

Vulkan[®] 1.3.301 - A Specification (with all registered extensions)

The Khronos[®] Vulkan Working Group

Version 1.3.301, 2024-11-01 15:31:09Z: from git branch: github-main commit:
d095b206f80dc85140898a7979b2c3bb81aeb7f9

Table of Contents

1. Preamble	1
2. Introduction	3
2.1. Document Conventions	3
3. Fundamentals	6
3.1. Host and Device Environment	6
3.2. Execution Model	6
3.3. Object Model	8
3.4. Application Binary Interface	12
3.5. Command Syntax and Duration	13
3.6. Threading Behavior	16
3.7. Valid Usage	38
3.8. VkResult Return Codes	44
3.9. Numeric Representation and Computation	50
3.10. Fixed-Point Data Conversions	52
3.11. String Representation	53
3.12. Common Object Types	54
3.13. API Name Aliases	106
4. Initialization	108
4.1. Command Function Pointers	108
4.2. Instances	111
5. Devices and Queues	128
5.1. Physical Devices	128
5.2. Devices	178
5.3. Queues	203
6. Command Buffers	214
6.1. Command Buffer Lifecycle	214
6.2. Command Pools	216
6.3. Command Buffer Allocation and Management	223
6.4. Command Buffer Recording	228
6.5. Command Buffer Submission	243
6.6. Queue Forward Progress	270
6.7. Secondary Command Buffer Execution	271
6.8. Nested Command Buffers	279
6.9. Command Buffer Device Mask	280
7. Synchronization and Cache Control	283
7.1. Execution and Memory Dependencies	283
7.2. Implicit Synchronization Guarantees	320
7.3. Fences	322

7.4. Semaphores	348
7.5. Events	383
7.6. Pipeline Barriers	410
7.7. Memory Barriers	422
7.8. Wait Idle Operations	481
7.9. Host Write Ordering Guarantees	483
7.10. Synchronization and Multiple Physical Devices	483
7.11. Calibrated Timestamps	484
8. Render Pass	488
8.1. Render Pass Objects	516
8.2. Render Pass Creation	518
8.3. Render Pass Compatibility	586
8.4. Framebuffers	587
8.5. Render Pass Load Operations	600
8.6. Render Pass Store Operations	601
8.7. Render Pass Multisample Resolve Operations	602
8.8. Render Pass Commands	605
8.9. Render Pass Creation Feedback	638
8.10. Common Render Pass Data Races (Informative)	641
9. Shaders	644
9.1. Shader Objects	644
9.2. Shader Modules	668
9.3. Shader Module Identifiers	673
9.4. Binding Shaders	676
9.5. Shader Execution	677
9.6. Shader Memory Access Ordering	677
9.7. Shader Inputs and Outputs	678
9.8. Task Shaders	678
9.9. Mesh Shaders	679
9.10. Cluster Culling Shaders	680
9.11. Vertex Shaders	680
9.12. Tessellation Control Shaders	681
9.13. Tessellation Evaluation Shaders	683
9.14. Geometry Shaders	683
9.15. Fragment Shaders	683
9.16. Compute Shaders	683
9.17. Ray Generation Shaders	684
9.18. Intersection Shaders	684
9.19. Any-Hit Shaders	684
9.20. Closest Hit Shaders	685
9.21. Miss Shaders	685

9.22. Callable Shaders	685
9.23. Interpolation Decorations	685
9.24. Static Use	686
9.25. Scope	686
9.26. Group Operations	691
9.27. Quad Group Operations	693
9.28. Derivative Operations	693
9.29. Helper Invocations	695
9.30. Cooperative Matrices	696
9.31. Validation Cache	705
9.32. CUDA Modules	712
10. Pipelines	720
10.1. Multiple Pipeline Creation	722
10.2. Compute Pipelines	722
10.3. Graphics Pipelines	747
10.4. Ray Tracing Pipelines	823
10.5. Pipeline Destruction	851
10.6. Pipeline Derivatives	852
10.7. Pipeline Cache	853
10.8. Pipeline Binaries	861
10.9. Specialization Constants	874
10.10. Pipeline Libraries	877
10.11. Pipeline Binding	879
10.12. Dynamic State	884
10.13. Pipeline Properties and Shader Information	885
10.14. Pipeline Compiler Control	899
10.15. Pipeline Creation Feedback	900
11. Memory Allocation	904
11.1. Host Memory	904
11.2. Device Memory	911
12. Resource Creation	1022
12.1. Buffers	1022
12.2. Buffer Views	1041
12.3. Images	1046
12.4. Image Layouts	1103
12.5. Image Views	1109
12.6. Acceleration Structures	1138
12.7. Micromaps	1170
12.8. Resource Memory Association	1178
12.9. Resource Sharing Mode	1217
12.10. Memory Aliasing	1219

12.11. Buffer Collections	1221
13. Samplers	1238
13.1. Sampler Y'C _B C _R Conversion	1253
14. Resource Descriptors	1267
14.1. Descriptor Types	1267
14.2. Descriptor Sets	1273
14.3. Physical Storage Buffer Access	1377
14.4. Descriptor Buffers	1381
15. Shader Interfaces	1419
15.1. Shader Input and Output Interfaces	1419
15.2. Vertex Input Interface	1423
15.3. Fragment Output Interface	1423
15.4. Legacy Dithering	1427
15.5. Fragment Tile Image Interface	1428
15.6. Fragment Input Attachment Interface	1428
15.7. Ray Tracing Pipeline Interface	1433
15.8. Shader Resource Interface	1434
15.9. Built-In Variables	1443
16. Image Operations	1497
16.1. Image Operations Overview	1497
16.2. Conversion Formulas	1502
16.3. Texel Input Operations	1503
16.4. Texel Output Operations	1522
16.5. Normalized Texel Coordinate Operations	1523
16.6. Unnormalized Texel Coordinate Operations	1530
16.7. Integer Texel Coordinate Operations	1532
16.8. Image Sample Operations	1533
16.9. Texel Footprint Evaluation	1539
16.10. Weight Image Sampling	1542
16.11. Block Matching	1547
16.12. Box Filter Sampling	1551
16.13. Image Operation Steps	1554
16.14. Image Query Instructions	1554
17. Fragment Density Map Operations	1556
17.1. Fragment Density Map Operations Overview	1556
17.2. Fetch Density Value	1556
17.3. Fragment Area Conversion	1557
18. Queries	1559
18.1. Query Pools	1559
18.2. Query Operation	1567
18.3. Occlusion Queries	1596

18.4. Pipeline Statistics Queries	1596
18.5. Timestamp Queries	1599
18.6. Performance Queries	1606
18.7. Transform Feedback Queries	1610
18.8. Primitives Generated Queries	1610
18.9. Mesh Shader Queries	1611
18.10. Intel Performance Queries	1611
18.11. Result Status Queries	1625
18.12. Video Encode Feedback Queries	1626
19. Clear Commands	1628
19.1. Clearing Images Outside a Render Pass Instance	1628
19.2. Clearing Images Inside a Render Pass Instance	1634
19.3. Clear Values	1638
19.4. Filling Buffers	1640
19.5. Updating Buffers	1642
20. Copy Commands	1645
20.1. Copying Data Between Buffers	1645
20.2. Copying Data Between Images	1652
20.3. Copying Data Between Buffers and Images	1671
20.4. Indirect Copies	1727
20.5. Image Copies With Scaling	1733
20.6. Resolving Multisample Images	1752
20.7. Buffer Markers	1765
21. Drawing Commands	1771
21.1. Primitive Topologies	1774
21.2. Primitive Order	1785
21.3. Programmable Primitive Shading	1786
21.4. Conditional Rendering	2194
21.5. Programmable Mesh Shading	2198
21.6. Programmable Cluster Culling Shading	2455
22. Fixed-Function Vertex Processing	2540
22.1. Vertex Attributes	2540
22.2. Vertex Input Description	2544
22.3. Vertex Attribute Divisor in Instanced Rendering	2557
22.4. Vertex Input Address Calculation	2559
23. Tessellation	2562
23.1. Tessellator	2562
23.2. Tessellator Patch Discard	2565
23.3. Tessellator Spacing	2566
23.4. Tessellation Primitive Ordering	2566
23.5. Tessellator Vertex Winding Order	2567

23.6. Triangle Tessellation	2567
23.7. Quad Tessellation	2569
23.8. Isoline Tessellation	2571
23.9. Tessellation Point Mode	2571
23.10. Tessellation Pipeline State	2571
24. Geometry Shading	2576
24.1. Geometry Shader Input Primitives	2576
24.2. Geometry Shader Output Primitives	2577
24.3. Multiple Invocations of Geometry Shaders	2577
24.4. Geometry Shader Primitive Ordering	2577
24.5. Geometry Shader Passthrough	2577
25. Mesh Shading	2580
25.1. Task Shader Input	2580
25.2. Task Shader Output	2580
25.3. Mesh Generation	2580
25.4. Mesh Shader Input	2580
25.5. Mesh Shader Output	2581
25.6. Mesh Shader Per-View Outputs	2582
25.7. Mesh Shader Primitive Ordering	2582
26. Cluster Culling Shading	2583
26.1. Cluster Culling Shader Input	2583
26.2. Cluster Culling Shader Output	2583
26.3. Cluster Culling Shader Cluster Ordering	2583
26.4. Cluster Culling Shader Primitive Ordering	2584
27. Fixed-Function Vertex Post-Processing	2585
27.1. Transform Feedback	2585
27.2. Viewport Swizzle	2594
27.3. Flat Shading	2598
27.4. Primitive Clipping	2601
27.5. Clipping Shader Outputs	2608
27.6. Controlling Viewport W Scaling	2609
27.7. Coordinate Transformations	2613
27.8. Render Pass Transform	2613
27.9. Controlling the Viewport	2614
28. Rasterization	2625
28.1. Discarding Primitives Before Rasterization	2630
28.2. Controlling the Vertex Stream Used for Rasterization	2632
28.3. Rasterization Order	2635
28.4. Multisampling	2636
28.5. Custom Sample Locations	2642
28.6. Fragment Shading Rates	2647

28.7. Shading Rate Image	2661
28.8. Sample Shading	2676
28.9. Barycentric Interpolation	2677
28.10. Points	2679
28.11. Line Segments	2680
28.12. Polygons	2693
29. Fragment Operations	2716
29.1. Discard Rectangles Test	2718
29.2. Scissor Test	2724
29.3. Exclusive Scissor Test	2726
29.4. Sample Mask Test	2731
29.5. Fragment Shading	2733
29.6. Multisample Coverage	2737
29.7. Depth and Stencil Operations	2740
29.8. Depth Bounds Test	2744
29.9. Stencil Test	2747
29.10. Depth Test	2757
29.11. Representative Fragment Test	2766
29.12. Sample Counting	2768
29.13. Fragment Coverage to Color	2768
29.14. Coverage Reduction	2772
30. The Framebuffer	2785
30.1. Blending	2785
30.2. Logical Operations	2814
30.3. Color Write Mask	2819
30.4. Color Write Enable	2820
30.5. Framebuffer Query Instructions	2822
31. Dispatching Commands	2825
31.1. Dispatch Command for CUDA PTX Kernels	2861
32. Device-Generated Commands	2867
32.1. Indirect Commands Layout	2867
32.2. Indirect Commands Generation and Execution	2904
33. Sparse Resources	3027
33.1. Sparse Resource Features	3027
33.2. Sparse Buffers and Fully-Resident Images	3028
33.3. Sparse Partially-Resident Buffers	3029
33.4. Sparse Partially-Resident Images	3029
33.5. Sparse Memory Aliasing	3037
33.6. Sparse Resource Implementation Guidelines (Informative)	3038
33.7. Sparse Resource API	3039
34. Window System Integration (WSI)	3067

34.1. WSI Platform	3067
34.2. WSI Surface	3067
34.3. Presenting Directly to Display Devices	3097
34.4. Querying for WSI Support	3128
34.5. Surface Queries	3135
34.6. Full Screen Exclusive Control	3168
34.7. Device Group Queries	3170
34.8. Display Timing Queries	3176
34.9. Present Wait	3182
34.10. WSI Swapchain	3182
34.11. HDR Metadata	3237
34.12. Lag Control	3240
34.13. Present Barrier	3254
35. Deferred Host Operations	3256
35.1. Requesting Deferral	3256
35.2. Deferred Host Operations API	3257
36. Private Data	3263
37. Acceleration Structures	3270
37.1. Acceleration Structures	3270
37.2. Host Acceleration Structure Operations	3337
38. Micromap	3353
38.1. Micromaps	3353
38.2. Host Micromap Operations	3373
39. Ray Traversal	3386
39.1. Ray Intersection Candidate Determination	3386
39.2. Ray Intersection Culling	3389
39.3. Ray Intersection Confirmation	3393
39.4. Ray Closest Hit Determination	3395
39.5. Ray Result Determination	3395
40. Ray Tracing	3397
40.1. Shader Call Instructions	3397
40.2. Ray Tracing Commands	3399
40.3. Shader Binding Table	3450
40.4. Ray Tracing Pipeline Stack	3453
40.5. Ray Tracing Capture Replay	3454
40.6. Ray Tracing Validation	3454
41. Memory Decompression	3455
42. Video Coding	3461
42.1. Video Picture Resources	3461
42.2. Decoded Picture Buffer	3463
42.3. Video Profiles	3465

42.4. Video Capabilities	3475
42.5. Video Sessions	3484
42.6. Video Profile Compatibility	3496
42.7. Video Session Parameters	3498
42.8. Video Coding Scope	3518
42.9. Video Coding Control	3528
42.10. Inline Queries	3532
42.11. Video Decode Operations	3533
42.12. H.264 Decode Operations	3550
42.13. H.265 Decode Operations	3563
42.14. AV1 Decode Operations	3577
42.15. Video Encode Operations	3588
42.16. Video Encode Rate Control	3617
42.17. H.264 Encode Operations	3626
42.18. H.265 Encode Operations	3659
43. Optical Flow	3700
43.1. Optical Flow Queues	3700
43.2. Optical Flow Image Formats	3700
43.3. Optical Flow Session	3703
44. Execution Graphs	3716
44.1. Pipeline Creation	3716
44.2. Initializing Scratch Memory	3725
44.3. Dispatching a Graph	3728
44.4. Shader Enqueue	3760
45. Extending Vulkan	3763
45.1. Instance and Device Functionality	3763
45.2. Core Versions	3763
45.3. Layers	3767
45.4. Extensions	3771
45.5. Extension Dependencies	3775
45.6. Compatibility Guarantees (Informative)	3776
46. Features	3781
46.1. Feature Requirements	3958
46.2. Profile Features	3967
47. Limits	3970
47.1. Limit Requirements	4066
47.2. Additional Multisampling Capabilities	4094
47.3. Profile Limits	4095
48. Formats	4098
48.1. Format Definition	4098
48.2. Format Properties	4150

48.3. Required Format Support	4171
49. Additional Capabilities	4193
49.1. Additional Image Capabilities	4193
49.2. Additional Buffer Capabilities	4220
49.3. Optional Semaphore Capabilities	4223
49.4. Optional Fence Capabilities	4229
49.5. Timestamp Calibration Capabilities	4235
50. Debugging	4237
50.1. Debug Utilities	4240
50.2. Debug Markers	4264
50.3. Debug Report Callbacks	4272
50.4. Device Loss Debugging	4280
50.5. Active Tooling Information	4292
50.6. Frame Boundary	4296
Appendix A: Vulkan Environment for SPIR-V	4299
Versions and Formats	4299
Capabilities	4299
Validation Rules Within a Module	4315
Precision and Operation of SPIR-V Instructions	4350
Signedness of SPIR-V Image Accesses	4356
Image Format and Type Matching	4356
Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types	4358
Compatibility Between SPIR-V Image Formats and Vulkan Formats	4359
Ray Query Precision and Operation	4360
Appendix B: Memory Model	4361
Agent	4361
Memory Location	4361
Allocation	4361
Memory Operation	4362
Reference	4362
Program-Order	4362
Shader Call Related	4363
Shader Call Order	4363
Scope	4363
Atomic Operation	4364
Scoped Modification Order	4364
Memory Semantics	4365
Release Sequence	4366
Synchronizes-With	4366
System-Synchronizes-With	4368
Private vs. Non-Private	4369

Inter-Thread-Happens-Before	4369
Happens-Before	4370
Availability and Visibility	4370
Availability, Visibility, and Domain Operations	4372
Availability and Visibility Semantics	4373
Per-Instruction Availability and Visibility Semantics	4373
Location-Ordered	4374
Data Race	4375
Visible-To	4375
Acyclicity	4375
Shader I/O	4376
Deallocation	4376
Descriptions (Informative)	4377
Tessellation Output Ordering	4377
Cooperative Matrix Memory Access	4378
Appendix C: Compressed Image Formats	4379
Block-Compressed Image Formats	4380
ETC Compressed Image Formats	4381
ASTC Compressed Image Formats	4382
PVRTC Compressed Image Formats	4384
Appendix D: Core Revisions (Informative)	4385
Vulkan Version 1.3	4385
Vulkan Version 1.2	4394
Vulkan Version 1.1	4402
Vulkan Version 1.0	4413
Appendix E: Layers & Extensions (Informative)	4428
Extension Dependencies	4428
Extension Interactions	4428
List of Current Extensions	4429
List of Provisional Extensions	5139
List of Deprecated Extensions	5149

Chapter 1. Preamble

Copyright 2014-2024 The Khronos Group Inc.

This Specification is protected by copyright laws and contains material proprietary to Khronos. Except as described by these terms, it or any components may not be reproduced, republished, distributed, transmitted, displayed, broadcast or otherwise exploited in any manner without the express prior written permission of Khronos.

Khronos grants a conditional copyright license to use and reproduce the unmodified Specification for any purpose, without fee or royalty, EXCEPT no licenses to any patent, trademark or other intellectual property rights are granted under these terms.

Khronos makes no, and expressly disclaims any, representations or warranties, express or implied, regarding this Specification, including, without limitation: merchantability, fitness for a particular purpose, non-infringement of any intellectual property, correctness, accuracy, completeness, timeliness, and reliability. Under no circumstances will Khronos, or any of its Promoters, Contributors or Members, or their respective partners, officers, directors, employees, agents or representatives be liable for any damages, whether direct, indirect, special or consequential damages for lost revenues, lost profits, or otherwise, arising from or in connection with these materials.

This document contains extensions which are not ratified by Khronos, and as such is not a ratified Specification, though it contains text from (and is a superset of) the ratified Vulkan Specification. The ratified versions of the Vulkan Specification can be found at <https://registry.khronos.org/vulkan/specs/1.3/html/vkspec.html> (core only) and <https://registry.khronos.org/vulkan/specs/1.3-khr-extensions/html/vkspec.html> (core with all ratified extensions) .

This Specification contains substantially unmodified functionality from, and is a successor to, Khronos specifications including OpenGL, OpenGL ES and OpenCL.

The Khronos Intellectual Property Rights Policy defines the terms 'Scope', 'Compliant Portion', and 'Necessary Patent Claims'.

Some parts of this Specification are purely informative and so are EXCLUDED the Scope of this Specification. The [Document Conventions](#) section of the [Introduction](#) defines how these parts of the Specification are identified.

Where this Specification uses [technical terminology](#), defined in the [Glossary](#) or otherwise, that refer to enabling technologies that are not expressly set forth in this Specification, those enabling technologies are EXCLUDED from the Scope of this Specification. For clarity, enabling technologies not disclosed with particularity in this Specification (e.g. semiconductor manufacturing technology, hardware architecture, processor architecture or microarchitecture, memory architecture, compiler technology, object oriented technology, basic operating system technology, compression technology, algorithms, and so on) are NOT to be considered expressly set forth; only those application program interfaces and data structures disclosed with particularity are included in the Scope of this Specification.

For purposes of the Khronos Intellectual Property Rights Policy as it relates to the definition of

Necessary Patent Claims, all recommended or optional features, behaviors and functionality set forth in this Specification, if implemented, are considered to be included as Compliant Portions.

Where this Specification identifies specific sections of external references, only those specifically identified sections define [normative](#) functionality. The Khronos Intellectual Property Rights Policy excludes external references to materials and associated enabling technology not created by Khronos from the Scope of this Specification, and any licenses that may be required to implement such referenced materials and associated technologies must be obtained separately and may involve royalty payments.

Khronos and Vulkan are registered trademarks, and SPIR-V is a trademark of The Khronos Group Inc. OpenCL is a trademark of Apple Inc., used under license by Khronos. OpenGL is a registered trademark and the OpenGL ES logo is a trademark of Hewlett Packard Enterprise, used under license by Khronos. ASTC is a trademark of ARM Holdings PLC. All other product names, trademarks, and/or company names are used solely for identification and belong to their respective owners.

Chapter 2. Introduction

This document, referred to as the “Vulkan Specification” or just the “Specification” hereafter, describes the Vulkan Application Programming Interface (API). Vulkan is a [C99](#) API designed for explicit control of low-level graphics and compute functionality.

The canonical version of the Specification is available in the official [Vulkan Registry](https://registry.khronos.org/vulkan/) (<https://registry.khronos.org/vulkan/>). The source files used to generate the Vulkan specification are stored in the [Vulkan Documentation Repository](https://github.com/KhronosGroup/Vulkan-Docs) (<https://github.com/KhronosGroup/Vulkan-Docs>).

The source repository additionally has a public issue tracker and allows the submission of pull requests that improve the specification.

2.1. Document Conventions

The Vulkan specification is intended for use by both implementors of the API and application developers seeking to make use of the API, forming a contract between these parties. Specification text may address either party; typically the intended audience can be inferred from context, though some sections are defined to address only one of these parties. (For example, [Valid Usage](#) sections only address application developers). Any requirements, prohibitions, recommendations or options defined by [normative terminology](#) are imposed only on the audience of that text.

NOTE

Structure and enumerated types defined in extensions that were promoted to core in a later version of Vulkan are now defined in terms of the equivalent Vulkan core interfaces. This affects the Vulkan Specification, the Vulkan header files, and the corresponding XML Registry.

2.1.1. Ratification

Ratification of a Vulkan core version or extension is a status conferred by vote of the Khronos Board of Promoters, bringing that core version or extension under the umbrella of the Khronos IP Policy.

All Vulkan core versions and [KHR](#) extensions (including provisional specifications) are ratified, as are some multi-vendor [EXT](#) extensions. Ratification status of extensions is described in the [Layers & Extensions \(Informative\)](#) appendix.

NOTE

Ratification status is primarily of interest to IHVs developing GPU hardware and Vulkan implementations

For developers, ratification does not necessarily mean that an extension is “better”; has a more stable API; or is more widely supported than alternative ways of achieving that functionality.

Interactions between ratified and non-ratified extensions are not themselves ratified.

2.1.2. Informative Language

Some language in the specification is purely informative, intended to give background or suggestions to implementors or developers.

If an entire chapter or section contains only informative language, its title will be suffixed with “(Informative)”.

All NOTES are implicitly informative.

2.1.3. Normative Terminology

Within this specification, the key words **must**, **required**, **should**, **recommended**, **may**, and **optional** are to be interpreted as described in [RFC 2119 - Key words for use in RFCs to Indicate Requirement Levels](https://www.ietf.org/rfc/rfc2119.txt) (<https://www.ietf.org/rfc/rfc2119.txt>). The additional key word **optionally** is an alternate form of **optional**, for use where grammatically appropriate.

These key words are highlighted in the specification for clarity. In text addressing application developers, their use expresses requirements that apply to application behavior. In text addressing implementors, their use expresses requirements that apply to implementations.

In text addressing application developers, the additional key words **can** and **cannot** are to be interpreted as describing the capabilities of an application, as follows:

can

This word means that the application is able to perform the action described.

cannot

This word means that the API and/or the execution environment provide no mechanism through which the application can express or accomplish the action described.

These key words are never used in text addressing implementors.

NOTE

There is an important distinction between **cannot** and **must not**, as used in this Specification. **Cannot** means something the application literally is unable to express or accomplish through the API, while **must not** means something that the application is capable of expressing through the API, but that the consequences of doing so are undefined and potentially unrecoverable for the implementation (see [Valid Usage](#)).

Unless otherwise noted in the section heading, all sections and appendices in this document are normative.

2.1.4. Technical Terminology

The Vulkan Specification makes use of common engineering and graphics terms such as **Pipeline**, **Shader**, and **Host** to identify and describe Vulkan API constructs and their attributes, states, and behaviors. The [Glossary](#) defines the basic meanings of these terms in the context of the Specification. The Specification text provides fuller definitions of the terms and may elaborate,

extend, or clarify the [Glossary](#) definitions. When a term defined in the [Glossary](#) is used in normative language within the Specification, the definitions within the Specification govern and supersede any meanings the terms may have in other technical contexts (i.e. outside the Specification).

2.1.5. Normative References

References to external documents are considered normative references if the Specification uses any of the normative terms defined in [Normative Terminology](#) to refer to them or their requirements, either as a whole or in part.

The following documents are referenced by normative sections of the specification:

IEEE. August, 2008. *IEEE Standard for Floating-Point Arithmetic*. IEEE Std 754-2008. <https://dx.doi.org/10.1109/IEEESTD.2008.4610935> .

Chapter 3. Fundamentals

This chapter introduces fundamental concepts including the Vulkan architecture and execution model, API syntax, queues, pipeline configurations, numeric representation, state and state queries, and the different types of objects and shaders. It provides a framework for interpreting more specific descriptions of commands and behavior in the remainder of the Specification.

3.1. Host and Device Environment

The Vulkan Specification assumes and requires: the following properties of the host environment with respect to Vulkan implementations:

- The host **must** have runtime support for 8, 16, 32 and 64-bit signed and unsigned twos-complement integers, all addressable at the granularity of their size in bytes.
- The host **must** have runtime support for 32- and 64-bit floating-point types satisfying the range and precision constraints in the [Floating-Point Computation](#) section.
- The representation and endianness of these types on the host **must** match the representation and endianness of the same types on every physical device supported.

NOTE

Since a variety of data types and structures in Vulkan **may** be accessible by both host and physical device operations, the implementation **should** be able to access such data efficiently in both paths in order to facilitate writing portable and performant applications.

3.2. Execution Model

This section outlines the execution model of a Vulkan system.

Vulkan exposes one or more *devices*, each of which exposes one or more *queues* which **may** process work asynchronously to one another. The set of queues supported by a device is partitioned into *families*. Each family supports one or more types of functionality and **may** contain multiple queues with similar characteristics. Queues within a single family are considered *compatible* with one another, and work produced for a family of queues **can** be executed on any queue within that family. This specification defines the following types of functionality that queues **may** support: graphics, compute, video decode, video encode, protected memory management, sparse memory management, and transfer.

NOTE

A single device **may** report multiple similar queue families rather than, or as well as, reporting multiple members of one or more of those families. This indicates that while members of those families have similar capabilities, they are *not* directly compatible with one another.

Device memory is explicitly managed by the application. Each device **may** advertise one or more heaps, representing different areas of memory. Memory heaps are either device-local or host-local, but are always visible to the device. Further detail about memory heaps is exposed via memory types available on that heap. Examples of memory areas that **may** be available on an

implementation include:

- *device-local* is memory that is physically connected to the device.
- *device-local, host visible* is device-local memory that is visible to the host.
- *host-local, host visible* is memory that is local to the host and visible to the device and host.

On other architectures, there **may** only be a single heap that **can** be used for any purpose.

3.2.1. Queue Operation

Vulkan queues provide an interface to the execution engines of a device. Commands for these execution engines are recorded into command buffers ahead of execution time, and then submitted to a queue for execution. Once submitted to a queue, command buffers will begin and complete execution without further application intervention, though the order of this execution is dependent on a number of [implicit and explicit ordering constraints](#).

Work is submitted to queues using *queue submission commands* that typically take the form `vkQueue*` (e.g. `vkQueueSubmit`, `vkQueueBindSparse`), and **can** take a list of semaphores upon which to wait before work begins and a list of semaphores to signal once work has completed. The work itself, as well as signaling and waiting on the semaphores are all *queue operations*. Queue submission commands return control to the application once queue operations have been submitted - they do not wait for completion.

There are no implicit ordering constraints between queue operations on different queues, or between queues and the host, so these **may** operate in any order with respect to each other. Explicit ordering constraints between different queues or with the host **can** be expressed with [semaphores](#) and [fences](#).

Command buffer submissions to a single queue respect [submission order](#) and other [implicit ordering guarantees](#), but otherwise **may** overlap or execute out of order. Other types of batches and queue submissions against a single queue (e.g. [sparse memory binding](#)) have no implicit ordering constraints with any other queue submission or batch. Additional explicit ordering constraints between queue submissions and individual batches can be expressed with [semaphores](#) and [fences](#).

Before a fence or semaphore is signaled, it is guaranteed that any previously submitted queue operations have completed execution, and that memory writes from those queue operations are [available](#) to future queue operations. Waiting on a signaled semaphore or fence guarantees that previous writes that are available are also [visible](#) to subsequent commands.

Command buffer boundaries, both between primary command buffers of the same or different batches or submissions as well as between primary and secondary command buffers, do not introduce any additional ordering constraints. In other words, submitting the set of command buffers (which **can** include executing secondary command buffers) between any semaphore or fence operations execute the recorded commands as if they had all been recorded into a single primary command buffer, except that the current state is [reset](#) on each boundary. Explicit ordering constraints **can** be expressed with [explicit synchronization primitives](#).

There are a few [implicit ordering guarantees](#) between commands within a command buffer, but only covering a subset of execution. Additional explicit ordering constraints can be expressed with

the various [explicit synchronization primitives](#).

NOTE

Implementations have significant freedom to overlap execution of work submitted to a queue, and this is common due to deep pipelining and parallelism in Vulkan devices.

Commands recorded in command buffers can perform actions, set state that persists across commands, synchronize other commands, or indirectly launch other commands, with some commands fulfilling several of these roles. The “Command Properties” section for each such command lists which of these roles the command takes:

Action

Action commands perform operations that can update values in memory. E.g. [draw commands](#), [dispatch commands](#).

State

State setting commands update the current state of a command buffer, affecting the operation of future action commands.

Synchronization

Synchronization commands impose ordering constraints on action commands, by introducing explicit [execution and memory dependencies](#).

Indirection

Indirection commands execute other commands which were not directly recorded in the same command buffer.

NOTE

In the absence of explicit synchronization or [implicit ordering guarantees](#), action commands may overlap execution or execute out of order, potentially leading to data races. However, such reordering does not affect the current state observed by any action command. Each action command uses the state in effect at the point where the command occurs in the command buffer, regardless of when it is executed.

3.3. Object Model

The devices, queues, and other entities in Vulkan are represented by Vulkan objects. At the API level, all objects are referred to by handles. There are two classes of handles, dispatchable and non-dispatchable. *Dispatchable* handle types are a pointer to an opaque type. This pointer **may** be used by layers as part of intercepting API commands, and thus each API command takes a dispatchable type as its first parameter. Each object of a dispatchable type **must** have a unique handle value during its lifetime.

Non-dispatchable handle types are a 64-bit integer type whose meaning is implementation-dependent. If the `privateData` feature is enabled for a [VkDevice](#), each object of a non-dispatchable type created on that device **must** have a handle value that is unique among objects created on that device, for the duration of the object’s lifetime. Otherwise, non-dispatchable handles **may** encode

object information directly in the handle rather than acting as a reference to an underlying object, and thus **may** not have unique handle values. If handle values are not unique, then destroying one such handle **must** not cause identical handles of other types to become invalid, and **must** not cause identical handles of the same type to become invalid if that handle value has been created more times than it has been destroyed.

All objects created or allocated from a `VkDevice` (i.e. with a `VkDevice` as the first parameter) are private to that device, and **must** not be used on other devices.

3.3.1. Object Lifetime

Objects are created or allocated by `vkCreate*` and `vkAllocate*` commands, respectively. Once an object is created or allocated, its “structure” is considered to be immutable, though the contents of certain object types is still free to change. Objects are destroyed or freed by `vkDestroy*` and `vkFree*` commands, respectively.

Objects that are allocated (rather than created) take resources from an existing pool object or memory heap, and when freed return resources to that pool or heap. While object creation and destruction are generally expected to be low-frequency occurrences during runtime, allocating and freeing objects **can** occur at high frequency. Pool objects help accommodate improved performance of the allocations and frees.

It is an application’s responsibility to track the lifetime of Vulkan objects, and not to destroy them while they are still in use.

The ownership of application-owned memory is immediately acquired by any Vulkan command it is passed into. Ownership of such memory **must** be released back to the application at the end of the duration of the command, unless that command was deferred, so that the application **can** alter or free this memory as soon as all the commands that acquired it have returned. If the command was `deferred`, ownership of such memory is released back to the application when the deferred operation is complete.

The following object types are consumed when they are passed into a Vulkan command and not further accessed by the objects they are used to create. They **must** not be destroyed in the duration of any API command they are passed into:

- `VkShaderModule`
- `VkPipelineCache`
- `VkValidationCacheEXT`

A `VkRenderPass` or `VkPipelineLayout` object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into. A `VkRenderPass` used in a command buffer follows the rules described below.

`VkDescriptorSetLayout` objects **may** be accessed by commands that operate on descriptor sets allocated using that layout, and those descriptor sets **must** not be updated with `vkUpdateDescriptorSets` after the descriptor set layout has been destroyed. Otherwise, a `VkDescriptorSetLayout` object is no longer referenced by an API command it is passed into once host execution of that command completes.

The application **must** not destroy any other type of Vulkan object until all uses of that object by the device (such as via command buffer execution) have completed.

The following Vulkan objects **must** not be destroyed while any command buffers using the object are in the [pending state](#):

- [VkEvent](#)
- [VkQueryPool](#)
- [VkBuffer](#)
- [VkBufferView](#)
- [VkImage](#)
- [VkImageView](#)
- [VkPipeline](#)
- [VkSampler](#)
- [VkSamplerYcbcrConversion](#)
- [VkDescriptorPool](#)
- [VkFramebuffer](#)
- [VkRenderPass](#)
- [VkCommandBuffer](#)
- [VkCommandPool](#)
- [VkDeviceMemory](#)
- [VkDescriptorSet](#)
- [VkIndirectCommandsLayoutNV](#)
- [VkIndirectCommandsLayoutEXT](#)
- [VkIndirectExecutionSetEXT](#)
- [VkAccelerationStructureNV](#)
- [VkAccelerationStructureKHR](#)
- [VkVideoSessionKHR](#)
- [VkVideoSessionParametersKHR](#)

Destroying these objects will move any command buffers that are in the [recording or executable state](#), and are using those objects, to the [invalid state](#).

The following Vulkan objects **must** not be destroyed while any queue is executing commands that use the object:

- [VkFence](#)
- [VkSemaphore](#)
- [VkCommandBuffer](#)

- `VkCommandPool`

In general, objects **can** be destroyed or freed in any order, even if the object being freed is involved in the use of another object (e.g. use of a resource in a view, use of a view in a descriptor set, use of a `pipeline library` in another pipeline, use of a `referenced pipeline` for additional graphics shader groups in another pipeline, use of a `referenced object` for additional shader-related states in a set, use of a `bottom level acceleration structure` in an instance referenced by a `top level acceleration structure`, use of an object in a command buffer, binding of a memory allocation to a resource), as long as any object that uses the freed object is not further used in any way except to be destroyed or to be reset in such a way that it no longer uses the other object (such as resetting a command buffer). If the object has been reset, then it **can** be used as if it never used the freed object. An exception to this is when there is a parent/child relationship between objects. In this case, the application **must** not destroy a parent object before its children, except when the parent is explicitly defined to free its children when it is destroyed (e.g. for pool objects, as defined below).

`VkCommandPool` objects are parents of `VkCommandBuffer` objects. `VkDescriptorPool` objects are parents of `VkDescriptorSet` objects. `VkDevice` objects are parents of many object types (all that take a `VkDevice` as a parameter to their creation).

The following Vulkan objects have specific restrictions for when they **can** be destroyed:

- `VkQueue` objects **cannot** be explicitly destroyed. Instead, they are implicitly destroyed when the `VkDevice` object they are retrieved from is destroyed.
- Destroying a pool object implicitly frees all objects allocated from that pool. Specifically, destroying `VkCommandPool` frees all `VkCommandBuffer` objects that were allocated from it, and destroying `VkDescriptorPool` frees all `VkDescriptorSet` objects that were allocated from it.
- `VkDevice` objects **can** be destroyed when all `VkQueue` objects retrieved from them are idle, and all objects created from them have been destroyed.
 - This includes the following objects:
 - `VkFence`
 - `VkSemaphore`
 - `VkEvent`
 - `VkQueryPool`
 - `VkBuffer`
 - `VkBufferView`
 - `VkImage`
 - `VkImageView`
 - `VkShaderModule`
 - `VkPipelineCache`
 - `VkPipeline`
 - `VkPipelineLayout`
 - `VkSampler`

- `VkSamplerYcbcrConversion`
 - `VkDescriptorSetLayout`
 - `VkDescriptorPool`
 - `VkFramebuffer`
 - `VkRenderPass`
 - `VkCommandPool`
 - `VkCommandBuffer`
 - `VkDeviceMemory`
 - `VkValidationCacheEXT`
 - `VkAccelerationStructureNV`
 - `VkAccelerationStructureKHR`
 - `VkVideoSessionKHR`
 - `VkVideoSessionParametersKHR`
- `VkPhysicalDevice` objects **cannot** be explicitly destroyed. Instead, they are implicitly destroyed when the `VkInstance` object they are retrieved from is destroyed.
 - `VkInstance` objects **can** be destroyed once all `VkDevice` objects created from any of its `VkPhysicalDevice` objects have been destroyed.

3.3.2. External Object Handles

As defined above, the scope of object handles created or allocated from a `VkDevice` is limited to that logical device. Objects which are not in scope are said to be external. To bring an external object into scope, an external handle **must** be exported from the object in the source scope and imported into the destination scope.

NOTE

The scope of external handles and their associated resources **may** vary according to their type, but they **can** generally be shared across process and API boundaries.

3.4. Application Binary Interface

The mechanism by which Vulkan is made available to applications is platform- or implementation-defined. On many platforms the C interface described in this Specification is provided by a shared library. Since shared libraries can be changed independently of the applications that use them, they present particular compatibility challenges, and this Specification places some requirements on them.

Shared library implementations **must** use the default Application Binary Interface (ABI) of the standard C compiler for the platform, or provide customized API headers that cause application code to use the implementation's non-default ABI. An ABI in this context means the size, alignment, and layout of C data types; the procedure calling convention; and the naming convention for shared library symbols corresponding to C functions. Customizing the calling convention for a platform is usually accomplished by defining [calling convention macros](#) appropriately in `vk_platform.h`.

On platforms where Vulkan is provided as a shared library, library symbols beginning with “vk” and followed by a digit or uppercase letter are reserved for use by the implementation. Applications which use Vulkan **must** not provide definitions of these symbols. This allows the Vulkan shared library to be updated with additional symbols for new API versions or extensions without causing symbol conflicts with existing applications.

Shared library implementations **should** provide library symbols for commands in the highest version of this Specification they support, and for [Window System Integration](#) extensions relevant to the platform. They **may** also provide library symbols for commands defined by additional extensions.

NOTE

These requirements and recommendations are intended to allow implementors to take advantage of platform-specific conventions for SDKs, ABIs, library versioning mechanisms, etc. while still minimizing the code changes necessary to port applications or libraries between platforms. Platform vendors, or providers of the *de facto* standard Vulkan shared library for a platform, are encouraged to document what symbols the shared library provides and how it will be versioned when new symbols are added.

Applications **should** only rely on shared library symbols for commands in the minimum core version required by the application. [vkGetInstanceProcAddr](#) and [vkGetDeviceProcAddr](#) **should** be used to obtain function pointers for commands in core versions beyond the application’s minimum required version.

3.5. Command Syntax and Duration

The Specification describes Vulkan commands as functions or procedures using C99 syntax. Language bindings for other languages such as C++ and JavaScript **may** allow for stricter parameter passing, or object-oriented interfaces.

Vulkan uses the standard C types for the base type of scalar parameters (e.g. types from `<stdint.h>`), with exceptions described below, or elsewhere in the text when appropriate:

[VkBool32](#) represents boolean **True** and **False** values, since C does not have a sufficiently portable built-in boolean type:

```
// Provided by VK_VERSION_1_0
typedef uint32_t VkBool32;
```

VK_TRUE represents a boolean **True** (unsigned integer 1) value, and **VK_FALSE** a boolean **False** (unsigned integer 0) value.

All values returned from a Vulkan implementation in a [VkBool32](#) will be either **VK_TRUE** or **VK_FALSE**.

Applications **must** not pass any other values than **VK_TRUE** or **VK_FALSE** into a Vulkan implementation where a [VkBool32](#) is expected.

VK_TRUE is a constant representing a [VkBool32](#) **True** value.

```
#define VK_TRUE
```

```
1U
```

`VK_FALSE` is a constant representing a [VkBool32](#) **False** value.

```
#define VK_FALSE
```

```
0U
```

[VkDeviceSize](#) represents device memory size and offset values:

```
// Provided by VK_VERSION_1_0  
typedef uint64_t VkDeviceSize;
```

[VkDeviceAddress](#) represents device buffer address values:

```
// Provided by VK_VERSION_1_0  
typedef uint64_t VkDeviceAddress;
```

Commands that create Vulkan objects are of the form `vkCreate*` and take `Vk*CreateInfo` structures with the parameters needed to create the object. These Vulkan objects are destroyed with commands of the form `vkDestroy*`.

The last in-parameter to each command that creates or destroys a Vulkan object is `pAllocator`. The `pAllocator` parameter **can** be a non-NULL value, in which case allocations for the given object are delegated to an application provided callback. Refer to the [Memory Allocation](#) chapter for further details.

Commands that allocate Vulkan objects owned by pool objects are of the form `vkAllocate*`, and take `Vk*AllocateInfo` structures. These Vulkan objects are freed with commands of the form `vkFree*`. These objects do not take allocators; if host memory is needed, they will use the allocator that was specified when their parent pool was created.

Commands are recorded into a command buffer by calling API commands of the form `vkCmd*`. Each such command **may** have different restrictions on where it **can** be used: in a primary and/or secondary command buffer, inside and/or outside a render pass, and in one or more of the supported queue types. These restrictions are documented together with the definition of each such command.

The *duration* of a Vulkan command refers to the interval between calling the command and its return to the caller.

3.5.1. Lifetime of Retrieved Results

Information is retrieved from the implementation with commands of the form `vkGet*` and `vkEnumerate*`.

Unless otherwise specified for an individual command, the results are *invariant*; that is, they will

remain unchanged when retrieved again by calling the same command with the same parameters, so long as those parameters themselves all remain valid.

3.5.2. Array Results

Some query commands of the form `vkGet*` and `vkEnumerate*` enable retrieving multiple results in the form of a return array. Such commands typically have two pointer arguments as follows:

- An element count pointer pointing to an integer variable, conventionally named as `p*Count` where `*` is the capitalized singular form of the name of the retrieved values.
- A pointer to an array where the result array is retrieved, conventionally named as `p*` where `*` is the capitalized plural form of the name of the retrieved values.

If such commands are called with the array pointer set to `NULL`, then the number of retrievable elements is returned in the variable pointed to by the element count pointer. Otherwise, the element count pointer **must** point to a variable set by the application to the number of elements in the return array, and on return the variable is overwritten with the number of elements actually written to the return array. If the input element count is less than the number of retrievable array elements, the query will write only as many elements to the return array as specified by the element count variable set by the application, and the command will return `VK_INCOMPLETE` instead of `VK_SUCCESS`, to indicate that not all retrievable array elements were returned.

NOTE

In practice, this means that applications will typically call such query commands twice:

- First, with the array pointer set to `NULL`, to retrieve the number of retrievable elements.
- Second, with the array pointer pointing to an application allocated storage for at least as many elements as indicated by the variable pointed to by the element count pointer, to retrieve at most as many of the retrievable elements.

Query commands that return one or more structures, regardless of whether they return a single or an array of structures with or without a `pNext` chain, **may** also contain arrays within those structures. Such return arrays are typically defined in the form of two members as follows:

- An integer value specifying the element count, conventionally named as `*Count` where `*` is the singular form of the name of the retrieved values.
- A pointer to an array where the result array is retrieved, conventionally named as `p*` where `*` is the capitalized plural form of the name of the retrieved values.

Analogously to query commands that return multiple results, if the command is called with the array pointer member of the output structure in question set to `NULL`, then the number of retrievable elements is returned in the element count member of that output structure. Otherwise, the element count **must** specify the number of elements in the return array, and on return the element count member is overwritten with the number of elements actually written to the return array. If the input element count is less than the number of retrievable array elements, the query will write only as many elements to the return array as specified by the input element count, and the command will return `VK_INCOMPLETE` instead of `VK_SUCCESS`, if the query command has a `VkResult`

return type, to indicate that not all retrievable array elements were returned.

Applications need to separately track the value they provided as the input element count member for such arrays and compare those with the returned element counts in order to determine whether the actually returned element count is smaller than the size of the return array. Another side effect of this is that it is impossible for the application to determine if the number of retrievable elements has increased beyond the provided input element count so using return arrays in output structures **should** be limited to *invariant* array results. In practice, this means that applications will typically call such query commands multiple times:

NOTE

- First, with the array pointer member(s) set to **NULL**, to retrieve the number(s) of retrievable elements.
- Second, with the array pointer(s) pointing to an application allocated storage for at least as many elements as indicated by the element count member(s), to retrieve at most as many of the retrievable elements.
- Then the process **may** need to be repeated for all other newly introduced return arrays in any nested output structures indirectly specified through the previously retrieved result arrays.

Regardless of the type of query command, any array pointer member of an output structure **must** either be **NULL**, or point to an application-allocated array. Query commands **must** not return a pointer to implementation allocated storage in any output structure.

3.6. Threading Behavior

Vulkan is intended to provide scalable performance when used on multiple host threads. All commands support being called concurrently from multiple threads, but certain parameters, or components of parameters are defined to be *externally synchronized*. This means that the caller **must** guarantee that no more than one thread is using such a parameter at a given time.

More precisely, Vulkan commands use simple stores to update the state of Vulkan objects. A parameter declared as externally synchronized **may** have its contents updated at any time during the host execution of the command. If two commands operate on the same object and at least one of the commands declares the object to be externally synchronized, then the caller **must** guarantee not only that the commands do not execute simultaneously, but also that the two commands are separated by an appropriate memory barrier (if needed).

NOTE

Memory barriers are particularly relevant for hosts based on the ARM CPU architecture, which is more weakly ordered than many developers are accustomed to from x86/x64 programming. Fortunately, most higher-level synchronization primitives (like the pthread library) perform memory barriers as a part of mutual exclusion, so mutexing Vulkan objects via these primitives will have the desired effect.

Similarly the application **must** avoid any potential data hazard of application-owned memory that has its **ownership temporarily acquired** by a Vulkan command. While the ownership of application-

owned memory remains acquired by a command the implementation **may** read the memory at any point, and it **may** write non-**const** qualified memory at any point. Parameters referring to non-**const** qualified application-owned memory are not marked explicitly as *externally synchronized* in the Specification.

If an application is using **deferred host operations** in a command, and that operation is successfully deferred, object parameters and application-owned memory passed to that command **may** be accessed at any time until the deferred operation is complete.

Many object types are *immutable*, meaning the objects **cannot** change once they have been created. These types of objects never need external synchronization, except that they **must** not be destroyed while they are in use on another thread. In certain special cases mutable object parameters are internally synchronized, making external synchronization unnecessary. Any command parameters that are not labeled as externally synchronized are either not mutated by the command or are internally synchronized. Additionally, certain objects related to a command's parameters (e.g. command pools and descriptor pools) **may** be affected by a command, and **must** also be externally synchronized. These implicit parameters are documented as described below.

Parameters of commands that are externally synchronized are listed below.

Externally Synchronized Parameters

- The **instance** parameter in **vkDestroyInstance**
- The **device** parameter in **vkDestroyDevice**
- The **queue** parameter in **vkQueueSubmit**
- The **fence** parameter in **vkQueueSubmit**
- The **queue** parameter in **vkQueueWaitIdle**
- The **memory** parameter in **vkFreeMemory**
- The **memory** parameter in **vkMapMemory**
- The **memory** parameter in **vkUnmapMemory**
- The **buffer** parameter in **vkBindBufferMemory**
- The **image** parameter in **vkBindImageMemory**

- The `commandBuffer` parameter in `vkCmdDrawMeshTasksIndirectCountEXT`

For `VkPipelineCache` objects created with `flags` containing `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, the above table is extended with the `pipelineCache` parameter to `vkCreate*Pipelines` being externally synchronized.

There are also a few instances where a command **can** take in an application-allocated list whose contents are externally synchronized parameters. In these cases, the caller **must** guarantee that at most one thread is using a given element within the list at a given time. These parameters are listed below.

Externally Synchronized Parameter Lists

- Each element of the `pFences` parameter in `vkResetFences`
- Each element of the `pDescriptorSets` parameter in `vkFreeDescriptorSets`
- Each element of the `pCommandBuffers` parameter in `vkFreeCommandBuffers`
- Each element of the `pWaitSemaphores` member of the `pPresentInfo` parameter in `vkQueuePresentKHR`
- Each element of the `pSwapchains` member of the `pPresentInfo` parameter in `vkQueuePresentKHR`
- The `surface` member of each element of the `pCreateInfos` parameter in `vkCreateSharedSwapchainsKHR`
- The `oldSwapchain` member of each element of the `pCreateInfos` parameter in `vkCreateSharedSwapchainsKHR`

In addition, there are some implicit parameters that need to be externally synchronized. For example, when a `commandBuffer` parameter needs to be externally synchronized, it implies that the `commandPool` from which that command buffer was allocated also needs to be externally synchronized. The implicit parameters and their associated object are listed below.

Implicit Externally Synchronized Parameters

- All `VkPhysicalDevice` objects enumerated from `instance` in `vkDestroyInstance`
- All `VkQueue` objects created from `device` in `vkDestroyDevice`
- All `VkQueue` objects created from `device` in `vkDeviceWaitIdle`
- Any `VkDescriptorSet` objects allocated from `descriptorPool` in `vkResetDescriptorPool`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkBeginCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkEndCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkResetCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindPipeline`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetViewport`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetScissor`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetLineWidth`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBias`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetBlendConstants`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBounds`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilCompareMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilWriteMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilReference`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindDescriptorSets`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindIndexBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindVertexBuffers`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDraw`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexed`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexedIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatch`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatchIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBlitImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBufferToImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImageToBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdUpdateBuffer`

- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdFillBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearColorImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearDepthStencilImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearAttachments`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResolveImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetEvent`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResetEvent`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWaitEvents`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPipelineBarrier`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginQuery`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndQuery`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResetQueryPool`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWriteTimestamp`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyQueryPoolResults`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPushConstants`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginRenderPass`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdNextSubpass`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndRenderPass`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdExecuteCommands`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDeviceMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatchBase`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirectCount`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexedIndirectCount`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginRenderPass2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdNextSubpass2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndRenderPass2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetEvent2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResetEvent2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWaitEvents2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPipelineBarrier2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWriteTimestamp2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBuffer2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImage2`

- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBufferToImage2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImageToBuffer2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBlitImage2`

3.7. Valid Usage

Valid usage defines a set of conditions which **must** be met in order to achieve well-defined runtime behavior in an application. These conditions depend only on Vulkan state, and the parameters or objects whose usage is constrained by the condition.

The core layer assumes applications are using the API correctly. Except as documented elsewhere in the Specification, the behavior of the core layer to an application using the API incorrectly is undefined, and **may** include program termination. However, implementations **must** ensure that incorrect usage by an application does not affect the integrity of the operating system, the Vulkan implementation, or other applications in the system using Vulkan. In particular, any guarantees made by an operating system about whether memory from one process **can** be visible to another process or not **must** not be violated by a Vulkan implementation for **any memory allocation**. Vulkan implementations are not **required** to make additional security or integrity guarantees beyond those provided by the OS unless explicitly directed by the application's use of a particular feature or extension.

NOTE

For instance, if an operating system guarantees that data in all its memory allocations are set to zero when newly allocated, the Vulkan implementation **must** make the same guarantees for any allocations it controls (e.g. `VkDeviceMemory`).

Similarly, if an operating system guarantees that use-after-free of host allocations will not result in values written by another process becoming visible, the same guarantees **must** be made by the Vulkan implementation for device memory.

If the `protectedMemory` feature is supported, the implementation provides additional guarantees when invalid usage occurs to prevent values in protected memory from being accessed or inferred outside of protected operations, as described in [Protected Memory Access Rules](#).

Some valid usage conditions have dependencies on runtime limits or feature availability. It is possible to validate these conditions against Vulkan's minimum supported values for these limits

and features, or some subset of other known values.

Valid usage conditions do not cover conditions where well-defined behavior (including returning an error code) exists.

Valid usage conditions **should** apply to the command or structure where complete information about the condition would be known during execution of an application. This is such that a validation layer or linter **can** be written directly against these statements at the point they are specified.

NOTE

This does lead to some non-obvious places for valid usage statements. For instance, the valid values for a structure might depend on a separate value in the calling command. In this case, the structure itself will not reference this valid usage as it is impossible to determine validity from the structure that it is invalid - instead this valid usage would be attached to the calling command.

Another example is draw state - the state setters are independent, and can cause a legitimately invalid state configuration between draw calls; so the valid usage statements are attached to the place where all state needs to be valid - at the drawing command.

Valid usage conditions are described in a block labeled “Valid Usage” following each command or structure they apply to.

3.7.1. Usage Validation

Vulkan is a layered API. The lowest layer is the core Vulkan layer, as defined by this Specification. The application **can** use additional layers above the core for debugging, validation, and other purposes.

One of the core principles of Vulkan is that building and submitting command buffers **should** be highly efficient. Thus error checking and validation of state in the core layer is minimal, although more rigorous validation **can** be enabled through the use of layers.

Validation of correct API usage is left to validation layers. Applications **should** be developed with validation layers enabled, to help catch and eliminate errors. Once validated, released applications **should** not enable validation layers by default.

3.7.2. Implicit Valid Usage

Some valid usage conditions apply to all commands and structures in the API, unless explicitly denoted otherwise for a specific command or structure. These conditions are considered *implicit*, and are described in a block labeled “Valid Usage (Implicit)” following each command or structure they apply to. Implicit valid usage conditions are described in detail below.

Valid Usage for Object Handles

Any input parameter to a command that is an object handle **must** be a valid object handle, unless otherwise specified. An object handle is valid if:

- It has been created or allocated by a previous, successful call to the API. Such calls are noted in the Specification.
- It has not been deleted or freed by a previous call to the API. Such calls are noted in the Specification.
- Any objects used by that object, either as part of creation or execution, **must** also be valid.

The reserved values `VK_NULL_HANDLE` and `NULL` **can** be used in place of valid non-dispatchable handles and dispatchable handles, respectively, when *explicitly called out in the Specification*. Any command that creates an object successfully **must** not return these values. It is valid to pass these values to `vkDestroy*` or `vkFree*` commands, which will silently ignore these values.

Valid Usage for Pointers

Any parameter that is a pointer **must** be a *valid pointer* only if it is explicitly called out by a Valid Usage statement.

A pointer is “valid” if it points at memory containing values of the number and type(s) expected by the command, and all fundamental types accessed through the pointer (e.g. as elements of an array or as members of a structure) satisfy the alignment requirements of the host processor.

Valid Usage for Strings

Any parameter that is a pointer to `char` **must** be a finite sequence of values terminated by a null character, or if *explicitly called out in the Specification*, **can** be `NULL`.

Strings specified as UTF-8 encoded **must** not contain invalid UTF-8 sequences. See [String Representation](#) for additional information about strings.

Valid Usage for Enumerated Types

Any parameter of an enumerated type **must** be a valid enumerant for that type. Use of an enumerant is valid if the following conditions are true:

- The enumerant is defined as part of the enumerated type.
- The enumerant is not a value suffixed with `_MAX_ENUM`.
 - This value exists only to ensure that C `enum` types are 32 bits in size and **must** not be used by applications.
- If the enumerant is used in a function that has a `VkInstance` as its first parameter and either:
 - it was added by a core version that is supported (as reported by `vkEnumerateInstanceVersion`) and the value of `VkApplicationInfo::apiVersion` is greater than or equal to the version that added it; or
 - it was added by an [instance extension](#) that was enabled for the instance.
- If the enumerant is used in a function that has a `VkPhysicalDevice` object as its first parameter and either:
 - it was added by a core version that is supported by that device (as reported by `VkPhysicalDeviceProperties::apiVersion`);

- it was added by an [instance extension](#) that was enabled for the instance; or
- it was added by a [device extension](#) that is supported by that device.
- If the enumerant is used in a function that has any other dispatchable object as its first parameter and either:
 - it was added by a core version that is supported for the device (as reported by [VkPhysicalDeviceProperties::apiVersion](#)); or
 - it was added by a [device extension](#) that was enabled for the device.

Additionally, if [maintenance5](#) is supported, any integer value representable in the range valid for the defined type is valid when used in a function that has a [VkPhysicalDevice](#) object as its first parameter. Physical device queries will either return results indicating lack of support, or ignore unsupported values when used as a bit flag in a [Vk*Flags*](#) parameter.

Any enumerated type returned from a query command or otherwise output from Vulkan to the application **must** not have a reserved value. Reserved values are values not defined by any extension for that enumerated type.

NOTE

In some special cases, an enumerant is only meaningful if a feature defined by an extension is also enabled, as well as the extension itself. The global “valid enumerant” rule described here does not address such cases.

NOTE

This language is intended to accommodate cases such as “hidden” extensions known only to driver internals, or layers enabling extensions without knowledge of the application, without allowing return of values not defined by any extension.

NOTE

Application developers are encouraged to be careful when using [switch](#) statements with Vulkan API enums. This is because new extensions can add new values to existing enums. Using a [default:](#) statement within a [switch](#) may avoid future compilation issues.

This is particularly true for enums such as [VkDriverId](#), which may have values added that do not belong to a corresponding new extension.

Valid Usage for Flags

A collection of flags is represented by a bitmask using the type [VkFlags](#):

```
// Provided by VK_VERSION_1_0
typedef uint32_t VkFlags;
```

Bitmasks are passed to many commands and structures to compactly represent options, but [VkFlags](#) is not used directly in the API. Instead, a [Vk*Flags](#) type which is an alias of [VkFlags](#), and whose name matches the corresponding [Vk*FlagBits](#) that are valid for that type, is used.

Any [Vk*Flags](#) member or parameter used in the API as an input **must** be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a `Vk*Flags` type if it would be a [valid enumerant](#) when used with the equivalent `Vk*FlagBits` type, where the bits type is obtained by taking the flag type and replacing the trailing `Flags` with `FlagBits`. For example, a flag value of type `VkColorComponentFlags` **must** contain only bit flags defined by `VkColorComponentFlagBits`.

Any `Vk*Flags` member or parameter returned from a query command or otherwise output from Vulkan to the application **may** contain bit flags undefined in its corresponding `Vk*FlagBits` type. An application **cannot** rely on the state of these unspecified bits.

Only the low-order 31 bits (bit positions zero through 30) are available for use as flag bits.

NOTE

This restriction is due to poorly defined behavior by C compilers given a C enumerant value of `0x80000000`. In some cases adding this enumerant value may increase the size of the underlying `Vk*FlagBits` type, breaking the ABI.

A collection of 64-bit flags is represented by a bitmask using the type `VkFlags64`:

```
// Provided by VK_VERSION_1_3, VK_KHR_synchronization2
typedef uint64_t VkFlags64;
```

When the 31 bits available in `VkFlags` are insufficient, the `VkFlags64` type can be passed to commands and structures to represent up to 64 options. `VkFlags64` is not used directly in the API. Instead, a `Vk*Flags2` type which is an alias of `VkFlags64`, and whose name matches the corresponding `Vk*FlagBits2` that are valid for that type, is used.

Any `Vk*Flags2` member or parameter used in the API as an input **must** be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a `Vk*Flags2` type if it would be a [valid enumerant](#) when used with the equivalent `Vk*FlagBits2` type, where the bits type is obtained by taking the flag type and replacing the trailing `Flags2` with `FlagBits2`. For example, a flag value of type `VkAccessFlags2KHR` **must** contain only bit flags defined by `VkAccessFlagBits2KHR`.

Any `Vk*Flags2` member or parameter returned from a query command or otherwise output from Vulkan to the application **may** contain bit flags undefined in its corresponding `Vk*FlagBits2` type. An application **cannot** rely on the state of these unspecified bits.

NOTE

Both the `Vk*FlagBits2` type, and the individual bits defined for that type, are defined as `uint64_t` integers in the C API. This is in contrast to the 32-bit types, where the `Vk*FlagBits` type is defined as a C `enum` and the individual bits as enumerants belonging to that `enum`. As a result, there is less compile time type checking possible for the 64-bit types. This is unavoidable since there is no sufficiently portable way to define a 64-bit `enum` type in C99.

Valid Usage for Structure Types

Any parameter that is a structure containing a `sType` member **must** have a value of `sType` which is a valid `VkStructureType` value matching the type of the structure.

Valid Usage for Structure Pointer Chains

Any parameter that is a structure containing a `void* pNext` member **must** have a value of `pNext` that is either `NULL`, or is a pointer to a valid *extending structure*, containing `sType` and `pNext` members as described in the [Vulkan Documentation and Extensions](#) document in the section “Extending Structures”. The set of structures connected by `pNext` pointers is referred to as a *pNext chain*.

Each structure included in the `pNext` chain **must** be defined at runtime by either:

- a core version which is supported
- an extension which is enabled
- a supported device extension in the case of physical-device-level functionality added by the device extension

Each type of extending structure **must** not appear more than once in a `pNext` chain, including any [aliases](#). This general rule may be explicitly overridden for specific structures.

Any component of the implementation (the loader, any enabled layers, and drivers) **must** skip over, without processing (other than reading the `sType` and `pNext` members) any extending structures in the chain not defined by core versions or extensions supported by that component.

As a convenience to implementations and layers needing to iterate through a structure pointer chain, the Vulkan API provides two *base structures*. These structures allow for some type safety, and can be used by Vulkan API functions that operate on generic inputs and outputs.

The `VkBaseInStructure` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBaseInStructure {
    VkStructureType      sType;
    const struct VkBaseInStructure* pNext;
} VkBaseInStructure;
```

- `sType` is the structure type of the structure being iterated through.
- `pNext` is `NULL` or a pointer to the next structure in a structure chain.

`VkBaseInStructure` can be used to facilitate iterating through a read-only structure pointer chain.

The `VkBaseOutStructure` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBaseOutStructure {
    VkStructureType      sType;
    struct VkBaseOutStructure* pNext;
} VkBaseOutStructure;
```

- `sType` is the structure type of the structure being iterated through.

- `pNext` is `NULL` or a pointer to the next structure in a structure chain.

`VkBaseOutStructure` can be used to facilitate iterating through a structure pointer chain that returns data back to the application.

Valid Usage for Nested Structures

The above conditions also apply recursively to members of structures provided as input to a command, either as a direct argument to the command, or themselves a member of another structure.

Specifics on valid usage of each command are covered in their individual sections.

Valid Usage for Extensions

Instance-level functionality or behavior added by an [instance extension](#) to the API **must** not be used unless that extension is supported by the instance as determined by [vkEnumerateInstanceExtensionProperties](#), and that extension is enabled in [VkInstanceCreateInfo](#).

Physical-device-level functionality or behavior added by an [instance extension](#) to the API **must** not be used unless that extension is supported by the instance as determined by [vkEnumerateInstanceExtensionProperties](#), and that extension is enabled in [VkInstanceCreateInfo](#).

Physical-device-level functionality or behavior added by a [device extension](#) to the API **must** not be used unless the conditions described in [Extending Physical Device From Device Extensions](#) are met.

Device-level functionality added by a [device extension](#) that is dispatched from a [VkDevice](#), or from a child object of a [VkDevice](#) **must** not be used unless that extension is supported by the device as determined by [vkEnumerateDeviceExtensionProperties](#), and that extension is enabled in [VkDeviceCreateInfo](#).

Valid Usage for Newer Core Versions

Instance-level functionality or behavior added by a [new core version](#) of the API **must** not be used unless it is supported by the instance as determined by [vkEnumerateInstanceVersion](#) and the specified version of [VkApplicationInfo::apiVersion](#).

Physical-device-level functionality or behavior added by a [new core version](#) of the API **must** not be used unless it is supported by the physical device as determined by [VkPhysicalDeviceProperties::apiVersion](#) and the specified version of [VkApplicationInfo::apiVersion](#).

Device-level functionality or behavior added by a [new core version](#) of the API **must** not be used unless it is supported by the device as determined by [VkPhysicalDeviceProperties::apiVersion](#) and the specified version of [VkApplicationInfo::apiVersion](#).

3.8. `VkResult` Return Codes

While the core Vulkan API is not designed to capture incorrect usage, some circumstances still require return codes. Commands in Vulkan return their status via return codes that are in one of two categories:

- Successful completion codes are returned when a command needs to communicate success or status information. All successful completion codes are non-negative values.
- Runtime error codes are returned when a command needs to communicate a failure that could only be detected at runtime. All runtime error codes are negative values.

All return codes in Vulkan are reported via [VkResult](#) return values. The possible codes are:

```
// Provided by VK_VERSION_1_0
typedef enum VkResult {
    VK_SUCCESS = 0,
    VK_NOT_READY = 1,
    VK_TIMEOUT = 2,
    VK_EVENT_SET = 3,
    VK_EVENT_RESET = 4,
    VK_INCOMPLETE = 5,
    VK_ERROR_OUT_OF_HOST_MEMORY = -1,
    VK_ERROR_OUT_OF_DEVICE_MEMORY = -2,
    VK_ERROR_INITIALIZATION_FAILED = -3,
    VK_ERROR_DEVICE_LOST = -4,
    VK_ERROR_MEMORY_MAP_FAILED = -5,
    VK_ERROR_LAYER_NOT_PRESENT = -6,
    VK_ERROR_EXTENSION_NOT_PRESENT = -7,
    VK_ERROR_FEATURE_NOT_PRESENT = -8,
    VK_ERROR_INCOMPATIBLE_DRIVER = -9,
    VK_ERROR_TOO_MANY_OBJECTS = -10,
    VK_ERROR_FORMAT_NOT_SUPPORTED = -11,
    VK_ERROR_FRAGMENTED_POOL = -12,
    VK_ERROR_UNKNOWN = -13,
// Provided by VK_VERSION_1_1
    VK_ERROR_OUT_OF_POOL_MEMORY = -1000069000,
// Provided by VK_VERSION_1_1
    VK_ERROR_INVALID_EXTERNAL_HANDLE = -1000072003,
// Provided by VK_VERSION_1_2
    VK_ERROR_FRAGMENTATION = -1000161000,
// Provided by VK_VERSION_1_2
    VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS = -1000257000,
// Provided by VK_VERSION_1_3
    VK_PIPELINE_COMPILE_REQUIRED = 1000297000,
// Provided by VK_KHR_surface
    VK_ERROR_SURFACE_LOST_KHR = -1000000000,
// Provided by VK_KHR_surface
    VK_ERROR_NATIVE_WINDOW_IN_USE_KHR = -1000000001,
// Provided by VK_KHR_swapchain
    VK_SUBOPTIMAL_KHR = 1000001003,
// Provided by VK_KHR_swapchain
    VK_ERROR_OUT_OF_DATE_KHR = -1000001004,
// Provided by VK_KHR_display_swapchain
    VK_ERROR_INCOMPATIBLE_DISPLAY_KHR = -1000003001,
// Provided by VK_EXT_debug_report
    VK_ERROR_VALIDATION_FAILED_EXT = -1000011001,
```

```

// Provided by VK_NV_glsl_shader
VK_ERROR_INVALID_SHADER_NV = -1000012000,
// Provided by VK_KHR_video_queue
VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR = -1000023000,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR = -1000023001,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR = -1000023002,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR = -1000023003,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR = -1000023004,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR = -1000023005,
// Provided by VK_EXT_image_drm_format_modifier
VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT = -1000158000,
// Provided by VK_KHR_global_priority
VK_ERROR_NOT_PERMITTED_KHR = -1000174001,
// Provided by VK_EXT_full_screen_exclusive
VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT = -1000255000,
// Provided by VK_KHR_deferred_host_operations
VK_THREAD_IDLE_KHR = 1000268000,
// Provided by VK_KHR_deferred_host_operations
VK_THREAD_DONE_KHR = 1000268001,
// Provided by VK_KHR_deferred_host_operations
VK_OPERATION_DEFERRED_KHR = 1000268002,
// Provided by VK_KHR_deferred_host_operations
VK_OPERATION_NOT_DEFERRED_KHR = 1000268003,
// Provided by VK_KHR_video_encode_queue
VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR = -1000299000,
// Provided by VK_EXT_image_compression_control
VK_ERROR_COMPRESSION_EXHAUSTED_EXT = -1000338000,
// Provided by VK_EXT_shader_object
VK_INCOMPATIBLE_SHADER_BINARY_EXT = 1000482000,
// Provided by VK_KHR_pipeline_binary
VK_PIPELINE_BINARY_MISSING_KHR = 1000483000,
// Provided by VK_KHR_pipeline_binary
VK_ERROR_NOT_ENOUGH_SPACE_KHR = -1000483000,
// Provided by VK_KHR_maintenance1
VK_ERROR_OUT_OF_POOL_MEMORY_KHR = VK_ERROR_OUT_OF_POOL_MEMORY,
// Provided by VK_KHR_external_memory
VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR = VK_ERROR_INVALID_EXTERNAL_HANDLE,
// Provided by VK_EXT_descriptor_indexing
VK_ERROR_FRAGMENTATION_EXT = VK_ERROR_FRAGMENTATION,
// Provided by VK_EXT_global_priority
VK_ERROR_NOT_PERMITTED_EXT = VK_ERROR_NOT_PERMITTED_KHR,
// Provided by VK_EXT_buffer_device_address
VK_ERROR_INVALID_DEVICE_ADDRESS_EXT = VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS,
// Provided by VK_KHR_buffer_device_address
VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR =
VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS,

```

```

// Provided by VK_EXT_pipeline_creation_cache_control
VK_PIPELINE_COMPILE_REQUIRED_EXT = VK_PIPELINE_COMPILE_REQUIRED,
// Provided by VK_EXT_pipeline_creation_cache_control
VK_ERROR_PIPELINE_COMPILE_REQUIRED_EXT = VK_PIPELINE_COMPILE_REQUIRED,
// Provided by VK_EXT_shader_object
// VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT is a deprecated alias
VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT = VK_INCOMPATIBLE_SHADER_BINARY_EXT,
} VkResult;

```

Success Codes

- **VK_SUCCESS** Command successfully completed
- **VK_NOT_READY** A fence or query has not yet completed
- **VK_TIMEOUT** A wait operation has not completed in the specified time
- **VK_EVENT_SET** An event is signaled
- **VK_EVENT_RESET** An event is unsignaled
- **VK_INCOMPLETE** A return array was too small for the result
- **VK_SUBOPTIMAL_KHR** A swapchain no longer matches the surface properties exactly, but **can** still be used to present to the surface successfully.
- **VK_THREAD_IDLE_KHR** A deferred operation is not complete but there is currently no work for this thread to do at the time of this call.
- **VK_THREAD_DONE_KHR** A deferred operation is not complete but there is no work remaining to assign to additional threads.
- **VK_OPERATION_DEFERRED_KHR** A deferred operation was requested and at least some of the work was deferred.
- **VK_OPERATION_NOT_DEFERRED_KHR** A deferred operation was requested and no operations were deferred.
- **VK_PIPELINE_COMPILE_REQUIRED** A requested pipeline creation would have required compilation, but the application requested compilation to not be performed.
- **VK_PIPELINE_BINARY_MISSING_KHR** The application attempted to create a pipeline binary by querying an internal cache, but the internal cache entry did not exist.
- **VK_INCOMPATIBLE_SHADER_BINARY_EXT** The provided binary shader code is not compatible with this device.

NOTE

In the initial version of the **VK_EXT_shader_object** extension, this return code was named **VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT** and improperly described as an error code. The name has been changed, but the old name is retained as an alias for compatibility with old code.

Error Codes

- **VK_ERROR_OUT_OF_HOST_MEMORY** A host memory allocation has failed.
- **VK_ERROR_OUT_OF_DEVICE_MEMORY** A device memory allocation has failed.

- **VK_ERROR_INITIALIZATION_FAILED** Initialization of an object could not be completed for implementation-specific reasons.
- **VK_ERROR_DEVICE_LOST** The logical or physical device has been lost. See [Lost Device](#)
- **VK_ERROR_MEMORY_MAP_FAILED** Mapping of a memory object has failed.
- **VK_ERROR_LAYER_NOT_PRESENT** A requested layer is not present or could not be loaded.
- **VK_ERROR_EXTENSION_NOT_PRESENT** A requested extension is not supported.
- **VK_ERROR_FEATURE_NOT_PRESENT** A requested feature is not supported.
- **VK_ERROR_INCOMPATIBLE_DRIVER** The requested version of Vulkan is not supported by the driver or is otherwise incompatible for implementation-specific reasons.
- **VK_ERROR_TOO_MANY_OBJECTS** Too many objects of the type have already been created.
- **VK_ERROR_FORMAT_NOT_SUPPORTED** A requested format is not supported on this device.
- **VK_ERROR_FRAGMENTED_POOL** A pool allocation has failed due to fragmentation of the pool's memory. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. This **should** be returned in preference to **VK_ERROR_OUT_OF_POOL_MEMORY**, but only if the implementation is certain that the pool allocation failure was due to fragmentation.
- **VK_ERROR_SURFACE_LOST_KHR** A surface is no longer available.
- **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** The requested window is already in use by Vulkan or another API in a manner which prevents it from being used again.
- **VK_ERROR_OUT_OF_DATE_KHR** A surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications **must** query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.
- **VK_ERROR_INCOMPATIBLE_DISPLAY_KHR** The display used by a swapchain does not use the same presentable image layout, or is incompatible in a way that prevents sharing an image.
- **VK_ERROR_INVALID_SHADER_NV** One or more shaders failed to compile or link. More details are reported back to the application via [VK_EXT_debug_report](#) if enabled.
- **VK_ERROR_OUT_OF_POOL_MEMORY** A pool memory allocation has failed. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. If the failure was definitely due to fragmentation of the pool, **VK_ERROR_FRAGMENTED_POOL** **should** be returned instead.
- **VK_ERROR_INVALID_EXTERNAL_HANDLE** An external handle is not a valid handle of the specified type.
- **VK_ERROR_FRAGMENTATION** A descriptor pool creation has failed due to fragmentation.
- **VK_ERROR_INVALID_DEVICE_ADDRESS_EXT** A buffer creation failed because the requested address is not available.
- **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS** A buffer creation or memory allocation failed because the requested address is not available. A shader group handle assignment failed because the requested shader group handle information is no longer valid.
- **VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT** An operation on a swapchain created with **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT** failed as it did not have exclusive full-

screen access. This **may** occur due to implementation-dependent reasons, outside of the application's control.

- **VK_ERROR_VALIDATION_FAILED_EXT** A command failed because invalid usage was detected by the implementation or a validation-layer.
- **VK_ERROR_COMPRESSION_EXHAUSTED_EXT** An image creation failed because internal resources required for compression are exhausted. This **must** only be returned when fixed-rate compression is requested.
- **VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR** The requested **VkImageUsageFlags** are not supported.
- **VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR** The requested video picture layout is not supported.
- **VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR** A video profile operation specified via **VkVideoProfileInfoKHR::videoCodecOperation** is not supported.
- **VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR** Format parameters in a requested **VkVideoProfileInfoKHR** chain are not supported.
- **VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR** Codec-specific parameters in a requested **VkVideoProfileInfoKHR** chain are not supported.
- **VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR** The specified video Std header version is not supported.
- **VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR** The specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.
- **VK_ERROR_NOT_PERMITTED_KHR** The driver implementation has denied a request to acquire a priority above the default priority (**VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT**) because the application does not have sufficient privileges.
- **VK_ERROR_NOT_ENOUGH_SPACE_KHR** The application did not provide enough space to return all the required data.
- **VK_ERROR_UNKNOWN** An unknown error has occurred; either the application has provided invalid input, or an implementation failure has occurred.

If a command returns a runtime error, unless otherwise specified any output parameters will have undefined contents, except that if the output parameter is a structure with **sType** and **pNext** fields, those fields will be unmodified. Any structures chained from **pNext** will also have undefined contents, except that **sType** and **pNext** will be unmodified.

VK_ERROR_OUT_OF_*_MEMORY errors do not modify any currently existing Vulkan objects. Objects that have already been successfully created **can** still be used by the application.

NOTE

As a general rule, **Free**, **Release**, and **Reset** commands do not return **VK_ERROR_OUT_OF_HOST_MEMORY**, while any other command with a return code **may** return it. Any exceptions from this rule are described for those commands.

`VK_ERROR_UNKNOWN` will be returned by an implementation when an unexpected error occurs that cannot be attributed to valid behavior of the application and implementation. Under these conditions, it **may** be returned from any command returning a `VkResult`.

NOTE

`VK_ERROR_UNKNOWN` is not expected to ever be returned if the application behavior is valid, and if the implementation is bug-free. If `VK_ERROR_UNKNOWN` is received, the application should be checked against the latest validation layers to verify correct behavior as much as possible. If no issues are identified it could be an implementation issue, and the implementor should be contacted for support.

Any command returning a `VkResult` **may** return `VK_ERROR_VALIDATION_FAILED_EXT` if a violation of valid usage is detected, even though commands do not explicitly list this as a possible return code.

Performance-critical commands generally do not have return codes. If a runtime error occurs in such commands, the implementation will defer reporting the error until a specified point. For commands that record into command buffers (`vkCmd*`) runtime errors are reported by `vkEndCommandBuffer`.

3.9. Numeric Representation and Computation

Implementations normally perform computations in floating-point, and **must** meet the range and precision requirements defined under “Floating-Point Computation” below.

These requirements only apply to computations performed in Vulkan operations outside of shader execution, such as texture image specification and sampling, and per-fragment operations. Range and precision requirements during shader execution differ and are specified by the [Precision and Operation of SPIR-V Instructions](#) section.

In some cases, the representation and/or precision of operations is implicitly limited by the specified format of vertex or texel data consumed by Vulkan. Specific floating-point formats are described later in this section.

3.9.1. Floating-Point Computation

Most floating-point computation is performed in SPIR-V shader modules. The properties of computation within shaders are constrained as defined by the [Precision and Operation of SPIR-V Instructions](#) section.

Some floating-point computation is performed outside of shaders, such as viewport and depth range calculations. For these computations, we do not specify how floating-point numbers are to be represented, or the details of how operations on them are performed, but only place minimal requirements on representation and precision as described in the remainder of this section.

We require simply that numbers’ floating-point parts contain enough bits and that their exponent fields are large enough so that individual results of floating-point operations are accurate to about 1 part in 10^5 . The maximum representable magnitude for all floating-point values **must** be at least 2^{32} .

$x \times 0 = 0 \times x = 0$ for any non-infinite and non-NaN x .

$$1 \times x = x \times 1 = x.$$

$$x + 0 = 0 + x = x.$$

$$0^0 = 1.$$

Occasionally, further requirements will be specified. Most single-precision floating-point formats meet these requirements.

The special values Inf and -Inf encode values with magnitudes too large to be represented; the special value NaN encodes “Not A Number” values resulting from undefined arithmetic operations such as $0 / 0$. Implementations **may** support Inf and NaN in their floating-point computations. Any computation which does not support either Inf or NaN, for which that value is an input or output will yield an undefined value.

3.9.2. Floating-Point Format Conversions

When a value is converted to a defined floating-point representation, finite values falling between two representable finite values are rounded to one or the other. The rounding mode is not defined. Finite values whose magnitude is larger than that of any representable finite value may be rounded either to the closest representable finite value or to the appropriately signed infinity. For unsigned destination formats any negative values are converted to zero. Positive infinity is converted to positive infinity; negative infinity is converted to negative infinity in signed formats and to zero in unsigned formats; and any NaN is converted to a NaN.

3.9.3. 16-Bit Floating-Point Numbers

16-bit floating-point numbers are defined in the “16-bit floating-point numbers” section of the [Khronos Data Format Specification](#).

3.9.4. Unsigned 11-Bit Floating-Point Numbers

Unsigned 11-bit floating-point numbers are defined in the “Unsigned 11-bit floating-point numbers” section of the [Khronos Data Format Specification](#).

3.9.5. Unsigned 10-Bit Floating-Point Numbers

Unsigned 10-bit floating-point numbers are defined in the “Unsigned 10-bit floating-point numbers” section of the [Khronos Data Format Specification](#).

3.9.6. General Requirements

Any representable floating-point value in the appropriate format is legal as input to a Vulkan command that requires floating-point data. The result of providing a value that is not a floating-point number to such a command is unspecified, but **must** not lead to Vulkan interruption or termination. For example, providing a negative zero (where applicable) or a denormalized number

to a Vulkan command **must** yield deterministic results, while providing a NaN or Inf yields unspecified results.

Some calculations require division. In such cases (including implied divisions performed by vector normalization), division by zero produces an unspecified result but **must** not lead to Vulkan interruption or termination.

3.10. Fixed-Point Data Conversions

When generic vertex attributes and pixel color or depth *components* are represented as integers, they are often (but not always) considered to be *normalized*. Normalized integer values are treated specially when being converted to and from floating-point values, and are usually referred to as *normalized fixed-point*.

In the remainder of this section, b denotes the bit width of the fixed-point integer representation. When the integer is one of the types defined by the API, b is the bit width of that type. When the integer comes from an [image](#) containing color or depth component texels, b is the number of bits allocated to that component in its [specified image format](#).

The signed and unsigned fixed-point representations are assumed to be b -bit binary two's-complement integers and binary unsigned integers, respectively.

3.10.1. Conversion From Normalized Fixed-Point to Floating-Point

Unsigned normalized fixed-point integers represent numbers in the range $[0,1]$. The conversion from an unsigned normalized fixed-point value c to the corresponding floating-point value f is defined as

$$f = \frac{c}{2^b - 1}$$

Signed normalized fixed-point integers represent numbers in the range $[-1,1]$. The conversion from a signed normalized fixed-point value c to the corresponding floating-point value f is performed using

$$f = \max\left(\frac{c}{2^{b-1} - 1}, -1.0\right)$$

Only the range $[-2^{b-1} + 1, 2^{b-1} - 1]$ is used to represent signed fixed-point values in the range $[-1,1]$. For example, if $b = 8$, then the integer value -127 corresponds to -1.0 and the value 127 corresponds to 1.0 . This equation is used everywhere that signed normalized fixed-point values are converted to floating-point.

Note that while zero is exactly expressible in this representation, one value (-128 in the example) is outside the representable range, and implementations **must** clamp it to -1.0 . Where the value is subject to further processing by the implementation, e.g. during texture filtering, values less than -1.0 **may** be used but the result **must** be clamped before the value is returned to shaders.

3.10.2. Conversion From Floating-Point to Normalized Fixed-Point

The conversion from a floating-point value f to the corresponding unsigned normalized fixed-point value c is defined by first clamping f to the range $[0,1]$, then computing

$$c = \text{convertFloatToUint}(f \times (2^b - 1), b)$$

where $\text{convertFloatToUint}(r,b)$ returns one of the two unsigned binary integer values with exactly b bits which are closest to the floating-point value r . Implementations **should** round to nearest. If r is equal to an integer, then that integer value **must** be returned. In particular, if f is equal to 0.0 or 1.0, then c **must** be assigned 0 or $2^b - 1$, respectively.

The conversion from a floating-point value f to the corresponding signed normalized fixed-point value c is performed by clamping f to the range $[-1,1]$, then computing

$$c = \text{convertFloatToInt}(f \times (2^{b-1} - 1), b)$$

where $\text{convertFloatToInt}(r,b)$ returns one of the two signed two's-complement binary integer values with exactly b bits which are closest to the floating-point value r . Implementations **should** round to nearest. If r is equal to an integer, then that integer value **must** be returned. In particular, if f is equal to -1.0, 0.0, or 1.0, then c **must** be assigned $-(2^{b-1} - 1)$, 0, or $2^{b-1} - 1$, respectively.

This equation is used everywhere that floating-point values are converted to signed normalized fixed-point.

3.11. String Representation

Strings passed into and returned from Vulkan API commands are usually defined to be null-terminated and UTF-8 encoded.

NOTE

Exceptions to this rule exist only when strings are defined or used by operating system APIs where that OS has a different convention. For example, `VkExportMemoryWin32HandleInfoKHR::name` is a null-terminated UTF-16 encoded string used in conjunction with Windows handles.

When a UTF-8 string is **returned from** a Vulkan API query, it is returned in a fixed-length buffer of C `char`. For example, a string returned in `VkPhysicalDeviceProperties::deviceName` has maximum length `VK_MAX_PHYSICAL_DEVICE_NAME_SIZE`, and a string returned in `VkExtensionProperties::extensionName` has maximum length `VK_MAX_EXTENSION_NAME_SIZE`. The string, **including** its null terminator, will always fit completely within this buffer. If the string is shorter than the buffer size, the contents of `char` in the buffer following the null terminator are undefined.

When a UTF-8 string is **passed into** a Vulkan API, such as `VkDeviceCreateInfo::ppEnabledExtensionNames`, there is no explicit limit on the length of that string. However, the string **must** contain a valid UTF-8 encoded string and **must** be null-terminated.

3.12. Common Object Types

Some types of Vulkan objects are used in many different structures and command parameters, and are described here. These types include *offsets*, *extents*, and *rectangles*.

3.12.1. Offsets

Offsets are used to describe a pixel location within an image or framebuffer, as an (x,y) location for two-dimensional images, or an (x,y,z) location for three-dimensional images.

A two-dimensional offset is defined by the structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkOffset2D {
    int32_t    x;
    int32_t    y;
} VkOffset2D;
```

- **x** is the x offset.
- **y** is the y offset.

A three-dimensional offset is defined by the structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkOffset3D {
    int32_t    x;
    int32_t    y;
    int32_t    z;
} VkOffset3D;
```

- **x** is the x offset.
- **y** is the y offset.
- **z** is the z offset.

3.12.2. Extents

Extents are used to describe the size of a rectangular region of pixels within an image or framebuffer, as (width,height) for two-dimensional images, or as (width,height,depth) for three-dimensional images.

A two-dimensional extent is defined by the structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkExtent2D {
    uint32_t    width;
    uint32_t    height;
} VkExtent2D;
```

- **width** is the width of the extent.
- **height** is the height of the extent.

A three-dimensional extent is defined by the structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkExtent3D {
    uint32_t    width;
    uint32_t    height;
    uint32_t    depth;
} VkExtent3D;
```

- **width** is the width of the extent.
- **height** is the height of the extent.
- **depth** is the depth of the extent.

3.12.3. Rectangles

Rectangles are used to describe a specified rectangular region of pixels within an image or framebuffer. Rectangles include both an offset and an extent of the same dimensionality, as described above. Two-dimensional rectangles are defined by the structure

```
// Provided by VK_VERSION_1_0
typedef struct VkRect2D {
    VkOffset2D    offset;
    VkExtent2D    extent;
} VkRect2D;
```

- **offset** is a [VkOffset2D](#) specifying the rectangle offset.
- **extent** is a [VkExtent2D](#) specifying the rectangle extent.

3.12.4. Structure Types

Each value corresponds to a particular structure with a **sType** member with a matching name. As a general rule, the name of each [VkStructureType](#) value is obtained by taking the name of the structure, stripping the leading **Vk**, prefixing each capital letter with **_**, converting the entire resulting string to upper case, and prefixing it with **VK_STRUCTURE_TYPE_**. For example, structures of type [VkImageCreateInfo](#) correspond to a [VkStructureType](#) value of **VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO**, and thus a structure of this type **must** have its **sType** member

set to this value before it is passed to the API.

The values `VK_STRUCTURE_TYPE_LOADER_INSTANCE_CREATE_INFO` and `VK_STRUCTURE_TYPE_LOADER_DEVICE_CREATE_INFO` are reserved for internal use by the loader, and do not have corresponding Vulkan structures in this Specification.

Structure types supported by the Vulkan API include:

```
// Provided by VK_VERSION_1_0
typedef enum VkStructureType {
    VK_STRUCTURE_TYPE_APPLICATION_INFO = 0,
    VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO = 1,
    VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO = 2,
    VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO = 3,
    VK_STRUCTURE_TYPE_SUBMIT_INFO = 4,

3.13. API Name Aliases

A small number of APIs did not follow the [naming conventions](#) when initially defined. For consistency, when we discover an API name that violates the naming conventions, we rename it in the Specification, XML, and header files. For backwards compatibility, the original (incorrect) name is retained as a “typo alias”. The alias is deprecated and should not be used, but will be retained indefinitely.

NOTE

VK_STENCIL_FRONT_AND_BACK is an example of a *typo alias*. It was initially defined as part of **VkStencilFaceFlagBits**. Once the naming inconsistency was noticed, it was

renamed to `VK_STENCIL_FACE_FRONT_AND_BACK`, and the old name was aliased to the correct name.

Chapter 4. Initialization

Before using Vulkan, an application **must** initialize it by loading the Vulkan commands, and creating a `VkInstance` object.

4.1. Command Function Pointers

Vulkan commands are not necessarily exposed by static linking on a platform. Commands to query function pointers for Vulkan commands are described below.

NOTE

When extensions are [promoted](#) or otherwise incorporated into another extension or Vulkan core version, command [aliases](#) may be included. Whilst the behavior of each command alias is identical, the behavior of retrieving each alias's function pointer is not. A function pointer for a given alias can only be retrieved if the extension or version that introduced that alias is supported and enabled, irrespective of whether any other alias is available.

Function pointers for all Vulkan commands **can** be obtained by calling:

```
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetInstanceProcAddr(
    VkInstance          instance,
    const char*         pName);
```

- `instance` is the instance that the function pointer will be compatible with, or `NULL` for commands not dependent on any instance.
- `pName` is the name of the command to obtain.

`vkGetInstanceProcAddr` itself is obtained in a platform- and loader- specific manner. Typically, the loader library will export this command as a function symbol, so applications **can** link against the loader library, or load it dynamically and look up the symbol using platform-specific APIs.

The table below defines the various use cases for `vkGetInstanceProcAddr` and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) **must** not be `NULL`.

The returned function pointer is of type `PFN_vkVoidFunction`, and **must** be cast to the type of the command being queried before use.

Table 1. `vkGetInstanceProcAddr` behavior

<code>instance</code>	<code>pName</code>	return value
* ¹	<code>NULL</code>	undefined
invalid non- <code>NULL</code> instance	* ¹	undefined
<code>NULL</code>	<i>global command</i> ²	fp
<code>NULL</code>	<code>vkGetInstanceProcAddr</code>	fp ⁵

instance	pName	return value
instance	vkGetInstanceProcAddr	fp
instance	core <i>dispatchable command</i>	fp ³
instance	enabled instance extension dispatchable command for instance	fp ³
instance	available device extension ⁴ dispatchable command for instance	fp ³
any other case, not covered above		NULL

1

"*" means any representable value for the parameter (including valid values, invalid values, and **NULL**).

2

The global commands are: [vkEnumerateInstanceVersion](#), [vkEnumerateInstanceExtensionProperties](#), [vkEnumerateInstanceLayerProperties](#), and [vkCreateInstance](#). Dispatchable commands are all other commands which are not global.

3

The returned function pointer **must** only be called with a dispatchable object (the first parameter) that is **instance** or a child of **instance**, e.g. [VkInstance](#), [VkPhysicalDevice](#), [VkDevice](#), [VkQueue](#), or [VkCommandBuffer](#).

4

An “available device extension” is a device extension supported by any physical device enumerated by **instance**.

5

Starting with Vulkan 1.2, [vkGetInstanceProcAddr](#) can resolve itself with a **NULL** instance pointer.

Valid Usage (Implicit)

- VUID-vkGetInstanceProcAddr-instance-parameter
If **instance** is not **NULL**, **instance** **must** be a valid [VkInstance](#) handle
- VUID-vkGetInstanceProcAddr-pName-parameter
pName **must** be a null-terminated UTF-8 string

In order to support systems with multiple Vulkan implementations, the function pointers returned by [vkGetInstanceProcAddr](#) **may** point to dispatch code that calls a different real implementation for different [VkDevice](#) objects or their child objects. The overhead of the internal dispatch for [VkDevice](#) objects can be avoided by obtaining device-specific function pointers for any commands that use a

device or device-child object as their dispatchable object. Such function pointers **can** be obtained by calling:

```
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetDeviceProcAddr(
    VkDevice          device,
    const char*       pName);
```

The table below defines the various use cases for `vkGetDeviceProcAddr` and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) **must** not be `NULL`.

The returned function pointer is of type `PFN_vkVoidFunction`, and **must** be cast to the type of the command being queried before use. The function pointer **must** only be called with a dispatchable object (the first parameter) that is `device` or a child of `device`.

Table 2. `vkGetDeviceProcAddr` behavior

device	pName	return value
NULL	* ¹	undefined
invalid device	* ¹	undefined
device	NULL	undefined
device	requested core version ² device-level dispatchable command ³	fp ⁴
device	enabled extension device-level dispatchable command ³	fp ⁴
any other case, not covered above		NULL

1
“*” means any representable value for the parameter (including valid values, invalid values, and `NULL`).

2
Device-level commands which are part of the core version specified by `VkApplicationInfo::apiVersion` when creating the instance will always return a valid function pointer. If the `maintenance5` feature is enabled, core commands beyond that version which are supported by the implementation will return `NULL`, otherwise the implementation **may** either return `NULL` or a function pointer. If a function pointer is returned, it **must** not be called.

3
In this function, device-level excludes all physical-device-level commands.

4
The returned function pointer **must** only be called with a dispatchable object (the first parameter) that is `device` or a child of `device` e.g. `VkDevice`, `VkQueue`, or `VkCommandBuffer`.

Valid Usage (Implicit)

- VUID-vkGetDeviceProcAddr-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetDeviceProcAddr-pName-parameter
pName **must** be a null-terminated UTF-8 string

The definition of [PFN_vkVoidFunction](#) is:

```
// Provided by VK_VERSION_1_0
typedef void (VKAPI_PTR *PFN_vkVoidFunction)(void);
```

This type is returned from command function pointer queries, and **must** be cast to an actual command function pointer before use.

4.1.1. Extending Physical Device Core Functionality

New core physical-device-level functionality **can** be used when both [VkPhysicalDeviceProperties::apiVersion](#) and [VkApplicationInfo::apiVersion](#) are greater than or equal to the version of Vulkan that added the new functionality. The Vulkan version supported by a physical device **can** be obtained by calling [vkGetPhysicalDeviceProperties](#).

4.1.2. Extending Physical Device From Device Extensions

When the [VK_KHR_get_physical_device_properties2](#) extension is enabled, or when both the instance and the physical-device versions are at least 1.1, physical-device-level functionality of a device extension **can** be used with a physical device if the corresponding extension is enumerated by [vkEnumerateDeviceExtensionProperties](#) for that physical device, even before a logical device has been created.

To obtain a function pointer for a physical-device-level command from a device extension, an application **can** use [vkGetInstanceProcAddr](#). This function pointer **may** point to dispatch code, which calls a different real implementation for different [VkPhysicalDevice](#) objects. Applications **must** not use a [VkPhysicalDevice](#) in any command added by an extension or core version that is not supported by that physical device.

Device extensions **may** define structures that **can** be added to the **pNext** chain of physical-device-level commands.

4.2. Instances

There is no global state in Vulkan and all per-application state is stored in a [VkInstance](#) object. Creating a [VkInstance](#) object initializes the Vulkan library and allows the application to pass information about itself to the implementation.

Instances are represented by [VkInstance](#) handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkInstance)
```

To query the version of instance-level functionality supported by the implementation, call:

```
// Provided by VK_VERSION_1_1
VkResult vkEnumerateInstanceVersion(
    uint32_t* pApiVersion);
```

- `pApiVersion` is a pointer to a `uint32_t`, which is the version of Vulkan supported by instance-level functionality, encoded as described in [Version Numbers](#).

NOTE

The intended behavior of `vkEnumerateInstanceVersion` is that an implementation **should** not need to perform memory allocations and **should** unconditionally return `VK_SUCCESS`. The loader, and any enabled layers, **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` in the case of a failed memory allocation.

Valid Usage (Implicit)

- VUID-vkEnumerateInstanceVersion-pApiVersion-parameter `pApiVersion` **must** be a valid pointer to a `uint32_t` value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

To create an instance object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateInstance(
    const VkInstanceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkInstance* pInstance);
```

- `pCreateInfo` is a pointer to a `VkInstanceCreateInfo` structure controlling creation of the instance.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pInstance` points a `VkInstance` handle in which the resulting instance is returned.

`vkCreateInstance` verifies that the requested layers exist. If not, `vkCreateInstance` will return

`VK_ERROR_LAYER_NOT_PRESENT`. Next `vkCreateInstance` verifies that the requested extensions are supported (e.g. in the implementation or in any enabled instance layer) and if any requested extension is not supported, `vkCreateInstance` **must** return `VK_ERROR_EXTENSION_NOT_PRESENT`. After verifying and enabling the instance layers and extensions the `VkInstance` object is created and returned to the application. If a requested extension is only supported by a layer, both the layer and the extension need to be specified at `vkCreateInstance` time for the creation to succeed.

Valid Usage

- VUID-vkCreateInstance-ppEnabledExtensionNames-01388

All **required extensions** for each extension in the `VkInstanceCreateInfo::ppEnabledExtensionNames` list **must** also be present in that list

Valid Usage (Implicit)

- VUID-vkCreateInstance-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkInstanceCreateInfo` structure
- VUID-vkCreateInstance-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateInstance-pInstance-parameter
`pInstance` **must** be a valid pointer to a `VkInstance` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_LAYER_NOT_PRESENT`
- `VK_ERROR_EXTENSION_NOT_PRESENT`
- `VK_ERROR_INCOMPATIBLE_DRIVER`

The `VkInstanceCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkInstanceCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkInstanceCreateFlags flags;
    const VkApplicationInfo* pApplicationInfo;
    uint32_t             enabledLayerCount;
    const char* const*   ppEnabledLayerNames;
    uint32_t             enabledExtensionCount;
    const char* const*   ppEnabledExtensionNames;
} VkInstanceCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkInstanceCreateFlagBits` indicating the behavior of the instance.
- `pApplicationInfo` is `NULL` or a pointer to a `VkApplicationInfo` structure. If not `NULL`, this information helps implementations recognize behavior inherent to classes of applications. `VkApplicationInfo` is defined in detail below.
- `enabledLayerCount` is the number of global layers to enable.
- `ppEnabledLayerNames` is a pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings containing the names of layers to enable for the created instance. The layers are loaded in the order they are listed in this array, with the first array element being the closest to the application, and the last array element being the closest to the driver. See the [Layers](#) section for further details.
- `enabledExtensionCount` is the number of global extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable.

To capture events that occur while creating or destroying an instance, an application **can** link a `VkDebugReportCallbackCreateInfoEXT` structure or a `VkDebugUtilsMessengerCreateInfoEXT` structure to the `pNext` element of the `VkInstanceCreateInfo` structure given to `vkCreateInstance`. This callback is only valid for the duration of the `vkCreateInstance` and the `vkDestroyInstance` call. Use `vkCreateDebugReportCallbackEXT` or `vkCreateDebugUtilsMessengerEXT` to create persistent callback objects.

An application can add additional drivers by including the `VkDirectDriverLoadingListLUNARG` struct to the `pNext` element of the `VkInstanceCreateInfo` structure given to `vkCreateInstance`.

NOTE

`VkDirectDriverLoadingListLUNARG` allows applications to ship drivers with themselves. Only drivers that are designed to work with it should be used, such as drivers that implement Vulkan in software or that implement Vulkan by translating it to a different API. Any driver that requires installation should not be used, such as hardware drivers.

Valid Usage

- VUID-VkInstanceCreateInfo-pNext-04925

If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkDebugReportCallbackCreateInfoEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_EXT_debug_report`

- VUID-VkInstanceCreateInfo-pNext-04926

If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkDebugUtilsMessengerCreateInfoEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_EXT_debug_utils`

- VUID-VkInstanceCreateInfo-pNext-06779

If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member **must** be either `VK_EXPORT_METAL_OBJECT_TYPE_METAL_DEVICE_BIT_EXT` or `VK_EXPORT_METAL_OBJECT_TYPE_METAL_COMMAND_QUEUE_BIT_EXT`

- VUID-VkInstanceCreateInfo-flags-06559

If `flags` has the `VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR` bit set, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_KHR_portability_enumeration`

- VUID-VkInstanceCreateInfo-pNext-09400

If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkDirectDriverLoadingListLUNARG` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_LUNARG_direct_driver_loading`

- VUID-VkInstanceCreateInfo-pNext-10242

If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkLayerSettingsCreateInfoEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_EXT_layer_settings`

- VUID-VkInstanceCreateInfo-pNext-10243

If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkValidationFeaturesEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_EXT_validation_features`

- VUID-VkInstanceCreateInfo-pNext-10244

If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkValidationFlagsEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_EXT_validation_flags`

Valid Usage (Implicit)

- VUID-VkInstanceCreateInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO`

- VUID-VkInstanceCreateInfo-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDebugReportCallbackCreateInfoEXT`,

VkDebugUtilsMessengerCreateInfoEXT,
VkExportMetalObjectCreateInfoEXT,
VkValidationFeaturesEXT, or VkValidationFlagsEXT

VkDirectDriverLoadingListLUNARG,
VkLayerSettingsCreateInfoEXT,

- VUID-VkInstanceCreateInfo-sType-unique
The **sType** value of each struct in the **pNext** chain **must** be unique, with the exception of structures of type [VkDebugUtilsMessengerCreateInfoEXT](#), [VkExportMetalObjectCreateInfoEXT](#), or [VkLayerSettingsCreateInfoEXT](#)
- VUID-VkInstanceCreateInfo-flags-parameter
flags **must** be a valid combination of [VkInstanceCreateFlagBits](#) values
- VUID-VkInstanceCreateInfo-pApplicationInfo-parameter
If **pApplicationInfo** is not **NULL**, **pApplicationInfo** **must** be a valid pointer to a valid [VkApplicationInfo](#) structure
- VUID-VkInstanceCreateInfo-ppEnabledLayerNames-parameter
If **enabledLayerCount** is not **0**, **ppEnabledLayerNames** **must** be a valid pointer to an array of **enabledLayerCount** null-terminated UTF-8 strings
- VUID-VkInstanceCreateInfo-ppEnabledExtensionNames-parameter
If **enabledExtensionCount** is not **0**, **ppEnabledExtensionNames** **must** be a valid pointer to an array of **enabledExtensionCount** null-terminated UTF-8 strings

```
// Provided by VK_VERSION_1_0
typedef enum VkInstanceCreateFlagBits {
    // Provided by VK_KHR_portability_enumeration
    VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR = 0x00000001,
} VkInstanceCreateFlagBits;
```

- **VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR** specifies that the instance will enumerate available Vulkan Portability-compliant physical devices and groups in addition to the Vulkan physical devices and groups that are enumerated by default.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkInstanceCreateFlags;
```

VkInstanceCreateFlags is a bitmask type for setting a mask of zero or more [VkInstanceCreateFlagBits](#).

When creating a Vulkan instance for which you wish to disable validation checks, add a [VkValidationFlagsEXT](#) structure to the **pNext** chain of the [VkInstanceCreateInfo](#) structure, specifying the checks to be disabled.

```
// Provided by VK_EXT_validation_flags
typedef struct VkValidationFlagsEXT {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             disabledValidationCheckCount;
    const VkValidationCheckEXT* pDisabledValidationChecks;
} VkValidationFlagsEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `disabledValidationCheckCount` is the number of checks to disable.
- `pDisabledValidationChecks` is a pointer to an array of `VkValidationCheckEXT` values specifying the validation checks to be disabled.

Valid Usage (Implicit)

- VUID-VkValidationFlagsEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VALIDATION_FLAGS_EXT`
- VUID-VkValidationFlagsEXT-pDisabledValidationChecks-parameter
`pDisabledValidationChecks` **must** be a valid pointer to an array of `disabledValidationCheckCount` valid `VkValidationCheckEXT` values
- VUID-VkValidationFlagsEXT-disabledValidationCheckCount-arraylength
`disabledValidationCheckCount` **must** be greater than 0

Possible values of elements of the `VkValidationFlagsEXT::pDisabledValidationChecks` array, specifying validation checks to be disabled, are:

```
// Provided by VK_EXT_validation_flags
typedef enum VkValidationCheckEXT {
    VK_VALIDATION_CHECK_ALL_EXT = 0,
    VK_VALIDATION_CHECK_SHADERS_EXT = 1,
} VkValidationCheckEXT;
```

- `VK_VALIDATION_CHECK_ALL_EXT` specifies that all validation checks are disabled.
- `VK_VALIDATION_CHECK_SHADERS_EXT` specifies that shader validation is disabled.

When creating a Vulkan instance for which you wish to enable or disable specific validation features, add a `VkValidationFeaturesEXT` structure to the `pNext` chain of the `VkInstanceCreateInfo` structure, specifying the features to be enabled or disabled.

```
// Provided by VK_EXT_validation_features
typedef struct VkValidationFeaturesEXT {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 enabledValidationFeatureCount;
    const VkValidationFeatureEnableEXT* pEnabledValidationFeatures;
    uint32_t                 disabledValidationFeatureCount;
    const VkValidationFeatureDisableEXT* pDisabledValidationFeatures;
} VkValidationFeaturesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `enabledValidationFeatureCount` is the number of features to enable.
- `pEnabledValidationFeatures` is a pointer to an array of `VkValidationFeatureEnableEXT` values specifying the validation features to be enabled.
- `disabledValidationFeatureCount` is the number of features to disable.
- `pDisabledValidationFeatures` is a pointer to an array of `VkValidationFeatureDisableEXT` values specifying the validation features to be disabled.

Valid Usage

- VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-02967
If the `pEnabledValidationFeatures` array contains `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT`, then it **must** also contain `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT` or `VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT`
- VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-02968
If the `pEnabledValidationFeatures` array contains `VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT`, then it **must** not contain `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT`

Valid Usage (Implicit)

- VUID-VkValidationFeaturesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VALIDATION_FEATURES_EXT`
- VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-parameter
If `enabledValidationFeatureCount` is not 0, `pEnabledValidationFeatures` **must** be a valid pointer to an array of `enabledValidationFeatureCount` valid `VkValidationFeatureEnableEXT` values
- VUID-VkValidationFeaturesEXT-pDisabledValidationFeatures-parameter
If `disabledValidationFeatureCount` is not 0, `pDisabledValidationFeatures` **must** be a valid pointer to an array of `disabledValidationFeatureCount` valid `VkValidationFeatureDisableEXT` values

Possible values of elements of the `VkValidationFeaturesEXT::pEnabledValidationFeatures` array, specifying validation features to be enabled, are:

```
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureEnableEXT {
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT = 0,
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT = 1,
    VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT = 2,
    VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT = 3,
    VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT = 4,
} VkValidationFeatureEnableEXT;
```

- `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT` specifies that GPU-assisted validation is enabled. Activating this feature instruments shader programs to generate additional diagnostic data. This feature is disabled by default.
- `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT` specifies that the validation layers reserve a descriptor set binding slot for their own use. The layer reports a value for `VkPhysicalDeviceLimits::maxBoundDescriptorSets` that is one less than the value reported by the device. If the device supports the binding of only one descriptor set, the validation layer does not perform GPU-assisted validation. This feature is disabled by default.
- `VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT` specifies that Vulkan best-practices validation is enabled. Activating this feature enables the output of warnings related to common misuse of the API, but which are not explicitly prohibited by the specification. This feature is disabled by default.
- `VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT` specifies that the layers will process `debugPrintfEXT` operations in shaders and send the resulting output to the debug callback. This feature is disabled by default.
- `VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT` specifies that Vulkan synchronization validation is enabled. This feature reports resource access conflicts due to missing or incorrect synchronization operations between actions (Draw, Copy, Dispatch, Blit) reading or writing the same regions of memory. This feature is disabled by default.

Possible values of elements of the `VkValidationFeaturesEXT::pDisabledValidationFeatures` array, specifying validation features to be disabled, are:

```
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureDisableEXT {
    VK_VALIDATION_FEATURE_DISABLE_ALL_EXT = 0,
    VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT = 1,
    VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT = 2,
    VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT = 3,
    VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT = 4,
    VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT = 5,
    VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT = 6,
    VK_VALIDATION_FEATURE_DISABLE_SHADER_VALIDATION_CACHE_EXT = 7,
} VkValidationFeatureDisableEXT;
```

- **VK_VALIDATION_FEATURE_DISABLE_ALL_EXT** specifies that all validation checks are disabled.
- **VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT** specifies that shader validation, both runtime and standalone, is disabled. This validation occurs inside [VkShaderCreateInfoEXT](#) and [VkShaderModuleCreateInfo](#). This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT** specifies that thread safety validation is disabled. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT** specifies that stateless parameter validation is disabled. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT** specifies that object lifetime validation is disabled. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT** specifies that core validation checks are disabled. This feature is enabled by default. If this feature is disabled, **VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT** is implied.
- **VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT** specifies that protection against duplicate non-dispatchable object handles is disabled. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_SHADER_VALIDATION_CACHE_EXT** specifies that there will be no caching of shader validation results and every shader will be validated on every application execution. Shader validation caching is enabled by default.

NOTE	Disabling checks such as parameter validation and object lifetime validation prevents the reporting of error conditions that can cause other validation checks to behave incorrectly or crash. Some validation checks assume that their inputs are already valid and do not always revalidate them.
-------------	---

NOTE	The VK_EXT_validation_features extension subsumes all the functionality provided in the VK_EXT_validation_flags extension.
-------------	--

To create a Vulkan instance with a specific configuration of layer settings, add [VkLayerSettingsCreateInfoEXT](#) structures to the **pNext** chain of the [VkInstanceCreateInfo](#) structure, specifying the settings to be configured.

```
// Provided by VK_EXT_layer_settings
typedef struct VkLayerSettingsCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             settingCount;
    const VkLayerSettingEXT* pSettings;
} VkLayerSettingsCreateInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **settingCount** is the number of settings to configure.
- **pSettings** is a pointer to an array of **settingCount** [VkLayerSettingEXT](#) values specifying the settings to be configured.

Valid Usage (Implicit)

- VUID-VkLayerSettingsCreateInfoEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_LAYER_SETTINGS_CREATE_INFO_EXT**
- VUID-VkLayerSettingsCreateInfoEXT-pSettings-parameter
If **settingCount** is not 0, **pSettings** **must** be a valid pointer to an array of **settingCount** valid [VkLayerSettingEXT](#) structures

The values of elements of the [VkLayerSettingsCreateInfoEXT::pSettings](#) array, specifying layer settings to be configured, are:

```
// Provided by VK_EXT_layer_settings
typedef struct VkLayerSettingEXT {
    const char*      pLayerName;
    const char*      pSettingName;
    VkLayerSettingTypeEXT type;
    uint32_t         valueCount;
    const void*      pValues;
} VkLayerSettingEXT;
```

- **pLayerName** is a pointer to a null-terminated UTF-8 string naming the layer to configure the setting from.
- **pSettingName** is a pointer to a null-terminated UTF-8 string naming the setting to configure. Values of **pSettingName** that are unknown to the layer are ignored.
- **type** is a [VkLayerSettingTypeEXT](#) value specifying the type of the **pValues** values.
- **valueCount** is the number of values used to configure the layer setting.
- **pValues** is a pointer to an array of **valueCount** values of the type indicated by **type** to configure the layer setting.

When multiple [VkLayerSettingsCreateInfoEXT](#) structures are chained and the same [pSettingName](#) is referenced for the same [pLayerName](#), the value of the first reference of the layer setting is used.

Valid Usage

- VUID-VkLayerSettingEXT-valueCount-10070

If [valueCount](#) is not 0, [pValues](#) **must** be a valid pointer to an array of [valueCount](#) values of the type indicated by [type](#)

Valid Usage (Implicit)

- VUID-VkLayerSettingEXT-pLayerName-parameter
[pLayerName](#) **must** be a null-terminated UTF-8 string
- VUID-VkLayerSettingEXT-pSettingName-parameter
[pSettingName](#) **must** be a null-terminated UTF-8 string
- VUID-VkLayerSettingEXT-type-parameter
[type](#) **must** be a valid [VkLayerSettingTypeEXT](#) value

Possible values of [VkLayerSettingEXT::type](#), specifying the type of the data returned in [VkLayerSettingEXT::pValues](#), are:

```
// Provided by VK_EXT_layer_settings
typedef enum VkLayerSettingTypeEXT {
    VK_LAYER_SETTING_TYPE_BOOL32_EXT = 0,
    VK_LAYER_SETTING_TYPE_INT32_EXT = 1,
    VK_LAYER_SETTING_TYPE_INT64_EXT = 2,
    VK_LAYER_SETTING_TYPE_UINT32_EXT = 3,
    VK_LAYER_SETTING_TYPE_UINT64_EXT = 4,
    VK_LAYER_SETTING_TYPE_FLOAT32_EXT = 5,
    VK_LAYER_SETTING_TYPE_FLOAT64_EXT = 6,
    VK_LAYER_SETTING_TYPE_STRING_EXT = 7,
} VkLayerSettingTypeEXT;
```

- [VK_LAYER_SETTING_TYPE_BOOL32_EXT](#) specifies that the layer setting's type is [VkBool32](#).
- [VK_LAYER_SETTING_TYPE_INT32_EXT](#) specifies that the layer setting's type is signed 32-bit integer.
- [VK_LAYER_SETTING_TYPE_INT64_EXT](#) specifies that the layer setting's type is signed 64-bit integer.
- [VK_LAYER_SETTING_TYPE_UINT32_EXT](#) specifies that the layer setting's type is unsigned 32-bit integer.
- [VK_LAYER_SETTING_TYPE_UINT64_EXT](#) specifies that the layer setting's type is unsigned 64-bit integer.
- [VK_LAYER_SETTING_TYPE_FLOAT32_EXT](#) specifies that the layer setting's type is 32-bit floating-point.
- [VK_LAYER_SETTING_TYPE_FLOAT64_EXT](#) specifies that the layer setting's type is 64-bit floating-point.

- `VK_LAYER_SETTING_TYPE_STRING_EXT` specifies that the layer setting's type is a pointer to a null-terminated UTF-8 string.

The `VkDirectDriverLoadingListLUNARG` structure is defined as:

```
// Provided by VK_LUNARG_direct_driver_loading
typedef struct VkDirectDriverLoadingListLUNARG {
    VkStructureType          sType;
    const void*              pNext;
    VkDirectDriverLoadingModeLUNARG mode;
    uint32_t                 driverCount;
    const VkDirectDriverLoadingInfoLUNARG* pDrivers;
} VkDirectDriverLoadingListLUNARG;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mode` controls the mode in which to load the provided drivers.
- `driverCount` is the number of driver manifest paths.
- `pDrivers` is a pointer to an array of `driverCount` `VkDirectDriverLoadingInfoLUNARG` structures.

When creating a Vulkan instance for which additional drivers are to be included, add a `VkDirectDriverLoadingListLUNARG` structure to the `pNext` chain of the `VkInstanceCreateInfo` structure, and include in it the list of `VkDirectDriverLoadingInfoLUNARG` structures which contain the information necessary to load additional drivers.

Valid Usage (Implicit)

- VUID-VkDirectDriverLoadingListLUNARG-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DIRECT_DRIVER_LOADING_LIST_LUNARG`
- VUID-VkDirectDriverLoadingListLUNARG-mode-parameter
`mode` **must** be a valid `VkDirectDriverLoadingModeLUNARG` value
- VUID-VkDirectDriverLoadingListLUNARG-pDrivers-parameter
`pDrivers` **must** be a valid pointer to an array of `driverCount` valid `VkDirectDriverLoadingInfoLUNARG` structures
- VUID-VkDirectDriverLoadingListLUNARG-driverCount-arraylength
`driverCount` **must** be greater than 0

The `VkDirectDriverLoadingInfoLUNARG` structure is defined as:

```
// Provided by VK_LUNARG_direct_driver_loading
typedef struct VkDirectDriverLoadingInfoLUNARG {
    VkStructureType          sType;
    void*                    pNext;
    VkDirectDriverLoadingFlagsLUNARG flags;
    PFN_vkGetInstanceProcAddrLUNARG pfnGetInstanceProcAddr;
} VkDirectDriverLoadingInfoLUNARG;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `pfnGetInstanceProcAddr` is a `PFN_vkGetInstanceProcAddrLUNARG` pointer to the driver `vkGetInstanceProcAddr` function.

Valid Usage (Implicit)

- VUID-VkDirectDriverLoadingInfoLUNARG-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DIRECT_DRIVER_LOADING_INFO_LUNARG`
- VUID-VkDirectDriverLoadingInfoLUNARG-flags-zero bitmask
`flags` **must** be 0

Possible values of `VkDirectDriverLoadingListLUNARG::mode`, specifying the mode in which drivers are used, are:

```
// Provided by VK_LUNARG_direct_driver_loading
typedef enum VkDirectDriverLoadingModeLUNARG {
    VK_DIRECT_DRIVER_LOADING_MODE_EXCLUSIVE_LUNARG = 0,
    VK_DIRECT_DRIVER_LOADING_MODE_INCLUSIVE_LUNARG = 1,
} VkDirectDriverLoadingModeLUNARG;
```

- `VK_DIRECT_DRIVER_LOADING_MODE_EXCLUSIVE_LUNARG` specifies that the provided drivers are used instead of the system-loaded drivers.
- `VK_DIRECT_DRIVER_LOADING_MODE_INCLUSIVE_LUNARG` specifies that the provided drivers are used in addition to the system-loaded drivers.

```
// Provided by VK_LUNARG_direct_driver_loading
typedef VkFlags VkDirectDriverLoadingFlagsLUNARG;
```

`VkDirectDriverLoadingFlagsLUNARG` is a bitmask type for setting a mask, but is currently reserved for future use.

The type of `PFN_vkGetInstanceProcAddrLUNARG` is:

```
// Provided by VK_LUNARG_direct_driver_loading
typedef PFN_vkVoidFunction (VKAPI_PTR *PFN_vkGetInstanceProcAddrLUNARG)(
    VkInstance instance, const char* pName);
```

- `instance` is a `VkInstance` handle.
- `pName` is the name of a Vulkan command.

This type is compatible with the type of a pointer to the `vkGetInstanceProcAddr` command, but is used only to specify device driver addresses in `VkDirectDriverLoadingInfoLUNARG::pfnGetInstanceProcAddr`.

NOTE

This type exists only because of limitations in the XML schema and processing scripts, and its name may change in the future. Ideally we would use the `PFN_vkGetInstanceProcAddr` type generated in the `vulkan_core.h` header.

The `VkApplicationInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkApplicationInfo {
    VkStructureType    sType;
    const void*        pNext;
    const char*        pApplicationName;
    uint32_t           applicationVersion;
    const char*        pEngineName;
    uint32_t           engineVersion;
    uint32_t           apiVersion;
} VkApplicationInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pApplicationName` is `NULL` or is a pointer to a null-terminated UTF-8 string containing the name of the application.
- `applicationVersion` is an unsigned integer variable containing the developer-supplied version number of the application.
- `pEngineName` is `NULL` or is a pointer to a null-terminated UTF-8 string containing the name of the engine (if any) used to create the application.
- `engineVersion` is an unsigned integer variable containing the developer-supplied version number of the engine used to create the application.
- `apiVersion` **must** be the highest version of Vulkan that the application is designed to use, encoded as described in [Version Numbers](#). The patch version number specified in `apiVersion` is ignored when creating an instance object. The variant version of the instance **must** match that requested in `apiVersion`.

Vulkan 1.0 implementations were required to return `VK_ERROR_INCOMPATIBLE_DRIVER` if `apiVersion`

was larger than 1.0. Implementations that support Vulkan 1.1 or later **must** not return `VK_ERROR_INCOMPATIBLE_DRIVER` for any value of `apiVersion`.

NOTE

Because Vulkan 1.0 implementations **may** fail with `VK_ERROR_INCOMPATIBLE_DRIVER`, applications **should** determine the version of Vulkan available before calling `vkCreateInstance`. If the `vkGetInstanceProcAddr` returns `NULL` for `vkEnumerateInstanceVersion`, it is a Vulkan 1.0 implementation. Otherwise, the application **can** call `vkEnumerateInstanceVersion` to determine the version of Vulkan.

As long as the instance supports at least Vulkan 1.1, an application **can** use different versions of Vulkan with an instance than it does with a device or physical device.

NOTE

The Khronos validation layers will treat `apiVersion` as the highest API version the application targets, and will validate API usage against the minimum of that version and the implementation version (instance or device, depending on context). If an application tries to use functionality from a greater version than this, a validation error will be triggered.

For example, if the instance supports Vulkan 1.1 and three physical devices support Vulkan 1.0, Vulkan 1.1, and Vulkan 1.2, respectively, and if the application sets `apiVersion` to 1.2, the application **can** use the following versions of Vulkan:

- Vulkan 1.0 **can** be used with the instance and with all physical devices.
- Vulkan 1.1 **can** be used with the instance and with the physical devices that support Vulkan 1.1 and Vulkan 1.2.
- Vulkan 1.2 **can** be used with the physical device that supports Vulkan 1.2.

If we modify the above example so that the application sets `apiVersion` to 1.1, then the application **must** not use Vulkan 1.2 functionality on the physical device that supports Vulkan 1.2.

NOTE

Providing a `NULL` `VkInstanceCreateInfo::pApplicationInfo` or providing an `apiVersion` of 0 is equivalent to providing an `apiVersion` of `VK_MAKE_API_VERSION(0,1,0,0)`.

Valid Usage

- VUID-VkApplicationInfo-apiVersion-04010
If `apiVersion` is not 0, then it **must** be greater than or equal to `VK_API_VERSION_1_0`

Valid Usage (Implicit)

- VUID-VkApplicationInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_APPLICATION_INFO`
- VUID-VkApplicationInfo-pNext-pNext

pNext must be NULL

- VUID-VkApplicationInfo-pApplicationName-parameter
If **pApplicationName** is not **NULL**, **pApplicationName must** be a null-terminated UTF-8 string
- VUID-VkApplicationInfo-pEngineName-parameter
If **pEngineName** is not **NULL**, **pEngineName must** be a null-terminated UTF-8 string

To destroy an instance, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyInstance(
    VkInstance          instance,
    const VkAllocationCallbacks* pAllocator);
```

- **instance** is the handle of the instance to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyInstance-instance-00629
All child objects created using **instance must** have been destroyed prior to destroying **instance**
- VUID-vkDestroyInstance-instance-00630
If **VkAllocationCallbacks** were provided when **instance** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyInstance-instance-00631
If no **VkAllocationCallbacks** were provided when **instance** was created, **pAllocator must** be **NULL**

Valid Usage (Implicit)

- VUID-vkDestroyInstance-instance-parameter
If **instance** is not **NULL**, **instance must** be a valid [VkInstance](#) handle
- VUID-vkDestroyInstance-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure

Host Synchronization

- Host access to **instance must** be externally synchronized
- Host access to all **VkPhysicalDevice** objects enumerated from **instance must** be externally synchronized

Chapter 5. Devices and Queues

Once Vulkan is initialized, devices and queues are the primary objects used to interact with a Vulkan implementation.

Vulkan separates the concept of *physical* and *logical* devices. A physical device usually represents a single complete implementation of Vulkan (excluding instance-level functionality) available to the host, of which there are a finite number. A logical device represents an instance of that implementation with its own state and resources independent of other logical devices.

Physical devices are represented by `VkPhysicalDevice` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkPhysicalDevice)
```

5.1. Physical Devices

To retrieve a list of physical device objects representing the physical devices installed in the system, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumeratePhysicalDevices(
    VkInstance          instance,
    uint32_t*           pPhysicalDeviceCount,
    VkPhysicalDevice*   pPhysicalDevices);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceCount` is a pointer to an integer related to the number of physical devices available or queried, as described below.
- `pPhysicalDevices` is either `NULL` or a pointer to an array of `VkPhysicalDevice` handles.

If `pPhysicalDevices` is `NULL`, then the number of physical devices available is returned in `pPhysicalDeviceCount`. Otherwise, `pPhysicalDeviceCount` **must** point to a variable set by the application to the number of elements in the `pPhysicalDevices` array, and on return the variable is overwritten with the number of handles actually written to `pPhysicalDevices`. If `pPhysicalDeviceCount` is less than the number of physical devices available, at most `pPhysicalDeviceCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available physical devices were returned.

Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDevices-instance-parameter `instance` **must** be a valid `VkInstance` handle
- VUID-vkEnumeratePhysicalDevices-pPhysicalDeviceCount-parameter

`pPhysicalDeviceCount` **must** be a valid pointer to a `uint32_t` value

- VUID-vkEnumeratePhysicalDevices-pPhysicalDevices-parameter

If the value referenced by `pPhysicalDeviceCount` is not 0, and `pPhysicalDevices` is not NULL, `pPhysicalDevices` **must** be a valid pointer to an array of `pPhysicalDeviceCount` `VkPhysicalDevice` handles

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

To query general properties of physical devices once enumerated, call:

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceProperties(
    VkPhysicalDevice          physicalDevice,
    VkPhysicalDeviceProperties* pProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pProperties` is a pointer to a `VkPhysicalDeviceProperties` structure in which properties are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceProperties-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceProperties-pProperties-parameter
`pProperties` **must** be a valid pointer to a `VkPhysicalDeviceProperties` structure

The `VkPhysicalDeviceProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceProperties {
    uint32_t          apiVersion;
    uint32_t          driverVersion;
    uint32_t          vendorID;
    uint32_t          deviceID;
    VkPhysicalDeviceType deviceType;
    char              deviceName[VK_MAX_PHYSICAL_DEVICE_NAME_SIZE];
    uint8_t           pipelineCacheUUID[VK_UUID_SIZE];
    VkPhysicalDeviceLimits limits;
    VkPhysicalDeviceSparseProperties sparseProperties;
} VkPhysicalDeviceProperties;
```

- **apiVersion** is the version of Vulkan supported by the device, encoded as described in [Version Numbers](#).
- **driverVersion** is the vendor-specified version of the driver.
- **vendorID** is a unique identifier for the *vendor* (see below) of the physical device.
- **deviceID** is a unique identifier for the physical device among devices available from the vendor.
- **deviceType** is a [VkPhysicalDeviceType](#) specifying the type of device.
- **deviceName** is an array of `VK_MAX_PHYSICAL_DEVICE_NAME_SIZE` **char** containing a null-terminated UTF-8 string which is the name of the device.
- **pipelineCacheUUID** is an array of `VK_UUID_SIZE` **uint8_t** values representing a universally unique identifier for the device.
- **limits** is the [VkPhysicalDeviceLimits](#) structure specifying device-specific limits of the physical device. See [Limits](#) for details.
- **sparseProperties** is the [VkPhysicalDeviceSparseProperties](#) structure specifying various sparse related properties of the physical device. See [Sparse Properties](#) for details.

NOTE

The value of **apiVersion** **may** be different than the version returned by [vkEnumerateInstanceVersion](#); either higher or lower. In such cases, the application **must** not use functionality that exceeds the version of Vulkan associated with a given object. The **pApiVersion** parameter returned by [vkEnumerateInstanceVersion](#) is the version associated with a [VkInstance](#) and its children, except for a [VkPhysicalDevice](#) and its children. `VkPhysicalDeviceProperties::apiVersion` is the version associated with a [VkPhysicalDevice](#) and its children.

NOTE

The encoding of **driverVersion** is implementation-defined. It **may** not use the same encoding as **apiVersion**. Applications should follow information from the *vendor* on how to extract the version information from **driverVersion**.

On implementations that claim support for the [Roadmap 2022](#) profile, the major and minor version expressed by **apiVersion** **must** be at least Vulkan 1.3.

The **vendorID** and **deviceID** fields are provided to allow applications to adapt to device

characteristics that are not adequately exposed by other Vulkan queries.

NOTE These **may** include performance profiles, hardware errata, or other characteristics.

The *vendor* identified by **vendorID** is the entity responsible for the most salient characteristics of the underlying implementation of the **VkPhysicalDevice** being queried.

NOTE For example, in the case of a discrete GPU implementation, this **should** be the GPU chipset vendor. In the case of a hardware accelerator integrated into a system-on-chip (SoC), this **should** be the supplier of the silicon IP used to create the accelerator.

If the vendor has a **PCI vendor ID**, the low 16 bits of **vendorID** **must** contain that PCI vendor ID, and the remaining bits **must** be zero. Otherwise, the value returned **must** be a valid Khronos vendor ID, obtained as described in the [Vulkan Documentation and Extensions: Procedures and Conventions](#) document in the section “Registering a Vendor ID with Khronos”. Khronos vendor IDs are allocated starting at 0x10000, to distinguish them from the PCI vendor ID namespace. Khronos vendor IDs are symbolically defined in the **VkVendorId** type.

The vendor is also responsible for the value returned in **deviceID**. If the implementation is driven primarily by a **PCI device** with a **PCI device ID**, the low 16 bits of **deviceID** **must** contain that PCI device ID, and the remaining bits **must** be zero. Otherwise, the choice of what values to return **may** be dictated by operating system or platform policies - but **should** uniquely identify both the device version and any major configuration options (for example, core count in the case of multicore devices).

NOTE The same device ID **should** be used for all physical implementations of that device version and configuration. For example, all uses of a specific silicon IP GPU version and configuration **should** use the same device ID, even if those uses occur in different SoCs.

Khronos vendor IDs which **may** be returned in **VkPhysicalDeviceProperties::vendorID** are:

```
// Provided by VK_VERSION_1_0
typedef enum VkVendorId {
    VK_VENDOR_ID_KHRONOS = 0x10000,
    VK_VENDOR_ID_VIV = 0x10001,
    VK_VENDOR_ID_VSI = 0x10002,
    VK_VENDOR_ID_KAZAN = 0x10003,
    VK_VENDOR_ID_CODEPLAY = 0x10004,
    VK_VENDOR_ID_MESA = 0x10005,
    VK_VENDOR_ID_POCL = 0x10006,
    VK_VENDOR_ID_MOBILEYE = 0x10007,
} VkVendorId;
```

NOTE Khronos vendor IDs may be allocated by vendors at any time. Only the latest canonical versions of this Specification, of the corresponding **vk.xml** API Registry,

and of the corresponding `vulkan_core.h` header file **must** contain all reserved Khronos vendor IDs.

Only Khronos vendor IDs are given symbolic names at present. PCI vendor IDs returned by the implementation can be looked up in the PCI-SIG database.

`VK_MAX_PHYSICAL_DEVICE_NAME_SIZE` is the length in `char` values of an array containing a physical device name string, as returned in `VkPhysicalDeviceProperties::deviceName`.

```
#define VK_MAX_PHYSICAL_DEVICE_NAME_SIZE 256U
```

The physical device types which **may** be returned in `VkPhysicalDeviceProperties::deviceType` are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPhysicalDeviceType {
    VK_PHYSICAL_DEVICE_TYPE_OTHER = 0,
    VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU = 1,
    VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU = 2,
    VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU = 3,
    VK_PHYSICAL_DEVICE_TYPE_CPU = 4,
} VkPhysicalDeviceType;
```

- `VK_PHYSICAL_DEVICE_TYPE_OTHER` - the device does not match any other available types.
- `VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU` - the device is typically one embedded in or tightly coupled with the host.
- `VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU` - the device is typically a separate processor connected to the host via an interlink.
- `VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU` - the device is typically a virtual node in a virtualization environment.
- `VK_PHYSICAL_DEVICE_TYPE_CPU` - the device is typically running on the same processors as the host.

The physical device type is advertised for informational purposes only, and does not directly affect the operation of the system. However, the device type **may** correlate with other advertised properties or capabilities of the system, such as how many memory heaps there are.

To query general properties of physical devices once enumerated, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceProperties2(
    VkPhysicalDevice          physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```

or the equivalent command

```
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceProperties2KHR(
    VkPhysicalDevice          physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pProperties` is a pointer to a `VkPhysicalDeviceProperties2` structure in which properties are returned.

Each structure in `pProperties` and its `pNext` chain contains members corresponding to implementation-dependent properties, behaviors, or limits. `vkGetPhysicalDeviceProperties2` fills in each member to specify the corresponding value for the implementation.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceProperties2-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceProperties2-pProperties-parameter `pProperties` **must** be a valid pointer to a `VkPhysicalDeviceProperties2` structure

The `VkPhysicalDeviceProperties2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProperties2 {
    VkStructureType    sType;
    void*              pNext;
    VkPhysicalDeviceProperties properties;
} VkPhysicalDeviceProperties2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceProperties2 VkPhysicalDeviceProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `properties` is a `VkPhysicalDeviceProperties` structure describing properties of the physical device. This structure is written with the same values as if it were written by `vkGetPhysicalDeviceProperties`.

The `pNext` chain of this structure is used to extend the structure with properties defined by extensions.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProperties2-sType-sType
sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2
- VUID-VkPhysicalDeviceProperties2-pNext-pNext
Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of

VkPhysicalDeviceVulkan13Properties

VkPhysicalDeviceVulkan12Properties,

or

- VUID-VkPhysicalDeviceProperties2-sType-unique
The **sType** value of each struct in the **pNext** chain **must** be unique

The **VkPhysicalDeviceVulkan11Properties** structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan11Properties {
    VkStructureType    sType;
    void*              pNext;
    uint8_t            deviceUUID[VK_UUID_SIZE];
    uint8_t            driverUUID[VK_UUID_SIZE];
    uint8_t            deviceLUID[VK_LUID_SIZE];
    uint32_t           deviceNodeMask;
    VkBool32           deviceLUIDValid;
    uint32_t           subgroupSize;
    VkShaderStageFlags subgroupSupportedStages;
    VkSubgroupFeatureFlags subgroupSupportedOperations;
    VkBool32           subgroupQuadOperationsInAllStages;
    VkPointClippingBehavior pointClippingBehavior;
    uint32_t           maxMultiviewViewCount;
    uint32_t           maxMultiviewInstanceIndex;
    VkBool32           protectedNoFault;
    uint32_t           maxPerSetDescriptors;
    VkDeviceSize        maxMemoryAllocationSize;
} VkPhysicalDeviceVulkan11Properties;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **deviceUUID** is an array of **VK_UUID_SIZE** **uint8_t** values representing a universally unique identifier for the device.
- **driverUUID** is an array of **VK_UUID_SIZE** **uint8_t** values representing a universally unique identifier for the driver build in use by the device.
- **deviceLUID** is an array of **VK_LUID_SIZE** **uint8_t** values representing a locally unique identifier for the device.
- **deviceNodeMask** is a **uint32_t** bitfield identifying the node within a linked device adapter corresponding to the device.
- **deviceLUIDValid** is a boolean value that will be **VK_TRUE** if **deviceLUID** contains a valid LUID and **deviceNodeMask** contains a valid node mask, and **VK_FALSE** if they do not.
- **subgroupSize** is the default number of invocations in each subgroup. **subgroupSize** is at least 1 if any of the physical device's queues support **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**. **subgroupSize** is a power-of-two.

- `subgroupSupportedStages` is a bitfield of `VkShaderStageFlagBits` describing the shader stages that `group operations` with `subgroup scope` are supported in. `subgroupSupportedStages` will have the `VK_SHADER_STAGE_COMPUTE_BIT` bit set if any of the physical device's queues support `VK_QUEUE_COMPUTE_BIT`.
- `subgroupSupportedOperations` is a bitmask of `VkSubgroupFeatureFlagBits` specifying the sets of `group operations` with `subgroup scope` supported on this device. `subgroupSupportedOperations` will have the `VK_SUBGROUP_FEATURE_BASIC_BIT` bit set if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`.
- `subgroupQuadOperationsInAllStages` is a boolean specifying whether `quad group operations` are available in all stages, or are restricted to fragment and compute stages.
- `pointClippingBehavior` is a `VkPointClippingBehavior` value specifying the point clipping behavior supported by the implementation.
- `maxMultiviewViewCount` is one greater than the maximum view index that **can** be used in a subpass.
- `maxMultiviewInstanceIndex` is the maximum valid value of instance index allowed to be generated by a drawing command recorded within a subpass of a multiview render pass instance.
- `protectedNoFault` specifies how an implementation behaves when an application attempts to write to unprotected memory in a protected queue operation, read from protected memory in an unprotected queue operation, or perform a query in a protected queue operation. If this limit is `VK_TRUE`, such writes will be discarded or have undefined values written, reads and queries will return undefined values. If this limit is `VK_FALSE`, applications **must** not perform these operations. See [Protected Memory Access Rules](#) for more information.
- `maxPerSetDescriptors` is a maximum number of descriptors (summed over all descriptor types) in a single descriptor set that is guaranteed to satisfy any implementation-dependent constraints on the size of a descriptor set itself. Applications **can** query whether a descriptor set that goes beyond this limit is supported using [vkGetDescriptorSetLayoutSupport](#).
- `maxMemoryAllocationSize` is the maximum size of a memory allocation that **can** be created, even if there is more space available in the heap.

If the `VkPhysicalDeviceVulkan11Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to [vkGetPhysicalDeviceProperties2](#), it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.1 functionality.

The members of `VkPhysicalDeviceVulkan11Properties` have the same values as the corresponding members of [VkPhysicalDeviceIDProperties](#), [VkPhysicalDeviceSubgroupProperties](#), [VkPhysicalDevicePointClippingProperties](#), [VkPhysicalDeviceMultiviewProperties](#), [VkPhysicalDeviceProtectedMemoryProperties](#), and [VkPhysicalDeviceMaintenance3Properties](#).

NOTE

The `subgroupSupportedStages`, `subgroupSupportedOperations`, and `subgroupQuadOperationsInAllStages` members of this structure correspond respectively to the `VkPhysicalDeviceSubgroupProperties::supportedStages`, `VkPhysicalDeviceSubgroupProperties::supportedOperations`, and

`VkPhysicalDeviceSubgroupProperties::quadOperationsInAllStages` members, but add the `subgroup` prefix to the member name.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceVulkan11Properties-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_1_PROPERTIES`

The `VkPhysicalDeviceVulkan12Properties` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan12Properties {
    VkStructureType    sType;
    void*              pNext;
    VkDriverId         driverID;
    char               driverName[VK_MAX_DRIVER_NAME_SIZE];
    char               driverInfo[VK_MAX_DRIVER_INFO_SIZE];
    VkConformanceVersion conformanceVersion;
    VkShaderFloatControlsIndependence denormBehaviorIndependence;
    VkShaderFloatControlsIndependence roundingModeIndependence;
    VkBool32           shaderSignedZeroInfNanPreserveFloat16;

```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **driverID** is a unique identifier for the driver of the physical device.
- **driverName** is an array of **VK_MAX_DRIVER_NAME_SIZE** **char** containing a null-terminated UTF-8 string which is the name of the driver.
- **driverInfo** is an array of **VK_MAX_DRIVER_INFO_SIZE** **char** containing a null-terminated UTF-8 string with additional information about the driver.
- **conformanceVersion** is the latest version of the Vulkan conformance test that the implementor has successfully tested this driver against prior to release (see [VkConformanceVersion](#)).
- **denormBehaviorIndependence** is a [VkShaderFloatControlsIndependence](#) value indicating whether, and how, denorm behavior can be set independently for different bit widths.
- **roundingModeIndependence** is a [VkShaderFloatControlsIndependence](#) value indicating whether,

and how, rounding modes can be set independently for different bit widths.

- `shaderSignedZeroInfNanPreserveFloat16` is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 16-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode **can** be used for 16-bit floating-point types.
- `shaderSignedZeroInfNanPreserveFloat32` is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 32-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode **can** be used for 32-bit floating-point types.
- `shaderSignedZeroInfNanPreserveFloat64` is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 64-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode **can** be used for 64-bit floating-point types.
- `shaderDenormPreserveFloat16` is a boolean value indicating whether denormals **can** be preserved in 16-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode **can** be used for 16-bit floating-point types.
- `shaderDenormPreserveFloat32` is a boolean value indicating whether denormals **can** be preserved in 32-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode **can** be used for 32-bit floating-point types.
- `shaderDenormPreserveFloat64` is a boolean value indicating whether denormals **can** be preserved in 64-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode **can** be used for 64-bit floating-point types.
- `shaderDenormFlushToZeroFloat16` is a boolean value indicating whether denormals **can** be flushed to zero in 16-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 16-bit floating-point types.
- `shaderDenormFlushToZeroFloat32` is a boolean value indicating whether denormals **can** be flushed to zero in 32-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 32-bit floating-point types.
- `shaderDenormFlushToZeroFloat64` is a boolean value indicating whether denormals **can** be flushed to zero in 64-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 64-bit floating-point types.
- `shaderRoundingModeRTEFloat16` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 16-bit floating-point types.
- `shaderRoundingModeRTEFloat32` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 32-bit floating-point types.
- `shaderRoundingModeRTEFloat64` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 64-bit floating-point types.
- `shaderRoundingModeRTZFloat16` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be

used for 16-bit floating-point types.

- `shaderRoundingModeRTZFloat32` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 32-bit floating-point types.
- `shaderRoundingModeRTZFloat64` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 64-bit floating-point types.
- `maxUpdateAfterBindDescriptorsInAllPools` is the maximum number of descriptors (summed over all descriptor types) that **can** be created across all pools that are created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set. Pool creation **may** fail when this limit is exceeded, or when the space this limit represents is unable to satisfy a pool creation due to fragmentation.
- `shaderUniformBufferArrayNonUniformIndexingNative` is a boolean value indicating whether uniform buffer descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of uniform buffers **may** execute multiple times in order to access all the descriptors.
- `shaderSampledImageArrayNonUniformIndexingNative` is a boolean value indicating whether sampler and image descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of samplers or images **may** execute multiple times in order to access all the descriptors.
- `shaderStorageBufferArrayNonUniformIndexingNative` is a boolean value indicating whether storage buffer descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of storage buffers **may** execute multiple times in order to access all the descriptors.
- `shaderStorageImageArrayNonUniformIndexingNative` is a boolean value indicating whether storage image descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of storage images **may** execute multiple times in order to access all the descriptors.
- `shaderInputAttachmentArrayNonUniformIndexingNative` is a boolean value indicating whether input attachment descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of input attachments **may** execute multiple times in order to access all the descriptors.
- `robustBufferAccessUpdateAfterBind` is a boolean value indicating whether `robustBufferAccess` **can** be enabled on a device simultaneously with `descriptorBindingUniformBufferUpdateAfterBind`, `descriptorBindingStorageBufferUpdateAfterBind`, `descriptorBindingUniformTexelBufferUpdateAfterBind`, and/or `descriptorBindingStorageTexelBufferUpdateAfterBind`. If this is `VK_FALSE`, then either `robustBufferAccess` **must** be disabled or all of these update-after-bind features **must** be disabled.
- `quadDivergentImplicitLod` is a boolean value indicating whether implicit LOD calculations for image operations have well-defined results when the image and/or sampler objects used for the instruction are not uniform within a quad. See [Derivative Image Operations](#).

- `maxPerStageDescriptorUpdateAfterBindSamplers` is similar to `maxPerStageDescriptorSamplers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindUniformBuffers` is similar to `maxPerStageDescriptorUniformBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindStorageBuffers` is similar to `maxPerStageDescriptorStorageBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindSampledImages` is similar to `maxPerStageDescriptorSampledImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindStorageImages` is similar to `maxPerStageDescriptorStorageImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageDescriptorUpdateAfterBindInputAttachments` is similar to `maxPerStageDescriptorInputAttachments` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxPerStageUpdateAfterBindResources` is similar to `maxPerStageResources` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindSamplers` is similar to `maxDescriptorSetSamplers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindUniformBuffers` is similar to `maxDescriptorSetUniformBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindUniformBuffersDynamic` is similar to `maxDescriptorSetUniformBuffersDynamic` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set. While an application **can** allocate dynamic uniform buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors **must** not be present in any descriptor set layout that includes bindings created with `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.
- `maxDescriptorSetUpdateAfterBindStorageBuffers` is similar to `maxDescriptorSetStorageBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindStorageBuffersDynamic` is similar to `maxDescriptorSetStorageBuffersDynamic` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set. While an application **can** allocate dynamic storage buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors **must** not be present in any descriptor set layout that includes bindings created with

VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT.

- `maxDescriptorSetUpdateAfterBindSampledImages` is similar to `maxDescriptorSetSampledImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindStorageImages` is similar to `maxDescriptorSetStorageImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetUpdateAfterBindInputAttachments` is similar to `maxDescriptorSetInputAttachments` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `supportedDepthResolveModes` is a bitmask of `VkResolveModeFlagBits` indicating the set of supported depth resolve modes. `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` **must** be included in the set but implementations **may** support additional modes.
- `supportedStencilResolveModes` is a bitmask of `VkResolveModeFlagBits` indicating the set of supported stencil resolve modes. `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` **must** be included in the set but implementations **may** support additional modes. `VK_RESOLVE_MODE_AVERAGE_BIT` **must** not be included in the set.
- `independentResolveNone` is `VK_TRUE` if the implementation supports setting the depth and stencil resolve modes to different values when one of those modes is `VK_RESOLVE_MODE_NONE`. Otherwise the implementation only supports setting both modes to the same value.
- `independentResolve` is `VK_TRUE` if the implementation supports all combinations of the supported depth and stencil resolve modes, including setting either depth or stencil resolve mode to `VK_RESOLVE_MODE_NONE`. An implementation that supports `independentResolve` **must** also support `independentResolveNone`.
- `filterMinmaxSingleComponentFormats` is a boolean value indicating whether a minimum set of required formats support min/max filtering.
- `filterMinmaxImageComponentMapping` is a boolean value indicating whether the implementation supports non-identity component mapping of the image when doing min/max filtering.
- `maxTimelineSemaphoreValueDifference` indicates the maximum difference allowed by the implementation between the current value of a timeline semaphore and any pending signal or wait operations.
- `framebufferIntegerColorSampleCounts` is a bitmask of `VkSampleCountFlagBits` indicating the color sample counts that are supported for all framebuffer color attachments with integer formats.

If the `VkPhysicalDeviceVulkan12Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.2 functionality.

The members of `VkPhysicalDeviceVulkan12Properties` **must** have the same values as the corresponding members of `VkPhysicalDeviceDriverProperties`, `VkPhysicalDeviceFloatControlsProperties`, `VkPhysicalDeviceDescriptorIndexingProperties`, `VkPhysicalDeviceDepthStencilResolveProperties`,

VkPhysicalDeviceSamplerFilterMinmaxProperties,
VkPhysicalDeviceTimelineSemaphoreProperties.

and

Valid Usage (Implicit)

```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **minSubgroupSize** is the minimum subgroup size supported by this device. **minSubgroupSize** is at least one if any of the physical device's queues support **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**. **minSubgroupSize** is a power-of-two. **minSubgroupSize** is less than or equal to **maxSubgroupSize**. **minSubgroupSize** is less than or equal to **subgroupSize**.
- **maxSubgroupSize** is the maximum subgroup size supported by this device. **maxSubgroupSize** is at least one if any of the physical device's queues support **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**. **maxSubgroupSize** is a power-of-two. **maxSubgroupSize** is greater than or equal to **minSubgroupSize**. **maxSubgroupSize** is greater than or equal to **subgroupSize**.
- **maxComputeWorkgroupSubgroups** is the maximum number of subgroups supported by the implementation within a workgroup.
- **requiredSubgroupSizeStages** is a bitfield of what shader stages support having a required subgroup size specified.
- **maxInlineUniformBlockSize** is the maximum size in bytes of an **inline uniform block** binding.
- **maxPerStageDescriptorInlineUniformBlocks** is the maximum number of inline uniform block bindings that **can** be accessible to a single shader stage in a pipeline layout. Descriptor bindings with a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** count against this limit. Only descriptor bindings in descriptor set layouts created without the

`VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.

- `maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks` is similar to `maxPerStageDescriptorInlineUniformBlocks` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetInlineUniformBlocks` is the maximum number of inline uniform block bindings that **can** be included in descriptor bindings in a pipeline layout across all pipeline shader stages and descriptor set numbers. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.
- `maxDescriptorSetUpdateAfterBindInlineUniformBlocks` is similar to `maxDescriptorSetInlineUniformBlocks` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxInlineUniformTotalSize` is the maximum total size in bytes of all inline uniform block bindings, across all pipeline shader stages and descriptor set numbers, that **can** be included in a pipeline layout. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit.
- `integerDotProduct8BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct8BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct8BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct4x8BitPackedUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the `OpUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct4x8BitPackedSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the `OpSDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct4x8BitPackedMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness dot product operations from operands packed into 32-bit integers using the `OpSUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct16BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct16BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct16BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V

instruction is accelerated [as defined below](#).

- `integerDotProduct32BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct32BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct32BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating8BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating8BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating16BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).

- `integerDotProductAccumulatingSaturating16BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating32BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating32BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `storageTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a storage texel buffer of any format. The value **must** be a power of two.
- `storageTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a storage texel buffer of any format.
- `uniformTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a uniform texel buffer of any format. The value **must** be a power of two.
- `uniformTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a uniform texel buffer of any format.
- `maxBufferSize` is the maximum size `VkBuffer` that **can** be created.

If the `VkPhysicalDeviceVulkan13Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.3 functionality.

The members of `VkPhysicalDeviceVulkan13Properties` **must** have the same values as the corresponding members of `VkPhysicalDeviceInlineUniformBlockProperties` and `VkPhysicalDeviceSubgroupSizeControlProperties`.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceVulkan13Properties-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_3_PROPERTIES`

The `VkPhysicalDeviceIDProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceIDProperties {
    VkStructureType    sType;
    void*              pNext;
    uint8_t            deviceUUID[VK_UUID_SIZE];
    uint8_t            driverUUID[VK_UUID_SIZE];
    uint8_t            deviceLUID[VK_LUID_SIZE];
    uint32_t           deviceNodeMask;
    VkBool32           deviceLUIDValid;
} VkPhysicalDeviceIDProperties;
```

or the equivalent

```
// Provided by VK_KHR_external_fence_capabilities,
VK_KHR_external_memory_capabilities, VK_KHR_external_semaphore_capabilities
typedef VkPhysicalDeviceIDProperties VkPhysicalDeviceIDPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the device.
- `driverUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the driver build in use by the device.
- `deviceLUID` is an array of `VK_LUID_SIZE` `uint8_t` values representing a locally unique identifier for the device.
- `deviceNodeMask` is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.
- `deviceLUIDValid` is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.

If the `VkPhysicalDeviceIDProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

`deviceUUID` **must** be immutable for a given device across instances, processes, driver APIs, driver versions, and system reboots.

Applications **can** compare the **driverUUID** value across instance and process boundaries, and **can** make similar queries in external APIs to determine whether they are capable of sharing memory objects and resources using them with the device.

deviceUUID and/or **driverUUID** **must** be used to determine whether a particular external object can be shared between driver components, where such a restriction exists as defined in the compatibility table for the particular object type:

- [External memory handle types compatibility](#)
- [External semaphore handle types compatibility](#)
- [External fence handle types compatibility](#)

If **deviceLUIDValid** is **VK_FALSE**, the values of **deviceLUID** and **deviceNodeMask** are undefined. If **deviceLUIDValid** is **VK_TRUE** and Vulkan is running on the Windows operating system, the contents of **deviceLUID** **can** be cast to an **LUID** object and **must** be equal to the locally unique identifier of a **IDXGIAdapter1** object that corresponds to **physicalDevice**. If **deviceLUIDValid** is **VK_TRUE**, **deviceNodeMask** **must** contain exactly one bit. If Vulkan is running on an operating system that supports the Direct3D 12 API and **physicalDevice** corresponds to an individual device in a linked device adapter, **deviceNodeMask** identifies the Direct3D 12 node corresponding to **physicalDevice**. Otherwise, **deviceNodeMask** **must** be 1.

NOTE

Although they have identical descriptions, [VkPhysicalDeviceIDProperties::deviceUUID](#) may differ from [VkPhysicalDeviceProperties2::pipelineCacheUUID](#). The former is intended to identify and correlate devices across API and driver boundaries, while the latter is used to identify a compatible device and driver combination to use when serializing and de-serializing pipeline state.

Implementations **should** return **deviceUUID** values which are likely to be unique even in the presence of multiple Vulkan implementations (such as a GPU driver and a software renderer; two drivers for different GPUs; or the same Vulkan driver running on two logically different devices).

Khronos' conformance testing is unable to guarantee that **deviceUUID** values are actually unique, so implementors **should** make their own best efforts to ensure this. In particular, hard-coded **deviceUUID** values, especially all-0 bits, **should** never be used.

A combination of values unique to the vendor, the driver, and the hardware environment can be used to provide a **deviceUUID** which is unique to a high degree of certainty. Some possible inputs to such a computation are:

- Information reported by [vkGetPhysicalDeviceProperties](#)
- PCI device ID (if defined)
- PCI bus ID, or similar system configuration information.
- Driver binary checksums.

NOTE

While [VkPhysicalDeviceIDProperties::deviceUUID](#) is specified to remain consistent

across driver versions and system reboots, it is not intended to be usable as a serializable persistent identifier for a device. It may change when a device is physically added to, removed from, or moved to a different connector in a system while that system is powered down. Further, there is no reasonable way to verify with conformance testing that a given device retains the same UUID in a given system across all driver versions supported in that system. While implementations should make every effort to report consistent device UUIDs across driver versions, applications should avoid relying on the persistence of this value for uses other than identifying compatible devices for external object sharing purposes.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceIDProperties-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ID_PROPERTIES`

`VK_UUID_SIZE` is the length in `uint8_t` values of an array containing a universally unique device or driver build identifier, as returned in `VkPhysicalDeviceIDProperties::deviceUUID` and `VkPhysicalDeviceIDProperties::driverUUID`.

```
#define VK_UUID_SIZE 16U
```

`VK_LUID_SIZE` is the length in `uint8_t` values of an array containing a locally unique device identifier, as returned in `VkPhysicalDeviceIDProperties::deviceLUID`.

```
#define VK_LUID_SIZE 8U
```

or the equivalent

```
#define VK_LUID_SIZE_KHR VK_LUID_SIZE
```

The `VkPhysicalDeviceDriverProperties` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDriverProperties {
    VkStructureType    sType;
    void*              pNext;
    VkDriverId         driverID;
    char               driverName[VK_MAX_DRIVER_NAME_SIZE];
    char               driverInfo[VK_MAX_DRIVER_INFO_SIZE];
    VkConformanceVersion conformanceVersion;
} VkPhysicalDeviceDriverProperties;
```

or the equivalent

```
// Provided by VK_KHR_driver_properties
typedef VkPhysicalDeviceDriverProperties VkPhysicalDeviceDriverPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `driverID` is a unique identifier for the driver of the physical device.
- `driverName` is an array of `VK_MAX_DRIVER_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the driver.
- `driverInfo` is an array of `VK_MAX_DRIVER_INFO_SIZE` `char` containing a null-terminated UTF-8 string with additional information about the driver.
- `conformanceVersion` is the latest version of the Vulkan conformance test that the implementor has successfully tested this driver against prior to release (see `VkConformanceVersion`).

If the `VkPhysicalDeviceDriverProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the driver corresponding to a physical device.

`driverID` **must** be immutable for a given driver across instances, processes, driver versions, and system reboots.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDriverProperties-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRIVER_PROPERTIES`

Khronos driver IDs which **may** be returned in `VkPhysicalDeviceDriverProperties::driverID` are:

```
// Provided by VK_VERSION_1_2
typedef enum VkDriverId {
    VK_DRIVER_ID_AMD_PROPRIETARY = 1,
    VK_DRIVER_ID_AMD_OPEN_SOURCE = 2,
    VK_DRIVER_ID_MESA_RADV = 3,
    VK_DRIVER_ID_NVIDIA_PROPRIETARY = 4,
    VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS = 5,
    VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA = 6,
    VK_DRIVER_ID_IMAGINATION_PROPRIETARY = 7,
    VK_DRIVER_ID_QUALCOMM_PROPRIETARY = 8,
    VK_DRIVER_ID_ARM_PROPRIETARY = 9,
    VK_DRIVER_ID_GOOGLE_SWIFTSHADER = 10,
    VK_DRIVER_ID_GGP_PROPRIETARY = 11,
    VK_DRIVER_ID_BROADCOM_PROPRIETARY = 12,
    VK_DRIVER_ID_MESA_LLVMPIPE = 13,
    VK_DRIVER_ID_MOLTENVK = 14,
```

```

VK_DRIVER_ID_COREAVI_PROPRIETARY = 15,
VK_DRIVER_ID_JUICE_PROPRIETARY = 16,
VK_DRIVER_ID_VERISILICON_PROPRIETARY = 17,
VK_DRIVER_ID_MESA_TURNIP = 18,
VK_DRIVER_ID_MESA_V3DV = 19,
VK_DRIVER_ID_MESA_PANVK = 20,
VK_DRIVER_ID_SAMSUNG_PROPRIETARY = 21,
VK_DRIVER_ID_MESA_VENUS = 22,
VK_DRIVER_ID_MESA_DOZEN = 23,
VK_DRIVER_ID_MESA_NVK = 24,
VK_DRIVER_ID_IMAGINATION_OPEN_SOURCE_MESA = 25,
VK_DRIVER_ID_MESA_HONEYKRISP = 26,
VK_DRIVER_ID_RESERVED_27 = 27,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_AMD_PROPRIETARY_KHR = VK_DRIVER_ID_AMD_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_AMD_OPEN_SOURCE_KHR = VK_DRIVER_ID_AMD_OPEN_SOURCE,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_MESA_RADV_KHR = VK_DRIVER_ID_MESA_RADV,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_NVIDIA_PROPRIETARY_KHR = VK_DRIVER_ID_NVIDIA_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS_KHR =
VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA_KHR = VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_IMAGINATION_PROPRIETARY_KHR = VK_DRIVER_ID_IMAGINATION_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_QUALCOMM_PROPRIETARY_KHR = VK_DRIVER_ID_QUALCOMM_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_ARM_PROPRIETARY_KHR = VK_DRIVER_ID_ARM_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_GOOGLE_SWIFTSHADER_KHR = VK_DRIVER_ID_GOOGLE_SWIFTSHADER,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_GGP_PROPRIETARY_KHR = VK_DRIVER_ID_GGP_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_BROADCOM_PROPRIETARY_KHR = VK_DRIVER_ID_BROADCOM_PROPRIETARY,
} VkDriverId;

```

or the equivalent

```

// Provided by VK_KHR_driver_properties
typedef VkDriverId VkDriverIdKHR;

```

NOTE

Khronos driver IDs may be allocated by vendors at any time. There may be multiple driver IDs for the same vendor, representing different drivers (for e.g. different platforms, proprietary or open source, etc.). Only the latest canonical versions of this Specification, of the corresponding [vk.xml](#) API Registry, and of the

corresponding `vulkan_core.h` header file **must** contain all reserved Khronos driver IDs.

Only driver IDs registered with Khronos are given symbolic names. There **may** be unregistered driver IDs returned.

`VK_MAX_DRIVER_NAME_SIZE` is the length in `char` values of an array containing a driver name string, as returned in `VkPhysicalDeviceDriverProperties::driverName`.

```
#define VK_MAX_DRIVER_NAME_SIZE          256U
```

or the equivalent

```
#define VK_MAX_DRIVER_NAME_SIZE_KHR      VK_MAX_DRIVER_NAME_SIZE
```

`VK_MAX_DRIVER_INFO_SIZE` is the length in `char` values of an array containing a driver information string, as returned in `VkPhysicalDeviceDriverProperties::driverInfo`.

```
#define VK_MAX_DRIVER_INFO_SIZE          256U
```

or the equivalent

```
#define VK_MAX_DRIVER_INFO_SIZE_KHR      VK_MAX_DRIVER_INFO_SIZE
```

The conformance test suite version an implementation is compliant with is described with the `VkConformanceVersion` structure:

```
// Provided by VK_VERSION_1_2
typedef struct VkConformanceVersion {
    uint8_t    major;
    uint8_t    minor;
    uint8_t    subminor;
    uint8_t    patch;
} VkConformanceVersion;
```

or the equivalent

```
// Provided by VK_KHR_driver_properties
typedef VkConformanceVersion VkConformanceVersionKHR;
```

- `major` is the major version number of the conformance test suite.
- `minor` is the minor version number of the conformance test suite.

- **subminor** is the subminor version number of the conformance test suite.
- **patch** is the patch version number of the conformance test suite.

The **VkPhysicalDevicePCIBusInfoPropertiesEXT** structure is defined as:

```
// Provided by VK_EXT_pci_bus_info
typedef struct VkPhysicalDevicePCIBusInfoPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           pciDomain;
    uint32_t           pciBus;
    uint32_t           pciDevice;
    uint32_t           pciFunction;
} VkPhysicalDevicePCIBusInfoPropertiesEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pciDomain** is the PCI bus domain.
- **pciBus** is the PCI bus identifier.
- **pciDevice** is the PCI device identifier.
- **pciFunction** is the PCI device function identifier.

If the **VkPhysicalDevicePCIBusInfoPropertiesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

These are properties of the PCI bus information of a physical device.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePCIBusInfoPropertiesEXT-sType-sType
sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PCI_BUS_INFO_PROPERTIES_EXT**

The **VkPhysicalDeviceDrmPropertiesEXT** structure is defined as:

```
// Provided by VK_EXT_physical_device_drm
typedef struct VkPhysicalDeviceDrmPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           hasPrimary;
    VkBool32           hasRender;
    int64_t            primaryMajor;
    int64_t            primaryMinor;
    int64_t            renderMajor;
    int64_t            renderMinor;
} VkPhysicalDeviceDrmPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hasPrimary` is a boolean indicating whether the physical device has a DRM primary node.
- `hasRender` is a boolean indicating whether the physical device has a DRM render node.
- `primaryMajor` is the DRM primary node major number, if any.
- `primaryMinor` is the DRM primary node minor number, if any.
- `renderMajor` is the DRM render node major number, if any.
- `renderMinor` is the DRM render node minor number, if any.

If the `VkPhysicalDeviceDrmPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the DRM information of a physical device.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDrmPropertiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRM_PROPERTIES_EXT`

The `VkPhysicalDeviceShaderIntegerDotProductProperties` structure is defined as:

```

// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceShaderIntegerDotProductProperties {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           integerDotProduct8BitUnsignedAccelerated;
    VkBool32           integerDotProduct8BitSignedAccelerated;
    VkBool32           integerDotProduct8BitMixedSignednessAccelerated;
    VkBool32           integerDotProduct4x8BitPackedUnsignedAccelerated;
    VkBool32           integerDotProduct4x8BitPackedSignedAccelerated;
    VkBool32           integerDotProduct4x8BitPackedMixedSignednessAccelerated;
    VkBool32           integerDotProduct16BitUnsignedAccelerated;
    VkBool32           integerDotProduct16BitSignedAccelerated;
    VkBool32           integerDotProduct16BitMixedSignednessAccelerated;
    VkBool32           integerDotProduct32BitUnsignedAccelerated;
    VkBool32           integerDotProduct32BitSignedAccelerated;
    VkBool32           integerDotProduct32BitMixedSignednessAccelerated;
    VkBool32           integerDotProduct64BitUnsignedAccelerated;
    VkBool32           integerDotProduct64BitSignedAccelerated;
    VkBool32           integerDotProduct64BitMixedSignednessAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating8BitUnsignedAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating8BitSignedAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating16BitUnsignedAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating16BitSignedAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating32BitUnsignedAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating32BitSignedAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating64BitUnsignedAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating64BitSignedAccelerated;
    VkBool32           integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated;
} VkPhysicalDeviceShaderIntegerDotProductProperties;

```

or the equivalent

```
// Provided by VK_KHR_shader_integer_dot_product
typedef VkPhysicalDeviceShaderIntegerDotProductProperties
VkPhysicalDeviceShaderIntegerDotProductPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `integerDotProduct8BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated [as defined below](#).

instruction is accelerated [as defined below](#).

- `integerDotProduct64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating8BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating8BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating16BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating16BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating32BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).

- `integerDotProductAccumulatingSaturating32BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).

If the `VkPhysicalDeviceShaderIntegerDotProductProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the integer dot product acceleration information of a physical device.

NOTE

A dot product operation is deemed accelerated if its implementation provides a performance advantage over application-provided code composed from elementary instructions and/or other dot product instructions, either because the implementation uses optimized machine code sequences whose generation from application-provided code cannot be guaranteed or because it uses hardware features that cannot otherwise be targeted from application-provided code.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceShaderIntegerDotProductProperties-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_DOT_PRODUCT_PROPERTIES`

The `VkPhysicalDeviceImageProcessingPropertiesQCOM` structure is defined as:

```
// Provided by VK_QCOM_image_processing
typedef struct VkPhysicalDeviceImageProcessingPropertiesQCOM {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           maxWeightFilterPhases;
    VkExtent2D         maxWeightFilterDimension;
    VkExtent2D         maxBlockMatchRegion;
    VkExtent2D         maxBoxFilterBlockSize;
} VkPhysicalDeviceImageProcessingPropertiesQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxWeightFilterPhases` is the maximum value that **can** be specified for `VkImageViewSampleWeightCreateInfoQCOM::numPhases` in `weight image sampling` operations.
- `maxWeightFilterDimension` is a `VkExtent2D` describing the largest dimensions (`width` and `height`) that **can** be specified for `VkImageViewSampleWeightCreateInfoQCOM::filterSize`.
- `maxBlockMatchRegion` is a `VkExtent2D` describing the largest dimensions (`width` and `height`) that **can** be specified for `blockSize` in `block matching` operations.
- `maxBoxFilterBlockSize` is a `VkExtent2D` describing the maximum dimensions (`width` and `height`) that **can** be specified for `blocksize` in `box filter sampling` operations.

If the `VkPhysicalDeviceImageProcessingPropertiesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the image processing information of a physical device.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageProcessingPropertiesQCOM-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_PROPERTIES_QCOM`

The `VkPhysicalDeviceShaderTileImagePropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_shader_tile_image
typedef struct VkPhysicalDeviceShaderTileImagePropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderTileImageCoherentReadAccelerated;
    VkBool32           shaderTileImageReadSampleFromPixelRateInvocation;
    VkBool32           shaderTileImageReadFromHelperInvocation;
} VkPhysicalDeviceShaderTileImagePropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderTileImageCoherentReadAccelerated` is a boolean that will be `VK_TRUE` if coherent reads of tile image data is accelerated.
- `shaderTileImageReadSampleFromPixelRateInvocation` is a boolean that will be `VK_TRUE` if reading from samples from a pixel rate fragment invocation is supported when `VkPipelineMultisampleStateCreateInfo::rasterizationSamples > 1`.
- `shaderTileImageReadFromHelperInvocation` is a boolean that will be `VK_TRUE` if reads of tile image data from helper fragment invocations result in valid values.

If the `VkPhysicalDeviceShaderTileImagePropertiesEXT` structure is included in the `pNext` chain of the

`VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the tile image information of a physical device.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceShaderTileImagePropertiesEXT-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TILE_IMAGE_PROPERTIES_EXT`

The `VkPhysicalDeviceImageProcessing2PropertiesQCOM` structure is defined as:

```
// Provided by VK_QCOM_image_processing2
typedef struct VkPhysicalDeviceImageProcessing2PropertiesQCOM {
    VkStructureType    sType;
    void*              pNext;
    VkExtent2D         maxBlockMatchWindow;
} VkPhysicalDeviceImageProcessing2PropertiesQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxBlockMatchWindow` is a `VkExtent2D` describing the largest dimensions (`width` and `height`) that **can** be specified for the block match window.

If the `VkPhysicalDeviceImageProcessing2PropertiesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the image processing2 information of a physical device.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceImageProcessing2PropertiesQCOM-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_2_PROPERTIES_QCOM`

The `VkPhysicalDeviceLayeredDriverPropertiesMSFT` structure is defined as:

```
// Provided by VK_MSFT_layered_driver
typedef struct VkPhysicalDeviceLayeredDriverPropertiesMSFT {
    VkStructureType    sType;
    void*              pNext;
    VkLayeredDriverUnderlyingApiMSFT underlyingAPI;
} VkPhysicalDeviceLayeredDriverPropertiesMSFT;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `underlyingAPI` is a `VkLayeredDriverUnderlyingApiMSFT` value indicating which underlying API is used to implement the layered driver, or `VK_LAYERED_DRIVER_UNDERLYING_API_NONE_MSFT` if the driver is not layered.

These are properties of the driver layering information of a physical device.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceLayeredDriverPropertiesMSFT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LAYERED_DRIVER_PROPERTIES_MSFT`

Underlying APIs which **may** be returned in `VkPhysicalDeviceLayeredDriverPropertiesMSFT::underlyingAPI` are:

```
// Provided by VK_MSFT_layered_driver
typedef enum VkLayeredDriverUnderlyingApiMSFT {
    VK_LAYERED_DRIVER_UNDERLYING_API_NONE_MSFT = 0,
    VK_LAYERED_DRIVER_UNDERLYING_API_D3D12_MSFT = 1,
} VkLayeredDriverUnderlyingApiMSFT;
```

The `VkPhysicalDeviceSchedulingControlsPropertiesARM` structure is defined as:

```
// Provided by VK_ARM_scheduling_controls
typedef struct VkPhysicalDeviceSchedulingControlsPropertiesARM {
    VkStructureType              sType;
    void*                        pNext;
    VkPhysicalDeviceSchedulingControlsFlagsARM schedulingControlsFlags;
} VkPhysicalDeviceSchedulingControlsPropertiesARM;
```

- `schedulingControlsFlags` specifies the specific scheduling controls that a physical device supports.

If the `VkPhysicalDeviceSchedulingControlsPropertiesARM` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSchedulingControlsPropertiesARM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_PROPERTIES_ARM`
- VUID-VkPhysicalDeviceSchedulingControlsPropertiesARM-schedulingControlsFlags-parameter
`schedulingControlsFlags` **must** be a valid combination of `VkPhysicalDeviceSchedulingControlsFlagBitsARM` values

- VUID-VkPhysicalDeviceSchedulingControlsPropertiesARM-schedulingControlsFlags-requiredbitmask
`schedulingControlsFlags` **must** not be 0

Bits which **can** be set in `VkPhysicalDeviceSchedulingControlsPropertiesARM::schedulingControlsFlags`, specifying supported scheduling controls, are:

```
// Provided by VK_ARM_scheduling_controls
// Flag bits for VkPhysicalDeviceSchedulingControlsFlagBitsARM
typedef VkFlags64 VkPhysicalDeviceSchedulingControlsFlagBitsARM;
static const VkPhysicalDeviceSchedulingControlsFlagBitsARM
VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_SHADER_CORE_COUNT_ARM = 0x00000001ULL;
```

- `VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_SHADER_CORE_COUNT_ARM` indicates that a `VkDeviceQueueShaderCoreControlCreateInfoARM` structure **may** be included in the `pNext` chain of a `VkDeviceQueueCreateInfo` or `VkDeviceCreateInfo` structure.

```
// Provided by VK_ARM_scheduling_controls
typedef VkFlags64 VkPhysicalDeviceSchedulingControlsFlagsARM;
```

`VkPhysicalDeviceSchedulingControlsFlagsARM` is a bitmask type for setting a mask of zero or more `VkPhysicalDeviceSchedulingControlsFlagBitsARM`.

To query properties of queues available on a physical device, call:

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceQueueFamilyProperties(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pQueueFamilyPropertyCount,
    VkQueueFamilyProperties*   pQueueFamilyProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pQueueFamilyPropertyCount` is a pointer to an integer related to the number of queue families available or queried, as described below.
- `pQueueFamilyProperties` is either `NULL` or a pointer to an array of `VkQueueFamilyProperties` structures.

If `pQueueFamilyProperties` is `NULL`, then the number of queue families available is returned in `pQueueFamilyPropertyCount`. Implementations **must** support at least one queue family. Otherwise, `pQueueFamilyPropertyCount` **must** point to a variable set by the application to the number of elements in the `pQueueFamilyProperties` array, and on return the variable is overwritten with the number of structures actually written to `pQueueFamilyProperties`. If `pQueueFamilyPropertyCount` is less than the number of queue families available, at most `pQueueFamilyPropertyCount` structures will be written.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceQueueFamilyProperties-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyPropertyCount-parameter `pQueueFamilyPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyProperties-parameter
If the value referenced by `pQueueFamilyPropertyCount` is not 0, and `pQueueFamilyProperties` is not `NULL`, `pQueueFamilyProperties` **must** be a valid pointer to an array of `pQueueFamilyPropertyCount` `VkQueueFamilyProperties` structures

The `VkQueueFamilyProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkQueueFamilyProperties {
    VkQueueFlags    queueFlags;
    uint32_t        queueCount;
    uint32_t        timestampValidBits;
    VkExtent3D      minImageTransferGranularity;
} VkQueueFamilyProperties;
```

- `queueFlags` is a bitmask of `VkQueueFlagBits` indicating capabilities of the queues in this queue family.
- `queueCount` is the unsigned integer count of queues in this queue family. Each queue family **must** support at least one queue.
- `timestampValidBits` is the unsigned integer count of meaningful bits in the timestamps written via `vkCmdWriteTimestamp2` or `vkCmdWriteTimestamp`. The valid range for the count is 36 to 64 bits, or a value of 0, indicating no support for timestamps. Bits outside the valid range are guaranteed to be zeros.
- `minImageTransferGranularity` is the minimum granularity supported for image transfer operations on the queues in this queue family.

The value returned in `minImageTransferGranularity` has a unit of compressed texel blocks for images having a block-compressed format, and a unit of texels otherwise.

Possible values of `minImageTransferGranularity` are:

- (0,0,0) specifies that only whole mip levels **must** be transferred using the image transfer operations on the corresponding queues. In this case, the following restrictions apply to all offset and extent parameters of image transfer operations:
 - The `x`, `y`, and `z` members of a `VkOffset3D` parameter **must** always be zero.
 - The `width`, `height`, and `depth` members of a `VkExtent3D` parameter **must** always match the width, height, and depth of the image subresource corresponding to the parameter,

respectively.

- (A_x, A_y, A_z) where A_x , A_y , and A_z are all integer powers of two. In this case the following restrictions apply to all image transfer operations:
 - x , y , and z of a `VkOffset3D` parameter **must** be integer multiples of A_x , A_y , and A_z , respectively.
 - `width` of a `VkExtent3D` parameter **must** be an integer multiple of A_x , or else $x + \text{width}$ **must** equal the width of the image subresource corresponding to the parameter.
 - `height` of a `VkExtent3D` parameter **must** be an integer multiple of A_y , or else $y + \text{height}$ **must** equal the height of the image subresource corresponding to the parameter.
 - `depth` of a `VkExtent3D` parameter **must** be an integer multiple of A_z , or else $z + \text{depth}$ **must** equal the depth of the image subresource corresponding to the parameter.
 - If the format of the image corresponding to the parameters is one of the block-compressed formats then for the purposes of the above calculations the granularity **must** be scaled up by the compressed texel block dimensions.

Queues supporting graphics and/or compute operations **must** report (1,1,1) in `minImageTransferGranularity`, meaning that there are no additional restrictions on the granularity of image transfer operations for these queues. Other queues supporting image transfer operations are only **required** to support whole mip level transfers, thus `minImageTransferGranularity` for queues belonging to such queue families **may** be (0,0,0).

The `Device Memory` section describes memory properties queried from the physical device.

For physical device feature queries see the `Features` chapter.

Bits which **may** be set in `VkQueueFamilyProperties::queueFlags`, indicating capabilities of queues in a queue family are:

```
// Provided by VK_VERSION_1_0
typedef enum VkQueueFlagBits {
    VK_QUEUE_GRAPHICS_BIT = 0x00000001,
    VK_QUEUE_COMPUTE_BIT = 0x00000002,
    VK_QUEUE_TRANSFER_BIT = 0x00000004,
    VK_QUEUE_SPARSE_BINDING_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_QUEUE_PROTECTED_BIT = 0x00000010,
    // Provided by VK_KHR_video_decode_queue
    VK_QUEUE_VIDEO_DECODE_BIT_KHR = 0x00000020,
    // Provided by VK_KHR_video_encode_queue
    VK_QUEUE_VIDEO_ENCODE_BIT_KHR = 0x00000040,
    // Provided by VK_NV_optical_flow
    VK_QUEUE_OPTICAL_FLOW_BIT_NV = 0x00000100,
} VkQueueFlagBits;
```

- `VK_QUEUE_GRAPHICS_BIT` specifies that queues in this queue family support graphics operations.
- `VK_QUEUE_COMPUTE_BIT` specifies that queues in this queue family support compute operations.

- `VK_QUEUE_TRANSFER_BIT` specifies that queues in this queue family support transfer operations.
- `VK_QUEUE_SPARSE_BINDING_BIT` specifies that queues in this queue family support sparse memory management operations (see [Sparse Resources](#)). If any of the sparse resource features are enabled, then at least one queue family **must** support this bit.
- `VK_QUEUE_VIDEO_DECODE_BIT_KHR` specifies that queues in this queue family support [video decode operations](#).
- `VK_QUEUE_VIDEO_ENCODE_BIT_KHR` specifies that queues in this queue family support [video encode operations](#).
- `VK_QUEUE_OPTICAL_FLOW_BIT_NV` specifies that queues in this queue family support optical flow operations.
- `VK_QUEUE_PROTECTED_BIT` specifies that queues in this queue family support the `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT` bit. (see [Protected Memory](#)). If the physical device supports the `protectedMemory` feature, at least one of its queue families **must** support this bit.

If an implementation exposes any queue family that supports graphics operations, at least one queue family of at least one physical device exposed by the implementation **must** support both graphics and compute operations.

Furthermore, if the `protectedMemory` physical device feature is supported, then at least one queue family of at least one physical device exposed by the implementation **must** support graphics operations, compute operations, and protected memory operations.

NOTE

All commands that are allowed on a queue that supports transfer operations are also allowed on a queue that supports either graphics or compute operations. Thus, if the capabilities of a queue family include `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, then reporting the `VK_QUEUE_TRANSFER_BIT` capability separately for that queue family is **optional**.

For further details see [Queues](#).

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueueFlags;
```

`VkQueueFlags` is a bitmask type for setting a mask of zero or more [VkQueueFlagBits](#).

To query properties of queues available on a physical device, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceQueueFamilyProperties2(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);
```

or the equivalent command

```
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceQueueFamilyProperties2KHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pQueueFamilyPropertyCount` is a pointer to an integer related to the number of queue families available or queried, as described in [vkGetPhysicalDeviceQueueFamilyProperties](#).
- `pQueueFamilyProperties` is either `NULL` or a pointer to an array of [VkQueueFamilyProperties2](#) structures.

`vkGetPhysicalDeviceQueueFamilyProperties2` behaves similarly to [vkGetPhysicalDeviceQueueFamilyProperties](#), with the ability to return extended information in a `pNext` chain of output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-physicalDevice-parameter `physicalDevice` **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyPropertyCount-parameter `pQueueFamilyPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyProperties-parameter If the value referenced by `pQueueFamilyPropertyCount` is not 0, and `pQueueFamilyProperties` is not `NULL`, `pQueueFamilyProperties` **must** be a valid pointer to an array of `pQueueFamilyPropertyCount` [VkQueueFamilyProperties2](#) structures

The `VkQueueFamilyProperties2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkQueueFamilyProperties2 {
    VkStructureType    sType;
    void*               pNext;
    VkQueueFamilyProperties queueFamilyProperties;
} VkQueueFamilyProperties2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkQueueFamilyProperties2 VkQueueFamilyProperties2KHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queueFamilyProperties` is a `VkQueueFamilyProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceQueueFamilyProperties`.

Valid Usage (Implicit)

- VUID-VkQueueFamilyProperties2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_PROPERTIES_2`
- VUID-VkQueueFamilyProperties2-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkQueueFamilyCheckpointProperties2NV`, `VkQueueFamilyCheckpointPropertiesNV`, `VkQueueFamilyGlobalPriorityPropertiesKHR`, `VkQueueFamilyQueryResultStatusPropertiesKHR`, or `VkQueueFamilyVideoPropertiesKHR`
- VUID-VkQueueFamilyProperties2-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique

The `VkQueueFamilyGlobalPriorityPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_global_priority
typedef struct VkQueueFamilyGlobalPriorityPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           priorityCount;
    VkQueueGlobalPriorityKHR priorities[VK_MAX_GLOBAL_PRIORITY_SIZE_KHR];
} VkQueueFamilyGlobalPriorityPropertiesKHR;
```

or the equivalent

```
// Provided by VK_EXT_global_priority_query
typedef VkQueueFamilyGlobalPriorityPropertiesKHR
VkQueueFamilyGlobalPriorityPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `priorityCount` is the number of supported global queue priorities in this queue family, and it **must** be greater than 0.
- `priorities` is an array of `VK_MAX_GLOBAL_PRIORITY_SIZE_KHR` `VkQueueGlobalPriorityKHR` enums representing all supported global queue priorities in this queue family. The first `priorityCount` elements of the array will be valid.

If the `VkQueueFamilyGlobalPriorityPropertiesKHR` structure is included in the `pNext` chain of the `VkQueueFamilyProperties2` structure passed to `vkGetPhysicalDeviceQueueFamilyProperties2`, it is filled in with the list of supported global queue priorities for the indicated family.

The valid elements of **priorities** **must** not contain any duplicate values.

The valid elements of **priorities** **must** be a continuous sequence of [VkQueueGlobalPriorityKHR](#) enums in the ascending order.

NOTE

For example, returning **priorityCount** as 3 with supported **priorities** as **VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR**, **VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR** and **VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR** is not allowed.

Valid Usage (Implicit)

- VUID-VkQueueFamilyGlobalPriorityPropertiesKHR-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES_KHR**

VK_MAX_GLOBAL_PRIORITY_SIZE_KHR is the length of an array of [VkQueueGlobalPriorityKHR](#) enumerants representing supported queue priorities, as returned in [VkQueueFamilyGlobalPriorityPropertiesKHR::priorities](#).

```
#define VK_MAX_GLOBAL_PRIORITY_SIZE_KHR 16U
```

or the equivalent

```
#define VK_MAX_GLOBAL_PRIORITY_SIZE_EXT VK_MAX_GLOBAL_PRIORITY_SIZE_KHR
```

The [VkQueueFamilyCheckpointProperties2NV](#) structure is defined as:

```
// Provided by VK_NV_device_diagnostic_checkpoints with VK_VERSION_1_3 or
VK_KHR_synchronization2
typedef struct VkQueueFamilyCheckpointProperties2NV {
    VkStructureType    sType;
    void*              pNext;
    VkPipelineStageFlags2 checkpointExecutionStageMask;
} VkQueueFamilyCheckpointProperties2NV;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **checkpointExecutionStageMask** is a mask indicating which pipeline stages the implementation can execute checkpoint markers in.

Additional queue family information can be queried by setting [VkQueueFamilyProperties2::pNext](#) to point to a [VkQueueFamilyCheckpointProperties2NV](#) structure.

Valid Usage (Implicit)

- VUID-VkQueueFamilyCheckpointProperties2NV-sType-sType
sType must be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_CHECKPOINT_PROPERTIES_2_NV`

The `VkQueueFamilyCheckpointPropertiesNV` structure is defined as:

```
// Provided by VK_NV_device_diagnostic_checkpoints
typedef struct VkQueueFamilyCheckpointPropertiesNV {
    VkStructureType    sType;
    void*              pNext;
    VkPipelineStageFlags checkpointExecutionStageMask;
} VkQueueFamilyCheckpointPropertiesNV;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **checkpointExecutionStageMask** is a mask indicating which pipeline stages the implementation can execute checkpoint markers in.

Additional queue family information can be queried by setting `VkQueueFamilyProperties2::pNext` to point to a `VkQueueFamilyCheckpointPropertiesNV` structure.

Valid Usage (Implicit)

- VUID-VkQueueFamilyCheckpointPropertiesNV-sType-sType
sType must be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_CHECKPOINT_PROPERTIES_NV`

The `VkQueueFamilyVideoPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkQueueFamilyVideoPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkVideoCodecOperationFlagsKHR videoCodecOperations;
} VkQueueFamilyVideoPropertiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **videoCodecOperations** is a bitmask of `VkVideoCodecOperationFlagBitsKHR` that indicates the set of video codec operations supported by the queue family.

If this structure is included in the **pNext** chain of the `VkQueueFamilyProperties2` structure passed to `vkGetPhysicalDeviceQueueFamilyProperties2`, then it is filled with the set of video codec operations supported by the specified queue family.

Valid Usage (Implicit)

- VUID-VkQueueFamilyVideoPropertiesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_VIDEO_PROPERTIES_KHR`

The `VkQueueFamilyQueryResultStatusPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkQueueFamilyQueryResultStatusPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           queryResultStatusSupport;
} VkQueueFamilyQueryResultStatusPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queryResultStatusSupport` reports `VK_TRUE` if query type `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR` and use of `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` are supported.

If this structure is included in the `pNext` chain of the `VkQueueFamilyProperties2` structure passed to `vkGetPhysicalDeviceQueueFamilyProperties2`, then it is filled with information about whether `result status queries` are supported by the specified queue family.

Valid Usage (Implicit)

- VUID-VkQueueFamilyQueryResultStatusPropertiesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_QUERY_RESULT_STATUS_PROPERTIES_KHR`

To enumerate the performance query counters available on a queue family of a physical device, call:

```
// Provided by VK_KHR_performance_query
VkResult vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    VkPhysicalDevice    physicalDevice,
    uint32_t            queueFamilyIndex,
    uint32_t*           pCounterCount,
    VkPerformanceCounterKHR* pCounters,
    VkPerformanceCounterDescriptionKHR* pCounterDescriptions);
```

- `physicalDevice` is the handle to the physical device whose queue family performance query counter properties will be queried.
- `queueFamilyIndex` is the index into the queue family of the physical device we want to get properties for.

- `pCounterCount` is a pointer to an integer related to the number of counters available or queried, as described below.
- `pCounters` is either `NULL` or a pointer to an array of `VkPerformanceCounterKHR` structures.
- `pCounterDescriptions` is either `NULL` or a pointer to an array of `VkPerformanceCounterDescriptionKHR` structures.

If `pCounters` is `NULL` and `pCounterDescriptions` is `NULL`, then the number of counters available is returned in `pCounterCount`. Otherwise, `pCounterCount` **must** point to a variable set by the application to the number of elements in the `pCounters`, `pCounterDescriptions`, or both arrays and on return the variable is overwritten with the number of structures actually written out. If `pCounterCount` is less than the number of counters available, at most `pCounterCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available counters were returned.

Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterCount-parameter
`pCounterCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounters-parameter
If the value referenced by `pCounterCount` is not `0`, and `pCounters` is not `NULL`, `pCounters` **must** be a valid pointer to an array of `pCounterCount` `VkPerformanceCounterKHR` structures
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterDescriptions-parameter
If the value referenced by `pCounterCount` is not `0`, and `pCounterDescriptions` is not `NULL`, `pCounterDescriptions` **must** be a valid pointer to an array of `pCounterCount` `VkPerformanceCounterDescriptionKHR` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkPerformanceCounterKHR` structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterKHR {
    VkStructureType      sType;
    void*                pNext;
    VkPerformanceCounterUnitKHR    unit;
    VkPerformanceCounterScopeKHR   scope;
    VkPerformanceCounterStorageKHR storage;
    uint8_t              uuid[VK_UUID_SIZE];
} VkPerformanceCounterKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `unit` is a `VkPerformanceCounterUnitKHR` specifying the unit that the counter data will record.
- `scope` is a `VkPerformanceCounterScopeKHR` specifying the scope that the counter belongs to.
- `storage` is a `VkPerformanceCounterStorageKHR` specifying the storage type that the counter's data uses.
- `uuid` is an array of size `VK_UUID_SIZE`, containing 8-bit values that represent a universally unique identifier for the counter of the physical device.

Valid Usage (Implicit)

- VUID-VkPerformanceCounterKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR`
- VUID-VkPerformanceCounterKHR-pNext-pNext
`pNext` **must** be `NULL`

Performance counters have an associated unit. This unit describes how to interpret the performance counter result.

The performance counter unit types which **may** be returned in `VkPerformanceCounterKHR::unit` are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterUnitKHR {
    VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR = 0,
    VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR = 1,
    VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR = 2,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR = 3,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR = 4,
    VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR = 5,
    VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR = 6,
    VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR = 7,
    VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR = 8,
    VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR = 9,
    VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR = 10,
} VkPerformanceCounterUnitKHR;
```

- `VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR` - the performance counter unit is a generic data point.
- `VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR` - the performance counter unit is a percentage (%).
- `VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR` - the performance counter unit is a value of nanoseconds (ns).
- `VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR` - the performance counter unit is a value of bytes.
- `VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR` - the performance counter unit is a value of bytes/s.
- `VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR` - the performance counter unit is a temperature reported in Kelvin.
- `VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR` - the performance counter unit is a value of watts (W).
- `VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR` - the performance counter unit is a value of volts (V).
- `VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR` - the performance counter unit is a value of amps (A).
- `VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR` - the performance counter unit is a value of hertz (Hz).
- `VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR` - the performance counter unit is a value of cycles.

Performance counters have an associated scope. This scope describes the granularity of a performance counter.

The performance counter scope types which **may** be returned in `VkPerformanceCounterKHR::scope` are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterScopeKHR {
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR = 0,
    VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR = 1,
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR = 2,
    // VK_QUERY_SCOPE_COMMAND_BUFFER_KHR is a deprecated alias
    VK_QUERY_SCOPE_COMMAND_BUFFER_KHR =
VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR,
    // VK_QUERY_SCOPE_RENDER_PASS_KHR is a deprecated alias
    VK_QUERY_SCOPE_RENDER_PASS_KHR = VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR,
    // VK_QUERY_SCOPE_COMMAND_KHR is a deprecated alias
    VK_QUERY_SCOPE_COMMAND_KHR = VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR,
} VkPerformanceCounterScopeKHR;
```

- **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR** - the performance counter scope is a single complete command buffer.
- **VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR** - the performance counter scope is zero or more complete render passes. The performance query containing the performance counter **must** begin and end outside a render pass instance.
- **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR** - the performance counter scope is zero or more commands.

Performance counters have an associated storage. This storage describes the payload of a counter result.

The performance counter storage types which **may** be returned in [VkPerformanceCounterKHR::storage](#) are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterStorageKHR {
    VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR = 0,
    VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR = 1,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR = 2,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR = 3,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR = 4,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR = 5,
} VkPerformanceCounterStorageKHR;
```

- **VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR** - the performance counter storage is a 32-bit signed integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR** - the performance counter storage is a 64-bit signed integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR** - the performance counter storage is a 32-bit unsigned integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR** - the performance counter storage is a 64-bit unsigned integer.

- `VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR` - the performance counter storage is a 32-bit floating-point.
- `VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR` - the performance counter storage is a 64-bit floating-point.

The `VkPerformanceCounterDescriptionKHR` structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterDescriptionKHR {
    VkStructureType          sType;
    void*                    pNext;
    VkPerformanceCounterDescriptionFlagsKHR flags;
    char                     name[VK_MAX_DESCRIPTION_SIZE];
    char                     category[VK_MAX_DESCRIPTION_SIZE];
    char                     description[VK_MAX_DESCRIPTION_SIZE];
} VkPerformanceCounterDescriptionKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPerformanceCounterDescriptionFlagBitsKHR` indicating the usage behavior for the counter.
- `name` is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the name of the counter.
- `category` is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the category of the counter.
- `description` is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the description of the counter.

Valid Usage (Implicit)

- VUID-VkPerformanceCounterDescriptionKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR`
- VUID-VkPerformanceCounterDescriptionKHR-pNext-pNext
`pNext` **must** be `NULL`

Bits which **can** be set in `VkPerformanceCounterDescriptionKHR::flags`, specifying usage behavior of a performance counter, are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterDescriptionFlagBitsKHR {
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR = 0x00000001,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR = 0x00000002,
    // VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR is a deprecated
    alias
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR =
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR,
    // VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR is a deprecated
    alias
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR =
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR,
} VkPerformanceCounterDescriptionFlagBitsKHR;
```

- `VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR` specifies that recording the counter **may** have a noticeable performance impact.
- `VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR` specifies that concurrently recording the counter while other submitted command buffers are running **may** impact the accuracy of the recording.

```
// Provided by VK_KHR_performance_query
typedef VkFlags VkPerformanceCounterDescriptionFlagsKHR;
```

`VkPerformanceCounterDescriptionFlagsKHR` is a bitmask type for setting a mask of zero or more `VkPerformanceCounterDescriptionFlagBitsKHR`.

5.2. Devices

Device objects represent logical connections to physical devices. Each device exposes a number of *queue families* each having one or more *queues*. All queues in a queue family support the same operations.

As described in [Physical Devices](#), a Vulkan application will first query for all physical devices in a system. Each physical device **can** then be queried for its capabilities, including its queue and queue family properties. Once an acceptable physical device is identified, an application will create a corresponding logical device. The created logical device is then the primary interface to the physical device.

How to enumerate the physical devices in a system and query those physical devices for their queue family properties is described in the [Physical Device Enumeration](#) section above.

A single logical device **can** be created from multiple physical devices, if those physical devices belong to the same device group. A *device group* is a set of physical devices that support accessing each other's memory and recording a single command buffer that **can** be executed on all the physical devices. Device groups are enumerated by calling `vkEnumeratePhysicalDeviceGroups`, and a logical device is created from a subset of the physical devices in a device group by passing the physical devices through `VkDeviceGroupDeviceCreateInfo`. For two physical devices to be in the

same device group, they **must** support identical extensions, features, and properties.

NOTE

Physical devices in the same device group **must** be so similar because there are no rules for how different features/properties would interact. They **must** return the same values for nearly every invariant `vkGetPhysicalDevice*` feature, property, capability, etc., but could potentially differ for certain queries based on things like having a different display connected, or a different compositor. The specification does not attempt to enumerate which state is in each category, because such a list would quickly become out of date.

To retrieve a list of the device groups present in the system, call:

```
// Provided by VK_VERSION_1_1
VkResult vkEnumeratePhysicalDeviceGroups(
    VkInstance          instance,
    uint32_t*           pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

or the equivalent command

```
// Provided by VK_KHR_device_group_creation
VkResult vkEnumeratePhysicalDeviceGroupsKHR(
    VkInstance          instance,
    uint32_t*           pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceGroupCount` is a pointer to an integer related to the number of device groups available or queried, as described below.
- `pPhysicalDeviceGroupProperties` is either `NULL` or a pointer to an array of `VkPhysicalDeviceGroupProperties` structures.

If `pPhysicalDeviceGroupProperties` is `NULL`, then the number of device groups available is returned in `pPhysicalDeviceGroupCount`. Otherwise, `pPhysicalDeviceGroupCount` **must** point to a variable set by the application to the number of elements in the `pPhysicalDeviceGroupProperties` array, and on return the variable is overwritten with the number of structures actually written to `pPhysicalDeviceGroupProperties`. If `pPhysicalDeviceGroupCount` is less than the number of device groups available, at most `pPhysicalDeviceGroupCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available device groups were returned.

Every physical device **must** be in exactly one device group.

Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDeviceGroups-instance-parameter

`instance` **must** be a valid `VkInstance` handle

- `VOID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupCount-parameter`
`pPhysicalDeviceGroupCount` **must** be a valid pointer to a `uint32_t` value
- `VOID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupProperties-parameter`
If the value referenced by `pPhysicalDeviceGroupCount` is not `0`, and `pPhysicalDeviceGroupProperties` is not `NULL`, `pPhysicalDeviceGroupProperties` **must** be a valid pointer to an array of `pPhysicalDeviceGroupCount` `VkPhysicalDeviceGroupProperties` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkPhysicalDeviceGroupProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceGroupProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           physicalDeviceCount;
    VkPhysicalDevice    physicalDevices[VK_MAX_DEVICE_GROUP_SIZE];
    VkBool32           subsetAllocation;
} VkPhysicalDeviceGroupProperties;
```

or the equivalent

```
// Provided by VK_KHR_device_group_creation
typedef VkPhysicalDeviceGroupProperties VkPhysicalDeviceGroupPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `physicalDeviceCount` is the number of physical devices in the group.
- `physicalDevices` is an array of `VK_MAX_DEVICE_GROUP_SIZE` `VkPhysicalDevice` handles representing all physical devices in the group. The first `physicalDeviceCount` elements of the array will be valid.

- **subsetAllocation** specifies whether logical devices created from the group support allocating device memory on a subset of devices, via the **deviceMask** member of the **VkMemoryAllocateFlagsInfo**. If this is **VK_FALSE**, then all device memory allocations are made across all physical devices in the group. If **physicalDeviceCount** is 1, then **subsetAllocation** **must** be **VK_FALSE**.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceGroupProperties-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES**
- VUID-VkPhysicalDeviceGroupProperties-pNext-pNext
pNext **must** be **NULL**

VK_MAX_DEVICE_GROUP_SIZE is the length of an array containing **VkPhysicalDevice** handle values representing all physical devices in a group, as returned in **VkPhysicalDeviceGroupProperties::physicalDevices**.

```
#define VK_MAX_DEVICE_GROUP_SIZE 32U
```

or the equivalent

```
#define VK_MAX_DEVICE_GROUP_SIZE_KHR VK_MAX_DEVICE_GROUP_SIZE
```

5.2.1. Device Creation

Logical devices are represented by **VkDevice** handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkDevice)
```

A logical device is created as a *connection* to a physical device. To create a logical device, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateDevice(
    VkPhysicalDevice          physicalDevice,
    const VkDeviceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDevice*                 pDevice);
```

- **physicalDevice** **must** be one of the device handles returned from a call to **vkEnumeratePhysicalDevices** (see **Physical Device Enumeration**).
- **pCreateInfo** is a pointer to a **VkDeviceCreateInfo** structure containing information about how to create the device.

- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pDevice` is a pointer to a handle in which the created `VkDevice` is returned.

`vkCreateDevice` verifies that extensions and features requested in the `ppEnabledExtensionNames` and `pEnabledFeatures` members of `pCreateInfo`, respectively, are supported by the implementation. If any requested extension is not supported, `vkCreateDevice` **must** return `VK_ERROR_EXTENSION_NOT_PRESENT`. If any requested feature is not supported, `vkCreateDevice` **must** return `VK_ERROR_FEATURE_NOT_PRESENT`. Support for extensions **can** be checked before creating a device by querying `vkEnumerateDeviceExtensionProperties`. Support for features **can** similarly be checked by querying `vkGetPhysicalDeviceFeatures`.

After verifying and enabling the extensions the `VkDevice` object is created and returned to the application.

Multiple logical devices **can** be created from the same physical device. Logical device creation **may** fail due to lack of device-specific resources (in addition to other errors). If that occurs, `vkCreateDevice` will return `VK_ERROR_TOO_MANY_OBJECTS`.

Valid Usage

- VUID-vkCreateDevice-ppEnabledExtensionNames-01387

All [required device extensions](#) for each extension in the `VkDeviceCreateInfo::ppEnabledExtensionNames` list **must** also be present in that list

Valid Usage (Implicit)

- VUID-vkCreateDevice-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkCreateDevice-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkDeviceCreateInfo` structure
- VUID-vkCreateDevice-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateDevice-pDevice-parameter
`pDevice` **must** be a valid pointer to a `VkDevice` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_EXTENSION_NOT_PRESENT`
- `VK_ERROR_FEATURE_NOT_PRESENT`
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_DEVICE_LOST`

The `VkDeviceCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDeviceCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkDeviceCreateFlags       flags;
    uint32_t                  queueCreateInfoCount;
    const VkDeviceQueueCreateInfo* pQueueCreateInfos;
    // enabledLayerCount is deprecated and should not be used
    uint32_t                  enabledLayerCount;
    // ppEnabledLayerNames is deprecated and should not be used
    const char* const*        ppEnabledLayerNames;
    uint32_t                  enabledExtensionCount;
    const char* const*        ppEnabledExtensionNames;
    const VkPhysicalDeviceFeatures* pEnabledFeatures;
} VkDeviceCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `queueCreateInfoCount` is the unsigned integer size of the `pQueueCreateInfos` array. Refer to the [Queue Creation](#) section below for further details.
- `pQueueCreateInfos` is a pointer to an array of `VkDeviceQueueCreateInfo` structures describing the queues that are requested to be created along with the logical device. Refer to the [Queue Creation](#) section below for further details.
- `enabledLayerCount` is deprecated and ignored.
- `ppEnabledLayerNames` is deprecated and ignored. See [Device Layer Deprecation](#).
- `enabledExtensionCount` is the number of device extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable for the created device. See the [Extensions](#) section for further details.
- `pEnabledFeatures` is `NULL` or a pointer to a `VkPhysicalDeviceFeatures` structure containing boolean indicators of all the features to be enabled. Refer to the [Features](#) section for further details.

Valid Usage

- VUID-VkDeviceCreateInfo-queueFamilyIndex-02802

The `queueFamilyIndex` member of each element of `pQueueCreateInfos` **must** be unique within `pQueueCreateInfos`, except that two members can share the same `queueFamilyIndex` if one describes protected-capable queues and one describes queues that are not protected-capable

- VUID-VkDeviceCreateInfo-pQueueCreateInfos-06755

If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, the sum of their `queueCount` members **must** be less than or equal to the `queueCount` member of the `VkQueueFamilyProperties` structure, as returned by `vkGetPhysicalDeviceQueueFamilyProperties` in the `pQueueFamilyProperties[queueFamilyIndex]`

- VUID-VkDeviceCreateInfo-pQueueCreateInfos-06654

If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, then all of such elements **must** have the same global priority level, which **can** be specified explicitly by the including a `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure in the `pNext` chain, or by the implicit default value

- VUID-VkDeviceCreateInfo-pNext-00373

If the `pNext` chain includes a `VkPhysicalDeviceFeatures2` structure, then `pEnabledFeatures` **must** be `NULL`

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-01840

If `VkPhysicalDeviceProperties::apiVersion` advertises Vulkan 1.1 or later, `ppEnabledExtensionNames` **must** not contain `VK_AMD_negative_viewport_height`

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-00374

`ppEnabledExtensionNames` **must** not contain both `VK_KHR_maintenance1` and `VK_AMD_negative_viewport_height`

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-03328

`ppEnabledExtensionNames` **must** not contain both `VK_KHR_buffer_device_address` and `VK_EXT_buffer_device_address`

- VUID-VkDeviceCreateInfo-pNext-04748

If the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure and `VkPhysicalDeviceVulkan12Features::bufferDeviceAddress` is `VK_TRUE`, `ppEnabledExtensionNames` **must** not contain `VK_EXT_buffer_device_address`

- VUID-VkDeviceCreateInfo-pNext-02829

If the `pNext` chain includes a `VkPhysicalDeviceVulkan11Features` structure, then it **must** not include a `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDeviceMultiviewFeatures`, `VkPhysicalDeviceVariablePointersFeatures`, `VkPhysicalDeviceProtectedMemoryFeatures`, `VkPhysicalDeviceSamplerYcbcrConversionFeatures`, or `VkPhysicalDeviceShaderDrawParametersFeatures` structure

- VUID-VkDeviceCreateInfo-pNext-02830

If the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then it **must** not include a `VkPhysicalDevice8BitStorageFeatures`,

VkPhysicalDeviceShaderAtomicInt64Features,
 VkPhysicalDeviceShaderFloat16Int8Features,
 VkPhysicalDeviceDescriptorIndexingFeatures,
 VkPhysicalDeviceScalarBlockLayoutFeatures,
 VkPhysicalDeviceImagelessFramebufferFeatures,
 VkPhysicalDeviceUniformBufferStandardLayoutFeatures,
 VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures,
 VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures,
 VkPhysicalDeviceHostQueryResetFeatures,
 VkPhysicalDeviceTimelineSemaphoreFeatures,
 VkPhysicalDeviceBufferDeviceAddressFeatures, or
 VkPhysicalDeviceVulkanMemoryModelFeatures structure

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-04476
 If `ppEnabledExtensionNames` contains "VK_KHR_shader_draw_parameters" and the `pNext` chain includes a `VkPhysicalDeviceVulkan11Features` structure, then `VkPhysicalDeviceVulkan11Features::shaderDrawParameters` **must** be `VK_TRUE`
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02831
 If `ppEnabledExtensionNames` contains "VK_KHR_draw_indirect_count" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::drawIndirectCount` **must** be `VK_TRUE`
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02832
 If `ppEnabledExtensionNames` contains "VK_KHR_sampler_mirror_clamp_to_edge" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::samplerMirrorClampToEdge` **must** be `VK_TRUE`
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02833
 If `ppEnabledExtensionNames` contains "VK_EXT_descriptor_indexing" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::descriptorIndexing` **must** be `VK_TRUE`
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02834
 If `ppEnabledExtensionNames` contains "VK_EXT_sampler_filter_minmax" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::samplerFilterMinmax` **must** be `VK_TRUE`
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02835
 If `ppEnabledExtensionNames` contains "VK_EXT_shader_viewport_index_layer" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::shaderOutputViewportIndex` and `VkPhysicalDeviceVulkan12Features::shaderOutputLayer` **must** both be `VK_TRUE`
- VUID-VkDeviceCreateInfo-pNext-06532
 If the `pNext` chain includes a `VkPhysicalDeviceVulkan13Features` structure, then it **must** not include a `VkPhysicalDeviceDynamicRenderingFeatures`, `VkPhysicalDeviceImageRobustnessFeatures`, `VkPhysicalDeviceInlineUniformBlockFeatures`, `VkPhysicalDeviceMaintenance4Features`, `VkPhysicalDevicePipelineCreationCacheControlFeatures`, `VkPhysicalDevicePrivateDataFeatures`, `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures`,

VkPhysicalDeviceShaderIntegerDotProductFeatures,
VkPhysicalDeviceShaderTerminateInvocationFeatures,
VkPhysicalDeviceSubgroupSizeControlFeatures,
VkPhysicalDeviceSynchronization2Features,
VkPhysicalDeviceTextureCompressionASTCHDRFeatures, or
VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures structure

- VUID-VkDeviceCreateInfo-pProperties-04451
If the `VK_KHR_portability_subset` extension is included in `pProperties` of `vkEnumerateDeviceExtensionProperties`, `ppEnabledExtensionNames` **must** include `"VK_KHR_portability_subset"`
- VUID-VkDeviceCreateInfo-shadingRateImage-04478
If the `shadingRateImage` feature is enabled, the `pipelineFragmentShadingRate` feature **must** not be enabled
- VUID-VkDeviceCreateInfo-shadingRateImage-04479
If the `shadingRateImage` feature is enabled, the `primitiveFragmentShadingRate` feature **must** not be enabled
- VUID-VkDeviceCreateInfo-shadingRateImage-04480
If the `shadingRateImage` feature is enabled, the `attachmentFragmentShadingRate` feature **must** not be enabled
- VUID-VkDeviceCreateInfo-fragmentDensityMap-04481
If the `fragmentDensityMap` feature is enabled, the `pipelineFragmentShadingRate` feature **must** not be enabled
- VUID-VkDeviceCreateInfo-fragmentDensityMap-04482
If the `fragmentDensityMap` feature is enabled, the `primitiveFragmentShadingRate` feature **must** not be enabled
- VUID-VkDeviceCreateInfo-fragmentDensityMap-04483
If the `fragmentDensityMap` feature is enabled, the `attachmentFragmentShadingRate` feature **must** not be enabled
- VUID-VkDeviceCreateInfo-None-04896
If `sparseImageInt64Atomics` is enabled, `shaderImageInt64Atomics` **must** be enabled
- VUID-VkDeviceCreateInfo-None-04897
If `sparseImageFloat32Atomics` is enabled, `shaderImageFloat32Atomics` **must** be enabled
- VUID-VkDeviceCreateInfo-None-04898
If `sparseImageFloat32AtomicAdd` is enabled, `shaderImageFloat32AtomicAdd` **must** be enabled
- VUID-VkDeviceCreateInfo-sparseImageFloat32AtomicMinMax-04975
If `sparseImageFloat32AtomicMinMax` is enabled, `shaderImageFloat32AtomicMinMax` **must** be enabled
- VUID-VkDeviceCreateInfo-None-08095
If `descriptorBuffer` is enabled, `ppEnabledExtensionNames` **must** not contain `VK_AMD_shader_fragment_mask`
- VUID-VkDeviceCreateInfo-pNext-09396
If the `pNext` chain includes a `VkDeviceQueueShaderCoreControlCreateInfoARM` structure, then it **must** not be included in the `pNext` chain of any of the `VkDeviceQueueCreateInfo`

structures in `pQueueCreateInfo`s

- VUID-VkDeviceCreateInfo-pNext-09397

If the `pNext` chain includes a `VkDeviceQueueShaderCoreControlCreateInfoARM` structure then `VkPhysicalDeviceSchedulingControlsPropertiesARM::schedulingControlsFlags` **must** contain `VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_SHADER_CORE_COUNT_ARM`

Valid Usage (Implicit)

- VUID-VkDeviceCreateInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO`

- VUID-VkDeviceCreateInfo-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceDeviceMemoryReportCreateInfoEXT`, `VkDeviceDiagnosticsConfigCreateInfoNV`, `VkDeviceGroupDeviceCreateInfo`, `VkDeviceMemoryOverallocationCreateInfoAMD`, `VkDevicePipelineBinaryInternalCacheControlKHR`, `VkDevicePrivateDataCreateInfo`, `VkDeviceQueueShaderCoreControlCreateInfoARM`, `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDevice4444FormatsFeaturesEXT`, `VkPhysicalDevice8BitStorageFeatures`, `VkPhysicalDeviceASTCDecodeFeaturesEXT`, `VkPhysicalDeviceAccelerationStructureFeaturesKHR`, `VkPhysicalDeviceAddressBindingReportFeaturesEXT`, `VkPhysicalDeviceAmigoProfilingFeaturesSEC`, `VkPhysicalDeviceAntiLagFeaturesAMD`, `VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT`, `VkPhysicalDeviceAttachmentFeedbackLoopLayoutFeaturesEXT`, `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT`, `VkPhysicalDeviceBorderColorSwizzleFeaturesEXT`, `VkPhysicalDeviceBufferDeviceAddressFeatures`, `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT`, `VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI`, `VkPhysicalDeviceCoherentMemoryFeaturesAMD`, `VkPhysicalDeviceColorWriteEnableFeaturesEXT`, `VkPhysicalDeviceCommandBufferInheritanceFeaturesNV`, `VkPhysicalDeviceComputeShaderDerivativesFeaturesKHR`, `VkPhysicalDeviceConditionalRenderingFeaturesEXT`, `VkPhysicalDeviceCooperativeMatrix2FeaturesNV`, `VkPhysicalDeviceCooperativeMatrixFeaturesKHR`, `VkPhysicalDeviceCooperativeMatrixFeaturesNV`, `VkPhysicalDeviceCopyMemoryIndirectFeaturesNV`, `VkPhysicalDeviceCornerSampledImageFeaturesNV`, `VkPhysicalDeviceCoverageReductionModeFeaturesNV`, `VkPhysicalDeviceCubicClampFeaturesQCOM`, `VkPhysicalDeviceCubicWeightsFeaturesQCOM`, `VkPhysicalDeviceCudaKernelLaunchFeaturesNV`, `VkPhysicalDeviceCustomBorderColorFeaturesEXT`, `VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV`, `VkPhysicalDeviceDepthBiasControlFeaturesEXT`,

VkDeviceGroupDeviceCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupDeviceCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           physicalDeviceCount;
    const VkPhysicalDevice* pPhysicalDevices;
} VkDeviceGroupDeviceCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_device_group_creation
typedef VkDeviceGroupDeviceCreateInfo VkDeviceGroupDeviceCreateInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **physicalDeviceCount** is the number of elements in the **pPhysicalDevices** array.
- **pPhysicalDevices** is a pointer to an array of physical device handles belonging to the same device group.

The elements of the **pPhysicalDevices** array are an ordered list of the physical devices that the logical device represents. These **must** be a subset of a single device group, and need not be in the same order as they were enumerated. The order of the physical devices in the **pPhysicalDevices** array determines the *device index* of each physical device, with element *i* being assigned a device index of *i*. Certain commands and structures refer to one or more physical devices by using device indices or *device masks* formed using device indices.

A logical device created without using **VkDeviceGroupDeviceCreateInfo**, or with **physicalDeviceCount** equal to zero, is equivalent to a **physicalDeviceCount** of one and **pPhysicalDevices** pointing to the **physicalDevice** parameter to [vkCreateDevice](#). In particular, the device index of that physical device is zero.

Valid Usage

- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00375
Each element of **pPhysicalDevices** **must** be unique
- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00376
All elements of **pPhysicalDevices** **must** be in the same device group as enumerated by [vkEnumeratePhysicalDeviceGroups](#)
- VUID-VkDeviceGroupDeviceCreateInfo-physicalDeviceCount-00377
If **physicalDeviceCount** is not 0, the **physicalDevice** parameter of [vkCreateDevice](#) **must** be an element of **pPhysicalDevices**

Valid Usage (Implicit)

- VUID-VkDeviceGroupDeviceCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO`
- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-parameter
If `physicalDeviceCount` is not 0, `pPhysicalDevices` **must** be a valid pointer to an array of `physicalDeviceCount` valid `VkPhysicalDevice` handles

To specify whether device memory allocation is allowed beyond the size reported by `VkPhysicalDeviceMemoryProperties`, add a `VkDeviceMemoryOverallocationCreateInfoAMD` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure. If this structure is not specified, it is as if the `VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD` value is used.

```
// Provided by VK_AMD_memory_overallocation_behavior
typedef struct VkDeviceMemoryOverallocationCreateInfoAMD {
    VkStructureType          sType;
    const void*              pNext;
    VkMemoryOverallocationBehaviorAMD overallocationBehavior;
} VkDeviceMemoryOverallocationCreateInfoAMD;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `overallocationBehavior` is the desired overallocation behavior.

Valid Usage (Implicit)

- VUID-VkDeviceMemoryOverallocationCreateInfoAMD-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_OVERALLOCATION_CREATE_INFO_AMD`
- VUID-VkDeviceMemoryOverallocationCreateInfoAMD-overallocationBehavior-parameter
`overallocationBehavior` **must** be a valid `VkMemoryOverallocationBehaviorAMD` value

Possible values for `VkDeviceMemoryOverallocationCreateInfoAMD::overallocationBehavior` include:

```
// Provided by VK_AMD_memory_overallocation_behavior
typedef enum VkMemoryOverallocationBehaviorAMD {
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD = 0,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD = 1,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD = 2,
} VkMemoryOverallocationBehaviorAMD;
```

- `VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD` lets the implementation decide if overallocation is allowed.

- `VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD` specifies overallocation is allowed if platform permits.
- `VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD` specifies the application is not allowed to allocate device memory beyond the heap sizes reported by `VkPhysicalDeviceMemoryProperties`. Allocations that are not explicitly made by the application within the scope of the Vulkan instance are not accounted for.

When using the Nsight™ Aftermath SDK, to configure how device crash dumps are created, add a `VkDeviceDiagnosticsConfigCreateInfoNV` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure.

```
// Provided by VK_NV_device_diagnostics_config
typedef struct VkDeviceDiagnosticsConfigCreateInfoNV {
    VkStructureType      sType;
    const void*          pNext;
    VkDeviceDiagnosticsConfigFlagsNV flags;
} VkDeviceDiagnosticsConfigCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkDeviceDiagnosticsConfigFlagBitsNV` specifying additional parameters for configuring diagnostic tools.

Valid Usage (Implicit)

- VUID-VkDeviceDiagnosticsConfigCreateInfoNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_DIAGNOSTICS_CONFIG_CREATE_INFO_NV`
- VUID-VkDeviceDiagnosticsConfigCreateInfoNV-flags-parameter
`flags` **must** be a valid combination of `VkDeviceDiagnosticsConfigFlagBitsNV` values

Bits which **can** be set in `VkDeviceDiagnosticsConfigCreateInfoNV::flags` include:

```
// Provided by VK_NV_device_diagnostics_config
typedef enum VkDeviceDiagnosticsConfigFlagBitsNV {
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_DEBUG_INFO_BIT_NV = 0x00000001,
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_RESOURCE_TRACKING_BIT_NV = 0x00000002,
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_AUTOMATIC_CHECKPOINTS_BIT_NV = 0x00000004,
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_ERROR_REPORTING_BIT_NV = 0x00000008,
} VkDeviceDiagnosticsConfigFlagBitsNV;
```

- `VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_DEBUG_INFO_BIT_NV` enables the generation of debug information for shaders.
- `VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_RESOURCE_TRACKING_BIT_NV` enables driver side tracking of resources (images, buffers, etc.) used to augment the device fault information.

- `VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_AUTOMATIC_CHECKPOINTS_BIT_NV` enables automatic insertion of [diagnostic checkpoints](#) for draw calls, dispatches, trace rays, and copies. The CPU call stack at the time of the command will be associated as the marker data for the automatically inserted checkpoints.
- `VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_ERROR_REPORTING_BIT_NV` enables shader error reporting.

```
// Provided by VK_NV_device_diagnostics_config
typedef VkFlags VkDeviceDiagnosticsConfigFlagsNV;
```

`VkDeviceDiagnosticsConfigFlagsNV` is a bitmask type for setting a mask of zero or more `VkDeviceDiagnosticsConfigFlagBitsNV`.

To register callbacks for underlying device memory events of type `VkDeviceMemoryReportEventTypeEXT`, add one or multiple `VkDeviceDeviceMemoryReportCreateInfoEXT` structures to the `pNext` chain of the `VkDeviceCreateInfo` structure.

```
// Provided by VK_EXT_device_memory_report
typedef struct VkDeviceDeviceMemoryReportCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkDeviceMemoryReportFlagsEXT flags;
    PFN_vkDeviceMemoryReportCallbackEXT pfnUserCallback;
    void*                    pUserData;
} VkDeviceDeviceMemoryReportCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is 0 and reserved for future use.
- `pfnUserCallback` is the application callback function to call.
- `pUserData` is user data to be passed to the callback.

The callback **may** be called from multiple threads simultaneously.

The callback **must** be called only once by the implementation when a `VkDeviceMemoryReportEventTypeEXT` event occurs.

NOTE

The callback could be called from a background thread other than the thread calling the Vulkan commands.

Valid Usage (Implicit)

- `VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_DEVICE_MEMORY_REPORT_CREATE_INFO_EXT`

- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-flags-zeroBitmask
flags **must** be 0
- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-pfnUserCallback-parameter
pfnUserCallback **must** be a valid [PFN_vkDeviceMemoryReportCallbackEXT](#) value
- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-pUserData-parameter
pUserData **must** be a pointer value

The prototype for the [VkDeviceDeviceMemoryReportCreateInfoEXT::pfnUserCallback](#) function implemented by the application is:

```
// Provided by VK_EXT_device_memory_report
typedef void (VKAPI_PTR *PFN_vkDeviceMemoryReportCallbackEXT)(
    const VkDeviceMemoryReportCallbackDataEXT* pCallbackData,
    void* pUserData);
```

- **pCallbackData** contains all the callback related data in the [VkDeviceMemoryReportCallbackDataEXT](#) structure.
- **pUserData** is the user data provided when the [VkDeviceDeviceMemoryReportCreateInfoEXT](#) was created.

The callback **must** not make calls to any Vulkan commands.

The definition of [VkDeviceMemoryReportCallbackDataEXT](#) is:

```
// Provided by VK_EXT_device_memory_report
typedef struct VkDeviceMemoryReportCallbackDataEXT {
    VkStructureType          sType;
    void*                    pNext;
    VkDeviceMemoryReportFlagsEXT flags;
    VkDeviceMemoryReportEventTypeEXT type;
    uint64_t                 memoryObjectId;
    VkDeviceSize             size;
    VkObjectType             objectType;
    uint64_t                 objectHandle;
    uint32_t                 heapIndex;
} VkDeviceMemoryReportCallbackDataEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is 0 and reserved for future use.
- **type** is a [VkDeviceMemoryReportEventTypeEXT](#) type specifying the type of event reported in this [VkDeviceMemoryReportCallbackDataEXT](#) structure.
- **memoryObjectId** is the unique id for the underlying memory object as described below.
- **size** is the size of the memory object in bytes. If **type** is

VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT,
VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT or
VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT, `size` is a valid `VkDeviceSize` value.
Otherwise, `size` is undefined.

- `objectType` is a `VkObjectType` value specifying the type of the object associated with this device memory report event. If `type` is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT` or `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT`, `objectType` is a valid `VkObjectType` enum. Otherwise, `objectType` is undefined.
- `objectHandle` is the object this device memory report event is attributed to. If `type` is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT` or `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT`, `objectHandle` is a valid Vulkan handle of the type associated with `objectType` as defined in the `VkObjectType` and `Vulkan Handle Relationship` table. Otherwise, `objectHandle` is undefined.
- `heapIndex` describes which memory heap this device memory allocation is made from. If `type` is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT` or `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT`, `heapIndex` corresponds to one of the valid heaps from the `VkPhysicalDeviceMemoryProperties` structure. Otherwise, `heapIndex` is undefined.

`memoryObjectId` is used to avoid double-counting on the same memory object.

If an internally-allocated device memory object or a `VkDeviceMemory` **cannot** be exported, `memoryObjectId` **must** be unique in the `VkDevice`.

If an internally-allocated device memory object or a `VkDeviceMemory` supports being exported, `memoryObjectId` **must** be unique system wide.

If an internal device memory object or a `VkDeviceMemory` is backed by an imported external memory object, `memoryObjectId` **must** be unique system wide.

Implementor's Note

If the heap backing an internally-allocated device memory **cannot** be used to back `VkDeviceMemory`, implementations **can** advertise that heap with no types.

NOTE

This structure should only be considered valid during the lifetime of the triggered callback.

For `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT` and `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT` events, `objectHandle` usually will not yet exist when the application or tool receives the callback. `objectHandle` will only exist when the create or allocate call that triggered the event returns, and if the allocation or import ends up failing `objectHandle` will not ever exist.

Valid Usage (Implicit)

- VUID-VkDeviceMemoryReportCallbackDataEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_REPORT_CALLBACK_DATA_EXT`
- VUID-VkDeviceMemoryReportCallbackDataEXT-pNext-pNext
`pNext` **must** be `NULL`

```
// Provided by VK_EXT_device_memory_report
typedef VkFlags VkDeviceMemoryReportFlagsEXT;
```

`VkDeviceMemoryReportFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of `VkDeviceMemoryReportCallbackDataEXT::type`, specifying event types which cause the device driver to call the callback, are:

```
// Provided by VK_EXT_device_memory_report
typedef enum VkDeviceMemoryReportEventTypeEXT {
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT = 0,
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT = 1,
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT = 2,
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT = 3,
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT = 4,
} VkDeviceMemoryReportEventTypeEXT;
```

- `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT` specifies this event corresponds to the allocation of an internal device memory object or a [VkDeviceMemory](#).
- `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT` specifies this event corresponds to the deallocation of an internally-allocated device memory object or a [VkDeviceMemory](#).
- `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT` specifies this event corresponds to the import of an external memory object.
- `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT` specifies this event is the release of an imported external memory object.
- `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT` specifies this event corresponds to the failed allocation of an internal device memory object or a [VkDeviceMemory](#).

To reserve private data storage slots, add a [VkDevicePrivateDataCreateInfo](#) structure to the `pNext` chain of the [VkDeviceCreateInfo](#) structure. Reserving slots in this manner is not strictly necessary, but doing so **may** improve performance.

```
// Provided by VK_VERSION_1_3
typedef struct VkDevicePrivateDataCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           privateDataSlotRequestCount;
} VkDevicePrivateDataCreateInfo;
```

or the equivalent

```
// Provided by VK_EXT_private_data
typedef VkDevicePrivateDataCreateInfo VkDevicePrivateDataCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `privateDataSlotRequestCount` is the amount of slots to reserve.

Valid Usage (Implicit)

- VUID-VkDevicePrivateDataCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_PRIVATE_DATA_CREATE_INFO`

To disable the implementation's internal pipeline cache, add a `VkDevicePipelineBinaryInternalCacheControlKHR` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure.

```
// Provided by VK_KHR_pipeline_binary
typedef struct VkDevicePipelineBinaryInternalCacheControlKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           disableInternalCache;
} VkDevicePipelineBinaryInternalCacheControlKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `disableInternalCache` specifies whether or not to disable the implementation's internal pipeline cache.

If the `VkDeviceCreateInfo::pNext` chain does not include this structure, then `disableInternalCache` defaults to `VK_FALSE`.

Valid Usage

- VUID-VkDevicePipelineBinaryInternalCacheControlKHR-disableInternalCache-09602

If `VkPhysicalDevicePipelineBinaryPropertiesKHR::pipelineBinaryInternalCacheControl` is `VK_FALSE`, `disableInternalCache` **must** be `VK_FALSE`

Valid Usage (Implicit)

- `VUID-VkDevicePipelineBinaryInternalCacheControlKHR-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_PIPELINE_BINARY_INTERNAL_CACHE_CONTROL_KHR`

The number of shader cores used by all the queues of a device **can** be controlled by adding a `VkDeviceQueueShaderCoreControlCreateInfoARM` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure.

5.2.2. Device Use

The following is a high-level list of `VkDevice` uses along with references on where to find more information:

- Creation of queues. See the [Queues](#) section below for further details.
- Creation and tracking of various synchronization constructs. See [Synchronization and Cache Control](#) for further details.
- Allocating, freeing, and managing memory. See [Memory Allocation](#) and [Resource Creation](#) for further details.
- Creation and destruction of command buffers and command buffer pools. See [Command Buffers](#) for further details.
- Creation, destruction, and management of graphics state. See [Pipelines](#) and [Resource Descriptors](#), among others, for further details.

5.2.3. Lost Device

A logical device **may** become *lost* for a number of implementation-specific reasons, indicating that pending and future command execution **may** fail and cause resources and backing memory to become undefined.

NOTE

Typical reasons for device loss will include things like execution timing out (to prevent denial of service), power management events, platform resource management, implementation errors.

Applications not adhering to [valid usage](#) may also result in device loss being reported, however this is not guaranteed. Even if device loss is reported, the system may be in an unrecoverable state, and further usage of the API is still considered invalid.

When this happens, certain commands will return `VK_ERROR_DEVICE_LOST`. After any such event, the logical device is considered *lost*. It is not possible to reset the logical device to a non-lost state, however the lost state is specific to a logical device (`VkDevice`), and the corresponding physical

device (`VkPhysicalDevice`) **may** be otherwise unaffected.

In some cases, the physical device **may** also be lost, and attempting to create a new logical device will fail, returning `VK_ERROR_DEVICE_LOST`. This is usually indicative of a problem with the underlying implementation, or its connection to the host. If the physical device has not been lost, and a new logical device is successfully created from that physical device, it **must** be in the non-lost state.

NOTE

Whilst logical device loss **may** be recoverable, in the case of physical device loss, it is unlikely that an application will be able to recover unless additional, unaffected physical devices exist on the system. The error is largely informational and intended only to inform the application that a platform issue has occurred, and **should** be investigated further. For example, underlying hardware **may** have developed a fault or become physically disconnected from the rest of the system. In many cases, physical device loss **may** cause other more serious issues such as the operating system crashing; in which case it **may** not be reported via the Vulkan API.

When a device is lost, its child objects are not implicitly destroyed and their handles are still valid. Those objects **must** still be destroyed before their parents or the device **can** be destroyed (see the [Object Lifetime](#) section). The host address space corresponding to device memory mapped using `vkMapMemory` is still valid, and host memory accesses to these mapped regions are still valid, but the contents are undefined. It is still legal to call any API command on the device and child objects.

Once a device is lost, command execution **may** fail, and certain commands that return a `VkResult` **may** return `VK_ERROR_DEVICE_LOST`. These commands can be identified by the inclusion of `VK_ERROR_DEVICE_LOST` in the Return Codes section for each command. Commands that do not allow runtime errors **must** still operate correctly for valid usage and, if applicable, return valid data.

Commands that wait indefinitely for device execution (namely `vkDeviceWaitIdle`, `vkQueueWaitIdle`, `vkWaitForFences` or `vkAcquireNextImageKHR` with a maximum `timeout`, and `vkGetQueryPoolResults` with the `VK_QUERY_RESULT_WAIT_BIT` bit set in `flags`) **must** return in finite time even in the case of a lost device, and return either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`. For any command that **may** return `VK_ERROR_DEVICE_LOST`, for the purpose of determining whether a command buffer is in the [pending state](#), or whether resources are considered in-use by the device, a return value of `VK_ERROR_DEVICE_LOST` is equivalent to `VK_SUCCESS`.

If a device was created with the `maintenance5` feature enabled, and any device command returns `VK_ERROR_DEVICE_LOST`, then all device commands for which `VK_ERROR_DEVICE_LOST` is a valid return value and which happen-after it on the same host thread **must** return `VK_ERROR_DEVICE_LOST`.

Device commands executing on other threads **must** begin returning `VK_ERROR_DEVICE_LOST` within finite time.

The content of any external memory objects that have been exported from or imported to a lost device become undefined. Objects on other logical devices or in other APIs which are associated with the same underlying memory resource as the external memory objects on the lost device are unaffected other than their content becoming undefined. The layout of subresources of images on other logical devices that are bound to `VkDeviceMemory` objects associated with the same underlying memory resources as external memory objects on the lost device becomes `VK_IMAGE_LAYOUT_UNDEFINED`.

The state of **VkSemaphore** objects on other logical devices created by [importing a semaphore payload](#) with temporary permanence which was exported from the lost device is undefined. The state of **VkSemaphore** objects on other logical devices that permanently share a semaphore payload with a **VkSemaphore** object on the lost device is undefined, and remains undefined following any subsequent signal operations. Implementations **must** ensure pending and subsequently submitted wait operations on such semaphores behave as defined in [Semaphore State Requirements For Wait Operations](#) for external semaphores not in a valid state for a wait operation.

5.2.4. Device Destruction

To destroy a device, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyDevice(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

To ensure that no work is active on the device, **vkDeviceWaitIdle** **can** be used to gate the destruction of the device. Prior to destroying a device, an application is responsible for destroying/freeing any Vulkan objects that were created using that device as the first parameter of the corresponding **vkCreate*** or **vkAllocate*** command.

NOTE

The lifetime of each of these objects is bound by the lifetime of the **VkDevice** object. Therefore, to avoid resource leaks, it is critical that an application explicitly free all of these resources prior to calling **vkDestroyDevice**.

Valid Usage

- VUID-vkDestroyDevice-device-05137
All child objects created on **device** **must** have been destroyed prior to destroying **device**
- VUID-vkDestroyDevice-device-00379
If **VkAllocationCallbacks** were provided when **device** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyDevice-device-00380
If no **VkAllocationCallbacks** were provided when **device** was created, **pAllocator** **must** be **NULL**

Valid Usage (Implicit)

- VUID-vkDestroyDevice-device-parameter
If **device** is not **NULL**, **device** **must** be a valid **VkDevice** handle

- VUID-vkDestroyDevice-pAllocator-parameter

If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

Host Synchronization

- Host access to `device` **must** be externally synchronized
- Host access to all `VkQueue` objects created from `device` **must** be externally synchronized

5.3. Queues

5.3.1. Queue Family Properties

As discussed in the [Physical Device Enumeration](#) section above, the `vkGetPhysicalDeviceQueueFamilyProperties` command is used to retrieve details about the queue families and queues supported by a device.

Each index in the `pQueueFamilyProperties` array returned by `vkGetPhysicalDeviceQueueFamilyProperties` describes a unique queue family on that physical device. These indices are used when creating queues, and they correspond directly with the `queueFamilyIndex` that is passed to the `vkCreateDevice` command via the `VkDeviceQueueCreateInfo` structure as described in the [Queue Creation](#) section below.

Grouping of queue families within a physical device is implementation-dependent.

NOTE

The general expectation is that a physical device groups all queues of matching capabilities into a single family. However, while implementations **should** do this, it is possible that a physical device **may** return two separate queue families with the same capabilities.

Once an application has identified a physical device with the queue(s) that it desires to use, it will create those queues in conjunction with a logical device. This is described in the following section.

5.3.2. Queue Creation

Creating a logical device also creates the queues associated with that device. The queues to create are described by a set of `VkDeviceQueueCreateInfo` structures that are passed to `vkCreateDevice` in `pQueueCreateInfos`.

Queues are represented by `VkQueue` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkQueue)
```

The `VkDeviceQueueCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDeviceQueueCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t           queueFamilyIndex;
    uint32_t           queueCount;
    const float*        pQueuePriorities;
} VkDeviceQueueCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask indicating behavior of the queues.
- `queueFamilyIndex` is an unsigned integer indicating the index of the queue family in which to create the queues on this device. This index corresponds to the index of an element of the `pQueueFamilyProperties` array that was returned by `vkGetPhysicalDeviceQueueFamilyProperties`.
- `queueCount` is an unsigned integer specifying the number of queues to create in the queue family indicated by `queueFamilyIndex`, and with the behavior specified by `flags`.
- `pQueuePriorities` is a pointer to an array of `queueCount` normalized floating-point values, specifying priorities of work that will be submitted to each created queue. See [Queue Priority](#) for more information.

Valid Usage

- VUID-VkDeviceQueueCreateInfo-queueFamilyIndex-00381
`queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties`
- VUID-VkDeviceQueueCreateInfo-queueCount-00382
`queueCount` **must** be less than or equal to the `queueCount` member of the `VkQueueFamilyProperties` structure, as returned by `vkGetPhysicalDeviceQueueFamilyProperties` in the `pQueueFamilyProperties[queueFamilyIndex]`
- VUID-VkDeviceQueueCreateInfo-pQueuePriorities-00383
Each element of `pQueuePriorities` **must** be between `0.0` and `1.0` inclusive
- VUID-VkDeviceQueueCreateInfo-flags-02861
If the `protectedMemory` feature is not enabled, the `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT` bit of `flags` **must** not be set
- VUID-VkDeviceQueueCreateInfo-flags-06449
If `flags` includes `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT`, `queueFamilyIndex` **must** be the index of a queue family that includes the `VK_QUEUE_PROTECTED_BIT` capability
- VUID-VkDeviceQueueCreateInfo-pNext-09398
If the `pNext` chain includes a `VkDeviceQueueShaderCoreControlCreateInfoARM` structure then `VkPhysicalDeviceSchedulingControlsPropertiesARM::schedulingControlsFlags` **must**

contain `VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_SHADER_CORE_COUNT_ARM`

Valid Usage (Implicit)

- `VUID-VkDeviceQueueCreateInfo-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO`
- `VUID-VkDeviceQueueCreateInfo-pNext-pNext`
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceQueueGlobalPriorityCreateInfoKHR` or `VkDeviceQueueShaderCoreControlCreateInfoARM`
- `VUID-VkDeviceQueueCreateInfo-sType-unique`
The `sType` value of each struct in the `pNext` chain **must** be unique
- `VUID-VkDeviceQueueCreateInfo-flags-parameter`
`flags` **must** be a valid combination of `VkDeviceQueueCreateFlagBits` values
- `VUID-VkDeviceQueueCreateInfo-pQueuePriorities-parameter`
`pQueuePriorities` **must** be a valid pointer to an array of `queueCount` `float` values
- `VUID-VkDeviceQueueCreateInfo-queueCount-arraylength`
`queueCount` **must** be greater than 0

Bits which **can** be set in `VkDeviceQueueCreateInfo::flags`, specifying usage behavior of a queue, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkDeviceQueueCreateFlagBits {
    // Provided by VK_VERSION_1_1
    VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT = 0x00000001,
} VkDeviceQueueCreateFlagBits;
```

- `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT` specifies that the device queue is a protected-capable queue.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceQueueCreateFlags;
```

`VkDeviceQueueCreateFlags` is a bitmask type for setting a mask of zero or more `VkDeviceQueueCreateFlagBits`.

Queues **can** be created with a system-wide priority by adding a `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure to the `pNext` chain of `VkDeviceQueueCreateInfo`.

The `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_global_priority
typedef struct VkDeviceQueueGlobalPriorityCreateInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkQueueGlobalPriorityKHR globalPriority;
} VkDeviceQueueGlobalPriorityCreateInfoKHR;
```

or the equivalent

```
// Provided by VK_EXT_global_priority
typedef VkDeviceQueueGlobalPriorityCreateInfoKHR
VkDeviceQueueGlobalPriorityCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `globalPriority` is the system-wide priority associated to these queues as specified by `VkQueueGlobalPriorityKHR`

Queues created without specifying `VkDeviceQueueGlobalPriorityCreateInfoKHR` will default to `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR`.

Valid Usage (Implicit)

- VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO_KHR`
- VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-globalPriority-parameter
`globalPriority` **must** be a valid `VkQueueGlobalPriorityKHR` value

Possible values of `VkDeviceQueueGlobalPriorityCreateInfoKHR::globalPriority`, specifying a system-wide priority level are:

```
// Provided by VK_KHR_global_priority
typedef enum VkQueueGlobalPriorityKHR {
    VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR = 128,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR = 256,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR = 512,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR = 1024,
    VK_QUEUE_GLOBAL_PRIORITY_LOW_EXT = VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT = VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_EXT = VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_EXT = VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR,
} VkQueueGlobalPriorityKHR;
```

or the equivalent

```
// Provided by VK_EXT_global_priority
typedef VkQueueGlobalPriorityKHR VkQueueGlobalPriorityEXT;
```

Priority values are sorted in ascending order. A comparison operation on the enum values can be used to determine the priority order.

- `VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR` is below the system default. Useful for non-interactive tasks.
- `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR` is the system default priority.
- `VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR` is above the system default.
- `VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR` is the highest priority. Useful for critical tasks.

Queues with higher system priority **may** be allotted more processing time than queues with lower priority. An implementation **may** allow a higher-priority queue to starve a lower-priority queue until the higher-priority queue has no further commands to execute.

Priorities imply no ordering or scheduling constraints.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

The global priority level of a queue takes precedence over the per-process queue priority (`VkDeviceQueueCreateInfo::pQueuePriorities`).

Abuse of this feature **may** result in starving the rest of the system of implementation resources. Therefore, the driver implementation **may** deny requests to acquire a priority above the default priority (`VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR`) if the caller does not have sufficient privileges. In this scenario `VK_ERROR_NOT_PERMITTED_KHR` is returned.

The driver implementation **may** fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

If the `globalPriorityQuery` feature is enabled and the requested global priority is not reported via `VkQueueFamilyGlobalPriorityPropertiesKHR`, the driver implementation **must** fail the queue creation. In this scenario, `VK_ERROR_INITIALIZATION_FAILED` is returned.

The number of shader cores used by a queue **can** be controlled by adding a `VkDeviceQueueShaderCoreControlCreateInfoARM` structure to the `pNext` chain of `VkDeviceQueueCreateInfo` structures.

The `VkDeviceQueueShaderCoreControlCreateInfoARM` structure is defined as:

```
// Provided by VK_ARM_scheduling_controls
typedef struct VkDeviceQueueShaderCoreControlCreateInfoARM {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           shaderCoreCount;
} VkDeviceQueueShaderCoreControlCreateInfoARM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderCoreCount` is the number of shader cores this queue uses.

Queues created without specifying `VkDeviceQueueShaderCoreControlCreateInfoARM` will default to using all the shader cores available.

Valid Usage

- VUID-VkDeviceQueueShaderCoreControlCreateInfoARM-shaderCoreCount-09399
`shaderCoreCount` **must** be greater than 0 and less than or equal to the total number of shader cores as reported via `VkPhysicalDeviceShaderCoreBuiltinsPropertiesARM::shaderCoreCount`

Valid Usage (Implicit)

- VUID-VkDeviceQueueShaderCoreControlCreateInfoARM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_SHADER_CORE_CONTROL_CREATE_INFO_ARM`

To retrieve a handle to a `VkQueue` object, call:

```
// Provided by VK_VERSION_1_0
void vkGetDeviceQueue(
    VkDevice          device,
    uint32_t          queueFamilyIndex,
    uint32_t          queueIndex,
    VkQueue*          pQueue);
```

- `device` is the logical device that owns the queue.
- `queueFamilyIndex` is the index of the queue family to which the queue belongs.
- `queueIndex` is the index within this queue family of the queue to retrieve.
- `pQueue` is a pointer to a `VkQueue` object that will be filled with the handle for the requested queue.

`vkGetDeviceQueue` **must** only be used to get queues that were created with the `flags` parameter of `VkDeviceQueueCreateInfo` set to zero. To get queues that were created with a non-zero `flags`

parameter use [vkGetDeviceQueue2](#).

Valid Usage

- VUID-vkGetDeviceQueue-queueFamilyIndex-00384
[queueFamilyIndex](#) **must** be one of the queue family indices specified when [device](#) was created, via the [VkDeviceQueueCreateInfo](#) structure
- VUID-vkGetDeviceQueue-queueIndex-00385
[queueIndex](#) **must** be less than the value of [VkDeviceQueueCreateInfo::queueCount](#) for the queue family indicated by [queueFamilyIndex](#) when [device](#) was created
- VUID-vkGetDeviceQueue-flags-01841
[VkDeviceQueueCreateInfo::flags](#) **must** have been zero when [device](#) was created

Valid Usage (Implicit)

- VUID-vkGetDeviceQueue-device-parameter
[device](#) **must** be a valid [VkDevice](#) handle
- VUID-vkGetDeviceQueue-pQueue-parameter
[pQueue](#) **must** be a valid pointer to a [VkQueue](#) handle

To retrieve a handle to a [VkQueue](#) object with specific [VkDeviceQueueCreateFlags](#) creation flags, call:

```
// Provided by VK_VERSION_1_1
void vkGetDeviceQueue2(
    VkDevice          device,
    const VkDeviceQueueInfo2* pQueueInfo,
    VkQueue*          pQueue);
```

- [device](#) is the logical device that owns the queue.
- [pQueueInfo](#) is a pointer to a [VkDeviceQueueInfo2](#) structure, describing parameters of the device queue to be retrieved.
- [pQueue](#) is a pointer to a [VkQueue](#) object that will be filled with the handle for the requested queue.

Valid Usage (Implicit)

- VUID-vkGetDeviceQueue2-device-parameter
[device](#) **must** be a valid [VkDevice](#) handle
- VUID-vkGetDeviceQueue2-pQueueInfo-parameter
[pQueueInfo](#) **must** be a valid pointer to a valid [VkDeviceQueueInfo2](#) structure
- VUID-vkGetDeviceQueue2-pQueue-parameter

pQueue must be a valid pointer to a **VkQueue** handle

The **VkDeviceQueueInfo2** structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceQueueInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t            queueFamilyIndex;
    uint32_t            queueIndex;
} VkDeviceQueueInfo2;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure. The **pNext** chain of **VkDeviceQueueInfo2** can be used to provide additional device queue parameters to **vkGetDeviceQueue2**.
- **flags** is a **VkDeviceQueueCreateFlags** value indicating the flags used to create the device queue.
- **queueFamilyIndex** is the index of the queue family to which the queue belongs.
- **queueIndex** is the index of the queue to retrieve from within the set of queues that share both the queue family and flags specified.

The queue returned by **vkGetDeviceQueue2** must have the same **flags** value from this structure as that used at device creation time in a **VkDeviceQueueCreateInfo** structure.

Normally, if you create both protected-capable and non-protected-capable queues with the same family, they are treated as separate lists of queues and **queueIndex** is relative to the start of the list of queues specified by both **queueFamilyIndex** and **flags**. However, for historical reasons, some implementations may exhibit different behavior. These divergent implementations instead concatenate the lists of queues and treat **queueIndex** as relative to the start of the first list of queues with the given **queueFamilyIndex**. This only matters in cases where an application has created both protected-capable and non-protected-capable queues from the same queue family.

NOTE

For such divergent implementations, the maximum value of **queueIndex** is equal to the sum of **VkDeviceQueueCreateInfo::queueCount** minus one, for all **VkDeviceQueueCreateInfo** structures that share a common **queueFamilyIndex**.

Such implementations will return **NULL** for either the protected or unprotected queues when calling **vkGetDeviceQueue2** with **queueIndex** in the range zero to **VkDeviceQueueCreateInfo::queueCount** minus one. In cases where these implementations returned **NULL**, the corresponding queues are instead located in the extended range described in the preceding two paragraphs.

This behavior will not be observed on any driver that has passed Vulkan conformance test suite version 1.3.3.0, or any subsequent version. This information

can be found by querying `VkPhysicalDeviceDriverProperties::conformanceVersion`.

Valid Usage

- VUID-VkDeviceQueueInfo2-queueFamilyIndex-01842
`queueFamilyIndex` **must** be one of the queue family indices specified when `device` was created, via the `VkDeviceQueueCreateInfo` structure
- VUID-VkDeviceQueueInfo2-flags-06225
`flags` **must** be equal to `VkDeviceQueueCreateInfo::flags` for a `VkDeviceQueueCreateInfo` structure for the queue family indicated by `queueFamilyIndex` when `device` was created
- VUID-VkDeviceQueueInfo2-queueIndex-01843
`queueIndex` **must** be less than `VkDeviceQueueCreateInfo::queueCount` for the corresponding queue family and flags indicated by `queueFamilyIndex` and `flags` when `device` was created

Valid Usage (Implicit)

- VUID-VkDeviceQueueInfo2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_INFO_2`
- VUID-VkDeviceQueueInfo2-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDeviceQueueInfo2-flags-parameter
`flags` **must** be a valid combination of `VkDeviceQueueCreateFlagBits` values

5.3.3. Queue Family Index

The queue family index is used in multiple places in Vulkan in order to tie operations to a specific family of queues.

When retrieving a handle to the queue via `vkGetDeviceQueue`, the queue family index is used to select which queue family to retrieve the `VkQueue` handle from as described in the previous section.

When creating a `VkCommandPool` object (see [Command Pools](#)), a queue family index is specified in the `VkCommandPoolCreateInfo` structure. Command buffers from this pool **can** only be submitted on queues corresponding to this queue family.

When creating `VkImage` (see [Images](#)) and `VkBuffer` (see [Buffers](#)) resources, a set of queue families is included in the `VkImageCreateInfo` and `VkBufferCreateInfo` structures to specify the queue families that **can** access the resource.

When inserting a `VkBufferMemoryBarrier` or `VkImageMemoryBarrier` (see [Pipeline Barriers](#)), a source and destination queue family index is specified to allow the ownership of a buffer or image to be transferred from one queue family to another. See the [Resource Sharing](#) section for details.

5.3.4. Queue Priority

Each queue is assigned a priority, as set in the [VkDeviceQueueCreateInfo](#) structures when creating the device. The priority of each queue is a normalized floating-point value between 0.0 and 1.0, which is then translated to a discrete priority level by the implementation. Higher values indicate a higher priority, with 0.0 being the lowest priority and 1.0 being the highest.

Within the same device, queues with higher priority **may** be allotted more processing time than queues with lower priority. The implementation makes no guarantees with regards to ordering or scheduling among queues with the same priority, other than the constraints defined by any [explicit synchronization primitives](#). The implementation makes no guarantees with regards to queues across different devices.

An implementation **may** allow a higher-priority queue to starve a lower-priority queue on the same [VkDevice](#) until the higher-priority queue has no further commands to execute. The relationship of queue priorities **must** not cause queues on one [VkDevice](#) to starve queues on another [VkDevice](#).

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

5.3.5. Queue Submission

Work is submitted to a queue via *queue submission* commands such as [vkQueueSubmit2](#) or [vkQueueSubmit](#). Queue submission commands define a set of *queue operations* to be executed by the underlying physical device, including synchronization with semaphores and fences.

Submission commands take as parameters a target queue, zero or more *batches* of work, and an **optional** fence to signal upon completion. Each batch consists of three distinct parts:

1. Zero or more semaphores to wait on before execution of the rest of the batch.
 - If present, these describe a [semaphore wait operation](#).
2. Zero or more work items to execute.
 - If present, these describe a *queue operation* matching the work described.
3. Zero or more semaphores to signal upon completion of the work items.
 - If present, these describe a [semaphore signal operation](#).

If a fence is present in a queue submission, it describes a [fence signal operation](#).

All work described by a queue submission command **must** be submitted to the queue before the command returns.

Sparse Memory Binding

In Vulkan it is possible to sparsely bind memory to buffers and images as described in the [Sparse Resource](#) chapter. Sparse memory binding is a queue operation. A queue whose flags include the [VK_QUEUE_SPARSE_BINDING_BIT](#) **must** be able to support the mapping of a virtual address to a physical address on the device. This causes an update to the page table mappings on the device. This update **must** be synchronized on a queue to avoid corrupting page table mappings during execution of

graphics commands. By binding the sparse memory resources on queues, all commands that are dependent on the updated bindings are synchronized to only execute after the binding is updated. See the [Synchronization and Cache Control](#) chapter for how this synchronization is accomplished.

5.3.6. Queue Destruction

Queues are created along with a logical device during `vkCreateDevice`. All queues associated with a logical device are destroyed when `vkDestroyDevice` is called on that device.

Chapter 6. Command Buffers

Command buffers are objects used to record commands which **can** be subsequently submitted to a device queue for execution. There are two levels of command buffers - *primary command buffers*, which **can** execute secondary command buffers, and which are submitted to queues, and *secondary command buffers*, which **can** be executed by primary command buffers, and which are not directly submitted to queues.

Command buffers are represented by `VkCommandBuffer` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkCommandBuffer)
```

Recorded commands include commands to bind pipelines and descriptor sets to the command buffer, commands to modify dynamic state, commands to draw (for graphics rendering), commands to dispatch (for compute), commands to execute secondary command buffers (for primary command buffers only), commands to copy buffers and images, and other commands.

Each command buffer manages state independently of other command buffers. There is no inheritance of state across primary and secondary command buffers, or between secondary command buffers. When a command buffer begins recording, all state in that command buffer is undefined. When secondary command buffer(s) are recorded to execute on a primary command buffer, the secondary command buffer inherits no state from the primary command buffer, and all state of the primary command buffer is undefined after an execute secondary command buffer command is recorded. There is one exception to this rule - if the primary command buffer is inside a render pass instance, then the render pass and subpass state is not disturbed by executing secondary command buffers. For state dependent commands (such as draws and dispatches), any state consumed by those commands **must** not be undefined.

`VkCommandBufferInheritanceViewportScissorInfoNV` defines an exception allowing limited inheritance of dynamic viewport and scissor state.

Unless otherwise specified, and without explicit synchronization, the various commands submitted to a queue via command buffers **may** execute in arbitrary order relative to each other, and/or concurrently. Also, the memory side effects of those commands **may** not be directly visible to other commands without explicit memory dependencies. This is true within a command buffer, and across command buffers submitted to a given queue. See [the synchronization chapter](#) for information on [implicit](#) and explicit synchronization between commands.

6.1. Command Buffer Lifecycle

Each command buffer is always in one of the following states:

Initial

When a command buffer is [allocated](#), it is in the *initial state*. Some commands are able to *reset* a command buffer (or a set of command buffers) back to this state from any of the executable, recording or invalid state. Command buffers in the initial state **can** only be moved to the

recording state, or freed.

Recording

[vkBeginCommandBuffer](#) changes the state of a command buffer from the initial state to the *recording state*. Once a command buffer is in the recording state, [vkCmd*](#) commands **can** be used to record to the command buffer.

Executable

[vkEndCommandBuffer](#) ends the recording of a command buffer, and moves it from the recording state to the *executable state*. Executable command buffers **can** be [submitted](#), reset, or [recorded to another command buffer](#).

Pending

[Queue submission](#) of a command buffer changes the state of a command buffer from the executable state to the *pending state*. Whilst in the pending state, applications **must** not attempt to modify the command buffer in any way - as the device **may** be processing the commands recorded to it. Once execution of a command buffer completes, the command buffer either reverts back to the *executable state*, or if it was recorded with [VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT](#), it moves to the *invalid state*. A [synchronization command](#) **should** be used to detect when this occurs.

Invalid

Some operations, such as [modifying or deleting a resource](#) that was used in a command recorded to a command buffer, will transition the state of that command buffer into the *invalid state*. Command buffers in the invalid state **can** only be reset or freed.

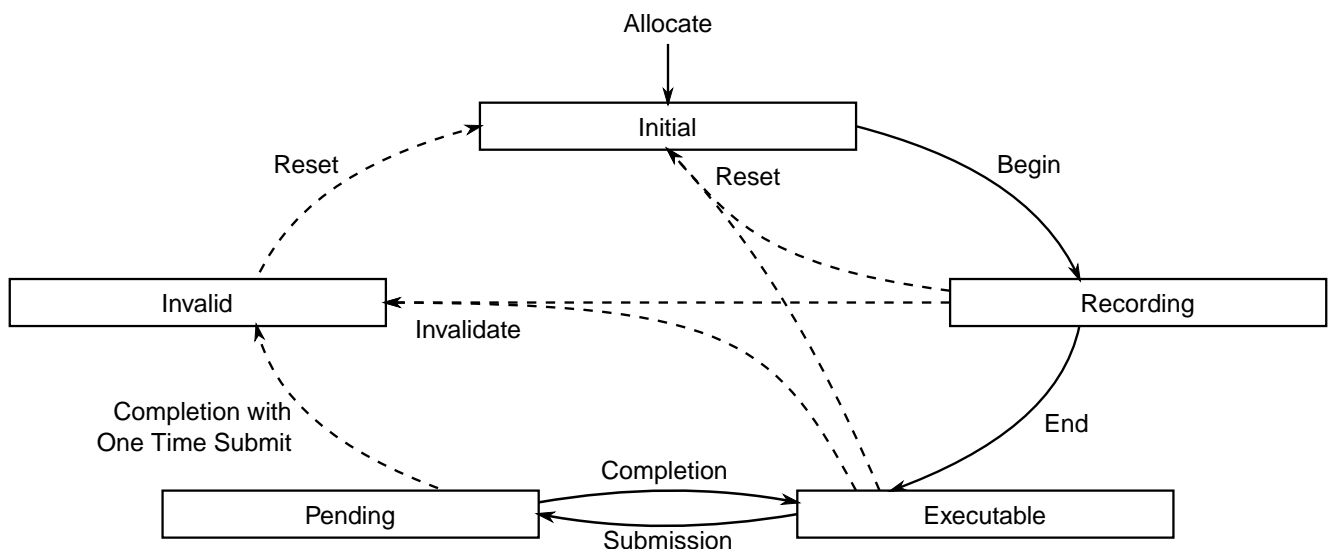

Figure 1. Lifecycle of a command buffer

Any given command that operates on a command buffer has its own requirements on what state a command buffer **must** be in, which are detailed in the valid usage constraints for that command.

Resetting a command buffer is an operation that discards any previously recorded commands and puts a command buffer in the *initial state*. Resetting occurs as a result of [vkResetCommandBuffer](#) or [vkResetCommandPool](#), or as part of [vkBeginCommandBuffer](#) (which additionally puts the command buffer in the *recording state*).

Secondary command buffers can be recorded to a primary command buffer via `vkCmdExecuteCommands`. This partially ties the lifecycle of the two command buffers together - if the primary is submitted to a queue, both the primary and any secondaries recorded to it move to the *pending state*. Once execution of the primary completes, so it does for any secondary recorded within it. After all executions of each command buffer complete, they each move to their appropriate completion state (either to the *executable state* or the *invalid state*, as specified above).

If a secondary moves to the *invalid state* or the *initial state*, then all primary buffers it is recorded in move to the *invalid state*. A primary moving to any other state does not affect the state of a secondary recorded in it.

NOTE

Resetting or freeing a primary command buffer removes the lifecycle linkage to all secondary command buffers that were recorded into it.

6.2. Command Pools

Command pools are opaque objects that command buffer memory is allocated from, and which allow the implementation to amortize the cost of resource creation across multiple command buffers. Command pools are externally synchronized, meaning that a command pool **must** not be used concurrently in multiple threads. That includes use via recording commands on any command buffers allocated from the pool, as well as operations that allocate, free, and reset command buffers or the pool itself.

Command pools are represented by `VkCommandPool` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCommandPool)
```

To create a command pool, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateCommandPool(
    VkDevice                                device,
    const VkCommandPoolCreateInfo*          pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkCommandPool*                          pCommandPool);
```

- `device` is the logical device that creates the command pool.
- `pCreateInfo` is a pointer to a `VkCommandPoolCreateInfo` structure specifying the state of the command pool object.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pCommandPool` is a pointer to a `VkCommandPool` handle in which the created pool is returned.

Valid Usage

- VUID-vkCreateCommandPool-queueFamilyIndex-01937
`pCreateInfo->queueFamilyIndex` **must** be the index of a queue family available in the logical device `device`

Valid Usage (Implicit)

- VUID-vkCreateCommandPool-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateCommandPool-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkCommandPoolCreateInfo` structure
- VUID-vkCreateCommandPool-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateCommandPool-pCommandPool-parameter
`pCommandPool` **must** be a valid pointer to a `VkCommandPool` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandPoolCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandPoolCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkCommandPoolCreateFlags flags;
    uint32_t           queueFamilyIndex;
} VkCommandPoolCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkCommandPoolCreateFlagBits` indicating usage behavior for the pool and command buffers allocated from it.

- `queueFamilyIndex` designates a queue family as described in section [Queue Family Properties](#). All command buffers allocated from this command pool **must** be submitted on queues from the same queue family.

Valid Usage

- VUID-VkCommandPoolCreateInfo-flags-02860
If the `protectedMemory` feature is not enabled, the `VK_COMMAND_POOL_CREATE_PROTECTED_BIT` bit of `flags` **must** not be set

Valid Usage (Implicit)

- VUID-VkCommandPoolCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO`
- VUID-VkCommandPoolCreateInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkCommandPoolCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkCommandPoolCreateFlagBits` values

Bits which **can** be set in `VkCommandPoolCreateInfo::flags`, specifying usage behavior for a command pool, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolCreateFlagBits {
    VK_COMMAND_POOL_CREATE_TRANSIENT_BIT = 0x00000001,
    VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT = 0x00000002,
    // Provided by VK_VERSION_1_1
    VK_COMMAND_POOL_CREATE_PROTECTED_BIT = 0x00000004,
} VkCommandPoolCreateFlagBits;
```

- `VK_COMMAND_POOL_CREATE_TRANSIENT_BIT` specifies that command buffers allocated from the pool will be short-lived, meaning that they will be reset or freed in a relatively short timeframe. This flag **may** be used by the implementation to control memory allocation behavior within the pool.
- `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` allows any command buffer allocated from a pool to be individually reset to the [initial state](#); either by calling `vkResetCommandBuffer`, or via the implicit reset when calling `vkBeginCommandBuffer`. If this flag is not set on a pool, then `vkResetCommandBuffer` **must** not be called for any command buffer allocated from that pool.
- `VK_COMMAND_POOL_CREATE_PROTECTED_BIT` specifies that command buffers allocated from the pool are protected command buffers.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolCreateFlags;
```

`VkCommandPoolCreateFlags` is a bitmask type for setting a mask of zero or more `VkCommandPoolCreateFlagBits`.

To trim a command pool, call:

```
// Provided by VK_VERSION_1_1
void vkTrimCommandPool(
    VkDevice          device,
    VkCommandPool     commandPool,
    VkCommandPoolTrimFlags flags);
```

or the equivalent command

```
// Provided by VK_KHR_maintenance1
void vkTrimCommandPoolKHR(
    VkDevice          device,
    VkCommandPool     commandPool,
    VkCommandPoolTrimFlags flags);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool to trim.
- `flags` is reserved for future use.

Trimming a command pool recycles unused memory from the command pool back to the system. Command buffers allocated from the pool are not affected by the command.

NOTE

This command provides applications with some control over the internal memory allocations used by command pools.

Unused memory normally arises from command buffers that have been recorded and later reset, such that they are no longer using the memory. On reset, a command buffer can return memory to its command pool, but the only way to release memory from a command pool to the system requires calling `vkResetCommandPool`, which cannot be executed while any command buffers from that pool are still in use. Subsequent recording operations into command buffers will reuse this memory but since total memory requirements fluctuate over time, unused memory can accumulate.

In this situation, trimming a command pool **may** be useful to return unused memory back to the system, returning the total outstanding memory allocated by the pool back to a more “average” value.

Implementations utilize many internal allocation strategies that make it impossible to guarantee that all unused memory is released back to the system. For instance, an implementation of a command pool **may** involve allocating memory in bulk from the system and sub-allocating from that memory. In such an implementation any live command buffer that holds a reference to a bulk allocation would prevent

that allocation from being freed, even if only a small proportion of the bulk allocation is in use.

In most cases trimming will result in a reduction in allocated but unused memory, but it does not guarantee the “ideal” behavior.

Trimming **may** be an expensive operation, and **should** not be called frequently. Trimming **should** be treated as a way to relieve memory pressure after application-known points when there exists enough unused memory that the cost of trimming is “worth” it.

Valid Usage (Implicit)

- VUID-vkTrimCommandPool-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkTrimCommandPool-commandPool-parameter
commandPool **must** be a valid [VkCommandPool](#) handle
- VUID-vkTrimCommandPool-flags-zeroBitmask
flags **must** be 0
- VUID-vkTrimCommandPool-commandPool-parent
commandPool **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **commandPool** **must** be externally synchronized

```
// Provided by VK_VERSION_1_1  
typedef VkFlags VkCommandPoolTrimFlags;
```

or the equivalent

```
// Provided by VK_KHR_maintenance1  
typedef VkCommandPoolTrimFlags VkCommandPoolTrimFlagsKHR;
```

VkCommandPoolTrimFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To reset a command pool, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetCommandPool(
    VkDevice                device,
    VkCommandPool           commandPool,
    VkCommandPoolResetFlags flags);
```

- **device** is the logical device that owns the command pool.
- **commandPool** is the command pool to reset.
- **flags** is a bitmask of [VkCommandPoolResetFlagBits](#) controlling the reset operation.

Resetting a command pool recycles all of the resources from all of the command buffers allocated from the command pool back to the command pool. All command buffers that have been allocated from the command pool are put in the [initial state](#).

Any primary command buffer allocated from another [VkCommandPool](#) that is in the [recording or executable state](#) and has a secondary command buffer allocated from **commandPool** recorded into it, becomes [invalid](#).

Valid Usage

- VUID-vkResetCommandPool-commandPool-00040
All **VkCommandBuffer** objects allocated from **commandPool** **must** not be in the [pending state](#)

Valid Usage (Implicit)

- VUID-vkResetCommandPool-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkResetCommandPool-commandPool-parameter
commandPool **must** be a valid [VkCommandPool](#) handle
- VUID-vkResetCommandPool-flags-parameter
flags **must** be a valid combination of [VkCommandPoolResetFlagBits](#) values
- VUID-vkResetCommandPool-commandPool-parent
commandPool **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **commandPool** **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Bits which **can** be set in `vkResetCommandPool::flags`, controlling the reset operation, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolResetFlagBits {
    VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandPoolResetFlagBits;
```

- `VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT` specifies that resetting a command pool recycles all of the resources from the command pool back to the system.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolResetFlags;
```

`VkCommandPoolResetFlags` is a bitmask type for setting a mask of zero or more `VkCommandPoolResetFlagBits`.

To destroy a command pool, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyCommandPool(
    VkDevice          device,
    VkCommandPool     commandPool,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the command pool.
- `commandPool` is the handle of the command pool to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

When a pool is destroyed, all command buffers allocated from the pool are [freed](#).

Any primary command buffer allocated from another `VkCommandPool` that is in the [recording or executable state](#) and has a secondary command buffer allocated from `commandPool` recorded into it, becomes [invalid](#).

Valid Usage

- VUID-vkDestroyCommandPool-commandPool-00041
All `VkCommandBuffer` objects allocated from `commandPool` **must** not be in the `pending state`
- VUID-vkDestroyCommandPool-commandPool-00042
If `VkAllocationCallbacks` were provided when `commandPool` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyCommandPool-commandPool-00043
If no `VkAllocationCallbacks` were provided when `commandPool` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyCommandPool-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyCommandPool-commandPool-parameter
If `commandPool` is not `VK_NULL_HANDLE`, `commandPool` **must** be a valid `VkCommandPool` handle
- VUID-vkDestroyCommandPool-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyCommandPool-commandPool-parent
If `commandPool` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `commandPool` **must** be externally synchronized

6.3. Command Buffer Allocation and Management

To allocate command buffers, call:

```
// Provided by VK_VERSION_1_0
VkResult vkAllocateCommandBuffers(
    VkDevice device,
    const VkCommandBufferAllocateInfo* pAllocateInfo,
    VkCommandBuffer* pCommandBuffers);
```

- `device` is the logical device that owns the command pool.
- `pAllocateInfo` is a pointer to a `VkCommandBufferAllocateInfo` structure describing parameters

of the allocation.

- `pCommandBuffers` is a pointer to an array of `VkCommandBuffer` handles in which the resulting command buffer objects are returned. The array **must** be at least the length specified by the `commandBufferCount` member of `pAllocateInfo`. Each allocated command buffer begins in the initial state.

`vkAllocateCommandBuffers` **can** be used to allocate multiple command buffers. If the allocation of any of those command buffers fails, the implementation **must** free all successfully allocated command buffer objects from this command, set all entries of the `pCommandBuffers` array to `NULL` and return the error.

NOTE

Filling `pCommandBuffers` with `NULL` values on failure is an exception to the default error behavior that output parameters will have undefined contents.

When command buffers are first allocated, they are in the [initial state](#).

Valid Usage (Implicit)

- VUID-vkAllocateCommandBuffers-device-parameter `device` **must** be a valid `VkDevice` handle
- VUID-vkAllocateCommandBuffers-pAllocateInfo-parameter `pAllocateInfo` **must** be a valid pointer to a valid `VkCommandBufferAllocateInfo` structure
- VUID-vkAllocateCommandBuffers-pCommandBuffers-parameter `pCommandBuffers` **must** be a valid pointer to an array of `pAllocateInfo->commandBufferCount` `VkCommandBuffer` handles
- VUID-vkAllocateCommandBuffers-pAllocateInfo::commandBufferCount-arraylength `pAllocateInfo->commandBufferCount` **must** be greater than 0

Host Synchronization

- Host access to `pAllocateInfo->commandPool` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandBufferAllocateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferAllocateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkCommandPool        commandPool;
    VkCommandBufferLevel level;
    uint32_t             commandBufferCount;
} VkCommandBufferAllocateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `commandPool` is the command pool from which the command buffers are allocated.
- `level` is a `VkCommandBufferLevel` value specifying the command buffer level.
- `commandBufferCount` is the number of command buffers to allocate from the pool.

Valid Usage (Implicit)

- VUID-VkCommandBufferAllocateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO`
- VUID-VkCommandBufferAllocateInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkCommandBufferAllocateInfo-commandPool-parameter
`commandPool` **must** be a valid `VkCommandPool` handle
- VUID-VkCommandBufferAllocateInfo-level-parameter
`level` **must** be a valid `VkCommandBufferLevel` value

Possible values of `VkCommandBufferAllocateInfo::level`, specifying the command buffer level, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferLevel {
    VK_COMMAND_BUFFER_LEVEL_PRIMARY = 0,
    VK_COMMAND_BUFFER_LEVEL_SECONDARY = 1,
} VkCommandBufferLevel;
```

- `VK_COMMAND_BUFFER_LEVEL_PRIMARY` specifies a primary command buffer.
- `VK_COMMAND_BUFFER_LEVEL_SECONDARY` specifies a secondary command buffer.

To reset a command buffer, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetCommandBuffer(
    VkCommandBuffer                commandBuffer,
    VkCommandBufferResetFlags      flags);
```

- **commandBuffer** is the command buffer to reset. The command buffer **can** be in any state other than **pending**, and is moved into the **initial state**.
- **flags** is a bitmask of **VkCommandBufferResetFlagBits** controlling the reset operation.

Any primary command buffer that is in the **recording or executable state** and has **commandBuffer** recorded into it, becomes **invalid**.

Valid Usage

- VUID-vkResetCommandBuffer-commandBuffer-00045
commandBuffer **must** not be in the **pending state**
- VUID-vkResetCommandBuffer-commandBuffer-00046
commandBuffer **must** have been allocated from a pool that was created with the **VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT**

Valid Usage (Implicit)

- VUID-vkResetCommandBuffer-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkResetCommandBuffer-flags-parameter
flags **must** be a valid combination of **VkCommandBufferResetFlagBits** values

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

Bits which **can** be set in **vkResetCommandBuffer::flags**, controlling the reset operation, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferResetFlagBits {
    VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandBufferResetFlagBits;
```

- **VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT** specifies that most or all memory resources currently owned by the command buffer **should** be returned to the parent command pool. If this flag is not set, then the command buffer **may** hold onto memory resources and reuse them when recording commands. **commandBuffer** is moved to the **initial state**.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandBufferResetFlags;
```

VkCommandBufferResetFlags is a bitmask type for setting a mask of zero or more **VkCommandBufferResetFlagBits**.

To free command buffers, call:

```
// Provided by VK_VERSION_1_0
void vkFreeCommandBuffers(
    VkDevice          device,
    VkCommandPool     commandPool,
    uint32_t          commandBufferCount,
    const VkCommandBuffer* pCommandBuffers);
```

- **device** is the logical device that owns the command pool.
- **commandPool** is the command pool from which the command buffers were allocated.
- **commandBufferCount** is the length of the **pCommandBuffers** array.
- **pCommandBuffers** is a pointer to an array of handles of command buffers to free.

Any primary command buffer that is in the **recording or executable state** and has any element of **pCommandBuffers** recorded into it, becomes **invalid**.

Valid Usage

- VUID-vkFreeCommandBuffers-pCommandBuffers-00047
All elements of **pCommandBuffers** **must** not be in the **pending state**
- VUID-vkFreeCommandBuffers-pCommandBuffers-00048
pCommandBuffers **must** be a valid pointer to an array of **commandBufferCount** **VkCommandBuffer** handles, each element of which **must** either be a valid handle or **NULL**

Valid Usage (Implicit)

- VUID-vkFreeCommandBuffers-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkFreeCommandBuffers-commandPool-parameter
`commandPool` **must** be a valid `VkCommandPool` handle
- VUID-vkFreeCommandBuffers-commandBufferCount-arraylength
`commandBufferCount` **must** be greater than 0
- VUID-vkFreeCommandBuffers-commandPool-parent
`commandPool` **must** have been created, allocated, or retrieved from `device`
- VUID-vkFreeCommandBuffers-pCommandBuffers-parent
Each element of `pCommandBuffers` that is a valid handle **must** have been created, allocated, or retrieved from `commandPool`

Host Synchronization

- Host access to `commandPool` **must** be externally synchronized
- Host access to each member of `pCommandBuffers` **must** be externally synchronized

6.4. Command Buffer Recording

To begin recording a command buffer, call:

```
// Provided by VK_VERSION_1_0
VkResult vkBeginCommandBuffer(
    VkCommandBuffer          commandBuffer,
    const VkCommandBufferBeginInfo* pBeginInfo);
```

- `commandBuffer` is the handle of the command buffer which is to be put in the recording state.
- `pBeginInfo` is a pointer to a `VkCommandBufferBeginInfo` structure defining additional information about how the command buffer begins recording.

Valid Usage

- VUID-vkBeginCommandBuffer-commandBuffer-00049
`commandBuffer` **must** not be in the `recording or pending state`
- VUID-vkBeginCommandBuffer-commandBuffer-00050
If `commandBuffer` was allocated from a `VkCommandPool` which did not have the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, `commandBuffer` **must** be in the `initial state`
- VUID-vkBeginCommandBuffer-commandBuffer-00051

If `commandBuffer` is a secondary command buffer, the `pInheritanceInfo` member of `pBeginInfo` **must** be a valid `VkCommandBufferInheritanceInfo` structure

- VUID-vkBeginCommandBuffer-commandBuffer-00052

If `commandBuffer` is a secondary command buffer and either the `occlusionQueryEnable` member of the `pInheritanceInfo` member of `pBeginInfo` is `VK_FALSE`, or the `occlusionQueryPrecise` feature is not enabled, then `pBeginInfo->pInheritanceInfo->queryFlags` **must** not contain `VK_QUERY_CONTROL_PRECISE_BIT`

- VUID-vkBeginCommandBuffer-commandBuffer-02840

If `commandBuffer` is a primary command buffer, then `pBeginInfo->flags` **must** not set both the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` and the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flags

Valid Usage (Implicit)

- VUID-vkBeginCommandBuffer-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkBeginCommandBuffer-pBeginInfo-parameter `pBeginInfo` **must** be a valid pointer to a valid `VkCommandBufferBeginInfo` structure

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandBufferBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferBeginInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkCommandBufferUsageFlags flags;
    const VkCommandBufferInheritanceInfo* pInheritanceInfo;
} VkCommandBufferBeginInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkCommandBufferUsageFlagBits](#) specifying usage behavior for the command buffer.
- **pInheritanceInfo** is a pointer to a [VkCommandBufferInheritanceInfo](#) structure, used if **commandBuffer** is a secondary command buffer. If this is a primary command buffer, then this value is ignored.

Valid Usage

- VUID-VkCommandBufferBeginInfo-flags-09123
If **flags** contains **VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT**, the [VkCommandPool](#) that **commandBuffer** was allocated from **must** support graphics operations
- VUID-VkCommandBufferBeginInfo-flags-00055
If **flags** contains **VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT**, the **framebuffer** member of **pInheritanceInfo** **must** be either **VK_NULL_HANDLE**, or a valid [VkFramebuffer](#) that is compatible with the **renderPass** member of **pInheritanceInfo**
- VUID-VkCommandBufferBeginInfo-flags-09240
If **flags** contains **VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT** and the **dynamicRendering** feature is not enabled, the **renderPass** member of **pInheritanceInfo** **must** not be **VK_NULL_HANDLE**
- VUID-VkCommandBufferBeginInfo-flags-06002
If **flags** contains **VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT** and the **renderPass** member of **pInheritanceInfo** is **VK_NULL_HANDLE**, the **pNext** chain of **pInheritanceInfo** **must** include a [VkCommandBufferInheritanceRenderingInfo](#) structure
- VUID-VkCommandBufferBeginInfo-flags-06003
If **flags** contains **VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT**, the **renderPass** member of **pInheritanceInfo** is **VK_NULL_HANDLE**, and the **pNext** chain of **pInheritanceInfo** includes a [VkAttachmentSampleCountInfoAMD](#) or [VkAttachmentSampleCountInfoNV](#) structure, the **colorAttachmentCount** member of that structure **must** be equal to the value of [VkCommandBufferInheritanceRenderingInfo::colorAttachmentCount](#)
- VUID-VkCommandBufferBeginInfo-flags-06000
If **flags** contains **VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT** and the **renderPass** member of **pInheritanceInfo** is not **VK_NULL_HANDLE**, the **renderPass** member of **pInheritanceInfo** **must** be a valid [VkRenderPass](#)

- VUID-VkCommandBufferBeginInfo-flags-06001

If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `renderPass` member of `pInheritanceInfo` is not `VK_NULL_HANDLE`, the `subpass` member of `pInheritanceInfo` **must** be a valid subpass index within the `renderPass` member of `pInheritanceInfo`

Valid Usage (Implicit)

- VUID-VkCommandBufferBeginInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO`
- VUID-VkCommandBufferBeginInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkDeviceGroupCommandBufferBeginInfo`
- VUID-VkCommandBufferBeginInfo-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkCommandBufferBeginInfo-flags-parameter
`flags` **must** be a valid combination of `VkCommandBufferUsageFlagBits` values

Bits which **can** be set in `VkCommandBufferBeginInfo::flags`, specifying usage behavior for a command buffer, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferUsageFlagBits {
    VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT = 0x00000001,
    VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT = 0x00000002,
    VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT = 0x00000004,
} VkCommandBufferUsageFlagBits;
```

- `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` specifies that each recording of the command buffer will only be submitted once, and the command buffer will be reset and recorded again between each submission.
- `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` specifies that a secondary command buffer is considered to be entirely inside a render pass. If this is a primary command buffer, then this bit is ignored.
- `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` specifies that a command buffer **can** be resubmitted to any queue of the same queue family while it is in the *pending state*, and recorded into multiple primary command buffers.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandBufferUsageFlags;
```

`VkCommandBufferUsageFlags` is a bitmask type for setting a mask of zero or more `VkCommandBufferUsageFlagBits`.

If the command buffer is a secondary command buffer, then the `VkCommandBufferInheritanceInfo` structure defines any state that will be inherited from the primary command buffer:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferInheritanceInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkRenderPass          renderPass;
    uint32_t              subpass;
    VkFramebuffer         framebuffer;
    VkBool32              occlusionQueryEnable;
    VkQueryControlFlags   queryFlags;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkCommandBufferInheritanceInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `renderPass` is a `VkRenderPass` object defining which render passes the `VkCommandBuffer` will be compatible with and **can** be executed within.
- `subpass` is the index of the subpass within the render pass instance that the `VkCommandBuffer` will be executed within.
- `framebuffer` **can** refer to the `VkFramebuffer` object that the `VkCommandBuffer` will be rendering to if it is executed within a render pass instance. It **can** be `VK_NULL_HANDLE` if the framebuffer is not known.

NOTE

Specifying the exact framebuffer that the secondary command buffer will be executed with **may** result in better performance at command buffer execution time.

- `occlusionQueryEnable` specifies whether the command buffer **can** be executed while an occlusion query is active in the primary command buffer. If this is `VK_TRUE`, then this command buffer **can** be executed whether the primary command buffer has an occlusion query active or not. If this is `VK_FALSE`, then the primary command buffer **must** not have an occlusion query active.
- `queryFlags` specifies the query flags that **can** be used by an active occlusion query in the primary command buffer when this secondary command buffer is executed. If this value includes the `VK_QUERY_CONTROL_PRECISE_BIT` bit, then the active query **can** return boolean results or actual sample counts. If this bit is not set, then the active query **must** not use the `VK_QUERY_CONTROL_PRECISE_BIT` bit.
- `pipelineStatistics` is a bitmask of `VkQueryPipelineStatisticFlagBits` specifying the set of pipeline statistics that **can** be counted by an active query in the primary command buffer when this secondary command buffer is executed. If this value includes a given bit, then this command buffer **can** be executed whether the primary command buffer has a pipeline statistics query active that includes this bit or not. If this value excludes a given bit, then the active pipeline statistics query **must** not be from a query pool that counts that statistic.

If the `VkCommandBuffer` will not be executed within a render pass instance, or if the render pass instance was begun with `vkCmdBeginRendering`, `renderPass`, `subpass`, and `framebuffer` are ignored.

Valid Usage

- VUID-VkCommandBufferInheritanceInfo-occlusionQueryEnable-00056
If the `inheritedQueries` feature is not enabled, `occlusionQueryEnable` **must** be `VK_FALSE`
- VUID-VkCommandBufferInheritanceInfo-queryFlags-00057
If the `inheritedQueries` feature is enabled, `queryFlags` **must** be a valid combination of `VkQueryControlFlagBits` values
- VUID-VkCommandBufferInheritanceInfo-queryFlags-02788
If the `inheritedQueries` feature is not enabled, `queryFlags` **must** be `0`
- VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-02789
If the `pipelineStatisticsQuery` feature is enabled, `pipelineStatistics` **must** be a valid combination of `VkQueryPipelineStatisticFlagBits` values
- VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-00058
If the `pipelineStatisticsQuery` feature is not enabled, `pipelineStatistics` **must** be `0`

Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO`
- VUID-VkCommandBufferInheritanceInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkAttachmentSampleCountInfoAMD`, `VkCommandBufferInheritanceConditionalRenderingInfoEXT`, `VkCommandBufferInheritanceRenderPassTransformInfoQCOM`, `VkCommandBufferInheritanceRenderingInfo`, `VkCommandBufferInheritanceViewportScissorInfoNV`, `VkExternalFormatANDROID`, `VkMultiviewPerViewAttributesInfoNVX`, `VkRenderingAttachmentLocationInfoKHR`, or `VkRenderingInputAttachmentIndexInfoKHR`
- VUID-VkCommandBufferInheritanceInfo-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkCommandBufferInheritanceInfo-commonparent
Both of `framebuffer`, and `renderPass` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

NOTE

On some implementations, not using the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` bit enables command buffers to be patched in-place if needed, rather than creating a copy of the command buffer.

If a command buffer is in the `invalid, or executable state`, and the command buffer was allocated from a command pool with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, then

`vkBeginCommandBuffer` implicitly resets the command buffer, behaving as if `vkResetCommandBuffer` had been called with `VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT` not set. After the implicit reset, `commandBuffer` is moved to the `recording state`.

If the `commandBufferInheritance` feature is enabled, all graphics and compute state including bound pipeline state, bound shader objects, bound vertex and index buffers, bound descriptor sets and push constants, and all previously set dynamic state is inherited by the secondary command buffer from the primary or secondary command buffer that executes it. Furthermore, all of the state set by this secondary command buffer is inherited back to the primary or secondary command buffer that executes it. If the `commandBufferInheritance` feature is not enabled there is a limited amount of inheritance of state into the secondary command buffer as specified below.

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceConditionalRenderingInfoEXT` structure, then that structure controls whether a command buffer **can** be executed while conditional rendering is `active` in the primary command buffer.

The `VkCommandBufferInheritanceConditionalRenderingInfoEXT` structure is defined as:

```
// Provided by VK_EXT_conditional_rendering
typedef struct VkCommandBufferInheritanceConditionalRenderingInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           conditionalRenderingEnable;
} VkCommandBufferInheritanceConditionalRenderingInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `conditionalRenderingEnable` specifies whether the command buffer **can** be executed while conditional rendering is active in the primary command buffer. If this is `VK_TRUE`, then this command buffer **can** be executed whether the primary command buffer has active conditional rendering or not. If this is `VK_FALSE`, then the primary command buffer **must** not have conditional rendering active.

If this structure is not present, the behavior is as if `conditionalRenderingEnable` is `VK_FALSE`.

Valid Usage

- VUID-VkCommandBufferInheritanceConditionalRenderingInfoEXT-conditionalRenderingEnable-01977

If the `inheritedConditionalRendering` feature is not enabled, `conditionalRenderingEnable` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceConditionalRenderingInfoEXT-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_CONDITIONAL_RENDERING_INFO_EXT`

To begin recording a secondary command buffer compatible with execution inside a render pass using `render pass transform`, add the `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` to the `pNext` chain of `VkCommandBufferInheritanceInfo` structure passed to the `vkBeginCommandBuffer` command specifying the parameters for transformed rasterization.

The `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` structure is defined as:

```
// Provided by VK_QCOM_render_pass_transform
typedef struct VkCommandBufferInheritanceRenderPassTransformInfoQCOM {
    VkStructureType      sType;
    void*                pNext;
    VkSurfaceTransformFlagBitsKHR transform;
    VkRect2D             renderArea;
} VkCommandBufferInheritanceRenderPassTransformInfoQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `transform` is a `VkSurfaceTransformFlagBitsKHR` value describing the transform to be applied to the render pass.
- `renderArea` is the render area that is affected by the command buffer.

When the secondary is recorded to execute within a render pass instance using `vkCmdExecuteCommands`, the render pass transform parameters of the secondary command buffer **must** be consistent with the render pass transform parameters specified for the render pass instance. In particular, the `transform` and `renderArea` for command buffer **must** be identical to the `transform` and `renderArea` of the render pass instance.

Valid Usage

- VUID-VkCommandBufferInheritanceRenderPassTransformInfoQCOM-transform-02864
`transform` **must** be `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR`, `VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR`, or `VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR`

Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceRenderPassTransformInfoQCOM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDER_PASS_TRANSFORM_INFO_QCOM`

The `VkCommandBufferInheritanceViewportScissorInfoNV` structure is defined as:

```
// Provided by VK_NV_inherited_viewport_scissor
typedef struct VkCommandBufferInheritanceViewportScissorInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           viewportScissor2D;
    uint32_t           viewportDepthCount;
    const VkViewport*   pViewportDepths;
} VkCommandBufferInheritanceViewportScissorInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `viewportScissor2D` specifies whether the listed dynamic state is inherited.
- `viewportDepthCount` specifies the maximum number of viewports to inherit. When `viewportScissor2D` is `VK_FALSE`, the behavior is as if this value is zero.
- `pViewportDepths` is a pointer to a `VkViewport` structure specifying the expected depth range for each inherited viewport.

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceViewportScissorInfoNV` structure, then that structure controls whether a command buffer **can** inherit the following state from other command buffers:

- `VK_DYNAMIC_STATE_SCISSOR`
- `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`
- `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT`
- `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT`
- `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT`

as well as the following state, with restrictions on inherited depth values and viewport count:

- `VK_DYNAMIC_STATE_VIEWPORT`
- `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`

If `viewportScissor2D` is `VK_FALSE`, then the command buffer does not inherit the listed dynamic state, and **should** set this state itself. If this structure is not present, the behavior is as if `viewportScissor2D` is `VK_FALSE`.

If `viewportScissor2D` is `VK_TRUE`, then the listed dynamic state is inherited, and the command buffer **must** not set this state, except that the viewport and scissor count **may** be set by binding a graphics pipeline that does not specify this state as dynamic.

NOTE

Due to this restriction, applications **should** ensure either all or none of the graphics pipelines bound in this secondary command buffer use dynamic viewport/scissor counts.

When the command buffer is executed as part of the execution of a `vkCmdExecuteCommands` command, the inherited state (if enabled) is determined by the following procedure, performed separately for each dynamic state, and separately for each value for dynamic state that consists of multiple values (e.g. multiple viewports).

- With *i* being the index of the executed command buffer in the `pCommandBuffers` array of `vkCmdExecuteCommands`, if *i* > 0 and any secondary command buffer from index 0 to *i*-1 modifies the state, the inherited state is provisionally set to the final value set by the last such secondary command buffer. Binding a graphics pipeline defining the state statically is equivalent to setting the state to an undefined value.
- Otherwise, the tentative inherited state is that of the primary command buffer at the point the `vkCmdExecuteCommands` command was recorded; if the state is undefined, then so is the provisional inherited state.
- If the provisional inherited state is an undefined value, then the state is not inherited.
- If the provisional inherited state is a viewport, with *n* being its viewport index, then if *n* ≥ `viewportDepthCount`, or if either `VkViewport::minDepth` or `VkViewport::maxDepth` are not equal to the respective values of the *n*th element of `pViewportDepths`, then the state is not inherited.
- If the provisional inherited state passes both checks, then it becomes the actual inherited state.

NOTE

There is no support for inheriting dynamic state from a secondary command buffer executed as part of a different `vkCmdExecuteCommands` command.

Valid Usage

- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04782
If the `inheritedViewportScissor2D` feature is not enabled, `viewportScissor2D` **must** be `VK_FALSE`
- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04783
If the `multiViewport` feature is not enabled and `viewportScissor2D` is `VK_TRUE`, then `viewportDepthCount` **must** be 1
- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04784
If `viewportScissor2D` is `VK_TRUE`, then `viewportDepthCount` **must** be greater than 0
- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04785
If `viewportScissor2D` is `VK_TRUE`, then `pViewportDepths` **must** be a valid pointer to an array of `viewportDepthCount` valid `VkViewport` structures, except any requirements on `x`, `y`, `width`, and `height` do not apply
- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04786
If `viewportScissor2D` is `VK_TRUE`, then the command buffer **must** be recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`

Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_VIEWPORT_SCISSOR_INFO_NV`

The `VkCommandBufferInheritanceRenderingInfo` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferInheritanceRenderingInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkRenderingFlags      flags;
    uint32_t              viewMask;
    uint32_t              colorAttachmentCount;
    const VkFormat*       pColorAttachmentFormats;
    VkFormat              depthAttachmentFormat;
    VkFormat              stencilAttachmentFormat;
    VkSampleCountFlagBits rasterizationSamples;
} VkCommandBufferInheritanceRenderingInfo;
```

or the equivalent

```
// Provided by VK_KHR_dynamic_rendering
typedef VkCommandBufferInheritanceRenderingInfo
VkCommandBufferInheritanceRenderingInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `flags` is a bitmask of `VkRenderingFlagBits` used by the render pass instance.
- `viewMask` is the view mask used for rendering.
- `colorAttachmentCount` is the number of color attachments specified in the render pass instance.
- `pColorAttachmentFormats` is a pointer to an array of `VkFormat` values defining the format of color attachments.
- `depthAttachmentFormat` is a `VkFormat` value defining the format of the depth attachment.
- `stencilAttachmentFormat` is a `VkFormat` value defining the format of the stencil attachment.
- `rasterizationSamples` is a `VkSampleCountFlagBits` specifying the number of samples used in rasterization.

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceRenderingInfo` structure, then that structure controls parameters of dynamic render pass instances that the `VkCommandBuffer` can be executed within. If `VkCommandBufferInheritanceInfo::renderPass` is not `VK_NULL_HANDLE`, or `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is not specified in `VkCommandBufferBeginInfo::flags`, parameters of this structure are ignored.

If `colorAttachmentCount` is `0` and the `variableMultisampleRate` feature is enabled, `rasterizationSamples` is ignored.

If `depthAttachmentFormat`, `stencilAttachmentFormat`, or any element of `pColorAttachmentFormats` is `VK_FORMAT_UNDEFINED`, it indicates that the corresponding attachment is unused within the render pass and writes to those attachments are discarded.

Valid Usage

- VUID-VkCommandBufferInheritanceRenderingInfo-colorAttachmentCount-06004
If `colorAttachmentCount` is not `0`, `rasterizationSamples` **must** be a valid `VkSampleCountFlagBits` value
- VUID-VkCommandBufferInheritanceRenderingInfo-variableMultisampleRate-06005
If the `variableMultisampleRate` feature is not enabled, `rasterizationSamples` **must** be a valid `VkSampleCountFlagBits` value
- VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06540
If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it **must** be a format that includes a depth component
- VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06007
If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it **must** be a format with `potential format features` that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkCommandBufferInheritanceRenderingInfo-pColorAttachmentFormats-06492
If any element of `pColorAttachmentFormats` is not `VK_FORMAT_UNDEFINED`, it **must** be a format with `potential format features` that include `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` , or `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV` if the `linearColorAttachment` feature is enabled
- VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-06541
If `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it **must** be a format that includes a stencil aspect
- VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-06199
If `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it **must** be a format with `potential format features` that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06200
If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED` and `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, `depthAttachmentFormat` **must** equal `stencilAttachmentFormat`
- VUID-VkCommandBufferInheritanceRenderingInfo-multiview-06008
If the `multiview` feature is not enabled, `viewMask` **must** be `0`
- VUID-VkCommandBufferInheritanceRenderingInfo-viewMask-06009
The index of the most significant bit in `viewMask` **must** be less than `maxMultiviewViewCount`

Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceRenderingInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDERING_INFO`
- VUID-VkCommandBufferInheritanceRenderingInfo-flags-parameter

flags must be a valid combination of [VkRenderingFlagBits](#) values

- VUID-VkCommandBufferInheritanceRenderingInfo-pColorAttachmentFormats-parameter
If **colorAttachmentCount** is not 0, **pColorAttachmentFormats** must be a valid pointer to an array of **colorAttachmentCount** valid [VkFormat](#) values
- VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-parameter
depthAttachmentFormat must be a valid [VkFormat](#) value
- VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-parameter
stencilAttachmentFormat must be a valid [VkFormat](#) value
- VUID-VkCommandBufferInheritanceRenderingInfo-rasterizationSamples-parameter
If **rasterizationSamples** is not 0, **rasterizationSamples** must be a valid [VkSampleCountFlagBits](#) value

The [VkAttachmentSampleCountInfoAMD](#) or [VkAttachmentSampleCountInfoNV](#) structure is defined as:

```
// Provided by VK_AMD_mixed_attachment_samples with VK_VERSION_1_3 or
VK_KHR_dynamic_rendering
typedef struct VkAttachmentSampleCountInfoAMD {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             colorAttachmentCount;
    const VkSampleCountFlagBits* pColorAttachmentSamples;
    VkSampleCountFlagBits depthStencilAttachmentSamples;
} VkAttachmentSampleCountInfoAMD;
```

or the equivalent

```
// Provided by VK_NV_framebuffer_mixed_samples with VK_VERSION_1_3 or
VK_KHR_dynamic_rendering
typedef VkAttachmentSampleCountInfoAMD VkAttachmentSampleCountInfoNV;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure
- **colorAttachmentCount** is the number of color attachments specified in a render pass instance.
- **pColorAttachmentSamples** is a pointer to an array of [VkSampleCountFlagBits](#) values defining the sample count of color attachments.
- **depthStencilAttachmentSamples** is a [VkSampleCountFlagBits](#) value defining the sample count of a depth/stencil attachment.

If [VkCommandBufferInheritanceInfo::renderPass](#) is [VK_NULL_HANDLE](#), [VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT](#) is specified in [VkCommandBufferBeginInfo::flags](#), and the **pNext** chain of [VkCommandBufferInheritanceInfo](#) includes [VkAttachmentSampleCountInfoAMD](#), then this structure defines the sample counts of each attachment within the render pass instance. If [VkAttachmentSampleCountInfoAMD](#) is not included, the value of

`VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` is used as the sample count for each attachment. If `VkCommandBufferInheritanceInfo::renderPass` is not `VK_NULL_HANDLE`, or `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is not specified in `VkCommandBufferBeginInfo::flags`, parameters of this structure are ignored.

`VkAttachmentSampleCountInfoAMD` can also be included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`. When a graphics pipeline is created without a `VkRenderPass`, if this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it specifies the sample count of attachments used for rendering. If this structure is not specified, and the pipeline does not include a `VkRenderPass`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` is used as the sample count for each attachment. If a graphics pipeline is created with a valid `VkRenderPass`, parameters of this structure are ignored.

Valid Usage (Implicit)

- VUID-VkAttachmentSampleCountInfoAMD-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ATTACHMENT_SAMPLE_COUNT_INFO_AMD`

Once recording starts, an application records a sequence of commands (`vkCmd*`) to set state in the command buffer, draw, dispatch, and other commands.

Several commands can also be recorded indirectly from `VkBuffer` content, see [Device-Generated Commands](#).

To complete recording of a command buffer, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEndCommandBuffer(
    VkCommandBuffer                commandBuffer);
```

- `commandBuffer` is the command buffer to complete recording.

The command buffer **must** have been in the [recording state](#), and, if successful, is moved to the [executable state](#).

If there was an error during recording, the application will be notified by an unsuccessful return code returned by `vkEndCommandBuffer`, and the command buffer will be moved to the [invalid state](#).

In case the application recorded one or more [video encode operations](#) into the command buffer, implementations **may** return the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

NOTE	Applications should not rely on the <code>VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR</code> error being returned by any command as a means to verify Video Std parameters,
-------------	--

as implementations are not required to report the error in any specific set of cases.

Valid Usage

- VUID-vkEndCommandBuffer-commandBuffer-00059
`commandBuffer` **must** be in the `recording` state
- VUID-vkEndCommandBuffer-commandBuffer-00060
If `commandBuffer` is a primary command buffer, there **must** not be an active render pass instance
- VUID-vkEndCommandBuffer-commandBuffer-00061
All queries made `active` during the recording of `commandBuffer` **must** have been made inactive
- VUID-vkEndCommandBuffer-None-01978
Conditional rendering **must** not be `active`
- VUID-vkEndCommandBuffer-None-06991
There **must** be no video session object bound
- VUID-vkEndCommandBuffer-commandBuffer-01815
If `commandBuffer` is a secondary command buffer, there **must** not be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdEndDebugUtilsLabelEXT`
- VUID-vkEndCommandBuffer-commandBuffer-00062
If `commandBuffer` is a secondary command buffer, there **must** not be an outstanding `vkCmdDebugMarkerBeginEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdDebugMarkerEndEXT`

Valid Usage (Implicit)

- VUID-vkEndCommandBuffer-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR`

When a command buffer is in the executable state, it **can** be submitted to a queue for execution.

6.5. Command Buffer Submission

NOTE

Submission can be a high overhead operation, and applications **should** attempt to batch work together into as few calls to `vkQueueSubmit` or `vkQueueSubmit2` as possible.

To submit command buffers to a queue, call:

```
// Provided by VK_VERSION_1_3
VkResult vkQueueSubmit2(
    VkQueue          queue,
    uint32_t         submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence          fence);
```

or the equivalent command

```
// Provided by VK_KHR_synchronization2
VkResult vkQueueSubmit2KHR(
    VkQueue          queue,
    uint32_t         submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence          fence);
```

- `queue` is the queue that the command buffers will be submitted to.
- `submitCount` is the number of elements in the `pSubmits` array.
- `pSubmits` is a pointer to an array of `VkSubmitInfo2` structures, each specifying a command buffer submission batch.
- `fence` is an **optional** handle to a fence to be signaled once all submitted command buffers have completed execution. If `fence` is not `VK_NULL_HANDLE`, it defines a [fence signal operation](#).

`vkQueueSubmit2` is a [queue submission command](#), with each batch defined by an element of `pSubmits`.

Semaphore operations submitted with `vkQueueSubmit2` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the [semaphore](#) section of [the synchronization chapter](#).

If any command buffer submitted to this queue is in the [executable state](#), it is moved to the [pending state](#). Once execution of all submissions of a command buffer complete, it moves from the [pending state](#), back to the [executable state](#). If a command buffer was recorded with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` flag, it instead moves back to the [invalid state](#).

If `vkQueueSubmit2` fails, it **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation **must** ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by `pSubmits` is unaffected by the call or its failure. If `vkQueueSubmit2` fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return `VK_ERROR_DEVICE_LOST`. See [Lost Device](#).

Valid Usage

- VUID-vkQueueSubmit2-fence-04894
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be unsignaled
- VUID-vkQueueSubmit2-fence-04895
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-vkQueueSubmit2-synchronization2-03866
The `synchronization2` feature **must** be enabled
- VUID-vkQueueSubmit2-commandBuffer-03867
If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` referenced a `VkEvent`, that event **must** not be referenced by a command that has been submitted to another queue and is still in the *pending state*
- VUID-vkQueueSubmit2-semaphore-03868
The `semaphore` member of any binary semaphore element of the `pSignalSemaphoreInfos` member of any element of `pSubmits` **must** be unsignaled when the semaphore signal operation it defines is executed on the device
- VUID-vkQueueSubmit2-stageMask-03869
The `stageMask` member of any element of the `pSignalSemaphoreInfos` member of any element of `pSubmits` **must** only include pipeline stages that are supported by the queue family which `queue` belongs to
- VUID-vkQueueSubmit2-stageMask-03870
The `stageMask` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits` **must** only include pipeline stages that are supported by the queue family which `queue` belongs to
- VUID-vkQueueSubmit2-semaphore-03871
When a semaphore wait operation for a binary semaphore is executed, as defined by the `semaphore` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits`, there **must** be no other queues waiting on the same semaphore
- VUID-vkQueueSubmit2-semaphore-03873
The `semaphore` member of any element of the `pWaitSemaphoreInfos` member of any element

of `pSubmits` that was created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_BINARY_KHR` **must** reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends **must** have also been submitted for execution

- VUID-vkQueueSubmit2-commandBuffer-03874

The `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` **must** be in the `pending or executable state`

- VUID-vkQueueSubmit2-commandBuffer-03875

If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it **must** not be in the `pending state`

- VUID-vkQueueSubmit2-commandBuffer-03876

Any `secondary command buffers recorded` into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` **must** be in the `pending or executable state`

- VUID-vkQueueSubmit2-commandBuffer-03877

If any `secondary command buffers recorded` into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it **must** not be in the `pending state`

- VUID-vkQueueSubmit2-commandBuffer-03878

The `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` **must** have been allocated from a `VkCommandPool` that was created for the same queue family `queue` belongs to

- VUID-vkQueueSubmit2-commandBuffer-03879

If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` includes a `Queue Family Ownership Transfer Acquire Operation`, there **must** exist a previously submitted `Queue Family Ownership Transfer Release Operation` on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such `acquire operations`, and which happens before the acquire operation

- VUID-vkQueueSubmit2-commandBuffer-03880

If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was a `vkCmdBeginQuery` whose `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `profiling lock` **must** have been held continuously on the `VkDevice` that `queue` was retrieved from, throughout recording of those command buffers

- VUID-vkQueueSubmit2-queue-06447

If `queue` was not created with `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT`, the `flags` member of any element of `pSubmits` **must** not include `VK_SUBMIT_PROTECTED_BIT_KHR`

Valid Usage (Implicit)

- VUID-vkQueueSubmit2-queue-parameter
`queue` **must** be a valid `VkQueue` handle
- VUID-vkQueueSubmit2-pSubmits-parameter
If `submitCount` is not 0, `pSubmits` **must** be a valid pointer to an array of `submitCount` valid `VkSubmitInfo2` structures
- VUID-vkQueueSubmit2-fence-parameter
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be a valid `VkFence` handle
- VUID-vkQueueSubmit2-commonparent
Both of `fence`, and `queue` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `queue` **must** be externally synchronized
- Host access to `fence` **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
-	-	-	Any	-

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

The `VkSubmitInfo2` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkSubmitInfo2 {
    VkStructureType           sType;
    const void*               pNext;
    VkSubmitFlags             flags;
    uint32_t                  waitSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pWaitSemaphoreInfos;
    uint32_t                  commandBufferInfoCount;
    const VkCommandBufferSubmitInfo* pCommandBufferInfos;
    uint32_t                  signalSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pSignalSemaphoreInfos;
} VkSubmitInfo2;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkSubmitInfo2 VkSubmitInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSubmitFlagBits`.
- `waitSemaphoreInfoCount` is the number of elements in `pWaitSemaphoreInfos`.
- `pWaitSemaphoreInfos` is a pointer to an array of `VkSemaphoreSubmitInfo` structures defining semaphore wait operations.
- `commandBufferInfoCount` is the number of elements in `pCommandBufferInfos` and the number of command buffers to execute in the batch.
- `pCommandBufferInfos` is a pointer to an array of `VkCommandBufferSubmitInfo` structures describing command buffers to execute in the batch.
- `signalSemaphoreInfoCount` is the number of elements in `pSignalSemaphoreInfos`.
- `pSignalSemaphoreInfos` is a pointer to an array of `VkSemaphoreSubmitInfo` describing semaphore signal operations.

Valid Usage

- VUID-VkSubmitInfo2-semaphore-03881
If the same semaphore is used as the `semaphore` member of both an element of `pSignalSemaphoreInfos` and `pWaitSemaphoreInfos`, and that semaphore is a timeline semaphore, the `value` member of the `pSignalSemaphoreInfos` element **must** be greater than the `value` member of the `pWaitSemaphoreInfos` element
- VUID-VkSubmitInfo2-semaphore-03882
If the `semaphore` member of any element of `pSignalSemaphoreInfos` is a timeline semaphore, the `value` member of that element **must** have a value greater than the current value of the semaphore when the semaphore signal operation is executed

- VUID-VkSubmitInfo2-semaphore-03883
If the **semaphore** member of any element of **pSignalSemaphoreInfos** is a timeline semaphore, the **value** member of that element **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than **maxTimelineSemaphoreValueDifference**
- VUID-VkSubmitInfo2-semaphore-03884
If the **semaphore** member of any element of **pWaitSemaphoreInfos** is a timeline semaphore, the **value** member of that element **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than **maxTimelineSemaphoreValueDifference**
- VUID-VkSubmitInfo2-flags-03886
If **flags** includes **VK_SUBMIT_PROTECTED_BIT**, all elements of **pCommandBuffers** **must** be protected command buffers
- VUID-VkSubmitInfo2-flags-03887
If **flags** does not include **VK_SUBMIT_PROTECTED_BIT**, each element of **pCommandBuffers** **must** not be a protected command buffer
- VUID-VkSubmitInfo2KHR-commandBuffer-06192
If any **commandBuffer** member of an element of **pCommandBufferInfos** contains any **resumed render pass instances**, they **must** be suspended by a render pass instance earlier in submission order within **pCommandBufferInfos**
- VUID-VkSubmitInfo2KHR-commandBuffer-06010
If any **commandBuffer** member of an element of **pCommandBufferInfos** contains any **suspended render pass instances**, they **must** be resumed by a render pass instance later in submission order within **pCommandBufferInfos**
- VUID-VkSubmitInfo2KHR-commandBuffer-06011
If any **commandBuffer** member of an element of **pCommandBufferInfos** contains any **suspended render pass instances**, there **must** be no action or synchronization commands between that render pass instance and the render pass instance that resumes it
- VUID-VkSubmitInfo2KHR-commandBuffer-06012
If any **commandBuffer** member of an element of **pCommandBufferInfos** contains any **suspended render pass instances**, there **must** be no render pass instances between that render pass instance and the render pass instance that resumes it
- VUID-VkSubmitInfo2KHR-variableSampleLocations-06013
If the **variableSampleLocations** limit is not supported, and any **commandBuffer** member of an element of **pCommandBufferInfos** contains any **suspended render pass instances**, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, **must** use the same sample locations

Valid Usage (Implicit)

- VUID-VkSubmitInfo2-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_SUBMIT_INFO_2**

- VUID-VkSubmitInfo2-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of **VkFrameBoundaryEXT**, **VkLatencySubmissionPresentIdNV**, **VkPerformanceQuerySubmitInfoKHR**, **VkWin32KeyedMutexAcquireReleaseInfoKHR**, or **VkWin32KeyedMutexAcquireReleaseInfoNV**
- VUID-VkSubmitInfo2-sType-unique
The **sType** value of each struct in the **pNext** chain **must** be unique
- VUID-VkSubmitInfo2-flags-parameter
flags **must** be a valid combination of **VkSubmitFlagBits** values
- VUID-VkSubmitInfo2-pWaitSemaphoreInfos-parameter
If **waitSemaphoreInfoCount** is not 0, **pWaitSemaphoreInfos** **must** be a valid pointer to an array of **waitSemaphoreInfoCount** valid **VkSemaphoreSubmitInfo** structures
- VUID-VkSubmitInfo2-pCommandBufferInfos-parameter
If **commandBufferInfoCount** is not 0, **pCommandBufferInfos** **must** be a valid pointer to an array of **commandBufferInfoCount** valid **VkCommandBufferSubmitInfo** structures
- VUID-VkSubmitInfo2-pSignalSemaphoreInfos-parameter
If **signalSemaphoreInfoCount** is not 0, **pSignalSemaphoreInfos** **must** be a valid pointer to an array of **signalSemaphoreInfoCount** valid **VkSemaphoreSubmitInfo** structures

Bits which **can** be set in **VkSubmitInfo2::flags**, specifying submission behavior, are:

```
// Provided by VK_VERSION_1_3
typedef enum VkSubmitFlagBits {
    VK_SUBMIT_PROTECTED_BIT = 0x00000001,
    VK_SUBMIT_PROTECTED_BIT_KHR = VK_SUBMIT_PROTECTED_BIT,
} VkSubmitFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkSubmitFlagBits VkSubmitFlagBitsKHR;
```

- **VK_SUBMIT_PROTECTED_BIT** specifies that this batch is a protected submission.

```
// Provided by VK_VERSION_1_3
typedef VkFlags VkSubmitFlags;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkSubmitFlags VkSubmitFlagsKHR;
```

`VkSubmitFlags` is a bitmask type for setting a mask of zero or more [VkSubmitFlagBits](#).

The `VkSemaphoreSubmitInfo` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkSemaphoreSubmitInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkSemaphore           semaphore;
    uint64_t              value;
    VkPipelineStageFlags2 stageMask;
    uint32_t              deviceIndex;
} VkSemaphoreSubmitInfo;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkSemaphoreSubmitInfo VkSemaphoreSubmitInfoKHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is a [VkSemaphore](#) affected by this operation.
- `value` is either the value used to signal `semaphore` or the value waited on by `semaphore`, if `semaphore` is a timeline semaphore. Otherwise it is ignored.
- `stageMask` is a [VkPipelineStageFlags2](#) mask of pipeline stages which limit the first synchronization scope of a semaphore signal operation, or second synchronization scope of a semaphore wait operation as described in the [semaphore wait operation](#) and [semaphore signal operation](#) sections of the [synchronization chapter](#).
- `deviceIndex` is the index of the device within a device group that executes the semaphore wait or signal operation.

Whether this structure defines a semaphore wait or signal operation is defined by how it is used.

Valid Usage

- VUID-VkSemaphoreSubmitInfo-stageMask-03929
If the `geometryShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- VUID-VkSemaphoreSubmitInfo-stageMask-03930
If the `tessellationShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkSemaphoreSubmitInfo-stageMask-03931
If the `conditionalRendering` feature is not enabled, `stageMask` **must** not contain

VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT

- VUID-VkSemaphoreSubmitInfo-stageMask-03932
If the `fragmentDensityMap` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkSemaphoreSubmitInfo-stageMask-03933
If the `transformFeedback` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-VkSemaphoreSubmitInfo-stageMask-03934
If the `meshShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`
- VUID-VkSemaphoreSubmitInfo-stageMask-03935
If the `taskShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
- VUID-VkSemaphoreSubmitInfo-stageMask-07316
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkSemaphoreSubmitInfo-stageMask-04957
If the `subpassShading` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`
- VUID-VkSemaphoreSubmitInfo-stageMask-04995
If the `invocationMask` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`
- VUID-VkSemaphoreSubmitInfo-stageMask-07946
If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkSemaphoreSubmitInfo-device-03888
If the `device` that `semaphore` was created on is not a device group, `deviceIndex` **must** be 0
- VUID-VkSemaphoreSubmitInfo-device-03889
If the `device` that `semaphore` was created on is a device group, `deviceIndex` **must** be a valid device index

Valid Usage (Implicit)

- VUID-VkSemaphoreSubmitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_SUBMIT_INFO`
- VUID-VkSemaphoreSubmitInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkSemaphoreSubmitInfo-semaphore-parameter
`semaphore` **must** be a valid `VkSemaphore` handle
- VUID-VkSemaphoreSubmitInfo-stageMask-parameter
`stageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values

The `VkCommandBufferSubmitInfo` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkCommandBuffer    commandBuffer;
    uint32_t           deviceMask;
} VkCommandBufferSubmitInfo;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkCommandBufferSubmitInfo VkCommandBufferSubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `commandBuffer` is a `VkCommandBuffer` to be submitted for execution.
- `deviceMask` is a bitmask indicating which devices in a device group execute the command buffer. A `deviceMask` of `0` is equivalent to setting all bits corresponding to valid devices in the group to `1`.

Valid Usage

- VUID-VkCommandBufferSubmitInfo-commandBuffer-03890
`commandBuffer` **must** not have been allocated with `VK_COMMAND_BUFFER_LEVEL_SECONDARY`
- VUID-VkCommandBufferSubmitInfo-deviceMask-03891
If `deviceMask` is not `0`, it **must** be a valid device mask
- VUID-VkCommandBufferSubmitInfo-commandBuffer-09445
If any render pass instance in `commandBuffer` was recorded with a `VkRenderPassStripeBeginInfoARM` structure in its `pNext` chain and did not specify the `VK_RENDERING_RESUMING_BIT` flag, a `VkRenderPassStripeSubmitInfoARM` **must** be included in the `pNext` chain
- VUID-VkCommandBufferSubmitInfo-pNext-09446
If a `VkRenderPassStripeSubmitInfoARM` is included in the `pNext` chain, the value of `VkRenderPassStripeSubmitInfoARM::stripeSemaphoreInfoCount` **must** be equal to the sum of the `VkRenderPassStripeBeginInfoARM::stripeInfoCount` parameters provided to render pass instances recorded in `commandBuffer` that did not specify the `VK_RENDERING_RESUMING_BIT` flag

Valid Usage (Implicit)

- VUID-VkCommandBufferSubmitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_SUBMIT_INFO`

- VUID-VkCommandBufferSubmitInfo-pNext-pNext
pNext **must** be **NULL** or a pointer to a valid instance of **VkRenderPassStripeSubmitInfoARM**
- VUID-VkCommandBufferSubmitInfo-sType-unique
The **sType** value of each struct in the **pNext** chain **must** be unique
- VUID-VkCommandBufferSubmitInfo-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle

The **VkRenderPassStripeSubmitInfoARM** structure is defined as:

```
// Provided by VK_ARM_render_pass_striped
typedef struct VkRenderPassStripeSubmitInfoARM {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             stripeSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pStripeSemaphoreInfos;
} VkRenderPassStripeSubmitInfoARM;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **stripeSemaphoreInfoCount** is the number of semaphores used to signal stripe completion in the render pass instances in the submitted command buffer.
- **pStripeSemaphoreInfos** is a pointer to an array of **stripeSemaphoreInfoCount** **VkSemaphoreSubmitInfo** structures describing the semaphores used to signal stripe completion.

This structure can be included in the **pNext** chain of **VkCommandBufferSubmitInfo** to provide a set of semaphores to be signaled for each striped render pass instance.

The elements of **pStripeSemaphoreInfos** are mapped to render pass instances in **VkCommandBufferSubmitInfo::commandBuffer** in submission order and in stripe order within each render pass instance. Each semaphore in **pStripeSemaphoreInfos** is signaled when the implementation has completed execution of the associated stripe. In a render pass instance that has multiview enabled, the stripe includes all views in the view mask. In a render pass instance with **layerCount** greater than 1, the stripe includes all layers.

Render pass instances that specify the **VK_RENDERING_RESUMING_BIT** will not have any elements of **pStripeSemaphoreInfos** mapped to them. Instead, for suspending and resuming render pass instances, this mapping is done for the first suspending render pass instance, and the per-stripe semaphores are only signaled for the last resuming render pass instance.

Valid Usage

- VUID-VkRenderPassStripeSubmitInfoARM-semaphore-09447
The **semaphore** member of each element of **pStripeSemaphoreInfos** **must** have been created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_BINARY**

Valid Usage (Implicit)

- VUID-VkRenderPassStripeSubmitInfoARM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_STRIPE_SUBMIT_INFO_ARM`
- VUID-VkRenderPassStripeSubmitInfoARM-pStripeSemaphoreInfos-parameter
`pStripeSemaphoreInfos` **must** be a valid pointer to an array of `stripeSemaphoreInfoCount` valid `VkSemaphoreSubmitInfo` structures
- VUID-VkRenderPassStripeSubmitInfoARM-stripeSemaphoreInfoCount-arraylength
`stripeSemaphoreInfoCount` **must** be greater than `0`

To submit command buffers to a queue, call:

```
// Provided by VK_VERSION_1_0
VkResult vkQueueSubmit(
    VkQueue          queue,
    uint32_t         submitCount,
    const VkSubmitInfo* pSubmits,
    VkFence          fence);
```

- `queue` is the queue that the command buffers will be submitted to.
- `submitCount` is the number of elements in the `pSubmits` array.
- `pSubmits` is a pointer to an array of `VkSubmitInfo` structures, each specifying a command buffer submission batch.
- `fence` is an **optional** handle to a fence to be signaled once all submitted command buffers have completed execution. If `fence` is not `VK_NULL_HANDLE`, it defines a `fence signal operation`.

`vkQueueSubmit` is a `queue submission command`, with each batch defined by an element of `pSubmits`. Batches begin execution in the order they appear in `pSubmits`, but **may** complete out of order.

Fence and semaphore operations submitted with `vkQueueSubmit` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the `semaphore` and `fence` sections of [the synchronization chapter](#).

Details on the interaction of `pWaitDstStageMask` with synchronization are described in the `semaphore wait operation` section of [the synchronization chapter](#).

The order that batches appear in `pSubmits` is used to determine `submission order`, and thus all the `implicit ordering guarantees` that respect it. Other than these implicit ordering guarantees and any `explicit synchronization primitives`, these batches **may** overlap or otherwise execute out of order.

If any command buffer submitted to this queue is in the `executable state`, it is moved to the `pending state`. Once execution of all submissions of a command buffer complete, it moves from the `pending state`, back to the `executable state`. If a command buffer was recorded with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` flag, it instead moves to the `invalid state`.

If `vkQueueSubmit` fails, it **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation **must** ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by `pSubmits` is unaffected by the call or its failure. If `vkQueueSubmit` fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return `VK_ERROR_DEVICE_LOST`. See [Lost Device](#).

Valid Usage

- VUID-vkQueueSubmit-fence-00063
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be unsignaled
- VUID-vkQueueSubmit-fence-00064
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-vkQueueSubmit-pCommandBuffers-00065
Any calls to `vkCmdSetEvent`, `vkCmdResetEvent` or `vkCmdWaitEvents` that have been recorded into any of the command buffer elements of the `pCommandBuffers` member of any element of `pSubmits`, **must** not reference any `VkEvent` that is referenced by any of those commands in a command buffer that has been submitted to another queue and is still in the *pending state*
- VUID-vkQueueSubmit-pWaitDstStageMask-00066
Any stage flag included in any element of the `pWaitDstStageMask` member of any element of `pSubmits` **must** be a pipeline stage supported by one of the capabilities of `queue`, as specified in the [table of supported pipeline stages](#)
- VUID-vkQueueSubmit-pSignalSemaphores-00067
Each binary semaphore element of the `pSignalSemaphores` member of any element of `pSubmits` **must** be unsignaled when the semaphore signal operation it defines is executed on the device
- VUID-vkQueueSubmit-pWaitSemaphores-00068
When a semaphore wait operation referring to a binary semaphore defined by any element of the `pWaitSemaphores` member of any element of `pSubmits` executes on `queue`, there **must** be no other queues waiting on the same semaphore
- VUID-vkQueueSubmit-pWaitSemaphores-03238
All elements of the `pWaitSemaphores` member of all elements of `pSubmits` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` **must** reference a semaphore signal operation that has been submitted for execution and any [semaphore signal operations](#) on which it depends **must** have also been submitted for execution
- VUID-vkQueueSubmit-pCommandBuffers-00070
Each element of the `pCommandBuffers` member of each element of `pSubmits` **must** be in the [pending or executable state](#)
- VUID-vkQueueSubmit-pCommandBuffers-00071
If any element of the `pCommandBuffers` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it **must** not be in the [pending state](#)

- VUID-vkQueueSubmit-pCommandBuffers-00072
Any [secondary command buffers recorded](#) into any element of the [pCommandBuffers](#) member of any element of [pSubmits](#) **must** be in the [pending or executable state](#)
- VUID-vkQueueSubmit-pCommandBuffers-00073
If any [secondary command buffers recorded](#) into any element of the [pCommandBuffers](#) member of any element of [pSubmits](#) was not recorded with the [VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT](#), it **must** not be in the [pending state](#)
- VUID-vkQueueSubmit-pCommandBuffers-00074
Each element of the [pCommandBuffers](#) member of each element of [pSubmits](#) **must** have been allocated from a [VkCommandPool](#) that was created for the same queue family [queue](#) belongs to
- VUID-vkQueueSubmit-pSubmits-02207
If any element of [pSubmits->pCommandBuffers](#) includes a [Queue Family Ownership Transfer Acquire Operation](#), there **must** exist a previously submitted [Queue Family Ownership Transfer Release Operation](#) on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such [acquire operations](#), and which happens-before the acquire operation
- VUID-vkQueueSubmit-pCommandBuffers-03220
If a command recorded into any element of [pCommandBuffers](#) was a [vkCmdBeginQuery](#) whose [queryPool](#) was created with a [queryType](#) of [VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR](#), the [profiling lock](#) **must** have been held continuously on the [VkDevice](#) that [queue](#) was retrieved from, throughout recording of those command buffers
- VUID-vkQueueSubmit-pSubmits-02808
Any resource created with [VK_SHARING_MODE_EXCLUSIVE](#) that is read by an operation specified by [pSubmits](#) **must** not be owned by any queue family other than the one which [queue](#) belongs to, at the time it is executed
- VUID-vkQueueSubmit-pSubmits-04626
Any resource created with [VK_SHARING_MODE_CONCURRENT](#) that is accessed by an operation specified by [pSubmits](#) **must** have included the queue family of [queue](#) at resource creation time
- VUID-vkQueueSubmit-queue-06448
If [queue](#) was not created with [VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT](#), there **must** be no element of [pSubmits](#) that includes a [VkProtectedSubmitInfo](#) structure in its [pNext](#) chain with [protectedSubmit](#) equal to [VK_TRUE](#)

Valid Usage (Implicit)

- VUID-vkQueueSubmit-queue-parameter
[queue](#) **must** be a valid [VkQueue](#) handle
- VUID-vkQueueSubmit-pSubmits-parameter
If [submitCount](#) is not 0, [pSubmits](#) **must** be a valid pointer to an array of [submitCount](#) valid [VkSubmitInfo](#) structures
- VUID-vkQueueSubmit-fence-parameter

If **fence** is not **VK_NULL_HANDLE**, **fence** **must** be a valid **VkFence** handle

- VUID-vkQueueSubmit-commonparent

Both of **fence**, and **queue** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same **VkDevice**

Host Synchronization

- Host access to **queue** **must** be externally synchronized
- Host access to **fence** **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
-	-	-	Any	-

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_DEVICE_LOST**

The **VkSubmitInfo** structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    const VkPipelineStageFlags* pWaitDstStageMask;
    uint32_t           commandBufferCount;
    const VkCommandBuffer* pCommandBuffers;
    uint32_t           signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
} VkSubmitInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores upon which to wait before executing the command buffers for the batch.
- `pWaitSemaphores` is a pointer to an array of `VkSemaphore` handles upon which to wait before the command buffers for this batch begin execution. If semaphores to wait on are provided, they define a [semaphore wait operation](#).
- `pWaitDstStageMask` is a pointer to an array of pipeline stages at which each corresponding semaphore wait will occur.
- `commandBufferCount` is the number of command buffers to execute in the batch.
- `pCommandBuffers` is a pointer to an array of `VkCommandBuffer` handles to execute in the batch.
- `signalSemaphoreCount` is the number of semaphores to be signaled once the commands specified in `pCommandBuffers` have completed execution.
- `pSignalSemaphores` is a pointer to an array of `VkSemaphore` handles which will be signaled when the command buffers for this batch have completed execution. If semaphores to be signaled are provided, they define a [semaphore signal operation](#).

The order that command buffers appear in `pCommandBuffers` is used to determine [submission order](#), and thus all the [implicit ordering guarantees](#) that respect it. Other than these implicit ordering guarantees and any [explicit synchronization primitives](#), these command buffers **may** overlap or otherwise execute out of order.

Valid Usage

- VUID-VkSubmitInfo-pWaitDstStageMask-04090
If the `geometryShader` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-VkSubmitInfo-pWaitDstStageMask-04091
If the `tessellationShader` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkSubmitInfo-pWaitDstStageMask-04092
If the `conditionalRendering` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-VkSubmitInfo-pWaitDstStageMask-04093
If the `fragmentDensityMap` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkSubmitInfo-pWaitDstStageMask-04094
If the `transformFeedback` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-VkSubmitInfo-pWaitDstStageMask-04095
If the `meshShader` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-VkSubmitInfo-pWaitDstStageMask-04096

If the `taskShader` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- VUID-VkSubmitInfo-pWaitDstStageMask-07318

If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkSubmitInfo-pWaitDstStageMask-03937

If the `synchronization2` feature is not enabled, `pWaitDstStageMask` **must** not be 0

- VUID-VkSubmitInfo-pWaitDstStageMask-07949

If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkSubmitInfo-pCommandBuffers-00075

Each element of `pCommandBuffers` **must** not have been allocated with `VK_COMMAND_BUFFER_LEVEL_SECONDARY`

- VUID-VkSubmitInfo-pWaitDstStageMask-00078

Each element of `pWaitDstStageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`

- VUID-VkSubmitInfo-pWaitSemaphores-03239

If any element of `pWaitSemaphores` or `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then the `pNext` chain **must** include a `VkTimelineSemaphoreSubmitInfo` structure

- VUID-VkSubmitInfo-pNext-03240

If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then its `waitSemaphoreValueCount` member **must** equal `waitSemaphoreCount`

- VUID-VkSubmitInfo-pNext-03241

If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then its `signalSemaphoreValueCount` member **must** equal `signalSemaphoreCount`

- VUID-VkSubmitInfo-pSignalSemaphores-03242

For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` **must** have a value greater than the current value of the semaphore when the `semaphore signal operation` is executed

- VUID-VkSubmitInfo-pWaitSemaphores-03243

For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`

- VUID-VkSubmitInfo-pSignalSemaphores-03244
For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`
- VUID-VkSubmitInfo-pNext-04120
If the `pNext` chain of this structure does not include a `VkProtectedSubmitInfo` structure with `protectedSubmit` set to `VK_TRUE`, then each element of the `pCommandBuffers` array **must** be an unprotected command buffer
- VUID-VkSubmitInfo-pNext-04148
If the `pNext` chain of this structure includes a `VkProtectedSubmitInfo` structure with `protectedSubmit` set to `VK_TRUE`, then each element of the `pCommandBuffers` array **must** be a protected command buffer
- VUID-VkSubmitInfo-pCommandBuffers-06193
If `pCommandBuffers` contains any `resumed render pass instances`, they **must** be suspended by a render pass instance earlier in submission order within `pCommandBuffers`
- VUID-VkSubmitInfo-pCommandBuffers-06014
If `pCommandBuffers` contains any `suspended render pass instances`, they **must** be resumed by a render pass instance later in submission order within `pCommandBuffers`
- VUID-VkSubmitInfo-pCommandBuffers-06015
If `pCommandBuffers` contains any `suspended render pass instances`, there **must** be no action or synchronization commands executed in a primary or `secondary` command buffer between that render pass instance and the render pass instance that resumes it
- VUID-VkSubmitInfo-pCommandBuffers-06016
If `pCommandBuffers` contains any `suspended render pass instances`, there **must** be no render pass instances between that render pass instance and the render pass instance that resumes it
- VUID-VkSubmitInfo-variableSampleLocations-06017
If the `variableSampleLocations` limit is not supported, and any element of `pCommandBuffers` contains any `suspended render pass instances`, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, **must** use the same sample locations

Valid Usage (Implicit)

- VUID-VkSubmitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SUBMIT_INFO`
- VUID-VkSubmitInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkAmigoProfilingSubmitInfoSEC`,

VkD3D12FenceSubmitInfoKHR, VkDeviceGroupSubmitInfo, VkFrameBoundaryEXT,
 VkLatencySubmissionPresentIdNV, VkPerformanceQuerySubmitInfoKHR,
 VkProtectedSubmitInfo, VkTimelineSemaphoreSubmitInfo,
 VkWin32KeyedMutexAcquireReleaseInfoKHR, or
 VkWin32KeyedMutexAcquireReleaseInfoNV

- VUID-VkSubmitInfo-sType-unique
The **sType** value of each struct in the **pNext** chain **must** be unique
- VUID-VkSubmitInfo-pWaitSemaphores-parameter
If **waitSemaphoreCount** is not 0, **pWaitSemaphores** **must** be a valid pointer to an array of **waitSemaphoreCount** valid **VkSemaphore** handles
- VUID-VkSubmitInfo-pWaitDstStageMask-parameter
If **waitSemaphoreCount** is not 0, **pWaitDstStageMask** **must** be a valid pointer to an array of **waitSemaphoreCount** valid combinations of **VkPipelineStageFlagBits** values
- VUID-VkSubmitInfo-pCommandBuffers-parameter
If **commandBufferCount** is not 0, **pCommandBuffers** **must** be a valid pointer to an array of **commandBufferCount** valid **VkCommandBuffer** handles
- VUID-VkSubmitInfo-pSignalSemaphores-parameter
If **signalSemaphoreCount** is not 0, **pSignalSemaphores** **must** be a valid pointer to an array of **signalSemaphoreCount** valid **VkSemaphore** handles
- VUID-VkSubmitInfo-commonparent
Each of the elements of **pCommandBuffers**, the elements of **pSignalSemaphores**, and the elements of **pWaitSemaphores** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same **VkDevice**

To specify the values to use when waiting for and signaling semaphores created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE**, add a **VkTimelineSemaphoreSubmitInfo** structure to the **pNext** chain of the **VkSubmitInfo** structure when using **vkQueueSubmit** or the **VkBindSparseInfo** structure when using **vkQueueBindSparse**. The **VkTimelineSemaphoreSubmitInfo** structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkTimelineSemaphoreSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreValueCount;
    const uint64_t*    pWaitSemaphoreValues;
    uint32_t           signalSemaphoreValueCount;
    const uint64_t*    pSignalSemaphoreValues;
} VkTimelineSemaphoreSubmitInfo;
```

or the equivalent

```
// Provided by VK_KHR_timeline_semaphore
typedef VkTimelineSemaphoreSubmitInfo VkTimelineSemaphoreSubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreValueCount` is the number of semaphore wait values specified in `pWaitSemaphoreValues`.
- `pWaitSemaphoreValues` is a pointer to an array of `waitSemaphoreValueCount` values for the corresponding semaphores in `VkSubmitInfo::pWaitSemaphores` to wait for.
- `signalSemaphoreValueCount` is the number of semaphore signal values specified in `pSignalSemaphoreValues`.
- `pSignalSemaphoreValues` is a pointer to an array `signalSemaphoreValueCount` values for the corresponding semaphores in `VkSubmitInfo::pSignalSemaphores` to set when signaled.

If the semaphore in `VkSubmitInfo::pWaitSemaphores` or `VkSubmitInfo::pSignalSemaphores` corresponding to an entry in `pWaitSemaphoreValues` or `pSignalSemaphoreValues` respectively was not created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, the implementation **must** ignore the value in the `pWaitSemaphoreValues` or `pSignalSemaphoreValues` entry.

Valid Usage (Implicit)

- VUID-VkTimelineSemaphoreSubmitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO`
- VUID-VkTimelineSemaphoreSubmitInfo-pWaitSemaphoreValues-parameter
If `waitSemaphoreValueCount` is not `0`, and `pWaitSemaphoreValues` is not `NULL`, `pWaitSemaphoreValues` **must** be a valid pointer to an array of `waitSemaphoreValueCount` `uint64_t` values
- VUID-VkTimelineSemaphoreSubmitInfo-pSignalSemaphoreValues-parameter
If `signalSemaphoreValueCount` is not `0`, and `pSignalSemaphoreValues` is not `NULL`, `pSignalSemaphoreValues` **must** be a valid pointer to an array of `signalSemaphoreValueCount` `uint64_t` values

To specify the values to use when waiting for and signaling semaphores whose `current payload` refers to a Direct3D 12 fence, add a `VkD3D12FenceSubmitInfoKHR` structure to the `pNext` chain of the `VkSubmitInfo` structure. The `VkD3D12FenceSubmitInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkD3D12FenceSubmitInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreValuesCount;
    const uint64_t*     pWaitSemaphoreValues;
    uint32_t           signalSemaphoreValuesCount;
    const uint64_t*     pSignalSemaphoreValues;
} VkD3D12FenceSubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreValuesCount` is the number of semaphore wait values specified in `pWaitSemaphoreValues`.
- `pWaitSemaphoreValues` is a pointer to an array of `waitSemaphoreValuesCount` values for the corresponding semaphores in `VkSubmitInfo::pWaitSemaphores` to wait for.
- `signalSemaphoreValuesCount` is the number of semaphore signal values specified in `pSignalSemaphoreValues`.
- `pSignalSemaphoreValues` is a pointer to an array of `signalSemaphoreValuesCount` values for the corresponding semaphores in `VkSubmitInfo::pSignalSemaphores` to set when signaled.

If the semaphore in `VkSubmitInfo::pWaitSemaphores` or `VkSubmitInfo::pSignalSemaphores` corresponding to an entry in `pWaitSemaphoreValues` or `pSignalSemaphoreValues` respectively does not currently have a `payload` referring to a Direct3D 12 fence, the implementation **must** ignore the value in the `pWaitSemaphoreValues` or `pSignalSemaphoreValues` entry.

NOTE

As the introduction of the external semaphore handle type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` is preserved for backwards compatibility. However, applications **should** prefer importing such handle types into semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, and use the `VkTimelineSemaphoreSubmitInfo` structure instead of the `VkD3D12FenceSubmitInfoKHR` structure to specify the values to use when waiting for and signaling such semaphores.

Valid Usage

- VUID-VkD3D12FenceSubmitInfoKHR-waitSemaphoreValuesCount-00079
`waitSemaphoreValuesCount` **must** be the same value as `VkSubmitInfo::waitSemaphoreCount`, where this structure is in the `pNext` chain of a `VkSubmitInfo` structure
- VUID-VkD3D12FenceSubmitInfoKHR-signalSemaphoreValuesCount-00080
`signalSemaphoreValuesCount` **must** be the same value as `VkSubmitInfo::`

`signalSemaphoreCount`, where this structure is in the `pNext` chain of a `VkSubmitInfo` structure

Valid Usage (Implicit)

- `VUID-Vkd3D12FenceSubmitInfoKHR-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_D3D12_FENCE_SUBMIT_INFO_KHR`
- `VUID-Vkd3D12FenceSubmitInfoKHR-pWaitSemaphoreValues-parameter`
If `waitSemaphoreValuesCount` is not 0, and `pWaitSemaphoreValues` is not `NULL`, `pWaitSemaphoreValues` **must** be a valid pointer to an array of `waitSemaphoreValuesCount` `uint64_t` values
- `VUID-Vkd3D12FenceSubmitInfoKHR-pSignalSemaphoreValues-parameter`
If `signalSemaphoreValuesCount` is not 0, and `pSignalSemaphoreValues` is not `NULL`, `pSignalSemaphoreValues` **must** be a valid pointer to an array of `signalSemaphoreValuesCount` `uint64_t` values

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism **may** be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They **can** only be used if the imported resource was created with the `D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX` flag.

To acquire keyed mutexes before submitted work and/or release them after, add a `VkWin32KeyedMutexAcquireReleaseInfoKHR` structure to the `pNext` chain of the `VkSubmitInfo` structure.

The `VkWin32KeyedMutexAcquireReleaseInfoKHR` structure is defined as:

```
// Provided by VK_KHR_win32_keyed_mutex
typedef struct VkWin32KeyedMutexAcquireReleaseInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           acquireCount;
    const VkDeviceMemory* pAcquireSyncs;
    const uint64_t*     pAcquireKeys;
    const uint32_t*     pAcquireTimeouts;
    uint32_t           releaseCount;
    const VkDeviceMemory* pReleaseSyncs;
    const uint64_t*     pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `acquireCount` is the number of entries in the `pAcquireSyncs`, `pAcquireKeys`, and `pAcquireTimeouts` arrays.

- `pAcquireSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pAcquireKeys` is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in `pAcquireSyncs`.
- `pAcquireTimeouts` is a pointer to an array of timeout values, in millisecond units, for each acquire specified in `pAcquireKeys`.
- `releaseCount` is the number of entries in the `pReleaseSyncs` and `pReleaseKeys` arrays.
- `pReleaseSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pReleaseKeys` is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in `pReleaseSyncs`.

Valid Usage

- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-00081
Each member of `pAcquireSyncs` and `pReleaseSyncs` **must** be a device memory object imported by setting `VkImportMemoryWin32HandleInfoKHR::handleType` to `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`

Valid Usage (Implicit)

- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_KHR`
- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-parameter
If `acquireCount` is not 0, `pAcquireSyncs` **must** be a valid pointer to an array of `acquireCount` valid `VkDeviceMemory` handles
- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireKeys-parameter
If `acquireCount` is not 0, `pAcquireKeys` **must** be a valid pointer to an array of `acquireCount` `uint64_t` values
- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireTimeouts-parameter
If `acquireCount` is not 0, `pAcquireTimeouts` **must** be a valid pointer to an array of `acquireCount` `uint32_t` values
- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseSyncs-parameter
If `releaseCount` is not 0, `pReleaseSyncs` **must** be a valid pointer to an array of `releaseCount` valid `VkDeviceMemory` handles
- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseKeys-parameter
If `releaseCount` is not 0, `pReleaseKeys` **must** be a valid pointer to an array of `releaseCount` `uint64_t` values
- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-commonparent

Both of the elements of `pAcquireSyncs`, and the elements of `pReleaseSyncs` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism **may** be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They **can** only be used if the imported resource was created with the `D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX` flag.

To acquire keyed mutexes before submitted work and/or release them after, add a `VkWin32KeyedMutexAcquireReleaseInfoNV` structure to the `pNext` chain of the `VkSubmitInfo` structure.

The `VkWin32KeyedMutexAcquireReleaseInfoNV` structure is defined as:

```
// Provided by VK_NV_win32_keyed_mutex
typedef struct VkWin32KeyedMutexAcquireReleaseInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t            acquireCount;
    const VkDeviceMemory* pAcquireSyncs;
    const uint64_t*     pAcquireKeys;
    const uint32_t*     pAcquireTimeoutMilliseconds;
    uint32_t            releaseCount;
    const VkDeviceMemory* pReleaseSyncs;
    const uint64_t*     pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoNV;
```

- `acquireCount` is the number of entries in the `pAcquireSyncs`, `pAcquireKeys`, and `pAcquireTimeoutMilliseconds` arrays.
- `pAcquireSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pAcquireKeys` is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in `pAcquireSyncs`.
- `pAcquireTimeoutMilliseconds` is a pointer to an array of timeout values, in millisecond units, for each acquire specified in `pAcquireKeys`.
- `releaseCount` is the number of entries in the `pReleaseSyncs` and `pReleaseKeys` arrays.
- `pReleaseSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pReleaseKeys` is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in `pReleaseSyncs`.

Valid Usage (Implicit)

- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_NV`
- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireSyncs-parameter
If `acquireCount` is not 0, `pAcquireSyncs` **must** be a valid pointer to an array of `acquireCount` valid `VkDeviceMemory` handles
- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireKeys-parameter
If `acquireCount` is not 0, `pAcquireKeys` **must** be a valid pointer to an array of `acquireCount` `uint64_t` values
- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireTimeoutMilliseconds-parameter
If `acquireCount` is not 0, `pAcquireTimeoutMilliseconds` **must** be a valid pointer to an array of `acquireCount` `uint32_t` values
- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pReleaseSyncs-parameter
If `releaseCount` is not 0, `pReleaseSyncs` **must** be a valid pointer to an array of `releaseCount` valid `VkDeviceMemory` handles
- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pReleaseKeys-parameter
If `releaseCount` is not 0, `pReleaseKeys` **must** be a valid pointer to an array of `releaseCount` `uint64_t` values
- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-commonparent
Both of the elements of `pAcquireSyncs`, and the elements of `pReleaseSyncs` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

If the `pNext` chain of `VkSubmitInfo` includes a `VkProtectedSubmitInfo` structure, then the structure indicates whether the batch is protected. The `VkProtectedSubmitInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkProtectedSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           protectedSubmit;
} VkProtectedSubmitInfo;
```

- `protectedSubmit` specifies whether the batch is protected. If `protectedSubmit` is `VK_TRUE`, the batch is protected. If `protectedSubmit` is `VK_FALSE`, the batch is unprotected. If the `VkSubmitInfo::pNext` chain does not include this structure, the batch is unprotected.

Valid Usage (Implicit)

- VUID-VkProtectedSubmitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PROTECTED_SUBMIT_INFO`

If the `pNext` chain of `VkSubmitInfo` includes a `VkDeviceGroupSubmitInfo` structure, then that structure includes device indices and masks specifying which physical devices execute semaphore operations and command buffers.

The `VkDeviceGroupSubmitInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreCount;
    const uint32_t*     pWaitSemaphoreDeviceIndices;
    uint32_t           commandBufferCount;
    const uint32_t*     pCommandBufferDeviceMasks;
    uint32_t           signalSemaphoreCount;
    const uint32_t*     pSignalSemaphoreDeviceIndices;
} VkDeviceGroupSubmitInfo;
```

or the equivalent

```
// Provided by VK_KHR_device_group
typedef VkDeviceGroupSubmitInfo VkDeviceGroupSubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of elements in the `pWaitSemaphoreDeviceIndices` array.
- `pWaitSemaphoreDeviceIndices` is a pointer to an array of `waitSemaphoreCount` device indices indicating which physical device executes the semaphore wait operation in the corresponding element of `VkSubmitInfo::pWaitSemaphores`.
- `commandBufferCount` is the number of elements in the `pCommandBufferDeviceMasks` array.
- `pCommandBufferDeviceMasks` is a pointer to an array of `commandBufferCount` device masks indicating which physical devices execute the command buffer in the corresponding element of `VkSubmitInfo::pCommandBuffers`. A physical device executes the command buffer if the corresponding bit is set in the mask.
- `signalSemaphoreCount` is the number of elements in the `pSignalSemaphoreDeviceIndices` array.
- `pSignalSemaphoreDeviceIndices` is a pointer to an array of `signalSemaphoreCount` device indices indicating which physical device executes the semaphore signal operation in the corresponding element of `VkSubmitInfo::pSignalSemaphores`.

If this structure is not present, semaphore operations and command buffers execute on device index zero.

Valid Usage

- VUID-VkDeviceGroupSubmitInfo-waitSemaphoreCount-00082
`waitSemaphoreCount` **must** equal `VkSubmitInfo::waitSemaphoreCount`
- VUID-VkDeviceGroupSubmitInfo-commandBufferCount-00083
`commandBufferCount` **must** equal `VkSubmitInfo::commandBufferCount`
- VUID-VkDeviceGroupSubmitInfo-signalSemaphoreCount-00084
`signalSemaphoreCount` **must** equal `VkSubmitInfo::signalSemaphoreCount`
- VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-00085
All elements of `pWaitSemaphoreDeviceIndices` and `pSignalSemaphoreDeviceIndices` **must** be valid device indices
- VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-00086
All elements of `pCommandBufferDeviceMasks` **must** be valid device masks

Valid Usage (Implicit)

- VUID-VkDeviceGroupSubmitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SUBMIT_INFO`
- VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-parameter
If `waitSemaphoreCount` is not 0, `pWaitSemaphoreDeviceIndices` **must** be a valid pointer to an array of `waitSemaphoreCount uint32_t` values
- VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-parameter
If `commandBufferCount` is not 0, `pCommandBufferDeviceMasks` **must** be a valid pointer to an array of `commandBufferCount uint32_t` values
- VUID-VkDeviceGroupSubmitInfo-pSignalSemaphoreDeviceIndices-parameter
If `signalSemaphoreCount` is not 0, `pSignalSemaphoreDeviceIndices` **must** be a valid pointer to an array of `signalSemaphoreCount uint32_t` values

If the `pNext` chain of `VkSubmitInfo` includes a `VkPerformanceQuerySubmitInfoKHR` structure, then the structure indicates which counter pass is active for the batch in that submit.

The `VkPerformanceQuerySubmitInfoKHR` structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceQuerySubmitInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           counterPassIndex;
} VkPerformanceQuerySubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `counterPassIndex` specifies which counter pass index is active.

If the `VkSubmitInfo::pNext` chain does not include this structure, the batch defaults to use counter pass index 0.

Valid Usage

- VUID-VkPerformanceQuerySubmitInfoKHR-counterPassIndex-03221
`counterPassIndex` **must** be less than the number of counter passes required by any queries within the batch. The required number of counter passes for a performance query is obtained by calling `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`

Valid Usage (Implicit)

- VUID-VkPerformanceQuerySubmitInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR`

6.6. Queue Forward Progress

When using binary semaphores, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application on any queue. After any call to `vkQueueSubmit` (or other queue operation), for every queued wait on a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` there **must** be a prior signal of that semaphore that will not be consumed by a different wait on the semaphore.

When using timeline semaphores, wait-before-signal behavior is well-defined and applications **can** submit work via `vkQueueSubmit` defining a `timeline semaphore wait operation` before submitting a corresponding `semaphore signal operation`. For each `timeline semaphore wait operation` defined by a call to `vkQueueSubmit`, the application **must** ensure that a corresponding `semaphore signal operation` is executed before forward progress can be made.

If a command buffer submission waits for any events to be signaled, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application. Events signaled by the host **must** be signaled before the command buffer waits on those events.

NOTE

The ability for commands to wait on the host to set an events was originally added to allow low-latency updates to resources between host and device. However, to ensure quality of service, implementations would necessarily detect extended stalls in execution and timeout after a short period. As this period is not defined in the Vulkan specification, it is impossible to correctly validate any application with any wait period. Since the original users of this functionality were highly limited and platform-specific, this functionality is now considered defunct and should not be used.

6.7. Secondary Command Buffer Execution

Secondary command buffers **must** not be directly submitted to a queue. To record a secondary command buffer to execute as part of a primary command buffer, call:

```
// Provided by VK_VERSION_1_0
void vkCmdExecuteCommands(
    VkCommandBuffer          commandBuffer,
    uint32_t                 commandBufferCount,
    const VkCommandBuffer*   pCommandBuffers);
```

- `commandBuffer` is a handle to a primary command buffer that the secondary command buffers are executed in.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of `commandBufferCount` secondary command buffer handles, which are recorded to execute in the primary command buffer in the order they are listed in the array.

If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, and it was recorded into any other primary command buffer which is currently in the `executable` or `recording` state, that primary command buffer becomes `invalid`.

If the `nestedCommandBuffer` feature is enabled it is valid usage for `vkCmdExecuteCommands` to also be recorded to a `secondary command buffer`.

Valid Usage

- VUID-vkCmdExecuteCommands-pCommandBuffers-00088
Each element of `pCommandBuffers` **must** have been allocated with a `level` of `VK_COMMAND_BUFFER_LEVEL_SECONDARY`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00089
Each element of `pCommandBuffers` **must** be in the `pending` or `executable` state
- VUID-vkCmdExecuteCommands-pCommandBuffers-00091
If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not be in the `pending` state
- VUID-vkCmdExecuteCommands-pCommandBuffers-00092
If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not have already been recorded to `commandBuffer`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00093
If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not appear more than once in `pCommandBuffers`

- VUID-vkCmdExecuteCommands-pCommandBuffers-00094
Each element of `pCommandBuffers` **must** have been allocated from a `VkCommandPool` that was created for the same queue family as the `VkCommandPool` from which `commandBuffer` was allocated
- VUID-vkCmdExecuteCommands-pCommandBuffers-00096
If `vkCmdExecuteCommands` is being called within a render pass instance, each element of `pCommandBuffers` **must** have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00099
If `vkCmdExecuteCommands` is being called within a render pass instance, and any element of `pCommandBuffers` was recorded with `VkCommandBufferInheritanceInfo::framebuffer` not equal to `VK_NULL_HANDLE`, that `VkFramebuffer` **must** match the `VkFramebuffer` used in the current render pass instance
- VUID-vkCmdExecuteCommands-contents-09680
If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, and `vkCmdNextSubpass` has not been called in the current render pass instance, the `contents` parameter of `vkCmdBeginRenderPass` **must** have been `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS`, or `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT`
- VUID-vkCmdExecuteCommands-None-09681
If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, and `vkCmdNextSubpass` has been called in the current render pass instance, the `contents` parameter of the last call to `vkCmdNextSubpass` **must** have been `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS`, or `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR`
- VUID-vkCmdExecuteCommands-pCommandBuffers-06019
If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::subpass` set to the index of the subpass which the given command buffer will be executed in
- VUID-vkCmdExecuteCommands-pBeginInfo-06020
If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, the render passes specified in the `pBeginInfo->pInheritanceInfo->renderPass` members of the `vkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` **must** be `compatible` with the current render pass
- VUID-vkCmdExecuteCommands-pNext-02865
If `vkCmdExecuteCommands` is being called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` in the `pNext` chain of `VkCommandBufferBeginInfo`
- VUID-vkCmdExecuteCommands-pNext-02866
If `vkCmdExecuteCommands` is being called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` **must** have been recorded with

`VkCommandBufferInheritanceRenderPassTransformInfoQCOM::transform` identical to `VkRenderPassTransformBeginInfoQCOM::transform`

- VUID-vkCmdExecuteCommands-pNext-02867
If `vkCmdExecuteCommands` is being called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceRenderPassTransformInfoQCOM::renderArea` identical to `VkRenderPassBeginInfo::renderArea`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00100
If `vkCmdExecuteCommands` is not being called within a render pass instance, each element of `pCommandBuffers` **must** not have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`
- VUID-vkCmdExecuteCommands-commandBuffer-00101
If the `inheritedQueries` feature is not enabled, `commandBuffer` **must** not have any queries `active`
- VUID-vkCmdExecuteCommands-commandBuffer-00102
If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query `active`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::occlusionQueryEnable` set to `VK_TRUE`
- VUID-vkCmdExecuteCommands-commandBuffer-00103
If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query `active`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::queryFlags` having all bits set that are set for the query
- VUID-vkCmdExecuteCommands-commandBuffer-00104
If `commandBuffer` has a `VK_QUERY_TYPE_PIPELINE_STATISTICS` query `active`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::pipelineStatistics` having all bits set that are set in the `VkQueryPool` the query uses
- VUID-vkCmdExecuteCommands-pCommandBuffers-00105
Each element of `pCommandBuffers` **must** not begin any query types that are `active` in `commandBuffer`
- VUID-vkCmdExecuteCommands-commandBuffer-07594
`commandBuffer` **must** not have any queries other than `VK_QUERY_TYPE_OCCLUSION` and `VK_QUERY_TYPE_PIPELINE_STATISTICS` `active`
- VUID-vkCmdExecuteCommands-commandBuffer-01820
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` **must** be a protected command buffer
- VUID-vkCmdExecuteCommands-commandBuffer-01821
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` **must** be an unprotected command buffer
- VUID-vkCmdExecuteCommands-None-02286
This command **must** not be recorded when transform feedback is active
- VUID-vkCmdExecuteCommands-commandBuffer-06533
If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded

command in `commandBuffer` in the current subpass will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` **must** not read from the memory backing that image subresource in any other way

- VUID-vkCmdExecuteCommands-commandBuffer-06534

If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in `commandBuffer` in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` **must** not write to that image subresource as an attachment

- VUID-vkCmdExecuteCommands-pCommandBuffers-06535

If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index **must** not read from the memory backing that image subresource in any other way

- VUID-vkCmdExecuteCommands-pCommandBuffers-06536

If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index **must** not write to that image subresource as an attachment

- VUID-vkCmdExecuteCommands-pCommandBuffers-06021

If `pCommandBuffers` contains any `suspended render pass instances`, there **must** be no action or synchronization commands between that render pass instance and any render pass instance that resumes it

- VUID-vkCmdExecuteCommands-pCommandBuffers-06022

If `pCommandBuffers` contains any `suspended render pass instances`, there **must** be no render pass instances between that render pass instance and any render pass instance that resumes it

- VUID-vkCmdExecuteCommands-variableSampleLocations-06023

If the `variableSampleLocations` limit is not supported, and any element of `pCommandBuffers` contains any `suspended render pass instances`, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, **must** use the same sample locations

- VUID-vkCmdExecuteCommands-flags-06024

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, its `VkRenderingInfo::flags` parameter **must** have included `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`

- VUID-vkCmdExecuteCommands-pBeginInfo-06025

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the render passes specified in the `pBeginInfo->pInheritanceInfo->renderPass` members of the `vkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` **must** be `VK_NULL_HANDLE`

- VUID-vkCmdExecuteCommands-flags-06026

If `vkCmdExecuteCommands` is being called within a render pass instance begun with

`vkCmdBeginRendering`, the `flags` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the `VkRenderingInfo::flags` parameter to `vkCmdBeginRendering`, excluding `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`

- VUID-vkCmdExecuteCommands-colorAttachmentCount-06027

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the `colorAttachmentCount` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the `VkRenderingInfo::colorAttachmentCount` parameter to `vkCmdBeginRendering`

- VUID-vkCmdExecuteCommands-imageView-06028

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the corresponding element of the `pColorAttachmentFormats` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the format used to create that image view

- VUID-vkCmdExecuteCommands-imageView-07606

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is `VK_NULL_HANDLE`, the corresponding element of the `pColorAttachmentFormats` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteCommands-pDepthAttachment-06029

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of the `depthAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the format used to create that image view

- VUID-vkCmdExecuteCommands-pStencilAttachment-06030

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `VkRenderingInfo::pStencilAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of the `stencilAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the format used to create that image view

- VUID-vkCmdExecuteCommands-pDepthAttachment-06774

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` was `VK_NULL_HANDLE`, the value of the `depthAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteCommands-pStencilAttachment-06775

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `VkRenderingInfo::pStencilAttachment->imageView` parameter to `vkCmdBeginRendering` was `VK_NULL_HANDLE`, the value of the `stencilAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteCommands-viewMask-06031

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the `viewMask` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the `VkRenderingInfo::viewMask` parameter to `vkCmdBeginRendering`

- VUID-vkCmdExecuteCommands-pNext-06032

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the corresponding element of the `pColorAttachmentSamples` member of the `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06033

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of the `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06034

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `VkRenderingInfo::pStencilAttachment->imageView` parameter to `vkCmdBeginRendering`

is not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of the `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06035

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` does not include a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06036

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` does not include a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06037

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` does not include a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `VkRenderingInfo::pStencilAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-09299

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, with any color attachment using a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, the `pNext` chain of `VkCommandBufferInheritanceInfo` used to create each element of `pCommandBuffers` **must** include a `VkExternalFormatANDROID` structure with an `externalFormat` matching that used to create the resolve attachment in the render pass

- VUID-vkCmdExecuteCommands-pNext-09300

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` with any color attachment using a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, and the `pNext` chain of `VkCommandBufferInheritanceInfo` does not include a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` **must** be `VK_SAMPLE_COUNT_1_BIT`

- VUID-vkCmdExecuteCommands-commandBuffer-09375

`commandBuffer` **must** not be a `secondary command buffer` unless the `nestedCommandBuffer` feature is enabled

- VUID-vkCmdExecuteCommands-nestedCommandBuffer-09376

If the `nestedCommandBuffer` feature is enabled, the `command buffer nesting level` of each element of `pCommandBuffers` **must** be less than `maxCommandBufferNestingLevel`

- VUID-vkCmdExecuteCommands-nestedCommandBufferRendering-09377

If the `nestedCommandBufferRendering` feature is not enabled, and `commandBuffer` is a `secondary command buffer`, `commandBuffer` **must** not have been recorded with `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`

- VUID-vkCmdExecuteCommands-nestedCommandBufferSimultaneousUse-09378

If the `nestedCommandBufferSimultaneousUse` feature is not enabled, and `commandBuffer` is a `secondary command buffer`, each element of `pCommandBuffers` **must** not have been recorded with `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`

- VUID-vkCmdExecuteCommands-pCommandBuffers-09504

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the color attachment mapping state specified by `VkRenderingAttachmentLocationInfoKHR` in the inheritance info of each element of `pCommandBuffers` and in the current state of `commandBuffer` **must** match

- VUID-vkCmdExecuteCommands-pCommandBuffers-09505

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the input attachment mapping state specified by `VkRenderingInputAttachmentIndexInfoKHR` in the inheritance info of each element of `pCommandBuffers` and in the current state of `commandBuffer` **must** match

Valid Usage (Implicit)

- VUID-vkCmdExecuteCommands-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdExecuteCommands-pCommandBuffers-parameter

`pCommandBuffers` **must** be a valid pointer to an array of `commandBufferCount` valid `VkCommandBuffer` handles

- VUID-vkCmdExecuteCommands-commandBuffer-recording

`commandBuffer` **must** be in the `recording state`

- VUID-vkCmdExecuteCommands-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations

- VUID-vkCmdExecuteCommands-videocoding

This command **must** only be called outside of a video coding scope

- VUID-vkCmdExecuteCommands-commandBufferCount-arraylength

`commandBufferCount` **must** be greater than 0

- VUID-vkCmdExecuteCommands-commonparent

Both of `commandBuffer`, and the elements of `pCommandBuffers` **must** have been created,

allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to [commandBuffer](#) **must** be externally synchronized
- Host access to the [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Transfer Graphics Compute	Indirection

6.8. Nested Command Buffers

In addition to secondary command buffer execution from primary command buffers, an implementation **may** support [nested command buffers](#), which enable secondary command buffers to be executed from other secondary command buffers. If the [nestedCommandBuffer](#) feature is enabled, the implementation supports [nested command buffers](#).

Nested command buffer execution works the same as primary-to-secondary execution, except that it is subject to some additional implementation-defined limits.

Each secondary command buffer has a [command buffer nesting level](#), which is determined at [vkEndCommandBuffer](#) time and evaluated at [vkCmdExecuteCommands](#) time. A secondary command buffer that executes no other secondary command buffers has a [command buffer nesting level](#) of zero. Otherwise, the [command buffer nesting level](#) of a secondary command buffer is equal to the maximum nesting level of all secondary command buffers executed by that command buffer plus one. Some implementations **may** have a limit on the maximum nesting level of secondary command buffers that **can** be recorded. This limit is advertised in [maxCommandBufferNestingLevel](#).

If the [nestedCommandBufferRendering](#) feature is enabled, the implementation supports calling [vkCmdExecuteCommands](#) inside secondary command buffers recorded with [VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT](#). If the [nestedCommandBufferSimultaneousUse](#) feature is enabled, the implementation supports calling [vkCmdExecuteCommands](#) with secondary command buffers recorded with [VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT](#).

Whenever [vkCmdExecuteCommands](#) is recorded inside a secondary command buffer recorded with [VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT](#), each member of [pCommandBuffers](#) **must** have been recorded with a [VkCommandBufferBeginInfo](#) with [VkCommandBufferInheritanceInfo](#)

compatible with the `VkCommandBufferInheritanceInfo` of the command buffer into which the `vkCmdExecuteCommands` call is being recorded. The `VkCommandBufferInheritanceRenderingInfo` structures are compatible when the `VkCommandBufferInheritanceRenderingInfo::renderpass` are compatible, or if they are `VK_NULL_HANDLE` then the `VkCommandBufferInheritanceRenderingInfo` members match, and all other members of `VkCommandBufferInheritanceRenderingInfo` match. This requirement applies recursively, down to the most nested command buffer and up to the command buffer where the render pass was originally begun.

6.9. Command Buffer Device Mask

Each command buffer has a piece of state storing the current device mask of the command buffer. This mask controls which physical devices within the logical device all subsequent commands will execute on, including state-setting commands, action commands, and synchronization commands.

Scissor, exclusive scissor, and viewport state (excluding the count of each) **can** be different values on each physical device (only when set as dynamic state), and each physical device will render using its local copy of the state. Other state is shared between physical devices, such that all physical devices use the most recently set values for the state. However, when recording an action command that uses a piece of state, the most recent command that set that state **must** have included all physical devices that execute the action command in its current device mask.

The command buffer's device mask is orthogonal to the `pCommandBufferDeviceMasks` member of `VkDeviceGroupSubmitInfo`. Commands only execute on a physical device if the device index is set in both device masks.

If the `pNext` chain of `VkCommandBufferBeginInfo` includes a `VkDeviceGroupCommandBufferBeginInfo` structure, then that structure includes an initial device mask for the command buffer.

The `VkDeviceGroupCommandBufferBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupCommandBufferBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceMask;
} VkDeviceGroupCommandBufferBeginInfo;
```

or the equivalent

```
// Provided by VK_KHR_device_group
typedef VkDeviceGroupCommandBufferBeginInfo VkDeviceGroupCommandBufferBeginInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceMask` is the initial value of the command buffer's device mask.

The initial device mask also acts as an upper bound on the set of devices that **can** ever be in the device mask in the command buffer.

If this structure is not present, the initial value of a command buffer's device mask includes all physical devices in the logical device when the command buffer begins recording.

Valid Usage

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00106
deviceMask **must** be a valid device mask value
- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00107
deviceMask **must** not be zero

Valid Usage (Implicit)

- VUID-VkDeviceGroupCommandBufferBeginInfo-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_COMMAND_BUFFER_BEGIN_INFO`

To update the current device mask of a command buffer, call:

```
// Provided by VK_VERSION_1_1
void vkCmdSetDeviceMask(
    VkCommandBuffer          commandBuffer,
    uint32_t                 deviceMask);
```

or the equivalent command

```
// Provided by VK_KHR_device_group
void vkCmdSetDeviceMaskKHR(
    VkCommandBuffer          commandBuffer,
    uint32_t                 deviceMask);
```

- **commandBuffer** is command buffer whose current device mask is modified.
- **deviceMask** is the new value of the current device mask.

deviceMask is used to filter out subsequent commands from executing on all physical devices whose bit indices are not set in the mask, except commands beginning a render pass instance, commands transitioning to the next subpass in the render pass instance, and commands ending a render pass instance, which always execute on the set of physical devices whose bit indices are included in the **deviceMask** member of the [VkDeviceGroupRenderPassBeginInfo](#) structure passed to the command beginning the corresponding render pass instance.

Valid Usage

- VUID-vkCmdSetDeviceMask-deviceMask-00108
`deviceMask` **must** be a valid device mask value
- VUID-vkCmdSetDeviceMask-deviceMask-00109
`deviceMask` **must** not be zero
- VUID-vkCmdSetDeviceMask-deviceMask-00110
`deviceMask` **must** not include any set bits that were not in the `VkDeviceGroupCommandBufferBeginInfo::deviceMask` value when the command buffer began recording
- VUID-vkCmdSetDeviceMask-deviceMask-00111
If `vkCmdSetDeviceMask` is called inside a render pass instance, `deviceMask` **must** not include any set bits that were not in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` value when the render pass instance began recording

Valid Usage (Implicit)

- VUID-vkCmdSetDeviceMask-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDeviceMask-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetDeviceMask-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute, or transfer operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Both	Graphics Compute Transfer	State

Chapter 7. Synchronization and Cache Control

Synchronization of access to resources is primarily the responsibility of the application in Vulkan. The order of execution of commands with respect to the host and other commands on the device has few implicit guarantees, and needs to be explicitly specified. Memory caches and other optimizations are also explicitly managed, requiring that the flow of data through the system is largely under application control.

Whilst some implicit guarantees exist between commands, five explicit synchronization mechanisms are exposed by Vulkan:

Fences

Fences **can** be used to communicate to the host that execution of some task on the device has completed, controlling resource access between host and device.

Semaphores

Semaphores **can** be used to control resource access across multiple queues.

Events

Events provide a fine-grained synchronization primitive which **can** be signaled either within a command buffer or by the host, and **can** be waited upon within a command buffer or queried on the host. Events **can** be used to control resource access within a single queue.

Pipeline Barriers

Pipeline barriers also provide synchronization control within a command buffer, but at a single point, rather than with separate signal and wait operations. Pipeline barriers **can** be used to control resource access within a single queue.

Render Pass Objects

Render pass objects provide a synchronization framework for rendering tasks, built upon the concepts in this chapter. Many cases that would otherwise need an application to use other synchronization primitives **can** be expressed more efficiently as part of a render pass. Render pass objects **can** be used to control resource access within a single queue.

7.1. Execution and Memory Dependencies

An *operation* is an arbitrary amount of work to be executed on the host, a device, or an external entity such as a presentation engine. Synchronization commands introduce explicit *execution dependencies*, and *memory dependencies* between two sets of operations defined by the command's two *synchronization scopes*.

The synchronization scopes define which other operations a synchronization command is able to create execution dependencies with. Any type of operation that is not in a synchronization command's synchronization scopes will not be included in the resulting dependency. For example, for many synchronization commands, the synchronization scopes **can** be limited to just operations executing in specific [pipeline stages](#), which allows other pipeline stages to be excluded from a

dependency. Other scoping options are possible, depending on the particular command.

An *execution dependency* is a guarantee that for two sets of operations, the first set **must** happen-before the second set. If an operation happens-before another operation, then the first operation **must** complete before the second operation is initiated. More precisely:

- Let **Ops₁** and **Ops₂** be separate sets of operations.
- Let **Sync** be a synchronization command.
- Let **Scope_{1st}** and **Scope_{2nd}** be the synchronization scopes of **Sync**.
- Let **ScopedOps₁** be the intersection of sets **Ops₁** and **Scope_{1st}**.
- Let **ScopedOps₂** be the intersection of sets **Ops₂** and **Scope_{2nd}**.
- Submitting **Ops₁**, **Sync** and **Ops₂** for execution, in that order, will result in execution dependency **ExeDep** between **ScopedOps₁** and **ScopedOps₂**.
- Execution dependency **ExeDep** guarantees that **ScopedOps₁** happen-before **ScopedOps₂**.

An *execution dependency chain* is a sequence of execution dependencies that form a happens-before relation between the first dependency's **ScopedOps₁** and the final dependency's **ScopedOps₂**. For each consecutive pair of execution dependencies, a chain exists if the intersection of **Scope_{2nd}** in the first dependency and **Scope_{1st}** in the second dependency is not an empty set. The formation of a single execution dependency from an execution dependency chain can be described by substituting the following in the description of execution dependencies:

- Let **Sync** be a set of synchronization commands that generate an execution dependency chain.
- Let **Scope_{1st}** be the first synchronization scope of the first command in **Sync**.
- Let **Scope_{2nd}** be the second synchronization scope of the last command in **Sync**.

Execution dependencies alone are not sufficient to guarantee that values resulting from writes in one set of operations **can** be read from another set of operations.

Three additional types of operations are used to control memory access. *Availability operations* cause the values generated by specified memory write accesses to become *available* to a memory domain for future access. Any available value remains available until a subsequent write to the same memory location occurs (whether it is made available or not) or the memory is freed. *Memory domain operations* cause writes that are available to a source memory domain to become available to a destination memory domain (an example of this is making writes available to the host domain available to the device domain). *Visibility operations* cause values available to a memory domain to become *visible* to specified memory accesses.

Availability, visibility, memory domains, and memory domain operations are formally defined in the [Availability and Visibility](#) section of the [Memory Model](#) chapter. Which API operations perform each of these operations is defined in [Availability, Visibility, and Domain Operations](#).

A *memory dependency* is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation.

- The availability operation happens-before the visibility operation.
- The visibility operation happens-before the second set of operations.

Once written values are made visible to a particular type of memory access, they **can** be read or written by that type of memory access. Most synchronization commands in Vulkan define a memory dependency.

The specific memory accesses that are made available and visible are defined by the *access scopes* of a memory dependency. Any type of access that is in a memory dependency's first access scope and occurs in **ScopedOps₁** is made available. Any type of access that is in a memory dependency's second access scope and occurs in **ScopedOps₂** has any available writes made visible to it. Any type of operation that is not in a synchronization command's access scopes will not be included in the resulting dependency.

A memory dependency enforces availability and visibility of memory accesses and execution order between two sets of operations. Adding to the description of [execution dependency chains](#):

- Let **MemOps₁** be the set of memory accesses performed by **ScopedOps₁**.
- Let **MemOps₂** be the set of memory accesses performed by **ScopedOps₂**.
- Let **AccessScope_{1st}** be the first access scope of the first command in the **Sync** chain.
- Let **AccessScope_{2nd}** be the second access scope of the last command in the **Sync** chain.
- Let **ScopedMemOps₁** be the intersection of sets **MemOps₁** and **AccessScope_{1st}**.
- Let **ScopedMemOps₂** be the intersection of sets **MemOps₂** and **AccessScope_{2nd}**.
- Submitting **Ops₁**, **Sync**, and **Ops₂** for execution, in that order, will result in a memory dependency **MemDep** between **ScopedOps₁** and **ScopedOps₂**.
- Memory dependency **MemDep** guarantees that:
 - Memory writes in **ScopedMemOps₁** are made available.
 - Available memory writes, including those from **ScopedMemOps₁**, are made visible to **ScopedMemOps₂**.

NOTE

Execution and memory dependencies are used to solve data hazards, i.e. to ensure that read and write operations occur in a well-defined order. Write-after-read hazards can be solved with just an execution dependency, but read-after-write and write-after-write hazards need appropriate memory dependencies to be included between them. If an application does not include dependencies to solve these hazards, the results and execution orders of memory accesses are undefined.

7.1.1. Image Layout Transitions

Image subresources **can** be transitioned from one [layout](#) to another as part of a [memory dependency](#) (e.g. by using an [image memory barrier](#)). When a layout transition is specified in a memory dependency, it happens-after the availability operations in the memory dependency, and happens-before the visibility operations. Image layout transitions **may** perform read and write accesses on all memory bound to the image subresource range, so applications **must** ensure that all memory writes have been made [available](#) before a layout transition is executed. Available memory

is automatically made visible to a layout transition, and writes performed by a layout transition are automatically made available.

Layout transitions always apply to a particular image subresource range, and specify both an old layout and new layout. The old layout **must** either be `VK_IMAGE_LAYOUT_UNDEFINED`, or match the current layout of the image subresource range. If the old layout matches the current layout of the image subresource range, the transition preserves the contents of that range. If the old layout is `VK_IMAGE_LAYOUT_UNDEFINED`, the contents of that range **may** be discarded.

NOTE

Image layout transitions with `VK_IMAGE_LAYOUT_UNDEFINED` allow the implementation to discard the image subresource range, which can provide performance or power benefits. Tile-based architectures may be able to avoid flushing tile data to memory, and immediate style renderers may be able to achieve fast metadata clears to reinitialize frame buffer compression state, or similar.

If the contents of an attachment are not needed after a render pass completes, then applications **should** use `VK_ATTACHMENT_STORE_OP_DONT_CARE`.

As image layout transitions **may** perform read and write accesses on the memory bound to the image, if the image subresource affected by the layout transition is bound to peer memory for any device in the current device mask then the memory heap the bound memory comes from **must** support the `VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT` and `VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT` capabilities as returned by `vkGetDeviceGroupPeerMemoryFeatures`.

NOTE

Applications **must** ensure that layout transitions happen-after all operations accessing the image with the old layout, and happen-before any operations that will access the image with the new layout. Layout transitions are potentially read/write operations, so not defining appropriate memory dependencies to guarantee this will result in a data race.

Image layout transitions interact with [memory aliasing](#).

Layout transitions that are performed via image memory barriers execute in their entirety in [submission order](#), relative to other image layout transitions submitted to the same queue, including those performed by [render passes](#). In effect there is an implicit execution dependency from each such layout transition to all layout transitions previously submitted to the same queue.

The image layout of each image subresource of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus when the `image` member of an [image memory barrier](#) is an image created with this flag the application **can** chain a `VkSampleLocationsInfoEXT` structure to the `pNext` chain of `VkImageMemoryBarrier2` or `VkImageMemoryBarrier` to specify the sample locations to use during any image layout transition.

If the `VkSampleLocationsInfoEXT` structure does not match the sample location state last used to render to the image subresource range specified by `subresourceRange`, or if no `VkSampleLocationsInfoEXT` structure is present, then the contents of the given image subresource range becomes undefined as if `oldLayout` would equal `VK_IMAGE_LAYOUT_UNDEFINED`.

7.1.2. Pipeline Stages

The work performed by an [action command](#) consists of multiple operations, which are performed as a sequence of logically independent steps known as *pipeline stages*. The exact pipeline stages executed depend on the particular command that is used, and current command buffer state when the command was recorded.

NOTE Operations performed by synchronization commands (e.g. [availability and visibility operations](#)) are not executed by a defined pipeline stage. However other commands can still synchronize with them by using the [synchronization scopes](#) to create a [dependency chain](#).

Execution of operations across pipeline stages **must** adhere to [implicit ordering guarantees](#), particularly including [pipeline stage order](#). Otherwise, execution across pipeline stages **may** overlap or execute out of order with regards to other stages, unless otherwise enforced by an execution dependency.

Several of the synchronization commands include pipeline stage parameters, restricting the [synchronization scopes](#) for that command to just those stages. This allows fine grained control over the exact execution dependencies and accesses performed by action commands. Implementations **should** use these pipeline stages to avoid unnecessary stalls or cache flushing.

Bits which **can** be set in a [VkPipelineStageFlags2](#) mask, specifying stages of execution, are:

```
// Provided by VK_VERSION_1_3
// Flag bits for VkPipelineStageFlagBits2
typedef VkFlags64 VkPipelineStageFlagBits2;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE_KHR = 0ULL;

```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkPipelineStageFlagBits2 VkPipelineStageFlagBits2KHR;
```

- `VK_PIPELINE_STAGE_2_NONE` specifies no stages of execution.
- `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT` specifies the stage of the pipeline where indirect command parameters are consumed. This stage also includes reading commands written by `vkCmdPreprocessGeneratedCommandsNV`. This stage also includes reading commands written by `vkCmdPreprocessGeneratedCommandsEXT`.
- `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT` specifies the task shader stage.
- `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT` specifies the mesh shader stage.
- `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT` specifies the stage of the pipeline where index buffers are consumed.
- `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT` specifies the stage of the pipeline where vertex buffers are consumed.
- `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT` is equivalent to the logical OR of:
 - `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`
 - `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`
- `VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT` specifies the vertex shader stage.
- `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` specifies the tessellation control shader stage.
- `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT` specifies the tessellation evaluation shader stage.
- `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT` specifies the geometry shader stage.
- `VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT` is equivalent to specifying all supported [pre-rasterization shader stages](#):
 - `VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
 - `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`
 - `VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` specifies the fragment shader stage.
- `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes [render pass load operations](#) for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also

includes [render pass store operations](#) for framebuffer attachments with a depth/stencil format.

- `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` specifies the stage of the pipeline where final color values are output from the pipeline. This stage includes [blending](#), [logic operations](#), render pass [load](#) and [store](#) operations for color attachments, [render pass multisample resolve operations](#), and [vkCmdClearAttachments](#).
- `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT` specifies the compute shader stage.
- `VK_PIPELINE_STAGE_2_HOST_BIT` specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.
- `VK_PIPELINE_STAGE_2_COPY_BIT` specifies the execution of all [copy commands](#), including [vkCmdCopyQueryPoolResults](#).
- `VK_PIPELINE_STAGE_2_BLIT_BIT` specifies the execution of [vkCmdBlitImage](#).
- `VK_PIPELINE_STAGE_2_RESOLVE_BIT` specifies the execution of [vkCmdResolveImage](#).
- `VK_PIPELINE_STAGE_2_CLEAR_BIT` specifies the execution of [clear commands](#), with the exception of [vkCmdClearAttachments](#).
- `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT` is equivalent to specifying all of:
 - `VK_PIPELINE_STAGE_2_COPY_BIT`
 - `VK_PIPELINE_STAGE_2_BLIT_BIT`
 - `VK_PIPELINE_STAGE_2_RESOLVE_BIT`
 - `VK_PIPELINE_STAGE_2_CLEAR_BIT`
 - `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`
- `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR` specifies the execution of the ray tracing shader stages.
- `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` specifies the execution of [acceleration structure commands](#) or [acceleration structure copy commands](#).
- `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` specifies the execution of [acceleration structure copy commands](#).
- `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT` specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
 - `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`
 - `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
 - `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`
 - `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`
 - `VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`

- `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`
- `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`
- `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`
- `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`
- `VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI`
- `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` specifies all operations performed by all commands supported on the queue it is used with.
- `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT` specifies the stage of the pipeline where the predicate of conditional rendering is consumed.
- `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT` specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.
- `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` specifies the stage of the pipeline where device-side generation of commands via `vkCmdPreprocessGeneratedCommandsNV` is handled.
- `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_EXT` specifies the stage of the pipeline where device-side generation of commands via `vkCmdPreprocessGeneratedCommandsEXT` is handled.
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies the stage of the pipeline where the `fragment shading rate attachment` or `shading rate image` is read to determine the fragment shading rate for portions of a rasterized primitive.
- `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT` specifies the stage of the pipeline where the fragment density map is read to `generate the fragment areas`.
- `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI` specifies the stage of the pipeline where the invocation mask image is read by the implementation to optimize the ray dispatch.
- `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR` specifies the execution of `video decode operations`.
- `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR` specifies the execution of `video encode operations`.
- `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV` specifies the stage of the pipeline where `optical flow operation` are performed.
- `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI` specifies the subpass shading shader stage.
- `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` specifies the execution of `micromap commands`.
- `VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI` specifies the cluster culling shader stage.
- `VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT` is equivalent to `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` with `VkAccessFlags2` set to `0` when specified in the second synchronization scope, but equivalent to `VK_PIPELINE_STAGE_2_NONE` in the first scope.

- `VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT` is equivalent to `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` with `VkAccessFlags2` set to `0` when specified in the first synchronization scope, but equivalent to `VK_PIPELINE_STAGE_2_NONE` in the second scope.

NOTE The `TOP` and `BOTTOM` pipeline stages are deprecated, and applications should prefer `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` and `VK_PIPELINE_STAGE_2_NONE`.

NOTE The `VkPipelineStageFlags2` bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how `VkPipelineStageFlagBits` is defined. The first 31 values are common to both, and are interchangeable.

`VkPipelineStageFlags2` is a bitmask type for setting a mask of zero or more `VkPipelineStageFlagBits2` flags:

```
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkPipelineStageFlags2;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkPipelineStageFlags2 VkPipelineStageFlags2KHR;
```

Bits which **can** be set in a `VkPipelineStageFlags` mask, specifying stages of execution, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPipelineStageFlagBits {
    VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT = 0x00000001,
    VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT = 0x00000002,
    VK_PIPELINE_STAGE_VERTEX_INPUT_BIT = 0x00000004,
    VK_PIPELINE_STAGE_VERTEX_SHADER_BIT = 0x00000008,
    VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010,
    VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020,
    VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT = 0x00000040,
    VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT = 0x00000080,
    VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT = 0x00000100,
    VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT = 0x00000200,
    VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT = 0x00000400,
    VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT = 0x00000800,
    VK_PIPELINE_STAGE_TRANSFER_BIT = 0x00001000,
    VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT = 0x00002000,
    VK_PIPELINE_STAGE_HOST_BIT = 0x00004000,
    VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT = 0x00008000,
    VK_PIPELINE_STAGE_ALL_COMMANDS_BIT = 0x00010000,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_STAGE_NONE = 0,
    // Provided by VK_EXT_transform_feedback
    VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT = 0x01000000,
```

```

// Provided by VK_EXT_conditional_rendering
VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT = 0x00040000,
// Provided by VK_KHR_acceleration_structure
VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR = 0x02000000,
// Provided by VK_KHR_ray_tracing_pipeline

VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT = 0x00080000,
// Provided by VK_EXT_mesh_shader
VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT = 0x00100000,
// Provided by VK_NV_shading_rate_image
VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV =
VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR,
// Provided by VK_NV_ray_tracing
VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_NV =
VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR,
// Provided by VK_NV_ray_tracing
VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_NV =
VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
// Provided by VK_NV_mesh_shader
VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV = VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT,
// Provided by VK_NV_mesh_shader
VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV = VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT,
// Provided by VK_KHR_synchronization2
VK_PIPELINE_STAGE_NONE_KHR = VK_PIPELINE_STAGE_NONE,
// Provided by VK_EXT_device_generated_commands
VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_EXT =
VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV,
} VkPipelineStageFlagBits;

```

These values all have the same meaning as the equivalently named values for [VkPipelineStageFlags2](#).

- **VK_PIPELINE_STAGE_NONE** specifies no stages of execution.
- **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT** specifies the stage of the pipeline where **VkDrawIndirect*** / **VkDispatchIndirect*** / **VkTraceRaysIndirect*** data structures are consumed. This stage also includes reading commands written by **vkCmdExecuteGeneratedCommandsNV**. This stage also includes reading commands written by **vkCmdExecuteGeneratedCommandsEXT**.
- **VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT** specifies the task shader stage.
- **VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT** specifies the mesh shader stage.
- **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT** specifies the stage of the pipeline where vertex and index buffers are consumed.

- `VK_PIPELINE_STAGE_VERTEX_SHADER_BIT` specifies the vertex shader stage.
- `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` specifies the tessellation control shader stage.
- `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT` specifies the tessellation evaluation shader stage.
- `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT` specifies the geometry shader stage.
- `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` specifies the fragment shader stage.
- `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes [render pass load operations](#) for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes [render pass store operations](#) for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` specifies the stage of the pipeline after blending where the final color values are output from the pipeline. This stage includes [blending](#), [logic operations](#), render pass [load](#) and [store](#) operations for color attachments, [render pass multisample resolve operations](#), and [vkCmdClearAttachments](#).
- `VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT` specifies the execution of a compute shader.
- `VK_PIPELINE_STAGE_TRANSFER_BIT` specifies the following commands:
 - All [copy commands](#), including [vkCmdCopyQueryPoolResults](#)
 - [vkCmdBlitImage2](#) and [vkCmdBlitImage](#)
 - [vkCmdResolveImage2](#) and [vkCmdResolveImage](#)
 - All [clear commands](#), with the exception of [vkCmdClearAttachments](#)
- `VK_PIPELINE_STAGE_HOST_BIT` specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.
- `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` specifies the execution of [vkCmdBuildAccelerationStructureNV](#), [vkCmdCopyAccelerationStructureNV](#), [vkCmdWriteAccelerationStructuresPropertiesNV](#), [vkCmdBuildAccelerationStructuresKHR](#), [vkCmdBuildAccelerationStructuresIndirectKHR](#), [vkCmdCopyAccelerationStructureKHR](#), [vkCmdCopyAccelerationStructureToMemoryKHR](#), [vkCmdCopyMemoryToAccelerationStructureKHR](#), and [vkCmdWriteAccelerationStructuresPropertiesKHR](#).
- `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR` specifies the execution of the ray tracing shader stages, via [vkCmdTraceRaysNV](#), [vkCmdTraceRaysKHR](#), or [vkCmdTraceRaysIndirectKHR](#)
- `VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT` specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
 - `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT`
 - `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
 - `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT`
- `VK_PIPELINE_STAGE_VERTEX_SHADER_BIT`
- `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT`
- `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT`
- `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` specifies all operations performed by all commands supported on the queue it is used with.
- `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT` specifies the stage of the pipeline where the predicate of conditional rendering is consumed.
- `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.
- `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV` specifies the stage of the pipeline where device-side preprocessing for generated commands via `vkCmdPreprocessGeneratedCommandsNV` is handled.
- `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_EXT` specifies the stage of the pipeline where device-side preprocessing for generated commands via `vkCmdPreprocessGeneratedCommandsEXT` is handled.
- `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies the stage of the pipeline where the `fragment shading rate attachment` or `shading rate image` is read to determine the fragment shading rate for portions of a rasterized primitive.
- `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT` specifies the stage of the pipeline where the fragment density map is read to `generate the fragment areas`.
- `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT` is equivalent to `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` with `VkAccessFlags` set to `0` when specified in the second synchronization scope, but specifies no stage of execution when specified in the first scope.
- `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT` is equivalent to `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` with `VkAccessFlags` set to `0` when specified in the first synchronization scope, but specifies no stage of execution when specified in the second scope.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineStageFlags;
```

VkPipelineStageFlags is a bitmask type for setting a mask of zero or more **VkPipelineStageFlagBits**.

If a synchronization command includes a source stage mask, its first **synchronization scope** only includes execution of the pipeline stages specified in that mask and any **logically earlier** stages. Its first **access scope** only includes memory accesses performed by pipeline stages explicitly specified in the source stage mask.

If a synchronization command includes a destination stage mask, its second **synchronization scope** only includes execution of the pipeline stages specified in that mask and any **logically later** stages. Its second **access scope** only includes memory accesses performed by pipeline stages explicitly specified in the destination stage mask.

NOTE

Note that **access scopes** do not interact with the logically earlier or later stages for either scope - only the stages the application specifies are considered part of each access scope.

Certain pipeline stages are only available on queues that support a particular set of operations. The following table lists, for each pipeline stage flag, which queue capability flag **must** be supported by the queue. When multiple flags are enumerated in the second column of the table, it means that the pipeline stage is supported on the queue if it supports any of the listed capability flags. For further details on queue capabilities see **Physical Device Enumeration** and **Queues**.

Table 3. Supported Pipeline Stage Flags

Pipeline stage flag	Required queue capability flag
VK_PIPELINE_STAGE_2_NONE	None required
VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT	None required
VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT	VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT	None required
VK_PIPELINE_STAGE_2_HOST_BIT	None required

Pipeline stage flag	Required queue capability flag
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT	None required
VK_PIPELINE_STAGE_2_COPY_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_RESOLVE_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_BLIT_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_CLEAR_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR	VK_QUEUE_VIDEO_DECODE_BIT_KHR
VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR	VK_QUEUE_VIDEO_ENCODE_BIT_KHR
VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_EXT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR	VK_QUEUE_GRAPHICS_BIT

Pipeline stage flag	Required queue capability flag
VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV	VK_QUEUE_OPTICAL_FLOW_BIT_NV

Pipeline stages that execute as a result of a command logically complete execution in a specific order, such that completion of a logically later pipeline stage **must** not happen-before completion of a logically earlier stage. This means that including any stage in the source stage mask for a particular synchronization command also implies that any logically earlier stages are included in **Scope_{1st}** for that command.

Similarly, initiation of a logically earlier pipeline stage **must** not happen-after initiation of a logically later pipeline stage. Including any given stage in the destination stage mask for a particular synchronization command also implies that any logically later stages are included in **Scope_{2nd}** for that command.

NOTE

Implementations **may** not support synchronization at every pipeline stage for every synchronization operation. If a pipeline stage that an implementation does not support synchronization for appears in a source stage mask, it **may** substitute any logically later stage in its place for the first synchronization scope. If a pipeline stage that an implementation does not support synchronization for appears in a destination stage mask, it **may** substitute any logically earlier stage in its place for the second synchronization scope.

For example, if an implementation is unable to signal an event immediately after vertex shader execution is complete, it **may** instead signal the event after color attachment output has completed.

If an implementation makes such a substitution, it **must** not affect the semantics of execution or memory dependencies or image and buffer memory barriers.

Graphics pipelines are executable on queues supporting **VK_QUEUE_GRAPHICS_BIT**. Stages executed by graphics pipelines **can** only be specified in commands recorded for queues supporting **VK_QUEUE_GRAPHICS_BIT**.

The graphics primitive pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT**
- **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT**
- **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT**
- **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT**
- **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT**
- **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**
- **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**

- `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`

The graphics mesh pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`
- `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
- `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`

For the compute pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`
- `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT`

For the subpass shading pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`

For graphics pipeline commands executing in a render pass with a fragment density map attachment, the following pipeline stage where the fragment density map read happens has no particular order relative to the other stages, except that it is logically earlier than `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`:

- `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`

The conditional rendering stage is formally part of both the graphics, and the compute pipeline. The pipeline stage where the predicate read happens has unspecified order relative to other stages of these pipelines:

- `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

For the transfer pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_2_TRANSFER_BIT`

For host operations, only one pipeline stage occurs, so no order is guaranteed:

- `VK_PIPELINE_STAGE_2_HOST_BIT`

For the command preprocessing pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_EXT`

For acceleration structure build operations, only one pipeline stage occurs, so no order is guaranteed:

- `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

For acceleration structure copy operations, only one pipeline stage occurs, so no order is guaranteed:

- `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`

For opacity micromap build operations, only one pipeline stage occurs, so no order is guaranteed:

- `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`

For the ray tracing pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`
- `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

For the video decode pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`

For the video encode pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`

7.1.3. Access Types

Memory in Vulkan **can** be accessed from within shader invocations and via some fixed-function stages of the pipeline. The *access type* is a function of the [descriptor type](#) used, or how a fixed-function stage accesses memory.

Some synchronization commands take sets of access types as parameters to define the [access scopes](#) of a memory dependency. If a synchronization command includes a *source access mask*, its first [access scope](#) only includes accesses via the access types specified in that mask. Similarly, if a synchronization command includes a *destination access mask*, its second [access scope](#) only includes accesses via the access types specified in that mask.

Bits which **can** be set in the `srcAccessMask` and `dstAccessMask` members of `VkMemoryBarrier2KHR`, `VkImageMemoryBarrier2KHR`, and `VkBufferMemoryBarrier2KHR`, specifying access behavior, are:

```

```

or the equivalent

```

// Provided by VK_KHR_synchronization2
typedef VkAccessFlagBits2 VkAccessFlagBits2KHR;

```

- **VK_ACCESS_2_NONE** specifies no accesses.
- **VK_ACCESS_2_MEMORY_READ_BIT** specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all **READ** access flags that are valid where it is used.
- **VK_ACCESS_2_MEMORY_WRITE_BIT** specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all **WRITE** access flags that are valid where it is used.
- **VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT** specifies read access to command data read from indirect buffers as part of an indirect build, trace, drawing or dispatch command. Such access occurs in the **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT** pipeline stage.

- `VK_ACCESS_2_INDEX_READ_BIT` specifies read access to an index buffer as part of an indexed drawing command, bound by `vkCmdBindIndexBuffer2KHR` and `vkCmdBindIndexBuffer`. Such access occurs in the `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT` pipeline stage.
- `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT` specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffers`. Such access occurs in the `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT` pipeline stage.
- `VK_ACCESS_2_UNIFORM_READ_BIT` specifies read access to a [uniform buffer](#) in any shader pipeline stage.
- `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT` specifies read access to an [input attachment](#) within a render pass during subpass shading or fragment shading. Such access occurs in the `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI` or `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT` specifies read access to a [uniform texel buffer](#) or [sampled image](#) in any shader pipeline stage.
- `VK_ACCESS_2_SHADER_STORAGE_READ_BIT` specifies read access to a [storage buffer](#), [physical storage buffer](#), [storage texel buffer](#), or [storage image](#) in any shader pipeline stage.
- `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR` specifies read access to a [shader binding table](#) in any shader pipeline stage.
- `VK_ACCESS_2_SHADER_READ_BIT` is equivalent to the logical OR of:
 - `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`
 - `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`
- `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT` specifies write access to a [storage buffer](#), [physical storage buffer](#), [storage texel buffer](#), or [storage image](#) in any shader pipeline stage.
- `VK_ACCESS_2_SHADER_WRITE_BIT` is equivalent to `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`.
- `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT` specifies read access to a [color attachment](#), such as via [blending](#) (other than [advanced blend operations](#)), [logic operations](#) or certain [render pass load operations](#) in the `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage or via [fragment shader tile image reads](#) in the `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT` specifies write access to a [color attachment](#) during a [render pass](#) or via certain render pass [load](#), [store](#), and [multisample resolve](#) operations. Such access occurs in the `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.
- `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT` specifies read access to a [depth/stencil attachment](#), via [depth or stencil operations](#) or certain [render pass load operations](#) in the `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT` pipeline stages or via [fragment shader tile image reads](#) in the `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT` specifies write access to a [depth/stencil attachment](#), via [depth or stencil operations](#) or certain render pass [load](#) and [store](#) operations. Such access occurs in the `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT` pipeline stages.
- `VK_ACCESS_2_TRANSFER_READ_BIT` specifies read access to an image or buffer in a [copy](#) operation.

Such access occurs in the `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, or `VK_PIPELINE_STAGE_2_RESOLVE_BIT` pipeline stages.

- `VK_ACCESS_2_TRANSFER_WRITE_BIT` specifies write access to an image or buffer in a [clear](#) or [copy](#) operation. Such access occurs in the `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_CLEAR_BIT`, or `VK_PIPELINE_STAGE_2_RESOLVE_BIT` pipeline stages.
- `VK_ACCESS_2_HOST_READ_BIT` specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_2_HOST_BIT` pipeline stage.
- `VK_ACCESS_2_HOST_WRITE_BIT` specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_2_HOST_BIT` pipeline stage.
- `VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT` specifies read access to a predicate as part of conditional rendering. Such access occurs in the `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT` pipeline stage.
- `VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT` specifies write access to a transform feedback buffer made when transform feedback is active. Such access occurs in the `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT` pipeline stage.
- `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT` specifies read access to a transform feedback counter buffer which is read when [vkCmdBeginTransformFeedbackEXT](#) executes. Such access occurs in the `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT` pipeline stage.
- `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT` specifies write access to a transform feedback counter buffer which is written when [vkCmdEndTransformFeedbackEXT](#) executes. Such access occurs in the `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT` pipeline stage.
- `VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV` specifies reads from buffer inputs to [vkCmdPreprocessGeneratedCommandsNV](#). Such access occurs in the `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` pipeline stage.
- `VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV` specifies writes to the target command buffer preprocess outputs. Such access occurs in the `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` pipeline stage.
- `VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_EXT` specifies reads from buffer inputs to [vkCmdPreprocessGeneratedCommandsEXT](#). Such access occurs in the `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_EXT` pipeline stage.
- `VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_EXT` specifies writes to the target command buffer preprocess outputs. Such access occurs in the `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_EXT` pipeline stage.
- `VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT` specifies read access to [color attachments](#), including [advanced blend operations](#). Such access occurs in the `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.
- `VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI` specifies read access to an invocation mask image in the `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI` pipeline stage.
- `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR` specifies read access to an acceleration

structure as part of a trace, build, or copy command, or to an [acceleration structure scratch buffer](#) as part of a build command. Such access occurs in the `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR` pipeline stage or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.

- `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` specifies write access to an acceleration structure or [acceleration structure scratch buffer](#) as part of a build or copy command. Such access occurs in the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.
- `VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT` specifies read access to a [fragment density map attachment](#) during dynamic [fragment density map operations](#). Such access occurs in the `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT` pipeline stage.
- `VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR` specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` pipeline stage.
- `VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV` specifies read access to a shading rate image during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV` pipeline stage. It is equivalent to `VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR`.
- `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR` specifies read access to an image or buffer resource in a [video decode operation](#). Such access occurs in the `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR` pipeline stage.
- `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR` specifies write access to an image or buffer resource in a [video decode operation](#). Such access occurs in the `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR` pipeline stage.
- `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR` specifies read access to an image or buffer resource in a [video encode operation](#). Such access occurs in the `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR` pipeline stage.
- `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR` specifies write access to an image or buffer resource in a [video encode operation](#). Such access occurs in the `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR` pipeline stage.
- `VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT` specifies read access to a [descriptor buffer](#) in any shader pipeline stage.
- `VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV` specifies read access to an image or buffer resource as part of a [optical flow operation](#). Such access occurs in the `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV` pipeline stage.
- `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV` specifies write access to an image or buffer resource as part of a [optical flow operation](#). Such access occurs in the `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV` pipeline stage.
- `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT` specifies write access to a micromap object. Such access occurs in the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage.
- `VK_ACCESS_2_MICROMAP_READ_BIT_EXT` specifies read access to a micromap object. Such access occurs in the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` and `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stages.

NOTE

In situations where an application wishes to select all access types for a given set of

pipeline stages, `VK_ACCESS_2_MEMORY_READ_BIT` or `VK_ACCESS_2_MEMORY_WRITE_BIT` can be used. This is particularly useful when specifying stages that only have a single access type.

NOTE

The `VkAccessFlags2` bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how `VkAccessFlagBits` is defined. The first 31 values are common to both, and are interchangeable.

`VkAccessFlags2` is a bitmask type for setting a mask of zero or more `VkAccessFlagBits2`:

```
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkAccessFlags2;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkAccessFlags2 VkAccessFlags2KHR;
```

Bits which **can** be set in the `srcAccessMask` and `dstAccessMask` members of `VkSubpassDependency`, `VkSubpassDependency2`, `VkMemoryBarrier`, `VkBufferMemoryBarrier`, and `VkImageMemoryBarrier`, specifying access behavior, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkAccessFlagBits {
    VK_ACCESS_INDIRECT_COMMAND_READ_BIT = 0x00000001,
    VK_ACCESS_INDEX_READ_BIT = 0x00000002,
    VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT = 0x00000004,
    VK_ACCESS_UNIFORM_READ_BIT = 0x00000008,
    VK_ACCESS_INPUT_ATTACHMENT_READ_BIT = 0x00000010,
    VK_ACCESS_SHADER_READ_BIT = 0x00000020,
    VK_ACCESS_SHADER_WRITE_BIT = 0x00000040,
    VK_ACCESS_COLOR_ATTACHMENT_READ_BIT = 0x00000080,
    VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT = 0x00000100,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT = 0x00000200,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT = 0x00000400,
    VK_ACCESS_TRANSFER_READ_BIT = 0x00000800,
    VK_ACCESS_TRANSFER_WRITE_BIT = 0x00001000,
    VK_ACCESS_HOST_READ_BIT = 0x00002000,
    VK_ACCESS_HOST_WRITE_BIT = 0x00004000,
    VK_ACCESS_MEMORY_READ_BIT = 0x00008000,
    VK_ACCESS_MEMORY_WRITE_BIT = 0x00010000,
    // Provided by VK_VERSION_1_3
    VK_ACCESS_NONE = 0,
    // Provided by VK_EXT_transform_feedback
    VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT = 0x02000000,
    // Provided by VK_EXT_transform_feedback
    VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT = 0x04000000,
```

```

// Provided by VK_EXT_transform_feedback
VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT = 0x08000000,
// Provided by VK_EXT_conditional_rendering
VK_ACCESS_CONDITIONAL_RENDERING_READ_BIT_EXT = 0x00100000,
// Provided by VK_EXT_blend_operation_advanced
VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT = 0x00080000,
// Provided by VK_KHR_acceleration_structure
VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR = 0x00200000,
// Provided by VK_KHR_acceleration_structure
VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR = 0x00400000,
// Provided by VK_EXT_fragment_density_map
VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT = 0x01000000,
// Provided by VK_KHR_fragment_shading_rate
VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR = 0x00800000,
// Provided by VK_NV_device_generated_commands
VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV = 0x00020000,
// Provided by VK_NV_device_generated_commands
VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV = 0x00040000,
// Provided by VK_NV_shading_rate_image
VK_ACCESS_SHADING_RATE_IMAGE_READ_BIT_NV =
VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR,
// Provided by VK_NV_ray_tracing
VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_NV =
VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR,
// Provided by VK_NV_ray_tracing
VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_NV =
VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR,
// Provided by VK_KHR_synchronization2
VK_ACCESS_NONE_KHR = VK_ACCESS_NONE,
// Provided by VK_EXT_device_generated_commands
VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_EXT =
VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV,
// Provided by VK_EXT_device_generated_commands
VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_EXT =
VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV,
} VkAccessFlagBits;

```

These values all have the same meaning as the equivalently named values for [VkAccessFlags2](#).

- **VK_ACCESS_NONE** specifies no accesses.
- **VK_ACCESS_MEMORY_READ_BIT** specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all **READ** access flags that are valid where it is used.
- **VK_ACCESS_MEMORY_WRITE_BIT** specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all **WRITE** access flags that are valid where it is used.
- **VK_ACCESS_INDIRECT_COMMAND_READ_BIT** specifies read access to indirect command data read as part of an indirect build, trace, drawing or dispatching command. Such access occurs in the **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT** pipeline stage.
- **VK_ACCESS_INDEX_READ_BIT** specifies read access to an index buffer as part of an indexed drawing

command, bound by `vkCmdBindIndexBuffer2KHR` and `vkCmdBindIndexBuffer`. Such access occurs in the `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` pipeline stage.

- `VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT` specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffers`. Such access occurs in the `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` pipeline stage.
- `VK_ACCESS_UNIFORM_READ_BIT` specifies read access to a `uniform buffer` in any shader pipeline stage.
- `VK_ACCESS_INPUT_ATTACHMENT_READ_BIT` specifies read access to an `input attachment` within a render pass during subpass shading or fragment shading. Such access occurs in the `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI` or `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_SHADER_READ_BIT` specifies read access to a `uniform texel buffer`, `sampled image`, `storage buffer`, `physical storage buffer`, `shader binding table`, `storage texel buffer`, or `storage image` in any shader pipeline stage.
- `VK_ACCESS_SHADER_WRITE_BIT` specifies write access to a `storage buffer`, `physical storage buffer`, `storage texel buffer`, or `storage image` in any shader pipeline stage.
- `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT` specifies read access to a `color attachment`, such as via `blending` (other than `advanced blend operations`), `logic operations` or certain `render pass load operations` in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage or via `fragment shader tile image reads` in the `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT` specifies write access to a `color`, `resolve`, or `depth/stencil resolve attachment` during a `render pass` or via certain render pass `load` and `store` operations. Such access occurs in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.
- `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT` specifies read access to a `depth/stencil attachment`, via `depth or stencil operations` or certain `render pass load operations` in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages or via `fragment shader tile image reads` in the `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT` specifies write access to a `depth/stencil attachment`, via `depth or stencil operations` or certain render pass `load` and `store` operations. Such access occurs in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages.
- `VK_ACCESS_TRANSFER_READ_BIT` specifies read access to an image or buffer in a `copy` operation. Such access occurs in the `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT` pipeline stage.
- `VK_ACCESS_TRANSFER_WRITE_BIT` specifies write access to an image or buffer in a `clear` or `copy` operation. Such access occurs in the `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT` pipeline stage.
- `VK_ACCESS_HOST_READ_BIT` specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_HOST_BIT` pipeline stage.
- `VK_ACCESS_HOST_WRITE_BIT` specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_HOST_BIT` pipeline stage.

- `VK_ACCESS_CONDITIONAL_RENDERING_READ_BIT_EXT` specifies read access to a predicate as part of conditional rendering. Such access occurs in the `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT` pipeline stage.
- `VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT` specifies write access to a transform feedback buffer made when transform feedback is active. Such access occurs in the `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` pipeline stage.
- `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT` specifies read access to a transform feedback counter buffer which is read when `vkCmdBeginTransformFeedbackEXT` executes. Such access occurs in the `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` pipeline stage.
- `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT` specifies write access to a transform feedback counter buffer which is written when `vkCmdEndTransformFeedbackEXT` executes. Such access occurs in the `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` pipeline stage.
- `VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV` specifies reads from buffer inputs to `vkCmdPreprocessGeneratedCommandsNV`. Such access occurs in the `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV` pipeline stage.
- `VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV` specifies writes to the target command buffer preprocess outputs in `vkCmdPreprocessGeneratedCommandsNV`. Such access occurs in the `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV` pipeline stage.
- `VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_EXT` specifies reads from buffer inputs to `vkCmdPreprocessGeneratedCommandsEXT`. Such access occurs in the `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_EXT` pipeline stage.
- `VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_EXT` specifies writes to the target command buffer preprocess outputs in `vkCmdPreprocessGeneratedCommandsEXT`. Such access occurs in the `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_EXT` pipeline stage.
- `VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT` specifies read access to [color attachments](#), including [advanced blend operations](#). Such access occurs in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.
- `VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI` specifies read access to an invocation mask image in the `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI` pipeline stage.
- `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an [acceleration structure scratch buffer](#) as part of a build command. Such access occurs in the `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR` pipeline stage or `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.
- `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` specifies write access to an acceleration structure or [acceleration structure scratch buffer](#) as part of a build or copy command. Such access occurs in the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.
- `VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT` specifies read access to a [fragment density map attachment](#) during dynamic [fragment density map operations](#). Such access occurs in the `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT` pipeline stage.
- `VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR` specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` pipeline stage.

- `VK_ACCESS_SHADING_RATE_IMAGE_READ_BIT_NV` specifies read access to a shading rate image during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV` pipeline stage. It is equivalent to `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

Certain access types are only performed by a subset of pipeline stages. Any synchronization command that takes both stage masks and access masks uses both to define the [access scopes](#) - only the specified access types performed by the specified stages are included in the access scope. An application **must** not specify an access flag in a synchronization command if it does not include a pipeline stage in the corresponding stage mask that is able to perform accesses of that type. The following table lists, for each access flag, which pipeline stages **can** perform that type of access.

Table 4. Supported Access Types

Access flag	Supported pipeline stages
<code>VK_ACCESS_2_NONE</code>	Any
<code>VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT</code>	<code>VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT</code> , <code>VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR</code>
<code>VK_ACCESS_2_INDEX_READ_BIT</code>	<code>VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT</code> , <code>VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT</code>
<code>VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT</code>	<code>VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT</code> , <code>VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT</code>
<code>VK_ACCESS_2_UNIFORM_READ_BIT</code>	<code>VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR</code> , <code>VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT</code> , <code>VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT</code> , <code>VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI</code> , <code>VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI</code>
<code>VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT</code>	<code>VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI</code>

Access flag	Supported pipeline stages

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkAccessFlags;
```

VkAccessFlags is a bitmask type for setting a mask of zero or more **VkAccessFlagBits**.

If a memory object does not have the **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** property, then **vkFlushMappedMemoryRanges** **must** be called in order to guarantee that writes to the memory object from the host are made available to the host domain, where they **can** be further made available to the device domain via a domain operation. Similarly, **vkInvalidateMappedMemoryRanges** **must** be called to guarantee that writes which are available to the host domain are made visible to host operations.

If the memory object does have the **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** property flag, writes to the memory object from the host are automatically made available to the host domain. Similarly, writes made available to the host domain are automatically made visible to the host.

NOTE

Queue submission commands automatically perform a domain operation from host to device for all writes performed before the command executes, so in most cases an explicit memory barrier is not needed for this case. In the few circumstances where a submit does not occur between the host write and the device read access, writes **can** be made available by using an explicit memory barrier.

7.1.4. Framebuffer Region Dependencies

Pipeline stages that operate on, or with respect to, the framebuffer are collectively the *framebuffer-space* pipeline stages. These stages are:

- **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT**
- **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT**
- **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT**
- **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT**

For these pipeline stages, an execution or memory dependency from the first set of operations to the second set **can** either be a single *framebuffer-global* dependency, or split into multiple *framebuffer-local* dependencies. A dependency with non-framebuffer-space pipeline stages is neither framebuffer-global nor framebuffer-local.

A *framebuffer region* is a subset of the entire framebuffer, and **can** either be:

- A *sample region*, which is set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer, or
- A *fragment region*, which is a set of fragment (x, y, layer) coordinates that is a subset of the entire framebuffer.

Both **synchronization scopes** of a framebuffer-local dependency include only the operations performed within corresponding framebuffer regions (as defined below). No ordering guarantees are made between different framebuffer regions for a framebuffer-local dependency.

Both **synchronization scopes** of a framebuffer-global dependency include operations on all framebuffer-regions.

If the first synchronization scope includes operations on pixels/fragments with N samples and the second synchronization scope includes operations on pixels/fragments with M samples, where N does not equal M, then a framebuffer region containing all samples at a given (x, y, layer) coordinate in the first synchronization scope corresponds to a region containing all samples at the same coordinate in the second synchronization scope. In other words, the framebuffer region is a fragment region and it is a pixel granularity dependency. If N equals M, and if the **VkSubpassDescription::flags** does not specify the **VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM** flag, then a framebuffer region containing a single (x, y, layer, sample) coordinate in the first synchronization scope corresponds to a region containing the same sample at the same coordinate in the second synchronization scope. In other words, the framebuffer region is a sample region and it is a sample granularity dependency.

If the pipeline performing the operation was created with **VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT**, **VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT**, or **VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT**, the framebuffer region is a fragment region and it is a pixel granularity dependency.

NOTE

Since fragment shader invocations are not specified to run in any particular groupings, the size of a framebuffer region is implementation-dependent, not known to the application, and **must** be assumed to be no larger than specified above.

NOTE

Practically, the pixel vs. sample granularity dependency means that if an input attachment has a different number of samples than the pipeline's **rasterizationSamples**, then a fragment **can** access any sample in the input attachment's pixel even if it only uses framebuffer-local dependencies. If the input attachment has the same number of samples, then the fragment **can** only access the covered samples in its input **SampleMask** (i.e. the fragment operations happen-after a framebuffer-local dependency for each sample the fragment covers). To access samples that are not covered, either the **VkSubpassDescription::flags** **VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM** flag is required, or a framebuffer-global dependency is required.

If a synchronization command includes a **dependencyFlags** parameter, and specifies the **VK_DEPENDENCY_BY_REGION_BIT** flag, then it defines framebuffer-local dependencies for the framebuffer-space pipeline stages in that synchronization command, for all framebuffer regions. If no **dependencyFlags** parameter is included, or the **VK_DEPENDENCY_BY_REGION_BIT** flag is not specified, then a framebuffer-global dependency is specified for those stages. The **VK_DEPENDENCY_BY_REGION_BIT** flag does not affect the dependencies between non-framebuffer-space pipeline stages, nor does it affect the dependencies between framebuffer-space and non-framebuffer-space pipeline stages.

NOTE

Framebuffer-local dependencies are more efficient for most architectures; particularly tile-based architectures - which can keep framebuffer-regions entirely

in on-chip registers and thus avoid external bandwidth across such a dependency. Including a framebuffer-global dependency in your rendering will usually force all implementations to flush data to memory, or to a higher level cache, breaking any potential locality optimizations.

7.1.5. View-Local Dependencies

In a render pass instance that has `multiview` enabled, dependencies **can** be either view-local or view-global.

A view-local dependency only includes operations from a single `source view` from the source subpass in the first synchronization scope, and only includes operations from a single `destination view` from the destination subpass in the second synchronization scope. A view-global dependency includes all views in the view mask of the source and destination subpasses in the corresponding synchronization scopes.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag, then it defines view-local dependencies for that synchronization command, for all views. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag is not specified, then a view-global dependency is specified.

7.1.6. Device-Local Dependencies

Dependencies **can** be either device-local or non-device-local. A device-local dependency acts as multiple separate dependencies, one for each physical device that executes the synchronization command, where each dependency only includes operations from that physical device in both synchronization scopes. A non-device-local dependency is a single dependency where both synchronization scopes include operations from all physical devices that participate in the synchronization command. For subpass dependencies, all physical devices in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` participate in the dependency, and for pipeline barriers all physical devices that are set in the command buffer's current device mask participate in the dependency.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag, then it defines a non-device-local dependency for that synchronization command. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag is not specified, then it defines device-local dependencies for that synchronization command, for all participating physical devices.

Semaphore and event dependencies are device-local and only execute on the one physical device that performs the dependency.

7.2. Implicit Synchronization Guarantees

A small number of implicit ordering guarantees are provided by Vulkan, ensuring that the order in which commands are submitted is meaningful, and avoiding unnecessary complexity in common operations.

Submission order is a fundamental ordering in Vulkan, giving meaning to the order in which [action and synchronization commands](#) are recorded and submitted to a single queue. Explicit and implicit ordering guarantees between commands in Vulkan all work on the premise that this ordering is meaningful. This order does not itself define any execution or memory dependencies; synchronization commands and other orderings within the API use this ordering to define their scopes.

Submission order for any given set of commands is based on the order in which they were recorded to command buffers and then submitted. This order is determined as follows:

1. The initial order is determined by the order in which [vkQueueSubmit](#) and [vkQueueSubmit2](#) commands are executed on the host, for a single queue, from first to last.
2. The order in which [VkSubmitInfo](#) structures are specified in the [pSubmits](#) parameter of [vkQueueSubmit](#), or in which [VkSubmitInfo2](#) structures are specified in the [pSubmits](#) parameter of [vkQueueSubmit2](#), from lowest index to highest.
3. The order in which command buffers are specified in the [pCommandBuffers](#) member of [VkSubmitInfo](#) or [VkSubmitInfo2](#) from lowest index to highest.
4. The order in which commands outside of a render pass were recorded to a command buffer on the host, from first to last.
5. The order in which commands inside a single subpass were recorded to a command buffer on the host, from first to last.

NOTE

When using a [render pass object](#) with multiple subpasses, commands in different subpasses have no defined submission order relative to each other, regardless of the order in which the subpasses were recorded. Commands within a subpass are still ordered relative to other commands in the same subpass, and those outside of the render pass.

[State commands](#) do not execute any operations on the device, instead they set the state of the command buffer when they execute on the host, in the order that they are recorded. [Action commands](#) consume the current state of the command buffer when they are recorded, and will execute state changes on the device as required to match the recorded state.

[The order of primitives passing through the graphics pipeline](#) and [image layout transitions as part of an image memory barrier](#) provide additional guarantees based on submission order.

Execution of [pipeline stages](#) within a given command also has a loose ordering, dependent only on a single command.

Signal operation order is a fundamental ordering in Vulkan, giving meaning to the order in which semaphore and fence signal operations occur when submitted to a single queue. The signal operation order for queue operations is determined as follows:

1. The initial order is determined by the order in which [vkQueueSubmit](#) and [vkQueueSubmit2](#) commands are executed on the host, for a single queue, from first to last.
2. The order in which [VkSubmitInfo](#) structures are specified in the [pSubmits](#) parameter of [vkQueueSubmit](#), or in which [VkSubmitInfo2](#) structures are specified in the [pSubmits](#) parameter

of [vkQueueSubmit2](#), from lowest index to highest.

3. The fence signal operation defined by the [fence](#) parameter of a [vkQueueSubmit](#) or [vkQueueSubmit2](#) or [vkQueueBindSparse](#) command is ordered after all semaphore signal operations defined by that command.

Semaphore signal operations defined by a single [VkSubmitInfo](#) or [VkSubmitInfo2](#) or [VkBindSparseInfo](#) structure are unordered with respect to other semaphore signal operations defined within the same structure.

The [vkSignalSemaphore](#) command does not execute on a queue but instead performs the signal operation from the host. The semaphore signal operation defined by executing a [vkSignalSemaphore](#) command happens-after the [vkSignalSemaphore](#) command is invoked and happens-before the command returns.

NOTE

When signaling timeline semaphores, it is the responsibility of the application to ensure that they are ordered such that the semaphore value is strictly increasing. Because the first synchronization scope for a semaphore signal operation contains all semaphore signal operations which occur earlier in submission order, all semaphore signal operations contained in any given batch are guaranteed to happen-after all semaphore signal operations contained in any previous batches. However, no ordering guarantee is provided between the semaphore signal operations defined within a single batch. This, combined with the requirement that timeline semaphore values strictly increase, means that it is invalid to signal the same timeline semaphore twice within a single batch.

If an application wishes to ensure that some semaphore signal operation happens-after some other semaphore signal operation, it can submit a separate batch containing only semaphore signal operations, which will happen-after the semaphore signal operations in any earlier batches.

When signaling a semaphore from the host, the only ordering guarantee is that the signal operation happens-after when [vkSignalSemaphore](#) is called and happens-before it returns. Therefore, it is invalid to call [vkSignalSemaphore](#) while there are any outstanding signal operations on that semaphore from any queue submissions unless those queue submissions have some dependency which ensures that they happen-after the host signal operation. One example of this would be if the pending signal operation is, itself, waiting on the same semaphore at a lower value and the call to [vkSignalSemaphore](#) signals that lower value. Furthermore, if there are two or more processes or threads signaling the same timeline semaphore from the host, the application must ensure that the [vkSignalSemaphore](#) with the lower semaphore value returns before [vkSignalSemaphore](#) is called with the higher value.

7.3. Fences

Fences are a synchronization primitive that **can** be used to insert a dependency from a queue to the host. Fences have two states - signaled and unsignaled. A fence **can** be signaled as part of the execution of a [queue submission](#) command. Fences **can** be unsignaled on the host with [vkResetFences](#). Fences **can** be waited on by the host with the [vkWaitForFences](#) command, and the

current state **can** be queried with [vkGetFenceStatus](#).

The internal data of a fence **may** include a reference to any resources and pending work associated with signal or unsignal operations performed on that fence object, collectively referred to as the fence's *payload*. Mechanisms to import and export that internal data to and from fences are provided [below](#). These mechanisms indirectly enable applications to share fence state between two or more fences and other synchronization primitives across process and API boundaries.

Fences are represented by [VkFence](#) handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFence)
```

To create a fence, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateFence(
    VkDevice                                device,
    const VkFenceCreateInfo*                pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkFence*                                 pFence);
```

- [device](#) is the logical device that creates the fence.
- [pCreateInfo](#) is a pointer to a [VkFenceCreateInfo](#) structure containing information about how the fence is to be created.
- [pAllocator](#) controls host memory allocation as described in the [Memory Allocation](#) chapter.
- [pFence](#) is a pointer to a handle in which the resulting fence object is returned.

Valid Usage (Implicit)

- VUID-vkCreateFence-device-parameter
[device](#) **must** be a valid [VkDevice](#) handle
- VUID-vkCreateFence-pCreateInfo-parameter
[pCreateInfo](#) **must** be a valid pointer to a valid [VkFenceCreateInfo](#) structure
- VUID-vkCreateFence-pAllocator-parameter
If [pAllocator](#) is not `NULL`, [pAllocator](#) **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateFence-pFence-parameter
[pFence](#) **must** be a valid pointer to a [VkFence](#) handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkFenceCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkFenceCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkFenceCreateFlags flags;
} VkFenceCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkFenceCreateFlagBits` specifying the initial state and behavior of the fence.

Valid Usage (Implicit)

- VUID-VkFenceCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_FENCE_CREATE_INFO`
- VUID-VkFenceCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkExportFenceCreateInfo` or `VkExportFenceWin32HandleInfoKHR`
- VUID-VkFenceCreateInfo-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkFenceCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkFenceCreateFlagBits` values

```
// Provided by VK_VERSION_1_0
typedef enum VkFenceCreateFlagBits {
    VK_FENCE_CREATE_SIGNALED_BIT = 0x00000001,
} VkFenceCreateFlagBits;
```

- `VK_FENCE_CREATE_SIGNALED_BIT` specifies that the fence object is created in the signaled state.

Otherwise, it is created in the unsignaled state.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkFenceCreateFlags;
```

VkFenceCreateFlags is a bitmask type for setting a mask of zero or more **VkFenceCreateFlagBits**.

To create a fence whose payload **can** be exported to external handles, add a **VkExportFenceCreateInfo** structure to the **pNext** chain of the **VkFenceCreateInfo** structure. The **VkExportFenceCreateInfo** structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExportFenceCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkExternalFenceHandleTypeFlags handleTypes;
} VkExportFenceCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_external_fence
typedef VkExportFenceCreateInfo VkExportFenceCreateInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **handleTypes** is a bitmask of **VkExternalFenceHandleTypeFlagBits** specifying one or more fence handle types the application **can** export from the resulting fence. The application **can** request multiple handle types for the same fence.

Valid Usage

- VUID-VkExportFenceCreateInfo-handleTypes-01446
The bits in **handleTypes** **must** be supported and compatible, as reported by **VkExternalFenceProperties**

Valid Usage (Implicit)

- VUID-VkExportFenceCreateInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_EXPORT_FENCE_CREATE_INFO**
- VUID-VkExportFenceCreateInfo-handleTypes-parameter
handleTypes **must** be a valid combination of **VkExternalFenceHandleTypeFlagBits** values

To specify additional attributes of NT handles exported from a fence, add a

`VkExportFenceWin32HandleInfoKHR` structure to the `pNext` chain of the `VkFenceCreateInfo` structure. The `VkExportFenceWin32HandleInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_fence_win32
typedef struct VkExportFenceWin32HandleInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD                dwAccess;
    LPCWSTR               name;
} VkExportFenceWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- `dwAccess` is a `DWORD` specifying access rights of the handle.
- `name` is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created fence.

If `VkExportFenceCreateInfo` is not included in the same `pNext` chain, this structure is ignored.

If `VkExportFenceCreateInfo` is included in the `pNext` chain of `VkFenceCreateInfo` with a Windows `handleType`, but either `VkExportFenceWin32HandleInfoKHR` is not included in the `pNext` chain, or it is included but `pAttributes` is `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”¹. Further, if the structure is not present, the access rights will be

`DXGI_SHARED_RESOURCE_READ | DXGI_SHARED_RESOURCE_WRITE`

for handles of the following types:

`VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`

1

<https://docs.microsoft.com/en-us/windows/win32/sync/synchronization-object-security-and-access-rights>

Valid Usage

- VUID-VkExportFenceWin32HandleInfoKHR-handleTypes-01447

If `VkExportFenceCreateInfo::handleTypes` does not include `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`, a `VkExportFenceWin32HandleInfoKHR` structure **must** not be included in the `pNext` chain of `VkFenceCreateInfo`

Valid Usage (Implicit)

- VUID-VkExportFenceWin32HandleInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_FENCE_WIN32_HANDLE_INFO_KHR`
- VUID-VkExportFenceWin32HandleInfoKHR-pAttributes-parameter
If `pAttributes` is not `NULL`, `pAttributes` **must** be a valid pointer to a valid `SECURITY_ATTRIBUTES` value

To export a Windows handle representing the state of a fence, call:

```
// Provided by VK_KHR_external_fence_win32
VkResult vkGetFenceWin32HandleKHR(
    VkDevice device,
    const VkFenceGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- `device` is the logical device that created the fence being exported.
- `pGetWin32HandleInfo` is a pointer to a `VkFenceGetWin32HandleInfoKHR` structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the fence state.

For handle types defined as NT handles, the handles returned by `vkGetFenceWin32HandleKHR` are owned by the application. To avoid leaking resources, the application **must** release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a fence **may** have side effects depending on the transference of the specified handle type, as described in [Importing Fence Payloads](#).

Valid Usage (Implicit)

- VUID-vkGetFenceWin32HandleKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetFenceWin32HandleKHR-pGetWin32HandleInfo-parameter
`pGetWin32HandleInfo` **must** be a valid pointer to a valid `VkFenceGetWin32HandleInfoKHR` structure
- VUID-vkGetFenceWin32HandleKHR-pHandle-parameter
`pHandle` **must** be a valid pointer to a `HANDLE` value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkFenceGetWin32HandleInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_fence_win32
typedef struct VkFenceGetWin32HandleInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkFence                  fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fence` is the fence from which state will be exported.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.

Valid Usage

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01448
`handleType` **must** have been included in `VkExportFenceCreateInfo::handleTypes` when the `fence`'s current payload was created
- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01449
If `handleType` is defined as an NT handle, `vkGetFenceWin32HandleKHR` **must** be called no more than once for each valid unique combination of `fence` and `handleType`
- VUID-VkFenceGetWin32HandleInfoKHR-fence-01450
`fence` **must** not currently have its payload replaced by an imported payload as described below in [Importing Fence Payloads](#) unless that imported payload's handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`
- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01451
If `handleType` refers to a handle type with copy payload transference semantics, `fence` **must** be signaled, or have an associated [fence signal operation](#) pending execution
- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01452
`handleType` **must** be defined as an NT handle or a global share handle

Valid Usage (Implicit)

- VUID-VkFenceGetWin32HandleInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_FENCE_GET_WIN32_HANDLE_INFO_KHR`
- VUID-VkFenceGetWin32HandleInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkFenceGetWin32HandleInfoKHR-fence-parameter
`fence` **must** be a valid `VkFence` handle
- VUID-VkFenceGetWin32HandleInfoKHR-handleType-parameter
`handleType` **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

To export a POSIX file descriptor representing the payload of a fence, call:

```
// Provided by VK_KHR_external_fence_fd
VkResult vkGetFenceFdKHR(
    VkDevice          device,
    const VkFenceGetFdInfoKHR* pGetFdInfo,
    int*              pFd);
```

- `device` is the logical device that created the fence being exported.
- `pGetFdInfo` is a pointer to a `VkFenceGetFdInfoKHR` structure containing parameters of the export operation.
- `pFd` will return the file descriptor representing the fence payload.

Each call to `vkGetFenceFdKHR` **must** create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor when it is no longer needed.

NOTE

Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a fence payload.

If `pGetFdInfo->handleType` is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` and the fence is signaled at the time `vkGetFenceFdKHR` is called, `pFd` **may** return the value `-1` instead of a valid file descriptor.

Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a fence **may** have side effects depending on the transference of the specified handle type, as described in [Importing Fence State](#).

Valid Usage (Implicit)

- VUID-vkGetFenceFdKHR-device-parameter

device **must** be a valid [VkDevice](#) handle

- VUID-vkGetFenceFdKHR-pGetFdInfo-parameter
pGetFdInfo **must** be a valid pointer to a valid [VkFenceGetFdInfoKHR](#) structure
- VUID-vkGetFenceFdKHR-pFd-parameter
pFd **must** be a valid pointer to an **int** value

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_TOO_MANY_OBJECTS**
- **VK_ERROR_OUT_OF_HOST_MEMORY**

The [VkFenceGetFdInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_external_fence_fd
typedef struct VkFenceGetFdInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkFence                  fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetFdInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **fence** is the fence from which state will be exported.
- **handleType** is a [VkExternalFenceHandleTypeFlagBits](#) value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of **handleType**. See [VkExternalFenceHandleTypeFlagBits](#) for a description of the properties of the defined external fence handle types.

Valid Usage

- VUID-VkFenceGetFdInfoKHR-handleType-01453
handleType **must** have been included in [VkExportFenceCreateInfo::handleTypes](#) when **fence**'s current payload was created
- VUID-VkFenceGetFdInfoKHR-handleType-01454
If **handleType** refers to a handle type with copy payload transference semantics, **fence** **must** be signaled, or have an associated [fence signal operation](#) pending execution

- VUID-VkFenceGetFdInfoKHR-fence-01455
fence **must** not currently have its payload replaced by an imported payload as described below in [Importing Fence Payloads](#) unless that imported payload's handle type was included in [VkExternalFenceProperties::exportFromImportedHandleTypes](#) for **handleType**
- VUID-VkFenceGetFdInfoKHR-handleType-01456
handleType **must** be defined as a POSIX file descriptor handle

Valid Usage (Implicit)

- VUID-VkFenceGetFdInfoKHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_FENCE_GET_FD_INFO_KHR](#)
- VUID-VkFenceGetFdInfoKHR-pNext-pNext
pNext **must** be [NULL](#)
- VUID-VkFenceGetFdInfoKHR-fence-parameter
fence **must** be a valid [VkFence](#) handle
- VUID-VkFenceGetFdInfoKHR-handleType-parameter
handleType **must** be a valid [VkExternalFenceHandleTypeFlagBits](#) value

To destroy a fence, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyFence(
    VkDevice          device,
    VkFence           fence,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the fence.
- **fence** is the handle of the fence to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyFence-fence-01120
All [queue submission](#) commands that refer to **fence** **must** have completed execution
- VUID-vkDestroyFence-fence-01121
If [VkAllocationCallbacks](#) were provided when **fence** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyFence-fence-01122
If no [VkAllocationCallbacks](#) were provided when **fence** was created, **pAllocator** **must** be [NULL](#)

Valid Usage (Implicit)

- VUID-vkDestroyFence-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkDestroyFence-fence-parameter
If **fence** is not [VK_NULL_HANDLE](#), **fence** **must** be a valid [VkFence](#) handle
- VUID-vkDestroyFence-pAllocator-parameter
If **pAllocator** is not [NULL](#), **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkDestroyFence-fence-parent
If **fence** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **fence** **must** be externally synchronized

To query the status of a fence from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkGetFenceStatus(
    VkDevice          device,
    VkFence           fence);
```

- **device** is the logical device that owns the fence.
- **fence** is the handle of the fence to query.

Upon success, **vkGetFenceStatus** returns the status of the fence object, with the following return codes:

Table 5. Fence Object Status Codes

Status	Meaning
VK_SUCCESS	The fence specified by fence is signaled.
VK_NOT_READY	The fence specified by fence is unsignaled.
VK_ERROR_DEVICE_LOST	The device has been lost. See Lost Device .

If a [queue submission](#) command is pending execution, then the value returned by this command **may** immediately be out of date.

If the device has been lost (see [Lost Device](#)), **vkGetFenceStatus** **may** return any of the above status

codes. If the device has been lost and `vkGetFenceStatus` is called repeatedly, it will eventually return either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

Valid Usage (Implicit)

- VUID-vkGetFenceStatus-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetFenceStatus-fence-parameter
`fence` **must** be a valid `VkFence` handle
- VUID-vkGetFenceStatus-fence-parent
`fence` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_NOT_READY`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To set the state of fences to unsignaled from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetFences(
    VkDevice          device,
    uint32_t          fenceCount,
    const VkFence*    pFences);
```

- `device` is the logical device that owns the fences.
- `fenceCount` is the number of fences to reset.
- `pFences` is a pointer to an array of fence handles to reset.

If any member of `pFences` currently has its `payload imported` with temporary permanence, that fence's prior permanent payload is first restored. The remaining operations described therefore operate on the restored payload.

When `vkResetFences` is executed on the host, it defines a *fence unsignal operation* for each fence, which resets the fence to the unsignaled state.

If any member of `pFences` is already in the unsignaled state when `vkResetFences` is executed, then

[vkResetFences](#) has no effect on that fence.

Valid Usage

- VUID-vkResetFences-pFences-01123
Each element of **pFences** **must** not be currently associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkResetFences-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkResetFences-pFences-parameter
pFences **must** be a valid pointer to an array of **fenceCount** valid [VkFence](#) handles
- VUID-vkResetFences-fenceCount-arraylength
fenceCount **must** be greater than 0
- VUID-vkResetFences-pFences-parent
Each element of **pFences** **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to each member of **pFences** **must** be externally synchronized

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

When a fence is submitted to a queue as part of a [queue submission](#) command, it defines a memory dependency on the batches that were submitted as part of that command, and defines a *fence signal operation* which sets the fence to the signaled state.

The first [synchronization scope](#) includes every batch submitted in the same [queue submission](#) command. Fence signal operations that are defined by [vkQueueSubmit](#) or [vkQueueSubmit2](#) additionally include in the first synchronization scope all commands that occur earlier in [submission order](#). Fence signal operations that are defined by [vkQueueSubmit](#) or [vkQueueSubmit2](#) or [vkQueueBindSparse](#) additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in [signal operation order](#).

The second [synchronization scope](#) only includes the fence signal operation.

The first [access scope](#) includes all memory access performed by the device.

The second [access scope](#) is empty.

To wait for one or more fences to enter the signaled state on the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkWaitForFences(
    VkDevice          device,
    uint32_t          fenceCount,
    const VkFence*    pFences,
    VkBool32          waitAll,
    uint64_t          timeout);
```

- `device` is the logical device that owns the fences.
- `fenceCount` is the number of fences to wait on.
- `pFences` is a pointer to an array of `fenceCount` fence handles.
- `waitAll` is the condition that **must** be satisfied to successfully unblock the wait. If `waitAll` is `VK_TRUE`, then the condition is that all fences in `pFences` are signaled. Otherwise, the condition is that at least one fence in `pFences` is signaled.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

If the condition is satisfied when `vkWaitForFences` is called, then `vkWaitForFences` returns immediately. If the condition is not satisfied at the time `vkWaitForFences` is called, then `vkWaitForFences` will block and wait until the condition is satisfied or the `timeout` has expired, whichever is sooner.

If `timeout` is zero, then `vkWaitForFences` does not wait, but simply returns the current state of the fences. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the `timeout` has expired, `vkWaitForFences` returns `VK_SUCCESS`. Otherwise, `vkWaitForFences` returns `VK_TIMEOUT` after the `timeout` has expired.

If device loss occurs (see [Lost Device](#)) before the timeout has expired, `vkWaitForFences` **must** return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

NOTE

While we guarantee that `vkWaitForFences` **must** return in finite time, no guarantees are made that it returns immediately upon device loss. However, the application can reasonably expect that the delay will be on the order of seconds and that calling `vkWaitForFences` will not result in a permanently (or seemingly permanently) dead process.

Valid Usage (Implicit)

- VUID-vkWaitForFences-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkWaitForFences-pFences-parameter
pFences **must** be a valid pointer to an array of **fenceCount** valid [VkFence](#) handles
- VUID-vkWaitForFences-fenceCount-arraylength
fenceCount **must** be greater than 0
- VUID-vkWaitForFences-pFences-parent
Each element of **pFences** **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- [VK_SUCCESS](#)
- [VK_TIMEOUT](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_DEVICE_LOST](#)

An execution dependency is defined by waiting for a fence to become signaled, either via [vkWaitForFences](#) or by polling on [vkGetFenceStatus](#).

The first [synchronization scope](#) includes only the fence signal operation.

The second [synchronization scope](#) includes the host operations of [vkWaitForFences](#) or [vkGetFenceStatus](#) indicating that the fence has become signaled.

NOTE

Signaling a fence and waiting on the host does not guarantee that the results of memory accesses will be visible to the host, as the access scope of a memory dependency defined by a fence only includes device access. A [memory barrier](#) or other memory dependency **must** be used to guarantee this. See the description of [host access types](#) for more information.

7.3.1. Alternate Methods to Signal Fences

Besides submitting a fence to a queue as part of a [queue submission](#) command, a fence **may** also be signaled when a particular event occurs on a device or display.

To create a fence that will be signaled when an event occurs on a device, call:

```
// Provided by VK_EXT_display_control
VkResult vkRegisterDeviceEventEXT(
    VkDevice                                device,
    const VkDeviceEventInfoEXT*             pDeviceEventInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkFence*                                 pFence);
```

- **device** is a logical device on which the event **may** occur.
- **pDeviceEventInfo** is a pointer to a [VkDeviceEventInfoEXT](#) structure describing the event of interest to the application.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pFence** is a pointer to a handle in which the resulting fence object is returned.

Valid Usage (Implicit)

- VUID-vkRegisterDeviceEventEXT-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkRegisterDeviceEventEXT-pDeviceEventInfo-parameter
pDeviceEventInfo **must** be a valid pointer to a valid [VkDeviceEventInfoEXT](#) structure
- VUID-vkRegisterDeviceEventEXT-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkRegisterDeviceEventEXT-pFence-parameter
pFence **must** be a valid pointer to a [VkFence](#) handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**

The [VkDeviceEventInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkDeviceEventInfoEXT {
    VkStructureType    sType;
    const void*         pNext;
    VkDeviceEventTypeEXT deviceEvent;
} VkDeviceEventInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `device` is a `VkDeviceEventTypeEXT` value specifying when the fence will be signaled.

Valid Usage (Implicit)

- VUID-VkDeviceEventInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_EVENT_INFO_EXT`
- VUID-VkDeviceEventInfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDeviceEventInfoEXT-deviceEvent-parameter
`deviceEvent` **must** be a valid `VkDeviceEventTypeEXT` value

Possible values of `VkDeviceEventInfoEXT::device`, specifying when a fence will be signaled, are:

```
// Provided by VK_EXT_display_control
typedef enum VkDeviceEventTypeEXT {
    VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT = 0,
} VkDeviceEventTypeEXT;
```

- `VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT` specifies that the fence is signaled when a display is plugged into or unplugged from the specified device. Applications **can** use this notification to determine when they need to re-enumerate the available displays on a device.

To create a fence that will be signaled when an event occurs on a `VkDisplayKHR` object, call:

```
// Provided by VK_EXT_display_control
VkResult vkRegisterDisplayEventEXT(
    VkDevice                device,
    VkDisplayKHR            display,
    const VkDisplayEventInfoEXT* pDisplayEventInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFence*                pFence);
```

- `device` is a logical device associated with `display`
- `display` is the display on which the event **may** occur.
- `pDisplayEventInfo` is a pointer to a `VkDisplayEventInfoEXT` structure describing the event of interest to the application.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pFence` is a pointer to a handle in which the resulting fence object is returned.

Valid Usage (Implicit)

- VUID-vkRegisterDisplayEventEXT-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkRegisterDisplayEventEXT-display-parameter
display **must** be a valid [VkDisplayKHR](#) handle
- VUID-vkRegisterDisplayEventEXT-pDisplayEventInfo-parameter
pDisplayEventInfo **must** be a valid pointer to a valid [VkDisplayEventInfoEXT](#) structure
- VUID-vkRegisterDisplayEventEXT-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkRegisterDisplayEventEXT-pFence-parameter
pFence **must** be a valid pointer to a [VkFence](#) handle
- VUID-vkRegisterDisplayEventEXT-commonparent
Both of **device**, and **display** **must** have been created, allocated, or retrieved from the same [VkPhysicalDevice](#)

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**

The **VkDisplayEventInfoEXT** structure is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkDisplayEventInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkDisplayEventTypeEXT displayEvent;
} VkDisplayEventInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **displayEvent** is a [VkDisplayEventTypeEXT](#) specifying when the fence will be signaled.

Valid Usage (Implicit)

- VUID-VkDisplayEventInfoEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT**

- VUID-VkDisplayEventInfoEXT-pNext-pNext
pNext must be **NULL**
- VUID-VkDisplayEventInfoEXT-displayEvent-parameter
displayEvent must be a valid **VkDisplayEventTypeEXT** value

Possible values of **VkDisplayEventInfoEXT::displayEvent**, specifying when a fence will be signaled, are:

```
// Provided by VK_EXT_display_control
typedef enum VkDisplayEventTypeEXT {
    VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT = 0,
} VkDisplayEventTypeEXT;
```

- **VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT** specifies that the fence is signaled when the first pixel of the next display refresh cycle leaves the display engine for the display.

7.3.2. Importing Fence Payloads

Applications **can** import a fence payload into an existing fence using an external fence handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the fence will be *restored* to its permanent state the next time that fence is passed to **vkResetFences**.

NOTE	Restoring a fence to its prior permanent payload is a distinct operation from resetting a fence payload. See vkResetFences for more detail.
-------------	--

Performing a subsequent temporary import on a fence before resetting it has no effect on this requirement; the next unsignal of the fence **must** still restore its last permanent state. A permanent payload import behaves as if the target fence was destroyed, and a new fence was created with the same handle but the imported payload. Because importing a fence payload temporarily or permanently detaches the existing payload from a fence, similar usage restrictions to those applied to **vkDestroyFence** are applied to any command that imports a fence payload. Which of these import types is used is referred to as the import operation's *permanence*. Each handle type supports either one or both types of permanence.

The implementation **must** perform the import operation by either referencing or copying the payload referred to by the specified external fence handle, depending on the handle's type. The import method used is referred to as the handle type's *transference*. When using handle types with reference transference, importing a payload to a fence adds the fence to the set of all fences sharing that payload. This set includes the fence from which the payload was exported. Fence signaling, waiting, and resetting operations performed on any fence in the set **must** behave as if the set were a single fence. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Fence signaling, waiting, and resetting operations performed on the target of copy imports **must** not affect any other fence or payload.

Export operations have the same transference as the specified handle type's import operations.

Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence's payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence's prior permanent payload will be restored.

NOTE The tables [Handle Types Supported by `VkImportFenceWin32HandleInfoKHR`](#) and [Handle Types Supported by `VkImportFenceFdInfoKHR`](#) define the permanence and transference of each handle type.

[External synchronization](#) allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for fences sharing a payload across processes, satisfying the external synchronization requirements of `VkFence` parameters as if all fences in the set were the same object is sometimes infeasible. Satisfying valid usage constraints on the state of a fence would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific fence handle, not to its payload. For distinct fence objects which share a payload:

- If multiple commands which queue a signal operation, or which unsignal a fence, are called concurrently, behavior will be as if the commands were called in an arbitrary sequential order.
- If a queue submission command is called with a fence that is sharing a payload, and the payload is already associated with another queue command that has not yet completed execution, either one or both of the commands will cause the fence to become signaled when they complete execution.
- If a fence payload is reset while it is associated with a queue command that has not yet completed execution, the payload will become unsignaled, but **may** become signaled again when the command completes execution.
- In the preceding cases, any of the devices associated with the fences sharing the payload **may** be lost, or any of the queue submission or fence reset commands **may** return `VK_ERROR_INITIALIZATION_FAILED`.

Other than these non-deterministic results, behavior is well defined. In particular:

- The implementation **must** not crash or enter an internally inconsistent state where future valid Vulkan commands might cause undefined results,
- Timeouts on future wait commands on fences sharing the payload **must** be effective.

NOTE These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared fence for more than synchronizing access to the shared memory. For example, a process should not use a fence with shared payload to tell when commands it submitted to a queue have completed and objects used by those commands may be destroyed, since the other process can accidentally or maliciously cause the fence to signal before the commands actually complete.

When a fence is using an imported payload, its `VkExportFenceCreateInfo::handleTypes` value is specified when creating the fence from which the payload was exported, rather than specified when creating the fence. Additionally, `VkExternalFenceProperties::exportFromImportedHandleTypes` restricts which handle types **can** be exported from such a fence based on the specific handle type

used to import the current payload. Passing a fence to [vkAcquireNextImageKHR](#) is equivalent to temporarily importing a fence payload to that fence.

NOTE

Because the exportable handle types of an imported fence correspond to its current imported payload, and [vkAcquireNextImageKHR](#) behaves the same as a temporary import operation for which the source fence is opaque to the application, applications have no way of determining whether any external handle types **can** be exported from a fence in this state. Therefore, applications **must** not attempt to export handles from fences using a temporarily imported payload from [vkAcquireNextImageKHR](#).

When importing a fence payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations **must** perform sufficient validation of external handles to ensure that the operation results in a valid fence which will not cause program termination, device loss, queue stalls, host thread stalls, or corruption of other resources when used as allowed according to its import parameters. If the external handle provided does not meet these requirements, the implementation **must** fail the fence payload import operation with the error code [VK_ERROR_INVALID_EXTERNAL_HANDLE](#).

To import a fence payload from a Windows handle, call:

```
// Provided by VK_KHR_external_fence_win32
VkResult vkImportFenceWin32HandleKHR(
    VkDevice device,
    const VkImportFenceWin32HandleInfoKHR* pImportFenceWin32HandleInfo);
```

- [device](#) is the logical device that created the fence.
- [pImportFenceWin32HandleInfo](#) is a pointer to a [VkImportFenceWin32HandleInfoKHR](#) structure specifying the fence and import parameters.

Importing a fence payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application **must** release ownership using the [CloseHandle](#) system call when the handle is no longer needed.

Applications **can** import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- VUID-vkImportFenceWin32HandleKHR-fence-04448
[fence](#) **must** not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportFenceWin32HandleKHR-device-parameter

device must be a valid [VkDevice](#) handle

- `VK_IMPORT_FENCE_WIN32_HANDLE_KHR` parameter **pImportFenceWin32HandleInfo** must be a valid pointer to a valid [VkImportFenceWin32HandleInfoKHR](#) structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportFenceWin32HandleInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_fence_win32
typedef struct VkImportFenceWin32HandleInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkFence             fence;
    VkFenceImportFlags  flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    HANDLE              handle;
    LPCWSTR             name;
} VkImportFenceWin32HandleInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **fence** is the fence into which the state will be imported.
- **flags** is a bitmask of [VkFenceImportFlagBits](#) specifying additional parameters for the fence payload import operation.
- **handleType** is a [VkExternalFenceHandleTypeFlagBits](#) value specifying the type of **handle**.
- **handle** is `NULL` or the external handle to import.
- **name** is `NULL` or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by **handleType** are:

Table 6. Handle Types Supported by `VkImportFenceWin32HandleInfoKHR`

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT</code>	Reference	Temporary,Permanent

Handle Type	Transference	Permanence Supported
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT	Reference	Temporary,Permanent

Valid Usage

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01457
`handleType` **must** be a value included in the [Handle Types Supported by VkImportFenceWin32HandleInfoKHR](#) table
- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01459
If `handleType` is not `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `name` **must** be `NULL`
- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01460
If `handle` is `NULL`, `name` **must** name a valid synchronization primitive of the type specified by `handleType`
- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01461
If `name` is `NULL`, `handle` **must** be a valid handle of the type specified by `handleType`
- VUID-VkImportFenceWin32HandleInfoKHR-handle-01462
If `handle` is not `NULL`, `name` **must** be `NULL`
- VUID-VkImportFenceWin32HandleInfoKHR-handle-01539
If `handle` is not `NULL`, it **must** obey any requirements listed for `handleType` in [external fence handle types compatibility](#)
- VUID-VkImportFenceWin32HandleInfoKHR-name-01540
If `name` is not `NULL`, it **must** obey any requirements listed for `handleType` in [external fence handle types compatibility](#)

Valid Usage (Implicit)

- VUID-VkImportFenceWin32HandleInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_FENCE_WIN32_HANDLE_INFO_KHR`
- VUID-VkImportFenceWin32HandleInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkImportFenceWin32HandleInfoKHR-fence-parameter
`fence` **must** be a valid [VkFence](#) handle
- VUID-VkImportFenceWin32HandleInfoKHR-flags-parameter
`flags` **must** be a valid combination of [VkFenceImportFlagBits](#) values

Host Synchronization

- Host access to `fence` **must** be externally synchronized

To import a fence payload from a POSIX file descriptor, call:

```
// Provided by VK_KHR_external_fence_fd
VkResult vkImportFenceFdKHR(
    VkDevice device,
    const VkImportFenceFdInfoKHR* pImportFenceFdInfo);
```

- **device** is the logical device that created the fence.
- **pImportFenceFdInfo** is a pointer to a [VkImportFenceFdInfoKHR](#) structure specifying the fence and import parameters.

Importing a fence payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- VUID-vkImportFenceFdKHR-fence-01463
fence must not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportFenceFdKHR-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkImportFenceFdKHR-pImportFenceFdInfo-parameter
pImportFenceFdInfo must be a valid pointer to a valid [VkImportFenceFdInfoKHR](#) structure

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_INVALID_EXTERNAL_HANDLE**

The [VkImportFenceFdInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_external_fence_fd
typedef struct VkImportFenceFdInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkFence              fence;
    VkFenceImportFlags    flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    int                  fd;
} VkImportFenceFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fence` is the fence into which the payload will be imported.
- `flags` is a bitmask of `VkFenceImportFlagBits` specifying additional parameters for the fence payload import operation.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of `fd`.
- `fd` is the external handle to import.

The handle types supported by `handleType` are:

Table 7. Handle Types Supported by `VkImportFenceFdInfoKHR`

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT</code>	Reference	Temporary,Permanent
<code>VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT</code>	Copy	Temporary

Valid Usage

- VUID-VkImportFenceFdInfoKHR-handleType-01464
`handleType` **must** be a value included in the [Handle Types Supported by VkImportFenceFdInfoKHR](#) table
- VUID-VkImportFenceFdInfoKHR-fd-01541
`fd` **must** obey any requirements listed for `handleType` in [external fence handle types compatibility](#)
- VUID-VkImportFenceFdInfoKHR-handleType-07306
If `handleType` refers to a handle type with copy payload transference semantics, `flags` **must** contain `VK_FENCE_IMPORT_TEMPORARY_BIT`

If `handleType` is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT`, the special value `-1` for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkFence` will have a temporarily imported payload as if a valid file descriptor had been provided.

NOTE

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a **-1** file descriptor when exporting a **VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT** from a **VkFence** which is signaled.

Valid Usage (Implicit)

- VUID-VkImportFenceFdInfoKHR-sType-sType
sType must be **VK_STRUCTURE_TYPE_IMPORT_FENCE_FD_INFO_KHR**
- VUID-VkImportFenceFdInfoKHR-pNext-pNext
pNext must be **NULL**
- VUID-VkImportFenceFdInfoKHR-fence-parameter
fence must be a valid **VkFence** handle
- VUID-VkImportFenceFdInfoKHR-flags-parameter
flags must be a valid combination of **VkFenceImportFlagBits** values
- VUID-VkImportFenceFdInfoKHR-handleType-parameter
handleType must be a valid **VkExternalFenceHandleTypeFlagBits** value

Host Synchronization

- Host access to **fence must** be externally synchronized

Bits which **can** be set in

- **VkImportFenceWin32HandleInfoKHR::flags**
- **VkImportFenceFdInfoKHR::flags**

specifying additional parameters of a fence import operation are:

```
// Provided by VK_VERSION_1_1
typedef enum VkFenceImportFlagBits {
    VK_FENCE_IMPORT_TEMPORARY_BIT = 0x00000001,
    // Provided by VK_KHR_external_fence
    VK_FENCE_IMPORT_TEMPORARY_BIT_KHR = VK_FENCE_IMPORT_TEMPORARY_BIT,
} VkFenceImportFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_external_fence
typedef VkFenceImportFlagBits VkFenceImportFlagBitsKHR;
```

- `VK_FENCE_IMPORT_TEMPORARY_BIT` specifies that the fence payload will be imported only temporarily, as described in [Importing Fence Payloads](#), regardless of the permanence of `handleType`.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkFenceImportFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_fence
typedef VkFenceImportFlags VkFenceImportFlagsKHR;
```

`VkFenceImportFlags` is a bitmask type for setting a mask of zero or more `VkFenceImportFlagBits`.

7.4. Semaphores

Semaphores are a synchronization primitive that **can** be used to insert a dependency between queue operations or between a queue operation and the host. [Binary semaphores](#) have two states - signaled and unsignaled. [Timeline semaphores](#) have a strictly increasing 64-bit unsigned integer payload and are signaled with respect to a particular reference value. A semaphore **can** be signaled after execution of a queue operation is completed, and a queue operation **can** wait for a semaphore to become signaled before it begins execution. A timeline semaphore **can** additionally be signaled from the host with the `vkSignalSemaphore` command and waited on from the host with the `vkWaitSemaphores` command.

The internal data of a semaphore **may** include a reference to any resources and pending work associated with signal or unsignal operations performed on that semaphore object, collectively referred to as the semaphore's *payload*. Mechanisms to import and export that internal data to and from semaphores are provided [below](#). These mechanisms indirectly enable applications to share semaphore state between two or more semaphores and other synchronization primitives across process and API boundaries.

Semaphores are represented by `VkSemaphore` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSemaphore)
```

To create a semaphore, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateSemaphore(
    VkDevice                                device,
    const VkSemaphoreCreateInfo*            pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkSemaphore*                            pSemaphore);
```

- **device** is the logical device that creates the semaphore.
- **pCreateInfo** is a pointer to a [VkSemaphoreCreateInfo](#) structure containing information about how the semaphore is to be created.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pSemaphore** is a pointer to a handle in which the resulting semaphore object is returned.

Valid Usage (Implicit)

- VUID-vkCreateSemaphore-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateSemaphore-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkSemaphoreCreateInfo](#) structure
- VUID-vkCreateSemaphore-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateSemaphore-pSemaphore-parameter
pSemaphore **must** be a valid pointer to a [VkSemaphore](#) handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The [VkSemaphoreCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSemaphoreCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphoreCreateFlags flags;
} VkSemaphoreCreateInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.

Valid Usage

- VUID-VkSemaphoreCreateInfo-pNext-06789

If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member **must** be `VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT`

Valid Usage (Implicit)

- VUID-VkSemaphoreCreateInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO`

- VUID-VkSemaphoreCreateInfo-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkExportMetalObjectCreateInfoEXT`, `VkExportSemaphoreCreateInfo`, `VkExportSemaphoreWin32HandleInfoKHR`, `VkImportMetalSharedEventInfoEXT`, `VkQueryLowLatencySupportNV`, or `VkSemaphoreTypeCreateInfo`

- VUID-VkSemaphoreCreateInfo-sType-unique

The `sType` value of each struct in the `pNext` chain **must** be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`

- VUID-VkSemaphoreCreateInfo-flags-zeroBitmask

`flags` **must** be 0

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSemaphoreCreateFlags;
```

`VkSemaphoreCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkSemaphoreTypeCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreTypeCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphoreType    semaphoreType;
    uint64_t           initialValue;
} VkSemaphoreTypeCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreTypeCreateInfo VkSemaphoreTypeCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphoreType` is a `VkSemaphoreType` value specifying the type of the semaphore.
- `initialValue` is the initial payload value if `semaphoreType` is `VK_SEMAPHORE_TYPE_TIMELINE`.

To create a semaphore of a specific type, add a `VkSemaphoreTypeCreateInfo` structure to the `VkSemaphoreCreateInfo::pNext` chain.

If no `VkSemaphoreTypeCreateInfo` structure is included in the `pNext` chain of `VkSemaphoreCreateInfo`, then the created semaphore will have a default `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.

Valid Usage

- VUID-VkSemaphoreTypeCreateInfo-timelineSemaphore-03252
If the `timelineSemaphore` feature is not enabled, `semaphoreType` **must** not equal `VK_SEMAPHORE_TYPE_TIMELINE`
- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-03279
If `semaphoreType` is `VK_SEMAPHORE_TYPE_BINARY`, `initialValue` **must** be zero

Valid Usage (Implicit)

- VUID-VkSemaphoreTypeCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO`
- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-parameter
`semaphoreType` **must** be a valid `VkSemaphoreType` value

Possible values of `VkSemaphoreTypeCreateInfo::semaphoreType`, specifying the type of a semaphore, are:

```
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreType {
    VK_SEMAPHORE_TYPE_BINARY = 0,
    VK_SEMAPHORE_TYPE_TIMELINE = 1,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_TYPE_BINARY_KHR = VK_SEMAPHORE_TYPE_BINARY,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_TYPE_TIMELINE_KHR = VK_SEMAPHORE_TYPE_TIMELINE,
} VkSemaphoreType;
```

or the equivalent

```
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreType VkSemaphoreTypeKHR;
```

- `VK_SEMAPHORE_TYPE_BINARY` specifies a *binary semaphore* type that has a boolean payload indicating whether the semaphore is currently signaled or unsignaled. When created, the semaphore is in the unsignaled state.
- `VK_SEMAPHORE_TYPE_TIMELINE` specifies a *timeline semaphore* type that has a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. When created, the semaphore payload has the value given by the `initialValue` field of `VkSemaphoreCreateInfo`.

To create a semaphore whose payload **can** be exported to external handles, add a `VkExportSemaphoreCreateInfo` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExportSemaphoreCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkExternalSemaphoreHandleTypeFlags handleTypes;
} VkExportSemaphoreCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore
typedef VkExportSemaphoreCreateInfo VkExportSemaphoreCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying one or more semaphore handle types the application **can** export from the resulting semaphore. The application **can** request multiple handle types for the same semaphore.

Valid Usage

- VUID-VkExportSemaphoreCreateInfo-handleTypes-01124
The bits in `handleTypes` **must** be supported and compatible, as reported by `VkExternalSemaphoreProperties`

Valid Usage (Implicit)

- VUID-VkExportSemaphoreCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO`
- VUID-VkExportSemaphoreCreateInfo-handleTypes-parameter
`handleTypes` **must** be a valid combination of `VkExternalSemaphoreHandleTypeFlagBits` values

To specify additional attributes of NT handles exported from a semaphore, add a `VkExportSemaphoreWin32HandleInfoKHR` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreWin32HandleInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkExportSemaphoreWin32HandleInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD                dwAccess;
    LPCWSTR              name;
} VkExportSemaphoreWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- `dwAccess` is a `DWORD` specifying access rights of the handle.
- `name` is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created semaphore.

If `VkExportSemaphoreCreateInfo` is not included in the same `pNext` chain, this structure is ignored.

If `VkExportSemaphoreCreateInfo` is included in the `pNext` chain of `VkSemaphoreCreateInfo` with a Windows `handleType`, but either `VkExportSemaphoreWin32HandleInfoKHR` is not included in the `pNext` chain, or it is included but `pAttributes` is `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”¹. Further, if the structure is not present, the access rights used depend on the handle type.

For handles of the following types:

`VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT`

The implementation **must** ensure the access rights allow both signal and wait operations on the semaphore.

For handles of the following types:

`VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`

The access rights **must** be:

`GENERIC_ALL`

1

<https://docs.microsoft.com/en-us/windows/win32/sync/synchronization-object-security-and-access-rights>

Valid Usage

- VUID-VkExportSemaphoreWin32HandleInfoKHR-handleTypes-01125
If `VkExportSemaphoreCreateInfo::handleTypes` does not include `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`, `VkExportSemaphoreWin32HandleInfoKHR` **must** not be included in the `pNext` chain of `VkSemaphoreCreateInfo`

Valid Usage (Implicit)

- VUID-VkExportSemaphoreWin32HandleInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR`
- VUID-VkExportSemaphoreWin32HandleInfoKHR-pAttributes-parameter
If `pAttributes` is not `NULL`, `pAttributes` **must** be a valid pointer to a valid `SECURITY_ATTRIBUTES` value

To export a Windows handle representing the payload of a semaphore, call:

```
// Provided by VK_KHR_external_semaphore_win32
VkResult vkGetSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkSemaphoreGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetWin32HandleInfo` is a pointer to a `VkSemaphoreGetWin32HandleInfoKHR` structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the semaphore state.

For handle types defined as NT handles, the handles returned by `vkGetSemaphoreWin32HandleKHR` are owned by the application. To avoid leaking resources, the application **must** release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a semaphore **may** have side effects depending on the transference of the specified handle type, as described in [Importing Semaphore Payloads](#).

Valid Usage (Implicit)

- VUID-vkGetSemaphoreWin32HandleKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetSemaphoreWin32HandleKHR-pGetWin32HandleInfo-parameter
`pGetWin32HandleInfo` **must** be a valid pointer to a valid `VkSemaphoreGetWin32HandleInfoKHR` structure

- VUID-vkGetSemaphoreWin32HandleKHR-pHandle-parameter
pHandle **must** be a valid pointer to a **HANDLE** value

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_TOO_MANY_OBJECTS**
- **VK_ERROR_OUT_OF_HOST_MEMORY**

The **VkSemaphoreGetWin32HandleInfoKHR** structure is defined as:

```
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkSemaphoreGetWin32HandleInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkSemaphore              semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetWin32HandleInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **semaphore** is the semaphore from which state will be exported.
- **handleType** is a **VkExternalSemaphoreHandleTypeFlagBits** value specifying the type of handle requested.

The properties of the handle returned depend on the value of **handleType**. See **VkExternalSemaphoreHandleTypeFlagBits** for a description of the properties of the defined external semaphore handle types.

Valid Usage

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01126
handleType **must** have been included in **VkExportSemaphoreCreateInfo::handleTypes** when the **semaphore**'s current payload was created
- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01127
If **handleType** is defined as an NT handle, **vkGetSemaphoreWin32HandleKHR** **must** be called no more than once for each valid unique combination of **semaphore** and **handleType**
- VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-01128
semaphore **must** not currently have its payload replaced by an imported payload as described below in **Importing Semaphore Payloads** unless that imported payload's handle

type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01129
If `handleType` refers to a handle type with copy payload transference semantics, as defined below in [Importing Semaphore Payloads](#), there **must** be no queue waiting on `semaphore`
- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01130
If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` **must** be signaled, or have an associated [semaphore signal operation](#) pending execution
- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01131
`handleType` **must** be defined as an NT handle or a global share handle

Valid Usage (Implicit)

- VUID-VkSemaphoreGetWin32HandleInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_WIN32_HANDLE_INFO_KHR`
- VUID-VkSemaphoreGetWin32HandleInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-parameter
`semaphore` **must** be a valid [VkSemaphore](#) handle
- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-parameter
`handleType` **must** be a valid [VkExternalSemaphoreHandleTypeFlagBits](#) value

The `VkQueryLowLatencySupportNV` structure is defined as:

```
// Provided by VK_NV_low_latency
typedef struct VkQueryLowLatencySupportNV {
    VkStructureType    sType;
    const void*        pNext;
    void*              pQueriedLowLatencyData;
} VkQueryLowLatencySupportNV;
```

This structure describes the following feature:

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pQueriedLowLatencyData` is used for NVIDIA Reflex Support.

Valid Usage (Implicit)

- VUID-VkQueryLowLatencySupportNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_QUERY_LOW_LATENCY_SUPPORT_NV`
- VUID-VkQueryLowLatencySupportNV-pQueriedLowLatencyData-parameter

`pQueriedLowLatencyData` **must** be a pointer value

To export a POSIX file descriptor representing the payload of a semaphore, call:

```
// Provided by VK_KHR_external_semaphore_fd
VkResult vkGetSemaphoreFdKHR(
    VkDevice device,
    const VkSemaphoreGetFdInfoKHR* pGetFdInfo,
    int* pFd);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetFdInfo` is a pointer to a [VkSemaphoreGetFdInfoKHR](#) structure containing parameters of the export operation.
- `pFd` will return the file descriptor representing the semaphore payload.

Each call to `vkGetSemaphoreFdKHR` **must** create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor when it is no longer needed.

NOTE

Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a semaphore **may** have side effects depending on the transference of the specified handle type, as described in [Importing Semaphore State](#).

Valid Usage (Implicit)

- VUID-vkGetSemaphoreFdKHR-device-parameter
`device` **must** be a valid [VkDevice](#) handle
- VUID-vkGetSemaphoreFdKHR-pGetFdInfo-parameter
`pGetFdInfo` **must** be a valid pointer to a valid [VkSemaphoreGetFdInfoKHR](#) structure
- VUID-vkGetSemaphoreFdKHR-pFd-parameter
`pFd` **must** be a valid pointer to an `int` value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkSemaphoreGetFdInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkSemaphoreGetFdInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkSemaphore               semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

Valid Usage

- VUID-VkSemaphoreGetFdInfoKHR-handleType-01132
`handleType` **must** have been included in `VkExportSemaphoreCreateInfo::handleTypes` when `semaphore`'s current payload was created
- VUID-VkSemaphoreGetFdInfoKHR-semaphore-01133
`semaphore` **must** not currently have its payload replaced by an imported payload as described below in [Importing Semaphore Payloads](#) unless that imported payload's handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`
- VUID-VkSemaphoreGetFdInfoKHR-handleType-01134
If `handleType` refers to a handle type with copy payload transference semantics, as defined below in [Importing Semaphore Payloads](#), there **must** be no queue waiting on `semaphore`
- VUID-VkSemaphoreGetFdInfoKHR-handleType-01135
If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` **must** be signaled, or have an associated [semaphore signal operation](#) pending execution
- VUID-VkSemaphoreGetFdInfoKHR-handleType-01136
`handleType` **must** be defined as a POSIX file descriptor handle
- VUID-VkSemaphoreGetFdInfoKHR-handleType-03253

If **handleType** refers to a handle type with copy payload transference semantics, **semaphore** **must** have been created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_BINARY**

- VUID-VkSemaphoreGetFdInfoKHR-handleType-03254

If **handleType** refers to a handle type with copy payload transference semantics, **semaphore** **must** have an associated semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends **must** have also been submitted for execution

Valid Usage (Implicit)

- VUID-VkSemaphoreGetFdInfoKHR-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR**
- VUID-VkSemaphoreGetFdInfoKHR-pNext-pNext
pNext **must** be **NULL**
- VUID-VkSemaphoreGetFdInfoKHR-semaphore-parameter
semaphore **must** be a valid **VkSemaphore** handle
- VUID-VkSemaphoreGetFdInfoKHR-handleType-parameter
handleType **must** be a valid **VkExternalSemaphoreHandleTypeFlagBits** value

To export a Zircon event handle representing the payload of a semaphore, call:

```
// Provided by VK_FUCHSIA_external_semaphore
VkResult vkGetSemaphoreZirconHandleFUCHSIA(
    VkDevice device,
    const VkSemaphoreGetZirconHandleInfoFUCHSIA* pGetZirconHandleInfo,
    zx_handle_t* pZirconHandle);
```

- **device** is the logical device that created the semaphore being exported.
- **pGetZirconHandleInfo** is a pointer to a **VkSemaphoreGetZirconHandleInfoFUCHSIA** structure containing parameters of the export operation.
- **pZirconHandle** will return the Zircon event handle representing the semaphore payload.

Each call to **vkGetSemaphoreZirconHandleFUCHSIA** **must** create a Zircon event handle and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the Zircon event handle when it is no longer needed.

NOTE

Ownership can be released in many ways. For example, the application can call `zx_handle_close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Exporting a Zircon event handle from a semaphore **may** have side effects depending on the transference of the specified handle type, as described in [Importing Semaphore State](#).

Valid Usage (Implicit)

- VUID-vkGetSemaphoreZirconHandleFUCHSIA-device-parameter **device** must be a valid [VkDevice](#) handle
- VUID-vkGetSemaphoreZirconHandleFUCHSIA-pGetZirconHandleInfo-parameter **pGetZirconHandleInfo** must be a valid pointer to a valid [VkSemaphoreGetZirconHandleInfoFUCHSIA](#) structure
- VUID-vkGetSemaphoreZirconHandleFUCHSIA-pZirconHandle-parameter **pZirconHandle** must be a valid pointer to a `zx_handle_t` value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkSemaphoreGetZirconHandleInfoFUCHSIA` structure is defined as:

```
// Provided by VK_FUCHSIA_external_semaphore
typedef struct VkSemaphoreGetZirconHandleInfoFUCHSIA {
    VkStructureType           sType;
    const void*               pNext;
    VkSemaphore               semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetZirconHandleInfoFUCHSIA;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **semaphore** is the semaphore from which state will be exported.
- **handleType** is a [VkExternalSemaphoreHandleTypeFlagBits](#) value specifying the type of handle requested.

The properties of the Zircon event handle returned depend on the value of **handleType**. See [VkExternalSemaphoreHandleTypeFlagBits](#) for a description of the properties of the defined external semaphore handle types.

Valid Usage

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04758 **handleType** must have been included in [VkExportSemaphoreCreateInfo::handleTypes](#) when

`semaphore`'s current payload was created

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-04759
`semaphore` **must** not currently have its payload replaced by an imported payload as described below in [Importing Semaphore Payloads](#) unless that imported payload's handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04760
If `handleType` refers to a handle type with copy payload transference semantics, as defined below in [Importing Semaphore Payloads](#), there **must** be no queue waiting on `semaphore`
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04761
If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` **must** be signaled, or have an associated [semaphore signal operation](#) pending execution
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04762
`handleType` **must** be defined as a Zircon event handle
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-04763
`semaphore` **must** have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`

Valid Usage (Implicit)

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_ZIRCON_HANDLE_INFO_FUCHSIA`
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-parameter
`semaphore` **must** be a valid `VkSemaphore` handle
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-parameter
`handleType` **must** be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

To destroy a semaphore, call:

```
// Provided by VK_VERSION_1_0
void vkDestroySemaphore(
    VkDevice          device,
    VkSemaphore       semaphore,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the semaphore.
- `semaphore` is the handle of the semaphore to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroySemaphore-semaphore-05149
All submitted batches that refer to **semaphore** **must** have completed execution
- VUID-vkDestroySemaphore-semaphore-01138
If **VkAllocationCallbacks** were provided when **semaphore** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroySemaphore-semaphore-01139
If no **VkAllocationCallbacks** were provided when **semaphore** was created, **pAllocator** **must** be **NULL**

Valid Usage (Implicit)

- VUID-vkDestroySemaphore-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkDestroySemaphore-semaphore-parameter
If **semaphore** is not **VK_NULL_HANDLE**, **semaphore** **must** be a valid **VkSemaphore** handle
- VUID-vkDestroySemaphore-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid **VkAllocationCallbacks** structure
- VUID-vkDestroySemaphore-semaphore-parent
If **semaphore** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **semaphore** **must** be externally synchronized

7.4.1. Semaphore Signaling

When a batch is submitted to a queue via a **queue submission**, and it includes semaphores to be signaled, it defines a memory dependency on the batch, and defines *semaphore signal operations* which set the semaphores to the signaled state.

In case of semaphores created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE** the semaphore is considered signaled with respect to the counter value set to be signaled as specified in **VkTimelineSemaphoreSubmitInfo** or **VkSemaphoreSignalInfo**.

The first **synchronization scope** includes every command submitted in the same batch. In the case of **vkQueueSubmit2**, the first synchronization scope is limited to the pipeline stage specified by **VkSemaphoreSubmitInfo::stageMask**. Semaphore signal operations that are defined by **vkQueueSubmit** or **vkQueueSubmit2** additionally include all commands that occur earlier in **submission order**. Semaphore signal operations that are defined by **vkQueueSubmit** or

`vkQueueSubmit2` or `vkQueueBindSparse` additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in [signal operation order](#).

The second [synchronization scope](#) includes only the semaphore signal operation.

The first [access scope](#) includes all memory access performed by the device.

The second [access scope](#) is empty.

7.4.2. Semaphore Waiting

When a batch is submitted to a queue via a [queue submission](#), and it includes semaphores to be waited on, it defines a memory dependency between prior semaphore signal operations and the batch, and defines *semaphore wait operations*.

Such semaphore wait operations set the semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` to the unsignaled state. In case of semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` a prior semaphore signal operation defines a memory dependency with a semaphore wait operation if the value the semaphore is signaled with is greater than or equal to the value the semaphore is waited with, thus the semaphore will continue to be considered signaled with respect to the counter value waited on as specified in [VkTimelineSemaphoreSubmitInfo](#).

The first [synchronization scope](#) includes one [semaphore signal operation](#) for each semaphore waited on by this batch. The specific signal operation waited on for each semaphore **must** meet the following criteria:

- for binary semaphores, the signal operation is either earlier in [submission order](#) on the same queue, or is submitted by a command whose host operation happens-before this batch is submitted on the host
- for binary semaphores, no wait operation exists that happens-after the signal operation and happens-before this wait operation
- the signal operation is not guaranteed to happen-after the semaphore wait operation in this batch
- for timeline semaphores, the signal value is greater than or equal to the wait value

If multiple semaphore signal operations meet these criteria, any of those operations **may** be included in the first [synchronization scope](#). When waiting on a binary semaphore, applications **must** ensure that exactly one semaphore signal operation meets these criteria.

The second [synchronization scope](#) includes every command submitted in the same batch. In the case of `vkQueueSubmit`, the second synchronization scope is limited to operations on the pipeline stages determined by the [destination stage mask](#) specified by the corresponding element of `pWaitDstStageMask`. In the case of `vkQueueSubmit2`, the second synchronization scope is limited to the pipeline stage specified by `VkSemaphoreSubmitInfo::stageMask`. Also, in the case of either `vkQueueSubmit2` or `vkQueueSubmit`, the second synchronization scope additionally includes all commands that occur later in [submission order](#).

The first [access scope](#) is empty.

The second [access scope](#) includes all memory access performed by the device.

The semaphore wait operation happens-after the first set of operations in the execution dependency, and happens-before the second set of operations in the execution dependency.

NOTE

Unlike timeline semaphores, fences or events, waiting for a binary semaphore also unsignals that semaphore when the wait completes. Applications **must** ensure that between two such wait operations, the semaphore is signaled again, with execution dependencies used to ensure these occur in order. Binary semaphore waits and signals should thus occur in discrete 1:1 pairs.

A common scenario for using `pWaitDstStageMask` with values other than `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` is when synchronizing a window system presentation operation against subsequent command buffers which render the next frame. In this case, a presentation image **must** not be overwritten until the presentation operation completes, but other pipeline stages **can** execute without waiting. A mask of `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` prevents subsequent color attachment writes from executing until the semaphore signals. Some implementations **may** be able to execute transfer operations and/or pre-rasterization work before the semaphore is signaled.

If an image layout transition needs to be performed on a presentable image before it is used in a framebuffer, that **can** be performed as the first operation submitted to the queue after acquiring the image, and **should** not prevent other work from overlapping with the presentation operation. For example, a `VkImageMemoryBarrier` could use:

NOTE

- `srcStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `srcAccessMask = 0`
- `dstStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `dstAccessMask = VK_ACCESS_COLOR_ATTACHMENT_READ_BIT | VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT.`
- `oldLayout = VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- `newLayout = VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

Alternatively, `oldLayout` **can** be `VK_IMAGE_LAYOUT_UNDEFINED`, if the image's contents need not be preserved.

This barrier accomplishes a dependency chain between previous presentation operations and subsequent color attachment output operations, with the layout transition performed in between, and does not introduce a dependency between previous work and any [pre-rasterization shader stages](#). More precisely, the semaphore signals after the presentation operation completes, the semaphore wait stalls the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage, and there is a dependency from that same stage to itself with the layout transition performed in between.

7.4.3. Semaphore State Requirements for Wait Operations

Before waiting on a semaphore, the application **must** ensure the semaphore is in a valid state for a wait operation. Specifically, when a [semaphore wait operation](#) is submitted to a queue:

- A binary semaphore **must** be signaled, or have an associated [semaphore signal operation](#) that is pending execution.
- Any [semaphore signal operations](#) on which the pending binary semaphore signal operation depends **must** also be completed or pending execution.
- There **must** be no other queue waiting on the same binary semaphore when the operation executes.

7.4.4. Host Operations on Semaphores

In addition to [semaphore signal operations](#) and [semaphore wait operations](#) submitted to device queues, timeline semaphores support the following host operations:

- Query the current counter value of the semaphore using the [vkGetSemaphoreCounterValue](#) command.
- Wait for a set of semaphores to reach particular counter values using the [vkWaitSemaphores](#) command.
- Signal the semaphore with a particular counter value from the host using the [vkSignalSemaphore](#) command.

To query the current counter value of a semaphore created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_TIMELINE](#) from the host, call:

```
// Provided by VK_VERSION_1_2
VkResult vkGetSemaphoreCounterValue(
    VkDevice      device,
    VkSemaphore   semaphore,
    uint64_t*     pValue);
```

or the equivalent command

```
// Provided by VK_KHR_timeline_semaphore
VkResult vkGetSemaphoreCounterValueKHR(
    VkDevice      device,
    VkSemaphore   semaphore,
    uint64_t*     pValue);
```

- [device](#) is the logical device that owns the semaphore.
- [semaphore](#) is the handle of the semaphore to query.
- [pValue](#) is a pointer to a 64-bit integer value in which the current counter value of the semaphore is returned.

NOTE

If a [queue submission](#) command is pending execution, then the value returned by this command **may** immediately be out of date.

Valid Usage

- VUID-vkGetSemaphoreCounterValue-semaphore-03255
semaphore must have been created with a [VkSemaphoreType](#) of `VK_SEMAPHORE_TYPE_TIMELINE`

Valid Usage (Implicit)

- VUID-vkGetSemaphoreCounterValue-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkGetSemaphoreCounterValue-semaphore-parameter
semaphore must be a valid [VkSemaphore](#) handle
- VUID-vkGetSemaphoreCounterValue-pValue-parameter
pValue must be a valid pointer to a `uint64_t` value
- VUID-vkGetSemaphoreCounterValue-semaphore-parent
semaphore must have been created, allocated, or retrieved from **device**

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To wait for a set of semaphores created with a [VkSemaphoreType](#) of `VK_SEMAPHORE_TYPE_TIMELINE` to reach particular counter values on the host, call:

```
// Provided by VK_VERSION_1_2
VkResult vkWaitSemaphores(
    VkDevice                                device,
    const VkSemaphoreWaitInfo*              pWaitInfo,
    uint64_t                                timeout);
```

or the equivalent command

```
// Provided by VK_KHR_timeline_semaphore
VkResult vkWaitSemaphoresKHR(
    VkDevice                                device,
    const VkSemaphoreWaitInfo*              pWaitInfo,
    uint64_t                                timeout);
```

- **device** is the logical device that owns the semaphores.
- **pWaitInfo** is a pointer to a [VkSemaphoreWaitInfo](#) structure containing information about the wait condition.
- **timeout** is the timeout period in units of nanoseconds. **timeout** is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

If the condition is satisfied when **vkWaitSemaphores** is called, then **vkWaitSemaphores** returns immediately. If the condition is not satisfied at the time **vkWaitSemaphores** is called, then **vkWaitSemaphores** will block and wait until the condition is satisfied or the **timeout** has expired, whichever is sooner.

If **timeout** is zero, then **vkWaitSemaphores** does not wait, but simply returns information about the current state of the semaphores. **VK_TIMEOUT** will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the **timeout** has expired, **vkWaitSemaphores** returns **VK_SUCCESS**. Otherwise, **vkWaitSemaphores** returns **VK_TIMEOUT** after the **timeout** has expired.

If device loss occurs (see [Lost Device](#)) before the timeout has expired, **vkWaitSemaphores** **must** return in finite time with either **VK_SUCCESS** or **VK_ERROR_DEVICE_LOST**.

Valid Usage (Implicit)

- VUID-vkWaitSemaphores-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkWaitSemaphores-pWaitInfo-parameter **pWaitInfo** **must** be a valid pointer to a valid [VkSemaphoreWaitInfo](#) structure

Return Codes

Success

- **VK_SUCCESS**
- **VK_TIMEOUT**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

- `VK_ERROR_DEVICE_LOST`

The `VkSemaphoreWaitInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreWaitInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkSemaphoreWaitFlags flags;
    uint32_t             semaphoreCount;
    const VkSemaphore*   pSemaphores;
    const uint64_t*      pValues;
} VkSemaphoreWaitInfo;
```

or the equivalent

```
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitInfo VkSemaphoreWaitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSemaphoreWaitFlagBits` specifying additional parameters for the semaphore wait operation.
- `semaphoreCount` is the number of semaphores to wait on.
- `pSemaphores` is a pointer to an array of `semaphoreCount` semaphore handles to wait on.
- `pValues` is a pointer to an array of `semaphoreCount` timeline semaphore values.

Valid Usage

- VUID-VkSemaphoreWaitInfo-pSemaphores-03256
All of the elements of `pSemaphores` **must** reference a semaphore that was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`

Valid Usage (Implicit)

- VUID-VkSemaphoreWaitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO`
- VUID-VkSemaphoreWaitInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkSemaphoreWaitInfo-flags-parameter
`flags` **must** be a valid combination of `VkSemaphoreWaitFlagBits` values

- VUID-VkSemaphoreWaitInfo-pSemaphores-parameter
`pSemaphores` **must** be a valid pointer to an array of `semaphoreCount` valid `VkSemaphore` handles
- VUID-VkSemaphoreWaitInfo-pValues-parameter
`pValues` **must** be a valid pointer to an array of `semaphoreCount` `uint64_t` values
- VUID-VkSemaphoreWaitInfo-semaphoreCount-arraylength
`semaphoreCount` **must** be greater than 0

Bits which **can** be set in `VkSemaphoreWaitInfo::flags`, specifying additional parameters of a semaphore wait operation, are:

```
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreWaitFlagBits {
    VK_SEMAPHORE_WAIT_ANY_BIT = 0x00000001,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_WAIT_ANY_BIT_KHR = VK_SEMAPHORE_WAIT_ANY_BIT,
} VkSemaphoreWaitFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitFlagBits VkSemaphoreWaitFlagBitsKHR;
```

- `VK_SEMAPHORE_WAIT_ANY_BIT` specifies that the semaphore wait condition is that at least one of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` has reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`. If `VK_SEMAPHORE_WAIT_ANY_BIT` is not set, the semaphore wait condition is that all of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` have reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`.

```
// Provided by VK_VERSION_1_2
typedef VkFlags VkSemaphoreWaitFlags;
```

or the equivalent

```
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitFlags VkSemaphoreWaitFlagsKHR;
```

`VkSemaphoreWaitFlags` is a bitmask type for setting a mask of zero or more `VkSemaphoreWaitFlagBits`.

To signal a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` with a particular counter value, on the host, call:

```
// Provided by VK_VERSION_1_2
VkResult vkSignalSemaphore(
    VkDevice                                device,
    const VkSemaphoreSignalInfo*            pSignalInfo);
```

or the equivalent command

```
// Provided by VK_KHR_timeline_semaphore
VkResult vkSignalSemaphoreKHR(
    VkDevice                                device,
    const VkSemaphoreSignalInfo*            pSignalInfo);
```

- **device** is the logical device that owns the semaphore.
- **pSignalInfo** is a pointer to a [VkSemaphoreSignalInfo](#) structure containing information about the signal operation.

When **vkSignalSemaphore** is executed on the host, it defines and immediately executes a *semaphore signal operation* which sets the timeline semaphore to the given value.

The first synchronization scope is defined by the host execution model, but includes execution of **vkSignalSemaphore** on the host and anything that happened-before it.

The second synchronization scope is empty.

Valid Usage (Implicit)

- VUID-vkSignalSemaphore-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkSignalSemaphore-pSignalInfo-parameter
pSignalInfo **must** be a valid pointer to a valid [VkSemaphoreSignalInfo](#) structure

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The **VkSemaphoreSignalInfo** structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreSignalInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphore        semaphore;
    uint64_t           value;
} VkSemaphoreSignalInfo;
```

or the equivalent

```
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreSignalInfo VkSemaphoreSignalInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **semaphore** is the handle of the semaphore to signal.
- **value** is the value to signal.

Valid Usage

- VUID-VkSemaphoreSignalInfo-semaphore-03257
semaphore must have been created with a [VkSemaphoreType](#) of **VK_SEMAPHORE_TYPE_TIMELINE**
- VUID-VkSemaphoreSignalInfo-value-03258
value must have a value greater than the current value of the semaphore
- VUID-VkSemaphoreSignalInfo-value-03259
value must be less than the value of any pending semaphore signal operations
- VUID-VkSemaphoreSignalInfo-value-03260
value must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on **semaphore** by more than **maxTimelineSemaphoreValueDifference**

Valid Usage (Implicit)

- VUID-VkSemaphoreSignalInfo-sType-sType
sType must be **VK_STRUCTURE_TYPE_SEMAPHORE_SIGNAL_INFO**
- VUID-VkSemaphoreSignalInfo-pNext-pNext
pNext must be **NULL**
- VUID-VkSemaphoreSignalInfo-semaphore-parameter
semaphore must be a valid [VkSemaphore](#) handle

7.4.5. Importing Semaphore Payloads

Applications **can** import a semaphore payload into an existing semaphore using an external semaphore handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the implementation **must** restore the semaphore to its prior permanent state after submitting the next semaphore wait operation. Performing a subsequent temporary import on a semaphore before performing a semaphore wait has no effect on this requirement; the next wait submitted on the semaphore **must** still restore its last permanent state. A permanent payload import behaves as if the target semaphore was destroyed, and a new semaphore was created with the same handle but the imported payload. Because importing a semaphore payload temporarily or permanently detaches the existing payload from a semaphore, similar usage restrictions to those applied to `vkDestroySemaphore` are applied to any command that imports a semaphore payload. Which of these import types is used is referred to as the import operation's *permanence*. Each handle type supports either one or both types of permanence.

The implementation **must** perform the import operation by either referencing or copying the payload referred to by the specified external semaphore handle, depending on the handle's type. The import method used is referred to as the handle type's *transference*. When using handle types with reference transference, importing a payload to a semaphore adds the semaphore to the set of all semaphores sharing that payload. This set includes the semaphore from which the payload was exported. Semaphore signaling and waiting operations performed on any semaphore in the set **must** behave as if the set were a single semaphore. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Semaphore signaling and waiting operations performed on the target of copy imports **must** not affect any other semaphore or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a semaphore payload to a handle with copy transference has the same side effects on the source semaphore's payload as executing a semaphore wait operation. If the semaphore was using a temporarily imported payload, the semaphore's prior permanent payload will be restored.

NOTE

The permanence and transference of handle types can be found in:

- [Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`](#)
- [Handle Types Supported by `VkImportSemaphoreFdInfoKHR`](#)
- [Handle Types Supported by `VkImportSemaphoreZirconHandleInfoFUCHSIA`](#)

[External synchronization](#) allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for semaphores sharing a payload across processes, satisfying the external synchronization requirements of `VkSemaphore` parameters as if all semaphores in the set were the same object is sometimes infeasible. Satisfying the [wait operation state requirements](#) would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific semaphore handle, not to its payload. For distinct semaphore objects which share a payload, if the semaphores are passed to separate queue submission commands concurrently, behavior will be as if the commands were called in an arbitrary sequential order. If the [wait operation state requirements](#) are violated for the

shared payload by a queue submission command, or if a signal operation is queued for a shared payload that is already signaled or has a pending signal operation, effects **must** be limited to one or more of the following:

- Returning `VK_ERROR_INITIALIZATION_FAILED` from the command which resulted in the violation.
- Losing the logical device on which the violation occurred immediately or at a future time, resulting in a `VK_ERROR_DEVICE_LOST` error from subsequent commands, including the one causing the violation.
- Continuing execution of the violating command or operation as if the semaphore wait completed successfully after an implementation-dependent timeout. In this case, the state of the payload becomes undefined, and future operations on semaphores sharing the payload will be subject to these same rules. The semaphore **must** be destroyed or have its payload replaced by an import operation to again have a well-defined state.

NOTE

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared semaphore for more than synchronizing access to the shared memory. For example, a process should not use a shared semaphore as part of an execution dependency chain that, when complete, leads to objects being destroyed, if it does not trust other processes sharing the semaphore payload.

When a semaphore is using an imported payload, its `VkExportSemaphoreCreateInfo::handleTypes` value is specified when creating the semaphore from which the payload was exported, rather than specified when creating the semaphore. Additionally, `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` restricts which handle types **can** be exported from such a semaphore based on the specific handle type used to import the current payload. Passing a semaphore to `vkAcquireNextImageKHR` is equivalent to temporarily importing a semaphore payload to that semaphore.

NOTE

Because the exportable handle types of an imported semaphore correspond to its current imported payload, and `vkAcquireNextImageKHR` behaves the same as a temporary import operation for which the source semaphore is opaque to the application, applications have no way of determining whether any external handle types **can** be exported from a semaphore in this state. Therefore, applications **must** not attempt to export external handles from semaphores using a temporarily imported payload from `vkAcquireNextImageKHR`.

When importing a semaphore payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations **must** perform sufficient validation of external handles to ensure that the operation results in a valid semaphore which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its import parameters, and excepting those side effects allowed for violations of the [valid semaphore state for wait operations](#) rules. If the external handle provided does not meet these requirements, the implementation **must** fail the semaphore payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

In addition, when importing a semaphore payload that is not compatible with the payload type

corresponding to the [VkSemaphoreType](#) the semaphore was created with, the implementation **may** fail the semaphore payload import operation with the error code [VK_ERROR_INVALID_EXTERNAL_HANDLE](#).

NOTE

As the introduction of the external semaphore handle type [VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT](#) predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_BINARY](#) is preserved for backwards compatibility. However, applications **should** prefer importing such handle types into semaphores created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_TIMELINE](#).

To import a semaphore payload from a Windows handle, call:

```
// Provided by VK_KHR_external_semaphore_win32
VkResult vkImportSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkImportSemaphoreWin32HandleInfoKHR* pImportSemaphoreWin32HandleInfo);
```

- [device](#) is the logical device that created the semaphore.
- [pImportSemaphoreWin32HandleInfo](#) is a pointer to a [VkImportSemaphoreWin32HandleInfoKHR](#) structure specifying the semaphore and import parameters.

Importing a semaphore payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application **must** release ownership using the [CloseHandle](#) system call when the handle is no longer needed.

Applications **can** import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage (Implicit)

- VUID-vkImportSemaphoreWin32HandleKHR-device-parameter [device](#) **must** be a valid [VkDevice](#) handle
- VUID-vkImportSemaphoreWin32HandleKHR-pImportSemaphoreWin32HandleInfo-parameter [pImportSemaphoreWin32HandleInfo](#) **must** be a valid pointer to a valid [VkImportSemaphoreWin32HandleInfoKHR](#) structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportSemaphoreWin32HandleInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkImportSemaphoreWin32HandleInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkSemaphore              semaphore;
    VkSemaphoreImportFlags    flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    HANDLE                   handle;
    LPCWSTR                  name;
} VkImportSemaphoreWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore into which the payload will be imported.
- `flags` is a bitmask of `VkSemaphoreImportFlagBits` specifying additional parameters for the semaphore payload import operation.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of `handle`.
- `handle` is `NULL` or the external handle to import.
- `name` is `NULL` or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by `handleType` are:

Table 8. Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT</code>	Reference	Temporary,Permanent
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT</code>	Reference	Temporary,Permanent
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT</code>	Reference	Temporary,Permanent

Valid Usage

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01140
`handleType` **must** be a value included in the [Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`](#) table

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01466
If `handleType` is not `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`, `name` **must** be `NULL`
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01467
If `handle` is `NULL`, `name` **must** name a valid synchronization primitive of the type specified by `handleType`
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01468
If `name` is `NULL`, `handle` **must** be a valid handle of the type specified by `handleType`
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handle-01469
If `handle` is not `NULL`, `name` **must** be `NULL`
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handle-01542
If `handle` is not `NULL`, it **must** obey any requirements listed for `handleType` in [external semaphore handle types compatibility](#)
- VUID-VkImportSemaphoreWin32HandleInfoKHR-name-01543
If `name` is not `NULL`, it **must** obey any requirements listed for `handleType` in [external semaphore handle types compatibility](#)
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03261
If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, the `VkSemaphoreCreateInfo::flags` field **must** match that of the semaphore from which `handle` or `name` was exported
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03262
If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field **must** match that of the semaphore from which `handle` or `name` was exported
- VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-03322
If `flags` contains `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field of the semaphore from which `handle` or `name` was exported **must** not be `VK_SEMAPHORE_TYPE_TIMELINE`

Valid Usage (Implicit)

- VUID-VkImportSemaphoreWin32HandleInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR`
- VUID-VkImportSemaphoreWin32HandleInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkImportSemaphoreWin32HandleInfoKHR-semaphore-parameter
`semaphore` **must** be a valid `VkSemaphore` handle
- VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-parameter
`flags` **must** be a valid combination of `VkSemaphoreImportFlagBits` values

Host Synchronization

- Host access to **semaphore** **must** be externally synchronized

To import a semaphore payload from a POSIX file descriptor, call:

```
// Provided by VK_KHR_external_semaphore_fd
VkResult vkImportSemaphoreFdKHR(
    VkDevice device,
    const VkImportSemaphoreFdInfoKHR* pImportSemaphoreFdInfo);
```

- **device** is the logical device that created the semaphore.
- **pImportSemaphoreFdInfo** is a pointer to a [VkImportSemaphoreFdInfoKHR](#) structure specifying the semaphore and import parameters.

Importing a semaphore payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- VUID-vkImportSemaphoreFdKHR-semaphore-01142
semaphore **must** not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportSemaphoreFdKHR-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkImportSemaphoreFdKHR-pImportSemaphoreFdInfo-parameter
pImportSemaphoreFdInfo **must** be a valid pointer to a valid [VkImportSemaphoreFdInfoKHR](#) structure

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportSemaphoreFdInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkImportSemaphoreFdInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkSemaphore               semaphore;
    VkSemaphoreImportFlags    flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    int                       fd;
} VkImportSemaphoreFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore into which the payload will be imported.
- `flags` is a bitmask of `VkSemaphoreImportFlagBits` specifying additional parameters for the semaphore payload import operation.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of `fd`.
- `fd` is the external handle to import.

The handle types supported by `handleType` are:

Table 9. Handle Types Supported by `VkImportSemaphoreFdInfoKHR`

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT</code>	Reference	Temporary,Permanent
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT</code>	Copy	Temporary

Valid Usage

- VUID-VkImportSemaphoreFdInfoKHR-handleType-01143
`handleType` **must** be a value included in the [Handle Types Supported by VkImportSemaphoreFdInfoKHR](#) table
- VUID-VkImportSemaphoreFdInfoKHR-fd-01544
`fd` **must** obey any requirements listed for `handleType` in [external semaphore handle types compatibility](#)
- VUID-VkImportSemaphoreFdInfoKHR-handleType-03263
If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreCreateInfo::flags` field **must** match that of the semaphore from which `fd` was exported

- VUID-VkImportSemaphoreFdInfoKHR-handleType-07307
If **handleType** refers to a handle type with copy payload transference semantics, **flags** **must** contain **VK_SEMAPHORE_IMPORT_TEMPORARY_BIT**
- VUID-VkImportSemaphoreFdInfoKHR-handleType-03264
If **handleType** is **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT**, the **VkSemaphoreCreateInfo::semaphoreType** field **must** match that of the semaphore from which **fd** was exported
- VUID-VkImportSemaphoreFdInfoKHR-flags-03323
If **flags** contains **VK_SEMAPHORE_IMPORT_TEMPORARY_BIT**, the **VkSemaphoreCreateInfo::semaphoreType** field of the semaphore from which **fd** was exported **must** not be **VK_SEMAPHORE_TYPE_TIMELINE**

If **handleType** is **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT**, the special value **-1** for **fd** is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the **VkSemaphore** will have a temporarily imported payload as if a valid file descriptor had been provided.

NOTE

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a **-1** file descriptor when exporting a **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT** from a **VkSemaphore** which is signaled.

Valid Usage (Implicit)

- VUID-VkImportSemaphoreFdInfoKHR-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR**
- VUID-VkImportSemaphoreFdInfoKHR-pNext-pNext
pNext **must** be **NULL**
- VUID-VkImportSemaphoreFdInfoKHR-semaphore-parameter
semaphore **must** be a valid **VkSemaphore** handle
- VUID-VkImportSemaphoreFdInfoKHR-flags-parameter
flags **must** be a valid combination of **VkSemaphoreImportFlagBits** values
- VUID-VkImportSemaphoreFdInfoKHR-handleType-parameter
handleType **must** be a valid **VkExternalSemaphoreHandleTypeFlagBits** value

Host Synchronization

- Host access to **semaphore** **must** be externally synchronized

To import a semaphore payload from a Zircon event handle, call:

```
// Provided by VK_FUCHSIA_external_semaphore
VkResult vkImportSemaphoreZirconHandleFUCHSIA(
    VkDevice device,
    const VkImportSemaphoreZirconHandleInfoFUCHSIA* pImportSemaphoreZirconHandleInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreZirconHandleInfo` is a pointer to a `VkImportSemaphoreZirconHandleInfoFUCHSIA` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a Zircon event handle transfers ownership of the handle from the application to the Vulkan implementation. The application **must** not perform any operations on the handle after a successful import.

Applications **can** import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-semaphore-04764
`semaphore` **must** not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkImportSemaphoreZirconHandleFUCHSIA-pImportSemaphoreZirconHandleInfo-parameter
`pImportSemaphoreZirconHandleInfo` **must** be a valid pointer to a valid `VkImportSemaphoreZirconHandleInfoFUCHSIA` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportSemaphoreZirconHandleInfoFUCHSIA` structure is defined as:

```
// Provided by VK_FUCHSIA_external_semaphore
typedef struct VkImportSemaphoreZirconHandleInfoFUCHSIA {
    VkStructureType          sType;
    const void*              pNext;
    VkSemaphore              semaphore;
    VkSemaphoreImportFlags    flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    zx_handle_t               zirconHandle;
} VkImportSemaphoreZirconHandleInfoFUCHSIA;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **semaphore** is the semaphore into which the payload will be imported.
- **flags** is a bitmask of **VkSemaphoreImportFlagBits** specifying additional parameters for the semaphore payload import operation.
- **handleType** is a **VkExternalSemaphoreHandleTypeFlagBits** value specifying the type of **zirconHandle**.
- **zirconHandle** is the external handle to import.

The handle types supported by **handleType** are:

Table 10. Handle Types Supported by **VkImportSemaphoreZirconHandleInfoFUCHSIA**

Handle Type	Transference	Permanence Supported
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA	Reference	Temporary,Permanent

Valid Usage

- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-handleType-04765 **handleType** **must** be a value included in the **Handle Types Supported by VkImportSemaphoreZirconHandleInfoFUCHSIA** table
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-zirconHandle-04766 **zirconHandle** **must** obey any requirements listed for **handleType** in **external semaphore handle types compatibility**
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-zirconHandle-04767 **zirconHandle** **must** have **ZX_RIGHTS_BASIC** and **ZX_RIGHTS_SIGNAL** rights
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-semaphoreType-04768 The **VkSemaphoreCreateInfo::semaphoreType** field **must** not be **VK_SEMAPHORE_TYPE_TIMELINE**

Valid Usage (Implicit)

- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-sType-sType **sType** must be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_ZIRCON_HANDLE_INFO_FUCHSIA`
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-pNext-pNext **pNext** must be `NULL`
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-semaphore-parameter **semaphore** must be a valid `VkSemaphore` handle
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-flags-parameter **flags** must be a valid combination of `VkSemaphoreImportFlagBits` values
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-handleType-parameter **handleType** must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

Host Synchronization

- Host access to **semaphore** must be externally synchronized

Bits which **can** be set in

- `VkImportSemaphoreWin32HandleInfoKHR::flags`
- `VkImportSemaphoreFdInfoKHR::flags`
- `VkImportSemaphoreZirconHandleInfoFUCHSIA::flags`

specifying additional parameters of a semaphore import operation are:

```
// Provided by VK_VERSION_1_1
typedef enum VkSemaphoreImportFlagBits {
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT = 0x00000001,
    // Provided by VK_KHR_external_semaphore
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT_KHR = VK_SEMAPHORE_IMPORT_TEMPORARY_BIT,
} VkSemaphoreImportFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore
typedef VkSemaphoreImportFlagBits VkSemaphoreImportFlagBitsKHR;
```

These bits have the following meanings:

- `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT` specifies that the semaphore payload will be imported only temporarily, as described in [Importing Semaphore Payloads](#), regardless of the permanence of **handleType**.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkSemaphoreImportFlags;
```

or the equivalent

```
// Provided by VK_KHR_external_semaphore
typedef VkSemaphoreImportFlags VkSemaphoreImportFlagsKHR;
```

`VkSemaphoreImportFlags` is a bitmask type for setting a mask of zero or more `VkSemaphoreImportFlagBits`.

7.5. Events

Events are a synchronization primitive that **can** be used to insert a fine-grained dependency between commands submitted to the same queue, or between the host and a queue. Events **must** not be used to insert a dependency between commands submitted to different queues. Events have two states - signaled and unsignaled. An application **can** signal or unsignal an event either on the host or on the device. A device **can** be made to wait for an event to become signaled before executing further operations. No command exists to wait for an event to become signaled on the host, but the current state of an event **can** be queried.

Events are represented by `VkEvent` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkEvent)
```

To create an event, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateEvent(
    VkDevice                                device,
    const VkEventCreateInfo*                 pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkEvent*                                 pEvent);
```

- `device` is the logical device that creates the event.
- `pCreateInfo` is a pointer to a `VkEventCreateInfo` structure containing information about how the event is to be created.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pEvent` is a pointer to a handle in which the resulting event object is returned.

When created, the event object is in the unsignaled state.

Valid Usage

- VUID-vkCreateEvent-device-09672

`device` **must** support at least one queue family with one of the `VK_QUEUE_VIDEO_ENCODE_BIT_KHR`, `VK_QUEUE_VIDEO_DECODE_BIT_KHR`, `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` capabilities

- VUID-vkCreateEvent-events-04468

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::events` is `VK_FALSE`, then the implementation does not support `events`, and `vkCreateEvent` **must** not be used

Valid Usage (Implicit)

- VUID-vkCreateEvent-device-parameter

`device` **must** be a valid `VkDevice` handle

- VUID-vkCreateEvent-pCreateInfo-parameter

`pCreateInfo` **must** be a valid pointer to a valid `VkEventCreateInfo` structure

- VUID-vkCreateEvent-pAllocator-parameter

If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateEvent-pEvent-parameter

`pEvent` **must** be a valid pointer to a `VkEvent` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkEventCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkEventCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkEventCreateFlags flags;
} VkEventCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkEventCreateFlagBits` defining additional creation parameters.

Valid Usage

- VUID-VkEventCreateInfo-pNext-06790

If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member **must** be `VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT`

Valid Usage (Implicit)

- VUID-VkEventCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EVENT_CREATE_INFO`
- VUID-VkEventCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkExportMetalObjectCreateInfoEXT` or `VkImportMetalSharedEventInfoEXT`
- VUID-VkEventCreateInfo-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`
- VUID-VkEventCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkEventCreateFlagBits` values

```
// Provided by VK_VERSION_1_0
typedef enum VkEventCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_EVENT_CREATE_DEVICE_ONLY_BIT = 0x00000001,
    // Provided by VK_KHR_synchronization2
    VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR = VK_EVENT_CREATE_DEVICE_ONLY_BIT,
} VkEventCreateFlagBits;
```

- `VK_EVENT_CREATE_DEVICE_ONLY_BIT` specifies that host event commands will not be used with this event.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkEventCreateFlags;
```

`VkEventCreateFlags` is a bitmask type for setting a mask of `VkEventCreateFlagBits`.

To destroy an event, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyEvent(
    VkDevice          device,
    VkEvent           event,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the event.
- **event** is the handle of the event to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyEvent-event-01145
All submitted commands that refer to **event** **must** have completed execution
- VUID-vkDestroyEvent-event-01146
If **VkAllocationCallbacks** were provided when **event** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyEvent-event-01147
If no **VkAllocationCallbacks** were provided when **event** was created, **pAllocator** **must** be **NULL**

Valid Usage (Implicit)

- VUID-vkDestroyEvent-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkDestroyEvent-event-parameter
If **event** is not **VK_NULL_HANDLE**, **event** **must** be a valid **VkEvent** handle
- VUID-vkDestroyEvent-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid **VkAllocationCallbacks** structure
- VUID-vkDestroyEvent-event-parent
If **event** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **event** **must** be externally synchronized

To query the state of an event from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkGetEventStatus(
    VkDevice          device,
    VkEvent            event);
```

- **device** is the logical device that owns the event.
- **event** is the handle of the event to query.

Upon success, **vkGetEventStatus** returns the state of the event object with the following return codes:

Table 11. Event Object Status Codes

Status	Meaning
VK_EVENT_SET	The event specified by event is signaled.
VK_EVENT_RESET	The event specified by event is unsignaled.

If a **vkCmdSetEvent** or **vkCmdResetEvent** command is in a command buffer that is in the **pending state**, then the value returned by this command **may** immediately be out of date.

The state of an event **can** be updated by the host. The state of the event is immediately changed, and subsequent calls to **vkGetEventStatus** will return the new state. If an event is already in the requested state, then updating it to the same state has no effect.

Valid Usage

- VUID-vkGetEventStatus-event-03940
event must not have been created with **VK_EVENT_CREATE_DEVICE_ONLY_BIT**

Valid Usage (Implicit)

- VUID-vkGetEventStatus-device-parameter
device must be a valid **VkDevice** handle
- VUID-vkGetEventStatus-event-parameter
event must be a valid **VkEvent** handle
- VUID-vkGetEventStatus-event-parent
event must have been created, allocated, or retrieved from **device**

Return Codes

Success

- **VK_EVENT_SET**

- `VK_EVENT_RESET`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To set the state of an event to signaled from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkSetEvent(
    VkDevice          device,
    VkEvent           event);
```

- `device` is the logical device that owns the event.
- `event` is the event to set.

When `vkSetEvent` is executed on the host, it defines an *event signal operation* which sets the event to the signaled state.

If `event` is already in the signaled state when `vkSetEvent` is executed, then `vkSetEvent` has no effect, and no event signal operation occurs.

NOTE

If a command buffer is waiting for an event to be signaled from the host, the application must signal the event before submitting the command buffer, as described in the [queue forward progress](#) section.

Valid Usage

- VUID-vkSetEvent-event-03941
`event` **must** not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT`
- VUID-vkSetEvent-event-09543
`event` **must** not be waited on by a command buffer in the [pending state](#)

Valid Usage (Implicit)

- VUID-vkSetEvent-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkSetEvent-event-parameter
`event` **must** be a valid `VkEvent` handle
- VUID-vkSetEvent-event-parent
`event` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to **event** **must** be externally synchronized

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

To set the state of an event to unsignaled from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetEvent(
    VkDevice          device,
    VkEvent           event);
```

- **device** is the logical device that owns the event.
- **event** is the event to reset.

When **vkResetEvent** is executed on the host, it defines an *event unsignal operation* which resets the event to the unsignaled state.

If **event** is already in the unsignaled state when **vkResetEvent** is executed, then **vkResetEvent** has no effect, and no event unsignal operation occurs.

Valid Usage

- VUID-vkResetEvent-event-03821
There **must** be an execution dependency between **vkResetEvent** and the execution of any **vkCmdWaitEvents** that includes **event** in its **pEvents** parameter
- VUID-vkResetEvent-event-03822
There **must** be an execution dependency between **vkResetEvent** and the execution of any **vkCmdWaitEvents2** that includes **event** in its **pEvents** parameter
- VUID-vkResetEvent-event-03823
event **must** not have been created with **VK_EVENT_CREATE_DEVICE_ONLY_BIT**

Valid Usage (Implicit)

- VUID-vkResetEvent-device-parameter

device **must** be a valid [VkDevice](#) handle

- VUID-vkResetEvent-event-parameter
event **must** be a valid [VkEvent](#) handle
- VUID-vkResetEvent-event-parent
event **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **event** **must** be externally synchronized

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)

The state of an event **can** also be updated on the device by commands inserted in command buffers.

To signal an event from a device, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetEvent2(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    const VkDependencyInfo*  pDependencyInfo);
```

or the equivalent command

```
// Provided by VK_KHR_synchronization2
void vkCmdSetEvent2KHR(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    const VkDependencyInfo*  pDependencyInfo);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **event** is the event that will be signaled.
- **pDependencyInfo** is a pointer to a [VkDependencyInfo](#) structure defining the first scopes of this operation.

When [vkCmdSetEvent2](#) is submitted to a queue, it defines the first half of memory dependencies

defined by `pDependencyInfo`, as well as an event signal operation which sets the event to the signaled state. A memory dependency is defined between the event signal operation and commands that occur earlier in submission order.

The first `synchronization scope` and `access scope` are defined by the union of all the memory dependencies defined by `pDependencyInfo`, and are applied to all operations that occur earlier in `submission order`. `Queue family ownership transfers` and `image layout transitions` defined by `pDependencyInfo` are also included in the first scopes.

The second `synchronization scope` includes only the event signal operation, and any `queue family ownership transfers` and `image layout transitions` defined by `pDependencyInfo`.

The second `access scope` includes only `queue family ownership transfers` and `image layout transitions`.

Future `vkCmdWaitEvents2` commands rely on all values of each element in `pDependencyInfo` matching exactly with those used to signal the corresponding event. `vkCmdWaitEvents` **must** not be used to wait on the result of a signal operation defined by `vkCmdSetEvent2`.

NOTE

The extra information provided by `vkCmdSetEvent2` compared to `vkCmdSetEvent` allows implementations to more efficiently schedule the operations required to satisfy the requested dependencies. With `vkCmdSetEvent`, the full dependency information is not known until `vkCmdWaitEvents` is recorded, forcing implementations to insert the required operations at that point and not before.

If `event` is already in the signaled state when `vkCmdSetEvent2` is executed on the device, then `vkCmdSetEvent2` has no effect, no event signal operation occurs, and no dependency is generated.

Valid Usage

- VUID-vkCmdSetEvent2-synchronization2-03824
The `synchronization2` feature **must** be enabled
- VUID-vkCmdSetEvent2-dependencyFlags-03825
The `dependencyFlags` member of `pDependencyInfo` **must** be 0
- VUID-vkCmdSetEvent2-srcStageMask-09391
The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** not include `VK_PIPELINE_STAGE_2_HOST_BIT`
- VUID-vkCmdSetEvent2-dstStageMask-09392
The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** not include `VK_PIPELINE_STAGE_2_HOST_BIT`
- VUID-vkCmdSetEvent2-commandBuffer-03826
The current device mask of `commandBuffer` **must** include exactly one physical device
- VUID-vkCmdSetEvent2-srcStageMask-03827
The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`,

or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- VUID-vkCmdSetEvent2-dstStageMask-03828

The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

Valid Usage (Implicit)

- VUID-vkCmdSetEvent2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetEvent2-event-parameter
`event` **must** be a valid `VkEvent` handle
- VUID-vkCmdSetEvent2-pDependencyInfo-parameter
`pDependencyInfo` **must** be a valid pointer to a valid `VkDependencyInfo` structure
- VUID-vkCmdSetEvent2-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetEvent2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute, decode, or encode operations
- VUID-vkCmdSetEvent2-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdSetEvent2-commonparent
Both of `commandBuffer`, and `event` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Both	Graphics Compute Decode Encode	Synchronization

The `VkDependencyInfo` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkDependencyInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkDependencyFlags    dependencyFlags;
    uint32_t             memoryBarrierCount;
    const VkMemoryBarrier2* pMemoryBarriers;
    uint32_t             bufferMemoryBarrierCount;
    const VkBufferMemoryBarrier2* pBufferMemoryBarriers;
    uint32_t             imageMemoryBarrierCount;
    const VkImageMemoryBarrier2* pImageMemoryBarriers;
} VkDependencyInfo;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkDependencyInfo VkDependencyInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier2` structures defining memory dependencies between any memory accesses.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier2` structures defining memory dependencies between buffer ranges.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier2` structures defining memory dependencies between image subresources.

This structure defines a set of [memory dependencies](#), as well as [queue family ownership transfer operations](#) and [image layout transitions](#).

Each member of `pMemoryBarriers`, `pBufferMemoryBarriers`, and `pImageMemoryBarriers` defines a separate [memory dependency](#).

Valid Usage (Implicit)

- VUID-VkDependencyInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEPENDENCY_INFO`
- VUID-VkDependencyInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDependencyInfo-dependencyFlags-parameter
`dependencyFlags` **must** be a valid combination of [VkDependencyFlagBits](#) values
- VUID-VkDependencyInfo-pMemoryBarriers-parameter
If `memoryBarrierCount` is not 0, `pMemoryBarriers` **must** be a valid pointer to an array of `memoryBarrierCount` valid [VkMemoryBarrier2](#) structures
- VUID-VkDependencyInfo-pBufferMemoryBarriers-parameter
If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` **must** be a valid pointer to an array of `bufferMemoryBarrierCount` valid [VkBufferMemoryBarrier2](#) structures
- VUID-VkDependencyInfo-pImageMemoryBarriers-parameter
If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` **must** be a valid pointer to an array of `imageMemoryBarrierCount` valid [VkImageMemoryBarrier2](#) structures

To set the state of an event to signaled from a device, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetEvent(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    VkPipelineStageFlags     stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be signaled.
- `stageMask` specifies the [source stage mask](#) used to determine the first [synchronization scope](#).

`vkCmdSetEvent` behaves identically to `vkCmdSetEvent2`, except that it does not define an access scope, and **must** only be used with `vkCmdWaitEvents`, not `vkCmdWaitEvents2`.

Valid Usage

- VUID-vkCmdSetEvent-stageMask-04090
If the `geometryShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-vkCmdSetEvent-stageMask-04091
If the `tessellationShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdSetEvent-stageMask-04092
If the `conditionalRendering` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-vkCmdSetEvent-stageMask-04093
If the `fragmentDensityMap` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-vkCmdSetEvent-stageMask-04094
If the `transformFeedback` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-vkCmdSetEvent-stageMask-04095
If the `meshShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-vkCmdSetEvent-stageMask-04096
If the `taskShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
- VUID-vkCmdSetEvent-stageMask-07318
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdSetEvent-stageMask-03937
If the `synchronization2` feature is not enabled, `stageMask` **must** not be 0
- VUID-vkCmdSetEvent-stageMask-07949
If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`
- VUID-vkCmdSetEvent-stageMask-06457
Any pipeline stage included in `stageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)
- VUID-vkCmdSetEvent-stageMask-01149
`stageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`
- VUID-vkCmdSetEvent-commandBuffer-01152
The current device mask of `commandBuffer` **must** include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdSetEvent-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetEvent-event-parameter

event **must** be a valid [VkEvent](#) handle

- VUID-vkCmdSetEvent-stageMask-parameter

stageMask **must** be a valid combination of [VkPipelineStageFlagBits](#) values

- VUID-vkCmdSetEvent-commandBuffer-recording

commandBuffer **must** be in the [recording state](#)

- VUID-vkCmdSetEvent-commandBuffer-cmdpool

The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support graphics, compute, decode, or encode operations

- VUID-vkCmdSetEvent-renderpass

This command **must** only be called outside of a render pass instance

- VUID-vkCmdSetEvent-commonparent

Both of **commandBuffer**, and **event** **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Both	Graphics Compute Decode Encode	Synchronization

To unsignal the event from a device, call:

```
// Provided by VK_VERSION_1_3
void vkCmdResetEvent2(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    VkPipelineStageFlags2    stageMask);
```

or the equivalent command

```
// Provided by VK_KHR_synchronization2
void vkCmdResetEvent2KHR(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    VkPipelineStageFlags2    stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a `VkPipelineStageFlags2` mask of pipeline stages used to determine the first `synchronization scope`.

When `vkCmdResetEvent2` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and defines an event unsignal operation which resets the event to the unsignaled state.

The first `synchronization scope` includes all commands that occur earlier in `submission order`. The synchronization scope is limited to operations by `stageMask` or stages that are `logically earlier` than `stageMask`.

The second `synchronization scope` includes only the event unsignal operation.

If `event` is already in the unsignaled state when `vkCmdResetEvent2` is executed on the device, then this command has no effect, no event unsignal operation occurs, and no execution dependency is generated.

Valid Usage

- VUID-vkCmdResetEvent2-stageMask-03929
If the `geometryShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- VUID-vkCmdResetEvent2-stageMask-03930
If the `tessellationShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdResetEvent2-stageMask-03931
If the `conditionalRendering` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-vkCmdResetEvent2-stageMask-03932
If the `fragmentDensityMap` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-vkCmdResetEvent2-stageMask-03933
If the `transformFeedback` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-vkCmdResetEvent2-stageMask-03934
If the `meshShader` feature is not enabled, `stageMask` **must** not contain

VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT

- VUID-vkCmdResetEvent2-stageMask-03935
If the `taskShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
- VUID-vkCmdResetEvent2-stageMask-07316
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdResetEvent2-stageMask-04957
If the `subpassShading` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`
- VUID-vkCmdResetEvent2-stageMask-04995
If the `invocationMask` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`
- VUID-vkCmdResetEvent2-stageMask-07946
If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
- VUID-vkCmdResetEvent2-synchronization2-03829
The `synchronization2` feature **must** be enabled
- VUID-vkCmdResetEvent2-stageMask-03830
`stageMask` **must** not include `VK_PIPELINE_STAGE_2_HOST_BIT`
- VUID-vkCmdResetEvent2-event-03831
There **must** be an execution dependency between `vkCmdResetEvent2` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter
- VUID-vkCmdResetEvent2-event-03832
There **must** be an execution dependency between `vkCmdResetEvent2` and the execution of any `vkCmdWaitEvents2` that includes `event` in its `pEvents` parameter
- VUID-vkCmdResetEvent2-commandBuffer-03833
`commandBuffer`'s current device mask **must** include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdResetEvent2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdResetEvent2-event-parameter
`event` **must** be a valid `VkEvent` handle
- VUID-vkCmdResetEvent2-stageMask-parameter
`stageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-vkCmdResetEvent2-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdResetEvent2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute,

decode, or encode operations

- VUID-vkCmdResetEvent2-renderpass

This command **must** only be called outside of a render pass instance

- VUID-vkCmdResetEvent2-commonparent

Both of **commandBuffer**, and **event** **must** have been created, allocated, or retrieved from the same **VkDevice**

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Both	Graphics Compute Decode Encode	Synchronization

To set the state of an event to unsignaled from a device, call:

```
// Provided by VK_VERSION_1_0
void vkCmdResetEvent(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    VkPipelineStageFlags     stageMask);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **event** is the event that will be unsignaled.
- **stageMask** is a bitmask of **VkPipelineStageFlagBits** specifying the **source stage mask** used to determine when the **event** is unsignaled.

vkCmdResetEvent behaves identically to **vkCmdResetEvent2**.

Valid Usage

- VUID-vkCmdResetEvent-stageMask-04090

If the **geometryShader** feature is not enabled, **stageMask** **must** not contain **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT**

- VUID-vkCmdResetEvent-stageMask-04091
If the `tessellationShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdResetEvent-stageMask-04092
If the `conditionalRendering` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-vkCmdResetEvent-stageMask-04093
If the `fragmentDensityMap` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-vkCmdResetEvent-stageMask-04094
If the `transformFeedback` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-vkCmdResetEvent-stageMask-04095
If the `meshShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-vkCmdResetEvent-stageMask-04096
If the `taskShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
- VUID-vkCmdResetEvent-stageMask-07318
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdResetEvent-stageMask-03937
If the `synchronization2` feature is not enabled, `stageMask` **must** not be 0
- VUID-vkCmdResetEvent-stageMask-07949
If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`
- VUID-vkCmdResetEvent-stageMask-06458
Any pipeline stage included in `stageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)
- VUID-vkCmdResetEvent-stageMask-01153
`stageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`
- VUID-vkCmdResetEvent-event-03834
There **must** be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter
- VUID-vkCmdResetEvent-event-03835
There **must** be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents2` that includes `event` in its `pEvents` parameter
- VUID-vkCmdResetEvent-commandBuffer-01157
`commandBuffer`'s current device mask **must** include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdResetEvent-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdResetEvent-event-parameter
`event` **must** be a valid `VkEvent` handle
- VUID-vkCmdResetEvent-stageMask-parameter
`stageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-vkCmdResetEvent-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdResetEvent-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute, decode, or encode operations
- VUID-vkCmdResetEvent-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdResetEvent-commonparent
Both of `commandBuffer`, and `event` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Both	Graphics Compute Decode Encode	Synchronization

To wait for one or more events to enter the signaled state on a device, call:

```
// Provided by VK_VERSION_1_3
void vkCmdWaitEvents2(
    VkCommandBuffer                      commandBuffer,
    uint32_t                             eventCount,
    const VkEvent*                       pEvents,
    const VkDependencyInfo*              pDependencyInfos);
```

or the equivalent command

```
// Provided by VK_KHR_synchronization2
void vkCmdWaitEvents2KHR(
    VkCommandBuffer                      commandBuffer,
    uint32_t                             eventCount,
    const VkEvent*                       pEvents,
    const VkDependencyInfo*              pDependencyInfos);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of `eventCount` events to wait on.
- `pDependencyInfos` is a pointer to an array of `eventCount` `VkDependencyInfo` structures, defining the second `synchronization scope`.

When `vkCmdWaitEvents2` is submitted to a queue, it inserts memory dependencies according to the elements of `pDependencyInfos` and each corresponding element of `pEvents`. `vkCmdWaitEvents2` **must** not be used to wait on event signal operations occurring on other queues, or signal operations executed by `vkCmdSetEvent`.

The first `synchronization scope` and `access scope` of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred earlier in `submission order` than the last event signal operation on element `i` of `pEvents`.

Signal operations for an event at index `i` are only included if:

- The event was signaled by a `vkCmdSetEvent2` command that occurred earlier in `submission order` with a `dependencyInfo` parameter exactly equal to the element of `pDependencyInfos` at index `i`; or
- The event was created without `VK_EVENT_CREATE_DEVICE_ONLY_BIT`, and the first `synchronization scope` defined by the element of `pDependencyInfos` at index `i` only includes host operations (`VK_PIPELINE_STAGE_2_HOST_BIT`).

The second `synchronization scope` and `access scope` of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred later in `submission order` than `vkCmdWaitEvents2`.

NOTE

`vkCmdWaitEvents2` is used with `vkCmdSetEvent2` to define a memory dependency between two sets of action commands, roughly in the same way as pipeline

barriers, but split into two commands such that work between the two **may** execute unhindered.

NOTE

Applications should be careful to avoid race conditions when using events. There is no direct ordering guarantee between `vkCmdSetEvent2` and `vkCmdResetEvent2`, `vkCmdResetEvent`, or `vkCmdSetEvent`. Another execution dependency (e.g. a pipeline barrier or semaphore with `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`) is needed to prevent such a race condition.

Valid Usage

- VUID-vkCmdWaitEvents2-synchronization2-03836
The `synchronization2` feature **must** be enabled
- VUID-vkCmdWaitEvents2-pEvents-03837
Members of `pEvents` **must** not have been signaled by `vkCmdSetEvent`
- VUID-vkCmdWaitEvents2-pEvents-03838
For any element `i` of `pEvents`, if that event is signaled by `vkCmdSetEvent2`, that command's `dependencyInfo` parameter **must** be exactly equal to the `i`th element of `pDependencyInfos`
- VUID-vkCmdWaitEvents2-pEvents-03839
For any element `i` of `pEvents`, if that event is signaled by `vkSetEvent`, barriers in the `i`th element of `pDependencyInfos` **must** include only host operations in their first `synchronization scope`
- VUID-vkCmdWaitEvents2-pEvents-03840
For any element `i` of `pEvents`, if barriers in the `i`th element of `pDependencyInfos` include only host operations, the `i`th element of `pEvents` **must** be signaled before `vkCmdWaitEvents2` is executed
- VUID-vkCmdWaitEvents2-pEvents-03841
For any element `i` of `pEvents`, if barriers in the `i`th element of `pDependencyInfos` do not include host operations, the `i`th element of `pEvents` **must** be signaled by a corresponding `vkCmdSetEvent2` that occurred earlier in `submission order`
- VUID-vkCmdWaitEvents2-srcStageMask-03842
The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfos` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from
- VUID-vkCmdWaitEvents2-dstStageMask-03843
The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfos` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from
- VUID-vkCmdWaitEvents2-dependencyFlags-03844
If `vkCmdWaitEvents2` is being called inside a render pass instance, the `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfos` **must** not include `VK_PIPELINE_STAGE_2_HOST_BIT`

- VUID-vkCmdWaitEvents2-commandBuffer-03846
`commandBuffer`'s current device mask **must** include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdWaitEvents2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdWaitEvents2-pEvents-parameter
`pEvents` **must** be a valid pointer to an array of `eventCount` valid `VkEvent` handles
- VUID-vkCmdWaitEvents2-pDependencyInfos-parameter
`pDependencyInfos` **must** be a valid pointer to an array of `eventCount` valid `VkDependencyInfo` structures
- VUID-vkCmdWaitEvents2-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdWaitEvents2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute, decode, or encode operations
- VUID-vkCmdWaitEvents2-eventCount-arraylength
`eventCount` **must** be greater than 0
- VUID-vkCmdWaitEvents2-commonparent
Both of `commandBuffer`, and the elements of `pEvents` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Both	Graphics Compute Decode Encode	Synchronization

To wait for one or more events to enter the signaled state on a device, call:

```
// Provided by VK_VERSION_1_0
void vkCmdWaitEvents(
    VkCommandBuffer                commandBuffer,
    uint32_t                       eventCount,
    const VkEvent*                 pEvents,
    VkPipelineStageFlags           srcStageMask,
    VkPipelineStageFlags           dstStageMask,
    uint32_t                       memoryBarrierCount,
    const VkMemoryBarrier*         pMemoryBarriers,
    uint32_t                       bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier*   pBufferMemoryBarriers,
    uint32_t                       imageMemoryBarrierCount,
    const VkImageMemoryBarrier*    pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of event object handles to wait on.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [source stage mask](#).
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [destination stage mask](#).
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdWaitEvents` is largely similar to `vkCmdWaitEvents2`, but **can** only wait on signal operations defined by `vkCmdSetEvent`. As `vkCmdSetEvent` does not define any access scopes, `vkCmdWaitEvents` defines the first access scope for each event signal operation in addition to its own access scopes.

NOTE	Since <code>vkCmdSetEvent</code> does not have any dependency information beyond a stage mask, implementations do not have the same opportunity to perform availability and visibility operations or image layout transitions in advance as they do with <code>vkCmdSetEvent2</code> and <code>vkCmdWaitEvents2</code> .
-------------	--

When `vkCmdWaitEvents` is submitted to a queue, it defines a memory dependency between prior event signal operations on the same queue or the host, and subsequent commands. `vkCmdWaitEvents` **must** not be used to wait on event signal operations occurring on other queues.

The first synchronization scope only includes event signal operations that operate on members of `pEvents`, and the operations that happened-before the event signal operations. Event signal operations performed by `vkCmdSetEvent` that occur earlier in [submission order](#) are included in the first synchronization scope, if the [logically latest](#) pipeline stage in their `stageMask` parameter is [logically earlier](#) than or equal to the [logically latest](#) pipeline stage in `srcStageMask`. Event signal

operations performed by `vkSetEvent` are only included in the first synchronization scope if `VK_PIPELINE_STAGE_HOST_BIT` is included in `srcStageMask`.

The second [synchronization scope](#) includes all commands that occur later in [submission order](#). The second synchronization scope is limited to operations on the pipeline stages determined by the [destination stage mask](#) specified by `dstStageMask`.

The first [access scope](#) is limited to accesses in the pipeline stages determined by the [source stage mask](#) specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of [memory barriers](#). If no memory barriers are specified, then the first access scope includes no accesses.

The second [access scope](#) is limited to accesses in the pipeline stages determined by the [destination stage mask](#) specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of [memory barriers](#). If no memory barriers are specified, then the second access scope includes no accesses.

Valid Usage

- VUID-vkCmdWaitEvents-srcStageMask-04090
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-vkCmdWaitEvents-srcStageMask-04091
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdWaitEvents-srcStageMask-04092
If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-vkCmdWaitEvents-srcStageMask-04093
If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-vkCmdWaitEvents-srcStageMask-04094
If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-vkCmdWaitEvents-srcStageMask-04095
If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-vkCmdWaitEvents-srcStageMask-04096
If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
- VUID-vkCmdWaitEvents-srcStageMask-07318
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled,

`srcStageMask` **must** **not** **contain**
`VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdWaitEvents-srcStageMask-03937
If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be 0
- VUID-vkCmdWaitEvents-srcStageMask-07949
If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`
- VUID-vkCmdWaitEvents-srcAccessMask-06257
If the `rayQuery` feature is not enabled and a memory barrier `srcAccessMask` includes `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` **must** not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`
- VUID-vkCmdWaitEvents-dstStageMask-04090
If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-vkCmdWaitEvents-dstStageMask-04091
If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdWaitEvents-dstStageMask-04092
If the `conditionalRendering` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-vkCmdWaitEvents-dstStageMask-04093
If the `fragmentDensityMap` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-vkCmdWaitEvents-dstStageMask-04094
If the `transformFeedback` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-vkCmdWaitEvents-dstStageMask-04095
If the `meshShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-vkCmdWaitEvents-dstStageMask-04096
If the `taskShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
- VUID-vkCmdWaitEvents-dstStageMask-07318
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `dstStageMask` **must** **not** **contain** `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdWaitEvents-dstStageMask-03937
If the `synchronization2` feature is not enabled, `dstStageMask` **must** not be 0
- VUID-vkCmdWaitEvents-dstStageMask-07949
If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled,

`dstStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdWaitEvents-dstAccessMask-06257

If the `rayQuery` feature is not enabled and a memory barrier `dstAccessMask` includes `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `dstStageMask` **must** not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdWaitEvents-srcAccessMask-02815

The `srcAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdWaitEvents-dstAccessMask-02816

The `dstAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02817

For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02818

For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02819

For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02820

For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdWaitEvents-srcStageMask-06459

Any pipeline stage included in `srcStageMask` **must** be supported by the capabilities of the

queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)

- VUID-vkCmdWaitEvents-dstStageMask-06460

Any pipeline stage included in `dstStageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)

- VUID-vkCmdWaitEvents-srcStageMask-01158

`srcStageMask` **must** be the bitwise OR of the `stageMask` parameter used in previous calls to `vkCmdSetEvent` with any of the elements of `pEvents` and `VK_PIPELINE_STAGE_HOST_BIT` if any of the elements of `pEvents` was set using `vkSetEvent`

- VUID-vkCmdWaitEvents-srcStageMask-07308

If `vkCmdWaitEvents` is being called inside a render pass instance, `srcStageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`

- VUID-vkCmdWaitEvents-srcQueueFamilyIndex-02803

The `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any element of `pBufferMemoryBarriers` or `pImageMemoryBarriers` **must** be equal

- VUID-vkCmdWaitEvents-commandBuffer-01167

`commandBuffer`'s current device mask **must** include exactly one physical device

- VUID-vkCmdWaitEvents-pEvents-03847

Elements of `pEvents` **must** not have been signaled by `vkCmdSetEvent2`

Valid Usage (Implicit)

- VUID-vkCmdWaitEvents-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdWaitEvents-pEvents-parameter

`pEvents` **must** be a valid pointer to an array of `eventCount` valid `VkEvent` handles

- VUID-vkCmdWaitEvents-srcStageMask-parameter

`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values

- VUID-vkCmdWaitEvents-dstStageMask-parameter

`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values

- VUID-vkCmdWaitEvents-pMemoryBarriers-parameter

If `memoryBarrierCount` is not 0, `pMemoryBarriers` **must** be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures

- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-parameter

If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` **must** be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-parameter

If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` **must** be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures

- VUID-vkCmdWaitEvents-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdWaitEvents-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute, decode, or encode operations
- VUID-vkCmdWaitEvents-eventCount-arraylength
`eventCount` **must** be greater than 0
- VUID-vkCmdWaitEvents-commonparent
Both of `commandBuffer`, and the elements of `pEvents` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Both	Graphics Compute Decode Encode	Synchronization

7.6. Pipeline Barriers

To record a pipeline barrier, call:

```
// Provided by VK_VERSION_1_3
void vkCmdPipelineBarrier2(
    VkCommandBuffer          commandBuffer,
    const VkDependencyInfo*  pDependencyInfo);
```

or the equivalent command

```
// Provided by VK_KHR_synchronization2
void vkCmdPipelineBarrier2KHR(
    VkCommandBuffer                      commandBuffer,
    const VkDependencyInfo*              pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the scopes of this operation.

When `vkCmdPipelineBarrier2` is submitted to a queue, it defines memory dependencies between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

The first `synchronization scope` and `access scope` of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred earlier in `submission order`.

The second `synchronization scope` and `access scope` of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred later in `submission order`.

If `vkCmdPipelineBarrier2` is recorded within a render pass instance, the synchronization scopes are limited to a subset of operations within the same subpass or render pass instance.

Valid Usage

- VUID-vkCmdPipelineBarrier2-None-07889
If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, the render pass **must** have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include `VK_DEPENDENCY_BY_REGION_BIT` if this command does not, does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT` if this command does not, and has `synchronization scopes` and `access scopes` that are all supersets of the scopes defined in this command
- VUID-vkCmdPipelineBarrier2-bufferMemoryBarrierCount-01178
If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, it **must** not include any buffer memory barriers
- VUID-vkCmdPipelineBarrier2-image-04073
If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, the `image` member of any image memory barrier included in this command **must** be an attachment used in the current subpass both as an input attachment, and as either a color, color resolve, or depth/stencil attachment
- VUID-vkCmdPipelineBarrier2-image-09373
If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, and the `image` member of any image memory barrier is a color resolve attachment, the corresponding color attachment **must** be `VK_ATTACHMENT_UNUSED`
- VUID-vkCmdPipelineBarrier2-image-09374
If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass`

object, and the **image** member of any image memory barrier is a color resolve attachment, it **must** have been created with a non-zero `VkExternalFormatANDROID::externalFormat` value

- VUID-vkCmdPipelineBarrier2-oldLayout-01181

If `vkCmdPipelineBarrier2` is called within a render pass instance, the **oldLayout** and **newLayout** members of any image memory barrier included in this command **must** be equal

- VUID-vkCmdPipelineBarrier2-srcQueueFamilyIndex-01182

If `vkCmdPipelineBarrier2` is called within a render pass instance, the **srcQueueFamilyIndex** and **dstQueueFamilyIndex** members of any memory barrier included in this command **must** be equal

- VUID-vkCmdPipelineBarrier2-None-07890

If `vkCmdPipelineBarrier2` is called within a render pass instance, and the source stage masks of any memory barriers include **framebuffer-space stages**, destination stage masks of all memory barriers **must** only include **framebuffer-space stages**

- VUID-vkCmdPipelineBarrier2-dependencyFlags-07891

If `vkCmdPipelineBarrier2` is called within a render pass instance, and the source stage masks of any memory barriers include **framebuffer-space stages**, then **dependencyFlags** **must** include `VK_DEPENDENCY_BY_REGION_BIT`

- VUID-vkCmdPipelineBarrier2-None-07892

If `vkCmdPipelineBarrier2` is called within a render pass instance, the source and destination stage masks of any memory barriers **must** only include graphics pipeline stages

- VUID-vkCmdPipelineBarrier2-dependencyFlags-01186

If `vkCmdPipelineBarrier2` is called outside of a render pass instance, the dependency flags **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier2-None-07893

If `vkCmdPipelineBarrier2` is called inside a render pass instance, and there is more than one view in the current subpass, dependency flags **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier2-None-09553

If none of the **shaderTileImageColorReadAccess**, **shaderTileImageStencilReadAccess**, or **shaderTileImageDepthReadAccess** features are enabled, and the **dynamicRenderingLocalRead** feature is not enabled, `vkCmdPipelineBarrier2` **must** not be called within a render pass instance started with `vkCmdBeginRendering`

- VUID-vkCmdPipelineBarrier2-None-09554

If the **dynamicRenderingLocalRead** feature is not enabled, and `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, there **must** be no buffer or image memory barriers specified by this command

- VUID-vkCmdPipelineBarrier2-None-09586

If the **dynamicRenderingLocalRead** feature is not enabled, and `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, memory barriers specified by this command **must** only include `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`,

VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT,
VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT in their access masks

or

- VUID-vkCmdPipelineBarrier2-image-09555
If `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, and the `image` member of any image memory barrier is used as an attachment in the current render pass instance, it **must** be in the `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` or `VK_IMAGE_LAYOUT_GENERAL` layout
- VUID-vkCmdPipelineBarrier2-srcStageMask-09556
If `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, this command **must** only specify `framebuffer-space` stages in `srcStageMask` and `dstStageMask`
- VUID-vkCmdPipelineBarrier2-synchronization2-03848
The `synchronization2` feature **must** be enabled
- VUID-vkCmdPipelineBarrier2-srcStageMask-09673
The `srcStageMask` member of any element of the `pMemoryBarriers` member of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from
- VUID-vkCmdPipelineBarrier2-dstStageMask-09674
The `dstStageMask` member of any element of the `pMemoryBarriers` member of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from
- VUID-vkCmdPipelineBarrier2-srcStageMask-09675
If a buffer or image memory barrier does not specify an `acquire operation`, the respective `srcStageMask` member of the element of the `pBufferMemoryBarriers` or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from
- VUID-vkCmdPipelineBarrier2-dstStageMask-09676
If a buffer or image memory barrier does not specify an `release operation`, the respective `dstStageMask` member of the element of the `pBufferMemoryBarriers` or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

Valid Usage (Implicit)

- VUID-vkCmdPipelineBarrier2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdPipelineBarrier2-pDependencyInfo-parameter
`pDependencyInfo` **must** be a valid pointer to a valid `VkDependencyInfo` structure
- VUID-vkCmdPipelineBarrier2-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdPipelineBarrier2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, compute, decode, or encode operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Both	Transfer Graphics Compute Decode Encode	Synchronization

To record a pipeline barrier, call:

```
// Provided by VK_VERSION_1_0
void vkCmdPipelineBarrier(
    VkCommandBuffer                commandBuffer,
    VkPipelineStageFlags            srcStageMask,
    VkPipelineStageFlags            dstStageMask,
    VkDependencyFlags               dependencyFlags,
    uint32_t                       memoryBarrierCount,
    const VkMemoryBarrier*          pMemoryBarriers,
    uint32_t                       bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier*    pBufferMemoryBarriers,
    uint32_t                       imageMemoryBarrierCount,
    const VkImageMemoryBarrier*     pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the **source stages**.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the **destination stages**.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.

- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdPipelineBarrier` operates almost identically to `vkCmdPipelineBarrier2`, except that the scopes and barriers are defined as direct parameters rather than being defined by a `VkDependencyInfo`.

When `vkCmdPipelineBarrier` is submitted to a queue, it defines a memory dependency between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the first `synchronization scope` includes all commands that occur earlier in `submission order`. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the first synchronization scope includes only commands that occur earlier in `submission order` within the same subpass. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the `source stage mask` specified by `srcStageMask`.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the second `synchronization scope` includes all commands that occur later in `submission order`. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the second synchronization scope includes only commands that occur later in `submission order` within the same subpass. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`.

The first `access scope` is limited to accesses in the pipeline stages determined by the `source stage mask` specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of `memory barriers`. If no memory barriers are specified, then the first access scope includes no accesses.

The second `access scope` is limited to accesses in the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of `memory barriers`. If no memory barriers are specified, then the second access scope includes no accesses.

If `dependencyFlags` includes `VK_DEPENDENCY_BY_REGION_BIT`, then any dependency between `framebuffer-space` pipeline stages is `framebuffer-local` - otherwise it is `framebuffer-global`.

Valid Usage

- VUID-vkCmdPipelineBarrier-srcStageMask-04090
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-vkCmdPipelineBarrier-srcStageMask-04091
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdPipelineBarrier-srcStageMask-04092

If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-vkCmdPipelineBarrier-srcStageMask-04093

If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-vkCmdPipelineBarrier-srcStageMask-04094

If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-vkCmdPipelineBarrier-srcStageMask-04095

If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- VUID-vkCmdPipelineBarrier-srcStageMask-04096

If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- VUID-vkCmdPipelineBarrier-srcStageMask-07318

If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdPipelineBarrier-srcStageMask-03937

If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be 0

- VUID-vkCmdPipelineBarrier-srcStageMask-07949

If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdPipelineBarrier-srcAccessMask-06257

If the `rayQuery` feature is not enabled and a memory barrier `srcAccessMask` includes `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` **must** not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdPipelineBarrier-dstStageMask-04090

If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04091

If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04092

If the `conditionalRendering` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04093

If the `fragmentDensityMap` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04094

If the `transformFeedback` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04095

If the `meshShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04096

If the `taskShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-07318

If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdPipelineBarrier-dstStageMask-03937

If the `synchronization2` feature is not enabled, `dstStageMask` **must** not be 0

- VUID-vkCmdPipelineBarrier-dstStageMask-07949

If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdPipelineBarrier-dstAccessMask-06257

If the `rayQuery` feature is not enabled and a memory barrier `dstAccessMask` includes `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `dstStageMask` **must** not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdPipelineBarrier-srcAccessMask-02815

The `srcAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdPipelineBarrier-dstAccessMask-02816

The `dstAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02817

For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02818

For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)

types

- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02819

For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02820

For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdPipelineBarrier-None-07889

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, the render pass **must** have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include `VK_DEPENDENCY_BY_REGION_BIT` if this command does not, does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT` if this command does not, and has [synchronization scopes](#) and [access scopes](#) that are all supersets of the scopes defined in this command

- VUID-vkCmdPipelineBarrier-bufferMemoryBarrierCount-01178

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, it **must** not include any buffer memory barriers

- VUID-vkCmdPipelineBarrier-image-04073

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, the `image` member of any image memory barrier included in this command **must** be an attachment used in the current subpass both as an input attachment, and as either a color, color resolve, or depth/stencil attachment

- VUID-vkCmdPipelineBarrier-image-09373

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, and the `image` member of any image memory barrier is a color resolve attachment, the corresponding color attachment **must** be `VK_ATTACHMENT_UNUSED`

- VUID-vkCmdPipelineBarrier-image-09374

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, and the `image` member of any image memory barrier is a color resolve attachment, it **must** have been created with a non-zero `VkExternalFormatANDROID::externalFormat` value

- VUID-vkCmdPipelineBarrier-oldLayout-01181

If `vkCmdPipelineBarrier` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command **must** be equal

- VUID-vkCmdPipelineBarrier-srcQueueFamilyIndex-01182

If `vkCmdPipelineBarrier` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command **must** be equal

- VUID-vkCmdPipelineBarrier-None-07890

If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include `framebuffer-space stages`, destination stage masks of all memory barriers **must** only include `framebuffer-space stages`

- VUID-vkCmdPipelineBarrier-dependencyFlags-07891

If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include `framebuffer-space stages`, then `dependencyFlags` **must** include `VK_DEPENDENCY_BY_REGION_BIT`

- VUID-vkCmdPipelineBarrier-None-07892

If `vkCmdPipelineBarrier` is called within a render pass instance, the source and destination stage masks of any memory barriers **must** only include graphics pipeline stages

- VUID-vkCmdPipelineBarrier-dependencyFlags-01186

If `vkCmdPipelineBarrier` is called outside of a render pass instance, the dependency flags **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier-None-07893

If `vkCmdPipelineBarrier` is called inside a render pass instance, and there is more than one view in the current subpass, dependency flags **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier-None-09553

If none of the `shaderTileImageColorReadAccess`, `shaderTileImageStencilReadAccess`, or `shaderTileImageDepthReadAccess` features are enabled, and the `dynamicRenderingLocalRead` feature is not enabled, `vkCmdPipelineBarrier` **must** not be called within a render pass instance started with `vkCmdBeginRendering`

- VUID-vkCmdPipelineBarrier-None-09554

If the `dynamicRenderingLocalRead` feature is not enabled, and `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, there **must** be no buffer or image memory barriers specified by this command

- VUID-vkCmdPipelineBarrier-None-09586

If the `dynamicRenderingLocalRead` feature is not enabled, and `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, memory barriers specified by this command **must** only include `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, or `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT` in their access masks

- VUID-vkCmdPipelineBarrier-image-09555

If `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, and the `image` member of any image memory barrier is used as an attachment in the current render pass instance, it **must** be in the `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` or `VK_IMAGE_LAYOUT_GENERAL` layout

- VUID-vkCmdPipelineBarrier-srcStageMask-09556

If `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, this command **must** only specify `framebuffer-space stages` in `srcStageMask` and `dstStageMask`

- VUID-vkCmdPipelineBarrier-srcStageMask-06461
Any pipeline stage included in `srcStageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)
- VUID-vkCmdPipelineBarrier-dstStageMask-06462
Any pipeline stage included in `dstStageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)
- VUID-vkCmdPipelineBarrier-srcStageMask-09633
If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_HOST_BIT`, for any element of `pImageMemoryBarriers`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be equal
- VUID-vkCmdPipelineBarrier-srcStageMask-09634
If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_HOST_BIT`, for any element of `pBufferMemoryBarriers`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be equal

Valid Usage (Implicit)

- VUID-vkCmdPipelineBarrier-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdPipelineBarrier-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-vkCmdPipelineBarrier-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-vkCmdPipelineBarrier-dependencyFlags-parameter
`dependencyFlags` **must** be a valid combination of `VkDependencyFlagBits` values
- VUID-vkCmdPipelineBarrier-pMemoryBarriers-parameter
If `memoryBarrierCount` is not 0, `pMemoryBarriers` **must** be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures
- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-parameter
If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` **must** be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures
- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-parameter
If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` **must** be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures
- VUID-vkCmdPipelineBarrier-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdPipelineBarrier-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics,

compute, decode, or encode operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Both	Transfer Graphics Compute Decode Encode	Synchronization

Bits which **can** be set in `vkCmdPipelineBarrier::dependencyFlags`, specifying how execution and memory dependencies are formed, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkDependencyFlagBits {
    VK_DEPENDENCY_BY_REGION_BIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_DEVICE_GROUP_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_VIEW_LOCAL_BIT = 0x00000002,
    // Provided by VK_EXT_attachment_feedback_loop_layout
    VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT = 0x00000008,
    // Provided by VK_KHR_multiview
    VK_DEPENDENCY_VIEW_LOCAL_BIT_KHR = VK_DEPENDENCY_VIEW_LOCAL_BIT,
    // Provided by VK_KHR_device_group
    VK_DEPENDENCY_DEVICE_GROUP_BIT_KHR = VK_DEPENDENCY_DEVICE_GROUP_BIT,
} VkDependencyFlagBits;
```

- `VK_DEPENDENCY_BY_REGION_BIT` specifies that dependencies will be [framebuffer-local](#).
- `VK_DEPENDENCY_VIEW_LOCAL_BIT` specifies that dependencies will be [view-local](#).
- `VK_DEPENDENCY_DEVICE_GROUP_BIT` specifies that dependencies are [non-device-local](#).
- `VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT` specifies that the render pass will write to and read from the same image using the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDependencyFlags;
```

`VkDependencyFlags` is a bitmask type for setting a mask of zero or more [VkDependencyFlagBits](#).

7.7. Memory Barriers

Memory barriers are used to explicitly control access to buffer and image subresource ranges. Memory barriers are used to [transfer ownership between queue families](#), [change image layouts](#), and define [availability and visibility operations](#). They explicitly define the [access types](#) and buffer and image subresource ranges that are included in the [access scopes](#) of a memory dependency that is created by a synchronization command that includes them.

7.7.1. Global Memory Barriers

Global memory barriers apply to memory accesses involving all memory objects that exist at the time of its execution.

The `VkMemoryBarrier2` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkMemoryBarrier2 {
    VkStructureType    sType;
    const void*        pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2     srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2     dstAccessMask;
} VkMemoryBarrier2;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkMemoryBarrier2 VkMemoryBarrier2KHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a [VkPipelineStageFlags2](#) mask of pipeline stages to be included in the [first synchronization scope](#).
- `srcAccessMask` is a [VkAccessFlags2](#) mask of access flags to be included in the [first access scope](#).
- `dstStageMask` is a [VkPipelineStageFlags2](#) mask of pipeline stages to be included in the [second synchronization scope](#).
- `dstAccessMask` is a [VkAccessFlags2](#) mask of access flags to be included in the [second access scope](#).

This structure defines a [memory dependency](#) affecting all device memory.

The first [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by [srcStageMask](#) and [srcAccessMask](#).

The second [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by [dstStageMask](#) and [dstAccessMask](#).

Valid Usage

- VUID-VkMemoryBarrier2-srcStageMask-03929
If the [geometryShader](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT](#)
- VUID-VkMemoryBarrier2-srcStageMask-03930
If the [tessellationShader](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT](#) or [VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT](#)
- VUID-VkMemoryBarrier2-srcStageMask-03931
If the [conditionalRendering](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT](#)
- VUID-VkMemoryBarrier2-srcStageMask-03932
If the [fragmentDensityMap](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT](#)
- VUID-VkMemoryBarrier2-srcStageMask-03933
If the [transformFeedback](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT](#)
- VUID-VkMemoryBarrier2-srcStageMask-03934
If the [meshShader](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT](#)
- VUID-VkMemoryBarrier2-srcStageMask-03935
If the [taskShader](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT](#)
- VUID-VkMemoryBarrier2-srcStageMask-07316
If neither the [shadingRateImage](#) or [attachmentFragmentShadingRate](#) are enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR](#)
- VUID-VkMemoryBarrier2-srcStageMask-04957
If the [subpassShading](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI](#)
- VUID-VkMemoryBarrier2-srcStageMask-04995
If the [invocationMask](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI](#)
- VUID-VkMemoryBarrier2-srcStageMask-07946
If neither the [VK_NV_ray_tracing](#) extension or [rayTracingPipeline](#) feature are enabled,

`srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkMemoryBarrier2-srcAccessMask-03900

If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03901

If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03902

If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03903

If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03904

If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-srcAccessMask-03905

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-srcAccessMask-03906

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-srcAccessMask-03907

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-srcAccessMask-07454

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-srcAccessMask-03909

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-srcAccessMask-03910

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03911

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03912

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03913

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03914

If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03915

If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_CLEAR_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03916

If `srcAccessMask` includes `VK_ACCESS_2_HOST_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_HOST_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03917

If `srcAccessMask` includes `VK_ACCESS_2_HOST_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_HOST_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03918

If `srcAccessMask` includes `VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT`, `srcStageMask`

must include VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03919

If `srcAccessMask` includes VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT, `srcStageMask`
must include VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03920

If `srcAccessMask` includes VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT, `srcStageMask`
must include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-04747

If `srcAccessMask` includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT,
`srcStageMask` **must** include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT,
VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT,
or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03922

If `srcAccessMask` includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT,
`srcStageMask` **must** include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03923

If `srcAccessMask` includes VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV, `srcStageMask` **must**
include VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-04994

If `srcAccessMask` includes VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI, `srcStageMask` **must**
include VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

- VUID-VkMemoryBarrier2-srcAccessMask-03924

If `srcAccessMask` includes VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV, `srcStageMask` **must**
include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV or
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03925

If `srcAccessMask` includes VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV, `srcStageMask` **must**
include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV or
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03926

If `srcAccessMask` includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT,
`srcStageMask` **must** include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03927

If `srcAccessMask` includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, `srcStageMask`
must include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR,
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT
stages

- VUID-VkMemoryBarrier2-srcAccessMask-03928
If `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-srcAccessMask-06256
If the `rayQuery` feature is not enabled and `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` **must** not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkMemoryBarrier2-srcAccessMask-07272
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkMemoryBarrier2-srcAccessMask-04858
If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`
- VUID-VkMemoryBarrier2-srcAccessMask-04859
If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`
- VUID-VkMemoryBarrier2-srcAccessMask-04860
If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`
- VUID-VkMemoryBarrier2-srcAccessMask-04861
If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`
- VUID-VkMemoryBarrier2-srcAccessMask-07455
If `srcAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`
- VUID-VkMemoryBarrier2-srcAccessMask-07456
If `srcAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`
- VUID-VkMemoryBarrier2-srcAccessMask-07457
If `srcAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`
- VUID-VkMemoryBarrier2-srcAccessMask-07458
If `srcAccessMask` includes `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`
- VUID-VkMemoryBarrier2-srcAccessMask-08118
If `srcAccessMask` includes `VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-dstStageMask-03929
If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- VUID-VkMemoryBarrier2-dstStageMask-03930
If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkMemoryBarrier2-dstStageMask-03931
If the `conditionalRendering` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-VkMemoryBarrier2-dstStageMask-03932
If the `fragmentDensityMap` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkMemoryBarrier2-dstStageMask-03933
If the `transformFeedback` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-VkMemoryBarrier2-dstStageMask-03934
If the `meshShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`
- VUID-VkMemoryBarrier2-dstStageMask-03935
If the `taskShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
- VUID-VkMemoryBarrier2-dstStageMask-07316
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkMemoryBarrier2-dstStageMask-04957
If the `subpassShading` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`
- VUID-VkMemoryBarrier2-dstStageMask-04995
If the `invocationMask` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`
- VUID-VkMemoryBarrier2-dstStageMask-07946
If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkMemoryBarrier2-dstAccessMask-03900
If `dstAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-03901
If `dstAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`,

VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03902

If `dstAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03903

If `dstAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03904

If `dstAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-dstAccessMask-03905

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-dstAccessMask-03906

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-dstAccessMask-03907

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-dstAccessMask-07454

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-dstAccessMask-03909

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryBarrier2-dstAccessMask-03910

If `dstAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03911

If `dstAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`

VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03912

If `dstAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03913

If `dstAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03914

If `dstAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03915

If `dstAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_CLEAR_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03916

If `dstAccessMask` includes `VK_ACCESS_2_HOST_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_HOST_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03917

If `dstAccessMask` includes `VK_ACCESS_2_HOST_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_HOST_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03918

If `dstAccessMask` includes `VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03919

If `dstAccessMask` includes `VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03920

If `dstAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-04747
If `dstAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-03922
If `dstAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-03923
If `dstAccessMask` includes `VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-04994
If `dstAccessMask` includes `VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`
- VUID-VkMemoryBarrier2-dstAccessMask-03924
If `dstAccessMask` includes `VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-03925
If `dstAccessMask` includes `VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-03926
If `dstAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-03927
If `dstAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkMemoryBarrier2-dstAccessMask-03928
If `dstAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-06256
If the `rayQuery` feature is not enabled and `dstAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `dstStageMask` **must** not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkMemoryBarrier2-dstAccessMask-07272
If `dstAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkMemoryBarrier2-dstAccessMask-04858
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`
- VUID-VkMemoryBarrier2-dstAccessMask-04859
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`
- VUID-VkMemoryBarrier2-dstAccessMask-04860
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`
- VUID-VkMemoryBarrier2-dstAccessMask-04861
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`
- VUID-VkMemoryBarrier2-dstAccessMask-07455
If `dstAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`
- VUID-VkMemoryBarrier2-dstAccessMask-07456
If `dstAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`
- VUID-VkMemoryBarrier2-dstAccessMask-07457
If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`
- VUID-VkMemoryBarrier2-dstAccessMask-07458
If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`
- VUID-VkMemoryBarrier2-dstAccessMask-08118
If `dstAccessMask` includes `VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

Valid Usage (Implicit)

- VUID-VkMemoryBarrier2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_BARRIER_2`
- VUID-VkMemoryBarrier2-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of [VkPipelineStageFlagBits2](#) values
- VUID-VkMemoryBarrier2-srcAccessMask-parameter
`srcAccessMask` **must** be a valid combination of [VkAccessFlagBits2](#) values

- VUID-VkMemoryBarrier2-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of [VkPipelineStageFlagBits2](#) values
- VUID-VkMemoryBarrier2-dstAccessMask-parameter
`dstAccessMask` **must** be a valid combination of [VkAccessFlagBits2](#) values

The `VkMemoryBarrier` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryBarrier {
    VkStructureType    sType;
    const void*        pNext;
    VkAccessFlags       srcAccessMask;
    VkAccessFlags       dstAccessMask;
} VkMemoryBarrier;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcAccessMask` is a bitmask of [VkAccessFlagBits](#) specifying a [source access mask](#).
- `dstAccessMask` is a bitmask of [VkAccessFlagBits](#) specifying a [destination access mask](#).

The first [access scope](#) is limited to access types in the [source access mask](#) specified by `srcAccessMask`.

The second [access scope](#) is limited to access types in the [destination access mask](#) specified by `dstAccessMask`.

Valid Usage (Implicit)

- VUID-VkMemoryBarrier-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_BARRIER`
- VUID-VkMemoryBarrier-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkMemoryBarrier-srcAccessMask-parameter
`srcAccessMask` **must** be a valid combination of [VkAccessFlagBits](#) values
- VUID-VkMemoryBarrier-dstAccessMask-parameter
`dstAccessMask` **must** be a valid combination of [VkAccessFlagBits](#) values

7.7.2. Buffer Memory Barriers

Buffer memory barriers only apply to memory accesses involving a specific buffer range. That is, a memory dependency formed from a buffer memory barrier is [scoped](#) to access via the specified buffer range. Buffer memory barriers **can** also be used to define a [queue family ownership transfer](#) for the specified buffer range.

The `VkBufferMemoryBarrier2` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkBufferMemoryBarrier2 {
    VkStructureType      sType;
    const void*          pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2       srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2       dstAccessMask;
    uint32_t             srcQueueFamilyIndex;
    uint32_t             dstQueueFamilyIndex;
    VkBuffer              buffer;
    VkDeviceSize          offset;
    VkDeviceSize          size;
} VkBufferMemoryBarrier2;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkBufferMemoryBarrier2 VkBufferMemoryBarrier2KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcStageMask** is a [VkPipelineStageFlags2](#) mask of pipeline stages to be included in the [first synchronization scope](#).
- **srcAccessMask** is a [VkAccessFlags2](#) mask of access flags to be included in the [first access scope](#).
- **dstStageMask** is a [VkPipelineStageFlags2](#) mask of pipeline stages to be included in the [second synchronization scope](#).
- **dstAccessMask** is a [VkAccessFlags2](#) mask of access flags to be included in the [second access scope](#).
- **srcQueueFamilyIndex** is the source queue family for a [queue family ownership transfer](#).
- **dstQueueFamilyIndex** is the destination queue family for a [queue family ownership transfer](#).
- **buffer** is a handle to the buffer whose backing memory is affected by the barrier.
- **offset** is an offset in bytes into the backing memory for **buffer**; this is relative to the base offset as bound to the buffer (see [vkBindBufferMemory](#)).
- **size** is a size in bytes of the affected area of backing memory for **buffer**, or `VK_WHOLE_SIZE` to use the range from **offset** to the end of the buffer.

This structure defines a [memory dependency](#) limited to a range of a buffer, and **can** define a [queue family ownership transfer operation](#) for that range.

The first [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by **srcStageMask** and **srcAccessMask**.

The second [synchronization scope](#) and [access scope](#) described by this structure include only

operations and memory accesses specified by `dstStageMask` and `dstAccessMask`.

Both `access scopes` are limited to only memory accesses to `buffer` in the range defined by `offset` and `size`.

If `buffer` was created with `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, this memory barrier defines a `queue family ownership transfer operation`. When executed on a queue in the family identified by `srcQueueFamilyIndex`, this barrier defines a `queue family release operation` for the specified buffer range, and the second synchronization scope does not apply to this operation. When executed on a queue in the family identified by `dstQueueFamilyIndex`, this barrier defines a `queue family acquire operation` for the specified buffer range, and the first synchronization scope does not apply to this operation.

A `queue family ownership transfer operation` is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in `Queue Family Ownership Transfer`. A `queue family release operation` is defined when `dstQueueFamilyIndex` is one of those values, and a `queue family acquire operation` is defined when `srcQueueFamilyIndex` is one of those values.

Valid Usage

- VUID-VkBufferMemoryBarrier2-srcStageMask-03929
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- VUID-VkBufferMemoryBarrier2-srcStageMask-03930
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkBufferMemoryBarrier2-srcStageMask-03931
If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-VkBufferMemoryBarrier2-srcStageMask-03932
If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkBufferMemoryBarrier2-srcStageMask-03933
If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-VkBufferMemoryBarrier2-srcStageMask-03934
If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`
- VUID-VkBufferMemoryBarrier2-srcStageMask-03935
If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
- VUID-VkBufferMemoryBarrier2-srcStageMask-07316
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled,

`srcStageMask` **must** not contain
`VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcStageMask-04957
If the `subpassShading` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`
- VUID-VkBufferMemoryBarrier2-srcStageMask-04995
If the `invocationMask` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`
- VUID-VkBufferMemoryBarrier2-srcStageMask-07946
If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03900
If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `srcStageMask` **must** include
`VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`,
`VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`,
`VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03901
If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `srcStageMask` **must** include
`VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`,
`VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`,
`VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03902
If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `srcStageMask` **must** include
`VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`,
`VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`,
`VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or
`VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03903
If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `srcStageMask` **must** include
`VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`,
`VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or
`VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03904
If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `srcStageMask` **must** include
`VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of
the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03905
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `srcStageMask` **must** include
`VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of
the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03906
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` **must** include
`VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of
the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03907

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkBufferMemoryBarrier2-srcAccessMask-07454

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03909

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03910

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03911

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03912

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03913

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03914

If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03915

If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_CLEAR_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`

VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03916
If `srcAccessMask` includes `VK_ACCESS_2_HOST_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_HOST_BIT`
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03917
If `srcAccessMask` includes `VK_ACCESS_2_HOST_WRITE_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_HOST_BIT`

If `dstAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-03912
If `dstAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-03913
If `dstAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-03914
If `dstAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-03915
If `dstAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_CLEAR_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-03916
If `dstAccessMask` includes `VK_ACCESS_2_HOST_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_HOST_BIT`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-03917
If `dstAccessMask` includes `VK_ACCESS_2_HOST_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_HOST_BIT`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-03918

If `dstAccessMask` includes `VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03919

If `dstAccessMask` includes `VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03920

If `dstAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-04747

If `dstAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03922

If `dstAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03923

If `dstAccessMask` includes `VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-04994

If `dstAccessMask` includes `VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03924

If `dstAccessMask` includes `VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03925

If `dstAccessMask` includes `VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03926

If `dstAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03927

If `dstAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT`

stages

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03928
If `dstAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-06256
If the `rayQuery` feature is not enabled and `dstAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `dstStageMask` **must** not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-07272
If `dstAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-04858
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-04859
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-04860
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-04861
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-07455
If `dstAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-07456
If `dstAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-07457
If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-07458
If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`
- VUID-VkBufferMemoryBarrier2-dstAccessMask-08118
If `dstAccessMask` includes `VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or

one of `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkBufferMemoryBarrier2-offset-01187
`offset` **must** be less than the size of `buffer`
- VUID-VkBufferMemoryBarrier2-size-01188
If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be greater than 0
- VUID-VkBufferMemoryBarrier2-size-01189
If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be less than or equal to the size of `buffer` minus `offset`
- VUID-VkBufferMemoryBarrier2-buffer-01931
If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkBufferMemoryBarrier2-buffer-09095
If `buffer` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `srcQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family
- VUID-VkBufferMemoryBarrier2-buffer-09096
If `buffer` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family
- VUID-VkBufferMemoryBarrier2-srcQueueFamilyIndex-04087
If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, at least one of `srcQueueFamilyIndex` or `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL` or `VK_QUEUE_FAMILY_FOREIGN_EXT`
- VUID-VkBufferMemoryBarrier2-None-09097
If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `srcQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL`
- VUID-VkBufferMemoryBarrier2-None-09098
If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL`
- VUID-VkBufferMemoryBarrier2-srcQueueFamilyIndex-09099
If the `VK_EXT_queue_family_foreign` extension is not enabled `srcQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`
- VUID-VkBufferMemoryBarrier2-dstQueueFamilyIndex-09100
If the `VK_EXT_queue_family_foreign` extension is not enabled `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`
- VUID-VkBufferMemoryBarrier2-srcStageMask-03851
If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be equal

Valid Usage (Implicit)

- VUID-VkBufferMemoryBarrier2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER_2`
- VUID-VkBufferMemoryBarrier2-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkExternalMemoryAcquireUnmodifiedEXT`
- VUID-VkBufferMemoryBarrier2-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkBufferMemoryBarrier2-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkBufferMemoryBarrier2-srcAccessMask-parameter
`srcAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values
- VUID-VkBufferMemoryBarrier2-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkBufferMemoryBarrier2-dstAccessMask-parameter
`dstAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values
- VUID-VkBufferMemoryBarrier2-buffer-parameter
`buffer` **must** be a valid `VkBuffer` handle

The `VkBufferMemoryBarrier` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBufferMemoryBarrier {
    VkStructureType    sType;
    const void*        pNext;
    VkAccessFlags       srcAccessMask;
    VkAccessFlags       dstAccessMask;
    uint32_t            srcQueueFamilyIndex;
    uint32_t            dstQueueFamilyIndex;
    VkBuffer            buffer;
    VkDeviceSize        offset;
    VkDeviceSize        size;
} VkBufferMemoryBarrier;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [source access mask](#).
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [destination access mask](#).
- `srcQueueFamilyIndex` is the source queue family for a [queue family ownership transfer](#).
- `dstQueueFamilyIndex` is the destination queue family for a [queue family ownership transfer](#).

- **buffer** is a handle to the buffer whose backing memory is affected by the barrier.
- **offset** is an offset in bytes into the backing memory for **buffer**; this is relative to the base offset as bound to the buffer (see [vkBindBufferMemory](#)).
- **size** is a size in bytes of the affected area of backing memory for **buffer**, or **VK_WHOLE_SIZE** to use the range from **offset** to the end of the buffer.

The first **access scope** is limited to access to memory through the specified buffer range, via access types in the **source access mask** specified by **srcAccessMask**. If **srcAccessMask** includes **VK_ACCESS_HOST_WRITE_BIT**, a **memory domain operation** is performed where available memory in the host domain is also made available to the device domain.

The second **access scope** is limited to access to memory through the specified buffer range, via access types in the **destination access mask** specified by **dstAccessMask**. If **dstAccessMask** includes **VK_ACCESS_HOST_WRITE_BIT** or **VK_ACCESS_HOST_READ_BIT**, a **memory domain operation** is performed where available memory in the device domain is also made available to the host domain.

NOTE

When **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** is used, available memory in host domain is automatically made visible to host domain, and any host write is automatically made available to host domain.

If **srcQueueFamilyIndex** is not equal to **dstQueueFamilyIndex**, and **srcQueueFamilyIndex** is equal to the current queue family, then the memory barrier defines a **queue family release operation** for the specified buffer range, and the second synchronization scope of the calling command does not apply to this operation.

If **dstQueueFamilyIndex** is not equal to **srcQueueFamilyIndex**, and **dstQueueFamilyIndex** is equal to the current queue family, then the memory barrier defines a **queue family acquire operation** for the specified buffer range, and the first synchronization scope of the calling command does not apply to this operation.

Valid Usage

- VUID-VkBufferMemoryBarrier-offset-01187
offset must be less than the size of **buffer**
- VUID-VkBufferMemoryBarrier-size-01188
If **size** is not equal to **VK_WHOLE_SIZE**, **size must** be greater than 0
- VUID-VkBufferMemoryBarrier-size-01189
If **size** is not equal to **VK_WHOLE_SIZE**, **size must** be less than or equal to than the size of **buffer** minus **offset**
- VUID-VkBufferMemoryBarrier-buffer-01931
If **buffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-VkBufferMemoryBarrier-buffer-09095
If **buffer** was created with a sharing mode of **VK_SHARING_MODE_EXCLUSIVE**, and **srcQueueFamilyIndex** and **dstQueueFamilyIndex** are not equal, **srcQueueFamilyIndex must** be **VK_QUEUE_FAMILY_EXTERNAL**, **VK_QUEUE_FAMILY_FOREIGN_EXT**, or a valid queue family

- VUID-VkBufferMemoryBarrier-buffer-09096
If `buffer` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family
- VUID-VkBufferMemoryBarrier-srcQueueFamilyIndex-04087
If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, at least one of `srcQueueFamilyIndex` or `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL` or `VK_QUEUE_FAMILY_FOREIGN_EXT`
- VUID-VkBufferMemoryBarrier-None-09097
If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `srcQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL`
- VUID-VkBufferMemoryBarrier-None-09098
If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL`
- VUID-VkBufferMemoryBarrier-srcQueueFamilyIndex-09099
If the `VK_EXT_queue_family_foreign` extension is not enabled `srcQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`
- VUID-VkBufferMemoryBarrier-dstQueueFamilyIndex-09100
If the `VK_EXT_queue_family_foreign` extension is not enabled `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`
- VUID-VkBufferMemoryBarrier-None-09049
If the `synchronization2` feature is not enabled, and `buffer` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, at least one of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_IGNORED`
- VUID-VkBufferMemoryBarrier-None-09050
If the `synchronization2` feature is not enabled, and `buffer` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, `srcQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_IGNORED` or `VK_QUEUE_FAMILY_EXTERNAL`
- VUID-VkBufferMemoryBarrier-None-09051
If the `synchronization2` feature is not enabled, and `buffer` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_IGNORED` or `VK_QUEUE_FAMILY_EXTERNAL`

Valid Usage (Implicit)

- VUID-VkBufferMemoryBarrier-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER`
- VUID-VkBufferMemoryBarrier-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkExternalMemoryAcquireUnmodifiedEXT`
- VUID-VkBufferMemoryBarrier-sType-unique

The `sType` value of each struct in the `pNext` chain **must** be unique

- `VOID-VkBufferMemoryBarrier-buffer-parameter`
`buffer` **must** be a valid `VkBuffer` handle

`VK_WHOLE_SIZE` is a special value indicating that the entire remaining length of a buffer following a given `offset` should be used. It **can** be specified for `VkBufferMemoryBarrier::size` and other structures.

```
#define VK_WHOLE_SIZE          (~0ULL)
```

7.7.3. Image Memory Barriers

Image memory barriers only apply to memory accesses involving a specific image subresource range. That is, a memory dependency formed from an image memory barrier is **scoped** to access via the specified image subresource range. Image memory barriers **can** also be used to define **image layout transitions** or a **queue family ownership transfer** for the specified image subresource range.

The `VkImageMemoryBarrier2` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkImageMemoryBarrier2 {
    VkStructureType    sType;
    const void*        pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2      srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2      dstAccessMask;
    VkImageLayout       oldLayout;
    VkImageLayout       newLayout;
    uint32_t            srcQueueFamilyIndex;
    uint32_t            dstQueueFamilyIndex;
    VkImage             image;
    VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier2;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkImageMemoryBarrier2 VkImageMemoryBarrier2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the **first**

synchronization scope.

- `srcAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the [first access scope](#).
- `dstStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the [second synchronization scope](#).
- `dstAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the [second access scope](#).
- `oldLayout` is the old layout in an [image layout transition](#).
- `newLayout` is the new layout in an [image layout transition](#).
- `srcQueueFamilyIndex` is the source queue family for a [queue family ownership transfer](#).
- `dstQueueFamilyIndex` is the destination queue family for a [queue family ownership transfer](#).
- `image` is a handle to the image affected by this barrier.
- `subresourceRange` describes the [image subresource range](#) within `image` that is affected by this barrier.

This structure defines a [memory dependency](#) limited to an image subresource range, and **can** define a [queue family ownership transfer operation](#) and [image layout transition](#) for that subresource range.

The first [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by `srcStageMask` and `srcAccessMask`.

The second [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by `dstStageMask` and `dstAccessMask`.

Both [access scopes](#) are limited to only memory accesses to `image` in the subresource range defined by `subresourceRange`.

If `image` was created with `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, this memory barrier defines a [queue family ownership transfer operation](#). When executed on a queue in the family identified by `srcQueueFamilyIndex`, this barrier defines a [queue family release operation](#) for the specified image subresource range, and the second synchronization scope does not apply to this operation. When executed on a queue in the family identified by `dstQueueFamilyIndex`, this barrier defines a [queue family acquire operation](#) for the specified image subresource range, and the first synchronization, the first synchronization scope does not apply to this operation.

A [queue family ownership transfer operation](#) is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in [Queue Family Ownership Transfer](#). A [queue family release operation](#) is defined when `dstQueueFamilyIndex` is one of those values, and a [queue family acquire operation](#) is defined when `srcQueueFamilyIndex` is one of those values.

If `oldLayout` is not equal to `newLayout`, then the memory barrier defines an [image layout transition](#) for the specified image subresource range. If this memory barrier defines a [queue family ownership transfer operation](#), the layout transition is only executed once between the queues.

NOTE	When the old and new layout are equal, the layout values are ignored - data is
-------------	--

preserved no matter what values are specified, or what layout the image is currently in.

If `image` has a multi-planar format and the image is *disjoint*, then including `VK_IMAGE_ASPECT_COLOR_BIT` in the `aspectMask` member of `subresourceRange` is equivalent to including `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, and (for three-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`.

Valid Usage

- VUID-VkImageMemoryBarrier2-srcStageMask-03929
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- VUID-VkImageMemoryBarrier2-srcStageMask-03930
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkImageMemoryBarrier2-srcStageMask-03931
If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-VkImageMemoryBarrier2-srcStageMask-03932
If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkImageMemoryBarrier2-srcStageMask-03933
If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-VkImageMemoryBarrier2-srcStageMask-03934
If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`
- VUID-VkImageMemoryBarrier2-srcStageMask-03935
If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
- VUID-VkImageMemoryBarrier2-srcStageMask-07316
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

If **dstAccessMask** includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-dstAccessMask-03923

If **dstAccessMask** includes VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-dstAccessMask-04994

If **dstAccessMask** includes VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

- VUID-VkImageMemoryBarrier2-dstAccessMask-03924

If **dstAccessMask** includes VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-dstAccessMask-03925

If **dstAccessMask** includes VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-dstAccessMask-03926

If **dstAccessMask** includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-dstAccessMask-03927

If **dstAccessMask** includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-dstAccessMask-03928

If **dstAccessMask** includes VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-dstAccessMask-06256

If the **rayQuery** feature is not enabled and **dstAccessMask** includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, **dstStageMask** **must** not include any of

the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except
`VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkImageMemoryBarrier2-dstAccessMask-07272
If `dstAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkImageMemoryBarrier2-dstAccessMask-04858
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`
- VUID-VkImageMemoryBarrier2-dstAccessMask-04859
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`
- VUID-VkImageMemoryBarrier2-dstAccessMask-04860
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`
- VUID-VkImageMemoryBarrier2-dstAccessMask-04861
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`
- VUID-VkImageMemoryBarrier2-dstAccessMask-07455
If `dstAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`
- VUID-VkImageMemoryBarrier2-dstAccessMask-07456
If `dstAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`
- VUID-VkImageMemoryBarrier2-dstAccessMask-07457
If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`
- VUID-VkImageMemoryBarrier2-dstAccessMask-07458
If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`
- VUID-VkImageMemoryBarrier2-dstAccessMask-08118
If `dstAccessMask` includes `VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkImageMemoryBarrier2-oldLayout-01208
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`
- VUID-VkImageMemoryBarrier2-oldLayout-01209
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is

VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL then **image must** have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier2-oldLayout-01210

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL then **image must** have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier2-oldLayout-01211

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL then **image must** have been created with VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier2-oldLayout-01212

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then **image must** have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT

- VUID-VkImageMemoryBarrier2-oldLayout-01213

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL then **image must** have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT

- VUID-VkImageMemoryBarrier2-oldLayout-01197

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), `oldLayout must` be VK_IMAGE_LAYOUT_UNDEFINED or the current layout of the image subresources affected by the barrier

- VUID-VkImageMemoryBarrier2-newLayout-01198

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), `newLayout must` not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

- VUID-VkImageMemoryBarrier2-oldLayout-01658

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL then **image must** have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier2-oldLayout-01659

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL then **image must** have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04065

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is

VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL then **image** **must** have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04066

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL then **image** **must** have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT set

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04067

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then **image** **must** have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04068

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL then **image** **must** have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT set

- VUID-VkImageMemoryBarrier2-synchronization2-07793

If the `synchronization2` feature is not enabled, `oldLayout` **must** not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkImageMemoryBarrier2-synchronization2-07794

If the `synchronization2` feature is not enabled, `newLayout` **must** not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03938

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL, **image** **must** have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03939

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL, **image** **must** have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier2-oldLayout-02088

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR then **image** **must** have been created with VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR set

- VUID-VkImageMemoryBarrier2-image-09117

If **image** was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `srcQueueFamilyIndex` **must** be

VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

- VUID-VkImageMemoryBarrier2-image-09118

If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04070

If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, at least one of `srcQueueFamilyIndex` or `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL` or `VK_QUEUE_FAMILY_FOREIGN_EXT`

- VUID-VkImageMemoryBarrier2-None-09119

If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `srcQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkImageMemoryBarrier2-None-09120

If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-09121

If the `VK_EXT_queue_family_foreign` extension is not enabled `srcQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`

- VUID-VkImageMemoryBarrier2-dstQueueFamilyIndex-09122

If the `VK_EXT_queue_family_foreign` extension is not enabled `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07120

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a `queue family ownership transfer` or `oldLayout` and `newLayout` define an `image layout transition`, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR`

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07121

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a `queue family ownership transfer` or `oldLayout` and `newLayout` define an `image layout transition`, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07122

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a `queue family ownership transfer` or `oldLayout` and `newLayout` define an `image layout transition`, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07123

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a `queue family ownership transfer` or `oldLayout` and `newLayout` define an `image layout transition`, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07124
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07125
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07006
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then `image` **must** have been created with either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage bits, and the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits, and the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit
- VUID-VkImageMemoryBarrier2-attachmentFeedbackLoopLayout-07313
If the `attachmentFeedbackLoopLayout` feature is not enabled, `newLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-09550
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` then `image` **must** have been created with either `VK_IMAGE_USAGE_STORAGE_BIT`, or with both `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` and either of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkImageMemoryBarrier2-dynamicRenderingLocalRead-09551
If the `dynamicRenderingLocalRead` feature is not enabled, `oldLayout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`
- VUID-VkImageMemoryBarrier2-dynamicRenderingLocalRead-09552
If the `dynamicRenderingLocalRead` feature is not enabled, `newLayout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`
- VUID-VkImageMemoryBarrier2-subresourceRange-01486
`subresourceRange.baseMipLevel` **must** be less than the `mipLevels` specified in [VkImageCreateInfo](#) when `image` was created
- VUID-VkImageMemoryBarrier2-subresourceRange-01724
If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` **must** be less than or equal to the `mipLevels` specified in [VkImageCreateInfo](#) when `image` was created
- VUID-VkImageMemoryBarrier2-subresourceRange-01488
`subresourceRange.baseArrayLayer` **must** be less than the `arrayLayers` specified in [VkImageCreateInfo](#) when `image` was created

- VUID-VkImageMemoryBarrier2-subresourceRange-01725
If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.baseArrayLayer + subresourceRange.layerCount` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkImageMemoryBarrier2-image-01932
If `image` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkImageMemoryBarrier2-image-09241
If `image` has a color format that is single-plane, then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-VkImageMemoryBarrier2-image-09242
If `image` has a color format and is not *disjoint*, then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-VkImageMemoryBarrier2-image-01672
If `image` has a multi-planar format and the image is *disjoint*, then the `aspectMask` member of `subresourceRange` **must** include at least one `multi-planar aspect mask` bit or `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-VkImageMemoryBarrier2-image-03320
If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is not enabled, then the `aspectMask` member of `subresourceRange` **must** include both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`
- VUID-VkImageMemoryBarrier2-image-03319
If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is enabled, then the `aspectMask` member of `subresourceRange` **must** include either or both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`
- VUID-VkImageMemoryBarrier2-aspectMask-08702
If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_DEPTH_BIT`, `oldLayout` and `newLayout` **must** not be one of `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkImageMemoryBarrier2-aspectMask-08703
If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, `oldLayout` and `newLayout` **must** not be one of `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`
- VUID-VkImageMemoryBarrier2-subresourceRange-09601
`subresourceRange.aspectMask` **must** be valid for the `format` the `image` was created with
- VUID-VkImageMemoryBarrier2-srcStageMask-03854
If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be equal
- VUID-VkImageMemoryBarrier2-srcStageMask-03855
If `srcStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a `queue family ownership transfer` or `oldLayout` and `newLayout`

define an `image layout transition`, `oldLayout` **must** be one of `VK_IMAGE_LAYOUT_PREINITIALIZED`, `VK_IMAGE_LAYOUT_UNDEFINED`, or `VK_IMAGE_LAYOUT_GENERAL`

Valid Usage (Implicit)

- VUID-VkImageMemoryBarrier2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER_2`
- VUID-VkImageMemoryBarrier2-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkExternalMemoryAcquireUnmodifiedEXT` or `VkSampleLocationsInfoEXT`
- VUID-VkImageMemoryBarrier2-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkImageMemoryBarrier2-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkImageMemoryBarrier2-srcAccessMask-parameter
`srcAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values
- VUID-VkImageMemoryBarrier2-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkImageMemoryBarrier2-dstAccessMask-parameter
`dstAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values
- VUID-VkImageMemoryBarrier2-oldLayout-parameter
`oldLayout` **must** be a valid `VkImageLayout` value
- VUID-VkImageMemoryBarrier2-newLayout-parameter
`newLayout` **must** be a valid `VkImageLayout` value
- VUID-VkImageMemoryBarrier2-image-parameter
`image` **must** be a valid `VkImage` handle
- VUID-VkImageMemoryBarrier2-subresourceRange-parameter
`subresourceRange` **must** be a valid `VkImageSubresourceRange` structure

The `VkImageMemoryBarrier` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageMemoryBarrier {
    VkStructureType      sType;
    const void*          pNext;
    VkAccessFlags         srcAccessMask;
    VkAccessFlags         dstAccessMask;
    VkImageLayout         oldLayout;
    VkImageLayout         newLayout;
    uint32_t              srcQueueFamilyIndex;
    uint32_t              dstQueueFamilyIndex;
    VkImage               image;
    VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [source access mask](#).
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [destination access mask](#).
- `oldLayout` is the old layout in an [image layout transition](#).
- `newLayout` is the new layout in an [image layout transition](#).
- `srcQueueFamilyIndex` is the source queue family for a [queue family ownership transfer](#).
- `dstQueueFamilyIndex` is the destination queue family for a [queue family ownership transfer](#).
- `image` is a handle to the image affected by this barrier.
- `subresourceRange` describes the [image subresource range](#) within `image` that is affected by this barrier.

The first [access scope](#) is limited to access to memory through the specified image subresource range, via access types in the [source access mask](#) specified by `srcAccessMask`. If `srcAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT`, memory writes performed by that access type are also made visible, as that access type is not performed through a resource.

The second [access scope](#) is limited to access to memory through the specified image subresource range, via access types in the [destination access mask](#) specified by `dstAccessMask`. If `dstAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT` or `VK_ACCESS_HOST_READ_BIT`, available memory writes are also made visible to accesses of those types, as those access types are not performed through a resource.

If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, and `srcQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a [queue family release operation](#) for the specified image subresource range, and the second synchronization scope of the calling command does not apply to this operation.

If `dstQueueFamilyIndex` is not equal to `srcQueueFamilyIndex`, and `dstQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a [queue family acquire operation](#) for the specified image subresource range, and the first synchronization scope of the calling command does not apply to this operation.

If the `synchronization2` feature is not enabled or `oldLayout` is not equal to `newLayout`, `oldLayout` and `newLayout` define an [image layout transition](#) for the specified image subresource range.

NOTE

If the `synchronization2` feature is enabled, when the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If `image` has a multi-planar format and the image is *disjoint*, then including `VK_IMAGE_ASPECT_COLOR_BIT` in the `aspectMask` member of `subresourceRange` is equivalent to including `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, and (for three-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`.

Valid Usage

- VUID-VkImageMemoryBarrier-oldLayout-01208

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier-oldLayout-01209

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier-oldLayout-01210

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier-oldLayout-01211

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier-oldLayout-01212

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`

- VUID-VkImageMemoryBarrier-oldLayout-01213

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT`

- VUID-VkImageMemoryBarrier-oldLayout-01197

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), `oldLayout` **must** be `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources affected by the barrier

- VUID-VkImageMemoryBarrier-newLayout-01198

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), `newLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- VUID-VkImageMemoryBarrier-oldLayout-01658

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier-oldLayout-01659

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04065

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` then `image` **must** have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04066

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04067

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04068

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set

- VUID-VkImageMemoryBarrier-synchronization2-07793

If the `synchronization2` feature is not enabled, `oldLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkImageMemoryBarrier-synchronization2-07794

If the `synchronization2` feature is not enabled, `newLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03938

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a `queue family ownership transfer` or `oldLayout` and `newLayout` define an `image layout transition`, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL`, `image` **must** have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03939

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a `queue family ownership transfer` or `oldLayout` and `newLayout` define an `image layout transition`, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL`, `image` **must** have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier-oldLayout-02088

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a `queue family ownership transfer` or `oldLayout` and `newLayout` define an `image layout transition`, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` set

- VUID-VkImageMemoryBarrier-image-09117

If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `srcQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family

- VUID-VkImageMemoryBarrier-image-09118

If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04070

If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, at least one of `srcQueueFamilyIndex` or `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL` or `VK_QUEUE_FAMILY_FOREIGN_EXT`

- VUID-VkImageMemoryBarrier-None-09119

If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `srcQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkImageMemoryBarrier-None-09120

If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-09121

If the `VK_EXT_queue_family_foreign` extension is not enabled `srcQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`

- VUID-VkImageMemoryBarrier-dstQueueFamilyIndex-09122

If the `VK_EXT_queue_family_foreign` extension is not enabled `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07120
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR`
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07121
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07122
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07123
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07124
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07125
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` then `image` **must** have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07006
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then `image` **must** have been created with either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage bits, and the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits, and the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit
- VUID-VkImageMemoryBarrier-attachmentFeedbackLoopLayout-07313
If the `attachmentFeedbackLoopLayout` feature is not enabled, `newLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-09550
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a [queue family ownership transfer](#) or `oldLayout` and `newLayout` define an [image layout transition](#), and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` then `image` **must** have been created with either

VK_IMAGE_USAGE_STORAGE_BIT, or with both VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT and either of VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-dynamicRenderingLocalRead-09551

If the `dynamicRenderingLocalRead` feature is not enabled, `oldLayout` **must** not be VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

- VUID-VkImageMemoryBarrier-dynamicRenderingLocalRead-09552

If the `dynamicRenderingLocalRead` feature is not enabled, `newLayout` **must** not be VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

- VUID-VkImageMemoryBarrier-subresourceRange-01486

`subresourceRange.baseMipLevel` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created

- VUID-VkImageMemoryBarrier-subresourceRange-01724

If `subresourceRange.levelCount` is not VK_REMAINING_MIP_LEVELS, `subresourceRange.baseMipLevel + subresourceRange.levelCount` **must** be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created

- VUID-VkImageMemoryBarrier-subresourceRange-01488

`subresourceRange.baseArrayLayer` **must** be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created

- VUID-VkImageMemoryBarrier-subresourceRange-01725

If `subresourceRange.layerCount` is not VK_REMAINING_ARRAY_LAYERS, `subresourceRange.baseArrayLayer + subresourceRange.layerCount` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created

- VUID-VkImageMemoryBarrier-image-01932

If `image` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkImageMemoryBarrier-image-09241

If `image` has a color format that is single-plane, then the `aspectMask` member of `subresourceRange` **must** be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageMemoryBarrier-image-09242

If `image` has a color format and is not *disjoint*, then the `aspectMask` member of `subresourceRange` **must** be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageMemoryBarrier-image-01672

If `image` has a multi-planar format and the image is *disjoint*, then the `aspectMask` member of `subresourceRange` **must** include at least one `multi-planar aspect mask` bit or VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageMemoryBarrier-image-03320

If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is not enabled, then the `aspectMask` member of `subresourceRange` **must** include both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkImageMemoryBarrier-image-03319

If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is enabled, then the `aspectMask` member of

`subresourceRange` **must** include either or both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkImageMemoryBarrier-aspectMask-08702

If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_DEPTH_BIT`, `oldLayout` and `newLayout` **must** not be one of `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkImageMemoryBarrier-aspectMask-08703

If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, `oldLayout` and `newLayout` **must** not be one of `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

- VUID-VkImageMemoryBarrier-subresourceRange-09601

`subresourceRange.aspectMask` **must** be valid for the `format` the `image` was created with

- VUID-VkImageMemoryBarrier-None-09052

If the `synchronization2` feature is not enabled, and `image` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, at least one of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_IGNORED`

- VUID-VkImageMemoryBarrier-None-09053

If the `synchronization2` feature is not enabled, and `image` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, `srcQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_IGNORED` or `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkImageMemoryBarrier-None-09054

If the `synchronization2` feature is not enabled, and `image` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_IGNORED` or `VK_QUEUE_FAMILY_EXTERNAL`

Valid Usage (Implicit)

- VUID-VkImageMemoryBarrier-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER`

- VUID-VkImageMemoryBarrier-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkExternalMemoryAcquireUnmodifiedEXT` or `VkSampleLocationsInfoEXT`

- VUID-VkImageMemoryBarrier-sType-unique

The `sType` value of each struct in the `pNext` chain **must** be unique

- VUID-VkImageMemoryBarrier-oldLayout-parameter

`oldLayout` **must** be a valid `VkImageLayout` value

- VUID-VkImageMemoryBarrier-newLayout-parameter

`newLayout` **must** be a valid `VkImageLayout` value

- VUID-VkImageMemoryBarrier-image-parameter

`image` **must** be a valid `VkImage` handle

- VUID-VkImageMemoryBarrier-subresourceRange-parameter

subresourceRange **must** be a valid [VkImageSubresourceRange](#) structure

To facilitate usage of images whose memory is initialized on the host, Vulkan allows image layout transitions to be performed by the host as well, albeit supporting limited layouts.

To perform an image layout transition on the host, call:

```
// Provided by VK_EXT_host_image_copy
VkResult vkTransitionImageLayoutEXT(
    VkDevice          device,
    uint32_t          transitionCount,
    const VkHostImageLayoutTransitionInfoEXT* pTransitions);
```

- **device** is the device which owns **pTransitions[i].image**.
- **transitionCount** is the number of image layout transitions to perform.
- **pTransitions** is a pointer to an array of [VkHostImageLayoutTransitionInfoEXT](#) structures specifying the image and [subresource ranges](#) within them to transition.

Valid Usage (Implicit)

- VUID-vkTransitionImageLayoutEXT-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkTransitionImageLayoutEXT-pTransitions-parameter **pTransitions** **must** be a valid pointer to an array of **transitionCount** valid [VkHostImageLayoutTransitionInfoEXT](#) structures
- VUID-vkTransitionImageLayoutEXT-transitionCount-arraylength **transitionCount** **must** be greater than 0

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_INITIALIZATION_FAILED**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_MEMORY_MAP_FAILED**

The **VkHostImageLayoutTransitionInfoEXT** structure is defined as:

```
// Provided by VK_EXT_host_image_copy
typedef struct VkHostImageLayoutTransitionInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkImage             image;
    VkImageLayout       oldLayout;
    VkImageLayout       newLayout;
    VkImageSubresourceRange subresourceRange;
} VkHostImageLayoutTransitionInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **image** is a handle to the image affected by this layout transition.
- **oldLayout** is the old layout in an [image layout transition](#).
- **newLayout** is the new layout in an [image layout transition](#).
- **subresourceRange** describes the [image subresource range](#) within **image** that is affected by this layout transition.

vkTransitionImageLayoutEXT does not check whether the device memory associated with an image is currently in use before performing the layout transition. The application **must** guarantee that any previously submitted command that reads from or writes to this subresource has completed before the host performs the layout transition. The memory of **image** is accessed by the host as if [coherent](#).

NOTE

Image layout transitions performed on the host do not require queue family ownership transfers as the physical layout of the image will not vary between queue families for the layouts supported by this function.

NOTE

If the device has written to the image memory, it is not automatically made available to the host. Before this command can be called, a memory barrier for this image **must** have been issued on the device with the second [synchronization scope](#) including **VK_PIPELINE_STAGE_HOST_BIT** and **VK_ACCESS_HOST_READ_BIT**.

Because queue submissions [automatically make host memory visible to the device](#), there would not be a need for a memory barrier before using the results of this layout transition on the device.

Valid Usage

- VUID-VkHostImageLayoutTransitionInfoEXT-image-09055
image **must** have been created with **VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT**
- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01486
subresourceRange.baseMipLevel **must** be less than the **mipLevels** specified in [VkImageCreateInfo](#) when **image** was created
- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01724

If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` **must** be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01488
`subresourceRange.baseArrayLayer` **must** be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01725
If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.baseArrayLayer + subresourceRange.layerCount` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkHostImageLayoutTransitionInfoEXT-image-01932
If `image` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkHostImageLayoutTransitionInfoEXT-image-09241
If `image` has a color format that is single-plane, then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-VkHostImageLayoutTransitionInfoEXT-image-09242
If `image` has a color format and is not *disjoint*, then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-VkHostImageLayoutTransitionInfoEXT-image-01672
If `image` has a multi-planar format and the image is *disjoint*, then the `aspectMask` member of `subresourceRange` **must** include at least one `multi-planar aspect mask` bit or `VK_IMAGE_ASPECT_COLOR_BIT`
- VUID-VkHostImageLayoutTransitionInfoEXT-image-03320
If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is not enabled, then the `aspectMask` member of `subresourceRange` **must** include both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`
- VUID-VkHostImageLayoutTransitionInfoEXT-image-03319
If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is enabled, then the `aspectMask` member of `subresourceRange` **must** include either or both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`
- VUID-VkHostImageLayoutTransitionInfoEXT-aspectMask-08702
If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_DEPTH_BIT`, `oldLayout` and `newLayout` **must** not be one of `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkHostImageLayoutTransitionInfoEXT-aspectMask-08703
If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, `oldLayout` and `newLayout` **must** not be one of `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`
- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-09601
`subresourceRange.aspectMask` **must** be valid for the `format` the `image` was created with

- VUID-VkHostImageLayoutTransitionInfoEXT-oldLayout-09229
`oldLayout` **must** be either `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources as specified in `subresourceRange`
- VUID-VkHostImageLayoutTransitionInfoEXT-oldLayout-09230
If `oldLayout` is not `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`, it **must** be one of the layouts in `VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopySrcLayouts`
- VUID-VkHostImageLayoutTransitionInfoEXT-newLayout-09057
`newLayout` **must** be one of the layouts in `VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopyDstLayouts`

Valid Usage (Implicit)

- VUID-VkHostImageLayoutTransitionInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_HOST_IMAGE_LAYOUT_TRANSITION_INFO_EXT`
- VUID-VkHostImageLayoutTransitionInfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkHostImageLayoutTransitionInfoEXT-image-parameter
`image` **must** be a valid `VkImage` handle
- VUID-VkHostImageLayoutTransitionInfoEXT-oldLayout-parameter
`oldLayout` **must** be a valid `VkImageLayout` value
- VUID-VkHostImageLayoutTransitionInfoEXT-newLayout-parameter
`newLayout` **must** be a valid `VkImageLayout` value
- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-parameter
`subresourceRange` **must** be a valid `VkImageSubresourceRange` structure

7.7.4. Queue Family Ownership Transfer

Resources created with a `VkSharingMode` of `VK_SHARING_MODE_EXCLUSIVE` **must** have their ownership explicitly transferred from one queue family to another in order to access their content in a well-defined manner on a queue in a different queue family.

The special queue family index `VK_QUEUE_FAMILY_IGNORED` indicates that a queue family parameter or member is ignored.

```
#define VK_QUEUE_FAMILY_IGNORED          (~0U)
```

Resources shared with external APIs or instances using external memory **must** also explicitly manage ownership transfers between local and external queues (or equivalent constructs in external APIs) regardless of the `VkSharingMode` specified when creating them.

The special queue family index `VK_QUEUE_FAMILY_EXTERNAL` represents any queue external to the resource's current Vulkan instance, as long as the queue uses the same underlying device group or physical device, and the same driver version as the resource's `VkDevice`, as indicated by

VkPhysicalDeviceIDProperties::deviceUUID and VkPhysicalDeviceIDProperties::driverUUID.

```
#define VK_QUEUE_FAMILY_EXTERNAL          (~1U)
```

or the equivalent

```
#define VK_QUEUE_FAMILY_EXTERNAL_KHR      VK_QUEUE_FAMILY_EXTERNAL
```

The special queue family index `VK_QUEUE_FAMILY_FOREIGN_EXT` represents any queue external to the resource's current Vulkan instance, regardless of the queue's underlying physical device or driver version. This includes, for example, queues for fixed-function image processing devices, media codec devices, and display devices, as well as all queues that use the same underlying device group or physical device, and the same driver version as the resource's `VkDevice`.

```
#define VK_QUEUE_FAMILY_FOREIGN_EXT      (~2U)
```

If memory dependencies are correctly expressed between uses of such a resource between two queues in different families, but no ownership transfer is defined, the contents of that resource are undefined for any read accesses performed by the second queue family.

NOTE	If an application does not need the contents of a resource to remain valid when transferring from one queue family to another, then the ownership transfer should be skipped.
NOTE	Applications should expect transfers to/from <code>VK_QUEUE_FAMILY_FOREIGN_EXT</code> to be more expensive than transfers to/from <code>VK_QUEUE_FAMILY_EXTERNAL_KHR</code> .

A queue family ownership transfer consists of two distinct parts:

1. Release exclusive ownership from the source queue family
2. Acquire exclusive ownership for the destination queue family

An application **must** ensure that these operations occur in the correct order by defining an execution dependency between them, e.g. using a semaphore.

A *release operation* is used to release exclusive ownership of a range of a buffer or image subresource range. A release operation is defined by executing a `buffer memory barrier` (for a buffer range) or an `image memory barrier` (for an image subresource range) using a pipeline barrier command, on a queue from the source queue family. The `srcQueueFamilyIndex` parameter of the barrier **must** be the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. `dstAccessMask` is ignored for such a barrier, such that no visibility operation is executed - the value of this mask does not affect the validity of the barrier. The release operation happens-after the availability operation. `dstStageMask` is also ignored for such a barrier as defined by `buffer memory ownership transfer` and `image memory ownership transfer`.

An *acquire operation* is used to acquire exclusive ownership of a range of a buffer or image subresource range. An acquire operation is defined by executing a [buffer memory barrier](#) (for a buffer range) or an [image memory barrier](#) (for an image subresource range) using a pipeline barrier command, on a queue from the destination queue family. The buffer range or image subresource range specified in an acquire operation **must** match exactly that of a previous release operation. The `srcQueueFamilyIndex` parameter of the barrier **must** be the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. `srcAccessMask` is ignored for such a barrier, such that no availability operation is executed - the value of this mask does not affect the validity of the barrier. The acquire operation happens-before the visibility operation. `srcStageMask` is also ignored for such a barrier as defined by [buffer memory ownership transfer](#) and [image memory ownership transfer](#). As the first synchronization scope for an acquire operation is empty there is no happens-before dependency. Such a dependency **can** be introduced by using `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`.

NOTE

Whilst it is not invalid to provide destination or source access masks for memory barriers used for release or acquire operations, respectively, they have no practical effect. Access after a release operation has undefined results, and so visibility for those accesses has no practical effect. Similarly, write access before an acquire operation will produce undefined results for future access, so availability of those writes has no practical use. In an earlier version of the specification, these were required to match on both sides - but this was subsequently relaxed. These masks **should** be set to 0.

NOTE

Since a release and acquire operation does not synchronize with second and first scopes respectively, the `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` stage must be used to wait for a release operation to complete. Typically, a release and acquire pair is performed by a [VkSemaphore](#) signal and wait in their respective queues. Signaling a semaphore with [vkQueueSubmit](#) waits for `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`. With [vkQueueSubmit2](#), `stageMask` for the signal semaphore must be `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`. Similarly, for the acquire operation, waiting for a semaphore must use `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` to make sure the acquire operation is synchronized.

If the transfer is via an image memory barrier, and an [image layout transition](#) is desired, then the values of `oldLayout` and `newLayout` in the *release operation's* memory barrier **must** be equal to values of `oldLayout` and `newLayout` in the *acquire operation's* memory barrier. Although the image layout transition is submitted twice, it will only be executed once. A layout transition specified in this way happens-after the *release operation* and happens-before the *acquire operation*.

If the values of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are equal, no ownership transfer is performed, and the barrier operates as if they were both set to `VK_QUEUE_FAMILY_IGNORED`.

Queue family ownership transfers **may** perform read and write accesses on all memory bound to the image subresource or buffer range, so applications **must** ensure that all memory writes have been made [available](#) before a queue family ownership transfer is executed. Available memory is automatically made visible to queue family release and acquire operations, and writes performed by those operations are automatically made available.

Once a queue family has acquired ownership of a buffer range or image subresource range of a `VK_SHARING_MODE_EXCLUSIVE` resource, its contents are undefined to other queue families unless ownership is transferred. The contents of any portion of another resource which aliases memory that is bound to the transferred buffer or image subresource range are undefined after a release or acquire operation.

NOTE

Because `events` **cannot** be used directly for inter-queue synchronization, and because `vkCmdSetEvent` does not have the queue family index or memory barrier parameters needed by a *release operation*, the release and acquire operations of a queue family ownership transfer **can** only be performed using `vkCmdPipelineBarrier`.

An *acquire operation* **may** have a performance penalty when acquiring ownership of a subresource range from one of the special queue families reserved for external memory ownership transfers described above. The application **can** reduce the performance penalty in some cases by adding a `VkExternalMemoryAcquireUnmodifiedEXT` structure to the `pNext` chain of the *acquire operation's* memory barrier structure.

The `VkExternalMemoryAcquireUnmodifiedEXT` structure is defined as:

```
// Provided by VK_EXT_external_memory_acquire_unmodified
typedef struct VkExternalMemoryAcquireUnmodifiedEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           acquireUnmodifiedMemory;
} VkExternalMemoryAcquireUnmodifiedEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `acquireUnmodifiedMemory` specifies, if `VK_TRUE`, that no range of `VkDeviceMemory` bound to the resource of the memory barrier's subresource range was modified at any time since the resource's most recent release of ownership to the queue family specified by the memory barrier's `srcQueueFamilyIndex`. If `VK_FALSE`, it specifies nothing.

If the application releases ownership of the subresource range to one of the special queue families reserved for external memory ownership transfers with a memory barrier structure, and later re-acquires ownership from the same queue family with a memory barrier structure, and if no range of `VkDeviceMemory` bound to the resource was modified at any time between the *release operation* and the *acquire operation*, then the application **should** add a `VkExternalMemoryAcquireUnmodifiedEXT` structure to the `pNext` chain of the *acquire operation's* memory barrier structure because this **may** reduce the performance penalty.

This struct is ignored if `acquireUnmodifiedMemory` is `VK_FALSE`. In particular, `VK_FALSE` does *not* specify that memory was modified.

This struct is ignored if the memory barrier's `srcQueueFamilyIndex` is not a special queue family reserved for external memory ownership transfers.

NOTE

The method by which the application determines whether memory was modified between the *release operation* and *acquire operation* is outside the scope of Vulkan.

For any Vulkan operation that accesses a resource, the application **must** not assume the implementation accesses the resource's memory as read-only, even for *apparently* read-only operations such as transfer commands and shader reads.

The validity of `VkExternalMemoryAcquireUnmodifiedEXT::acquireUnmodifiedMemory` is independent of memory ranges outside the ranges of `VkDeviceMemory` bound to the resource. In particular, it is independent of any implementation-private memory associated with the resource.

Valid Usage

- VUID-VkExternalMemoryAcquireUnmodifiedEXT-acquireUnmodifiedMemory-08922

If `acquireUnmodifiedMemory` is `VK_TRUE`, and the memory barrier's `srcQueueFamilyIndex` is a special queue family reserved for external memory ownership transfers (as described in [Queue Family Ownership Transfer](#)), then each range of `VkDeviceMemory` bound to the resource **must** have remained unmodified during all time since the resource's most recent release of ownership to the queue family

Valid Usage (Implicit)

- VUID-VkExternalMemoryAcquireUnmodifiedEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_ACQUIRE_UNMODIFIED_EXT`

7.8. Wait Idle Operations

To wait on the host for the completion of outstanding queue operations for a given queue, call:

```
// Provided by VK_VERSION_1_0
VkResult vkQueueWaitIdle(
    VkQueue queue);
```

- `queue` is the queue on which to wait.

`vkQueueWaitIdle` is equivalent to having submitted a valid fence to every previously executed [queue submission command](#) that accepts a fence, then waiting for all of those fences to signal using [vkWaitForFences](#) with an infinite timeout and `waitAll` set to `VK_TRUE`.

Valid Usage (Implicit)

- VUID-vkQueueWaitIdle-queue-parameter
`queue` **must** be a valid `VkQueue` handle

Host Synchronization

- Host access to **queue** **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
-	-	-	Any	-

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_DEVICE_LOST**

To wait on the host for the completion of outstanding queue operations for all queues on a given logical device, call:

```
// Provided by VK_VERSION_1_0
VkResult vkDeviceWaitIdle(
    VkDevice device);
```

- **device** is the logical device to idle.

vkDeviceWaitIdle is equivalent to calling **vkQueueWaitIdle** for all queues owned by **device**.

Valid Usage (Implicit)

- VUID-vkDeviceWaitIdle-device-parameter **device** **must** be a valid **VkDevice** handle

Host Synchronization

- Host access to all **VkQueue** objects created from **device** **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

7.9. Host Write Ordering Guarantees

When batches of command buffers are submitted to a queue via a [queue submission command](#), it defines a memory dependency with prior host operations, and execution of command buffers submitted to the queue.

The first [synchronization scope](#) includes execution of `vkQueueSubmit` on the host and anything that happened-before it, as defined by the host memory model.

NOTE

Some systems allow writes that do not directly integrate with the host memory model; these have to be synchronized by the application manually. One example of this is non-temporal store instructions on x86; to ensure these happen-before submission, applications should call `_mm_sfence()`.

The second [synchronization scope](#) includes all commands submitted in the same [queue submission](#), and all commands that occur later in [submission order](#).

The first [access scope](#) includes all host writes to mappable device memory that are available to the host memory domain.

The second [access scope](#) includes all memory access performed by the device.

7.10. Synchronization and Multiple Physical Devices

If a logical device includes more than one physical device, then fences, semaphores, and events all still have a single instance of the signaled state.

A fence becomes signaled when all physical devices complete the necessary queue operations.

Semaphore wait and signal operations all include a device index that is the sole physical device that performs the operation. These indices are provided in the [VkDeviceGroupSubmitInfo](#) and [VkDeviceGroupBindSparseInfo](#) structures. Semaphores are not exclusively owned by any physical device. For example, a semaphore can be signaled by one physical device and then waited on by a different physical device.

An event **can** only be waited on by the same physical device that signaled it (or the host).

7.11. Calibrated Timestamps

In order to be able to correlate the time a particular operation took place at on timelines of different time domains (e.g. a device operation vs. a host operation), Vulkan allows querying calibrated timestamps from multiple time domains.

To query calibrated timestamps from a set of time domains, call:

```
// Provided by VK_KHR_calibrated_timestamps
VkResult vkGetCalibratedTimestampsKHR(
    VkDevice          device,
    uint32_t          timestampCount,
    const VkCalibratedTimestampInfoKHR* pTimestampInfos,
    uint64_t*          pTimestamps,
    uint64_t*          pMaxDeviation);
```

or the equivalent command

```
// Provided by VK_EXT_calibrated_timestamps
VkResult vkGetCalibratedTimestampsEXT(
    VkDevice          device,
    uint32_t          timestampCount,
    const VkCalibratedTimestampInfoKHR* pTimestampInfos,
    uint64_t*          pTimestamps,
    uint64_t*          pMaxDeviation);
```

- **device** is the logical device used to perform the query.
- **timestampCount** is the number of timestamps to query.
- **pTimestampInfos** is a pointer to an array of **timestampCount** [VkCalibratedTimestampInfoKHR](#) structures, describing the time domains the calibrated timestamps should be captured from.
- **pTimestamps** is a pointer to an array of **timestampCount** 64-bit unsigned integer values in which the requested calibrated timestamp values are returned.
- **pMaxDeviation** is a pointer to a 64-bit unsigned integer value in which the strictly positive maximum deviation, in nanoseconds, of the calibrated timestamp values is returned.

NOTE

The maximum deviation **may** vary between calls to [vkGetCalibratedTimestampsKHR](#) even for the same set of time domains due to implementation and platform specific reasons. It is the application's responsibility to assess whether the returned maximum deviation makes the timestamp values suitable for any particular purpose and **can** choose to re-issue the timestamp calibration call pursuing a lower deviation value.

Calibrated timestamp values **can** be extrapolated to estimate future coinciding timestamp values, however, depending on the nature of the time domains and other properties of the platform extrapolating values over a sufficiently long period of time **may** no longer be accurate enough to fit

any particular purpose, so applications are expected to re-calibrate the timestamps on a regular basis.

Valid Usage

- VUID-vkGetCalibratedTimestampsEXT-timeDomain-09246
The `timeDomain` value of each `VkCalibratedTimestampInfoKHR` in `pTimestampInfos` **must** be unique

Valid Usage (Implicit)

- VUID-vkGetCalibratedTimestampsKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetCalibratedTimestampsKHR-pTimestampInfos-parameter
`pTimestampInfos` **must** be a valid pointer to an array of `timestampCount` valid `VkCalibratedTimestampInfoKHR` structures
- VUID-vkGetCalibratedTimestampsKHR-pTimestamps-parameter
`pTimestamps` **must** be a valid pointer to an array of `timestampCount` `uint64_t` values
- VUID-vkGetCalibratedTimestampsKHR-pMaxDeviation-parameter
`pMaxDeviation` **must** be a valid pointer to a `uint64_t` value
- VUID-vkGetCalibratedTimestampsKHR-timestampCount-arraylength
`timestampCount` **must** be greater than `0`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCalibratedTimestampInfoKHR` structure is defined as:

```
// Provided by VK_KHR_calibrated_timestamps
typedef struct VkCalibratedTimestampInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkTimeDomainKHR    timeDomain;
} VkCalibratedTimestampInfoKHR;
```

or the equivalent

```
// Provided by VK_EXT_calibrated_timestamps
typedef VkCalibratedTimestampInfoKHR VkCalibratedTimestampInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **timeDomain** is a [VkTimeDomainKHR](#) value specifying the time domain from which the calibrated timestamp value should be returned.

Valid Usage

- VUID-VkCalibratedTimestampInfoEXT-timeDomain-02354
timeDomain **must** be one of the [VkTimeDomainKHR](#) values returned by [vkGetPhysicalDeviceCalibrateableTimeDomainsKHR](#)

Valid Usage (Implicit)

- VUID-VkCalibratedTimestampInfoKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_CALIBRATED_TIMESTAMP_INFO_KHR`
- VUID-VkCalibratedTimestampInfoKHR-pNext-pNext
pNext **must** be `NULL`
- VUID-VkCalibratedTimestampInfoKHR-timeDomain-parameter
timeDomain **must** be a valid [VkTimeDomainKHR](#) value

The set of supported time domains consists of:

```
// Provided by VK_KHR_calibrated_timestamps
typedef enum VkTimeDomainKHR {
    VK_TIME_DOMAIN_DEVICE_KHR = 0,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR = 1,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR = 2,
    VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR = 3,
    // Provided by VK_EXT_calibrated_timestamps
    VK_TIME_DOMAIN_DEVICE_EXT = VK_TIME_DOMAIN_DEVICE_KHR,
    // Provided by VK_EXT_calibrated_timestamps
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_EXT = VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR,
    // Provided by VK_EXT_calibrated_timestamps
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_EXT = VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR,
    // Provided by VK_EXT_calibrated_timestamps
    VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_EXT =
VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR,
} VkTimeDomainKHR;
```

or the equivalent

```
// Provided by VK_EXT_calibrated_timestamps
typedef VkTimeDomainKHR VkTimeDomainEXT;
```

- **VK_TIME_DOMAIN_DEVICE_KHR** specifies the device time domain. Timestamp values in this time domain use the same units and are comparable with device timestamp values captured using **vkCmdWriteTimestamp** or **vkCmdWriteTimestamp2** and are defined to be incrementing according to the **timestampPeriod** of the device.
- **VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR** specifies the CLOCK_MONOTONIC time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX **clock_gettime** API as computed by this example:

NOTE An implementation supporting **VK_KHR_calibrated_timestamps** or **VK_EXT_calibrated_timestamps** will use the same time domain for all its **VkQueue** so that timestamp values reported for **VK_TIME_DOMAIN_DEVICE_KHR** can be matched to any timestamp captured through **vkCmdWriteTimestamp** or **vkCmdWriteTimestamp2**.

```
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

- **VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR** specifies the CLOCK_MONOTONIC_RAW time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX **clock_gettime** API as computed by this example:

```
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC_RAW, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

- **VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR** specifies the performance counter (QPC) time domain available on Windows. Timestamp values in this time domain are in the same units as those provided by the Windows **QueryPerformanceCounter** API and are comparable with platform timestamp values captured using that API as computed by this example:

```
LARGE_INTEGER counter;
QueryPerformanceCounter(&counter);
return counter.QuadPart;
```

Chapter 8. Render Pass

Draw commands **must** be recorded within a *render pass instance*. Each render pass instance defines a set of image resources, referred to as *attachments*, used during rendering.

To begin a render pass instance, call:

```
// Provided by VK_VERSION_1_3
void vkCmdBeginRendering(
    VkCommandBuffer                commandBuffer,
    const VkRenderingInfo*         pRenderingInfo);
```

or the equivalent command

```
// Provided by VK_KHR_dynamic_rendering
void vkCmdBeginRenderingKHR(
    VkCommandBuffer                commandBuffer,
    const VkRenderingInfo*         pRenderingInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderingInfo` is a pointer to a `VkRenderingInfo` structure specifying details of the render pass instance to begin.

After beginning a render pass instance, the command buffer is ready to record **draw commands**.

If `pRenderingInfo->flags` includes `VK_RENDERING_RESUMING_BIT` then this render pass is resumed from a render pass instance that has been suspended earlier in **submission order**.

Valid Usage

- VUID-vkCmdBeginRendering-dynamicRendering-06446
The `dynamicRendering` feature **must** be enabled
- VUID-vkCmdBeginRendering-commandBuffer-06068
If `commandBuffer` is a secondary command buffer, and the `nestedCommandBuffer` feature is not enabled, `pRenderingInfo->flags` **must** not include `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`
- VUID-vkCmdBeginRendering-pRenderingInfo-09588
If `pRenderingInfo->pDepthAttachment` is not `NULL` and `pRenderingInfo->pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pDepthAttachment->imageView` **must** be in the layout specified by `pRenderingInfo->pDepthAttachment->imageLayout`
- VUID-vkCmdBeginRendering-pRenderingInfo-09589
If `pRenderingInfo->pDepthAttachment` is not `NULL`, `pRenderingInfo->pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pDepthAttachment->imageResolveMode` is not `VK_RESOLVE_MODE_NONE`, and `pRenderingInfo->pDepthAttachment->resolveImageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pDepthAttachment->resolveImageView` **must** be in

the layout specified by `pRenderingInfo->pDepthAttachment->resolveImageLayout`

- VUID-vkCmdBeginRendering-pRenderingInfo-09590

If `pRenderingInfo->pStencilAttachment` is not `NULL` and `pRenderingInfo->pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pStencilAttachment->imageView` **must** be in the layout specified by `pRenderingInfo->pStencilAttachment->imageLayout`

- VUID-vkCmdBeginRendering-pRenderingInfo-09591

If `pRenderingInfo->pStencilAttachment` is not `NULL`, `pRenderingInfo->pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pStencilAttachment->imageResolveMode` is not `VK_RESOLVE_MODE_NONE`, and `pRenderingInfo->pStencilAttachment->resolveImageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pStencilAttachment->resolveImageView` **must** be in the layout specified by `pRenderingInfo->pStencilAttachment->resolveImageLayout`

- VUID-vkCmdBeginRendering-pRenderingInfo-09592

For any element of `pRenderingInfo->pColorAttachments`, if `imageView` is not `VK_NULL_HANDLE`, that image view **must** be in the layout specified by `imageLayout`

- VUID-vkCmdBeginRendering-pRenderingInfo-09593

For any element of `pRenderingInfo->pColorAttachments`, if either `imageResolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, or `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, and `resolveImageView` is not `VK_NULL_HANDLE`, `resolveImageView` **must** be in the layout specified by `resolveImageLayout`

Valid Usage (Implicit)

- VUID-vkCmdBeginRendering-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdBeginRendering-pRenderingInfo-parameter
`pRenderingInfo` **must** be a valid pointer to a valid `VkRenderingInfo` structure

- VUID-vkCmdBeginRendering-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state

- VUID-vkCmdBeginRendering-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdBeginRendering-renderpass
This command **must** only be called outside of a render pass instance

- VUID-vkCmdBeginRendering-vidcoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Graphics	Action State

The `VkRenderingInfo` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkRenderingInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkRenderingFlags          flags;
    VkRect2D                  renderArea;
    uint32_t                  layerCount;
    uint32_t                  viewMask;
    uint32_t                  colorAttachmentCount;
    const VkRenderingAttachmentInfo* pColorAttachments;
    const VkRenderingAttachmentInfo* pDepthAttachment;
    const VkRenderingAttachmentInfo* pStencilAttachment;
} VkRenderingInfo;
```

or the equivalent

```
// Provided by VK_KHR_dynamic_rendering, VK_QCOM_tile_properties with
VK_KHR_dynamic_rendering or VK_VERSION_1_3
typedef VkRenderingInfo VkRenderingInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkRenderingFlagBits`.
- `renderArea` is the render area that is affected by the render pass instance.
- `layerCount` is the number of layers rendered to in each attachment when `viewMask` is 0.
- `viewMask` is the view mask indicating the indices of attachment layers that will be rendered when it is not 0.
- `colorAttachmentCount` is the number of elements in `pColorAttachments`.
- `pColorAttachments` is a pointer to an array of `colorAttachmentCount` `VkRenderingAttachmentInfo` structures describing any color attachments used.

- `pDepthAttachment` is a pointer to a `VkRenderingAttachmentInfo` structure describing a depth attachment.
- `pStencilAttachment` is a pointer to a `VkRenderingAttachmentInfo` structure describing a stencil attachment.

If `viewMask` is not 0, multiview is enabled.

If there is an instance of `VkDeviceGroupRenderPassBeginInfo` included in the `pNext` chain and its `deviceRenderAreaCount` member is not 0, then `renderArea` is ignored, and the render area is defined per-device by that structure.

If multiview is enabled, and the `multiviewPerViewRenderAreas` feature is enabled, and there is an instance of `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` included in the `pNext` chain with `perViewRenderAreaCount` not equal to 0, then the elements of `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM::pPerViewRenderAreas` override `renderArea` and define a render area for each view. In this case, `renderArea` **must** be an area at least as large as the union of all the per-view render areas.

Each element of the `pColorAttachments` array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of `X`, then it uses the attachment provided in `pColorAttachments[X]`. If the `imageView` member of any element of `pColorAttachments` is `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, writes to the corresponding location by a fragment are discarded.

Valid Usage

- VUID-VkRenderingInfo-viewMask-06069
If `viewMask` is 0, `layerCount` **must** not be 0
- VUID-VkRenderingInfo-multisampledRenderToSingleSampled-06857
`imageView` members of `pDepthAttachment`, `pStencilAttachment`, and elements of `pColorAttachments` that are not `VK_NULL_HANDLE` **must** have been created with the same `sampleCount`, if none of the following are enabled:
 - The `VK_AMD_mixed_attachment_samples` extension
 - The `VK_NV_framebuffer_mixed_samples` extension
 - The `multisampledRenderToSingleSampled` feature,
- VUID-VkRenderingInfo-imageView-09429
`imageView` members of elements of `pColorAttachments` that are not `VK_NULL_HANDLE` **must** have been created with the same `sampleCount`, if the `multisampledRenderToSingleSampled` feature is not enabled
- VUID-VkRenderingInfo-None-08994
If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0, `renderArea.extent.width` **must** be greater than 0
- VUID-VkRenderingInfo-None-08995
If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0,

`renderArea.extent.height` **must** be greater than 0

- VUID-VkRenderingInfo-imageView-06858

If `multisampled-render-to-single-sampled` is enabled, then all attachments referenced by `imageView` members of `pDepthAttachment`, `pStencilAttachment`, and elements of `pColorAttachments` that are not `VK_NULL_HANDLE` **must** have a sample count that is either `VK_SAMPLE_COUNT_1_BIT` or equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`

- VUID-VkRenderingInfo-imageView-06859

If `multisampled-render-to-single-sampled` is enabled, then all attachments referenced by `imageView` members of `pDepthAttachment`, `pStencilAttachment`, and elements of `pColorAttachments` that are not `VK_NULL_HANDLE` and have a sample count of `VK_SAMPLE_COUNT_1_BIT` **must** have been created with `VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT` in their `VkImageCreateInfo::flags`

- VUID-VkRenderingInfo-pNext-06077

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` **must** be greater than or equal to 0

- VUID-VkRenderingInfo-pNext-06078

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` **must** be greater than or equal to 0

- VUID-VkRenderingInfo-pNext-07815

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the sum of `renderArea.extent.width` and `renderArea.offset.x` **must** be less than or equal to `maxFramebufferWidth`

- VUID-VkRenderingInfo-pNext-07816

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the sum of `renderArea.extent.height` and `renderArea.offset.y` **must** be less than or equal to `maxFramebufferHeight`

- VUID-VkRenderingInfo-pNext-06079

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the width of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` **must** be greater than or equal to `renderArea.offset.x + renderArea.extent.width`

- VUID-VkRenderingInfo-pNext-06080

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the height of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` **must** be greater than or equal to `renderArea.offset.y + renderArea.extent.height`

- VUID-VkRenderingInfo-pNext-06083

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the width of the

`imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` **must** be greater than or equal to the sum of the `offset.x` and `extent.width` members of each element of `pDeviceRenderAreas`

- VUID-VkRenderingInfo-pNext-06084

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the height of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` **must** be greater than or equal to the sum of the `offset.y` and `extent.height` members of each element of `pDeviceRenderAreas`

- VUID-VkRenderingInfo-pDepthAttachment-06085

If neither `pDepthAttachment` or `pStencilAttachment` are `NULL` and the `imageView` member of either structure is not `VK_NULL_HANDLE`, the `imageView` member of each structure **must** be the same

- VUID-VkRenderingInfo-pDepthAttachment-06086

If neither `pDepthAttachment` or `pStencilAttachment` are `NULL`, and the `resolveMode` member of each is not `VK_RESOLVE_MODE_NONE`, the `resolveImageView` member of each structure **must** be the same

- VUID-VkRenderingInfo-colorAttachmentCount-06087

If `colorAttachmentCount` is not `0` and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, that `imageView` **must** have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- VUID-VkRenderingInfo-colorAttachmentCount-09476

If `colorAttachmentCount` is not `0` and there is an element of `pColorAttachments` with either its `resolveMode` member set to `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, or its `imageView` member not `VK_NULL_HANDLE`, and its `resolveMode` member not set to `VK_RESOLVE_MODE_NONE`, the `resolveImageView` member of that element of `pColorAttachments` **must** have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- VUID-VkRenderingInfo-pDepthAttachment-06547

If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->imageView` **must** have been created with a format that includes a depth component

- VUID-VkRenderingInfo-pDepthAttachment-06088

If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->imageView` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkRenderingInfo-pDepthAttachment-09477

If `pDepthAttachment` is not `NULL` and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageView` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkRenderingInfo-pStencilAttachment-06548

If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->imageView` **must** have been created with a format that includes a stencil aspect

- VUID-VkRenderingInfo-pStencilAttachment-06089

If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not

`VK_NULL_HANDLE`, `pStencilAttachment->imageView` **must** have been created with a stencil usage including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkRenderingInfo-pStencilAttachment-09478

If `pStencilAttachment` is not `NULL` and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageView` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkRenderingInfo-colorAttachmentCount-06090

If `colorAttachmentCount` is not `0` and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, the `layout` member of that element of `pColorAttachments` **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderingInfo-colorAttachmentCount-06091

If `colorAttachmentCount` is not `0` and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, if the `resolveMode` member of that element of `pColorAttachments` is not `VK_RESOLVE_MODE_NONE`, its `resolveImageLayout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderingInfo-pDepthAttachment-06092

If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->layout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- VUID-VkRenderingInfo-pDepthAttachment-06093

If `pDepthAttachment` is not `NULL`, `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- VUID-VkRenderingInfo-pStencilAttachment-06094

If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->layout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- VUID-VkRenderingInfo-pStencilAttachment-06095

If `pStencilAttachment` is not `NULL`, `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- VUID-VkRenderingInfo-colorAttachmentCount-06096

If `colorAttachmentCount` is not `0` and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, the `layout` member of that element of `pColorAttachments` **must** not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderingInfo-colorAttachmentCount-06097

If `colorAttachmentCount` is not `0` and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, if the `resolveMode` member of that element of `pColorAttachments` is not `VK_RESOLVE_MODE_NONE`, its `resolveImageLayout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderingInfo-pDepthAttachment-06098
If `pDepthAttachment` is not `NULL`, `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkRenderingInfo-pStencilAttachment-06099
If `pStencilAttachment` is not `NULL`, `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkRenderingInfo-colorAttachmentCount-06100
If `colorAttachmentCount` is not `0` and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, the `layout` member of that element of `pColorAttachments` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkRenderingInfo-colorAttachmentCount-06101
If `colorAttachmentCount` is not `0` and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, if the `resolveMode` member of that element of `pColorAttachments` is not `VK_RESOLVE_MODE_NONE`, its `resolveImageLayout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkRenderingInfo-pDepthAttachment-07732
If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->layout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkRenderingInfo-pDepthAttachment-07733
If `pDepthAttachment` is not `NULL`, `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkRenderingInfo-pStencilAttachment-07734
If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->layout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`
- VUID-VkRenderingInfo-pStencilAttachment-07735
If `pStencilAttachment` is not `NULL`, `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`
- VUID-VkRenderingInfo-pDepthAttachment-06102
If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->resolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes`

- VUID-VkRenderingInfo-pStencilAttachment-06103
If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->resolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes`
- VUID-VkRenderingInfo-pDepthAttachment-06104
If `pDepthAttachment` or `pStencilAttachment` are both not `NULL`, `pDepthAttachment->imageView` and `pStencilAttachment->imageView` are both not `VK_NULL_HANDLE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_FALSE`, the `resolveMode` of both structures **must** be the same value
- VUID-VkRenderingInfo-pDepthAttachment-06105
If `pDepthAttachment` or `pStencilAttachment` are both not `NULL`, `pDepthAttachment->imageView` and `pStencilAttachment->imageView` are both not `VK_NULL_HANDLE`, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and the `resolveMode` of neither structure is `VK_RESOLVE_MODE_NONE`, the `resolveMode` of both structures **must** be the same value
- VUID-VkRenderingInfo-colorAttachmentCount-06106
`colorAttachmentCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxColorAttachments`
- VUID-VkRenderingInfo-imageView-06107
If the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and the `fragmentDensityMapNonSubsampledImages` feature is not enabled, valid `imageView` and `resolveImageView` members of `pDepthAttachment`, `pStencilAttachment`, and each element of `pColorAttachments` **must** be a `VkImageView` created with `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`
- VUID-VkRenderingInfo-imageView-06108
If the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is not `0`, `imageView` **must** have a `layerCount` greater than or equal to the index of the most significant bit in `viewMask`
- VUID-VkRenderingInfo-imageView-06109
If the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is `0`, `imageView` **must** have a `layerCount` equal to `1`
- VUID-VkRenderingInfo-pNext-06112
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to `0` and the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` **must** have a width greater than or equal to
$$\lceil \frac{renderArea_x + renderArea_width}{maxFragmentDensityTexelSize_width} \rceil$$
- VUID-VkRenderingInfo-pNext-06114
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to `0` and the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` **must** have a height greater than or equal to

$$\lceil \frac{renderArea_y + renderArea_{height}}{maxFragmentDensityTexelSize_{height}} \rceil$$

- VUID-VkRenderingInfo-pNext-06113

If the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` **must** have a width greater than or equal to $\lceil \frac{pDeviceRenderAreas_x + pDeviceRenderAreas_{width}}{maxFragmentDensityTexelSize_{width}} \rceil$ for each element of `pDeviceRenderAreas`

- VUID-VkRenderingInfo-pNext-06115

If the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` **must** have a height greater than or equal to $\lceil \frac{pDeviceRenderAreas_y + pDeviceRenderAreas_{height}}{maxFragmentDensityTexelSize_{height}} \rceil$ for each element of `pDeviceRenderAreas`

- VUID-VkRenderingInfo-imageView-06116

If the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, it **must** not be equal to the `imageView` or `resolveImageView` member of `pDepthAttachment`, `pStencilAttachment`, or any element of `pColorAttachments`

- VUID-VkRenderingInfo-pNext-06119

If `maintenance7` is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` **must** have a width greater than or equal to $\lceil \frac{renderArea_x + renderArea_{width}}{shadingRateAttachmentTexelSize_{width}} \rceil$

- VUID-VkRenderingInfo-pNext-06121

If `maintenance7` is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0 and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` **must** have a height greater than or equal to $\lceil \frac{renderArea_y + renderArea_{height}}{shadingRateAttachmentTexelSize_{height}} \rceil$

- VUID-VkRenderingInfo-pNext-06120

If `maintenance7` is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` **must** have a width greater than or equal to $\lceil \frac{pDeviceRenderAreas_x + pDeviceRenderAreas_{width}}{shadingRateAttachmentTexelSize_{width}} \rceil$ for each element of

pDeviceRenderAreas

- VUID-VkRenderingInfo-pNext-06122

If **maintenance7** is not enabled or the **robustFragmentShadingRateAttachmentAccess** limit is **VK_FALSE** or the **imageView** member of a **VkRenderingFragmentShadingRateAttachmentInfoKHR** structure was created with **VkImageSubresourceRange::baseMipLevel** greater than 0, the **pNext** chain contains a **VkDeviceGroupRenderPassBeginInfo** structure, its **deviceRenderAreaCount** member is not 0, and the **imageView** member of a **VkRenderingFragmentShadingRateAttachmentInfoKHR** structure included in the **pNext** chain is not **VK_NULL_HANDLE**, **imageView** **must** have a height greater than or equal to $\lceil \frac{pDeviceRenderAreas_y + pDeviceRenderAreas_{height}}{shadingRateAttachmentTexelSize_{height}} \rceil$ for each element of **pDeviceRenderAreas**

- VUID-VkRenderingInfo-layerCount-07817

layerCount **must** be less than or equal to **maxFramebufferLayers**

- VUID-VkRenderingInfo-imageView-06123

If the **imageView** member of a **VkRenderingFragmentShadingRateAttachmentInfoKHR** structure included in the **pNext** chain is not **VK_NULL_HANDLE**, and **viewMask** is 0, **imageView** **must** have a **layerCount** that is either equal to 1 or greater than or equal to **layerCount**

- VUID-VkRenderingInfo-imageView-06124

If the **imageView** member of a **VkRenderingFragmentShadingRateAttachmentInfoKHR** structure included in the **pNext** chain is not **VK_NULL_HANDLE**, and **viewMask** is not 0, **imageView** **must** have a **layerCount** that either equal to 1 or greater than or equal to the index of the most significant bit in **viewMask**

- VUID-VkRenderingInfo-imageView-06125

If the **imageView** member of a **VkRenderingFragmentShadingRateAttachmentInfoKHR** structure included in the **pNext** chain is not **VK_NULL_HANDLE**, it **must** not be equal to the **imageView** or **resolveImageView** member of **pDepthAttachment**, **pStencilAttachment**, or any element of **pColorAttachments**

- VUID-VkRenderingInfo-imageView-06126

If the **imageView** member of a **VkRenderingFragmentShadingRateAttachmentInfoKHR** structure included in the **pNext** chain is not **VK_NULL_HANDLE**, it **must** not be equal to the **imageView** member of a **VkRenderingFragmentDensityMapAttachmentInfoEXT** structure included in the **pNext** chain

- VUID-VkRenderingInfo-multiview-06127

If the **multiview** feature is not enabled, **viewMask** **must** be 0

- VUID-VkRenderingInfo-viewMask-06128

The index of the most significant bit in **viewMask** **must** be less than **maxMultiviewViewCount**

- VUID-VkRenderingInfo-perViewRenderAreaCount-07857

If the **perViewRenderAreaCount** member of a **VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM** structure included in the **pNext** chain is not 0, then the **multiviewPerViewRenderAreas** feature **must** be enabled

- VUID-VkRenderingInfo-perViewRenderAreaCount-07858

If the **perViewRenderAreaCount** member of a **VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM** structure included in the

`pNext` chain is not `0`, then `renderArea` **must** specify a render area that includes the union of all per view render areas

- VUID-VkRenderingInfo-None-09044

Valid attachments specified by this structure **must** not be bound to memory locations that are bound to any other valid attachments specified by this structure

- VUID-VkRenderingInfo-flags-10012

If `flags` includes `VK_RENDERING_CONTENTS_INLINE_BIT_KHR` then at least one of the following features **must** be enabled

- `maintenance7`
- `nestedCommandBuffer`

- VUID-VkRenderingInfo-pDepthAttachment-09318

`pDepthAttachment->resolveMode` **must** not be `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`

- VUID-VkRenderingInfo-pStencilAttachment-09319

`pStencilAttachment->resolveMode` **must** not be `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`

- VUID-VkRenderingInfo-colorAttachmentCount-09320

If `colorAttachmentCount` is not `1`, the `resolveMode` member of any element of `pColorAttachments` **must** not be `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`

- VUID-VkRenderingInfo-resolveMode-09321

If the `resolveMode` of any element of `pColorAttachments` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` **must** be `VK_NULL_HANDLE`

- VUID-VkRenderingInfo-resolveMode-09322

If the `resolveMode` of any element of `pColorAttachments` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` **must** be `VK_NULL_HANDLE`

- VUID-VkRenderingInfo-pNext-09535

If the `pNext` chain contains a `VkRenderPassStripeBeginInfoARM` structure, the union of stripe areas defined by the elements of `VkRenderPassStripeInfoARM::pStripeInfos` **must** cover the `renderArea`

- VUID-VkRenderingInfo-colorAttachmentCount-09479

If `colorAttachmentCount` is not `0` and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, that `imageView` **must** have been created with the `identity swizzle`

- VUID-VkRenderingInfo-colorAttachmentCount-09480

If `colorAttachmentCount` is not `0`, and there is an element of `pColorAttachments` with either its `resolveMode` member set to `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, or its `imageView` member not set to `VK_NULL_HANDLE` and its `resolveMode` member not set to `VK_RESOLVE_MODE_NONE`, the `resolveImageView` member of that element of `pColorAttachments` **must** have been created with the `identity swizzle`

- VUID-VkRenderingInfo-pDepthAttachment-09481
If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->imageView` **must** have been created with the [identity swizzle](#)
- VUID-VkRenderingInfo-pDepthAttachment-09482
If `pDepthAttachment` is not `NULL`, `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageView` **must** have been created with the [identity swizzle](#)
- VUID-VkRenderingInfo-pStencilAttachment-09483
If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->imageView` **must** have been created with the [identity swizzle](#)
- VUID-VkRenderingInfo-pStencilAttachment-09484
If `pStencilAttachment` is not `NULL`, `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageView` **must** have been created with the [identity swizzle](#)
- VUID-VkRenderingInfo-imageView-09485
If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, it **must** have been created with the [identity swizzle](#)
- VUID-VkRenderingInfo-imageView-09486
If the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, it **must** have been created with the [identity swizzle](#)

Valid Usage (Implicit)

- VUID-VkRenderingInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDERING_INFO`
- VUID-VkRenderingInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupRenderPassBeginInfo`, `VkMultisampledRenderToSingleSampledInfoEXT`, `VkMultiviewPerViewAttributesInfoNVX`, `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM`, `VkRenderPassStripeBeginInfoARM`, `VkRenderingFragmentDensityMapAttachmentInfoEXT`, `VkRenderingFragmentShadingRateAttachmentInfoKHR` or
- VUID-VkRenderingInfo-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkRenderingInfo-flags-parameter
`flags` **must** be a valid combination of `VkRenderingFlagBits` values
- VUID-VkRenderingInfo-pColorAttachments-parameter
If `colorAttachmentCount` is not `0`, `pColorAttachments` **must** be a valid pointer to an array of

`colorAttachmentCount` valid `VkRenderingAttachmentInfo` structures

- `VUID-VkRenderingInfo-pDepthAttachment-parameter`
If `pDepthAttachment` is not `NULL`, `pDepthAttachment` **must** be a valid pointer to a valid `VkRenderingAttachmentInfo` structure
- `VUID-VkRenderingInfo-pStencilAttachment-parameter`
If `pStencilAttachment` is not `NULL`, `pStencilAttachment` **must** be a valid pointer to a valid `VkRenderingAttachmentInfo` structure

Bits which **can** be set in `VkRenderingInfo::flags` describing additional properties of the render pass are:

```
// Provided by VK_VERSION_1_3
typedef enum VkRenderingFlagBits {
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT = 0x00000001,
    VK_RENDERING_SUSPENDING_BIT = 0x00000002,
    VK_RENDERING_RESUMING_BIT = 0x00000004,
    // Provided by VK_EXT_legacy_dithering with (VK_KHR_dynamic_rendering or
    VK_VERSION_1_3) and VK_KHR_maintenance5
    VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT = 0x00000008,
    // Provided by VK_KHR_maintenance7
    VK_RENDERING_CONTENTS_INLINE_BIT_KHR = 0x00000010,
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT_KHR =
VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT,
    VK_RENDERING_SUSPENDING_BIT_KHR = VK_RENDERING_SUSPENDING_BIT,
    VK_RENDERING_RESUMING_BIT_KHR = VK_RENDERING_RESUMING_BIT,
    // Provided by VK_EXT_nested_command_buffer
    VK_RENDERING_CONTENTS_INLINE_BIT_EXT = VK_RENDERING_CONTENTS_INLINE_BIT_KHR,
} VkRenderingFlagBits;
```

or the equivalent

```
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingFlagBits VkRenderingFlagBitsKHR;
```

- `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` specifies that draw calls for the render pass instance will be recorded in secondary command buffers. If the `nestedCommandBuffer` feature is enabled, the draw calls **can** come from both inline and `vkCmdExecuteCommands`.
- `VK_RENDERING_RESUMING_BIT` specifies that the render pass instance is resuming an earlier suspended render pass instance.
- `VK_RENDERING_SUSPENDING_BIT` specifies that the render pass instance will be suspended.
- `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` specifies that `Legacy Dithering` is enabled for the render pass instance.
- `VK_RENDERING_CONTENTS_INLINE_BIT_KHR` specifies that draw calls for the render pass instance **can** be recorded inline within the current command buffer. This **can** be combined with the

`VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` bit to allow draw calls to be recorded both inline and in secondary command buffers.

The contents of `pRenderingInfo` **must** match between suspended render pass instances and the render pass instances that resume them, other than the presence or absence of the `VK_RENDERING_RESUMING_BIT`, `VK_RENDERING_SUSPENDING_BIT`, and `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` flags. No action or synchronization commands, or other render pass instances, are allowed between suspending and resuming render pass instances.

```
// Provided by VK_VERSION_1_3
typedef VkFlags VkRenderingFlags;
```

or the equivalent

```
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingFlags VkRenderingFlagsKHR;
```

`VkRenderingFlags` is a bitmask type for setting a mask of zero or more `VkRenderingFlagBits`.

The `VkRenderingAttachmentInfo` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkRenderingAttachmentInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImageView         imageView;
    VkImageLayout       imageLayout;
    VkResolveModeFlagBits resolveMode;
    VkImageView         resolveImageView;
    VkImageLayout       resolveImageLayout;
    VkAttachmentLoadOp  loadOp;
    VkAttachmentStoreOp storeOp;
    VkClearColorValue  clearColor;
} VkRenderingAttachmentInfo;
```

or the equivalent

```
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingAttachmentInfo VkRenderingAttachmentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageView` is the image view that will be used for rendering.

- `imageViewLayout` is the layout that `imageView` will be in during rendering.
- `resolveMode` is a `VkResolveModeFlagBits` value defining how data written to `imageView` will be resolved into `resolveImageView`.
- `resolveImageView` is an image view used to write resolved data at the end of rendering.
- `resolveImageLayout` is the layout that `resolveImageView` will be in during rendering.
- `loadOp` is a `VkAttachmentLoadOp` value defining the `load operation` for the attachment.
- `storeOp` is a `VkAttachmentStoreOp` value defining the `store operation` for the attachment.
- `clearValue` is a `VkClearValue` structure defining values used to clear `imageView` when `loadOp` is `VK_ATTACHMENT_LOAD_OP_CLEAR`.

Values in `imageView` are loaded and stored according to the values of `loadOp` and `storeOp`, within the render area for each device specified in `VkRenderingInfo`. If `imageView` is `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, other members of this structure are ignored; writes to this attachment will be discarded, and no `load`, `store`, or `multisample resolve` operations will be performed.

If `resolveMode` is `VK_RESOLVE_MODE_NONE`, then `resolveImageView` is ignored. If `resolveMode` is not `VK_RESOLVE_MODE_NONE`, and `resolveImageView` is not `VK_NULL_HANDLE`, a `render pass multisample resolve operation` is defined for the attachment subresource. If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, and the `nullColorAttachmentWithExternalFormatResolve` limit is `VK_TRUE`, values are only undefined once `load operations` have completed.

NOTE

The resolve mode and store operation are independent; it is valid to write both resolved and unresolved values, and equally valid to discard the unresolved values while writing the resolved ones.

Store and resolve operations are only performed at the end of a render pass instance that does not specify the `VK_RENDERING_SUSPENDING_BIT_KHR` flag.

Load operations are only performed at the beginning of a render pass instance that does not specify the `VK_RENDERING_RESUMING_BIT_KHR` flag.

Image contents at the end of a suspended render pass instance remain defined for access by a resuming render pass instance.

If the `nullColorAttachmentWithExternalFormatResolve` limit is `VK_TRUE`, and `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, values in the color attachment will be loaded from the resolve attachment at the start of rendering, and **may** also be reloaded any time after a resolve occurs or the resolve attachment is written to; if this occurs it **must** happen-before any writes to the color attachment are performed which happen-after the resolve that triggers this. If any color component in the external format is subsampled, values will be read from the nearest sample in the image when they are loaded.

Valid Usage

- VUID-VkRenderingAttachmentInfo-imageView-06129
If `imageView` is not `VK_NULL_HANDLE` and has a non-integer color format, `resolveMode` **must** be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_AVERAGE_BIT`
- VUID-VkRenderingAttachmentInfo-imageView-06130
If `imageView` is not `VK_NULL_HANDLE` and has an integer color format, `resolveMode` **must** be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT`
- VUID-VkRenderingAttachmentInfo-imageView-06861
`imageView` **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT` if all of the following hold:
 - `imageView` is not `VK_NULL_HANDLE`
 - `resolveMode` is not `VK_RESOLVE_MODE_NONE`
 - the `pNext` chain of `VkRenderingInfo` does not include a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`
- VUID-VkRenderingAttachmentInfo-imageView-06862
`resolveImageView` **must** not be `VK_NULL_HANDLE` if all of the following hold:
 - `imageView` is not `VK_NULL_HANDLE`
 - `resolveMode` is not `VK_RESOLVE_MODE_NONE`
 - the `pNext` chain of `VkRenderingInfo` does not include a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`
- VUID-VkRenderingAttachmentInfo-imageView-06863
If `imageView` is not `VK_NULL_HANDLE`, `resolveMode` is not `VK_RESOLVE_MODE_NONE`, the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`, and `imageView` has a sample count of `VK_SAMPLE_COUNT_1_BIT`, `resolveImageView` **must** be `VK_NULL_HANDLE`
- VUID-VkRenderingAttachmentInfo-imageView-06864
If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageView` **must** have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkRenderingAttachmentInfo-imageView-06865
If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `imageView` and `resolveImageView` **must** have the same `VkFormat`
- VUID-VkRenderingAttachmentInfo-imageView-06135
If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`
- VUID-VkRenderingAttachmentInfo-imageView-06136

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- VUID-VkRenderingAttachmentInfo-imageView-06137

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderingAttachmentInfo-imageView-06138

If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` **must** not be `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV`

- VUID-VkRenderingAttachmentInfo-imageView-06139

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV`

- VUID-VkRenderingAttachmentInfo-imageView-06140

If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` **must** not be `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`

- VUID-VkRenderingAttachmentInfo-imageView-06141

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`

- VUID-VkRenderingAttachmentInfo-imageView-06142

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkRenderingAttachmentInfo-imageView-06143

If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` **must** not be `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`

- VUID-VkRenderingAttachmentInfo-imageView-06144

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`

- VUID-VkRenderingAttachmentInfo-imageView-06145

If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` **must** not be `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

- VUID-VkRenderingAttachmentInfo-imageView-06146

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

- VUID-VkRenderingAttachmentInfo-externalFormatResolve-09323

If `externalFormatResolve` is not enabled, `resolveMode` **must** not be `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`

- VUID-VkRenderingAttachmentInfo-resolveMode-09324

If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, `resolveImageView` **must** be a valid image view

- VUID-VkRenderingAttachmentInfo-nullColorAttachmentWithExternalFormatResolve-09325
If the `nullColorAttachmentWithExternalFormatResolve` property is `VK_TRUE` and `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, `resolveImageView` **must** have been created with an image with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkRenderingAttachmentInfo-resolveMode-09326
If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, `resolveImageView` **must** have been created with an external format specified by `VkExternalFormatANDROID`
- VUID-VkRenderingAttachmentInfo-resolveMode-09327
If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, `resolveImageView` **must** have been created with a `subresourceRange.layerCount` of 1
- VUID-VkRenderingAttachmentInfo-resolveMode-09328
If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` and `nullColorAttachmentWithExternalFormatResolve` is `VK_TRUE`, `imageView` **must** be `VK_NULL_HANDLE`
- VUID-VkRenderingAttachmentInfo-resolveMode-09329
If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` and `nullColorAttachmentWithExternalFormatResolve` is `VK_FALSE`, `imageView` **must** be a valid `VkImageView`
- VUID-VkRenderingAttachmentInfo-resolveMode-09330
If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` and `nullColorAttachmentWithExternalFormatResolve` is `VK_FALSE`, `imageView` **must** have a format equal to the value of `VkAndroidHardwareBufferFormatResolvePropertiesANDROID::colorAttachmentFormat` as returned by a call to `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer that was used to create `resolveImageView`

Valid Usage (Implicit)

- VUID-VkRenderingAttachmentInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDERING_ATTACHMENT_INFO`
- VUID-VkRenderingAttachmentInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkRenderingAttachmentInfo-imageView-parameter
If `imageView` is not `VK_NULL_HANDLE`, `imageView` **must** be a valid `VkImageView` handle
- VUID-VkRenderingAttachmentInfo-imageLayout-parameter
`imageLayout` **must** be a valid `VkImageLayout` value
- VUID-VkRenderingAttachmentInfo-resolveMode-parameter
If `resolveMode` is not 0, `resolveMode` **must** be a valid `VkResolveModeFlagBits` value
- VUID-VkRenderingAttachmentInfo-resolveImageView-parameter
If `resolveImageView` is not `VK_NULL_HANDLE`, `resolveImageView` **must** be a valid `VkImageView` handle

- VUID-VkRenderingAttachmentInfo-resolveImageLayout-parameter **resolveImageLayout** **must** be a valid [VkImageLayout](#) value
- VUID-VkRenderingAttachmentInfo-loadOp-parameter **loadOp** **must** be a valid [VkAttachmentLoadOp](#) value
- VUID-VkRenderingAttachmentInfo-storeOp-parameter **storeOp** **must** be a valid [VkAttachmentStoreOp](#) value
- VUID-VkRenderingAttachmentInfo-clearValue-parameter **clearValue** **must** be a valid [VkClearColor](#) union
- VUID-VkRenderingAttachmentInfo-commonparent
Both of **imageView**, and **resolveImageView** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same [VkDevice](#)

The [VkRenderingFragmentShadingRateAttachmentInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_fragment_shading_rate with VK_VERSION_1_3 or
VK_KHR_dynamic_rendering
typedef struct VkRenderingFragmentShadingRateAttachmentInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkImageView         imageView;
    VkImageLayout       imageLayout;
    VkExtent2D          shadingRateAttachmentTexelSize;
} VkRenderingFragmentShadingRateAttachmentInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **imageView** is the image view that will be used as a fragment shading rate attachment.
- **imageLayout** is the layout that **imageView** will be in during rendering.
- **shadingRateAttachmentTexelSize** specifies the number of pixels corresponding to each texel in **imageView**.

This structure can be included in the **pNext** chain of [VkRenderingInfo](#) to define a [fragment shading rate attachment](#). If **imageView** is [VK_NULL_HANDLE](#), or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

Valid Usage

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06147
If **imageView** is not [VK_NULL_HANDLE](#), **layout** **must** be [VK_IMAGE_LAYOUT_GENERAL](#) or [VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR](#)
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06148
If **imageView** is not [VK_NULL_HANDLE](#), it **must** have been created with

VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06149
If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` **must** be a power of two value
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06150
If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.width`
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06151
If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` **must** be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06152
If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be a power of two value
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06153
If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.height`
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06154
If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.height`
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06155
If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06156
If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

Valid Usage (Implicit)

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-parameter
If `imageView` is not `VK_NULL_HANDLE`, `imageView` **must** be a valid `VkImageView` handle
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageLayout-parameter
`imageLayout` **must** be a valid `VkImageLayout` value

The `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure is defined as:

```
// Provided by VK_EXT_fragment_density_map with VK_VERSION_1_3 or
VK_KHR_dynamic_rendering
typedef struct VkRenderingFragmentDensityMapAttachmentInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkImageView         imageView;
    VkImageLayout       imageLayout;
} VkRenderingFragmentDensityMapAttachmentInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageView` is the image view that will be used as a fragment density map attachment.
- `imageLayout` is the layout that `imageView` will be in during rendering.

This structure can be included in the `pNext` chain of `VkRenderingInfo` to define a fragment density map. If this structure is not included in the `pNext` chain, `imageView` is treated as `VK_NULL_HANDLE`.

Valid Usage

- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-06157
If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` **must** be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`
- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-06158
If `imageView` is not `VK_NULL_HANDLE`, it **must** have been created with `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`
- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-06159
If `imageView` is not `VK_NULL_HANDLE`, it **must** not have been created with `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`
- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-apiVersion-07908
If the `multiview` feature is not enabled, `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, and `imageView` is not `VK_NULL_HANDLE`, it **must** have a `layerCount` equal to 1

Valid Usage (Implicit)

- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_INFO_EXT`
- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-parameter
`imageView` **must** be a valid `VkImageView` handle
- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageLayout-parameter
`imageLayout` **must** be a valid `VkImageLayout` value

To query the render area granularity for a render pass instance, call:

```
// Provided by VK_KHR_maintenance5
void vkGetRenderingAreaGranularityKHR(
    VkDevice device,
    const VkRenderingAreaInfoKHR* pRenderingAreaInfo,
    VkExtent2D* pGranularity);
```

- **device** is the logical device that owns the render pass instance.
- **pRenderingAreaInfo** is a pointer to a [VkRenderingAreaInfoKHR](#) structure specifying details of the render pass instance to query the render area granularity for.
- **pGranularity** is a pointer to a [VkExtent2D](#) structure in which the granularity is returned.

The conditions leading to an optimal **renderArea** are:

- the **offset.x** member in **renderArea** is a multiple of the **width** member of the returned [VkExtent2D](#) (the horizontal granularity).
- the **offset.y** member in **renderArea** is a multiple of the **height** member of the returned [VkExtent2D](#) (the vertical granularity).
- either the **extent.width** member in **renderArea** is a multiple of the horizontal granularity or **offset.x+extent.width** is equal to the **width** of each attachment used in the render pass instance.
- either the **extent.height** member in **renderArea** is a multiple of the vertical granularity or **offset.y+extent.height** is equal to the **height** of each attachment used in the render pass instance.

Valid Usage (Implicit)

- VUID-vkGetRenderingAreaGranularityKHR-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetRenderingAreaGranularityKHR-pRenderingAreaInfo-parameter **pRenderingAreaInfo** **must** be a valid pointer to a valid [VkRenderingAreaInfoKHR](#) structure
- VUID-vkGetRenderingAreaGranularityKHR-pGranularity-parameter **pGranularity** **must** be a valid pointer to a [VkExtent2D](#) structure

The [VkRenderingAreaInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_maintenance5
typedef struct VkRenderingAreaInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           viewMask;
    uint32_t           colorAttachmentCount;
    const VkFormat*     pColorAttachmentFormats;
    VkFormat            depthAttachmentFormat;
    VkFormat            stencilAttachmentFormat;
} VkRenderingAreaInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **viewMask** is the viewMask used for rendering.
- **colorAttachmentCount** is the number of entries in **pColorAttachmentFormats**
- **pColorAttachmentFormats** is a pointer to an array of **VkFormat** values defining the format of color attachments used in the render pass instance.
- **depthAttachmentFormat** is a **VkFormat** value defining the format of the depth attachment used in the render pass instance.
- **stencilAttachmentFormat** is a **VkFormat** value defining the format of the stencil attachment used in the render pass instance.

Valid Usage (Implicit)

- VUID-VkRenderingAreaInfoKHR-sType-sType
sType must be **VK_STRUCTURE_TYPE_RENDERING_AREA_INFO_KHR**
- VUID-VkRenderingAreaInfoKHR-pNext-pNext
pNext must be **NULL**

The **VkRenderPassStripeBeginInfoARM** structure is defined as:

```
// Provided by VK_ARM_render_pass_striped
typedef struct VkRenderPassStripeBeginInfoARM {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           stripeInfoCount;
    const VkRenderPassStripeInfoARM* pStripeInfos;
} VkRenderPassStripeBeginInfoARM;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **stripeInfoCount** is the number of stripes in this render pass instance

- `pStripeInfos` is a pointer to an array of `stripeInfoCount` `VkRenderPassStripeInfoARM` structures describing the stripes used by the render pass instance.

This structure can be included in the `pNext` chain of `VkRenderPassBeginInfo` or `VkRenderingInfo` to define how the render pass instance is split into stripes.

Valid Usage

- VUID-VkRenderPassStripeBeginInfoARM-stripeInfoCount-09450
`stripeInfoCount` **must** be less than or equal to `VkPhysicalDeviceRenderPassStripedPropertiesARM::maxRenderPassStripes`
- VUID-VkRenderPassStripeBeginInfoARM-stripeArea-09451
The `stripeArea` defined by each element of `pStripeInfos` **must** not overlap the `stripeArea` of any other element

Valid Usage (Implicit)

- VUID-VkRenderPassStripeBeginInfoARM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_STRIPE_BEGIN_INFO_ARM`
- VUID-VkRenderPassStripeBeginInfoARM-pStripeInfos-parameter
`pStripeInfos` **must** be a valid pointer to an array of `stripeInfoCount` valid `VkRenderPassStripeInfoARM` structures
- VUID-VkRenderPassStripeBeginInfoARM-stripeInfoCount-arraylength
`stripeInfoCount` **must** be greater than 0

The `VkRenderPassStripeInfoARM` structure is defined as:

```
// Provided by VK_ARM_render_pass_striped
typedef struct VkRenderPassStripeInfoARM {
    VkStructureType    sType;
    const void*        pNext;
    VkRect2D           stripeArea;
} VkRenderPassStripeInfoARM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stripeArea` is the stripe area, and is described in more detail below.

`stripeArea` is the render area that is affected by this stripe of the render pass instance. It **must** be a subregion of the `renderArea` of the render pass instance.

Valid Usage

- VUID-VkRenderPassStripeInfoARM-stripeArea-09452
`stripeArea.offset.x` **must** be a multiple of `VkPhysicalDeviceRenderPassStripedPropertiesARM::renderPassStripeGranularity.width`
- VUID-VkRenderPassStripeInfoARM-stripeArea-09453
`stripeArea.extent.width` **must** be a multiple of `VkPhysicalDeviceRenderPassStripedPropertiesARM::renderPassStripeGranularity.width`, or the sum of `stripeArea.offset.x` and `stripeArea.extent.width` **must** be equal to the `renderArea.extent.width` of the render pass instance
- VUID-VkRenderPassStripeInfoARM-stripeArea-09454
`stripeArea.offset.y` **must** be a multiple of `VkPhysicalDeviceRenderPassStripedPropertiesARM::renderPassStripeGranularity.height`
- VUID-VkRenderPassStripeInfoARM-stripeArea-09455
`stripeArea.extent.height` **must** be a multiple of `VkPhysicalDeviceRenderPassStripedPropertiesARM::renderPassStripeGranularity.height`, or the sum of `stripeArea.offset.y` and `stripeArea.extent.height` **must** be equal to the `renderArea.extent.height` of the render pass instance

Valid Usage (Implicit)

- VUID-VkRenderPassStripeInfoARM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_STRIPE_INFO_ARM`
- VUID-VkRenderPassStripeInfoARM-pNext-pNext
`pNext` **must** be `NULL`

To end a render pass instance, call:

```
// Provided by VK_VERSION_1_3
void vkCmdEndRendering(
    VkCommandBuffer                                commandBuffer);
```

or the equivalent command

```
// Provided by VK_KHR_dynamic_rendering
void vkCmdEndRenderingKHR(
    VkCommandBuffer                                commandBuffer);
```

- `commandBuffer` is the command buffer in which to record the command.

If the value of `pRenderingInfo->flags` used to begin this render pass instance included `VK_RENDERING_SUSPENDING_BIT`, then this render pass is suspended and will be resumed later in [submission order](#).

Valid Usage

- VUID-vkCmdEndRendering-None-06161
The current render pass instance **must** have been begun with `vkCmdBeginRendering`
- VUID-vkCmdEndRendering-commandBuffer-06162
The current render pass instance **must** have been begun in `commandBuffer`
- VUID-vkCmdEndRendering-None-06781
This command **must** not be recorded when transform feedback is active
- VUID-vkCmdEndRendering-None-06999
If `vkCmdBeginQuery*` was called within the render pass, the corresponding `vkCmdEndQuery*` **must** have been called subsequently within the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndRendering-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdEndRendering-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdEndRendering-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdEndRendering-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdEndRendering-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	Graphics	Action State

NOTE

For more complex rendering graphs, it is possible to pre-define a static *render pass* object, which as well as allowing draw commands, allows the definition of framebuffer-local dependencies between multiple subpasses. These objects have a lot of setup cost compared to [vkCmdBeginRendering](#), but use of subpass dependencies can confer important performance benefits on some devices.

The `VkTilePropertiesQCOM` structure is defined as:

```
// Provided by VK_QCOM_tile_properties
typedef struct VkTilePropertiesQCOM {
    VkStructureType    sType;
    void*              pNext;
    VkExtent3D         tileSize;
    VkExtent2D         apronSize;
    VkOffset2D         origin;
} VkTilePropertiesQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `tileSize` is the dimensions of a tile, with width and height describing the width and height of a tile in pixels, and depth corresponding to the number of slices the tile spans.
- `apronSize` is the dimension of the apron.
- `origin` is the top-left corner of the first tile in attachment space.

All tiles will be tightly packed around the first tile, with edges being multiples of tile width and/or height from the origin.

NOTE

Reported value for `apronSize` will be zero and its functionality will be described in a future extension.

Valid Usage (Implicit)

- VUID-VkTilePropertiesQCOM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_TILE_PROPERTIES_QCOM`
- VUID-VkTilePropertiesQCOM-pNext-pNext
`pNext` **must** be `NULL`

To query the tile properties when using dynamic rendering, call:

```
// Provided by VK_QCOM_tile_properties
VkResult vkGetDynamicRenderingTilePropertiesQCOM(
    VkDevice device,
    const VkRenderingInfo* pRenderingInfo,
    VkTilePropertiesQCOM* pProperties);
```

- **device** is a logical device associated with the render pass.
- **pRenderingInfo** is a pointer to the [VkRenderingInfo](#) structure specifying details of the render pass instance in dynamic rendering.
- **pProperties** is a pointer to a [VkTilePropertiesQCOM](#) structure in which the properties are returned.

Valid Usage (Implicit)

- VUID-vkGetDynamicRenderingTilePropertiesQCOM-device-parameter **device** must be a valid [VkDevice](#) handle
- VUID-vkGetDynamicRenderingTilePropertiesQCOM-pRenderingInfo-parameter **pRenderingInfo** must be a valid pointer to a valid [VkRenderingInfo](#) structure
- VUID-vkGetDynamicRenderingTilePropertiesQCOM-pProperties-parameter **pProperties** must be a valid pointer to a [VkTilePropertiesQCOM](#) structure

Return Codes

Success

- **VK_SUCCESS**

Failure

None

8.1. Render Pass Objects

A render pass object represents a collection of attachments, subpasses, and dependencies between the subpasses, and describes how the attachments are used over the course of the subpasses.

Render passes are represented by **VkRenderPass** handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkRenderPass)
```

An *attachment description* describes the properties of an attachment including its format, sample count, and how its contents are treated at the beginning and end of each render pass instance.

A *subpass* represents a phase of rendering that reads and writes a subset of the attachments in a

render pass. Rendering commands are recorded into a particular subpass of a render pass instance.

A *subpass description* describes the subset of attachments that is involved in the execution of a subpass. Each subpass **can** read from some attachments as *input attachments*, write to some as *color attachments* or *depth/stencil attachments*, perform *shader resolve operations* to *color_attachments* or *depth/stencil_attachments*, and perform *multisample resolve operations* to *resolve attachments*. A subpass description **can** also include a set of *preserve attachments*, which are attachments that are not read or written by the subpass but whose contents **must** be preserved throughout the subpass.

A subpass *uses an attachment* if the attachment is a color, depth/stencil, resolve, depth/stencil resolve, fragment shading rate, or input attachment for that subpass (as determined by the `pColorAttachments`, `pDepthStencilAttachment`, `pResolveAttachments`, `VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment`, `VkFragmentShadingRateAttachmentInfoKHR::pFragmentShadingRateAttachment->attachment`, and `pInputAttachments` members of `VkSubpassDescription`, respectively). A subpass does not use an attachment if that attachment is preserved by the subpass. The *first use of an attachment* is in the lowest numbered subpass that uses that attachment. Similarly, the *last use of an attachment* is in the highest numbered subpass that uses that attachment.

The subpasses in a render pass all render to the same dimensions, and fragments for pixel (x,y,layer) in one subpass **can** only read attachment contents written by previous subpasses at that same (x,y,layer) location. For multi-pixel fragments, the pixel read from an input attachment is selected from the pixels covered by that fragment in an implementation-dependent manner. However, this selection **must** be made consistently for any fragment with the same shading rate for the lifetime of the `VkDevice`.

NOTE

By describing a complete set of subpasses in advance, render passes provide the implementation an opportunity to optimize the storage and transfer of attachment data between subpasses.

In practice, this means that subpasses with a simple framebuffer-space dependency **may** be merged into a single tiled rendering pass, keeping the attachment data on-chip for the duration of a render pass instance. However, it is also quite common for a render pass to only contain a single subpass.

Subpass dependencies describe [execution and memory dependencies](#) between subpasses.

A *subpass dependency chain* is a sequence of subpass dependencies in a render pass, where the source subpass of each subpass dependency (after the first) equals the destination subpass of the previous dependency.

Execution of subpasses **may** overlap or execute out of order with regards to other subpasses, unless otherwise enforced by an execution dependency. Each subpass only respects [submission order](#) for commands recorded in the same subpass, and the `vkCmdBeginRenderPass` and `vkCmdEndRenderPass` commands that delimit the render pass - commands within other subpasses are not included. This affects most other [implicit ordering guarantees](#).

A render pass describes the structure of subpasses and attachments independent of any specific

image views for the attachments. The specific image views that will be used for the attachments, and their dimensions, are specified in `VkFramebuffer` objects. Framebuffers are created with respect to a specific render pass that the framebuffer is compatible with (see [Render Pass Compatibility](#)). Collectively, a render pass and a framebuffer define the complete render target state for one or more subpasses as well as the algorithmic dependencies between the subpasses.

The various pipeline stages of the drawing commands for a given subpass **may** execute concurrently and/or out of order, both within and across drawing commands, whilst still respecting [pipeline order](#). However for a given (x,y,layer,sample) sample location, certain per-sample operations are performed in [rasterization order](#).

`VK_ATTACHMENT_UNUSED` is a constant indicating that a render pass attachment is not used.

```
#define VK_ATTACHMENT_UNUSED (~0U)
```

8.2. Render Pass Creation

To create a render pass, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateRenderPass(
    VkDevice                                device,
    const VkRenderPassCreateInfo*          pCreateInfo,
    const VkAllocationCallbacks*          pAllocator,
    VkRenderPass*                          pRenderPass);
```

- `device` is the logical device that creates the render pass.
- `pCreateInfo` is a pointer to a [VkRenderPassCreateInfo](#) structure describing the parameters of the render pass.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pRenderPass` is a pointer to a [VkRenderPass](#) handle in which the resulting render pass object is returned.

Valid Usage

- VUID-vkCreateRenderPass-device-10000
`device` **must** support at least one queue family with the `VK_QUEUE_GRAPHICS_BIT` capability

Valid Usage (Implicit)

- VUID-vkCreateRenderPass-device-parameter
`device` **must** be a valid [VkDevice](#) handle
- VUID-vkCreateRenderPass-pCreateInfo-parameter

pCreateInfo **must** be a valid pointer to a valid [VkRenderPassCreateInfo](#) structure

- VUID-vkCreateRenderPass-pAllocator-parameter

If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure

- VUID-vkCreateRenderPass-pRenderPass-parameter

pRenderPass **must** be a valid pointer to a [VkRenderPass](#) handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The [VkRenderPassCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkRenderPassCreateFlags flags;
    uint32_t             attachmentCount;
    const VkAttachmentDescription* pAttachments;
    uint32_t             subpassCount;
    const VkSubpassDescription* pSubpasses;
    uint32_t             dependencyCount;
    const VkSubpassDependency* pDependencies;
} VkRenderPassCreateInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkRenderPassCreateFlagBits](#)
- **attachmentCount** is the number of attachments used by this render pass.
- **pAttachments** is a pointer to an array of **attachmentCount** [VkAttachmentDescription](#) structures describing the attachments used by the render pass.
- **subpassCount** is the number of subpasses to create.
- **pSubpasses** is a pointer to an array of **subpassCount** [VkSubpassDescription](#) structures describing each subpass.
- **dependencyCount** is the number of memory dependencies between pairs of subpasses.
- **pDependencies** is a pointer to an array of **dependencyCount** [VkSubpassDependency](#) structures

describing dependencies between pairs of subpasses.

NOTE

Care should be taken to avoid a data race here; if any subpasses access attachments with overlapping memory locations, and one of those accesses is a write, a subpass dependency needs to be included between them.

Valid Usage

- VUID-VkRenderPassCreateInfo-attachment-00834

If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, then it **must** be less than `attachmentCount`

- VUID-VkRenderPassCreateInfo-fragmentDensityMapAttachment-06471

If the `pNext` chain includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure and the `fragmentDensityMapAttachment` member is not `VK_ATTACHMENT_UNUSED`, then `attachment` **must** be less than `attachmentCount`

- VUID-VkRenderPassCreateInfo-pAttachments-00836

For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderPassCreateInfo-pAttachments-02511

For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderPassCreateInfo-pAttachments-01566

For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- VUID-VkRenderPassCreateInfo-pAttachments-01567

For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderPassCreateInfo-pNext-01926

If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `subpass` member of each element of its `pAspectReferences` member **must** be less than `subpassCount`

- VUID-VkRenderPassCreateInfo-pNext-01927

If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `inputAttachmentIndex` member of each element of its `pAspectReferences` member **must** be less than the value of `inputAttachmentCount` in the element of `pSubpasses` identified by its `subpass` member

- VUID-VkRenderPassCreateInfo-pNext-01963
If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, for any element of the `pInputAttachments` member of any element of `pSubpasses` where the `attachment` member is not `VK_ATTACHMENT_UNUSED`, the `aspectMask` member of the corresponding element of `VkRenderPassInputAttachmentAspectCreateInfo::pAspectReferences` **must** only include aspects that are present in images of the format specified by the element of `pAttachments` at `attachment`
- VUID-VkRenderPassCreateInfo-pNext-01928
If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and its `subpassCount` member is not zero, that member **must** be equal to the value of `subpassCount`
- VUID-VkRenderPassCreateInfo-pNext-01929
If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, if its `dependencyCount` member is not zero, it **must** be equal to `dependencyCount`
- VUID-VkRenderPassCreateInfo-pNext-01930
If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, for each non-zero element of `pViewOffsets`, the `srcSubpass` and `dstSubpass` members of `pDependencies` at the same index **must** not be equal
- VUID-VkRenderPassCreateInfo-pNext-02512
If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, for any element of `pDependencies` with a `dependencyFlags` member that does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`, the corresponding element of the `pViewOffsets` member of that `VkRenderPassMultiviewCreateInfo` instance **must** be 0
- VUID-VkRenderPassCreateInfo-pNext-02513
If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, elements of its `pViewMasks` member **must** either all be 0, or all not be 0
- VUID-VkRenderPassCreateInfo-pNext-02514
If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and each element of its `pViewMasks` member is 0, the `dependencyFlags` member of each element of `pDependencies` **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`
- VUID-VkRenderPassCreateInfo-pNext-02515
If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and each element of its `pViewMasks` member is 0, its `correlationMaskCount` member **must** be 0
- VUID-VkRenderPassCreateInfo-pDependencies-00837
For any element of `pDependencies`, if the `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `srcStageMask` member of that dependency **must** be a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the source subpass
- VUID-VkRenderPassCreateInfo-pDependencies-00838
For any element of `pDependencies`, if the `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `dstStageMask` member of that dependency **must** be a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the destination subpass
- VUID-VkRenderPassCreateInfo-pDependencies-06866
For any element of `pDependencies`, if its `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, it **must** be

less than `subpassCount`

- VUID-VkRenderPassCreateInfo-pDependencies-06867

For any element of `pDependencies`, if its `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, it **must** be less than `subpassCount`

Valid Usage (Implicit)

- VUID-VkRenderPassCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO`
- VUID-VkRenderPassCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkRenderPassFragmentDensityMapCreateInfoEXT`, `VkRenderPassInputAttachmentAspectCreateInfo`, or `VkRenderPassMultiviewCreateInfo`
- VUID-VkRenderPassCreateInfo-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkRenderPassCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkRenderPassCreateFlagBits` values
- VUID-VkRenderPassCreateInfo-pAttachments-parameter
If `attachmentCount` is not `0`, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkAttachmentDescription` structures
- VUID-VkRenderPassCreateInfo-pSubpasses-parameter
`pSubpasses` **must** be a valid pointer to an array of `subpassCount` valid `VkSubpassDescription` structures
- VUID-VkRenderPassCreateInfo-pDependencies-parameter
If `dependencyCount` is not `0`, `pDependencies` **must** be a valid pointer to an array of `dependencyCount` valid `VkSubpassDependency` structures
- VUID-VkRenderPassCreateInfo-subpassCount-arraylength
`subpassCount` **must** be greater than `0`

Bits which **can** be set in `VkRenderPassCreateInfo::flags`, describing additional properties of the render pass, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkRenderPassCreateFlagBits {
    // Provided by VK_QCOM_render_pass_transform
    VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM = 0x00000002,
} VkRenderPassCreateFlagBits;
```

- `VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM` specifies that the created render pass is compatible with `render pass transform`.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkRenderPassCreateFlags;
```

`VkRenderPassCreateFlags` is a bitmask type for setting a mask of zero or more `VkRenderPassCreateFlagBits`.

If the `VkRenderPassCreateInfo::pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, then that structure includes an array of view masks, view offsets, and correlation masks for the render pass.

The `VkRenderPassMultiviewCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassMultiviewCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           subpassCount;
    const uint32_t*     pViewMasks;
    uint32_t           dependencyCount;
    const int32_t*      pViewOffsets;
    uint32_t           correlationMaskCount;
    const uint32_t*     pCorrelationMasks;
} VkRenderPassMultiviewCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_multiview
typedef VkRenderPassMultiviewCreateInfo VkRenderPassMultiviewCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `subpassCount` is zero or the number of subpasses in the render pass.
- `pViewMasks` is a pointer to an array of `subpassCount` view masks, where each mask is a bitfield of view indices describing which views rendering is broadcast to in each subpass, when multiview is enabled. If `subpassCount` is zero, each view mask is treated as zero.
- `dependencyCount` is zero or the number of dependencies in the render pass.
- `pViewOffsets` is a pointer to an array of `dependencyCount` view offsets, one for each dependency. If `dependencyCount` is zero, each dependency's view offset is treated as zero. Each view offset controls which views in the source subpass the views in the destination subpass depend on.
- `correlationMaskCount` is zero or the number of correlation masks.
- `pCorrelationMasks` is a pointer to an array of `correlationMaskCount` view masks indicating sets of views that **may** be more efficient to render concurrently.

When a subpass uses a non-zero view mask, *multiview* functionality is considered to be enabled.

Multiview is all-or-nothing for a render pass - that is, either all subpasses **must** have a non-zero view mask (though some subpasses **may** have only one view) or all **must** be zero. Multiview causes all drawing and clear commands in the subpass to behave as if they were broadcast to each view, where a view is represented by one layer of the framebuffer attachments. All draws and clears are broadcast to each *view index* whose bit is set in the view mask. The view index is provided in the `ViewIndex` shader input variable, and color, depth/stencil, and input attachments all read/write the layer of the framebuffer corresponding to the view index.

If the view mask is zero for all subpasses, multiview is considered to be disabled and all drawing commands execute normally, without this additional broadcasting.

Some implementations **may** not support multiview in conjunction with [mesh shaders](#), [geometry shaders](#) or [tessellation shaders](#).

When multiview is enabled, the `VK_DEPENDENCY_VIEW_LOCAL_BIT` bit in a dependency **can** be used to express a view-local dependency, meaning that each view in the destination subpass depends on a single view in the source subpass. Unlike pipeline barriers, a subpass dependency **can** potentially have a different view mask in the source subpass and the destination subpass. If the dependency is view-local, then each view (`dstView`) in the destination subpass depends on the view `dstView + pViewOffsets[dependency]` in the source subpass. If there is not such a view in the source subpass, then this dependency does not affect that view in the destination subpass. If the dependency is not view-local, then all views in the destination subpass depend on all views in the source subpass, and the view offset is ignored. A non-zero view offset is not allowed in a self-dependency.

The elements of `pCorrelationMasks` are a set of masks of views indicating that views in the same mask **may** exhibit spatial coherency between the views, making it more efficient to render them concurrently. Correlation masks **must** not have a functional effect on the results of the multiview rendering.

When multiview is enabled, at the beginning of each subpass all non-render pass state is undefined. In particular, each time `vkCmdBeginRenderPass` or `vkCmdNextSubpass` is called the graphics pipeline **must** be bound, any relevant descriptor sets or vertex/index buffers **must** be bound, and any relevant dynamic state or push constants **must** be set before they are used.

A multiview subpass **can** declare that its shaders will write per-view attributes for all views in a single invocation, by setting the `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX` bit in the subpass description. The only supported per-view attributes are position and viewport mask, and per-view position and viewport masks are written to output array variables decorated with `PositionPerViewNV` and `ViewportMaskPerViewNV`, respectively. If `VK_NV_viewport_array2` is not supported and enabled, `ViewportMaskPerViewNV` **must** not be used. Values written to elements of `PositionPerViewNV` and `ViewportMaskPerViewNV` **must** not depend on the `ViewIndex`. The shader **must** also write to an output variable decorated with `Position`, and the value written to `Position` **must** equal the value written to `PositionPerViewNV[ViewIndex]`. Similarly, if `ViewportMaskPerViewNV` is written to then the shader **must** also write to an output variable decorated with `ViewportMaskNV`, and the value written to `ViewportMaskNV` **must** equal the value written to `ViewportMaskPerViewNV[ViewIndex]`. Implementations will either use values taken from `Position` and `ViewportMaskNV` and invoke the shader once for each view, or will use values taken from `PositionPerViewNV` and `ViewportMaskPerViewNV` and invoke the shader fewer times. The values written to `Position` and `ViewportMaskNV` **must** not depend on the values written to `PositionPerViewNV` and

`ViewportMaskPerViewNV`, or vice versa (to allow compilers to eliminate the unused outputs). All attributes that do not have `*PerViewNV` counterparts **must** not depend on `ViewIndex`.

Per-view attributes are all-or-nothing for a subpass. That is, all pipelines compiled against a subpass that includes the `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX` bit **must** write per-view attributes to the `*PerViewNV[]` shader outputs, in addition to the non-per-view (e.g. `Position`) outputs. Pipelines compiled against a subpass that does not include this bit **must** not include the `*PerViewNV[]` outputs in their interfaces.

Valid Usage

- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-00841
Each view index **must** not be set in more than one element of `pCorrelationMasks`
- VUID-VkRenderPassMultiviewCreateInfo-multiview-06555
If the `multiview` feature is not enabled, each element of `pViewMasks` **must** be 0
- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-06697
The index of the most significant bit in each element of `pViewMasks` **must** be less than `maxMultiviewViewCount`

Valid Usage (Implicit)

- VUID-VkRenderPassMultiviewCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_MULTIVIEW_CREATE_INFO`
- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-parameter
If `subpassCount` is not 0, `pViewMasks` **must** be a valid pointer to an array of `subpassCount` `uint32_t` values
- VUID-VkRenderPassMultiviewCreateInfo-pViewOffsets-parameter
If `dependencyCount` is not 0, `pViewOffsets` **must** be a valid pointer to an array of `dependencyCount` `int32_t` values
- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-parameter
If `correlationMaskCount` is not 0, `pCorrelationMasks` **must** be a valid pointer to an array of `correlationMaskCount` `uint32_t` values

The `VkMultiviewPerViewAttributesInfoNVX` structure is defined as:

```
// Provided by VK_NVX_multiview_per_view_attributes with VK_VERSION_1_3 or
VK_KHR_dynamic_rendering
typedef struct VkMultiviewPerViewAttributesInfoNVX {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           perViewAttributes;
    VkBool32           perViewAttributesPositionXOnly;
} VkMultiviewPerViewAttributesInfoNVX;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `perViewAttributes` specifies that shaders compiled for this pipeline write the attributes for all views in a single invocation of each vertex processing stage. All pipelines executed within a render pass instance that includes this bit **must** write per-view attributes to the `*PerViewNV[]` shader outputs, in addition to the non-per-view (e.g. `Position`) outputs.
- `perViewAttributesPositionXOnly` specifies that shaders compiled for this pipeline use per-view positions which only differ in value in the x component. Per-view viewport mask **can** also be used.

When dynamic render pass instances are being used, instead of specifying `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX` or `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX` in the subpass description flags, the per-attribute properties of the render pass instance **must** be specified by the `VkMultiviewPerViewAttributesInfoNVX` structure. Include the `VkMultiviewPerViewAttributesInfoNVX` structure in the `pNext` chain of `VkGraphicsPipelineCreateInfo` when creating a graphics pipeline for dynamic rendering, `VkRenderingInfo` when starting a dynamic render pass instance, and `VkCommandBufferInheritanceInfo` when specifying the dynamic render pass instance parameters for secondary command buffers.

Valid Usage (Implicit)

- VUID-VkMultiviewPerViewAttributesInfoNVX-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MULTIVIEW_PER_VIEW_ATTRIBUTES_INFO_NVX`

If the `VkRenderPassCreateInfo::pNext` chain includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure, then that structure includes a fragment density map attachment for the render pass.

The `VkRenderPassFragmentDensityMapCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_fragment_density_map
typedef struct VkRenderPassFragmentDensityMapCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkAttachmentReference fragmentDensityMapAttachment;
} VkRenderPassFragmentDensityMapCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityMapAttachment` is the fragment density map to use for the render pass.

The fragment density map is read at an implementation-dependent time with the following constraints determined by the attachment's image view `flags`:

- `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT` specifies that the fragment density

map will be read by the device during `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT` specifies that the fragment density map will be read by the host during `vkEndCommandBuffer` of the primary command buffer that the render pass is recorded into
- Otherwise the fragment density map will be read by the host during `vkCmdBeginRenderPass`

The fragment density map **may** additionally be read by the device during `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT` for any mode.

If this structure is not present, it is as if `fragmentDensityMapAttachment` was given as `VK_ATTACHMENT_UNUSED`.

Valid Usage

- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02548
If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` **must** not be an element of `VkSubpassDescription::pInputAttachments`, `VkSubpassDescription::pColorAttachments`, `VkSubpassDescription::pResolveAttachments`, `VkSubpassDescription::pDepthStencilAttachment`, or `VkSubpassDescription::pPreserveAttachments` for any subpass
- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02549
If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `layout` **must** be equal to `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`, or `VK_IMAGE_LAYOUT_GENERAL`
- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02550
If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` **must** reference an attachment with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_LOAD` or `VK_ATTACHMENT_LOAD_OP_DONT_CARE`
- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02551
If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` **must** reference an attachment with a `storeOp` equal to `VK_ATTACHMENT_STORE_OP_DONT_CARE`

Valid Usage (Implicit)

- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_FRAGMENT_DENSITY_MAP_CREATE_INFO_EXT`
- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-parameter
`fragmentDensityMapAttachment` **must** be a valid `VkAttachmentReference` structure

The `VkAttachmentDescription` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentDescription {
    VkAttachmentDescriptionFlags    flags;
    VkFormat                        format;
    VkSampleCountFlagBits          samples;
    VkAttachmentLoadOp              loadOp;
    VkAttachmentStoreOp             storeOp;
    VkAttachmentLoadOp              stencilLoadOp;
    VkAttachmentStoreOp             stencilStoreOp;
    VkImageLayout                   initialLayout;
    VkImageLayout                   finalLayout;
} VkAttachmentDescription;
```

- **flags** is a bitmask of **VkAttachmentDescriptionFlagBits** specifying additional properties of the attachment.
- **format** is a **VkFormat** value specifying the format of the image view that will be used for the attachment.
- **samples** is a **VkSampleCountFlagBits** value specifying the number of samples of the image.
- **loadOp** is a **VkAttachmentLoadOp** value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- **storeOp** is a **VkAttachmentStoreOp** value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- **stencilLoadOp** is a **VkAttachmentLoadOp** value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- **stencilStoreOp** is a **VkAttachmentStoreOp** value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- **initialLayout** is the layout the attachment image subresource will be in when a render pass instance begins.
- **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

If the attachment uses a color format, then **loadOp** and **storeOp** are used, and **stencilLoadOp** and **stencilStoreOp** are ignored. If the format has depth and/or stencil components, **loadOp** and **storeOp** apply only to the depth data, while **stencilLoadOp** and **stencilStoreOp** define how the stencil data is handled. **loadOp** and **stencilLoadOp** define the **load operations** for the attachment. **storeOp** and **stencilStoreOp** define the **store operations** for the attachment. If an attachment is not used by any subpass, **loadOp**, **storeOp**, **stencilStoreOp**, and **stencilLoadOp** will be ignored for that attachment, and no load or store ops will be performed. However, any transition specified by **initialLayout** and **finalLayout** will still be executed.

If **flags** includes **VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT**, then the attachment is treated as if it shares physical memory with another attachment in the same render pass. This information limits the ability of the implementation to reorder certain operations (like layout transitions and the **loadOp**) such that it is not improperly reordered against other uses of the same physical memory via a different attachment. This is described in more detail below.

If a render pass uses multiple attachments that alias the same device memory, those attachments **must** each include the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit in their attachment description flags. Attachments aliasing the same memory occurs in multiple ways:

- Multiple attachments being assigned the same image view as part of framebuffer creation.
- Attachments using distinct image views that correspond to the same image subresource of an image.
- Attachments using views of distinct image subresources which are bound to overlapping memory ranges.

NOTE

Render passes **must** include subpass dependencies (either directly or via a subpass dependency chain) between any two subpasses that operate on the same attachment or aliasing attachments and those subpass dependencies **must** include execution and memory dependencies separating uses of the aliases, if at least one of those subpasses writes to one of the aliases. These dependencies **must** not include the `VK_DEPENDENCY_BY_REGION_BIT` if the aliases are views of distinct image subresources which overlap in memory.

Multiple attachments that alias the same memory **must** not be used in a single subpass. A given attachment index **must** not be used multiple times in a single subpass, with one exception: two subpass attachments **can** use the same attachment index if at least one use is as an input attachment and neither use is as a resolve or preserve attachment. In other words, the same view **can** be used simultaneously as an input and color or depth/stencil attachment, but **must** not be used as multiple color or depth/stencil attachments nor as resolve or preserve attachments.

If a set of attachments alias each other, then all except the first to be used in the render pass **must** use an `initialLayout` of `VK_IMAGE_LAYOUT_UNDEFINED`, since the earlier uses of the other aliases make their contents undefined. Once an alias has been used and a different alias has been used after it, the first alias **must** not be used in any later subpasses. However, an application **can** assign the same image view to multiple aliasing attachment indices, which allows that image view to be used multiple times even if other aliases are used in between.

NOTE

Once an attachment needs the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit, there **should** be no additional cost of introducing additional aliases, and using these additional aliases **may** allow more efficient clearing of the attachments on multiple uses via `VK_ATTACHMENT_LOAD_OP_CLEAR`.

Valid Usage

- VUID-VkAttachmentDescription-format-06699
If `format` includes a color or depth component and `loadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`
- VUID-VkAttachmentDescription-finalLayout-00843
`finalLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`
- VUID-VkAttachmentDescription-format-03280
If `format` is a color format, `initialLayout` **must** not be

VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription-format-03281

If `format` is a depth/stencil format, `initialLayout` **must** not be
VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

- VUID-VkAttachmentDescription-format-03282

If `format` is a color format, `finalLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription-format-03283

If `format` is a depth/stencil format, `finalLayout` **must** not be
VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

- VUID-VkAttachmentDescription-format-06487

If `format` is a color format, `initialLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkAttachmentDescription-format-06488

If `format` is a color format, `finalLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkAttachmentDescription-separateDepthStencilLayouts-03284

If the `separateDepthStencilLayouts` feature is not enabled, `initialLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

- VUID-VkAttachmentDescription-separateDepthStencilLayouts-03285

If the `separateDepthStencilLayouts` feature is not enabled, `finalLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

- VUID-VkAttachmentDescription-format-03286

If `format` is a color format, `initialLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription-format-03287

If `format` is a color format, `finalLayout` **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription-format-06906

If `format` is a depth/stencil format which includes both depth and stencil components,
`initialLayout` **must** not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription-format-06907
If **format** is a depth/stencil format which includes both depth and stencil components, **finalLayout** **must** not be **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**
- VUID-VkAttachmentDescription-format-03290
If **format** is a depth/stencil format which includes only the depth component, **initialLayout** **must** not be **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**
- VUID-VkAttachmentDescription-format-03291
If **format** is a depth/stencil format which includes only the depth component, **finalLayout** **must** not be **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**
- VUID-VkAttachmentDescription-synchronization2-06908
If the **synchronization2** feature is not enabled, **initialLayout** **must** not be **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR** or **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR**
- VUID-VkAttachmentDescription-synchronization2-06909
If the **synchronization2** feature is not enabled, **finalLayout** **must** not be **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR** or **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR**
- VUID-VkAttachmentDescription-attachmentFeedbackLoopLayout-07309
If the **attachmentFeedbackLoopLayout** feature is not enabled, **initialLayout** **must** not be **VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT**
- VUID-VkAttachmentDescription-attachmentFeedbackLoopLayout-07310
If the **attachmentFeedbackLoopLayout** feature is not enabled, **finalLayout** **must** not be **VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT**
- VUID-VkAttachmentDescription-samples-08745
samples **must** be a valid **VkSampleCountFlagBits** value that is set in **imageCreateSampleCounts** (as defined in **Image Creation Limits**) for the given **format**
- VUID-VkAttachmentDescription-dynamicRenderingLocalRead-09544
If the **dynamicRenderingLocalRead** feature is not enabled, **initialLayout** **must** not be **VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR**
- VUID-VkAttachmentDescription-dynamicRenderingLocalRead-09545
If the **dynamicRenderingLocalRead** feature is not enabled, **finalLayout** **must** not be **VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR**
- VUID-VkAttachmentDescription-format-06698
format **must** not be **VK_FORMAT_UNDEFINED**
- VUID-VkAttachmentDescription-format-06700
If **format** includes a stencil component and **stencilLoadOp** is **VK_ATTACHMENT_LOAD_OP_LOAD**, then **initialLayout** **must** not be **VK_IMAGE_LAYOUT_UNDEFINED**
- VUID-VkAttachmentDescription-format-03292
If **format** is a depth/stencil format which includes only the stencil component, **initialLayout** **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**
- VUID-VkAttachmentDescription-format-03293

If **format** is a depth/stencil format which includes only the stencil component, **finalLayout** **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**

- VUID-VkAttachmentDescription-format-06242

If **format** is a depth/stencil format which includes both depth and stencil components, **initialLayout** **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**

- VUID-VkAttachmentDescription-format-06243

If **format** is a depth/stencil format which includes both depth and stencil components, **finalLayout** **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**

Valid Usage (Implicit)

- VUID-VkAttachmentDescription-flags-parameter
flags **must** be a valid combination of **VkAttachmentDescriptionFlagBits** values
- VUID-VkAttachmentDescription-format-parameter
format **must** be a valid **VkFormat** value
- VUID-VkAttachmentDescription-samples-parameter
samples **must** be a valid **VkSampleCountFlagBits** value
- VUID-VkAttachmentDescription-loadOp-parameter
loadOp **must** be a valid **VkAttachmentLoadOp** value
- VUID-VkAttachmentDescription-storeOp-parameter
storeOp **must** be a valid **VkAttachmentStoreOp** value
- VUID-VkAttachmentDescription-stencilLoadOp-parameter
stencilLoadOp **must** be a valid **VkAttachmentLoadOp** value
- VUID-VkAttachmentDescription-stencilStoreOp-parameter
stencilStoreOp **must** be a valid **VkAttachmentStoreOp** value
- VUID-VkAttachmentDescription-initialLayout-parameter
initialLayout **must** be a valid **VkImageLayout** value
- VUID-VkAttachmentDescription-finalLayout-parameter
finalLayout **must** be a valid **VkImageLayout** value

Bits which **can** be set in **VkAttachmentDescription::flags**, describing additional properties of the attachment, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentDescriptionFlagBits {
    VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT = 0x00000001,
} VkAttachmentDescriptionFlagBits;
```

- **VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT** specifies that the attachment aliases the same device

memory as other attachments.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkAttachmentDescriptionFlags;
```

`VkAttachmentDescriptionFlags` is a bitmask type for setting a mask of zero or more `VkAttachmentDescriptionFlagBits`.

The `VkRenderPassInputAttachmentAspectCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassInputAttachmentAspectCreateInfo {
    VkStructureType              sType;
    const void*                  pNext;
    uint32_t                     aspectReferenceCount;
    const VkInputAttachmentAspectReference* pAspectReferences;
} VkRenderPassInputAttachmentAspectCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_maintenance2
typedef VkRenderPassInputAttachmentAspectCreateInfo
VkRenderPassInputAttachmentAspectCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `aspectReferenceCount` is the number of elements in the `pAspectReferences` array.
- `pAspectReferences` is a pointer to an array of `aspectReferenceCount` `VkInputAttachmentAspectReference` structures containing a mask describing which aspect(s) **can** be accessed for a given input attachment within a given subpass.

To specify which aspects of an input attachment **can** be read, add a `VkRenderPassInputAttachmentAspectCreateInfo` structure to the `pNext` chain of the `VkRenderPassCreateInfo` structure:

An application **can** access any aspect of an input attachment that does not have a specified aspect mask in the `pAspectReferences` array. Otherwise, an application **must** not access aspect(s) of an input attachment other than those in its specified aspect mask.

Valid Usage (Implicit)

- VUID-VkRenderPassInputAttachmentAspectCreateInfo-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO`
- VUID-VkRenderPassInputAttachmentAspectCreateInfo-pAspectReferences-parameter

`pAspectReferences` **must** be a valid pointer to an array of `aspectReferenceCount` valid `VkInputAttachmentAspectReference` structures

- VUID-VkRenderPassInputAttachmentAspectCreateInfo-aspectReferenceCount-arraylength `aspectReferenceCount` **must** be greater than 0

The `VkInputAttachmentAspectReference` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkInputAttachmentAspectReference {
    uint32_t      subpass;
    uint32_t      inputAttachmentIndex;
    VkImageAspectFlags aspectMask;
} VkInputAttachmentAspectReference;
```

or the equivalent

```
// Provided by VK_KHR_maintenance2
typedef VkInputAttachmentAspectReference VkInputAttachmentAspectReferenceKHR;
```

- `subpass` is an index into the `pSubpasses` array of the parent `VkRenderPassCreateInfo` structure.
- `inputAttachmentIndex` is an index into the `pInputAttachments` of the specified subpass.
- `aspectMask` is a mask of which aspect(s) **can** be accessed within the specified subpass.

This structure specifies an aspect mask for a specific input attachment of a specific subpass in the render pass.

`subpass` and `inputAttachmentIndex` index into the render pass as:

```
pCreateInfo->pSubpasses[subpass].pInputAttachments[inputAttachmentIndex]
```

Valid Usage

- VUID-VkInputAttachmentAspectReference-aspectMask-01964 `aspectMask` **must** not include `VK_IMAGE_ASPECT_METADATA_BIT`
- VUID-VkInputAttachmentAspectReference-aspectMask-02250 `aspectMask` **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index *i*

Valid Usage (Implicit)

- VUID-VkInputAttachmentAspectReference-aspectMask-parameter `aspectMask` **must** be a valid combination of `VkImageAspectFlagBits` values
- VUID-VkInputAttachmentAspectReference-aspectMask-requiredbitmask

aspectMask **must** not be 0

The `VkSubpassDescription` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDescription {
    VkSubpassDescriptionFlags    flags;
    VkPipelineBindPoint          pipelineBindPoint;
    uint32_t                     inputAttachmentCount;
    const VkAttachmentReference* pInputAttachments;
    uint32_t                     colorAttachmentCount;
    const VkAttachmentReference* pColorAttachments;
    const VkAttachmentReference* pResolveAttachments;
    const VkAttachmentReference* pDepthStencilAttachment;
    uint32_t                     preserveAttachmentCount;
    const uint32_t*              pPreserveAttachments;
} VkSubpassDescription;
```

- **flags** is a bitmask of `VkSubpassDescriptionFlagBits` specifying usage of the subpass.
- **pipelineBindPoint** is a `VkPipelineBindPoint` value specifying the pipeline type supported for this subpass.
- **inputAttachmentCount** is the number of input attachments.
- **pInputAttachments** is a pointer to an array of `VkAttachmentReference` structures defining the input attachments for this subpass and their layouts.
- **colorAttachmentCount** is the number of color attachments.
- **pColorAttachments** is a pointer to an array of **colorAttachmentCount** `VkAttachmentReference` structures defining the color attachments for this subpass and their layouts.
- **pResolveAttachments** is `NULL` or a pointer to an array of **colorAttachmentCount** `VkAttachmentReference` structures defining the resolve attachments for this subpass and their layouts.
- **pDepthStencilAttachment** is a pointer to a `VkAttachmentReference` structure specifying the depth/stencil attachment for this subpass and its layout.
- **preserveAttachmentCount** is the number of preserved attachments.
- **pPreserveAttachments** is a pointer to an array of **preserveAttachmentCount** render pass attachment indices identifying attachments that are not used by this subpass, but whose contents **must** be preserved throughout the subpass.

Each element of the **pInputAttachments** array corresponds to an input attachment index in a fragment shader, i.e. if a shader declares an image variable decorated with a **InputAttachmentIndex** value of **X**, then it uses the attachment provided in **pInputAttachments[X]**. Input attachments **must** also be bound to the pipeline in a descriptor set. If the **attachment** member of any element of **pInputAttachments** is `VK_ATTACHMENT_UNUSED`, the application **must** not read from the corresponding input attachment index. Fragment shaders **can** use subpass input variables to access the contents of an input attachment at the fragment's (x, y, layer) framebuffer coordinates. Input attachments **must**

not be used by any subpasses within a render pass that enables [render pass transform](#).

Each element of the `pColorAttachments` array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of `X`, then it uses the attachment provided in `pColorAttachments[X]`. If the `attachment` member of any element of `pColorAttachments` is `VK_ATTACHMENT_UNUSED`, or if [Color Write Enable](#) has been disabled for the corresponding attachment index, then writes to the corresponding location by a fragment shader are discarded.

If `flags` does not include `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, and if `pResolveAttachments` is not `NULL`, each of its elements corresponds to a color attachment (the element in `pColorAttachments` at the same index), and a [multisample resolve operation](#) is defined for each attachment unless the resolve attachment index is `VK_ATTACHMENT_UNUSED`.

Similarly, if `flags` does not include `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, and `VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, it corresponds to the depth/stencil attachment in `pDepthStencilAttachment`, and [multisample resolve operation](#) for depth and stencil are defined by `VkSubpassDescriptionDepthStencilResolve::depthResolveMode` and `VkSubpassDescriptionDepthStencilResolve::stencilResolveMode`, respectively. If `VkSubpassDescriptionDepthStencilResolve::depthResolveMode` is `VK_RESOLVE_MODE_NONE` or the `pDepthStencilResolveAttachment` does not have a depth aspect, no resolve operation is performed for the depth attachment. If `VkSubpassDescriptionDepthStencilResolve::stencilResolveMode` is `VK_RESOLVE_MODE_NONE` or the `pDepthStencilResolveAttachment` does not have a stencil aspect, no resolve operation is performed for the stencil attachment.

If the image subresource range referenced by the depth/stencil attachment is created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`, then the [multisample resolve operation](#) uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` for the subpass.

If `pDepthStencilAttachment` is `NULL`, or if its attachment index is `VK_ATTACHMENT_UNUSED`, it indicates that no depth/stencil attachment will be used in the subpass.

The contents of an attachment within the render area become undefined at the start of a subpass `S` if all of the following conditions are true:

- The attachment is used as a color, depth/stencil, or resolve attachment in any subpass in the render pass.
- There is a subpass `S1` that uses or preserves the attachment, and a subpass dependency from `S1` to `S`.
- The attachment is not used or preserved in subpass `S`.

In addition, the contents of an attachment within the render area become undefined at the start of a subpass `S` if all of the following conditions are true:

- `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM` is set.
- The attachment is used as a color or depth/stencil in the subpass.

Once the contents of an attachment become undefined in subpass **S**, they remain undefined for subpasses in subpass dependency chains starting with subpass **S** until they are written again. However, they remain valid for subpasses in other subpass dependency chains starting with subpass **S**₁ if those subpasses use or preserve the attachment.

Valid Usage

- VUID-VkSubpassDescription-attachment-06912
If the **attachment** member of an element of **pInputAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL**
- VUID-VkSubpassDescription-attachment-06913
If the **attachment** member of an element of **pColorAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL**
- VUID-VkSubpassDescription-attachment-06914
If the **attachment** member of an element of **pResolveAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL**
- VUID-VkSubpassDescription-attachment-06915
If the **attachment** member of **pDepthStencilAttachment** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL**
- VUID-VkSubpassDescription-attachment-06916
If the **attachment** member of an element of **pColorAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL**
- VUID-VkSubpassDescription-attachment-06917
If the **attachment** member of an element of **pResolveAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL**
- VUID-VkSubpassDescription-attachment-06918
If the **attachment** member of an element of **pInputAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL**
- VUID-VkSubpassDescription-attachment-06919
If the **attachment** member of an element of **pColorAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL**, or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**
- VUID-VkSubpassDescription-attachment-06920

If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkSubpassDescription-attachment-06921

If the `attachment` member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR`

- VUID-VkSubpassDescription-attachment-06922

If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkSubpassDescription-attachment-06923

If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkSubpassDescription-pipelineBindPoint-04952

`pipelineBindPoint` **must** be `VK_PIPELINE_BIND_POINT_GRAPHICS` or `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`

- VUID-VkSubpassDescription-colorAttachmentCount-00845

`colorAttachmentCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxColorAttachments`

- VUID-VkSubpassDescription-loadOp-00846

If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then `loadOp` **must** not be `VK_ATTACHMENT_LOAD_OP_CLEAR`

- VUID-VkSubpassDescription-pResolveAttachments-00847

If `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not be `VK_ATTACHMENT_UNUSED`

- VUID-VkSubpassDescription-pResolveAttachments-00848

If `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkSubpassDescription-pResolveAttachments-00849

If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` **must** have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkSubpassDescription-pResolveAttachments-00850

If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` **must** have the same `VkFormat` as its corresponding color attachment

- VUID-VkSubpassDescription-pColorAttachments-09430

All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have the same sample count

- VUID-VkSubpassDescription-pInputAttachments-02647
All attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` contain at least `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkSubpassDescription-pColorAttachments-02648
All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`
- VUID-VkSubpassDescription-pResolveAttachments-02649
All attachments in `pResolveAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`
- VUID-VkSubpassDescription-pDepthStencilAttachment-02650
If `pDepthStencilAttachment` is not `NULL` and the attachment is not `VK_ATTACHMENT_UNUSED` then it **must** have an image format whose `potential format features` contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkSubpassDescription-linearColorAttachment-06496
If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` **must** contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`
- VUID-VkSubpassDescription-linearColorAttachment-06497
If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` **must** contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`
- VUID-VkSubpassDescription-linearColorAttachment-06498
If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pResolveAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` **must** contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`
- VUID-VkSubpassDescription-None-09431
If either of the following is enabled:
 - The `VK_AMD_mixed_attachment_samples` extension
 - The `VK_NV_framebuffer_mixed_samples` extension
 all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have a sample count that is smaller than or equal to the sample count of `pDepthStencilAttachment` if it is not `VK_ATTACHMENT_UNUSED`
- VUID-VkSubpassDescription-pDepthStencilAttachment-01418
If `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED` and any attachments in `pColorAttachments` are not `VK_ATTACHMENT_UNUSED`, they **must** have the same sample count , if none of the following are enabled:

- The [VK_AMD_mixed_attachment_samples](#) extension
- The [VK_NV_framebuffer_mixed_samples](#) extension
- VUID-VkSubpassDescription-attachment-00853
Each element of [pPreserveAttachments](#) **must** not be [VK_ATTACHMENT_UNUSED](#)
- VUID-VkSubpassDescription-pPreserveAttachments-00854
Each element of [pPreserveAttachments](#) **must** not also be an element of any other member of the subpass description
- VUID-VkSubpassDescription-layout-02519
If any attachment is used by more than one [VkAttachmentReference](#) member, then each use **must** use the same [layout](#)
- VUID-VkSubpassDescription-flags-00856
If [flags](#) includes [VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX](#), it **must** also include [VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX](#)
- VUID-VkSubpassDescription-flags-03341
If [flags](#) includes [VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM](#), and if [pResolveAttachments](#) is not [NULL](#), then each resolve attachment **must** be [VK_ATTACHMENT_UNUSED](#)
- VUID-VkSubpassDescription-flags-03343
If [flags](#) includes [VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM](#), then the subpass **must** be the last subpass in a subpass dependency chain
- VUID-VkSubpassDescription-pInputAttachments-02868
If the render pass is created with [VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM](#) each of the elements of [pInputAttachments](#) **must** be [VK_ATTACHMENT_UNUSED](#)
- VUID-VkSubpassDescription-pDepthStencilAttachment-04438
[pDepthStencilAttachment](#) and [pColorAttachments](#) **must** not contain references to the same attachment

Valid Usage (Implicit)

- VUID-VkSubpassDescription-flags-parameter
[flags](#) **must** be a valid combination of [VkSubpassDescriptionFlagBits](#) values
- VUID-VkSubpassDescription-pipelineBindPoint-parameter
[pipelineBindPoint](#) **must** be a valid [VkPipelineBindPoint](#) value
- VUID-VkSubpassDescription-pInputAttachments-parameter
If [inputAttachmentCount](#) is not 0, [pInputAttachments](#) **must** be a valid pointer to an array of [inputAttachmentCount](#) valid [VkAttachmentReference](#) structures
- VUID-VkSubpassDescription-pColorAttachments-parameter
If [colorAttachmentCount](#) is not 0, [pColorAttachments](#) **must** be a valid pointer to an array of [colorAttachmentCount](#) valid [VkAttachmentReference](#) structures
- VUID-VkSubpassDescription-pResolveAttachments-parameter
If [colorAttachmentCount](#) is not 0, and [pResolveAttachments](#) is not [NULL](#), [pResolveAttachments](#) **must** be a valid pointer to an array of [colorAttachmentCount](#) valid [VkAttachmentReference](#)

structures

- VUID-VkSubpassDescription-pDepthStencilAttachment-parameter
If `pDepthStencilAttachment` is not `NULL`, `pDepthStencilAttachment` **must** be a valid pointer to a valid `VkAttachmentReference` structure
- VUID-VkSubpassDescription-pPreserveAttachments-parameter
If `preserveAttachmentCount` is not `0`, `pPreserveAttachments` **must** be a valid pointer to an array of `preserveAttachmentCount` `uint32_t` values

Bits which **can** be set in `VkSubpassDescription::flags`, specifying usage of the subpass, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSubpassDescriptionFlagBits {
    // Provided by VK_NVX_multiview_per_view_attributes
    VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX = 0x00000001,
    // Provided by VK_NVX_multiview_per_view_attributes
    VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX = 0x00000002,
    // Provided by VK_QCOM_render_pass_shader_resolve
    VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM = 0x00000004,
    // Provided by VK_QCOM_render_pass_shader_resolve
    VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM = 0x00000008,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT =
0x00000010,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT =
0x00000020,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT =
0x00000040,
    // Provided by VK_EXT_legacy_dithering
    VK_SUBPASS_DESCRIPTION_ENABLE_LEGACY_DITHERING_BIT_EXT = 0x00000080,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_ARM =
VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM =
VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM =
VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT,
} VkSubpassDescriptionFlagBits;
```

- `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX` specifies that shaders compiled for this subpass write the attributes for all views in a single invocation of each `pre-rasterization shader stage`. All pipelines compiled against a subpass that includes this bit **must** write per-view attributes to the `*PerViewNV[]` shader outputs, in addition to the non-per-view (e.g. `Position`) outputs.

- `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX` specifies that shaders compiled for this subpass use per-view positions which only differ in value in the x component. Per-view viewport mask **can** also be used.
- `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM` specifies that the framebuffer region is the fragment region, that is, the minimum region dependencies are by pixel rather than by sample, such that any fragment shader invocation **can** access any sample associated with that fragment shader invocation.
- `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM` specifies that the subpass performs shader resolve operations.
- `VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT` specifies that this subpass supports pipelines created with `VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT`.
- `VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT` specifies that this subpass supports pipelines created with `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT`.
- `VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT` specifies that this subpass supports pipelines created with `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`.
- `VK_SUBPASS_DESCRIPTION_ENABLE_LEGACY_DITHERING_BIT_EXT` specifies that [Legacy Dithering](#) is enabled for this subpass.

NOTE

Shader resolve operations allow for custom resolve operations, but overdrawing pixels **may** have a performance and/or power cost. Furthermore, since the content of any depth stencil attachment or color attachment is undefined at the beginning of a shader resolve subpass, any depth testing, stencil testing, or blending operation which sources these undefined values also has undefined result value.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSubpassDescriptionFlags;
```

`VkSubpassDescriptionFlags` is a bitmask type for setting a mask of zero or more `VkSubpassDescriptionFlagBits`.

The `VkAttachmentReference` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentReference {
    uint32_t      attachment;
    VkImageLayout layout;
} VkAttachmentReference;
```

- `attachment` is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is

not used.

- **layout** is a [VkImageLayout](#) value specifying the layout the attachment uses during the subpass.

Valid Usage

- VUID-VkAttachmentReference-layout-03077
If **attachment** is not `VK_ATTACHMENT_UNUSED`, **layout** **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- VUID-VkAttachmentReference-separateDepthStencilLayouts-03313
If the `separateDepthStencilLayouts` feature is not enabled, and **attachment** is not `VK_ATTACHMENT_UNUSED`, **layout** **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`,
- VUID-VkAttachmentReference-synchronization2-06910
If the `synchronization2` feature is not enabled, **layout** **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkAttachmentReference-attachmentFeedbackLoopLayout-07311
If the `attachmentFeedbackLoopLayout` feature is not enabled, **layout** **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`
- VUID-VkAttachmentReference-dynamicRenderingLocalRead-09546
If the `dynamicRenderingLocalRead` feature is not enabled, **layout** **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`

Valid Usage (Implicit)

- VUID-VkAttachmentReference-layout-parameter
layout **must** be a valid [VkImageLayout](#) value

`VK_SUBPASS_EXTERNAL` is a special subpass index value expanding synchronization scope outside a subpass. It is described in more detail by [VkSubpassDependency](#).

```
#define VK_SUBPASS_EXTERNAL          (~0U)
```

The [VkSubpassDependency](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDependency {
    uint32_t          srcSubpass;
    uint32_t          dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags      srcAccessMask;
    VkAccessFlags      dstAccessMask;
    VkDependencyFlags  dependencyFlags;
} VkSubpassDependency;
```

- `srcSubpass` is the subpass index of the first subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `dstSubpass` is the subpass index of the second subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [source stage mask](#).
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [destination stage mask](#).
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [source access mask](#).
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [destination access mask](#).
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits`.

If `srcSubpass` is equal to `dstSubpass` then the `VkSubpassDependency` does not directly define a [dependency](#). Instead, it enables pipeline barriers to be used in a render pass instance within the identified subpass, where the scopes of one pipeline barrier **must** be a subset of those described by one subpass dependency. Subpass dependencies specified in this way that include [framebuffer-space stages](#) in the `srcStageMask` **must** only include [framebuffer-space stages](#) in `dstStageMask`, and **must** include `VK_DEPENDENCY_BY_REGION_BIT`. When a subpass dependency is specified in this way for a subpass that has more than one view in its view mask, its `dependencyFlags` **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

If `srcSubpass` and `dstSubpass` are not equal, when a render pass instance which includes a subpass dependency is submitted to a queue, it defines a [dependency](#) between the subpasses identified by `srcSubpass` and `dstSubpass`.

If `srcSubpass` is equal to `VK_SUBPASS_EXTERNAL`, the first [synchronization scope](#) includes commands that occur earlier in [submission order](#) than the `vkCmdBeginRenderPass` used to begin the render pass instance. Otherwise, the first set of commands includes all commands submitted as part of the subpass instance identified by `srcSubpass` and any [load](#), [store](#), or [multisample resolve](#) operations on attachments used in `srcSubpass`. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the [source stage mask](#) specified by `srcStageMask`.

If `dstSubpass` is equal to `VK_SUBPASS_EXTERNAL`, the second [synchronization scope](#) includes commands that occur later in [submission order](#) than the `vkCmdEndRenderPass` used to end the render pass instance. Otherwise, the second set of commands includes all commands submitted as part of the subpass instance identified by `dstSubpass` and any [load](#), [store](#), and [multisample resolve](#) operations on attachments used in `dstSubpass`. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the [destination stage mask](#) specified by

`dstStageMask`.

The first `access scope` is limited to accesses in the pipeline stages determined by the `source stage mask` specified by `srcStageMask`. It is also limited to access types in the `source access mask` specified by `srcAccessMask`.

The second `access scope` is limited to accesses in the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`. It is also limited to access types in the `destination access mask` specified by `dstAccessMask`.

The `availability and visibility operations` defined by a subpass dependency affect the execution of `image layout transitions` within the render pass.

For non-attachment resources, the memory dependency expressed by subpass dependency is nearly identical to that of a `VkMemoryBarrier` (with matching `srcAccessMask` and `dstAccessMask` parameters) submitted as a part of a `vkCmdPipelineBarrier` (with matching `srcStageMask` and `dstStageMask` parameters). The only difference being that its scopes are limited to the identified subpasses rather than potentially affecting everything before and after.

NOTE

For attachments however, subpass dependencies work more like a `VkImageMemoryBarrier` defined similarly to the `VkMemoryBarrier` above, the queue family indices set to `VK_QUEUE_FAMILY_IGNORED`, and layouts as follows:

- The equivalent to `oldLayout` is the attachment's layout according to the subpass description for `srcSubpass`.
- The equivalent to `newLayout` is the attachment's layout according to the subpass description for `dstSubpass`.

Valid Usage

- VUID-VkSubpassDependency-srcStageMask-04090
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-VkSubpassDependency-srcStageMask-04091
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkSubpassDependency-srcStageMask-04092
If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-VkSubpassDependency-srcStageMask-04093
If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkSubpassDependency-srcStageMask-04094
If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain

VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-VkSubpassDependency-srcStageMask-04095
If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-VkSubpassDependency-srcStageMask-04096
If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
- VUID-VkSubpassDependency-srcStageMask-07318
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkSubpassDependency-srcStageMask-03937
If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be 0
- VUID-VkSubpassDependency-srcStageMask-07949
If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkSubpassDependency-dstStageMask-04090
If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-VkSubpassDependency-dstStageMask-04091
If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkSubpassDependency-dstStageMask-04092
If the `conditionalRendering` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-VkSubpassDependency-dstStageMask-04093
If the `fragmentDensityMap` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkSubpassDependency-dstStageMask-04094
If the `transformFeedback` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-VkSubpassDependency-dstStageMask-04095
If the `meshShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-VkSubpassDependency-dstStageMask-04096
If the `taskShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
- VUID-VkSubpassDependency-dstStageMask-07318
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkSubpassDependency-dstStageMask-03937
If the [synchronization2](#) feature is not enabled, **dstStageMask** **must** not be 0
- VUID-VkSubpassDependency-dstStageMask-07949
If neither the [VK_NV_ray_tracing](#) extension or [rayTracingPipeline](#) feature are enabled, **dstStageMask** **must** not contain [VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR](#)
- VUID-VkSubpassDependency-srcSubpass-00864
srcSubpass **must** be less than or equal to **dstSubpass**, unless one of them is [VK_SUBPASS_EXTERNAL](#), to avoid cyclic dependencies and ensure a valid execution order
- VUID-VkSubpassDependency-srcSubpass-00865
srcSubpass and **dstSubpass** **must** not both be equal to [VK_SUBPASS_EXTERNAL](#)
- VUID-VkSubpassDependency-srcSubpass-06809
If **srcSubpass** is equal to **dstSubpass** and **srcStageMask** includes a [framebuffer-space](#) stage, **dstStageMask** **must** only contain [framebuffer-space](#) stages
- VUID-VkSubpassDependency-srcAccessMask-00868
Any access flag included in **srcAccessMask** **must** be supported by one of the pipeline stages in **srcStageMask**, as specified in the [table of supported access types](#)
- VUID-VkSubpassDependency-dstAccessMask-00869
Any access flag included in **dstAccessMask** **must** be supported by one of the pipeline stages in **dstStageMask**, as specified in the [table of supported access types](#)
- VUID-VkSubpassDependency-srcSubpass-02243
If **srcSubpass** equals **dstSubpass**, and **srcStageMask** and **dstStageMask** both include a [framebuffer-space](#) stage, then **dependencyFlags** **must** include [VK_DEPENDENCY_BY_REGION_BIT](#)
- VUID-VkSubpassDependency-dependencyFlags-02520
If **dependencyFlags** includes [VK_DEPENDENCY_VIEW_LOCAL_BIT](#), **srcSubpass** **must** not be equal to [VK_SUBPASS_EXTERNAL](#)
- VUID-VkSubpassDependency-dependencyFlags-02521
If **dependencyFlags** includes [VK_DEPENDENCY_VIEW_LOCAL_BIT](#), **dstSubpass** **must** not be equal to [VK_SUBPASS_EXTERNAL](#)
- VUID-VkSubpassDependency-srcSubpass-00872
If **srcSubpass** equals **dstSubpass** and that subpass has more than one bit set in the view mask, then **dependencyFlags** **must** include [VK_DEPENDENCY_VIEW_LOCAL_BIT](#)

Valid Usage (Implicit)

- VUID-VkSubpassDependency-srcStageMask-parameter
srcStageMask **must** be a valid combination of [VkPipelineStageFlagBits](#) values
- VUID-VkSubpassDependency-dstStageMask-parameter
dstStageMask **must** be a valid combination of [VkPipelineStageFlagBits](#) values
- VUID-VkSubpassDependency-srcAccessMask-parameter
srcAccessMask **must** be a valid combination of [VkAccessFlagBits](#) values
- VUID-VkSubpassDependency-dstAccessMask-parameter
dstAccessMask **must** be a valid combination of [VkAccessFlagBits](#) values

- VUID-VkSubpassDependency-dependencyFlags-parameter
`dependencyFlags` **must** be a valid combination of `VkDependencyFlagBits` values

When multiview is enabled, the execution of the multiple views of one subpass **may** not occur simultaneously or even back-to-back, and rather **may** be interleaved with the execution of other subpasses. The load and store operations apply to attachments on a per-view basis. For example, an attachment using `VK_ATTACHMENT_LOAD_OP_CLEAR` will have each view cleared on first use, but the first use of one view may be temporally distant from the first use of another view.

NOTE

A good mental model for multiview is to think of a multiview subpass as if it were a collection of individual (per-view) subpasses that are logically grouped together and described as a single multiview subpass in the API. Similarly, a multiview attachment can be thought of like several individual attachments that happen to be layers in a single image. A view-local dependency between two multiview subpasses acts like a set of one-to-one dependencies between corresponding pairs of per-view subpasses. A view-global dependency between two multiview subpasses acts like a set of $N \times M$ dependencies between all pairs of per-view subpasses in the source and destination. Thus, it is a more compact representation which also makes clear the commonality and reuse that is present between views in a subpass. This interpretation motivates the answers to questions like “when does the load op apply” - it is on the first use of each view of an attachment, as if each view was a separate attachment.

The content of each view follows the description in [attachment content behavior](#). In particular, if an attachment is preserved, all views within the attachment are preserved.

If any two subpasses of a render pass activate transform feedback to the same bound transform feedback buffers, a subpass dependency **must** be included (either directly or via some intermediate subpasses) between them.

If there is no subpass dependency from `VK_SUBPASS_EXTERNAL` to the first subpass that uses an attachment, then an implicit subpass dependency exists from `VK_SUBPASS_EXTERNAL` to the first subpass it is used in. The implicit subpass dependency only exists if there exists an automatic layout transition away from `initialLayout`. The subpass dependency operates as if defined with the following parameters:

```
VkSubpassDependency implicitDependency = {
    .srcSubpass = VK_SUBPASS_EXTERNAL,
    .dstSubpass = firstSubpass, // First subpass attachment is used in
    .srcStageMask = VK_PIPELINE_STAGE_NONE,
    .dstStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
    .srcAccessMask = 0,
    .dstAccessMask = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT |
                     VK_ACCESS_COLOR_ATTACHMENT_READ_BIT |
                     VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                     VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT |
                     VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
```

```
.dependencyFlags = 0  
};
```

Similarly, if there is no subpass dependency from the last subpass that uses an attachment to `VK_SUBPASS_EXTERNAL`, then an implicit subpass dependency exists from the last subpass it is used in to `VK_SUBPASS_EXTERNAL`. The implicit subpass dependency only exists if there exists an automatic layout transition into `finalLayout`. The subpass dependency operates as if defined with the following parameters:

```
VkSubpassDependency implicitDependency = {  
    .srcSubpass = lastSubpass, // Last subpass attachment is used in  
    .dstSubpass = VK_SUBPASS_EXTERNAL,  
    .srcStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,  
    .dstStageMask = VK_PIPELINE_STAGE_NONE,  
    .srcAccessMask = VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |  
                    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,  
    .dstAccessMask = 0,  
    .dependencyFlags = 0  
};
```

As subpasses **may** overlap or execute out of order with regards to other subpasses unless a subpass dependency chain describes otherwise, the layout transitions required between subpasses **cannot** be known to an application. Instead, an application provides the layout that each attachment **must** be in at the start and end of a render pass, and the layout it **must** be in during each subpass it is used in. The implementation then **must** execute layout transitions between subpasses in order to guarantee that the images are in the layouts required by each subpass, and in the final layout at the end of the render pass.

Automatic layout transitions apply to the entire image subresource attached to the framebuffer. If multiview is not enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the number of layers specified by `VkFramebufferCreateInfo::layers`. If multiview is enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the layers corresponding to views which are used by some subpass in the render pass, even if that subpass does not reference the given attachment. If the attachment view is a 2D or 2D array view of a 3D image, even if the attachment view only refers to a subset of the slices of the selected mip level of the 3D image, automatic layout transitions apply to the entire subresource referenced which is the entire mip level in this case.

Automatic layout transitions away from the layout used in a subpass happen-after the availability operations for all dependencies with that subpass as the `srcSubpass`.

Automatic layout transitions into the layout used in a subpass happen-before the visibility operations for all dependencies with that subpass as the `dstSubpass`.

Automatic layout transitions away from `initialLayout` happen-after the availability operations for all dependencies with a `srcSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `dstSubpass` uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions away from `initialLayout`

happen-after the availability operations for all dependencies with a `srcSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `dstSubpass` uses any aliased attachment.

Automatic layout transitions into `finalLayout` happen-before the visibility operations for all dependencies with a `dstSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `srcSubpass` uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions into `finalLayout` happen-before the visibility operations for all dependencies with a `dstSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `srcSubpass` uses any aliased attachment.

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the attachment, thus automatic layout transitions use the sample locations state specified in `VkRenderPassSampleLocationsBeginInfoEXT`.

Automatic layout transitions of an attachment referring to a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` use the sample locations the image subresource range referenced by the attachment was last rendered with. If the current render pass does not use the attachment as a depth/stencil attachment in any subpass that happens-before, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pAttachmentInitialSampleLocations` array for which the `attachmentIndex` member equals the attachment index of the attachment, if one is specified. Otherwise, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` array for which the `subpassIndex` member equals the index of the subpass that last used the attachment as a depth/stencil attachment, if one is specified.

If no sample locations state has been specified for an automatic layout transition performed on an attachment referring to a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` the contents of the depth aspect of the depth/stencil attachment become undefined as if the layout of the attachment was transitioned from the `VK_IMAGE_LAYOUT_UNDEFINED` layout.

If two subpasses use the same attachment, and both subpasses use the attachment in a read-only layout, no subpass dependency needs to be specified between those subpasses. If an implementation treats those layouts separately, it **must** insert an implicit subpass dependency between those subpasses to separate the uses in each layout. The subpass dependency operates as if defined with the following parameters:

```
// Used for input attachments
VkPipelineStageFlags inputAttachmentStages = VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT;
VkAccessFlags inputAttachmentDstAccess = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT;

// Used for depth/stencil attachments
VkPipelineStageFlags depthStencilAttachmentStages =
VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT |
VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT;
VkAccessFlags depthStencilAttachmentDstAccess =
```

```
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT;
```

```
VkSubpassDependency implicitDependency = {  
    .srcSubpass = firstSubpass;  
    .dstSubpass = secondSubpass;  
    .srcStageMask = inputAttachmentStages | depthStencilAttachmentStages;  
    .dstStageMask = inputAttachmentStages | depthStencilAttachmentStages;  
    .srcAccessMask = 0;  
    .dstAccessMask = inputAttachmentDstAccess | depthStencilAttachmentDstAccess;  
    .dependencyFlags = 0;  
};
```

When drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, the application **must** specify which types of attachments that are written to during a render pass will also be accessed as non-attachments in the render pass.

To [dynamically set](#) whether a pipeline **can** access a resource as a non-attachment while it is also used as an attachment that is written to, call:

```
// Provided by VK_EXT_attachment_feedback_loop_dynamic_state  
void vkCmdSetAttachmentFeedbackLoopEnableEXT(  
    VkCommandBuffer                commandBuffer,  
    VkImageAspectFlags             aspectMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `aspectMask` specifies the types of attachments for which feedback loops will be enabled. Attachment types whose aspects are not included in `aspectMask` will have feedback loops disabled.

For attachments that are written to in a render pass, only attachments with the aspects specified in `aspectMask` **can** be accessed as non-attachments by subsequent [drawing commands](#).

Valid Usage

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-attachmentFeedbackLoopDynamicState-08862
The `attachmentFeedbackLoopDynamicState` feature **must** be enabled
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-aspectMask-08863
`aspectMask` **must** only include `VK_IMAGE_ASPECT_NONE`, `VK_IMAGE_ASPECT_COLOR_BIT`, `VK_IMAGE_ASPECT_DEPTH_BIT`, and `VK_IMAGE_ASPECT_STENCIL_BIT`
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-attachmentFeedbackLoopLayout-08864
If the `attachmentFeedbackLoopLayout` feature is not enabled, `aspectMask` **must** be `VK_IMAGE_ASPECT_NONE`

Valid Usage (Implicit)

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-parameter **commandBuffer** **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-aspectMask-parameter **aspectMask** **must** be a valid combination of [VkImageAspectFlags](#) values
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-recording **commandBuffer** **must** be in the [recording state](#)
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support graphics operations
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-vidcoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

A more extensible version of render pass creation is also defined below.

To create a render pass, call:

```
// Provided by VK_VERSION_1_2
VkResult vkCreateRenderPass2(
    VkDevice                                device,
    const VkRenderPassCreateInfo2*          pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkRenderPass*                           pRenderPass);
```

or the equivalent command

```
// Provided by VK_KHR_create_renderpass2
VkResult vkCreateRenderPass2KHR(
    VkDevice                                device,
    const VkRenderPassCreateInfo2*          pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkRenderPass*                           pRenderPass);
```

- **device** is the logical device that creates the render pass.
- **pCreateInfo** is a pointer to a [VkRenderPassCreateInfo2](#) structure describing the parameters of the render pass.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pRenderPass** is a pointer to a [VkRenderPass](#) handle in which the resulting render pass object is returned.

This command is functionally identical to [vkCreateRenderPass](#), but includes extensible sub-structures that include **sType** and **pNext** parameters, allowing them to be more easily extended.

Valid Usage

- VUID-vkCreateRenderPass2-device-10001
device must support at least one queue family with the **VK_QUEUE_GRAPHICS_BIT** capability

Valid Usage (Implicit)

- VUID-vkCreateRenderPass2-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkCreateRenderPass2-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid [VkRenderPassCreateInfo2](#) structure
- VUID-vkCreateRenderPass2-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateRenderPass2-pRenderPass-parameter
pRenderPass must be a valid pointer to a [VkRenderPass](#) handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkRenderPassCreateInfo2` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassCreateInfo2 {
    VkStructureType          sType;
    const void*              pNext;
    VkRenderPassCreateFlags  flags;
    uint32_t                 attachmentCount;
    const VkAttachmentDescription2* pAttachments;
    uint32_t                 subpassCount;
    const VkSubpassDescription2* pSubpasses;
    uint32_t                 dependencyCount;
    const VkSubpassDependency2* pDependencies;
    uint32_t                 correlatedViewMaskCount;
    const uint32_t*          pCorrelatedViewMasks;
} VkRenderPassCreateInfo2;
```

or the equivalent

```
// Provided by VK_KHR_create_renderpass2
typedef VkRenderPassCreateInfo2 VkRenderPassCreateInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `attachmentCount` is the number of attachments used by this render pass.
- `pAttachments` is a pointer to an array of `attachmentCount` `VkAttachmentDescription2` structures describing the attachments used by the render pass.
- `subpassCount` is the number of subpasses to create.
- `pSubpasses` is a pointer to an array of `subpassCount` `VkSubpassDescription2` structures describing each subpass.
- `dependencyCount` is the number of dependencies between pairs of subpasses.
- `pDependencies` is a pointer to an array of `dependencyCount` `VkSubpassDependency2` structures describing dependencies between pairs of subpasses.
- `correlatedViewMaskCount` is the number of correlation masks.
- `pCorrelatedViewMasks` is a pointer to an array of view masks indicating sets of views that **may** be more efficient to render concurrently.

Parameters defined by this structure with the same name as those in `VkRenderPassCreateInfo` have the identical effect to those parameters; the child structures are variants of those used in `VkRenderPassCreateInfo` which add `sType` and `pNext` parameters, allowing them to be extended.

If the `VkSubpassDescription2::viewMask` member of any element of `pSubpasses` is not zero, *multiview*

functionality is considered to be enabled for this render pass.

`correlatedViewMaskCount` and `pCorrelatedViewMasks` have the same effect as `VkRenderPassMultiviewCreateInfo::correlationMaskCount` and `VkRenderPassMultiviewCreateInfo::pCorrelationMasks`, respectively.

Valid Usage

- VUID-VkRenderPassCreateInfo2-None-03049
If any two subpasses operate on attachments with overlapping ranges of the same `VkDeviceMemory` object, and at least one subpass writes to that area of `VkDeviceMemory`, a subpass dependency **must** be included (either directly or via some intermediate subpasses) between them
- VUID-VkRenderPassCreateInfo2-attachment-03050
If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or the attachment indexed by any element of `pPreserveAttachments` in any element of `pSubpasses` is bound to a range of a `VkDeviceMemory` object that overlaps with any other attachment in any subpass (including the same subpass), the `VkAttachmentDescription2` structures describing them **must** include `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` in `flags`
- VUID-VkRenderPassCreateInfo2-attachment-03051
If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, then it **must** be less than `attachmentCount`
- VUID-VkRenderPassCreateInfo2-fragmentDensityMapAttachment-06472
If the `pNext` chain includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure and the `fragmentDensityMapAttachment` member is not `VK_ATTACHMENT_UNUSED`, then `attachment` **must** be less than `attachmentCount`
- VUID-VkRenderPassCreateInfo2-pSubpasses-06473
If the `pSubpasses` `pNext` chain includes a `VkSubpassDescriptionDepthStencilResolve` structure and the `pDepthStencilResolveAttachment` member is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, then `attachment` **must** be less than `attachmentCount`
- VUID-VkRenderPassCreateInfo2-pAttachments-02522
For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkRenderPassCreateInfo2-pAttachments-02523
For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderPassCreateInfo2-pDependencies-03054
For any element of `pDependencies`, if the `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `srcStageMask` member of that dependency **must** be a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the source subpass
- VUID-VkRenderPassCreateInfo2-pDependencies-03055
For any element of `pDependencies`, if the `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `dstStageMask` member of that dependency **must** be a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the destination subpass
- VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-03056
The set of bits included in any element of `pCorrelatedViewMasks` **must** not overlap with the set of bits included in any other element of `pCorrelatedViewMasks`
- VUID-VkRenderPassCreateInfo2-viewMask-03057
If the `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` is `0`, `correlatedViewMaskCount` **must** be `0`
- VUID-VkRenderPassCreateInfo2-viewMask-03058
The `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` **must** either all be `0`, or all not be `0`
- VUID-VkRenderPassCreateInfo2-viewMask-03059
If the `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` is `0`, the `dependencyFlags` member of any element of `pDependencies` **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`
- VUID-VkRenderPassCreateInfo2-pDependencies-03060
For any element of `pDependencies` where its `srcSubpass` member equals its `dstSubpass` member, if the `viewMask` member of the corresponding element of `pSubpasses` includes more than one bit, its `dependencyFlags` member **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`
- VUID-VkRenderPassCreateInfo2-attachment-02525
If the `attachment` member of any element of the `pInputAttachments` member of any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, the `aspectMask` member of that element of `pInputAttachments` **must** only include aspects that are present in images of the format specified by the element of `pAttachments` specified by `attachment`
- VUID-VkRenderPassCreateInfo2-srcSubpass-02526
The `srcSubpass` member of each element of `pDependencies` **must** be less than `subpassCount`
- VUID-VkRenderPassCreateInfo2-dstSubpass-02527
The `dstSubpass` member of each element of `pDependencies` **must** be less than `subpassCount`
- VUID-VkRenderPassCreateInfo2-pAttachments-04585
If any element of `pAttachments` is used as a fragment shading rate attachment in any subpass, it **must** not be used as any other attachment in the render pass
- VUID-VkRenderPassCreateInfo2-pAttachments-09387
If any element of `pAttachments` is used as a fragment shading rate attachment, the `loadOp` for that attachment **must** not be `VK_ATTACHMENT_LOAD_OP_CLEAR`

- VUID-VkRenderPassCreateInfo2-flags-04521
If `flags` includes `VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM`, an element of `pSubpasses` includes an instance of `VkFragmentShadingRateAttachmentInfoKHR` in its `pNext` chain, and the `pFragmentShadingRateAttachment` member of that structure is not equal to `NULL`, the `attachment` member of `pFragmentShadingRateAttachment` **must** be `VK_ATTACHMENT_UNUSED`
- VUID-VkRenderPassCreateInfo2-pAttachments-04586
If any element of `pAttachments` is used as a fragment shading rate attachment in any subpass, it **must** have an image format whose `potential format features` contain `VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkRenderPassCreateInfo2-rasterizationSamples-04905
If the pipeline is being created with fragment shader state, and the `VK_QCOM_render_pass_shader_resolve` extension is enabled, and if subpass has any input attachments, and if the subpass description contains `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM`, then the sample count of the input attachments **must** equal `rasterizationSamples`
- VUID-VkRenderPassCreateInfo2-sampleShadingEnable-04906
If the pipeline is being created with fragment shader state, and the `VK_QCOM_render_pass_shader_resolve` extension is enabled, and if the subpass description contains `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM`, then `sampleShadingEnable` **must** be false
- VUID-VkRenderPassCreateInfo2-flags-04907
If `flags` includes `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, and if `pResolveAttachments` is not `NULL`, then each resolve attachment **must** be `VK_ATTACHMENT_UNUSED`
- VUID-VkRenderPassCreateInfo2-flags-04908
If `flags` includes `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, and if `pDepthStencilResolveAttachment` is not `NULL`, then the depth/stencil resolve attachment **must** be `VK_ATTACHMENT_UNUSED`
- VUID-VkRenderPassCreateInfo2-flags-04909
If `flags` includes `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, then the subpass **must** be the last subpass in a subpass dependency chain
- VUID-VkRenderPassCreateInfo2-attachment-06244
If the `attachment` member of the `pDepthStencilAttachment` member of an element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, the `layout` member of that same structure is either `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, and the `pNext` chain of that structure does not include a `VkAttachmentReferenceStencilLayout` structure, then the element of `pAttachments` with an index equal to `attachment` **must** not have a `format` that includes both depth and stencil components
- VUID-VkRenderPassCreateInfo2-attachment-06245
If the `attachment` member of the `pDepthStencilAttachment` member of an element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED` and the `layout` member of that same structure is either `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, then the element of `pAttachments` with an index equal to `attachment` **must** have a `format` that includes only a stencil component

- VUID-VkRenderPassCreateInfo2-attachment-06246

If the `attachment` member of the `pDepthStencilAttachment` member of an element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED` and the `layout` member of that same structure is either `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, then the element of `pAttachments` with an index equal to `attachment` **must** not have a `format` that includes only a stencil component

- VUID-VkRenderPassCreateInfo2-pResolveAttachments-09331

If any element of `pResolveAttachments` of any element of `pSubpasses` references an attachment description with a format of `VK_FORMAT_UNDEFINED`, `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment->attachment` **must** be `VK_ATTACHMENT_UNUSED`

Valid Usage (Implicit)

- VUID-VkRenderPassCreateInfo2-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO_2`

- VUID-VkRenderPassCreateInfo2-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkRenderPassCreationControlEXT`, `VkRenderPassCreationFeedbackCreateInfoEXT`, or `VkRenderPassFragmentDensityMapCreateInfoEXT`

- VUID-VkRenderPassCreateInfo2-sType-unique

The `sType` value of each struct in the `pNext` chain **must** be unique

- VUID-VkRenderPassCreateInfo2-flags-parameter

`flags` **must** be a valid combination of `VkRenderPassCreateFlagBits` values

- VUID-VkRenderPassCreateInfo2-pAttachments-parameter

If `attachmentCount` is not `0`, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkAttachmentDescription2` structures

- VUID-VkRenderPassCreateInfo2-pSubpasses-parameter

`pSubpasses` **must** be a valid pointer to an array of `subpassCount` valid `VkSubpassDescription2` structures

- VUID-VkRenderPassCreateInfo2-pDependencies-parameter

If `dependencyCount` is not `0`, `pDependencies` **must** be a valid pointer to an array of `dependencyCount` valid `VkSubpassDependency2` structures

- VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-parameter

If `correlatedViewMaskCount` is not `0`, `pCorrelatedViewMasks` **must** be a valid pointer to an array of `correlatedViewMaskCount` `uint32_t` values

- VUID-VkRenderPassCreateInfo2-subpassCount-arraylength

`subpassCount` **must** be greater than `0`

The `VkAttachmentDescription2` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescription2 {
    VkStructureType      sType;
    const void*          pNext;
    VkAttachmentDescriptionFlags flags;
    VkFormat             format;
    VkSampleCountFlagBits samples;
    VkAttachmentLoadOp    loadOp;
    VkAttachmentStoreOp   storeOp;
    VkAttachmentLoadOp    stencilLoadOp;
    VkAttachmentStoreOp   stencilStoreOp;
    VkImageLayout         initialLayout;
    VkImageLayout         finalLayout;
} VkAttachmentDescription2;
```

or the equivalent

```
// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentDescription2 VkAttachmentDescription2KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkAttachmentDescriptionFlagBits](#) specifying additional properties of the attachment.
- **format** is a [VkFormat](#) value specifying the format of the image that will be used for the attachment.
- **samples** is a [VkSampleCountFlagBits](#) value specifying the number of samples of the image.
- **loadOp** is a [VkAttachmentLoadOp](#) value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- **storeOp** is a [VkAttachmentStoreOp](#) value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- **stencilLoadOp** is a [VkAttachmentLoadOp](#) value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- **stencilStoreOp** is a [VkAttachmentStoreOp](#) value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- **initialLayout** is the layout the attachment image subresource will be in when a render pass instance begins.
- **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

Parameters defined by this structure with the same name as those in [VkAttachmentDescription](#) have the identical effect to those parameters.

If the `separateDepthStencilLayouts` feature is enabled, and `format` is a depth/stencil format, `initialLayout` and `finalLayout` **can** be set to a layout that only specifies the layout of the depth aspect.

If the `pNext` chain includes a `VkAttachmentDescriptionStencilLayout` structure, then the `stencilInitialLayout` and `stencilFinalLayout` members specify the initial and final layouts of the stencil aspect of a depth/stencil format, and `initialLayout` and `finalLayout` only apply to the depth aspect. For depth-only formats, the `VkAttachmentDescriptionStencilLayout` structure is ignored. For stencil-only formats, the initial and final layouts of the stencil aspect are taken from the `VkAttachmentDescriptionStencilLayout` structure if present, or `initialLayout` and `finalLayout` if not present.

If `format` is a depth/stencil format, and either `initialLayout` or `finalLayout` does not specify a layout for the stencil aspect, then the application **must** specify the initial and final layouts of the stencil aspect by including a `VkAttachmentDescriptionStencilLayout` structure in the `pNext` chain.

`loadOp` and `storeOp` are ignored for fragment shading rate attachments. No access to the shading rate attachment is performed in `loadOp` and `storeOp`. Instead, access to `VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR` is performed as fragments are rasterized.

Valid Usage

- VUID-VkAttachmentDescription2-format-06699
If `format` includes a color or depth component and `loadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`
- VUID-VkAttachmentDescription2-finalLayout-00843
`finalLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`
- VUID-VkAttachmentDescription2-format-03280
If `format` is a color format, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription2-format-03281
If `format` is a depth/stencil format, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`
- VUID-VkAttachmentDescription2-format-03282
If `format` is a color format, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription2-format-03283
If `format` is a depth/stencil format, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`
- VUID-VkAttachmentDescription2-format-06487
If `format` is a color format, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- VUID-VkAttachmentDescription2-format-06488
If `format` is a color format, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03284
If the `separateDepthStencilLayouts` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`,
- VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03285
If the `separateDepthStencilLayouts` feature is not enabled, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`,
- VUID-VkAttachmentDescription2-format-03286
If `format` is a color format, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription2-format-03287
If `format` is a color format, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription2-format-06906
If `format` is a depth/stencil format which includes both depth and stencil components, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription2-format-06907
If `format` is a depth/stencil format which includes both depth and stencil components, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription2-format-03290
If `format` is a depth/stencil format which includes only the depth component, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription2-format-03291
If `format` is a depth/stencil format which includes only the depth component, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription2-synchronization2-06908
If the `synchronization2` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkAttachmentDescription2-synchronization2-06909

If the `synchronization2` feature is not enabled, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07309

If the `attachmentFeedbackLoopLayout` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`

- VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07310

If the `attachmentFeedbackLoopLayout` feature is not enabled, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`

- VUID-VkAttachmentDescription2-samples-08745

`samples` **must** be a valid `VkSampleCountFlagBits` value that is set in `imageCreateSampleCounts` (as defined in [Image Creation Limits](#)) for the given `format`

- VUID-VkAttachmentDescription2-dynamicRenderingLocalRead-09544

If the `dynamicRenderingLocalRead` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`

- VUID-VkAttachmentDescription2-dynamicRenderingLocalRead-09545

If the `dynamicRenderingLocalRead` feature is not enabled, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`

- VUID-VkAttachmentDescription2-pNext-06704

If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure, `format` includes a stencil component, and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`

- VUID-VkAttachmentDescription2-pNext-06705

If the `pNext` chain includes a `VkAttachmentDescriptionStencilLayout` structure, `format` includes a stencil component, and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `VkAttachmentDescriptionStencilLayout::stencilInitialLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`

- VUID-VkAttachmentDescription2-format-06249

If `format` is a depth/stencil format which includes both depth and stencil components, and `initialLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, the `pNext` chain **must** include a `VkAttachmentDescriptionStencilLayout` structure

- VUID-VkAttachmentDescription2-format-06250

If `format` is a depth/stencil format which includes both depth and stencil components, and `finalLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, the `pNext` chain **must** include a `VkAttachmentDescriptionStencilLayout` structure

- VUID-VkAttachmentDescription2-format-06247

If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure and `format` only includes a stencil component, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription2-format-06248

If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure and `format` only includes a stencil component, `finalLayout` **must** not be

VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-format-09332
If `externalFormatResolve` is not enabled, `format` **must** not be `VK_FORMAT_UNDEFINED`
- VUID-VkAttachmentDescription2-format-09334
If `format` is `VK_FORMAT_UNDEFINED`, there **must** be a `VkExternalFormatANDROID` structure in the `pNext` chain with a `externalFormat` that is not equal to `0`

Valid Usage (Implicit)

- VUID-VkAttachmentDescription2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_2`
- VUID-VkAttachmentDescription2-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkAttachmentDescriptionStencilLayout` or `VkExternalFormatANDROID`
- VUID-VkAttachmentDescription2-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkAttachmentDescription2-flags-parameter
`flags` **must** be a valid combination of `VkAttachmentDescriptionFlagBits` values
- VUID-VkAttachmentDescription2-format-parameter
`format` **must** be a valid `VkFormat` value
- VUID-VkAttachmentDescription2-samples-parameter
`samples` **must** be a valid `VkSampleCountFlagBits` value
- VUID-VkAttachmentDescription2-loadOp-parameter
`loadOp` **must** be a valid `VkAttachmentLoadOp` value
- VUID-VkAttachmentDescription2-storeOp-parameter
`storeOp` **must** be a valid `VkAttachmentStoreOp` value
- VUID-VkAttachmentDescription2-stencilLoadOp-parameter
`stencilLoadOp` **must** be a valid `VkAttachmentLoadOp` value
- VUID-VkAttachmentDescription2-stencilStoreOp-parameter
`stencilStoreOp` **must** be a valid `VkAttachmentStoreOp` value
- VUID-VkAttachmentDescription2-initialLayout-parameter
`initialLayout` **must** be a valid `VkImageLayout` value
- VUID-VkAttachmentDescription2-finalLayout-parameter
`finalLayout` **must** be a valid `VkImageLayout` value

The `VkAttachmentDescriptionStencilLayout` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescriptionStencilLayout {
    VkStructureType    sType;
    void*              pNext;
    VkImageLayout       stencilInitialLayout;
    VkImageLayout       stencilFinalLayout;
} VkAttachmentDescriptionStencilLayout;
```

or the equivalent

```
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentDescriptionStencilLayout VkAttachmentDescriptionStencilLayoutKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stencilInitialLayout` is the layout the stencil aspect of the attachment image subresource will be in when a render pass instance begins.
- `stencilFinalLayout` is the layout the stencil aspect of the attachment image subresource will be transitioned to when a render pass instance ends.

Valid Usage

- VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-03308
`stencilInitialLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, or
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03309
`stencilFinalLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, or
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03310
`stencilFinalLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or
`VK_IMAGE_LAYOUT_PREINITIALIZED`

Valid Usage (Implicit)

- VUID-VkAttachmentDescriptionStencilLayout-sType-sType

sType **must** be `VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_STENCIL_LAYOUT`

- `VOID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-parameter` **stencilInitialLayout** **must** be a valid `VkImageLayout` value
- `VOID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-parameter` **stencilFinalLayout** **must** be a valid `VkImageLayout` value

The `VkSubpassDescription2` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescription2 {
    VkStructureType          sType;
    const void*              pNext;
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint      pipelineBindPoint;
    uint32_t                 viewMask;
    uint32_t                 inputAttachmentCount;
    const VkAttachmentReference2* pInputAttachments;
    uint32_t                 colorAttachmentCount;
    const VkAttachmentReference2* pColorAttachments;
    const VkAttachmentReference2* pResolveAttachments;
    const VkAttachmentReference2* pDepthStencilAttachment;
    uint32_t                 preserveAttachmentCount;
    const uint32_t*          pPreserveAttachments;
} VkSubpassDescription2;
```

or the equivalent

```
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDescription2 VkSubpassDescription2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkSubpassDescriptionFlagBits` specifying usage of the subpass.
- **pipelineBindPoint** is a `VkPipelineBindPoint` value specifying the pipeline type supported for this subpass.
- **viewMask** is a bitfield of view indices describing which views rendering is broadcast to in this subpass, when multiview is enabled.
- **inputAttachmentCount** is the number of input attachments.
- **pInputAttachments** is a pointer to an array of `VkAttachmentReference2` structures defining the input attachments for this subpass and their layouts.
- **colorAttachmentCount** is the number of color attachments.
- **pColorAttachments** is a pointer to an array of **colorAttachmentCount** `VkAttachmentReference2` structures defining the color attachments for this subpass and their layouts.

- `pResolveAttachments` is `NULL` or a pointer to an array of `colorAttachmentCount` `VkAttachmentReference2` structures defining the resolve attachments for this subpass and their layouts.
- `pDepthStencilAttachment` is a pointer to a `VkAttachmentReference2` structure specifying the depth/stencil attachment for this subpass and its layout.
- `preserveAttachmentCount` is the number of preserved attachments.
- `pPreserveAttachments` is a pointer to an array of `preserveAttachmentCount` render pass attachment indices identifying attachments that are not used by this subpass, but whose contents **must** be preserved throughout the subpass.

Parameters defined by this structure with the same name as those in `VkSubpassDescription` have the identical effect to those parameters.

`viewMask` has the same effect for the described subpass as `VkRenderPassMultiviewCreateInfo::pViewMasks` has on each corresponding subpass.

If a `VkFragmentShadingRateAttachmentInfoKHR` structure is included in the `pNext` chain, `pFragmentShadingRateAttachment` is not `NULL`, and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the identified attachment defines a fragment shading rate attachment for that subpass.

If any element of `pResolveAttachments` is an image specified with an `VkExternalFormatANDROID`, values in the corresponding color attachment will be resolved to the resolve attachment in the same manner as specified for `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`.

If the `nullColorAttachmentWithExternalFormatResolve` limit is `VK_TRUE`, values in the color attachment will be loaded from the resolve attachment at the start of rendering, and **may** also be reloaded any time after a resolve occurs or the resolve attachment is written to; if this occurs it **must** happen-before any writes to the color attachment are performed which happen-after the resolve that triggers this. If any color component in the external format is subsampled, values will be read from the nearest sample in the image when they are loaded. If the color attachment is also used as an input attachment, the same behavior applies.

Setting the color attachment to `VK_ATTACHMENT_UNUSED` when an external resolve attachment is used and the `nullColorAttachmentWithExternalFormatResolve` limit is `VK_TRUE` will not result in color attachment writes to be discarded for that attachment.

When `nullColorAttachmentWithExternalFormatResolve` is `VK_TRUE`, the color output from the subpass can still be read via an input attachment; but the application cannot bind an image view for the color attachment as there is no such image view bound. Instead to access the data as an input attachment applications **can** use the resolve attachment in its place - using the resolve attachment image for the descriptor, and setting the corresponding element of `pInputAttachments` to the index of the resolve attachment.

Loads or input attachment reads from the resolve attachment are performed as if using a `VkSamplerYcbcrConversionCreateInfo` with the following parameters:

```
VkSamplerYcbcrConversionCreateInfo createInfo = {
    .sType = VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_CREATE_INFO,
```

```

.pNext = NULL,
.format = VK_FORMAT_UNDEFINED,
.ycberModel = VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY,
.ycberRange = VK_SAMPLER_YCBCR_RANGE_ITU_FULL,
.components = {
    .r = VK_COMPONENT_SWIZZLE_B
    .g = VK_COMPONENT_SWIZZLE_R
    .b = VK_COMPONENT_SWIZZLE_G
    .a = VK_COMPONENT_SWIZZLE_IDENTITY},
.xChromaOffset = properties.chromaOffsetX,
.yChromaOffset = properties.chromaOffsetY,
.chromaFilter = VK_FILTER_NEAREST,
.forceExplicitReconstruction = ... };

```

where `properties` is equal to `VkPhysicalDeviceExternalFormatResolvePropertiesANDROID` returned by the device and `forceExplicitReconstruction` is effectively ignored as the `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY` model is used. The applied swizzle is the same effective swizzle that would be applied by the `VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY` model, but no range expansion is applied.

Valid Usage

- VUID-VkSubpassDescription2-attachment-06912
If the `attachment` member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkSubpassDescription2-attachment-06913
If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`
- VUID-VkSubpassDescription2-attachment-06914
If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`
- VUID-VkSubpassDescription2-attachment-06915
If the `attachment` member of `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`
- VUID-VkSubpassDescription2-attachment-06916
If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkSubpassDescription2-attachment-06917
If the `attachment` member of an element of `pResolveAttachments` is not

VK_ATTACHMENT_UNUSED, its layout member **must** not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06918

If the **attachment** member of an element of **pInputAttachments** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06919

If the **attachment** member of an element of **pColorAttachments** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06920

If the **attachment** member of an element of **pResolveAttachments** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06921

If the **attachment** member of an element of **pInputAttachments** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR

- VUID-VkSubpassDescription2-attachment-06922

If the **attachment** member of an element of **pColorAttachments** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkSubpassDescription2-attachment-06923

If the **attachment** member of an element of **pResolveAttachments** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkSubpassDescription2-attachment-06251

If the **attachment** member of **pDepthStencilAttachment** is not VK_ATTACHMENT_UNUSED and its **pNext** chain includes a **VkAttachmentReferenceStencilLayout** structure, the **layout** member of **pDepthStencilAttachment** **must** not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription2-pipelineBindPoint-04953

pipelineBindPoint **must** be VK_PIPELINE_BIND_POINT_GRAPHICS or VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI

- VUID-VkSubpassDescription2-colorAttachmentCount-03063

colorAttachmentCount **must** be less than or equal to **VkPhysicalDeviceLimits::maxColorAttachments**

- VUID-VkSubpassDescription2-loadOp-03064

If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then **loadOp** **must** not be VK_ATTACHMENT_LOAD_OP_CLEAR

- VUID-VkSubpassDescription2-pResolveAttachments-03067
If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` **must** have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkSubpassDescription2-externalFormatResolve-09335
If `externalFormatResolve` is not enabled and `pResolveAttachments` is not `NULL`, for each resolve attachment that does not have the value `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not have the value `VK_ATTACHMENT_UNUSED`
- VUID-VkSubpassDescription2-nullColorAttachmentWithExternalFormatResolve-09336
If the `nullColorAttachmentWithExternalFormatResolve` property is `VK_FALSE` and `pResolveAttachments` is not `NULL`, for each resolve attachment that has a format of `VK_FORMAT_UNDEFINED`, the corresponding color attachment **must** not have the value `VK_ATTACHMENT_UNUSED`
- VUID-VkSubpassDescription2-nullColorAttachmentWithExternalFormatResolve-09337
If the `nullColorAttachmentWithExternalFormatResolve` property is `VK_TRUE` and `pResolveAttachments` is not `NULL`, for each resolve attachment that has a format of `VK_FORMAT_UNDEFINED`, the corresponding color attachment **must** have the value `VK_ATTACHMENT_UNUSED`
- VUID-VkSubpassDescription2-externalFormatResolve-09338
If `externalFormatResolve` is not enabled and `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkSubpassDescription2-externalFormatResolve-09339
If `externalFormatResolve` is not enabled, each element of `pResolveAttachments` **must** have the same `VkFormat` as its corresponding color attachment
- VUID-VkSubpassDescription2-multisampledRenderToSingleSampled-06869
If the `multisampledRenderToSingleSampled` feature is not enabled, all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have the same sample count
- VUID-VkSubpassDescription2-pInputAttachments-02897
All attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` and any of the following is true:
 - the `externalFormatResolve` feature is not enabled
 - the `nullColorAttachmentWithExternalFormatResolve` property is `VK_FALSE`
 - does not have a non-zero value of `VkExternalFormatANDROID::externalFormat`**must** have image formats whose `potential format features` contain at least `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkSubpassDescription2-pColorAttachments-02898
All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`
- VUID-VkSubpassDescription2-pResolveAttachments-09343
All attachments in `pResolveAttachments` that are not `VK_ATTACHMENT_UNUSED` and do not have an image format of `VK_FORMAT_UNDEFINED` **must** have image formats whose `potential format`

features contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-pDepthStencilAttachment-02900

If `pDepthStencilAttachment` is not `NULL` and the attachment is not `VK_ATTACHMENT_UNUSED` then it **must** have an image format whose `potential format features` contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-linearColorAttachment-06499

If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` **must** contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`

- VUID-VkSubpassDescription2-linearColorAttachment-06500

If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` **must** contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`

- VUID-VkSubpassDescription2-linearColorAttachment-06501

If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pResolveAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` **must** contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`

- VUID-VkSubpassDescription2-None-09456

If either of the following is enabled:

- The `VK_AMD_mixed_attachment_samples` extension
- The `VK_NV_framebuffer_mixed_samples` extension

all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have a sample count that is smaller than or equal to the sample count of `pDepthStencilAttachment` if it is not `VK_ATTACHMENT_UNUSED`

- VUID-VkSubpassDescription2-pNext-06870

If the `pNext` chain includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then all attachments in `pColorAttachments` and `pDepthStencilAttachment` that are not `VK_ATTACHMENT_UNUSED` **must** have a sample count that is either `VK_SAMPLE_COUNT_1_BIT` or equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`

- VUID-VkSubpassDescription2-pNext-06871

If the `pNext` chain includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, and `pDepthStencilAttachment` is not `NULL`, does not have the value `VK_ATTACHMENT_UNUSED`, and has a sample count of `VK_SAMPLE_COUNT_1_BIT`, the `pNext` chain **must** also include a `VkSubpassDescriptionDepthStencilResolve` structure with `pDepthStencilResolveAttachment` that is either `NULL` or has the value `VK_ATTACHMENT_UNUSED`

- VUID-VkSubpassDescription2-multisampledRenderToSingleSampled-06872

All attachments in `pDepthStencilAttachment` or `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have the same sample count, if none of the following are

enabled:

- The `VK_AMD_mixed_attachment_samples` extension
 - The `VK_NV_framebuffer_mixed_samples` extension
 - The `multisampledRenderToSingleSampled` feature,
- VUID-VkSubpassDescription2-attachment-03073
Each element of `pPreserveAttachments` **must** not be `VK_ATTACHMENT_UNUSED`
 - VUID-VkSubpassDescription2-pPreserveAttachments-03074
Each element of `pPreserveAttachments` **must** not also be an element of any other member of the subpass description
 - VUID-VkSubpassDescription2-layout-02528
If any attachment is used by more than one `VkAttachmentReference2` member, then each use **must** use the same `layout`
 - VUID-VkSubpassDescription2-flags-03076
If `flags` includes `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX`, it **must** also include `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX`
 - VUID-VkSubpassDescription2-attachment-02799
If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** be a valid combination of `VkImageAspectFlagBits`
 - VUID-VkSubpassDescription2-attachment-02800
If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** not be `0`
 - VUID-VkSubpassDescription2-attachment-02801
If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** not include `VK_IMAGE_ASPECT_METADATA_BIT`
 - VUID-VkSubpassDescription2-attachment-04563
If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`
 - VUID-VkSubpassDescription2-pDepthStencilAttachment-04440
An attachment **must** not be used in both `pDepthStencilAttachment` and `pColorAttachments`
 - VUID-VkSubpassDescription2-multiview-06558
If the `multiview` feature is not enabled, `viewMask` **must** be `0`
 - VUID-VkSubpassDescription2-viewMask-06706
The index of the most significant bit in `viewMask` **must** be less than `maxMultiviewViewCount`
 - VUID-VkSubpassDescription2-externalFormatResolve-09344
If `externalFormatResolve` is enabled, `pResolveAttachments` is not `NULL`, and `colorAttachmentCount` is not `1`, any element of `pResolveAttachments` that is not `VK_ATTACHMENT_UNUSED`, **must** not have a format of `VK_FORMAT_UNDEFINED`
 - VUID-VkSubpassDescription2-externalFormatResolve-09345
If `externalFormatResolve` is enabled, `pResolveAttachments` is not `NULL`, any element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED` and has a format of `VK_FORMAT_UNDEFINED`,

and the corresponding element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, the color attachment **must** have a `samples` value of 1

- VUID-VkSubpassDescription2-externalFormatResolve-09346

If `externalFormatResolve` is enabled, `pResolveAttachments` is not `NULL`, and any element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED` and has a format of `VK_FORMAT_UNDEFINED`, `viewMask` **must** be 0

- VUID-VkSubpassDescription2-externalFormatResolve-09347

If `externalFormatResolve` is enabled, `pResolveAttachments` is not `NULL`, and any element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED` and has a format of `VK_FORMAT_UNDEFINED`, `VkFragmentShadingRateAttachmentInfoKHR::pFragmentShadingRateAttachment` **must** either be `NULL` or a `VkAttachmentReference2` structure with an `attachment` value of `VK_ATTACHMENT_UNUSED`

- VUID-VkSubpassDescription2-externalFormatResolve-09348

If `externalFormatResolve` is enabled, `pResolveAttachments` is not `NULL`, and any element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED` and has a format of `VK_FORMAT_UNDEFINED`, elements of `pInputAttachments` referencing either a color attachment or resolve attachment used in this subpass **must** not include `VK_IMAGE_ASPECT_PLANE_i_BIT` for any index *i* in its `aspectMask`

Valid Usage (Implicit)

- VUID-VkSubpassDescription2-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2`

- VUID-VkSubpassDescription2-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkFragmentShadingRateAttachmentInfoKHR`, `VkMultisampledRenderToSingleSampledInfoEXT`, `VkRenderPassCreationControlEXT`, `VkRenderPassSubpassFeedbackCreateInfoEXT`, or `VkSubpassDescriptionDepthStencilResolve`

- VUID-VkSubpassDescription2-sType-unique

The `sType` value of each struct in the `pNext` chain **must** be unique

- VUID-VkSubpassDescription2-flags-parameter

`flags` **must** be a valid combination of `VkSubpassDescriptionFlagBits` values

- VUID-VkSubpassDescription2-pipelineBindPoint-parameter

`pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value

- VUID-VkSubpassDescription2-pInputAttachments-parameter

If `inputAttachmentCount` is not 0, `pInputAttachments` **must** be a valid pointer to an array of `inputAttachmentCount` valid `VkAttachmentReference2` structures

- VUID-VkSubpassDescription2-pColorAttachments-parameter

If `colorAttachmentCount` is not 0, `pColorAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference2` structures

- VUID-VkSubpassDescription2-pResolveAttachments-parameter

If `colorAttachmentCount` is not 0, and `pResolveAttachments` is not `NULL`, `pResolveAttachments`

must be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference2` structures

- VUID-VkSubpassDescription2-pDepthStencilAttachment-parameter
If `pDepthStencilAttachment` is not `NULL`, `pDepthStencilAttachment` **must** be a valid pointer to a valid `VkAttachmentReference2` structure
- VUID-VkSubpassDescription2-pPreserveAttachments-parameter
If `preserveAttachmentCount` is not `0`, `pPreserveAttachments` **must** be a valid pointer to an array of `preserveAttachmentCount` `uint32_t` values

The `VkSubpassDescriptionDepthStencilResolve` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescriptionDepthStencilResolve {
    VkStructureType          sType;
    const void*              pNext;
    VkResolveModeFlagBits    depthResolveMode;
    VkResolveModeFlagBits    stencilResolveMode;
    const VkAttachmentReference2* pDepthStencilResolveAttachment;
} VkSubpassDescriptionDepthStencilResolve;
```

or the equivalent

```
// Provided by VK_KHR_depth_stencil_resolve
typedef VkSubpassDescriptionDepthStencilResolve
VkSubpassDescriptionDepthStencilResolveKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `depthResolveMode` is a `VkResolveModeFlagBits` value describing the depth resolve mode.
- `stencilResolveMode` is a `VkResolveModeFlagBits` value describing the stencil resolve mode.
- `pDepthStencilResolveAttachment` is `NULL` or a pointer to a `VkAttachmentReference2` structure defining the depth/stencil resolve attachment for this subpass and its layout.

If the `pNext` chain of `VkSubpassDescription2` includes a `VkSubpassDescriptionDepthStencilResolve` structure, then that structure describes `multisample resolve operations` for the depth/stencil attachment in a subpass. If this structure is not included in the `pNext` chain of `VkSubpassDescription2`, or if it is and either `pDepthStencilResolveAttachment` is `NULL` or its attachment index is `VK_ATTACHMENT_UNUSED`, it indicates that no depth/stencil resolve attachment will be used in the subpass.

Valid Usage

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03177
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value

VK_ATTACHMENT_UNUSED, pDepthStencilAttachment **must** not be NULL or have the value VK_ATTACHMENT_UNUSED

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03179
If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, pDepthStencilAttachment **must** not have a sample count of VK_SAMPLE_COUNT_1_BIT
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03180
If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, pDepthStencilResolveAttachment **must** have a sample count of VK_SAMPLE_COUNT_1_BIT
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-02651
If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED then it **must** have an image format whose potential format features contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03181
If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED and VkFormat of pDepthStencilResolveAttachment has a depth component, then the VkFormat of pDepthStencilAttachment **must** have a depth component with the same number of bits and numeric format
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03182
If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, and VkFormat of pDepthStencilResolveAttachment has a stencil component, then the VkFormat of pDepthStencilAttachment **must** have a stencil component with the same number of bits and numeric format
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03178
If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, depthResolveMode and stencilResolveMode **must** not both be VK_RESOLVE_MODE_NONE
- VUID-VkSubpassDescriptionDepthStencilResolve-depthResolveMode-03183
If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED and the VkFormat of pDepthStencilResolveAttachment has a depth component, then the value of depthResolveMode **must** be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes or VK_RESOLVE_MODE_NONE
- VUID-VkSubpassDescriptionDepthStencilResolve-stencilResolveMode-03184
If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED and the VkFormat of pDepthStencilResolveAttachment has a stencil component, then the value of stencilResolveMode **must** be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes or VK_RESOLVE_MODE_NONE
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03185
If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, the VkFormat of pDepthStencilResolveAttachment has both depth and stencil components, VkPhysicalDeviceDepthStencilResolveProperties::independentResolve

is `VK_FALSE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_FALSE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03186
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, the `VkFormat` of `pDepthStencilResolveAttachment` has both depth and stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE` and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_TRUE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical or one of them **must** be `VK_RESOLVE_MODE_NONE`
- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06873
If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure, the `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, and `pDepthStencilAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` **must** not both be `VK_RESOLVE_MODE_NONE`
- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06874
If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, and `pDepthStencilAttachment` is not `NULL`, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` that has a depth component, then the value of `depthResolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes` or `VK_RESOLVE_MODE_NONE`
- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06875
If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, and `pDepthStencilAttachment` is not `NULL`, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` with a stencil component, then the value of `stencilResolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes` or `VK_RESOLVE_MODE_NONE`
- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06876
If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, `pDepthStencilAttachment` is not `NULL`, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` with both depth and stencil components, and both `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` are `VK_FALSE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical
- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06877
If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, `pDepthStencilAttachment` is not `NULL`, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` with both depth

and stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_TRUE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical or one of them **must** be `VK_RESOLVE_MODE_NONE`

Valid Usage (Implicit)

- VUID-VkSubpassDescriptionDepthStencilResolve-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_DEPTH_STENCIL_RESOLVE`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-parameter
If `pDepthStencilResolveAttachment` is not `NULL`, `pDepthStencilResolveAttachment` **must** be a valid pointer to a valid `VkAttachmentReference2` structure

The `VkFragmentShadingRateAttachmentInfoKHR` structure is defined as:

```
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkFragmentShadingRateAttachmentInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    const VkAttachmentReference2* pFragmentShadingRateAttachment;
    VkExtent2D               shadingRateAttachmentTexelSize;
} VkFragmentShadingRateAttachmentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pFragmentShadingRateAttachment` is `NULL` or a pointer to a `VkAttachmentReference2` structure defining the fragment shading rate attachment for this subpass.
- `shadingRateAttachmentTexelSize` specifies the size of the portion of the framebuffer corresponding to each texel in `pFragmentShadingRateAttachment`.

If no shading rate attachment is specified, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

Valid Usage

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04524
If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** be equal to `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`
- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04525

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` **must** be a power of two value

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04526

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.width`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04527

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` **must** be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04528

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` **must** be a power of two value

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04529

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.height`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04530

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` **must** be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.height`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04531

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04532

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

Valid Usage (Implicit)

- VUID-VkFragmentShadingRateAttachmentInfoKHR-sType-sType

sType must be `VK_STRUCTURE_TYPE_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-parameter

If `pFragmentShadingRateAttachment` is not `NULL`, `pFragmentShadingRateAttachment` must be a valid pointer to a valid `VkAttachmentReference2` structure

If the `pNext` chain of `VkSubpassDescription2` or `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure, then that structure describes how multisampled rendering is performed on single sampled attachments in that subpass.

The `VkMultisampledRenderToSingleSampledInfoEXT` structure is defined as:

```
// Provided by VK_EXT_multisampled_render_to_single_sampled
typedef struct VkMultisampledRenderToSingleSampledInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           multisampledRenderToSingleSampledEnable;
    VkSampleCountFlagBits rasterizationSamples;
} VkMultisampledRenderToSingleSampledInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **multisampledRenderToSingleSampledEnable** controls whether multisampled rendering to single-sampled attachments is performed as described below.
- **rasterizationSamples** is a `VkSampleCountFlagBits` specifying the number of samples used in rasterization.

Valid Usage

- VUID-VkMultisampledRenderToSingleSampledInfoEXT-rasterizationSamples-06878
The value of **rasterizationSamples** must not be `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkMultisampledRenderToSingleSampledInfoEXT-pNext-06880
If added to the **pNext** chain of `VkRenderingInfo`, each **imageView** member of any element of `VkRenderingInfo::pColorAttachments`, `VkRenderingInfo::pDepthAttachment`, or `VkRenderingInfo::pStencilAttachment` that is not `VK_NULL_HANDLE` must have a format that supports the sample count specified in **rasterizationSamples**

Valid Usage (Implicit)

- VUID-VkMultisampledRenderToSingleSampledInfoEXT-sType-sType
sType must be `VK_STRUCTURE_TYPE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_INFO_EXT`
- VUID-VkMultisampledRenderToSingleSampledInfoEXT-rasterizationSamples-parameter
rasterizationSamples must be a valid `VkSampleCountFlagBits` value

If the `pNext` chain of `VkSubpassDescription2` or `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, the graphics pipelines **must** have `VkGraphicsPipelineCreateInfo::rasterizationSamples` equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`, and the subpass attachments **can** have a sample count of `VK_SAMPLE_COUNT_1_BIT`. For attachments with a sample count of `VK_SAMPLE_COUNT_1_BIT`, multisampled rendering is performed to an intermediate multisampled image with `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples` samples, implicitly allocated by the implementation for the duration of the subpass. For such attachments:

- If `loadOp` equals to `VK_ATTACHMENT_LOAD_OP_LOAD`, samples of the implicit image are initialized by replicating the value from the corresponding pixel in the attachment.
- If `storeOp` or `stencilStoreOp` is equal to `VK_ATTACHMENT_STORE_OP_STORE`, the implicit image is implicitly resolved prior to storage in the attachment.

Memory constraints due to high primitive counts **may** result in an implicit split of the subpass. This is the equivalent of partial rasterization of geometry in a render pass that ends in `storeOp` and `stencilStoreOp` equal to `VK_ATTACHMENT_STORE_OP_STORE`, followed by another render pass with `loadOp` and `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_LOAD` with appropriate barriers in between. When `VkMultisampledRenderToSingleSampledInfoEXT` is used, the implementation is allowed to resolve attachments with a sample count of `VK_SAMPLE_COUNT_1_BIT` and lose multisampled data on such splits. The implementation **may** similarly split the render pass at subpass boundaries even if they use the same value for `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`.

The `VkAttachmentReference2` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReference2 {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           attachment;
    VkImageLayout       layout;
    VkImageAspectFlags aspectMask;
} VkAttachmentReference2;
```

or the equivalent

```
// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentReference2 VkAttachmentReference2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachment` is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo2::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is not used.

- **layout** is a [VkImageLayout](#) value specifying the layout the attachment uses during the subpass.
- **aspectMask** is a mask of which aspect(s) **can** be accessed within the specified subpass as an input attachment.

Parameters defined by this structure with the same name as those in [VkAttachmentReference](#) have the identical effect to those parameters.

aspectMask is ignored when this structure is used to describe anything other than an input attachment reference.

If the **separateDepthStencilLayouts** feature is enabled, and **attachment** has a depth/stencil format, **layout** **can** be set to a layout that only specifies the layout of the depth aspect.

If **layout** only specifies the layout of the depth aspect of the attachment, the layout of the stencil aspect is specified by the **stencilLayout** member of a [VkAttachmentReferenceStencilLayout](#) structure included in the **pNext** chain. Otherwise, **layout** describes the layout for all relevant image aspects.

Valid Usage

- VUID-VkAttachmentReference2-layout-03077
If **attachment** is not **VK_ATTACHMENT_UNUSED**, **layout** **must** not be **VK_IMAGE_LAYOUT_UNDEFINED**, **VK_IMAGE_LAYOUT_PREINITIALIZED**, or **VK_IMAGE_LAYOUT_PRESENT_SRC_KHR**
- VUID-VkAttachmentReference2-separateDepthStencilLayouts-03313
If the **separateDepthStencilLayouts** feature is not enabled, and **attachment** is not **VK_ATTACHMENT_UNUSED**, **layout** **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL**, or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**,
- VUID-VkAttachmentReference2-synchronization2-06910
If the **synchronization2** feature is not enabled, **layout** **must** not be **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR** or **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR**
- VUID-VkAttachmentReference2-attachmentFeedbackLoopLayout-07311
If the **attachmentFeedbackLoopLayout** feature is not enabled, **layout** **must** not be **VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT**
- VUID-VkAttachmentReference2-dynamicRenderingLocalRead-09546
If the **dynamicRenderingLocalRead** feature is not enabled, **layout** **must** not be **VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR**

Valid Usage (Implicit)

- VUID-VkAttachmentReference2-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_2**
- VUID-VkAttachmentReference2-pNext-pNext
pNext **must** be **NULL** or a pointer to a valid instance of [VkAttachmentReferenceStencilLayout](#)

- VUID-VkAttachmentReference2-sType-unique
The **sType** value of each struct in the **pNext** chain **must** be unique
- VUID-VkAttachmentReference2-layout-parameter
layout **must** be a valid **VkImageLayout** value

The **VkAttachmentReferenceStencilLayout** structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReferenceStencilLayout {
    VkStructureType    sType;
    void*              pNext;
    VkImageLayout       stencilLayout;
} VkAttachmentReferenceStencilLayout;
```

or the equivalent

```
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentReferenceStencilLayout VkAttachmentReferenceStencilLayoutKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **stencilLayout** is a **VkImageLayout** value specifying the layout the stencil aspect of the attachment uses during the subpass.

Valid Usage

- VUID-VkAttachmentReferenceStencilLayout-stencilLayout-03318
stencilLayout **must** not be **VK_IMAGE_LAYOUT_UNDEFINED**, **VK_IMAGE_LAYOUT_PREINITIALIZED**, **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL**, or **VK_IMAGE_LAYOUT_PRESENT_SRC_KHR**

Valid Usage (Implicit)

- VUID-VkAttachmentReferenceStencilLayout-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_STENCIL_LAYOUT**
- VUID-VkAttachmentReferenceStencilLayout-stencilLayout-parameter
stencilLayout **must** be a valid **VkImageLayout** value

The `VkSubpassDependency2` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDependency2 {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             srcSubpass;
    uint32_t             dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags        srcAccessMask;
    VkAccessFlags        dstAccessMask;
    VkDependencyFlags    dependencyFlags;
    int32_t              viewOffset;
} VkSubpassDependency2;
```

or the equivalent

```
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDependency2 VkSubpassDependency2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcSubpass` is the subpass index of the first subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `dstSubpass` is the subpass index of the second subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the `source stage mask`.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the `destination stage mask`.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a `source access mask`.
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a `destination access mask`.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits`.
- `viewOffset` controls which views in the source subpass the views in the destination subpass depend on.

Parameters defined by this structure with the same name as those in `VkSubpassDependency` have the identical effect to those parameters.

`viewOffset` has the same effect for the described subpass dependency as `VkRenderPassMultiviewCreateInfo::pViewOffsets` has on each corresponding subpass dependency.

If a `VkMemoryBarrier2` is included in the `pNext` chain, `srcStageMask`, `dstStageMask`, `srcAccessMask`, and `dstAccessMask` parameters are ignored. The synchronization and access scopes instead are defined by the parameters of `VkMemoryBarrier2`.

Valid Usage

- VUID-VkSubpassDependency2-srcStageMask-04090
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-VkSubpassDependency2-srcStageMask-04091
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkSubpassDependency2-srcStageMask-04092
If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-VkSubpassDependency2-srcStageMask-04093
If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkSubpassDependency2-srcStageMask-04094
If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-VkSubpassDependency2-srcStageMask-04095
If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-VkSubpassDependency2-srcStageMask-04096
If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
- VUID-VkSubpassDependency2-srcStageMask-07318
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkSubpassDependency2-srcStageMask-03937
If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be `0`
- VUID-VkSubpassDependency2-srcStageMask-07949
If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkSubpassDependency2-dstStageMask-04090
If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-VkSubpassDependency2-dstStageMask-04091
If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkSubpassDependency2-dstStageMask-04092
If the `conditionalRendering` feature is not enabled, `dstStageMask` **must** not contain

VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

- VUID-VkSubpassDependency2-dstStageMask-04093
If the `fragmentDensityMap` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkSubpassDependency2-dstStageMask-04094
If the `transformFeedback` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-VkSubpassDependency2-dstStageMask-04095
If the `meshShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-VkSubpassDependency2-dstStageMask-04096
If the `taskShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
- VUID-VkSubpassDependency2-dstStageMask-07318
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkSubpassDependency2-dstStageMask-03937
If the `synchronization2` feature is not enabled, `dstStageMask` **must** not be 0
- VUID-VkSubpassDependency2-dstStageMask-07949
If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkSubpassDependency2-srcSubpass-03084
`srcSubpass` **must** be less than or equal to `dstSubpass`, unless one of them is `VK_SUBPASS_EXTERNAL`, to avoid cyclic dependencies and ensure a valid execution order
- VUID-VkSubpassDependency2-srcSubpass-03085
`srcSubpass` and `dstSubpass` **must** not both be equal to `VK_SUBPASS_EXTERNAL`
- VUID-VkSubpassDependency2-srcSubpass-06810
If `srcSubpass` is equal to `dstSubpass` and `srcStageMask` includes a `framebuffer-space` stage, `dstStageMask` **must** only contain `framebuffer-space` stages
- VUID-VkSubpassDependency2-srcAccessMask-03088
Any access flag included in `srcAccessMask` **must** be supported by one of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- VUID-VkSubpassDependency2-dstAccessMask-03089
Any access flag included in `dstAccessMask` **must** be supported by one of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)
- VUID-VkSubpassDependency2-dependencyFlags-03090
If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `srcSubpass` **must** not be equal to `VK_SUBPASS_EXTERNAL`
- VUID-VkSubpassDependency2-dependencyFlags-03091
If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `dstSubpass` **must** not be equal to `VK_SUBPASS_EXTERNAL`

- VUID-VkSubpassDependency2-srcSubpass-02245
If `srcSubpass` equals `dstSubpass`, and `srcStageMask` and `dstStageMask` both include a `framebuffer-space stage`, then `dependencyFlags` **must** include `VK_DEPENDENCY_BY_REGION_BIT`
- VUID-VkSubpassDependency2-viewOffset-02530
If `viewOffset` is not equal to 0, `srcSubpass` **must** not be equal to `dstSubpass`
- VUID-VkSubpassDependency2-dependencyFlags-03092
If `dependencyFlags` does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `viewOffset` **must** be 0

Valid Usage (Implicit)

- VUID-VkSubpassDependency2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_DEPENDENCY_2`
- VUID-VkSubpassDependency2-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkMemoryBarrier2`
- VUID-VkSubpassDependency2-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkSubpassDependency2-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-VkSubpassDependency2-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-VkSubpassDependency2-srcAccessMask-parameter
`srcAccessMask` **must** be a valid combination of `VkAccessFlagBits` values
- VUID-VkSubpassDependency2-dstAccessMask-parameter
`dstAccessMask` **must** be a valid combination of `VkAccessFlagBits` values
- VUID-VkSubpassDependency2-dependencyFlags-parameter
`dependencyFlags` **must** be a valid combination of `VkDependencyFlagBits` values

To destroy a render pass, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyRenderPass(
    VkDevice          device,
    VkRenderPass      renderPass,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the render pass.
- `renderPass` is the handle of the render pass to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyRenderPass-renderPass-00873
All submitted commands that refer to **renderPass** **must** have completed execution
- VUID-vkDestroyRenderPass-renderPass-00874
If **VkAllocationCallbacks** were provided when **renderPass** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyRenderPass-renderPass-00875
If no **VkAllocationCallbacks** were provided when **renderPass** was created, **pAllocator** **must** be **NULL**

Valid Usage (Implicit)

- VUID-vkDestroyRenderPass-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkDestroyRenderPass-renderPass-parameter
If **renderPass** is not **VK_NULL_HANDLE**, **renderPass** **must** be a valid **VkRenderPass** handle
- VUID-vkDestroyRenderPass-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid **VkAllocationCallbacks** structure
- VUID-vkDestroyRenderPass-renderPass-parent
If **renderPass** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **renderPass** **must** be externally synchronized

8.3. Render Pass Compatibility

Framebuffers and graphics pipelines are created based on a specific render pass object. They **must** only be used with that render pass object, or one compatible with it.

Two attachment references are compatible if they have matching format and sample count, or are both **VK_ATTACHMENT_UNUSED** or the pointer that would contain the reference is **NULL**.

Two arrays of attachment references are compatible if all corresponding pairs of attachments are compatible. If the arrays are of different lengths, attachment references not present in the smaller array are treated as **VK_ATTACHMENT_UNUSED**.

Two render passes are compatible if their corresponding color, input, resolve, and depth/stencil attachment references are compatible and if they are otherwise identical except for:

- Initial and final image layout in attachment descriptions
- Load and store operations in attachment descriptions
- Image layout in attachment references

As an additional special case, if two render passes have a single subpass, the resolve attachment reference and depth/stencil resolve mode compatibility requirements are ignored.

A framebuffer is compatible with a render pass if it was created using the same render pass or a compatible render pass.

8.4. Framebuffers

Render passes operate in conjunction with *framebuffers*. Framebuffers represent a collection of specific memory attachments that a render pass instance uses.

Framebuffers are represented by `VkFramebuffer` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFramebuffer)
```

To create a framebuffer, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateFramebuffer(
    VkDevice                                device,
    const VkFramebufferCreateInfo*          pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkFramebuffer*                          pFramebuffer);
```

- `device` is the logical device that creates the framebuffer.
- `pCreateInfo` is a pointer to a `VkFramebufferCreateInfo` structure describing additional information about framebuffer creation.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pFramebuffer` is a pointer to a `VkFramebuffer` handle in which the resulting framebuffer object is returned.

Valid Usage

- VUID-vkCreateFramebuffer-device-10002
`device` **must** support at least one queue family with the `VK_QUEUE_GRAPHICS_BIT` capability
- VUID-vkCreateFramebuffer-pCreateInfo-02777
If `pCreateInfo->flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `attachmentCount` is not 0, each element of `pCreateInfo->pAttachments` **must** have been created on `device`

Valid Usage (Implicit)

- VUID-vkCreateFramebuffer-device-parameter
`device` **must** be a valid [VkDevice](#) handle
- VUID-vkCreateFramebuffer-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid [VkFramebufferCreateInfo](#) structure
- VUID-vkCreateFramebuffer-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateFramebuffer-pFramebuffer-parameter
`pFramebuffer` **must** be a valid pointer to a [VkFramebuffer](#) handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkFramebufferCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkFramebufferCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkFramebufferCreateFlags flags;
    VkRenderPass        renderPass;
    uint32_t           attachmentCount;
    const VkImageView*  pAttachments;
    uint32_t           width;
    uint32_t           height;
    uint32_t           layers;
} VkFramebufferCreateInfo;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of [VkFramebufferCreateFlagBits](#)
- `renderPass` is a render pass defining what render passes the framebuffer will be compatible with. See [Render Pass Compatibility](#) for details.
- `attachmentCount` is the number of attachments.

- `pAttachments` is a pointer to an array of `VkImageView` handles, each of which will be used as the corresponding attachment in a render pass instance. If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, this parameter is ignored.
- `width`, `height` and `layers` define the dimensions of the framebuffer. If the render pass uses multiview, then `layers` **must** be one and each attachment requires a number of layers that is greater than the maximum bit index set in the view mask in the subpasses in which it is used.

It is legal for a subpass to use no color or depth/stencil attachments, either because it has no attachment references or because all of them are `VK_ATTACHMENT_UNUSED`. This kind of subpass **can** use shader side effects such as image stores and atomics to produce an output. In this case, the subpass continues to use the `width`, `height`, and `layers` of the framebuffer to define the dimensions of the rendering area, and the `rasterizationSamples` from each pipeline's `VkPipelineMultisampleStateCreateInfo` to define the number of samples used in rasterization; however, if `VkPhysicalDeviceFeatures::variableMultisampleRate` is `VK_FALSE`, then all pipelines to be bound with the subpass **must** have the same value for `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. In all such cases, `rasterizationSamples` **must** be a valid `VkSampleCountFlagBits` value that is set in `VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts`.

Valid Usage

- VUID-VkFramebufferCreateInfo-attachmentCount-00876
`attachmentCount` **must** be equal to the attachment count specified in `renderPass`
- VUID-VkFramebufferCreateInfo-flags-02778
If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` and `attachmentCount` is not 0, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkImageView` handles
- VUID-VkFramebufferCreateInfo-pAttachments-00877
If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a color attachment or resolve attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`
- VUID-VkFramebufferCreateInfo-pAttachments-02633
If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a depth/stencil attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkFramebufferCreateInfo-pAttachments-02634
If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a depth/stencil resolve attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkFramebufferCreateInfo-pAttachments-00879
If `renderpass` is not `VK_NULL_HANDLE`, `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as an input attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`
- VUID-VkFramebufferCreateInfo-pAttachments-02552

Each element of `pAttachments` that is used as a fragment density map attachment by `renderPass` **must** not have been created with a `flags` value including `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

- VUID-VkFramebufferCreateInfo-renderPass-02553

If `renderPass` has a fragment density map attachment and the `fragmentDensityMapNonSubsampledImages` feature is not enabled, each element of `pAttachments` **must** have been created with a `flags` value including `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT` unless that element is the fragment density map attachment

- VUID-VkFramebufferCreateInfo-renderPass-06502

If `renderPass` was created with `fragment density map offsets` other than (0,0), each element of `pAttachments` **must** have been created with a `flags` value including `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM`

- VUID-VkFramebufferCreateInfo-pAttachments-00880

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` **must** have been created with a `VkFormat` value that matches the `VkFormat` specified by the corresponding `VkAttachmentDescription` in `renderPass`

- VUID-VkFramebufferCreateInfo-pAttachments-00881

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` **must** have been created with a `samples` value that matches the `samples` value specified by the corresponding `VkAttachmentDescription` in `renderPass`

- VUID-VkFramebufferCreateInfo-flags-04533

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as an input, color, resolve, or depth/stencil attachment by `renderPass` **must** have been created with a `VkImageCreateInfo::extent.width` greater than or equal to `width`

- VUID-VkFramebufferCreateInfo-flags-04534

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as an input, color, resolve, or depth/stencil attachment by `renderPass` **must** have been created with a `VkImageCreateInfo::extent.height` greater than or equal to `height`

- VUID-VkFramebufferCreateInfo-flags-04535

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as an input, color, resolve, or depth/stencil attachment by `renderPass` **must** have been created with a `VkImageViewCreateInfo::subresourceRange.layerCount` greater than or equal to `layers`

- VUID-VkFramebufferCreateInfo-renderPass-04536

If `renderPass` was specified with non-zero view masks, each element of `pAttachments` that is used as an input, color, resolve, or depth/stencil attachment by `renderPass` **must** have a `layerCount` greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-renderPass-02746

Each element of `pAttachments` that is referenced by `fragmentDensityMapAttachment` **must** have a `layerCount` equal to 1 or if `renderPass` was specified with non-zero view masks, greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-pAttachments-02555

If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, an element of **pAttachments** that is referenced by **fragmentDensityMapAttachment** **must** have a width at least as large as $\lceil \frac{\text{width}}{\text{maxFragmentDensityTexelSize}_{\text{width}}} \rceil$

- VUID-VkFramebufferCreateInfo-pAttachments-02556

If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, an element of **pAttachments** that is referenced by **fragmentDensityMapAttachment** **must** have a height at least as large as $\lceil \frac{\text{height}}{\text{maxFragmentDensityTexelSize}_{\text{height}}} \rceil$

- VUID-VkFramebufferCreateInfo-flags-04537

If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, and **renderPass** was specified with non-zero view masks, each element of **pAttachments** that is used as a **fragment shading rate attachment** by **renderPass** **must** have a **layerCount** that is either 1, or greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-flags-04538

If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, and **renderPass** was not specified with non-zero view masks, each element of **pAttachments** that is used as a **fragment shading rate attachment** by **renderPass** **must** have a **layerCount** that is either 1, or greater than **layers**

- VUID-VkFramebufferCreateInfo-flags-04539

If **maintenance7** is not enabled or the **robustFragmentShadingRateAttachmentAccess** limit is **VK_FALSE** or the **imageView** member of a **VkRenderingFragmentShadingRateAttachmentInfoKHR** structure was created with **VkImageSubresourceRange::baseMipLevel** greater than 0, **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, an element of **pAttachments** that is used as a **fragment shading rate attachment** **must** have a width at least as large as $\lceil \text{width} / \text{texelWidth} \rceil$, where **texelWidth** is the largest value of **shadingRateAttachmentTexelSize.width** in a **VkFragmentShadingRateAttachmentInfoKHR** which references that attachment

- VUID-VkFramebufferCreateInfo-flags-04540

If **maintenance7** is not enabled or the **robustFragmentShadingRateAttachmentAccess** limit is **VK_FALSE** or the **imageView** member of a **VkRenderingFragmentShadingRateAttachmentInfoKHR** structure was created with **VkImageSubresourceRange::baseMipLevel** greater than 0, **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, an element of **pAttachments** that is used as a **fragment shading rate attachment** **must** have a height at least as large as $\lceil \text{height} / \text{texelHeight} \rceil$, where **texelHeight** is the largest value of **shadingRateAttachmentTexelSize.height** in a **VkFragmentShadingRateAttachmentInfoKHR** which references that attachment

- VUID-VkFramebufferCreateInfo-pAttachments-00883

If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of **pAttachments** **must** only specify a single mip level

- VUID-VkFramebufferCreateInfo-pAttachments-00884

If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of **pAttachments** **must** have been created with the identity swizzle

- VUID-VkFramebufferCreateInfo-width-00885

width **must** be greater than 0

- VUID-VkFramebufferCreateInfo-width-00886

width **must** be less than or equal to **maxFramebufferWidth**

- VUID-VkFramebufferCreateInfo-height-00887

height **must** be greater than 0

- VUID-VkFramebufferCreateInfo-height-00888

height **must** be less than or equal to **maxFramebufferHeight**

- VUID-VkFramebufferCreateInfo-layers-00889

layers **must** be greater than 0

- VUID-VkFramebufferCreateInfo-layers-00890

layers **must** be less than or equal to **maxFramebufferLayers**

- VUID-VkFramebufferCreateInfo-renderPass-02531

If **renderPass** was specified with non-zero view masks, **layers** **must** be 1

- VUID-VkFramebufferCreateInfo-pAttachments-00891

If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of **pAttachments** that is a 2D or 2D array image view taken from a 3D image **must** not be a depth/stencil format

- VUID-VkFramebufferCreateInfo-flags-03189

If the **imagelessFramebuffer** feature is not enabled, **flags** **must** not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**

- VUID-VkFramebufferCreateInfo-flags-03190

If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, the **pNext** chain **must** include a **VkFramebufferAttachmentsCreateInfo** structure

- VUID-VkFramebufferCreateInfo-flags-03191

If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, the **attachmentImageInfoCount** member of a **VkFramebufferAttachmentsCreateInfo** structure in the **pNext** chain **must** be equal to either zero or **attachmentCount**

- VUID-VkFramebufferCreateInfo-flags-04541

If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, the **width** member of any element of the **pAttachmentImageInfos** member of a **VkFramebufferAttachmentsCreateInfo** structure in the **pNext** chain that is used as an input, color, resolve or depth/stencil attachment in **renderPass** **must** be greater than or equal to **width**

- VUID-VkFramebufferCreateInfo-flags-04542

If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, the **height** member of any element of the **pAttachmentImageInfos** member of a **VkFramebufferAttachmentsCreateInfo** structure in the **pNext** chain that is used as an input, color, resolve or depth/stencil attachment in **renderPass** **must** be greater than or equal to **height**

- VUID-VkFramebufferCreateInfo-flags-03196

If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, the **width** member of any element of the **pAttachmentImageInfos** member of a **VkFramebufferAttachmentsCreateInfo** structure in the **pNext** chain that is referenced by **VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment** in **renderPass** **must** be greater than or equal to $\lceil \frac{\text{width}}{\text{maxFragmentDensityTexelSize}_{\text{width}}} \rceil$

- VUID-VkFramebufferCreateInfo-flags-03197

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `height` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that is referenced by `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment` in `renderPass` **must** be greater than or equal to $\lceil \frac{\text{height}}{\text{maxFragmentDensityTexelSize}_{\text{height}}} \rceil$

- VUID-VkFramebufferCreateInfo-flags-04543

If `maintenance7` is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `width` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a `fragment shading rate attachment` **must** be greater than or equal to $\lceil \text{width} / \text{texelWidth} \rceil$, where `texelWidth` is the largest value of `shadingRateAttachmentTexelSize.width` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment

- VUID-VkFramebufferCreateInfo-flags-04544

If `maintenance7` is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `height` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a `fragment shading rate attachment` **must** be greater than or equal to $\lceil \text{height} / \text{texelHeight} \rceil$, where `texelHeight` is the largest value of `shadingRateAttachmentTexelSize.height` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment

- VUID-VkFramebufferCreateInfo-flags-04545

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a `fragment shading rate attachment` **must** be either 1, or greater than or equal to `layers`

- VUID-VkFramebufferCreateInfo-flags-04587

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` and `renderPass` was specified with non-zero view masks, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a `fragment shading rate attachment` **must** be either 1, or greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-renderPass-03198

If `multiview` is enabled for `renderPass` and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain used as an input, color, resolve, or depth/stencil attachment in `renderPass` **must** be greater than the maximum bit index set in the view mask in the subpasses in which it is used in `renderPass`

- VUID-VkFramebufferCreateInfo-renderPass-04546
If `multiview` is not enabled for `renderPass` and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain used as an input, color, resolve, or depth/stencil attachment in `renderPass` **must** be greater than or equal to `layers`
- VUID-VkFramebufferCreateInfo-flags-03201
If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a color attachment or resolve attachment by `renderPass` **must** include `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`
- VUID-VkFramebufferCreateInfo-flags-03202
If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a depth/stencil attachment by `renderPass` **must** include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkFramebufferCreateInfo-flags-03203
If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a depth/stencil resolve attachment by `renderPass` **must** include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkFramebufferCreateInfo-flags-03204
If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as an input attachment by `renderPass` **must** include `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`
- VUID-VkFramebufferCreateInfo-flags-03205
If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, at least one element of the `pViewFormats` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain **must** be equal to the corresponding value of `VkAttachmentDescription::format` used to create `renderPass`
- VUID-VkFramebufferCreateInfo-flags-04113
If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` **must** have been created with `VkImageViewCreateInfo::viewType` not equal to `VK_IMAGE_VIEW_TYPE_3D`
- VUID-VkFramebufferCreateInfo-flags-04548
If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a fragment shading rate attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkFramebufferCreateInfo-flags-04549
If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element

of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a fragment shading rate attachment by `renderPass` **must** include `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkFramebufferCreateInfo-samples-06881

If `multisampled-render-to-single-sampled` is enabled for any subpass, all color, depth/stencil and input attachments used in that subpass which have `VkAttachmentDescription::samples` or `VkAttachmentDescription2::samples` equal to `VK_SAMPLE_COUNT_1_BIT` **must** have been created with `VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT` in their `VkImageCreateInfo::flags`

- VUID-VkFramebufferCreateInfo-samples-07009

If `multisampled-render-to-single-sampled` is enabled for any subpass, all color, depth/stencil and input attachments used in that subpass which have `VkAttachmentDescription::samples` or `VkAttachmentDescription2::samples` equal to `VK_SAMPLE_COUNT_1_BIT` **must** have a format that supports the sample count specified in `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`

- VUID-VkFramebufferCreateInfo-nullColorAttachmentWithExternalFormatResolve-09349

If the `nullColorAttachmentWithExternalFormatResolve` is `VK_FALSE`, and `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the format of the color attachment for each subpass in `renderPass` that includes an external format image as a resolve attachment **must** have a format equal to the value of `VkAndroidHardwareBufferFormatResolvePropertiesANDROID::colorAttachmentFormat` as returned by a call to `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer that was used to create the image view use as its resolve attachment

- VUID-VkFramebufferCreateInfo-pAttachments-09350

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, then if an element of `pAttachments` has a format of `VK_FORMAT_UNDEFINED`, it **must** have been created with a `VkExternalFormatANDROID::externalFormat` value identical to that provided in the `VkExternalFormatANDROID::externalFormat` specified by the corresponding `VkAttachmentDescription2` in `renderPass`

Valid Usage (Implicit)

- VUID-VkFramebufferCreateInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO`

- VUID-VkFramebufferCreateInfo-pNext-pNext

`pNext` **must** be `NULL` or a pointer to a valid instance of `VkFramebufferAttachmentsCreateInfo`

- VUID-VkFramebufferCreateInfo-sType-unique

The `sType` value of each struct in the `pNext` chain **must** be unique

- VUID-VkFramebufferCreateInfo-flags-parameter

`flags` **must** be a valid combination of `VkFramebufferCreateFlagBits` values

- VUID-VkFramebufferCreateInfo-renderPass-parameter
`renderPass` **must** be a valid [VkRenderPass](#) handle
- VUID-VkFramebufferCreateInfo-commonparent
Both of `renderPass`, and the elements of `pAttachments` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same [VkDevice](#)

The `VkFramebufferAttachmentsCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentsCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    uint32_t                  attachmentImageInfoCount;
    const VkFramebufferAttachmentImageInfo* pAttachmentImageInfos;
} VkFramebufferAttachmentsCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_imageless_framebuffer
typedef VkFramebufferAttachmentsCreateInfo VkFramebufferAttachmentsCreateInfoKHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentImageInfoCount` is the number of attachments being described.
- `pAttachmentImageInfos` is a pointer to an array of [VkFramebufferAttachmentImageInfo](#) structures, each structure describing a number of parameters of the corresponding attachment in a render pass instance.

Valid Usage (Implicit)

- VUID-VkFramebufferAttachmentsCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENTS_CREATE_INFO`
- VUID-VkFramebufferAttachmentsCreateInfo-pAttachmentImageInfos-parameter
If `attachmentImageInfoCount` is not 0, `pAttachmentImageInfos` **must** be a valid pointer to an array of `attachmentImageInfoCount` valid [VkFramebufferAttachmentImageInfo](#) structures

The `VkFramebufferAttachmentImageInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentImageInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImageCreateFlags  flags;
    VkImageUsageFlags   usage;
    uint32_t           width;
    uint32_t           height;
    uint32_t           layerCount;
    uint32_t           viewFormatCount;
    const VkFormat*     pViewFormats;
} VkFramebufferAttachmentImageInfo;
```

or the equivalent

```
// Provided by VK_KHR_imageless_framebuffer
typedef VkFramebufferAttachmentImageInfo VkFramebufferAttachmentImageInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkImageCreateFlagBits](#), matching the value of [VkImageCreateInfo::flags](#) used to create an image that will be used with this framebuffer.
- **usage** is a bitmask of [VkImageUsageFlagBits](#), matching the value of [VkImageCreateInfo::usage](#) used to create an image used with this framebuffer.
- **width** is the width of the image view used for rendering.
- **height** is the height of the image view used for rendering.
- **layerCount** is the number of array layers of the image view used for rendering.
- **viewFormatCount** is the number of entries in the **pViewFormats** array, matching the value of [VkImageFormatListCreateInfo::viewFormatCount](#) used to create an image used with this framebuffer.
- **pViewFormats** is a pointer to an array of [VkFormat](#) values specifying all of the formats which **can** be used when creating views of the image, matching the value of [VkImageFormatListCreateInfo::pViewFormats](#) used to create an image used with this framebuffer.

Images that **can** be used with the framebuffer when beginning a render pass, as specified by [VkRenderPassAttachmentBeginInfo](#), **must** be created with parameters that are identical to those specified here.

Valid Usage

- VUID-VkFramebufferAttachmentImageInfo-viewFormatCount-09536
If **viewFormatCount** is not 0, and the render pass is not being used with an external format

resolve attachment, each element of `pViewFormats` **must** not be `VK_FORMAT_UNDEFINED`

Valid Usage (Implicit)

- `VUID-VkFramebufferAttachmentImageInfo-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENT_IMAGE_INFO`
- `VUID-VkFramebufferAttachmentImageInfo-pNext-pNext`
`pNext` **must** be `NULL`
- `VUID-VkFramebufferAttachmentImageInfo-flags-parameter`
`flags` **must** be a valid combination of `VkImageCreateFlagBits` values
- `VUID-VkFramebufferAttachmentImageInfo-usage-parameter`
`usage` **must** be a valid combination of `VkImageUsageFlagBits` values
- `VUID-VkFramebufferAttachmentImageInfo-usage-requiredbitmask`
`usage` **must** not be `0`
- `VUID-VkFramebufferAttachmentImageInfo-pViewFormats-parameter`
If `viewFormatCount` is not `0`, `pViewFormats` **must** be a valid pointer to an array of `viewFormatCount` valid `VkFormat` values

Bits which **can** be set in `VkFramebufferCreateInfo::flags`, specifying options for framebuffers, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkFramebufferCreateFlagBits {
    // Provided by VK_VERSION_1_2
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT = 0x00000001,
    // Provided by VK_KHR_imageless_framebuffer
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR = VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT,
} VkFramebufferCreateFlagBits;
```

- `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` specifies that image views are not specified, and only attachment compatibility information will be provided via a `VkFramebufferAttachmentImageInfo` structure.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkFramebufferCreateFlags;
```

`VkFramebufferCreateFlags` is a bitmask type for setting a mask of zero or more `VkFramebufferCreateFlagBits`.

To destroy a framebuffer, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyFramebuffer(
    VkDevice          device,
    VkFramebuffer     framebuffer,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the framebuffer.
- **framebuffer** is the handle of the framebuffer to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyFramebuffer-framebuffer-00892
All submitted commands that refer to **framebuffer** **must** have completed execution
- VUID-vkDestroyFramebuffer-framebuffer-00893
If **VkAllocationCallbacks** were provided when **framebuffer** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyFramebuffer-framebuffer-00894
If no **VkAllocationCallbacks** were provided when **framebuffer** was created, **pAllocator** **must** be **NULL**

Valid Usage (Implicit)

- VUID-vkDestroyFramebuffer-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkDestroyFramebuffer-framebuffer-parameter
If **framebuffer** is not **VK_NULL_HANDLE**, **framebuffer** **must** be a valid **VkFramebuffer** handle
- VUID-vkDestroyFramebuffer-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid **VkAllocationCallbacks** structure
- VUID-vkDestroyFramebuffer-framebuffer-parent
If **framebuffer** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **framebuffer** **must** be externally synchronized

8.5. Render Pass Load Operations

Render pass load operations define the initial values of an attachment during a render pass instance.

Load operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` pipeline stage. Load operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. The load operation for each sample in an attachment happens-before any recorded command which accesses the sample in that render pass instance via that attachment or an alias.

NOTE

Because load operations always happen first, external synchronization with attachment access only needs to synchronize the load operations with previous commands; not the operations within the render pass instance. This does not apply when using `VK_ATTACHMENT_LOAD_OP_NONE_KHR`.

Load operations only update values within the defined render area for the render pass instance. However, any writes performed by a load operation (as defined by its access masks) to a given attachment **may** read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, if [maintenance7](#) is not enabled on the device or `separateDepthStencilAttachmentAccess` is `VK_FALSE`, writes to one aspect **may** also result in read-modify-write operations for the other aspect. If the subresource is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout, implementations **must** not access pixels outside of the render area.

NOTE

As entire subresources could be accessed by load operations, applications cannot safely access values outside of the render area during a render pass instance when a load operation that modifies values is used.

Load operations that **can** be used for a render pass are:

```
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentLoadOp {
    VK_ATTACHMENT_LOAD_OP_LOAD = 0,
    VK_ATTACHMENT_LOAD_OP_CLEAR = 1,
    VK_ATTACHMENT_LOAD_OP_DONT_CARE = 2,
    // Provided by VK_KHR_load_store_op_none
    VK_ATTACHMENT_LOAD_OP_NONE_KHR = 1000400000,
    // Provided by VK_EXT_load_store_op_none
    VK_ATTACHMENT_LOAD_OP_NONE_EXT = VK_ATTACHMENT_LOAD_OP_NONE_KHR,
} VkAttachmentLoadOp;
```

- `VK_ATTACHMENT_LOAD_OP_LOAD` specifies that the previous contents of the image within the render area will be preserved as the initial values. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`.
- `VK_ATTACHMENT_LOAD_OP_CLEAR` specifies that the contents within the render area will be cleared to

a uniform value, which is specified when a render pass instance is begun. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- `VK_ATTACHMENT_LOAD_OP_DONT_CARE` specifies that the previous contents within the area need not be preserved; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.
- `VK_ATTACHMENT_LOAD_OP_NONE_KHR` specifies that the previous contents of the image will be undefined inside the render pass. No access type is used as the image is not accessed.

During a render pass instance, input and color attachments with color formats that have a component size of 8, 16, or 32 bits **must** be represented in the attachment's format throughout the instance. Attachments with other floating- or fixed-point color formats, or with depth components **may** be represented in a format with a precision higher than the attachment format, but **must** be represented with the same range. When such a component is loaded via the `loadOp`, it will be converted into an implementation-dependent format used by the render pass. Such components **must** be converted from the render pass format, to the format of the attachment, before they are resolved or stored at the end of a render pass instance via `storeOp`. Conversions occur as described in [Numeric Representation and Computation](#) and [Fixed-Point Data Conversions](#).

8.6. Render Pass Store Operations

Render pass store operations define how values written to an attachment during a render pass instance are stored to memory.

Store operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stage. Store operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. The store operation for each sample in an attachment happens-after any recorded command which accesses the sample via that attachment or an alias.

NOTE

Because store operations always happen after other accesses in a render pass instance, external synchronization with attachment access in an earlier render pass only needs to synchronize with the store operations; not the operations within the render pass instance. This does not apply when using `VK_ATTACHMENT_STORE_OP_NONE`.

Store operations only update values within the defined render area for the render pass instance. However, any writes performed by a store operation (as defined by its access masks) to a given attachment **may** read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, if `separateDepthStencilAttachmentAccess` is `VK_FALSE`, writes to one aspect **may** also result in read-modify-write operations for the other aspect. If the subresource is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout, implementations **must** not access pixels outside of the render area.

NOTE

As entire subresources could be accessed by store operations, applications cannot

safely access values outside of the render area via aliased resources during a render pass instance when a store operation that modifies values is used.

Possible values of `VkAttachmentDescription::storeOp` and `stencilStoreOp`, specifying how the contents of the attachment are treated, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentStoreOp {
    VK_ATTACHMENT_STORE_OP_STORE = 0,
    VK_ATTACHMENT_STORE_OP_DONT_CARE = 1,
    // Provided by VK_VERSION_1_3
    VK_ATTACHMENT_STORE_OP_NONE = 1000301000,
    // Provided by VK_KHR_dynamic_rendering, VK_KHR_load_store_op_none
    VK_ATTACHMENT_STORE_OP_NONE_KHR = VK_ATTACHMENT_STORE_OP_NONE,
    // Provided by VK_QCOM_render_pass_store_ops
    VK_ATTACHMENT_STORE_OP_NONE_QCOM = VK_ATTACHMENT_STORE_OP_NONE,
    // Provided by VK_EXT_load_store_op_none
    VK_ATTACHMENT_STORE_OP_NONE_EXT = VK_ATTACHMENT_STORE_OP_NONE,
} VkAttachmentStoreOp;
```

- `VK_ATTACHMENT_STORE_OP_STORE` specifies the contents generated during the render pass and within the render area are written to memory. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.
- `VK_ATTACHMENT_STORE_OP_DONT_CARE` specifies the contents within the render area are not needed after rendering, and **may** be discarded; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.
- `VK_ATTACHMENT_STORE_OP_NONE` specifies the contents within the render area are not accessed by the store operation as long as no values are written to the attachment during the render pass. If values are written during the render pass, this behaves identically to `VK_ATTACHMENT_STORE_OP_DONT_CARE` and with matching access semantics.

NOTE `VK_ATTACHMENT_STORE_OP_DONT_CARE` **can** cause contents generated during previous render passes to be discarded before reaching memory, even if no write to the attachment occurs during the current render pass.

8.7. Render Pass Multisample Resolve Operations

Render pass multisample resolve operations combine sample values from a single pixel in a multisample attachment and store the result to the corresponding pixel in a single sample attachment.

Multisample resolve operations for attachments execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. A final resolve operation for all

pixels in the render area happens-after any recorded command which writes a pixel via the multisample attachment to be resolved or an explicit alias of it in the subpass that it is specified. Any single sample attachment specified for use in a multisample resolve operation **may** have its contents modified at any point once rendering begins for the render pass instance. Reads from the multisample attachment can be synchronized with `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`. Access to the single sample attachment can be synchronized with `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT` and `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`. These pipeline stage and access types are used whether the attachments are color or depth/stencil attachments.

When using render pass objects, a subpass dependency specified with the above pipeline stages and access flags will ensure synchronization with multisample resolve operations for any attachments that were last accessed by that subpass. This allows later subpasses to read resolved values as input attachments.

Resolve operations only update values within the defined render area for the render pass instance. However, any writes performed by a resolve operation (as defined by its access masks) to a given attachment **may** read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, if `separateDepthStencilAttachmentAccess` is `VK_FALSE`, writes to one aspect **may** also result in read-modify-write operations for the other aspect. If the subresource is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout, implementations **must** not access pixels outside of the render area.

NOTE

As entire subresources could be accessed by multisample resolve operations, applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a multisample resolve operation is performed.

Multisample values in a multisample attachment are combined according to the resolve mode used:

```

// Provided by VK_VERSION_1_2
typedef enum VkResolveModeFlagBits {
    VK_RESOLVE_MODE_NONE = 0,
    VK_RESOLVE_MODE_SAMPLE_ZERO_BIT = 0x00000001,
    VK_RESOLVE_MODE_AVERAGE_BIT = 0x00000002,
    VK_RESOLVE_MODE_MIN_BIT = 0x00000004,
    VK_RESOLVE_MODE_MAX_BIT = 0x00000008,
    // Provided by VK_ANDROID_external_format_resolve with VK_KHR_dynamic_rendering or
    VK_VERSION_1_3
    VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID = 0x00000010,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_NONE_KHR = VK_RESOLVE_MODE_NONE,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_SAMPLE_ZERO_BIT_KHR = VK_RESOLVE_MODE_SAMPLE_ZERO_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_AVERAGE_BIT_KHR = VK_RESOLVE_MODE_AVERAGE_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_MIN_BIT_KHR = VK_RESOLVE_MODE_MIN_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_MAX_BIT_KHR = VK_RESOLVE_MODE_MAX_BIT,
} VkResolveModeFlagBits;

```

or the equivalent

```

// Provided by VK_KHR_depth_stencil_resolve
typedef VkResolveModeFlagBits VkResolveModeFlagBitsKHR;

```

- **VK_RESOLVE_MODE_NONE** indicates that no resolve operation is done.
- **VK_RESOLVE_MODE_SAMPLE_ZERO_BIT** indicates that result of the resolve operation is equal to the value of sample 0.
- **VK_RESOLVE_MODE_AVERAGE_BIT** indicates that result of the resolve operation is the average of the sample values.
- **VK_RESOLVE_MODE_MIN_BIT** indicates that result of the resolve operation is the minimum of the sample values.
- **VK_RESOLVE_MODE_MAX_BIT** indicates that result of the resolve operation is the maximum of the sample values.
- **VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID** indicates that rather than a multisample resolve, a single sampled color attachment will be downsampled into a $Y'C_B C_R$ format image specified by an external Android format. Unlike other resolve modes, implementations can resolve multiple times during rendering, or even bypass writing to the color attachment altogether, as long as the final value is resolved to the resolve attachment. Values in the G, B, and R channels of the color attachment will be written to the Y, C_B , and C_R channels of the external format image, respectively. Chroma values are calculated as if sampling with a linear filter from the color attachment at full rate, at the location the chroma values sit according to [VkPhysicalDeviceExternalFormatResolvePropertiesANDROID::chromaOffsetX](#),

`VkPhysicalDeviceExternalFormatResolvePropertiesANDROID::chromaOffsetY`, and the chroma sample rate of the resolved image.

If no resolve mode is otherwise specified, `VK_RESOLVE_MODE_AVERAGE_BIT` is used.

NOTE

No range compression or Y'C_BC_R model conversion is performed by `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`; applications have to do these conversions themselves. Value outputs are expected to match those that would be read through a Y'C_BC_R sampler using `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`. The color space that the values should be in is defined by the platform and is not exposed via Vulkan.

```
// Provided by VK_VERSION_1_2
typedef VkFlags VkResolveModeFlags;
```

or the equivalent

```
// Provided by VK_KHR_depth_stencil_resolve
typedef VkResolveModeFlags VkResolveModeFlagsKHR;
```

`VkResolveModeFlags` is a bitmask type for setting a mask of zero or more `VkResolveModeFlagBits`.

8.8. Render Pass Commands

An application records the commands for a render pass instance one subpass at a time, by beginning a render pass instance, iterating over the subpasses to record commands for that subpass, and then ending the render pass instance.

To begin a render pass instance, call:

```
// Provided by VK_VERSION_1_0
void vkCmdBeginRenderPass(
    VkCommandBuffer          commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    VkSubpassContents        contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `contents` is a `VkSubpassContents` value specifying how the commands in the first subpass will be provided.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

Valid Usage

- VUID-vkCmdBeginRenderPass-initialLayout-00895

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-01758

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-02842

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-stencilInitialLayout-02843

If any of the `stencilInitialLayout` or `stencilFinalLayout` member of the `VkAttachmentDescriptionStencilLayout` structures or the `stencilLayout` member of the `VkAttachmentReferenceStencilLayout` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00897

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view

of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00898

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00899

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_DST_BIT`

- VUID-vkCmdBeginRenderPass-initialLayout-00900

If the `initialLayout` member of any of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` **must** be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin`

- VUID-vkCmdBeginRenderPass-srcStageMask-06451

The `srcStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from

- VUID-vkCmdBeginRenderPass-dstStageMask-06452

The `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from

- VUID-vkCmdBeginRenderPass-framebuffer-02532

For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments **must** have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set

- VUID-vkCmdBeginRenderPass-framebuffer-09045

If any attachments specified in `framebuffer` are used by `renderPass` and are bound to overlapping memory locations, there **must** be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass

- VUID-vkCmdBeginRenderPass-initialLayout-07000

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` and either the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits

- VUID-vkCmdBeginRenderPass-initialLayout-07001

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit

- VUID-vkCmdBeginRenderPass-initialLayout-09537

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including either `VK_IMAGE_USAGE_STORAGE_BIT`, or both `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` and either of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass-contents-09640

If `contents` is `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR`, then at least one of the following features **must** be enabled:

- `maintenance7`
- `nestedCommandBuffer`

Valid Usage (Implicit)

- VUID-vkCmdBeginRenderPass-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginRenderPass-pRenderPassBegin-parameter `pRenderPassBegin` **must** be a valid pointer to a valid `VkRenderPassBeginInfo` structure
- VUID-vkCmdBeginRenderPass-contents-parameter `contents` **must** be a valid `VkSubpassContents` value
- VUID-vkCmdBeginRenderPass-commandBuffer-recording `commandBuffer` **must** be in the `recording` state
- VUID-vkCmdBeginRenderPass-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics

operations

- VUID-vkCmdBeginRenderPass-renderpass

This command **must** only be called outside of a render pass instance

- VUID-vkCmdBeginRenderPass-videocoding

This command **must** only be called outside of a video coding scope

- VUID-vkCmdBeginRenderPass-bufferlevel

`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Outside	Outside	Graphics	Action State Synchronization

Alternatively to begin a render pass, call:

```
// Provided by VK_VERSION_1_2
void vkCmdBeginRenderPass2(
    VkCommandBuffer                      commandBuffer,
    const VkRenderPassBeginInfo*         pRenderPassBegin,
    const VkSubpassBeginInfo*           pSubpassBeginInfo);
```

or the equivalent command

```
// Provided by VK_KHR_create_renderpass2
void vkCmdBeginRenderPass2KHR(
    VkCommandBuffer                      commandBuffer,
    const VkRenderPassBeginInfo*         pRenderPassBegin,
    const VkSubpassBeginInfo*           pSubpassBeginInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.

- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

Valid Usage

- VUID-vkCmdBeginRenderPass2-framebuffer-02779
Both the `framebuffer` and `renderPass` members of `pRenderPassBegin` **must** have been created on the same `VkDevice` that `commandBuffer` was allocated on
- VUID-vkCmdBeginRenderPass2-initialLayout-03094
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`
- VUID-vkCmdBeginRenderPass2-initialLayout-03096
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-vkCmdBeginRenderPass2-initialLayout-02844
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-vkCmdBeginRenderPass2-stencilInitialLayout-02845
If any of the `stencilInitialLayout` or `stencilFinalLayout` member of the `VkAttachmentDescriptionStencilLayout` structures or the `stencilLayout` member of the `VkAttachmentReferenceStencilLayout` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image

view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass2-initialLayout-03097

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-vkCmdBeginRenderPass2-initialLayout-03098

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`

- VUID-vkCmdBeginRenderPass2-initialLayout-03099

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_DST_BIT`

- VUID-vkCmdBeginRenderPass2-initialLayout-03100

If the `initialLayout` member of any of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` **must** be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin`

- VUID-vkCmdBeginRenderPass2-srcStageMask-06453

The `srcStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from

- VUID-vkCmdBeginRenderPass2-dstStageMask-06454

The `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from

- VUID-vkCmdBeginRenderPass2-framebuffer-02533

For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory

locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments **must** have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set

- VUID-vkCmdBeginRenderPass2-framebuffer-09046

If any attachments specified in `framebuffer` are used by `renderPass` and are bound to overlapping memory locations, there **must** be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass

- VUID-vkCmdBeginRenderPass2-initialLayout-07002

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` and either the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits

- VUID-vkCmdBeginRenderPass2-initialLayout-07003

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit

- VUID-vkCmdBeginRenderPass2-initialLayout-09538

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including either `VK_IMAGE_USAGE_STORAGE_BIT`, or both `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` and either of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

Valid Usage (Implicit)

- VUID-vkCmdBeginRenderPass2-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdBeginRenderPass2-pRenderPassBegin-parameter

`pRenderPassBegin` **must** be a valid pointer to a valid `VkRenderPassBeginInfo` structure

- VUID-vkCmdBeginRenderPass2-pSubpassBeginInfo-parameter

`pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfo` structure

- VUID-vkCmdBeginRenderPass2-commandBuffer-recording

`commandBuffer` **must** be in the `recording state`

- VUID-vkCmdBeginRenderPass2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdBeginRenderPass2-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdBeginRenderPass2-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdBeginRenderPass2-bufferlevel
`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Outside	Outside	Graphics	Action State Synchronization

The `VkRenderPassBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkRenderPass        renderPass;
    VkFramebuffer        framebuffer;
    VkRect2D            renderArea;
    uint32_t            clearValueCount;
    const VkClearValue* pClearValues;
} VkRenderPassBeginInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `renderPass` is the render pass to begin an instance of.
- `framebuffer` is the framebuffer containing the attachments that are used with the render pass.

- **renderArea** is the render area that is affected by the render pass instance, and is described in more detail below.
- **clearValueCount** is the number of elements in **pClearValues**.
- **pClearValues** is a pointer to an array of **clearValueCount** **VkClearColor** structures containing clear values for each attachment, if the attachment uses a **loadOp** value of **VK_ATTACHMENT_LOAD_OP_CLEAR** or if the attachment has a depth/stencil format and uses a **stencilLoadOp** value of **VK_ATTACHMENT_LOAD_OP_CLEAR**. The array is indexed by attachment number. Only elements corresponding to cleared attachments are used. Other elements of **pClearValues** are ignored.

renderArea is the render area that is affected by the render pass instance. The effects of attachment load, store and multisample resolve operations are restricted to the pixels whose x and y coordinates fall within the render area on all attachments. The render area extends to all layers of **framebuffer**. The application **must** ensure (using scissor if necessary) that all rendering is contained within the render area. The render area, after any transform specified by **VkRenderPassTransformBeginInfoQCOM::transform** is applied, **must** be contained within the framebuffer dimensions.

If **render pass transform** is enabled, then **renderArea** **must** equal the framebuffer pre-transformed dimensions. After **renderArea** has been transformed by **VkRenderPassTransformBeginInfoQCOM::transform**, the resulting render area **must** be equal to the framebuffer dimensions.

If multiview is enabled in **renderPass**, and **multiviewPerViewRenderAreas** feature is enabled, and there is an instance of **VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM** included in the **pNext** chain with **perViewRenderAreaCount** not equal to 0, then the elements of **VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM::pPerViewRenderAreas** override **renderArea** and define a render area for each view. In this case, **renderArea** **must** be an area at least as large as the union of all the per-view render areas.

If the **subpassShading** feature is enabled, then **renderArea** **must** equal the framebuffer dimensions.

NOTE

There **may** be a performance cost for using a render area smaller than the framebuffer, unless it matches the render area granularity for the render pass.

Valid Usage

- VUID-VkRenderPassBeginInfo-clearValueCount-00902
clearValueCount **must** be greater than the largest attachment index in **renderPass** specifying a **loadOp** (or **stencilLoadOp**, if the attachment has a depth/stencil format) of **VK_ATTACHMENT_LOAD_OP_CLEAR**
- VUID-VkRenderPassBeginInfo-clearValueCount-04962
If **clearValueCount** is not 0, **pClearValues** **must** be a valid pointer to an array of **clearValueCount** **VkClearColor** unions
- VUID-VkRenderPassBeginInfo-renderPass-00904
renderPass **must** be **compatible** with the **renderPass** member of the **VkFramebufferCreateInfo** structure specified when creating **framebuffer**

- VUID-VkRenderPassBeginInfo-None-08996
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.width` **must** be greater than 0
- VUID-VkRenderPassBeginInfo-None-08997
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.height` **must** be greater than 0
- VUID-VkRenderPassBeginInfo-pNext-02850
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` **must** be greater than or equal to 0
- VUID-VkRenderPassBeginInfo-pNext-02851
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` **must** be greater than or equal to 0
- VUID-VkRenderPassBeginInfo-pNext-02852
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` + `renderArea.extent.width` **must** be less than or equal to `VkFramebufferCreateInfo::width` the `framebuffer` was created with
- VUID-VkRenderPassBeginInfo-pNext-02853
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` + `renderArea.extent.height` **must** be less than or equal to `VkFramebufferCreateInfo::height` the `framebuffer` was created with
- VUID-VkRenderPassBeginInfo-pNext-02856
If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.x` + `extent.width` of each element of `pDeviceRenderAreas` **must** be less than or equal to `VkFramebufferCreateInfo::width` the `framebuffer` was created with
- VUID-VkRenderPassBeginInfo-pNext-02857
If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.y` + `extent.height` of each element of `pDeviceRenderAreas` **must** be less than or equal to `VkFramebufferCreateInfo::height` the `framebuffer` was created with
- VUID-VkRenderPassBeginInfo-framebuffer-03207
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that did not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and the `pNext` chain includes a `VkRenderPassAttachmentBeginInfo` structure, its `attachmentCount` **must** be zero
- VUID-VkRenderPassBeginInfo-framebuffer-03208
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `attachmentCount` of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be equal to the value of `VkFramebufferAttachmentsCreateInfo::attachmentImageInfoCount` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-02780
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** have been created on the same `VkDevice` as `framebuffer` and `renderPass`
- VUID-VkRenderPassBeginInfo-framebuffer-03209
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageCreateInfo::flags` equal to the `flags` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`
- VUID-VkRenderPassBeginInfo-framebuffer-04627
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` with an `inherited usage` equal to the `usage` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`
- VUID-VkRenderPassBeginInfo-framebuffer-03211
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` with a `width` equal to the `width` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`
- VUID-VkRenderPassBeginInfo-framebuffer-03212
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` with a `height` equal to the `height` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`
- VUID-VkRenderPassBeginInfo-framebuffer-03213
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageViewCreateInfo::subresourceRange.layerCount` equal to the `layerCount` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`
- VUID-VkRenderPassBeginInfo-framebuffer-03214
If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageFormatListCreateInfo::viewFormatCount` equal to the `viewFormatCount` member of the corresponding element of

`VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-03215

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a set of elements in `VkImageFormatListCreateInfo::pViewFormats` equal to the set of elements in the `pViewFormats` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-03216

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageViewCreateInfo::format` equal to the corresponding value of `VkAttachmentDescription::format` in `renderPass`

- VUID-VkRenderPassBeginInfo-framebuffer-09353

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and the `nullColorAttachmentWithExternalFormatResolve` is `VK_FALSE`, the format of the color attachment for each subpass that includes an external format image as a resolve attachment **must** have a format equal to the value of `VkAndroidHardwareBufferFormatResolvePropertiesANDROID::colorAttachmentFormat` as returned by a call to `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer that was used to create the image view use as its resolve attachment

- VUID-VkRenderPassBeginInfo-framebuffer-09354

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkExternalFormatANDROID::externalFormat` equal to `VkExternalFormatANDROID::externalFormat` in the `pNext` chain of the corresponding `VkAttachmentDescription2` structure used to create `renderPass`

- VUID-VkRenderPassBeginInfo-framebuffer-09047

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageCreateInfo::samples` equal to the corresponding value of `VkAttachmentDescription::samples` in `renderPass`, or `VK_SAMPLE_COUNT_1_BIT` if `renderPass` was created with `VkMultisampledRenderToSingleSampledInfoEXT` structure in the `pNext` chain with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`

- VUID-VkRenderPassBeginInfo-pNext-02869

If the `pNext` chain includes `VkRenderPassTransformBeginInfoQCOM`, `renderArea.offset` **must** equal (0,0)

- VUID-VkRenderPassBeginInfo-pNext-02870

If the `pNext` chain includes `VkRenderPassTransformBeginInfoQCOM`, `renderArea.extent`

transformed by `VkRenderPassTransformBeginInfoQCOM::transform` **must** equal the `framebuffer` dimensions

- VUID-VkRenderPassBeginInfo-perViewRenderAreaCount-07859

If the `perViewRenderAreaCount` member of a `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` structure included in the `pNext` chain is not `0`, then the `multiviewPerViewRenderAreas` feature **must** be enabled

- VUID-VkRenderPassBeginInfo-perViewRenderAreaCount-07860

If the `perViewRenderAreaCount` member of a `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` structure included in the `pNext` chain is not `0`, then `renderArea` **must** specify a render area that includes the union of all per view render areas

- VUID-VkRenderPassBeginInfo-pNext-09539

If the `pNext` chain contains a `VkRenderPassStripeBeginInfoARM` structure, the union of stripe areas defined by the elements of `VkRenderPassStripeInfoARM::pStripeInfos` **must** cover the `renderArea`

Valid Usage (Implicit)

- VUID-VkRenderPassBeginInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO`

- VUID-VkRenderPassBeginInfo-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupRenderPassBeginInfo`, `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM`, `VkRenderPassAttachmentBeginInfo`, `VkRenderPassSampleLocationsBeginInfoEXT`, `VkRenderPassStripeBeginInfoARM`, or `VkRenderPassTransformBeginInfoQCOM`

- VUID-VkRenderPassBeginInfo-sType-unique

The `sType` value of each struct in the `pNext` chain **must** be unique

- VUID-VkRenderPassBeginInfo-renderPass-parameter

`renderPass` **must** be a valid `VkRenderPass` handle

- VUID-VkRenderPassBeginInfo-framebuffer-parameter

`framebuffer` **must** be a valid `VkFramebuffer` handle

- VUID-VkRenderPassBeginInfo-commonparent

Both of `framebuffer`, and `renderPass` **must** have been created, allocated, or retrieved from the same `VkDevice`

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource, thus preserving the contents of such depth/stencil attachments across subpass boundaries requires the application to specify these sample locations whenever a layout transition of the attachment **may** occur. This information **can** be provided by adding a `VkRenderPassSampleLocationsBeginInfoEXT` structure to the `pNext` chain of `VkRenderPassBeginInfo`.

The `VkRenderPassSampleLocationsBeginInfoEXT` structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkRenderPassSampleLocationsBeginInfoEXT {
    VkStructureType           sType;
    const void*               pNext;
    uint32_t                  attachmentInitialSampleLocationsCount;
    const VkAttachmentSampleLocationsEXT* pAttachmentInitialSampleLocations;
    uint32_t                  postSubpassSampleLocationsCount;
    const VkSubpassSampleLocationsEXT* pPostSubpassSampleLocations;
} VkRenderPassSampleLocationsBeginInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentInitialSampleLocationsCount` is the number of elements in the `pAttachmentInitialSampleLocations` array.
- `pAttachmentInitialSampleLocations` is a pointer to an array of `attachmentInitialSampleLocationsCount` `VkAttachmentSampleLocationsEXT` structures specifying the attachment indices and their corresponding sample location state. Each element of `pAttachmentInitialSampleLocations` **can** specify the sample location state to use in the automatic layout transition performed to transition a depth/stencil attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.
- `postSubpassSampleLocationsCount` is the number of elements in the `pPostSubpassSampleLocations` array.
- `pPostSubpassSampleLocations` is a pointer to an array of `postSubpassSampleLocationsCount` `VkSubpassSampleLocationsEXT` structures specifying the subpass indices and their corresponding sample location state. Each element of `pPostSubpassSampleLocations` **can** specify the sample location state to use in the automatic layout transition performed to transition the depth/stencil attachment used by the specified subpass to the image layout specified in a dependent subpass or to the final layout of the attachment in case the specified subpass is the last subpass using that attachment. In addition, if `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE`, each element of `pPostSubpassSampleLocations` **must** specify the sample location state that matches the sample locations used by all pipelines that will be bound to a command buffer during the specified subpass. If `variableSampleLocations` is `VK_TRUE`, the sample locations used for rasterization do not depend on `pPostSubpassSampleLocations`.

Valid Usage (Implicit)

- VUID-VkRenderPassSampleLocationsBeginInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_SAMPLE_LOCATIONS_BEGIN_INFO_EXT`
- VUID-VkRenderPassSampleLocationsBeginInfoEXT-pAttachmentInitialSampleLocations-parameter
If `attachmentInitialSampleLocationsCount` is not 0, `pAttachmentInitialSampleLocations` **must**

be a valid pointer to an array of `attachmentInitialSampleLocationsCount` valid `VkAttachmentSampleLocationsEXT` structures

- VUID-VkRenderPassSampleLocationsBeginInfoEXT-pPostSubpassSampleLocations-parameter

If `postSubpassSampleLocationsCount` is not 0, `pPostSubpassSampleLocations` **must** be a valid pointer to an array of `postSubpassSampleLocationsCount` valid `VkSubpassSampleLocationsEXT` structures

The `VkAttachmentSampleLocationsEXT` structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkAttachmentSampleLocationsEXT {
    uint32_t          attachmentIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkAttachmentSampleLocationsEXT;
```

- `attachmentIndex` is the index of the attachment for which the sample locations state is provided.
- `sampleLocationsInfo` is the sample locations state to use for the layout transition of the given attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.

If the image referenced by the framebuffer attachment at index `attachmentIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` then the values specified in `sampleLocationsInfo` are ignored.

Valid Usage

- VUID-VkAttachmentSampleLocationsEXT-attachmentIndex-01531
`attachmentIndex` **must** be less than the `attachmentCount` specified in `VkRenderPassCreateInfo` the render pass specified by `VkRenderPassBeginInfo::renderPass` was created with

Valid Usage (Implicit)

- VUID-VkAttachmentSampleLocationsEXT-sampleLocationsInfo-parameter
`sampleLocationsInfo` **must** be a valid `VkSampleLocationsInfoEXT` structure

The `VkSubpassSampleLocationsEXT` structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkSubpassSampleLocationsEXT {
    uint32_t                subpassIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkSubpassSampleLocationsEXT;
```

- **subpassIndex** is the index of the subpass for which the sample locations state is provided.
- **sampleLocationsInfo** is the sample locations state to use for the layout transition of the depth/stencil attachment away from the image layout the attachment is used with in the subpass specified in **subpassIndex**.

If the image referenced by the depth/stencil attachment used in the subpass identified by **subpassIndex** was not created with **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** or if the subpass does not use a depth/stencil attachment, and **VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations** is **VK_TRUE** then the values specified in **sampleLocationsInfo** are ignored.

Valid Usage

- VUID-VkSubpassSampleLocationsEXT-subpassIndex-01532
subpassIndex **must** be less than the **subpassCount** specified in **VkRenderPassCreateInfo** the render pass specified by **VkRenderPassBeginInfo::renderPass** was created with

Valid Usage (Implicit)

- VUID-VkSubpassSampleLocationsEXT-sampleLocationsInfo-parameter
sampleLocationsInfo **must** be a valid **VkSampleLocationsInfoEXT** structure

To begin a render pass instance with **render pass transform** enabled, add the **VkRenderPassTransformBeginInfoQCOM** to the **pNext** chain of **VkRenderPassBeginInfo** structure passed to the **vkCmdBeginRenderPass** command specifying the render pass transform.

The **VkRenderPassTransformBeginInfoQCOM** structure is defined as:

```
// Provided by VK_QCOM_render_pass_transform
typedef struct VkRenderPassTransformBeginInfoQCOM {
    VkStructureType    sType;
    void*              pNext;
    VkSurfaceTransformFlagBitsKHR transform;
} VkRenderPassTransformBeginInfoQCOM;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **transform** is a **VkSurfaceTransformFlagBitsKHR** value describing the transform to be applied to

rasterization.

Valid Usage

- VUID-VkRenderPassTransformBeginInfoQCOM-transform-02871
`transform` **must** be `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR`, `VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR`, or `VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR`
- VUID-VkRenderPassTransformBeginInfoQCOM-flags-02872
The `renderpass` **must** have been created with `VkRenderPassCreateInfo::flags` containing `VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM`

Valid Usage (Implicit)

- VUID-VkRenderPassTransformBeginInfoQCOM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_TRANSFORM_BEGIN_INFO_QCOM`

The `VkSubpassBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSubpassContents  contents;
} VkSubpassBeginInfo;
```

or the equivalent

```
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassBeginInfo VkSubpassBeginInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `contents` is a `VkSubpassContents` value specifying how the commands in the next subpass will be provided.

Valid Usage

- VUID-VkSubpassBeginInfo-contents-09382
If `contents` is `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR`, then at least one of the following features **must** be enabled:
 - `maintenance7`

- `nestedCommandBuffer`

Valid Usage (Implicit)

- VUID-VkSubpassBeginInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_BEGIN_INFO`
- VUID-VkSubpassBeginInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkSubpassBeginInfo-contents-parameter
`contents` **must** be a valid `VkSubpassContents` value

Possible values of `vkCmdBeginRenderPass::contents`, specifying how the commands in the first subpass will be provided, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSubpassContents {
    VK_SUBPASS_CONTENTS_INLINE = 0,
    VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS = 1,
    // Provided by VK_KHR_maintenance7
    VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR = 1000451000,
    // Provided by VK_EXT_nested_command_buffer
    VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT =
VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR,
} VkSubpassContents;
```

- `VK_SUBPASS_CONTENTS_INLINE` specifies that the contents of the subpass will be recorded inline in the primary command buffer, and secondary command buffers **must** not be executed within the subpass.
- `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS` specifies that the contents are recorded in secondary command buffers that will be called from the primary command buffer, and `vkCmdExecuteCommands` is the only valid command in the command buffer until `vkCmdNextSubpass` or `vkCmdEndRenderPass`.
- `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR` specifies that the contents of the subpass **can** be recorded both inline and in secondary command buffers executed from this command buffer with `vkCmdExecuteCommands`.

If the `pNext` chain of `VkRenderPassBeginInfo` or `VkRenderingInfo` includes a `VkDeviceGroupRenderPassBeginInfo` structure, then that structure includes a device mask and set of render areas for the render pass instance.

The `VkDeviceGroupRenderPassBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupRenderPassBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceMask;
    uint32_t           deviceRenderAreaCount;
    const VkRect2D*    pDeviceRenderAreas;
} VkDeviceGroupRenderPassBeginInfo;
```

or the equivalent

```
// Provided by VK_KHR_device_group
typedef VkDeviceGroupRenderPassBeginInfo VkDeviceGroupRenderPassBeginInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceMask` is the device mask for the render pass instance.
- `deviceRenderAreaCount` is the number of elements in the `pDeviceRenderAreas` array.
- `pDeviceRenderAreas` is a pointer to an array of `VkRect2D` structures defining the render area for each physical device.

The `deviceMask` serves several purposes. It is an upper bound on the set of physical devices that **can** be used during the render pass instance, and the initial device mask when the render pass instance begins. In addition, commands transitioning to the next subpass in a render pass instance and commands ending the render pass instance, and, accordingly render pass `load`, `store`, and `multisample resolve` operations and subpass dependencies corresponding to the render pass instance, are executed on the physical devices included in the device mask provided here.

If `deviceRenderAreaCount` is not zero, then the elements of `pDeviceRenderAreas` override the value of `VkRenderPassBeginInfo::renderArea`, and provide a render area specific to each physical device. These render areas serve the same purpose as `VkRenderPassBeginInfo::renderArea`, including controlling the region of attachments that are cleared by `VK_ATTACHMENT_LOAD_OP_CLEAR` and that are resolved into resolve attachments.

If this structure is not present, the render pass instance's device mask is the value of `VkDeviceGroupCommandBufferBeginInfo::deviceMask`. If this structure is not present or if `deviceRenderAreaCount` is zero, `VkRenderPassBeginInfo::renderArea` is used for all physical devices.

Valid Usage

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00905
`deviceMask` **must** be a valid device mask value
- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00906
`deviceMask` **must** not be zero

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00907
`deviceMask` **must** be a subset of the command buffer's initial device mask
- VUID-VkDeviceGroupRenderPassBeginInfo-deviceRenderAreaCount-00908
`deviceRenderAreaCount` **must** either be zero or equal to the number of physical devices in the logical device
- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06166
The `offset.x` member of any element of `pDeviceRenderAreas` **must** be greater than or equal to 0
- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06167
The `offset.y` member of any element of `pDeviceRenderAreas` **must** be greater than or equal to 0
- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06168
The sum of the `offset.x` and `extent.width` members of any element of `pDeviceRenderAreas` **must** be less than or equal to `maxFramebufferWidth`
- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06169
The sum of the `offset.y` and `extent.height` members of any element of `pDeviceRenderAreas` **must** be less than or equal to `maxFramebufferHeight`
- VUID-VkDeviceGroupRenderPassBeginInfo-extent-08998
The `extent.width` member of any element of `pDeviceRenderAreas` **must** be greater than 0
- VUID-VkDeviceGroupRenderPassBeginInfo-extent-08999
The `extent.height` member of any element of `pDeviceRenderAreas` **must** be greater than 0

Valid Usage (Implicit)

- VUID-VkDeviceGroupRenderPassBeginInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO`
- VUID-VkDeviceGroupRenderPassBeginInfo-pDeviceRenderAreas-parameter
If `deviceRenderAreaCount` is not 0, `pDeviceRenderAreas` **must** be a valid pointer to an array of `deviceRenderAreaCount` `VkRect2D` structures

The `VkRenderPassAttachmentBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassAttachmentBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           attachmentCount;
    const VkImageView* pAttachments;
} VkRenderPassAttachmentBeginInfo;
```

or the equivalent

```
// Provided by VK_KHR_imageless_framebuffer
typedef VkRenderPassAttachmentBeginInfo VkRenderPassAttachmentBeginInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentCount` is the number of attachments.
- `pAttachments` is a pointer to an array of `VkImageView` handles, each of which will be used as the corresponding attachment in the render pass instance.

Valid Usage

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03218
Each element of `pAttachments` **must** only specify a single mip level
- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03219
Each element of `pAttachments` **must** have been created with the `identity swizzle`
- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-04114
Each element of `pAttachments` **must** have been created with `VkImageViewCreateInfo::viewType` not equal to `VK_IMAGE_VIEW_TYPE_3D`
- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-07010
If `multisampled-render-to-single-sampled` is enabled for any subpass, all element of `pAttachments` which have a sample count equal to `VK_SAMPLE_COUNT_1_BIT` **must** have a format that supports the sample count specified in `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`

Valid Usage (Implicit)

- VUID-VkRenderPassAttachmentBeginInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_ATTACHMENT_BEGIN_INFO`
- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-parameter
If `attachmentCount` is not 0, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkImageView` handles

If a render pass instance enables multiview and if the `multiviewPerViewRenderAreas` feature is enabled, the `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` structure **can** be included in the `pNext` chain of `VkRenderPassBeginInfo` or `VkRenderingInfo`

The `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` structure is defined as:

```
// Provided by VK_QCOM_multiview_per_view_render_areas
typedef struct VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           perViewRenderAreaCount;
    const VkRect2D*    pPerViewRenderAreas;
} VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `perViewRenderAreaCount` is the number of elements in the `pPerViewRenderAreas` array.
- `pPerViewRenderAreas` is a pointer to an array of `VkRect2D` structures defining the render area for each view.

If `perViewRenderAreaCount` is not zero, then the elements of `pPerViewRenderAreas` override the value of `VkRenderPassBeginInfo::renderArea` or `VkRenderingInfo::renderArea` and define per-view render areas for the individual views of a multiview render pass. The render area for the view with view index `i` is specified by `pPerViewRenderAreas[i]`.

The per-view render areas define per-view regions of attachments that are loaded, stored, and resolved according to the `loadOp`, `storeOp`, and `resolveMode` values of the render pass instance. When per-view render areas are defined, the value of `VkRenderPassBeginInfo::renderArea` or `VkRenderingInfo::renderArea` **must** be a render area that includes the union of all per-view render areas, **may** be used by the implementation for optimizations, but does not affect loads, stores, or resolves.

If this structure is present and if `perViewRenderAreaCount` is not zero, then `perViewRenderAreaCount` **must** be at least one greater than the most significant bit set in any element of `VkRenderPassMultiviewCreateInfo::pViewMasks`. or `VkRenderingInfo::viewMask`

If this structure is not present or if `perViewRenderAreaCount` is zero, `VkRenderPassBeginInfo::renderArea` or `VkRenderingInfo::renderArea` is used for all views.

Valid Usage

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07861
The `offset.x` member of any element of `pPerViewRenderAreas` **must** be greater than or equal to 0
- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07862
The `offset.y` member of any element of `pPerViewRenderAreas` **must** be greater than or equal to 0
- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07863
The sum of the `offset.x` and `extent.width` members of any element of `pPerViewRenderAreas` **must** be less than or equal to `maxFramebufferWidth`
- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07864

The sum of the `offset.y` and `extent.height` members of any element of `pPerViewRenderAreas` **must** be less than or equal to `maxFramebufferHeight`

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-pNext-07865
If this structure is in the `pNext` chain of `VkRenderPassBeginInfo` and if the render pass object included an element in `VkRenderPassMultiviewCreateInfo::pViewMasks` that set bit `n`, then `perViewRenderAreaCount` **must** be at least equal to `n+1`
- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-pNext-07866
If this structure is in the `pNext` chain of `VkRenderingInfo` and if `VkRenderingInfo::viewMask` set bit `n`, then `perViewRenderAreaCount` **must** be at least equal to `n+1`

Valid Usage (Implicit)

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-sType-sType **must** be `VK_STRUCTURE_TYPE_MULTIVIEW_PER_VIEW_RENDER_AREAS_RENDER_PASS_BEGIN_INFO_QCOM`
- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-pPerViewRenderAreas-parameter
If `perViewRenderAreaCount` is not 0, `pPerViewRenderAreas` **must** be a valid pointer to an array of `perViewRenderAreaCount` `VkRect2D` structures

To query the render area granularity, call:

```
// Provided by VK_VERSION_1_0
void vkGetRenderAreaGranularity(
    VkDevice          device,
    VkRenderPass      renderPass,
    VkExtent2D*       pGranularity);
```

- `device` is the logical device that owns the render pass.
- `renderPass` is a handle to a render pass.
- `pGranularity` is a pointer to a `VkExtent2D` structure in which the granularity is returned.

The conditions leading to an optimal `renderArea` are:

- the `offset.x` member in `renderArea` is a multiple of the `width` member of the returned `VkExtent2D` (the horizontal granularity).
- the `offset.y` member in `renderArea` is a multiple of the `height` member of the returned `VkExtent2D` (the vertical granularity).
- either the `extent.width` member in `renderArea` is a multiple of the horizontal granularity or `offset.x+extent.width` is equal to the `width` of the `framebuffer` in the `VkRenderPassBeginInfo`.
- either the `extent.height` member in `renderArea` is a multiple of the vertical granularity or `offset.y+extent.height` is equal to the `height` of the `framebuffer` in the `VkRenderPassBeginInfo`.

Subpass dependencies are not affected by the render area, and apply to the entire image subresources attached to the framebuffer as specified in the description of [automatic layout transitions](#). Similarly, pipeline barriers are valid even if their effect extends outside the render area.

Valid Usage (Implicit)

- VUID-vkGetRenderAreaGranularity-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetRenderAreaGranularity-renderPass-parameter **renderPass** **must** be a valid [VkRenderPass](#) handle
- VUID-vkGetRenderAreaGranularity-pGranularity-parameter **pGranularity** **must** be a valid pointer to a [VkExtent2D](#) structure
- VUID-vkGetRenderAreaGranularity-renderPass-parent **renderPass** **must** have been created, allocated, or retrieved from **device**

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```
// Provided by VK_VERSION_1_0
void vkCmdNextSubpass(
    VkCommandBuffer          commandBuffer,
    VkSubpassContents        contents);
```

- **commandBuffer** is the command buffer in which to record the command.
- **contents** specifies how the commands in the next subpass will be provided, in the same fashion as the corresponding parameter of [vkCmdBeginRenderPass](#).

The subpass index for a render pass begins at zero when [vkCmdBeginRenderPass](#) is recorded, and increments each time [vkCmdNextSubpass](#) is recorded.

After transitioning to the next subpass, the application **can** record the commands for that subpass.

Valid Usage

- VUID-vkCmdNextSubpass-None-00909
The current subpass index **must** be less than the number of subpasses in the render pass minus one
- VUID-vkCmdNextSubpass-None-02349
This command **must** not be recorded when transform feedback is active

Valid Usage (Implicit)

- VUID-vkCmdNextSubpass-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdNextSubpass-contents-parameter
`contents` **must** be a valid `VkSubpassContents` value
- VUID-vkCmdNextSubpass-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdNextSubpass-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdNextSubpass-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdNextSubpass-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdNextSubpass-bufferlevel
`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Inside	Outside	Graphics	Action State Synchronization

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```
// Provided by VK_VERSION_1_2
void vkCmdNextSubpass2(
    VkCommandBuffer                commandBuffer,
    const VkSubpassBeginInfo*      pSubpassBeginInfo,
    const VkSubpassEndInfo*        pSubpassEndInfo);
```

or the equivalent command

```
// Provided by VK_KHR_create_renderpass2
void vkCmdNextSubpass2KHR(
    VkCommandBuffer                commandBuffer,
    const VkSubpassBeginInfo*      pSubpassBeginInfo,
    const VkSubpassEndInfo*        pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the previous subpass will be ended.

`vkCmdNextSubpass2` is semantically identical to `vkCmdNextSubpass`, except that it is extensible, and that `contents` is provided as part of an extensible structure instead of as a flat parameter.

Valid Usage

- VUID-vkCmdNextSubpass2-None-03102
The current subpass index **must** be less than the number of subpasses in the render pass minus one
- VUID-vkCmdNextSubpass2-None-02350
This command **must** not be recorded when transform feedback is active

Valid Usage (Implicit)

- VUID-vkCmdNextSubpass2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdNextSubpass2-pSubpassBeginInfo-parameter
`pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfo` structure
- VUID-vkCmdNextSubpass2-pSubpassEndInfo-parameter
`pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfo` structure
- VUID-vkCmdNextSubpass2-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdNextSubpass2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdNextSubpass2-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdNextSubpass2-encoding
This command **must** only be called outside of a video coding scope

- VUID-vkCmdNextSubpass2-bufferlevel
`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Inside	Outside	Graphics	Action State Synchronization

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```
// Provided by VK_VERSION_1_0
void vkCmdEndRenderPass(
    VkCommandBuffer                commandBuffer);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.

Ending a render pass instance performs any multisample resolve operations on the final subpass.

Valid Usage

- VUID-vkCmdEndRenderPass-None-00910
The current subpass index **must** be equal to the number of subpasses in the render pass minus one
- VUID-vkCmdEndRenderPass-None-02351
This command **must** not be recorded when transform feedback is active
- VUID-vkCmdEndRenderPass-None-06170
The current render pass instance **must** not have been begun with `vkCmdBeginRendering`
- VUID-vkCmdEndRenderPass-None-07004
If `vkCmdBeginQuery*` was called within a subpass of the render pass, the corresponding `vkCmdEndQuery*` **must** have been called subsequently within the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdEndRenderPass-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdEndRenderPass-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdEndRenderPass-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdEndRenderPass-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdEndRenderPass-bufferlevel
`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Inside	Outside	Graphics	Action State Synchronization

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```
// Provided by VK_VERSION_1_2
void vkCmdEndRenderPass2(
    VkCommandBuffer                commandBuffer,
    const VkSubpassEndInfo*        pSubpassEndInfo);
```

or the equivalent command

```
// Provided by VK_KHR_create_renderpass2
void vkCmdEndRenderPass2KHR(
    VkCommandBuffer                      commandBuffer,
    const VkSubpassEndInfo*             pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the last subpass will be ended.

`vkCmdEndRenderPass2` is semantically identical to `vkCmdEndRenderPass`, except that it is extensible.

Valid Usage

- VUID-vkCmdEndRenderPass2-None-03103
The current subpass index **must** be equal to the number of subpasses in the render pass minus one
- VUID-vkCmdEndRenderPass2-None-02352
This command **must** not be recorded when transform feedback is active
- VUID-vkCmdEndRenderPass2-None-06171
The current render pass instance **must** not have been begun with `vkCmdBeginRendering`
- VUID-vkCmdEndRenderPass2-None-07005
If `vkCmdBeginQuery*` was called within a subpass of the render pass, the corresponding `vkCmdEndQuery*` **must** have been called subsequently within the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdEndRenderPass2-pSubpassEndInfo-parameter
`pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfo` structure
- VUID-vkCmdEndRenderPass2-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdEndRenderPass2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdEndRenderPass2-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdEndRenderPass2-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdEndRenderPass2-bufferlevel
`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Inside	Outside	Graphics	Action State Synchronization

The `VkSubpassEndInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassEndInfo {
    VkStructureType    sType;
    const void*        pNext;
} VkSubpassEndInfo;
```

or the equivalent

```
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassEndInfo VkSubpassEndInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

Valid Usage (Implicit)

- VUID-VkSubpassEndInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_END_INFO`
- VUID-VkSubpassEndInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkSubpassFragmentDensityMapOffsetEndInfoQCOM`
- VUID-VkSubpassEndInfo-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique

If the `VkSubpassEndInfo::pNext` chain includes a `VkSubpassFragmentDensityMapOffsetEndInfoQCOM`

structure, then that structure includes an array of fragment density map offsets per layer for the render pass.

The `VkSubpassFragmentDensityMapOffsetEndInfoQCOM` structure is defined as:

```
// Provided by VK_QCOM_fragment_density_map_offset
typedef struct VkSubpassFragmentDensityMapOffsetEndInfoQCOM {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           fragmentDensityOffsetCount;
    const VkOffset2D*   pFragmentDensityOffsets;
} VkSubpassFragmentDensityMapOffsetEndInfoQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityOffsetCount` is the number of offsets being specified.
- `pFragmentDensityOffsets` is a pointer to an array of `VkOffset2D` structs, each of which describes the offset per layer.

The array elements are given per `layer` as defined by `Fetch Density Value`, where `index = layer`. Each (x,y) offset is in framebuffer pixels and shifts the fetch of the fragment density map by that amount. Offsets can be positive or negative.

Offset values specified for any subpass that is not the last subpass in the render pass are ignored. If the `VkSubpassEndInfo::pNext` chain for the last subpass of a render pass does not include `VkSubpassFragmentDensityMapOffsetEndInfoQCOM`, or if `fragmentDensityOffsetCount` is zero, then the offset (0,0) is used for `Fetch Density Value`.

Valid Usage

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityMapOffsets-06503
If the `fragmentDensityMapOffset` feature is not enabled or fragment density map is not enabled in the render pass, `fragmentDensityOffsetCount` **must** equal 0
- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityMapAttachment-06504
If `VkSubpassDescription::fragmentDensityMapAttachment` is not is not `VK_ATTACHMENT_UNUSED` and was not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM`, `fragmentDensityOffsetCount` **must** equal 0
- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pDepthStencilAttachment-06505
If `VkSubpassDescription::pDepthStencilAttachment` is not is not `VK_ATTACHMENT_UNUSED` and was not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM`, `fragmentDensityOffsetCount` **must** equal 0
- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pInputAttachments-06506

If any element of `VkSubpassDescription::pInputAttachments` is not `VK_ATTACHMENT_UNUSED` and was not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM`, `fragmentDensityOffsetCount` **must** equal 0

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pColorAttachments-06507

If any element of `VkSubpassDescription::pColorAttachments` is not `VK_ATTACHMENT_UNUSED` and was not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM`, `fragmentDensityOffsetCount` **must** equal 0

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pResolveAttachments-06508

If any element of `VkSubpassDescription::pResolveAttachments` is not `VK_ATTACHMENT_UNUSED` and was not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM`, `fragmentDensityOffsetCount` **must** equal 0

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pPreserveAttachments-06509

If any element of `VkSubpassDescription::pPreserveAttachments` is not `VK_ATTACHMENT_UNUSED` and was not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM`, `fragmentDensityOffsetCount` **must** equal 0

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityOffsetCount-06510

If `fragmentDensityOffsetCount` is not 0 and multiview is enabled for the render pass, `fragmentDensityOffsetCount` **must** equal the `layerCount` that was specified in creating the fragment density map attachment view

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityOffsetCount-06511

If `fragmentDensityOffsetCount` is not 0 and multiview is not enabled for the render pass, `fragmentDensityOffsetCount` **must** equal 1

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-x-06512

The `x` component of each element of `pFragmentDensityOffsets` **must** be an integer multiple of `fragmentDensityOffsetGranularity.width`

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-y-06513

The `y` component of each element of `pFragmentDensityOffsets` **must** be an integer multiple of `fragmentDensityOffsetGranularity.height`

Valid Usage (Implicit)

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_FRAGMENT_DENSITY_MAP_OFFSET_END_INFO_QCOM`

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pFragmentDensityOffsets-parameter

If `fragmentDensityOffsetCount` is not 0, `pFragmentDensityOffsets` **must** be a valid pointer to an array of `fragmentDensityOffsetCount` [VkOffset2D](#) structures

8.9. Render Pass Creation Feedback

A `VkRenderPassCreationControlEXT` structure can be included in the `pNext` chain of `VkRenderPassCreateInfo2` or `pNext` chain of `VkSubpassDescription2`. The `VkRenderPassCreationControlEXT` structure is defined as:

```
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassCreationControlEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           disallowMerging;
} VkRenderPassCreationControlEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `disallowMerging` is a boolean value indicating whether subpass merging will be disabled.

If a `VkRenderPassCreationControlEXT` structure is included in the `pNext` chain of `VkRenderPassCreateInfo2` and its value of `disallowMerging` is `VK_TRUE`, the implementation will disable subpass merging for the entire render pass. If a `VkRenderPassCreationControlEXT` structure is included in the `pNext` chain of `VkSubpassDescription2` and its value of `disallowMerging` is `VK_TRUE`, the implementation will disable merging the described subpass with previous subpasses in the render pass.

Valid Usage (Implicit)

- VUID-VkRenderPassCreationControlEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATION_CONTROL_EXT`

To obtain feedback about the creation of a render pass, include a `VkRenderPassCreationFeedbackCreateInfoEXT` structure in the `pNext` chain of `VkRenderPassCreateInfo2`. The `VkRenderPassCreationFeedbackCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassCreationFeedbackCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkRenderPassCreationFeedbackInfoEXT* pRenderPassFeedback;
} VkRenderPassCreationFeedbackCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pRenderPassFeedback` is a pointer to a `VkRenderPassCreationFeedbackInfoEXT` structure in which feedback is returned.

Valid Usage (Implicit)

- VUID-VkRenderPassCreationFeedbackCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATION_FEEDBACK_CREATE_INFO_EXT`
- VUID-VkRenderPassCreationFeedbackCreateInfoEXT-pRenderPassFeedback-parameter
`pRenderPassFeedback` **must** be a valid pointer to a `VkRenderPassCreationFeedbackInfoEXT` structure

The `VkRenderPassCreationFeedbackInfoEXT` structure is defined as:

```
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassCreationFeedbackInfoEXT {
    uint32_t    postMergeSubpassCount;
} VkRenderPassCreationFeedbackInfoEXT;
```

- `postMergeSubpassCount` is the subpass count after merge.

Feedback about the creation of a subpass **can** be obtained by including a `VkRenderPassSubpassFeedbackCreateInfoEXT` structure in the `pNext` chain of `VkSubpassDescription2`. `VkRenderPassSubpassFeedbackCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassSubpassFeedbackCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkRenderPassSubpassFeedbackInfoEXT* pSubpassFeedback;
} VkRenderPassSubpassFeedbackCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pSubpassFeedback` is a pointer to a `VkRenderPassSubpassFeedbackInfoEXT` structure in which feedback is returned.

Valid Usage (Implicit)

- VUID-VkRenderPassSubpassFeedbackCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_SUBPASS_FEEDBACK_CREATE_INFO_EXT`
- VUID-VkRenderPassSubpassFeedbackCreateInfoEXT-pSubpassFeedback-parameter
`pSubpassFeedback` **must** be a valid pointer to a `VkRenderPassSubpassFeedbackInfoEXT` structure

The `VkRenderPassSubpassFeedbackInfoEXT` structure is defined as:

```
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassSubpassFeedbackInfoEXT {
    VkSubpassMergeStatusEXT    subpassMergeStatus;
    char                        description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t                    postMergeIndex;
} VkRenderPassSubpassFeedbackInfoEXT;
```

- `subpassMergeStatus` is a `VkSubpassMergeStatusEXT` value specifying information about whether the subpass is merged with previous subpass and the reason why it is not merged.
- `description` is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which provides additional details.
- `postMergeIndex` is the subpass index after the subpass merging.

Possible values of `VkRenderPassSubpassFeedbackInfoEXT:subpassMergeStatus` are:

```
// Provided by VK_EXT_subpass_merge_feedback
typedef enum VkSubpassMergeStatusEXT {
    VK_SUBPASS_MERGE_STATUS_MERGED_EXT = 0,
    VK_SUBPASS_MERGE_STATUS_DISALLOWED_EXT = 1,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SIDE_EFFECTS_EXT = 2,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SAMPLES_MISMATCH_EXT = 3,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_VIEWS_MISMATCH_EXT = 4,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_ALIASING_EXT = 5,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPENDENCIES_EXT = 6,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INCOMPATIBLE_INPUT_ATTACHMENT_EXT = 7,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_TOO_MANY_ATTACHMENTS_EXT = 8,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INSUFFICIENT_STORAGE_EXT = 9,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPTH_STENCIL_COUNT_EXT = 10,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_RESOLVE_ATTACHMENT_REUSE_EXT = 11,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SINGLE_SUBPASS_EXT = 12,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_UNSPECIFIED_EXT = 13,
} VkSubpassMergeStatusEXT;
```

- `VK_SUBPASS_MERGE_STATUS_MERGED_EXT` specifies the subpass is merged with a previous subpass.
- `VK_SUBPASS_MERGE_STATUS_DISALLOWED_EXT` specifies the subpass is disallowed to merge with previous subpass. If the render pass does not allow subpass merging, then all subpass statuses are set to this value. If a subpass description does not allow subpass merging, then only that subpass's status is set to this value.
- `VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SIDE_EFFECTS_EXT` specifies the subpass is not merged because it contains side effects.
- `VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SAMPLES_MISMATCH_EXT` specifies the subpass is not merged because sample count is not compatible with previous subpass.
- `VK_SUBPASS_MERGE_STATUS_NOT_MERGED_VIEWS_MISMATCH_EXT` specifies the subpass is not merged because view masks do not match with previous subpass.
- `VK_SUBPASS_MERGE_STATUS_NOT_MERGED_ALIASING_EXT` specifies the subpass is not merged because of

attachments aliasing between them.

- `VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPENDENCIES_EXT` specifies the subpass is not merged because subpass dependencies do not allow merging.
- `VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INCOMPATIBLE_INPUT_ATTACHMENT_EXT` specifies the subpass is not merged because input attachment is not a color attachment from previous subpass or the formats are incompatible.
- `VK_SUBPASS_MERGE_STATUS_NOT_MERGED_TOO_MANY_ATTACHMENTS_EXT` specifies the subpass is not merged because of too many attachments.
- `VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INSUFFICIENT_STORAGE_EXT` specifies the subpass is not merged because of insufficient memory.
- `VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPTH_STENCIL_COUNT_EXT` specifies the subpass is not merged because of too many depth/stencil attachments.
- `VK_SUBPASS_MERGE_STATUS_NOT_MERGED_RESOLVE_ATTACHMENT_REUSE_EXT` specifies the subpass is not merged because a resolve attachment is reused as an input attachment in a subsequent subpass.
- `VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SINGLE_SUBPASS_EXT` specifies the subpass is not merged because the render pass has only one subpass.
- `VK_SUBPASS_MERGE_STATUS_NOT_MERGED_UNSPECIFIED_EXT` specifies other reasons why subpass is not merged. It is also the recommended default value that should be reported when a subpass is not merged and when no other value is appropriate.

8.10. Common Render Pass Data Races (Informative)

Due to the complexity of how rendering is performed, there are several ways an application can accidentally introduce a data race, usually by doing something that may seem benign but actually cannot be supported. This section indicates a number of the more common cases as guidelines to help avoid them.

8.10.1. Sampling From a Read-only Attachment

Vulkan includes read-only layouts for depth/stencil images, that allow the images to be both read during a render pass for the purposes of depth/stencil tests, and read as a non-attachment.

However, because `VK_ATTACHMENT_STORE_OP_STORE` and `VK_ATTACHMENT_STORE_OP_DONT_CARE` may perform write operations, even if no recorded command writes to an attachment, reading from an image while also using it as an attachment with these store operations can result in a data race. If the reads from the non-attachment are performed in a fragment shader where the accessed samples match those covered by the fragment shader, no data race will occur as store operations are guaranteed to operate after fragment shader execution for the set of samples the fragment covers. Notably, input attachments can also be used for this case. Reading other samples or in any other shader stage can result in unexpected behavior due to the potential for a data race, and validation errors should be generated for doing so. In practice, many applications have shipped reading samples outside of the covered fragment without any observable issue, but there is no guarantee that this will always work, and it is not advisable to rely on this in new or re-worked code bases. As `VK_ATTACHMENT_STORE_OP_NONE` is guaranteed to perform no writes, applications wishing to read an image as both an attachment and a non-attachment should make use of this

store operation, coupled with a load operation that also performs no writes.

8.10.2. Non-overlapping Access Between Resources

When relying on non-overlapping accesses between attachments and other resources, it is important to note that [load](#) and [store](#) operations have fairly wide alignment requirements - potentially affecting entire subresources and adjacent depth/stencil aspects. This makes it invalid to access a non-attachment subresource that is simultaneously being used as an attachment where either access performs a write operation.

The only exception to this is if a subresource is in the [VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT](#) image layout, in which case the overlap is defined to occur at a per-pixel granularity, and applications can read data from pixels outside the render area without introducing a data race.

8.10.3. Depth/Stencil and Input Attachments

When rendering to only the depth OR stencil aspect of an image, an input attachment accessing the other aspect will not cause a data race only under very specific conditions. To avoid a data race, the aspect not being written **must** be in a read-only layout, and writes to it **must** be disabled in the draw state. For example, to read from stencil while writing depth, the attachment **must** be in [VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL](#) (or equivalent), and the stencil write mask **must** be 0. Similarly to read from depth while writing stencil, the attachment **must** be in [VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL](#) (or equivalent), and depth write enable **must** be [VK_FALSE](#).

8.10.4. Synchronization Options

There are several synchronization options available to synchronize between accesses to resources within a render pass. Some of the options are outlined below:

- A [VkSubpassDependency](#) in a render pass object can synchronize attachment writes and [multisample resolve operations](#) from a prior subpass for subsequent input attachment reads.
- A [vkCmdPipelineBarrier](#) inside a subpass can synchronize prior attachment writes in the subpass with subsequent input attachment reads.
- A [vkCmdPipelineBarrier](#) inside a subpass can synchronize prior attachment writes in the subpass with subsequent non-attachment reads if the attachment is in the [VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT](#) image layout.
- If a subresource is used as a color and input attachment, and the pipeline performing the read was [VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT](#) created with [VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT](#)
- If a subresource is used as a depth and input attachment, and the pipeline performing the read was [VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT](#) created with [VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT](#)
- If a subresource is used as a stencil and input attachment, and the pipeline performing the read was [VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EX](#) created with [VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EX](#)

T

- If a subresource is used as two separate non-attachment resources, writes to a pixel or individual sample in a fragment shader can be synchronized with access to the same pixel or sample in another fragment shader by using one of the [fragment interlock](#) execution modes.

Chapter 9. Shaders

A shader specifies programmable operations that execute for each vertex, control point, tessellated vertex, primitive, fragment, or workgroup in the corresponding stage(s) of the graphics and compute pipelines.

Graphics pipelines include vertex shader execution as a result of [primitive assembly](#), followed, if enabled, by tessellation control and evaluation shaders operating on [patches](#), geometry shaders, if enabled, operating on primitives, and fragment shaders, if present, operating on fragments generated by [Rasterization](#). In this specification, vertex, tessellation control, tessellation evaluation and geometry shaders are collectively referred to as [pre-rasterization shader stages](#) and occur in the logical pipeline before rasterization. The fragment shader occurs logically after rasterization.

Only the compute shader stage is included in a compute pipeline. Compute shaders operate on compute invocations in a workgroup.

Shaders **can** read from input variables, and read from and write to output variables. Input and output variables **can** be used to transfer data between shader stages, or to allow the shader to interact with values that exist in the execution environment. Similarly, the execution environment provides constants describing capabilities.

Shader variables are associated with execution environment-provided inputs and outputs using *built-in* decorations in the shader. The available decorations for each stage are documented in the following subsections.

9.1. Shader Objects

Shaders **may** be compiled and linked into pipeline objects as described in [Pipelines](#) chapter, or if the `shaderObject` feature is enabled they **may** be compiled into individual per-stage *shader objects* which **can** be bound on a command buffer independently from one another. Unlike pipelines, shader objects are not intrinsically tied to any specific set of state. Instead, state is specified dynamically in the command buffer.

Each shader object represents a single compiled shader stage, which **may optionally** be linked with one or more other stages.

Shader objects are represented by `VkShaderEXT` handles:

```
// Provided by VK_EXT_shader_object
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderEXT)
```

9.1.1. Shader Object Creation

Shader objects **may** be created from shader code provided as SPIR-V, or in an opaque, implementation-defined binary format specific to the physical device.

To create one or more shader objects, call:

```
// Provided by VK_EXT_shader_object
VkResult vkCreateShadersEXT(
    VkDevice                                device,
    uint32_t                                createInfoCount,
    const VkShaderCreateInfoEXT*            pCreateInfos,
    const VkAllocationCallbacks*            pAllocator,
    VkShaderEXT*                             pShaders);
```

- **device** is the logical device that creates the shader objects.
- **createInfoCount** is the length of the **pCreateInfos** and **pShaders** arrays.
- **pCreateInfos** is a pointer to an array of **VkShaderCreateInfoEXT** structures.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pShaders** is a pointer to an array of **VkShaderEXT** handles in which the resulting shader objects are returned.

When this function returns, whether or not it succeeds, it is guaranteed that every element of **pShaders** will have been overwritten by either **VK_NULL_HANDLE** or a valid **VkShaderEXT** handle.

This means that whenever shader creation fails, the application **can** determine which shader the returned error pertains to by locating the first **VK_NULL_HANDLE** element in **pShaders**. It also means that an application **can** reliably clean up from a failed call by iterating over the **pShaders** array and destroying every element that is not **VK_NULL_HANDLE**.

Valid Usage

- VUID-vkCreateShadersEXT-device-09669
device **must** support at least one queue family with one of the **VK_QUEUE_COMPUTE_BIT** or **VK_QUEUE_GRAPHICS_BIT** capabilities
- VUID-vkCreateShadersEXT-stage-09670
If the **stage** member of any element of **pCreateInfos** is **VK_SHADER_STAGE_COMPUTE_BIT**, **device** **must** support at least one queue family with the **VK_QUEUE_COMPUTE_BIT** capability
- VUID-vkCreateShadersEXT-stage-09671
If the **stage** member of any element of **pCreateInfos** is **VK_SHADER_STAGE_TASK_BIT_EXT**, **VK_SHADER_STAGE_MESH_BIT_EXT**, **VK_SHADER_STAGE_VERTEX_BIT**, **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT**, **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT**, **VK_SHADER_STAGE_GEOMETRY_BIT**, or **VK_SHADER_STAGE_FRAGMENT_BIT**, **device** **must** support at least one queue family with the **VK_QUEUE_GRAPHICS_BIT** capability
- VUID-vkCreateShadersEXT-None-08400
The **shaderObject** feature **must** be enabled
- VUID-vkCreateShadersEXT-pCreateInfos-08402
If the **flags** member of any element of **pCreateInfos** includes **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT**, the **flags** member of all other elements of **pCreateInfos** whose **stage** is **VK_SHADER_STAGE_VERTEX_BIT**, **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT**, **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT**,

VK_SHADER_STAGE_GEOMETRY_BIT, or VK_SHADER_STAGE_FRAGMENT_BIT **must** also include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

- VUID-vkCreateShadersEXT-pCreateInfos-08403

If the **flags** member of any element of **pCreateInfos** includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, the **flags** member of all other elements of **pCreateInfos** whose **stage** is VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT **must** also include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

- VUID-vkCreateShadersEXT-pCreateInfos-08404

If the **flags** member of any element of **pCreateInfos** whose **stage** is VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, there **must** be no member of **pCreateInfos** whose **stage** is VK_SHADER_STAGE_VERTEX_BIT and whose **flags** member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

- VUID-vkCreateShadersEXT-pCreateInfos-08405

If there is any element of **pCreateInfos** whose **stage** is VK_SHADER_STAGE_MESH_BIT_EXT and whose **flags** member includes both VK_SHADER_CREATE_LINK_STAGE_BIT_EXT and VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT, there **must** be no element of **pCreateInfos** whose **stage** is VK_SHADER_STAGE_TASK_BIT_EXT and whose **flags** member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

- VUID-vkCreateShadersEXT-pCreateInfos-08409

For each element of **pCreateInfos** whose **flags** member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, if there is any other element of **pCreateInfos** whose **stage** is logically later than the **stage** of the former and whose **flags** member also includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, the **nextStage** of the former **must** be equal to the **stage** of the element with the logically earliest **stage** following the **stage** of the former whose **flags** member also includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

- VUID-vkCreateShadersEXT-pCreateInfos-08410

The **stage** member of each element of **pCreateInfos** whose **flags** member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT **must** be unique

- VUID-vkCreateShadersEXT-pCreateInfos-08411

The **codeType** member of all elements of **pCreateInfos** whose **flags** member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT **must** be the same

- VUID-vkCreateShadersEXT-pCreateInfos-08867

If **pCreateInfos** contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements' **flags** include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements' **codeType** is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT stage's **pCode** contains an **OpExecutionMode** instruction specifying the type of subdivision, it **must** match the subdivision type specified in the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage

- VUID-vkCreateShadersEXT-pCreateInfos-08868

If **pCreateInfos** contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements' **flags** include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements' **codeType** is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT stage's

`pCode` contains an `OpExecutionMode` instruction specifying the orientation of triangles, it **must** match the triangle orientation specified in the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage

- VUID-vkCreateShadersEXT-pCreateInfos-08869

If `pCreateInfos` contains elements with both `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` and `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, both elements' flags include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, both elements' `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage's `pCode` contains an `OpExecutionMode` instruction specifying `PointMode`, the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage **must** also contain an `OpExecutionMode` instruction specifying `PointMode`

- VUID-vkCreateShadersEXT-pCreateInfos-08870

If `pCreateInfos` contains elements with both `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` and `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, both elements' flags include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, both elements' `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage's `pCode` contains an `OpExecutionMode` instruction specifying the spacing of segments on the edges of tessellated primitives, it **must** match the segment spacing specified in the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage

- VUID-vkCreateShadersEXT-pCreateInfos-08871

If `pCreateInfos` contains elements with both `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` and `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, both elements' flags include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, both elements' `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage's `pCode` contains an `OpExecutionMode` instruction specifying the output patch size, it **must** match the output patch size specified in the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage

- VUID-vkCreateShadersEXT-pCreateInfos-09632

If `pCreateInfos` contains a `VK_SHADER_STAGE_MESH_BIT_EXT` with `codeType` of `VK_SHADER_CODE_TYPE_SPIRV_EXT` and `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` is not set, then the mesh shader's entry point **must** not declare a variable with a `DrawIndex BuiltIn` decoration

Valid Usage (Implicit)

- VUID-vkCreateShadersEXT-device-parameter

`device` **must** be a valid `VkDevice` handle

- VUID-vkCreateShadersEXT-pCreateInfos-parameter

`pCreateInfos` **must** be a valid pointer to an array of `createInfoCount` valid `VkShaderCreateInfoEXT` structures

- VUID-vkCreateShadersEXT-pAllocator-parameter

If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateShadersEXT-pShaders-parameter

`pShaders` **must** be a valid pointer to an array of `createInfoCount` `VkShaderEXT` handles

- `VUID-vkCreateShadersEXT-createInfoCount-arraylength`
`createInfoCount` **must** be greater than 0

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPATIBLE_SHADER_BINARY_EXT`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkShaderCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_shader_object
typedef struct VkShaderCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkShaderCreateFlagsEXT    flags;
    VkShaderStageFlagBits    stage;
    VkShaderStageFlags        nextStage;
    VkShaderCodeTypeEXT       codeType;
    size_t                   codeSize;
    const void*              pCode;
    const char*              pName;
    uint32_t                 setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t                 pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
    const VkSpecializationInfo* pSpecializationInfo;
} VkShaderCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkShaderCreateFlagBitsEXT` describing additional parameters of the shader.
- `stage` is a `VkShaderStageFlagBits` value specifying a single shader stage.
- `nextStage` is a bitmask of `VkShaderStageFlagBits` specifying zero or stages which **may** be used as a logically next bound stage when drawing with the shader bound.
- `codeType` is a `VkShaderCodeTypeEXT` value specifying the type of the shader code pointed to be

`pCode`.

- `codeSize` is the size in bytes of the shader code pointed to by `pCode`.
- `pCode` is a pointer to the shader code to use to create the shader.
- `pName` is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
- `setLayoutCount` is the number of descriptor set layouts pointed to by `pSetLayouts`.
- `pSetLayouts` is a pointer to an array of [VkDescriptorSetLayout](#) objects used by the shader stage.
- `pushConstantRangeCount` is the number of push constant ranges pointed to by `pPushConstantRanges`.
- `pPushConstantRanges` is a pointer to an array of [VkPushConstantRange](#) structures used by the shader stage.
- `pSpecializationInfo` is a pointer to a [VkSpecializationInfo](#) structure, as described in [Specialization Constants](#), or `NULL`.

Valid Usage

- VUID-VkShaderCreateInfoEXT-codeSize-08735
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `codeSize` **must** be a multiple of 4
- VUID-VkShaderCreateInfoEXT-pCode-08736
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** point to valid SPIR-V code, formatted and packed as described by the [Khronos SPIR-V Specification](#)
- VUID-VkShaderCreateInfoEXT-pCode-08737
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** adhere to the validation rules described by the [Validation Rules within a Module](#) section of the [SPIR-V Environment](#) appendix
- VUID-VkShaderCreateInfoEXT-pCode-08738
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** declare the `Shader` capability for SPIR-V code
- VUID-VkShaderCreateInfoEXT-pCode-08739
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** not declare any capability that is not supported by the API, as described by the [Capabilities](#) section of the [SPIR-V Environment](#) appendix
- VUID-VkShaderCreateInfoEXT-pCode-08740
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `pCode` declares any of the capabilities listed in the [SPIR-V Environment](#) appendix, one of the corresponding requirements **must** be satisfied
- VUID-VkShaderCreateInfoEXT-pCode-08741
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** not declare any SPIR-V extension that is not supported by the API, as described by the [Extension](#) section of the [SPIR-V Environment](#) appendix
- VUID-VkShaderCreateInfoEXT-pCode-08742
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `pCode` declares any of the SPIR-V

extensions listed in the [SPIR-V Environment](#) appendix, one of the corresponding requirements **must** be satisfied

- VUID-VkShaderCreateInfoEXT-flags-08412

If `stage` is not `VK_SHADER_STAGE_TASK_BIT_EXT`, `VK_SHADER_STAGE_MESH_BIT_EXT`, `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, or `VK_SHADER_STAGE_FRAGMENT_BIT`, `flags` **must** not include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-08486

If `stage` is not `VK_SHADER_STAGE_FRAGMENT_BIT`, `flags` **must** not include `VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-08487

If the `attachmentFragmentShadingRate` feature is not enabled, `flags` **must** not include `VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-08488

If `stage` is not `VK_SHADER_STAGE_FRAGMENT_BIT`, `flags` **must** not include `VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-08489

If the `fragmentDensityMap` feature is not enabled, `flags` **must** not include `VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-09404

If `flags` includes `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT`, the `subgroupSizeControl` feature **must** be enabled

- VUID-VkShaderCreateInfoEXT-flags-09405

If `flags` includes `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`, the `computeFullSubgroups` feature **must** be enabled

- VUID-VkShaderCreateInfoEXT-flags-11005

If `flags` includes `VK_SHADER_CREATE_INDIRECT_BINDABLE_BIT_EXT`, then the `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT::deviceGeneratedCommands` feature **must** be enabled

- VUID-VkShaderCreateInfoEXT-flags-11006

If `flags` includes `VK_SHADER_CREATE_INDIRECT_BINDABLE_BIT_EXT`, then the identified entry point **must** not specify `Xfb` execution mode

- VUID-VkShaderCreateInfoEXT-flags-08992

If `flags` includes `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`, `stage` **must** be one of `VK_SHADER_STAGE_MESH_BIT_EXT`, `VK_SHADER_STAGE_TASK_BIT_EXT`, or `VK_SHADER_STAGE_COMPUTE_BIT`

- VUID-VkShaderCreateInfoEXT-flags-08485

If `stage` is not `VK_SHADER_STAGE_COMPUTE_BIT`, `flags` **must** not include `VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-08414

If `stage` is not `VK_SHADER_STAGE_MESH_BIT_EXT`, `flags` **must** not include `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-08416
If `flags` includes both `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` and `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`, the local workgroup size in the X dimension of the shader **must** be a multiple of `maxSubgroupSize`
- VUID-VkShaderCreateInfoEXT-flags-08417
If `flags` includes `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` but not `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` and no `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure is included in the `pNext` chain, the local workgroup size in the X dimension of the shader **must** be a multiple of `subgroupSize`
- VUID-VkShaderCreateInfoEXT-stage-08418
`stage` **must** not be `VK_SHADER_STAGE_ALL_GRAPHICS` or `VK_SHADER_STAGE_ALL`
- VUID-VkShaderCreateInfoEXT-stage-08419
If the `tessellationShader` feature is not enabled, `stage` **must** not be `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`
- VUID-VkShaderCreateInfoEXT-stage-08420
If the `geometryShader` feature is not enabled, `stage` **must** not be `VK_SHADER_STAGE_GEOMETRY_BIT`
- VUID-VkShaderCreateInfoEXT-stage-08421
If the `taskShader` feature is not enabled, `stage` **must** not be `VK_SHADER_STAGE_TASK_BIT_EXT`
- VUID-VkShaderCreateInfoEXT-stage-08422
If the `meshShader` feature is not enabled, `stage` **must** not be `VK_SHADER_STAGE_MESH_BIT_EXT`
- VUID-VkShaderCreateInfoEXT-stage-08425
`stage` **must** not be `VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI`
- VUID-VkShaderCreateInfoEXT-stage-08426
`stage` **must** not be `VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI`
- VUID-VkShaderCreateInfoEXT-nextStage-08427
If `stage` is `VK_SHADER_STAGE_VERTEX_BIT`, `nextStage` **must** not include any bits other than `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, and `VK_SHADER_STAGE_FRAGMENT_BIT`
- VUID-VkShaderCreateInfoEXT-nextStage-08428
If the `tessellationShader` feature is not enabled, `nextStage` **must** not include `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`
- VUID-VkShaderCreateInfoEXT-nextStage-08429
If the `geometryShader` feature is not enabled, `nextStage` **must** not include `VK_SHADER_STAGE_GEOMETRY_BIT`
- VUID-VkShaderCreateInfoEXT-nextStage-08430
If `stage` is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `nextStage` **must** not include any bits other than `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`
- VUID-VkShaderCreateInfoEXT-nextStage-08431
If `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `nextStage` **must** not include any

bits other than `VK_SHADER_STAGE_GEOMETRY_BIT` and `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-VkShaderCreateInfoEXT-nextStage-08433

If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, `nextStage` **must** not include any bits other than `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-VkShaderCreateInfoEXT-nextStage-08434

If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT` or `VK_SHADER_STAGE_COMPUTE_BIT`, `nextStage` **must** be 0

- VUID-VkShaderCreateInfoEXT-nextStage-08435

If `stage` is `VK_SHADER_STAGE_TASK_BIT_EXT`, `nextStage` **must** not include any bits other than `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-nextStage-08436

If `stage` is `VK_SHADER_STAGE_MESH_BIT_EXT`, `nextStage` **must** not include any bits other than `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-VkShaderCreateInfoEXT-pName-08440

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pName` **must** be the name of an `OpEntryPoint` in `pCode` with an execution model that matches `stage`

- VUID-VkShaderCreateInfoEXT-pCode-08492

If `codeType` is `VK_SHADER_CODE_TYPE_BINARY_EXT`, `pCode` **must** be aligned to 16 bytes

- VUID-VkShaderCreateInfoEXT-pCode-08493

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** be aligned to 4 bytes

- VUID-VkShaderCreateInfoEXT-pCode-08448

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes any variable in its interface that is declared with the `ClipDistance BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxClipDistances`

- VUID-VkShaderCreateInfoEXT-pCode-08449

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes any variable in its interface that is declared with the `CullDistance BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxCullDistances`

- VUID-VkShaderCreateInfoEXT-pCode-08450

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes variables in its interface that are declared with the `ClipDistance BuiltIn` decoration and variables in its interface that are declared with the `CullDistance BuiltIn` decoration, those variables **must** not have array sizes which sum to more than `VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances`

- VUID-VkShaderCreateInfoEXT-pCode-08451

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes any variable in its interface that is declared with the `SampleMask BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxSampleMaskWords`

- VUID-VkShaderCreateInfoEXT-pCode-08452

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_VERTEX_BIT`, the

identified entry point **must** not include any input variable in its interface that is decorated with `CullDistance`

- VUID-VkShaderCreateInfoEXT-pCode-08453

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, and the identified entry point has an `OpExecutionMode` instruction specifying a patch size with `OutputVertices`, the patch size **must** be greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

- VUID-VkShaderCreateInfoEXT-pCode-08454

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction specifying a maximum output vertex count that is greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxGeometryOutputVertices`

- VUID-VkShaderCreateInfoEXT-pCode-08455

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction specifying an invocation count that is greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxGeometryShaderInvocations`

- VUID-VkShaderCreateInfoEXT-pCode-08456

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is a `pre-rasterization shader stage`, and the identified entry point writes to `Layer` for any primitive, it **must** write the same value to `Layer` for all vertices of a given primitive

- VUID-VkShaderCreateInfoEXT-pCode-08457

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is a `pre-rasterization shader stage`, and the identified entry point writes to `ViewportIndex` for any primitive, it **must** write the same value to `ViewportIndex` for all vertices of a given primitive

- VUID-VkShaderCreateInfoEXT-pCode-08458

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, the identified entry point **must** not include any output variables in its interface decorated with `CullDistance`

- VUID-VkShaderCreateInfoEXT-pCode-08459

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragDepth` in any execution path, all execution paths that are not exclusive to helper invocations **must** either discard the fragment, or write or initialize the value of `FragDepth`

- VUID-VkShaderCreateInfoEXT-pCode-08460

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, the shader code in `pCode` **must** be valid as described by the `Khronos SPIR-V Specification` after applying the specializations provided in `pSpecializationInfo`, if any, and then converting all specialization constants into fixed constants

- VUID-VkShaderCreateInfoEXT-codeType-08872

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` **must** contain an `OpExecutionMode`

instruction specifying the type of subdivision

- VUID-VkShaderCreateInfoEXT-codeType-08873

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` **must** contain an `OpExecutionMode` instruction specifying the orientation of triangles generated by the tessellator

- VUID-VkShaderCreateInfoEXT-codeType-08874

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` **must** contain an `OpExecutionMode` instruction specifying the spacing of segments on the edges of tessellated primitives

- VUID-VkShaderCreateInfoEXT-codeType-08875

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` **must** contain an `OpExecutionMode` instruction specifying the output patch size

- VUID-VkShaderCreateInfoEXT-pPushConstantRanges-10063

Any two elements of `pPushConstantRanges` **must** not include the same stage in `stageFlags`

- VUID-VkShaderCreateInfoEXT-codeType-10064

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and if a push constant block is declared in a shader, then an element of `pPushConstantRanges::stageFlags` **must** match `pname::stage`

- VUID-VkShaderCreateInfoEXT-codeType-10065

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and if a push constant block is declared in a shader, the block must be contained inside the element of `pPushConstantRanges` that matches the stage

Valid Usage (Implicit)

- VUID-VkShaderCreateInfoEXT-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT`

- VUID-VkShaderCreateInfoEXT-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` or `VkValidationFeaturesEXT`

- VUID-VkShaderCreateInfoEXT-sType-unique

The `sType` value of each struct in the `pNext` chain **must** be unique

- VUID-VkShaderCreateInfoEXT-flags-parameter

`flags` **must** be a valid combination of `VkShaderCreateFlagBitsEXT` values

- VUID-VkShaderCreateInfoEXT-stage-parameter

`stage` **must** be a valid `VkShaderStageFlagBits` value

- VUID-VkShaderCreateInfoEXT-nextStage-parameter

`nextStage` **must** be a valid combination of `VkShaderStageFlagBits` values

- VUID-VkShaderCreateInfoEXT-codeType-parameter

`codeType` **must** be a valid `VkShaderCodeTypeEXT` value

- VUID-VkShaderCreateInfoEXT-pCode-parameter

`pCode` **must** be a valid pointer to an array of `codeSize` bytes

- VUID-VkShaderCreateInfoEXT-pName-parameter
If `pName` is not `NULL`, `pName` **must** be a null-terminated UTF-8 string
- VUID-VkShaderCreateInfoEXT-pSetLayouts-parameter
If `setLayoutCount` is not `0`, and `pSetLayouts` is not `NULL`, `pSetLayouts` **must** be a valid pointer to an array of `setLayoutCount` valid `VkDescriptorSetLayout` handles
- VUID-VkShaderCreateInfoEXT-pPushConstantRanges-parameter
If `pushConstantRangeCount` is not `0`, and `pPushConstantRanges` is not `NULL`, `pPushConstantRanges` **must** be a valid pointer to an array of `pushConstantRangeCount` valid `VkPushConstantRange` structures
- VUID-VkShaderCreateInfoEXT-pSpecializationInfo-parameter
If `pSpecializationInfo` is not `NULL`, `pSpecializationInfo` **must** be a valid pointer to a valid `VkSpecializationInfo` structure
- VUID-VkShaderCreateInfoEXT-codeSize-arraylength
`codeSize` **must** be greater than `0`

```
// Provided by VK_EXT_shader_object
typedef VkFlags VkShaderCreateFlagsEXT;
```

`VkShaderCreateFlagsEXT` is a bitmask type for setting a mask of zero or more `VkShaderCreateFlagBitsEXT`.

Possible values of the `flags` member of `VkShaderCreateInfoEXT` specifying how a shader object is created, are:

```

// Provided by VK_EXT_shader_object
typedef enum VkShaderCreateFlagBitsEXT {
    VK_SHADER_CREATE_LINK_STAGE_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_shader_object with VK_EXT_subgroup_size_control or
    VK_VERSION_1_3
    VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT = 0x00000002,
    // Provided by VK_EXT_shader_object with VK_EXT_subgroup_size_control or
    VK_VERSION_1_3
    VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT = 0x00000004,
    // Provided by VK_EXT_shader_object with VK_EXT_mesh_shader or VK_NV_mesh_shader
    VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT = 0x00000008,
    // Provided by VK_EXT_shader_object with VK_KHR_device_group or VK_VERSION_1_1
    VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT = 0x00000010,
    // Provided by VK_KHR_fragment_shading_rate with VK_EXT_shader_object
    VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT = 0x00000020,
    // Provided by VK_EXT_fragment_density_map with VK_EXT_shader_object
    VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT = 0x00000040,
    // Provided by VK_EXT_device_generated_commands
    VK_SHADER_CREATE_INDIRECT_BINDABLE_BIT_EXT = 0x00000080,
} VkShaderCreateFlagBitsEXT;

```

- **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** specifies that a shader is linked to all other shaders created in the same [vkCreateShadersEXT](#) call whose [VkShaderCreateInfoEXT](#) structures' **flags** include **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT**.
- **VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT** specifies that the **SubgroupSize** **may** vary in a task, mesh, or compute shader.
- **VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT** specifies that the subgroup sizes **must** be launched with all invocations active in a task, mesh, or compute shader.
- **VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT** specifies that a mesh shader **must** only be used without a task shader. Otherwise, the mesh shader **must** only be used with a task shader.
- **VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT** specifies that a compute shader **can** be used with [vkCmdDispatchBase](#) with a non-zero base workgroup.
- **VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT** specifies that a fragment shader **can** be used with a fragment shading rate attachment.
- **VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT** specifies that a fragment shader **can** be used with a fragment density map attachment.
- **VK_SHADER_CREATE_INDIRECT_BINDABLE_BIT_EXT** specifies that the shader **can** be used in combination with [Device-Generated Commands](#).

NOTE

The behavior of **VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT** and **VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT** differs subtly from the behavior of **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** and **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT** in that the shader bit allows, but does not require the shader to be used with that type of

attachment. This means that the application need not create multiple shaders when it does not know in advance whether the shader will be used with or without the attachment type, or when it needs the same shader to be compatible with usage both with and without. This **may** come at some performance cost on some implementations, so applications **should** still only set bits that are actually necessary.

Shader objects **can** be created using different types of shader code. Possible values of `VkShaderCreateInfoEXT::codeType`, are:

```
// Provided by VK_EXT_shader_object
typedef enum VkShaderCodeTypeEXT {
    VK_SHADER_CODE_TYPE_BINARY_EXT = 0,
    VK_SHADER_CODE_TYPE_SPIRV_EXT = 1,
} VkShaderCodeTypeEXT;
```

- `VK_SHADER_CODE_TYPE_BINARY_EXT` specifies shader code in an opaque, implementation-defined binary format specific to the physical device.
- `VK_SHADER_CODE_TYPE_SPIRV_EXT` specifies shader code in SPIR-V format.

9.1.2. Binary Shader Code

Binary shader code **can** be retrieved from a shader object using the command:

```
// Provided by VK_EXT_shader_object
VkResult vkGetShaderBinaryDataEXT(
    VkDevice          device,
    VkShaderEXT       shader,
    size_t*           pDataSize,
    void*             pData);
```

- `device` is the logical device that shader object was created from.
- `shader` is the shader object to retrieve binary shader code from.
- `pDataSize` is a pointer to a `size_t` value related to the size of the binary shader code, as described below.
- `pData` is either `NULL` or a pointer to a buffer.

If `pData` is `NULL`, then the size of the binary shader code of the shader object, in bytes, is returned in `pDataSize`. Otherwise, `pDataSize` **must** point to a variable set by the application to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with the amount of data actually written to `pData`. If `pDataSize` is less than the size of the binary shader code, nothing is written to `pData`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`.

NOTE

The behavior of this command when `pDataSize` is too small differs from how some other getter-type commands work in Vulkan. Because shader binary data is only

usable in its entirety, it would never be useful for the implementation to return partial data. Because of this, nothing is written to `pData` unless `pDataSize` is large enough to fit the data in its entirety.

Binary shader code retrieved using `vkGetShaderBinaryDataEXT` can be passed to a subsequent call to `vkCreateShadersEXT` on a compatible physical device by specifying `VK_SHADER_CODE_TYPE_BINARY_EXT` in the `codeType` member of `VkShaderCreateInfoEXT`.

The shader code returned by repeated calls to this function with the same `VkShaderEXT` is guaranteed to be invariant for the lifetime of the `VkShaderEXT` object.

Valid Usage

- VUID-vkGetShaderBinaryDataEXT-None-08461
The `shaderObject` feature **must** be enabled
- VUID-vkGetShaderBinaryDataEXT-None-08499
If `pData` is not `NULL`, it **must** be aligned to 16 bytes

Valid Usage (Implicit)

- VUID-vkGetShaderBinaryDataEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetShaderBinaryDataEXT-shader-parameter
`shader` **must** be a valid `VkShaderEXT` handle
- VUID-vkGetShaderBinaryDataEXT-pDataSize-parameter
`pDataSize` **must** be a valid pointer to a `size_t` value
- VUID-vkGetShaderBinaryDataEXT-pData-parameter
If the value referenced by `pDataSize` is not 0, and `pData` is not `NULL`, `pData` **must** be a valid pointer to an array of `pDataSize` bytes
- VUID-vkGetShaderBinaryDataEXT-shader-parent
`shader` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

9.1.3. Binary Shader Compatibility

Binary shader compatibility means that binary shader code returned from a call to `vkGetShaderBinaryDataEXT` **can** be passed to a later call to `vkCreateShadersEXT`, potentially on a different logical and/or physical device, and that this will result in the successful creation of a shader object functionally equivalent to the shader object that the code was originally queried from.

Binary shader code queried from `vkGetShaderBinaryDataEXT` is not guaranteed to be compatible across all devices, but implementations are required to provide some compatibility guarantees. Applications **may** determine binary shader compatibility using either (or both) of two mechanisms.

Guaranteed compatibility of shader binaries is expressed through a combination of the `shaderBinaryUUID` and `shaderBinaryVersion` members of the `VkPhysicalDeviceShaderObjectPropertiesEXT` structure queried from a physical device. Binary shaders retrieved from a physical device with a certain `shaderBinaryUUID` are guaranteed to be compatible with all other physical devices reporting the same `shaderBinaryUUID` and the same or higher `shaderBinaryVersion`.

Whenever a new version of an implementation incorporates any changes that affect the output of `vkGetShaderBinaryDataEXT`, the implementation **should** either increment `shaderBinaryVersion` if binary shader code retrieved from older versions remains compatible with the new implementation, or else replace `shaderBinaryUUID` with a new value if backward compatibility has been broken. Binary shader code queried from a device with a matching `shaderBinaryUUID` and lower `shaderBinaryVersion` relative to the device on which `vkCreateShadersEXT` is being called **may** be suboptimal for the new device in ways that do not change shader functionality, but it is still guaranteed to be usable to successfully create the shader object(s).

NOTE

Implementations are encouraged to share `shaderBinaryUUID` between devices and driver versions to the maximum extent their hardware naturally allows, and are **strongly** discouraged from ever changing the `shaderBinaryUUID` for the same hardware except unless absolutely necessary.

In addition to the shader compatibility guarantees described above, it is valid for an application to call `vkCreateShadersEXT` with binary shader code created on a device with a different or unknown `shaderBinaryUUID` and/or higher `shaderBinaryVersion`. In this case, the implementation **may** use any unspecified means of its choosing to determine whether the provided binary shader code is usable. If it is, `vkCreateShadersEXT` **must** return `VK_SUCCESS`, and the created shader object is guaranteed to be valid. Otherwise, in the absence of some error, `vkCreateShadersEXT` **must** return `VK_INCOMPATIBLE_SHADER_BINARY_EXT` to indicate that the provided binary shader code is not compatible with the device.

9.1.4. Binding Shader Objects

Once shader objects have been created, they **can** be bound to the command buffer using the command:

```
// Provided by VK_EXT_shader_object
void vkCmdBindShadersEXT(
    VkCommandBuffer                commandBuffer,
    uint32_t                       stageCount,
    const VkShaderStageFlagBits*   pStages,
    const VkShaderEXT*             pShaders);
```

- `commandBuffer` is the command buffer that the shader object will be bound to.
- `stageCount` is the length of the `pStages` and `pShaders` arrays.
- `pStages` is a pointer to an array of `VkShaderStageFlagBits` values specifying one stage per array index that is affected by the corresponding value in the `pShaders` array.
- `pShaders` is a pointer to an array of `VkShaderEXT` handles and/or `VK_NULL_HANDLE` values describing the shader binding operations to be performed on each stage in `pStages`.

When binding linked shaders, an application **may** bind them in any combination of one or more calls to `vkCmdBindShadersEXT` (i.e., shaders that were created linked together do not need to be bound in the same `vkCmdBindShadersEXT` call).

Any shader object bound to a particular stage **may** be unbound by setting its value in `pShaders` to `VK_NULL_HANDLE`. If `pShaders` is `NULL`, `vkCmdBindShadersEXT` behaves as if `pShaders` was an array of `stageCount` `VK_NULL_HANDLE` values (i.e., any shaders bound to the stages specified in `pStages` are unbound).

Valid Usage

- VUID-vkCmdBindShadersEXT-None-08462
The `shaderObject` feature **must** be enabled
- VUID-vkCmdBindShadersEXT-pStages-08463
Every element of `pStages` **must** be unique
- VUID-vkCmdBindShadersEXT-pStages-08464
`pStages` **must** not contain `VK_SHADER_STAGE_ALL_GRAPHICS` or `VK_SHADER_STAGE_ALL`
- VUID-vkCmdBindShadersEXT-pStages-08465
`pStages` **must** not contain `VK_SHADER_STAGE_RAYGEN_BIT_KHR`,
`VK_SHADER_STAGE_ANY_HIT_BIT_KHR`, `VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR`,
`VK_SHADER_STAGE_MISS_BIT_KHR`, `VK_SHADER_STAGE_INTERSECTION_BIT_KHR`, or
`VK_SHADER_STAGE_CALLABLE_BIT_KHR`
- VUID-vkCmdBindShadersEXT-pStages-08467
`pStages` **must** not contain `VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI`
- VUID-vkCmdBindShadersEXT-pStages-08468
`pStages` **must** not contain `VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI`
- VUID-vkCmdBindShadersEXT-pShaders-08469
For each element of `pStages`, if `pShaders` is not `NULL`, and the element of the `pShaders` array with the same index is not `VK_NULL_HANDLE`, it **must** have been created with a `stage` equal to the corresponding element of `pStages`

- VUID-vkCmdBindShadersEXT-pShaders-08470
If `pStages` contains both `VK_SHADER_STAGE_TASK_BIT_EXT` and `VK_SHADER_STAGE_VERTEX_BIT`, and `pShaders` is not `NULL`, and the same index in `pShaders` as `VK_SHADER_STAGE_TASK_BIT_EXT` in `pStages` is not `VK_NULL_HANDLE`, the same index in `pShaders` as `VK_SHADER_STAGE_VERTEX_BIT` in `pStages` **must** be `VK_NULL_HANDLE`
- VUID-vkCmdBindShadersEXT-pShaders-08471
If `pStages` contains both `VK_SHADER_STAGE_MESH_BIT_EXT` and `VK_SHADER_STAGE_VERTEX_BIT`, and `pShaders` is not `NULL`, and the same index in `pShaders` as `VK_SHADER_STAGE_MESH_BIT_EXT` in `pStages` is not `VK_NULL_HANDLE`, the same index in `pShaders` as `VK_SHADER_STAGE_VERTEX_BIT` in `pStages` **must** be `VK_NULL_HANDLE`
- VUID-vkCmdBindShadersEXT-pShaders-08474
If the `tessellationShader` feature is not enabled, and `pStages` contains `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, and `pShaders` is not `NULL`, the same index or indices in `pShaders` **must** be `VK_NULL_HANDLE`
- VUID-vkCmdBindShadersEXT-pShaders-08475
If the `geometryShader` feature is not enabled, and `pStages` contains `VK_SHADER_STAGE_GEOMETRY_BIT`, and `pShaders` is not `NULL`, the same index in `pShaders` **must** be `VK_NULL_HANDLE`
- VUID-vkCmdBindShadersEXT-pShaders-08490
If the `taskShader` feature is not enabled, and `pStages` contains `VK_SHADER_STAGE_TASK_BIT_EXT`, and `pShaders` is not `NULL`, the same index in `pShaders` **must** be `VK_NULL_HANDLE`
- VUID-vkCmdBindShadersEXT-pShaders-08491
If the `meshShader` feature is not enabled, and `pStages` contains `VK_SHADER_STAGE_MESH_BIT_EXT`, and `pShaders` is not `NULL`, the same index in `pShaders` **must** be `VK_NULL_HANDLE`
- VUID-vkCmdBindShadersEXT-pShaders-08476
If `pStages` contains `VK_SHADER_STAGE_COMPUTE_BIT`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdBindShadersEXT-pShaders-08477
If `pStages` contains `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, or `VK_SHADER_STAGE_FRAGMENT_BIT`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdBindShadersEXT-pShaders-08478
If `pStages` contains `VK_SHADER_STAGE_MESH_BIT_EXT` or `VK_SHADER_STAGE_TASK_BIT_EXT`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

Valid Usage (Implicit)

- VUID-vkCmdBindShadersEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindShadersEXT-pStages-parameter
pStages **must** be a valid pointer to an array of **stageCount** valid **VkShaderStageFlagBits** values
- VUID-vkCmdBindShadersEXT-pShaders-parameter
If **pShaders** is not **NULL**, **pShaders** **must** be a valid pointer to an array of **stageCount** valid or **VK_NULL_HANDLE** **VkShaderEXT** handles
- VUID-vkCmdBindShadersEXT-commandBuffer-recording
commandBuffer **must** be in the **recording state**
- VUID-vkCmdBindShadersEXT-commandBuffer-cmdpool
The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics, or compute operations
- VUID-vkCmdBindShadersEXT-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdBindShadersEXT-stageCount-arraylength
stageCount **must** be greater than **0**
- VUID-vkCmdBindShadersEXT-commonparent
Both of **commandBuffer**, and the elements of **pShaders** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same **VkDevice**

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics Compute	State

9.1.5. Setting State

Whenever shader objects are used to issue drawing commands, the appropriate **dynamic state** setting commands **must** have been called to set the relevant state in the command buffer prior to drawing:

- **vkCmdSetViewportWithCount**
- **vkCmdSetScissorWithCount**
- **vkCmdSetRasterizerDiscardEnable**

If a shader is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetVertexInputEXT`
- `vkCmdSetPrimitiveTopology`
- `vkCmdSetPrimitiveRestartEnable`

If a shader is bound to the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetPatchControlPointsEXT`, if `primitiveTopology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`

If a shader is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetTessellationDomainOriginEXT`

If `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetRasterizationSamplesEXT`
- `vkCmdSetSampleMaskEXT`
- `vkCmdSetAlphaToCoverageEnableEXT`
- `vkCmdSetAlphaToOneEnableEXT`, if the `alphaToOne` feature is enabled on the device
- `vkCmdSetPolygonModeEXT`
- `vkCmdSetLineWidth`, if `polygonMode` is `VK_POLYGON_MODE_LINE`, or if a shader is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage and `primitiveTopology` is a line topology, or if a shader which outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage
- `vkCmdSetCullMode`
- `vkCmdSetFrontFace`
- `vkCmdSetDepthTestEnable`
- `vkCmdSetDepthWriteEnable`
- `vkCmdSetDepthCompareOp`, if `depthTestEnable` is `VK_TRUE`
- `vkCmdSetDepthBoundsTestEnable`, if the `depthBounds` feature is enabled on the device
- `vkCmdSetDepthBounds`, if `depthBoundsTestEnable` is `VK_TRUE`
- `vkCmdSetDepthBiasEnable`
- `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT`, if `depthBiasEnable` is `VK_TRUE`
- `vkCmdSetDepthClampEnableEXT`, if the `depthClamp` feature is enabled on the device
- `vkCmdSetStencilTestEnable`
- `vkCmdSetStencilOp`, if `stencilTestEnable` is `VK_TRUE`
- `vkCmdSetStencilCompareMask`, if `stencilTestEnable` is `VK_TRUE`

- `vkCmdSetStencilWriteMask`, if `stencilTestEnable` is `VK_TRUE`
- `vkCmdSetStencilReference`, if `stencilTestEnable` is `VK_TRUE`

If a shader is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetLogicOpEnableEXT`, if the `logicOp` feature is enabled on the device
- `vkCmdSetLogicOpEXT`, if `logicOpEnable` is `VK_TRUE`
- `vkCmdSetColorBlendEnableEXT` and `vkCmdSetColorWriteMaskEXT`, if color attachments are bound, with values set for every color attachment in the render pass instance active at draw time
- `vkCmdSetColorBlendEquationEXT` or `vkCmdSetColorBlendAdvancedEXT`, if color attachments are bound, for every attachment whose index in `pColorBlendEnables` is a pointer to a value of `VK_TRUE`
- `vkCmdSetBlendConstants`, if any index in `pColorBlendEnables` is `VK_TRUE`, and the same index in `pColorBlendEquations` is a `VkColorBlendEquationEXT` structure with any `VkBlendFactor` member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`

If the `pipelineFragmentShadingRate` feature is enabled on the device, and a shader is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetFragmentShadingRateKHR`

If the `geometryStreams` feature is enabled on the device, and a shader is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetRasterizationStreamEXT`

If the `VK_EXT_discard_rectangles` extension is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetDiscardRectangleEnableEXT`
- `vkCmdSetDiscardRectangleModeEXT`, if `discardRectangleEnable` is `VK_TRUE`
- `vkCmdSetDiscardRectangleEXT`, if `discardRectangleEnable` is `VK_TRUE`

If `VK_EXT_conservative_rasterization` extension is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetConservativeRasterizationModeEXT`
- `vkCmdSetExtraPrimitiveOverestimationSizeEXT`, if `conservativeRasterizationMode` is `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`

If the `depthClipEnable` feature is enabled on the device, the following command **must** have been

called in the command buffer prior to drawing:

- [vkCmdSetDepthClipEnableEXT](#)

If the [VK_EXT_sample_locations](#) extension is enabled on the device, and [rasterizerDiscardEnable](#) is [VK_FALSE](#), the following commands **must** have been called in the command buffer prior to drawing:

- [vkCmdSetSampleLocationsEnableEXT](#)
- [vkCmdSetSampleLocationsEXT](#), if [sampleLocationsEnable](#) is [VK_TRUE](#)

If the [VK_EXT_provoking_vertex](#) extension is enabled on the device, and [rasterizerDiscardEnable](#) is [VK_FALSE](#), and a shader is bound to the [VK_SHADER_STAGE_VERTEX_BIT](#) stage, the following command **must** have been called in the command buffer prior to drawing:

- [vkCmdSetProvokingVertexModeEXT](#)

If any of the [<features-stippledRectangularLines, stippledRectangularLines>>](#), [<features-stippledBresenhamLines, stippledBresenhamLines>>](#), or [<features-stippledSmoothLines, stippledSmoothLines>>](#) features are enabled on the device, and [rasterizerDiscardEnable](#) is [VK_FALSE](#), and if [polygonMode](#) is [VK_POLYGON_MODE_LINE](#) or a shader is bound to the [VK_SHADER_STAGE_VERTEX_BIT](#) stage and [primitiveTopology](#) is a line topology or a shader which outputs line primitives is bound to the [VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT](#) or [VK_SHADER_STAGE_GEOMETRY_BIT](#) stage, the following commands **must** have been called in the command buffer prior to drawing:

- [vkCmdSetLineRasterizationModeEXT](#)
- [vkCmdSetLineStippleEnableEXT](#)
- [vkCmdSetLineStippleKHR](#), if [stippledLineEnable](#) is [VK_TRUE](#)

If the [depthClipControl](#) feature is enabled on the device, the following command **must** have been called in the command buffer prior to drawing:

- [vkCmdSetDepthClipNegativeOneToOneEXT](#)

If the [colorWriteEnable](#) feature is enabled on the device, and a shader is bound to the [VK_SHADER_STAGE_FRAGMENT_BIT](#) stage, and [rasterizerDiscardEnable](#) is [VK_FALSE](#), the following command **must** have been called in the command buffer prior to drawing:

- [vkCmdSetColorWriteEnableEXT](#), with values set for every color attachment in the render pass instance active at draw time

If the [attachmentFeedbackLoopDynamicState](#) feature is enabled on the device, and a shader is bound to the [VK_SHADER_STAGE_FRAGMENT_BIT](#) stage, and [rasterizerDiscardEnable](#) is [VK_FALSE](#), the following command **must** have been called in the command buffer prior to drawing:

- [vkCmdSetAttachmentFeedbackLoopEnableEXT](#)

If the [VK_NV_clip_space_w_scaling](#) extension is enabled on the device, the following commands **must** have been called in the command buffer prior to drawing:

- [vkCmdSetViewportWScalingEnableNV](#)

- `vkCmdSetViewportWScalingNV`, if `viewportWScalingEnable` is `VK_TRUE`

If the `depthClamp` and `depthClampControl` feature are enabled on the device, and `depthClampEnable` is `VK_TRUE`, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetDepthClampRangeEXT`

If the `VK_NV_viewport_swizzle` extension is enabled on the device, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetViewportSwizzleNV`

If the `VK_NV_fragment_coverage_to_color` extension is enabled on the device, and a shader is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetCoverageToColorEnableNV`
- `vkCmdSetCoverageToColorLocationNV`, if `coverageToColorEnable` is `VK_TRUE`

If the `VK_NV_framebuffer_mixed_samples` extension is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetCoverageModulationModeNV`
- `vkCmdSetCoverageModulationTableEnableNV`, if `coverageModulationMode` is not `VK_COVERAGE_MODULATION_MODE_NONE_NV`
- `vkCmdSetCoverageModulationTableNV`, if `coverageModulationTableEnable` is `VK_TRUE`

If the `coverageReductionMode` feature is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetCoverageReductionModeNV`

If the `representativeFragmentTest` feature is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetRepresentativeFragmentTestEnableNV`

If the `shadingRateImage` feature is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetCoarseSampleOrderNV`
- `vkCmdSetShadingRateImageEnableNV`
- `vkCmdSetViewportShadingRatePaletteNV`, if `shadingRateImageEnable` is `VK_TRUE`

If the `exclusiveScissor` feature is enabled on the device, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetExclusiveScissorEnableNV`

- `vkCmdSetExclusiveScissorNV`, if any value in `pExclusiveScissorEnables` is `VK_TRUE`

State **can** be set either at any time before or after shader objects are bound, but all required state **must** be set prior to issuing drawing commands.

If the `commandBufferInheritance` feature is enabled, graphics and compute state is inherited from the previously executed command buffer in the queue. Any valid state inherited in this way does not need to be set again in the current command buffer.

9.1.6. Interaction With Pipelines

Calling `vkCmdBindShadersEXT` causes the pipeline bind points corresponding to each stage in `pStages` to be disturbed, meaning that any pipelines that had previously been bound to those pipeline bind points are no longer bound.

If `VK_PIPELINE_BIND_POINT_GRAPHICS` is disturbed (i.e., if `pStages` contains any graphics stage), any graphics pipeline state that the previously bound pipeline did not specify as `dynamic` becomes undefined, and **must** be set in the command buffer before issuing drawing commands using shader objects.

Calls to `vkCmdBindPipeline` likewise disturb the shader stage(s) corresponding to `pipelineBindPoint`, meaning that any shaders that had previously been bound to any of those stages are no longer bound, even if the pipeline was created without shaders for some of those stages.

9.1.7. Shader Object Destruction

To destroy a shader object, call:

```
// Provided by VK_EXT_shader_object
void vkDestroyShaderEXT(
    VkDevice          device,
    VkShaderEXT       shader,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the shader object.
- `shader` is the handle of the shader object to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Destroying a shader object used by one or more command buffers in the `recording or executable state` causes those command buffers to move into the *invalid state*.

Valid Usage

- VUID-vkDestroyShaderEXT-None-08481
The `shaderObject` feature **must** be enabled
- VUID-vkDestroyShaderEXT-shader-08482
All submitted commands that refer to `shader` **must** have completed execution

- VUID-vkDestroyShaderEXT-pAllocator-08483
If `VkAllocationCallbacks` were provided when `shader` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyShaderEXT-pAllocator-08484
If no `VkAllocationCallbacks` were provided when `shader` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyShaderEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyShaderEXT-shader-parameter
If `shader` is not `VK_NULL_HANDLE`, `shader` **must** be a valid `VkShaderEXT` handle
- VUID-vkDestroyShaderEXT-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyShaderEXT-shader-parent
If `shader` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `shader` **must** be externally synchronized

9.2. Shader Modules

Shader modules contain *shader code* and one or more entry points. Shaders are selected from a shader module by specifying an entry point as part of `pipeline` creation. The stages of a pipeline **can** use shaders that come from different modules. The shader code defining a shader module **must** be in the SPIR-V format, as described by the [Vulkan Environment for SPIR-V](#) appendix.

Shader modules are represented by `VkShaderModule` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderModule)
```

To create a shader module, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateShaderModule(
    VkDevice                                device,
    const VkShaderModuleCreateInfo*         pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkShaderModule*                         pShaderModule);
```

- **device** is the logical device that creates the shader module.
- **pCreateInfo** is a pointer to a [VkShaderModuleCreateInfo](#) structure.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pShaderModule** is a pointer to a [VkShaderModule](#) handle in which the resulting shader module object is returned.

Once a shader module has been created, any entry points it contains **can** be used in pipeline shader stages as described in [Compute Pipelines](#) and [Graphics Pipelines](#).

NOTE

If the **maintenance5** feature is enabled, shader module creation can be omitted entirely. Instead, applications should provide the [VkShaderModuleCreateInfo](#) structure directly in to pipeline creation by chaining it to [VkPipelineShaderStageCreateInfo](#). This avoids the overhead of creating and managing an additional object.

Valid Usage

- VUID-vkCreateShaderModule-pCreateInfo-06904
If **pCreateInfo** is not **NULL**, **pCreateInfo->pNext** **must** be **NULL** or a pointer to a valid instance of
 - [VkShaderModuleValidationCacheCreateInfoEXT](#)
 - [VkValidationFeaturesEXT](#)

Valid Usage (Implicit)

- VUID-vkCreateShaderModule-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateShaderModule-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkShaderModuleCreateInfo](#) structure
- VUID-vkCreateShaderModule-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateShaderModule-pShaderModule-parameter
pShaderModule **must** be a valid pointer to a [VkShaderModule](#) handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_SHADER_NV`

The `VkShaderModuleCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkShaderModuleCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkShaderModuleCreateFlags flags;
    size_t               codeSize;
    const uint32_t*       pCode;
} VkShaderModuleCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `codeSize` is the size, in bytes, of the code pointed to by `pCode`.
- `pCode` is a pointer to code that is used to create the shader module. The type and format of the code is determined from the content of the memory addressed by `pCode`.

Valid Usage

- VUID-VkShaderModuleCreateInfo-codeSize-08735
If `pCode` is a pointer to SPIR-V code, `codeSize` **must** be a multiple of 4
- VUID-VkShaderModuleCreateInfo-pCode-08736
If `pCode` is a pointer to SPIR-V code, `pCode` **must** point to valid SPIR-V code, formatted and packed as described by the [Khronos SPIR-V Specification](#)
- VUID-VkShaderModuleCreateInfo-pCode-08737
If `pCode` is a pointer to SPIR-V code, `pCode` **must** adhere to the validation rules described by the [Validation Rules within a Module](#) section of the [SPIR-V Environment](#) appendix
- VUID-VkShaderModuleCreateInfo-pCode-08738
If `pCode` is a pointer to SPIR-V code, `pCode` **must** declare the `Shader` capability for SPIR-V code
- VUID-VkShaderModuleCreateInfo-pCode-08739

If pCode is a pointer to SPIR-V code, pCode **must** not declare any capability that is not supported by the API, as described by the [Capabilities](#) section of the [SPIR-V Environment](#) appendix

- VUID-VkShaderModuleCreateInfo-pCode-08740

If pCode is a pointer to SPIR-V code, and pCode declares any of the capabilities listed in the [SPIR-V Environment](#) appendix, one of the corresponding requirements **must** be satisfied

- VUID-VkShaderModuleCreateInfo-pCode-08741

If pCode is a pointer to SPIR-V code, pCode **must** not declare any SPIR-V extension that is not supported by the API, as described by the [Extension](#) section of the [SPIR-V Environment](#) appendix

- VUID-VkShaderModuleCreateInfo-pCode-08742

If pCode is a pointer to SPIR-V code, and pCode declares any of the SPIR-V extensions listed in the [SPIR-V Environment](#) appendix, one of the corresponding requirements **must** be satisfied

- VUID-VkShaderModuleCreateInfo-pCode-07912

If the [VK_NV_glsl_shader](#) extension is not enabled, pCode **must** be a pointer to SPIR-V code

- VUID-VkShaderModuleCreateInfo-pCode-01379

If pCode is a pointer to GLSL code, it **must** be valid GLSL code written to the [GL_KHR_vulkan_glsl](#) GLSL extension specification

- VUID-VkShaderModuleCreateInfo-codeSize-01085

codeSize **must** be greater than 0

Valid Usage (Implicit)

- VUID-VkShaderModuleCreateInfo-sType-sType

sType **must** be [VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO](#)

- VUID-VkShaderModuleCreateInfo-flags-zeroBitmask

flags **must** be 0

- VUID-VkShaderModuleCreateInfo-pCode-parameter

pCode **must** be a valid pointer to an array of $\frac{\text{codeSize}}{4}$ [uint32_t](#) values

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderModuleCreateFlags;
```

[VkShaderModuleCreateFlags](#) is a bitmask type for setting a mask, but is currently reserved for future use.

To use a [VkValidationCacheEXT](#) to cache shader validation results, add a [VkShaderModuleValidationCacheCreateInfoEXT](#) structure to the pNext chain of the [VkShaderModuleCreateInfo](#) structure, specifying the cache object to use.

The [VkShaderModuleValidationCacheCreateInfoEXT](#) struct is defined as:

```
// Provided by VK_EXT_validation_cache
typedef struct VkShaderModuleValidationCacheCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkValidationCacheEXT validationCache;
} VkShaderModuleValidationCacheCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `validationCache` is the validation cache object from which the results of prior validation attempts will be written, and to which new validation results for this `VkShaderModule` will be written (if not already present).

Valid Usage (Implicit)

- VUID-VkShaderModuleValidationCacheCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SHADER_MODULE_VALIDATION_CACHE_CREATE_INFO_EXT`
- VUID-VkShaderModuleValidationCacheCreateInfoEXT-validationCache-parameter
`validationCache` **must** be a valid `VkValidationCacheEXT` handle

To destroy a shader module, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyShaderModule(
    VkDevice          device,
    VkShaderModule    shaderModule,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the shader module.
- `shaderModule` is the handle of the shader module to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

A shader module **can** be destroyed while pipelines created using its shaders are still in use.

Valid Usage

- VUID-vkDestroyShaderModule-shaderModule-01092
If `VkAllocationCallbacks` were provided when `shaderModule` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyShaderModule-shaderModule-01093
If no `VkAllocationCallbacks` were provided when `shaderModule` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyShaderModule-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyShaderModule-shaderModule-parameter
If `shaderModule` is not `VK_NULL_HANDLE`, `shaderModule` **must** be a valid `VkShaderModule` handle
- VUID-vkDestroyShaderModule-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyShaderModule-shaderModule-parent
If `shaderModule` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `shaderModule` **must** be externally synchronized

9.3. Shader Module Identifiers

Shader modules have unique identifiers associated with them. To query an implementation provided identifier, call:

```
// Provided by VK_EXT_shader_module_identifier
void vkGetShaderModuleIdentifierEXT(
    VkDevice                device,
    VkShaderModule          shaderModule,
    VkShaderModuleIdentifierEXT* pIdentifier);
```

- `device` is the logical device that created the shader module.
- `shaderModule` is the handle of the shader module.
- `pIdentifier` is a pointer to the returned `VkShaderModuleIdentifierEXT`.

The identifier returned by the implementation **must** only depend on `shaderIdentifierAlgorithmUUID` and information provided in the `VkShaderModuleCreateInfo` which created `shaderModule`. The implementation **may** return equal identifiers for two different `VkShaderModuleCreateInfo` structures if the difference does not affect pipeline compilation. Identifiers are only meaningful on different `VkDevice` objects if the device the identifier was queried from had the same `shaderModuleIdentifierAlgorithmUUID` as the device consuming the identifier.

Valid Usage

- VUID-vkGetShaderModuleIdentifierEXT-shaderModuleIdentifier-06884
`shaderModuleIdentifier` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetShaderModuleIdentifierEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetShaderModuleIdentifierEXT-shaderModule-parameter
`shaderModule` **must** be a valid `VkShaderModule` handle
- VUID-vkGetShaderModuleIdentifierEXT-pIdentifier-parameter
`pIdentifier` **must** be a valid pointer to a `VkShaderModuleIdentifierEXT` structure
- VUID-vkGetShaderModuleIdentifierEXT-shaderModule-parent
`shaderModule` **must** have been created, allocated, or retrieved from `device`

`VkShaderModuleCreateInfo` structures have unique identifiers associated with them. To query an implementation provided identifier, call:

```
// Provided by VK_EXT_shader_module_identifier
void vkGetShaderModuleCreateInfoIdentifierEXT(
    VkDevice device,
    const VkShaderModuleCreateInfo* pCreateInfo,
    VkShaderModuleIdentifierEXT* pIdentifier);
```

- `device` is the logical device that **can** create a `VkShaderModule` from `pCreateInfo`.
- `pCreateInfo` is a pointer to a `VkShaderModuleCreateInfo` structure.
- `pIdentifier` is a pointer to the returned `VkShaderModuleIdentifierEXT`.

The identifier returned by implementation **must** only depend on `shaderIdentifierAlgorithmUUID` and information provided in the `VkShaderModuleCreateInfo`. The implementation **may** return equal identifiers for two different `VkShaderModuleCreateInfo` structures if the difference does not affect pipeline compilation. Identifiers are only meaningful on different `VkDevice` objects if the device the identifier was queried from had the same `shaderModuleIdentifierAlgorithmUUID` as the device consuming the identifier.

The identifier returned by the implementation in `vkGetShaderModuleCreateInfoIdentifierEXT` **must** be equal to the identifier returned by `vkGetShaderModuleIdentifierEXT` given equivalent definitions of `VkShaderModuleCreateInfo` and any chained `pNext` structures.

Valid Usage

- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-shaderModuleIdentifier-06885

`shaderModuleIdentifier` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-device-parameter `device` **must** be a valid `VkDevice` handle
- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-pCreateInfo-parameter `pCreateInfo` **must** be a valid pointer to a valid `VkShaderModuleCreateInfo` structure
- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-pIdentifier-parameter `pIdentifier` **must** be a valid pointer to a `VkShaderModuleIdentifierEXT` structure

`VkShaderModuleIdentifierEXT` represents a shader module identifier returned by the implementation.

```
// Provided by VK_EXT_shader_module_identifier
typedef struct VkShaderModuleIdentifierEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           identifierSize;
    uint8_t            identifier[VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT];
} VkShaderModuleIdentifierEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `identifierSize` is the size, in bytes, of valid data returned in `identifier`.
- `identifier` is a buffer of opaque data specifying an identifier.

Any returned values beyond the first `identifierSize` bytes are undefined. Implementations **must** return an `identifierSize` greater than 0, and less-or-equal to `VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT`.

Two identifiers are considered equal if `identifierSize` is equal and the first `identifierSize` bytes of `identifier` compare equal.

Implementations **may** return a different `identifierSize` for different modules. Implementations **should** ensure that `identifierSize` is large enough to uniquely define a shader module.

Valid Usage (Implicit)

- VUID-VkShaderModuleIdentifierEXT-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_SHADER_MODULE_IDENTIFIER_EXT`
- VUID-VkShaderModuleIdentifierEXT-pNext-pNext `pNext` **must** be `NULL`

`VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT` is the length in bytes of a shader module identifier, as returned in `VkShaderModuleIdentifierEXT::identifierSize`.

```
#define VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT 32U
```

9.4. Binding Shaders

Before a shader can be used it **must** be first bound to the command buffer.

Calling `vkCmdBindPipeline` binds all stages corresponding to the `VkPipelineBindPoint`. Calling `vkCmdBindShadersEXT` binds all stages in `pStages`

The following table describes the relationship between shader stages and pipeline bind points:

Shader stage	Pipeline bind point	behavior controlled
<ul style="list-style-type: none">• <code>VK_SHADER_STAGE_VERTEX_BIT</code>• <code>VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT</code>• <code>VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT</code>• <code>VK_SHADER_STAGE_GEOMETRY_BIT</code>• <code>VK_SHADER_STAGE_FRAGMENT_BIT</code>• <code>VK_SHADER_STAGE_TASK_BIT_EXT</code>• <code>VK_SHADER_STAGE_MESH_BIT_EXT</code>	<code>VK_PIPELINE_BIND_POINT_GRAPHICS</code>	all <code>drawing commands</code>
<ul style="list-style-type: none">• <code>VK_SHADER_STAGE_COMPUTE_BIT</code>	<code>VK_PIPELINE_BIND_POINT_COMPUTE</code>	all <code>dispatch commands</code>
<ul style="list-style-type: none">• <code>VK_SHADER_STAGE_ANY_HIT_BIT_KHR</code>• <code>VK_SHADER_STAGE_CALLABLE_BIT_KHR</code>• <code>VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR</code>• <code>VK_SHADER_STAGE_INTERSECTION_BIT_KHR</code>• <code>VK_SHADER_STAGE_MISS_BIT_KHR</code>• <code>VK_SHADER_STAGE_RAYGEN_BIT_KHR</code>	<code>VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR</code>	<code>vkCmdTraceRaysNV</code> <code>vkCmdTraceRaysKHR</code> and <code>vkCmdTraceRaysIndirectKHR</code>

9.5. Shader Execution

At each stage of the pipeline, multiple invocations of a shader **may** execute simultaneously. Further, invocations of a single shader produced as the result of different commands **may** execute simultaneously. The relative execution order of invocations of the same shader type is undefined. Shader invocations **may** complete in a different order than that in which the primitives they originated from were drawn or dispatched by the application. However, fragment shader outputs are written to attachments in [rasterization order](#).

The relative execution order of invocations of different shader types is largely undefined. However, when invoking a shader whose inputs are generated from a previous pipeline stage, the shader invocations from the previous stage are guaranteed to have executed far enough to generate input values for all required inputs.

9.5.1. Shader Termination

A shader invocation that is *terminated* has finished executing instructions.

Executing `OpReturn` in the entry point, or executing `OpTerminateInvocation` in any function will terminate an invocation. Implementations **may** also terminate a shader invocation when `OpKill` is executed in any function; otherwise it becomes a [helper invocation](#).

In addition to the above conditions, [helper invocations](#) **may** be terminated when all non-helper invocations in the same [derivative group](#) either terminate or become [helper invocations](#).

A shader stage for a given command completes execution when all invocations for that stage have terminated.

NOTE

`OpKill` will behave the same as either `OpTerminateInvocation` or `OpDemoteToHelperInvocation` depending on the implementation. It is recommended that shader authors use `OpTerminateInvocation` or `OpDemoteToHelperInvocation` instead of `OpKill` whenever possible to produce more predictable behavior.

9.6. Shader Memory Access Ordering

The order in which image or buffer memory is read or written by shaders is largely undefined. For some shader types (vertex, tessellation evaluation, and in some cases, fragment), even the number of shader invocations that **may** perform loads and stores is undefined.

In particular, the following rules apply:

- [Vertex](#) and [tessellation evaluation](#) shaders will be invoked at least once for each unique vertex, as defined in those sections.
- [Fragment](#) shaders will be invoked zero or more times, as defined in that section.
- The relative execution order of invocations of the same shader type is undefined. A store issued by a shader when working on primitive B might complete prior to a store for primitive A, even if primitive A is specified prior to primitive B. This applies even to fragment shaders; while fragment shader outputs are always written to the framebuffer in [rasterization order](#), stores executed by fragment shader invocations are not.
- The relative execution order of invocations of different shader types is largely undefined.

NOTE

The above limitations on shader invocation order make some forms of synchronization between shader invocations within a single set of primitives unimplementable. For example, having one invocation poll memory written by another invocation assumes that the other invocation has been launched and will complete its writes in finite time.

The [Memory Model](#) appendix defines the terminology and rules for how to correctly communicate between shader invocations, such as when a write is [Visible-To](#) a read, and what constitutes a [Data Race](#).

Applications **must** not cause a data race.

The SPIR-V **SubgroupMemory**, **CrossWorkgroupMemory**, and **AtomicCounterMemory** memory semantics are ignored. Sequentially consistent atomics and barriers are not supported and **SequentiallyConsistent** is treated as **AcquireRelease**. **SequentiallyConsistent** **should** not be used.

9.7. Shader Inputs and Outputs

Data is passed into and out of shaders using variables with input or output storage class, respectively. User-defined inputs and outputs are connected between stages by matching their [Location](#) decorations. Additionally, data **can** be provided by or communicated to special functions provided by the execution environment using [BuiltIn](#) decorations.

In many cases, the same [BuiltIn](#) decoration **can** be used in multiple shader stages with similar meaning. The specific behavior of variables decorated as [BuiltIn](#) is documented in the following sections.

9.8. Task Shaders

Task shaders operate in conjunction with the mesh shaders to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Its primary purpose is to create a variable amount of subsequent mesh shader invocations.

Task shaders are invoked via the execution of the [programmable mesh shading](#) pipeline.

The task shader has no fixed-function inputs other than variables identifying the specific workgroup and invocation. In the **TaskNV Execution Model** the number of mesh shader workgroups to create is specified via a **TaskCountNV** decorated output variable. In the **TaskEXT Execution Model** the number of mesh shader workgroups to create is specified via the **OpEmitMeshTasksEXT** instruction.

The task shader can write additional outputs to task memory, which can be read by all of the mesh shader workgroups it created.

9.8.1. Task Shader Execution

Task workloads are formed from groups of work items called workgroups and processed by the task shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Task shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that **can** be set by assigning a value to the **LocalSize** or **LocalSizeId** execution mode or via an object decorated by the **WorkgroupSize** decoration. An invocation within a local workgroup **can** share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup. If the subpass includes multiple views in its view mask, a Task shader using **TaskEXT Execution Model** **may** be invoked separately for each view.

9.9. Mesh Shaders

Mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Each workgroup emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

Mesh shaders are invoked via the execution of the **programmable mesh shading** pipeline.

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written to task memory by the task shader that spawned the mesh shader's workgroup. The mesh shader can operate without a task shader as well.

The invocations of the mesh shader workgroup write an output mesh, comprising a set of primitives with per-primitive attributes, a set of vertices with per-vertex attributes, and an array of indices identifying the mesh vertices that belong to each primitive. The primitives of this mesh are then processed by subsequent graphics pipeline stages, where the outputs of the mesh shader form an interface with the fragment shader.

9.9.1. Mesh Shader Execution

Mesh workloads are formed from groups of work items called workgroups and processed by the mesh shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Mesh shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that **can** be set by assigning a value to the **LocalSize** or **LocalSizeId** execution mode or via an object decorated by the **WorkgroupSize** decoration. An invocation within a local workgroup **can** share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

The *global workgroups* may be generated explicitly via the API, or implicitly through the task shader's work creation mechanism. If the subpass includes multiple views in its view mask, a Mesh shader using **MeshEXT Execution Model** **may** be invoked separately for each view.

9.10. Cluster Culling Shaders

Cluster Culling shaders are invoked via the execution of the [Programmable Cluster Culling Shading](#) pipeline.

The only inputs available to the cluster culling shader are variables identifying the specific workgroup and invocation.

Cluster Culling shaders operate in workgroups to perform cluster-based culling and produce zero or more cluster drawing command that will be processed by subsequent stages of the graphics pipeline.

The Cluster Drawing Command(CDC) is very similar to the MDI command, invocations in workgroup can emit zero or more CDC to draw zero or more visible cluster.

9.10.1. Cluster Culling Shader Execution

Cluster Culling workloads are formed from groups of work items called workgroups and processed by the cluster culling shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Cluster Culling shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that **can** be set by assigning a value to the **LocalSize** or **LocalSizeId** execution mode or via an object decorated by the **WorkgroupSize** decoration. An invocation within a local workgroup **can** share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.11. Vertex Shaders

Each vertex shader invocation operates on one vertex and its associated [vertex attribute](#) data, and outputs one vertex and associated data. Graphics pipelines using primitive shading **must** include a vertex shader, and the vertex shader stage is always the first shader stage in the graphics pipeline.

9.11.1. Vertex Shader Execution

A vertex shader **must** be executed at least once for each vertex specified by a drawing command. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view. During execution, the shader is presented with the index of the vertex and instance for which it has been invoked. Input variables declared in the vertex shader are filled by the implementation with the values of vertex attributes associated with the invocation being executed.

If the same vertex is specified multiple times in a drawing command (e.g. by including the same index value multiple times in an index buffer) the implementation **may** reuse the results of vertex shading if it can statically determine that the vertex shader invocations will produce identical results.

NOTE

It is implementation-dependent when and if results of vertex shading are reused, and thus how many times the vertex shader will be executed. This is true also if the vertex shader contains stores or atomic operations (see `vertexPipelineStoresAndAtomics`).

9.12. Tessellation Control Shaders

The tessellation control shader is used to read an input patch provided by the application and to produce an output patch. Each tessellation control shader invocation operates on an input patch (after all control points in the patch are processed by a vertex shader) and its associated data, and outputs a single control point of the output patch and its associated data, and **can** also output additional per-patch data. The input patch is sized according to the `patchControlPoints` member of `VkPipelineTessellationStateCreateInfo`, as part of input assembly.

The input patch can also be dynamically sized with `patchControlPoints` parameter of `vkCmdSetPatchControlPointsEXT`.

To [dynamically set](#) the number of control points per patch, call:

```
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
void vkCmdSetPatchControlPointsEXT(
    VkCommandBuffer          commandBuffer,
    uint32_t                 patchControlPoints);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `patchControlPoints` specifies the number of control points per patch.

This command sets the number of control points per patch for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineTessellationStateCreateInfo::patchControlPoints` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetPatchControlPointsEXT-None-09422

At least one of the following **must** be true:

- The `extendedDynamicState2PatchControlPoints` feature is enabled
- The `shaderObject` feature is enabled
- VUID-vkCmdSetPatchControlPointsEXT-patchControlPoints-04874
`patchControlPoints` **must** be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

Valid Usage (Implicit)

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetPatchControlPointsEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	Graphics	State

The size of the output patch is controlled by the `OpExecutionMode OutputVertices` specified in the tessellation control or tessellation evaluation shaders, which **must** be specified in at least one of the shaders. The size of the input and output patches **must** each be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`.

9.12.1. Tessellation Control Shader Execution

A tessellation control shader is invoked at least once for each *output* vertex in a patch. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

Inputs to the tessellation control shader are generated by the vertex shader. Each invocation of the tessellation control shader **can** read the attributes of any incoming vertices and their associated data. The invocations corresponding to a given patch execute logically in parallel, with undefined relative execution order. However, the `OpControlBarrier` instruction **can** be used to provide limited control of the execution order by synchronizing invocations within a patch, effectively dividing tessellation control shader execution into a set of phases. Tessellation control shaders will read

undefined values if one invocation reads a per-vertex or per-patch output written by another invocation at any point during the same phase, or if two invocations attempt to write different values to the same per-patch output in a single phase.

9.13. Tessellation Evaluation Shaders

The Tessellation Evaluation Shader operates on an input patch of control points and their associated data, and a single input barycentric coordinate indicating the invocation's relative position within the subdivided patch, and outputs a single vertex and its associated data.

9.13.1. Tessellation Evaluation Shader Execution

A tessellation evaluation shader is invoked at least once for each unique vertex generated by the tessellator. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

9.14. Geometry Shaders

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

9.14.1. Geometry Shader Execution

A geometry shader is invoked at least once for each primitive produced by the tessellation stages, or at least once for each primitive generated by [primitive assembly](#) when tessellation is not in use. A shader can request that the geometry shader runs multiple [instances](#). A geometry shader is invoked at least once for each instance. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

9.15. Fragment Shaders

Fragment shaders are invoked as a [fragment operation](#) in a graphics pipeline. Each fragment shader invocation operates on a single fragment and its associated data. With few exceptions, fragment shaders do not have access to any data associated with other fragments and are considered to execute in isolation of fragment shader invocations associated with other fragments.

9.16. Compute Shaders

Compute shaders are invoked via [vkCmdDispatch](#) and [vkCmdDispatchIndirect](#) commands. In general, they have access to similar resources as shader stages executing as part of a graphics pipeline.

Compute workloads are formed from groups of work items called workgroups and processed by the compute shader in the current compute pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Compute shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that **can** be set by

assigning a value to the `LocalSize` or `LocalSizeId` execution mode or via an object decorated by the `WorkgroupSize` decoration. An invocation within a local workgroup **can** share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.17. Ray Generation Shaders

A ray generation shader is similar to a compute shader. Its main purpose is to execute ray tracing queries using `pipeline trace ray` instructions (such as `OpTraceRayKHR`) and process the results.

9.17.1. Ray Generation Shader Execution

One ray generation shader is executed per ray tracing dispatch. Its location in the shader binding table (see [Shader Binding Table](#) for details) is passed directly into `vkCmdTraceRaysKHR` using the `pRaygenShaderBindingTable` parameter or `vkCmdTraceRaysNV` using the `raygenShaderBindingTableBuffer` and `raygenShaderBindingOffset` parameters.

9.18. Intersection Shaders

Intersection shaders enable the implementation of arbitrary, application defined geometric primitives. An intersection shader for a primitive is executed whenever its axis-aligned bounding box is hit by a ray.

Like other ray tracing shader domains, an intersection shader operates on a single ray at a time. It also operates on a single primitive at a time. It is therefore the purpose of an intersection shader to compute the ray-primitive intersections and report them. To report an intersection, the shader calls the `OpReportIntersectionKHR` instruction.

An intersection shader communicates with any-hit and closest shaders by generating attribute values that they **can** read. Intersection shaders **cannot** read or modify the ray payload.

9.18.1. Intersection Shader Execution

The order in which intersections are found along a ray, and therefore the order in which intersection shaders are executed, is unspecified.

The intersection shader of the closest AABB which intersects the ray is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

9.19. Any-Hit Shaders

The any-hit shader is executed after the intersection shader reports an intersection that lies within the current $[t_{\min}, t_{\max}]$ of the ray. The main use of any-hit shaders is to programmatically decide whether or not an intersection will be accepted. The intersection will be accepted unless the shader calls the `OpIgnoreIntersectionKHR` instruction. Any-hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and **can** read or modify the ray payload.

9.19.1. Any-Hit Shader Execution

The order in which intersections are found along a ray, and therefore the order in which any-hit shaders are executed, is unspecified.

The any-hit shader of the closest hit is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

9.20. Closest Hit Shaders

Closest hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and **can** read or modify the ray payload. They also have access to a number of system-generated values. Closest hit shaders **can** call [pipeline trace ray](#) instructions to recursively trace rays.

9.20.1. Closest Hit Shader Execution

Exactly one closest hit shader is executed when traversal is finished and an intersection has been found and accepted.

9.21. Miss Shaders

Miss shaders **can** access the ray payload and **can** trace new rays through the [pipeline trace ray](#) instructions, but **cannot** access attributes since they are not associated with an intersection.

9.21.1. Miss Shader Execution

A miss shader is executed instead of a closest hit shader if no intersection was found during traversal.

9.22. Callable Shaders

Callable shaders **can** access a callable payload that works similarly to ray payloads to do subroutine work.

9.22.1. Callable Shader Execution

A callable shader is executed by calling `OpExecuteCallableKHR` from an allowed shader stage.

9.23. Interpolation Decorations

Variables in the `Input` storage class in a fragment shader's interface are interpolated from the values specified by the primitive being rasterized.

NOTE

Interpolation decorations can be present on input and output variables in pre-rasterization shaders but have no effect on the interpolation performed.

An undecorated input variable will be interpolated with perspective-correct interpolation according to the primitive type being rasterized. **Lines** and **polygons** are interpolated in the same way as the primitive's clip coordinates. If the **NoPerspective** decoration is present, linear interpolation is instead used for **lines** and **polygons**. For points, as there is only a single vertex, input values are never interpolated and instead take the value written for the single vertex.

If the **Flat** decoration is present on an input variable, the value is not interpolated, and instead takes its value directly from the **provoking vertex**. Fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type **must** be decorated with **Flat**.

Interpolation of input variables is performed at an implementation-defined position within the fragment area being shaded. The position is further constrained as follows:

- If the **Centroid** decoration is used, the interpolation position used for the variable **must** also fall within the bounds of the primitive being rasterized.
- If the **Sample** decoration is used, the interpolation position used for the variable **must** be at the position of the sample being shaded by the current fragment shader invocation.
- If a sample count of 1 is used, the interpolation position **must** be at the center of the fragment area.

NOTE

As **Centroid** restricts the possible interpolation position to the covered area of the primitive, the position can be forced to vary between neighboring fragments when it otherwise would not. Derivatives calculated based on these differing locations can produce inconsistent results compared to undecorated inputs. It is recommended that input variables used in derivative calculations are not decorated with **Centroid**.

If the **PerVertexKHR** decoration is present on an input variable, the value is not interpolated, and instead values from all input vertices are available in an array. Each index of the array corresponds to one of the vertices of the primitive that produced the fragment.

If the **CustomInterpAMD** decoration is present on an input variable, the value **cannot** be accessed directly; instead the extended instruction **InterpolateAtVertexAMD** **must** be used to obtain values from the input vertices.

9.24. Static Use

A SPIR-V module declares a global object in memory using the **OpVariable** instruction, which results in a pointer **x** to that object. A specific entry point in a SPIR-V module is said to *statically use* that object if that entry point's call tree contains a function containing a instruction with **x** as an **id** operand. A shader entry point also *statically uses* any variables explicitly declared in its interface.

9.25. Scope

A *scope* describes a set of shader invocations, where each such set is a *scope instance*. Each invocation belongs to one or more scope instances, but belongs to no more than one scope instance for each scope.

The operations available between invocations in a given scope instance vary, with smaller scopes generally able to perform more operations, and with greater efficiency.

9.25.1. Cross Device

All invocations executed in a Vulkan instance fall into a single *cross device scope instance*.

Whilst the **CrossDevice** scope is defined in SPIR-V, it is disallowed in Vulkan. API [synchronization](#) commands **can** be used to communicate between devices.

9.25.2. Device

All invocations executed on a single device form a *device scope instance*.

If the **vulkanMemoryModel** and **vulkanMemoryModelDeviceScope** features are enabled, this scope is represented in SPIR-V by the **Device Scope**, which **can** be used as a **Memory Scope** for barrier and atomic operations.

If both the **shaderDeviceClock** and **vulkanMemoryModelDeviceScope** features are enabled, using the **Device Scope** with the **OpReadClockKHR** instruction will read from a clock that is consistent across invocations in the same device scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this **can** only be done with API synchronization primitives.

Invocations executing on different devices in a device group operate in separate device scope instances.

9.25.3. Queue Family

Invocations executed by queues in a given queue family form a *queue family scope instance*.

This scope is identified in SPIR-V as the **QueueFamily Scope** if the **vulkanMemoryModel** feature is enabled, or if not, the **Device Scope**, which **can** be used as a **Memory Scope** for barrier and atomic operations.

If the **shaderDeviceClock** feature is enabled, but the **vulkanMemoryModelDeviceScope** feature is not enabled, using the **Device Scope** with the **OpReadClockKHR** instruction will read from a clock that is consistent across invocations in the same queue family scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this **can** only be done with API synchronization primitives.

Each invocation in a queue family scope instance **must** be in the same [device scope instance](#).

9.25.4. Command

Any shader invocations executed as the result of a single command such as [vkCmdDispatch](#) or [vkCmdDraw](#) form a *command scope instance*. For indirect drawing commands with **drawCount** greater than one, invocations from separate draws are in separate command scope instances. For

ray tracing shaders, an invocation group is an implementation-dependent subset of the set of shader invocations of a given shader stage which are produced by a single trace rays command.

There is no specific **Scope** for communication across invocations in a command scope instance. As this has a clear boundary at the API level, coordination here **can** be performed in the API, rather than in SPIR-V.

Each invocation in a command scope instance **must** be in the same [queue-family scope instance](#).

For shaders without defined [workgroups](#), this set of invocations forms an *invocation group* as defined in the [SPIR-V specification](#).

9.25.5. Primitive

Any fragment shader invocations executed as the result of rasterization of a single primitive form a *primitive scope instance*.

There is no specific **Scope** for communication across invocations in a primitive scope instance.

Any generated [helper invocations](#) are included in this scope instance.

Each invocation in a primitive scope instance **must** be in the same [command scope instance](#).

Any input variables decorated with **Flat** are uniform within a primitive scope instance.

9.25.6. Shader Call

Any [shader-call-related](#) invocations that are executed in one or more ray tracing execution models form a *shader call scope instance*.

The **ShaderCallKHR Scope** can be used as **Memory Scope** for barrier and atomic operations.

Each invocation in a shader call scope instance **must** be in the same [queue family scope instance](#).

9.25.7. Workgroup

A *local workgroup* is a set of invocations that can synchronize and share data with each other using memory in the **Workgroup** storage class.

The **Workgroup Scope** can be used as both an **Execution Scope** and **Memory Scope** for barrier and atomic operations.

Each invocation in a local workgroup **must** be in the same [command scope instance](#).

Only task, mesh, and compute shaders have defined workgroups - other shader types **cannot** use workgroup functionality. For shaders that have defined workgroups, this set of invocations forms an *invocation group* as defined in the [SPIR-V specification](#).

When variables declared with the **Workgroup** storage class are explicitly laid out (hence they are also decorated with **Block**), the amount of storage consumed is the size of the largest Block variable, not counting any padding at the end. The amount of storage consumed by the non-Block variables

declared with the **Workgroup** storage class is implementation-dependent. However, the amount of storage consumed may not exceed the largest block size that would be obtained if all active non-Block variables declared with **Workgroup** storage class were assigned offsets in an arbitrary order by successively taking the smallest valid offset according to the [Standard Storage Buffer Layout](#) rules, and with **Boolean** values considered as 32-bit integer values for the purpose of this calculation. (This is equivalent to using the GLSL std430 layout rules.)

9.25.8. Subgroup

A *subgroup* (see the subsection “Control Flow” of section 2 of the SPIR-V 1.3 Revision 1 specification) is a set of invocations that can synchronize and share data with each other efficiently.

The **Subgroup Scope** can be used as both an **Execution Scope** and **Memory Scope** for barrier and atomic operations. Other [subgroup features](#) allow the use of [group operations](#) with subgroup scope.

If the **shaderSubgroupClock** feature is enabled, using the **Subgroup Scope** with the **OpReadClockKHR** instruction will read from a clock that is consistent across invocations in the same subgroup.

For [shaders that have defined workgroups](#), each invocation in a subgroup **must** be in the same [local workgroup](#).

In other shader stages, each invocation in a subgroup **must** be in the same [device scope instance](#).

Only [shader stages that support subgroup operations](#) have defined subgroups.

Subgroups are not guaranteed to be a subset of a single command in [shaders that do not have defined workgroups](#). Values that are guaranteed to be uniform for a given command or sub command may then not be uniform for the subgroup, and vice versa. As such, applications must take care when dealing with mixed uniformity.

A somewhat common example of this would something like trying to optimize access to per-draw data using subgroup operations:

NOTE

```
buffer { uint draw_data[]; };

flat in int vDrawID; // Passed through from vertex shader

void main()
{
    uint local_draw_data = subgroupBroadcastFirst(draw_data
[local_draw_data]);
}
```

This can be done in an attempt to optimize the shader to only perform the loads once per subgroup. However, if the implementation packs multiple draws into a single subgroup, invocations from draws with a different drawID are now receiving data from the wrong invocation. Applications should rely on implementations to do this kind of optimization automatically where the implementation can, rather than trying to force it.

9.25.9. Quad

A *quad scope instance* is formed of four shader invocations.

In a fragment shader, each invocation in a quad scope instance is formed of invocations in neighboring framebuffer locations (x_i, y_i) , where:

- i is the index of the invocation within the scope instance.
- w and h are the number of pixels the fragment covers in the x and y axes.
- w and h are identical for all participating invocations.
- $(x_0) = (x_1 - w) = (x_2) = (x_3 - w)$
- $(y_0) = (y_1) = (y_2 - h) = (y_3 - h)$
- Each invocation has the same layer and sample indices.

In a mesh, task, or compute shader, if the **DerivativeGroupQuadsKHR** execution mode is specified, each invocation in a quad scope instance is formed of invocations with adjacent local invocation IDs (x_i, y_i) , where:

- i is the index of the invocation within the quad scope instance.
- $(x_0) = (x_1 - 1) = (x_2) = (x_3 - 1)$
- $(y_0) = (y_1) = (y_2 - 1) = (y_3 - 1)$
- x_0 and y_0 are integer multiples of 2.
- Each invocation has the same z coordinate.

In a mesh, task, or compute shader, if the **DerivativeGroupLinearKHR** execution mode is specified, each invocation in a quad scope instance is formed of invocations with adjacent local invocation indices (l_i) , where:

- i is the index of the invocation within the quad scope instance.
- $(l_0) = (l_1 - 1) = (l_2 - 2) = (l_3 - 3)$
- l_0 is an integer multiple of 4.

In all shaders, each invocation in a quad scope instance is formed of invocations in adjacent subgroup invocation indices (s_i) , where:

- i is the index of the invocation within the quad scope instance.
- $(s_0) = (s_1 - 1) = (s_2 - 2) = (s_3 - 3)$
- s_0 is an integer multiple of 4.

Each invocation in a quad scope instance **must** be in the same **subgroup**.

In a fragment shader, each invocation in a quad scope instance **must** be in the same **primitive scope instance**.

Fragment , mesh, task, and compute shaders have defined quad scope instances. If the

`quadOperationsInAllStages` limit is supported, any `shader` stages that support subgroup operations also have defined quad scope instances.

9.25.10. Fragment Interlock

A *fragment interlock scope instance* is formed of fragment shader invocations based on their framebuffer locations (x,y,layer,sample), executed by commands inside a single `subpass`.

The specific set of invocations included varies based on the execution mode as follows:

- If the `SampleInterlockOrderedEXT` or `SampleInterlockUnorderedEXT` execution modes are used, only invocations with identical framebuffer locations (x,y,layer,sample) are included.
- If the `PixelInterlockOrderedEXT` or `PixelInterlockUnorderedEXT` execution modes are used, fragments with different sample ids are also included.
- If the `ShadingRateInterlockOrderedEXT` or `ShadingRateInterlockUnorderedEXT` execution modes are used, fragments from neighboring framebuffer locations are also included. The `shading rate image` or `fragment shading rate` determines these fragments.

Only fragment shaders with one of the above execution modes have defined fragment interlock scope instances.

There is no specific `Scope` value for communication across invocations in a fragment interlock scope instance. However, this is implicitly used as a memory scope by `OpBeginInvocationInterlockEXT` and `OpEndInvocationInterlockEXT`.

Each invocation in a fragment interlock scope instance **must** be in the same `queue family scope instance`.

9.25.11. Invocation

The smallest *scope* is a single invocation; this is represented by the `Invocation Scope` in SPIR-V.

Fragment shader invocations **must** be in a `primitive scope instance`.

Invocations in `fragment shaders that have a defined fragment interlock scope` **must** be in a `fragment interlock scope instance`.

Invocations in `shaders that have defined workgroups` **must** be in a `local workgroup`.

Invocations in `shaders that have a defined subgroup scope` **must** be in a `subgroup`.

Invocations in `shaders that have a defined quad scope` **must** be in a `quad scope instance`.

All invocations in all stages **must** be in a `command scope instance`.

9.26. Group Operations

Group operations are executed by multiple invocations within a `scope instance`; with each invocation involved in calculating the result. This provides a mechanism for efficient

communication between invocations in a particular scope instance.

Group operations all take a **Scope** defining the desired **scope instance** to operate within. Only the **Subgroup** scope **can** be used for these operations; the **subgroupSupportedOperations** limit defines which types of operation **can** be used.

9.26.1. Basic Group Operations

Basic group operations include the use of **OpGroupNonUniformElect**, **OpControlBarrier**, **OpMemoryBarrier**, and atomic operations.

OpGroupNonUniformElect **can** be used to choose a single invocation to perform a task for the whole group. Only the invocation with the lowest id in the group will return **true**.

The **Memory Model** appendix defines the operation of barriers and atomics.

9.26.2. Vote Group Operations

The vote group operations allow invocations within a group to compare values across a group. The types of votes enabled are:

- Do all active group invocations agree that an expression is true?
- Do any active group invocations evaluate an expression to true?
- Do all active group invocations have the same value of an expression?

NOTE

These operations are useful in combination with control flow in that they allow for developers to check whether conditions match across the group and choose potentially faster code-paths in these cases.

9.26.3. Arithmetic Group Operations

The arithmetic group operations allow invocations to perform scans and reductions across a group. The operators supported are add, mul, min, max, and, or, xor.

For reductions, every invocation in a group will obtain the cumulative result of these operators applied to all values in the group. For exclusive scans, each invocation in a group will obtain the cumulative result of these operators applied to all values in invocations with a lower index in the group. Inclusive scans are identical to exclusive scans, except the cumulative result includes the operator applied to the value in the current invocation.

The order in which these operators are applied is implementation-dependent.

9.26.4. Ballot Group Operations

The ballot group operations allow invocations to perform more complex votes across the group. The ballot functionality allows all invocations within a group to provide a boolean value and get as a result what each invocation provided as their boolean value. The broadcast functionality allows values to be broadcast from an invocation to all other invocations within the group.

9.26.5. Shuffle Group Operations

The shuffle group operations allow invocations to read values from other invocations within a group.

9.26.6. Shuffle Relative Group Operations

The shuffle relative group operations allow invocations to read values from other invocations within the group relative to the current invocation in the group. The relative operations supported allow data to be shifted up and down through the invocations within a group.

9.26.7. Clustered Group Operations

The clustered group operations allow invocations to perform an operation among partitions of a group, such that the operation is only performed within the group invocations within a partition. The partitions for clustered group operations are consecutive power-of-two size groups of invocations and the cluster size **must** be known at pipeline creation time. The operations supported are add, mul, min, max, and, or, xor.

9.26.8. Rotate Group Operations

The rotate group operations allow invocations to read values from other invocations within the group relative to the current invocation and modulo the size of the group. Clustered rotate group operations perform the same operation within individual partitions of a group.

The partitions for clustered rotate group operations are consecutive power-of-two size groups of invocations and the cluster size **must** be known at pipeline creation time.

9.27. Quad Group Operations

Quad group operations (`OpGroupNonUniformQuad*`) are a specialized type of [group operations](#) that only operate on [quad scope instances](#). Whilst these instructions do include a `Scope` parameter, this scope is always overridden; only the [quad scope instance](#) is included in its execution scope.

Fragment shaders that statically execute either `OpGroupNonUniformQuadBroadcast` or `OpGroupNonUniformQuadSwap` **must** launch sufficient invocations to ensure their correct operation; additional [helper invocations](#) are launched for framebuffer locations not covered by rasterized fragments if necessary.

The index used to select participating invocations is `i`, as described for a [quad scope instance](#), defined as the *quad index* in the [SPIR-V specification](#).

For `OpGroupNonUniformQuadBroadcast` this value is equal to `Index`. For `OpGroupNonUniformQuadSwap`, it is equal to the implicit `Index` used by each participating invocation.

9.28. Derivative Operations

Derivative operations calculate the partial derivative for an expression `P` as a function of an invocation's `x` and `y` coordinates.

Derivative operations operate on a set of invocations known as a *derivative group* as defined in the [SPIR-V specification](#).

A derivative group in a fragment shader is equivalent to the [quad scope instance](#) if the [QuadDerivativesKHR](#) execution mode is specified, otherwise it is equivalent to the [primitive scope instance](#). A derivative group in a mesh, task, or compute shader is equivalent to the [quad scope instance](#).

Derivatives are calculated assuming that P is piecewise linear and continuous within the derivative group.

The following control-flow restrictions apply to derivative operations:

- If the [QuadDerivativesKHR](#) execution mode is specified, dynamic instances of any derivative operations **must** be executed in control flow that is uniform within the current [quad scope instance](#).
- If the [QuadDerivativesKHR](#) execution mode is not specified:
 - dynamic instances of explicit derivative instructions ([OpDPdx*](#), [OpDPdy*](#), and [OpFwidth*](#)) **must** be executed in control flow that is uniform within a derivative group.
 - dynamic instances of implicit derivative operations **can** be executed in control flow that is not uniform within the derivative group, but results are undefined.

Fragment shaders that statically execute derivative operations **must** launch sufficient invocations to ensure their correct operation; additional [helper invocations](#) are launched for framebuffer locations not covered by rasterized fragments if necessary.

NOTE

In a mesh, task, or compute shader, it is the application's responsibility to ensure that sufficient invocations are launched.

Derivative operations calculate their results as the difference between the result of P across invocations in the quad. For fine derivative operations ([OpDPdxFine](#) and [OpDPdyFine](#)), the values of $DPdx(P_i)$ are calculated as

$$DPdx(P_0) = DPdx(P_1) = P_1 - P_0$$

$$DPdx(P_2) = DPdx(P_3) = P_3 - P_2$$

and the values of $DPdy(P_i)$ are calculated as

$$DPdy(P_0) = DPdy(P_2) = P_2 - P_0$$

$$DPdy(P_1) = DPdy(P_3) = P_3 - P_1$$

where i is the index of each invocation as described in [Quad](#).

Coarse derivative operations (`OpDPdxCoarse` and `OpDPdyCoarse`), calculate their results in roughly the same manner, but **may** only calculate two values instead of four (one for each of `DPdx` and `DPdy`), reusing the same result no matter the originating invocation. If an implementation does this, it **should** use the fine derivative calculations described for `P0`.

NOTE

Derivative values are calculated between fragments rather than pixels. If the fragment shader invocations involved in the calculation cover multiple pixels, these operations cover a wider area, resulting in larger derivative values. This in turn will result in a coarser LOD being selected for image sampling operations using derivatives.

Applications may want to account for this when using multi-pixel fragments; if pixel derivatives are desired, applications should use explicit derivative operations and divide the results by the size of the fragment in each dimension as follows:

$$DPdx(P_n)' = DPdx(P_n) / w$$

$$DPdy(P_n)' = DPdy(P_n) / h$$

where `w` and `h` are the size of the fragments in the quad, and `DPdx(Pn)'` and `DPdy(Pn)'` are the pixel derivatives.

The results for `OpDPdx` and `OpDPdy` **may** be calculated as either fine or coarse derivatives, with implementations favoring the most efficient approach. Implementations **must** choose coarse or fine consistently between the two.

Executing `OpFwidthFine`, `OpFwidthCoarse`, or `OpFwidth` is equivalent to executing the corresponding `OpDPdx*` and `OpDPdy*` instructions, taking the absolute value of the results, and summing them.

Executing an `OpImage*Sample*ImplicitLod` instruction is equivalent to executing `OpDPdx(Coordinate)` and `OpDPdy(Coordinate)`, and passing the results as the `Grad` operands `dx` and `dy`.

NOTE

It is expected that using the `ImplicitLod` variants of sampling functions will be substantially more efficient than using the `ExplicitLod` variants with explicitly generated derivatives.

9.29. Helper Invocations

When performing `derivative` or `quad group` operations in a fragment shader, additional invocations **may** be spawned in order to ensure correct results. These additional invocations are known as *helper invocations* and **can** be identified by a non-zero value in the `HelperInvocation` built-in. Stores and atomics performed by helper invocations **must** not have any effect on memory except for the `Function`, `Private` and `Output` storage classes, and values returned by atomic instructions in helper invocations are undefined.

NOTE

While storage to `Output` storage class has an effect even in helper invocations, it does

not mean that helper invocations have an effect on the framebuffer. **Output** variables in fragment shaders can be read from as well, and they behave more like **Private** variables for the duration of the shader invocation.

If the **MaximallyReconvergesKHR** execution mode is applied to the entry point, helper invocations **must** remain active for all instructions for the lifetime of the quad scope instance they are a part of. If the **MaximallyReconvergesKHR** execution mode is not applied to the entry point, helper invocations **may** be considered inactive for **group operations** other than **derivative** and **quad group** operations. All invocations in a quad scope instance **may** become permanently inactive at any point once the only remaining invocations in that quad scope instance are helper invocations.

9.30. Cooperative Matrices

A *cooperative matrix* type is a SPIR-V type where the storage for and computations performed on the matrix are spread across the invocations in a scope instance. These types give the implementation freedom in how to optimize matrix multiplies.

SPIR-V defines the types and instructions, but does not specify rules about what sizes/combinations are valid, and it is expected that different implementations **may** support different sizes.

To enumerate the supported cooperative matrix types and operations, call:

```
// Provided by VK_KHR_cooperative_matrix
VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pPropertyCount,
    VkCooperativeMatrixPropertiesKHR* pProperties);
```

- **physicalDevice** is the physical device.
- **pPropertyCount** is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- **pProperties** is either **NULL** or a pointer to an array of **VkCooperativeMatrixPropertiesKHR** structures.

If **pProperties** is **NULL**, then the number of cooperative matrix properties available is returned in **pPropertyCount**. Otherwise, **pPropertyCount** **must** point to a variable set by the application to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If **pPropertyCount** is less than the number of cooperative matrix properties available, at most **pPropertyCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available cooperative matrix properties were returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-physicalDevice-parameter **physicalDevice** **must** be a valid **VkPhysicalDevice** handle

- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pPropertyCount-parameter **pPropertyCount** **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pProperties-parameter
If the value referenced by **pPropertyCount** is not 0, and **pProperties** is not `NULL`, **pProperties** **must** be a valid pointer to an array of **pPropertyCount** `VkCooperativeMatrixPropertiesKHR` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To enumerate additional supported cooperative matrix types and operations, call:

```
// Provided by VK_NV_cooperative_matrix2
VkResult vkGetPhysicalDeviceCooperativeMatrixFlexibleDimensionsPropertiesNV(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pPropertyCount,
    VkCooperativeMatrixFlexibleDimensionsPropertiesNV* pProperties);
```

- **physicalDevice** is the physical device.
- **pPropertyCount** is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- **pProperties** is either `NULL` or a pointer to an array of `VkCooperativeMatrixFlexibleDimensionsPropertiesNV` structures.

If **pProperties** is `NULL`, then the number of flexible dimensions properties available is returned in **pPropertyCount**. Otherwise, **pPropertyCount** **must** point to a variable set by the application to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If **pPropertyCount** is less than the number flexible dimensions properties available, at most **pPropertyCount** structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available flexible dimensions properties were returned.

If `cooperativeMatrixFlexibleDimensions` is not supported, the implementation **must** advertise zero properties.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceCooperativeMatrixFlexibleDimensionsPropertiesNV-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceCooperativeMatrixFlexibleDimensionsPropertiesNV-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceCooperativeMatrixFlexibleDimensionsPropertiesNV-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkCooperativeMatrixFlexibleDimensionsPropertiesNV` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To enumerate the supported cooperative matrix types and operations, call:

```
// Provided by VK_NV_cooperative_matrix
VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesNV(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pPropertyCount,
    VkCooperativeMatrixPropertiesNV* pProperties);
```

- `physicalDevice` is the physical device.
- `pPropertyCount` is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- `pProperties` is either `NULL` or a pointer to an array of `VkCooperativeMatrixPropertiesNV` structures.

If `pProperties` is `NULL`, then the number of cooperative matrix properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of cooperative matrix properties available, at most `pPropertyCount` structures will be written, and

`VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available cooperative matrix properties were returned.

Valid Usage (Implicit)

- `VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-physicalDevice-parameter physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-pPropertyCount-parameter pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- `VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-pProperties-parameter`
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkCooperativeMatrixPropertiesNV` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Each `VkCooperativeMatrixPropertiesKHR` or `VkCooperativeMatrixPropertiesNV` structure describes a single supported combination of types for a matrix multiply/add operation (`OpCooperativeMatrixMulAddKHR` or `OpCooperativeMatrixMulAddNV`). The multiply **can** be described in terms of the following variables and types (in SPIR-V pseudocode):

```
%A is of type OpTypeCooperativeMatrixKHR %AType %scope %MSize %KSize %MatrixAKHR
%B is of type OpTypeCooperativeMatrixKHR %BType %scope %KSize %NSize %MatrixBKHR
%C is of type OpTypeCooperativeMatrixKHR %CType %scope %MSize %NSize
%MatrixAccumulatorKHR
%Result is of type OpTypeCooperativeMatrixKHR %ResultType %scope %MSize %NSize
%MatrixAccumulatorKHR

%Result = %A * %B + %C // using OpCooperativeMatrixMulAddKHR
```

```
%A is of type OpTypeCooperativeMatrixNV %AType %scope %MSize %KSize
%B is of type OpTypeCooperativeMatrixNV %BType %scope %KSize %NSize
%C is of type OpTypeCooperativeMatrixNV %CType %scope %MSize %NSize
%D is of type OpTypeCooperativeMatrixNV %DType %scope %MSize %NSize
```

```
%D = %A * %B + %C // using OpCooperativeMatrixMulAddNV
```

A matrix multiply with these dimensions is known as an $M \times N \times K$ matrix multiply.

The `VkCooperativeMatrixPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_cooperative_matrix
typedef struct VkCooperativeMatrixPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           MSize;
    uint32_t           NSize;
    uint32_t           KSize;
    VkComponentTypeKHR AType;
    VkComponentTypeKHR BType;
    VkComponentTypeKHR CType;
    VkComponentTypeKHR ResultType;
    VkBool32           saturatingAccumulation;
    VkScopeKHR         scope;
} VkCooperativeMatrixPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `MSize` is the number of rows in matrices `A`, `C`, and `Result`.
- `KSize` is the number of columns in matrix `A` and rows in matrix `B`.
- `NSize` is the number of columns in matrices `B`, `C`, `Result`.
- `AType` is the component type of matrix `A`, of type `VkComponentTypeKHR`.
- `BType` is the component type of matrix `B`, of type `VkComponentTypeKHR`.
- `CType` is the component type of matrix `C`, of type `VkComponentTypeKHR`.
- `ResultType` is the component type of matrix `Result`, of type `VkComponentTypeKHR`.
- `saturatingAccumulation` indicates whether the `SaturatingAccumulation` operand to `OpCooperativeMatrixMulAddKHR` **must** be present or not. If it is `VK_TRUE`, the `SaturatingAccumulation` operand **must** be present. If it is `VK_FALSE`, the `SaturatingAccumulation` operand **must** not be present.
- `scope` is the scope of all the matrix types, of type `VkScopeKHR`.

If some types are preferred over other types (e.g. for performance), they **should** appear earlier in the list enumerated by `vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR`.

At least one entry in the list **must** have power of two values for all of `MSize`, `KSize`, and `NSize`.

If `cooperativeMatrixWorkgroupScope` is not supported, `scope` **must** be `VK_SCOPE_SUBGROUP_KHR`.

Valid Usage (Implicit)

- VUID-VkCooperativeMatrixPropertiesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_KHR`
- VUID-VkCooperativeMatrixPropertiesKHR-pNext-pNext
`pNext` **must** be `NULL`

The `VkCooperativeMatrixFlexibleDimensionsPropertiesNV` structure is defined as:

```
// Provided by VK_NV_cooperative_matrix2
typedef struct VkCooperativeMatrixFlexibleDimensionsPropertiesNV {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           MGranularity;
    uint32_t           NGranularity;
    uint32_t           KGranularity;
    VkComponentTypeKHR AType;
    VkComponentTypeKHR BType;
    VkComponentTypeKHR CType;
    VkComponentTypeKHR ResultType;
    VkBool32           saturatingAccumulation;
    VkScopeKHR         scope;
    uint32_t           workgroupInvocations;
} VkCooperativeMatrixFlexibleDimensionsPropertiesNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `MGranularity` is the granularity of the number of rows in matrices `A`, `C`, and `Result`. The rows **must** be an integer multiple of this value.
- `KGranularity` is the granularity of columns in matrix `A` and rows in matrix `B`. The columns/rows **must** be an integer multiple of this value.
- `NGranularity` is the granularity of columns in matrices `B`, `C`, `Result`. The columns **must** be an integer multiple of this value.
- `AType` is the component type of matrix `A`, of type `VkComponentTypeKHR`.
- `BType` is the component type of matrix `B`, of type `VkComponentTypeKHR`.
- `CType` is the component type of matrix `C`, of type `VkComponentTypeKHR`.
- `ResultType` is the component type of matrix `Result`, of type `VkComponentTypeKHR`.
- `saturatingAccumulation` indicates whether the `SaturatingAccumulation` operand to `OpCooperativeMatrixMulAddKHR` **must** be present or not. If it is `VK_TRUE`, the `SaturatingAccumulation` operand **must** be present. If it is `VK_FALSE`, the `SaturatingAccumulation` operand **must** not be present.
- `scope` is the scope of all the matrix types, of type `VkScopeKHR`.

- `workgroupInvocations` is the number of invocations in the local workgroup when this combination of values is supported.

Rather than explicitly enumerating a list of supported sizes, `VkCooperativeMatrixFlexibleDimensionsPropertiesNV` advertises size granularities, where the matrix **must** be a multiple of the advertised size. The M and K granularities apply to rows and columns of matrices with Use of `MatrixA`, K, and N apply to rows and columns of matrices with Use of `MatrixB`, M, and N apply to rows and columns of matrices with Use of `MatrixAccumulator`.

For a given type combination, if multiple workgroup sizes are supported there **may** be multiple `VkCooperativeMatrixFlexibleDimensionsPropertiesNV` structures with different granularities.

All granularity values **must** be powers of two.

NOTE

Different A/B types may require different granularities but share the same accumulator type. In such a case, the supported granularity for a matrix with the accumulator type would be the smallest advertised granularity.

Valid Usage (Implicit)

- `VOID-VkCooperativeMatrixFlexibleDimensionsPropertiesNV-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_FLEXIBLE_DIMENSIONS_PROPERTIES_NV`
- `VOID-VkCooperativeMatrixFlexibleDimensionsPropertiesNV-pNext-pNext`
`pNext` **must** be `NULL`

The `VkCooperativeMatrixPropertiesNV` structure is defined as:

```
// Provided by VK_NV_cooperative_matrix
typedef struct VkCooperativeMatrixPropertiesNV {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           MSize;
    uint32_t           NSize;
    uint32_t           KSize;
    VkComponentTypeNV  AType;
    VkComponentTypeNV  BType;
    VkComponentTypeNV  CType;
    VkComponentTypeNV  DType;
    VkScopeNV          scope;
} VkCooperativeMatrixPropertiesNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `MSize` is the number of rows in matrices A, C, and D.
- `KSize` is the number of columns in matrix A and rows in matrix B.

- **MSize** is the number of columns in matrices B, C, D.
- **AType** is the component type of matrix A, of type [VkComponentTypeNV](#).
- **BType** is the component type of matrix B, of type [VkComponentTypeNV](#).
- **CType** is the component type of matrix C, of type [VkComponentTypeNV](#).
- **DType** is the component type of matrix D, of type [VkComponentTypeNV](#).
- **scope** is the scope of all the matrix types, of type [VkScopeNV](#).

If some types are preferred over other types (e.g. for performance), they **should** appear earlier in the list enumerated by [vkGetPhysicalDeviceCooperativeMatrixPropertiesNV](#).

At least one entry in the list **must** have power of two values for all of **MSize**, **KSize**, and **NSize**.

Valid Usage (Implicit)

- VUID-VkCooperativeMatrixPropertiesNV-sType-sType
sType must be `VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_NV`
- VUID-VkCooperativeMatrixPropertiesNV-pNext-pNext
pNext must be `NULL`

Possible values for [VkScopeKHR](#) include:

```
// Provided by VK_KHR_cooperative_matrix
typedef enum VkScopeKHR {
    VK_SCOPE_DEVICE_KHR = 1,
    VK_SCOPE_WORKGROUP_KHR = 2,
    VK_SCOPE_SUBGROUP_KHR = 3,
    VK_SCOPE_QUEUE_FAMILY_KHR = 5,
// Provided by VK_NV_cooperative_matrix
    VK_SCOPE_DEVICE_NV = VK_SCOPE_DEVICE_KHR,
// Provided by VK_NV_cooperative_matrix
    VK_SCOPE_WORKGROUP_NV = VK_SCOPE_WORKGROUP_KHR,
// Provided by VK_NV_cooperative_matrix
    VK_SCOPE_SUBGROUP_NV = VK_SCOPE_SUBGROUP_KHR,
// Provided by VK_NV_cooperative_matrix
    VK_SCOPE_QUEUE_FAMILY_NV = VK_SCOPE_QUEUE_FAMILY_KHR,
} VkScopeKHR;
```

or the equivalent

```
// Provided by VK_NV_cooperative_matrix
typedef VkScopeKHR VkScopeNV;
```

- `VK_SCOPE_DEVICE_KHR` corresponds to SPIR-V **Device** scope.
- `VK_SCOPE_WORKGROUP_KHR` corresponds to SPIR-V **Workgroup** scope.

- `VK_SCOPE_SUBGROUP_KHR` corresponds to SPIR-V `Subgroup` scope.
- `VK_SCOPE_QUEUE_FAMILY_KHR` corresponds to SPIR-V `QueueFamily` scope.

All enum values match the corresponding SPIR-V value.

Possible values for `VkComponentTypeKHR` include:

```
// Provided by VK_KHR_cooperative_matrix
typedef enum VkComponentTypeKHR {
    VK_COMPONENT_TYPE_FLOAT16_KHR = 0,
    VK_COMPONENT_TYPE_FLOAT32_KHR = 1,
    VK_COMPONENT_TYPE_FLOAT64_KHR = 2,
    VK_COMPONENT_TYPE_SINT8_KHR = 3,
    VK_COMPONENT_TYPE_SINT16_KHR = 4,
    VK_COMPONENT_TYPE_SINT32_KHR = 5,
    VK_COMPONENT_TYPE_SINT64_KHR = 6,
    VK_COMPONENT_TYPE_UINT8_KHR = 7,
    VK_COMPONENT_TYPE_UINT16_KHR = 8,
    VK_COMPONENT_TYPE_UINT32_KHR = 9,
    VK_COMPONENT_TYPE_UINT64_KHR = 10,
// Provided by VK_NV_cooperative_matrix
    VK_COMPONENT_TYPE_FLOAT16_NV = VK_COMPONENT_TYPE_FLOAT16_KHR,
// Provided by VK_NV_cooperative_matrix
    VK_COMPONENT_TYPE_FLOAT32_NV = VK_COMPONENT_TYPE_FLOAT32_KHR,
// Provided by VK_NV_cooperative_matrix
    VK_COMPONENT_TYPE_FLOAT64_NV = VK_COMPONENT_TYPE_FLOAT64_KHR,
// Provided by VK_NV_cooperative_matrix
    VK_COMPONENT_TYPE_SINT8_NV = VK_COMPONENT_TYPE_SINT8_KHR,
// Provided by VK_NV_cooperative_matrix
    VK_COMPONENT_TYPE_SINT16_NV = VK_COMPONENT_TYPE_SINT16_KHR,
// Provided by VK_NV_cooperative_matrix
    VK_COMPONENT_TYPE_SINT32_NV = VK_COMPONENT_TYPE_SINT32_KHR,
// Provided by VK_NV_cooperative_matrix
    VK_COMPONENT_TYPE_SINT64_NV = VK_COMPONENT_TYPE_SINT64_KHR,
// Provided by VK_NV_cooperative_matrix
    VK_COMPONENT_TYPE_UINT8_NV = VK_COMPONENT_TYPE_UINT8_KHR,
// Provided by VK_NV_cooperative_matrix
    VK_COMPONENT_TYPE_UINT16_NV = VK_COMPONENT_TYPE_UINT16_KHR,
// Provided by VK_NV_cooperative_matrix
    VK_COMPONENT_TYPE_UINT32_NV = VK_COMPONENT_TYPE_UINT32_KHR,
// Provided by VK_NV_cooperative_matrix
    VK_COMPONENT_TYPE_UINT64_NV = VK_COMPONENT_TYPE_UINT64_KHR,
} VkComponentTypeKHR;
```

or the equivalent

```
// Provided by VK_NV_cooperative_matrix
typedef VkComponentTypeKHR VkComponentTypeNV;
```

- `VK_COMPONENT_TYPE_FLOAT16_KHR` corresponds to SPIR-V `OpTypeFloat` 16.
- `VK_COMPONENT_TYPE_FLOAT32_KHR` corresponds to SPIR-V `OpTypeFloat` 32.
- `VK_COMPONENT_TYPE_FLOAT64_KHR` corresponds to SPIR-V `OpTypeFloat` 64.
- `VK_COMPONENT_TYPE_SINT8_KHR` corresponds to SPIR-V `OpTypeInt` 8 0/1.
- `VK_COMPONENT_TYPE_SINT16_KHR` corresponds to SPIR-V `OpTypeInt` 16 0/1.
- `VK_COMPONENT_TYPE_SINT32_KHR` corresponds to SPIR-V `OpTypeInt` 32 0/1.
- `VK_COMPONENT_TYPE_SINT64_KHR` corresponds to SPIR-V `OpTypeInt` 64 0/1.
- `VK_COMPONENT_TYPE_UINT8_KHR` corresponds to SPIR-V `OpTypeInt` 8 0/1.
- `VK_COMPONENT_TYPE_UINT16_KHR` corresponds to SPIR-V `OpTypeInt` 16 0/1.
- `VK_COMPONENT_TYPE_UINT32_KHR` corresponds to SPIR-V `OpTypeInt` 32 0/1.
- `VK_COMPONENT_TYPE_UINT64_KHR` corresponds to SPIR-V `OpTypeInt` 64 0/1.

9.31. Validation Cache

Validation cache objects allow the result of internal validation to be reused, both within a single application run and between multiple runs. Reuse within a single run is achieved by passing the same validation cache object when creating supported Vulkan objects. Reuse across runs of an application is achieved by retrieving validation cache contents in one run of an application, saving the contents, and using them to preinitialize a validation cache on a subsequent run. The contents of the validation cache objects are managed by the validation layers. Applications **can** manage the host memory consumed by a validation cache object and control the amount of data retrieved from a validation cache object.

Validation cache objects are represented by `VkValidationCacheEXT` handles:

```
// Provided by VK_EXT_validation_cache
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkValidationCacheEXT)
```

To create validation cache objects, call:

```
// Provided by VK_EXT_validation_cache
VkResult vkCreateValidationCacheEXT(
    VkDevice                                device,
    const VkValidationCacheCreateInfoEXT*   pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkValidationCacheEXT*                   pValidationCache);
```

- `device` is the logical device that creates the validation cache object.
- `pCreateInfo` is a pointer to a `VkValidationCacheCreateInfoEXT` structure containing the initial parameters for the validation cache object.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

- `pValidationCache` is a pointer to a `VkValidationCacheEXT` handle in which the resulting validation cache object is returned.

NOTE

Applications **can** track and manage the total host memory size of a validation cache object using the `pAllocator`. Applications **can** limit the amount of data retrieved from a validation cache object in `vkGetValidationCacheDataEXT`. Implementations **should** not internally limit the total number of entries added to a validation cache object or the total host memory consumed.

Once created, a validation cache **can** be passed to the `vkCreateShaderModule` command by adding this object to the `VkShaderModuleCreateInfo` structure's `pNext` chain. If a `VkShaderModuleValidationCacheCreateInfoEXT` object is included in the `VkShaderModuleCreateInfo::pNext` chain, and its `validationCache` field is not `VK_NULL_HANDLE`, the implementation will query it for possible reuse opportunities and update it with new content. The use of the validation cache object in these commands is internally synchronized, and the same validation cache object **can** be used in multiple threads simultaneously.

NOTE

Implementations **should** make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the `vkCreateShaderModule` command.

Valid Usage (Implicit)

- VUID-vkCreateValidationCacheEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateValidationCacheEXT-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkValidationCacheCreateInfoEXT` structure
- VUID-vkCreateValidationCacheEXT-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateValidationCacheEXT-pValidationCache-parameter
`pValidationCache` **must** be a valid pointer to a `VkValidationCacheEXT` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkValidationCacheCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_validation_cache
typedef struct VkValidationCacheCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkValidationCacheCreateFlagsEXT flags;
    size_t               initialDataSize;
    const void*          pInitialData;
} VkValidationCacheCreateInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **initialDataSize** is the number of bytes in **pInitialData**. If **initialDataSize** is zero, the validation cache will initially be empty.
- **pInitialData** is a pointer to previously retrieved validation cache data. If the validation cache data is incompatible (as defined below) with the device, the validation cache will be initially empty. If **initialDataSize** is zero, **pInitialData** is ignored.

Valid Usage

- VUID-VkValidationCacheCreateInfoEXT-initialDataSize-01534
If **initialDataSize** is not 0, it **must** be equal to the size of **pInitialData**, as returned by **vkGetValidationCacheDataEXT** when **pInitialData** was originally retrieved
- VUID-VkValidationCacheCreateInfoEXT-initialDataSize-01535
If **initialDataSize** is not 0, **pInitialData** **must** have been retrieved from a previous call to **vkGetValidationCacheDataEXT**

Valid Usage (Implicit)

- VUID-VkValidationCacheCreateInfoEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_VALIDATION_CACHE_CREATE_INFO_EXT**
- VUID-VkValidationCacheCreateInfoEXT-pNext-pNext
pNext **must** be **NULL**
- VUID-VkValidationCacheCreateInfoEXT-flags-zero bitmask
flags **must** be 0
- VUID-VkValidationCacheCreateInfoEXT-pInitialData-parameter
If **initialDataSize** is not 0, **pInitialData** **must** be a valid pointer to an array of **initialDataSize** bytes

```
// Provided by VK_EXT_validation_cache
typedef VkFlags VkValidationCacheCreateFlagsEXT;
```

`VkValidationCacheCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

Validation cache objects **can** be merged using the command:

```
// Provided by VK_EXT_validation_cache
VkResult vkMergeValidationCachesEXT(
    VkDevice          device,
    VkValidationCacheEXT dstCache,
    uint32_t          srcCacheCount,
    const VkValidationCacheEXT* pSrcCaches);
```

- `device` is the logical device that owns the validation cache objects.
- `dstCache` is the handle of the validation cache to merge results into.
- `srcCacheCount` is the length of the `pSrcCaches` array.
- `pSrcCaches` is a pointer to an array of validation cache handles, which will be merged into `dstCache`. The previous contents of `dstCache` are included after the merge.

NOTE

The details of the merge operation are implementation-dependent, but implementations **should** merge the contents of the specified validation caches and prune duplicate entries.

Valid Usage

- VUID-vkMergeValidationCachesEXT-dstCache-01536
`dstCache` **must** not appear in the list of source caches

Valid Usage (Implicit)

- VUID-vkMergeValidationCachesEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkMergeValidationCachesEXT-dstCache-parameter
`dstCache` **must** be a valid `VkValidationCacheEXT` handle
- VUID-vkMergeValidationCachesEXT-pSrcCaches-parameter
`pSrcCaches` **must** be a valid pointer to an array of `srcCacheCount` valid `VkValidationCacheEXT` handles
- VUID-vkMergeValidationCachesEXT-srcCacheCount-arraylength
`srcCacheCount` **must** be greater than 0
- VUID-vkMergeValidationCachesEXT-dstCache-parent
`dstCache` **must** have been created, allocated, or retrieved from `device`
- VUID-vkMergeValidationCachesEXT-pSrcCaches-parent
Each element of `pSrcCaches` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `dstCache` **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Data **can** be retrieved from a validation cache object using the command:

```
// Provided by VK_EXT_validation_cache
VkResult vkGetValidationCacheDataEXT(
    VkDevice                device,
    VkValidationCacheEXT    validationCache,
    size_t*                 pDataSize,
    void*                   pData);
```

- `device` is the logical device that owns the validation cache.
- `validationCache` is the validation cache to retrieve data from.
- `pDataSize` is a pointer to a value related to the amount of data in the validation cache, as described below.
- `pData` is either `NULL` or a pointer to a buffer.

If `pData` is `NULL`, then the maximum size of the data that **can** be retrieved from the validation cache, in bytes, is returned in `pDataSize`. Otherwise, `pDataSize` **must** point to a variable set by the application to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with the amount of data actually written to `pData`. If `pDataSize` is less than the maximum size that **can** be retrieved by the validation cache, at most `pDataSize` bytes will be written to `pData`, and `vkGetValidationCacheDataEXT` will return `VK_INCOMPLETE` instead of `VK_SUCCESS`, to indicate that not all of the validation cache was returned.

Any data written to `pData` is valid and **can** be provided as the `pInitialData` member of the `VkValidationCacheCreateInfoEXT` structure passed to `vkCreateValidationCacheEXT`.

Two calls to `vkGetValidationCacheDataEXT` with the same parameters **must** retrieve the same data unless a command that modifies the contents of the cache is called between them.

Applications **can** store the data retrieved from the validation cache, and use these data, possibly in a future run of the application, to populate new validation cache objects. The results of validation, however, **may** depend on the vendor ID, device ID, driver version, and other details of the device.

To enable applications to detect when previously retrieved data is incompatible with the device, the initial bytes written to **pData** **must** be a header consisting of the following members:

Table 12. Layout for Validation Cache Header Version

VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT

Offset	Size	Meaning
0	4	length in bytes of the entire validation cache header written as a stream of bytes, with the least significant byte first
4	4	a VkValidationCacheHeaderVersionEXT value written as a stream of bytes, with the least significant byte first
8	VK_UUID_SIZE	a layer commit ID expressed as a UUID, which uniquely identifies the version of the validation layers used to generate these validation results

The first four bytes encode the length of the entire validation cache header, in bytes. This value includes all fields in the header including the validation cache version field and the size of the length field.

The next four bytes encode the validation cache version, as described for [VkValidationCacheHeaderVersionEXT](#). A consumer of the validation cache **should** use the cache version to interpret the remainder of the cache header.

If **pDataSize** is less than what is necessary to store this header, nothing will be written to **pData** and zero will be written to **pDataSize**.

Valid Usage (Implicit)

- VUID-vkGetValidationCacheDataEXT-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetValidationCacheDataEXT-validationCache-parameter
validationCache **must** be a valid [VkValidationCacheEXT](#) handle
- VUID-vkGetValidationCacheDataEXT-pDataSize-parameter
pDataSize **must** be a valid pointer to a **size_t** value
- VUID-vkGetValidationCacheDataEXT-pData-parameter
If the value referenced by **pDataSize** is not 0, and **pData** is not **NULL**, **pData** **must** be a valid pointer to an array of **pDataSize** bytes
- VUID-vkGetValidationCacheDataEXT-validationCache-parent
validationCache **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Possible values of the second group of four bytes in the header returned by `vkGetValidationCacheDataEXT`, encoding the validation cache version, are:

```
// Provided by VK_EXT_validation_cache
typedef enum VkValidationCacheHeaderVersionEXT {
    VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT = 1,
} VkValidationCacheHeaderVersionEXT;
```

- `VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT` specifies version one of the validation cache.

To destroy a validation cache, call:

```
// Provided by VK_EXT_validation_cache
void vkDestroyValidationCacheEXT(
    VkDevice                device,
    VkValidationCacheEXT    validationCache,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the validation cache object.
- `validationCache` is the handle of the validation cache to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyValidationCacheEXT-validationCache-01537
If `VkAllocationCallbacks` were provided when `validationCache` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyValidationCacheEXT-validationCache-01538
If no `VkAllocationCallbacks` were provided when `validationCache` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyValidationCacheEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyValidationCacheEXT-validationCache-parameter
If `validationCache` is not `VK_NULL_HANDLE`, `validationCache` **must** be a valid `VkValidationCacheEXT` handle
- VUID-vkDestroyValidationCacheEXT-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyValidationCacheEXT-validationCache-parent
If `validationCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `validationCache` **must** be externally synchronized

9.32. CUDA Modules

9.32.1. Creating a CUDA Module

CUDA modules **must** contain some kernel code and **must** expose at least one function entry point.

CUDA modules are represented by `VkCudaModuleNV` handles:

```
// Provided by VK_NV_cuda_kernel_launch
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCudaModuleNV)
```

To create a CUDA module, call:

```
// Provided by VK_NV_cuda_kernel_launch
VkResult vkCreateCudaModuleNV(
    VkDevice                                device,
    const VkCudaModuleCreateInfoNV*        pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkCudaModuleNV*                        pModule);
```

- `device` is the logical device that creates the shader module.
- `pCreateInfo` is a pointer to a `VkCudaModuleCreateInfoNV` structure.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

- `pModule` is a pointer to a `VkCudaModuleNV` handle in which the resulting CUDA module object is returned.

Once a CUDA module has been created, the application **may** create the function entry point, which **must** refer to one function in the module.

Valid Usage (Implicit)

- VUID-vkCreateCudaModuleNV-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateCudaModuleNV-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkCudaModuleCreateInfoNV` structure
- VUID-vkCreateCudaModuleNV-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateCudaModuleNV-pModule-parameter
`pModule` **must** be a valid pointer to a `VkCudaModuleNV` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkCudaModuleCreateInfoNV` structure is defined as:

```
// Provided by VK_NV_cuda_kernel_launch
typedef struct VkCudaModuleCreateInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    size_t             dataSize;
    const void*        pData;
} VkCudaModuleCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` **may** be `NULL` or **may** be a pointer to a structure extending this structure.
- `dataSize` is the length of the `pData` array.
- `pData` is a pointer to CUDA code

Valid Usage

- VUID-VkCudaModuleCreateInfoNV-dataSize-09413
dataSize must be the total size in bytes of the PTX files or binary cache passed to **pData**

Valid Usage (Implicit)

- VUID-VkCudaModuleCreateInfoNV-sType-sType
sType must be `VK_STRUCTURE_TYPE_CUDA_MODULE_CREATE_INFO_NV`
- VUID-VkCudaModuleCreateInfoNV-pNext-pNext
pNext must be `NULL`
- VUID-VkCudaModuleCreateInfoNV-pData-parameter
pData must be a valid pointer to an array of **dataSize** bytes
- VUID-VkCudaModuleCreateInfoNV-dataSize-arraylength
dataSize must be greater than `0`

9.32.2. Creating a CUDA Function Handle

CUDA functions are represented by `VkCudaFunctionNV` handles. Handles to `global` functions **may** then be used to issue a kernel launch (i.e. dispatch) from a commandbuffer. See [Dispatching Command for CUDA PTX kernel](#).

```
// Provided by VK_NV_cuda_kernel_launch
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCudaFunctionNV)
```

To create a CUDA function, call:

```
// Provided by VK_NV_cuda_kernel_launch
VkResult vkCreateCudaFunctionNV(
    VkDevice                                device,
    const VkCudaFunctionCreateInfoNV*       pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkCudaFunctionNV*                       pFunction);
```

- **device** is the logical device that creates the shader module.
- **pCreateInfo** is a pointer to a `VkCudaFunctionCreateInfoNV` structure.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pFunction** is a pointer to a `VkCudaFunctionNV` handle in which the resulting CUDA function object is returned.

Valid Usage (Implicit)

- VUID-vkCreateCudaFunctionNV-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateCudaFunctionNV-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkCudaFunctionCreateInfoNV](#) structure
- VUID-vkCreateCudaFunctionNV-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateCudaFunctionNV-pFunction-parameter
pFunction **must** be a valid pointer to a [VkCudaFunctionNV](#) handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_INITIALIZATION_FAILED**
- **VK_ERROR_OUT_OF_HOST_MEMORY**

The [VkCudaFunctionCreateInfoNV](#) structure is defined as:

```
// Provided by VK_NV_cuda_kernel_launch
typedef struct VkCudaFunctionCreateInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkCudaModuleNV     module;
    const char*        pName;
} VkCudaFunctionCreateInfoNV;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **module** is the CUDA [VkCudaModuleNV](#) module in which the function resides.
- **pName** is a null-terminated UTF-8 string containing the name of the shader entry point for this stage.

Valid Usage (Implicit)

- VUID-VkCudaFunctionCreateInfoNV-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_CUDA_FUNCTION_CREATE_INFO_NV**
- VUID-VkCudaFunctionCreateInfoNV-pNext-pNext

pNext must be **NULL**

- VUID-VkCudaFunctionCreateInfoNV-module-parameter
module must be a valid [VkCudaModuleNV](#) handle
- VUID-VkCudaFunctionCreateInfoNV-pName-parameter
pName must be a null-terminated UTF-8 string

9.32.3. Destroying a CUDA Function

To destroy a CUDA function handle, call:

```
// Provided by VK_NV_cuda_kernel_launch
void vkDestroyCudaFunctionNV(
    VkDevice                device,
    VkCudaFunctionNV        function,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the Function.
- **function** is the handle of the CUDA function to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage (Implicit)

- VUID-vkDestroyCudaFunctionNV-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkDestroyCudaFunctionNV-function-parameter
function must be a valid [VkCudaFunctionNV](#) handle
- VUID-vkDestroyCudaFunctionNV-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkDestroyCudaFunctionNV-function-parent
function must have been created, allocated, or retrieved from **device**

9.32.4. Destroying a CUDA Module

To destroy a CUDA shader module, call:

```
// Provided by VK_NV_cuda_kernel_launch
void vkDestroyCudaModuleNV(
    VkDevice                device,
    VkCudaModuleNV          module,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the shader module.
- **module** is the handle of the CUDA module to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage (Implicit)

- VUID-vkDestroyCudaModuleNV-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkDestroyCudaModuleNV-module-parameter
module **must** be a valid [VkCudaModuleNV](#) handle
- VUID-vkDestroyCudaModuleNV-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkDestroyCudaModuleNV-module-parent
module **must** have been created, allocated, or retrieved from **device**

9.32.5. Reading back CUDA Module Cache

After uploading the PTX kernel code, the module compiles the code to generate a binary cache with all the necessary information for the device to execute it. It is possible to read back this cache for later use, such as accelerating the initialization of further executions.

To get the CUDA module cache call:

```
// Provided by VK_NV_cuda_kernel_launch
VkResult vkGetCudaModuleCacheNV(
    VkDevice          device,
    VkCudaModuleNV    module,
    size_t*           pCacheSize,
    void*             pCacheData);
```

- **device** is the logical device that destroys the Function.
- **module** is the CUDA module.
- **pCacheSize** is a pointer containing the amount of bytes to be copied in **pCacheData**
- **pCacheData** is a pointer to a buffer in which to copy the binary cache

If **pCacheData** is **NULL**, then the size of the binary cache, in bytes, is returned in **pCacheSize**. Otherwise, **pCacheSize** **must** point to a variable set by the application to the size of the buffer, in bytes, pointed to by **pCacheData**, and on return the variable is overwritten with the amount of data actually written to **pCacheData**. If **pCacheSize** is less than the size of the binary shader code, nothing is written to **pCacheData**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**.

The returned cache **may** then be used later for further initialization of the CUDA module, by sending this cache *instead* of the PTX code when using [vkCreateCudaModuleNV](#).

NOTE

Using the binary cache instead of the original PTX code **should** significantly speed up initialization of the CUDA module, given that the whole compilation and validation will not be necessary.

As with [VkPipelineCache](#), the binary cache depends on the specific implementation. The application **must** assume the cache upload might fail in many circumstances and thus **may** have to get ready for falling back to the original PTX code if necessary. Most often, the cache **may** succeed if the same device driver and architecture is used between the cache generation from PTX and the use of this cache. In the event of a new driver version or if using a different device architecture, this cache **may** become invalid.

Valid Usage (Implicit)

- VUID-vkGetCudaModuleCacheNV-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetCudaModuleCacheNV-module-parameter
module **must** be a valid [VkCudaModuleNV](#) handle
- VUID-vkGetCudaModuleCacheNV-pCacheSize-parameter
pCacheSize **must** be a valid pointer to a [size_t](#) value
- VUID-vkGetCudaModuleCacheNV-pCacheData-parameter
If the value referenced by **pCacheSize** is not 0, and **pCacheData** is not NULL, **pCacheData** **must** be a valid pointer to an array of **pCacheSize** bytes
- VUID-vkGetCudaModuleCacheNV-module-parent
module **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- [VK_SUCCESS](#)
- [VK_INCOMPLETE](#)

Failure

- [VK_ERROR_INITIALIZATION_FAILED](#)

9.32.6. Limitations

CUDA and Vulkan do not use the device in the same configuration. The following limitations **must** be taken into account:

- It is not possible to read or write global parameters from Vulkan. The only way to share resources or send values to the PTX kernel is to pass them as arguments of the function. See [Resources sharing between CUDA Kernel and Vulkan](#) for more details.

- No calls to functions external to the module PTX are supported.
- Vulkan disables some shader/kernel exceptions, which could break CUDA kernels relying on exceptions.
- CUDA kernels submitted to Vulkan are limited to the amount of shared memory, which can be queried from the physical capabilities. It may be less than what CUDA can offer.
- CUDA instruction-level preemption (CILP) does not work.
- CUDA Unified Memory will not work in this extension.
- CUDA Dynamic parallelism is not supported.
- `vk*DispatchIndirect` is not available.

Chapter 10. Pipelines

The following [figure](#) shows a block diagram of the Vulkan pipelines. Some Vulkan commands specify geometric objects to be drawn or computational work to be performed, while others specify state controlling how objects are handled by the various pipeline stages, or control data transfer between memory organized as images and buffers. Commands are effectively sent through a processing pipeline, either a *graphics pipeline*, a *ray tracing pipeline*, or a *compute pipeline*.

The graphics pipeline can be operated in two modes, as either *primitive shading* or *mesh shading* pipeline.

Primitive Shading

The first stage of the [graphics pipeline](#) ([Input Assembler](#)) assembles vertices to form geometric primitives such as points, lines, and triangles, based on a requested primitive topology. In the next stage ([Vertex Shader](#)) vertices **can** be transformed, computing positions and attributes for each vertex. If [tessellation](#) and/or [geometry](#) shaders are supported, they **can** then generate multiple primitives from a single input primitive, possibly changing the primitive topology or generating additional attribute data in the process.

Cluster Culling Shading

When using the Cluster Culling Shader, a compute-like shader will perform cluster-based culling, a set of new built-in output variables are used to express visible cluster, in addition, a new built-in function is used to emit these variables from the cluster culling shader to the Input Assembler(IA) stage, then IA can use these variables to fetches vertices of visible cluster and drive vertex shader to work.

Mesh Shading

When using the [mesh shading](#) pipeline input primitives are not assembled implicitly, but explicitly through the ([Mesh Shader](#)). The work on the mesh pipeline is initiated by the application [drawing](#) a set of mesh tasks.

If an optional ([Task Shader](#)) is active, each task triggers the execution of a task shader workgroup that will generate a new set of tasks upon completion. Each of these spawned tasks, or each of the original dispatched tasks if no task shader is present, triggers the execution of a mesh shader workgroup that produces an output mesh with a variable-sized number of primitives assembled from vertices stored in the output mesh.

Common

The final resulting primitives are [clipped](#) to a clip volume in preparation for the next stage, [Rasterization](#). The rasterizer produces a series of *fragments* associated with a region of the framebuffer, from a two-dimensional description of a point, line segment, or triangle. These fragments are processed by [fragment operations](#) to determine whether generated values will be written to the framebuffer. [Fragment shading](#) determines the values to be written to the framebuffer attachments. Framebuffer operations then read and write the color and depth/stencil attachments of the framebuffer for a given subpass of a [render pass instance](#). The attachments **can**

be used as input attachments in the fragment shader in a later subpass of the same render pass.

The [compute pipeline](#) is a separate pipeline from the graphics pipeline, which operates on one-, two-, or three-dimensional workgroups which **can** read from and write to buffer and image memory.

This ordering is meant only as a tool for describing Vulkan, not as a strict rule of how Vulkan is implemented, and we present it only as a means to organize the various operations of the pipelines. Actual ordering guarantees between pipeline stages are explained in detail in the [synchronization chapter](#).

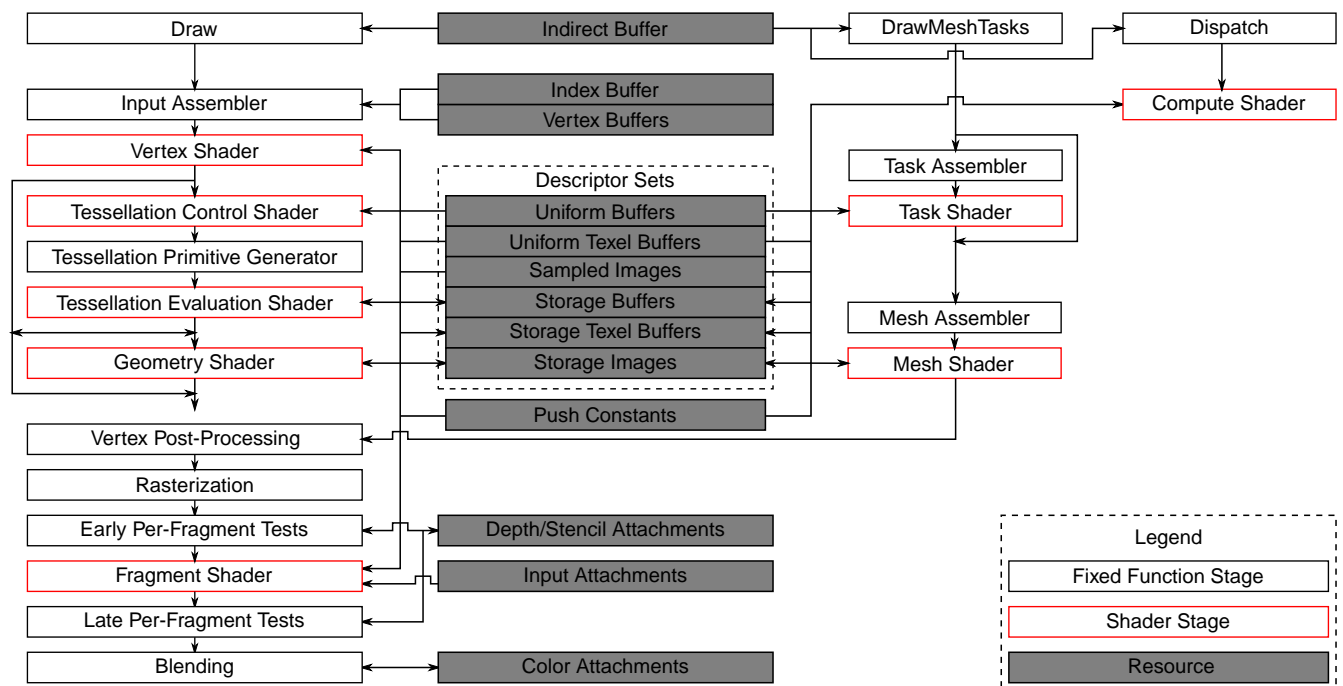

Figure 2. Block diagram of the Vulkan pipeline

Each pipeline is controlled by a monolithic object created from a description of all of the shader stages and any relevant fixed-function stages. [Linking](#) the whole pipeline together allows the optimization of shaders based on their input/outputs and eliminates expensive draw time state validation.

A pipeline object is bound to the current state using [vkCmdBindPipeline](#). Any pipeline object state that is specified as [dynamic](#) is not applied to the current state when the pipeline object is bound, but is instead set by dynamic state setting commands.

If the [commandBufferInheritance](#) feature is not enabled, then no state, including dynamic state, is inherited from one command buffer to another.

If the [commandBufferInheritance](#) feature is enabled, then all graphics and compute state that is valid at the end of the command buffer executed in a queue is inherited and valid at beginning of the command buffer next executed in the same queue. This applies to both primary and secondary command buffers, where a primary command buffer submitted to a queue will inherit state from the previously submitted command buffer to that queue, secondary command buffers will inherit state from the primary or secondary command buffer they are executed in, and after a secondary command buffer is executed, its state is inherited by the primary or secondary command buffer that executed it. Command buffers executed in one queue do not inherit state from any command

buffers executed in another queue.

Compute, ray tracing, and graphics pipelines are each represented by `VkPipeline` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipeline)
```

10.1. Multiple Pipeline Creation

Multiple pipelines **can** be created in a single call by commands such as `vkCreateExecutionGraphPipelinesAMD`, `vkCreateRayTracingPipelinesKHR`, `vkCreateRayTracingPipelinesNV`, `vkCreateComputePipelines`, and `vkCreateGraphicsPipelines`.

The creation commands are passed an array `pCreateInfos` of `Vk*PipelineCreateInfo` structures specifying parameters of each pipeline to be created, and return a corresponding array of handles in `pPipelines`. Each element index i of `pPipelines` is created based on the corresponding element i of `pCreateInfos`.

Applications **can** group together similar pipelines to be created in a single call, and implementations are encouraged to look for reuse opportunities when creating a group.

When attempting to create many pipelines in a single command, it is possible that creation **may** fail for a subset of them. In this case, the corresponding elements of `pPipelines` will be `VK_NULL_HANDLE`. If creation fails for a pipeline despite valid arguments (for example, due to out of memory errors), the `VkResult` code returned by the pipeline creation command will indicate why. The implementation will attempt to create all pipelines, and only return `VK_NULL_HANDLE` values for those that actually failed.

If creation fails for a pipeline that has the `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT` set in its `Vk*PipelineCreateInfo`, pipelines at an index in the `pPipelines` array greater than or equal to that of the failing pipeline will be `VK_NULL_HANDLE`.

If creation fails for multiple pipelines, the returned `VkResult` **must** be the return value of any one of the pipelines which did not succeed. An application **can** reliably clean up from a failed call by iterating over the `pPipelines` array and destroying every element that is not `VK_NULL_HANDLE`.

If the entire command fails and no pipelines are created, all elements of `pPipelines` will be `VK_NULL_HANDLE`.

10.2. Compute Pipelines

Compute pipelines consist of a single static compute shader stage and the pipeline layout.

The compute pipeline represents a compute shader and is created by calling `vkCreateComputePipelines` with `module` and `pName` selecting an entry point from a shader module, where that entry point defines a valid compute shader, in the `VkPipelineShaderStageCreateInfo` structure contained within the `VkComputePipelineCreateInfo` structure.

To create compute pipelines, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateComputePipelines(
    VkDevice                                device,
    VkPipelineCache                        pipelineCache,
    uint32_t                              createInfoCount,
    const VkComputePipelineCreateInfo*    pCreateInfos,
    const VkAllocationCallbacks*         pAllocator,
    VkPipeline*                            pPipelines);
```

- **device** is the logical device that creates the compute pipelines.
- **pipelineCache** is either [VK_NULL_HANDLE](#), indicating that pipeline caching is disabled; or the handle of a valid [pipeline cache](#) object, in which case use of that cache is enabled for the duration of the command.
- **createInfoCount** is the length of the **pCreateInfos** and **pPipelines** arrays.
- **pCreateInfos** is a pointer to an array of [VkComputePipelineCreateInfo](#) structures.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pPipelines** is a pointer to an array of [VkPipeline](#) handles in which the resulting compute pipeline objects are returned.

Pipelines are created and returned as described for [Multiple Pipeline Creation](#).

Valid Usage

- VUID-vkCreateComputePipelines-device-09661
device **must** support at least one queue family with the [VK_QUEUE_COMPUTE_BIT](#) capability
- VUID-vkCreateComputePipelines-flags-00695
If the **flags** member of any element of **pCreateInfos** contains the [VK_PIPELINE_CREATE_DERIVATIVE_BIT](#) flag, and the **basePipelineIndex** member of that same element is not **-1**, **basePipelineIndex** **must** be less than the index into **pCreateInfos** that corresponds to that element
- VUID-vkCreateComputePipelines-flags-00696
If the **flags** member of any element of **pCreateInfos** contains the [VK_PIPELINE_CREATE_DERIVATIVE_BIT](#) flag, the base pipeline **must** have been created with the [VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT](#) flag set
- VUID-vkCreateComputePipelines-pipelineCache-02873
If **pipelineCache** was created with [VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT](#), host access to **pipelineCache** **must** be [externally synchronized](#)
- VUID-vkCreateComputePipelines-pNext-09616
If [VkPipelineBinaryInfoKHR::binaryCount](#) is not **0** for any element of **pCreateInfos**, **pipelineCache** **must** be [VK_NULL_HANDLE](#)
- VUID-vkCreateComputePipelines-pNext-09617

If a `VkPipelineCreateFlags2CreateInfoKHR` structure with the `VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR` flag set is included in the `pNext` chain of any element of `pCreateInfo`s, `pipelineCache` **must** be `VK_NULL_HANDLE`

- VUID-vkCreateComputePipelines-binaryCount-09620

If `VkPipelineBinaryInfoKHR::binaryCount` is not `0` for any element of `pCreateInfo`s, `VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT` **must** not be set in the `flags` of that element

- VUID-vkCreateComputePipelines-binaryCount-09621

If `VkPipelineBinaryInfoKHR::binaryCount` is not `0` for any element of `pCreateInfo`s, `VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT` **must** not be set in the `flags` of that element

- VUID-vkCreateComputePipelines-binaryCount-09622

If `VkPipelineBinaryInfoKHR::binaryCount` is not `0` for any element of `pCreateInfo`s, `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT` **must** not be set in the `flags` of that element

Valid Usage (Implicit)

- VUID-vkCreateComputePipelines-device-parameter

`device` **must** be a valid `VkDevice` handle

- VUID-vkCreateComputePipelines-pipelineCache-parameter

If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` **must** be a valid `VkPipelineCache` handle

- VUID-vkCreateComputePipelines-pCreateInfo-parameter

`pCreateInfo`s **must** be a valid pointer to an array of `createInfoCount` valid `VkComputePipelineCreateInfo` structures

- VUID-vkCreateComputePipelines-pAllocator-parameter

If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateComputePipelines-pPipelines-parameter

`pPipelines` **must** be a valid pointer to an array of `createInfoCount` `VkPipeline` handles

- VUID-vkCreateComputePipelines-createInfoCount-arraylength

`createInfoCount` **must** be greater than `0`

- VUID-vkCreateComputePipelines-pipelineCache-parent

If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`

- `VK_PIPELINE_COMPILE_REQUIRED_EXT`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_SHADER_NV`

The `VkComputePipelineCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkComputePipelineCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkPipelineCreateFlags     flags;
    VkPipelineShaderStageCreateInfo stage;
    VkPipelineLayout          layout;
    VkPipeline                basePipelineHandle;
    int32_t                  basePipelineIndex;
} VkComputePipelineCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stage` is a `VkPipelineShaderStageCreateInfo` structure describing the compute shader.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- `basePipelineHandle` is a pipeline to derive from.
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in [Pipeline Derivatives](#).

If the `pNext` chain includes a `VkPipelineCreateFlags2CreateInfoKHR` structure, `VkPipelineCreateFlags2CreateInfoKHR::flags` from that structure is used instead of `flags` from this structure.

Valid Usage

- VUID-VkComputePipelineCreateInfo-None-09497
If the `pNext` chain does not include a `VkPipelineCreateFlags2CreateInfoKHR` structure, `flags` **must** be a valid combination of `VkPipelineCreateFlagBits` values
- VUID-VkComputePipelineCreateInfo-flags-07984
If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1,

`basePipelineHandle` **must** be a valid compute `VkPipeline` handle

- VUID-VkComputePipelineCreateInfo-flags-07985

If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` **must** be a valid index into the calling command's `pCreateInfos` parameter

- VUID-VkComputePipelineCreateInfo-flags-07986

If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, `basePipelineIndex` **must** be -1 or `basePipelineHandle` **must** be `VK_NULL_HANDLE`

- VUID-VkComputePipelineCreateInfo-layout-07987

If a push constant block is declared in a shader, a push constant range in `layout` **must** match the shader stage

- VUID-VkComputePipelineCreateInfo-layout-10069

If a push constant block is declared in a shader, the block must be contained inside the push constant range in `layout` that matches the stage

- VUID-VkComputePipelineCreateInfo-layout-07988

If a `resource variables` is declared in a shader, a descriptor slot in `layout` **must** match the shader stage

- VUID-VkComputePipelineCreateInfo-layout-07990

If a `resource variables` is declared in a shader, and the descriptor type is not `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, a descriptor slot in `layout` **must** match the descriptor type

- VUID-VkComputePipelineCreateInfo-layout-07991

If a `resource variables` is declared in a shader as an array, a descriptor slot in `layout` **must** match the descriptor count

- VUID-VkComputePipelineCreateInfo-flags-03365

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`

- VUID-VkComputePipelineCreateInfo-flags-03366

<code>flags</code>	must	not	include
<code>VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR</code>			

- VUID-VkComputePipelineCreateInfo-flags-03367

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`

- VUID-VkComputePipelineCreateInfo-flags-03368

<code>flags</code>	must	not	include
<code>VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR</code>			

- VUID-VkComputePipelineCreateInfo-flags-03369

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`

- VUID-VkComputePipelineCreateInfo-flags-03370

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`

- VUID-VkComputePipelineCreateInfo-flags-03576

<code>flags</code>	must	not	include
<code>VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR</code>			

- VUID-VkComputePipelineCreateInfo-flags-04945
`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV`
- VUID-VkComputePipelineCreateInfo-flags-09007
 If the `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines` is not enabled, `flags` **must** not include `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`
- VUID-VkComputePipelineCreateInfo-flags-09008
 If `flags` includes `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`, then the `pNext` chain **must** include a pointer to a valid instance of `VkComputePipelineIndirectBufferInfoNV` specifying the address where the pipeline's metadata will be saved
- VUID-VkComputePipelineCreateInfo-flags-11007
 If `flags` includes `VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_EXT`, then the `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT::deviceGeneratedCommands` feature **must** be enabled
- VUID-VkComputePipelineCreateInfo-pipelineCreationCacheControl-02875
 If the `pipelineCreationCacheControl` feature is not enabled, `flags` **must** not include `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` or `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`
- VUID-VkComputePipelineCreateInfo-stage-00701
 The `stage` member of `stage` **must** be `VK_SHADER_STAGE_COMPUTE_BIT`
- VUID-VkComputePipelineCreateInfo-stage-00702
 The shader code for the entry point identified by `stage` and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the [Shader Interfaces](#) chapter
- VUID-VkComputePipelineCreateInfo-layout-01687
 The number of resources in `layout` accessible to the compute shader stage **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`
- VUID-VkComputePipelineCreateInfo-shaderEnqueue-09177
 If `shaderEnqueue` is not enabled, `flags` **must** not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`
- VUID-VkComputePipelineCreateInfo-flags-09178
 If `flags` does not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`, the shader specified by `stage` **must** not declare the `ShaderEnqueueAMD` capability
- VUID-VkComputePipelineCreateInfo-pipelineStageCreationFeedbackCount-06566
 If `VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount` is not 0, it **must** be 1
- VUID-VkComputePipelineCreateInfo-flags-07367
`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT`
- VUID-VkComputePipelineCreateInfo-flags-07996
`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV`

Valid Usage (Implicit)

- VUID-VkComputePipelineCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO`
- VUID-VkComputePipelineCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkComputePipelineIndirectBufferInfoNV`, `VkPipelineBinaryInfoKHR`, `VkPipelineCompilerControlCreateInfoAMD`, `VkPipelineCreateFlags2CreateInfoKHR`, `VkPipelineCreationFeedbackCreateInfo`, `VkPipelineRobustnessCreateInfoEXT`, or `VkSubpassShadingPipelineCreateInfoHUAWEI`
- VUID-VkComputePipelineCreateInfo-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkComputePipelineCreateInfo-stage-parameter
`stage` **must** be a valid `VkPipelineShaderStageCreateInfo` structure
- VUID-VkComputePipelineCreateInfo-layout-parameter
`layout` **must** be a valid `VkPipelineLayout` handle
- VUID-VkComputePipelineCreateInfo-commonparent
Both of `basePipelineHandle`, and `layout` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkPipelineShaderStageCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineShaderStageCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkPipelineShaderStageCreateFlags flags;
    VkShaderStageFlagBits stage;
    VkShaderModule      module;
    const char*         pName;
    const VkSpecializationInfo* pSpecializationInfo;
} VkPipelineShaderStageCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineShaderStageCreateFlagBits` specifying how the pipeline shader stage will be generated.
- `stage` is a `VkShaderStageFlagBits` value specifying a single pipeline stage.
- `module` is optionally a `VkShaderModule` object containing the shader code for this stage.
- `pName` is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
- `pSpecializationInfo` is a pointer to a `VkSpecializationInfo` structure, as described in

Specialization Constants, or **NULL**.

If **module** is not **VK_NULL_HANDLE**, the shader code used by the pipeline is defined by **module**. If **module** is **VK_NULL_HANDLE**, the shader code is defined by the chained **VkShaderModuleCreateInfo** if present.

If the **shaderModuleIdentifier** feature is enabled, applications **can** omit shader code for **stage** and instead provide a module identifier. This is done by including a **VkPipelineShaderStageModuleIdentifierCreateInfoEXT** struct with **identifierSize** not equal to 0 in the **pNext** chain. A shader stage created in this way is equivalent to one created using a shader module with the same identifier. The identifier allows an implementation to look up a pipeline without consuming a valid SPIR-V module. If a pipeline is not found, pipeline compilation is not possible and the implementation **must** fail as specified by **VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT**.

When an identifier is used in lieu of a shader module, implementations **may** fail pipeline compilation with **VK_PIPELINE_COMPILE_REQUIRED** for any reason.

NOTE

The rationale for the relaxed requirement on implementations to return a pipeline with **VkPipelineShaderStageModuleIdentifierCreateInfoEXT** is that layers or tools may intercept pipeline creation calls and require the full SPIR-V context to operate correctly. ICDs are not expected to fail pipeline compilation if the pipeline exists in a cache somewhere.

Applications **can** use identifiers when creating pipelines with **VK_PIPELINE_CREATE_LIBRARY_BIT_KHR**. When creating such pipelines, **VK_SUCCESS** **may** be returned, but subsequently fail when referencing the pipeline in a **VkPipelineLibraryCreateInfoKHR** struct. Applications **must** allow pipeline compilation to fail during link steps with **VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT** as it **may** not be possible to determine if a pipeline **can** be created from identifiers until the link step.

Valid Usage

- VUID-VkPipelineShaderStageCreateInfo-stage-00704
If the **geometryShader** feature is not enabled, **stage** **must** not be **VK_SHADER_STAGE_GEOMETRY_BIT**
- VUID-VkPipelineShaderStageCreateInfo-stage-00705
If the **tessellationShader** feature is not enabled, **stage** **must** not be **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT** or **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT**
- VUID-VkPipelineShaderStageCreateInfo-stage-02091
If the **meshShaders** feature is not enabled, **stage** **must** not be **VK_SHADER_STAGE_MESH_BIT_EXT**
- VUID-VkPipelineShaderStageCreateInfo-stage-02092
If the **taskShaders** feature is not enabled, **stage** **must** not be **VK_SHADER_STAGE_TASK_BIT_EXT**
- VUID-VkPipelineShaderStageCreateInfo-clustercullingShader-07813
If the **clustercullingShader** feature is not enabled, **stage** **must** not be

VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI

- VUID-VkPipelineShaderStageCreateInfo-stage-00706
`stage` **must** not be `VK_SHADER_STAGE_ALL_GRAPHICS`, or `VK_SHADER_STAGE_ALL`
- VUID-VkPipelineShaderStageCreateInfo-pName-00707
`pName` **must** be the name of an `OpEntryPoint` in `module` with an execution model that matches `stage`
- VUID-VkPipelineShaderStageCreateInfo-maxClipDistances-00708
If the identified entry point includes any variable in its interface that is declared with the `ClipDistance BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxClipDistances`
- VUID-VkPipelineShaderStageCreateInfo-maxCullDistances-00709
If the identified entry point includes any variable in its interface that is declared with the `CullDistance BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxCullDistances`
- VUID-VkPipelineShaderStageCreateInfo-maxCombinedClipAndCullDistances-00710
If the identified entry point includes variables in its interface that are declared with the `ClipDistance BuiltIn` decoration and variables in its interface that are declared with the `CullDistance BuiltIn` decoration, those variables **must** not have array sizes which sum to more than `VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances`
- VUID-VkPipelineShaderStageCreateInfo-maxSampleMaskWords-00711
If the identified entry point includes any variable in its interface that is declared with the `SampleMask BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxSampleMaskWords`
- VUID-VkPipelineShaderStageCreateInfo-stage-00713
If `stage` is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, and the identified entry point has an `OpExecutionMode` instruction specifying a patch size with `OutputVertices`, the patch size **must** be greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`
- VUID-VkPipelineShaderStageCreateInfo-stage-00714
If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction specifying a maximum output vertex count that is greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxGeometryOutputVertices`
- VUID-VkPipelineShaderStageCreateInfo-stage-00715
If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction specifying an invocation count that is greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxGeometryShaderInvocations`
- VUID-VkPipelineShaderStageCreateInfo-stage-02596
If `stage` is either `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`, and the identified entry point writes to `Layer` for any primitive, it **must** write the same value to `Layer` for all vertices of a given primitive
- VUID-VkPipelineShaderStageCreateInfo-stage-02597

If `stage` is either `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`, and the identified entry point writes to `ViewportIndex` for any primitive, it **must** write the same value to `ViewportIndex` for all vertices of a given primitive

- VUID-VkPipelineShaderStageCreateInfo-stage-06685

If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragDepth` in any execution path, all execution paths that are not exclusive to helper invocations **must** either discard the fragment, or write or initialize the value of `FragDepth`

- VUID-VkPipelineShaderStageCreateInfo-stage-06686

If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragStencilRefEXT` in any execution path, all execution paths that are not exclusive to helper invocations **must** either discard the fragment, or write or initialize the value of `FragStencilRefEXT`

- VUID-VkPipelineShaderStageCreateInfo-flags-02784

If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set, the `subgroupSizeControl` feature **must** be enabled

- VUID-VkPipelineShaderStageCreateInfo-flags-02785

If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set, the `computeFullSubgroups` feature **must** be enabled

- VUID-VkPipelineShaderStageCreateInfo-flags-08988

If `flags` includes `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT`, `stage` **must** be one of `VK_SHADER_STAGE_MESH_BIT_EXT`, `VK_SHADER_STAGE_TASK_BIT_EXT`, or `VK_SHADER_STAGE_COMPUTE_BIT`

- VUID-VkPipelineShaderStageCreateInfo-pNext-02754

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, `flags` **must** not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set

- VUID-VkPipelineShaderStageCreateInfo-pNext-02755

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the `subgroupSizeControl` feature **must** be enabled, and `stage` **must** be a valid bit specified in `requiredSubgroupSizeStages`

- VUID-VkPipelineShaderStageCreateInfo-pNext-02756

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain and `stage` is `VK_SHADER_STAGE_COMPUTE_BIT`, `VK_SHADER_STAGE_MESH_BIT_EXT`, or `VK_SHADER_STAGE_TASK_BIT_EXT`, the local workgroup size of the shader **must** be less than or equal to the product of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize` and `maxComputeWorkgroupSubgroups`

- VUID-VkPipelineShaderStageCreateInfo-pNext-02757

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, and `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set, the local workgroup size in the X dimension of the pipeline **must** be a multiple of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize`

- VUID-VkPipelineShaderStageCreateInfo-flags-02758

If `flags` has both the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` and `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flags set, the local workgroup size in the X dimension of the pipeline **must** be a multiple of `maxSubgroupSize`

- VUID-VkPipelineShaderStageCreateInfo-flags-02759

If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set and `flags` does not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the local workgroup size in the X dimension of the pipeline **must** be a multiple of `subgroupSize`

- VUID-VkPipelineShaderStageCreateInfo-module-08987

If `module` uses the `OpTypeCooperativeMatrixKHR` instruction with a `Scope` equal to `Subgroup`, then the local workgroup size in the X dimension of the pipeline **must** be a multiple of `subgroupSize`

- VUID-VkPipelineShaderStageCreateInfo-module-10169

If `module` uses the `OpTypeCooperativeMatrixKHR` instruction with a `Scope` equal to `Workgroup`, then the local workgroup size in the X dimension of the pipeline **must** be a multiple of `subgroupSize` and the total local workgroup size **must** be a power of two multiple of `subgroupSize` and **must** be less than or equal to `cooperativeMatrixWorkgroupScopeMaxWorkgroupSize`

- VUID-VkPipelineShaderStageCreateInfo-stage-08771

If a shader module identifier is not specified for this `stage`, `module` **must** be a valid `VkShaderModule`, or the `pNext` chain of the parent `Vk*CreateInfo` structure **must** set `VkPipelineBinaryInfoKHR::binaryCount` to a value greater than 0, if none of the following features are enabled:

- `graphicsPipelineLibrary`
- `maintenance5`

- VUID-VkPipelineShaderStageCreateInfo-stage-06845

If a shader module identifier is not specified for this `stage`, `module` **must** be a valid `VkShaderModule`, or there **must** be a valid `VkShaderModuleCreateInfo` structure in the `pNext` chain, or the `pNext` chain of the parent `Vk*CreateInfo` structure **must** set `VkPipelineBinaryInfoKHR::binaryCount` to a value greater than 0,

- VUID-VkPipelineShaderStageCreateInfo-stage-06844

If a shader module identifier is specified for this `stage`, the `pNext` chain **must** not include a `VkShaderModuleCreateInfo` structure

- VUID-VkPipelineShaderStageCreateInfo-stage-06848

If a shader module identifier is specified for this `stage`, `module` **must** be `VK_NULL_HANDLE`

- VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-06849

If a shader module identifier is not specified, the shader code used by the pipeline **must** be valid as described by the [Khronos SPIR-V Specification](#) after applying the specializations provided in `pSpecializationInfo`, if any, and then converting all specialization constants into fixed constants

Valid Usage (Implicit)

- VUID-VkPipelineShaderStageCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO`
- VUID-VkPipelineShaderStageCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDebugUtilsObjectNameInfoEXT`, `VkPipelineRobustnessCreateInfoEXT`, `VkPipelineShaderStageModuleIdentifierCreateInfoEXT`, `VkPipelineShaderStageNodeCreateInfoAMD`, `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo`, `VkShaderModuleCreateInfo`, or `VkShaderModuleValidationCacheCreateInfoEXT`
- VUID-VkPipelineShaderStageCreateInfo-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkPipelineShaderStageCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkPipelineShaderStageCreateFlagBits` values
- VUID-VkPipelineShaderStageCreateInfo-stage-parameter
`stage` **must** be a valid `VkShaderStageFlagBits` value
- VUID-VkPipelineShaderStageCreateInfo-module-parameter
If `module` is not `VK_NULL_HANDLE`, `module` **must** be a valid `VkShaderModule` handle
- VUID-VkPipelineShaderStageCreateInfo-pName-parameter
`pName` **must** be a null-terminated UTF-8 string
- VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-parameter
If `pSpecializationInfo` is not `NULL`, `pSpecializationInfo` **must** be a valid pointer to a valid `VkSpecializationInfo` structure

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineShaderStageCreateFlags;
```

`VkPipelineShaderStageCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineShaderStageCreateFlagBits`.

Possible values of the `flags` member of `VkPipelineShaderStageCreateInfo` specifying how a pipeline shader stage is created, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPipelineShaderStageCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT = 0x00000001,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT = 0x00000002,
    // Provided by VK_EXT_subgroup_size_control
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT =
VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT,
    // Provided by VK_EXT_subgroup_size_control
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT =
VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT,
} VkPipelineShaderStageCreateFlagBits;
```

- `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` specifies that the `SubgroupSize` **may** vary in the shader stage.
- `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` specifies that the subgroup sizes **must** be launched with all invocations active in the task, mesh, or compute stage.

NOTE

If `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` and `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` are specified and `minSubgroupSize` does not equal `maxSubgroupSize` and no `required subgroup size` is specified, then the only way to guarantee that the 'X' dimension of the local workgroup size is a multiple of `SubgroupSize` is to make it a multiple of `maxSubgroupSize`. Under these conditions, you are guaranteed full subgroups but not any particular subgroup size.

Bits which **can** be set by commands and structures, specifying one or more shader stages, are:

```

// Provided by VK_VERSION_1_0
typedef enum VkShaderStageFlagBits {
    VK_SHADER_STAGE_VERTEX_BIT = 0x00000001,
    VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT = 0x00000002,
    VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT = 0x00000004,
    VK_SHADER_STAGE_GEOMETRY_BIT = 0x00000008,
    VK_SHADER_STAGE_FRAGMENT_BIT = 0x00000010,
    VK_SHADER_STAGE_COMPUTE_BIT = 0x00000020,
    VK_SHADER_STAGE_ALL_GRAPHICS = 0x0000001F,
    VK_SHADER_STAGE_ALL = 0x7FFFFFFF,
// Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_RAYGEN_BIT_KHR = 0x00000100,
// Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_ANY_HIT_BIT_KHR = 0x00000200,
// Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR = 0x00000400,
// Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_MISS_BIT_KHR = 0x00000800,
// Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_INTERSECTION_BIT_KHR = 0x00001000,
// Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_CALLABLE_BIT_KHR = 0x00002000,
// Provided by VK_EXT_mesh_shader
    VK_SHADER_STAGE_TASK_BIT_EXT = 0x00000040,
// Provided by VK_EXT_mesh_shader
    VK_SHADER_STAGE_MESH_BIT_EXT = 0x00000080,
// Provided by VK_HUAWEI_subpass_shading
    VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI = 0x00004000,
// Provided by VK_HUAWEI_cluster_culling_shader
    VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI = 0x00080000,
// Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_RAYGEN_BIT_NV = VK_SHADER_STAGE_RAYGEN_BIT_KHR,
// Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_ANY_HIT_BIT_NV = VK_SHADER_STAGE_ANY_HIT_BIT_KHR,
// Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_CLOSEST_HIT_BIT_NV = VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR,
// Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_MISS_BIT_NV = VK_SHADER_STAGE_MISS_BIT_KHR,
// Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_INTERSECTION_BIT_NV = VK_SHADER_STAGE_INTERSECTION_BIT_KHR,
// Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_CALLABLE_BIT_NV = VK_SHADER_STAGE_CALLABLE_BIT_KHR,
// Provided by VK_NV_mesh_shader
    VK_SHADER_STAGE_TASK_BIT_NV = VK_SHADER_STAGE_TASK_BIT_EXT,
// Provided by VK_NV_mesh_shader
    VK_SHADER_STAGE_MESH_BIT_NV = VK_SHADER_STAGE_MESH_BIT_EXT,
} VkShaderStageFlagBits;

```

- **VK_SHADER_STAGE_VERTEX_BIT** specifies the vertex stage.

- `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` specifies the tessellation control stage.
- `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` specifies the tessellation evaluation stage.
- `VK_SHADER_STAGE_GEOMETRY_BIT` specifies the geometry stage.
- `VK_SHADER_STAGE_FRAGMENT_BIT` specifies the fragment stage.
- `VK_SHADER_STAGE_COMPUTE_BIT` specifies the compute stage.
- `VK_SHADER_STAGE_ALL_GRAPHICS` is a combination of bits used as shorthand to specify all graphics stages defined above (excluding the compute stage).
- `VK_SHADER_STAGE_ALL` is a combination of bits used as shorthand to specify all shader stages supported by the device, including all additional stages which are introduced by extensions.
- `VK_SHADER_STAGE_TASK_BIT_EXT` specifies the task stage.
- `VK_SHADER_STAGE_MESH_BIT_EXT` specifies the mesh stage.
- `VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI` specifies the cluster culling stage.
- `VK_SHADER_STAGE_RAYGEN_BIT_KHR` specifies the ray generation stage.
- `VK_SHADER_STAGE_ANY_HIT_BIT_KHR` specifies the any-hit stage.
- `VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR` specifies the closest hit stage.
- `VK_SHADER_STAGE_MISS_BIT_KHR` specifies the miss stage.
- `VK_SHADER_STAGE_INTERSECTION_BIT_KHR` specifies the intersection stage.
- `VK_SHADER_STAGE_CALLABLE_BIT_KHR` specifies the callable stage.

NOTE

`VK_SHADER_STAGE_ALL_GRAPHICS` only includes the original five graphics stages included in Vulkan 1.0, and not any stages added by extensions. Thus, it may not have the desired effect in all cases.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderStageFlags;
```

`VkShaderStageFlags` is a bitmask type for setting a mask of zero or more `VkShaderStageFlagBits`.

The `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPipelineShaderStageRequiredSubgroupSizeCreateInfo {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           requiredSubgroupSize;
} VkPipelineShaderStageRequiredSubgroupSizeCreateInfo;
```

or the equivalent

```
// Provided by VK_EXT_subgroup_size_control
typedef VkPipelineShaderStageRequiredSubgroupSizeCreateInfo
VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT;
```

or the equivalent

```
// Provided by VK_EXT_shader_object
typedef VkPipelineShaderStageRequiredSubgroupSizeCreateInfo
VkShaderRequiredSubgroupSizeCreateInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **requiredSubgroupSize** is an unsigned integer value specifying the required subgroup size for the newly created pipeline shader stage.

If a **VkPipelineShaderStageRequiredSubgroupSizeCreateInfo** structure is included in the **pNext** chain of **VkPipelineShaderStageCreateInfo**, it specifies that the pipeline shader stage being compiled has a required subgroup size.

If a **VkShaderRequiredSubgroupSizeCreateInfoEXT** structure is included in the **pNext** chain of **VkShaderCreateInfoEXT**, it specifies that the shader being compiled has a required subgroup size.

Valid Usage

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02760
requiredSubgroupSize **must** be a power-of-two integer
- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02761
requiredSubgroupSize **must** be greater or equal to **minSubgroupSize**
- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02762
requiredSubgroupSize **must** be less than or equal to **maxSubgroupSize**

Valid Usage (Implicit)

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-sType-sType
sType **must** be
VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED_SUBGROUP_SIZE_CREATE_INFO

A subpass shading pipeline is a compute pipeline which **must** be called only in a subpass of a render pass with work dimensions specified by render area size. The subpass shading pipeline shader is a compute shader allowed to access input attachments specified in the calling subpass. To

create a subpass shading pipeline, call [vkCreateComputePipelines](#) with [VkSubpassShadingPipelineCreateInfoHUAWEI](#) in the [pNext](#) chain of [VkComputePipelineCreateInfo](#).

The [VkSubpassShadingPipelineCreateInfoHUAWEI](#) structure is defined as:

```
// Provided by VK_HUAWEI_subpass_shading
typedef struct VkSubpassShadingPipelineCreateInfoHUAWEI {
    VkStructureType    sType;
    void*              pNext;
    VkRenderPass        renderPass;
    uint32_t            subpass;
} VkSubpassShadingPipelineCreateInfoHUAWEI;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [renderPass](#) is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline **must** only be used with a render pass instance compatible with the one provided. See [Render Pass Compatibility](#) for more information.
- [subpass](#) is the index of the subpass in the render pass where this pipeline will be used.

Valid Usage

- VUID-VkSubpassShadingPipelineCreateInfoHUAWEI-subpass-04946
[subpass](#) **must** be created with [VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI](#) bind point

Valid Usage (Implicit)

- VUID-VkSubpassShadingPipelineCreateInfoHUAWEI-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_SUBPASS_SHADING_PIPELINE_CREATE_INFO_HUAWEI](#)
- VUID-VkSubpassShadingPipelineCreateInfoHUAWEI-renderPass-parameter
[renderPass](#) **must** be a valid [VkRenderPass](#) handle

A subpass shading pipeline's workgroup size is a 2D vector with number of power-of-two in width and height. The maximum number of width and height is implementation-dependent, and **may** vary for different formats and sample counts of attachments in a render pass.

To query the maximum workgroup size, call:

```
// Provided by VK_HUAWEI_subpass_shading
VkResult vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI(
    VkDevice          device,
    VkRenderPass       renderpass,
    VkExtent2D*        pMaxWorkgroupSize);
```

- **device** is a handle to a local device object that was used to create the given render pass.
- **renderPass** is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline **must** only be used with a render pass instance compatible with the one provided. See [Render Pass Compatibility](#) for more information.
- **pMaxWorkgroupSize** is a pointer to a [VkExtent2D](#) structure.

Valid Usage (Implicit)

- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-renderpass-parameter **renderpass** **must** be a valid [VkRenderPass](#) handle
- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-pMaxWorkgroupSize-parameter **pMaxWorkgroupSize** **must** be a valid pointer to [VkExtent2D](#) structures
- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-renderpass-parent **renderpass** **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_SURFACE_LOST_KHR**

The **VkPipelineRobustnessCreateInfoEXT** structure is defined as:

```
// Provided by VK_EXT_pipeline_robustness
typedef struct VkPipelineRobustnessCreateInfoEXT {
    VkStructureType             sType;
    const void*                 pNext;
    VkPipelineRobustnessBufferBehaviorEXT storageBuffers;
    VkPipelineRobustnessBufferBehaviorEXT uniformBuffers;
    VkPipelineRobustnessBufferBehaviorEXT vertexInputs;
    VkPipelineRobustnessImageBehaviorEXT  images;
} VkPipelineRobustnessCreateInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- `storageBuffers` sets the behavior of out of bounds accesses made to resources bound as:
 - `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`
 - `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`
 - `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`
- `uniformBuffers` describes the behavior of out of bounds accesses made to resources bound as:
 - `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`
 - `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`
 - `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`
 - `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`
- `vertexInputs` describes the behavior of out of bounds accesses made to vertex input attributes
- `images` describes the behavior of out of bounds accesses made to resources bound as:
 - `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`
 - `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`

Resources bound as `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` will have the robustness behavior that covers its active descriptor type.

The scope of the effect of `VkPipelineRobustnessCreateInfoEXT` depends on which structure's `pNext` chain it is included in.

- `VkGraphicsPipelineCreateInfo`, `VkRayTracingPipelineCreateInfoKHR`, `VkComputePipelineCreateInfo`:
The robustness behavior described by `VkPipelineRobustnessCreateInfoEXT` applies to all accesses through this pipeline
- `VkPipelineShaderStageCreateInfo`:
The robustness behavior described by `VkPipelineRobustnessCreateInfoEXT` applies to all accesses emanating from the shader code of this shader stage

If `VkPipelineRobustnessCreateInfoEXT` is specified for both a pipeline and a pipeline stage, the `VkPipelineRobustnessCreateInfoEXT` specified for the pipeline stage will take precedence.

When `VkPipelineRobustnessCreateInfoEXT` is specified for a pipeline, it only affects the subset of the pipeline that is specified by the create info, as opposed to subsets linked from pipeline libraries. For `VkGraphicsPipelineCreateInfo`, that subset is specified by `VkGraphicsPipelineLibraryCreateInfoEXT::flags`. For `VkRayTracingPipelineCreateInfoKHR`, that subset is specified by the specific stages in `VkRayTracingPipelineCreateInfoKHR::pStages`.

Valid Usage

- VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06926
If the `pipelineRobustness` feature is not enabled, `storageBuffers` **must** be `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT`
- VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06927
If the `pipelineRobustness` feature is not enabled, `uniformBuffers` **must** be

VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT

- VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06928
If the `pipelineRobustness` feature is not enabled, `vertexInputs` **must** be VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT
- VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06929
If the `pipelineRobustness` feature is not enabled, `images` **must** be VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT_EXT
- VUID-VkPipelineRobustnessCreateInfoEXT-robustImageAccess-06930
If the `robustImageAccess` feature is not supported, `images` **must** not be VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_EXT
- VUID-VkPipelineRobustnessCreateInfoEXT-robustBufferAccess2-06931
If the `robustBufferAccess2` feature is not supported, `storageBuffers` **must** not be VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT
- VUID-VkPipelineRobustnessCreateInfoEXT-robustBufferAccess2-06932
If the `robustBufferAccess2` feature is not supported, `uniformBuffers` **must** not be VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT
- VUID-VkPipelineRobustnessCreateInfoEXT-robustBufferAccess2-06933
If the `robustBufferAccess2` feature is not supported, `vertexInputs` **must** not be VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT
- VUID-VkPipelineRobustnessCreateInfoEXT-robustImageAccess2-06934
If the `robustImageAccess2` feature is not supported, `images` **must** not be VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2_EXT

Valid Usage (Implicit)

- VUID-VkPipelineRobustnessCreateInfoEXT-sType-sType
`sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_ROBUSTNESS_CREATE_INFO_EXT
- VUID-VkPipelineRobustnessCreateInfoEXT-storageBuffers-parameter
`storageBuffers` **must** be a valid [VkPipelineRobustnessBufferBehaviorEXT](#) value
- VUID-VkPipelineRobustnessCreateInfoEXT-uniformBuffers-parameter
`uniformBuffers` **must** be a valid [VkPipelineRobustnessBufferBehaviorEXT](#) value
- VUID-VkPipelineRobustnessCreateInfoEXT-vertexInputs-parameter
`vertexInputs` **must** be a valid [VkPipelineRobustnessBufferBehaviorEXT](#) value
- VUID-VkPipelineRobustnessCreateInfoEXT-images-parameter
`images` **must** be a valid [VkPipelineRobustnessImageBehaviorEXT](#) value

Possible values of the `storageBuffers`, `uniformBuffers`, and `vertexInputs` members of [VkPipelineRobustnessCreateInfoEXT](#) are:

```
// Provided by VK_EXT_pipeline_robustness
typedef enum VkPipelineRobustnessBufferBehaviorEXT {
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT = 0,
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DISABLED_EXT = 1,
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT = 2,
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT = 3,
} VkPipelineRobustnessBufferBehaviorEXT;
```

- `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT` specifies that this pipeline stage follows the behavior of robustness features that are enabled on the device that created this pipeline
- `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DISABLED_EXT` specifies that buffer accesses by this pipeline stage to the relevant resource types **must** not be out of bounds
- `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` specifies that out of bounds accesses by this pipeline stage to the relevant resource types behave as if the `robustBufferAccess` feature is enabled
- `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` specifies that out of bounds accesses by this pipeline stage to the relevant resource types behave as if the `robustBufferAccess2` feature is enabled

Possible values of the `images` member of `VkPipelineRobustnessCreateInfoEXT` are:

```
// Provided by VK_EXT_pipeline_robustness
typedef enum VkPipelineRobustnessImageBehaviorEXT {
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT_EXT = 0,
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DISABLED_EXT = 1,
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_EXT = 2,
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2_EXT = 3,
} VkPipelineRobustnessImageBehaviorEXT;
```

- `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT_EXT` specifies that this pipeline stage follows the behavior of robustness features that are enabled on the device that created this pipeline
- `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DISABLED_EXT` specifies that image accesses by this pipeline stage to the relevant resource types **must** not be out of bounds
- `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_EXT` specifies that out of bounds accesses by this pipeline stage to images behave as if the `robustImageAccess` feature is enabled
- `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2_EXT` specifies that out of bounds accesses by this pipeline stage to images behave as if the `robustImageAccess2` feature is enabled

An identifier **can** be provided instead of shader code in an attempt to compile pipelines without providing complete SPIR-V to the implementation.

The `VkPipelineShaderStageModuleIdentifierCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_shader_module_identifier
typedef struct VkPipelineShaderStageModuleIdentifierCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           identifierSize;
    const uint8_t*      pIdentifier;
} VkPipelineShaderStageModuleIdentifierCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `identifierSize` is the size, in bytes, of the buffer pointed to by `pIdentifier`.
- `pIdentifier` is a pointer to a buffer of opaque data specifying an identifier.

Any identifier **can** be used. If the pipeline being created with identifier requires compilation to complete the pipeline creation call, pipeline compilation **must** fail as defined by `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT`.

`pIdentifier` and `identifierSize` **can** be obtained from an `VkShaderModuleIdentifierEXT` queried earlier.

Valid Usage

- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pNext-06850
If this structure is included in a `pNext` chain and `identifierSize` is not equal to 0, the `shaderModuleIdentifier` feature **must** be enabled
- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pNext-06851
If this struct is included in a `pNext` chain of `VkPipelineShaderStageCreateInfo` and `identifierSize` is not equal to 0, the pipeline **must** be created with the `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` flag set
- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-identifierSize-06852
`identifierSize` **must** be less-or-equal to `VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT`

Valid Usage (Implicit)

- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_MODULE_IDENTIFIER_CREATE_INFO_EXT`
- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pIdentifier-parameter
If `identifierSize` is not 0, `pIdentifier` **must** be a valid pointer to an array of `identifierSize` `uint8_t` values

If a compute pipeline is going to be used in `Device-Generated Commands` by specifying its pipeline token with `VkBindPipelineIndirectCommandNV`, then that pipeline's associated metadata **must** be

saved at a specified buffer device address for later use in indirect command generation. The buffer device address **must** be specified at the time of compute pipeline creation with `VkComputePipelineIndirectBufferInfoNV` structure in the `pNext` chain of `VkComputePipelineCreateInfo`.

The `VkComputePipelineIndirectBufferInfoNV` structure is defined as:

```
// Provided by VK_NV_device_generated_commands_compute
typedef struct VkComputePipelineIndirectBufferInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceAddress     deviceAddress;
    VkDeviceSize        size;
    VkDeviceAddress     pipelineDeviceAddressCaptureReplay;
} VkComputePipelineIndirectBufferInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceAddress` is the address where the pipeline's metadata will be stored.
- `size` is the size of pipeline's metadata that was queried using `vkGetPipelineIndirectMemoryRequirementsNV`.
- `pipelineDeviceAddressCaptureReplay` is the device address where pipeline's metadata was originally saved and can now be used to re-populate `deviceAddress` for replay.

If `pipelineDeviceAddressCaptureReplay` is zero, no specific address is requested. If `pipelineDeviceAddressCaptureReplay` is not zero, then it **must** be an address retrieved from an identically created pipeline on the same implementation. The pipeline metadata **must** also be placed on an identically created buffer and at the same offset using the `vkCmdUpdatePipelineIndirectBufferNV` command.

Valid Usage

- VUID-VkComputePipelineIndirectBufferInfoNV-deviceGeneratedComputePipelines-09009
The `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines` feature **must** be enabled
- VUID-VkComputePipelineIndirectBufferInfoNV-flags-09010
The pipeline creation flags in `VkComputePipelineCreateInfo::flags` **must** include `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`
- VUID-VkComputePipelineIndirectBufferInfoNV-deviceAddress-09011
`deviceAddress` **must** be aligned to the `VkMemoryRequirements2::alignment`, as returned by `vkGetPipelineIndirectMemoryRequirementsNV`
- VUID-VkComputePipelineIndirectBufferInfoNV-deviceAddress-09012
`deviceAddress` **must** have been allocated from a buffer that was created with usage `VK_BUFFER_USAGE_TRANSFER_DST_BIT` and `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT`

- VUID-VkComputePipelineIndirectBufferInfoNV-size-09013
`size` **must** be greater than or equal to the `VkMemoryRequirements2::size`, as returned by `vkGetPipelineIndirectMemoryRequirementsNV`
- VUID-VkComputePipelineIndirectBufferInfoNV-pipelineDeviceAddressCaptureReplay-09014
If `pipelineDeviceAddressCaptureReplay` is non-zero then the `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputeCaptureReplay` feature **must** be enabled
- VUID-VkComputePipelineIndirectBufferInfoNV-pipelineDeviceAddressCaptureReplay-09015
If `pipelineDeviceAddressCaptureReplay` is non-zero then that address **must** have been allocated with flag `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` set
- VUID-VkComputePipelineIndirectBufferInfoNV-pipelineDeviceAddressCaptureReplay-09016
If `pipelineDeviceAddressCaptureReplay` is non-zero, the `pipeline` **must** have been recreated for replay
- VUID-VkComputePipelineIndirectBufferInfoNV-pipelineDeviceAddressCaptureReplay-09017
`pipelineDeviceAddressCaptureReplay` **must** satisfy the `alignment` and `size` requirements similar to `deviceAddress`

Valid Usage (Implicit)

- VUID-VkComputePipelineIndirectBufferInfoNV-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_INDIRECT_BUFFER_INFO_NV`

To save a compute pipeline's metadata at a device address call:

```
// Provided by VK_NV_device_generated_commands_compute
void vkCmdUpdatePipelineIndirectBufferNV(
    VkCommandBuffer          commandBuffer,
    VkPipelineBindPoint      pipelineBindPoint,
    VkPipeline               pipeline);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the type of pipeline whose metadata will be saved.
- `pipeline` is the pipeline whose metadata will be saved.

`vkCmdUpdatePipelineIndirectBufferNV` is only allowed outside of a render pass. This command is treated as a “transfer” operation for the purposes of synchronization barriers. The writes to the address **must** be synchronized using stages `VK_PIPELINE_STAGE_2_COPY_BIT` and `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV` and with access masks `VK_ACCESS_MEMORY_WRITE_BIT`

and `VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV` respectively before using the results in preprocessing.

Valid Usage

- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipelineBindPoint-09018
`pipelineBindPoint` **must** be `VK_PIPELINE_BIND_POINT_COMPUTE`
- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipeline-09019
`pipeline` **must** have been created with `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV` flag set
- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipeline-09020
`pipeline` **must** have been created with `VkComputePipelineIndirectBufferInfoNV` structure specifying a valid address where its metadata will be saved
- VUID-vkCmdUpdatePipelineIndirectBufferNV-deviceGeneratedComputePipelines-09021
The `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCmdUpdatePipelineIndirectBufferNV-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipelineBindPoint-parameter
`pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value
- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipeline-parameter
`pipeline` **must** be a valid `VkPipeline` handle
- VUID-vkCmdUpdatePipelineIndirectBufferNV-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdUpdatePipelineIndirectBufferNV-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations
- VUID-vkCmdUpdatePipelineIndirectBufferNV-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdUpdatePipelineIndirectBufferNV-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdUpdatePipelineIndirectBufferNV-commonparent
Both of `commandBuffer`, and `pipeline` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	Transfer Graphics Compute	Action

10.3. Graphics Pipelines

Graphics pipelines consist of multiple shader stages, multiple fixed-function pipeline stages, and a pipeline layout.

To create graphics pipelines, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateGraphicsPipelines(
    VkDevice                device,
    VkPipelineCache         pipelineCache,
    uint32_t               createInfoCount,
    const VkGraphicsPipelineCreateInfo* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkPipeline*             pPipelines);
```

- `device` is the logical device that creates the graphics pipelines.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled; or the handle of a valid `pipeline cache` object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkGraphicsPipelineCreateInfo` structures.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pPipelines` is a pointer to an array of `VkPipeline` handles in which the resulting graphics pipeline objects are returned.

The `VkGraphicsPipelineCreateInfo` structure includes an array of `VkPipelineShaderStageCreateInfo` structures for each of the desired active shader stages, as well as creation information for all relevant fixed-function stages, and a pipeline layout.

Pipelines are created and returned as described for [Multiple Pipeline Creation](#).

Valid Usage

- VUID-vkCreateGraphicsPipelines-device-09662
`device` **must** support at least one queue family with the `VK_QUEUE_GRAPHICS_BIT` capability
- VUID-vkCreateGraphicsPipelines-flags-00720
If the `flags` member of any element of `pCreateInfo`s contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not `-1`, `basePipelineIndex` **must** be less than the index into `pCreateInfo`s that corresponds to that element
- VUID-vkCreateGraphicsPipelines-flags-00721
If the `flags` member of any element of `pCreateInfo`s contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline **must** have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set
- VUID-vkCreateGraphicsPipelines-pipelineCache-02876
If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to `pipelineCache` **must** be `externally synchronized`
- VUID-vkCreateGraphicsPipelines-pNext-09616
If `VkPipelineBinaryInfoKHR::binaryCount` is not `0` for any element of `pCreateInfo`s, `pipelineCache` **must** be `VK_NULL_HANDLE`
- VUID-vkCreateGraphicsPipelines-pNext-09617
If a `VkPipelineCreateFlags2CreateInfoKHR` structure with the `VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR` flag set is included in the `pNext` chain of any element of `pCreateInfo`s, `pipelineCache` **must** be `VK_NULL_HANDLE`
- VUID-vkCreateGraphicsPipelines-binaryCount-09620
If `VkPipelineBinaryInfoKHR::binaryCount` is not `0` for any element of `pCreateInfo`s, `VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT` **must** not be set in the `flags` of that element
- VUID-vkCreateGraphicsPipelines-binaryCount-09621
If `VkPipelineBinaryInfoKHR::binaryCount` is not `0` for any element of `pCreateInfo`s, `VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT` **must** not be set in the `flags` of that element
- VUID-vkCreateGraphicsPipelines-binaryCount-09622
If `VkPipelineBinaryInfoKHR::binaryCount` is not `0` for any element of `pCreateInfo`s, `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT` **must** not be set in the `flags` of that element

NOTE

An implicit cache may be provided by the implementation or a layer. For this reason, it is still valid to set `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` on `flags` for any element of `pCreateInfo`s while passing `VK_NULL_HANDLE` for `pipelineCache`.

Valid Usage (Implicit)

- VUID-vkCreateGraphicsPipelines-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateGraphicsPipelines-pipelineCache-parameter
If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` **must** be a valid `VkPipelineCache` handle
- VUID-vkCreateGraphicsPipelines-pCreateInfos-parameter
`pCreateInfos` **must** be a valid pointer to an array of `createInfoCount` valid `VkGraphicsPipelineCreateInfo` structures
- VUID-vkCreateGraphicsPipelines-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateGraphicsPipelines-pPipelines-parameter
`pPipelines` **must** be a valid pointer to an array of `createInfoCount` `VkPipeline` handles
- VUID-vkCreateGraphicsPipelines-createInfoCount-arraylength
`createInfoCount` **must** be greater than `0`
- VUID-vkCreateGraphicsPipelines-pipelineCache-parent
If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`
- `VK_PIPELINE_COMPILE_REQUIRED_EXT`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_SHADER_NV`

The `VkGraphicsPipelineCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkGraphicsPipelineCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineCreateFlags     flags;
    uint32_t                  stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineVertexInputStateCreateInfo* pVertexInputState;
    const VkPipelineInputAssemblyStateCreateInfo* pInputAssemblyState;
    const VkPipelineTessellationStateCreateInfo* pTessellationState;
    const VkPipelineViewportStateCreateInfo* pViewportState;
    const VkPipelineRasterizationStateCreateInfo* pRasterizationState;
    const VkPipelineMultisampleStateCreateInfo* pMultisampleState;
    const VkPipelineDepthStencilStateCreateInfo* pDepthStencilState;
    const VkPipelineColorBlendStateCreateInfo* pColorBlendState;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout          layout;
    VkRenderPass              renderPass;
    uint32_t                  subpass;
    VkPipeline                basePipelineHandle;
    int32_t                   basePipelineIndex;
} VkGraphicsPipelineCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of `stageCount` `VkPipelineShaderStageCreateInfo` structures describing the set of the shader stages to be included in the graphics pipeline.
- `pVertexInputState` is a pointer to a `VkPipelineVertexInputStateCreateInfo` structure. It is ignored if the pipeline includes a mesh shader stage. It **can** be `NULL` if the pipeline is created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state set.
- `pInputAssemblyState` is a pointer to a `VkPipelineInputAssemblyStateCreateInfo` structure which determines input assembly behavior for vertex shading, as described in [Drawing Commands](#). If the `VK_EXT_extended_dynamic_state3` extension is enabled, it **can** be `NULL` if the pipeline is created with both `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`, and `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic states set and `dynamicPrimitiveTopologyUnrestricted` is `VK_TRUE`. It is ignored if the pipeline includes a mesh shader stage.
- `pTessellationState` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure defining tessellation state used by tessellation shaders. It **can** be `NULL` if the pipeline is created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state set.
- `pViewportState` is a pointer to a `VkPipelineViewportStateCreateInfo` structure defining viewport state used when rasterization is enabled. If the `VK_EXT_extended_dynamic_state3` extension is enabled, it **can** be `NULL` if the pipeline is created with both `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic states

set.

- `pRasterizationState` is a pointer to a [VkPipelineRasterizationStateCreateInfo](#) structure defining rasterization state. If the [VK_EXT_extended_dynamic_state3](#) extension is enabled, it **can** be `NULL` if the pipeline is created with all of `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT`, `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE`, `VK_DYNAMIC_STATE_POLYGON_MODE_EXT`, `VK_DYNAMIC_STATE_CULL_MODE`, `VK_DYNAMIC_STATE_FRONT_FACE`, `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_BIAS`, and `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic states set.
- `pMultisampleState` is a pointer to a [VkPipelineMultisampleStateCreateInfo](#) structure defining multisample state used when rasterization is enabled. If the [VK_EXT_extended_dynamic_state3](#) extension is enabled, it **can** be `NULL` if the pipeline is created with all of `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT`, `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT`, and `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic states set, and either [alphaToOne](#) is disabled on the device or `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` is set, in which case [VkPipelineMultisampleStateCreateInfo::sampleShadingEnable](#) is assumed to be `VK_FALSE`.
- `pDepthStencilState` is a pointer to a [VkPipelineDepthStencilStateCreateInfo](#) structure defining depth/stencil state used when rasterization is enabled for depth or stencil attachments accessed during rendering. If the [VK_EXT_extended_dynamic_state3](#) extension is enabled, it **can** be `NULL` if the pipeline is created with all of `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`, `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_OP`, and `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic states set.
- `pColorBlendState` is a pointer to a [VkPipelineColorBlendStateCreateInfo](#) structure defining color blend state used when rasterization is enabled for any color attachments accessed during rendering. If the [VK_EXT_extended_dynamic_state3](#) extension is enabled, it **can** be `NULL` if the pipeline is created with all of `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT`, `VK_DYNAMIC_STATE_LOGIC_OP_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic states set.
- `pDynamicState` is a pointer to a [VkPipelineDynamicStateCreateInfo](#) structure defining which properties of the pipeline state object are dynamic and **can** be changed independently of the pipeline state. This **can** be `NULL`, which means no state in the pipeline is considered dynamic.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- `renderPass` is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline **must** only be used with a render pass instance compatible with the one provided. See [Render Pass Compatibility](#) for more information.
- `subpass` is the index of the subpass in the render pass where this pipeline will be used.
- `basePipelineHandle` is a pipeline to derive from.
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in [Pipeline Derivatives](#).

If any shader stage fails to compile, the compile log will be reported back to the application, and `VK_ERROR_INVALID_SHADER_NV` will be generated.

NOTE

With `VK_EXT_extended_dynamic_state3`, it is possible that many of the `VkGraphicsPipelineCreateInfo` members above **can** be `NULL` because all their state is dynamic and therefore ignored. This is optional so the application **can** still use a valid pointer if it needs to set the `pNext` or `flags` fields to specify state for other extensions.

The state required for a graphics pipeline is divided into [vertex input state](#), [pre-rasterization shader state](#), [fragment shader state](#), and [fragment output state](#).

Vertex Input State

Vertex input state is defined by:

- [VkPipelineVertexInputStateCreateInfo](#)
- [VkPipelineInputAssemblyStateCreateInfo](#)

If this pipeline specifies [pre-rasterization state](#) either directly or by including it as a pipeline library and its `pStages` includes a vertex shader, this state **must** be specified to create a [complete graphics pipeline](#).

If a pipeline includes `VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT` in `VkGraphicsPipelineLibraryCreateInfoEXT::flags` either explicitly or as a default, and either the conditions requiring this state for a [complete graphics pipeline](#) are met or this pipeline does not specify [pre-rasterization state](#) in any way, that pipeline **must** specify this state directly.

Pre-Rasterization Shader State

Pre-rasterization shader state is defined by:

- [VkPipelineShaderStageCreateInfo](#) entries for:
 - Vertex shaders
 - Tessellation control shaders
 - Tessellation evaluation shaders
 - Geometry shaders
 - Task shaders
 - Mesh shaders
- Within the [VkPipelineLayout](#), all descriptor sets with pre-rasterization shader bindings if `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was specified.
 - If `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was not specified, the full pipeline layout **must** be specified.
- [VkPipelineViewportStateCreateInfo](#)
- [VkPipelineRasterizationStateCreateInfo](#)
- [VkPipelineTessellationStateCreateInfo](#)

- `VkRenderPass` and `subpass` parameter
- The `viewMask` parameter of `VkPipelineRenderingCreateInfo` (formats are ignored)
- `VkPipelineDiscardRectangleStateCreateInfoEXT`
- `VkPipelineFragmentShadingRateStateCreateInfoKHR`

This state **must** be specified to create a [complete graphics pipeline](#).

If either the `pNext` chain includes a `VkGraphicsPipelineLibraryCreateInfoEXT` structure with `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` included in `flags`, or it is not specified and would default to include that value, this state **must** be specified in the pipeline.

Fragment Shader State

Fragment shader state is defined by:

- A `VkPipelineShaderStageCreateInfo` entry for the fragment shader
- Within the `VkPipelineLayout`, all descriptor sets with fragment shader bindings if `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was specified.
 - If `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was not specified, the full pipeline layout **must** be specified.
- `VkPipelineMultisampleStateCreateInfo` if `sample shading` is enabled or `renderpass` is not `VK_NULL_HANDLE`
- `VkPipelineDepthStencilStateCreateInfo`
- `VkRenderPass` and `subpass` parameter
- The `viewMask` parameter of `VkPipelineRenderingCreateInfo` (formats are ignored)
- `VkPipelineFragmentShadingRateStateCreateInfoKHR`
- `VkPipelineFragmentShadingRateEnumStateCreateInfoNV`
- `VkPipelineRepresentativeFragmentTestStateCreateInfoNV`
- Inclusion/omission of the `VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` flag
- Inclusion/omission of the `VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT` flag
- `VkRenderingInputAttachmentIndexInfoKHR`

If a pipeline specifies [pre-rasterization state](#) either directly or by including it as a pipeline library and `rasterizerDiscardEnable` is `VK_FALSE` or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` is used, this state **must** be specified to create a [complete graphics pipeline](#).

If a pipeline includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` in `VkGraphicsPipelineLibraryCreateInfoEXT::flags` either explicitly or as a default, and either the conditions requiring this state for a [complete graphics pipeline](#) are met or this pipeline does not specify [pre-rasterization state](#) in any way, that pipeline **must** specify this state directly.

Fragment Output State

Fragment output state is defined by:

- [VkPipelineColorBlendStateCreateInfo](#)
- [VkRenderPass](#) and [subpass](#) parameter
- [VkPipelineMultisampleStateCreateInfo](#)
- [VkPipelineRenderingCreateInfo](#)
- [VkAttachmentSampleCountInfoAMD](#)
- [VkAttachmentSampleCountInfoNV](#)
- [VkExternalFormatANDROID](#)
- Inclusion/omission of the [VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT](#) and [VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT](#) flags
- Inclusion/omission of the [VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT](#) flag
- [VkRenderingAttachmentLocationInfoKHR](#)

If a pipeline specifies [pre-rasterization state](#) either directly or by including it as a pipeline library and [rasterizerDiscardEnable](#) is [VK_FALSE](#) or [VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE](#) is used, this state **must** be specified to create a [complete graphics pipeline](#).

If a pipeline includes [VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT](#) in [VkGraphicsPipelineLibraryCreateInfoEXT::flags](#) either explicitly or as a default, and either the conditions requiring this state for a [complete graphics pipeline](#) are met or this pipeline does not specify [pre-rasterization state](#) in any way, that pipeline **must** specify this state directly.

Dynamic State

Dynamic state values set via [pDynamicState](#) **must** be ignored if the state they correspond to is not otherwise statically set by one of the state subsets used to create the pipeline. Additionally, setting dynamic state values **must** not modify whether state in a linked library is static or dynamic; this is set and unchangeable when the library is created. For example, if a pipeline only included [pre-rasterization shader state](#), then any dynamic state value corresponding to depth or stencil testing has no effect. Any linked library that has dynamic state enabled that same dynamic state **must** also be enabled in all the other linked libraries to which that dynamic state applies.

Complete Graphics Pipelines

A complete graphics pipeline always includes [pre-rasterization shader state](#), with other subsets included depending on that state as specified in the above sections.

Graphics Pipeline Library Layouts

If different subsets are linked together with pipeline layouts created with [VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT](#), the final effective pipeline layout is effectively the union of the linked pipeline layouts. When binding descriptor sets for this pipeline, the pipeline layout used **must** be compatible with this union. This pipeline layout **can** be overridden when linking with [VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT](#) by providing a [VkPipelineLayout](#) that is [compatible](#) with this union other than [VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT](#), or when linking without [VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT](#) by providing a [VkPipelineLayout](#) that is fully [compatible](#) with this union.

If the `pNext` chain includes a `VkPipelineCreateFlags2CreateInfoKHR` structure, `VkPipelineCreateFlags2CreateInfoKHR::flags` from that structure is used instead of `flags` from this structure.

Valid Usage

- VUID-VkGraphicsPipelineCreateInfo-None-09497
If the `pNext` chain does not include a `VkPipelineCreateFlags2CreateInfoKHR` structure, `flags` **must** be a valid combination of `VkPipelineCreateFlagBits` values
- VUID-VkGraphicsPipelineCreateInfo-flags-07984
If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` **must** be a valid graphics `VkPipeline` handle
- VUID-VkGraphicsPipelineCreateInfo-flags-07985
If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` **must** be a valid index into the calling command's `pCreateInfos` parameter
- VUID-VkGraphicsPipelineCreateInfo-flags-07986
If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, `basePipelineIndex` **must** be -1 or `basePipelineHandle` **must** be `VK_NULL_HANDLE`
- VUID-VkGraphicsPipelineCreateInfo-layout-07987
If a push constant block is declared in a shader, a push constant range in `layout` **must** match the shader stage
- VUID-VkGraphicsPipelineCreateInfo-layout-10069
If a push constant block is declared in a shader, the block must be contained inside the push constant range in `layout` that matches the stage
- VUID-VkGraphicsPipelineCreateInfo-layout-07988
If a `resource variables` is declared in a shader, a descriptor slot in `layout` **must** match the shader stage
- VUID-VkGraphicsPipelineCreateInfo-layout-07990
If a `resource variables` is declared in a shader, and the descriptor type is not `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, a descriptor slot in `layout` **must** match the descriptor type
- VUID-VkGraphicsPipelineCreateInfo-layout-07991
If a `resource variables` is declared in a shader as an array, a descriptor slot in `layout` **must** match the descriptor count
- VUID-VkGraphicsPipelineCreateInfo-stage-02096
If the pipeline requires `pre-rasterization shader state` the `stage` member of one element of `pStages` **must** be `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_EXT`
- VUID-VkGraphicsPipelineCreateInfo-pStages-02095
If the pipeline requires `pre-rasterization shader state` the geometric shader stages provided in `pStages` **must** be either from the mesh shading pipeline (`stage` is `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`) or from the primitive shading pipeline (`stage` is `VK_SHADER_STAGE_VERTEX_BIT`,

VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, or VK_SHADER_STAGE_GEOMETRY_BIT)

- VUID-VkGraphicsPipelineCreateInfo-pStages-09631
If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) contains both VK_SHADER_STAGE_TASK_BIT_EXT and VK_SHADER_STAGE_MESH_BIT_EXT, then the mesh shader's entry point **must** not declare a variable with a [DrawIndex BuiltIn](#) decoration
- VUID-VkGraphicsPipelineCreateInfo-TaskNV-07063
The shader stages for VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT **must** use either the [TaskNV](#) and [MeshNV Execution Model](#) or the [TaskEXT](#) and [MeshEXT Execution Model](#), but **must** not use both
- VUID-VkGraphicsPipelineCreateInfo-pStages-00729
If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes a tessellation control shader stage, it **must** include a tessellation evaluation shader stage
- VUID-VkGraphicsPipelineCreateInfo-pStages-00730
If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes a tessellation evaluation shader stage, it **must** include a tessellation control shader stage
- VUID-VkGraphicsPipelineCreateInfo-pStages-09022
If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes a tessellation control shader stage, and the [VK_EXT_extended_dynamic_state3](#) extension is not enabled or the [VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT](#) dynamic state is not set, [pTessellationState](#) **must** be a valid pointer to a valid [VkPipelineTessellationStateCreateInfo](#) structure
- VUID-VkGraphicsPipelineCreateInfo-pTessellationState-09023
If [pTessellationState](#) is not NULL it **must** be a pointer to a valid [VkPipelineTessellationStateCreateInfo](#) structure
- VUID-VkGraphicsPipelineCreateInfo-pStages-00732
If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes tessellation shader stages, the shader code of at least one stage **must** contain an [OpExecutionMode](#) instruction specifying the type of subdivision in the pipeline
- VUID-VkGraphicsPipelineCreateInfo-pStages-00733
If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes tessellation shader stages, and the shader code of both stages contain an [OpExecutionMode](#) instruction specifying the type of subdivision in the pipeline, they **must** both specify the same subdivision mode
- VUID-VkGraphicsPipelineCreateInfo-pStages-00734
If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes tessellation shader stages, the shader code of at least one stage **must** contain an [OpExecutionMode](#) instruction specifying the output patch size in the pipeline
- VUID-VkGraphicsPipelineCreateInfo-pStages-00735
If the pipeline requires [pre-rasterization shader state](#) and [pStages](#) includes tessellation shader stages, and the shader code of both contain an [OpExecutionMode](#) instruction specifying the out patch size in the pipeline, they **must** both specify the same patch size
- VUID-VkGraphicsPipelineCreateInfo-pStages-08888

If the pipeline is being created with [pre-rasterization shader state](#) and [vertex input state](#) and `pStages` includes tessellation shader stages, and either `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state is not enabled or `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, the `topology` member of `pInputAssembly` **must** be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`

- VUID-VkGraphicsPipelineCreateInfo-topology-08889

If the pipeline is being created with [pre-rasterization shader state](#) and [vertex input state](#) and the `topology` member of `pInputAssembly` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, and either `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state is not enabled or `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, then `pStages` **must** include tessellation shader stages

- VUID-VkGraphicsPipelineCreateInfo-TessellationEvaluation-07723

If the pipeline is being created with a [TessellationEvaluation Execution Model](#), no [Geometry Execution Model](#), uses the [PointMode Execution Mode](#), and `shaderTessellationAndGeometryPointSize` is enabled, a `PointSize` decorated variable **must** be written to if `maintenance5` is not enabled

- VUID-VkGraphicsPipelineCreateInfo-topology-08773

If the pipeline is being created with a [Vertex Execution Model](#) and no [TessellationEvaluation](#) or [Geometry Execution Model](#), and the `topology` member of `pInputAssembly` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, and either `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state is not enabled or `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, a `PointSize` decorated variable **must** be written to if `maintenance5` is not enabled

- VUID-VkGraphicsPipelineCreateInfo-maintenance5-08775

If `maintenance5` is enabled and a `PointSize` decorated variable is written to, all execution paths **must** write to a `PointSize` decorated variable

- VUID-VkGraphicsPipelineCreateInfo-TessellationEvaluation-07724

If the pipeline is being created with a [TessellationEvaluation Execution Model](#), no [Geometry Execution Model](#), uses the [PointMode Execution Mode](#), and `shaderTessellationAndGeometryPointSize` is not enabled, a `PointSize` decorated variable **must** not be written to

- VUID-VkGraphicsPipelineCreateInfo-shaderTessellationAndGeometryPointSize-08776

If the pipeline is being created with a [Geometry Execution Model](#), uses the [OutputPoints Execution Mode](#), and `shaderTessellationAndGeometryPointSize` is enabled, a `PointSize` decorated variable **must** be written to for every vertex emitted if `maintenance5` is not enabled

- VUID-VkGraphicsPipelineCreateInfo-Geometry-07726

If the pipeline is being created with a [Geometry Execution Model](#), uses the [OutputPoints Execution Mode](#), and `shaderTessellationAndGeometryPointSize` is not enabled, a `PointSize` decorated variable **must** not be written to

- VUID-VkGraphicsPipelineCreateInfo-pStages-00738

If the pipeline requires [pre-rasterization shader state](#) and `pStages` includes a geometry shader stage, and does not include any tessellation shader stages, its shader code **must** contain an `OpExecutionMode` instruction specifying an input primitive type that is [compatible](#) with the primitive topology specified in `pInputAssembly`

- VUID-VkGraphicsPipelineCreateInfo-pStages-00739
If the pipeline requires [pre-rasterization shader state](#) and `pStages` includes a geometry shader stage, and also includes tessellation shader stages, its shader code **must** contain an `OpExecutionMode` instruction specifying an input primitive type that is [compatible](#) with the primitive topology that is output by the tessellation stages
- VUID-VkGraphicsPipelineCreateInfo-pStages-00740
If the pipeline requires [pre-rasterization shader state](#) and [fragment shader state](#), it includes both a fragment shader and a geometry shader, and the fragment shader code reads from an input variable that is decorated with `PrimitiveId`, then the geometry shader code **must** write to a matching output variable, decorated with `PrimitiveId`, in all execution paths
- VUID-VkGraphicsPipelineCreateInfo-PrimitiveId-06264
If the pipeline requires [pre-rasterization shader state](#), it includes a mesh shader and the fragment shader code reads from an input variable that is decorated with `PrimitiveId`, then the mesh shader code **must** write to a matching output variable, decorated with `PrimitiveId`, in all execution paths
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06038
If `renderPass` is not `VK_NULL_HANDLE` and the pipeline is being created with [fragment shader state](#) the fragment shader **must** not read from any input attachment that is defined as `VK_ATTACHMENT_UNUSED` in `subpass`
- VUID-VkGraphicsPipelineCreateInfo-pStages-00742
If the pipeline requires [pre-rasterization shader state](#) and multiple pre-rasterization shader stages are included in `pStages`, the shader code for the entry points identified by those `pStages` and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the [Shader Interfaces](#) chapter
- VUID-VkGraphicsPipelineCreateInfo-None-04889
If the pipeline requires [pre-rasterization shader state](#) and [fragment shader state](#), the fragment shader and last [pre-rasterization shader stage](#) and any relevant state **must** adhere to the pipeline linking rules described in the [Shader Interfaces](#) chapter
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06041
If `renderPass` is not `VK_NULL_HANDLE`, and the pipeline is being created with [fragment output interface state](#), then for each color attachment in the subpass, if the [potential format features](#) of the format of the corresponding attachment description do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` **must** be `VK_FALSE`
- VUID-VkGraphicsPipelineCreateInfo-renderPass-07609
If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with [fragment output interface state](#), the `pColorBlendState` pointer is not `NULL`, the `attachmentCount` member of `pColorBlendState` is not ignored, and the subpass uses color attachments, the `attachmentCount` member of `pColorBlendState` **must** be equal to the `colorAttachmentCount` used to create `subpass`
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04130
If the pipeline requires [pre-rasterization shader state](#), and `pViewportState->pViewports` is not dynamic, then `pViewportState->pViewports` **must** be a valid pointer to an array of `pViewportState->viewportCount` valid `VkViewport` structures

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04131
If the pipeline requires [pre-rasterization shader state](#), and `pViewportState->pScissors` is not dynamic, then `pViewportState->pScissors` **must** be a valid pointer to an array of `pViewportState->scissorCount` `VkRect2D` structures
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00749
If the pipeline requires [pre-rasterization shader state](#), and the `wideLines` feature is not enabled, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_LINE_WIDTH`, the `lineWidth` member of `pRasterizationState` **must** be `1.0`
- VUID-VkGraphicsPipelineCreateInfo-rasterizerDiscardEnable-09024
If the pipeline requires [pre-rasterization shader state](#), and the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state is enabled or the `rasterizerDiscardEnable` member of `pRasterizationState` is `VK_FALSE`, and [related dynamic state is not set](#), `pViewportState` **must** be a valid pointer to a valid `VkPipelineViewportStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-pViewportState-09025
If `pViewportState` is not `NULL` it **must** be a valid pointer to a valid `VkPipelineViewportStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-pMultisampleState-09026
If the pipeline requires [fragment output interface state](#), and the `VK_EXT_extended_dynamic_state3` extension is not enabled or any of the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT`, `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT`, or `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic states is not set, or [alphaToOne](#) is enabled on the device and `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` is not set, `pMultisampleState` **must** be a valid pointer to a valid `VkPipelineMultisampleStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-pMultisampleState-09027
If `pMultisampleState` is not `NULL` it **must** be a valid pointer to a valid `VkPipelineMultisampleStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-alphaToCoverageEnable-08891
If the pipeline is being created with [fragment shader state](#), the `VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable` is not ignored and is `VK_TRUE`, then the [Fragment Output Interface](#) **must** contain a variable for the alpha Component word in Location 0 at Index 0
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09028
If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with [fragment shader state](#), and `subpass` uses a depth/stencil attachment, and [related dynamic state is not set](#), `pDepthStencilState` **must** be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-pDepthStencilState-09029
If `pDepthStencilState` is not `NULL` it **must** be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09030
If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with [fragment output interface state](#), and `subpass` uses color attachments, and [related dynamic state is not set](#),

`pColorBlendState` **must** be a valid pointer to a valid `VkPipelineColorBlendStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00754

If the pipeline requires `pre-rasterization shader state`, the `depthBiasClamp` feature is not enabled, no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_DEPTH_BIAS`, and the `depthBiasEnable` member of `pRasterizationState` is `VK_TRUE`, the `depthBiasClamp` member of `pRasterizationState` **must** be `0.0`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-02510

If the pipeline requires `fragment shader state`, the `VK_EXT_depth_range_unrestricted` extension is not enabled and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_DEPTH_BOUNDS`, and the `depthBoundsTestEnable` member of `pDepthStencilState` is `VK_TRUE`, the `minDepthBounds` and `maxDepthBounds` members of `pDepthStencilState` **must** be between `0.0` and `1.0`, inclusive

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07610

If the pipeline requires `fragment shader state` or `fragment output interface state`, and `rasterizationSamples` and `sampleLocationsInfo` are not dynamic, and `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` included in the `pNext` chain of `pMultisampleState` is `VK_TRUE`, `sampleLocationsInfo.sampleLocationGridSize.width` **must** evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07611

If the pipeline requires `fragment shader state` or `fragment output interface state`, and `rasterizationSamples` and `sampleLocationsInfo` are not dynamic, and `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` the included in the `pNext` chain of `pMultisampleState` is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` is used, `sampleLocationsInfo.sampleLocationGridSize.height` **must** evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07612

If the pipeline requires `fragment shader state` or `fragment output interface state`, and `rasterizationSamples` and `sampleLocationsInfo` are not dynamic, and `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` included in the `pNext` chain of `pMultisampleState` is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` is used, `sampleLocationsInfo.sampleLocationsPerPixel` **must** equal `rasterizationSamples`

- VUID-VkGraphicsPipelineCreateInfo-sampleLocationsEnable-01524

If the pipeline requires `fragment shader state`, and the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT` structure included in the `pNext` chain of `pMultisampleState` is `VK_TRUE`, the fragment shader code **must** not statically use the extended instruction `InterpolateAtSample`

- VUID-VkGraphicsPipelineCreateInfo-multisampledRenderToSingleSampled-06853

If the pipeline requires `fragment output interface state`, and none of the `VK_AMD_mixed_attachment_samples` extension, the `VK_NV_framebuffer_mixed_samples` extension, or the `multisampledRenderToSingleSampled` feature are enabled, `rasterizationSamples` is not dynamic, and if `subpass` uses color and/or depth/stencil attachments, then the `rasterizationSamples` member of `pMultisampleState` **must** be the same as the sample count for those subpass attachments

- VUID-VkGraphicsPipelineCreateInfo-subpass-01505

If the pipeline requires `fragment output interface state`, and the `VK_AMD_mixed_attachment_samples` extension is enabled, `rasterizationSamples` is not dynamic, and if `subpass` uses color and/or depth/stencil attachments, then the `rasterizationSamples` member of `pMultisampleState` **must** equal the maximum of the sample counts of those subpass attachments

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06854

If `renderPass` is not `VK_NULL_HANDLE`, the `VK_EXT_multisampled_render_to_single_sampled` extension is enabled, `rasterizationSamples` is not dynamic, and `subpass` has a `VkMultisampledRenderToSingleSampledInfoEXT` structure included in the `VkSubpassDescription2::pNext` chain with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the `rasterizationSamples` member of `pMultisampleState` **must** be equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`

- VUID-VkGraphicsPipelineCreateInfo-subpass-01411

If the pipeline requires `fragment output interface state`, the `VK_NV_framebuffer_mixed_samples` extension is enabled, `rasterizationSamples` is not dynamic, and if `subpass` has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled, then the `rasterizationSamples` member of `pMultisampleState` **must** be the same as the sample count of the depth/stencil attachment

- VUID-VkGraphicsPipelineCreateInfo-subpass-01412

If the pipeline requires `fragment output interface state`, the `VK_NV_framebuffer_mixed_samples` extension is enabled, `rasterizationSamples` is not dynamic, and if `subpass` has any color attachments, then the `rasterizationSamples` member of `pMultisampleState` **must** be greater than or equal to the sample count for those subpass attachments

- VUID-VkGraphicsPipelineCreateInfo-coverageReductionMode-02722

If the pipeline requires `fragment output interface state`, the `VK_NV_coverage_reduction_mode` extension is enabled, and `rasterizationSamples` is not dynamic, the coverage reduction mode specified by `VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode`, the `rasterizationSamples` member of `pMultisampleState` and the sample counts for the color and depth/stencil attachments (if the subpass has them) **must** be a valid combination returned by `vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV`

- VUID-VkGraphicsPipelineCreateInfo-subpass-00758

If the pipeline requires `fragment output interface state`, `rasterizationSamples` is not dynamic, and `subpass` does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` member of `pMultisampleState` **must** follow the rules for a `zero-attachment subpass`

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06046

If `renderPass` is not `VK_NULL_HANDLE`, `subpass` **must** be a valid subpass within `renderPass`

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06047

If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with `pre-rasterization shader state`, `subpass` `viewMask` is not `0`, and `multiviewTessellationShader` is not enabled, then `pStages` **must** not include tessellation shaders

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06048

If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with `pre-rasterization shader state`, `subpass` `viewMask` is not `0`, and `multiviewGeometryShader` is not enabled, then `pStages` **must** not include a geometry shader

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06050

If `renderPass` is not `VK_NULL_HANDLE` and the pipeline is being created with `pre-rasterization shader state`, and `subpass` `viewMask` is not `0`, then all of the shaders in the pipeline **must** not include variables decorated with the `Layer` built-in decoration in their interfaces

- VUID-VkGraphicsPipelineCreateInfo-renderPass-07064

If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with `pre-rasterization shader state`, `subpass` `viewMask` is not `0`, and `multiviewMeshShader` is not enabled, then `pStages` **must** not include a mesh shader

- VUID-VkGraphicsPipelineCreateInfo-flags-00764

`flags` **must** not contain the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag

- VUID-VkGraphicsPipelineCreateInfo-pStages-01565

If the pipeline requires `fragment shader state` and an input attachment was referenced by an `aspectMask` at `renderPass` creation time, the fragment shader **must** only read from the aspects that were specified for that input attachment

- VUID-VkGraphicsPipelineCreateInfo-layout-01688

The number of resources in `layout` accessible to each shader stage that is used by the pipeline **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-01715

If the pipeline requires `pre-rasterization shader state`, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV`, and the `viewportWScalingEnable` member of a `VkPipelineViewportWScalingStateCreateInfoNV` structure, included in the `pNext` chain of `pViewportState`, is `VK_TRUE`, the `pViewportWScalings` member of the `VkPipelineViewportWScalingStateCreateInfoNV` **must** be a pointer to an array of `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` valid `VkViewportWScalingNV` structures

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04056

If the pipeline requires `pre-rasterization shader state`, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV`, and if `pViewportState->pNext` chain includes a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure, and if its `exclusiveScissorCount` member is not `0`, then its `pExclusiveScissors` member **must** be a valid pointer to an array of `exclusiveScissorCount` `VkRect2D` structures

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07854

If `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV` is included in the `pDynamicStates` array

then the implementation **must** support at least `specVersion 2` of the `VK_NV_scissor_exclusive` extension

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04057

If the pipeline requires `pre-rasterization shader state`, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV`, and if `pViewportState->pNext` chain includes a `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure, then its `pShadingRatePalettes` member **must** be a valid pointer to an array of `viewportCount` valid `VkShadingRatePaletteNV` structures

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04058

If the pipeline requires `pre-rasterization shader state`, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT`, and if `pNext` chain includes a `VkPipelineDiscardRectangleStateCreateInfoEXT` structure, and if its `discardRectangleCount` member is not 0, then its `pDiscardRectangles` member **must** be a valid pointer to an array of `discardRectangleCount` `VkRect2D` structures

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07855

If `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` is included in the `pDynamicStates` array then the implementation **must** support at least `specVersion 2` of the `VK_EXT_discard_rectangles` extension

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07856

If `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` is included in the `pDynamicStates` array then the implementation **must** support at least `specVersion 2` of the `VK_EXT_discard_rectangles` extension

- VUID-VkGraphicsPipelineCreateInfo-pStages-02097

If the pipeline requires `vertex input state`, and `pVertexInputState` is not dynamic, then `pVertexInputState` **must** be a valid pointer to a valid `VkPipelineVertexInputStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-Input-07904

If the pipeline is being created with `vertex input state` and `pVertexInputState` is not dynamic, then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` **must** contain a location in `VkVertexInputAttributeDescription::location`

- VUID-VkGraphicsPipelineCreateInfo-Input-08733

If the pipeline requires `vertex input state` and `pVertexInputState` is not dynamic, then the numeric type associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be the same as `VkVertexInputAttributeDescription::format`

- VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08929

If the pipeline is being created with `vertex input state` and `pVertexInputState` is not dynamic, and `VkVertexInputAttributeDescription::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be 64-bit

- VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08930

If the pipeline is being created with `vertex input state` and `pVertexInputState` is not

dynamic, and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription::format` **must** have a 64-bit component

- VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-09198

If the pipeline is being created with `vertex input state` and `pVertexInputState` is not dynamic, and `VkVertexInputAttributeDescription::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** not use components that are not present in the format

- VUID-VkGraphicsPipelineCreateInfo-dynamicPrimitiveTopologyUnrestricted-09031

If the pipeline requires `vertex input state`, and `related dynamic state is not set`, `pInputAssemblyState` **must** be a valid pointer to a valid `VkPipelineInputAssemblyStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-pInputAssemblyState-09032

If `pInputAssemblyState` is not `NULL` it **must** be a valid pointer to a valid `VkPipelineInputAssemblyStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-pStages-02317

If the pipeline requires `pre-rasterization shader state`, the `Xfb` execution mode **can** be specified by no more than one shader stage in `pStages`

- VUID-VkGraphicsPipelineCreateInfo-pStages-02318

If the pipeline requires `pre-rasterization shader state`, and any shader stage in `pStages` specifies `Xfb` execution mode it **must** be the last `pre-rasterization shader stage`

- VUID-VkGraphicsPipelineCreateInfo-rasterizationStream-02319

If the pipeline requires `pre-rasterization shader state`, and a `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream` value other than zero is specified, all variables in the output interface of the entry point being compiled decorated with `Position`, `PointSize`, `ClipDistance`, or `CullDistance` **must** be decorated with identical `Stream` values that match the `rasterizationStream`

- VUID-VkGraphicsPipelineCreateInfo-rasterizationStream-02320

If the pipeline requires `pre-rasterization shader state`, and `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream` is zero, or not specified, all variables in the output interface of the entry point being compiled decorated with `Position`, `PointSize`, `ClipDistance`, or `CullDistance` **must** be decorated with a `Stream` value of zero, or **must** not specify the `Stream` decoration

- VUID-VkGraphicsPipelineCreateInfo-geometryStreams-02321

If the pipeline requires `pre-rasterization shader state`, and the last `pre-rasterization shader stage` is a geometry shader, and that geometry shader uses the `GeometryStreams` capability, then `VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams` feature **must** be enabled

- VUID-VkGraphicsPipelineCreateInfo-None-02322

If the pipeline requires `pre-rasterization shader state`, and there are any mesh shader stages in the pipeline there **must** not be any shader stage in the pipeline with a `Xfb` execution mode

- VUID-VkGraphicsPipelineCreateInfo-lineRasterizationMode-02766

If the pipeline requires `pre-rasterization shader state` and at least one of `fragment output`

interface state or fragment shader state, and `pMultisampleState` is not `NULL`, the `lineRasterizationMode` member of a `VkPipelineRasterizationLineStateCreateInfoKHR` structure included in the `pNext` chain of `pRasterizationState` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR` or `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, then the `alphaToCoverageEnable`, `alphaToOneEnable`, and `sampleShadingEnable` members of `pMultisampleState` **must** all be `VK_FALSE`

- VUID-VkGraphicsPipelineCreateInfo-stippledLineEnable-02767

If the pipeline requires `pre-rasterization shader state`, the `stippledLineEnable` member of `VkPipelineRasterizationLineStateCreateInfoKHR` is `VK_TRUE`, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT`, then the `lineStippleFactor` member of `VkPipelineRasterizationLineStateCreateInfoKHR` **must** be in the range [1,256]

- VUID-VkGraphicsPipelineCreateInfo-shaderMeshEnqueue-10187

If `shaderMeshEnqueue` is not enabled, shaders specified by `pStages` **must** not declare the `ShaderEnqueueAMD` capability

- VUID-VkGraphicsPipelineCreateInfo-flags-10188

If `flags` does not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`, shaders specified by `pStages` **must** not declare the `ShaderEnqueueAMD` capability

- VUID-VkGraphicsPipelineCreateInfo-pStages-10189

If any shader stages in `pStages` declare the `ShaderEnqueueAMD` capability, `VK_PIPELINE_CREATE_2_EXECUTION_GRAPH_BIT_AMD` and `VK_PIPELINE_CREATE_2_LIBRARY_BIT_KHR` **must** be included in `flags`

- VUID-VkGraphicsPipelineCreateInfo-flags-10190

If `VK_PIPELINE_CREATE_2_EXECUTION_GRAPH_BIT_AMD` is included in `flags`, and the pipeline requires `pre-rasterization shader state`, there **must** not be a task or vertex shader specified in `pStages`

- VUID-VkGraphicsPipelineCreateInfo-flags-10191

If `VK_PIPELINE_CREATE_2_EXECUTION_GRAPH_BIT_AMD` is included in `flags`, all elements of `VkPipelineLibraryCreateInfoKHR::pLibraries` **must** have been created with `VK_PIPELINE_CREATE_2_EXECUTION_GRAPH_BIT_AMD`

- VUID-VkGraphicsPipelineCreateInfo-flags-03372

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`

- VUID-VkGraphicsPipelineCreateInfo-flags-03373

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`

- VUID-VkGraphicsPipelineCreateInfo-flags-03374

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`

- VUID-VkGraphicsPipelineCreateInfo-flags-03375

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`

- VUID-VkGraphicsPipelineCreateInfo-flags-03376

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`

- VUID-VkGraphicsPipelineCreateInfo-flags-03377
flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-flags-03577
flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-flags-04947
flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03378
If the `extendedDynamicState` feature is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is less than Version 1.3 there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_CULL_MODE`, `VK_DYNAMIC_STATE_FRONT_FACE`, `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`, `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`, `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`, `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE`, `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`, `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`, or `VK_DYNAMIC_STATE_STENCIL_OP`
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03379
If the pipeline requires `pre-rasterization shader state`, and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is included in the `pDynamicStates` array then `viewportCount` **must** be zero
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03380
If the pipeline requires `pre-rasterization shader state`, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` is included in the `pDynamicStates` array then `scissorCount` **must** be zero
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04132
If the pipeline requires `pre-rasterization shader state`, and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is included in the `pDynamicStates` array then `VK_DYNAMIC_STATE_VIEWPORT` **must** not be present
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04133
If the pipeline requires `pre-rasterization shader state`, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` is included in the `pDynamicStates` array then `VK_DYNAMIC_STATE_SCISSOR` **must** not be present
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07065
If the pipeline requires `pre-rasterization shader state`, and includes a mesh shader, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`, or `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE`
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04868
If the `extendedDynamicState2` feature is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is less than Version 1.3 there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE`, `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`, or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE`
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04869

If the `extendedDynamicState2LogicOp` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LOGIC_OP_EXT`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04870

If the `extendedDynamicState2PatchControlPoints` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07066

If the pipeline requires `pre-rasterization shader state`, and includes a mesh shader, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`, or `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`

- VUID-VkGraphicsPipelineCreateInfo-flags-02877

If `flags` includes `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`, then the `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature **must** be enabled

- VUID-VkGraphicsPipelineCreateInfo-flags-02966

If the pipeline requires `pre-rasterization shader state` and `flags` includes `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`, then all stages **must** not specify `Xfb` execution mode

- VUID-VkGraphicsPipelineCreateInfo-libraryCount-06648

If the pipeline is not created with a `complete set of state`, or `VkPipelineLibraryCreateInfoKHR::libraryCount` is not `0`, `VkGraphicsPipelineShaderGroupsCreateInfoNV::groupCount` and `VkGraphicsPipelineShaderGroupsCreateInfoNV::pipelineCount` **must** be `0`

- VUID-VkGraphicsPipelineCreateInfo-libraryCount-06649

If the pipeline is created with a `complete set of state`, and `VkPipelineLibraryCreateInfoKHR::libraryCount` is `0`, and the `pNext` chain includes an instance of `VkGraphicsPipelineShaderGroupsCreateInfoNV`, `VkGraphicsPipelineShaderGroupsCreateInfoNV::groupCount` **must** be greater than `0`

- VUID-VkGraphicsPipelineCreateInfo-flags-11000

If `flags` includes `VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_EXT`, then the `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT::deviceGeneratedCommands` feature **must** be enabled

- VUID-VkGraphicsPipelineCreateInfo-flags-11001

If the pipeline requires `pre-rasterization shader state` and `flags` includes `VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_EXT`, then all stages **must** not specify `Xfb` execution mode

- VUID-VkGraphicsPipelineCreateInfo-pipelineCreationCacheControl-02878

If the `pipelineCreationCacheControl` feature is not enabled, `flags` **must** not include `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` or `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`

- VUID-VkGraphicsPipelineCreateInfo-pipelineProtectedAccess-07368

If the `pipelineProtectedAccess` feature is not enabled, `flags` **must** not include `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT` or `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`

- VUID-VkGraphicsPipelineCreateInfo-flags-07369
`flags` **must** not include both `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT` and `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04494
 If the pipeline requires `pre-rasterization shader state` or `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` **must** be greater than or equal to 1
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04495
 If the pipeline requires `pre-rasterization shader state` or `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height` **must** be greater than or equal to 1
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04496
 If the pipeline requires `pre-rasterization shader state` or `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` **must** be a power-of-two value
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04497
 If the pipeline requires `pre-rasterization shader state` or `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height` **must** be a power-of-two value
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04498
 If the pipeline requires `pre-rasterization shader state` or `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` **must** be less than or equal to 4
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04499
 If the pipeline requires `pre-rasterization shader state` or `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height` **must** be less than or equal to 4
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04500
 If the pipeline requires `pre-rasterization shader state` or `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `pipelineFragmentShadingRate` feature is not enabled, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` and `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height` **must** both be equal to 1
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06567
 If the pipeline requires `pre-rasterization shader state` or `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0]` **must** be a valid `VkFragmentShadingRateCombinerOpKHR` value

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06568
If the pipeline requires [pre-rasterization shader state](#) or [fragment shader state](#) and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1]` **must** be a valid `VkFragmentShadingRateCombinerOpKHR` value
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04501
If the pipeline requires [pre-rasterization shader state](#) or [fragment shader state](#) and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `primitiveFragmentShadingRate` feature is not enabled, `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04502
If the pipeline requires [pre-rasterization shader state](#) or [fragment shader state](#) and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `attachmentFragmentShadingRate` feature is not enabled, `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`
- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04503
If the pipeline requires [pre-rasterization shader state](#) and the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is not included in `pDynamicState->pDynamicStates`, and `VkPipelineViewportStateCreateInfo::viewportCount` is greater than 1, entry points specified in `pStages` **must** not write to the `PrimitiveShadingRateKHR` built-in
- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04504
If the pipeline requires [pre-rasterization shader state](#) and the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and entry points specified in `pStages` write to the `ViewportIndex` built-in, they **must** not also write to the `PrimitiveShadingRateKHR` built-in
- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04505
If the pipeline requires [pre-rasterization shader state](#) and the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and entry points specified in `pStages` write to the `ViewportMaskNV` built-in, they **must** not also write to the `PrimitiveShadingRateKHR` built-in
- VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04506
If the pipeline requires [pre-rasterization shader state](#) or [fragment shader state](#), the `fragmentShadingRateNonTrivialCombinerOps` limit is not supported, and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, elements of `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`
- VUID-VkGraphicsPipelineCreateInfo-None-06569
If the pipeline requires [fragment shader state](#) and

`VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRateType` **must** be a valid `VkFragmentShadingRateTypeNV` value

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06570

If the pipeline requires `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate` **must** be a valid `VkFragmentShadingRateNV` value

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06571

If the pipeline requires `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[0]` **must** be a valid `VkFragmentShadingRateCombinerOpKHR` value

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06572

If the pipeline requires `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[1]` **must** be a valid `VkFragmentShadingRateCombinerOpKHR` value

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04569

If the pipeline requires `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `fragmentShadingRateEnums` feature is not enabled, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRateType` **must** be equal to `VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04570

If the pipeline requires `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `pipelineFragmentShadingRate` feature is not enabled, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate` **must** be equal to `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04571

If the pipeline requires `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `primitiveFragmentShadingRate` feature is not enabled, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[0]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04572

If the pipeline requires `fragment shader state` and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `attachmentFragmentShadingRate` feature is not enabled, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[1]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04573

If the pipeline requires `fragment shader state`, and the `fragmentShadingRateNonTrivialCombinerOps` limit is not supported and

VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, elements of VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps **must** be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR or VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR

- VUID-VkGraphicsPipelineCreateInfo-None-04574

If the pipeline requires [fragment shader state](#), and the [supersampleFragmentShadingRates](#) feature is not enabled, [VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate](#) **must** not be equal to VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV, VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV, VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV, or VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV

- VUID-VkGraphicsPipelineCreateInfo-None-04575

If the pipeline requires [fragment shader state](#), and the [noInvocationFragmentShadingRates](#) feature is not enabled, [VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate](#) **must** not be equal to VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03578

All elements of the pDynamicStates member of pDynamicState **must** not be VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04807

If the pipeline requires [pre-rasterization shader state](#) and the [vertexInputDynamicState](#) feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_VERTEX_INPUT_EXT

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07067

If the pipeline requires [pre-rasterization shader state](#), and includes a mesh shader, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_VERTEX_INPUT_EXT

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04800

If the [colorWriteEnable](#) feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT

- VUID-VkGraphicsPipelineCreateInfo-rasterizationSamples-04899

If the pipeline requires [fragment shader state](#), and the [VK_QCOM_render_pass_shader_resolve](#) extension is enabled, [rasterizationSamples](#) is not dynamic, and if subpass has any input attachments, and if the subpass description contains VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM, then the sample count of the input attachments **must** equal [rasterizationSamples](#)

- VUID-VkGraphicsPipelineCreateInfo-sampleShadingEnable-04900

If the pipeline requires [fragment shader state](#), and the [VK_QCOM_render_pass_shader_resolve](#) extension is enabled, and if the subpass description contains VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM, then [sampleShadingEnable](#) **must** be false

- VUID-VkGraphicsPipelineCreateInfo-flags-04901

If [flags](#) includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, then the subpass **must** be the last subpass in a subpass dependency chain

- VUID-VkGraphicsPipelineCreateInfo-flags-04902

If `flags` includes `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, and if `pResolveAttachments` is not `NULL`, then each resolve attachment **must** be `VK_ATTACHMENT_UNUSED`

- VUID-VkGraphicsPipelineCreateInfo-dynamicRendering-06576

If the `dynamicRendering` feature is not enabled and the pipeline requires `pre-rasterization shader state`, `fragment shader state`, or `fragment output interface state`, `renderPass` **must** not be `VK_NULL_HANDLE`

- VUID-VkGraphicsPipelineCreateInfo-multiview-06577

If the `multiview` feature is not enabled, the pipeline requires `pre-rasterization shader state`, `fragment shader state`, or `fragment output interface state`, and `renderPass` is `VK_NULL_HANDLE`, `VkPipelineRenderingCreateInfo::viewMask` **must** be 0

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06578

If the pipeline requires `pre-rasterization shader state`, `fragment shader state`, or `fragment output interface state`, and `renderPass` is `VK_NULL_HANDLE`, the index of the most significant bit in `VkPipelineRenderingCreateInfo::viewMask` **must** be less than `maxMultiviewViewCount`

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06579

If the pipeline requires `fragment output interface state`, and `renderPass` is `VK_NULL_HANDLE`, and `VkPipelineRenderingCreateInfo::colorAttachmentCount` is not 0, `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkFormat` values

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06580

If the pipeline requires `fragment output interface state`, and `renderPass` is `VK_NULL_HANDLE`, each element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` **must** be a valid `VkFormat` value

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06582

If the pipeline requires `fragment output interface state`, `renderPass` is `VK_NULL_HANDLE`, and any element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` is not `VK_FORMAT_UNDEFINED`, that format **must** be a format with `potential format features` that include `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06583

If the pipeline requires `fragment output interface state`, and `renderPass` is `VK_NULL_HANDLE`, `VkPipelineRenderingCreateInfo::depthAttachmentFormat` **must** be a valid `VkFormat` value

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06584

If the pipeline requires `fragment output interface state`, and `renderPass` is `VK_NULL_HANDLE`, `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` **must** be a valid `VkFormat` value

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06585

If the pipeline requires `fragment output interface state`, `renderPass` is `VK_NULL_HANDLE`, and `VkPipelineRenderingCreateInfo::depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it **must** be a format with `potential format features` that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06586
If the pipeline requires **fragment output interface state**, **renderPass** is **VK_NULL_HANDLE**, and **VkPipelineRenderingCreateInfo::stencilAttachmentFormat** is not **VK_FORMAT_UNDEFINED**, it **must** be a format with **potential format features** that include **VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT**
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06587
If the pipeline requires **fragment output interface state**, **renderPass** is **VK_NULL_HANDLE**, and **VkPipelineRenderingCreateInfo::depthAttachmentFormat** is not **VK_FORMAT_UNDEFINED**, it **must** be a format that includes a depth component
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06588
If the pipeline requires **fragment output interface state**, **renderPass** is **VK_NULL_HANDLE**, and **VkPipelineRenderingCreateInfo::stencilAttachmentFormat** is not **VK_FORMAT_UNDEFINED**, it **must** be a format that includes a stencil component
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06589
If the pipeline requires **fragment output interface state**, **renderPass** is **VK_NULL_HANDLE**, **VkPipelineRenderingCreateInfo::depthAttachmentFormat** is not **VK_FORMAT_UNDEFINED**, and **VkPipelineRenderingCreateInfo::stencilAttachmentFormat** is not **VK_FORMAT_UNDEFINED**, **depthAttachmentFormat** **must** equal **stencilAttachmentFormat**
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09033
If **renderPass** is **VK_NULL_HANDLE**, the pipeline is being created with **fragment shader state** and **fragment output interface state**, and either of **VkPipelineRenderingCreateInfo::depthAttachmentFormat** or **VkPipelineRenderingCreateInfo::stencilAttachmentFormat** are not **VK_FORMAT_UNDEFINED**, and the **VK_EXT_extended_dynamic_state3** extension is not enabled or any of the **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE**, **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE**, **VK_DYNAMIC_STATE_DEPTH_COMPARE_OP**, **VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE**, **VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE**, **VK_DYNAMIC_STATE_STENCIL_OP**, or **VK_DYNAMIC_STATE_DEPTH_BOUNDS** dynamic states are not set, **pDepthStencilState** **must** be a valid pointer to a valid **VkPipelineDepthStencilStateCreateInfo** structure
- VUID-VkGraphicsPipelineCreateInfo-pDepthStencilState-09034
If **pDepthStencilState** is not **NULL** it **must** be a valid pointer to a valid **VkPipelineDepthStencilStateCreateInfo** structure
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09035
If **renderPass** is **VK_NULL_HANDLE** and the pipeline is being created with **fragment shader state** but not **fragment output interface state**, and the **VK_EXT_extended_dynamic_state3** extension is not enabled, or any of the **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE**, **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE**, **VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE**, **VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE**, **VK_DYNAMIC_STATE_STENCIL_OP**, or **VK_DYNAMIC_STATE_DEPTH_BOUNDS** dynamic states are not set, **pDepthStencilState** **must** be a valid pointer to a valid **VkPipelineDepthStencilStateCreateInfo** structure
- VUID-VkGraphicsPipelineCreateInfo-pDepthStencilState-09036
If **pDepthStencilState** is not **NULL** it **must** be a valid pointer to a valid **VkPipelineDepthStencilStateCreateInfo** structure
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09037
If **renderPass** is **VK_NULL_HANDLE**, the pipeline is being created with **fragment output**

interface state, and any element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` is not `VK_FORMAT_UNDEFINED`, and the `VK_EXT_extended_dynamic_state3` extension is not enabled, or any of the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT`, `VK_DYNAMIC_STATE_LOGIC_OP_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, or `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic states are not set, `pColorBlendState` **must** be a valid pointer to a valid `VkPipelineColorBlendStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-pColorBlendState-09038

If `pColorBlendState` is not `NULL` it **must** be a valid pointer to a valid `VkPipelineColorBlendStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06055

If `renderPass` is `VK_NULL_HANDLE`, `pColorBlendState` is not dynamic, and the pipeline is being created with `fragment output interface state`, `pColorBlendState->attachmentCount` **must** be equal to `VkPipelineRenderingCreateInfo::colorAttachmentCount`

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06057

If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with `pre-rasterization shader state`, `VkPipelineRenderingCreateInfo::viewMask` is not `0`, and the `multiviewTessellationShader` feature is not enabled, then `pStages` **must** not include tessellation shaders

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06058

If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with `pre-rasterization shader state`, `VkPipelineRenderingCreateInfo::viewMask` is not `0`, and the `multiviewGeometryShader` feature is not enabled, then `pStages` **must** not include a geometry shader

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06059

If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with `pre-rasterization shader state`, and `VkPipelineRenderingCreateInfo::viewMask` is not `0`, all of the shaders in the pipeline **must** not include variables decorated with the `Layer` built-in decoration in their interfaces

- VUID-VkGraphicsPipelineCreateInfo-renderPass-07720

If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with `pre-rasterization shader state`, and `VkPipelineRenderingCreateInfo::viewMask` is not `0`, and `multiviewMeshShader` is not enabled, then `pStages` **must** not include a mesh shader

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06061

If the `dynamicRenderingLocalRead` feature is not enabled, the pipeline requires `fragment shader state`, and `renderPass` is `VK_NULL_HANDLE`, fragment shaders in `pStages` **must** not include the `InputAttachment` capability

- VUID-VkGraphicsPipelineCreateInfo-renderPass-08710

If the pipeline requires `fragment shader state` and `renderPass` is not `VK_NULL_HANDLE`, fragment shaders in `pStages` **must** not include any of the `TileImageColorReadAccessEXT`, `TileImageDepthReadAccessEXT`, or `TileImageStencilReadAccessEXT` capabilities

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06062

If the pipeline requires `fragment output interface state` and `renderPass` is

VK_NULL_HANDLE, for each color attachment format defined by the pColorAttachmentFormats member of VkPipelineRenderingCreateInfo, if its potential format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState **must** be VK_FALSE

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06063

If the pipeline requires fragment output interface state and renderPass is VK_NULL_HANDLE, if the pNext chain includes VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV, the colorAttachmentCount member of that structure **must** be equal to the value of VkPipelineRenderingCreateInfo::colorAttachmentCount

- VUID-VkGraphicsPipelineCreateInfo-flags-06591

If pStages includes a fragment shader stage, and the fragment shader declares the EarlyFragmentTests execution mode, the flags member of VkPipelineDepthStencilStateCreateInfo **must** not include VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT or VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT

- VUID-VkGraphicsPipelineCreateInfo-flags-06482

If the dynamicRenderingLocalRead feature is not enabled, the pipeline requires fragment output interface state, and the flags member of VkPipelineColorBlendStateCreateInfo includes

VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT, renderPass **must** not be VK_NULL_HANDLE

- VUID-VkGraphicsPipelineCreateInfo-None-09526

If the dynamicRenderingLocalRead feature is not enabled, the pipeline requires fragment output interface state, and the flags member of VkPipelineDepthStencilStateCreateInfo includes

VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT or VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT, renderPass **must** not be VK_NULL_HANDLE

- VUID-VkGraphicsPipelineCreateInfo-pColorAttachmentSamples-06592

If the fragment output interface state, elements of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV **must** be valid VkSampleCountFlagBits values

- VUID-VkGraphicsPipelineCreateInfo-depthStencilAttachmentSamples-06593

If the fragment output interface state and the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV is not 0, it **must** be a valid VkSampleCountFlagBits value

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09527

If the pipeline requires fragment output interface state, renderPass is not VK_NULL_HANDLE, and the flags member of VkPipelineColorBlendStateCreateInfo includes

VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT

subpass must have been created with
VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09528

If the pipeline requires fragment shader state, renderPass is not VK_NULL_HANDLE, and the flags member of VkPipelineDepthStencilStateCreateInfo includes VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT, subpass must have been created with VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09529

If the pipeline requires fragment shader state, renderPass is not VK_NULL_HANDLE, and the flags member of VkPipelineDepthStencilStateCreateInfo includes VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT, subpass must have been created with VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT

- VUID-VkGraphicsPipelineCreateInfo-pipelineStageCreationFeedbackCount-06594

If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it must be equal to stageCount

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06595

If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state or fragment shader state, and VkMultiviewPerViewAttributesInfoNVX::perViewAttributesPositionXOnly is VK_TRUE then VkMultiviewPerViewAttributesInfoNVX::perViewAttributes must also be VK_TRUE

- VUID-VkGraphicsPipelineCreateInfo-flags-06596

If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other flag, the value of VkMultiviewPerViewAttributesInfoNVX::perViewAttributes specified in both this pipeline and the library must be equal

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06597

If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, the value of VkMultiviewPerViewAttributesInfoNVX::perViewAttributes specified in both libraries must be equal

- VUID-VkGraphicsPipelineCreateInfo-flags-06598

If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other flag, the value of VkMultiviewPerViewAttributesInfoNVX::perViewAttributesPositionXOnly specified in both this pipeline and the library must be equal

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06599

If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element

includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, the value of `VkMultiviewPerViewAttributesInfoNVX::perViewAttributesPositionXOnly` specified in both libraries **must** be equal

- VUID-VkGraphicsPipelineCreateInfo-pStages-06600
If the pipeline requires `pre-rasterization shader state` or `fragment shader state`, `pStages` **must** be a valid pointer to an array of `stageCount` valid `VkPipelineShaderStageCreateInfo` structures
- VUID-VkGraphicsPipelineCreateInfo-stageCount-09587
If the pipeline does not require `pre-rasterization shader state` or `fragment shader state`, `stageCount` **must** be zero
- VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-06601
If the pipeline requires `pre-rasterization shader state`, and `related dynamic state is not set`, `pRasterizationState` **must** be a valid pointer to a valid `VkPipelineRasterizationStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-09039
If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT`, and `related dynamic state is not set`, then `pMultisampleState` **must** be a valid pointer to a valid `VkPipelineMultisampleStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-09040
If `pRasterizationState` is not `NULL` it **must** be a valid pointer to a valid `VkPipelineRasterizationStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-layout-06602
If the pipeline requires `fragment shader state` or `pre-rasterization shader state`, `layout` **must** be a valid `VkPipelineLayout` handle
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06603
If the pipeline requires `pre-rasterization shader state`, `fragment shader state`, or `fragment output state`, and `renderPass` is not `VK_NULL_HANDLE`, `renderPass` **must** be a valid `VkRenderPass` handle
- VUID-VkGraphicsPipelineCreateInfo-stageCount-09530
If the pipeline requires `pre-rasterization shader state`, `stageCount` **must** be greater than 0
- VUID-VkGraphicsPipelineCreateInfo-graphicsPipelineLibrary-06606
If the `graphicsPipelineLibrary` feature is not enabled, and if the `shaderMeshEnqueue` feature is not enabled, `flags` **must** not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`
- VUID-VkGraphicsPipelineCreateInfo-flags-06608
If `shaderMeshEnqueue feature` is not enabled, and the pipeline is being created with `all possible state subsets`, `flags` **must** not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`
- VUID-VkGraphicsPipelineCreateInfo-flags-06609
If `flags` includes `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT`, pipeline libraries included via `VkPipelineLibraryCreateInfoKHR` **must** have been created with `VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT`
- VUID-VkGraphicsPipelineCreateInfo-flags-09245
If `flags` includes `VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT`, `flags`

must also include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`

- VUID-VkGraphicsPipelineCreateInfo-flags-06610

If `flags` includes `VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT`, pipeline libraries included via `VkPipelineLibraryCreateInfoKHR` **must** have been created with `VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT`

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06611

Any pipeline libraries included via `VkPipelineLibraryCreateInfoKHR::pLibraries` **must** not include any `state subset` already defined by this structure or defined by any other pipeline library in `VkPipelineLibraryCreateInfoKHR::pLibraries`

- VUID-VkGraphicsPipelineCreateInfo-flags-06612

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other flag, and `layout` was not created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then the `layout` used by this pipeline and the library **must** be *identically defined*

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06613

If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and the `layout` specified by either library was not created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then the `layout` used by each library **must** be *identically defined*

- VUID-VkGraphicsPipelineCreateInfo-flags-06614

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other subset, and `layout` was created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then the `layout` used by the library **must** also have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06615

If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and the `layout` specified by either library was created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then the `layout` used by both libraries **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`

- VUID-VkGraphicsPipelineCreateInfo-flags-06616

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other subset, and `layout` was created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, elements of the `pSetLayouts` array which `layout` was created with that are not `VK_NULL_HANDLE` **must** be

identically defined to the element at the same index of `pSetLayouts` used to create the library's `layout`

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06617

If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and the `layout` specified by either library was created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, elements of the `pSetLayouts` array which either `layout` was created with that are not `VK_NULL_HANDLE` **must** be *identically defined* to the element at the same index of `pSetLayouts` used to create the other library's `layout`

- VUID-VkGraphicsPipelineCreateInfo-flags-06618

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other flag, any descriptor set layout `N` specified by `layout` in both this pipeline and the library which include bindings accessed by shader stages in each **must** be *identically defined*

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06619

If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, any descriptor set layout `N` specified by `layout` in both libraries which include bindings accessed by shader stages in each **must** be *identically defined*

- VUID-VkGraphicsPipelineCreateInfo-flags-06620

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other flag, push constants specified in `layout` in both this pipeline and the library which are available to shader stages in each **must** be *identically defined*

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06621

If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, push constants specified in `layout` in both this pipeline and the library which are available to shader stages in each **must** be *identically defined*

- VUID-VkGraphicsPipelineCreateInfo-flags-06679

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other subset, any element of the `pSetLayouts` array when `layout` was created and the corresponding element of the `pSetLayouts` array used to create the library's `layout` **must** not both be `VK_NULL_HANDLE`

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06681

If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes

VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and any element of the pSetLayouts array used to create each library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create the other library's layout **must** not be VK_NULL_HANDLE

- VUID-VkGraphicsPipelineCreateInfo-flags-06756

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other subset, and any element of the pSetLayouts array which layout was created with was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create the library's layout **must** not have shader bindings for shaders in the other subset

- VUID-VkGraphicsPipelineCreateInfo-flags-06757

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other subset, and any element of the pSetLayouts array used to create the library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create this pipeline's layout **must** not have shader bindings for shaders in the other subset

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06758

If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and any element of the pSetLayouts array used to create each library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create the other library's layout **must** not have shader bindings for shaders in the other subset

- VUID-VkGraphicsPipelineCreateInfo-flags-06682

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes both VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, layout **must** have been created with no elements of the pSetLayouts array set to VK_NULL_HANDLE

- VUID-VkGraphicsPipelineCreateInfo-flags-06683

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and `pRasterizationState->rasterizerDiscardEnable` is VK_TRUE, layout **must** have been created with no elements of the pSetLayouts array set to VK_NULL_HANDLE

- VUID-VkGraphicsPipelineCreateInfo-flags-06684

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes one of the other flags, the value of `subpass` **must** be equal to that used to create the library

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06623
If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes at least one of and no more than two of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT`, `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, and another element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes one of the other flags, the value of `subpass` used to create each library **must** be identical
- VUID-VkGraphicsPipelineCreateInfo-renderpass-06624
If `renderpass` is not `VK_NULL_HANDLE`, `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes at least one of and no more than two of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT`, `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes one of the other flags, `renderPass` **must** be compatible with that used to create the library
- VUID-VkGraphicsPipelineCreateInfo-renderpass-06625
If `renderpass` is `VK_NULL_HANDLE`, `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes at least one of and no more than two of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT`, `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes one of the other flags, the value of `renderPass` used to create that library **must** also be `VK_NULL_HANDLE`
- VUID-VkGraphicsPipelineCreateInfo-flags-06626
If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes at least one of and no more than two of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT`, `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes one of the other flags, and `renderPass` is `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::viewMask` used by this pipeline and that specified by the library **must** be identical
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06627
If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes at least one of and no more than two of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT`, `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, another element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes one of the other flags, and `renderPass` was `VK_NULL_HANDLE` for both libraries, the value of `VkPipelineRenderingCreateInfo::viewMask` set by each library **must** be identical
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06628
If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes at least one of and no more than two of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT`, `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, or

VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and another element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes one of the other flags, the `renderPass` objects used to create each library **must** be compatible or all equal to `VK_NULL_HANDLE`

- VUID-VkGraphicsPipelineCreateInfo-renderpass-06631

If `renderPass` is not `VK_NULL_HANDLE`, the pipeline requires `fragment shader state`, and the `VK_EXT_extended_dynamic_state3` extension is not enabled or any of the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT`, `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT`, or `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic states is not set, or `alphaToOne` is enabled on the device and `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` is not set, then `pMultisampleState` **must** be a valid pointer to a valid `VkPipelineMultisampleStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-Input-06632

If the pipeline requires `fragment shader state` with a fragment shader that either enables `sample shading` or decorates any variable in the `Input` storage class with `Sample`, and the `VK_EXT_extended_dynamic_state3` extension is not enabled or any of the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT`, `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT`, or `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic states is not set, or `alphaToOne` is enabled on the device and `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` is not set, then `pMultisampleState` **must** be a valid pointer to a valid `VkPipelineMultisampleStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-flags-06633

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` with a `pMultisampleState` that was not `NULL`, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, `pMultisampleState` **must** be *identically defined* to that used to create the library

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06634

If an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` with a `pMultisampleState` that was not `NULL`, and if `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, `pMultisampleState` **must** be *identically defined* to that used to create the library

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06635

If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` with a `pMultisampleState` that was not `NULL`, and if a different element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, the `pMultisampleState` used to create each library **must** be *identically defined*

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06636

If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT` and a value of `pMultisampleState->sampleShadingEnable` equal `VK_TRUE`, and if a different element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, the `pMultisampleState` used to

create each library **must** be *identically defined*

- VUID-VkGraphicsPipelineCreateInfo-flags-06637

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, `pMultisampleState->sampleShadingEnable` is `VK_TRUE`, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, `pMultisampleState` **must** be *identically defined* to that used to create the library

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-09567

If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT` and a value of `pMultisampleState->sampleShadingEnable` equal `VK_TRUE`, and if `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, `pMultisampleState` **must** be *identically defined* to that used to create the library

- VUID-VkGraphicsPipelineCreateInfo-flags-06638

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other flag, values specified in `VkPipelineFragmentShadingRateStateCreateInfoKHR` for both this pipeline and that library **must** be identical

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06639

If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, values specified in `VkPipelineFragmentShadingRateStateCreateInfoKHR` for both this pipeline and that library **must** be identical

- VUID-VkGraphicsPipelineCreateInfo-flags-06640

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, `pStages` **must** be a valid pointer to an array of `stageCount` valid `VkPipelineShaderStageCreateInfo` structures

- VUID-VkGraphicsPipelineCreateInfo-flags-06642

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, `layout` **must** be a valid `VkPipelineLayout` handle

- VUID-VkGraphicsPipelineCreateInfo-flags-06643

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT`, `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, and `renderPass` is not `VK_NULL_HANDLE`, `renderPass` **must** be a valid `VkRenderPass` handle

- VUID-VkGraphicsPipelineCreateInfo-flags-06644

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes

VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, stageCount **must** be greater than 0

- VUID-VkGraphicsPipelineCreateInfo-flags-06645

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` is non-zero, if `flags` includes `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`, any libraries **must** have also been created with `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06646

If `VkPipelineLibraryCreateInfoKHR::pLibraries` includes more than one library, and any library was created with `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`, all libraries **must** have also been created with `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06647

If `VkPipelineLibraryCreateInfoKHR::pLibraries` includes at least one library, `VkGraphicsPipelineLibraryCreateInfoEXT::flags` is non-zero, and any library was created with `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`, `flags` **must** include `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`

- VUID-VkGraphicsPipelineCreateInfo-None-07826

If the pipeline includes a **complete set of state**, and there are no libraries included in `VkPipelineLibraryCreateInfoKHR::pLibraries`, then `VkPipelineLayout` **must** be a valid pipeline layout

- VUID-VkGraphicsPipelineCreateInfo-layout-07827

If the pipeline includes a **complete set of state** specified entirely by libraries, and each library was created with a `VkPipelineLayout` created without `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then `layout` **must** be **compatible** with the layouts in those libraries

- VUID-VkGraphicsPipelineCreateInfo-flags-06729

If `flags` includes `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT`, the pipeline includes a **complete set of state** specified entirely by libraries, and each library was created with a `VkPipelineLayout` created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then `layout` **must** be **compatible** with the union of the libraries' pipeline layouts other than the inclusion/exclusion of `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`

- VUID-VkGraphicsPipelineCreateInfo-flags-06730

If `flags` does not include `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT`, the pipeline includes a **complete set of state** specified entirely by libraries, and each library was created with a `VkPipelineLayout` created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then `layout` **must** be **compatible** with the union of the libraries' pipeline layouts

- VUID-VkGraphicsPipelineCreateInfo-conservativePointAndLineRasterization-08892

If `conservativePointAndLineRasterization` is not supported; the pipeline is being created with **vertex input state** and **pre-rasterization shader state**; the pipeline does not include a geometry shader; and the value of `VkPipelineInputAssemblyStateCreateInfo::topology` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, and either `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state is not enabled or `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, then

VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode **must** be VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT

- VUID-VkGraphicsPipelineCreateInfo-conservativePointAndLineRasterization-06760
If conservativePointAndLineRasterization is not supported, the pipeline requires pre-rasterization shader state, and the pipeline includes a geometry shader with either the OutputPoints or OutputLineStrip execution modes, VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode **must** be VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT
- VUID-VkGraphicsPipelineCreateInfo-conservativePointAndLineRasterization-06761
If conservativePointAndLineRasterization is not supported, the pipeline requires pre-rasterization shader state, and the pipeline includes a mesh shader with either the OutputPoints or OutputLinesNV execution modes, VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode **must** be VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT
- VUID-VkGraphicsPipelineCreateInfo-pStages-06894
If the pipeline requires pre-rasterization shader state but not fragment shader state, elements of pStages **must** not have stage set to VK_SHADER_STAGE_FRAGMENT_BIT
- VUID-VkGraphicsPipelineCreateInfo-pStages-06895
If the pipeline requires fragment shader state but not pre-rasterization shader state, elements of pStages **must** not have stage set to a shader stage which participates in pre-rasterization
- VUID-VkGraphicsPipelineCreateInfo-pStages-06896
If the pipeline requires pre-rasterization shader state, all elements of pStages **must** have a stage set to a shader stage which participates in fragment shader state or pre-rasterization shader state
- VUID-VkGraphicsPipelineCreateInfo-stage-06897
If the pipeline requires fragment shader state and/or pre-rasterization shader state, any value of stage **must** not be set in more than one element of pStages
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3TessellationDomainOrigin-07370
If the extendedDynamicState3TessellationDomainOrigin feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClampEnable-07371
If the extendedDynamicState3DepthClampEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3PolygonMode-07372
If the extendedDynamicState3PolygonMode feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_POLYGON_MODE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RasterizationSamples-07373
If the extendedDynamicState3RasterizationSamples feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3SampleMask-07374
If the `extendedDynamicState3SampleMask` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT`
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToCoverageEnable-07375
If the `extendedDynamicState3AlphaToCoverageEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT`
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToOneEnable-07376
If the `extendedDynamicState3AlphaToOneEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT`
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LogicOpEnable-07377
If the `extendedDynamicState3LogicOpEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT`
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendEnable-07378
If the `extendedDynamicState3ColorBlendEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendEquation-07379
If the `extendedDynamicState3ColorBlendEquation` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorWriteMask-07380
If the `extendedDynamicState3ColorWriteMask` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RasterizationStream-07381
If the `extendedDynamicState3RasterizationStream` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT`
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ConservativeRasterizationMode-07382
If the `extendedDynamicState3ConservativeRasterizationMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT`
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ExtraPrimitiveOverestimationSize-07383
If the `extendedDynamicState3ExtraPrimitiveOverestimationSize` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT`
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-09639
If the pipeline requires `pre-rasterization shader state`, `pDynamicState` includes

VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT, and pDynamicState does not include VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT, pRasterizationState **must** include a VkPipelineRasterizationConservativeStateCreateInfoEXT in its pNext chain

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClipEnable-07384
If the extendedDynamicState3DepthClipEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3SampleLocationsEnable-07385
If the extendedDynamicState3SampleLocationsEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendAdvanced-07386
If the extendedDynamicState3ColorBlendAdvanced feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ProvokingVertexMode-07387
If the extendedDynamicState3ProvokingVertexMode feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LineRasterizationMode-07388
If the extendedDynamicState3LineRasterizationMode feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LineStippleEnable-07389
If the extendedDynamicState3LineStippleEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClipNegativeOneToOne-07390
If the extendedDynamicState3DepthClipNegativeOneToOne feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ViewportWScalingEnable-07391
If the extendedDynamicState3ViewportWScalingEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ViewportSwizzle-07392
If the extendedDynamicState3ViewportSwizzle feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageToColorEnable-

07393

If the `extendedDynamicState3CoverageToColorEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageToColorLocation-07394

If the `extendedDynamicState3CoverageToColorLocation` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationMode-07395

If the `extendedDynamicState3CoverageModulationMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationTableEnable-07396

If the `extendedDynamicState3CoverageModulationTableEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationTable-07397

If the `extendedDynamicState3CoverageModulationTable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageReductionMode-07398

If the `extendedDynamicState3CoverageReductionMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RepresentativeFragmentTestEnable-07399

If the `extendedDynamicState3RepresentativeFragmentTestEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ShadingRateImageEnable-07400

If the `extendedDynamicState3ShadingRateImageEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV`

- VUID-VkGraphicsPipelineCreateInfo-flags-07401

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT`

- VUID-VkGraphicsPipelineCreateInfo-flags-07997

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07730

If the pipeline requires **pre-rasterization shader state**, and no element of the **pDynamicStates** member of **pDynamicState** is **VK_DYNAMIC_STATE_VIEWPORT** or **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT**, and if **multiviewPerViewViewports** is enabled, then the index of the most significant bit in each element of **VkRenderPassMultiviewCreateInfo::pViewMasks** **must** be less than **pViewportState->viewportCount**

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07731

If the pipeline requires **pre-rasterization shader state**, and no element of the **pDynamicStates** member of **pDynamicState** is **VK_DYNAMIC_STATE_SCISSOR** or **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT**, and if **multiviewPerViewViewports** is enabled, then the index of the most significant bit in each element of **VkRenderPassMultiviewCreateInfo::pViewMasks** **must** be less than **pViewportState->scissorCount**

- VUID-VkGraphicsPipelineCreateInfo-pStages-08711

If **pStages** includes a fragment shader stage, **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE** is not set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**, and the fragment shader declares the **EarlyFragmentTests** execution mode and uses **OpDepthAttachmentReadEXT**, the **depthWriteEnable** member of **VkPipelineDepthStencilStateCreateInfo** **must** be **VK_FALSE**

- VUID-VkGraphicsPipelineCreateInfo-pStages-08712

If **pStages** includes a fragment shader stage, **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** is not set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**, and the fragment shader declares the **EarlyFragmentTests** execution mode and uses **OpStencilAttachmentReadEXT**, the value of **VkStencilOpState::writeMask** for both **front** and **back** in **VkPipelineDepthStencilStateCreateInfo** **must** be **0**

- VUID-VkGraphicsPipelineCreateInfo-renderPass-08744

If **renderPass** is **VK_NULL_HANDLE**, the pipeline requires **fragment output state** or **fragment shader state**, the pipeline enables **sample shading**, **rasterizationSamples** is not dynamic, and the **pNext** chain includes a **VkPipelineRenderingCreateInfo** structure, **rasterizationSamples** **must** be a valid **VkSampleCountFlagBits** value that is set in **imageCreateSampleCounts** (as defined in **Image Creation Limits**) for every element of **depthAttachmentFormat**, **stencilAttachmentFormat** and the **pColorAttachmentFormats** array which is not **VK_FORMAT_UNDEFINED**

- VUID-VkGraphicsPipelineCreateInfo-flags-08897

If **VkGraphicsPipelineLibraryCreateInfoEXT::flags** includes **VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT**, **pre-rasterization shader state** is specified either in a library or by the inclusion of **VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT**, and that state includes a vertex shader stage in **pStages**, the pipeline **must** define **vertex input state**

- VUID-VkGraphicsPipelineCreateInfo-flags-08898

If **VkGraphicsPipelineLibraryCreateInfoEXT::flags** includes **VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT**, and **pre-rasterization shader state** is not specified, the pipeline **must** define **vertex input state**

- VUID-VkGraphicsPipelineCreateInfo-flags-08899

If **flags** does not include **VK_PIPELINE_CREATE_LIBRARY_BIT_KHR**, **pre-rasterization shader state** is specified either in a library or by the inclusion of

VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and that state includes a vertex shader stage in pStages, the pipeline **must** either define vertex input state or include that state in a linked pipeline library

- VUID-VkGraphicsPipelineCreateInfo-flags-08900

If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT the pipeline **must** define pre-rasterization shader state

- VUID-VkGraphicsPipelineCreateInfo-flags-08901

If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, the pipeline **must** either define pre-rasterization shader state or include that state in a linked pipeline library

- VUID-VkGraphicsPipelineCreateInfo-flags-08903

If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and that state either includes VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE or has pRasterizationState->rasterizerDiscardEnable set to VK_FALSE, the pipeline **must** define fragment shader state

- VUID-VkGraphicsPipelineCreateInfo-flags-08904

If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and pre-rasterization shader state is not specified, the pipeline **must** define fragment shader state

- VUID-VkGraphicsPipelineCreateInfo-flags-08906

If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and that state either includes VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE or has pRasterizationState->rasterizerDiscardEnable set to VK_FALSE, the pipeline **must** define fragment output interface state

- VUID-VkGraphicsPipelineCreateInfo-flags-08907

If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and pre-rasterization shader state is not specified, the pipeline **must** define fragment output interface state

- VUID-VkGraphicsPipelineCreateInfo-flags-08909

If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and that state either includes VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE or has pRasterizationState->rasterizerDiscardEnable set to VK_FALSE, the pipeline **must** define fragment output interface state and fragment shader state or include those states in linked pipeline libraries

- VUID-VkGraphicsPipelineCreateInfo-None-09043

If pDynamicState->pDynamicStates does not include VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the colorWriteMask member of the corresponding element of pColorBlendState->pAttachments

must either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, and `VK_COLOR_COMPONENT_B_BIT`, or none of them

- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09301
If the `externalFormatResolve` feature is enabled, the pipeline requires `fragment output interface state`, `renderPass` is `VK_NULL_HANDLE`, and `VkExternalFormatANDROID::externalFormat` is not `0`, `VkPipelineRenderingCreateInfo::viewMask` **must** be `0`
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09304
If the `externalFormatResolve` feature is enabled, the pipeline requires `fragment output interface state`, `renderPass` is `VK_NULL_HANDLE`, `VkExternalFormatANDROID::externalFormat` is not `0`, and `rasterizationSamples` is not dynamic, `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` **must** be `1`
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09305
If the `externalFormatResolve` feature is enabled, the pipeline requires `fragment output interface state`, `renderPass` is `VK_NULL_HANDLE`, and `VkExternalFormatANDROID::externalFormat` is not `0`, and `blendEnable` is not dynamic, the `blendEnable` member of each element of `pColorBlendState->pAttachments` **must** be `VK_FALSE`
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09306
If the `externalFormatResolve` feature is enabled, the pipeline requires `fragment output interface state`, `renderPass` is `VK_NULL_HANDLE`, and `VkExternalFormatANDROID::externalFormat` is not `0`, and `pDynamicState->pDynamicStates` does not include `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::width` **must** be `1`
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09307
If the `externalFormatResolve` feature is enabled, the pipeline requires `fragment output interface state`, `renderPass` is `VK_NULL_HANDLE`, and `VkExternalFormatANDROID::externalFormat` is not `0`, and `pDynamicState->pDynamicStates` does not include `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::height` **must** be `1`
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09308
If the `externalFormatResolve` feature is enabled, the pipeline requires `pre-rasterization shader state` and `fragment output interface state`, `renderPass` is `VK_NULL_HANDLE`, and `VkExternalFormatANDROID::externalFormat` is not `0`, the last `pre-rasterization shader stage` **must** not statically use a variable with the `PrimitiveShadingRateKHR` built-in
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09309
If the `externalFormatResolve` feature is enabled, the pipeline requires `fragment output interface state`, `renderPass` is `VK_NULL_HANDLE`, and `VkExternalFormatANDROID::externalFormat` is not `0`, `VkPipelineRenderingCreateInfo::colorAttachmentCount` **must** be `1`
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09310
If the `externalFormatResolve` feature is enabled, the pipeline requires `fragment shader state` and `fragment output interface state`, `renderPass` is `VK_NULL_HANDLE`, and `VkExternalFormatANDROID::externalFormat` is not `0`, the fragment shader **must** not declare the `DepthReplacing` or `StencilRefReplacingEXT` execution modes
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09313
If the `externalFormatResolve` feature is enabled, the pipeline requires `fragment output`

fragment output interface state, renderPass is not VK_NULL_HANDLE, subpass includes an external format resolve attachment, and rasterizationSamples is not dynamic, VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be VK_SAMPLE_COUNT_1_BIT

- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09314
If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is not VK_NULL_HANDLE, subpass includes an external format resolve attachment, and blendEnable is not dynamic, the blendEnable member of each element of pColorBlendState->pAttachments must be VK_FALSE
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09315
If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is not VK_NULL_HANDLE, subpass includes an external format resolve attachment, and pDynamicState->pDynamicStates does not include VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR, VkPipelineFragmentShadingRateStateCreateInfoKHR::width must be 1
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09316
If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is not VK_NULL_HANDLE, subpass includes an external format resolve attachment, and pDynamicState->pDynamicStates does not include VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR, VkPipelineFragmentShadingRateStateCreateInfoKHR::height must be 1
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09317
If the externalFormatResolve feature is enabled, the pipeline requires pre-rasterization shader state and fragment output interface state, renderPass is not VK_NULL_HANDLE, and subpass includes an external format resolve attachment, the last pre-rasterization shader stage must not statically use a variable with the PrimitiveShadingRateKHR built-in
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09531
If the pipeline is being created with fragment shader state and fragment output state, the value of renderPass is VK_NULL_HANDLE, and VkRenderingInputAttachmentIndexInfoKHR is included, VkRenderingInputAttachmentIndexInfoKHR::colorAttachmentCount must be equal to VkPipelineRenderingCreateInfo::colorAttachmentCount
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09652
If the pipeline is being created with fragment shader state and fragment output state, the value of renderPass is VK_NULL_HANDLE, and VkRenderingInputAttachmentIndexInfoKHR is not included, the fragment shader must not contain any input attachments with a InputAttachmentIndex greater than or equal to VkPipelineRenderingCreateInfo::colorAttachmentCount
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09532
If the pipeline is being created with fragment output state, and the value of renderPass is VK_NULL_HANDLE, VkRenderingAttachmentLocationInfoKHR::colorAttachmentCount must be equal to VkPipelineRenderingCreateInfo::colorAttachmentCount

Valid Usage (Implicit)

- VUID-VkGraphicsPipelineCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO`
- VUID-VkGraphicsPipelineCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkAttachmentSampleCountInfoAMD`, `VkExternalFormatANDROID`, `VkGraphicsPipelineLibraryCreateInfoEXT`, `VkGraphicsPipelineShaderGroupsCreateInfoNV`, `VkMultiviewPerViewAttributesInfoNVX`, `VkPipelineBinaryInfoKHR`, `VkPipelineCompilerControlCreateInfoAMD`, `VkPipelineCreateFlags2CreateInfoKHR`, `VkPipelineCreationFeedbackCreateInfo`, `VkPipelineDiscardRectangleStateCreateInfoEXT`, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV`, `VkPipelineFragmentShadingRateStateCreateInfoKHR`, `VkPipelineLibraryCreateInfoKHR`, `VkPipelineRenderingCreateInfo`, `VkPipelineRepresentativeFragmentTestStateCreateInfoNV`, `VkPipelineRobustnessCreateInfoEXT`, `VkRenderingAttachmentLocationInfoKHR`, or `VkRenderingInputAttachmentIndexInfoKHR`
- VUID-VkGraphicsPipelineCreateInfo-sType-unique
The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-parameter
If `pDynamicState` is not `NULL`, `pDynamicState` **must** be a valid pointer to a valid `VkPipelineDynamicStateCreateInfo` structure
- VUID-VkGraphicsPipelineCreateInfo-commonparent
Each of `basePipelineHandle`, `layout`, and `renderPass` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkPipelineRenderingCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPipelineRenderingCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           viewMask;
    uint32_t           colorAttachmentCount;
    const VkFormat*     pColorAttachmentFormats;
    VkFormat            depthAttachmentFormat;
    VkFormat            stencilAttachmentFormat;
} VkPipelineRenderingCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_dynamic_rendering
typedef VkPipelineRenderingCreateInfo VkPipelineRenderingCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `viewMask` is the viewMask used for rendering.
- `colorAttachmentCount` is the number of entries in `pColorAttachmentFormats`
- `pColorAttachmentFormats` is a pointer to an array of `VkFormat` values defining the format of color attachments used in this pipeline.
- `depthAttachmentFormat` is a `VkFormat` value defining the format of the depth attachment used in this pipeline.
- `stencilAttachmentFormat` is a `VkFormat` value defining the format of the stencil attachment used in this pipeline.

When a pipeline is created without a `VkRenderPass`, if the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes this structure, it specifies the view mask and format of attachments used for rendering. If this structure is not specified, and the pipeline does not include a `VkRenderPass`, `viewMask` and `colorAttachmentCount` are 0, and `depthAttachmentFormat` and `stencilAttachmentFormat` are `VK_FORMAT_UNDEFINED`. If a graphics pipeline is created with a valid `VkRenderPass`, parameters of this structure are ignored.

If `depthAttachmentFormat`, `stencilAttachmentFormat`, or any element of `pColorAttachmentFormats` is `VK_FORMAT_UNDEFINED`, it indicates that the corresponding attachment is unused within the render pass. Valid formats indicate that an attachment **can** be used - but it is still valid to set the attachment to `NULL` when beginning rendering.

If the render pass is going to be used with an external format resolve attachment, a `VkExternalFormatANDROID` structure **must** also be included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, defining the external format of the resolve attachment that will be used.

Valid Usage

- VUID-VkPipelineRenderingCreateInfo-colorAttachmentCount-09533
`colorAttachmentCount` **must** be less than or equal to `maxColorAttachments`

Valid Usage (Implicit)

- VUID-VkPipelineRenderingCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_RENDERING_CREATE_INFO`

The `VkPipelineCreateFlags2CreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_maintenance5
typedef struct VkPipelineCreateFlags2CreateInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkPipelineCreateFlags2KHR  flags;
} VkPipelineCreateFlags2CreateInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkPipelineCreateFlagBits2KHR](#) specifying how a pipeline will be generated.

If this structure is included in the **pNext** chain of a pipeline creation structure, **flags** is used instead of the corresponding **flags** value passed in that creation structure, allowing additional creation flags to be specified.

Valid Usage (Implicit)

- VUID-VkPipelineCreateFlags2CreateInfoKHR-sType-sType
sType must be `VK_STRUCTURE_TYPE_PIPELINE_CREATE_FLAGS_2_CREATE_INFO_KHR`
- VUID-VkPipelineCreateFlags2CreateInfoKHR-flags-parameter
flags must be a valid combination of [VkPipelineCreateFlagBits2KHR](#) values
- VUID-VkPipelineCreateFlags2CreateInfoKHR-flags-requiredbitmask
flags must not be `0`

Bits which **can** be set in [VkPipelineCreateFlags2CreateInfoKHR::flags](#), specifying how a pipeline is created, are:

```
// Provided by VK_KHR_maintenance5

```

- **VK_PIPELINE_CREATE_2_DISABLE_OPTIMIZATION_BIT_KHR** specifies that the created pipeline will not be optimized. Using this flag **may** reduce the time taken to create the pipeline.
- **VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT_KHR** specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.

- `VK_PIPELINE_CREATE_2_DERIVATIVE_BIT_KHR` specifies that the pipeline to be created will be a child of a previously created parent pipeline.
- `VK_PIPELINE_CREATE_2_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR` specifies that any shader input variables decorated as `ViewIndex` will be assigned values as if they were decorated as `DeviceIndex`.
- `VK_PIPELINE_CREATE_2_DISPATCH_BASE_BIT_KHR` specifies that a compute pipeline **can** be used with `vkCmdDispatchBase` with a non-zero base workgroup.
- `VK_PIPELINE_CREATE_2_DEFER_COMPILE_BIT_NV` specifies that a pipeline is created with all shaders in the deferred state. Before using the pipeline the application **must** call `vkCompileDeferredNV` exactly once on each shader in the pipeline before using the pipeline.
- `VK_PIPELINE_CREATE_2_CAPTURE_STATISTICS_BIT_KHR` specifies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which **can** later be retrieved by calling `vkGetPipelineExecutableStatisticsKHR`. Enabling this flag **must** not affect the final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time.
- `VK_PIPELINE_CREATE_2_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR` specifies that the shader compiler should capture the internal representations of pipeline executables produced by the compile process which **can** later be retrieved by calling `vkGetPipelineExecutableInternalRepresentationsKHR`. Enabling this flag **must** not affect the final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee that IR from libraries **can** be retrieved from the linked pipeline. Applications **should** retrieve IR from each library, and any linked pipelines, separately.
- `VK_PIPELINE_CREATE_2_LIBRARY_BIT_KHR` specifies that the pipeline **cannot** be used directly, and instead defines a *pipeline library* that **can** be combined with other pipelines using the `VkPipelineLibraryCreateInfoKHR` structure. This is available in ray tracing and graphics pipelines.
- `VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR` specifies that an any-hit shader will always be present when an any-hit shader would be executed. A NULL any-hit shader is an any-hit shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.
- `VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR` specifies that a closest hit shader will always be present when a closest hit shader would be executed. A NULL closest hit shader is a closest hit shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.
- `VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR` specifies that a miss shader will always be present when a miss shader would be executed. A NULL miss shader is a miss shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.
- `VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR` specifies that an intersection shader will always be present when an intersection shader would be executed. A NULL intersection shader is an intersection shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

- `VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR` specifies that triangle primitives will be skipped during traversal using [pipeline trace ray](#) instructions.
- `VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_AABBS_BIT_KHR` specifies that AABB primitives will be skipped during traversal using [pipeline trace ray](#) instructions.
- `VK_PIPELINE_CREATE_2_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR` specifies that the shader group handles **can** be saved and reused on a subsequent run (e.g. for trace capture and replay).
- `VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_NV` specifies that the pipeline can be used in combination with [Device-Generated Commands](#).
- `VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_EXT` specifies that the pipeline **can** be used in a `VkIndirectExecutionSetEXT`.
- `VK_PIPELINE_CREATE_2_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_KHR` specifies that pipeline creation will fail if a compile is required for creation of a valid [VkPipeline](#) object; `VK_PIPELINE_COMPILE_REQUIRED` will be returned by pipeline creation, and the [VkPipeline](#) will be `VK_NULL_HANDLE`.
- When creating multiple pipelines, `VK_PIPELINE_CREATE_2_EARLY_RETURN_ON_FAILURE_BIT_KHR` specifies that control will be returned to the application if any individual pipeline returns a result which is not `VK_SUCCESS` rather than continuing to create additional pipelines.
- `VK_PIPELINE_CREATE_2_RAY_TRACING_ALLOW_MOTION_BIT_NV` specifies that the pipeline is allowed to use `OpTraceRayMotionNV`.
- `VK_PIPELINE_CREATE_2_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies that the pipeline will be used with a fragment shading rate attachment.
- `VK_PIPELINE_CREATE_2_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT` specifies that the pipeline will be used with a fragment density map attachment.
- `VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT` specifies that pipeline libraries being linked into this library **should** have link time optimizations applied. If this bit is omitted, implementations **should** instead perform linking as rapidly as possible.
- `VK_PIPELINE_CREATE_2_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT` specifies that pipeline libraries should retain any information necessary to later perform an optimal link with `VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT`.
- `VK_PIPELINE_CREATE_2_DESCRIPTOR_BUFFER_BIT_EXT` specifies that a pipeline will be used with [descriptor buffers](#), rather than [descriptor sets](#).
- `VK_PIPELINE_CREATE_2_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` specifies that the pipeline **may** be used with an attachment feedback loop including color attachments.
- `VK_PIPELINE_CREATE_2_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` specifies that the pipeline **may** be used with an attachment feedback loop including depth-stencil attachments.
- `VK_PIPELINE_CREATE_2_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT` specifies that the ray tracing pipeline **can** be used with acceleration structures which reference an opacity micromap array.
- `VK_PIPELINE_CREATE_2_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV` specifies that the ray tracing pipeline **can** be used with acceleration structures which reference a displacement micromap array.

- `VK_PIPELINE_CREATE_2_NO_PROTECTED_ACCESS_BIT_EXT` specifies that the pipeline **must** not be bound to a protected command buffer.
- `VK_PIPELINE_CREATE_2_PROTECTED_ACCESS_ONLY_BIT_EXT` specifies that the pipeline **must** not be bound to an unprotected command buffer.
- `VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR` specifies that `VkPipelineBinaryKHR` objects **can** be created from the pipeline. If `VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR` is used, implementations **should** not store pipeline data to an internal cache, if such a cache exists as stated by `pipelineBinaryInternalCache`. If `pipelineBinaryPrefersInternalCache` is `VK_TRUE`, applications **should** not use `VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR`.
- `VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT` specifies that the pipeline will be used in a render pass that is begun with `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT`.
- `VK_PIPELINE_CREATE_2_EXECUTION_GRAPH_BIT_AMD` specifies that the pipeline will be used in an [execution graph](#)

It is valid to set both `VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT_KHR` and `VK_PIPELINE_CREATE_2_DERIVATIVE_BIT_KHR`. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See [Pipeline Derivatives](#) for more information.

When an implementation is looking up a pipeline in a [pipeline cache](#), if that pipeline is being created using linked libraries, implementations **should** always return an equivalent pipeline created with `VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT` if available, whether or not that bit was specified.

NOTE

Using `VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT` (or not) when linking pipeline libraries is intended as a performance tradeoff between host and device. If the bit is omitted, linking should be faster and produce a pipeline more rapidly, but performance of the pipeline on the target device may be reduced. If the bit is included, linking may be slower but should produce a pipeline with device performance comparable to a monolithically created pipeline. Using both options can allow latency-sensitive applications to generate a suboptimal but usable pipeline quickly, and then perform an optimal link in the background, substituting the result for the suboptimally linked pipeline as soon as it is available.

```
// Provided by VK_KHR_maintenance5
typedef VkFlags64 VkPipelineCreateFlags2KHR;
```

`VkPipelineCreateFlags2KHR` is a bitmask type for setting a mask of zero or more [VkPipelineCreateFlagBits2KHR](#).

Bits which **can** be set in

- [VkGraphicsPipelineCreateInfo::flags](#)
- [VkComputePipelineCreateInfo::flags](#)
- [VkRayTracingPipelineCreateInfoKHR::flags](#)
- [VkRayTracingPipelineCreateInfoNV::flags](#)

specify how a pipeline is created, and are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCreateFlagBits {

VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR =
VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR,
// Provided by VK_EXT_pipeline_creation_cache_control
VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT =
VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT,
// Provided by VK_EXT_pipeline_creation_cache_control
VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT =
VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT,
} VkPipelineCreateFlagBits;

```

- **VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT** specifies that the created pipeline will not be optimized. Using this flag **may** reduce the time taken to create the pipeline.
- **VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT** specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.

- `VK_PIPELINE_CREATE_DERIVATIVE_BIT` specifies that the pipeline to be created will be a child of a previously created parent pipeline.
- `VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT` specifies that any shader input variables decorated as `ViewIndex` will be assigned values as if they were decorated as `DeviceIndex`.
- `VK_PIPELINE_CREATE_DISPATCH_BASE` specifies that a compute pipeline **can** be used with `vkCmdDispatchBase` with a non-zero base workgroup.
- `VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV` specifies that a pipeline is created with all shaders in the deferred state. Before using the pipeline the application **must** call `vkCompileDeferredNV` exactly once on each shader in the pipeline before using the pipeline.
- `VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR` specifies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which **can** later be retrieved by calling `vkGetPipelineExecutableStatisticsKHR`. Enabling this flag **must** not affect the final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time.
- `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR` specifies that the shader compiler should capture the internal representations of pipeline executables produced by the compile process which **can** later be retrieved by calling `vkGetPipelineExecutableInternalRepresentationsKHR`. Enabling this flag **must** not affect the final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee that IR from libraries **can** be retrieved from the linked pipeline. Applications **should** retrieve IR from each library, and any linked pipelines, separately.
- `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` specifies that the pipeline **cannot** be used directly, and instead defines a *pipeline library* that **can** be combined with other pipelines using the `VkPipelineLibraryCreateInfoKHR` structure. This is available in ray tracing and graphics pipelines.
- `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR` specifies that an any-hit shader will always be present when an any-hit shader would be executed. A NULL any-hit shader is an any-hit shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.
- `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR` specifies that a closest hit shader will always be present when a closest hit shader would be executed. A NULL closest hit shader is a closest hit shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.
- `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR` specifies that a miss shader will always be present when a miss shader would be executed. A NULL miss shader is a miss shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.
- `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR` specifies that an intersection shader will always be present when an intersection shader would be executed. A NULL intersection shader is an intersection shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.
- `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR` specifies that triangle primitives will be

skipped during traversal using [pipeline trace ray](#) instructions.

- `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR` specifies that AABB primitives will be skipped during traversal using [pipeline trace ray](#) instructions.
- `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR` specifies that the shader group handles **can** be saved and reused on a subsequent run (e.g. for trace capture and replay).
- `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV` specifies that the pipeline **can** be used in combination with [Device-Generated Commands](#).
- `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` specifies that pipeline creation will fail if a compile is required for creation of a valid [VkPipeline](#) object; `VK_PIPELINE_COMPILE_REQUIRED` will be returned by pipeline creation, and the [VkPipeline](#) will be `VK_NULL_HANDLE`.
- When creating multiple pipelines, `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT` specifies that control will be returned to the application if any individual pipeline returns a result which is not `VK_SUCCESS` rather than continuing to create additional pipelines.
- `VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV` specifies that the pipeline is allowed to use `OpTraceRayMotionNV`.
- `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies that the pipeline will be used with a fragment shading rate attachment and dynamic rendering.
- `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT` specifies that the pipeline will be used with a fragment density map attachment and dynamic rendering.
- `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT` specifies that pipeline libraries being linked into this library **should** have link time optimizations applied. If this bit is omitted, implementations **should** instead perform linking as rapidly as possible.
- `VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT` specifies that pipeline libraries should retain any information necessary to later perform an optimal link with `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT`.
- `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT` specifies that a pipeline will be used with [descriptor buffers](#), rather than [descriptor sets](#).
- `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` specifies that the pipeline **may** be used with an attachment feedback loop including color attachments. It is ignored if `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` is set in `pDynamicStates`.
- `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` specifies that the pipeline **may** be used with an attachment feedback loop including depth-stencil attachments. It is ignored if `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` is set in `pDynamicStates`.
- `VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT` specifies that the ray tracing pipeline **can** be used with acceleration structures which reference an opacity micromap array.
- `VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV` specifies that the ray tracing pipeline **can** be used with acceleration structures which reference a displacement micromap array.
- `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT` specifies that the pipeline **must** not be bound

to a protected command buffer.

- `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT` specifies that the pipeline **must** not be bound to an unprotected command buffer.

It is valid to set both `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` and `VK_PIPELINE_CREATE_DERIVATIVE_BIT`. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See [Pipeline Derivatives](#) for more information.

When an implementation is looking up a pipeline in a [pipeline cache](#), if that pipeline is being created using linked libraries, implementations **should** always return an equivalent pipeline created with `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT` if available, whether or not that bit was specified.

NOTE

Using `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT` (or not) when linking pipeline libraries is intended as a performance tradeoff between host and device. If the bit is omitted, linking should be faster and produce a pipeline more rapidly, but performance of the pipeline on the target device may be reduced. If the bit is included, linking may be slower but should produce a pipeline with device performance comparable to a monolithically created pipeline. Using both options can allow latency-sensitive applications to generate a suboptimal but usable pipeline quickly, and then perform an optimal link in the background, substituting the result for the suboptimally linked pipeline as soon as it is available.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCreateFlags;
```

`VkPipelineCreateFlags` is a bitmask type for setting a mask of zero or more [VkPipelineCreateFlagBits](#).

The `VkPipelineBinaryInfoKHR` structure is defined as:

```
// Provided by VK_KHR_pipeline_binary
typedef struct VkPipelineBinaryInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           binaryCount;
    const VkPipelineBinaryKHR* pPipelineBinaries;
} VkPipelineBinaryInfoKHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `binaryCount` is the number of elements in the `pPipelineBinaries` array.
- `pPipelineBinaries` is a pointer to an array of [VkPipelineBinaryKHR](#) handles.

If a `VkPipelineBinaryInfoKHR` structure with a `binaryCount` greater than 0 is included in the `pNext`

chain of any `Vk*PipelineCreateInfo` structure when creating a pipeline, implementations **must** use the data in `pPipelineBinaries` instead of recalculating it. Any shader module identifiers or shader modules declared in `VkPipelineShaderStageCreateInfo` instances are ignored.

If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `binaryCount` of 0.

Valid Usage

- VUID-VkPipelineBinaryInfoKHR-binaryCount-09603

`binaryCount` and the order of the elements in `pPipelineBinaries` **must** exactly match that returned by `vkCreatePipelineBinariesKHR` for the matching `Vk*PipelineCreateInfo` structure and its `pNext` chain, ignoring the presence of the `VkPipelineBinaryInfoKHR` structure, the presence of the `VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR` flag, and absence of any shader module identifiers or shader modules, for the same `global pipeline key`, from either:

- `VkPipelineBinaryCreateInfoKHR::pPipelineCreateInfo`, or
- `VkPipelineBinaryCreateInfoKHR::pipeline`

Valid Usage (Implicit)

- VUID-VkPipelineBinaryInfoKHR-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_BINARY_INFO_KHR`

- VUID-VkPipelineBinaryInfoKHR-pPipelineBinaries-parameter

If `binaryCount` is not 0, `pPipelineBinaries` **must** be a valid pointer to an array of `binaryCount` valid `VkPipelineBinaryKHR` handles

The `VkGraphicsPipelineLibraryCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_graphics_pipeline_library
typedef struct VkGraphicsPipelineLibraryCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkGraphicsPipelineLibraryFlagsEXT flags;
} VkGraphicsPipelineLibraryCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkGraphicsPipelineLibraryFlagBitsEXT` specifying the subsets of the graphics pipeline that are being compiled.

If a `VkGraphicsPipelineLibraryCreateInfoEXT` structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it specifies the `subsets of the graphics pipeline` being created, excluding any subsets from linked pipeline libraries. If the pipeline is created with pipeline

libraries, state from those libraries is aggregated with said subset.

If this structure is omitted, and either `VkGraphicsPipelineCreateInfo::flags` includes `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` or the `VkGraphicsPipelineCreateInfo::pNext` chain includes a `VkPipelineLibraryCreateInfoKHR` structure with a `libraryCount` greater than 0, it is as if `flags` is 0. Otherwise if this structure is omitted, it is as if `flags` includes all possible subsets of the graphics pipeline (i.e. a [complete graphics pipeline](#)).

Valid Usage (Implicit)

- VUID-VkGraphicsPipelineLibraryCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_LIBRARY_CREATE_INFO_EXT`
- VUID-VkGraphicsPipelineLibraryCreateInfoEXT-flags-parameter
`flags` **must** be a valid combination of `VkGraphicsPipelineLibraryFlagBitsEXT` values
- VUID-VkGraphicsPipelineLibraryCreateInfoEXT-flags-requiredbitmask
`flags` **must** not be 0

```
// Provided by VK_EXT_graphics_pipeline_library
typedef VkFlags VkGraphicsPipelineLibraryFlagsEXT;
```

`VkGraphicsPipelineLibraryFlagsEXT` is a bitmask type for setting a mask of zero or more `VkGraphicsPipelineLibraryFlagBitsEXT`.

Possible values of the `flags` member of `VkGraphicsPipelineLibraryCreateInfoEXT`, specifying the subsets of a graphics pipeline to compile are:

```
// Provided by VK_EXT_graphics_pipeline_library
typedef enum VkGraphicsPipelineLibraryFlagBitsEXT {
    VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT = 0x00000001,
    VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT = 0x00000002,
    VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT = 0x00000004,
    VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT = 0x00000008,
} VkGraphicsPipelineLibraryFlagBitsEXT;
```

- `VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT` specifies that a pipeline will include [vertex input interface state](#).
- `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` specifies that a pipeline will include [pre-rasterization shader state](#).
- `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` specifies that a pipeline will include [fragment shader state](#).
- `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT` specifies that a pipeline will include [fragment output interface state](#).

The `VkPipelineDynamicStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDynamicStateCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkPipelineDynamicStateCreateFlags flags;
    uint32_t                 dynamicStateCount;
    const VkDynamicState*     pDynamicStates;
} VkPipelineDynamicStateCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **dynamicStateCount** is the number of elements in the **pDynamicStates** array.
- **pDynamicStates** is a pointer to an array of **VkDynamicState** values specifying which pieces of pipeline state will use the values from dynamic state commands rather than from pipeline state creation information.

Valid Usage

- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-01442
Each element of **pDynamicStates** **must** be unique

Valid Usage (Implicit)

- VUID-VkPipelineDynamicStateCreateInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO**
- VUID-VkPipelineDynamicStateCreateInfo-pNext-pNext
pNext **must** be **NULL**
- VUID-VkPipelineDynamicStateCreateInfo-flags-zero bitmask
flags **must** be 0
- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-parameter
If **dynamicStateCount** is not 0, **pDynamicStates** **must** be a valid pointer to an array of **dynamicStateCount** valid **VkDynamicState** values

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDynamicStateCreateFlags;
```

VkPipelineDynamicStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The source of different pieces of dynamic state is specified by the **VkPipelineDynamicStateCreateInfo::pDynamicStates** property of the currently active pipeline, each

of whose elements **must** be one of the values:

```
// Provided by VK_VERSION_1_0
typedef enum VkDynamicState {
    VK_DYNAMIC_STATE_VIEWPORT = 0,
    VK_DYNAMIC_STATE_SCISSOR = 1,
    VK_DYNAMIC_STATE_LINE_WIDTH = 2,
    VK_DYNAMIC_STATE_DEPTH_BIAS = 3,
    VK_DYNAMIC_STATE_BLEND_CONSTANTS = 4,
    VK_DYNAMIC_STATE_DEPTH_BOUNDS = 5,
    VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK = 6,
    VK_DYNAMIC_STATE_STENCIL_WRITE_MASK = 7,
    VK_DYNAMIC_STATE_STENCIL_REFERENCE = 8,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_CULL_MODE = 1000267000,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_FRONT_FACE = 1000267001,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY = 1000267002,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT = 1000267003,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT = 1000267004,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE = 1000267005,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE = 1000267006,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE = 1000267007,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_DEPTH_COMPARE_OP = 1000267008,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE = 1000267009,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE = 1000267010,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_STENCIL_OP = 1000267011,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE = 1000377001,
// Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE = 1000377002,
// Provided by VK_VERSION_1_3

```

- **VK_DYNAMIC_STATE_VIEWPORT** specifies that the **pViewports** state in **VkPipelineViewportStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetViewport** before any drawing commands. The number of viewports used by a pipeline is still specified by the **viewportCount** member of **VkPipelineViewportStateCreateInfo**.
- **VK_DYNAMIC_STATE_SCISSOR** specifies that the **pScissors** state in **VkPipelineViewportStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetScissor** before any drawing commands. The number of scissor rectangles used by a pipeline is still specified by the **scissorCount** member of **VkPipelineViewportStateCreateInfo**.
- **VK_DYNAMIC_STATE_LINE_WIDTH** specifies that the **lineWidth** state in **VkPipelineRasterizationStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetLineWidth** before any drawing commands that generate line primitives for the rasterizer.
- **VK_DYNAMIC_STATE_DEPTH_BIAS** specifies that any instance of **VkDepthBiasRepresentationInfoEXT** included in the **pNext** chain of **VkPipelineRasterizationStateCreateInfo** as well as the **depthBiasConstantFactor**, **depthBiasClamp** and **depthBiasSlopeFactor** states in **VkPipelineRasterizationStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetDepthBias** or **vkCmdSetDepthBias2EXT** before any draws are performed with **depth bias** enabled.

- `VK_DYNAMIC_STATE_BLEND_CONSTANTS` specifies that the `blendConstants` state in `VkPipelineColorBlendStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetBlendConstants` before any draws are performed with a pipeline state with `VkPipelineColorBlendAttachmentState` member `blendEnable` set to `VK_TRUE` and any of the blend functions using a constant blend color.
- `VK_DYNAMIC_STATE_DEPTH_BOUNDS` specifies that the `minDepthBounds` and `maxDepthBounds` states of `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthBounds` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `depthBoundsTestEnable` set to `VK_TRUE`.
- `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` specifies that the `compareMask` state in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and **must** be set dynamically with `vkCmdSetStencilCompareMask` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`.
- `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` specifies that the `writeMask` state in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and **must** be set dynamically with `vkCmdSetStencilWriteMask` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`.
- `VK_DYNAMIC_STATE_STENCIL_REFERENCE` specifies that the `reference` state in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and **must** be set dynamically with `vkCmdSetStencilReference` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`.
- `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` specifies that the `pViewportWScalings` state in `VkPipelineViewportWScalingStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetViewportWScalingNV` before any draws are performed with a pipeline state with `VkPipelineViewportWScalingStateCreateInfoNV` member `viewportScalingEnable` set to `VK_TRUE`.
- `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` specifies that the `pDiscardRectangles` state in `VkPipelineDiscardRectangleStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetDiscardRectangleEXT` before any draw or clear commands.
- `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` specifies that the presence of the `VkPipelineDiscardRectangleStateCreateInfoEXT` structure in the `VkGraphicsPipelineCreateInfo` chain with a `discardRectangleCount` greater than zero does not implicitly enable discard rectangles and they **must** be enabled dynamically with `vkCmdSetDiscardRectangleEnableEXT` before any draw commands. This is available on implementations that support at least `specVersion 2` of the `VK_EXT_discard_rectangles` extension.
- `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` specifies that the `discardRectangleMode` state in `VkPipelineDiscardRectangleStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetDiscardRectangleModeEXT` before any draw commands. This is available on implementations that support at least `specVersion 2` of the `VK_EXT_discard_rectangles` extension.
- `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` specifies that the `sampleLocationsInfo` state in `VkPipelineSampleLocationsStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetSampleLocationsEXT` before any draw or clear commands. Enabling custom sample locations is still indicated by the `sampleLocationsEnable` member of `VkPipelineSampleLocationsStateCreateInfoEXT`.

- `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` specifies that the `pExclusiveScissors` state in `VkPipelineViewportExclusiveScissorStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetExclusiveScissorNV` before any drawing commands.
- `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV` specifies that the exclusive scissors **must** be explicitly enabled with `vkCmdSetExclusiveScissorEnableNV` and the `exclusiveScissorCount` value in `VkPipelineViewportExclusiveScissorStateCreateInfoNV` will not implicitly enable them. This is available on implementations that support at least `specVersion 2` of the `VK_NV_scissor_exclusive` extension.
- `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` specifies that the `pShadingRatePalettes` state in `VkPipelineViewportShadingRateImageStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetViewportShadingRatePaletteNV` before any drawing commands.
- `VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV` specifies that the coarse sample order state in `VkPipelineViewportCoarseSampleOrderStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetCoarseSampleOrderNV` before any drawing commands.
- `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT` specifies that the `lineStippleFactor` and `lineStipplePattern` state in `VkPipelineRasterizationLineStateCreateInfoKHR` will be ignored and **must** be set dynamically with `vkCmdSetLineStippleKHR` before any draws are performed with a pipeline state with `VkPipelineRasterizationLineStateCreateInfoKHR` member `stippledLineEnable` set to `VK_TRUE`.
- `VK_DYNAMIC_STATE_CULL_MODE` specifies that the `cullMode` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetCullMode` before any drawing commands.
- `VK_DYNAMIC_STATE_FRONT_FACE` specifies that the `frontFace` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetFrontFace` before any drawing commands.
- `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` specifies that the `topology` state in `VkPipelineInputAssemblyStateCreateInfo` only specifies the `topology class`, and the specific topology order and adjacency **must** be set dynamically with `vkCmdSetPrimitiveTopology` before any drawing commands.
- `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` specifies that the `viewportCount` and `pViewports` state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetViewportWithCount` before any draw call.
- `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` specifies that the `scissorCount` and `pScissors` state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetScissorWithCount` before any draw call.
- `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` specifies that the `stride` state in `VkVertexInputBindingDescription` will be ignored and **must** be set dynamically with `vkCmdBindVertexBuffers2` before any draw call.
- `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` specifies that the `depthTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthTestEnable` before any draw call.
- `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` specifies that the `depthWriteEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with

`vkCmdSetDepthWriteEnable` before any draw call.

- `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` specifies that the `depthCompareOp` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthCompareOp` before any draw call.
- `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` specifies that the `depthBoundsTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthBoundsTestEnable` before any draw call.
- `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` specifies that the `stencilTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetStencilTestEnable` before any draw call.
- `VK_DYNAMIC_STATE_STENCIL_OP` specifies that the `failOp`, `passOp`, `depthFailOp`, and `compareOp` states in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and **must** be set dynamically with `vkCmdSetStencilOp` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`
- `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` specifies that the `patchControlPoints` state in `VkPipelineTessellationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetPatchControlPointsEXT` before any drawing commands.
- `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` specifies that the `rasterizerDiscardEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetRasterizerDiscardEnable` before any drawing commands.
- `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` specifies that the `depthBiasEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthBiasEnable` before any drawing commands.
- `VK_DYNAMIC_STATE_LOGIC_OP_EXT` specifies that the `logicOp` state in `VkPipelineColorBlendStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetLogicOpEXT` before any drawing commands.
- `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` specifies that the `primitiveRestartEnable` state in `VkPipelineInputAssemblyStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetPrimitiveRestartEnable` before any drawing commands.
- `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` specifies that state in `VkPipelineFragmentShadingRateStateCreateInfoKHR` and `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetFragmentShadingRateKHR` or `vkCmdSetFragmentShadingRateEnumNV` before any drawing commands.
- `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` specifies that the default stack size computation for the pipeline will be ignored and **must** be set dynamically with `vkCmdSetRayTracingPipelineStackSizeKHR` before any ray tracing calls are performed.
- `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` specifies that the `pVertexInputState` state will be ignored and **must** be set dynamically with `vkCmdSetVertexInputEXT` before any drawing commands
- `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` specifies that the `pColorWriteEnables` state in `VkPipelineColorWriteCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetColorWriteEnableEXT` before any draw call.

- `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` specifies that the `domainOrigin` state in `VkPipelineTessellationDomainOriginStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetTessellationDomainOriginEXT` before any draw call.
- `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` specifies that the `depthClampEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthClampEnableEXT` before any draw call.
- `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` specifies that the `polygonMode` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetPolygonModeEXT` before any draw call.
- `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` specifies that the `rasterizationSamples` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetRasterizationSamplesEXT` before any draw call.
- `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` specifies that the `pSampleMask` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetSampleMaskEXT` before any draw call.
- `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` specifies that the `alphaToCoverageEnable` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetAlphaToCoverageEnableEXT` before any draw call.
- `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` specifies that the `alphaToOneEnable` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetAlphaToOneEnableEXT` before any draw call.
- `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` specifies that the `logicOpEnable` state in `VkPipelineColorBlendStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetLogicOpEnableEXT` before any draw call.
- `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` specifies that the `blendEnable` state in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendEnableEXT` before any draw call.
- `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` specifies that the `srcColorBlendFactor`, `dstColorBlendFactor`, `colorBlendOp`, `srcAlphaBlendFactor`, `dstAlphaBlendFactor`, and `alphaBlendOp` states in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendEquationEXT` before any draw call.
- `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` specifies that the `colorWriteMask` state in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorWriteMaskEXT` before any draw call.
- `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` specifies that the `rasterizationStream` state in `VkPipelineRasterizationStateStreamCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetRasterizationStreamEXT` before any draw call.
- `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` specifies that the `conservativeRasterizationMode` state in `VkPipelineRasterizationConservativeStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetConservativeRasterizationModeEXT` before any draw call.
- `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` specifies that the `extraPrimitiveOverestimationSize` state in

`VkPipelineRasterizationConservativeStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetExtraPrimitiveOverestimationSizeEXT` before any draw call.

- `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` specifies that the `depthClipEnable` state in `VkPipelineRasterizationDepthClipStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetDepthClipEnableEXT` before any draw call.
- `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` specifies that the `sampleLocationsEnable` state in `VkPipelineSampleLocationsStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetSampleLocationsEnableEXT` before any draw call.
- `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` specifies that the `colorBlendOp` state in `VkPipelineColorBlendAttachmentState`, and `srcPremultiplied`, `dstPremultiplied`, and `blendOverlap` states in `VkPipelineColorBlendAdvancedStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendAdvancedEXT` before any draw call.
- `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` specifies that the `provokingVertexMode` state in `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetProvokingVertexModeEXT` before any draw call.
- `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` specifies that the `lineRasterizationMode` state in `VkPipelineRasterizationLineStateCreateInfoKHR` will be ignored and **must** be set dynamically with `vkCmdSetLineRasterizationModeEXT` before any draw call.
- `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` specifies that the `stippledLineEnable` state in `VkPipelineRasterizationLineStateCreateInfoKHR` will be ignored and **must** be set dynamically with `vkCmdSetLineStippleEnableEXT` before any draw call.
- `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT` specifies that the `negativeOneToOne` state in `VkPipelineViewportDepthClipControlCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetDepthClipNegativeOneToOneEXT` before any draw call.
- `VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT` specifies that the `depthClampMode` and `pDepthClampRange` state in `VkPipelineViewportDepthClampControlCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetDepthClampRangeEXT` before any draw call.
- `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV` specifies that the `viewportWScalingEnable` state in `VkPipelineViewportWScalingStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetViewportWScalingEnableNV` before any draw call.
- `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` specifies that the `viewportCount`, and `pViewportSwizzles` states in `VkPipelineViewportSwizzleStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetViewportSwizzleNV` before any draw call.
- `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` specifies that the `coverageToColorEnable` state in `VkPipelineCoverageToColorStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetCoverageToColorEnableNV` before any draw call.
- `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV` specifies that the `coverageToColorLocation` state in `VkPipelineCoverageToColorStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetCoverageToColorLocationNV` before any draw call.
- `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV` specifies that the `coverageModulationMode` state in `VkPipelineCoverageModulationStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetCoverageModulationModeNV` before any draw call.

- `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` specifies that the `coverageModulationTableEnable` state in `VkPipelineCoverageModulationStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetCoverageModulationTableEnableNV` before any draw call.
- `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV` specifies that the `coverageModulationTableCount`, and `pCoverageModulationTable` states in `VkPipelineCoverageModulationStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetCoverageModulationTableNV` before any draw call.
