not contain any useful data.
1 DATA_FORMAT_24_BIT	Used only when WORD_LENGTH = 3, i.e. 24-bit. Note that this applies to both packed and unpacked 24-bit data. 0x0 **ALL_24_BITS_VALID** — Data input to the block is in 24 bpp format, such that all RGB 888 data is contained in 24 bits. 0x1 **DROP_UPPER_2_BITS_PER_BYTE** — Data input to the block is actually RGB 18 bpp, but there is 1 color per byte, hence the upper 2 bits in each byte do not contain any useful data, and should be dropped.
0 RUN	When this bit is set by software, the LCDIF will begin transferring data between the SoC and the display. This bit must remain set until the operation is complete.

13.2.5.2 LCDIF General Control1 Register (LCDIF_CTRL1*n*)

The LCDIF Control Register provides overall control of the LCDIF block.

The LCDIF Control1 Register provides additional programming to the LCDIF. It implements some bits which are unlikely to change often in a particular application. It also carries interrupt-related bits which are common across more than one mode of operation.

Address: 3032_0000h base + 10h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

LCDIF_CTRL1*n* field descriptions

Field	Description
31 -	This field is reserved. Reserved bits. Write as 0.
30 -	This field is reserved. Reserved bits. Write as 0.
29–28 -	This field is reserved. Reserved bits. Write as 0.
27 COMBINE_MPU_WR_STRB	If this bit is not set, the write strobe will be driven on LCD_WR_RWn pin in the 8080 mode and on the LCD_RD_E pin in the 6800 mode. If it is set, the write strobe of both the 6800 and 8080 modes will be driven only on the LCD_WR_RWn pin. Note that this does not work for read strobe.
26 BM_ERROR_IRQ_EN	This bit is set to enable bus master error interrupt in the LCDIF master mode.

Table continues on the next page...

LCDIF_CTRL1*n* field descriptions (continued)

Field	Description
25 BM_ERROR_ IRQ	This bit is set to indicate that an interrupt is requested by the LCDIF block. This bit is cleared by software by writing a one to its SCT clear address. This bit will be set when the LCDIF is in master mode and an error response was returned by the slave. 0x0 **NO_REQUEST** — No Interrupt Request Pending. 0x1 **REQUEST** — Interrupt Request Pending.
24 RECOVER_ON_ UNDERFLOW	Set this bit to enable the LCDIF block to recover in the next field/frame if there was an underflow in the current field/frame.
23 INTERLACE_ FIELDS	Set this bit if it is required that the LCDIF block fetches odd lines in one field and even lines in the other field. It will work only in LCDIF_MASTER is set to 1.
22 START_ INTERLACE_ FROM_ SECOND_FIELD	The default is to grab the odd lines first and then the even lines. Set this bit if it is required to grab the even lines first and then the odd lines. (Line numbers start from 1, so odd lines are 1,3,5,etc. and even lines are 2,4,6, etc.)
21 FIFO_CLEAR	Set this bit to clear all the data in the latency FIFO (LFIFO), TXFIFO and the RXFIFO.
20 IRQ_ON_ ALTERNATE_ FIELDS	If this bit is set, the LCDIF block will assert the cur_frame_done interrupt only on alternate fields, otherwise it will issue the interrupt on both odd and even field. This bit is mostly relevant if INTERLACE_FIELDS is set.
19–16 BYTE_ PACKING_ FORMAT	This bitfield is used to show which data bytes in a 32-bit word are valid. Default value 0xf indicates that all bytes are valid. For 8-bit transfers, any combination in this bitfield will mean valid data is present in the corresponding bytes. In the 16-bit mode, a 16-bit half-word is valid only if adjacent bits [1:0] or [3:2] or both are 1. A value of 0x0 will mean that none of the bytes are valid and should not be used. For example, set the bit field value to 0x7 if the display data is arranged in the 24-bit unpacked format (A-R-G-B where A value does not have be transmitted). When input data is in YCbCr 4:2:2 format (YCBCR422_INPUT is 1), H_COUNT should be the number of pixels that should be fetched by the block and the BYTE_PACKING_FORMAT should be 0xF.(Note - YCBCR422_INPUT = 1 implies 2 pixels per 32 bits).
15 OVERFLOW_ IRQ_EN	This bit is set to enable an overflow interrupt in the TXFIFO in the write mode.
14 UNDERFLOW_ IRQ_EN	This bit is set to enable an underflow interrupt in the TXFIFO in the write mode.
13 CUR_FRAME_ DONE_IRQ_EN	This bit is set to 1 enable an interrupt every time the hardware enters in the vertical blanking state.
12 VSYNC_EDGE_ IRQ_EN	This bit is set to enable an interrupt every time the hardware encounters the leading VSYNC edge in the VSYNC and DOTCLK modes, or the beginning of every field in DVI mode.
11 OVERFLOW_ IRQ	This bit is set to indicate that an interrupt is requested by the LCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A latency FIFO (LFIFO) overflow in the write mode (MPU/VSYNC/DOTCLK/DVI mode) was detected, data samples have been lost. 0x0 **NO_REQUEST** — No Interrupt Request Pending. 0x1 **REQUEST** — Interrupt Request Pending.

Table continues on the next page...

LCDIF_CTRL1*n* field descriptions (continued)

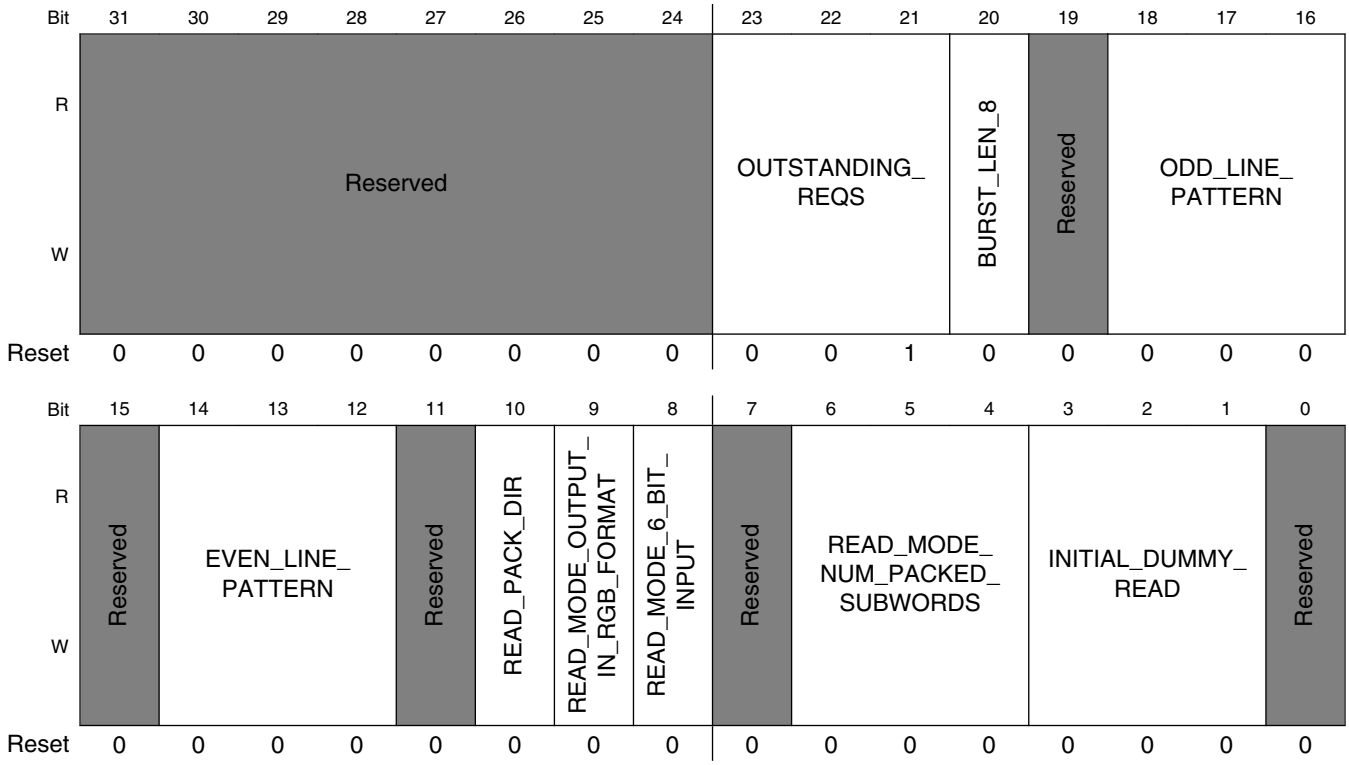
Field	Description
10 UNDERFLOW_IRQ	This bit is set to indicate that an interrupt is requested by the LCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A TXFIFO underflow in the write mode (MPU/VSYNC/ DOTCLK/DVI mode) was detected. Could produce an error in the DOTCLK / DVI modes. 0x0 **NO_REQUEST** — No Interrupt Request Pending. 0x1 **REQUEST** — Interrupt Request Pending.
9 CUR_FRAME_DONE_IRQ	This bit is set to indicate that an interrupt is requested by the LCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It indicates that the hardware has completed transmitting the current frame and is in the vertical blanking period in the DOTCLK/DVI modes. In the MPU and VSYNC modes, this IRQ is asserted at the end of the data transfer indicated by LCDIF_TRANSFER_COUNT register. 0x0 **NO_REQUEST** — No Interrupt Request Pending. 0x1 **REQUEST** — Interrupt Request Pending.
8 VSYNC_EDGE_IRQ	This bit is set to indicate that an interrupt is requested by the LCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It is set whenever the leading VSYNC edge is detected in the VSYNC and DOTCLK modes. In the DVI mode, it is asserted every time the block enters a new field. 0x0 **NO_REQUEST** — No Interrupt Request Pending. 0x1 **REQUEST** — Interrupt Request Pending.
7–3 RSRVD0	This field is reserved. Reserved bits. Write as 0.
2 BUSY_ENABLE	This bit enables the use of the interface's busy signal input. This should be enabled for LCD controllers that implement a busy line (to stall the LCDIF from sending more data until ready). Otherwise this bit should be cleared. 0x0 **BUSY_DISABLED** — The busy signal from the LCD controller will be ignored. 0x1 **BUSY_ENABLED** — Enable the use of the busy signal from the LCD controller.
1 MODE86	This bit is used to select between the 8080 and 6800 series of microprocessor modes. This bit should only be changed when RUN is 0. 0x0 **8080_MODE** — Pins LCD_WR_RWn and LCD_RD_E function as active low WR and active low RD signals respectively. 0x1 **6800_MODE** — Pins LCD_WR_RWn and LCD_RD_E function as Read/Write and active high Enable signals respectively.
0 RESET	Reset bit for the external LCD controller. This bit can be changed at any time. It CANNOT be reset by SFTRST. 0x0 **LCDRESET_LOW** — LCD_RESET output signal is low. 0x1 **LCDRESET_HIGH** — LCD_RESET output signal is high.

13.2.5.3 LCDIF General Control2 Register (LCDIF_CTRL2*n*)

The LCDIF Control Register provides overall control of the LCDIF block.

The LCDIF Control2 Register provides additional programming to the LCDIF. It implements some bits which are unlikely to change often in a particular application.

Address: 3032_0000h base + 20h offset + (4d × i), where i=0d to 3d



LCDIF_CTRL2*n* field descriptions

Field	Description
31–24 RSRVD5	This field is reserved. Reserved bits. Write as 0.
23–21 OUTSTANDING_ REQS	This bitfield indicates the maximum number of outstanding transactions that LCDIF should request when it is acting as a bus master. Default is 2 outstanding transactions. 0x0 **REQ_1** — 0x1 **REQ_2** — 0x2 **REQ_4** — 0x3 **REQ_8** — 0x4 **REQ_16** —
20 BURST_LEN_8	By default, when the LCDIF is in the bus master mode, it will issue AXI bursts of length 16 (except when in packed 24 bpp mode, it will issue bursts of length 15). When this bit is set to 1, the block will issue bursts of length 8 (except when in packed 24 bpp mode, it will issue bursts of length 9). Note that this bitfield is only applicable when LCDIF_MASTER is set to 1.
19 RSRVD4	This field is reserved. Reserved bits. Write as 0.
18–16 ODD_LINE_ PATTERN	This field determines the order of the RGB components of each pixel in ODD lines (line numbers 1,3,5,..). This bitfield must be 0 in DVI mode. 0x0 **RGB** — 0x1 **RBG** — 0x2 **GBR** — 0x3 **GRB** —

Table continues on the next page...

LCDIF_CTRL2*n* field descriptions (continued)

Field	Description
	0x4 **BRG** — 0x5 **BGR** —
15 RSRVD3	This field is reserved. Reserved bits. Write as 0.
14–12 EVEN_LINE_ PATTERN	This field determines the order of the RGB components of each pixel in EVEN lines (line numbers 2,4,6,..). This bitfield must be 0 in DVI mode. 0x0 **RGB** — 0x1 **RBG** — 0x2 **GBR** — 0x3 **GRB** — 0x4 **BRG** — 0x5 **BGR** —
11 RSRVD2	This field is reserved. Reserved bits. Write as 0.
10 READ_PACK_DIR	The default value of 0 indicates data is stored in the little endian format. When LCD_DATABUS_WIDTH is 8-bit, this bit provides the option of rearranging the data byte-wise in the big endian format. For example, if READ_MODE_NUM_PACKED_SUBWORDS = 3 and the order of incoming data is 0x11, 0x22 and 0x33, then setting this bit to 1 will cause the data to be stored as 0x00112233 as opposed to the default 0x00332211. This operation occurs after the shifting operation done by SHIFT_NUM_BITS bitfield.
9 READ_MODE_ OUTPUT_IN_ RGB_FORMAT	Setting this bit will enable the LCDIF to convert the incoming data to the RGB format given by WORD_LENGTH bitfield. This feature is not available when WORD_LENGTH is set to 8 bits. LCDIF performs this operation of converting to RGB format after the endianness has been determined by the READ_PACK_DIR bitfield.
8 READ_MODE_6_ BIT_INPUT	Setting this bit to 1 indicates to LCDIF that even though LCD_DATABUS_WIDTH is set to 8 bits, the input data is actually only 6 bits wide and exists on D5-D0.
7 RSRVD1	This field is reserved. Reserved bits. Write as 0.
6–4 READ_MODE_ NUM_PACKED_ SUBWORDS	Indicates the number of valid 8/16/18/24-bit subwords that will be packed into the 32-bit word in read mode. The subword size (8,16, 18 or 24 bits) is determined by the LCD_DATABUS_WIDTH field. The swizzle operation is performed after READ_MODE_NUM_PACKED_SUBWORDS number of subwords has been received and stored in little-endian format. For example, if LCD_DATABUS_WIDTH is set to 8-bit and data to be read back has to be stored in memory in 24-bit unpacked RGB format, set READ_MODE_NUM_PACKED_SUBWORDS to 0x3 so that each 32-bit word will contain only 3 valid bytes (RGB). Maximum value of READ_MODE_NUM_PACKED_SUBWORDS is 4 for 8-bit databus, 2 for 16-bit databus and 1 for 18/24-bit databus.
3–1 INITIAL_DUMMY_ READ	The value in this field determines the number of dummy 8/16/18/24-bit subwords that have to be read back from the LCD panel/controller. They will then not be stored in the read FIFO.
0 RSRVD0	This field is reserved. Reserved bits. Write as 0.

13.2.5.4 LCDIF Horizontal and Vertical Valid Data Count Register (LCDIF_TRANSFER_COUNT)

This register tells the LCDIF how much data will be sent for this frame, or transaction. The total number of words is a product of the V_COUNT and H_COUNT fields. The word size is specified by the WORD_LENGTH field.

This register gives the dimensions of the input frame. For normal operation, but V_COUNT and H_COUNT should be non-zero.

Address: 3032_0000h base + 30h offset = 3032_0030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	V_COUNT																H_COUNT															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_TRANSFER_COUNT field descriptions

Field	Description
31–16 V_COUNT	Number of horizontal lines per frame which contain valid data. In DOTCLK mode, V_COUNT should be the same as the number of active horizontal lines in a progressive frame. In DVI mode, V_COUNT should be the number of active horizontal lines per frame, and not per field.
H_COUNT	Total valid data (pixels) in each horizontal line. The data size is given by the WORD_LENGTH. When input data is in YCbCr 4:2:2 format (YCBCR422_INPUT is 1), H_COUNT should be the number of 32-bit words that should be fetched by the block and the BYTE_PACKING_FORMAT should be 0xF. In 24-bit packed format (WORD_LENGTH=0x3, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 4 pixels. In 16-bit packed format (WORD_LENGTH=0x0, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 2 pixels.

13.2.5.5 LCD Interface Current Buffer Address Register (LCDIF_CUR_BUF)

This register indicates the address of the current frame being transmitted by LCDIF.

When the LCDIF is behaving as a master, this address points to the address of the current frame of data being sent out via the LCDIF. When the current frame is done, the LCDIF block will assert the cur_frame_done interrupt for software to take action. The block will also copy the LCDIF_NEXT_BUF_ADDR into this bitfield so that the software can program the next frame address into the LCDIF_NEXT_BUF_ADDR bitfield. This address must always be double-word aligned.

Address: 3032_0000h base + 40h offset = 3032_0040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_CUR_BUF field descriptions

Field	Description
ADDR	Address of the current frame being transmitted by LCDIF.

13.2.5.6 LCD Interface Next Buffer Address Register (LCDIF_NEXT_BUF)

This register indicates the address of next frame that will be transmitted by LCDIF.

When the LCDIF is behaving as a master, this address points to the address of the next frame of data that will be sent out via the LCDIF. It is up to the software to make sure that this register is programmed before the end of the current frame, otherwise it might result in old data going out the LCDIF. This address must always be double-word aligned.

Address: 3032_0000h base + 50h offset = 3032_0050h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_NEXT_BUF field descriptions

Field	Description
ADDR	Address of the next frame that will be transmitted by LCDIF.

13.2.5.7 LCD Interface Timing Register (LCDIF_TIMING)

The LCD interface timing register controls the various setup and hold times enforced by the LCD interface in the 6800/8080 MPU and VSYNC modes of operation.

The values used in this register are dependent on the particular LCD controller used, consult the users manual for the particular controller for required timings. Each field of the register must be non-zero, therefore the minimum value is: 0x01010101. NOTE: the timings are not automatically adjusted if the DISPLAY CLOCK (pix_clk) frequency changes—it may be necessary to adjust the timings if DISPLAY CLOCK (pix_clk) changes. NOTE: Each field in this register must be non-zero for the MPU and VSYNC modes to function. The settings in this register do not affect the DOTCLK and DVI modes.

Address: 3032_0000h base + 60h offset = 3032_0060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	CMD_HOLD								CMD_SETUP								DATA_HOLD								DATA_SETUP							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_TIMING field descriptions

Field	Description
31–24 CMD_HOLD	Number of DISPLAY CLOCK (pix_clk) cycles that the LCD_RS signal is active after LCD_CS is deasserted.
23–16 CMD_SETUP	Number of DISPLAY CLOCK (pix_clk) cycles that the LCD_RS signal is active before LCD_CS is asserted.
15–8 DATA_HOLD	Data bus hold time in DISPLAY CLOCK (pix_clk) cycles. Also the time that the data strobe is deasserted in a cycle
DATA_SETUP	Data bus setup time in DISPLAY CLOCK (pix_clk) cycles. Also the time that the data strobe is asserted in a cycle.

13.2.5.8 LCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF_VDCTRL0*n*)

This register is used to control the VSYNC and DOTCLK modes of the LCDIF so as to work with different types of LCDs like moving picture displays and delta pixel displays.

This register gives general programmability to the VSYNC signal including polarity, direction, pulse width, etc.

Address: 3032_0000h base + 70h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved		VSYNC_OEB	ENABLE_PRESENT	VSYNC_POL	HSYNC_POL	DOTCLK_POL	ENABLE_POL	Reserved		VSYNC_PERIOD_UNIT	VSYNC_PULSE_WIDTH_UNIT	HALF_LINE	HALF_LINE_MODE	VSYNC_PULSE_WIDTH	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	VSYNC_PULSE_WIDTH															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_VDCTRL0*n* field descriptions

Field	Description
31–30 RSRVD2	This field is reserved. Reserved bits. Write as 0.
29 VSYNC_OEB	0 means the VSYNC signal is an output, 1 means it is an input. Should be set to 0 in the DOTCLK mode. 0x0 **VSYNC_OUTPUT** — The VSYNC pin is in the output mode and the VSYNC signal has to be generated by the LCDIF block. 0x1 **VSYNC_INPUT** — The VSYNC pin is in the input mode and the LCD controller sends the VSYNC signal to the block.
28 ENABLE_ PRESENT	Setting this bit to 1 will make the hardware generate the ENABLE signal in the DOTCLK mode, thereby making it the true RGB interface along with the remaining three signals VSYNC, HSYNC and DOTCLK.
27 VSYNC_POL	Default 0 active low during VSYNC_PULSE_WIDTH time and will be high during the rest of the VSYNC period. Set it to 1 to invert the polarity.
26 HSYNC_POL	Default 0 active low during HSYNC_PULSE_WIDTH time and will be high during the rest of the HSYNC period. Set it to 1 to invert the polarity.
25 DOTCLK_POL	Default is data launched at negative edge of DOTCLK and captured at positive edge. Set it to 1 to invert the polarity. Set it to 0 in DVI mode.
24 ENABLE_POL	Default 0 active low during valid data transfer on each horizontal line.
23–22 RSRVD1	This field is reserved. Reserved bits. Write as 0.
21 VSYNC_ PERIOD_UNIT	Default 0 for counting VSYNC_PERIOD in terms of DISPLAY CLOCK (pix_clk) cycles. Set it to 1 to count in terms of complete horizontal lines. DISPLAY CLOCK (pix_clk) cycles should be used in the VSYNC mode, while horizontal line should be used in the DOTCLK mode.
20 VSYNC_PULSE_ WIDTH_UNIT	Default 0 for counting VSYNC_PULSE_WIDTH in terms of DISPLAY CLOCK (pix_clk) cycles. Set it to 1 to count in terms of complete horizontal lines.
19 HALF_LINE	Setting this bit to 1 will make the total VSYNC period equal to the VSYNC_PERIOD field plus half the HORIZONTAL_PERIOD field (i.e. VSYNC_PERIOD field plus half horizontal line), otherwise it is just VSYNC_PERIOD. Should be only used in the DOTCLK mode, not in the VSYNC interface mode.
18 HALF_LINE_ MODE	When this bit is 0, the first field (VSYNC period) will end in half a horizontal line and the second field will begin with half a horizontal line. When this bit is 1, all fields will end with half a horizontal line, and none will begin with half a horizontal line.
VSYNC_PULSE_ WIDTH	Number of units for which VSYNC signal is active. For the DOTCLK mode, the unit is determined by the VSYNC_PULSE_WIDTH_UNIT. If the VSYNC_PULSE_WIDTH_UNIT is 0 for DOTCLK mode, VSYNC_PULSE_WIDTH must be less than HSYNC_PERIOD. For the VSYNC interface mode, it should be in terms of number of DISPLAY CLOCK (pix_clk) cycles only.

13.2.5.9 LCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIF_VDCTRL1)

This register is used to control the VSYNC signal in the VSYNC and DOTCLK modes of the block.

This register determines the period and duty cycle of the VSYNC signal when it is generated in the block.

Address: 3032_0000h base + 80h offset = 3032_0080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	VSYNC_PERIOD																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_VDCTRL1 field descriptions

Field	Description
VSYNC_PERIOD	Total number of units between two positive or two negative edges of the VSYNC signal. If HALF_LINE is set, it is implicitly calculated to be VSYNC_PERIOD plus half HSYNC_PERIOD.

13.2.5.10 LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIF_VDCTRL2)

This register is used to control the HSYNC signal in the DOTCLK mode of the block.

This register determines the period and duty cycle of the HSYNC signal when it is generated in the block.

Address: 3032_0000h base + 90h offset = 3032_0090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	HSYNC_PULSE_WIDTH														HSYNC_PERIOD																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_VDCTRL2 field descriptions

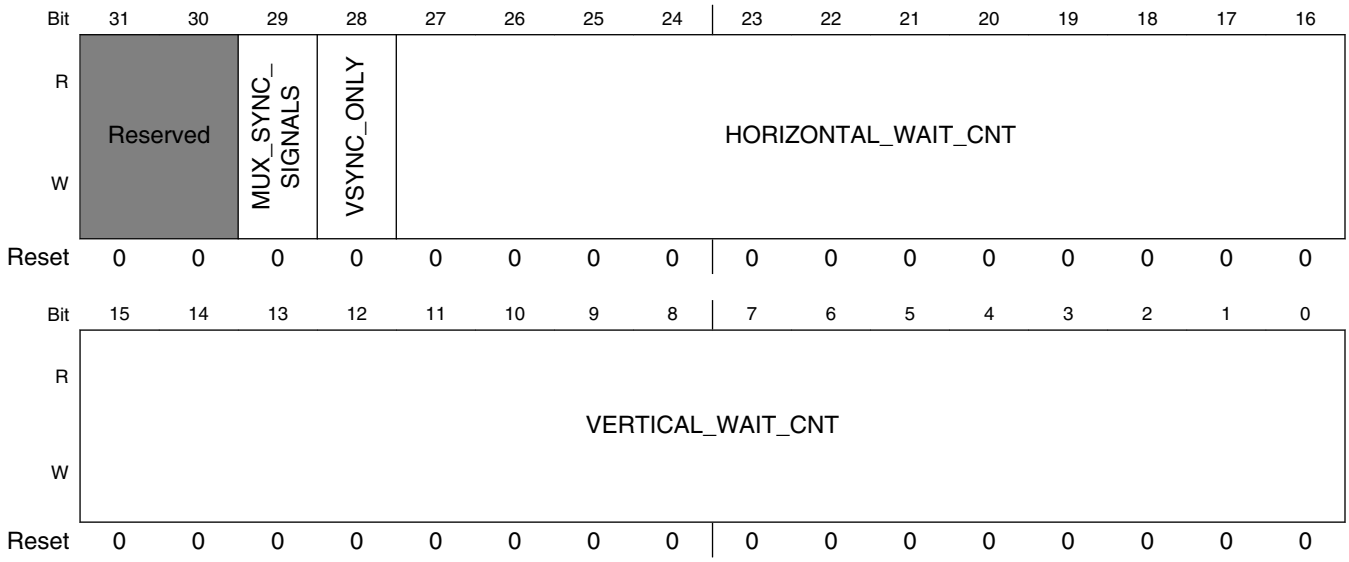
Field	Description
31–18 HSYNC_PULSE_ WIDTH	Number of DISPLAY CLOCK (pix_clk) cycles for which HSYNC signal is active.
HSYNC_PERIOD	Total number of DISPLAY CLOCK (pix_clk) cycles between two positive or two negative edges of the HSYNC signal.

13.2.5.11 LCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIF_VDCTRL3)

This register is used to determine the vertical and horizontal wait counts.

This register determines the back porches of HSYNC and VSYNC signals when they are generated by the block.

Address: 3032_0000h base + A0h offset = 3032_00A0h



LCDIF_VDCTRL3 field descriptions

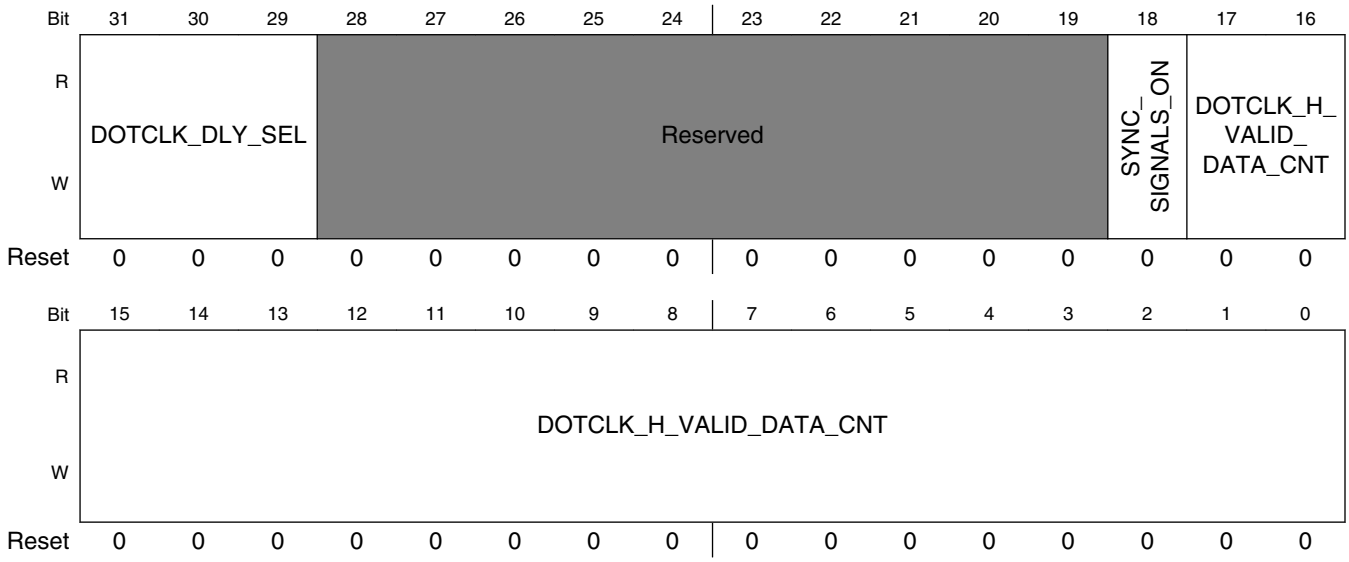
Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29 MUX_SYNC_SIGNALS	When this bit is set, the LCDIF block will internally mux HSYNC with LCD_D14, DOTCLK with LCD_D13 and ENABLE with LCD_D12, otherwise these signals will go out on separate pins. This feature can be used to maintain backward compatible with 37xx.
28 VSYNC_ONLY	This bit must be set to 1 in the VSYNC mode of operation, and 0 in the DOTCLK mode of operation.
27–16 HORIZONTAL_WAIT_CNT	In the DOTCLK mode, wait for this number of clocks from falling edge (or rising if HSYNC_POL is 1) of HSYNC signal to account for horizontal back porch plus the number of DOTCLKs before the moving picture information begins.
VERTICAL_WAIT_CNT	In the VSYNC interface mode, wait for this number of DISPLAY CLOCK (pix_clk) cycles from the falling VSYNC edge (or rising if VSYNC_POL is 1) before starting LCD transactions and is applicable only if WAIT_FOR_VSYNC_EDGE is set. Minimum is CMD_SETUP+5. In the DOTCLK mode, it accounts for the vertical back porch lines plus the number of horizontal lines before the moving picture begins. The unit for this parameter is inherently the same as the VSYNC_PERIOD_UNIT.

13.2.5.12 LCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIF_VDCTRL4)

This register is used to control the DOTCLK mode of the block.

This register determines the active data in each horizontal line in the DOTCLK mode. Note that the total number of active horizontal lines in the DOTCLK mode is the same as the V_COUNT bitfield in the LCDIF_TRANSFER_COUNT register.

Address: 3032_0000h base + B0h offset = 3032_00B0h



LCDIF_VDCTRL4 field descriptions

Field	Description
31–29 DOTCLK_DLY_ SEL	This bitfield selects the amount of time by which the DOTCLK signal should be delayed before coming out of the LCD_DOTCK pin. 0 = 2ns; 1=4ns;2=6ns;3=8ns. Remaining values are reserved.
28–19 RSRVD0	This field is reserved. Reserved bits, write as 0.
18 SYNC_ SIGNALS_ON	Set this field to 1 if the LCD controller requires that the VSYNC or VSYNC/HSYNC/DOTCLK control signals should be active at least one frame before the data transfers actually start and remain active at least one frame after the data transfers end. The hardware does not count the number of frames automatically. Rather, the VSYNC edge interrupt can be monitored by software to count the number of frames that have occurred after this bit is set and then the RUN bit can be set to start the data transactions. This bit must always be set in the DOTCLK mode of operation, and it must be set in the VSYNC mode of operation when VSYNC signal is an output.
DOTCLK_H_ VALID_DATA_ CNT	Total number of DISPLAY CLOCK (pix_clk) cycles on each horizontal line that carry valid data in DOTCLK mode.

13.2.5.13 Digital Video Interface Control0 Register (LCDIF_DVICTRL0)

The Digital Video interface Control0 register provides the overall control of the Digital Video interface.

This register gives information about the horizontal active, horizontal blanking and total number of lines in the ITU-R BT.656 interface.

EXAMPLE

```
//525/60 video system
```

```
HW_LCDIF_DVICTRL0_H_ACTIVE_CNT_WR(0x5A0);//1440
HW_LCDIF_DVICTRL0_H_BLANKING_CNT_WR(0x106);//262
//625/50 video system
HW_LCDIF_DVICTRL0_H_ACTIVE_CNT_WR(0x5A0);//1440
HW_LCDIF_DVICTRL0_H_BLANKING_CNT_WR(0x112);//274
```

Address: 3032_0000h base + C0h offset = 3032_00C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved				H_ACTIVE_CNT												Reserved				H_BLANKING_CNT											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_DVICTRL0 field descriptions

Field	Description
31–28 RSRVD1	This field is reserved. Reserved bits, write as 0.
27–16 H_ACTIVE_CNT	Number of active video samples to be transmitted. (Mostly will be 1440 for both PAL and NTSC). Must always be a multiple of 4.
15–12 RSRVD0	This field is reserved. Reserved bits, write as 0.
H_BLANKING_ CNT	Number of blanking samples to be inserted between EAV and SAV during horizontal blanking interval.

13.2.5.14 Digital Video Interface Control1 Register (LCDIF_DVICTRL1)

The Digital Video interface Control1 register provides the overall control of the Digital Video interface.

This register contains information about the Field1 start and end, and the Field2 start in the ITU-R BT.656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL1_F1_START_LINE_WR(0x4);//4
HW_LCDIF_DVICTRL1_F1_END_LINE_WR(0x109);//265
HW_LCDIF_DVICTRL1_F2_START_LINE_WR(0x10A);//266
//625/50 video system
HW_LCDIF_DVICTRL1_F1_START_LINE_WR(0x1);//1
HW_LCDIF_DVICTRL1_F1_END_LINE_WR(0x138);//312
HW_LCDIF_DVICTRL1_F2_START_LINE_WR(0x139);//313
```

Address: 3032_0000h base + D0h offset = 3032_00D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved		F1_START_LINE										F1_END_LINE			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R W	F1_END_LINE								F2_START_LINE							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_DVICTRL1 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 F1_START_LINE	Vertical line number from which Field 1 begins.
19–10 F1_END_LINE	Vertical line number at which Field1 ends.
F2_START_LINE	Vertical line number from which Field 2 begins.

13.2.5.15 Digital Video Interface Control2 Register (LCDIF_DVICTRL2)

The Digital Video interface Control2 register provides the overall control of the Digital Video interface.

This register contains information about the Field2 end, and the Vertical Blanking1 interval in the ITU-R BT.656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL2_F2_END_LINE_WR(0x3);//3
HW_LCDIF_DVICTRL2_V1_BLANK_START_LINE_WR(0x108);//264
HW_LCDIF_DVICTRL2_V1_BLANK_END_LINE_WR(0x11A);//282
//625/50 video system
HW_LCDIF_DVICTRL2_F2_END_LINE_WR(0x271);//625
HW_LCDIF_DVICTRL2_V1_BLANK_START_LINE_WR(0x137);//311
HW_LCDIF_DVICTRL2_V1_BLANK_END_LINE_WR(0x14F);//335
```

Address: 3032_0000h base + E0h offset = 3032_00E0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved		F2_END_LINE										V1_BLANK_START_LINE			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R W	V1_BLANK_START_LINE								V1_BLANK_END_LINE							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_DVICTRL2 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 F2_END_LINE	Vertical line number at which Field 2 ends.
19–10 V1_BLANK_ START_LINE	Vertical line number towards the end of Field1 where first Vertical Blanking interval starts.
V1_BLANK_ END_LINE	Vertical line number in the beginning part of Field2 where first Vertical Blanking interval ends.

13.2.5.16 Digital Video Interface Control3 Register (LCDIF_DVICTRL3)

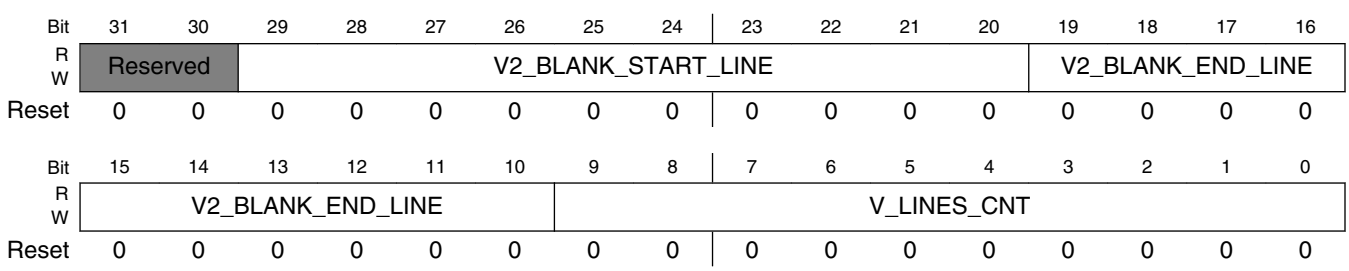
The Digital Video interface Control3 register provides the overall control of the Digital Video interface.

This register contains information about the Vertical Blanking2 interval in the ITU-R BT. 656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL3_V2_BLANK_START_LINE_WR(0x1);//1
HW_LCDIF_DVICTRL3_V2_BLANK_END_LINE_WR(0x13);//19
HW_LCDIF_DVICTRL0_V_LINES_CNT_WR(0x20D);//525
//625/50 video system
HW_LCDIF_DVICTRL3_V2_BLANK_START_LINE_WR(0x270);//624
HW_LCDIF_DVICTRL3_V2_BLANK_END_LINE_WR(0x16);//22
HW_LCDIF_DVICTRL0_V_LINES_CNT_WR(0x271);//625
```

Address: 3032_0000h base + F0h offset = 3032_00F0h



LCDIF_DVICTRL3 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.

Table continues on the next page...

LCDIF_DVICTRL3 field descriptions (continued)

Field	Description
29–20 V2_BLANK_ START_LINE	Vertical line number towards the end of Field2 where second Vertical Blanking interval starts.
19–10 V2_BLANK_ END_LINE	Vertical line number in the beginning part of Field1 where second Vertical Blanking interval ends.
V_LINES_CNT	Total number of vertical lines per frame (generally 525 or 625)

13.2.5.17 Digital Video Interface Control4 Register (LCDIF_DVICTRL4)

The Digital Video interface Control4 register provides the overall control of the Digital Video interface.

This register is used to add side borders to the output if the input frame width is less than 720 pixels.

EXAMPLE

```
                //If input frame has only 640 pixels per line, but output is supposed to have
720 pixels per line.
                HW_LCDIF_DVICTRL4_H_FILL_CNT_WR(0x50);//80
                HW_LCDIF_DVICTRL4_Y_FILL_VALUE_WR(0x10);//16
                HW_LCDIF_DVICTRL4_CB_FILL_VALUE_WR(0x80);//128
                HW_LCDIF_DVICTRL4_CR_FILL_VALUE_WR(0x80);//128
```

Address: 3032_0000h base + 100h offset = 3032_0100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Y_FILL_VALUE								CB_FILL_VALUE								CR_FILL_VALUE								H_FILL_CNT							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_DVICTRL4 field descriptions

Field	Description
31–24 Y_FILL_VALUE	Value of Y component of filler data
23–16 CB_FILL_VALUE	Value of CB component of filler data
15–8 CR_FILL_VALUE	Value of CR component of filler data.
H_FILL_CNT	Number of active video samples that have to be filled with the filler data in the front and back portions of the active horizontal interval. Must be a multiple of 4. This field will have to be programmed if the input frame has less than 720 pixels per line.

13.2.5.18 RGB to YCbCr 4:2:2 CSC Coefficient0 Register (LCDIF_CSC_COEFF0)

LCDIF_CSC_COEFF0 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF0_C0_WR(0x41);//0.257x256=65
HW_LCDIF_CSC_COEFF0_CSC_SUBSAMPLE_FILTER_WR(0x3);
```

Address: 3032_0000h base + 110h offset = 3032_0110h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved								C0							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved														CSC_ SUBSAMPL E_FILTER	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_CSC_COEFF0 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C0	Two's complement red multiplier coefficient for Y
15–2 RSRVD0	This field is reserved. Reserved bits, write as 0.
CSC_ SUBSAMPLE_ FILTER	This register describes the filtering and subsampling scheme to be performed on the chroma components in order to convert from YCbCr 4:4:4 to YCbCr 4:2:2 space. Note that the following descriptions apply individually to Cb and Cr. 0x0 **SAMPLE_AND_HOLD** — No filtering, simply keep every chroma value for samples numbered 2n and discard chroma values associated with all samples numbered 2n+1. 0x1 **RSRVD** — Reserved 0x2 **INTERSTITIAL** — Chroma samples numbered 2n and 2n+1 are averaged (weights 1/2, 1/2) and that chroma value replaces the two chroma values at 2n and 2n+1. This chroma now exists horizontally halfway between the two luma samples. 0x3 **COSITED** — Chroma samples numbered 2n-1, 2n, and 2n+1 are averaged (weights 1/4, 1/2, 1/4) and that chroma value exists at the same site as the luma sample numbered 2n and the chroma samples at 2n+1 are discarded.

13.2.5.19 RGB to YCbCr 4:2:2 CSC Coefficient1 Register (LCDIF_CSC_COEFF1)

LCDIF_CSC_COEFF1 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF1_C1_WR(0x81);//0.504x256=129
HW_LCDIF_CSC_COEFF1_C2_WR(0x19);//0.098x256=25
```

Address: 3032_0000h base + 120h offset = 3032_0120h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved						C2										Reserved						C1									
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_CSC_COEFF1 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C2	Two's complement blue multiplier coefficient for Y
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C1	Two's complement green multiplier coefficient for Y

13.2.5.20 RGB to YCbCr 4:2:2 CSC Coefficent2 Register (LCDIF_CSC_COEFF2)

LCDIF_CSC_COEFF2 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF2_C3_WR(0x3DB);//-0.148x256=-37
HW_LCDIF_CSC_COEFF2_C4_WR(0x3B6);//-0.291x256=-74
```

Address: 3032_0000h base + 130h offset = 3032_0130h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved						C4										Reserved						C3									
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_CSC_COEFF2 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C4	Two's complement green multiplier coefficient for Cb
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C3	Two's complement red multiplier coefficient for Cb

13.2.5.21 RGB to YCbCr 4:2:2 CSC Coefficient3 Register (LCDIF_CSC_COEFF3)

LCDIF_CSC_COEFF3 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF3_C5_WR(0x70);//0.439x256=112
HW_LCDIF_CSC_COEFF3_C6_WR(0x70);//0.439x256=112
```

Address: 3032_0000h base + 140h offset = 3032_0140h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_CSC_COEFF3 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.

Table continues on the next page...

LCDIF_CSC_COEFF3 field descriptions (continued)

Field	Description
25–16 C6	Two's complement red multiplier coefficient for Cr
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C5	Two's complement blue multiplier coefficient for Cb

13.2.5.22 RGB to YCbCr 4:2:2 CSC Coefficient4 Register (LCDIF_CSC_COEFF4)

LCDIF_CSC_COEFF4 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF4_C7_WR(0x3A2);//-0.368x256=-94
HW_LCDIF_CSC_COEFF4_C8_WR(0x3EE);//-0.071x256=-18
```

Address: 3032_0000h base + 150h offset = 3032_0150h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved						C8										Reserved						C7									
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_CSC_COEFF4 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C8	Two's complement blue multiplier coefficient for Cr
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C7	Two's complement green multiplier coefficient for Cr

13.2.5.23 RGB to YCbCr 4:2:2 CSC Offset Register (LCDIF_CSC_OFFSET)

LCDIF_CSC_ register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

Address: 3032_0000h base + 160h offset = 3032_0160h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved							CBCR_OFFSET									Reserved							Y_OFFSET								
Reset	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

LCDIF_CSC_OFFSET field descriptions

Field	Description
31–25 RSRVD1	This field is reserved. Reserved bits, write as 0.
24–16 CBCR_OFFSET	Two's complement offset for the Cb and Cr components
15–9 RSRVD0	This field is reserved. Reserved bits, write as 0.
Y_OFFSET	Two's complement offset for the Y component

13.2.5.24 RGB to YCbCr 4:2:2 CSC Limit Register (LCDIF_CSC_LIMIT)

LCDIF_CSC_CTRL0 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: Y = C0*R + C1*G + C2*B + Y_offset Cb= C3*R + C4*G + C5*B + CbCr_offset Cr= C6*R + C7*G + C8*B + CbCr_offset

This register carries programming information about RGB to YCbCr 4:2:2 CSC. Note that the values in this register are unsigned.

EXAMPLE

```
HW_LCDIF_CSC_LIMIT_CBCR_MIN_WR(0x10);//16
HW_LCDIF_CSC_LIMIT_CBCR_MAX_WR(0xF0);//240
HW_LCDIF_CSC_LIMIT_Y_MIN_WR(0x10);//16
HW_LCDIF_CSC_LIMIT_Y_MAX_WR(0xEB);//235
```

Address: 3032_0000h base + 170h offset = 3032_0170h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	CBCR_MIN								CBCR_MAX								Y_MIN								Y_MAX							
Reset	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1

LCDIF_CSC_LIMIT field descriptions

Field	Description
31–24 CBCR_MIN	Lower limit of Cb and Cr after RGB to 4:2:2 YCbCr conversion
23–16 CBCR_MAX	Upper limit of Cb and Cr after RGB to 4:2:2 YCbCr conversion
15–8 Y_MIN	Lower limit of Y after RGB to 4:2:2 YCbCr conversion
Y_MAX	Upper limit of Y after RGB to 4:2:2 YCbCr conversion

13.2.5.25 LCD Interface Data Register (LCDIF_DATA)

This register is used to transfer data using the PIO interface mode of operation. In MPU mode, data written to this register will be transferred out to the display device. When receiving data from the display, data is read from this register using PIO operations. During write operations, data can be written to this register (from the processor's perspective) as bytes, half-words (16 bits), or words (32 bits) as desired.

This register holds the 32-bit word written by the Arm platform into LCDIF. This data then gets sent out by the block across the interface.

Address: 3032_0000h base + 180h offset = 3032_0180h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	DATA_THREE								DATA_TWO								DATA_ONE								DATA_ZERO							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_DATA field descriptions

Field	Description
31–24 DATA_THREE	Byte 3 (most significant byte) of data written to LCDIF.
23–16 DATA_TWO	Byte 2 of data written to LCDIF.
15–8 DATA_ONE	Byte 1 of data written to LCDIF.
DATA_ZERO	Byte 0 (least significant byte) of data written to LCDIF.

13.2.5.26 Bus Master Error Status Register (LCDIF_BM_ERROR_STAT)

This register reflects the virtual address at which the AXI master received an error response from the slave.

When the BM_ERROR_IRQ is asserted, the address of the bus error is updated in the register.

Address: 3032_0000h base + 190h offset = 3032_0190h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_BM_ERROR_STAT field descriptions

Field	Description
ADDR	Virtual address at which bus master error occurred.

13.2.5.27 CRC Status Register (LCDIF_CRC_STAT)

This register reflects the CRC value of each frame sent out by LCDIF. The CRC is done on the final output bus, so the value will be dependent on the LCD_DATABUS_WIDTH bitfield even if the input data is the same.

This register will be updated when the CUR_FRAME_DONE_IRQ is asserted. In the case of DVI mode, the CRC is calculated for the entire frame, not separately for each field in the frame.

Address: 3032_0000h base + 1A0h offset = 3032_01A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	CRC_VALUE																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_CRC_STAT field descriptions

Field	Description
CRC_VALUE	Calculated CRC value.

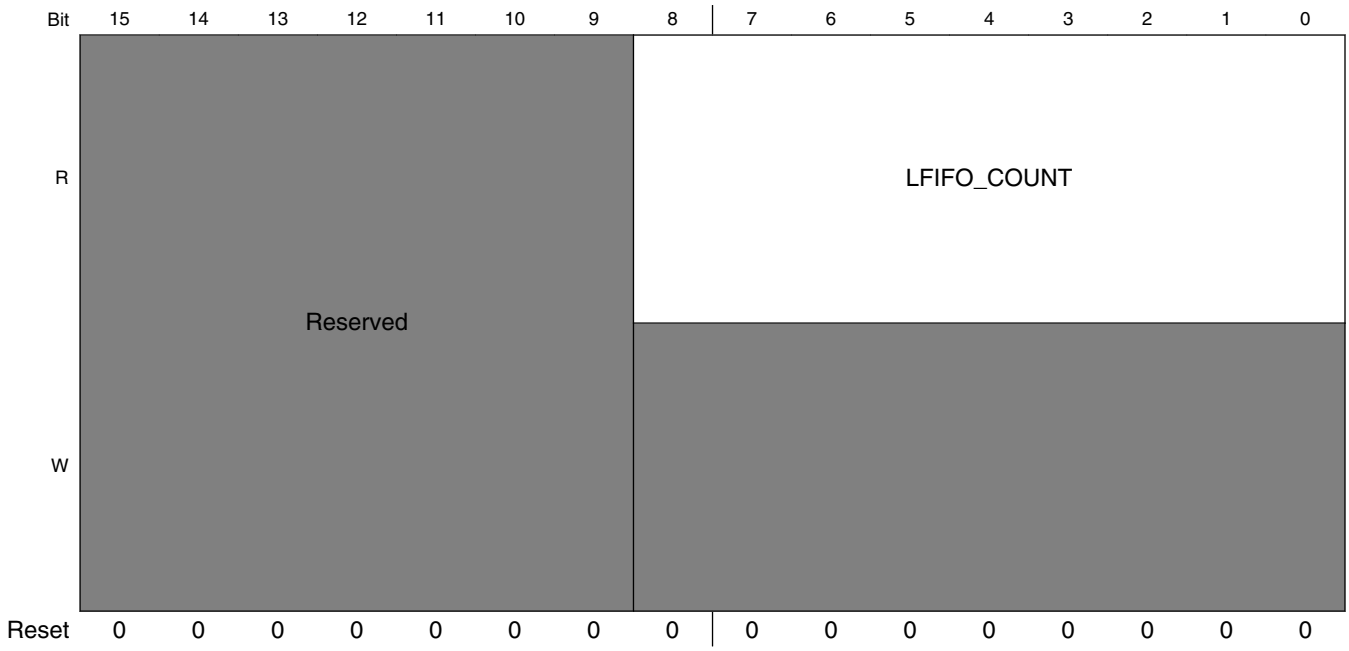
13.2.5.28 LCD Interface Status Register (LCDIF_STAT)

The LCD interface status register can be used to check the current status of the LCDIF block.

The LCD interface status register that contains read only views of some parameters or current state of the block.

Address: 3032_0000h base + 1B0h offset = 3032_01B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	PRESENT	Reserved	LFIFO_FULL	LFIFO_EMPTY	TXFIFO_FULL	TXFIFO_EMPTY	BUSY	DVI_CURRENT_FIELD	Reserved							
W																
Reset	1	0	0	1	0	1	0	1	0	0	0	0	0	0	0	0



LCDIF_STAT field descriptions

Field	Description
31 PRESENT	0: LCDIF not present on this product 1: LCDIF is present.
30 -	This field is reserved. Reserved.
29 LFIFO_FULL	Read only view of the signals that indicates LCD LFIFO is full.
28 LFIFO_EMPTY	Read only view of the signals that indicates LCD LFIFO is empty.
27 TXFIFO_FULL	Read only view of the signals that indicates LCD TXFIFO is full.
26 TXFIFO_EMPTY	Read only view of the signals that indicates LCD TXFIFO is empty.
25 BUSY	Read only view of the input busy signal from the external LCD controller.
24 DVI_CURRENT_FIELD	Read only view of the current field being transmitted. DVI_CURRENT_FIELD = 0 means field 1. DVI_CURRENT_FIELD = 1 means field 2.
23–9 RSRVD0	This field is reserved. Reserved bits. Write as 0.
LFIFO_COUNT	Read only view of the current count in Latency buffer (LFIFO).

13.2.5.29 LCDIF Threshold Register (LCDIF_THRES)

This register is used to activate control signals when the number of pixels reaches the programmed threshold. These control signals, in turn, can be used to manipulate access priority or dynamically change the input clock frequency to meet the required pixel throughput.

Memory request priority threshold register.

Address: 3032_0000h base + 200h offset = 3032_0200h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved							FASTCLOCK									Reserved							PANIC								
Reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1

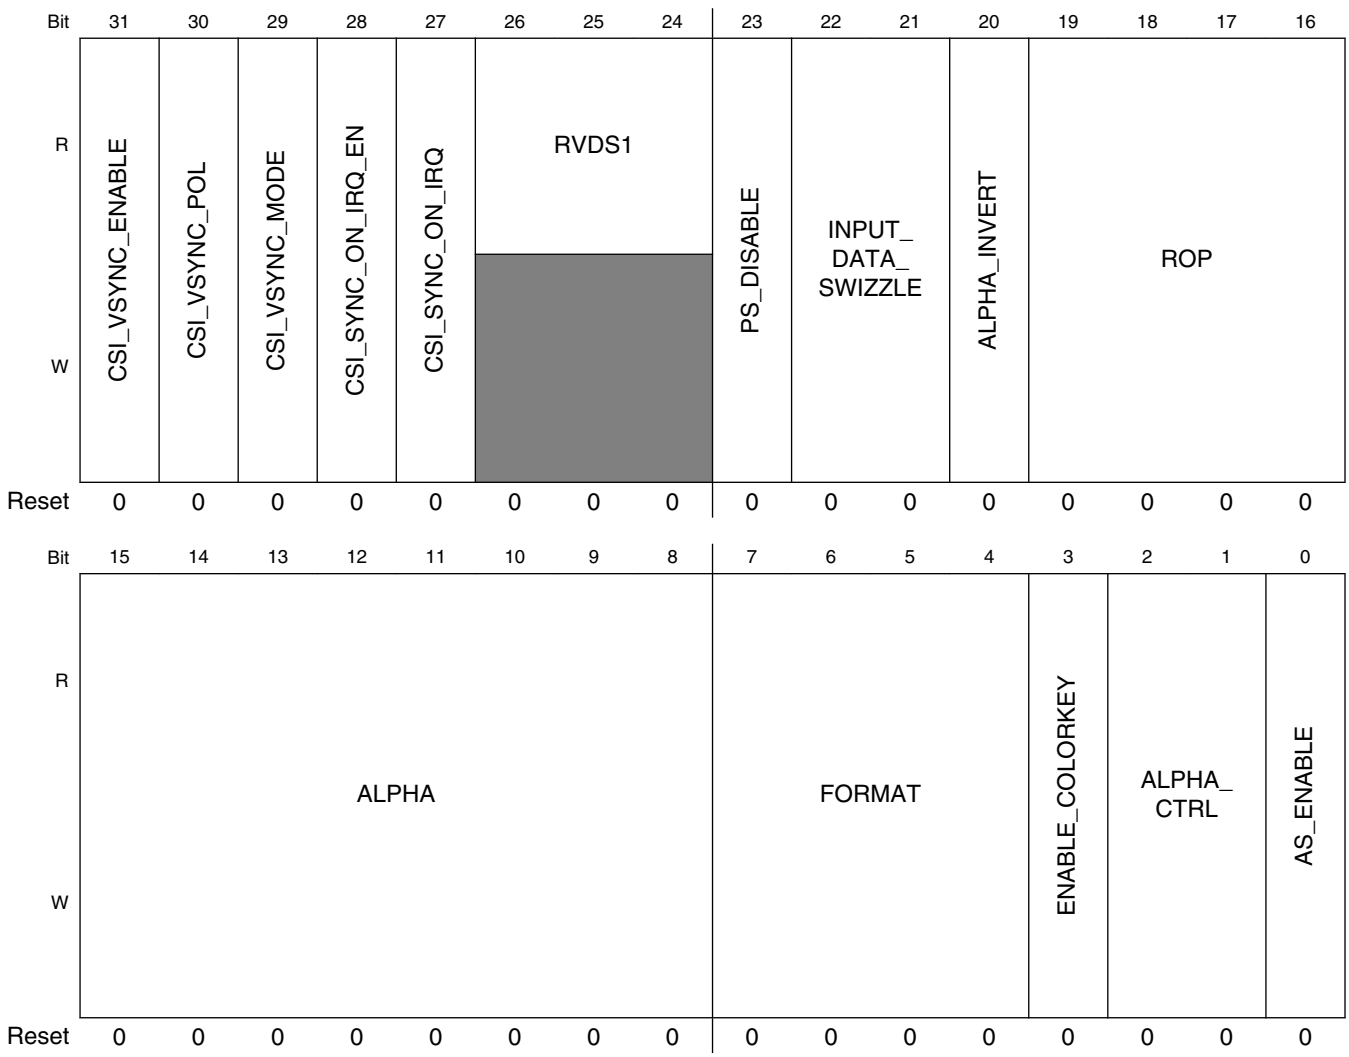
LCDIF_THRES field descriptions

Field	Description
31–25 RSRVD2	This field is reserved. Reserved bits. Write as 0.
24–16 FASTCLOCK	This value should be set to a value of pixels, from 0 to 511. When the number of pixels in the input pixel FIFO is LESS than this value, the fast clock control output will be raised. This signal can be used to reduce the system bus clock frequency to save power during horizontal or vertical blanking intervals. This value should also be programmed to a value that is greater than the "PANIC" threshold value. This will allow a faster clock to recover the number of pixels in the FIFO before a "panic" level is encountered.
15–9 RSRVD1	This field is reserved. Reserved bits. Write as 0.
PANIC	This value should be set to a value of pixels from 0 to 511. When the number of pixels in the input pixel FIFO is less than this value, the internal panic control output will be raised. This signal can be used to raise the access LCDIF's access priority.

13.2.5.30 LCDIF AS Buffer Control Register (LCDIF_AS_CTRL)

The Alpha Surface Parameter register provides additional controls for AS.

Address: 3032_0000h base + 210h offset = 3032_0210h



LCDIF_AS_CTRL field descriptions

Field	Description
31 CSI_VSYNC_ ENABLE	When this bit is set by software, the LCDIF work as sync mode with CSI input.
30 CSI_VSYNC_ POL	Default 0 active low during VSYNC_PULSE_WIDTH time and will be high during the rest of the VSYNC period. Set it to 1 to invert the polarity.

Table continues on the next page...

LCDIF_AS_CTRL field descriptions (continued)

Field	Description
29 CSI_VSYNC_MODE	this bit is set by software to decide which vsync generate mode. LCDIF vsync generate by internal counter when set to 0, LCDIF vsync delayed by each csi_vsync_in when set to 1; INT_SYNC_MODE = 0x0 LCDIF vsync generate by internal counter. EXT_SYNC_MODE = 0x1 LCDIF vsync delayed by each csi_vsync_in.
28 CSI_SYNC_ON_IRQ_EN	This bit is set to enable an interrupt when LCDIF lock with CSI vsync input.
27 CSI_SYNC_ON_IRQ	this bit is set by software to decide which vsync generate mode. LCDIF vsync generate by internal counter when set to 0, LCDIF vsync delayed by each csi_vsync_in when set to 1; INT_SYNC_MODE = 0x0 LCDIF vsync generate by internal counter. EXT_SYNC_MODE = 0x1 LCDIF vsync delayed by each csi_vsync_in.
26–24 RVDS1	Reserved, always set to zero.
23 PS_DISABLE	When this bit is set by software, the LCDIF will disable PS buffer data.
22–21 INPUT_DATA_SWIZZLE	This field specifies how to swap the bytes either in the HW_LCDIF_DATA register or those fetched by the AXI master part of LCDIF. The swizzle function is independent of the WORD_LENGTH bit. See the explanation of the HW_LCDIF_DATA below for names and definitions of data register fields. The supported swizzle configurations are: NO_SWAP = 0x0 No byte swapping.(Little endian) LITTLE_ENDIAN = 0x0 Little Endian byte ordering (same as NO_SWAP). BIG_ENDIAN_SWAP = 0x1 Big Endian swap (swap bytes 0, 3 and 1, 2). SWAP_ALL_BYTES = 0x1 Swizzle all bytes, swap bytes 0, 3 and 1, 2 (aka Big Endian). HWD_SWAP = 0x2 Swap half-words. HWD_BYTE_SWAP = 0x3 Swap bytes within each half-word.
20 ALPHA_INVERT	Setting this bit to logic 0 will not alter the alpha value. A logic 1 will invert the alpha value and apply (1-alpha) for image composition.
19–16 ROP	Indicates a raster operation to perform when enabled. Raster operations are enabled through the ALPHA_CTRL field. MASKAS = 0x0 AS AND PS MASKNOTAS = 0x1 nAS AND PS MASKASNOT = 0x2 AS AND nPS MERGEAS = 0x3 AS OR PS MERGENOTAS = 0x4 nAS OR PS MERGEASNOT = 0x5 AS OR nPS NOTCOPYAS = 0x6 nAS NOT = 0x7 nPS NOTMASKAS = 0x8 AS NAND PS NOTMERGEAS = 0x9 AS NOR PS XORAS = 0xA AS XOR PS NOTXORAS = 0xB AS XNOR PS

Table continues on the next page...

LCDIF_AS_CTRL field descriptions (continued)

Field	Description
15–8 ALPHA	Alpha modifier used when the ALPHA_MULTIPLY or ALPHA_OVERRIDE values are programmed in REG_AS_CTRL[ALPHA_CTRL]. The output alpha value will either be replaced (ALPHA_OVERRIDE) or scaled (ALPHA_MULTIPLY) when selected.
7–4 FORMAT	Indicates the input buffer format for AS. ARGB8888 = 0x0 32-bit pixels with alpha RGB888 = 0x4 32-bit pixels without alpha (unpacked 24-bit format) ARGB1555 = 0x8 16-bit pixels with alpha ARGB4444 = 0x9 16-bit pixels with alpha RGB555 = 0xC 16-bit pixels without alpha RGB444 = 0xD 16-bit pixels without alpha RGB565 = 0xE 16-bit pixels without alpha
3 ENABLE_ COLORKEY	Indicates that colorkey functionality is enabled for this alpha surface. Pixels found in the alpha surface colorkey range will be displayed as transparent (the PS pixel will be used).
2–1 ALPHA_CTRL	Determines how the alpha value is constructed for this alpha surface. Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. Embedded = 0x0 Indicates that the AS pixel alpha value will be used to blend the AS with PS. The ALPHA field is ignored. Override = 0x1 Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. Multiply = 0x2 Indicates that the value in the ALPHA field should be used to scale all pixel alpha values. Each pixel alpha is multiplied by the value in the ALPHA field. ROPs = 0x3 Enable ROPs. The ROP field indicates an operation to be performed on the alpha surface and PS pixels.
0 AS_ENABLE	When this bit is set by software, the LCDIF will start fetching AS buffer data in bus master mode and combine it with another buffer.

13.2.5.31 Alpha Surface Buffer Pointer (LCDIF_AS_BUF)

This register is used to indicate the base address of the AS buffer.

Address: 3032_0000h base + 220h offset = 3032_0220h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ADDR																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIF_AS_BUF field descriptions

Field	Description
ADDR	Address pointer for the alpha surface 0 buffer.

13.2.5.32 LCDIF_AS_NEXT_BUF

When the LCDIF is behaving as a master, this address points to the address of the next frame of data that will be sent out via the LCDIF. It is upto the software to make sure that this register is programmed before the end of the current frame, otherwise it might result in old data going out the LCDIF. This address must always be double-word aligned.

Address: 3032_0000h base + 230h offset = 3032_0230h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_AS_NEXT_BUF field descriptions

Field	Description
ADDR	Address of the next frame that will be transmitted by LCDIF.

13.2.5.33 LCDIF Overlay Color Key Low (LCDIF_AS_CLRKEYLOW)

If a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. Colorkey operations are higher priority than alpha or ROP operations.

Address: 3032_0000h base + 240h offset = 3032_0240h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_AS_CLRKEYHIGH field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	High range of RGB color key applied to AS buffer

13.2.5.35 LCD working insync mode with CSI for VSYNC delay (LCDIF_SYNC_DELAY)

The LCDIF DOTCLK mode VSYNC will delay from CSI_VSYNC as
(V_COUNT_DELAY * HSYNC_PERIOD + H_COUNT_DELAY) PIXCLK cycles

Address: 3032_0000h base + 260h offset = 3032_0260h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIF_SYNC_DELAY field descriptions

Field	Description
31–16 V_COUNT_ DELAY	LCDIF VSYNC delayed counter for CSI_VSYNC.
H_COUNT_ DELAY	LCDIF VSYNC delayed counter for CSI_VSYNC.

13.3 Graphics Processing Unit (GPU)

13.3.1 Overview

The graphics processing unit (GPU) provides high performance, high quality graphics, low power consumption, and the smallest silicon footprint for its class. The dynamic power consumption is minimized by extensive use of multi-level hierarchical clock gating.

An optimized software stack, complete software development tools, and a growing application ecosystem are supported by a robust graphics pipeline designed for industry-standard APIs, and with full support for Android, Linux, and Windows embedded development platforms. The GPU supports the following graphics APIs:

- OpenGL ES 3.1/3.0
- OpenGL ES 2.0/1.1
- EGL 1.4
- DirectX 11 (9_3)
- OpenGL 3.1/3.0
- OpenGL 2.1/2.0
- OpenVG 1.1
- OpenCL 1.2 FP / 1.1 FP w/ Global memory

13.3.1.1 Block Diagram

A block diagram and a description of the functional blocks of the complete graphics pipeline is given below.

- Host Interface - Allows GCCORE to communicate with external memory and the CPU through AXI or AHB bus. In this block data crosses clock domain boundaries.
- Memory Controller - Internal memory management unit that controls the block-to-host memory request interface.
- Fetch Engine - Inserts high level primitives and commands into the graphics pipeline.
- Input Assembly - Assembles vertices and primitives for further processing.
- Compute Modules:
  - Fixed Function 3D Rendering Engine Units:
    - Setup/Raster - Converts triangles and lines into pixels. Computes slopes of color attributes and texture coordinates. Performs clipping.

        - Texture Engine - Retrieves texture information from memory upon request by the vertex shader or fragment shader. Performs interpolation and filtering, and transfers the computed value to the fragment shader or the vertex shader. The texture unit can process two pixels or two vertices/cycle.
        - Pixel Engine/Blit - The Pixel Engine does alpha blending and visible surface determination. The Blit Engine does resolve, clear, tiling and de-tiling as well as FSAA filtering. The Pixel Engine can process two pixels/cycle.
    - Programmable Engine Units:
        - Shader Execution Units - SIMD processor that performs as vertex shader and fragment shader. When used as a vertex shader, it performs geometry transformations and lighting computations. When used as a fragment shader it applies texture data and computes color values for each pixel. The shaders also act as Compute Units for OpenCL. The GPU has 4 such vec4 shaders.
- Universal Storage Cache - Cache shared between the Fetch Engine and the Compute Modules. A portion of this cache can be locked to stay on-chip.

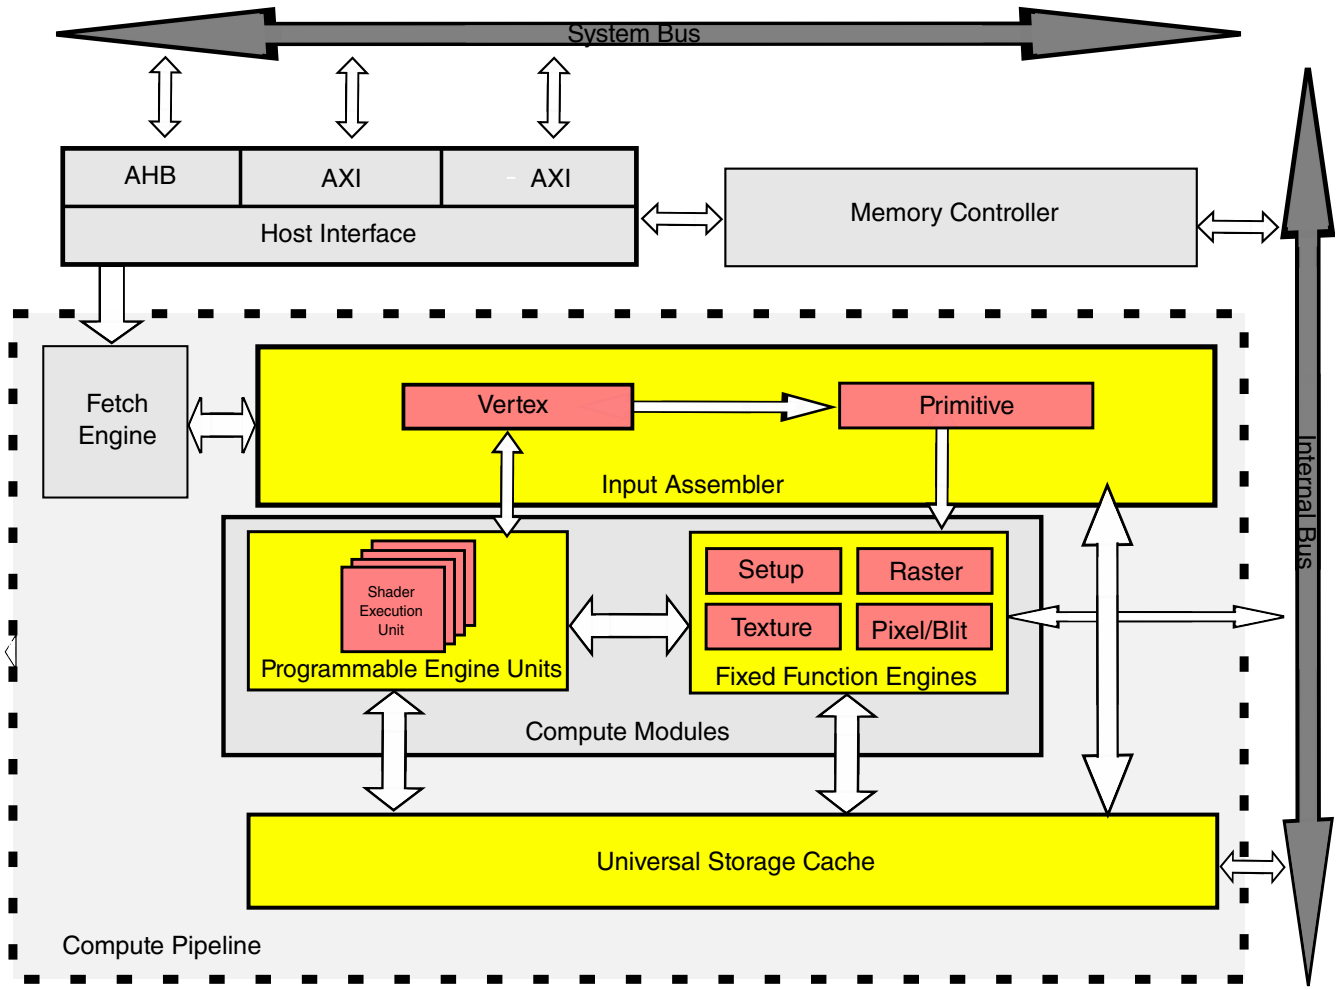

Figure 13-18. GPU Block Diagram

13.3.2 GPU Features

The features of the GPU 3D unit include:

- OpenGL ES 3.1 / 3.0 / 2.0 / 1.1 compliance, including extensions; OpenVG 1.1
- IEEE 32-bit floating-point pipeline
- Ultra-threaded, unified vertex and fragment (pixel) shaders
- Low bandwidth at both high and low data rates
- Low CPU loading
- Up to 16 programmable elements per vertex
- Dependent texture operation with high-performance
- Alpha blending
- Depth and stencil compare

- Point sampling, bi-linear sampling, tri-linear filtering, and cubic textures
- Resolve and fast clear
- 8k x 8k texture size and 8k x 8k rendering target
- 16 Vertex DMA streams
- Generates 2 texels and 2 pixels/cycle.
- Supports YUV formats for display output (YUV422, YUYV 4:2:2)
- 3D Composition engine
- MMU functionality supported
- Wide AA line support
- Primitive restart support
- Software programmable Big Endian support
- Performance Counters for DMA Profiling

The following table describes API support and select architectural features of the GPU:

Table 13-9. GPU Architecture Features

Feature	GPU Support
Primary API	OpenGL ES 3.1 / 3.0 / 2.0 / 1.1 OpenCL 1.1 / 1.2
Additional APIs	OpenVG 1.1 DirectX 11 (9_3) OpenGL 3.1 / 3.0 / 2.0 / 2.1
Other graphics support	EGL 1.4
Drivers	OpenGL ES 3.1 / 3.0 / 2.0 / 1.1 OpenVG 1.1 EGL 1.4 DirectX 11 (9_3) OpenGL 3.1 / 3.0 / 2.0 / 2.1 OpenCL 1.1 / 1.2
Operating systems	Windows Embedded Compact / Embedded CE 6 Embedded Linux Android 8.0/7.x / 6.0 /5.1 / 4.x
Z (depth)	Early Z support included
Stencil	Early stencil support included
GLSL ES Shader languages	3.1 / 3.0 / 1.0
DirectX Shader model compatibility	SM3.0
Shader types and execution units	Four programmable Scalable Ultra-threaded Unified Shaders (SIMD4:transcendental,ctl-flow,tx-load) one instruction issue per shader per clock; IEEE 32-bit floating-point pipeline supports long shader instructions
FSAA anti-aliasing mechanisms	High quality MSAA 4x

13.3.2.1 GPU Host and Memory Interface Features

Table 13-10. GPU host and memory interface features

Feature	GPU Support
AHB interface	32-bit
AXI interface	2 128-bit AXI / ACE-Lite interfaces for external memory access
Virtual memory support	Yes
Code and data memory location restrictions	Unrestricted; arbitrary memory reads and writes
Physical address	32 bits
Resource locks with CPU	Semaphore lock

13.3.2.2 GPU Power Management Features

Table 13-11. Power management features

Feature	GPU Support
Low power CMOS technology compatible	Yes
Dynamic frequency scaling based on current load	Yes
Automatic clock gating of flip flops and rams	Yes
Global clock gating of unused macro blocks	Yes
Independent clock gating for the shader core	Yes
Software controlled effective clock frequency without changing the PLL	Yes

13.3.2.3 GPU Command Processor Features

Table 13-12. GPU command processor features

Feature	GPU Support
Counters	Variety of hardware counters for performance profiling

13.3.2.4 OpenCL Support

Support for OpenCL includes the following capabilities in a full memory configuration:

Table 13-13. OpenCL Support

OpenCL Support	GPU Support
Profile	Full Profile with Global memory
Compute Devices (GPGPU cores)	1
Compute Units per device	1
Processing Elements per compute unit (vec4 sh cores)	4
Preferred work-group/ thread group size	8
Max count global work-items each dim	64KB
Max count work-items each dim per work-group	1 KB
Instruction Cache Size	512

13.3.2.5 Texture processing

Table 13-14. Texture Processing Features

13.3.2.7 Destination / Alpha Blending

Table 13-16. Destination / Alpha Blending Features

Feature	GPU Support					
Destination / Resolve (3DBlit) color formats	Bits	Format	Alpha	R	B	G
	16	ARGB4444	4	4	4	4
	16	ARGB1555	1	5	5	5
	16	RGB565	0	5	6	5
	32	ARGB8888	8	8	8	8
	32	sRGB8888	8	8	8	8
	32	ABGR8888	8	8	8	8
	32	RGB10_a2ui	2	10	10	10

13.3.3 Usage Mode

The GPU should be programmed through the NXP provided driver. NXP does not provide support for software that directly programs the GPU registers. APIs for programming the GPU through the software driver are described in separate driver documentation.

13.4 HD Display Transmitter Controller (HDMI TX)

13.4.1 Overview

The HD Display Transmitter Controller IP offers multi-protocol support of standards such as HDMI, DisplayPort, eDP, with one of these standards supported at a time.

the mentioned protocol options enable switching between the modes to be applied on a system level and performed by means of software configuration.

Protocols supported by the controller are:

- HDMI 1.4 Specification
- HDMI 2.0a Specification
- DisplayPort Specification, Version 1.3
- eDP Specification, Version, 1.4
- High-bandwidth Digital Content Protection system, Mapping HDCP to HDMI, Revision 2.2

- High-bandwidth Digital Content Protection system, Mapping HDCP to DisplayPort, Revision 2.2
- High-bandwidth Digital Content Protection system, Mapping HDCP to HDMI, Revision 1.4
- High-bandwidth Digital Content Protection system, Mapping HDCP to DsiplayPort, Revision 1.3
- CEA-861-F
- IEC60958
- ARM AMBA 3 APB Specification, Version 1.0

13.4.1.1 Features

The HDMI_TX includes the following generic features:

- Compliant with HDCP2.2 (and back compatible with HDCP1.3/HDCP1.4)
- Variety of video resolutions and formats
  - Supports up to 4k2k at 60Hz resolution
  - 25-600Mhz pixel clk
  - Supports 8, 10, 12, and 16bpp
  - Supports RGB, YCbCr422 formats
- Variety of audio formats – PCM and compressed, over I2S interface
  - I2S PCM samples are converted to comply with IEC60958 sub-frames
  - Supporting I2S-TDM
- Enhanced testability using uCPU debugger (over JTAG) and Integrated Pattern Generator

HDMI 2.0a and DisplayPort 1.3 specific features:

- In HDMI mode, supports up to 600Mhz pixel clk
- In DisplayPort mode, supports up to HBR2

DisplayPort-specific features:

- 1Mbps AUX channel
- Configurable number of lanes (1, 2, or 4)
- SSC injection is supported by PHY
- Support for Single Stream-only (SST)
- 6bpp support

eDP-specific features:

- Supports backlights and multi-touch commands
- eDP DPCD registers

- Variable link rate R162/R216/R243/R270/R324/R432/R540
- Fast link training

13.4.2 Block diagram

This is a high-level block diagram illustrating the HD Display Transmitter Controller IP.

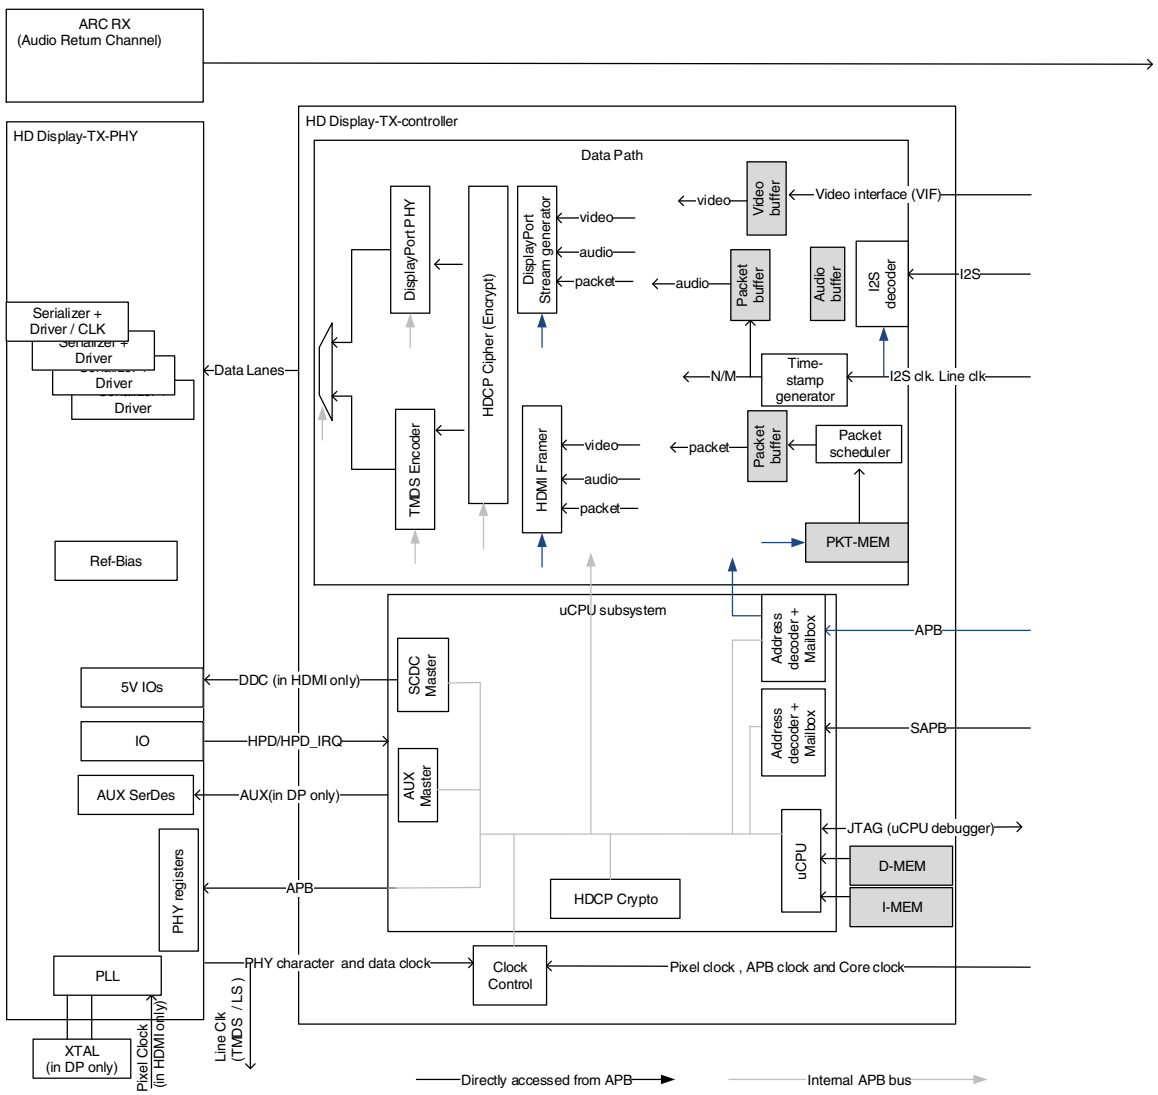

Figure 13-19. HDMI_TX block diagram

13.4.3 Video Packing

In HDMI, the Controller automatically detects the video timing from the video interface bus (VIF) and pack the video over the TMDS stream. The PHY PLL generates the character clock from the pixel clock configured by the HD Display Controller to a specific ratio (1:1, 1:1.25, 1:1.5, 1:2).

In DisplayPort, the Controller is configured by the external host with the video timing of the video interface bus (VIF) and packs the video over the main-stream. Video time stamp information (Nvid, Mvid) is generated by the Controller based on the ratio between the pixel clock and the ls clock.

The video data is transparently mapped to the video stream, where the Controller does not perform any color conversion.

13.4.4 Audio Packing

Audio info-frames and time-stamp information are generated by the Controller and encoded over the TMDS stream blanking period on HDMIsecondary stream in Displayport.

The Audio time-stamp information (NCTS in HDMI Maud and Naud in DisplayPort) is generated by the controller based on the ratio between the audio sample clock and the link clock (tmds in HDMIls clock in DisplayPort).

A peripheral module converting I2S stream into AIF bus can easily interface with the Controller.

13.4.5 Info-Frame Packing

Info-frames are encoded over the TMDS stream blanking period on HDMI the secondary stream in DisplayPort.

Time sensitive info-frames (i.e. GC-packet, CTS in HDMI) are generated autonomously by the Controller. Other info-frames (i.e. audio and video meta-data) are written into the PKT-MEM by the external host (directly accessed over the APB bus), to be then read and encoded by the Controller over the TMDS stream blanking period (on HDMI) the secondary stream (in DisplayPort).

Checksum (in HDMI) is parity bytes (in DisplayPort) are generated by the Controller.

13.4.6 HDCP

HDCP 2.2 is supported by the Controller. A dedicated HW provides the cipher and the cryptographic acceleration, the HDCP authentication state-machine is implemented in the FW (running over the uCPU).

13.4.7 Clock Control

The clock control block integrates clock-gates and provides clock metering functionality.

13.4.8 Functional Description

13.4.8.1 Functional description

The following sections describe functional details of the HDMI_TX module.

13.4.8.1.1 Management And Control Interface

The HD Display TX controller has the following APB slave ports that are controlled by the host processor:

- APB Slave port (APB):
  - Used as the main control interface between the host processor and the HD Display TX controller.
  - Used in different methods during boot.
  - Used for directly loading the FW into the memories.
  - Used for directly accessing several HW modules and for communicating the internal uCPU over the mailbox channel.
- SAPB Slave port (SAPB):
  - Used for secure connection, that is, HDCP key loading between the host processor and the uCPU through mailbox and pre-defined commands.

The internal APB bus has an output APB master port which is used to manage the PHY.

Each Mailxbox channel (APB or SAPB) generates an interrupt-level signal when its received FIFO is not empty or when its transmitted FIFO is full. The interrupt is cleared when the MAILBOX_INT_STATUS register is read. There are two sets of register, one for APB and one for SAPB.

13.4.8.1.2 Video Interface

The video interface (VIF) is compliant with CEA video timing and composed of 48-bit pixel data and the following control signals: data-enable, hsync, and vsync. The video timing of the video-interface bus (VIF) complies with the specification in CEA-861-F Annex L.

NOTE

Only a single video stream is supported

The video interface has the following control signals:

- VSYNC – Video Vertical Blanking indication signal as defined in the above standards.
- HSYNC - Video Horizontal Blanking indication signal as defined in the above standards.
- DATA ENABLE – Video data enable indication signal as defined in the above standards.
- DATA - 48 bits of data for supporting up to 16bpp.
- Clock – As defined for each format from 25MHz-600MHz.

13.4.8.1.2.1 Pixel Mapping

The following table shows the pixel mapping in different video formats.

Video Bus	RGB / YCbCr 4:4:4				4:2:0 / 4:2:2				Y Only
Bit Width	8	10	12	16	8	10	12	16 (4:2:0 only)	16/ 12/ 10/ 8
Channel 2	R/Cr				Cb/Cr				
[47:40]	Cr[15:8]	Cr[15:6]	Cr[15:8]	Cb[15:0]	C[15:8]	C[15:6]	C[15:4]	C[15:0]	
[39:38]									
[37:36]									
[35:32]									
Channel 1	G/Y				Y				
[31:24]	Y[15:8]	Y[15:6]	Y[15:4]	Y[15:0]	Y[15:8]	Y[15:6]	Y[15:4]	Y[15:0]	Y[15:0] Y[15:4] Y[15:6] Y[15:8]
[23:22]									
[21:20]									
[19:16]									
Channel 0	B/Cb								
[15:12]	Cb[15:8]	Cb[15:6]	Cb[15:4]	Cb[15:0]					
[11:8]									
[7:6]									
[5:4]									
[3:0]									

Figure 13-20. Pixel Mapping

NOTE

- In YCbCr4:2:2 or YCbCr4:2:0 the Cb and Cr are alternating as defined in timing diagram below.
- 6bpp in all formats and 16bpp in YCbCr422 format are supported only in DisplayPortoreDP.

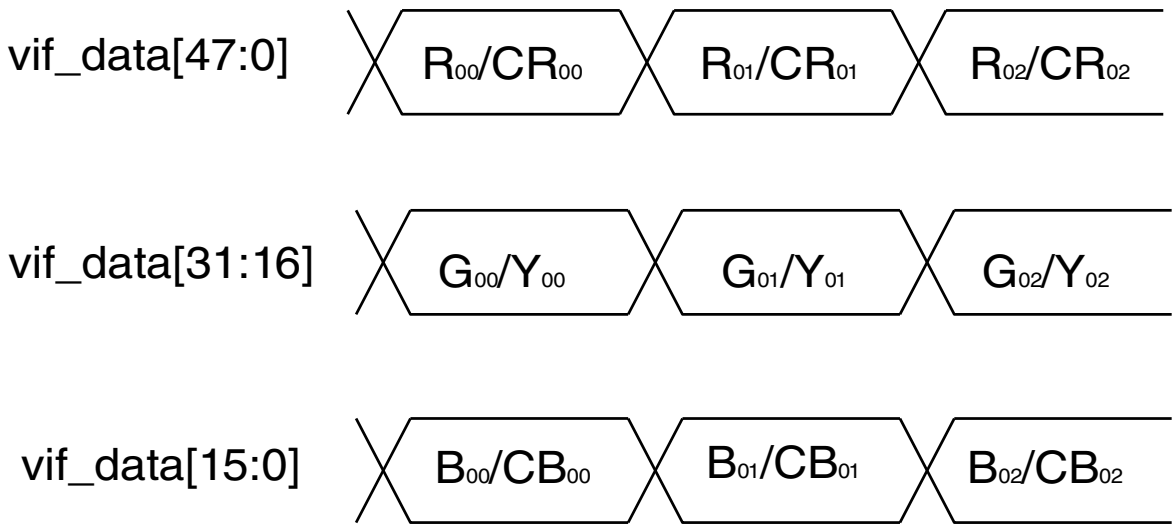

Figure 13-21. YCbCr 4:4:4 pixel mapping

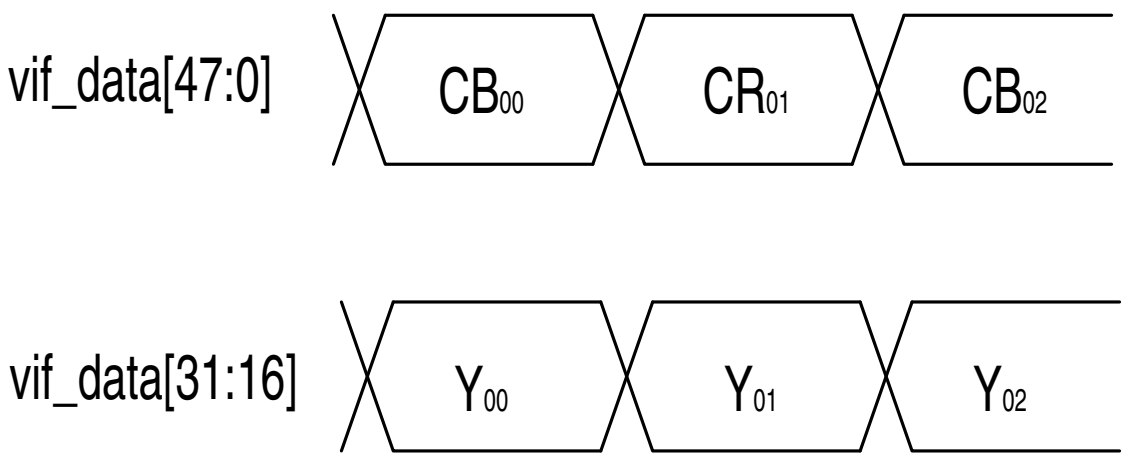

Figure 13-22. YCbCr 4:2:2 pixel mapping

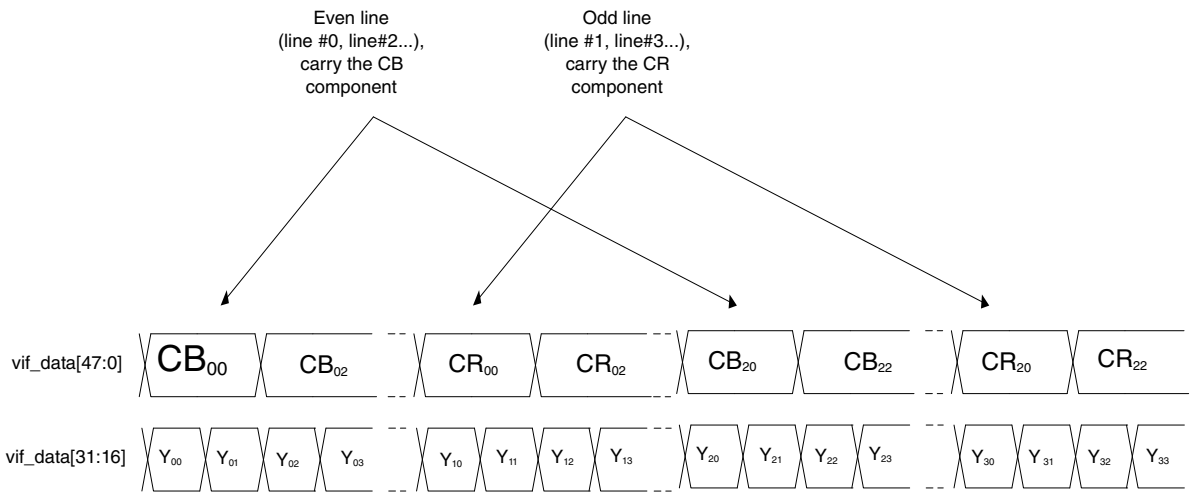

Figure 13-23. YCbCr 4:0:0 pixel mapping

13.4.8.1.2.2 Interlaced Video Timing

The HD Display TX controller expect the interlaced timing format to comply with the specification defined in CEA-861-F. The field information will be extracted from the input signal (hsync, vsync and de) and will be propagated towards the framer (i.e VB-ID field bit in DisplayPort).

13.4.8.1.2.3 3D Stereo Video Timing

The HD Display TX controller expect the stereo timing format to comply with one of the following formats:

- Frame-packing (in HD1.4)/Stacked-Top (in DP1.3).
- Top-Bottom (in HD1.4).
- Side-By-Side (in DP1.3 or HD1.4).

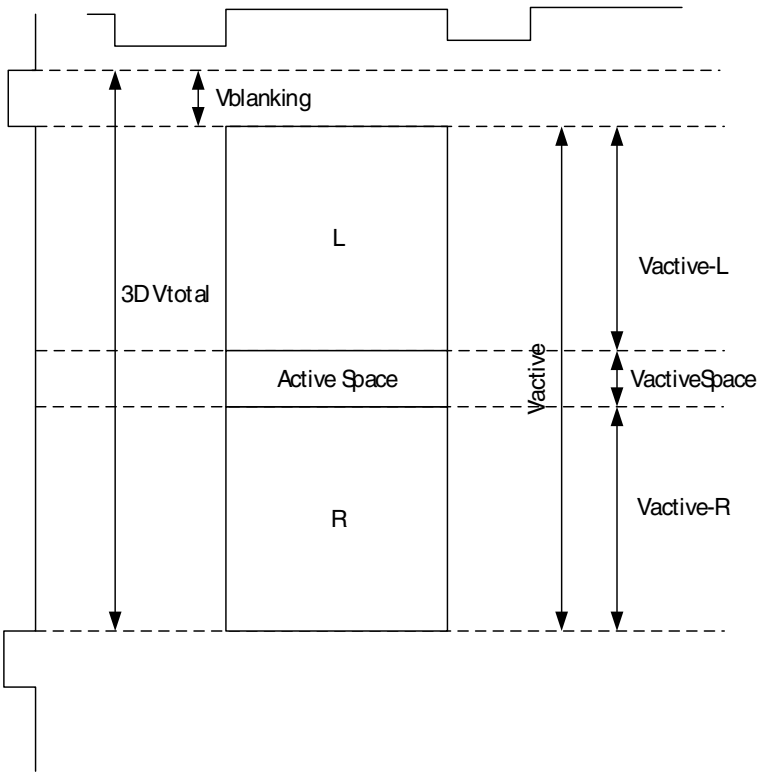

Figure 13-24. Frame-packing/Stacked-Top 3D Video Timing

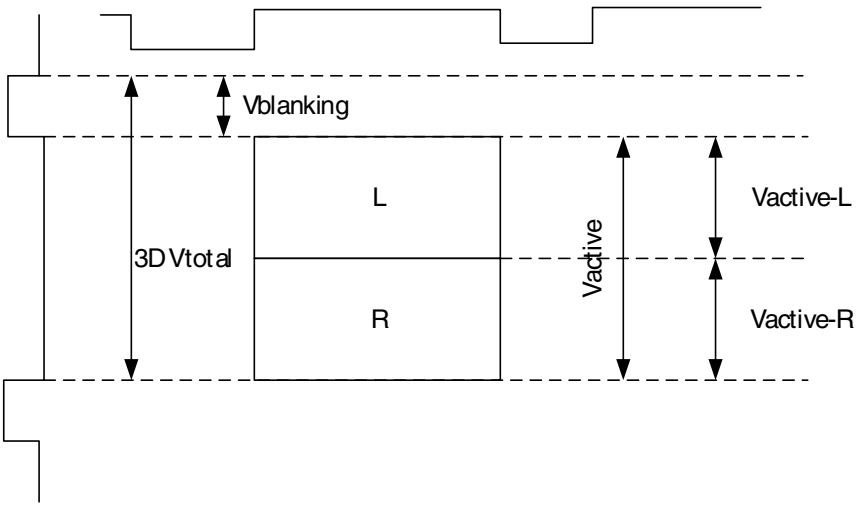

Figure 13-25. Top-Bottom 3D Video Timing

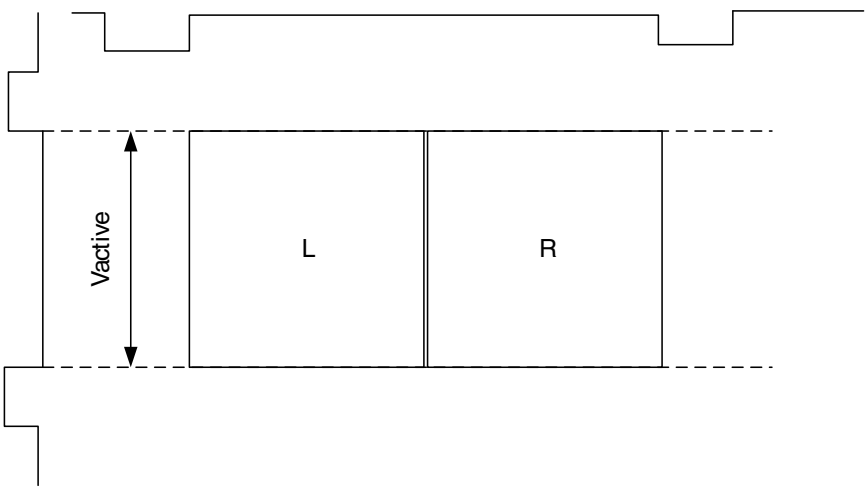

Figure 13-26. Side-By-Side 3D Video Timing

In the DisplayPort mode, the HD Display TX controller can convert the Frame-packing video timing into Field-sequential (in DP1.3). While converting into Field-sequential, the Vactive-space height should be equal to the Vertical-blank height.

13.4.8.1.2.4 Color Space Conversion Module

An add-on Color Space Conversion (CSC) module is optionally provided, it supports the video-timing defined in CEA-861-F.

The following conversion operations are supported:

- Color space conversion from RGB to YCbCr
- Color space conversion from YCbCr to RGB
- YCbCr up-sampling from 4:2:2 to 4:4:4
- YCbCr down-sampling from 4:4:4 to 4:2:2

The CSC module is configurable over its dedicated APB slave port.

13.4.8.1.3 Audio Interface

The Audio interface can be configured to support I2S.

When I2S is supported, the integrated I2S decoder extracts the PCM audio samples and converts them into 32-bit SPDIF sub-frame format compliant with IEC60958 to be carried over the data-stream. The Validity Flag (V), User Data (U), and the Channel Status (C) fields are configured by the external host. Parity bit (P) is calculated by the HD Display Transmitter Controller IP .

The I2S interface supports configurable slot time (16, 24, 32 bits), up to 8 channels, where each audio sample can occupy up to 24bits (right justified).

The interface is composed from three signals – I2S-data[3:0], I2S-bit-clk, and I2S-ws.

NOTE

Only a single audio stream is supported.

The sequence of operation is as follows:

1. Samples are decoded.
2. buffered (compensating for the video active period).
3. Mapped into an audio info-frame packet.

13.4.8.1.3.1 I2S Interface

The I2S interface could be configured to support multiple physical channels, i2s_data[n], (n=1, 2, 4), where channels could be configured with variable TDM time slots (m = 2 or 8). Time slot size is 32, 24 or 16 bits, supporting variable word length (28, 24, 20, and 16) configured as left or right justified.

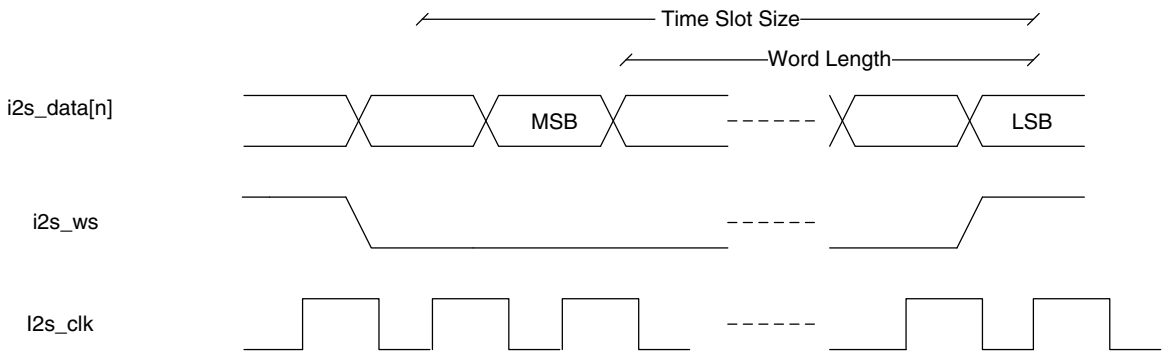

Figure 13-27. I2S bit Allocation (right justification)

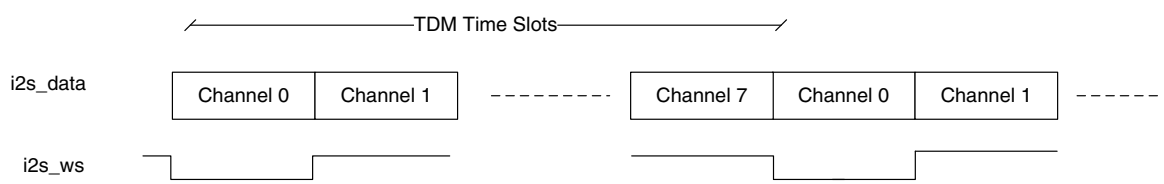

Figure 13-28. I2S TDM time allocation (M=8)

The I2S interface can carry audio samples in one of the following formats:

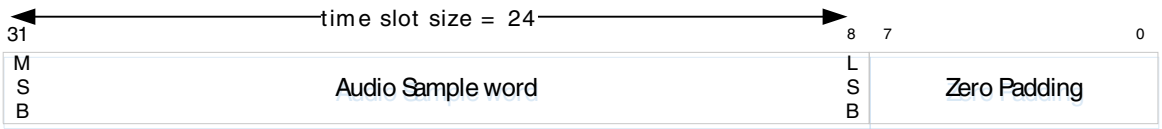

Figure 13-29. Audio L-PCM Sample Format

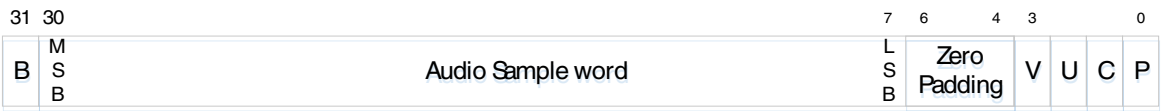

Figure 13-30. Audio SPDIF Sample Format

13.4.8.1.3.2 Audio Path

The following block diagram represents the audio path from I2S interface to creation of audio info-frame.

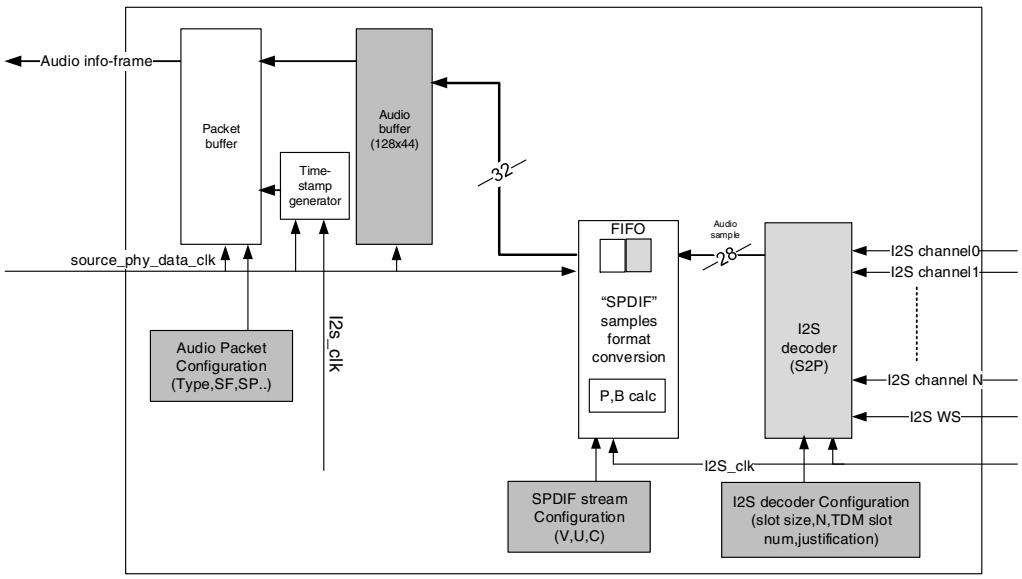

Figure 13-31. Audio Path

13.4.8.1.3.3 Audio Buffer Size

The Audio buffer is used to store audio samples during video active period, its default configuration is 128 samples (each sample occupy 44 bits).

You can configure its size to meet different worst case scenarios by using the following formula:

Audio buffer size (in samples)= $MAX[H_{active} * MaxFrameRate * 2]/F_{pixel}$

That is, if VIC10 (2880x480i) represents a worst-case scenario, its related video/audio parameters are (refer to Table 7-5 in HDMI1.4b):

Hactive = 2880, Fpixel = 54.05MHz, Max Frame Rate = 768Khz (i.e 8 ch L-PCM @192Khz)

This results in 82 samples.

13.4.8.1.4 Info-frame Processing

Info-frames are encoded over the video stream vertical blanking period.

Time-sensitive info-frames, that is, GC-packet and CTS in HDMI are generated autonomously by the HD Display TX controller.

Other info-frames, that is, audio and video meta-data are written into the PKT-MEM by the host processor (directly accessed over the APB bus) only when changed, to be then read and encoded by the HD Display TX controller packet-scheduler over the stream once per frame.

Checksum (in HDMI)Parity bytes (in DisplayPort) are generated by the HD Display TX controller.

Up to 16 info-frames are supported. When writing info-frames into the PKT-MEM the host must update the packet allocation table.

13.4.8.1.5 PHY Interface

The Controller interfaces to the PHY over interfaces described in the following sections:

13.4.8.1.5.1 Data Lanes

In HDMI, three data lanes are supported.

In DisplayPort, 1, 2, or 4 data lanes are active – actual number of active lanes is configured during link-training.

Each data lane is of 20-bit width is composed of two characters and is synchronous to phy_data_clk.

13.4.8.1.5.2 APB Master Interface

The Controller has control over the PHY by means of an APB interface.

13.4.8.1.5.3 AUX Interface

The AUX master supports various protocols: native-AUX, I2C over AUX.

13.4.8.1.5.4 DDC Interface

DDC interface is used for reading the sink EDID content and to carry the HDCP and SCDC commands.

13.4.8.1.5.5 HPD/HDP_IRQ

The HPD signal is input to the Controller and provides the HPD functionality in HDMIHPD_IRQ functionality in (DisplayPort mode).

Glitch filtering is integrated in the Controller.

13.4.8.1.6 APB Slave Interface

The Controller interfaces to the SoC as a slave over the APB bus. Up to three APB slave ports are supported.

The primary APB slave interface used for the main external host to IP communication where mailbox is used for communicating with the embedded FW (control and status), packet memory is directly mapped to the APB bus and I-MEM / D-MEM are directly accessed during boot mode (for FW download) . An interrupt signal is driven by the Controller.

The secondary APB slave is used to carry designated commands which are part of the HDCP functionality, i.e. key loading and content encryption control.

13.4.9 Clocks And Resets

13.4.9.1 Clocks Overview

The section describes the clocks and the resets of the HD Display TX IP.

13.4.9.1.1 Overview

The clock domains in the IP are as shown:

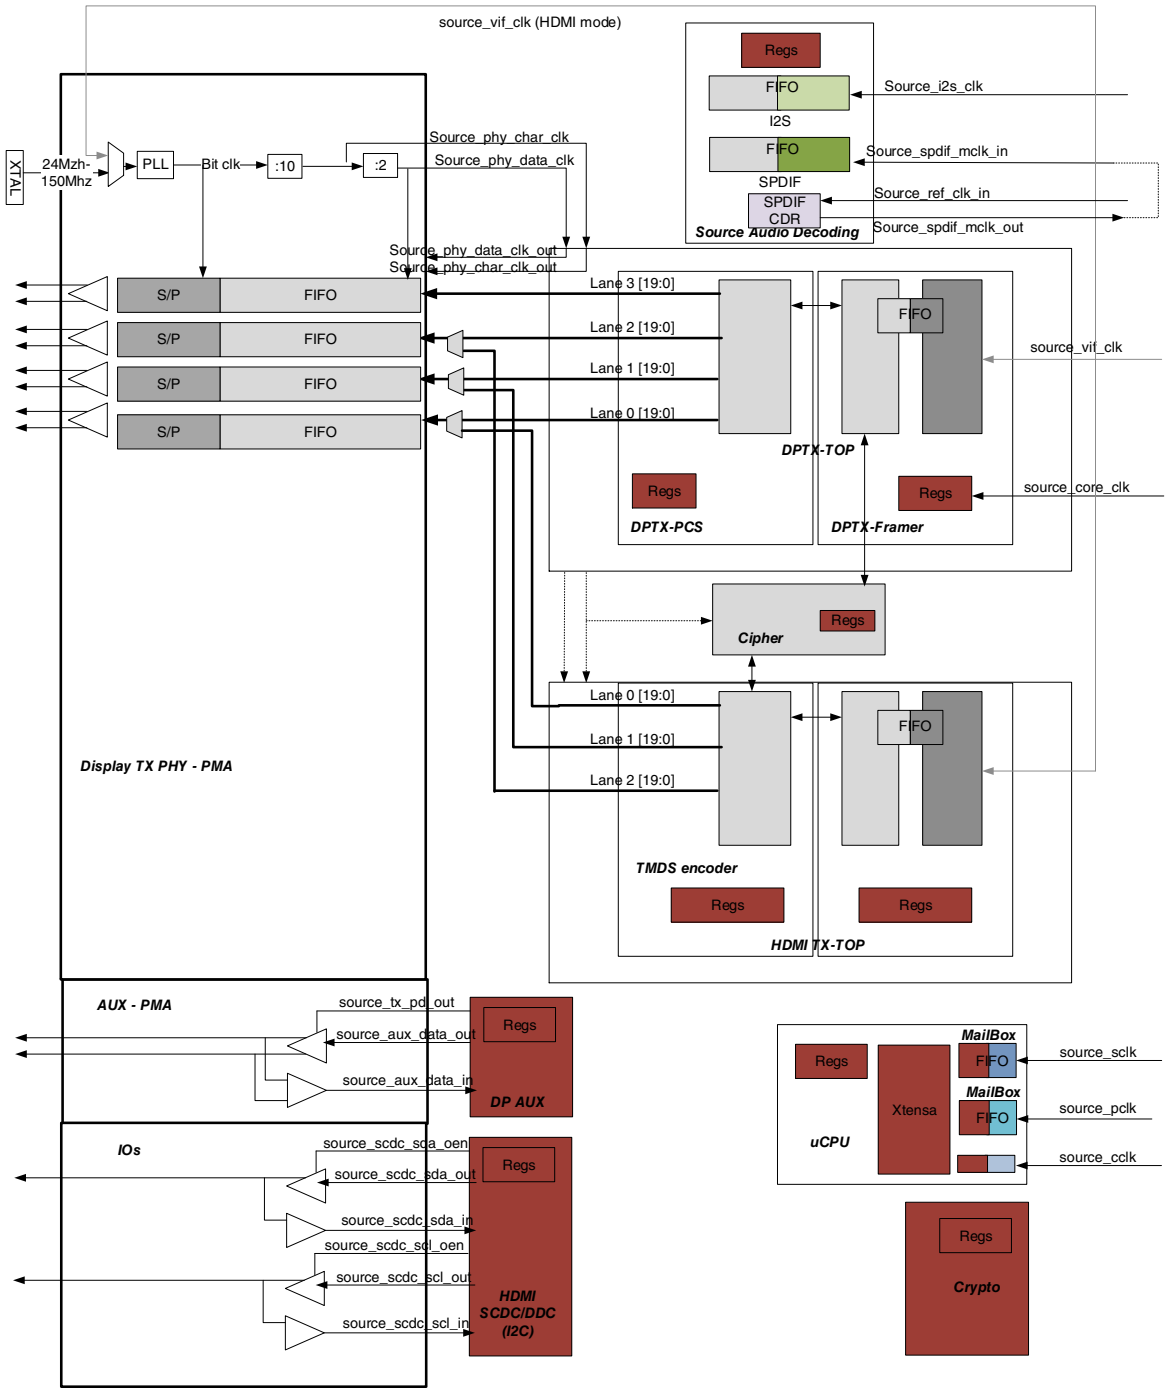

Figure 13-32. HD Display TX Clock Domains

NOTE

- Clock-gates are not represented in the clock scheme.
- Generated clocks are considered as the same clock domain.

The following table shows the list of all input clocks.

Table 13-17. Input Clock Signals

SignalName	Frequency	Source	Description
source_core_clk	100- 200Mhz	Host	main HDDisplay TX controller clock, usedby theuCPUandbythe internal register bus
source_pclk	50-200MHz	Host	APB slave clock
source_sclk	50-200MHz	Host	SAPB slave clock
source_cclk	50-200MHz	Host	CAPB slave clock
xt_jtck	<10Mhz	JTAG debugger	Debugger JTAG clock
source_ref_clk_in	200-400Mhz	Host	SPDIF CDR reference clock. Must be >10 times the SPDIF BMC rate (i.e for 192Khz , 10x192Khzx64x2 = 245.76Mhz)
source_spdif_mclk_in	<24.57Mhz	SPDIF CDR	SPDIF BMC decoder clock , need to be connected to source_spdif_mclk_out after scan clk mux insertion
source_i2s_clk	<50Mhz	Host	Audio I2S stream clock
source_vif_clk	24-600Mhz	Host	Video Pixel Clock
source_phy_char_clk	In DP: 162/270/540 /810MHZ In HDMI: <600Mhz	PHY	Lane clock (in DP:ls_clk) generated by the PHY and passed to use in the HD Display TX controller. In HDMI source_phy_char_clk is derived from source_vif_clk (ratio defined by HDMI standard) but its phase is independent , in DP independent clock
source_phy_data_clk	In DP: 81/135/270/ 405MHZ In HDMI: <300Mhz	PHY	Lane clock divided by two generated by the PHY and passed to use in the HD Display TX controller. source_phy_data_clk is derived from source_phy_char_clk but its phase is independent

The following table shows the clock signals that are internally generated in the CAR module.

Table 13-18. Generated Clock Signals

SignalName	Frequency	Source	Description
source_aux_clk_out	2MHz	source_core_clk	Not connected– for future use. Divided by configurable number according to the source_core_clk frequency
source_spdif_mclk_out	<24.57Mhz	source_ref_clk_in	Generated by SPDIF CDR, need to be fed-back (after scan clk muxing) to source_spdif_mclk_in
source_xt_pclk	100- 200Mhz	source_core_clk	PHY apb clock

13.4.10 Memory Map and register definition

This section includes the HDMI_TX module memory map and detailed descriptions of all registers.

13.4.10.1 HDMI TX register descriptions

13.4.10.1.1 HDMI_TX memory map

Offset	Register	Width (In bits)	Access	Reset value
0h	APB Control Register (APB_CTRL)	32	RW	0000_0007h
4h	Internal CPU Interrupt Polarity Control Register (XT_INT_CTRL)	32	RW	0000_0000h
8h	Mailboxes full indication register (MAILBOX_FULL_ADDR)	32	RO	0000_0000h
Ch	Mailboxes Empty indication register (MAILBOX_EMPTY_ADDR)	32	RO	0000_0001h
10h	Write Data to Mailbox register (MAILBOX0_WR_DATA)	32	RW	0000_0000h
14h	Mailbox Read data register (MAILBOX0_RD_DATA)	32	RO	0000_0000h
18h	Software keep alive counter (KEEP_ALIVE)	32	RO	0000_0000h
1Ch	Software Version LSB (VER_L)	32	RO	0000_0000h
20h	Software Version MSB (VER_H)	32	RO	0000_0000h
24h	Software Lib version written by CPU (LSB) (VER_LIB_L_ADDR)	32	RO	0000_0000h
28h	Software Lib version written by CPU (MSB) (VER_LIB_H_ADDR)	32	RO	0000_0000h
2Ch	Software Debug Register H (SW_DEBUG_L)	32	RO	0000_0000h
30h	Software Debug Register L (SW_DEBUG_H)	32	RO	0000_0000h

13.4.10.1.96.3 Fields

Field	Function
31-22 reserved_0	
21 dp_tx_phy_10bit_enable	Used to enable the 10-bit mode. Used to enable the 10-bit mode. Active high.
20-18 dp_tx_phy_lane3_skew	Specifies the programmable lane3 skew. Specifies the programmable lane3 skew.
17-15 dp_tx_phy_lane2_skew	Specifies the programmable lane2 skew. Specifies the programmable lane2 skew.
14-12	Specifies the programmable lane1 skew. Specifies the programmable lane1 skew.

Table continues on the next page...

Field	Function
dp_tx_phy_lane 1_skew	
11-9 dp_tx_phy_lane 0_skew	Specifies the programmable lane0 skew. Specifies the programmable lane0 skew.
8 dp_tx_phy_traini ng_automatic	Used to bypass 8/10 encoder and scrambler during link training. Used to bypass 8/10 encoder and scrambler during link training. Bit is sampled only when dp_tx_phy_training_enable bit is set.
7 dp_tx_phy_skew _bypass	Used to bypass the lane skew. Used to bypass the lane skew. Active high.
6 dp_tx_phy_enco der_bypass	Used to bypass the encoder. Used to bypass the encoder. Active high.
5 dp_tx_phy_scra mbler_bypass	Used to bypass the scrambler. Used to bypass the scrambler. Active high.
4-1 dp_tx_phy_traini ng_type	Specifies the training pattern type used as follows: 0000 PRBS7, 0001 TPS1, 0010 TPS2, 0011 TPS3, 0100 TPS4, 0101 custom 80-bit pattern, 0110 D10. Specifies the training pattern type used as follows: 0000 PRBS7, 0001 TPS1, 0010 TPS2, 0011 TPS3, 0100 TPS4, 0101 custom 80-bit pattern, 0110 D10.2 training pattern, 0111 Symbol Error Rate Measurement pattern, 1000 CP2520 pattern1, 1001 CP2520 pattern2, 1010 CP2520 pattern3, others reserved
0 dp_tx_phy_traini ng_enable	Enables the training sequence (when set to 1). Enables the training sequence (when set to 1).

13-8	MST SS generator FSM status

Table continues on the next page...

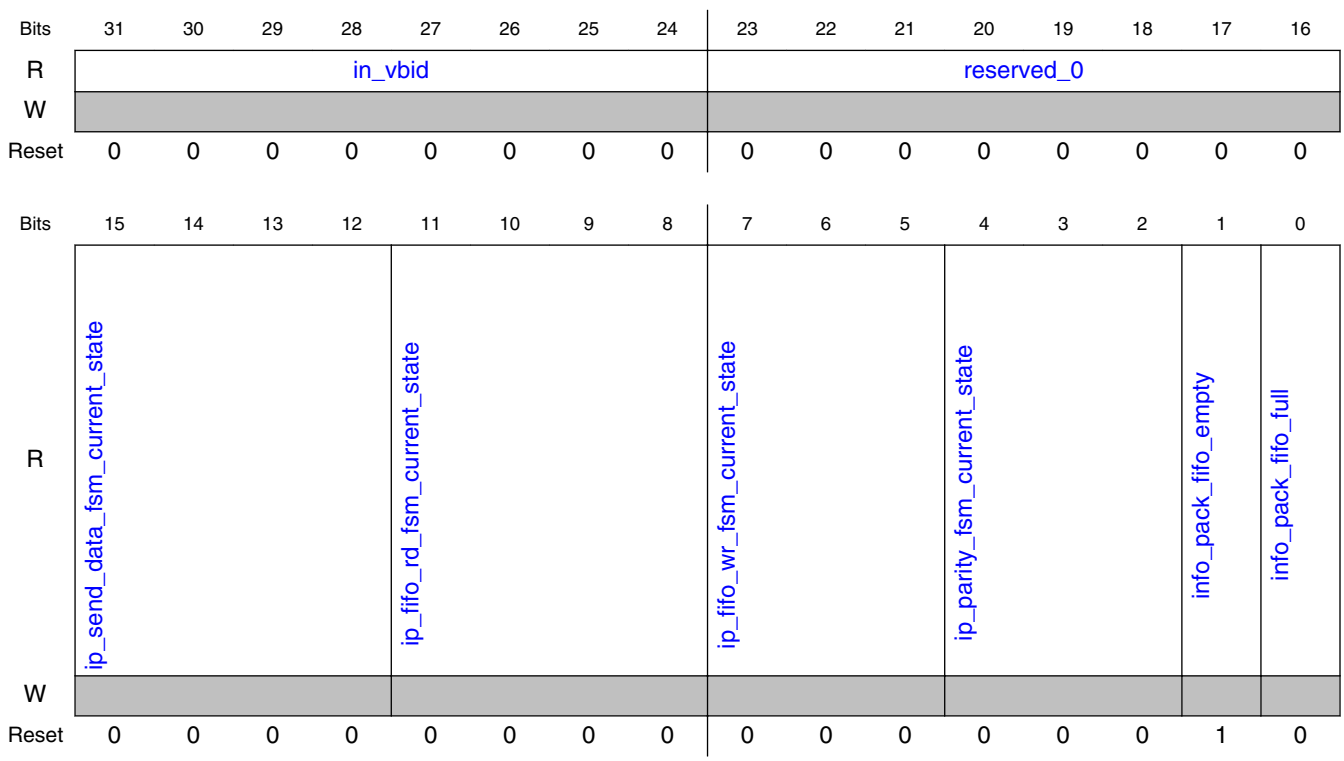
Field	Function
mst_ss_gen_state	
7-6 reserved_0	
5-0 sst_ss_gen_state	MSA generator FSM status

13.4.10.1.153 Status signals for the info pack module, as well as final VB-ID value (INFO_PACK_STATUS)

13.4.10.1.153.1 Offset

Register	Offset
INFO_PACK_STATUS	22A8h

13.4.10.1.153.2 Diagram



13.4.10.1.153.3 Fields

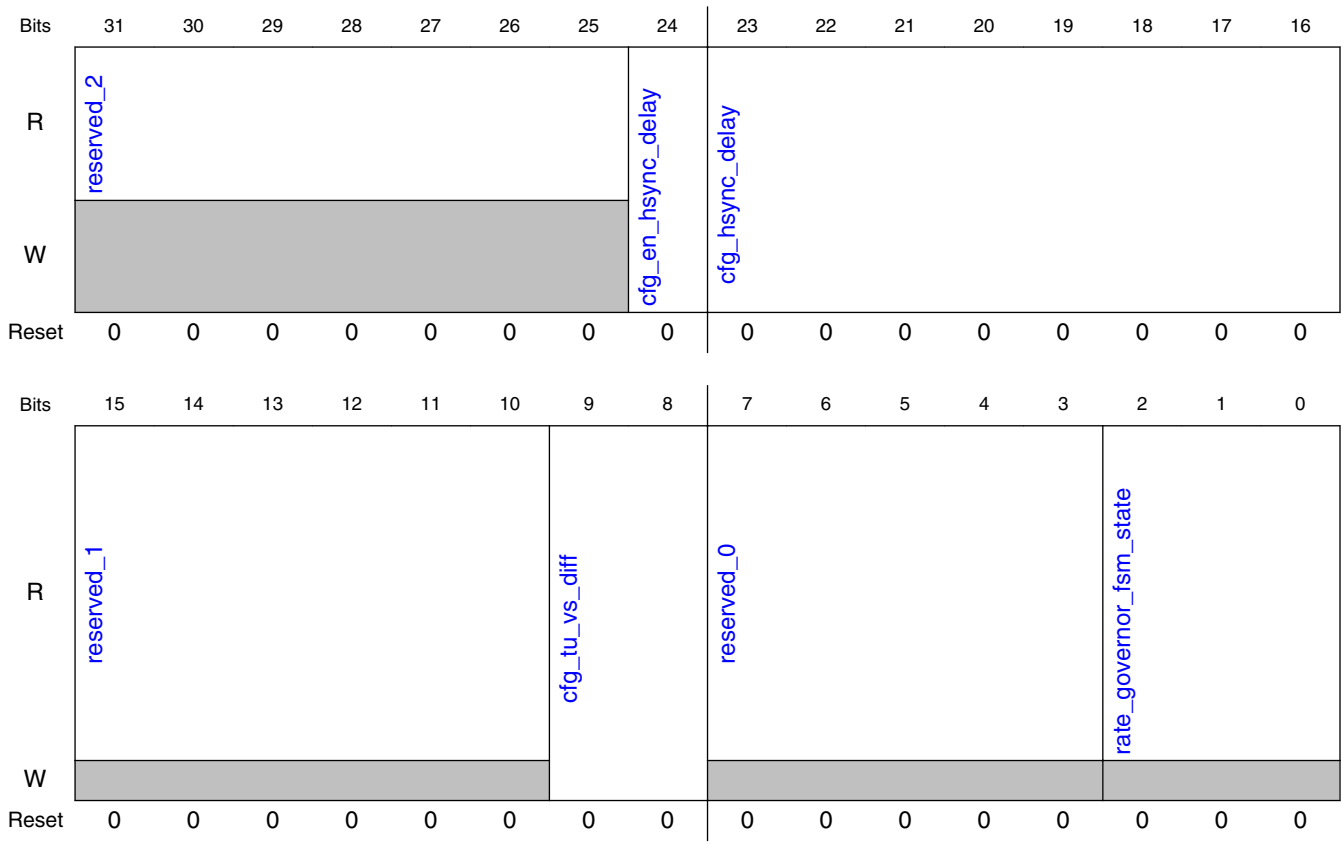
Field	Function
31-24 in_vbid	Value of the sent VB-ID (vb_id_final)
23-16 reserved_0	
15-12 ip_send_data_fsm_current_state	State of the send_data fsm
11-8 ip_fifo_rd_fsm_current_state	State of the fifo_rd fsm
7-5 ip_fifo_wr_fsm_current_state	State of the fifo_wr fsm
4-2 ip_parity_fsm_current_state	State of the parity fsm
1 info_pack_fifo_empty	Info_pack fifo empty flag, active high
0 info_pack_fifo_full	Info_pack fifo full flag, active high

13.4.10.1.154 Rate governer status, as well as additional video configuration (RATE_GOVERNOR_STATUS)

13.4.10.1.154.1 Offset

Register	Offset
RATE_GOVERNOR_STATUS	22ACh

13.4.10.1.154.2 Diagram



13.4.10.1.154.3 Fields

Field	Function
31-25 reserved_2	
24 cfg_en_hsync_delay	Hsync Delay Enable. Hsync Delay Enable. Active high
23-16 cfg_hsync_delay	Hsync delay value (in pixel clocks). Hsync delay value (in pixel clocks). Actual delay is: (cfg_hsync_delay+2) pixel clocks.
15-10 reserved_1	
9-8 cfg_tu_vs_diff	TU-VS difference. TU-VS difference. b'00: TU-VS>3, b'01:NA, b'10:TU-VS=2, b'11:TU-VS=3
7-3 reserved_0	
2-0	Status of the governer FSM, relevant only for MST

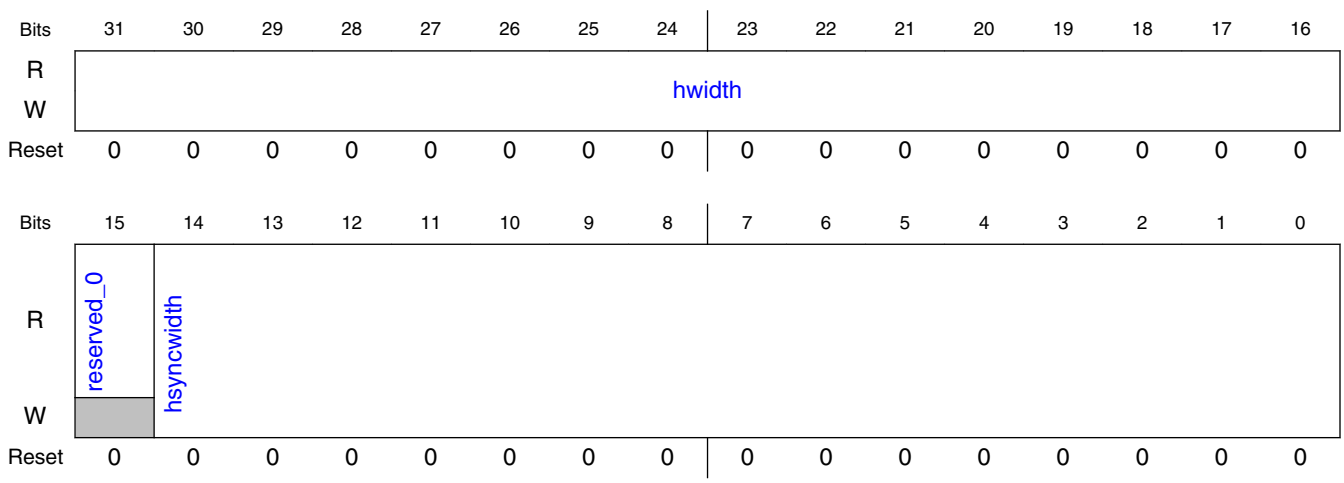
Field	Function
rate_governor_fsm_state	

13.4.10.1.155 Video line parameters to be used in the RTL calculations (DP_HORIZONTAL)

13.4.10.1.155.1 Offset

Register	Offset
DP_HORIZONTAL	22B0h

13.4.10.1.155.2 Diagram



13.4.10.1.155.3 Fields

Field	Function
31-16 hwidth	Horizontal Active Video Width, number of active pixels per line
15 reserved_0	
14-0 hsyncwidth	Horizontal Sync Width, number of pixels Hsync is active

13.4.10.1.156 Video frame parameters to be used in the RTL calculations, part 1 (DP_VERTICAL_0)

13.4.10.1.156.1 Offset

Register	Offset
DP_VERTICAL_0	22B4h

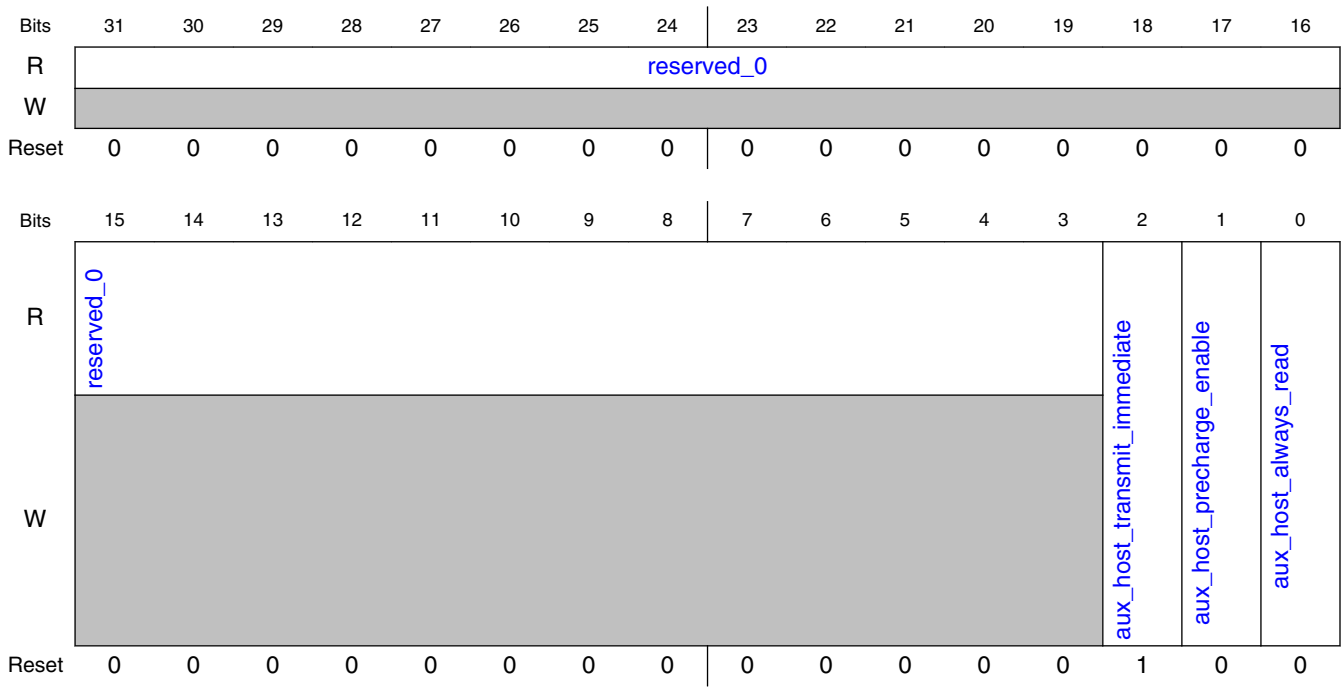
13.4.10.1.167 Control bits for DP_AUX (DP_AUX_HOST_CONTROL)

13.4.10.1.167.1 Offset

Register	Offset
DP_AUX_HOST_CONTROL	2800h

13.4.10.1.167.2 Diagram



13.4.10.1.167.3 Fields

Field	Function
31-3 reserved_0	
2 aux_host_transmit_immediate	This bit is used only in DP_OUT mode. This bit is used only in DP_OUT mode. If SET, a transaction that comes from the adapter will be sent immediately without waiting for send_external_transaction pulse. If CLEAR, the MC controls the traffic to/from the adapter.
1 aux_host_precharge_enable	According to the current standard the tx precharge is done by sending 10 to 16 data_0 on the line before the SYNC. According to the current standard the tx precharge is done by sending 10 to 16 data_0 on the line before the SYNC. Old standard define the precharge by forcing the AFE to be in precharge mode before transmitting the SYNC.
0 aux_host_always_read	Normally, the aux_rx is disabled during transmit. Normally, the aux_rx is disabled during transmit. Setting this bit allow loopback operation and all transmit transactions will go to the receiver. Used for debug.

13.4.10.1.168 Status of the DP_AUX interrupt sources (DP_AUX_INTERRUPT_SOURCE)

13.4.10.1.168.1 Offset

Register	Offset
DP_AUX_INTERRUPT_SOURCE	2804h

13.4.10.1.168.3 Fields

Field	Function
31-10 reserved_0	
9 aux_main_expire_tx	timer expire (external) in DP_OUT
8 aux_rx_error_cycle_time	Cycle time error. Cycle time error. Asserted if aux_rx_last_cycle is less then aux_host_1m_min or greater then aux_host_1m_max.
7	The received transaction corrupted during the data phase (bad STOP, or unaligned STOP).

Table continues on the next page...

Field	Function
aux_main_rx_status_corrupted	The received transaction corrupted during the data phase (bad STOP, or unaligned STOP).
6 aux_main_rx_status_long_data	The received transaction had more than 20 data bytes. The received transaction had more than 20 data bytes.
5 aux_main_rx_status_long_preamble	The received transaction had preamble greater than the preamble_max. The received transaction had preamble greater than the preamble_max.
4 aux_main_rx_status_short_preamble	The received transaction had preamble shorter than the preamble_max. The received transaction had preamble shorter than the preamble_max.
3 aux_main_rx_status_done	This module control the packet extraction and packet read from the memory. This module control the packet extraction and packet read from the memory.
2 aux_rx_data_transfer_init	Rx data transfer may be initiated. Rx data transfer may be initiated. Falling edge of the aux_mailbox_empty.
1 aux_tx_done	Tx data transfer finished. Tx data transfer finished.
0 pslverr_dpaux	APB slave error interrupt from DP AUX module. APB slave error interrupt from DP AUX module.

13.4.10.1.169 Mask vector of the DP_AUX interrupt sources (DP_AUX_INTERRUPT_MASK)

13.4.10.1.169.1 Offset

13.4.10.1.171.3 Fields

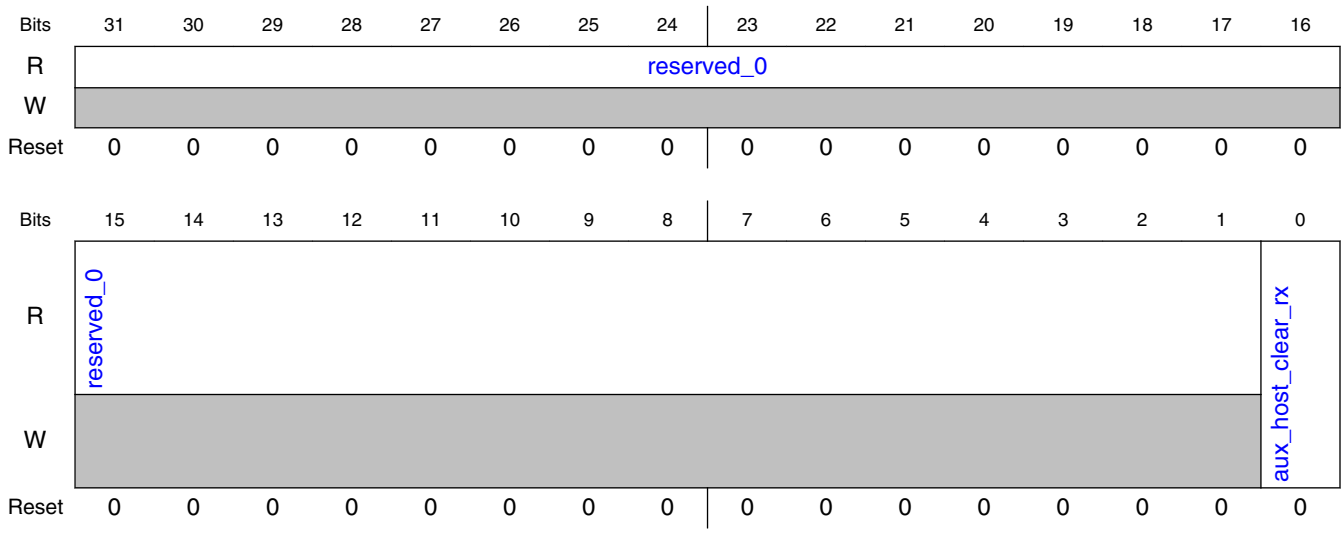
Field	Function
31-1 reserved_0	
0 aux_host_send_nack_transaction	Send nack transaction by AUX_TX. Send nack transaction by AUX_TX. This bit is automaticaly cleared when operation in completed.

13.4.10.1.172 RX bits clear (DP_AUX_CLEAR_RX)

13.4.10.1.172.1 Offset

Register	Offset
DP_AUX_CLEAR_RX	2814h

13.4.10.1.172.2 Diagram



13.4.10.1.172.3 Fields

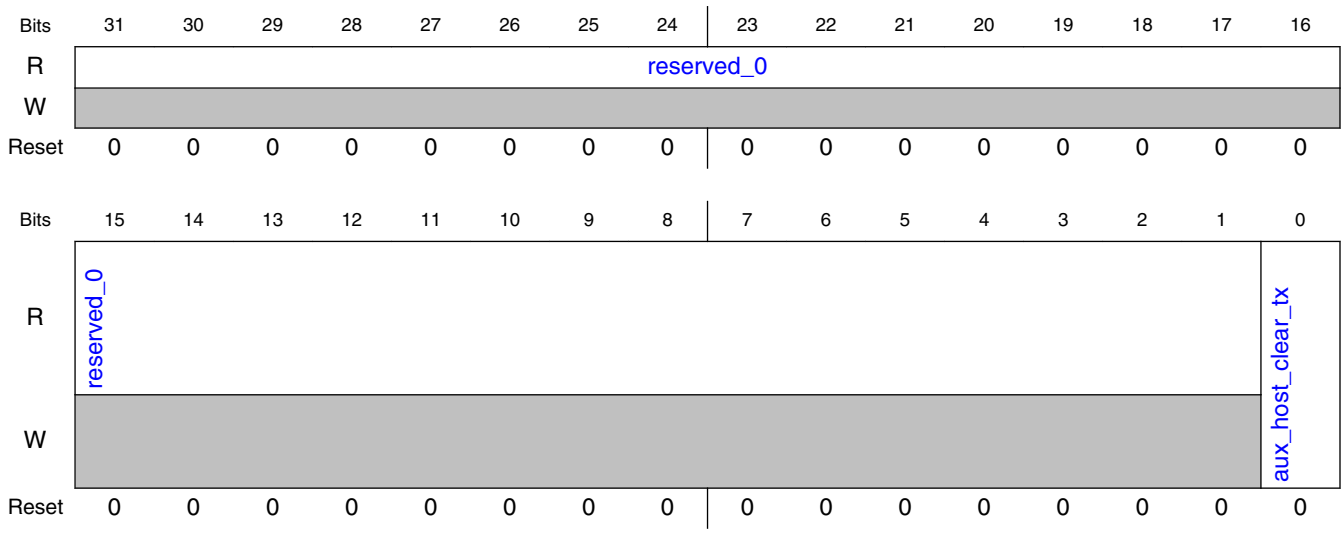
Field	Function
31-1 reserved_0	
0 aux_host_clear_rx	Clear all rx bits in register 64,65. Clear all rx bits in register 64,65.This command is an indication that the processing of last receive transaction was completed and the AUX_RX can start looking for new receive transaction. This bit is automaticaly cleared when operation in completed.

13.4.10.1.173 TX bits clear (DP_AUX_CLEAR_TX)

13.4.10.1.173.1 Offset

Register	Offset
DP_AUX_CLEAR_TX	2818h

13.4.10.1.173.2 Diagram



13.4.10.1.173.3 Fields

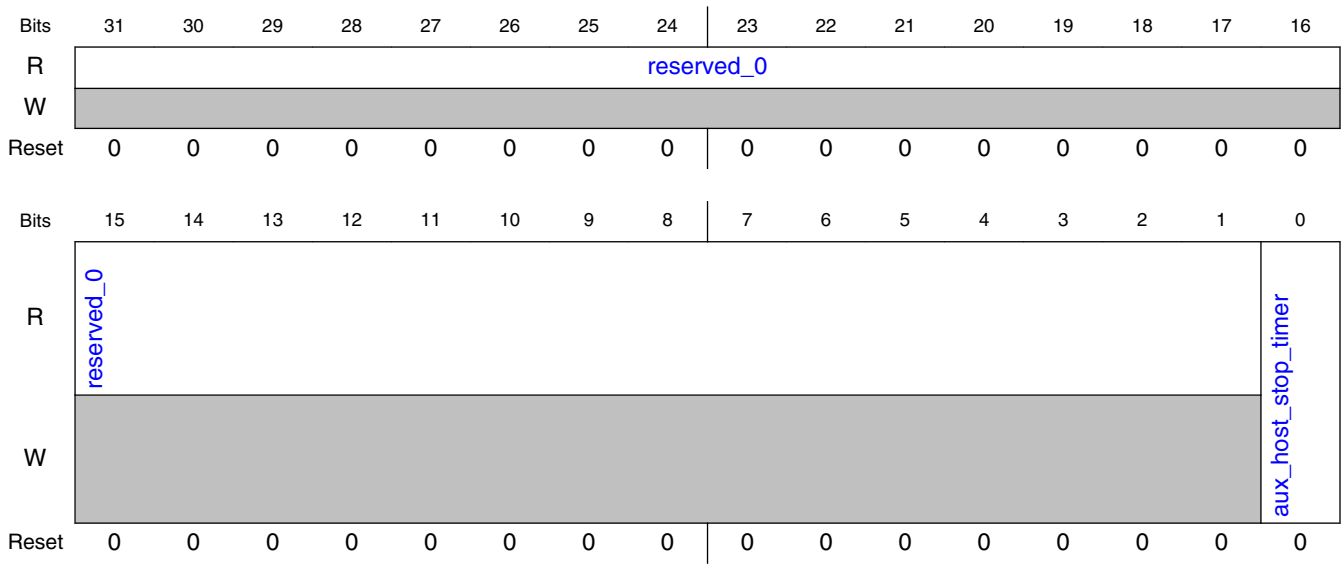
Field	Function
31-1 reserved_0	
0 aux_host_clear_tx	Clear all external bits in registers 64,67. Clear all external bits in registers 64,67.This command used in DP_IN mode. It is an indication that the processing of last external transaction was completed and the DP_AUX can start receive new external transaction from the adapter. This bit is automaticaly cleared when operation in completed.

13.4.10.1.174 Stop timer operation (DP_AUX_TIMER_STOP)

13.4.10.1.174.1 Offset

Register	Offset
DP_AUX_TIMER_STOP	281Ch

13.4.10.1.174.2 Diagram



13.4.10.1.174.3 Fields

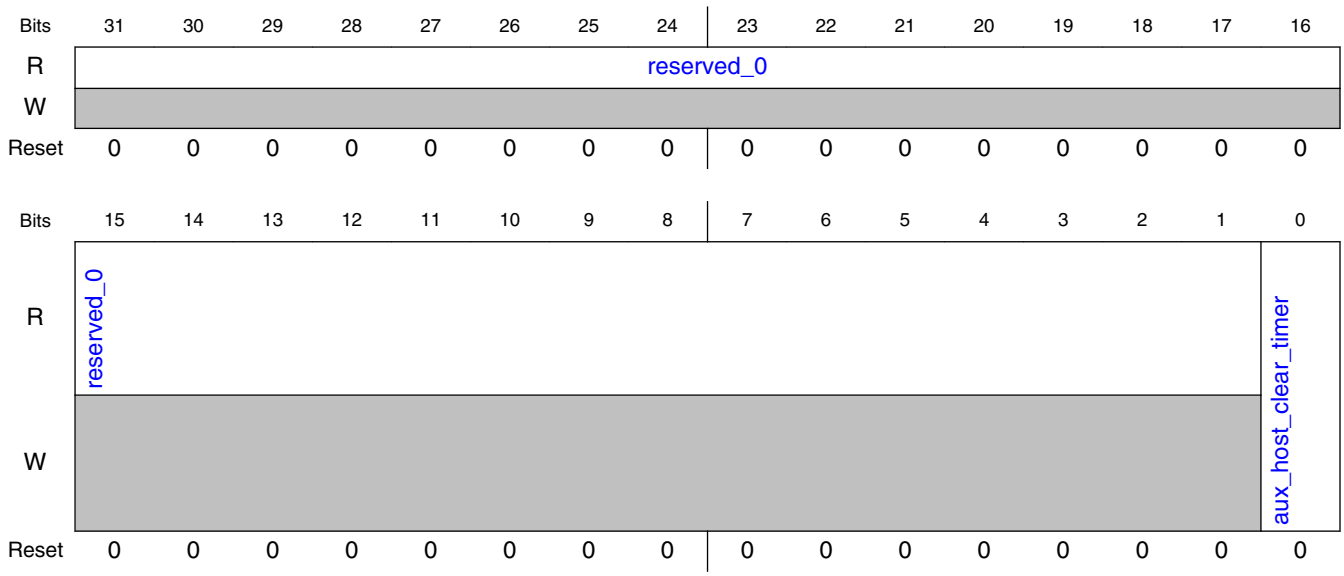
Field	Function
31-1 reserved_0	
0 aux_host_stop_timer	Stop timer operation

13.4.10.1.175 Clear timer operation (DP_AUX_TIMER_CLEAR)

13.4.10.1.175.1 Offset

Register	Offset
DP_AUX_TIMER_CLEAR	2820h

13.4.10.1.175.2 Diagram



13.4.10.1.175.3 Fields

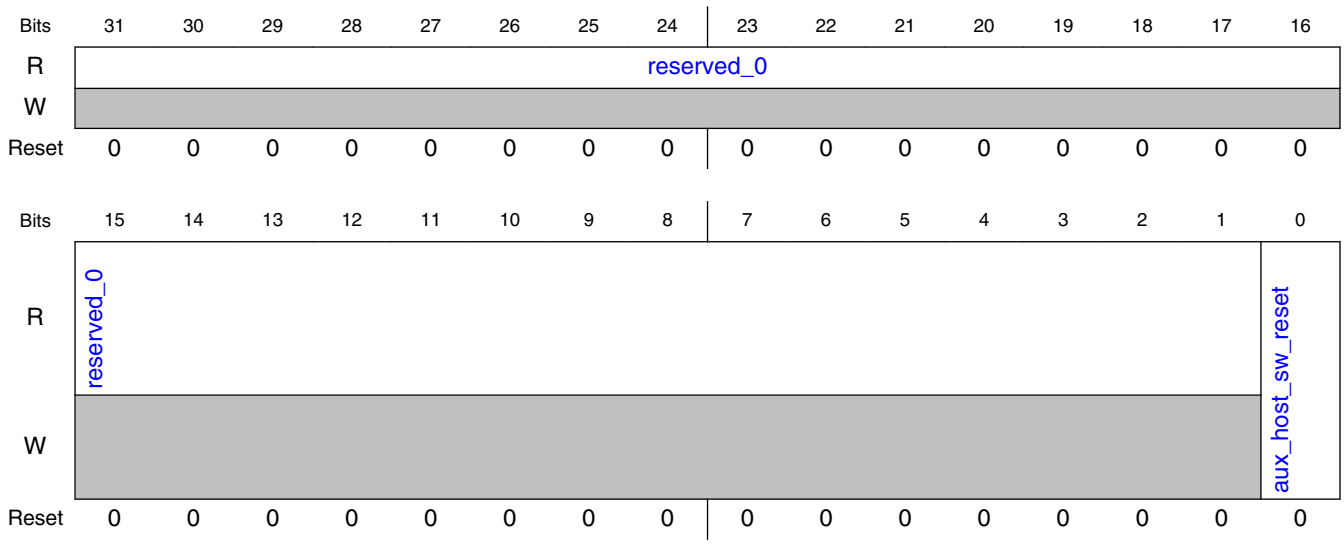
Field	Function
31-1 reserved_0	
0 aux_host_clear_timer	Stop timer operation. Stop timer operation. This bit is automaticaly cleared when operation in completed.

13.4.10.1.176 Soft reset of the DP_AUX (DP_AUX_RESET_SW)

13.4.10.1.176.1 Offset

Register	Offset
DP_AUX_RESET_SW	2824h

13.4.10.1.176.2 Diagram



13.4.10.1.176.3 Fields

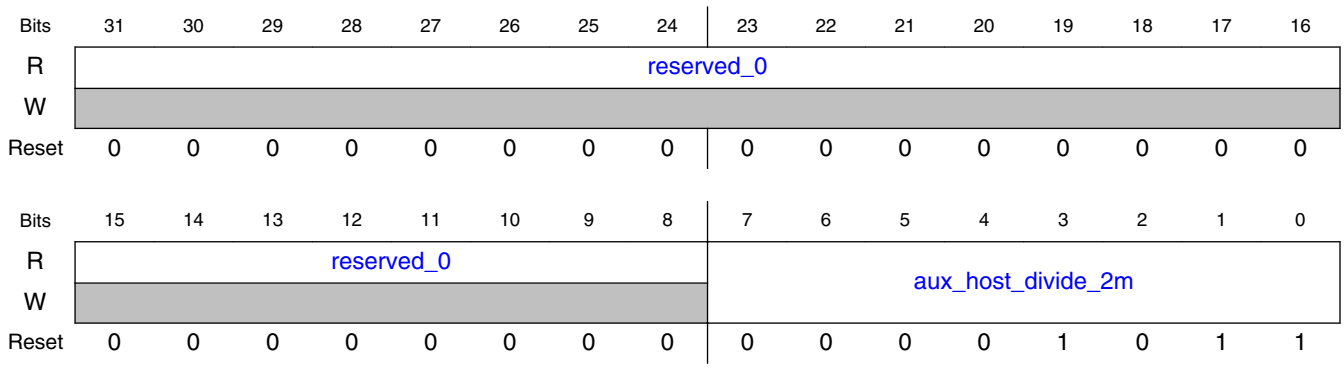
Field	Function
31-1 reserved_0	
0 aux_host_sw_reset	Reset all DP_AUX state machines and clear all the status bits. Reset all DP_AUX state machines and clear all the status bits. The registers value remains. (S/W reset). This bit is automaticaly cleared when operation in completed.

13.4.10.1.177 SYS_CLK and 2 MHz clock ratio (DP_AUX_DIVIDE_2M)

13.4.10.1.177.1 Offset

Register	Offset
DP_AUX_DIVIDE_2M	2828h

13.4.10.1.177.2 Diagram



13.4.10.1.177.3 Fields

Field	Function
31-8 reserved_0	
7-0 aux_host_divide_2m	The ratio between sys_clk and 2MHz, [(sys_clk frequency/2MHz) - 1], for 25MHz sys_clk the value is 11. The ratio between sys_clk and 2MHz, [(sys_clk frequency/2MHz) - 1], for 25MHz sys_clk the value is 11. This register is used by AUX_TX for generating the AUX_TX clock.

13.4.10.1.178 Pre charge field length (DP_AUX_TX_PREACHARGE_LENGTH)

13.4.10.1.178.1 Offset

Register	Offset
DP_AUX_TX_PREACHARGE_LENGTH	282Ch

13.4.10.1.186.3 Fields

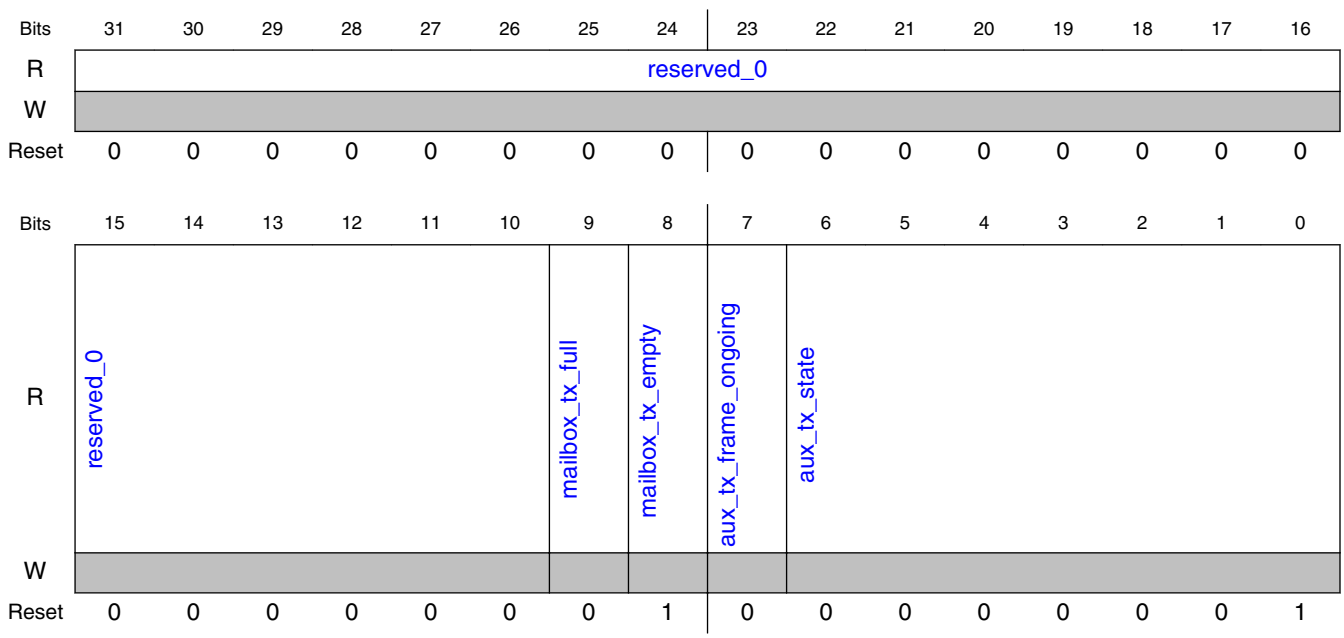
Field	Function
31-10 reserved_0	
9-0 mailbox_rx_data	Read data from the mailbox. Read data from the mailbox. Whenever read to this register occurs, aux_mailbox_read to RX Mailbox shall be asserted for one clock cycle.

13.4.10.1.187 AUX_TX status (DP_AUX_TX_STATUS)

13.4.10.1.187.1 Offset

Register	Offset
DP_AUX_TX_STATUS	2850h

13.4.10.1.187.2 Diagram



13.4.10.1.187.3 Fields

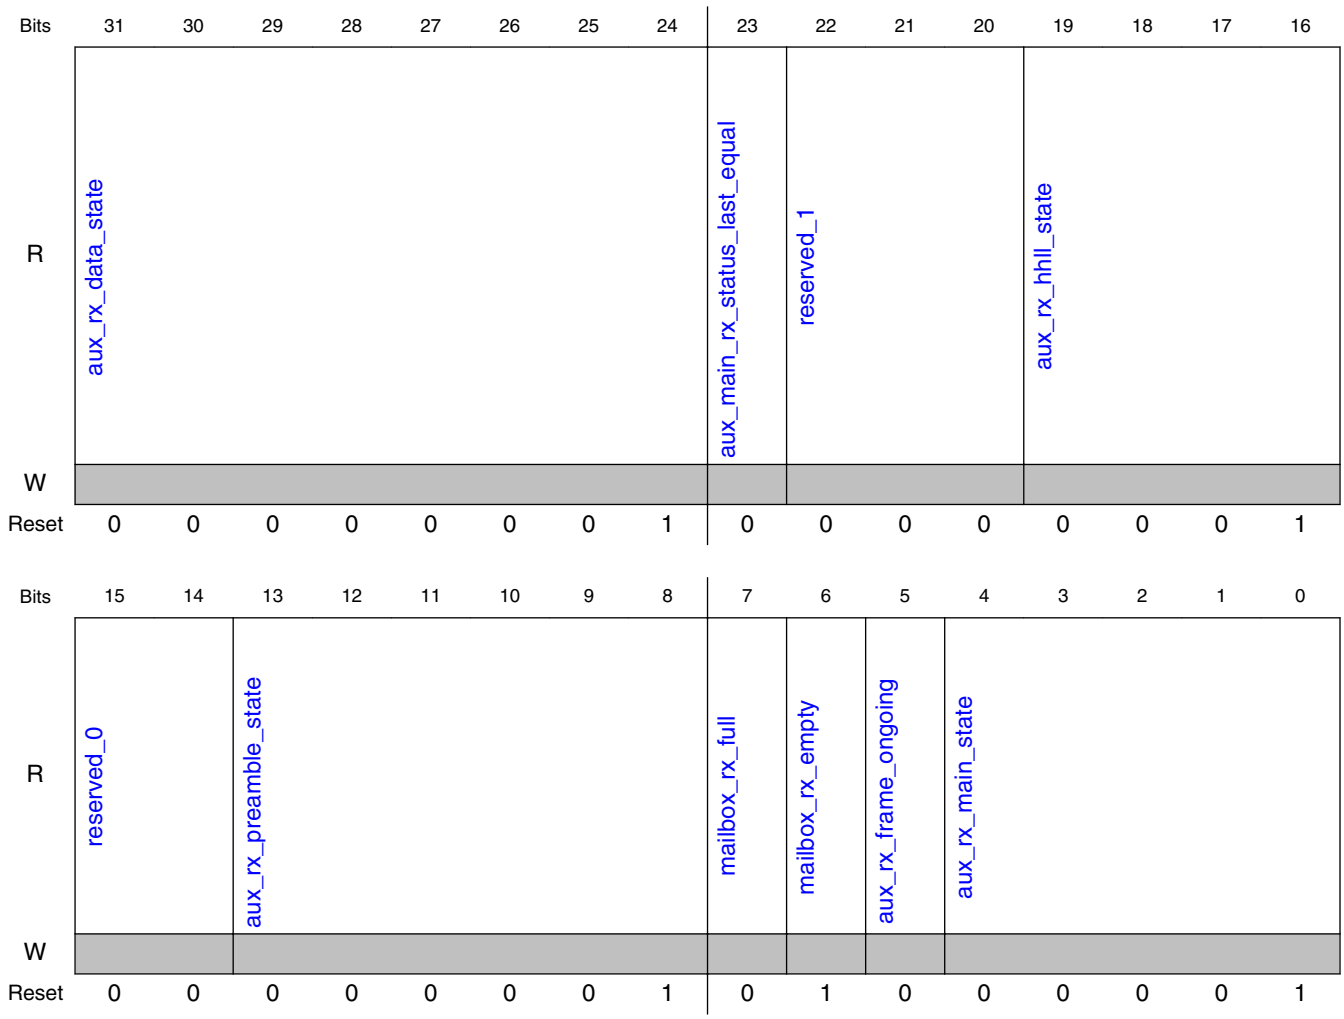
Field	Function
31-10 reserved_0	
9 mailbox_tx_full	Mailbox TX full flag
8 mailbox_tx_empty	Mailbox TX empty flag
7 aux_tx_frame_ongoing	Frame transmission status
6-0 aux_tx_state	Aux_tx state machine register

13.4.10.1.188 AUX_RX status (DP_AUX_RX_STATUS)

13.4.10.1.188.1 Offset

Register	Offset
DP_AUX_RX_STATUS	2854h

13.4.10.1.188.2 Diagram



13.4.10.1.188.3 Fields

Field	Function
31-24 aux_rx_data_state	AUX_RX SM state
23 aux_main_rx_status_last_equal	The receive transaction is equal to the previous transaction. The receive transaction is equal to the previous transaction. (THIS IS NOT ERROR BIT !!)
22-20 reserved_1	
19-16 aux_rx_hhll_state	AUX_RX hhll state machine register

Table continues on the next page...

Field	Function
15-14 reserved_0	
13-8 aux_rx_preamble_state	AUX_RX preamble state machine register
7 mailbox_rx_full	Mailbox RX full flag
6 mailbox_rx_empty	Mailbox RX empty flag
5 aux_rx_frame_ongoing	Frame reception status
4-0 aux_rx_main_state	AUX_RX main state machine register

13.4.10.1.189 RX counter status (DP_AUX_RX_CYCLE_COUNTER)

13.4.10.1.189.1 Offset

Register	Offset
DP_AUX_RX_CYCLE_COUNTER	2858h

13.4.10.1.189.3 Fields

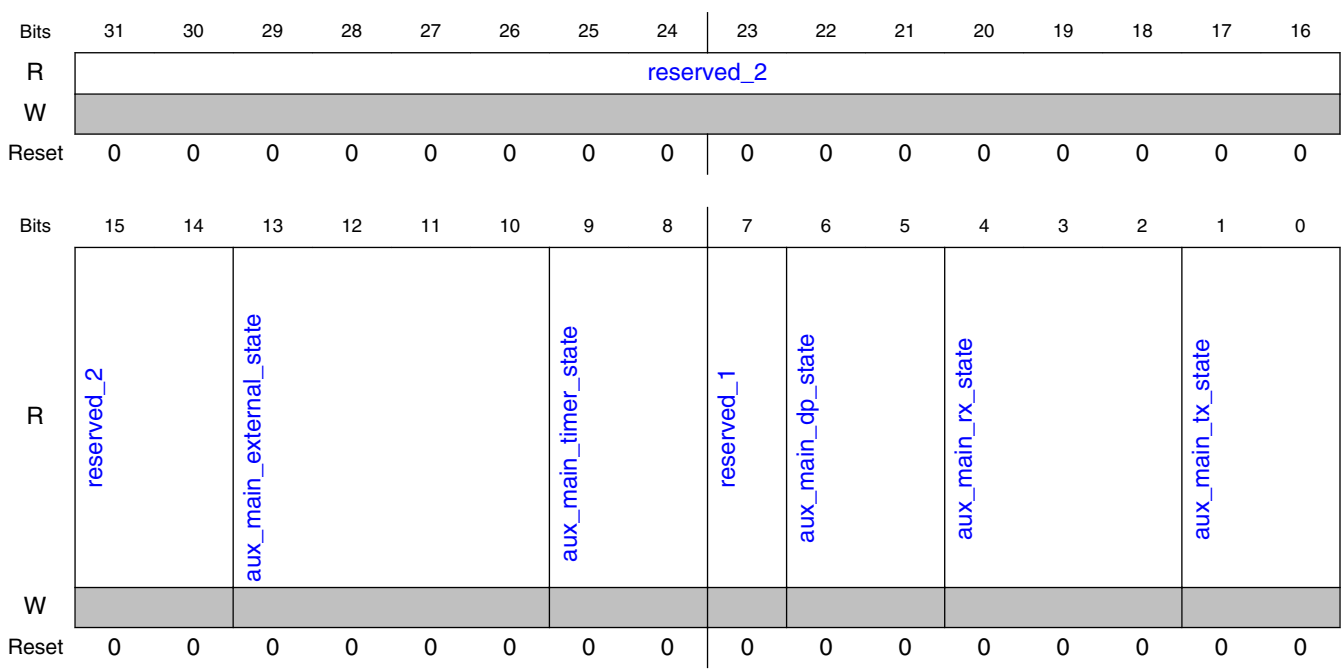
Field	Function
31-11 reserved_0	
10-0 aux_rx_cycle_counter	Count system clocks from last change in the auxiliary line input

13.4.10.1.190 DP_AUX MAIN State Machines status (DP_AUX_MAIN_STATES)

13.4.10.1.190.1 Offset

Register	Offset
DP_AUX_MAIN_STATES	285Ch

13.4.10.1.190.2 Diagram



13.4.10.1.190.3 Fields

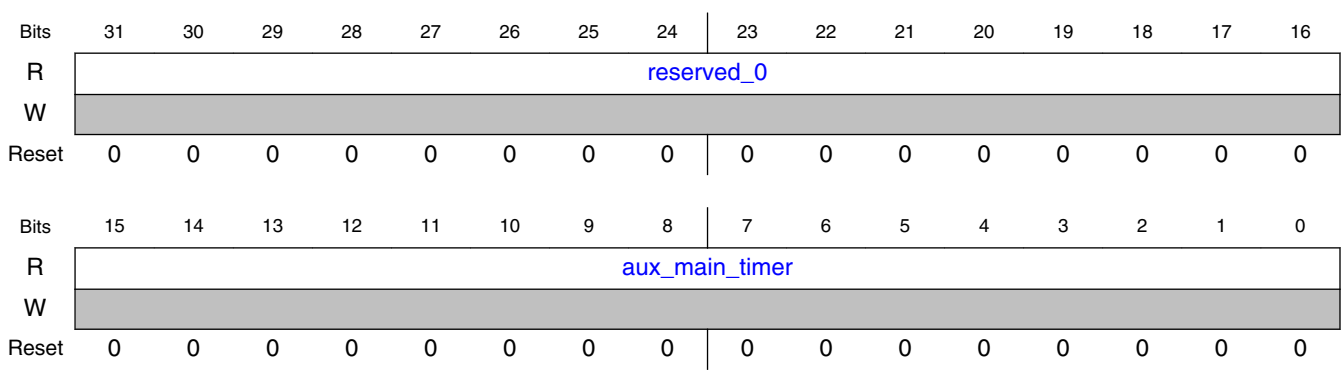
Field	Function
31-14 reserved_2	
13-10 aux_main_external_state	AUX_MAIN external state machine register
9-8 aux_main_timer_state	AUX_MAIN timer state machine
7 reserved_1	
6-5 aux_main_dp_state	AUX_MAIN dp state machine
4-2 aux_main_rx_state	AUX_MAIN rx state machine
1-0 aux_main_tx_state	AUX_MAIN tx state machine

13.4.10.1.191 DP_AUX MAIN timer status (DP_AUX_MAIN_TIMER)

13.4.10.1.191.1 Offset

Register	Offset
DP_AUX_MAIN_TIMER	2860h

13.4.10.1.191.2 Diagram



13.4.10.1.191.3 Fields

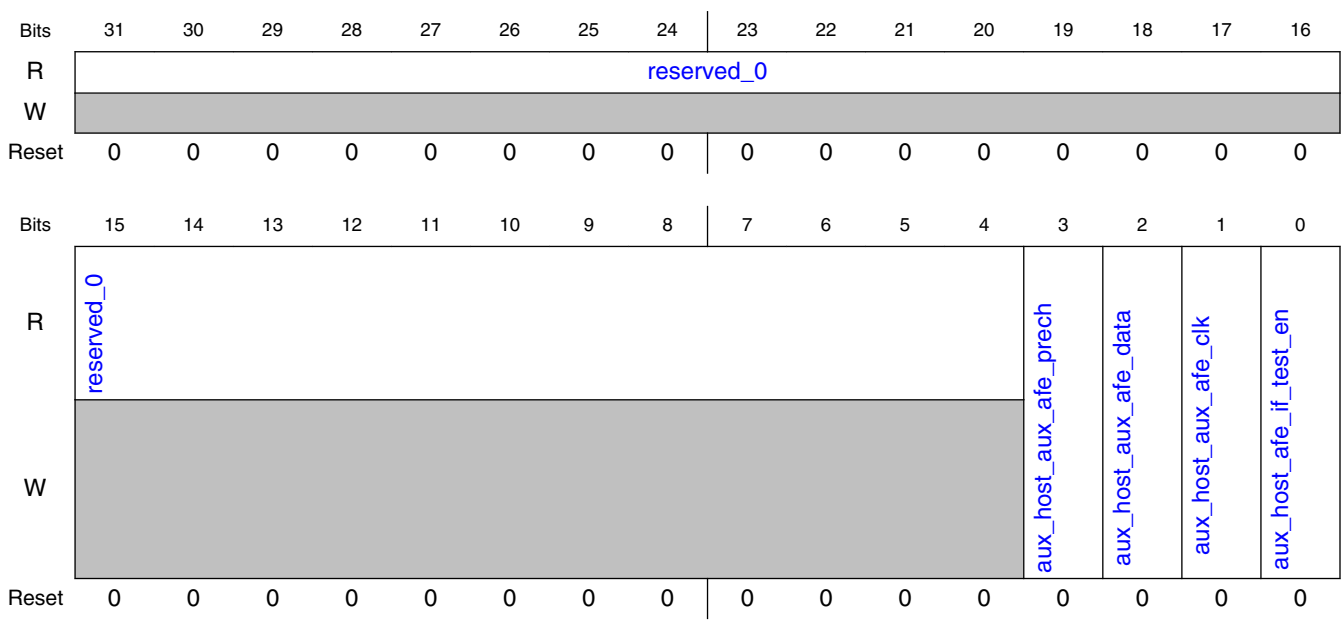
Field	Function
31-16 reserved_0	
15-0 aux_main_timer	DP_AUX MAIN timer status

13.4.10.1.192 Test mode configuration (DP_AUX_AFE_OUT)

13.4.10.1.192.1 Offset

Register	Offset
DP_AUX_AFE_OUT	2864h

13.4.10.1.192.2 Diagram



13.4.10.1.192.3 Fields

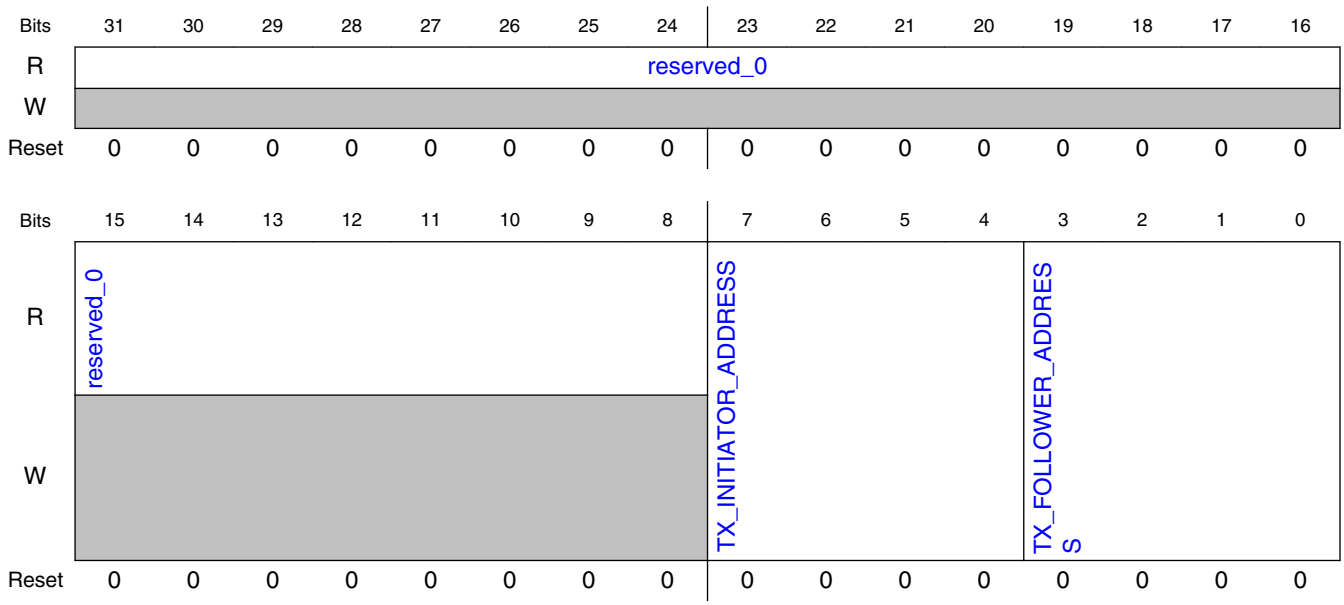
Field	Function
31-4 reserved_0	
3 aux_host_aux_afe_prech	Drive the aux_data_prech output to the AFE when aux_host_afe_if_test_en (bit 0) is set
2 aux_host_aux_afe_data	Drive the aux_data_out output to the AFE when aux_host_afe_if_test_en (bit 0) is set
1 aux_host_aux_afe_clk	Drive the aux_clk_out output to the AFE when aux_host_afe_if_test_en (bit 0) is set
0 aux_host_afe_if_test_en	TESTER mode enable. TESTER mode enable. Give the TESTER direct interface to the AFE_AUX.

13.4.10.1.193 CEC TX message header (TX_MSG_HEADER)

13.4.10.1.193.1 Offset

Register	Offset
TX_MSG_HEADER	3800h

13.4.10.1.193.2 Diagram



13.4.10.1.193.3 Fields

Field	Function
31-8 reserved_0	
7-4 TX_INITIATOR_ADDRESS	The 4 bit logical address of the initiator
3-0 TX_FOLLOWER_ADDRESS	The 4 bit logical address of the follower

13.4.10.1.194 CEC TX message opcode (TX_MSG_OPCODE)

13.4.10.1.194.1 Offset

Register	Offset
TX_MSG_OPCODE	3804h

13.4.10.1.194.2 Diagram

13.4.10.1.252.3 Fields

Field	Function
31-11	

Table continues on the next page...

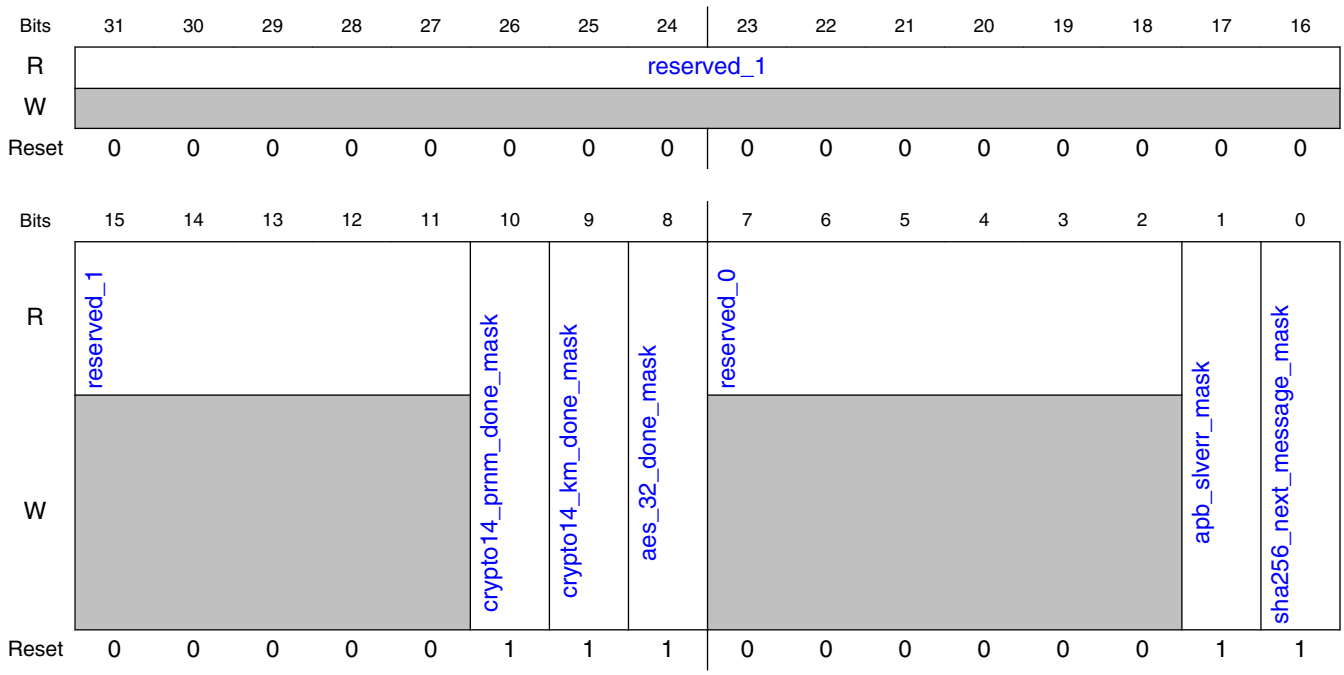
Field	Function
reserved_1	
10 crypto14_prnm_done	LFSR and block output finished calculation. LFSR and block output finished calculation.
9 crypto14_km_done	Done reading/calculating Km. Done reading/calculating Km.
8 aes_32_done	Asserted when the rising edge of the AES-32 done output is detected. Asserted when the rising edge of the AES-32 done output is detected.
7-2 reserved_0	
1 apb_slverr	APB slave error. APB slave error. Asserted when APB address is out of address range.
0 sha256_next_message	Asserted when the rising edge of the SHA256 done output is detected. Asserted when the rising edge of the SHA256 done output is detected.

13.4.10.1.253 CContains the mask vector of the HDCP interrupt sources (CRYPTO_INTERRUPT_MASK)

13.4.10.1.253.1 Offset

Register	Offset
CRYPTO_INTERRUPT_MASK	400Ch

13.4.10.1.253.2 Diagram



13.4.10.1.253.3 Fields

Field	Function
31-11 reserved_1	
10 crypto14_prnm_done_mask	Set to 1 to mask the crypto14_prnm_done interrupt. Set to 1 to mask the crypto14_prnm_done interrupt.
9 crypto14_km_done_mask	Set to 1 to mask the crypto14_km_done interrupt. Set to 1 to mask the crypto14_km_done interrupt.
8 aes_32_done_mask	Set to 1 to mask the AES32_done interrupt. Set to 1 to mask the AES32_done interrupt.
7-2 reserved_0	
1 apb_slverr_mask	Set to 1 for the apb_slverr interrupt. Set to 1 for the apb_slverr interrupt.
0 sha256_next_message_mask	Set to 1 to mask the SHA256_done interrupt. Set to 1 to mask the SHA256_done interrupt.

13.4.10.1.254 Contains global configuration information for the HDCP 2. (CRYPTO22_CONFIG)

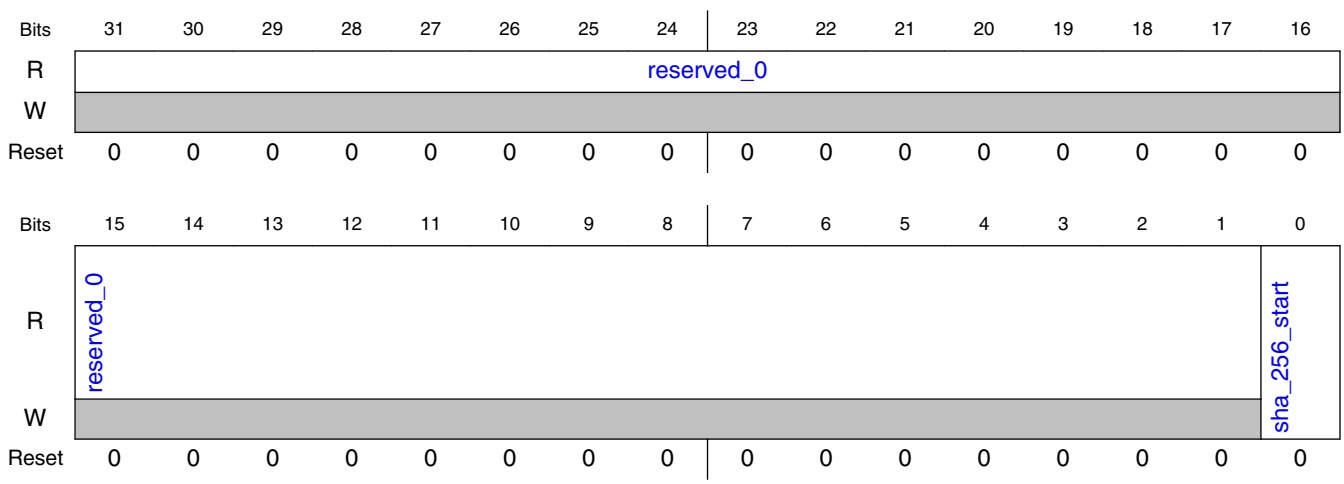
13.4.10.1.254.1 Offset

Register	Offset
CRYPTO22_CONFIG	4018h

13.4.10.1.254.2 Function

Contains global configuration information for the HDCP 2.2 Crypto module

13.4.10.1.254.3 Diagram



13.4.10.1.254.4 Fields

Field	Function
31-1 reserved_0	
0 sha_256_start	Set to 1 for Sha-256 start

13.4.10.1.255 Crypto 2. (CRYPTO22_STATUS)

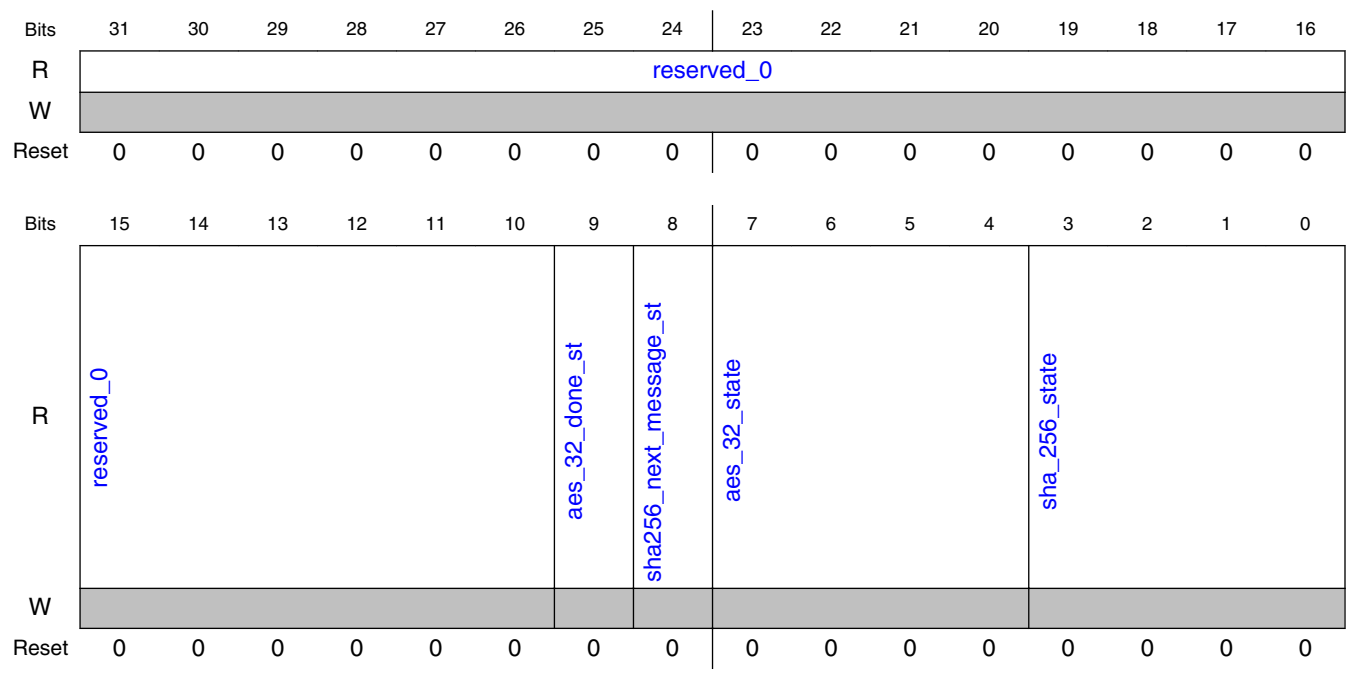
13.4.10.1.255.1 Offset

Register	Offset
CRYPTO22_STATUS	401Ch

13.4.10.1.255.2 Function

Crypto 2.2 global status register

13.4.10.1.255.3 Diagram



13.4.10.1.255.4 Fields

Field	Function
31-10 reserved_0	
9 aes_32_done_st	Asserted when the rising edge of the AES-32 done output is detected. Asserted when the rising edge of the AES-32 done output is detected.
8 sha256_next_message_st	Asserted when the SHA-256 module is ready to receive the next message
7-4	AES-32 current state

Table continues on the next page...

Field	Function
aes_32_state	
3-0 sha_256_state	SHA-256 current state

13.4.10.1.256 Holds 32-bit input data word of the SHA-256 module (SHA_256_DATA_IN)

13.4.10.1.273.3 Fields

Field	Function
31-0 aes_32_data_out_3	Holds the most significant 32-bits word of the 128-bits output data word of the AES-32 module. Holds the most significant 32-bits word of the 128-bits output data word of the AES-32 module.

13.4.10.1.274 Contains global configuration information for the HDCP 1. (CRYPTO14_CONFIG)

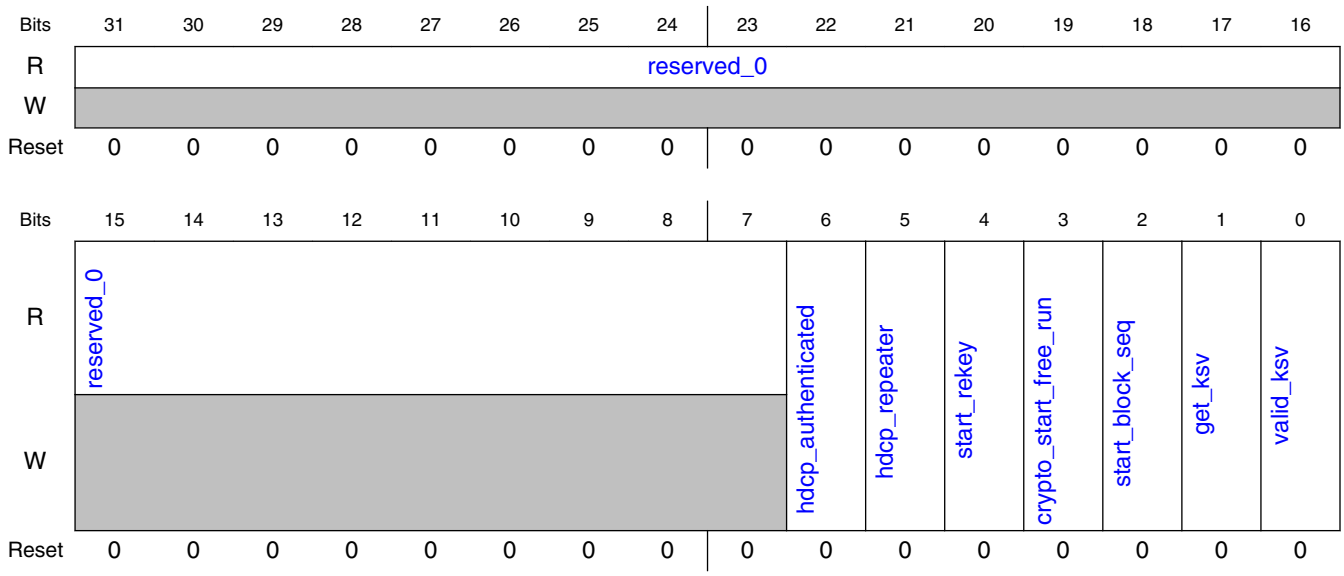
13.4.10.1.274.1 Offset

Register	Offset
CRYPTO14_CONFIG	40A0h

13.4.10.1.274.2 Function

Contains global configuration information for the HDCP 1.4 Crypto module

13.4.10.1.274.3 Diagram



13.4.10.1.274.4 Fields

Field	Function
31-7 reserved_0	
6 hdcp_authenticated	Authenticated finished. Authenticated finished.
5 hdcp_repeater	Repeater bit : 0: for the receiver, 1: for the repeater
4 start_rekey	Crypto 1. Crypto 1.4 command to start hdcpRekeyCipher
3 crypto_start_free_run	Crypto 1. Crypto 1.4 command to start free running enable for operation hdcpRngCipher
2 start_block_seq	Crypto 1. Crypto 1.4 command to start LFSR calculation
1 get_ksv	Read it's own KSV enable bit. Read it's own KSV enable bit.'0' reading not allowed'1' start reading.
0 valid_ksv	Enable for Km calculation. Enable for Km calculation. When high,start calculating Km. Indicates a good moment for ri_out sampling.

13.4.10.1.275 Contains global status information for the HDCP 1. (CRYPTO14_STATUS)

13.4.10.1.275.1 Offset

Register	Offset
CRYPTO14_STATUS	40A4h

13.4.10.1.275.2 Function

13.4.10.1.275.4 Fields

Field	Function
31-21 reserved_3	
20-19	Crypto operation SM state: Possible values:00- HDCP_RNG_CIPHER; 01 - HDCP_BLOCK_CIPHER; 10 - HDCP_STREAM_CIPHER; 11 - HDCP_REKEY_CIPHER

Table continues on the next page...

Field	Function
crypto14_state	
18 sha1_v_ready	Indication that V value from SHA-1 CRYPTO14_SHA1_V_VALUE_4 is ready. Indication that V value from SHA-1 CRYPTO14_SHA1_V_VALUE_4 is ready.
17 sha1_next_msg	Request for the next message block. Request for the next message block. When set high, CRYPTO14_SHA1_MSG_DATA_0-15 registers shall be written.
16-12 reserved_2	
11-9 sha1_state	Current state for Crypto 1. Current state for Crypto 1.4 SHA-1 FSM. Used for debug purpose.Possible values:000 - IDLE; 001 - PREPARE; 010 - CALCULATE; 011 - RESULT; 100 - BLOCK_WAIT
8-6 reserved_1	
5-3 dks_state	Crypto 1. Crypto 1.4 DKS current state. Used for debug purpose.Possible values:000 - HDCP_IDLE_KSV; 010 - HDCP_IDLE;100 - HDCP_PRECALC; 101 - HDCP_POSTCALC; 110 - HDCP_CALC; 111 - HDCP_READY
2 prnm_done	LFSR and block output finished calculation. LFSR and block output finished calculation.
1 reserved_0	
0 km_done	Done reading/calculating Km. Done reading/calculating Km. Used as interrupt event.

13.4.10.1.276 Contains 24-bit pseudo random data (CRYPTO14_PRNM_OUT)

13.4.10.1.276.1 Offset

Register	Offset
CRYPTO14_PRNM_OUT	40A8h

Table continues on the next page...

Field	Function
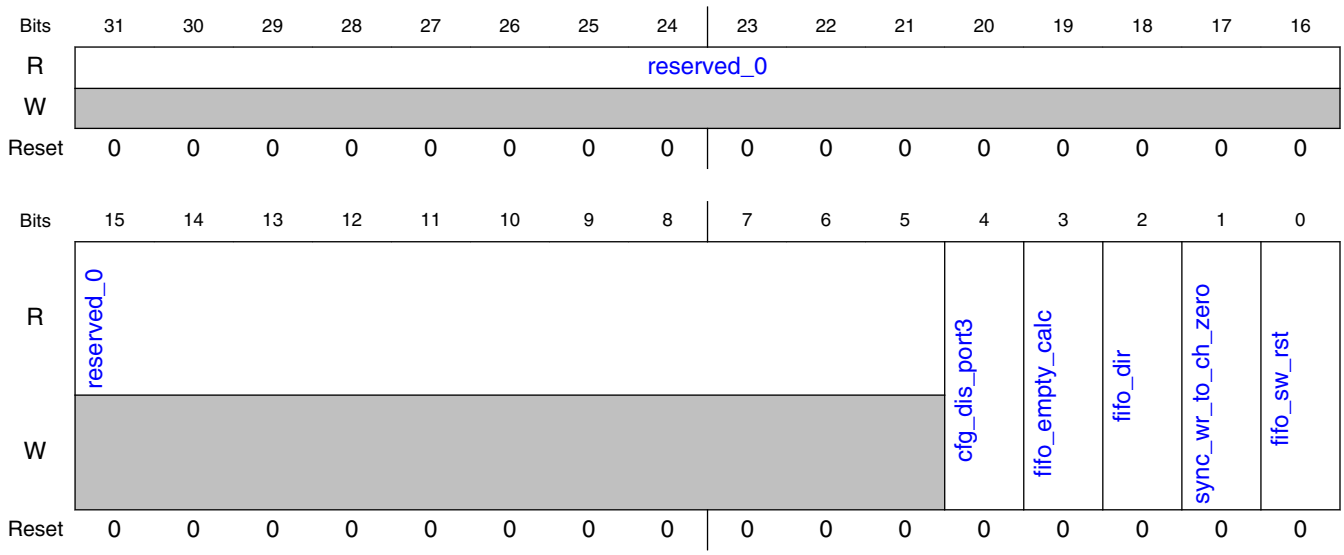
20 cfg_sample_present_force	Force sample present bits
19-16 cfg_sample_present	Sample present bits if force them is active
15 cfg_en_auto_sub_pckt_num	Enable automatics sub packet number. Enable automatics sub packet number. When enabled number of sub-packts will be set according to MEM FIFO number of samples.
14 cfg_block_lpcm_first_pkt	0 - All packets behave the same. 0 - All packets behave the same. 1- First lpcm audio packet is sent with 1 - SP.
13-11 cfg_sub_pckt_num	Number of sub-packets in HDMI audio 2-ch packet. Number of sub-packets in HDMI audio 2-ch packet. 00: 1-SP, 01: 2-SP, 10: 3-SP, 11: 4-SP.100-111: NA.
10-7 audio_type	Audio Type setting. Audio Type setting. Packet is structured according to audio type.
6-5 num_of_i2s_ports	Number ofactive I2S ports. Number ofactive I2S ports. 00- 1 port, 01-2 ports, 11- 4 ports, 11 -NA.
4-0 max_num_ch	Number of channels to decode. Number of channels to decode. 0: 1 channel, 31: 32 channels

13.4.10.1.334 FIFO control register (FIFO_CNTL)

13.4.10.1.334.1 Offset

Register	Offset
FIFO_CNTL	3_0088h

13.4.10.1.334.2 Diagram



13.4.10.1.334.3 Fields

Field	Function
31-5 reserved_0	
4 cfg_dis_port3	0 - Normal Operation. 0 - Normal Operation. 1 - I2S port 3 is disabled (user should ignore its outputs). This allows for 24-ch, 12-ch, 6-ch transfer.
3 fifo_empty_calc	0- Empty is a function of read address. 0- Empty is a function of read address. 1 - Empty is a function of BASE read address.
2 fifo_dir	0 - smpl2pkt (inc_step=number of I2S ports), 1 - pkt2smpl (inc_step=num_ch_per_port)
1 sync_wr_to_ch_zero	When high the last channel index synchronizes the write addresses (to the next channel group)
0 fifo_sw_rst	Resets Fifo's write and read pointers. Resets Fifo's write and read pointers. When FIFO configuration bits change this signal should be high (due to synchronization issues).

13.4.10.1.335 FIFO Status register (FIFO_STTS)

SOURCE_PIF_DATA_RD	3_0814h

13.4.10.1.342.2 Function

The 32 bits of the data to be read from the packet memory.

13.4.10.1.342.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	fifo2_data_out															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	fifo2_data_out															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

13.4.10.1.342.4 Fields

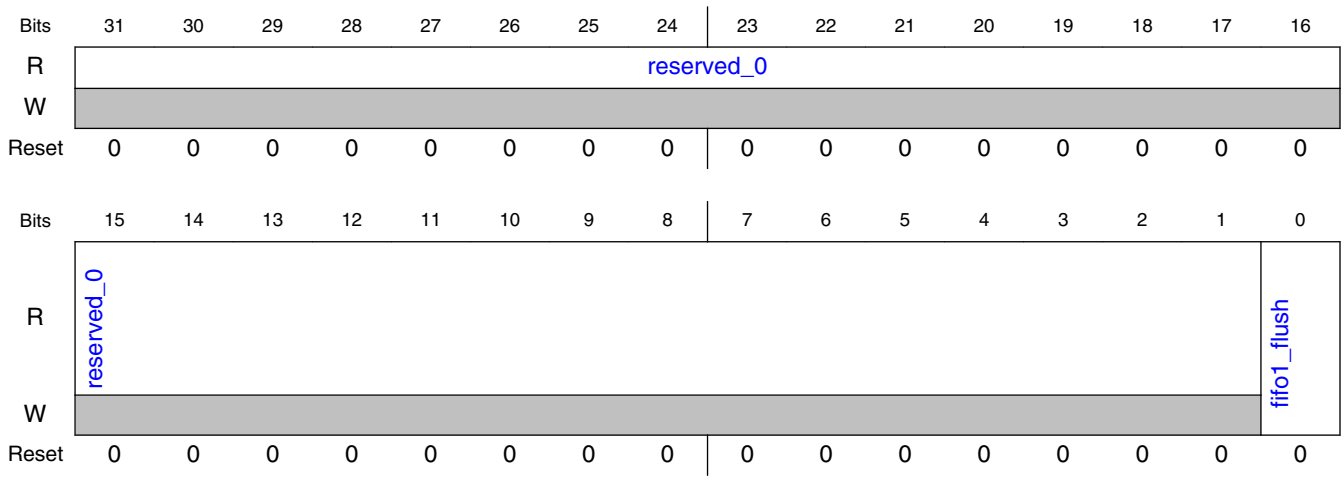
Field	Function
31-0 fifo2_data_out	The 32 bits of the data to be read from the packet memory. The 32 bits of the data to be read from the packet memory. When read from this register fifo2_rd_enable will automatically be asserted and the data is read from the FIFO.

13.4.10.1.343 Fifo1 flush (SOURCE_PIF_FIFO1_FLUSH)

13.4.10.1.343.1 Offset

Register	Offset
SOURCE_PIF_FIFO1_FLUSH	3_0818h

13.4.10.1.343.2 Diagram



13.4.10.1.343.3 Fields

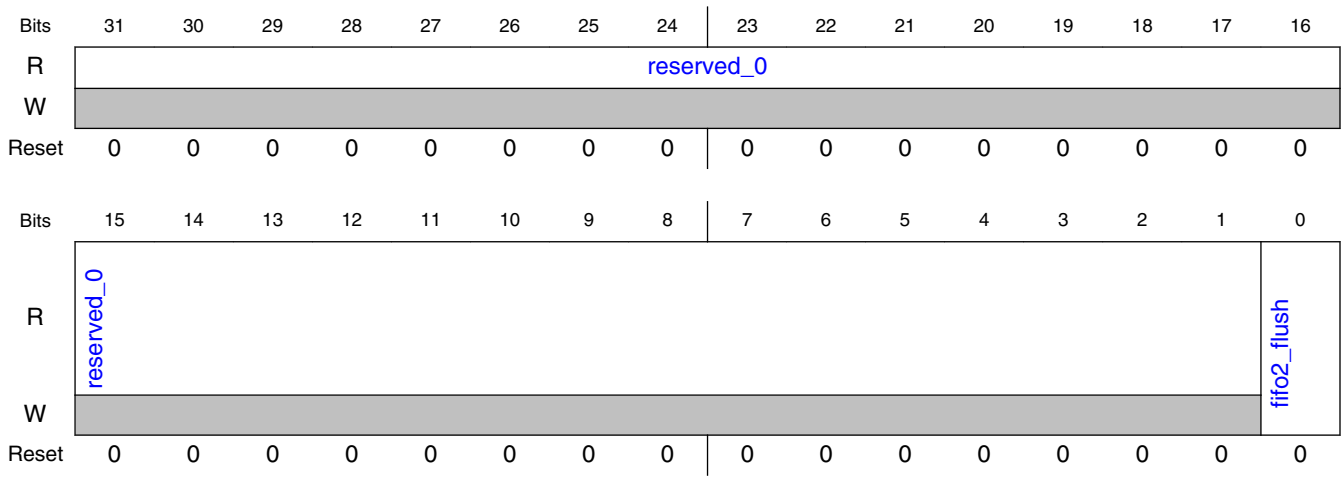
Field	Function
31-1 reserved_0	
0 fifo1_flush	Fifo1 flush bit, active high. Fifo1 flush bit, active high. Bit is automaticaly cleared when operation is completed.

13.4.10.1.344 Fifo2 flush (SOURCE_PIF_FIFO2_FLUSH)

13.4.10.1.344.1 Offset

Register	Offset
SOURCE_PIF_FIFO2_FLUSH	3_081Ch

13.4.10.1.344.2 Diagram



13.4.10.1.344.3 Fields

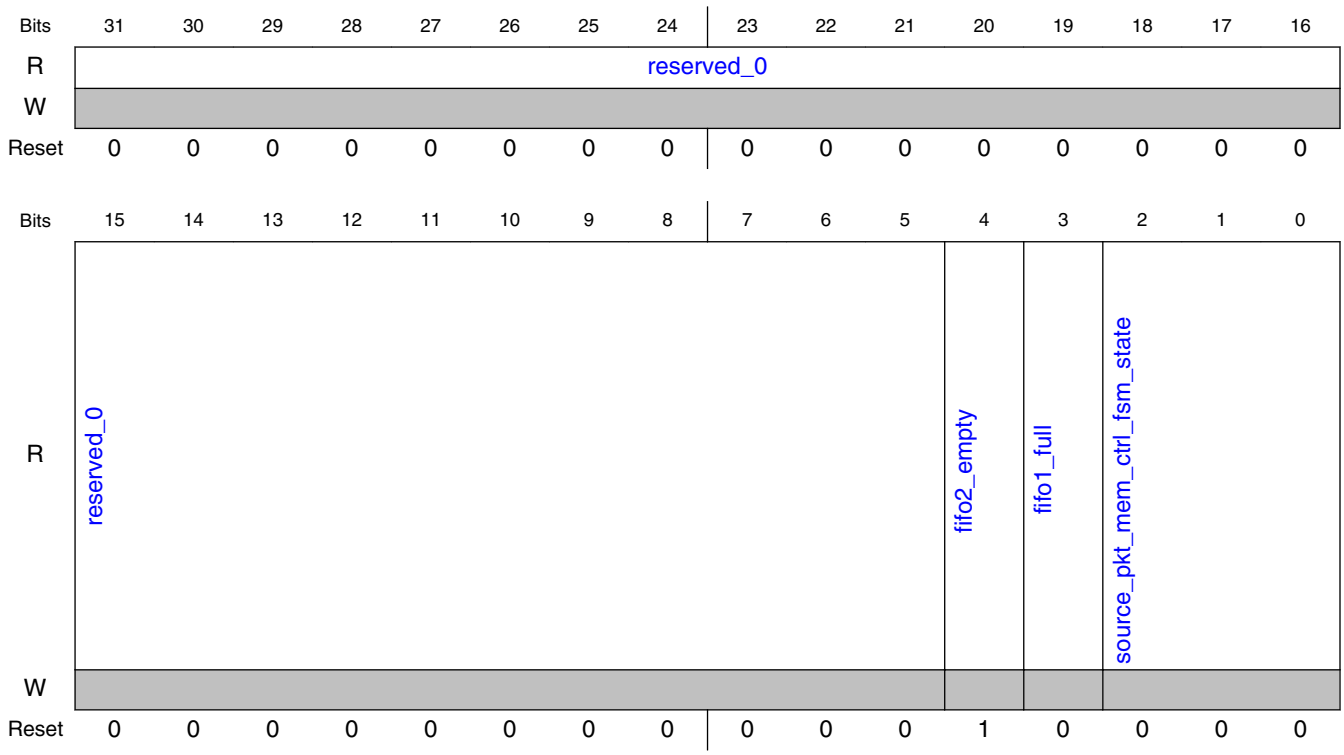
Field	Function
31-1 reserved_0	
0 fifo2_flush	Fifo2 flush bit, active high. Fifo2 flush bit, active high. Bit is automaticaly cleared when operation is completed.

13.4.10.1.345 Status bits for the PIF module (SOURCE_PIF_STATUS)

13.4.10.1.345.1 Offset

Register	Offset
SOURCE_PIF_STATUS	3_0820h

13.4.10.1.345.2 Diagram



13.4.10.1.345.3 Fields

Field	Function
31-5 reserved_0	
4 fifo2_empty	Fifo2 empty indication, when high indicates that FIFO2 is empty
3 fifo1_full	Fifo1 full indication, when high indicates that FIFO1 is full
2-0 source_pkt_mem_ctrl_fsm_state	State of the FSM that controls packet memory transactions. State of the FSM that controls packet memory transactions.

13.4.10.1.346 Interrupt sources of the PIF module, active high. (SOURCE_PIF_INTERRUPT_SOURCE)

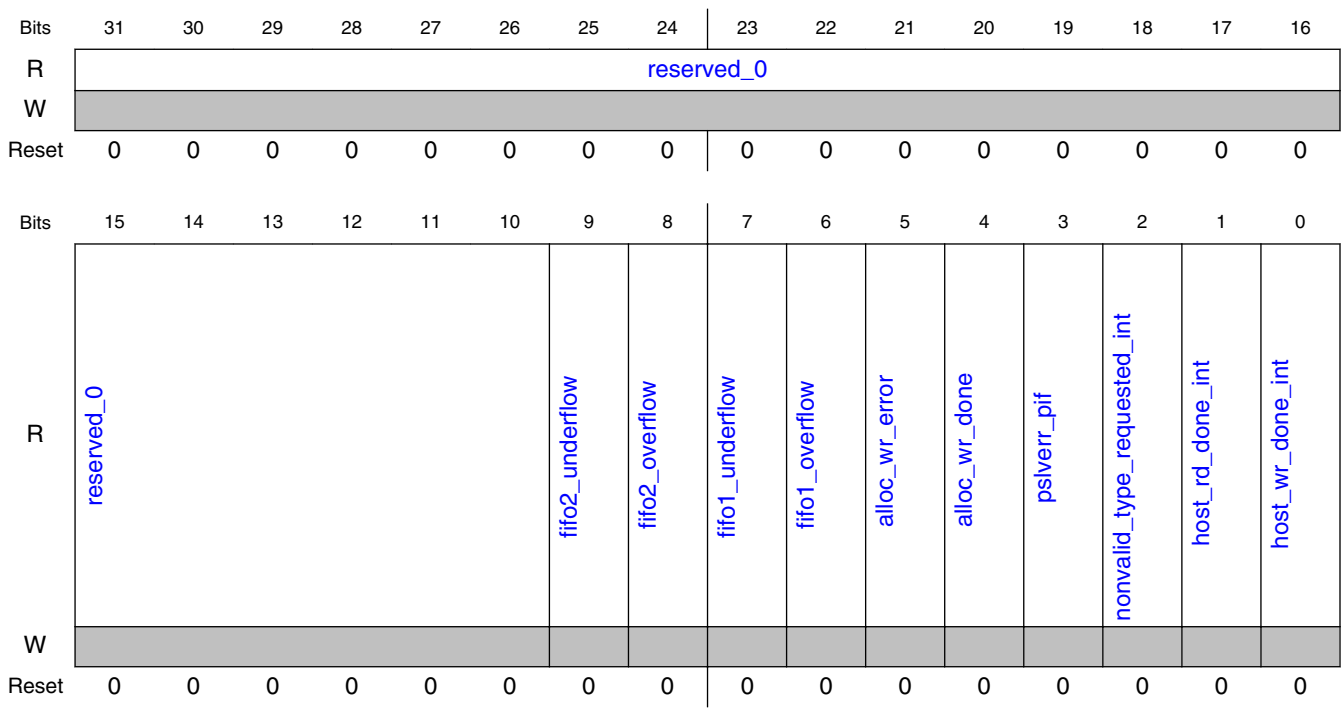
13.4.10.1.346.1 Offset

Register	Offset
SOURCE_PIF_INTERRUPT_SOURCE	3_0824h

13.4.10.1.346.2 Function

Interrupt sources of the PIF module, active high. Automatically cleared on read.

13.4.10.1.346.3 Diagram



13.4.10.1.346.4 Fields

Field	Function
31-10 reserved_0	
9 fifo2_underflow	Fifo2 underflow indication
8 fifo2_overflow	Fifo2 overflow indication

Table continues on the next page...

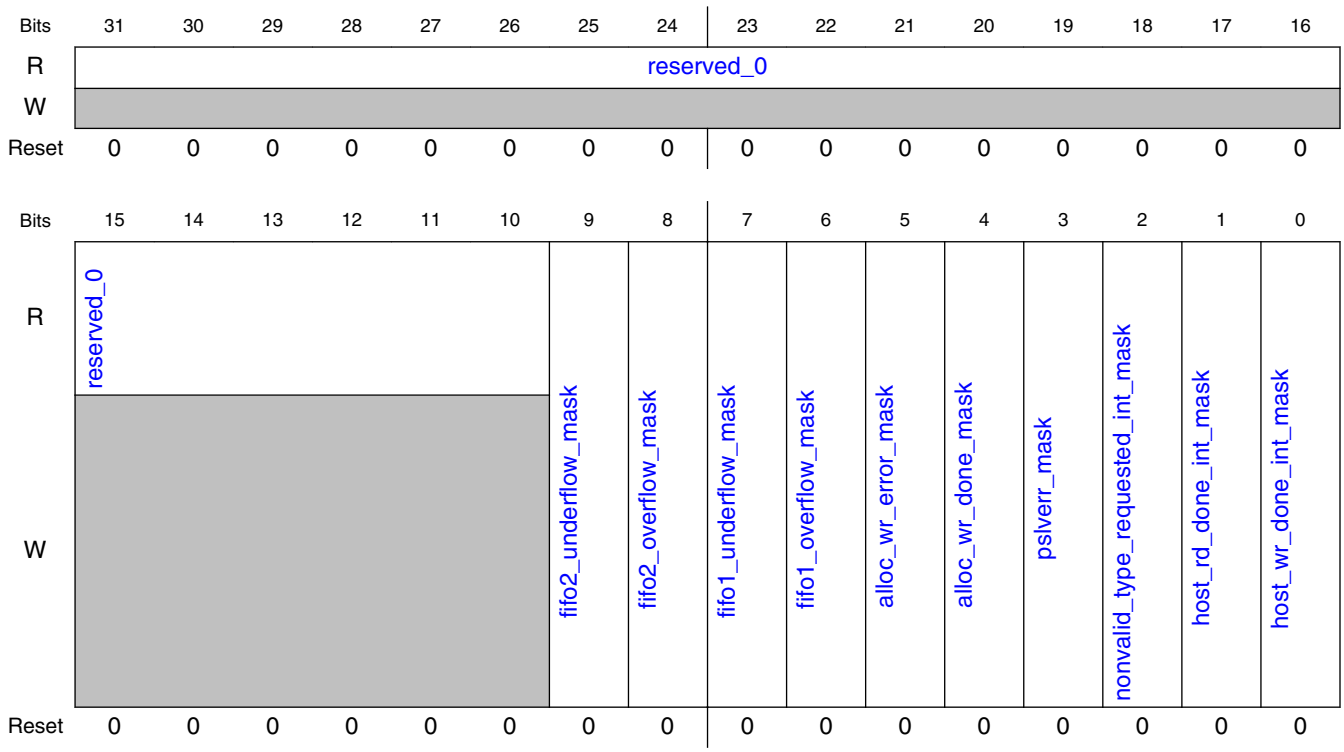
Field	Function
7 fifo1_underflow	Fifo1 underflow indication
6 fifo1_overflow	Fifo1 overflow indication
5 alloc_wr_error	Error happened, invalid write to the allocation table. Error happened, invalid write to the allocation table.
4 alloc_wr_done	Successful write to the allocation table. Successful write to the allocation table.
3 pslverr_pif	APB slave error interrupt from Packet Interface
2 nonvalid_type_requested_int	Indication that nonvalid type of packet is requested by the packet interface. Indication that nonvalid type of packet is requested by the packet interface.
1 host_rd_done_int	Indication that the host read transaction finished. Indication that the host read transaction finished.
0 host_wr_done_int	Indication that the host write transaction finished. Indication that the host write transaction finished.

13.4.10.1.347 Masks for the interrupt sources in the SOURCE_PIF_INTERRUPT_SOURCE register, when set high, these bits disable the corresponding interrupts (SOURCE_PIF_INTERRUPT_MASK)

13.4.10.1.347.1 Offset

Register	Offset
SOURCE_PIF_INTERRUPT_MASK	3_0828h

13.4.10.1.347.2 Diagram



13.4.10.1.347.3 Fields

Field	Function
31-10 reserved_0	
9 fifo2_underflow_mask	Masks the fifo2_underflow interrupt
8 fifo2_overflow_mask	Masks the fifo2_overflow interrupt
7 fifo1_underflow_mask	Masks the fifo1_underflow interrupt
6 fifo1_overflow_mask	Masks the fifo1_overflow interrupt
5 alloc_wr_error_mask	Masks the alloc_wr_error interrupt
4	Masks the alloc_wr_done interrupt

Table continues on the next page...

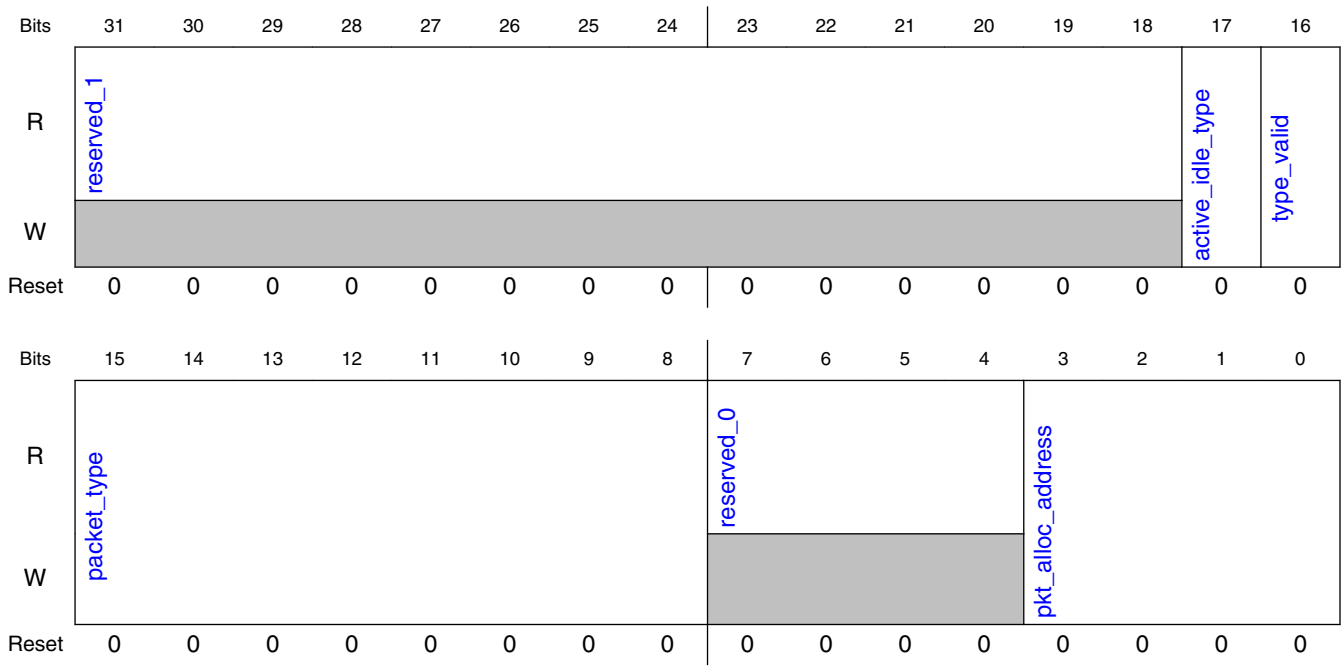
Field	Function
alloc_wr_done_mask	
3 pslverr_mask	Masks the pslverr_pif interrupt
2 nonvalid_type_requested_int_mask	Masks the nonvalid_type_requested_int interrupt
1 host_rd_done_int_mask	Masks the host_rd_done_int interrupt
0 host_wr_done_int_mask	Masks the host_wr_done_int interrupt

13.4.10.1.348 Packet configuration to be stored in the allocation table (SOURCE_PIF_PKT_ALLOC_REG)

13.4.10.1.348.1 Offset

Register	Offset
SOURCE_PIF_PKT_ALLOC_REG	3_082Ch

13.4.10.1.348.2 Diagram



13.4.10.1.348.3 Fields

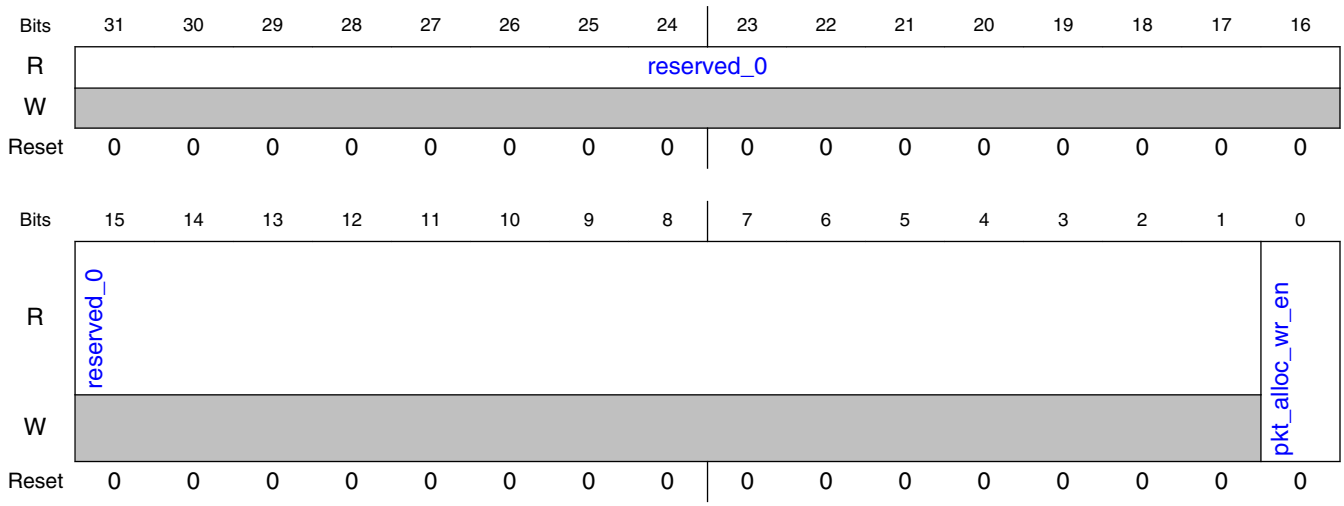
Field	Function
31-18 reserved_1	
17 active_idle_type	Indicates in which mode the SDP will be sent. Indicates in which mode the SDP will be sent. 0- no_video mode, 1- video mode
16 type_valid	1 for valid, 0 for nonvalid
15-8 packet_type	8-bit value of the packet type
7-4 reserved_0	
3-0 pkt_alloc_address	Address of the register in the source allocation table

13.4.10.1.349 Enable bit for writing to the allocation table (SOURCE_PIF_PKT_ALLOC_WR_EN)

13.4.10.1.349.1 Offset

Register	Offset
SOURCE_PIF_PKT_ALLOC_WR_EN	3_0830h

13.4.10.1.349.2 Diagram



13.4.10.1.349.3 Fields

Field	Function
31-1 reserved_0	
0 pkt_alloc_wr_en	Enable bit for writing to the allocation table, active high

13.4.10.1.350 Software reset. (SOURCE_PIF_SW_RESET)

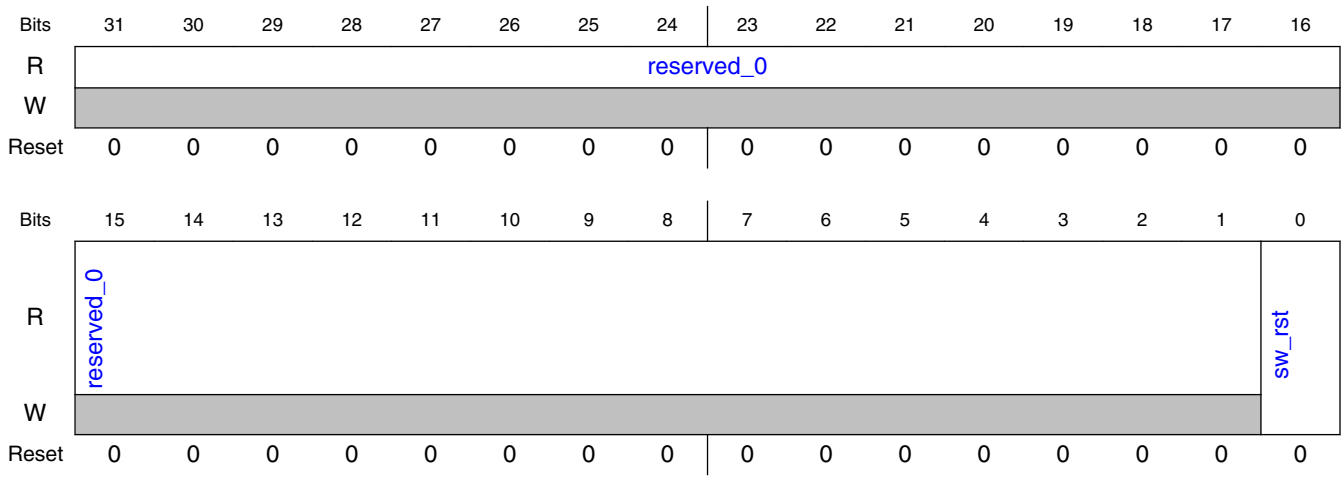
13.4.10.1.350.1 Offset

Register	Offset
SOURCE_PIF_SW_RESET	3_0834h

13.4.10.1.350.2 Function

Software reset.

13.4.10.1.350.3 Diagram



13.4.10.1.350.4 Fields

Field	Function
31-1 reserved_0	
0 sw_rst	Software reset, active high. Software reset, active high. Bit is automaticaly cleared when operation is completed.

13.4.10.1.351 Contains the revision information of the HDCP Cipher module (HDCP_REVISION)

13.4.10.1.351.1 Offset

Register	Offset
HDCP_REVISION	6_0000h

13.4.10.1.351.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	reg_file_rev								hdcp_22_rev							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	hdcp_14_rev								top_hdcp_rev							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

13.4.10.1.351.3 Fields

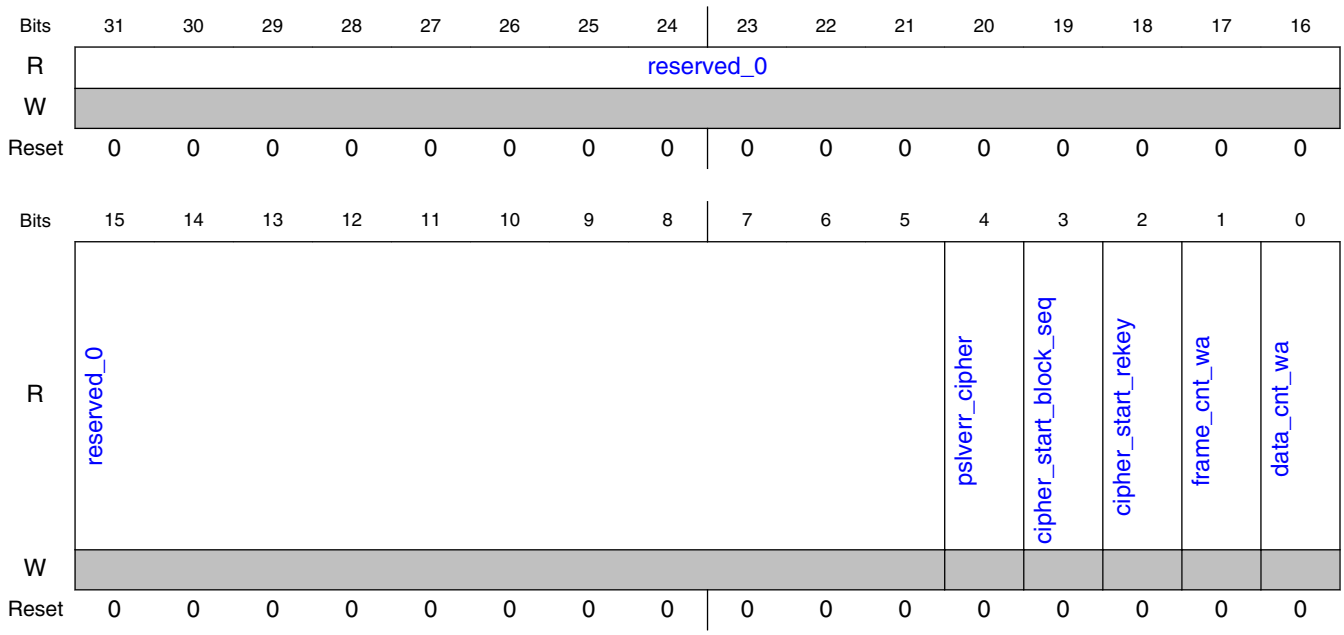
Field	Function
31-24 reg_file_rev	Revision number for the register file
23-16 hdcp_22_rev	Revision number for the HDCP 2. Revision number for the HDCP 2.2 engine
15-8 hdcp_14_rev	Revision number for the HDCP 1. Revision number for the HDCP 1.4 engine
7-0 top_hdcp_rev	Revision number for the top level RTL code

13.4.10.1.352 Contains the status of the HDCP Cipher interrupt sources (INTERRUPT_SOURCE)

13.4.10.1.352.1 Offset

Register	Offset
INTERRUPT_SOURCE	6_0004h

13.4.10.1.352.2 Diagram



13.4.10.1.352.3 Fields

Field	Function
31-5 reserved_0	Reserved Reserved. Writes are ignored. 0x0 when read
4 pslverr_cipher	APB slave error from Cipher module. APB slave error from Cipher module. Generated when APB address is out of the range
3 cipher_start_block_seq	Block start event
2 cipher_start_rekey	Start rekey event
1 frame_cnt_wa	Frame counter wraparound event. Frame counter wraparound event. Active high
0 data_cnt_wa	Data counter wraparound event. Data counter wraparound event. Active high

13.4.10.1.353 Contains the mask vector of the HDCP Cipher interrupt sources. (INTERRUPT_MASK)

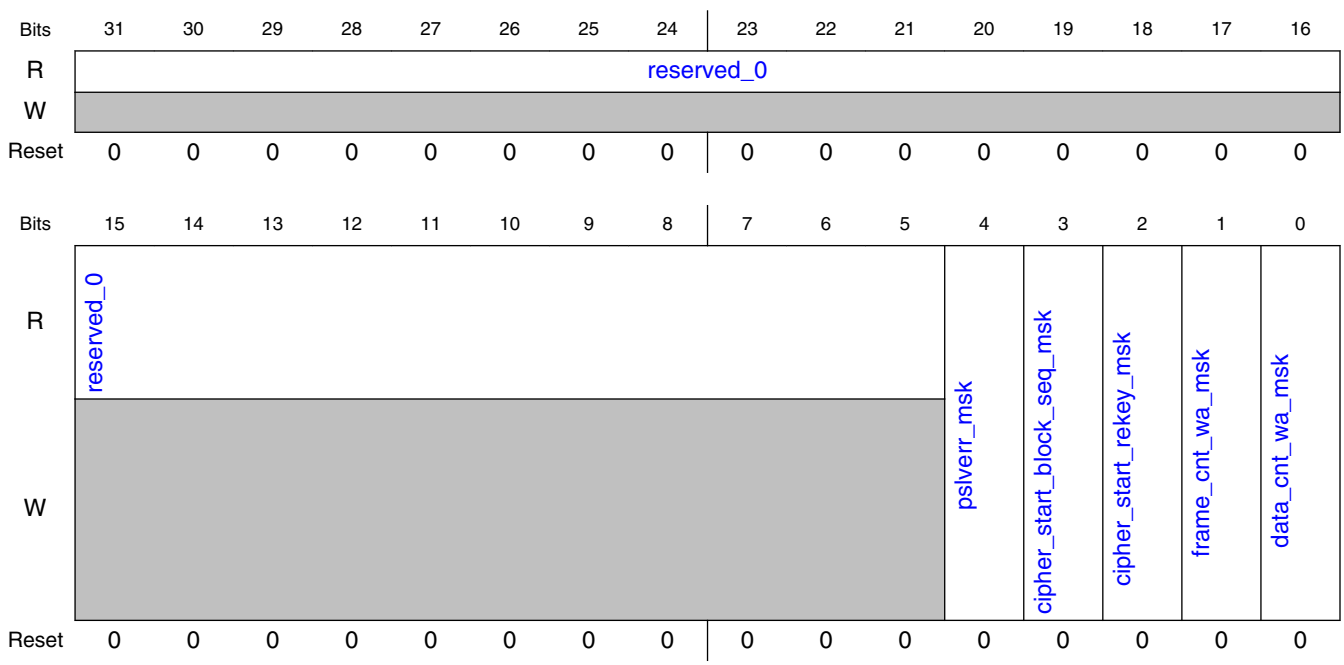
13.4.10.1.353.1 Offset

Register	Offset
INTERRUPT_MASK	6_0008h

13.4.10.1.353.2 Function

Contains the mask vector of the HDCP Cipher interrupt sources.

13.4.10.1.353.3 Diagram



13.4.10.1.353.4 Fields

Field	Function
31-5 reserved_0	Reserved Reserved. Writes are ignored. 0x0 when read
4 pslverr_msk	Set to 1 to mask the pslverr_cipher interrupt
3 cipher_start_block_seq_msk	Set to 1 mask the BLOCK_START interrupt
2	Set to 1 mask the START_REKEY interrupt

Table continues on the next page...

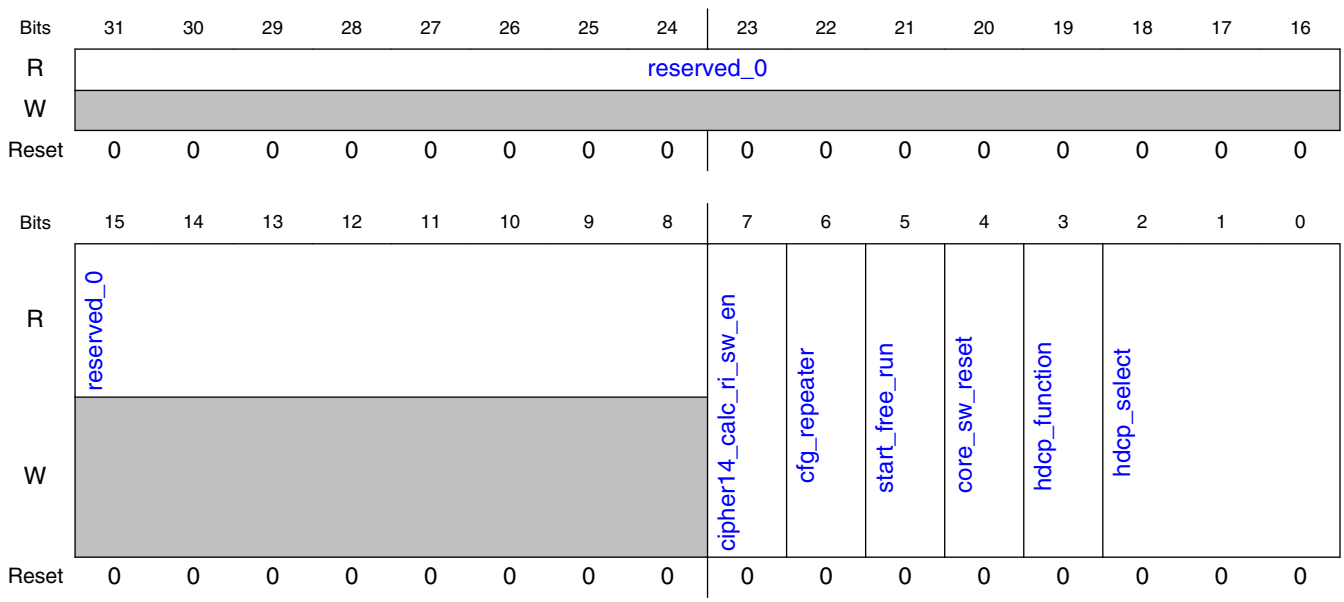
Field	Function
cipher_start_rekey_msk	
1 frame_cnt_wa_msk	Set to 1 mask the FRAME_COUNT_WA interrupt
0 data_cnt_wa_msk	Set to 1 mask the DATA_COUNT_WA interrupt

13.4.10.1.354 Contains the configuration details for the Cipher core module (HDCP_CIPHER_CONFIG)

13.4.10.1.354.1 Offset

Register	Offset
HDCP_CIPHER_CONFIG	6_000Ch

13.4.10.1.354.2 Diagram



13.4.10.1.354.3 Fields

Field	Function
31-8 reserved_0	Reserved Reserved. Writes are ignored. 0x0 when read
7 cipher14_calc_ri_sw_en	For RX; calculate Ri
6 cfg_repeater	HDCP Repeater capability bit : 0 connection from receiver. HDCP Repeater capability bit : 0 connection from receiver. HDCP receiver is not an HDCP repeater,1 connection from repeater. HDCP receiver is an HDCP repeater
5 start_free_run	Cipher 1. Cipher 1.4 command to start free running enable for operation hdcpRngCipher
4 core_sw_reset	Software reset signal for the Cipher core. Software reset signal for the Cipher core. Active high
3 hdcp_function	Selects the HDCP function performed. Selects the HDCP function performed.- 0x0 - Transmitter- 0x1 - Receiver
2-0 hdcp_select	Selects the HDCP core version support. Selects the HDCP core version support.- 0x0 - HDCP 1.4- 0x1 - HDCP 2.2- Other: Reserved

13.4.10.1.355 Holds the least significant 32-bits word of the 128-bits input key word of the AES-128 module (AES_128_KEY_0)

13.4.10.1.355.1 Offset

Register	Offset
AES_128_KEY_0	6_0010h

13.4.10.1.355.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	aes_128_key_0

13.4.10.1.361.3 Fields

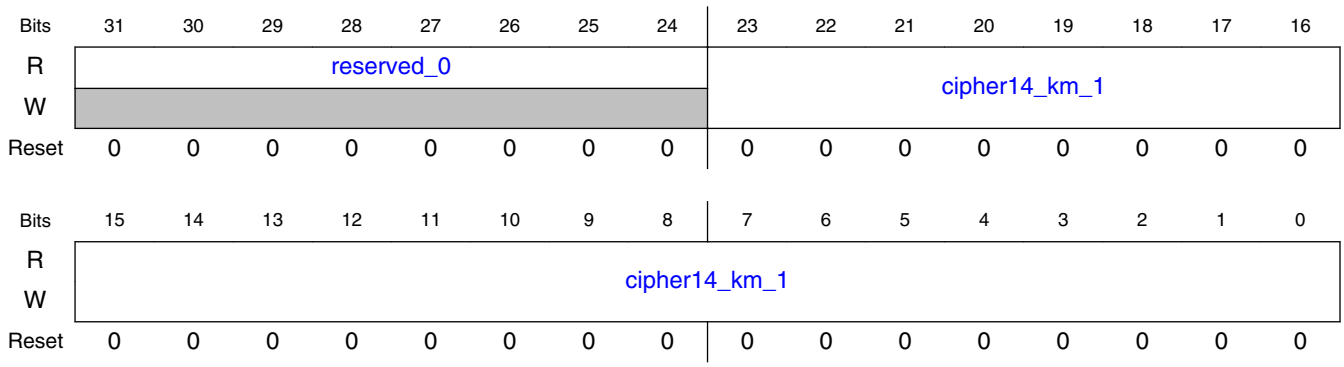
Field	Function
31-0 cipher14_km_0	Holds the first word of the Km value

13.4.10.1.362 Holds the most significant 3 bytes of the Km value (CIPHER14_KM_1)

13.4.10.1.362.1 Offset

Register	Offset
CIPHER14_KM_1	6_002Ch

13.4.10.1.362.2 Diagram



13.4.10.1.362.3 Fields

Field	Function
31-24 reserved_0	Reserved Reserved. Writes are ignored. 0x0 when read
23-0 cipher14_km_1	Holds the most significant 3 bytes of the Km value

13.4.10.1.363 Cipher 1. (CIPHER14_STATUS)

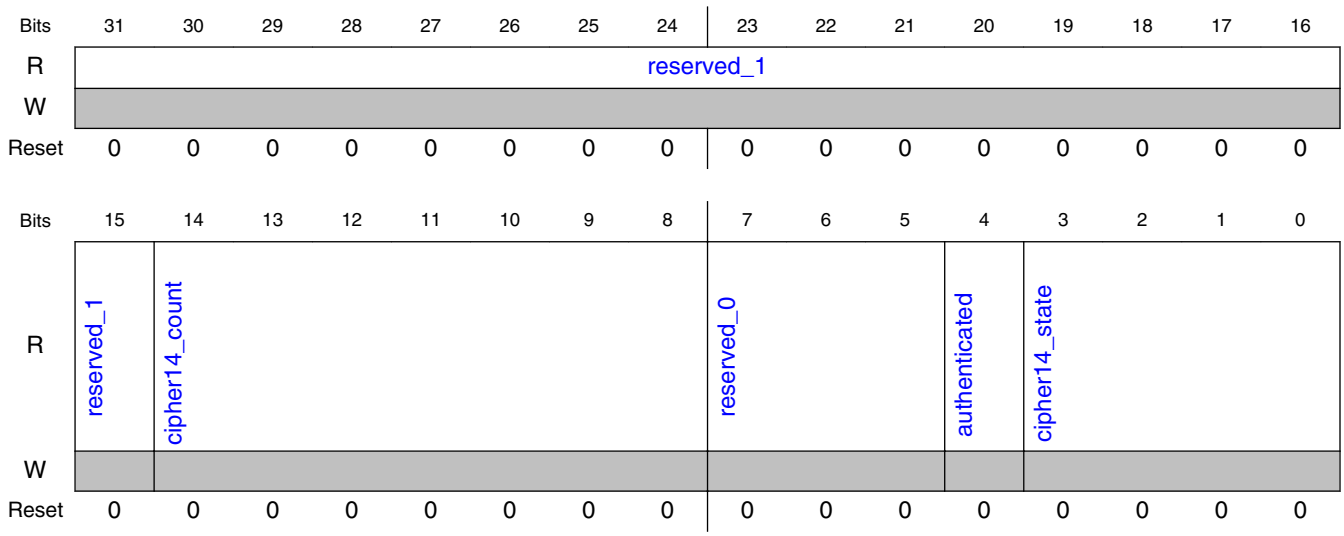
13.4.10.1.363.1 Offset

Register	Offset
CIPHER14_STATUS	6_0030h

13.4.10.1.363.2 Function

Cipher 1.4 status register

13.4.10.1.363.3 Diagram



13.4.10.1.363.4 Fields

Field	Function
31-15 reserved_1	Reserved Reserved. Writes are ignored. 0x0 when read
14-8 cipher14_count	Cipher 1. Cipher 1.4 counter output status.
7-5 reserved_0	Reserved Reserved. Writes are ignored. 0x0 when read
4 authenticated	Authenticated status bit. Authenticated status bit.Set to 1 when first block starts generating R0
3-0 cipher14_state	Current state for Cipher FSM. Current state for Cipher FSM.Possible values:0001 - HDCPRNGCIPHER,0010 - HDCPBLOCKCIPHER, 0100 - HDCPSTREAMCIPHER state,1000 - HDCPREKEYCIPHER

13.4.10.1.364 Cipher 1. (CIPHER14_RI_PJ_STATUS)

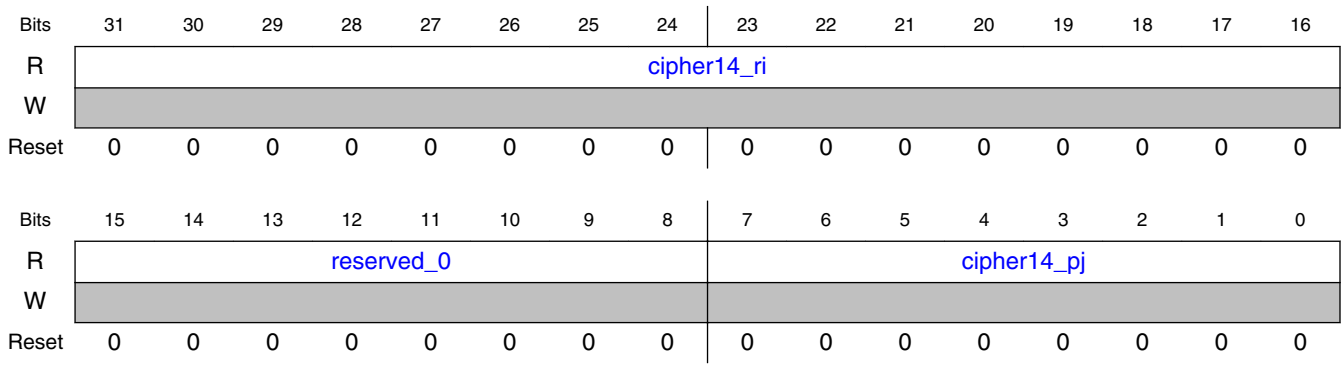
13.4.10.1.364.1 Offset

Register	Offset
CIPHER14_RI_PJ_STATUS	6_0034h

13.4.10.1.364.2 Function

Cipher 1.4 status register for Ri and Pj values

13.4.10.1.364.3 Diagram



13.4.10.1.364.4 Fields

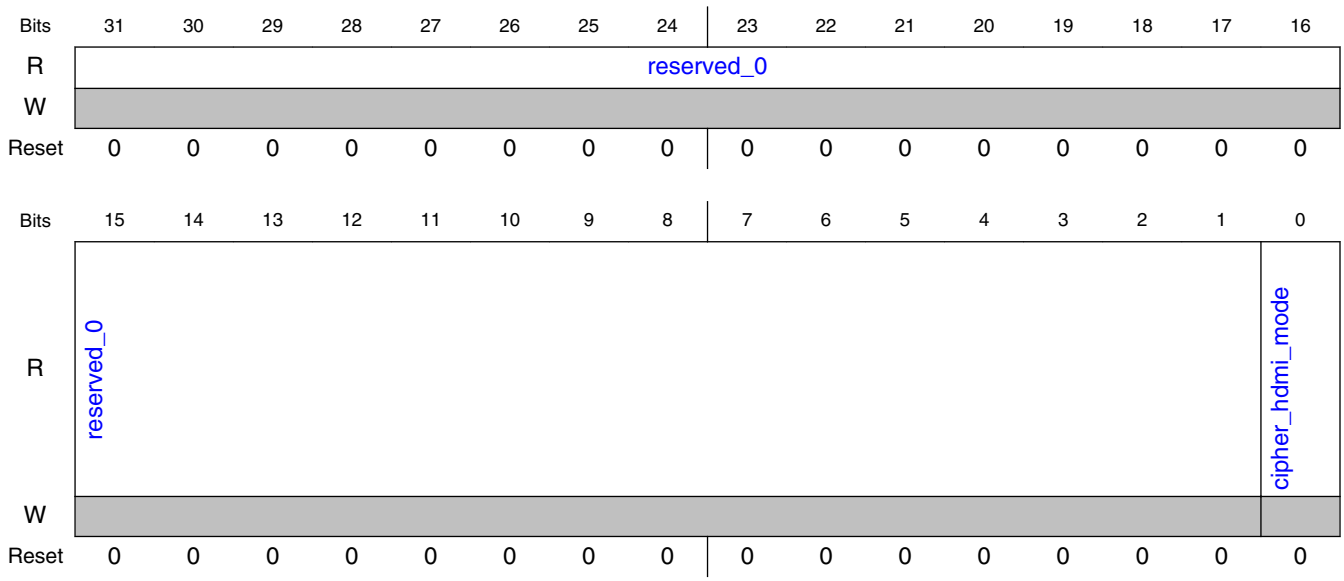
Field	Function
31-16 cipher14_ri	HDCP 1. HDCP 1.4 Ri data.
15-8 reserved_0	Reserved Reserved. Writes are ignored. 0x0 when read
7-0 cipher14_pj	HDCP 1. HDCP 1.4 Pj data.

13.4.10.1.365 Cipher mode status register (CIPHER_MODE)

13.4.10.1.365.1 Offset

Register	Offset
CIPHER_MODE	6_0038h

13.4.10.1.365.2 Diagram



13.4.10.1.365.3 Fields

Field	Function
31-1 reserved_0	Reserved Reserved. Writes are ignored. 0x0 when read
0 cipher_hdmi_mode	HDMI mode status (input cipher_hdmi_mode). HDMI mode status (input cipher_hdmi_mode).When 1 - HDMI -When 0 - DVI

13.4.10.1.366 Holds the First word of An value generated by hdcpRngCipher operation. (CIPHER14_AN_0)

13.4.10.1.366.1 Offset

Register	Offset
CIPHER14_AN_0	6_003Ch

13.4.10.1.366.2 Function

Holds the First word of An value generated by hdcpRngCipher operation.

13.4.10.1.366.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

13.4.10.1.367.3 Fields

Field	Function
31-0 cipher14_an_1	Holds the second word of An value generated by hdcpRngCipher operation

13.4.10.1.368 HDCP2. (CIPHER22_AUTH)

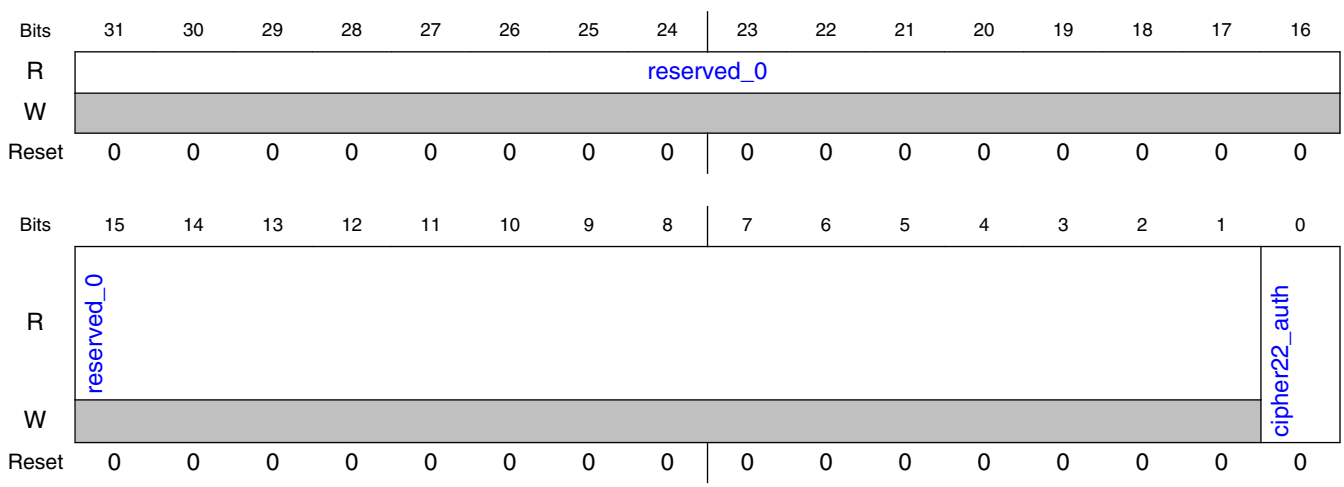
13.4.10.1.368.1 Offset

Register	Offset
CIPHER22_AUTH	6_0044h

13.4.10.1.368.2 Function

HDCP2.2 authentication status register. Set to 1 by firmware when authentication is finished successfuly. Cleared by FW when Sink is not authenticated (start of operation, Sink disconnection, authentication restart).

13.4.10.1.368.3 Diagram



13.4.10.1.368.4 Fields

Field	Function
31-1	Reserved

Table continues on the next page...

Field	Function
reserved_0	Reserved. Writes are ignored. 0x0 when read
0 cipher22_auth	Cipher 2. Cipher 2.2 authentication status. 1 - authenticated, 0 - not authenticated

13.4.10.1.369 This register contains Ri value in A5: Link Integrity Check state [HDCP 1. (CIPHER14_R0_DP_STATUS)

13.4.10.1.369.1 Offset

Register	Offset
CIPHER14_R0_DP_STATUS	6_0048h

13.4.10.1.369.2 Function

This register contains Ri value in A5: Link Integrity Check state [HDCP 1.4]

13.4.10.1.369.3 Diagram
