

Vulkan[®] 1.4.350 - A Specification (with all registered extensions)

The Khronos[®] Vulkan Working Group

Version 1.4.350, 2026-05-01 01:36:47Z: from git branch: github-main commit:
81b1d516cbf42f04a3c7f781977c499945b5e5dc

Table of Contents

1. Preamble	1
2. Introduction	3
2.1. Document Conventions	3
3. Fundamentals	7
3.1. Host and Device Environment	7
3.2. Execution Model	7
3.3. Object Model	9
3.4. Application Binary Interface	11
3.5. Command Syntax and Duration	12
3.6. Threading Behavior	16
3.7. Valid Usage	43
3.8. VkResult Return Codes	49
3.9. Numeric Representation and Computation	55
3.10. Fixed-Point Data Conversions	57
3.11. String Representation	58
3.12. Common Object Types	59
3.13. API Name Aliases	131
4. Initialization	133
4.1. Command Function Pointers	133
4.2. Instances	136
5. Devices and Queues	154
5.1. Physical Devices	154
5.2. Devices	216
5.3. Queues	244
6. Command Buffers	260
6.1. Command Buffer Lifecycle	261
6.2. Command Pools	262
6.3. Command Buffer Allocation and Management	270
6.4. Command Buffer Recording	275
6.5. Command Buffer Submission	293
6.6. Queue Forward Progress	324
6.7. Secondary Command Buffer Execution	325
6.8. Nested Command Buffers	337
6.9. Command Buffer Device Mask	338
7. Synchronization and Cache Control	342
7.1. Execution and Memory Dependencies	342
7.2. Implicit Synchronization Guarantees	390
7.3. Fences	392

7.4. Semaphores	419
7.5. Events	454
7.6. Pipeline Barriers	487
7.7. Memory Barriers	501
7.8. Wait Idle Operations	596
7.9. Host Write Ordering Guarantees	598
7.10. Synchronization and Multiple Physical Devices	598
7.11. Calibrated Timestamps	598
8. Render Pass	605
8.1. Render Pass Objects	650
8.2. Render Pass Creation	651
8.3. Render Pass Compatibility	729
8.4. Framebuffers	730
8.5. Render Pass Load Operations	743
8.6. Render Pass Store Operations	745
8.7. Render Pass Multisample Resolve Operations	746
8.8. Render Pass Commands	750
8.9. Render Pass Creation Feedback	788
8.10. Common Render Pass Data Races (Informative)	792
8.11. Tile Shading Render Pass	795
9. Shaders	805
9.1. Shader Objects	805
9.2. Shader Modules	833
9.3. Shader Module Identifiers	838
9.4. Binding Shaders	841
9.5. Shader Execution	842
9.6. Shader Out-of-Bounds Memory Access	842
9.7. Shader Memory Access Ordering	847
9.8. Shader Inputs and Outputs	848
9.9. Task Shaders	848
9.10. Mesh Shaders	849
9.11. Cluster Culling Shaders	849
9.12. Vertex Shaders	850
9.13. Tessellation Control Shaders	850
9.14. Tessellation Evaluation Shaders	852
9.15. Geometry Shaders	853
9.16. Fragment Shaders	853
9.17. Compute Shaders	853
9.18. Ray Generation Shaders	853
9.19. Intersection Shaders	854
9.20. Any-Hit Shaders	854

9.21. Closest Hit Shaders	855
9.22. Miss Shaders	855
9.23. Callable Shaders	855
9.24. Interpolation Decorations	855
9.25. Push Constant Decorations	856
9.26. Static Use	857
9.27. Scope	857
9.28. Group Operations	862
9.29. Quad Group Operations	863
9.30. Derivative Operations	864
9.31. Helper Invocations	866
9.32. Cooperative Matrices	866
9.33. Cooperative Vectors	876
9.34. Validation Cache	886
9.35. CUDA Modules	893
9.36. Shader Instrumentation	900
10. Pipelines	912
10.1. Multiple Pipeline Creation	914
10.2. Pipeline Creation Flags	915
10.3. Compute Pipelines	928
10.4. Graphics Pipelines	957
10.5. Ray Tracing Pipelines	1032
10.6. Pipeline Destruction	1065
10.7. Pipeline Derivatives	1066
10.8. Pipeline Cache	1066
10.9. Pipeline Binaries	1077
10.10. Specialization Constants	1090
10.11. Pipeline Libraries	1094
10.12. Pipeline Binding	1095
10.13. Dynamic State	1102
10.14. Pipeline Properties and Shader Information	1103
10.15. Pipeline Compiler Control	1118
10.16. Pipeline Creation Feedback	1119
11. Memory Allocation	1123
11.1. Host Memory	1123
11.2. Device Memory	1130
12. Resource Creation	1258
12.1. Buffers	1258
12.2. Buffer Views	1281
12.3. Buffer Device Addresses	1287
12.4. Images	1291

12.5. Image Layouts	1365
12.6. Image Views	1373
12.7. Acceleration Structures	1405
12.8. Micromaps	1446
12.9. Resource Memory Association	1454
12.10. Resource Sharing Mode	1504
12.11. Memory Aliasing	1507
12.12. Buffer Collections	1510
12.13. Tensors	1527
12.14. Tensor Views	1538
13. Images	1543
13.1. Image Coordinate Validation	1544
13.2. Image Reads	1544
13.3. Image Writes	1545
13.4. SPIR-V Image Access	1545
14. Samplers	1548
14.1. Sampler Y'C _B C _R Conversion	1564
14.2. Custom Border Colors	1575
14.3. Sampler block matching	1581
15. Resource Descriptors	1583
15.1. Descriptor Types	1583
15.2. Physical Storage Buffer Access	1592
16. Descriptor Heaps	1593
16.1. Writing Descriptors	1593
16.2. Using Heaps	1604
16.3. Shader Bindings	1615
16.4. Packing descriptors more tightly	1637
17. Descriptor Sets	1639
17.1. Descriptor Set Layout	1639
17.2. Pipeline Layouts	1661
17.3. Allocation of Descriptor Sets	1677
17.4. Descriptor Set Updates	1694
17.5. Descriptor Update Templates	1715
17.6. Descriptor Set Updates With Templates	1715
17.7. Descriptor Set Binding	1725
17.8. Push Descriptor Updates	1735
17.9. Push Descriptor Updates With Descriptor Update Templates	1742
17.10. Push Constant Updates	1749
18. Descriptor Buffers	1756
18.1. Putting Descriptors in Memory	1756
18.2. Binding Descriptor Buffers	1769

18.3. Updating Descriptor Buffers	1788
18.4. Push Descriptors With Descriptor Buffers	1789
18.5. Capture and Replay	1789
19. Shader Interfaces	1806
19.1. Shader Input and Output Interfaces	1806
19.2. Vertex Input Interface	1809
19.3. Fragment Output Interface	1810
19.4. Legacy Dithering	1815
19.5. Fragment Tile Image Interface	1815
19.6. Tile Attachment Interface	1815
19.7. Fragment Input Attachment Interface	1817
19.8. Ray Tracing Pipeline Interface	1822
19.9. Shader Resource Interface	1823
19.10. Built-In Variables	1836
20. Sampling	1896
20.1. Sampling Coordinate Systems	1896
20.2. Sampling Operations	1901
20.3. Normalized Texel Coordinate Operations	1918
20.4. Unnormalized Texel Coordinate Operations	1925
20.5. Integer Texel Coordinate Operations	1927
20.6. Image Sample Operations	1927
20.7. Texel Footprint Evaluation	1934
20.8. Weight Image Sampling	1937
20.9. Block Matching	1941
20.10. Box Filter Sampling	1946
20.11. Image Operation Steps	1948
20.12. LOD Query	1949
21. Fragment Density Map Operations	1950
21.1. Fragment Density Map Operations Overview	1950
21.2. Fetch Density Value	1950
21.3. Fragment Area Conversion	1952
22. Tensor Operations	1954
22.1. Tensor Operations Overview	1954
22.2. Tensor Element Input Operations	1954
22.3. Tensor Element Output Operations	1956
22.4. Tensor Query Instructions	1957
23. Queries	1958
23.1. Query Pools	1958
23.2. Query Operation	1967
23.3. Occlusion Queries	2005
23.4. Pipeline Statistics Queries	2005

23.5. Timestamp Queries	2008
23.6. Performance Queries	2016
23.7. Transform Feedback Queries	2020
23.8. Primitives Generated Queries	2020
23.9. Mesh Shader Queries	2020
23.10. Intel Performance Queries	2021
23.11. Result Status Queries	2037
23.12. Video Encode Feedback Queries	2037
24. Clear Commands	2040
24.1. Clearing Images Outside a Render Pass Instance	2040
24.2. Clearing Images Inside a Render Pass Instance	2046
24.3. Clear Values	2051
24.4. Filling Memory	2052
24.5. Updating Memory	2055
24.6. Filling Buffers	2058
24.7. Updating Buffers	2061
25. Copy Commands	2064
25.1. Copying Data Between Memory Ranges	2064
25.2. Copying Data Between Buffers	2070
25.3. Copying Data Between Images	2077
25.4. Copying Data Between Memory Ranges and Images	2101
25.5. Copying Data Between Buffers and Images	2113
25.6. Indirect Copies	2175
25.7. Image Copies With Scaling	2192
25.8. Resolving Multisample Images	2212
25.9. Buffer Markers	2229
25.10. Copying Data Between Tensors	2241
26. Drawing Commands	2247
26.1. Primitive Topologies	2251
26.2. Effective Primitive Topology	2263
26.3. Primitive Order	2265
26.4. Programmable Primitive Shading	2265
26.5. Conditional Rendering	3021
26.6. Programmable Mesh Shading	3030
26.7. Programmable Cluster Culling Shading	3429
27. Fixed-Function Vertex Processing	3528
27.1. Vertex Attributes	3528
27.2. Vertex Input Description	3533
27.3. Vertex Attribute Divisor in Instanced Rendering	3551
27.4. Vertex Input Address Calculation	3553
28. Tessellation	3555

28.1. Tessellator	3555
28.2. Tessellator Patch Discard	3558
28.3. Tessellator Spacing	3559
28.4. Tessellation Primitive Ordering	3559
28.5. Tessellator Vertex Winding Order	3560
28.6. Triangle Tessellation	3560
28.7. Quad Tessellation	3562
28.8. Isoline Tessellation	3564
28.9. Tessellation Point Mode	3564
28.10. Tessellation Pipeline State	3564
29. Geometry Shading	3569
29.1. Geometry Shader Input Primitives	3569
29.2. Geometry Shader Output Primitives	3570
29.3. Multiple Invocations of Geometry Shaders	3570
29.4. Geometry Shader Primitive Ordering	3570
29.5. Geometry Shader Passthrough	3570
30. Mesh Shading	3573
30.1. Task Shader Input	3573
30.2. Task Shader Output	3573
30.3. Mesh Generation	3573
30.4. Mesh Shader Input	3573
30.5. Mesh Shader Output	3574
30.6. Mesh Shader Per-View Outputs	3575
30.7. Mesh Shader Primitive Ordering	3575
31. Cluster Culling Shading	3576
31.1. Cluster Culling Shader Input	3576
31.2. Cluster Culling Shader Output	3576
31.3. Cluster Culling Shader Cluster Ordering	3576
31.4. Cluster Culling Shader Primitive Ordering	3577
32. Fixed-Function Vertex Post-Processing	3578
32.1. Transform Feedback	3578
32.2. Viewport Swizzle	3596
32.3. Flat Shading	3601
32.4. Primitive Clipping	3604
32.5. Clipping Shader Outputs	3611
32.6. Controlling Viewport W Scaling	3612
32.7. Coordinate Transformations	3616
32.8. Render Pass Transform	3617
32.9. Controlling the Viewport	3618
33. Rasterization	3629
33.1. Discarding Primitives Before Rasterization	3634

33.2. Controlling the Vertex Stream Used for Rasterization	3636
33.3. Rasterization Order	3639
33.4. Multisampling	3641
33.5. Custom Sample Locations	3647
33.6. Fragment Shading Rates	3652
33.7. Shading Rate Image	3667
33.8. Sample Shading	3684
33.9. Barycentric Interpolation	3684
33.10. Points	3686
33.11. Line Segments	3687
33.12. Polygons	3702
34. Fragment Operations	3726
34.1. Discard Rectangles Test	3728
34.2. Scissor Test	3735
34.3. Exclusive Scissor Test	3737
34.4. Sample Mask Test	3742
34.5. Fragment Shading	3744
34.6. Multisample Coverage	3749
34.7. Depth and Stencil Operations	3752
34.8. Depth Bounds Test	3756
34.9. Stencil Test	3759
34.10. Depth Test	3770
34.11. Representative Fragment Test	3779
34.12. Sample Counting	3781
34.13. Fragment Coverage to Color	3781
34.14. Coverage Reduction	3786
35. The Framebuffer	3799
35.1. Blending	3799
35.2. Logical Operations	3830
35.3. Color Write Mask	3835
35.4. Color Write Enable	3836
35.5. Framebuffer Query Instructions	3839
36. Dispatching Commands	3841
36.1. Dispatch Command for CUDA PTX Kernels	3928
36.2. Compute Occupancy Priority	3934
37. Device-Generated Commands	3940
37.1. Indirect Commands Layout	3940
37.2. Indirect Commands Generation and Execution	3981
38. Sparse Resources	4122
38.1. Sparse Resource Features	4122
38.2. Sparse Buffers and Fully-Resident Images	4123

38.3. Sparse Partially-Resident Buffers	4124
38.4. Sparse Partially-Resident Images	4124
38.5. Sparse Memory Aliasing	4132
38.6. Sparse Resource Implementation Guidelines (Informative)	4133
38.7. Sparse Resource API	4134
39. Window System Integration (WSI)	4163
39.1. WSI Platform	4163
39.2. WSI Surface	4163
39.3. Presenting Directly to Display Devices	4198
39.4. Querying for WSI Support	4233
39.5. Surface Queries	4240
39.6. Full Screen Exclusive Control	4279
39.7. Device Group Queries	4282
39.8. Present Timing Queries	4288
39.9. Present Wait	4306
39.10. WSI Swapchain	4307
39.11. HDR Metadata	4375
39.12. Lag Control	4378
39.13. Present Barrier	4393
40. Deferred Host Operations	4396
40.1. Requesting Deferral	4396
40.2. Deferred Host Operations API	4397
41. Private Data	4403
42. Acceleration Structures	4410
42.1. Acceleration Structures	4410
42.2. Cluster Level Acceleration Structures	4498
42.3. Partitioned Top Level Acceleration Structures	4530
42.4. Host Acceleration Structure Operations	4544
43. Compressed triangle data	4564
43.1. Dense Geometry Format Version 1 (DGF1)	4564
44. Micromap	4578
44.1. Micromaps	4578
44.2. Host Micromap Operations	4599
45. Ray Traversal	4612
45.1. Ray Intersection Candidate Determination	4612
45.2. Ray Intersection Culling	4615
45.3. Ray Intersection Confirmation	4620
45.4. Ray Closest Hit Determination	4622
45.5. Ray Result Determination	4622
46. Ray Tracing	4624
46.1. Shader Call Instructions	4624

46.2. Ray Tracing Commands	4627
46.3. Shader Binding Table	4697
46.4. Ray Tracing Pipeline Stack	4700
46.5. Ray Tracing Capture Replay	4701
46.6. Ray Tracing Validation	4701
47. Memory Decompression	4702
48. Video Coding	4715
48.1. Video Picture Resources	4715
48.2. Decoded Picture Buffer	4717
48.3. Video Profiles	4719
48.4. Video Capabilities	4730
48.5. Video Sessions	4739
48.6. Video Profile Compatibility	4754
48.7. Video Session Parameters	4756
48.8. Video Coding Scope	4780
48.9. Video Coding Control	4791
48.10. Inline Queries	4795
48.11. Video Decode Operations	4796
48.12. H.264 Decode Operations	4817
48.13. H.265 Decode Operations	4833
48.14. VP9 Decode Operations	4849
48.15. AV1 Decode Operations	4856
48.16. Video Encode Operations	4870
48.17. Video Encode Intra Refresh	4913
48.18. Video Encode Rate Control	4921
48.19. Video Encode Quantization Maps	4931
48.20. Video Encode R'G'B' Conversion	4940
48.21. H.264 Encode Operations	4947
48.22. H.265 Encode Operations	4986
48.23. AV1 Encode Operations	5032
49. Optical Flow	5075
49.1. Optical Flow Queues	5075
49.2. Optical Flow Image Formats	5075
49.3. Optical Flow Session	5079
50. Execution Graphs	5092
50.1. Pipeline Creation	5092
50.2. Initializing Scratch Memory	5102
50.3. Dispatching a Graph	5106
50.4. Shader Enqueue	5153
51. External Compute Queues	5156
52. Data graphs	5162

52.1. Pipeline Creation	5162
52.2. Sessions	5180
52.3. Dispatch	5193
52.4. Properties	5198
52.5. Processing Engines	5203
52.6. Operations	5207
53. Extending Vulkan	5227
53.1. Functionality Levels	5227
53.2. Instance and Device Versions	5227
53.3. Core Versions	5227
53.4. Layers	5231
53.5. Extensions	5235
53.6. Extension Dependencies	5239
53.7. Compatibility Guarantees (Informative)	5240
54. Features	5245
54.1. Feature Requirements	5522
54.2. Roadmap Milestone Features	5537
55. Limits	5540
55.1. Limit Requirements	5674
55.2. Additional Multisampling Capabilities	5711
55.3. Milestone Limits	5712
56. Formats	5716
56.1. Format Definition	5716
56.2. Format Properties	5779
56.3. Required Format Support	5804
57. Additional Capabilities	5832
57.1. Additional Image Capabilities	5832
57.2. Additional Buffer Capabilities	5862
57.3. Additional Tensor Capabilities	5865
57.4. Optional Semaphore Capabilities	5867
57.5. Optional Fence Capabilities	5873
57.6. Timestamp Calibration Capabilities	5879
58. Debugging	5881
58.1. Debug Utilities	5885
58.2. Debug Markers	5911
58.3. Debug Report Callbacks	5921
58.4. Device Loss Debugging	5931
58.5. Active Tooling Information	5951
58.6. Frame Boundary	5954
Appendix A: Vulkan Environment for SPIR-V	5958
Versions and Formats	5958

Capabilities	5958
Validation Rules Within a Module.....	5977
Precision and Operation of SPIR-V Instructions	6028
Buffer Indexing Calculations	6035
Signedness of SPIR-V Image Accesses.....	6037
Image Format and Type Matching.....	6037
Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types	6039
Compatibility Between SPIR-V Image Formats and Vulkan Formats	6040
Ray Query Precision and Operation	6041
Compatibility Between SPIR-V Tensor Element Types And Vulkan Formats	6041
Appendix B: Memory Model	6043
Agent.....	6043
Memory Location	6043
Allocation.....	6043
Memory Operation	6044
Reference.....	6044
Program-Order.....	6044
Shader Call Related	6045
Shader Call Order	6045
Scope.....	6046
Atomic Operation	6046
Scoped Modification Order	6046
Memory Semantics	6047
Release Sequence.....	6048
Synchronizes-With	6049
System-Synchronizes-With	6051
Private vs. Non-Private	6051
Inter-Thread-Happens-Before	6051
Happens-Before	6052
Availability and Visibility	6052
Availability, Visibility, and Domain Operations	6054
Availability and Visibility Semantics	6055
Per-Instruction Availability and Visibility Semantics.....	6056
Location-Ordered	6056
Data Race	6057
Visible-To	6057
Acyclicity	6058
Shader I/O	6059
Deallocation	6059
Descriptions (Informative)	6059
Tessellation Output Ordering	6060

Cooperative Matrix Memory Access	6060
Appendix C: Compressed Image Formats	6061
Block-Compressed Image Formats	6062
ETC Compressed Image Formats	6063
ASTC Compressed Image Formats	6064
PVRTC Compressed Image Formats	6067
Appendix D: Core Revisions (Informative)	6068
Vulkan Version 1.4	6068
Vulkan Version 1.3	6077
Vulkan Version 1.2	6086
Vulkan Version 1.1	6094
Vulkan Version 1.0	6106
Appendix E: Layers & Extensions (Informative)	6121
Extension Dependencies	6121
Extension Interactions	6121
List of Current Extensions	6122
List of Provisional Extensions	7100
List of Deprecated Extensions	7112
Appendix F: Vulkan Roadmap Milestones	7500
Roadmap 2022	7500
Roadmap 2024	7504
Roadmap 2026	7506
Appendix G: Legacy and Superseded Functionality	7509
List of Legacy Functionality	7510
Appendix H: API Boilerplate	7513
Vulkan Header Files	7513
Window System-Specific Header Control (Informative)	7517
Provisional Extension Header Control (Informative)	7519
Video Std Headers	7519
Appendix I: Invariance	7521
Repeatability	7521
Multi-Pass Algorithms	7521
Invariance Rules	7521
Tessellation Invariance	7523
Appendix J: Lexicon	7525
Glossary	7525
Common Abbreviations	7556
Video-Specific Abbreviations	7558
Prefixes	7559
Appendix K: Credits (Informative)	7561
Working Group Contributors to Vulkan	7561

Other Credits	7573

Chapter 1. Preamble

Copyright 2014-2026 The Khronos Group Inc.

This Specification is protected by copyright laws and contains material proprietary to Khronos. Except as described by these terms, it or any components may not be reproduced, republished, distributed, transmitted, displayed, broadcast or otherwise exploited in any manner without the express prior written permission of Khronos.

Khronos grants a conditional copyright license to use and reproduce the unmodified Specification for any purpose, without fee or royalty, EXCEPT no licenses to any patent, trademark or other intellectual property rights are granted under these terms.

Khronos makes no, and expressly disclaims any, representations or warranties, express or implied, regarding this Specification, including, without limitation: merchantability, fitness for a particular purpose, non-infringement of any intellectual property, correctness, accuracy, completeness, timeliness, and reliability. Under no circumstances will Khronos, or any of its Promoters, Contributors or Members, or their respective partners, officers, directors, employees, agents or representatives be liable for any damages, whether direct, indirect, special or consequential damages for lost revenues, lost profits, or otherwise, arising from or in connection with these materials.

This document contains extensions which are not ratified by Khronos, and as such is not a ratified Specification, though it contains text from (and is a superset of) the ratified Specification.

The ratified version of the Vulkan Specification can be found at <https://registry.khronos.org/vulkan/specs/latest-ratified/pdf/vkspec.pdf> (core with all ratified extensions).

This Specification contains substantially unmodified functionality from, and is a successor to, Khronos specifications including OpenGL, OpenGL ES and OpenCL.

The Khronos Intellectual Property Rights Policy defines the terms 'Scope', 'Compliant Portion', and 'Necessary Patent Claims'.

Some parts of this Specification are purely informative and so are EXCLUDED the Scope of this Specification. The [Document Conventions](#) section of the [Introduction](#) defines how these parts of the Specification are identified.

Where this Specification uses [technical terminology](#), defined in the [Glossary](#) or otherwise, that refer to enabling technologies that are not expressly set forth in this Specification, those enabling technologies are EXCLUDED from the Scope of this Specification. For clarity, enabling technologies not disclosed with particularity in this Specification (e.g. semiconductor manufacturing technology, hardware architecture, processor architecture or microarchitecture, memory architecture, compiler technology, object oriented technology, basic operating system technology, compression technology, algorithms, and so on) are NOT to be considered expressly set forth; only those application program interfaces and data structures disclosed with particularity are included in the Scope of this Specification.

For purposes of the Khronos Intellectual Property Rights Policy as it relates to the definition of

Necessary Patent Claims, all recommended or optional features, behaviors and functionality set forth in this Specification, if implemented, are considered to be included as Compliant Portions.

Where this Specification identifies specific sections of external references, only those specifically identified sections define [normative](#) functionality. The Khronos Intellectual Property Rights Policy excludes external references to materials and associated enabling technology not created by Khronos from the Scope of this Specification, and any licenses that may be required to implement such referenced materials and associated technologies must be obtained separately and may involve royalty payments.

Khronos and Vulkan are registered trademarks, and SPIR-V is a trademark of The Khronos Group Inc. OpenCL is a trademark of Apple Inc., used under license by Khronos. OpenGL is a registered trademark and the OpenGL ES logo is a trademark of Hewlett Packard Enterprise, used under license by Khronos. ASTC is a trademark of ARM Holdings PLC. All other product names, trademarks, and/or company names are used solely for identification and belong to their respective owners.

Chapter 2. Introduction

This document, referred to as the “Vulkan Specification” or just the “Specification” hereafter, describes the Vulkan Application Programming Interface (API). Vulkan is a [C99](#) API designed for explicit control of low-level graphics and compute functionality.

The canonical version of the Specification is available in the official [Vulkan Registry](#) (<https://registry.khronos.org/vulkan/>). The source files used to generate the Vulkan specification are stored in the [Vulkan Documentation Repository](#) (<https://github.com/KhronosGroup/Vulkan-Docs>).

The source repository additionally has a public issue tracker and allows the submission of pull requests that improve the specification.

2.1. Document Conventions

The Vulkan specification is intended for use by both implementors of the API and application developers seeking to make use of the API, forming a contract between these parties. Specification text may address either party; typically the intended audience can be inferred from context, though some sections are defined to address only one of these parties. (For example, [Valid Usage](#) sections only address application developers). Any requirements, prohibitions, recommendations, or options defined in specification text are imposed only on the audience of that text.

2.1.1. Normative Requirements

The Vulkan Specification uses a combination of [normative terminology](#) and [normative descriptions](#) to express the requirements that it imposes on applications and implementations. An application which complies with all normative requirements imposed on applications is said to make **valid use** of the API; failing to comply with such requirements results in undefined behavior, as discussed in the [Valid Usage](#) section below. In the context of this document, an implementation which complies with all normative requirements imposed on implementations is said to be **conformant**.

NOTE

The Khronos Group imposes additional requirements on implementors who wish to make public statements describing their Vulkan implementations as conformant. These include signing the Vulkan Adopter’s Agreement, paying the associated fee, and making a successful conformance test submission to the Khronos Conformance Process. For details see the [Khronos Trademark Guidelines](#) (<https://www.khronos.org/legal/khronos-trademark-guidelines>).

Normative Terminology

Within this specification, the key words **must**, **required**, **should**, **may**, and **optional** are to be interpreted as described in [RFC 2119 - Key words for use in RFCs to Indicate Requirement Levels](#) (<https://www.ietf.org/rfc/rfc2119.txt>). The additional key word **optionally** is an alternate form of **optional**, for use where grammatically appropriate. These key words are highlighted in the specification to indicate that they are being used in a specific technical sense.

The additional key words **can** and **cannot** are to be interpreted as describing the capabilities of an application, as follows:

can

This word means that the application is able to perform the action described.

cannot

This word means that the API and/or the execution environment provide no mechanism through which the application can express or accomplish the action described.

These key words are never used in text addressing implementors.

NOTE

There is an important distinction between **cannot** and **must not**, as used in this Specification. **Cannot** refers to something the API provides no way for the application to express or accomplish. **Must not** describes something that the application is able to express, but that is not valid use of the API, and will have undefined and potentially unrecoverable consequences.

Normative Descriptions

In the Vulkan Specification, the normative term **must** is primarily used to describe **application** behavior, and in particular to constrain what inputs or commands issued by the application to the implementation are considered valid.

To constrain **implementation** behavior, the specification sometimes uses **must**, but more often simply describes the behavior of the implementation in response to specified commands and inputs. Unless explicitly stated otherwise, such references to implementation behavior describe the behavior of **conformant** implementations, and express normative requirements which an implementation must satisfy in order to conform to the specification. For example, if the specification says “Under **specified condition**, the error code [VK_ERROR_FEATURE_NOT_PRESENT](#) is returned”, that behavior is a requirement of the specification, and an implementation which does not return that error code under that condition is not conformant.

When the normative terms **may**, **should**, or **optional** are used to describe implementation behavior, they define alternative or optional behaviors which a conformant implementation may or may not exhibit. Such statements are also normative. For example, if the specification says “Under **specified condition**, the implementation **should** return A but **may** instead return B”, then an implementation that returns either A or B under that condition is conformant (assuming it does not violate other normative requirements), while an implementation that returns anything else is not.

2.1.2. Normative References

References to external documents are considered normative references if the Specification uses [normative terminology](#) or [normative descriptions](#) to refer to them or their requirements, either as a whole or in part.

The following documents are referenced by normative sections of the specification:

IEEE. August, 2008. *IEEE Standard for Floating-Point Arithmetic*. IEEE Std 754-2008. <https://dx.doi.org/10.1109/IEEESTD.2008.4610935>.

2.1.3. Informative Language

Some language in the specification is purely informative, intended to provide background information or make suggestions to implementors or developers. Such language does not impose normative requirements on implementations or applications.

All NOTES are implicitly informative.

If an entire chapter, section, or appendix contains only informative language, its title will be suffixed with “(Informative)”. Unless so noted in the title, all chapters, sections, and appendices in this document are normative.

2.1.4. Technical Terminology

The Vulkan Specification makes use of common engineering and graphics terms such as **Pipeline**, **Shader**, and **Host** to identify and describe Vulkan API constructs and their attributes, states, and behaviors. The [Glossary](#) defines the basic meanings of these terms in the context of the Specification. The Specification text provides fuller definitions of the terms and may elaborate, extend, or clarify the [Glossary](#) definitions. When a term defined in the [Glossary](#) is used in

normative language within the Specification, the definitions within the Specification govern and supersede any meanings the terms may have in other technical contexts (i.e. outside the Specification).

2.1.5. Ratification

Ratification of a Vulkan core version or extension is a status conferred by vote of the Khronos Board of Promoters, bringing that core version or extension under the umbrella of the Khronos IP Rights Policy.

All Vulkan core versions and **KHR** extensions (including provisional specifications) are ratified, as are some multi-vendor **EXT** extensions. Ratification status of extensions is described in the [Layers & Extensions \(Informative\)](#) appendix.

NOTE

Ratification status is primarily of interest to IHVs developing GPU hardware and Vulkan implementations. For developers, ratification does not necessarily mean that an extension is “better”, has a more stable API, or is more widely supported than alternative ways of achieving that functionality.

Interactions between ratified and non-ratified extensions are not themselves ratified.

Chapter 3. Fundamentals

This chapter introduces fundamental concepts including the Vulkan architecture and execution model, API syntax, queues, pipeline configurations, numeric representation, state and state queries, and the different types of objects and shaders. It provides a framework for interpreting more specific descriptions of commands and behavior in the remainder of the Specification.

3.1. Host and Device Environment

The Vulkan Specification assumes and requires: the following properties of the host environment with respect to Vulkan implementations:

- The host **must** have runtime support for 8-, 16-, 32-, and 64-bit signed and unsigned twos-complement integers, all addressable at the granularity of their size in bytes.
- The host **must** have runtime support for 32- and 64-bit floating-point types satisfying the range and precision constraints in the [Floating-Point Computation](#) section.
- The representation and endianness of these types on the host **must** match the representation and endianness of the same types on every physical device supported.

NOTE

Since a variety of data types and structures in Vulkan **may** be accessible by both host and physical device operations, the implementation **should** be able to access such data efficiently in both paths in order to facilitate writing portable and performant applications.

3.2. Execution Model

This section outlines the execution model of a Vulkan system.

Vulkan exposes one or more *devices*, each of which exposes one or more *queues* which **may** process work asynchronously to one another. The set of queues supported by a device is partitioned into *families*. Each family supports one or more types of functionality and **may** contain multiple queues with similar characteristics. Queues within a single family are considered *compatible* with one another, and work produced for a family of queues **can** be executed on any queue within that family. This specification defines the following types of functionality that queues **may** support: graphics, compute, video decode, video encode, protected memory management, sparse memory management, and transfer.

NOTE

A single device **may** report multiple similar queue families rather than, or as well as, reporting multiple members of one or more of those families. This indicates that while members of those families have similar capabilities, they are *not* directly compatible with one another.

Device memory is explicitly managed by the application. Each device **may** advertise one or more heaps, representing different areas of memory. Memory heaps are either device-local or host-local, but are always visible to the device. Further detail about memory heaps is exposed via memory types available on that heap. Examples of memory areas that **may** be available on an

implementation include:

- *device-local* is memory that is physically connected to the device.
- *device-local, host visible* is device-local memory that is visible to the host.
- *host-local, host visible* is memory that is local to the host and visible to the device and host.

On other architectures, there **may** only be a single heap that **can** be used for any purpose.

3.2.1. Queue Operation

Each device supports a number of [queues](#), which provide an interface for [submitting work](#) for execution on the device.

[Queue submission commands](#) are used to submit work, along with a set of [synchronization primitives](#) used to constrain the order of submitted operations. Queues are intended for asynchronous execution of submitted workloads, and queue submission commands **should** return as soon as the work has been submitted, without waiting for the work to complete. Once submitted to a queue, work will begin and complete execution without further application intervention.

There are no implicit ordering constraints between queue operations on different queues, or between queues and the host, so these **may** operate in any order with respect to each other. Explicit ordering constraints between different queues or with the host **can** be expressed with [semaphores](#) and [fences](#).

Many commands for queues are recorded into [command buffers](#) first, before the command buffers are then submitted to a queue for execution. Command buffer submissions to a single queue respect [submission order](#) and other [implicit ordering guarantees](#), but otherwise **may** overlap or execute out of order. Other types of batches and queue submissions against a single queue (e.g. [sparse memory binding](#)) have no implicit ordering constraints with any other queue submission or batch. Additional explicit ordering constraints between queue submissions and individual batches can be expressed with [semaphores](#) and [fences](#).

Before a fence or semaphore is signaled, it is guaranteed that any previously submitted queue operations have completed execution, and that memory writes from those queue operations are [available](#) to future queue operations. Waiting on a signaled semaphore or fence guarantees that previous writes that are available are also [visible](#) to subsequent commands.

Command buffer boundaries, both between primary command buffers of the same or different batches or submissions as well as between primary and secondary command buffers, do not introduce any additional ordering constraints. In other words, submitting the set of command buffers (which **can** include executing secondary command buffers) between any semaphore or fence operations execute the recorded commands as if they had all been recorded into a single primary command buffer, except that the current state is [reset](#) on each boundary. Explicit ordering constraints **can** be expressed with [explicit synchronization primitives](#).

There are a few [implicit ordering guarantees](#) between commands within a command buffer, but only covering a subset of execution. Additional explicit ordering constraints can be expressed with the various [explicit synchronization primitives](#).

NOTE

Implementations have significant freedom to overlap execution of work submitted to a queue, and this is common due to deep pipelining and parallelism in Vulkan devices.

Commands recorded in command buffers can perform actions, set state that persists across commands, synchronize other commands, or indirectly launch other commands, with some commands fulfilling several of these roles. The “Command Properties” section for each such command lists which of these roles the command takes:

Action

Action commands perform operations that can update values in memory. E.g. [draw commands](#), [dispatch commands](#).

State

State setting commands update the current state of a command buffer, affecting the operation of future action commands.

Synchronization

Synchronization commands impose ordering constraints on action commands, by introducing explicit [execution and memory dependencies](#).

Indirection

Indirection commands execute other commands which were not directly recorded in the same command buffer.

NOTE

In the absence of explicit synchronization or [implicit ordering guarantees](#), action commands may overlap execution or execute out of order, potentially leading to data races. However, such reordering does not affect the current state observed by any action command. Each action command uses the state in effect at the point where the command occurs in the command buffer, regardless of when it is executed.

3.3. Object Model

The devices, queues, and other entities in Vulkan are represented by Vulkan objects. At the API level, all objects are referred to by handles. There are two classes of handles: dispatchable and non-dispatchable. *Dispatchable* handle types are a pointer to an opaque type. This pointer **may** be used by layers as part of intercepting API commands, and thus each API command takes a dispatchable type as its first parameter. Each object of a dispatchable type **must** have a unique handle value during its lifetime.

Non-dispatchable handle types are a 64-bit integer type whose meaning is implementation-dependent. If the `privateData` feature is enabled for a [VkDevice](#), each object of a non-dispatchable type created on that device **must** have a handle value that is unique among objects created on that device, for the duration of the object’s lifetime. Otherwise, non-dispatchable handles **may** encode object information directly in the handle rather than acting as a reference to an underlying object, and thus **may** not have unique handle values. If handle values are not unique, then destroying one

such handle **must** not cause identical handles of other types to become invalid, and **must** not cause identical handles of the same type to become invalid if that handle value has been created more times than it has been destroyed.

All objects created or allocated from a **VkDevice** (i.e. with a **VkDevice** as the first parameter) are private to that device, and **must** not be used on other devices.

3.3.1. Object Lifetime

Objects are created or allocated by **vkCreate*** and **vkAllocate*** commands, respectively. Once an object is created or allocated, its “structure” is considered to be immutable, though the content of certain object types is still free to change. When an object is passed to another command, it **may** be accessed by the implementation, which **may** include both read and write access unless explicitly stated otherwise. Objects are destroyed or freed by **vkDestroy*** and **vkFree*** commands, respectively.

Objects that are allocated (rather than created) take resources from an existing pool object or memory heap, and when freed return resources to that pool or heap. While object creation and destruction are generally expected to be low-frequency occurrences during runtime, allocating and freeing objects **can** occur at high frequency. Pool objects help accommodate improved performance of the allocations and frees.

Applications are responsible for managing the lifetimes of Vulkan objects and memory passed into the Vulkan API. The access semantics of different functions in the API follow a typical pattern as laid out below, with any exceptions listed with the commands or objects that have them.

Application-owned memory and Vulkan objects **may** be accessed at any time during the execution of a command they are passed to. Vulkan objects that device addresses are retrieved from **may** be accessed by the implementation any time that memory backing the device address is accessed. Device addresses and Vulkan objects passed in during the creation or allocation of another object **may** be accessed by the implementation any time that the created/allocated object is accessed unless explicitly stated otherwise. Device addresses and Vulkan objects passed to a recording command (**vkCmd***) **may** be accessed at any time during the execution of the command, when the command buffer is subsequently recorded into another command buffer, during any subsequent command that is recorded to either the command buffer or one it is recorded into, or while the command buffer is in the *pending state*, unless explicitly stated otherwise. If an application is using *deferred host operations* in a command, and that operation is successfully deferred, objects and memory passed to that command **may** be accessed at any time until the deferred operation is complete. Some additional operations hold references to other objects or application-owned memory beyond the duration of the command; in which case the access semantics and lifetime of those references are described by that command.

When destroying or freeing an object, implementations **must** not access any memory or other objects that **may** otherwise be accessed when the object is accessed. Applications **can** free or destroy objects in any order, except that parent objects **must** be freed only after all child objects are freed. An object is the parent of another child object if the parent was used as the first object parameter in the creation of the child. Once an object is freed or destroyed it **must** not be accessed again, either directly or via access through another object. Applications **must** not free or destroy any object while it is being accessed.

3.3.2. External Object Handles

As defined above, the scope of object handles created or allocated from a `VkDevice` is limited to that logical device. Objects which are not in scope are said to be external. To bring an external object into scope, an external handle **must** be exported from the object in the source scope and imported into the destination scope.

NOTE

The scope of external handles and their associated resources **may** vary according to their type, but they **can** generally be shared across process and API boundaries.

3.4. Application Binary Interface

The mechanism by which Vulkan is made available to applications is platform- or implementation-defined. On many platforms the C interface described in this Specification is provided by a shared library. Since shared libraries can be changed independently of the applications that use them, they present particular compatibility challenges, and this Specification places some requirements on them.

Shared library implementations **must** use the default Application Binary Interface (ABI) of the standard C compiler for the platform, or provide customized API headers that cause application code to use the implementation's non-default ABI. An ABI in this context means the size, alignment, and layout of C data types; the procedure calling convention; and the naming convention for shared library symbols corresponding to C functions. Customizing the calling convention for a platform is usually accomplished by defining [calling convention macros](#) appropriately in `vk_platform.h`.

On platforms where Vulkan is provided as a shared library, library symbols beginning with “vk” and followed by a digit or uppercase letter are reserved for use by the implementation. Applications which use Vulkan **must** not provide definitions of these symbols. This allows the Vulkan shared library to be updated with additional symbols for new API versions or extensions without causing symbol conflicts with existing applications.

Shared library implementations **should** provide library symbols for commands in the highest version of this Specification they support, and for [Window System Integration](#) extensions relevant to the platform. They **may** also provide library symbols for commands defined by additional extensions.

NOTE

These requirements and recommendations are intended to allow implementors to take advantage of platform-specific conventions for SDKs, ABIs, library versioning mechanisms, etc. while still minimizing the code changes necessary to port applications or libraries between platforms. Platform vendors, or providers of the *de facto* standard Vulkan shared library for a platform, are encouraged to document what symbols the shared library provides and how it will be versioned when new symbols are added.

Applications **should** only rely on shared library symbols for commands in the minimum core version required by the application. [vkGetInstanceProcAddr](#) and [vkGetDeviceProcAddr](#) **should** be used to obtain function pointers for commands in core versions beyond the application's minimum required version.

3.5. Command Syntax and Duration

The Specification describes Vulkan commands as functions or procedures using C99 syntax. Language bindings for other languages such as C++ and JavaScript **may** allow for stricter parameter passing, or object-oriented interfaces.

Vulkan uses the standard C types for the base type of scalar parameters (e.g. types from `<stdint.h>`), with exceptions described below, or elsewhere in the text when appropriate:

`VkBool32` represents boolean `True` and `False` values, since C does not have a sufficiently portable built-in boolean type:

```
// Provided by VK_VERSION_1_0
typedef uint32_t VkBool32;
```

`VK_TRUE` represents a boolean **True** (unsigned integer 1) value, and `VK_FALSE` a boolean **False** (unsigned integer 0) value.

All values returned from a Vulkan implementation in a `VkBool32` will be either `VK_TRUE` or `VK_FALSE`.

Applications **must** not pass any other values than `VK_TRUE` or `VK_FALSE` into a Vulkan implementation where a `VkBool32` is expected.

`VK_TRUE` is a constant representing a `VkBool32` **True** value.

```
#define VK_TRUE 1U
```

`VK_FALSE` is a constant representing a `VkBool32` **False** value.

```
#define VK_FALSE 0U
```

`VkDeviceSize` represents device memory size and offset values:

```
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceSize;
```

`VkDeviceAddress` represents device buffer address values:

```
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceAddress;
```

Valid Usage

- VUID-VkDeviceAddress-size-11364

A valid `VkDeviceAddress` **must** be equal to the sum of an address retrieved from a `VkBuffer` via `vkGetBufferDeviceAddress`, and any offset in the range `[0, size)`, where `size` is the value of `VkBufferCreateInfo::size` used to create that `VkBuffer`

- VUID-VkDeviceAddress-None-10894

If a `VkDeviceAddress` was retrieved from a non-sparse buffer, that buffer **must** be bound completely and contiguously to a single `VkDeviceMemory` object

Commands that create Vulkan objects are of the form `vkCreate*` and take `Vk*CreateInfo` structures with the parameters needed to create the object. These Vulkan objects are destroyed with commands of the form `vkDestroy*`.

The last in-parameter to each command that creates or destroys a Vulkan object is `pAllocator`. The `pAllocator` parameter **can** be a non-NULL value, in which case allocations for the given object are delegated to an application provided callback. Refer to the [Memory Allocation](#) chapter for further details.

Commands that allocate Vulkan objects owned by pool objects are of the form `vkAllocate*`, and take `Vk*AllocateInfo` structures. These Vulkan objects are freed with commands of the form `vkFree*`. These objects do not take allocators; if host memory is needed, they will use the allocator that was specified when their parent pool was created.

Commands are recorded into a command buffer by calling API commands of the form `vkCmd*`. Each such command **may** have different restrictions on where it **can** be used: in a primary and/or secondary command buffer, inside and/or outside a render pass, and in one or more of the supported queue types. These restrictions are documented together with the definition of each such command.

The *duration* of a Vulkan command refers to the interval between calling the command and its return to the caller.

3.5.1. Lifetime of Retrieved Results

Information is retrieved from the implementation with commands of the form `vkGet*` and `vkEnumerate*`.

Unless otherwise specified for an individual command, the results are *invariant*; that is, they will remain unchanged when retrieved again by calling the same command with the same parameters, so long as those parameters themselves all remain valid.

3.5.2. Array Results

Some query commands of the form `vkGet*` and `vkEnumerate*` enable retrieving multiple results in the form of a return array. Such commands typically have two pointer arguments as follows:

- An element count pointer pointing to an integer variable, conventionally named as `p*Count`

where ***** is the capitalized singular form of the name of the retrieved values.

- A pointer to an array where the result array is retrieved, conventionally named as **p*** where ***** is the capitalized plural form of the name of the retrieved values.

If such commands are called with the array pointer set to **NULL**, then the number of retrievable elements is returned in the variable pointed to by the element count pointer. Otherwise, the element count pointer **must** point to a variable set by the application to the number of elements in the return array, and on return the variable is overwritten with the number of elements actually written to the return array. If the input element count is less than the number of retrievable array elements, the query will write only as many elements to the return array as specified by the element count variable set by the application, and the command will return **VK_INCOMPLETE** instead of **VK_SUCCESS**, to indicate that not all retrievable array elements were returned.

NOTE

In practice, this means that applications will typically call such query commands twice:

- First, with the array pointer set to **NULL**, to retrieve the number of retrievable elements.
- Second, with the array pointer pointing to an application allocated storage for at least as many elements as indicated by the variable pointed to by the element count pointer, to retrieve at most as many of the retrievable elements.

Query commands that return one or more structures, regardless of whether they return a single or an array of structures with or without a **pNext** chain, **may** also contain arrays within those structures. Such return arrays are typically defined in the form of two members as follows:

- An integer value specifying the element count, conventionally named as ***Count** where ***** is the singular form of the name of the retrieved values.
- A pointer to an array where the result array is retrieved, conventionally named as **p*** where ***** is the capitalized plural form of the name of the retrieved values.

Analogously to query commands that return multiple results, if the command is called with the array pointer member of the output structure in question set to **NULL**, then the number of retrievable elements is returned in the element count member of that output structure. Otherwise, the element count **must** specify the number of elements in the return array, and on return the element count member is overwritten with the number of elements actually written to the return array. If the input element count is less than the number of retrievable array elements, the query will write only as many elements to the return array as specified by the input element count, and the command will return **VK_INCOMPLETE** instead of **VK_SUCCESS**, if the query command has a **VkResult** return type, to indicate that not all retrievable array elements were returned.

NOTE

Applications need to separately track the value they provided as the input element count member for such arrays and compare those with the returned element counts in order to determine whether the actually returned element count is smaller than the size of the return array. Another side effect of this is that it is impossible for the application to determine if the number of retrievable elements has increased beyond the provided input element count so using return arrays in output

structures **should** be limited to *invariant* array results. In practice, this means that applications will typically call such query commands multiple times:

- First, with the array pointer member(s) set to **NULL**, to retrieve the number(s) of retrievable elements.
- Second, with the array pointer(s) pointing to an application allocated storage for at least as many elements as indicated by the element count member(s), to retrieve at most as many of the retrievable elements.
- Then the process **may** need to be repeated for all other newly introduced return arrays in any nested output structures indirectly specified through the previously retrieved result arrays.

Regardless of the type of query command, any array pointer member of an output structure **must** either be **NULL**, or point to an application-allocated array. Query commands **must** not return a pointer to implementation allocated storage in any output structure.

3.5.3. Opaque Binary Data Results

Some query commands of the form **vkGet*** retrieve opaque binary data in the form of a byte array and have a possible result code of **VK_ERROR_NOT_ENOUGH_SPACE_KHR**. Such commands always have two pointer arguments as follows:

- A binary data size pointer pointing to a **size_t** variable, conventionally named as **p*Size** where ***** is the capitalized form of the name of the retrieved binary data.
- A pointer to a byte array where the binary data is retrieved, conventionally named as **p*** where ***** is the capitalized form of the name of the retrieved binary data.

If such commands are called with the binary pointer not set to **NULL**, the binary size pointer **must** point to a variable set by the application to the allocated size of the binary pointer. These arguments **may** also be placed in an extensible structure, in which case the binary data size argument is not a pointer.

If the input binary size is less than the total retrievable binary size, the query will not write any data to the location pointed to the binary pointer, and the command will return **VK_ERROR_NOT_ENOUGH_SPACE_KHR** instead of **VK_SUCCESS**.

If the return code is **VK_SUCCESS** or **VK_ERROR_NOT_ENOUGH_SPACE_KHR**, the total size of the binary data that **can** be retrieved is returned in the variable pointed to by the binary size pointer.

If multiple binaries are being retrieved, **VK_ERROR_NOT_ENOUGH_SPACE_KHR** will be returned if any input binary sizes are less than their respective total retrievable binary sizes. Unless otherwise specified, this command will determine writing data to each binary individually based on if their input binary sizes are sufficiently sized, following the behavior for single binary retrieval.

For all other error codes, the contents of the return structures are undefined.

NOTE

If **VK_ERROR_NOT_ENOUGH_SPACE_KHR** is returned with a command that returns multiple binaries, the application **can** determine which binaries are undersized by

comparing the total binary size that is returned for each binary against the allocated size that was provided to the command.

NOTE

Some binary queries do not behave consistently with this pattern for historical reasons, primarily that the [VK_ERROR_NOT_ENOUGH_SPACE_KHR](#) error code was not defined until after those queries were written.

A NOTE is added to each such query, describing such inconsistent behavior.

3.6. Threading Behavior

Vulkan is intended to provide scalable performance when used on multiple host threads. All commands support being called concurrently from multiple threads, but certain parameters, or components of parameters are defined to be *externally synchronized*. This means that the caller **must** guarantee that no more than one thread is using such a parameter at a given time.

More precisely, Vulkan commands use simple stores to update the state of Vulkan objects. The implementation **may** not synchronize accesses to memory parameters or object parameters declared as externally synchronized with other accesses. If two commands access the same object or memory and at least one of the commands declares the object to be externally synchronized, then the caller **must** guarantee not only that the commands do not execute simultaneously, but also that the two commands are separated by an appropriate memory barrier (if needed). Similarly, if a Vulkan command accesses a non-const memory parameter and the application also accesses that memory, or if the application writes to that memory and the command accesses it as a const memory parameter, the application **must** ensure the accesses are properly synchronized with a memory barrier if needed.

NOTE

Memory barriers are particularly relevant for hosts based on the ARM CPU architecture, which is more weakly ordered than many developers are accustomed to from x86/x64 programming. Fortunately, most higher-level synchronization primitives (like the pthread library) perform memory barriers as a part of mutual exclusion, so mutexing Vulkan objects via these primitives will have the desired effect.

Any object parameters that are not labeled as externally synchronized are either not mutated by the command or are internally synchronized. Additionally, certain objects related to a command's parameters (e.g. command pools and descriptor pools) **may** be affected by a command, and **must** also be externally synchronized. These implicit parameters are documented as described below.

Parameters of commands that are externally synchronized are listed below.

Externally Synchronized Parameters and Members

- The **instance** parameter in [vkDestroyInstance](#)
- The **device** parameter in [vkDestroyDevice](#)
- The **queue** parameter in [vkQueueSubmit](#), if it was not created with

VK_DEVICE_QUEUE_CREATE INTERNALLY SYNCHRONIZED_BIT_KHR

- The **fence** parameter in `vkQueueSubmit`
- The **queue** parameter in `vkQueueWaitIdle`, if it was not created with `VK_DEVICE_QUEUE_CREATE INTERNALLY SYNCHRONIZED_BIT_KHR`
- The **memory** parameter in `vkFreeMemory`
- The **memory** parameter in `vkMapMemory`
- The **memory** parameter in `vkUnmapMemory`
- The **buffer** parameter in `vkBindBufferMemory`
- The **image** parameter in `vkBindImageMemory`
- The **queue** parameter in `vkQueueBindSparse`, if it was not created with `VK_DEVICE_QUEUE_CREATE INTERNALLY SYNCHRONIZED_BIT_KHR`
- The **fence** parameter in `vkQueueBindSparse`
- The **fence** parameter in `vkDestroyFence`
- The **semaphore** parameter in `vkDestroySemaphore`
- The **queryPool** parameter in `vkDestroyQueryPool`
- The **buffer** parameter in `vkDestroyBuffer`
- The **image** parameter in `vkDestroyImage`
- The **imageView** parameter in `vkDestroyImageView`
- The **commandPool** parameter in `vkDestroyCommandPool`
- The **commandPool** parameter in `vkResetCommandPool`
- The **commandPool** parameter in `vkFreeCommandBuffers`
- The **commandBuffer** parameter in `vkBeginCommandBuffer`
- The **commandBuffer** parameter in `vkEndCommandBuffer`
- The **commandBuffer** parameter in `vkResetCommandBuffer`
- The **commandBuffer** parameter in `vkCmdCopyBuffer`
- The **commandBuffer** parameter in `vkCmdCopyImage`
- The **commandBuffer** parameter in `vkCmdCopyBufferToImage`
- The **commandBuffer** parameter in `vkCmdCopyImageToBuffer`
- The **commandBuffer** parameter in `vkCmdUpdateBuffer`
- The **commandBuffer** parameter in `vkCmdFillBuffer`
- The **commandBuffer** parameter in `vkCmdPipelineBarrier`
- The **commandBuffer** parameter in `vkCmdBeginQuery`
- The **commandBuffer** parameter in `vkCmdEndQuery`
- The **commandBuffer** parameter in `vkCmdResetQueryPool`
- The **commandBuffer** parameter in `vkCmdWriteTimestamp`

- The `commandBuffer` parameter in `vkCmdCopyQueryPoolResults`
- The `commandBuffer` parameter in `vkCmdExecuteCommands`
- The `event` parameter in `vkDestroyEvent`
- The `event` parameter in `vkSetEvent`
- The `event` parameter in `vkResetEvent`
- The `bufferView` parameter in `vkDestroyBufferView`
- The `shaderModule` parameter in `vkDestroyShaderModule`
- The `pipelineCache` parameter in `vkDestroyPipelineCache`
- The `dstCache` parameter in `vkMergePipelineCaches`, conditionally¹
- The `pipelineCache` parameter in `vkCreateComputePipelines`, conditionally¹
- The `pipeline` parameter in `vkDestroyPipeline`
- The `pipelineLayout` parameter in `vkDestroyPipelineLayout`
- The `sampler` parameter in `vkDestroySampler`
- The `descriptorSetLayout` parameter in `vkDestroyDescriptorSetLayout`
- The `descriptorPool` parameter in `vkDestroyDescriptorPool`
- The `descriptorPool` parameter in `vkResetDescriptorPool`
- The `descriptorPool` parameter in `vkFreeDescriptorSets`
- The `commandBuffer` parameter in `vkCmdBindPipeline`
- The `commandBuffer` parameter in `vkCmdBindDescriptorSets`
- The `commandBuffer` parameter in `vkCmdClearColorImage`
- The `commandBuffer` parameter in `vkCmdDispatch`
- The `commandBuffer` parameter in `vkCmdDispatchIndirect`
- The `commandBuffer` parameter in `vkCmdSetEvent`
- The `commandBuffer` parameter in `vkCmdResetEvent`
- The `commandBuffer` parameter in `vkCmdWaitEvents`
- The `commandBuffer` parameter in `vkCmdPushConstants`
- The `pipelineCache` parameter in `vkCreateGraphicsPipelines`, conditionally¹
- The `framebuffer` parameter in `vkDestroyFramebuffer`
- The `renderPass` parameter in `vkDestroyRenderPass`
- The `commandBuffer` parameter in `vkCmdSetViewport`
- The `commandBuffer` parameter in `vkCmdSetScissor`
- The `commandBuffer` parameter in `vkCmdSetLineWidth`
- The `commandBuffer` parameter in `vkCmdSetDepthBias`
- The `commandBuffer` parameter in `vkCmdSetBlendConstants`
- The `commandBuffer` parameter in `vkCmdSetDepthBounds`

- The `commandBuffer` parameter in `vkCmdSetStencilCompareMask`
- The `commandBuffer` parameter in `vkCmdSetStencilWriteMask`
- The `commandBuffer` parameter in `vkCmdSetStencilReference`
- The `commandBuffer` parameter in `vkCmdBindIndexBuffer`
- The `commandBuffer` parameter in `vkCmdBindVertexBuffers`
- The `commandBuffer` parameter in `vkCmdDraw`
- The `commandBuffer` parameter in `vkCmdDrawIndexed`
- The `commandBuffer` parameter in `vkCmdDrawIndirect`
- The `commandBuffer` parameter in `vkCmdDrawIndexedIndirect`
- The `commandBuffer` parameter in `vkCmdBlitImage`
- The `commandBuffer` parameter in `vkCmdClearDepthStencilImage`
- The `commandBuffer` parameter in `vkCmdClearAttachments`
- The `commandBuffer` parameter in `vkCmdResolveImage`
- The `commandBuffer` parameter in `vkCmdBeginRenderPass`
- The `commandBuffer` parameter in `vkCmdNextSubpass`
- The `commandBuffer` parameter in `vkCmdEndRenderPass`
- The `commandBuffer` parameter in `vkCmdSetDeviceMask`
- The `commandPool` parameter in `vkTrimCommandPool`
- The `commandBuffer` parameter in `vkCmdDispatchBase`
- The `descriptorUpdateTemplate` parameter in `vkDestroyDescriptorUpdateTemplate`
- The `descriptorSet` parameter in `vkUpdateDescriptorSetWithTemplate`, conditionally¹
- The `ycbcrConversion` parameter in `vkDestroySamplerYcbcrConversion`
- The `commandBuffer` parameter in `vkCmdDrawIndirectCount`
- The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCount`
- The `commandBuffer` parameter in `vkCmdBeginRenderPass2`
- The `commandBuffer` parameter in `vkCmdNextSubpass2`
- The `commandBuffer` parameter in `vkCmdEndRenderPass2`
- The `privateDataSlot` parameter in `vkDestroyPrivateDataSlot`
- The `commandBuffer` parameter in `vkCmdPipelineBarrier2`
- The `commandBuffer` parameter in `vkCmdWriteTimestamp2`
- The `queue` parameter in `vkQueueSubmit2`, if it was not created with `VK_DEVICE_QUEUE_CREATE INTERNALLY SYNCHRONIZED_BIT_KHR`
- The `fence` parameter in `vkQueueSubmit2`
- The `commandBuffer` parameter in `vkCmdCopyBuffer2`
- The `commandBuffer` parameter in `vkCmdCopyImage2`

- The `commandBuffer` parameter in `vkCmdCopyBufferToImage2`
- The `commandBuffer` parameter in `vkCmdCopyImageToBuffer2`
- The `commandBuffer` parameter in `vkCmdSetEvent2`
- The `commandBuffer` parameter in `vkCmdResetEvent2`
- The `commandBuffer` parameter in `vkCmdWaitEvents2`
- The `commandBuffer` parameter in `vkCmdBlitImage2`
- The `commandBuffer` parameter in `vkCmdResolveImage2`
- The `commandBuffer` parameter in `vkCmdBeginRendering`
- The `commandBuffer` parameter in `vkCmdEndRendering`

¹ See Valid Usage language for this token for details.

There are also a few instances where a command **can** take in an application-allocated list whose contents are externally synchronized parameters. In these cases, the caller **must** guarantee that at most one thread is using a given element within the list at a given time. These parameters are listed below.

Externally Synchronized Parameter and Member Lists

- Each element of the **pFences** parameter in [vkResetFences](#)
- Each element of the **pCommandBuffers** parameter in [vkFreeCommandBuffers](#)
- Each element of the **pDescriptorSets** parameter in [vkFreeDescriptorSets](#)
- The **dstSet** member of each element of the **pDescriptorWrites** parameter in [vkUpdateDescriptorSets](#), conditionally¹

- Each element of the `pSwapchains` parameter in `vkSetHdrMetadataEXT`
- Each element of the `pWaitSemaphores` member of `VkPresentInfoKHR`
- Each element of the `pSwapchains` member of `VkPresentInfoKHR`

¹ See Valid Usage language for this token for details.

In addition, there are some implicit parameters that need to be externally synchronized. For example, when a `commandBuffer` parameter needs to be externally synchronized, it implies that the `commandPool` from which that command buffer was allocated also needs to be externally synchronized. The implicit parameters and their associated object are listed below.

Implicit Externally Synchronized Parameters

- All `VkPhysicalDevice` objects enumerated from `instance` in `vkDestroyInstance`
- All `VkQueue` objects created from `device` in `vkDestroyDevice`
- All `VkQueue` objects created from `device` that are not created with `VK_DEVICE_QUEUE_CREATE INTERNALLY SYNCHRONIZED_BIT_KHR` in `vkDeviceWaitIdle`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkBeginCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkEndCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkResetCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBufferToImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImageToBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdUpdateBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdFillBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPipelineBarrier`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginQuery`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndQuery`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResetQueryPool`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWriteTimestamp`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyQueryPoolResults`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdExecuteCommands`
- Any `VkDescriptorSet` objects allocated from `descriptorPool` in `vkResetDescriptorPool`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindPipeline`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindDescriptorSets`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearColorImage`

- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatch`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatchIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetEvent`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResetEvent`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWaitEvents`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPushConstants`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetViewport`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetScissor`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetLineWidth`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBias`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetBlendConstants`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBounds`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilCompareMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilWriteMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilReference`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindIndexBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindVertexBuffers`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDraw`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexed`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexedIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBlitImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearDepthStencilImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearAttachments`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResolveImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginRenderPass`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdNextSubpass`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndRenderPass`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDeviceMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatchBase`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirectCount`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexedIndirectCount`

- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginRenderPass2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdNextSubpass2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndRenderPass2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPipelineBarrier2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWriteTimestamp2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBuffer2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImage2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBufferToImage2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImageToBuffer2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetEvent2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResetEvent2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWaitEvents2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBlitImage2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResolveImage2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginRendering`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndRendering`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetCullMode`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetFrontFace`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetPrimitiveTopology`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetViewportWithCount`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetScissorWithCount`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindVertexBuffers2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthTestEnable`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthWriteEnable`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthCompareOp`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBoundsTestEnable`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilTestEnable`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilOp`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetRasterizerDiscardEnable`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBiasEnable`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetPrimitiveRestartEnable`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPushDescriptorSet`

- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPushDescriptorSetWithTemplate`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindDescriptorSets2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPushConstants2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPushDescriptorSet2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPushDescriptorSetWithTemplate2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetLineStipple`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindIndexBuffer2`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetRenderingAttachmentLocations`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetRenderingInputAttachmentIndices`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginVideoCodingKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndVideoCodingKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdControlVideoCodingKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDecodeVideoKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginRenderingKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndRenderingKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDeviceMaskKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatchBaseKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPushDescriptorSetKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPushDescriptorSetWithTemplateKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginRenderPass2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdNextSubpass2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndRenderPass2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirectCountKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexedIndirectCountKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetFragmentShadingRateKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetRenderingAttachmentLocationsKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetRenderingInputAttachmentIndicesKHR`

- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEncodeVideoKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetEvent2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResetEvent2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWaitEvents2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPipelineBarrier2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWriteTimestamp2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindIndexBuffer3KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindVertexBuffers3KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirect2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexedIndirect2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatchIndirect2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyMemoryKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyMemoryToImageKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImageToMemoryKHR`

3.7. Valid Usage

Valid usage defines a set of conditions which **must** be met in order to achieve well-defined runtime behavior in an application. These conditions depend only on Vulkan state, and the parameters or objects whose usage is constrained by the condition.

The core layer assumes applications are using the API correctly. Except as documented elsewhere in the Specification, the behavior of the core layer to an application using the API incorrectly is undefined, and **may** include program termination. However, implementations **must** ensure that incorrect usage by an application does not affect the integrity of the operating system, the Vulkan implementation, or other applications in the system using Vulkan. In particular, any guarantees made by an operating system about whether memory from one process **can** be visible to another process or not **must** not be violated by a Vulkan implementation for **any memory allocation**. Vulkan implementations are not **required** to make additional security or integrity guarantees beyond those provided by the OS unless explicitly directed by the application's use of a particular feature or extension.

NOTE

For instance, if an operating system guarantees that data in all its memory allocations are set to zero when newly allocated, the Vulkan implementation **must** make the same guarantees for any allocations it controls (e.g. [VkDeviceMemory](#)).

Similarly, if an operating system guarantees that use-after-free of host allocations will not result in values written by another process becoming visible, the same guarantees **must** be made by the Vulkan implementation for device memory.

If the [protectedMemory](#) feature is supported, the implementation provides additional guarantees when invalid usage occurs to prevent values in protected memory from being accessed or inferred outside of protected operations, as described in [Protected Memory Access Rules](#).

Some valid usage conditions have dependencies on runtime limits or feature availability. It is possible to validate these conditions against Vulkan's minimum supported values for these limits and features, or some subset of other known values.

Valid usage conditions do not cover conditions where well-defined behavior (including returning an error code) exists.

Valid usage conditions **should** apply to the command or structure where complete information about the condition would be known during execution of an application. This is such that a validation layer or linter **can** be written directly against these statements at the point they are specified.

NOTE

This does lead to some non-obvious places for valid usage statements. For instance, the valid values for a structure might depend on a separate value in the calling command. In this case, the structure itself will not reference this valid usage as it is impossible to determine validity from the structure that it is invalid - instead this valid usage would be attached to the calling command.

Another example is draw state - the state setters are independent, and can cause a legitimately invalid state configuration between draw calls; so the valid usage

statements are attached to the place where all state needs to be valid - at the drawing command.

Valid usage conditions are described in a block labeled “Valid Usage” following each command or structure they apply to.

3.7.1. Usage Validation

Vulkan is a layered API. The lowest layer is the core Vulkan layer, as defined by this Specification. The application **can** use additional layers above the core for debugging, validation, and other purposes.

One of the core principles of Vulkan is that building and submitting command buffers **should** be highly efficient. Thus error checking and validation of state in the core layer is minimal, although more rigorous validation **can** be enabled through the use of layers.

Validation of correct API usage is left to validation layers. Applications **should** be developed with validation layers enabled, to help catch and eliminate errors. Once validated, released applications **should** not enable validation layers by default.

3.7.2. Implicit Valid Usage

Some valid usage conditions apply to all commands and structures in the API, unless explicitly denoted otherwise for a specific command or structure. These conditions are considered *implicit*, and are described in a block labeled “Valid Usage (Implicit)” following each command or structure they apply to. Implicit valid usage conditions are described in detail below.

Valid Usage for Object Handles

Any input parameter to a command that is an object handle **must** be a valid object handle, unless otherwise specified. An object handle is valid if:

- It has been created or allocated by a previous, successful call to the API. Such calls are noted in the Specification.
- It has not been deleted or freed by a previous call to the API. Such calls are noted in the Specification.
- Any objects used by that object, either as part of creation or execution, **must** also be valid.

The reserved values `VK_NULL_HANDLE` and `NULL` **can** be used in place of valid non-dispatchable handles and dispatchable handles, respectively, when *explicitly called out in the Specification*. Any command that creates an object successfully **must** not return these values. It is valid to pass these values to `vkDestroy*` or `vkFree*` commands, which will silently ignore these values.

Valid Usage for Pointers

Any parameter that is a pointer **must** be a *valid pointer* only if it is explicitly called out by a Valid Usage statement.

A pointer is “valid” if it points at memory containing values of the number and type(s) expected by

the command, and all fundamental types accessed through the pointer (e.g. as elements of an array or as members of a structure) satisfy the alignment requirements of the host processor.

Valid Usage for Strings

Any parameter that is a pointer to **char** **must** be a finite sequence of values terminated by a null character, or if *explicitly called out in the Specification*, **can** be **NULL**.

Strings specified as UTF-8 encoded **must** not contain invalid UTF-8 sequences. See [String Representation](#) for additional information about strings.

Valid Usage for Enumerated Types

Any parameter of an enumerated type **must** be a valid enumerant for that type. Use of an enumerant is valid if the following conditions are true:

- The enumerant is defined as part of the enumerated type.
- The enumerant is not a value suffixed with **_MAX_ENUM**.
 - This value exists only to ensure that C **enum** types are 32 bits in size and **must** not be used by applications.
- If the enumerant is used in a function that has a [VkInstance](#) as its first parameter and either:
 - it was added by a core version that is supported (as reported by [vkEnumerateInstanceVersion](#)) and the value of [VkApplicationInfo::apiVersion](#) is greater than or equal to the version that added it; or
 - it was added by an [instance extension](#) that was enabled for the instance.
- If the enumerant is used in a function that has a [VkPhysicalDevice](#) object as its first parameter and either:
 - it was added by a core version that is supported by that device (as reported by [VkPhysicalDeviceProperties::apiVersion](#));
 - it was added by an [instance extension](#) that was enabled for the instance; or
 - it was added by a [device extension](#) that is supported by that device.
- If the enumerant is used in a function that has any other dispatchable object as its first parameter and either:
 - it was added by a core version that is supported for the device (as reported by [VkPhysicalDeviceProperties::apiVersion](#)); or
 - it was added by a [device extension](#) that was enabled for the device.

Additionally, if the **maintenance5** feature is supported, any integer value representable in the range valid for the defined type is valid when used in a function that has a [VkPhysicalDevice](#) object as its first parameter. Physical device queries will either return results indicating lack of support, or ignore unsupported values when used as a bit flag in a **Vk*Flags*** parameter.

Any enumerated type returned from a query command or otherwise output from Vulkan to the application **must** not have a reserved value. Reserved values are values not defined by any extension for that enumerated type.

NOTE

In some special cases, an enumerator is only meaningful if a feature defined by an extension is also enabled, as well as the extension itself. The global “valid enumerator” rule described here does not address such cases.

NOTE

This language is intended to accommodate cases such as “hidden” extensions known only to driver internals, or layers enabling extensions without knowledge of the application, without allowing return of values not defined by any extension.

NOTE

Application developers are encouraged to be careful when using **switch** statements with Vulkan API enums. This is because new extensions can add new values to existing enums. Using a **default:** statement within a **switch** may avoid future compilation issues.

This is particularly true for enums such as **VkDriverId**, which may have values added that do not belong to a corresponding new extension.

Valid Usage for Flags

A collection of flags is represented by a bitmask using the type **VkFlags**:

```
// Provided by VK_VERSION_1_0
typedef uint32_t VkFlags;
```

Bitmasks are passed to many commands and structures to compactly represent options, but **VkFlags** is not used directly in the API. Instead, a **Vk*Flags** type which is an alias of **VkFlags**, and whose name matches the corresponding **Vk*FlagBits** that are valid for that type, is used.

Any **Vk*Flags** member or parameter used in the API as an input **must** be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a **Vk*Flags** type if it would be a **valid enumerator** when used with the equivalent **Vk*FlagBits** type, where the bits type is obtained by taking the flag type and replacing the trailing **Flags** with **FlagBits**. For example, a flag value of type **VkColorComponentFlags** **must** contain only bit flags defined by **VkColorComponentFlagBits**.

Any **Vk*Flags** member or parameter returned from a query command or otherwise output from Vulkan to the application **may** contain bit flags undefined in its corresponding **Vk*FlagBits** type. An application **cannot** rely on the state of these unspecified bits.

Only the low-order 31 bits (bit positions zero through 30) are available for use as flag bits.

NOTE

This restriction is due to poorly defined behavior by C compilers given a C enumerator value of **0x80000000**. In some cases adding this enumerator value may increase the size of the underlying **Vk*FlagBits** type, breaking the ABI.

A collection of 64-bit flags is represented by a bitmask using the type **VkFlags64**:

```
// Provided by VK_VERSION_1_3, VK_KHR_synchronization2
typedef uint64_t VkFlags64;
```

When the 31 bits available in `VkFlags` are insufficient, the `VkFlags64` type can be passed to commands and structures to represent up to 64 options. `VkFlags64` is not used directly in the API. Instead, a `Vk*Flags2` type which is an alias of `VkFlags64`, and whose name matches the corresponding `Vk*FlagBits2` that are valid for that type, is used.

Any `Vk*Flags2` member or parameter used in the API as an input **must** be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a `Vk*Flags2` type if it would be a [valid enumerant](#) when used with the equivalent `Vk*FlagBits2` type, where the bits type is obtained by taking the flag type and replacing the trailing `Flags2` with `FlagBits2`. For example, a flag value of type `VkAccessFlags2KHR` **must** contain only bit flags defined by `VkAccessFlagBits2KHR`.

Any `Vk*Flags2` member or parameter returned from a query command or otherwise output from Vulkan to the application **may** contain bit flags undefined in its corresponding `Vk*FlagBits2` type. An application **cannot** rely on the state of these unspecified bits.

NOTE

Both the `Vk*FlagBits2` type, and the individual bits defined for that type, are defined as `uint64_t` integers in the C API. This is in contrast to the 32-bit types, where the `Vk*FlagBits` type is defined as a C `enum` and the individual bits as enumerants belonging to that `enum`. As a result, there is less compile time type checking possible for the 64-bit types. This is unavoidable since there is no sufficiently portable way to define a 64-bit `enum` type in C99.

Valid Usage for Structure Types

Any parameter that is a structure containing a `sType` member **must** have a value of `sType` which is a valid `VkStructureType` value matching the type of the structure.

Valid Usage for Structure Pointer Chains

Any parameter that is a structure containing a `void* pNext` member **must** have a value of `pNext` that is either `NULL`, or is a pointer to a valid *extending structure*, containing `sType` and `pNext` members as described in the [Vulkan Documentation and Extensions](#) document in the section “Extending Structures”. The set of structures connected by `pNext` pointers is referred to as a *pNext chain*.

Each structure included in the `pNext` chain **must** be defined at runtime by either:

- a core version which is supported
- an extension which is enabled
- a supported device extension in the case of physical-device-level functionality added by the device extension

Each type of extending structure **must** not appear more than once in a `pNext` chain, including any [aliases](#). This general rule may be explicitly overridden for specific structures.

Any component of the implementation (the loader, any enabled layers, and drivers) **must** skip over, without processing (other than reading the `sType` and `pNext` members) any extending structures in the chain not defined by core versions or extensions supported by that component.

As a convenience to implementations and layers needing to iterate through a structure pointer chain, the Vulkan API provides two *base structures*. These structures allow for some type safety, and can be used by Vulkan API functions that operate on generic inputs and outputs.

The `VkBaseInStructure` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBaseInStructure {
    VkStructureType      sType;
    const struct VkBaseInStructure* pNext;
} VkBaseInStructure;
```

- `sType` is the structure type of the structure being iterated through.
- `pNext` is `NULL` or a pointer to the next structure in a structure chain.

`VkBaseInStructure` can be used to facilitate iterating through a read-only structure pointer chain.

The `VkBaseOutStructure` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBaseOutStructure {
    VkStructureType      sType;
    struct VkBaseOutStructure* pNext;
} VkBaseOutStructure;
```

- `sType` is the structure type of the structure being iterated through.
- `pNext` is `NULL` or a pointer to the next structure in a structure chain.

`VkBaseOutStructure` can be used to facilitate iterating through a structure pointer chain that returns data back to the application.

Valid Usage for Nested Structures

The above conditions also apply recursively to members of structures provided as input to a command, either as a direct argument to the command, or themselves a member of another structure.

Specifics on valid usage of each command are covered in their individual sections.

Valid Usage for Extensions

Instance-level functionality or behavior added by an [instance extension](#) to the API **must** not be used unless that extension is supported by the instance as determined by [vkEnumerateInstanceExtensionProperties](#), and that extension is enabled in [VkInstanceCreateInfo](#).

Physical-device-level functionality or behavior added by an [instance extension](#) to the API **must** not be used unless that extension is supported by the instance as determined by [vkEnumerateInstanceExtensionProperties](#), and that extension is enabled in [VkInstanceCreateInfo](#).

Physical-device-level functionality or behavior added by a [device extension](#) to the API **must** not be used unless the conditions described in [Extending Physical Device From Device Extensions](#) are met.

Device-level functionality added by a [device extension](#) that is dispatched from a [VkDevice](#), or from a child object of a [VkDevice](#) **must** not be used unless that extension is supported by the device as determined by [vkEnumerateDeviceExtensionProperties](#), and that extension is enabled in [VkDeviceCreateInfo](#).

Valid Usage for Newer Core Versions

Instance-level functionality or behavior added by a [new core version](#) of the API **must** not be used unless it is supported by the instance as determined by [vkEnumerateInstanceVersion](#) and the specified version of [VkApplicationInfo::apiVersion](#).

Physical-device-level functionality or behavior added by a [new core version](#) of the API **must** not be used unless it is supported by the physical device as determined by [VkPhysicalDeviceProperties::apiVersion](#) and the specified version of [VkApplicationInfo::apiVersion](#).

Device-level functionality or behavior added by a [new core version](#) of the API **must** not be used unless it is supported by the device as determined by [VkPhysicalDeviceProperties::apiVersion](#) and the specified version of [VkApplicationInfo::apiVersion](#).

3.8. [VkResult](#) Return Codes

While the core Vulkan API is not designed to capture incorrect usage, some circumstances still require return codes. Commands in Vulkan return their status via return codes that are in one of two categories:

- Successful completion codes are returned when a command needs to communicate success or status information. All successful completion codes are non-negative values.
- Runtime error codes are returned when a command needs to communicate a failure that could only be detected at runtime. All runtime error codes are negative values.

All return codes in Vulkan are reported via [VkResult](#) return values. The possible codes are:

```
// Provided by VK_VERSION_1_0
typedef enum VkResult {
    VK_SUCCESS = 0,
    VK_NOT_READY = 1,
    VK_TIMEOUT = 2,
    VK_EVENT_SET = 3,
    VK_EVENT_RESET = 4,
    VK_INCOMPLETE = 5,
    VK_ERROR_OUT_OF_HOST_MEMORY = -1,
    VK_ERROR_OUT_OF_DEVICE_MEMORY = -2,
```

```
VK_ERROR_INITIALIZATION_FAILED = -3,  
VK_ERROR_DEVICE_LOST = -4,  
VK_ERROR_MEMORY_MAP_FAILED = -5,  
VK_ERROR_LAYER_NOT_PRESENT = -6,  
VK_ERROR_EXTENSION_NOT_PRESENT = -7,

// Provided by VK_EXT_pipeline_creation_cache_control
VK_ERROR_PIPELINE_COMPILE_REQUIRED_EXT = VK_PIPELINE_COMPILE_REQUIRED,
// Provided by VK_EXT_shader_object
// VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT is a legacy alias
VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT = VK_INCOMPATIBLE_SHADER_BINARY_EXT,
} VkResult;

```

Success Codes

- **VK_SUCCESS** Command successfully completed

- [VK_NOT_READY](#) A fence or query has not yet completed
- [VK_TIMEOUT](#) A wait operation has not completed in the specified time
- [VK_EVENT_SET](#) An event is signaled
- [VK_EVENT_RESET](#) An event is unsignaled
- [VK_INCOMPLETE](#) A return array was too small for the result
- [VK_SUBOPTIMAL_KHR](#) A swapchain no longer matches the surface properties exactly, but **can** still be used to present to the surface successfully.
- [VK_THREAD_IDLE_KHR](#) A deferred operation is not complete but there is currently no work for this thread to do at the time of this call.
- [VK_THREAD_DONE_KHR](#) A deferred operation is not complete but there is no work remaining to assign to additional threads.
- [VK_OPERATION_DEFERRED_KHR](#) A deferred operation was requested and at least some of the work was deferred.
- [VK_OPERATION_NOT_DEFERRED_KHR](#) A deferred operation was requested and no operations were deferred.
- [VK_PIPELINE_COMPILE_REQUIRED](#) A requested pipeline creation would have required compilation, but the application requested compilation to not be performed.
- [VK_PIPELINE_BINARY_MISSING_KHR](#) The application attempted to create a pipeline binary by querying an internal cache, but the internal cache entry did not exist.
- [VK_INCOMPATIBLE_SHADER_BINARY_EXT](#) The provided binary shader code is not compatible with this device.

NOTE

In the initial version of the [VK_EXT_shader_object](#) extension, this return code was named [VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT](#) and improperly described as an error code. The name has been changed, but the old name is retained as an alias for compatibility with old code.

Error Codes

- [VK_ERROR_OUT_OF_HOST_MEMORY](#) A host memory allocation has failed.
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#) A device memory allocation has failed.
- [VK_ERROR_INITIALIZATION_FAILED](#) Initialization of an object could not be completed for implementation-specific reasons.
- [VK_ERROR_DEVICE_LOST](#) The logical or physical device has been lost. See [Lost Device](#)
- [VK_ERROR_MEMORY_MAP_FAILED](#) Mapping of a memory object has failed.
- [VK_ERROR_LAYER_NOT_PRESENT](#) A requested layer is not present or could not be loaded.
- [VK_ERROR_EXTENSION_NOT_PRESENT](#) A requested extension is not supported.
- [VK_ERROR_FEATURE_NOT_PRESENT](#) A requested feature is not supported.
- [VK_ERROR_INCOMPATIBLE_DRIVER](#) The requested version of Vulkan is not supported by the driver or is otherwise incompatible for implementation-specific reasons.

- [VK_ERROR_TOO_MANY_OBJECTS](#) Too many objects of the type have already been created.
- [VK_ERROR_FORMAT_NOT_SUPPORTED](#) A requested format is not supported on this device.
- [VK_ERROR_FRAGMENTED_POOL](#) A pool allocation has failed due to fragmentation of the pool's memory. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. This **should** be returned in preference to [VK_ERROR_OUT_OF_POOL_MEMORY](#), but only if the implementation is certain that the pool allocation failure was due to fragmentation.
- [VK_ERROR_SURFACE_LOST_KHR](#) A surface is no longer available.
- [VK_ERROR_NATIVE_WINDOW_IN_USE_KHR](#) The requested window is already in use by Vulkan or another API in a manner which prevents it from being used again.
- [VK_ERROR_OUT_OF_DATE_KHR](#) A surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications **must** query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.
- [VK_ERROR_INCOMPATIBLE_DISPLAY_KHR](#) The display used by a swapchain does not use the same presentable image layout, or is incompatible in a way that prevents sharing an image.
- [VK_ERROR_INVALID_SHADER_NV](#) One or more shaders failed to compile or link. More details are reported back to the application via [VK_EXT_debug_report](#) if enabled.
- [VK_ERROR_OUT_OF_POOL_MEMORY](#) A pool memory allocation has failed. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. If the failure was definitely due to fragmentation of the pool, [VK_ERROR_FRAGMENTED_POOL](#) **should** be returned instead.
- [VK_ERROR_INVALID_EXTERNAL_HANDLE](#) An external handle is not a valid handle of the specified type.
- [VK_ERROR_FRAGMENTATION](#) A descriptor pool creation has failed due to fragmentation.
- [VK_ERROR_INVALID_DEVICE_ADDRESS_EXT](#) A buffer creation failed because the requested address is not available.
- [VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS](#) A buffer creation or memory allocation failed because the requested address is not available. A shader group handle assignment failed because the requested shader group handle information is no longer valid.
- [VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT](#) An operation on a swapchain created with [VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT](#) failed as it did not have exclusive full-screen access. This **may** occur due to implementation-dependent reasons, outside of the application's control.
- [VK_ERROR_PRESENT_TIMING_QUEUE_FULL_EXT](#) A present operation on a swapchain created with [VK_SWAPCHAIN_CREATE_PRESENT_TIMING_BIT_EXT](#) failed due to insufficient space in the swapchain's internal results queue to hold requested present timing data.
- [VK_ERROR_VALIDATION_FAILED](#) A command failed because invalid usage was detected by the implementation or a validation layer. This **may** result in the command not being dispatched to the ICD.
- [VK_ERROR_COMPRESSION_EXHAUSTED_EXT](#) An image creation failed because internal

resources required for compression are exhausted. This **must** only be returned when fixed-rate compression is requested.

- [VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR](#) The requested [VkImageUsageFlags](#) are not supported.
- [VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR](#) The requested video picture layout is not supported.
- [VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR](#) A video profile operation specified via [VkVideoProfileInfoKHR::videoCodecOperation](#) is not supported.
- [VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR](#) Format parameters in a requested [VkVideoProfileInfoKHR](#) chain are not supported.
- [VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR](#) Codec-specific parameters in a requested [VkVideoProfileInfoKHR](#) chain are not supported.
- [VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR](#) The specified video Std header version is not supported.
- [VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR](#) The specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.
- [VK_ERROR_NOT_PERMITTED](#) The driver implementation has denied a request to acquire a priority above the default priority ([VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT](#)) because the application does not have sufficient privileges.
- [VK_ERROR_NOT_ENOUGH_SPACE_KHR](#) The application did not provide enough space to return all the required data.
- [VK_ERROR_UNKNOWN](#) An unknown error has occurred; either the application has provided invalid input, or an implementation failure has occurred.

If a command returns a runtime error, unless otherwise specified any output parameters will have undefined contents, except that if the output parameter is a structure with [sType](#) and [pNext](#) fields, those fields will be unmodified. Any structures chained from [pNext](#) will also have undefined contents, except that [sType](#) and [pNext](#) will be unmodified.

[VK_ERROR_OUT_OF_*_MEMORY](#) errors do not modify any currently existing Vulkan objects. Objects that have already been successfully created **can** still be used by the application.

NOTE

As a general rule, [Free](#), [Release](#), and [Reset](#) commands do not return [VK_ERROR_OUT_OF_HOST_MEMORY](#), while any other command with a return code **may** return it. Any exceptions from this rule are described for those commands.

[VK_ERROR_UNKNOWN](#) will be returned by an implementation when an unexpected error occurs that cannot be attributed to valid behavior of the application and implementation. Under these conditions, it **may** be returned from any command returning a [VkResult](#).

NOTE

[VK_ERROR_UNKNOWN](#) is not expected to ever be returned if the application

behavior is valid, and if the implementation is bug-free. If [VK_ERROR_UNKNOWN](#) is returned, the application should be checked against the latest validation layers to verify correct behavior as much as possible. If no issues are identified it could be an implementation issue, and the implementor should be contacted for support.

Any command returning a [VkResult](#) **may** return [VK_ERROR_VALIDATION_FAILED](#) if a violation of valid usage is detected.

Performance-critical commands generally do not have return codes. If a runtime error occurs in such commands, the implementation will defer reporting the error until a specified point. For commands that record into command buffers ([vkCmd*](#)) runtime errors are reported by [vkEndCommandBuffer](#).

3.9. Numeric Representation and Computation

Implementations normally perform computations in floating-point, and **must** meet the range and precision requirements defined under “Floating-Point Computation” below.

These requirements only apply to computations performed in Vulkan operations outside of shader execution, such as texture image specification and sampling, and per-fragment operations. Range and precision requirements during shader execution differ, and are specified by the [Precision and Operation of SPIR-V Instructions](#) section.

In some cases, the representation and/or precision of operations is implicitly limited by the specified format of vertex or texel data consumed by Vulkan. Specific floating-point formats are described later in this section.

3.9.1. Floating-Point Computation

Most floating-point computation is performed in SPIR-V shader modules. The properties of computation within shaders are constrained as defined by the [Precision and Operation of SPIR-V Instructions](#) section.

Some floating-point computation is performed outside of shaders, such as viewport and depth range calculations. For these computations, we do not specify how floating-point numbers are to be represented, or the details of how operations on them are performed, but only place minimal requirements on representation and precision as described in the remainder of this section.

We require simply that numbers' floating-point parts contain enough bits and that their exponent fields are large enough so that individual results of floating-point operations are accurate to about 1 part in 10^5 . The maximum representable magnitude for all floating-point values **must** be at least 2^{32} .

$$x \times 0 = 0 \times x = 0 \text{ for any non-infinite and non-NaN } x.$$

$$1 \times x = x \times 1 = x.$$

$$x + 0 = 0 + x = x.$$

$$0^0 = 1.$$

Occasionally, further requirements will be specified. Most single-precision floating-point formats meet these requirements.

The special values Inf and -Inf encode values with magnitudes too large to be represented; the special value NaN encodes “Not A Number” values resulting from undefined arithmetic operations such as $0 / 0$. Implementations **may** support Inf and NaN in their floating-point computations. Any computation which does not support either Inf or NaN, for which that value is an input or output will yield an undefined value.

3.9.2. Floating-Point Format Conversions

When a value is converted to a defined floating-point representation, finite values falling between two representable finite values are rounded to one or the other. The rounding mode is not defined. Finite values whose magnitude is larger than that of any representable finite value may be rounded either to the closest representable finite value or to the appropriately signed infinity. For unsigned destination formats any negative values are converted to zero. Positive infinity is converted to positive infinity; negative infinity is converted to negative infinity in signed formats and to zero in unsigned formats; and any NaN is converted to a NaN.

3.9.3. 16-Bit Floating-Point Numbers

16-bit floating-point numbers are defined in the “16-bit floating-point numbers” section of the [Khronos Data Format Specification](#).

3.9.4. Unsigned 11-Bit Floating-Point Numbers

Unsigned 11-bit floating-point numbers are defined in the “Unsigned 11-bit floating-point numbers” section of the [Khronos Data Format Specification](#).

3.9.5. Unsigned 10-Bit Floating-Point Numbers

Unsigned 10-bit floating-point numbers are defined in the “Unsigned 10-bit floating-point numbers” section of the [Khronos Data Format Specification](#).

3.9.6. 8-bit booleans

An 8-bit boolean uses the following representation for **true** and **false**:

- Zero to represent **false**
- Any non-zero value to represent **true**

3.9.7. General Requirements

Any representable floating-point value in the appropriate format is legal as input to a Vulkan command that requires floating-point data. The result of providing a value that is not a floating-point number to such a command is unspecified, but **must** not lead to Vulkan interruption or termination. For example, providing a negative zero (where applicable) or a denormalized number to a Vulkan command **must** yield deterministic results, while providing a NaN or Inf yields unspecified results.

Some calculations require division. In such cases (including implied divisions performed by vector normalization), division by zero produces an unspecified result but **must** not lead to Vulkan interruption or termination.

3.10. Fixed-Point Data Conversions

When generic vertex attributes and pixel color or depth *components* are represented as integers, they are often (but not always) considered to be *normalized*. Normalized integer values are treated specially when being converted to and from floating-point values, and are usually referred to as *normalized fixed-point*.

In the remainder of this section, b denotes the bit width of the fixed-point integer representation. When the integer is one of the types defined by the API, b is the bit width of that type. When the integer comes from an [image](#) containing color or depth component texels, b is the number of bits allocated to that component in its [specified image format](#).

The signed and unsigned fixed-point representations are assumed to be b -bit binary two's-complement integers and binary unsigned integers, respectively.

3.10.1. Conversion From Normalized Fixed-Point to Floating-Point

Unsigned normalized fixed-point integers represent numbers in the range $[0,1]$. The conversion from an unsigned normalized fixed-point value c to the corresponding floating-point value f is defined as

$$f = \frac{c}{2^b - 1}$$

Signed normalized fixed-point integers represent numbers in the range $[-1,1]$. The conversion from a signed normalized fixed-point value c to the corresponding floating-point value f is performed using

$$f = \max\left(\frac{c}{2^{b-1} - 1}, -1.0\right)$$

Only the range $[-2^{b-1} + 1, 2^{b-1} - 1]$ is used to represent signed fixed-point values in the range $[-1,1]$. For example, if $b = 8$, then the integer value -127 corresponds to -1.0 and the value 127 corresponds to 1.0. This equation is used everywhere that signed normalized fixed-point values are converted to floating-point.

Note that while zero is exactly expressible in this representation, one value (-128 in the example) is

outside the representable range, and implementations **must** clamp it to -1.0. Where the value is subject to further processing by the implementation, e.g. during texture filtering, values less than -1.0 **may** be used but the result **must** be clamped before the value is returned to shaders.

3.10.2. Conversion From Floating-Point to Normalized Fixed-Point

The conversion from a floating-point value f to the corresponding unsigned normalized fixed-point value c is defined by first clamping f to the range $[0,1]$, then computing

$$c = \text{convertFloatToUint}(f \times (2^b - 1), b)$$

where $\text{convertFloatToUint}(r,b)$ returns one of the two unsigned binary integer values with exactly b bits which are closest to the floating-point value r . Implementations **should** round to nearest. If r is equal to an integer, then that integer value **must** be returned. In particular, if f is equal to 0.0 or 1.0, then c **must** be assigned 0 or $2^b - 1$, respectively.

The conversion from a floating-point value f to the corresponding signed normalized fixed-point value c is performed by clamping f to the range $[-1,1]$, then computing

$$c = \text{convertFloatToInt}(f \times (2^{b-1} - 1), b)$$

where $\text{convertFloatToInt}(r,b)$ returns one of the two signed two's-complement binary integer values with exactly b bits which are closest to the floating-point value r . Implementations **should** round to nearest. If r is equal to an integer, then that integer value **must** be returned. In particular, if f is equal to -1.0, 0.0, or 1.0, then c **must** be assigned $-(2^{b-1} - 1)$, 0, or $2^{b-1} - 1$, respectively.

This equation is used everywhere that floating-point values are converted to signed normalized fixed-point.

3.11. String Representation

Strings passed into and returned from Vulkan API commands are usually defined to be null-terminated and UTF-8 encoded.

NOTE

Exceptions to this rule exist only when strings are defined or used by operating system APIs where that OS has a different convention. For example, `VkExportMemoryWin32HandleInfoKHR::name` is a null-terminated UTF-16 encoded string used in conjunction with Windows handles.

When a UTF-8 string is **returned from** a Vulkan API query, it is returned in a fixed-length buffer of C `char`. For example, a string returned in `VkPhysicalDeviceProperties::deviceName` has maximum length `VK_MAX_PHYSICAL_DEVICE_NAME_SIZE`, and a string returned in `VkExtensionProperties::extensionName` has maximum length `VK_MAX_EXTENSION_NAME_SIZE`. The string, **including** its null terminator, will always fit completely within this buffer. If the string is shorter than the buffer size, the contents of `char` in the buffer following the null terminator are undefined.

When a UTF-8 string is **passed into** a Vulkan API, such as `VkDeviceCreateInfo`

::ppEnabledExtensionNames, there is no explicit limit on the length of that string. However, the string **must** contain a valid UTF-8 encoded string and **must** be null-terminated.

3.12. Common Object Types

Some types of Vulkan objects are used in many different structures and command parameters, and are described here. These types include *offsets*, *extents*, and *rectangles*.

3.12.1. Offsets

Offsets are used to describe a pixel location within an image or framebuffer, as an (x,y) location for two-dimensional images, or an (x,y,z) location for three-dimensional images.

A two-dimensional offset is defined by the structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkOffset2D {
    int32_t    x;
    int32_t    y;
} VkOffset2D;
```

- **x** is the x offset.
- **y** is the y offset.

A three-dimensional offset is defined by the structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkOffset3D {
    int32_t    x;
    int32_t    y;
    int32_t    z;
} VkOffset3D;
```

- **x** is the x offset.
- **y** is the y offset.
- **z** is the z offset.

3.12.2. Extents

Extents are used to describe the size of a rectangular region of pixels within an image or framebuffer, as (width,height) for two-dimensional images, or as (width,height,depth) for three-dimensional images.

A two-dimensional extent is defined by the structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkExtent2D {
    uint32_t    width;
    uint32_t    height;
} VkExtent2D;
```

- **width** is the width of the extent.
- **height** is the height of the extent.

A three-dimensional extent is defined by the structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkExtent3D {
    uint32_t    width;
    uint32_t    height;
    uint32_t    depth;
} VkExtent3D;
```

- **width** is the width of the extent.
- **height** is the height of the extent.
- **depth** is the depth of the extent.

3.12.3. Rectangles

Rectangles are used to describe a specified rectangular region of pixels within an image or framebuffer. Rectangles include both an offset and an extent of the same dimensionality, as described above. Two-dimensional rectangles are defined by the structure

```
// Provided by VK_VERSION_1_0
typedef struct VkRect2D {
    VkOffset2D    offset;
    VkExtent2D    extent;
} VkRect2D;
```

- **offset** is a [VkOffset2D](#) specifying the rectangle offset.
- **extent** is a [VkExtent2D](#) specifying the rectangle extent.

3.12.4. Host Address Ranges

A host address range indicates a range of host memory.

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkHostAddressRangeEXT {
    void*      address;
    size_t     size;
} VkHostAddressRangeEXT;
```

- **address** is a host memory address.
- **size** is the size of the range.

Valid Usage (Implicit)

- VUID-VkHostAddressRangeEXT-address-parameter
address must be a valid pointer to an array of **size** bytes
- VUID-VkHostAddressRangeEXT-size-arraylength
size must be greater than 0

A constant host address range indicates a range of host memory that cannot be altered.

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkHostAddressRangeConstEXT {
    const void*  address;
    size_t       size;
} VkHostAddressRangeConstEXT;
```

- **address** is a read-only host memory address.
- **size** is the size of the range.

Valid Usage (Implicit)

- VUID-VkHostAddressRangeConstEXT-address-parameter
address must be a valid pointer to an array of **size** bytes
- VUID-VkHostAddressRangeConstEXT-size-arraylength
size must be greater than 0

3.12.5. Device Address Ranges

A device address range indicates a sized range of device memory.

```
// Provided by VK_KHR_device_address_commands
typedef struct VkDeviceAddressRangeKHR {
    VkDeviceAddress    address;
    VkDeviceSize       size;
} VkDeviceAddressRangeKHR;
```

```
// Provided by VK_EXT_descriptor_heap
// Equivalent to VkDeviceAddressRangeKHR
typedef VkDeviceAddressRangeKHR VkDeviceAddressRangeEXT;
```

- **address** is 0 or a [VkDeviceAddress](#) specifying the start of the range.
- **size** is a [VkDeviceSize](#) specifying the size of the range.

Valid Usage

- VUID-VkDeviceAddressRangeKHR-size-11411
If **size** is not 0, **address** **must** not be 0
- VUID-VkDeviceAddressRangeKHR-address-11365
The sum of **address** and **size** **must** be less than or equal to the sum of an address retrieved from a [VkBuffer](#) and the value of [VkBufferCreateInfo::size](#) used to create that [VkBuffer](#)

Valid Usage (Implicit)

- VUID-VkDeviceAddressRangeKHR-address-parameter
If **address** is not 0, **address** **must** be a valid [VkDeviceAddress](#) value

A strided device address range is defined by the structure:

```
// Provided by VK_KHR_copy_memory_indirect, VK_KHR_device_address_commands
typedef struct VkStridedDeviceAddressRangeKHR {
    VkDeviceAddress    address;
    VkDeviceSize       size;
    VkDeviceSize       stride;
} VkStridedDeviceAddressRangeKHR;
```

- **address** is a [VkDeviceAddress](#) specifying the start of the range.
- **size** is a [VkDeviceSize](#) specifying the size of the range.
- **stride** is a [VkDeviceSize](#) specifying the stride of elements over the range.

Valid Usage

- VUID-VkStridedDeviceAddressRangeKHR-size-11411
If **size** is not 0, **address** **must** not be 0
- VUID-VkStridedDeviceAddressRangeKHR-address-11365
The sum of **address** and **size** **must** be less than or equal to the sum of an address retrieved from a **VkBuffer** and the value of **VkBufferCreateInfo::size** used to create that **VkBuffer**
- VUID-VkStridedDeviceAddressRangeKHR-stride-10957
stride **must** be less than or equal to **size**

Valid Usage (Implicit)

- VUID-VkStridedDeviceAddressRangeKHR-address-parameter
If **address** is not 0, **address** **must** be a valid **VkDeviceAddress** value

Many Vulkan commands need additional information about an address range; this **may** be provided by the following flags.

Bits which **can** be set in a **VkAddressCommandFlagsKHR** mask are:

```
// Provided by VK_KHR_device_address_commands
typedef enum VkAddressCommandFlagBitsKHR {
    VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR = 0x00000001,
    VK_ADDRESS_COMMAND_FULLY_BOUND_BIT_KHR = 0x00000002,
    VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR = 0x00000004,
    VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR = 0x00000008,
    // Provided by VK_KHR_device_address_commands with VK_EXT_transform_feedback
    VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR = 0x00000010,
    // Provided by VK_KHR_device_address_commands with VK_EXT_transform_feedback
    VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR = 0x00000020,
} VkAddressCommandFlagBitsKHR;
```

- **VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR** specifies that an address range is allocated from protected memory.
- **VK_ADDRESS_COMMAND_FULLY_BOUND_BIT_KHR** specifies that an address range will be fully bound to physical memory when accessed.
- **VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR** specifies that all buffers containing any part of an address range were created with the **VK_BUFFER_USAGE_STORAGE_BUFFER_BIT** usage.
- **VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR** specifies that whether buffers containing any part of an address range were created with **VK_BUFFER_USAGE_STORAGE_BUFFER_BIT** usage or not is unknown.
- **VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR** specifies that all buffers containing any part of an address range are allocated with the **VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT** usage.

- [VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR](#) specifies that whether buffers containing an any part of an address range were created with [VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT](#) usage or not is unknown.

If neither [VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR](#) nor [VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR](#) are specified, the address range **must** not be aliased with any buffer allocated with the [VK_BUFFER_USAGE_STORAGE_BUFFER_BIT](#). If neither [VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR](#) nor [VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR](#) are specified, the address range **must** not be aliased with any buffer allocated with the [VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT](#).

NOTE

Buffers can return overlapping address ranges if they are bound to overlapping ranges of a [VkDeviceMemory](#) object. Applications should ensure that if they do this kind of aliasing, that they consistently either include or do not include [VK_BUFFER_USAGE_STORAGE_BUFFER_BIT](#) and [VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT](#) on aliased buffers when considering these flags.

```
// Provided by VK_KHR_device_address_commands
typedef VkFlags VkAddressCommandFlagsKHR;
```

[VkAddressCommandFlagsKHR](#) is a bitmask type for setting a mask of zero or more [VkAddressCommandFlagBitsKHR](#).

3.12.6. Structure Types

Each value corresponds to a particular structure with a **sType** member with a matching name. As a general rule, the name of each [VkStructureType](#) value is obtained by taking the name of the structure, stripping the leading **Vk**, prefixing each capital letter except the first with **_**, converting the entire resulting string to upper case, and prefixing it with [VK_STRUCTURE_TYPE_](#). For example, structures of type [VkImageCreateInfo](#) correspond to a [VkStructureType](#) value of [VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO](#), and thus a structure of this type **must** have its **sType** member set to this value before it is passed to the API.

The values [VK_STRUCTURE_TYPE_LOADER_INSTANCE_CREATE_INFO](#) and [VK_STRUCTURE_TYPE_LOADER_DEVICE_CREATE_INFO](#) are reserved for internal use by the loader, and do not have corresponding Vulkan structures in this Specification.

Structure types supported by the Vulkan API include:

```
// Provided by VK_VERSION_1_0
typedef enum VkStructureType {
    VK_STRUCTURE_TYPE_APPLICATION_INFO = 0,
    VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO = 1,
    VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO = 2,
```

```

VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO = 3,
VK_STRUCTURE_TYPE_SUBMIT_INFO = 4,
VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO = 5,
VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE = 6,
VK_STRUCTURE_TYPE_BIND_SPARSE_INFO = 7,
VK_STRUCTURE_TYPE_FENCE_CREATE_INFO = 8,
VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO = 9,
VK_STRUCTURE_TYPE_EVENT_CREATE_INFO = 10,
VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO = 11,
VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO = 12,
VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO = 13,
VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO = 14,
VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO = 15,
VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO = 16,
VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO = 17,
VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO = 18,
VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO = 19,
VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO = 20,
VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO = 21,
VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO = 22,
VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO = 23,
VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO = 24,

3.13. API Name Aliases

A small number of APIs did not follow the [naming conventions](#) when initially defined. For consistency, when we discover an API name that violates the naming conventions, we rename it in the Specification, XML, and header files. For backwards compatibility, the original (incorrect) name is retained as a “typo alias”. The alias is legacy and should not be used, but will be retained

indefinitely.

NOTE

`VK_STENCIL_FRONT_AND_BACK` is an example of a *typo alias*. It was initially defined as part of `VkStencilFaceFlagBits`. Once the naming inconsistency was noticed, it was renamed to `VK_STENCIL_FACE_FRONT_AND_BACK`, and the old name was aliased to the correct name.

Chapter 4. Initialization

Before using Vulkan, an application **must** initialize it by loading the Vulkan commands, and creating a `VkInstance` object.

4.1. Command Function Pointers

Vulkan commands are not necessarily exposed by static linking on a platform. Commands to query function pointers for Vulkan commands are described below.

NOTE

When extensions are [promoted](#) or otherwise incorporated into another extension or Vulkan core version, command [aliases](#) may be included. Whilst the behavior of each command alias is identical, the behavior of retrieving each alias's function pointer is not. A function pointer for a given alias can only be retrieved if the extension or version that introduced that alias is supported and enabled, irrespective of whether any other alias is available.

Function pointers for all Vulkan commands **can** be obtained by calling:

```
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetInstanceProcAddr(
    VkInstance          instance,
    const char*         pName);
```

- `instance` is the instance that the function pointer will be compatible with, or `NULL` for commands not dependent on any instance.
- `pName` is the name of the command to obtain.

`vkGetInstanceProcAddr` itself is obtained in a platform- and loader- specific manner. Typically, the loader library will export this command as a function symbol, so applications **can** link against the loader library, or load it dynamically and look up the symbol using platform-specific APIs.

The table below defines the various use cases for `vkGetInstanceProcAddr` and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) **must** not be `NULL`.

The returned function pointer is of type `PFN_vkVoidFunction`, and **must** be cast to the type of the command being queried before use.

Table 1. `vkGetInstanceProcAddr` behavior

<code>instance</code>	<code>pName</code>	return value
* ¹	<code>NULL</code>	undefined
invalid non- <code>NULL</code> instance	* ¹	undefined
<code>NULL</code>	<i>global command</i> ²	fp
<code>NULL</code>	<code>vkGetInstanceProcAddr</code>	fp ⁵

instance	pName	return value
instance	vkGetInstanceProcAddr	fp
instance	core <i>dispatchable command</i>	fp ³
instance	enabled instance extension dispatchable command for instance	fp ³
instance	available device extension ⁴ dispatchable command for instance	fp ³
any other case, not covered above		NULL

1

"*" means any representable value for the parameter (including valid values, invalid values, and **NULL**).

2

The global commands are: [vkEnumerateInstanceVersion](#), [vkEnumerateInstanceExtensionProperties](#), [vkEnumerateInstanceLayerProperties](#), and [vkCreateInstance](#). Dispatchable commands are all other commands which are not global.

3

The returned function pointer **must** only be called with a dispatchable object (the first parameter) that is **instance** or a child of **instance**, e.g. [VkInstance](#), [VkPhysicalDevice](#), [VkDevice](#), [VkQueue](#), or [VkCommandBuffer](#).

4

An “available device extension” is a device extension supported by any physical device enumerated by **instance**.

5

Starting with Vulkan 1.2, [vkGetInstanceProcAddr](#) can resolve itself with a **NULL** instance pointer.

Valid Usage (Implicit)

- VUID-vkGetInstanceProcAddr-instance-parameter
If **instance** is not **NULL**, **instance** **must** be a valid [VkInstance](#) handle
- VUID-vkGetInstanceProcAddr-pName-parameter
pName **must** be a null-terminated UTF-8 string

In order to support systems with multiple Vulkan implementations, the function pointers returned by [vkGetInstanceProcAddr](#) **may** point to dispatch code that calls a different real implementation for different [VkDevice](#) objects or their child objects. The overhead of the internal dispatch for [VkDevice](#) objects can be avoided by obtaining device-specific function pointers for any commands that use a

device or device-child object as their dispatchable object. Such function pointers **can** be obtained by calling:

```
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetDeviceProcAddr(
    VkDevice          device,
    const char*       pName);
```

The table below defines the various use cases for `vkGetDeviceProcAddr` and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) **must** not be `NULL`.

The returned function pointer is of type `PFN_vkVoidFunction`, and **must** be cast to the type of the command being queried before use. The function pointer **must** only be called with a dispatchable object (the first parameter) that is `device` or a child of `device`.

Table 2. `vkGetDeviceProcAddr` behavior

device	pName	return value
<code>NULL</code>	* ¹	undefined
invalid device	* ¹	undefined
device	<code>NULL</code>	undefined
device	requested core version ² device-level dispatchable command ³	fp ⁴
device	enabled extension device-level dispatchable command ³	fp ⁴
any other case, not covered above		<code>NULL</code>

1
“*” means any representable value for the parameter (including valid values, invalid values, and `NULL`).

2
Device-level commands which are part of the core version specified by `VkApplicationInfo::apiVersion` when creating the instance will always return a valid function pointer. If the `maintenance5` feature is enabled, core commands beyond that version which are supported by the implementation will return `NULL`, otherwise the implementation **may** either return `NULL` or a function pointer. If a function pointer is returned, it **must** not be called.

3
In this function, device-level excludes all physical-device-level commands.

4
The returned function pointer **must** only be called with a dispatchable object (the first parameter) that is `device` or a child of `device` e.g. `VkDevice`, `VkQueue`, or `VkCommandBuffer`.

Valid Usage (Implicit)

- VUID-vkGetDeviceProcAddr-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetDeviceProcAddr-pName-parameter
pName **must** be a null-terminated UTF-8 string

The definition of [PFN_vkVoidFunction](#) is:

```
// Provided by VK_VERSION_1_0
typedef void (*PFN_vkVoidFunction)(void);
```

This type is returned from command function pointer queries, and **must** be cast to an actual command function pointer before use.

4.1.1. Extending Physical Device Core Functionality

New core physical-device-level functionality **can** be used when both [VkPhysicalDeviceProperties::apiVersion](#) and [VkApplicationInfo::apiVersion](#) are greater than or equal to the version of Vulkan that added the new functionality. The Vulkan version supported by a physical device **can** be obtained by calling [vkGetPhysicalDeviceProperties](#).

4.1.2. Extending Physical Device From Device Extensions

When the [VK_KHR_get_physical_device_properties2](#) extension is enabled, or when both the instance and the physical-device versions are at least 1.1, physical-device-level functionality of a device extension **can** be used with a physical device if the corresponding extension is enumerated by [vkEnumerateDeviceExtensionProperties](#) for that physical device, even before a logical device has been created.

To obtain a function pointer for a physical-device-level command from a device extension, an application **can** use [vkGetInstanceProcAddr](#). This function pointer **may** point to dispatch code, which calls a different real implementation for different [VkPhysicalDevice](#) objects. Applications **must** not use a [VkPhysicalDevice](#) in any command added by an extension or core version that is not supported by that physical device.

Device extensions **may** define structures that **can** be added to the **pNext** chain of physical-device-level commands.

4.2. Instances

There is no global state in Vulkan and all per-application state is stored in a [VkInstance](#) object. Creating a [VkInstance](#) object initializes the Vulkan library and allows the application to pass information about itself to the implementation.

Instances are represented by [VkInstance](#) handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkInstance)
```

To query the version of instance-level functionality supported by the implementation, call:

```
// Provided by VK_VERSION_1_1
VkResult vkEnumerateInstanceVersion(
    uint32_t*                                pApiVersion);
```

- `pApiVersion` is a pointer to a `uint32_t`, which is the version of Vulkan supported by instance-level functionality, encoded as described in [Version Numbers](#).

NOTE

The intended behavior of `vkEnumerateInstanceVersion` is that an implementation **should** not need to perform memory allocations and **should** unconditionally return `VK_SUCCESS`. The loader, and any enabled layers, **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` in the case of a failed memory allocation.

Valid Usage (Implicit)

- VUID-vkEnumerateInstanceVersion-pApiVersion-parameter `pApiVersion` **must** be a valid pointer to a `uint32_t` value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To create an instance object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateInstance(
    const VkInstanceCreateInfo*    pCreateInfo,
    const VkAllocationCallbacks*   pAllocator,
    VkInstance*                    pInstance);
```

- `pCreateInfo` is a pointer to a `VkInstanceCreateInfo` structure controlling creation of the instance.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

- `pInstance` points a `VkInstance` handle in which the resulting instance is returned.

`vkCreateInstance` verifies that the requested layers exist. If not, `vkCreateInstance` will return `VK_ERROR_LAYER_NOT_PRESENT`. Next `vkCreateInstance` verifies that the requested extensions are supported (e.g. in the implementation or in any enabled instance layer) and if any requested extension is not supported, `vkCreateInstance` **must** return `VK_ERROR_EXTENSION_NOT_PRESENT`. After verifying and enabling the instance layers and extensions the `VkInstance` object is created and returned to the application. If a requested extension is only supported by a layer, both the layer and the extension need to be specified at `vkCreateInstance` time for the creation to succeed.

Valid Usage

- VUID-vkCreateInstance-ppEnabledExtensionNames-01388

All **required extensions** for each extension in the `VkInstanceCreateInfo::ppEnabledExtensionNames` list **must** also be present in that list

Valid Usage (Implicit)

- VUID-vkCreateInstance-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkInstanceCreateInfo` structure
- VUID-vkCreateInstance-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateInstance-pInstance-parameter
`pInstance` **must** be a valid pointer to a `VkInstance` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_EXTENSION_NOT_PRESENT`
- `VK_ERROR_INCOMPATIBLE_DRIVER`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_LAYER_NOT_PRESENT`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkInstanceCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkInstanceCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkInstanceCreateFlags flags;
    const VkApplicationInfo* pApplicationInfo;
    uint32_t             enabledLayerCount;
    const char* const*   ppEnabledLayerNames;
    uint32_t             enabledExtensionCount;
    const char* const*   ppEnabledExtensionNames;
} VkInstanceCreateInfo;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of [VkInstanceCreateFlagBits](#) indicating the behavior of the instance.
- `pApplicationInfo` is `NULL` or a pointer to a [VkApplicationInfo](#) structure. If not `NULL`, this information helps implementations recognize behavior inherent to classes of applications. [VkApplicationInfo](#) is defined in detail below.
- `enabledLayerCount` is the number of global layers to enable.
- `ppEnabledLayerNames` is a pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings containing the names of layers to enable for the created instance. The layers are loaded in the order they are listed in this array, with the first array element being the closest to the application, and the last array element being the closest to the driver. See the [Layers](#) section for further details.
- `enabledExtensionCount` is the number of global extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable.

To capture events that occur while creating or destroying an instance, an application **can** link a [VkDebugReportCallbackCreateInfoEXT](#) structure or a [VkDebugUtilsMessengerCreateInfoEXT](#) structure to the `pNext` chain of the [VkInstanceCreateInfo](#) structure passed to `vkCreateInstance`. This callback is only valid for the duration of the `vkCreateInstance` and the `vkDestroyInstance` call. Use [vkCreateDebugReportCallbackEXT](#) or [vkCreateDebugUtilsMessengerEXT](#) to create persistent callback objects.

An application can add additional drivers by including the [VkDirectDriverLoadingListLUNARG](#) structure in the `pNext` chain of the [VkInstanceCreateInfo](#) structure passed to `vkCreateInstance`.

NOTE

[VkDirectDriverLoadingListLUNARG](#) allows applications to ship drivers with themselves. Only drivers that are designed to work with it should be used, such as drivers that implement Vulkan in software or that implement Vulkan by translating it to a different API. Any driver that requires installation should not be used, such as hardware drivers.

Valid Usage

- VUID-VkInstanceCreateInfo-pNext-04925

If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkDebugReportCallbackCreateInfoEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_EXT_debug_report`

- VUID-VkInstanceCreateInfo-pNext-04926

If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkDebugUtilsMessengerCreateInfoEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_EXT_debug_utils`

- VUID-VkInstanceCreateInfo-pNext-06779

If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member **must** be either `VK_EXPORT_METAL_OBJECT_TYPE_METAL_DEVICE_BIT_EXT` or `VK_EXPORT_METAL_OBJECT_TYPE_METAL_COMMAND_QUEUE_BIT_EXT`

- VUID-VkInstanceCreateInfo-flags-06559

If `flags` has the `VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR` bit set, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_KHR_portability_enumeration`

- VUID-VkInstanceCreateInfo-pNext-09400

If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkDirectDriverLoadingListLUNARG` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_LUNARG_direct_driver_loading`

- VUID-VkInstanceCreateInfo-pNext-10242

If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkLayerSettingsCreateInfoEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_EXT_layer_settings`

- VUID-VkInstanceCreateInfo-pNext-10243

If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkValidationFeaturesEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_EXT_validation_features`

- VUID-VkInstanceCreateInfo-pNext-10244

If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkValidationFlagsEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` **must** contain `VK_EXT_validation_flags`

Valid Usage (Implicit)

- VUID-VkInstanceCreateInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO`

- VUID-VkInstanceCreateInfo-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDebugReportCallbackCreateInfoEXT`,

VkDebugUtilsMessengerCreateInfoEXT,
VkExportMetalObjectCreateInfoEXT,
VkValidationFeaturesEXT, or VkValidationFlagsEXT

VkDirectDriverLoadingListLUNARG,
VkLayerSettingsCreateInfoEXT,

- VUID-VkInstanceCreateInfo-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique, with the exception of structures of type **VkDebugUtilsMessengerCreateInfoEXT**, **VkExportMetalObjectCreateInfoEXT**, or **VkLayerSettingsCreateInfoEXT**
- VUID-VkInstanceCreateInfo-flags-parameter
flags **must** be a valid combination of **VkInstanceCreateFlagBits** values
- VUID-VkInstanceCreateInfo-pApplicationInfo-parameter
If **pApplicationInfo** is not **NULL**, **pApplicationInfo** **must** be a valid pointer to a valid **VkApplicationInfo** structure
- VUID-VkInstanceCreateInfo-ppEnabledLayerNames-parameter
If **enabledLayerCount** is not **0**, **ppEnabledLayerNames** **must** be a valid pointer to an array of **enabledLayerCount** null-terminated UTF-8 strings
- VUID-VkInstanceCreateInfo-ppEnabledExtensionNames-parameter
If **enabledExtensionCount** is not **0**, **ppEnabledExtensionNames** **must** be a valid pointer to an array of **enabledExtensionCount** null-terminated UTF-8 strings

```
// Provided by VK_VERSION_1_0
typedef enum VkInstanceCreateFlagBits {
    // Provided by VK_KHR_portability_enumeration
    VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR = 0x00000001,
} VkInstanceCreateFlagBits;
```

- **VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR** specifies that the instance will enumerate available Vulkan Portability-compliant physical devices and groups in addition to the Vulkan physical devices and groups that are enumerated by default.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkInstanceCreateFlags;
```

VkInstanceCreateFlags is a bitmask type for setting a mask of zero or more **VkInstanceCreateFlagBits**.

When creating a Vulkan instance for which you wish to disable validation checks, add a **VkValidationFlagsEXT** structure to the **pNext** chain of the **VkInstanceCreateInfo** structure, specifying the checks to be disabled.

```
// Provided by VK_EXT_validation_flags
typedef struct VkValidationFlagsEXT {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             disabledValidationCheckCount;
    const VkValidationCheckEXT* pDisabledValidationChecks;
} VkValidationFlagsEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `disabledValidationCheckCount` is the number of checks to disable.
- `pDisabledValidationChecks` is a pointer to an array of `VkValidationCheckEXT` values specifying the validation checks to be disabled.

Valid Usage (Implicit)

- VUID-VkValidationFlagsEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VALIDATION_FLAGS_EXT`
- VUID-VkValidationFlagsEXT-pDisabledValidationChecks-parameter
`pDisabledValidationChecks` **must** be a valid pointer to an array of `disabledValidationCheckCount` valid `VkValidationCheckEXT` values
- VUID-VkValidationFlagsEXT-disabledValidationCheckCount-arraylength
`disabledValidationCheckCount` **must** be greater than 0

Structure Chaining

Extends the structure

- `VkInstanceCreateInfo`

Possible values of elements of the `VkValidationFlagsEXT::pDisabledValidationChecks` array, specifying validation checks to be disabled, are:

```
// Provided by VK_EXT_validation_flags
typedef enum VkValidationCheckEXT {
    VK_VALIDATION_CHECK_ALL_EXT = 0,
    VK_VALIDATION_CHECK_SHADERS_EXT = 1,
} VkValidationCheckEXT;
```

- `VK_VALIDATION_CHECK_ALL_EXT` specifies that all validation checks are disabled.
- `VK_VALIDATION_CHECK_SHADERS_EXT` specifies that shader validation is disabled.

When creating a Vulkan instance for which you wish to enable or disable specific validation

features, add a [VkValidationFeaturesEXT](#) structure to the **pNext** chain of the [VkInstanceCreateInfo](#) structure, specifying the features to be enabled or disabled.

```
// Provided by VK_EXT_validation_features
typedef struct VkValidationFeaturesEXT {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             enabledValidationFeatureCount;
    const VkValidationFeatureEnableEXT* pEnabledValidationFeatures;
    uint32_t             disabledValidationFeatureCount;
    const VkValidationFeatureDisableEXT* pDisabledValidationFeatures;
} VkValidationFeaturesEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **enabledValidationFeatureCount** is the number of features to enable.
- **pEnabledValidationFeatures** is a pointer to an array of [VkValidationFeatureEnableEXT](#) values specifying the validation features to be enabled.
- **disabledValidationFeatureCount** is the number of features to disable.
- **pDisabledValidationFeatures** is a pointer to an array of [VkValidationFeatureDisableEXT](#) values specifying the validation features to be disabled.

Valid Usage

- VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-02967

If the **pEnabledValidationFeatures** array contains [VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT](#), then it **must** also contain [VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT](#) or [VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT](#)

Valid Usage (Implicit)

- VUID-VkValidationFeaturesEXT-sType-sType

sType **must** be [VK_STRUCTURE_TYPE_VALIDATION_FEATURES_EXT](#)

- VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-parameter

If **enabledValidationFeatureCount** is not 0, **pEnabledValidationFeatures** **must** be a valid pointer to an array of **enabledValidationFeatureCount** valid [VkValidationFeatureEnableEXT](#) values

- VUID-VkValidationFeaturesEXT-pDisabledValidationFeatures-parameter

If **disabledValidationFeatureCount** is not 0, **pDisabledValidationFeatures** **must** be a valid pointer to an array of **disabledValidationFeatureCount** valid [VkValidationFeatureDisableEXT](#) values

Structure Chaining

Extends the structures

- [VkInstanceCreateInfo](#)
- [VkShaderCreateInfoEXT](#)
- [VkShaderModuleCreateInfo](#)

Possible values of elements of the [VkValidationFeaturesEXT::pEnabledValidationFeatures](#) array, specifying validation features to be enabled, are:

```
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureEnableEXT {
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT = 0,
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT = 1,
    VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT = 2,
    VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT = 3,
    VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT = 4,
} VkValidationFeatureEnableEXT;
```

- [VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT](#) specifies that GPU-assisted validation is enabled. Activating this feature instruments shader programs to generate additional diagnostic data. This feature is disabled by default.
- [VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT](#) specifies that the validation layers reserve a descriptor set binding slot for their own use. The layer reports a value for [VkPhysicalDeviceLimits::maxBoundDescriptorSets](#) that is one less than the value reported by the device. If the device supports the binding of only one descriptor set, the validation layer does not perform GPU-assisted validation. This feature is disabled by default.
- [VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT](#) specifies that Vulkan best-practices validation is enabled. Activating this feature enables the output of warnings related to common misuse of the API, but which are not explicitly prohibited by the specification. This feature is disabled by default.
- [VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT](#) specifies that the layers will process [debugPrintfEXT](#) operations in shaders and send the resulting output to the debug callback. This feature is disabled by default.
- [VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT](#) specifies that Vulkan synchronization validation is enabled. This feature reports resource access conflicts due to missing or incorrect synchronization operations between actions (Draw, Copy, Dispatch, Blit) reading or writing the same regions of memory. This feature is disabled by default.

Possible values of elements of the [VkValidationFeaturesEXT::pDisabledValidationFeatures](#) array, specifying validation features to be disabled, are:

```
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureDisableEXT {
    VK_VALIDATION_FEATURE_DISABLE_ALL_EXT = 0,
    VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT = 1,
    VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT = 2,
    VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT = 3,
    VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT = 4,
    VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT = 5,
    VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT = 6,
    VK_VALIDATION_FEATURE_DISABLE_SHADER_VALIDATION_CACHE_EXT = 7,
} VkValidationFeatureDisableEXT;
```

- [VK_VALIDATION_FEATURE_DISABLE_ALL_EXT](#) specifies that all validation checks are disabled.
- [VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT](#) specifies that shader validation, both runtime and standalone, is disabled. This validation occurs inside [VkShaderCreateInfoEXT](#) and [VkShaderModuleCreateInfo](#). This feature is enabled by default.
- [VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT](#) specifies that thread safety validation is disabled. This feature is enabled by default.
- [VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT](#) specifies that stateless parameter validation is disabled. This feature is enabled by default.
- [VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT](#) specifies that object lifetime validation is disabled. This feature is enabled by default.
- [VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT](#) specifies that core validation checks are disabled. This feature is enabled by default. If this feature is disabled, [VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT](#) is implied.
- [VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT](#) specifies that protection against duplicate non-dispatchable object handles is disabled. This feature is enabled by default.
- [VK_VALIDATION_FEATURE_DISABLE_SHADER_VALIDATION_CACHE_EXT](#) specifies that there will be no caching of shader validation results and every shader will be validated on every application execution. Shader validation caching is enabled by default.

NOTE	Disabling checks such as parameter validation and object lifetime validation prevents the reporting of error conditions that can cause other validation checks to behave incorrectly or crash. Some validation checks assume that their inputs are already valid and do not always revalidate them.
-------------	---

NOTE	The VK_EXT_validation_features extension subsumes all the functionality provided in the VK_EXT_validation_flags extension.
-------------	--

To create a Vulkan instance with a specific configuration of layer settings, add [VkLayerSettingsCreateInfoEXT](#) structures to the `pNext` chain of the [VkInstanceCreateInfo](#) structure, specifying the settings to be configured.

```
// Provided by VK_EXT_layer_settings
typedef struct VkLayerSettingsCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             settingCount;
    const VkLayerSettingEXT* pSettings;
} VkLayerSettingsCreateInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **settingCount** is the number of settings to configure.
- **pSettings** is a pointer to an array of **settingCount** [VkLayerSettingEXT](#) values specifying the settings to be configured.

Valid Usage (Implicit)

- VUID-VkLayerSettingsCreateInfoEXT-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_LAYER_SETTINGS_CREATE_INFO_EXT](#)
- VUID-VkLayerSettingsCreateInfoEXT-pSettings-parameter
If **settingCount** is not 0, **pSettings** **must** be a valid pointer to an array of **settingCount** valid [VkLayerSettingEXT](#) structures

Structure Chaining

Extends the structure

- [VkInstanceCreateInfo](#)

The values of elements of the [VkLayerSettingsCreateInfoEXT::pSettings](#) array, specifying layer settings to be configured, are:

```
// Provided by VK_EXT_layer_settings
typedef struct VkLayerSettingEXT {
    const char*      pLayerName;
    const char*      pSettingName;
    VkLayerSettingTypeEXT type;
    uint32_t         valueCount;
    const void*      pValues;
} VkLayerSettingEXT;
```

- **pLayerName** is a pointer to a null-terminated UTF-8 string naming the layer to configure the setting from.
- **pSettingName** is a pointer to a null-terminated UTF-8 string naming the setting to configure.

Values of `pSettingName` that are unknown to the layer are ignored.

- `type` is a `VkLayerSettingTypeEXT` value specifying the type of the `pValues` values.
- `valueCount` is the number of values used to configure the layer setting.
- `pValues` is a pointer to an array of `valueCount` values of the type indicated by `type` to configure the layer setting.

When multiple `VkLayerSettingsCreateInfoEXT` structures are chained and the same `pSettingName` is referenced for the same `pLayerName`, the value of the first reference of the layer setting is used.

Valid Usage

- VUID-VkLayerSettingEXT-valueCount-10070
If `valueCount` is not 0, `pValues` **must** be a valid pointer to an array of `valueCount` values of the type indicated by `type`

Valid Usage (Implicit)

- VUID-VkLayerSettingEXT-pLayerName-parameter
`pLayerName` **must** be a null-terminated UTF-8 string
- VUID-VkLayerSettingEXT-pSettingName-parameter
`pSettingName` **must** be a null-terminated UTF-8 string
- VUID-VkLayerSettingEXT-type-parameter
`type` **must** be a valid `VkLayerSettingTypeEXT` value

Possible values of `VkLayerSettingEXT::type`, specifying the type of the data returned in `VkLayerSettingEXT::pValues`, are:

```
// Provided by VK_EXT_layer_settings
typedef enum VkLayerSettingTypeEXT {
    VK_LAYER_SETTING_TYPE_BOOL32_EXT = 0,
    VK_LAYER_SETTING_TYPE_INT32_EXT = 1,
    VK_LAYER_SETTING_TYPE_INT64_EXT = 2,
    VK_LAYER_SETTING_TYPE_UINT32_EXT = 3,
    VK_LAYER_SETTING_TYPE_UINT64_EXT = 4,
    VK_LAYER_SETTING_TYPE_FLOAT32_EXT = 5,
    VK_LAYER_SETTING_TYPE_FLOAT64_EXT = 6,
    VK_LAYER_SETTING_TYPE_STRING_EXT = 7,
} VkLayerSettingTypeEXT;
```

- `VK_LAYER_SETTING_TYPE_BOOL32_EXT` specifies that the layer setting's type is `VkBool32`.
- `VK_LAYER_SETTING_TYPE_INT32_EXT` specifies that the layer setting's type is signed 32-bit integer.
- `VK_LAYER_SETTING_TYPE_INT64_EXT` specifies that the layer setting's type is signed 64-bit

integer.

- [VK_LAYER_SETTING_TYPE_UINT32_EXT](#) specifies that the layer setting's type is unsigned 32-bit integer.
- [VK_LAYER_SETTING_TYPE_UINT64_EXT](#) specifies that the layer setting's type is unsigned 64-bit integer.
- [VK_LAYER_SETTING_TYPE_FLOAT32_EXT](#) specifies that the layer setting's type is 32-bit floating-point.
- [VK_LAYER_SETTING_TYPE_FLOAT64_EXT](#) specifies that the layer setting's type is 64-bit floating-point.
- [VK_LAYER_SETTING_TYPE_STRING_EXT](#) specifies that the layer setting's type is a pointer to a null-terminated UTF-8 string.

The [VkDirectDriverLoadingListLUNARG](#) structure is defined as:

```
// Provided by VK_LUNARG_direct_driver_loading
typedef struct VkDirectDriverLoadingListLUNARG {
    VkStructureType          sType;
    const void*              pNext;
    VkDirectDriverLoadingModeLUNARG mode;
    uint32_t                 driverCount;
    const VkDirectDriverLoadingInfoLUNARG* pDrivers;
} VkDirectDriverLoadingListLUNARG;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is `NULL` or a pointer to a structure extending this structure.
- [mode](#) controls the mode in which to load the provided drivers.
- [driverCount](#) is the number of driver manifest paths.
- [pDrivers](#) is a pointer to an array of [driverCount](#) [VkDirectDriverLoadingInfoLUNARG](#) structures.

When creating a Vulkan instance for which additional drivers are to be included, add a [VkDirectDriverLoadingListLUNARG](#) structure to the [pNext](#) chain of the [VkInstanceCreateInfo](#) structure, and include in it the list of [VkDirectDriverLoadingInfoLUNARG](#) structures which contain the information necessary to load additional drivers.

Valid Usage (Implicit)

- VUID-VkDirectDriverLoadingListLUNARG-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_DIRECT_DRIVER_LOADING_LIST_LUNARG](#)
- VUID-VkDirectDriverLoadingListLUNARG-mode-parameter
[mode](#) **must** be a valid [VkDirectDriverLoadingModeLUNARG](#) value
- VUID-VkDirectDriverLoadingListLUNARG-pDrivers-parameter
[pDrivers](#) **must** be a valid pointer to an array of [driverCount](#) valid [VkDirectDriverLoadingInfoLUNARG](#) structures

- VUID-VkDirectDriverLoadingListLUNARG-driverCount-arraylength
driverCount must be greater than 0

Structure Chaining

Extends the structure

- [VkInstanceCreateInfo](#)

The [VkDirectDriverLoadingInfoLUNARG](#) structure is defined as:

```
// Provided by VK_LUNARG_direct_driver_loading
typedef struct VkDirectDriverLoadingInfoLUNARG {
    VkStructureType          sType;
    void*                    pNext;
    VkDirectDriverLoadingFlagsLUNARG flags;
    PFN_vkGetInstanceProcAddrLUNARG pfnGetInstanceProcAddr;
} VkDirectDriverLoadingInfoLUNARG;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pfnGetInstanceProcAddr** is a [PFN_vkGetInstanceProcAddrLUNARG](#) pointer to the driver [vkGetInstanceProcAddr](#) function.

Valid Usage (Implicit)

- VUID-VkDirectDriverLoadingInfoLUNARG-sType-sType
sType must be [VK_STRUCTURE_TYPE_DIRECT_DRIVER_LOADING_INFO_LUNARG](#)
- VUID-VkDirectDriverLoadingInfoLUNARG-flags-zero bitmask
flags must be 0

Possible values of [VkDirectDriverLoadingListLUNARG::mode](#), specifying the mode in which drivers are used, are:

```
// Provided by VK_LUNARG_direct_driver_loading
typedef enum VkDirectDriverLoadingModeLUNARG {
    VK_DIRECT_DRIVER_LOADING_MODE_EXCLUSIVE_LUNARG = 0,
    VK_DIRECT_DRIVER_LOADING_MODE_INCLUSIVE_LUNARG = 1,
} VkDirectDriverLoadingModeLUNARG;
```

- [VK_DIRECT_DRIVER_LOADING_MODE_EXCLUSIVE_LUNARG](#) specifies that the provided drivers are used instead of the system-loaded drivers.

- [VK_DIRECT_DRIVER_LOADING_MODE_INCLUSIVE_LUNARG](#) specifies that the provided drivers are used in addition to the system-loaded drivers.

```
// Provided by VK_LUNARG_direct_driver_loading
typedef VkFlags VkDirectDriverLoadingFlagsLUNARG;
```

[VkDirectDriverLoadingFlagsLUNARG](#) is a bitmask type for setting a mask, but is currently reserved for future use.

The type of [PFN_vkGetInstanceProcAddrLUNARG](#) is:

```
// Provided by VK_LUNARG_direct_driver_loading
typedef PFN_vkVoidFunction (*PFN_vkGetInstanceProcAddrLUNARG)(
    VkInstance          instance,
    const char*         pName);
```

- `instance` is a [VkInstance](#) handle.
- `pName` is the name of a Vulkan command.

This type is compatible with the type of a pointer to the [vkGetInstanceProcAddr](#) command, but is used only to specify device driver addresses in [VkDirectDriverLoadingInfoLUNARG::pfnGetInstanceProcAddr](#).

NOTE

This type exists only because of limitations in the XML schema and processing scripts, and its name may change in the future. Ideally we would use the [PFN_vkGetInstanceProcAddr](#) type generated in the [vulkan_core.h](#) header.

The [VkApplicationInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkApplicationInfo {
    VkStructureType    sType;
    const void*        pNext;
    const char*         pApplicationName;
    uint32_t            applicationVersion;
    const char*         pEngineName;
    uint32_t            engineVersion;
    uint32_t            apiVersion;
} VkApplicationInfo;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pApplicationName` is `NULL` or is a pointer to a null-terminated UTF-8 string containing the name of the application.
- `applicationVersion` is an unsigned integer variable containing the developer-supplied version

number of the application.

- `pEngineName` is `NULL` or is a pointer to a null-terminated UTF-8 string containing the name of the engine (if any) used to create the application.
- `engineVersion` is an unsigned integer variable containing the developer-supplied version number of the engine used to create the application.
- `apiVersion` **must** be the highest version of Vulkan that the application is designed to use, encoded as described in [Version Numbers](#). The patch version number specified in `apiVersion` is ignored when creating an instance object. The variant version of the instance **must** match that requested in `apiVersion`.

Vulkan 1.0 implementations were required to return `VK_ERROR_INCOMPATIBLE_DRIVER` if `apiVersion` was larger than 1.0. Implementations that support Vulkan 1.1 or later **must** not return `VK_ERROR_INCOMPATIBLE_DRIVER` for any value of `apiVersion`.

NOTE

Because Vulkan 1.0 implementations **may** fail with `VK_ERROR_INCOMPATIBLE_DRIVER`, applications **should** determine the version of Vulkan available before calling `vkCreateInstance`. If the `vkGetInstanceProcAddr` returns `NULL` for `vkEnumerateInstanceVersion`, it is a Vulkan 1.0 implementation. Otherwise, the application **can** call `vkEnumerateInstanceVersion` to determine the version of Vulkan.

As long as the instance supports at least Vulkan 1.1, an application **can** use different versions of Vulkan with an instance than it does with a device or physical device.

NOTE

The Khronos validation layers will treat `apiVersion` as the highest API version the application targets, and will validate API usage against the minimum of that version and the implementation version (instance or device, depending on context). If an application tries to use functionality from a greater version than this, a validation error will be triggered.

For example, if the instance supports Vulkan 1.1 and three physical devices support Vulkan 1.0, Vulkan 1.1, and Vulkan 1.2, respectively, and if the application sets `apiVersion` to 1.2, the application **can** use the following versions of Vulkan:

- Vulkan 1.0 **can** be used with the instance and with all physical devices.
- Vulkan 1.1 **can** be used with the instance and with the physical devices that support Vulkan 1.1 and Vulkan 1.2.
- Vulkan 1.2 **can** be used with the physical device that supports Vulkan 1.2.

If we modify the above example so that the application sets `apiVersion` to 1.1, then the application **must** not use Vulkan 1.2 functionality on the physical device that supports Vulkan 1.2.

NOTE

Providing a `NULL VkInstanceCreateInfo::pApplicationInfo` or providing an `apiVersion` of 0 is equivalent to providing an `apiVersion` of `VK_MAKE_API_VERSION(0,1,0,0)`.

Valid Usage

- VUID-VkApplicationInfo-apiVersion-04010
If `apiVersion` is not 0, then it **must** be greater than or equal to `VK_API_VERSION_1_0`

Valid Usage (Implicit)

- VUID-VkApplicationInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_APPLICATION_INFO`
- VUID-VkApplicationInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkApplicationInfo-pApplicationName-parameter
If `pApplicationName` is not `NULL`, `pApplicationName` **must** be a null-terminated UTF-8 string
- VUID-VkApplicationInfo-pEngineName-parameter
If `pEngineName` is not `NULL`, `pEngineName` **must** be a null-terminated UTF-8 string

To destroy an instance, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyInstance(
    VkInstance          instance,
    const VkAllocationCallbacks* pAllocator);
```

- `instance` is the handle of the instance to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Prior to destroying an instance, an application is responsible for destroying/freeing any Vulkan objects with explicit `vkDestroy*` or `vkFree*` commands that were created using that instance, or any `VkPhysicalDevice` object retrieved from it, as the first parameter of the corresponding `vkCreate*` or `vkAllocate*` command.

Valid Usage

- VUID-vkDestroyInstance-instance-00629
All child objects that were created with `instance` or with a `VkPhysicalDevice` retrieved from it, and that **can** be destroyed or freed, **must** have been destroyed or freed prior to destroying `instance`
- VUID-vkDestroyInstance-instance-00630
If `VkAllocationCallbacks` were provided when `instance` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyInstance-instance-00631
If no `VkAllocationCallbacks` were provided when `instance` was created, `pAllocator` **must**

be **NULL**

Valid Usage (Implicit)

- VUID-vkDestroyInstance-instance-parameter
If **instance** is not **NULL**, **instance** **must** be a valid **VkInstance** handle
- VUID-vkDestroyInstance-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid **VkAllocationCallbacks** structure

Host Synchronization

- Host access to **instance** **must** be externally synchronized
- Host access to all **VkPhysicalDevice** objects enumerated from **instance** **must** be externally synchronized

Chapter 5. Devices and Queues

Once Vulkan is initialized, devices and queues are the primary objects used to interact with a Vulkan implementation.

Vulkan separates the concept of *physical* and *logical* devices. A physical device usually represents a single complete implementation of Vulkan (excluding instance-level functionality) available to the host, of which there are a finite number. A logical device represents an instance of that implementation with its own state and resources independent of other logical devices.

Physical devices **cannot** be independently destroyed, and are instead destroyed with the [VkInstance](#) that they were retrieved from.

Physical devices are represented by [VkPhysicalDevice](#) handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkPhysicalDevice)
```

5.1. Physical Devices

To retrieve a list of physical device objects representing the physical devices installed in the system, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumeratePhysicalDevices(
    VkInstance          instance,
    uint32_t*           pPhysicalDeviceCount,
    VkPhysicalDevice*   pPhysicalDevices);
```

- [instance](#) is a handle to a Vulkan instance previously created with [vkCreateInstance](#).
- [pPhysicalDeviceCount](#) is a pointer to an integer related to the number of physical devices available or queried, as described below.
- [pPhysicalDevices](#) is either [NULL](#) or a pointer to an array of [VkPhysicalDevice](#) handles.

If [pPhysicalDevices](#) is [NULL](#), then the number of physical devices available is returned in [pPhysicalDeviceCount](#). Otherwise, [pPhysicalDeviceCount](#) **must** point to a variable set by the application to the number of elements in the [pPhysicalDevices](#) array, and on return the variable is overwritten with the number of handles actually written to [pPhysicalDevices](#). If [pPhysicalDeviceCount](#) is less than the number of physical devices available, at most [pPhysicalDeviceCount](#) structures will be written, and [VK_INCOMPLETE](#) will be returned instead of [VK_SUCCESS](#), to indicate that not all the available physical devices were returned.

Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDevices-instance-parameter

instance **must** be a valid [VkInstance](#) handle

- VUID-vkEnumeratePhysicalDevices-pPhysicalDeviceCount-parameter

pPhysicalDeviceCount **must** be a valid pointer to a [uint32_t](#) value

- VUID-vkEnumeratePhysicalDevices-pPhysicalDevices-parameter

If the value referenced by **pPhysicalDeviceCount** is not 0, and **pPhysicalDevices** is not NULL, **pPhysicalDevices** **must** be a valid pointer to an array of [pPhysicalDeviceCount](#) [VkPhysicalDevice](#) handles

Return Codes

Success

- [VK_INCOMPLETE](#)
- [VK_SUCCESS](#)

Failure

- [VK_ERROR_INITIALIZATION_FAILED](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

To query general properties of physical devices once enumerated, call:

WARNING

This functionality is superseded by [vkGetPhysicalDeviceProperties2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceProperties(
    VkPhysicalDevice          physicalDevice,
    VkPhysicalDeviceProperties* pProperties);
```

- **physicalDevice** is the handle to the physical device whose properties will be queried.
- **pProperties** is a pointer to a [VkPhysicalDeviceProperties](#) structure in which properties are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceProperties-physicalDevice-parameter

physicalDevice **must** be a valid [VkPhysicalDevice](#) handle

- VUID-vkGetPhysicalDeviceProperties-pProperties-parameter

pProperties **must** be a valid pointer to a [VkPhysicalDeviceProperties](#) structure

The `VkPhysicalDeviceProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceProperties {
    uint32_t          apiVersion;
    uint32_t          driverVersion;
    uint32_t          vendorID;
    uint32_t          deviceID;
    VkPhysicalDeviceType deviceType;
    char              deviceName[VK_MAX_PHYSICAL_DEVICE_NAME_SIZE];
    uint8_t           pipelineCacheUUID[VK_UUID_SIZE];
    VkPhysicalDeviceLimits limits;
    VkPhysicalDeviceSparseProperties sparseProperties;
} VkPhysicalDeviceProperties;
```

- `apiVersion` is the version of Vulkan supported by the device, encoded as described in [Version Numbers](#).
- `driverVersion` is the vendor-specified version of the driver.
- `vendorID` is a unique identifier for the *vendor* (see below) of the physical device.
- `deviceID` is a unique identifier for the physical device among devices available from the vendor.
- `deviceType` is a [VkPhysicalDeviceType](#) specifying the type of device.
- `deviceName` is an array of `VK_MAX_PHYSICAL_DEVICE_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the device.
- `pipelineCacheUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the device.
- `limits` is the [VkPhysicalDeviceLimits](#) structure specifying device-specific limits of the physical device. See [Limits](#) for details.
- `sparseProperties` is the [VkPhysicalDeviceSparseProperties](#) structure specifying various sparse related properties of the physical device. See [Sparse Properties](#) for details.

NOTE The value of `apiVersion` **may** be different than the version returned by [vkEnumerateInstanceVersion](#); either higher or lower. In such cases, the application **must** not use functionality that exceeds the version of Vulkan associated with a given object. The `pApiVersion` parameter returned by [vkEnumerateInstanceVersion](#) is the version associated with a [VkInstance](#) and its children, except for a [VkPhysicalDevice](#) and its children. `VkPhysicalDeviceProperties::apiVersion` is the version associated with a [VkPhysicalDevice](#) and its children.

NOTE The encoding of `driverVersion` is implementation-defined. It **may** not use the same encoding as `apiVersion`. Applications should follow information from the *vendor* on how to extract the version information from `driverVersion`.

On implementations that claim support for the [Roadmap 2022](#) profile, the major and minor version expressed by `apiVersion` **must** be at least Vulkan 1.3.

The `vendorID` and `deviceID` fields are provided to allow applications to adapt to device characteristics that are not adequately exposed by other Vulkan queries.

NOTE These **may** include performance profiles, hardware errata, or other characteristics.

The *vendor* identified by `vendorID` is the entity responsible for the most salient characteristics of the underlying implementation of the `VkPhysicalDevice` being queried.

NOTE For example, in the case of a discrete GPU implementation, this **should** be the GPU chipset vendor. In the case of a hardware accelerator integrated into a system-on-chip (SoC), this **should** be the supplier of the silicon IP used to create the accelerator.

If the vendor has a `PCI vendor ID`, the low 16 bits of `vendorID` **must** contain that PCI vendor ID, and the remaining bits **must** be zero. Otherwise, the value returned **must** be a valid Khronos vendor ID, obtained as described in the [Vulkan Documentation and Extensions: Procedures and Conventions](#) document in the section “Registering a Vendor ID with Khronos”. Khronos vendor IDs are allocated starting at 0x10000, to distinguish them from the PCI vendor ID namespace. Khronos vendor IDs are symbolically defined in the `VkVendorId` type.

The vendor is also responsible for the value returned in `deviceID`. If the implementation is driven primarily by a `PCI device` with a `PCI device ID`, the low 16 bits of `deviceID` **must** contain that PCI device ID, and the remaining bits **must** be zero. Otherwise, the choice of what values to return **may** be dictated by operating system or platform policies - but **should** uniquely identify both the device version and any major configuration options (for example, core count in the case of multicore devices).

NOTE The same device ID **should** be used for all physical implementations of that device version and configuration. For example, all uses of a specific silicon IP GPU version and configuration **should** use the same device ID, even if those uses occur in different SoCs.

Khronos vendor IDs which **may** be returned in `VkPhysicalDeviceProperties::vendorID` are:

```
// Provided by VK_VERSION_1_0
typedef enum VkVendorId {
    VK_VENDOR_ID_KHRONOS = 0x10000,
    VK_VENDOR_ID_VIV = 0x10001,
    VK_VENDOR_ID_VSI = 0x10002,
    VK_VENDOR_ID_KAZAN = 0x10003,
    VK_VENDOR_ID_CODEPLAY = 0x10004,
    VK_VENDOR_ID_MESA = 0x10005,
    VK_VENDOR_ID_POCL = 0x10006,
    VK_VENDOR_ID_MOBILEYE = 0x10007,
} VkVendorId;
```

NOTE Khronos vendor IDs may be allocated by vendors at any time. Only the latest

canonical versions of this Specification, of the corresponding `vk.xml` API Registry, and of the corresponding `vulkan_core.h` header file **must** contain all reserved Khronos vendor IDs.

Only Khronos vendor IDs are given symbolic names at present. PCI vendor IDs returned by the implementation can be looked up in the PCI-SIG database.

`VK_MAX_PHYSICAL_DEVICE_NAME_SIZE` is the length in `char` values of an array containing a physical device name string, as returned in `VkPhysicalDeviceProperties::deviceName`.

```
#define VK_MAX_PHYSICAL_DEVICE_NAME_SIZE 256U
```

The physical device types which **may** be returned in `VkPhysicalDeviceProperties::deviceType` are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPhysicalDeviceType {
    VK_PHYSICAL_DEVICE_TYPE_OTHER = 0,
    VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU = 1,
    VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU = 2,
    VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU = 3,
    VK_PHYSICAL_DEVICE_TYPE_CPU = 4,
} VkPhysicalDeviceType;
```

- `VK_PHYSICAL_DEVICE_TYPE_OTHER` - the device does not match any other available types.
- `VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU` - the device is typically one embedded in or tightly coupled with the host.
- `VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU` - the device is typically a separate processor connected to the host via an interlink.
- `VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU` - the device is typically a virtual node in a virtualization environment.
- `VK_PHYSICAL_DEVICE_TYPE_CPU` - the device is typically running on the same processors as the host.

The physical device type is advertised for informational purposes only, and does not directly affect the operation of the system. However, the device type **may** correlate with other advertised properties or capabilities of the system, such as how many memory heaps there are.

To query general properties of physical devices once enumerated, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceProperties2(
    VkPhysicalDevice          physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```

```
// Provided by VK_KHR_get_physical_device_properties2
// Equivalent to vkGetPhysicalDeviceProperties2
void vkGetPhysicalDeviceProperties2KHR(
    VkPhysicalDevice          physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```

- **physicalDevice** is the handle to the physical device whose properties will be queried.
- **pProperties** is a pointer to a **VkPhysicalDeviceProperties2** structure in which properties are returned.

Each structure in **pProperties** and its **pNext** chain contains members corresponding to implementation-dependent properties, behaviors, or limits. **vkGetPhysicalDeviceProperties2** fills in each member to specify the corresponding value for the implementation.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceProperties2-physicalDevice-parameter **physicalDevice** **must** be a valid **VkPhysicalDevice** handle
- VUID-vkGetPhysicalDeviceProperties2-pProperties-parameter **pProperties** **must** be a valid pointer to a **VkPhysicalDeviceProperties2** structure

The **VkPhysicalDeviceProperties2** structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProperties2 {
    VkStructureType    sType;
    void*              pNext;
    VkPhysicalDeviceProperties properties;
} VkPhysicalDeviceProperties2;
```

```
// Provided by VK_KHR_get_physical_device_properties2
// Equivalent to VkPhysicalDeviceProperties2
typedef VkPhysicalDeviceProperties2 VkPhysicalDeviceProperties2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **properties** is a **VkPhysicalDeviceProperties** structure describing properties of the physical device. This structure is written with the same values as if it were written by **vkGetPhysicalDeviceProperties**.

The **pNext** chain of this structure is used to extend the structure with properties defined by extensions.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProperties2-sType-sType

sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2`

- VUID-VkPhysicalDeviceProperties2-pNext-pNext

Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of

- VUID-VkPhysicalDeviceProperties2-sType-unique
 The **sType** value of each structure in the **pNext** chain **must** be unique

The **VkPhysicalDeviceVulkan11Properties** structure is defined as:

```

// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan11Properties {
    VkStructureType    sType;
    void*              pNext;
    uint8_t            deviceUUID[VK_UUID_SIZE];
    uint8_t            driverUUID[VK_UUID_SIZE];
    uint8_t            deviceLUID[VK_LUID_SIZE];
    uint32_t           deviceNodeMask;
    VkBool32           deviceLUIDValid;
    uint32_t           subgroupSize;
    VkShaderStageFlags subgroupSupportedStages;
    VkSubgroupFeatureFlags subgroupSupportedOperations;
    VkBool32           subgroupQuadOperationsInAllStages;
    VkPointClippingBehavior pointClippingBehavior;
    uint32_t           maxMultiviewViewCount;
    uint32_t           maxMultiviewInstanceIndex;
    VkBool32           protectedNoFault;
    uint32_t           maxPerSetDescriptors;
    VkDeviceSize        maxMemoryAllocationSize;
} VkPhysicalDeviceVulkan11Properties;
  
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the device.
- `driverUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the driver build in use by the device.
- `deviceLUID` is an array of `VK_LUID_SIZE` `uint8_t` values representing a locally unique identifier for the device.
- `deviceNodeMask` is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.
- `deviceLUIDValid` is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.
- `subgroupSize` is the default number of invocations in each subgroup. `subgroupSize` is at least 1 if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `subgroupSize` is a power-of-two.
- `subgroupSupportedStages` is a bitfield of `VkShaderStageFlagBits` describing the shader stages that group operations with subgroup scope are supported in. `subgroupSupportedStages` will have the `VK_SHADER_STAGE_COMPUTE_BIT` bit set if any of the physical device's queues support `VK_QUEUE_COMPUTE_BIT`.
- `subgroupSupportedOperations` is a bitmask of `VkSubgroupFeatureFlagBits` specifying the sets of group operations with subgroup scope supported on this device. `subgroupSupportedOperations` will have the `VK_SUBGROUP_FEATURE_BASIC_BIT` bit set if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`.
- `subgroupQuadOperationsInAllStages` is a boolean specifying whether quad group operations are available in all stages, or are restricted to fragment and compute stages.
- `pointClippingBehavior` is a `VkPointClippingBehavior` value specifying the point clipping behavior supported by the implementation.
- `maxMultiviewViewCount` is one greater than the maximum view index that **can** be used in a subpass.
- `maxMultiviewInstanceIndex` is the maximum valid value of instance index allowed to be generated by a drawing command recorded within a subpass of a multiview render pass instance.
- `protectedNoFault` specifies how an implementation behaves when an application attempts to write to unprotected memory in a protected queue operation, read from protected memory in an unprotected queue operation, or perform a query in a protected queue operation. If this limit is `VK_TRUE`, such writes will be discarded or have undefined values written; reads and queries will return poison. If this limit is `VK_FALSE`, applications **must** not perform these operations. See [Protected Memory Access Rules](#) for more information.
- `maxPerSetDescriptors` is a maximum number of descriptors (summed over all descriptor types) in a single descriptor set that is guaranteed to satisfy any implementation-dependent constraints on the size of a descriptor set itself. Applications **can** query whether a descriptor set

that goes beyond this limit is supported using [vkGetDescriptorSetLayoutSupport](#).

- [maxMemoryAllocationSize](#) is the maximum size of a memory allocation that **can** be created, even if there is more space available in the heap. If [VkMemoryAllocateInfo::allocationSize](#) is larger the error [VK_ERROR_OUT_OF_DEVICE_MEMORY](#) **may** be returned.

If the [VkPhysicalDeviceVulkan11Properties](#) structure is included in the [pNext](#) chain of the [VkPhysicalDeviceProperties2](#) structure passed to [vkGetPhysicalDeviceProperties2](#), it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.1 functionality.

The members of [VkPhysicalDeviceVulkan11Properties](#) have the same values as the corresponding members of [VkPhysicalDeviceIDProperties](#), [VkPhysicalDeviceSubgroupProperties](#), [VkPhysicalDevicePointClippingProperties](#), [VkPhysicalDeviceMultiviewProperties](#), [VkPhysicalDeviceProtectedMemoryProperties](#), and [VkPhysicalDeviceMaintenance3Properties](#).

NOTE

The [subgroupSupportedStages](#), [subgroupSupportedOperations](#), and [subgroupQuadOperationsInAllStages](#) members of this structure correspond respectively to the [VkPhysicalDeviceSubgroupProperties::supportedStages](#), [VkPhysicalDeviceSubgroupProperties::supportedOperations](#), and [VkPhysicalDeviceSubgroupProperties::quadOperationsInAllStages](#) members, but add the [subgroup](#) prefix to the member name.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan11Properties-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_1_PROPERTIES](#)

```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **driverID** is a unique identifier for the driver of the physical device.
- **driverName** is an array of [VK_MAX_DRIVER_NAME_SIZE](#) `char` containing a null-terminated UTF-8 string which is the name of the driver.
- **driverInfo** is an array of [VK_MAX_DRIVER_INFO_SIZE](#) `char` containing a null-terminated UTF-8 string with additional information about the driver.
- **conformanceVersion** is the latest version of the Vulkan conformance test that the implementor has successfully tested this driver against prior to release (see [VkConformanceVersion](#)).
- **denormBehaviorIndependence** is a [VkShaderFloatControlsIndependence](#) value indicating whether, and how, denorm behavior can be set independently for different bit widths.
- **roundingModeIndependence** is a [VkShaderFloatControlsIndependence](#) value indicating whether, and how, rounding modes can be set independently for different bit widths.
- **shaderSignedZeroInfNanPreserveFloat16** is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 16-bit floating-point computations. It also indicates whether the [SignedZeroInfNanPreserve](#) execution mode **can** be used for 16-bit floating-point types.
- **shaderSignedZeroInfNanPreserveFloat32** is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 32-bit floating-point computations. It also indicates whether the [SignedZeroInfNanPreserve](#) execution mode **can** be used for 32-bit floating-point types.
- **shaderSignedZeroInfNanPreserveFloat64** is a boolean value indicating whether sign of a zero, Nans and $\pm\infty$ **can** be preserved in 64-bit floating-point computations. It also indicates whether the [SignedZeroInfNanPreserve](#) execution mode **can** be used for 64-bit floating-point types.
- **shaderDenormPreserveFloat16** is a boolean value indicating whether denormals **can** be preserved in 16-bit floating-point computations. It also indicates whether the [DenormPreserve](#) execution mode **can** be used for 16-bit floating-point types.
- **shaderDenormPreserveFloat32** is a boolean value indicating whether denormals **can** be preserved in 32-bit floating-point computations. It also indicates whether the [DenormPreserve](#) execution mode **can** be used for 32-bit floating-point types.
- **shaderDenormPreserveFloat64** is a boolean value indicating whether denormals **can** be preserved in 64-bit floating-point computations. It also indicates whether the [DenormPreserve](#) execution mode **can** be used for 64-bit floating-point types.

- `shaderDenormFlushToZeroFloat16` is a boolean value indicating whether denormals **can** be flushed to zero in 16-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 16-bit floating-point types.
- `shaderDenormFlushToZeroFloat32` is a boolean value indicating whether denormals **can** be flushed to zero in 32-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 32-bit floating-point types.
- `shaderDenormFlushToZeroFloat64` is a boolean value indicating whether denormals **can** be flushed to zero in 64-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode **can** be used for 64-bit floating-point types.
- `shaderRoundingModeRTEFloat16` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 16-bit floating-point types.
- `shaderRoundingModeRTEFloat32` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 32-bit floating-point types.
- `shaderRoundingModeRTEFloat64` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode **can** be used for 64-bit floating-point types.
- `shaderRoundingModeRTZFloat16` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 16-bit floating-point types.
- `shaderRoundingModeRTZFloat32` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 32-bit floating-point types.
- `shaderRoundingModeRTZFloat64` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode **can** be used for 64-bit floating-point types.
- `maxUpdateAfterBindDescriptorsInAllPools` is the maximum number of descriptors (summed over all descriptor types) that **can** be created across all pools that are created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set. Pool creation **may** fail when this limit is exceeded, or when the space this limit represents is unable to satisfy a pool creation due to fragmentation.
- `shaderUniformBufferArrayNonUniformIndexingNative` is a boolean value indicating whether uniform buffer descriptors natively support non-uniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that non-uniformly indexes an array of uniform buffers **may** execute multiple times in order to access all the descriptors.
- `shaderSampledImageArrayNonUniformIndexingNative` is a boolean value indicating whether

sampler and image descriptors natively support non-uniform indexing. If this is [VK_FALSE](#), then a single dynamic instance of an instruction that non-uniformly indexes an array of samplers or images **may** execute multiple times in order to access all the descriptors.

- [shaderStorageBufferArrayNonUniformIndexingNative](#) is a boolean value indicating whether storage buffer descriptors natively support non-uniform indexing. If this is [VK_FALSE](#), then a single dynamic instance of an instruction that non-uniformly indexes an array of storage buffers **may** execute multiple times in order to access all the descriptors.
- [shaderStorageImageArrayNonUniformIndexingNative](#) is a boolean value indicating whether storage image descriptors natively support non-uniform indexing. If this is [VK_FALSE](#), then a single dynamic instance of an instruction that non-uniformly indexes an array of storage images **may** execute multiple times in order to access all the descriptors.
- [shaderInputAttachmentArrayNonUniformIndexingNative](#) is a boolean value indicating whether input attachment descriptors natively support non-uniform indexing. If this is [VK_FALSE](#), then a single dynamic instance of an instruction that non-uniformly indexes an array of input attachments **may** execute multiple times in order to access all the descriptors.
- [robustBufferAccessUpdateAfterBind](#) is a boolean value indicating whether [robustBufferAccess](#) can be enabled on a device simultaneously with [descriptorBindingUniformBufferUpdateAfterBind](#), [descriptorBindingStorageBufferUpdateAfterBind](#), [descriptorBindingUniformTexelBufferUpdateAfterBind](#), and/or [descriptorBindingStorageTexelBufferUpdateAfterBind](#). If this is [VK_FALSE](#), then either [robustBufferAccess](#) **must** be disabled or all of these update-after-bind features **must** be disabled. Similarly, if this property is [VK_FALSE](#), robustness **must** not be enabled through the [VkPipelineRobustnessCreateInfo](#) mechanism.
- [quadDivergentImplicitLod](#) is a boolean value indicating whether implicit LOD calculations for image operations have well-defined results when the image and/or sampler objects used for the instruction are not uniform within a quad. See [Derivative Image Operations](#).
- [maxPerStageDescriptorUpdateAfterBindSamplers](#) is similar to [maxPerStageDescriptorSamplers](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set.
- [maxPerStageDescriptorUpdateAfterBindUniformBuffers](#) is similar to [maxPerStageDescriptorUniformBuffers](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set.
- [maxPerStageDescriptorUpdateAfterBindStorageBuffers](#) is similar to [maxPerStageDescriptorStorageBuffers](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set.
- [maxPerStageDescriptorUpdateAfterBindSampledImages](#) is similar to [maxPerStageDescriptorSampledImages](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set.
- [maxPerStageDescriptorUpdateAfterBindStorageImages](#) is similar to [maxPerStageDescriptorStorageImages](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set.
- [maxPerStageDescriptorUpdateAfterBindInputAttachments](#) is similar to [maxPerStageDescriptorInputAttachments](#) but counts descriptors from descriptor sets created with

or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set.

- [maxPerStageUpdateAfterBindResources](#) is similar to [maxPerStageResources](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set.
- [maxDescriptorSetUpdateAfterBindSamplers](#) is similar to [maxDescriptorSetSamplers](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set.
- [maxDescriptorSetUpdateAfterBindUniformBuffers](#) is similar to [maxDescriptorSetUniformBuffers](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set.
- [maxDescriptorSetUpdateAfterBindUniformBuffersDynamic](#) is similar to [maxDescriptorSetUniformBuffersDynamic](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set. While an application **can** allocate dynamic uniform buffer descriptors from a pool created with the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#), bindings for these descriptors **must** not be present in any descriptor set layout that includes bindings created with [VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT](#).
- [maxDescriptorSetUpdateAfterBindStorageBuffers](#) is similar to [maxDescriptorSetStorageBuffers](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set.
- [maxDescriptorSetUpdateAfterBindStorageBuffersDynamic](#) is similar to [maxDescriptorSetStorageBuffersDynamic](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set. While an application **can** allocate dynamic storage buffer descriptors from a pool created with the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#), bindings for these descriptors **must** not be present in any descriptor set layout that includes bindings created with [VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT](#).
- [maxDescriptorSetUpdateAfterBindSampledImages](#) is similar to [maxDescriptorSetSampledImages](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set.
- [maxDescriptorSetUpdateAfterBindStorageImages](#) is similar to [maxDescriptorSetStorageImages](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set.
- [maxDescriptorSetUpdateAfterBindInputAttachments](#) is similar to [maxDescriptorSetInputAttachments](#) but counts descriptors from descriptor sets created with or without the [VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT](#) bit set.
- [supportedDepthResolveModes](#) is a bitmask of [VkResolveModeFlagBits](#) indicating the set of supported depth resolve modes. [VK_RESOLVE_MODE_SAMPLE_ZERO_BIT](#) **must** be included in the set but implementations **may** support additional modes.
- [supportedStencilResolveModes](#) is a bitmask of [VkResolveModeFlagBits](#) indicating the set of supported stencil resolve modes. [VK_RESOLVE_MODE_SAMPLE_ZERO_BIT](#) **must** be included in the set but implementations **may** support additional modes. [VK_RESOLVE_MODE_AVERAGE_BIT](#) **must** not be included in the set.

- `independentResolveNone` is `VK_TRUE` if the implementation supports setting the depth and stencil resolve modes to different values when one of those modes is `VK_RESOLVE_MODE_NONE`. Otherwise the implementation only supports setting both modes to the same value.
- `independentResolve` is `VK_TRUE` if the implementation supports all combinations of the supported depth and stencil resolve modes, including setting either depth or stencil resolve mode to `VK_RESOLVE_MODE_NONE`. An implementation that supports `independentResolve` **must** also support `independentResolveNone`.
- `filterMinmaxSingleComponentFormats` is a boolean value indicating whether a minimum set of required formats support min/max filtering.
- `filterMinmaxImageComponentMapping` is a boolean value indicating whether the implementation supports non-identity component mapping of the image when doing min/max filtering.
- `maxTimelineSemaphoreValueDifference` indicates the maximum difference allowed by the implementation between the current value of a timeline semaphore and any pending signal or wait operations.
- `framebufferIntegerColorSampleCounts` is a bitmask of `VkSampleCountFlagBits` indicating the color sample counts that are supported for all framebuffer color attachments with integer formats.

If the `VkPhysicalDeviceVulkan12Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.2 functionality.

The members of `VkPhysicalDeviceVulkan12Properties` **must** have the same values as the corresponding members of `VkPhysicalDeviceDriverProperties`, `VkPhysicalDeviceFloatControlsProperties`, `VkPhysicalDeviceDescriptorIndexingProperties`, `VkPhysicalDeviceDepthStencilResolveProperties`, `VkPhysicalDeviceSamplerFilterMinmaxProperties`, and `VkPhysicalDeviceTimelineSemaphoreProperties`.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan12Properties-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_2_PROPERTIES`

```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **minSubgroupSize** is the minimum subgroup size supported by this device. **minSubgroupSize** is at least one if any of the physical device's queues support **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**. **minSubgroupSize** is a power-of-two. **minSubgroupSize** is less than or equal to **maxSubgroupSize**. **minSubgroupSize** is less than or equal to **subgroupSize**.
- **maxSubgroupSize** is the maximum subgroup size supported by this device. **maxSubgroupSize** is at least one if any of the physical device's queues support **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**. **maxSubgroupSize** is a power-of-two. **maxSubgroupSize** is greater than or equal to **minSubgroupSize**. **maxSubgroupSize** is greater than or equal to **subgroupSize**.
- **maxComputeWorkgroupSubgroups** is the maximum number of subgroups supported by the implementation within a workgroup.
- **requiredSubgroupSizeStages** is a bitfield of what shader stages support having a required subgroup size specified.
- **maxInlineUniformBlockSize** is the maximum size in bytes of an **inline uniform block** binding.
- **maxPerStageDescriptorInlineUniformBlocks** is the maximum number of inline uniform block bindings that **can** be accessible to a single shader stage in a pipeline layout. Descriptor bindings with a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** count against this limit. Only descriptor bindings in descriptor set layouts created without the **VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT** bit set count against this limit.
- **maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks** is similar to **maxPerStageDescriptorInlineUniformBlocks** but counts descriptor bindings from descriptor sets created with or without the **VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT** bit set.
- **maxDescriptorSetInlineUniformBlocks** is the maximum number of inline uniform block bindings that **can** be included in descriptor bindings in a pipeline layout across all pipeline shader stages and descriptor set numbers. Descriptor bindings with a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** count against this limit. Only descriptor bindings in descriptor set layouts created without the **VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT** bit set count against this limit.

this limit.

- `maxDescriptorSetUpdateAfterBindInlineUniformBlocks` is similar to `maxDescriptorSetInlineUniformBlocks` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxInlineUniformTotalSize` is the maximum total size in bytes of all inline uniform block bindings, across all pipeline shader stages and descriptor set numbers, that **can** be included in a pipeline layout. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit.
- `integerDotProduct8BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct8BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct8BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct4x8BitPackedUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the `OpUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct4x8BitPackedSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the `OpSDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct4x8BitPackedMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness dot product operations from operands packed into 32-bit integers using the `OpSUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct16BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct16BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct16BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated [as defined below](#).

- `integerDotProductAccumulatingSaturating8BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating8BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating16BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating16BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating32BitUnsignedAccelerated` is a boolean that will be

`VK_TRUE` if the support for 32-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).

- `integerDotProductAccumulatingSaturating32BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `storageTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a storage texel buffer of any format. The value **must** be a power of two.
- `storageTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a storage texel buffer of any format.
- `uniformTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a uniform texel buffer of any format. The value **must** be a power of two.
- `uniformTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a uniform texel buffer of any format.
- `maxBufferSize` is the maximum size `VkBuffer` that **can** be created.

If the `VkPhysicalDeviceVulkan13Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.3 functionality.

The members of `VkPhysicalDeviceVulkan13Properties` **must** have the same values as the corresponding members of `VkPhysicalDeviceInlineUniformBlockProperties` and `VkPhysicalDeviceSubgroupSizeControlProperties`.

Valid Usage (Implicit)

- `VOID-VkPhysicalDeviceVulkan13Properties-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_3_PROPERTIES`

    VkImageLayout*           pCopyDstLayouts;
    uint8_t                  optimalTilingLayoutUUID[VK_UUID_SIZE];
    VkBool32                 identicalMemoryTypeRequirements;
} VkPhysicalDeviceVulkan14Properties;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `lineSubPixelPrecisionBits` is the number of bits of subpixel precision in framebuffer coordinates x_f and y_f when rasterizing [line segments](#).

- `maxVertexAttribDivisor` is the maximum value of the number of instances that will repeat the value of vertex attribute data when instanced rendering is enabled.
- `supportsNonZeroFirstInstance` specifies whether a non-zero value for the `firstInstance` parameter of `drawing commands` is supported when `VkVertexInputBindingDivisorDescription::divisor` is not 1.
- `maxPushDescriptors` is the maximum number of descriptors that **can** be used in a descriptor set layout created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT` set.
- `dynamicRenderingLocalReadDepthStencilAttachments` is `VK_TRUE` if the implementation supports local reads of depth/stencil attachments, `VK_FALSE` otherwise.
- `dynamicRenderingLocalReadMultisampledAttachments` is `VK_TRUE` if the implementation supports local reads of multisampled attachments, `VK_FALSE` otherwise.
- `earlyFragmentMultisampleCoverageAfterSampleCounting` is a boolean value indicating whether the `fragment shading` and `multisample coverage` operations are performed after `sample counting` for `fragment shaders` with `EarlyFragmentTests` execution mode.
- `earlyFragmentSampleMaskTestBeforeSampleCounting` is a boolean value indicating whether the `sample mask test` operation is performed before `sample counting` for `fragment shaders` using the `EarlyFragmentTests` execution mode.
- `depthStencilSwizzleOneSupport` is a boolean indicating that depth/stencil texturing operations with `VK_COMPONENT_SWIZZLE_ONE` have defined behavior.
- `polygonModePointSize` is a boolean value indicating whether the point size of the final rasterization of polygons with `VK_POLYGON_MODE_POINT` is controlled by `PointSize`.
- `nonStrictSinglePixelWideLinesUseParallelogram` is a boolean value indicating whether non-strict lines with a width of 1.0 are rasterized as parallelograms or using Bresenham's algorithm.
- `nonStrictWideLinesUseParallelogram` is a boolean value indicating whether non-strict lines with a width greater than 1.0 are rasterized as parallelograms or using Bresenham's algorithm.
- `blockTexelViewCompatibleMultipleLayers` is a boolean value indicating that an implementation supports creating image views with `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` where the `layerCount` member of `subresourceRange` is greater than 1.
- `maxCombinedImageSamplerDescriptorCount` is the maximum number of combined image sampler descriptors that the implementation uses to access any of the `formats that require a sampler Y'CBCR conversion` supported by the implementation.
- `fragmentShadingRateClampCombinerInputs` is a boolean value indicating that an implementation clamps the inputs to `combiner operations`.
- `defaultRobustnessStorageBuffers` describes the behavior of out of bounds accesses made to storage buffers when no robustness features are enabled
- `defaultRobustnessUniformBuffers` describes the behavior of out of bounds accesses made to uniform buffers when no robustness features are enabled
- `defaultRobustnessVertexInputs` describes the behavior of out of bounds accesses made to vertex input attributes when no robustness features are enabled
- `defaultRobustnessImages` describes the behavior of out of bounds accesses made to images when

no robustness features are enabled

- `copySrcLayoutCount` is an integer related to the number of image layouts for host copies from images available or queried, as described below.
- `pCopySrcLayouts` is a pointer to an array of `VkImageLayout` in which supported image layouts for use with host copy operations from images are returned.
- `copyDstLayoutCount` is an integer related to the number of image layouts for host copies to images available or queried, as described below.
- `pCopyDstLayouts` is a pointer to an array of `VkImageLayout` in which supported image layouts for use with host copy operations to images are returned.
- `optimalTilingLayoutUUID` is an array of `VK_UUID_SIZE uint8_t` values representing a universally unique identifier for the implementation's swizzling layout of images created with `VK_IMAGE_TILING_OPTIMAL`.
- `identicalMemoryTypeRequirements` indicates that specifying the `VK_IMAGE_USAGE_HOST_TRANSFER_BIT` flag in `VkImageCreateInfo::usage` does not affect the memory type requirements of the image.

If the `VkPhysicalDeviceVulkan14Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.4 functionality.

Valid Usage (Implicit)

- `UUID-VkPhysicalDeviceVulkan14Properties-sType-sType`
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_4_PROPERTIES`

Structure Chaining

Extends the structure

- `VkPhysicalDeviceProperties2`

The `VkPhysicalDeviceIDProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceIDProperties {
    VkStructureType    sType;
    void*              pNext;
    uint8_t             deviceUUID[VK_UUID_SIZE];
    uint8_t             driverUUID[VK_UUID_SIZE];
    uint8_t             deviceLUID[VK_LUID_SIZE];
    uint32_t            deviceNodeMask;
    VkBool32            deviceLUIDValid;
} VkPhysicalDeviceIDProperties;
```

```
// Provided by VK_KHR_external_fence_capabilities,
VK_KHR_external_memory_capabilities, VK_KHR_external_semaphore_capabilities
// Equivalent to VkPhysicalDeviceIDProperties
typedef VkPhysicalDeviceIDProperties VkPhysicalDeviceIDPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the device.
- `driverUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the driver build in use by the device.
- `deviceLUID` is an array of `VK_LUID_SIZE` `uint8_t` values representing a locally unique identifier for the device.
- `deviceNodeMask` is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.
- `deviceLUIDValid` is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.

If the `VkPhysicalDeviceIDProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

`deviceUUID` **must** be immutable for a given device across instances, processes, driver APIs, driver versions, and system reboots.

Applications **can** compare the `driverUUID` value across instance and process boundaries, and **can** make similar queries in external APIs to determine whether they are capable of sharing memory objects and resources using them with the device.

`deviceUUID` and/or `driverUUID` **must** be used to determine whether a particular external object can be shared between driver components, where such a restriction exists as defined in the compatibility table for the particular object type:

- [External memory handle types compatibility](#)

- External semaphore handle types compatibility
- External fence handle types compatibility

If `deviceLUIDValid` is `VK_FALSE`, the values of `deviceLUID` and `deviceNodeMask` are undefined. If `deviceLUIDValid` is `VK_TRUE` and Vulkan is running on the Windows operating system, the contents of `deviceLUID` **can** be cast to an `LUID` object and **must** be equal to the locally unique identifier of a `IDXGIAdapter1` object that corresponds to `physicalDevice`. If `deviceLUIDValid` is `VK_TRUE`, `deviceNodeMask` **must** contain exactly one bit. If Vulkan is running on an operating system that supports the Direct3D 12 API and `physicalDevice` corresponds to an individual device in a linked device adapter, `deviceNodeMask` identifies the Direct3D 12 node corresponding to `physicalDevice`. Otherwise, `deviceNodeMask` **must** be 1.

NOTE	<p>Although they have identical descriptions, <code>VkPhysicalDeviceIDProperties::deviceUUID</code> may differ from <code>VkPhysicalDeviceProperties2::properties.pipelineCacheUUID</code>. The former is intended to identify and correlate devices across API and driver boundaries, while the latter is used to identify a compatible device and driver combination to use when serializing and de-serializing pipeline state.</p> <p>Implementations should return <code>deviceUUID</code> values which are likely to be unique even in the presence of multiple Vulkan implementations (such as a GPU driver and a software renderer; two drivers for different GPUs; or the same Vulkan driver running on two logically different devices).</p> <p>Khronos' conformance testing is unable to guarantee that <code>deviceUUID</code> values are actually unique, so implementors should make their own best efforts to ensure this. In particular, hard-coded <code>deviceUUID</code> values, especially all-0 bits, should never be used.</p> <p>A combination of values unique to the vendor, the driver, and the hardware environment can be used to provide a <code>deviceUUID</code> which is unique to a high degree of certainty. Some possible inputs to such a computation are:</p> <ul style="list-style-type: none"> • Information reported by <code>vkGetPhysicalDeviceProperties</code> • PCI device ID (if defined) • PCI bus ID, or similar system configuration information. • Driver binary checksums.
NOTE	<p>While <code>VkPhysicalDeviceIDProperties::deviceUUID</code> is specified to remain consistent across driver versions and system reboots, it is not intended to be usable as a serializable persistent identifier for a device. It may change when a device is physically added to, removed from, or moved to a different connector in a system while that system is powered down. Further, there is no reasonable way to verify with conformance testing that a given device retains the same UUID in a given system across all driver versions supported in that system. While implementations should make every effort to report consistent device UUIDs across driver versions, applications should avoid relying on the persistence of this value for uses other</p>

than identifying compatible devices for external object sharing purposes.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceIDProperties-sType-sType
sType must be [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ID_PROPERTIES](#)

Structure Chaining

Extends the structure

- [VkPhysicalDeviceProperties2](#)

[VK_UUID_SIZE](#) is the length in `uint8_t` values of an array containing a universally unique device or driver build identifier, as returned in [VkPhysicalDeviceIDProperties::deviceUUID](#) and [VkPhysicalDeviceIDProperties::driverUUID](#).

```
#define VK_UUID_SIZE 16U
```

[VK_LUID_SIZE](#) is the length in `uint8_t` values of an array containing a locally unique device identifier, as returned in [VkPhysicalDeviceIDProperties::deviceLUID](#).

```
#define VK_LUID_SIZE 8U
```

```
#define VK_LUID_SIZE_KHR VK_LUID_SIZE
```

The [VkPhysicalDeviceDriverProperties](#) structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDriverProperties {
    VkStructureType    sType;
    void*              pNext;
    VkDriverId          driverID;
    char                driverName[VK_MAX_DRIVER_NAME_SIZE];
    char                driverInfo[VK_MAX_DRIVER_INFO_SIZE];
    VkConformanceVersion conformanceVersion;
} VkPhysicalDeviceDriverProperties;
```

```
// Provided by VK_KHR_driver_properties
// Equivalent to VkPhysicalDeviceDriverProperties
typedef VkPhysicalDeviceDriverProperties VkPhysicalDeviceDriverPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `driverID` is a unique identifier for the driver of the physical device.
- `driverName` is an array of `VK_MAX_DRIVER_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the driver.
- `driverInfo` is an array of `VK_MAX_DRIVER_INFO_SIZE` `char` containing a null-terminated UTF-8 string with additional information about the driver.
- `conformanceVersion` is the latest version of the Vulkan conformance test that the implementor has successfully tested this driver against prior to release (see `VkConformanceVersion`).

If the `VkPhysicalDeviceDriverProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the driver corresponding to a physical device.

`driverID` **must** be immutable for a given driver across instances, processes, driver versions, and system reboots.

// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_GGP_PROPRIETARY_KHR = VK_DRIVER_ID_GGP_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_BROADCOM_PROPRIETARY_KHR = VK_DRIVER_ID_BROADCOM_PROPRIETARY,
} VkDriverId;

```

```

// Provided by VK_KHR_driver_properties
// Equivalent to VkDriverId
typedef VkDriverId VkDriverIdKHR;

```

NOTE | Khronos driver IDs may be allocated by vendors at any time. There may be multiple

driver IDs for the same vendor, representing different drivers (for e.g. different platforms, proprietary or open source, etc.). Only the latest canonical versions of this Specification, of the corresponding `vk.xml` API Registry, and of the corresponding `vulkan_core.h` header file **must** contain all reserved Khronos driver IDs.

Only driver IDs registered with Khronos are given symbolic names. There **may** be unregistered driver IDs returned.

`VK_MAX_DRIVER_NAME_SIZE` is the length in `char` values of an array containing a driver name string, as returned in `VkPhysicalDeviceDriverProperties::driverName`.

```
#define VK_MAX_DRIVER_NAME_SIZE          256U
```

```
#define VK_MAX_DRIVER_NAME_SIZE_KHR     VK_MAX_DRIVER_NAME_SIZE
```

`VK_MAX_DRIVER_INFO_SIZE` is the length in `char` values of an array containing a driver information string, as returned in `VkPhysicalDeviceDriverProperties::driverInfo`.

```
#define VK_MAX_DRIVER_INFO_SIZE         256U
```

```
#define VK_MAX_DRIVER_INFO_SIZE_KHR    VK_MAX_DRIVER_INFO_SIZE
```

The conformance test suite version an implementation is compliant with is described with the `VkConformanceVersion` structure:

```
// Provided by VK_VERSION_1_2
typedef struct VkConformanceVersion {
    uint8_t    major;
    uint8_t    minor;
    uint8_t    subminor;
    uint8_t    patch;
} VkConformanceVersion;
```

```
// Provided by VK_KHR_driver_properties
// Equivalent to VkConformanceVersion
typedef VkConformanceVersion VkConformanceVersionKHR;
```

- `major` is the major version number of the conformance test suite.
- `minor` is the minor version number of the conformance test suite.
- `subminor` is the subminor version number of the conformance test suite.

- `patch` is the patch version number of the conformance test suite.

The `VkPhysicalDevicePCIBusInfoPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_pci_bus_info
typedef struct VkPhysicalDevicePCIBusInfoPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           pciDomain;
    uint32_t           pciBus;
    uint32_t           pciDevice;
    uint32_t           pciFunction;
} VkPhysicalDevicePCIBusInfoPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pciDomain` is the PCI bus domain.
- `pciBus` is the PCI bus identifier.
- `pciDevice` is the PCI device identifier.
- `pciFunction` is the PCI device function identifier.

If the `VkPhysicalDevicePCIBusInfoPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the PCI bus information of a physical device.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePCIBusInfoPropertiesEXT-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PCI_BUS_INFO_PROPERTIES_EXT`

Structure Chaining

Extends the structure

- `VkPhysicalDeviceProperties2`

The `VkPhysicalDeviceDrmPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_physical_device_drm
typedef struct VkPhysicalDeviceDrmPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           hasPrimary;
    VkBool32           hasRender;
    int64_t            primaryMajor;
    int64_t            primaryMinor;
    int64_t            renderMajor;
    int64_t            renderMinor;
} VkPhysicalDeviceDrmPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hasPrimary` is a boolean indicating whether the physical device has a DRM primary node.
- `hasRender` is a boolean indicating whether the physical device has a DRM render node.
- `primaryMajor` is the DRM primary node major number, if any.
- `primaryMinor` is the DRM primary node minor number, if any.
- `renderMajor` is the DRM render node major number, if any.
- `renderMinor` is the DRM render node minor number, if any.

If the `VkPhysicalDeviceDrmPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the DRM information of a physical device.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDrmPropertiesEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRM_PROPERTIES_EXT`

Structure Chaining

- **integerDotProduct32BitMixedSignednessAccelerated** is a boolean that will be [VK_TRUE](#) if the

support for 32-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated [as defined below](#).

- `integerDotProduct64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProduct64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating8BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating8BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating16BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating16BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated [as defined below](#).
- `integerDotProductAccumulatingSaturating32BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit unsigned accumulating saturating dot product operations

using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating32BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.
- `integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.
- `integerDotProductAccumulatingSaturating64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.
- `integerDotProductAccumulatingSaturating64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.
- `integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

If the `VkPhysicalDeviceShaderIntegerDotProductProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the integer dot product acceleration information of a physical device.

NOTE

A dot product operation is deemed accelerated if its implementation provides a performance advantage over application-provided code composed from elementary instructions and/or other dot product instructions, either because the implementation uses optimized machine code sequences whose generation from application-provided code cannot be guaranteed or because it uses hardware features that cannot otherwise be targeted from application-provided code.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceShaderIntegerDotProductProperties-sType-sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_DOT_PRODUCT_PROPERTIES`

Structure Chaining

Extends the structure

- `VkPhysicalDeviceProperties2`

The `VkPhysicalDeviceImageProcessingPropertiesQCOM` structure is defined as:

```
// Provided by VK_QCOM_image_processing
typedef struct VkPhysicalDeviceImageProcessingPropertiesQCOM {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           maxWeightFilterPhases;
    VkExtent2D         maxWeightFilterDimension;
    VkExtent2D         maxBlockMatchRegion;
    VkExtent2D         maxBoxFilterBlockSize;
} VkPhysicalDeviceImageProcessingPropertiesQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxWeightFilterPhases` is the maximum value that **can** be specified for `VkImageViewSampleWeightCreateInfoQCOM::numPhases` in `weight image sampling` operations.
- `maxWeightFilterDimension` is a `VkExtent2D` describing the largest dimensions (`width` and `height`) that **can** be specified for `VkImageViewSampleWeightCreateInfoQCOM::filterSize`.
- `maxBlockMatchRegion` is a `VkExtent2D` describing the largest dimensions (`width` and `height`) that **can** be specified for `blockSize` in `block matching` operations.
- `maxBoxFilterBlockSize` is a `VkExtent2D` describing the maximum dimensions (`width` and `height`) that **can** be specified for `blocksize` in `box filter sampling` operations.

If the `VkPhysicalDeviceImageProcessingPropertiesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the image processing information of a physical device.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageProcessingPropertiesQCOM-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_PROPERTIES_QCOM`

Structure Chaining

Extends the structure

- `VkPhysicalDeviceProperties2`

The `VkPhysicalDeviceShaderTileImagePropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_shader_tile_image
typedef struct VkPhysicalDeviceShaderTileImagePropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           shaderTileImageCoherentReadAccelerated;
    VkBool32           shaderTileImageReadSampleFromPixelRateInvocation;
    VkBool32           shaderTileImageReadFromHelperInvocation;
} VkPhysicalDeviceShaderTileImagePropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderTileImageCoherentReadAccelerated` is a boolean that will be `VK_TRUE` if coherent reads of tile image data is accelerated.
- `shaderTileImageReadSampleFromPixelRateInvocation` is a boolean that will be `VK_TRUE` if reading from samples from a pixel rate fragment invocation is supported when `VkPipelineMultisampleStateCreateInfo::rasterizationSamples > 1`.
- `shaderTileImageReadFromHelperInvocation` is a boolean that will be `VK_TRUE` if reads of tile image data from helper fragment invocations result in valid values.

If the `VkPhysicalDeviceShaderTileImagePropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the tile image information of a physical device.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderTileImagePropertiesEXT-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TILE_IMAGE_PROPERTIES_EXT`

Structure Chaining

- `VkPhysicalDeviceProperties2`

The `VkPhysicalDeviceImageProcessing2PropertiesQCOM` structure is defined as:

```
// Provided by VK_QCOM_image_processing2
typedef struct VkPhysicalDeviceImageProcessing2PropertiesQCOM {
    VkStructureType    sType;
    void*              pNext;
    VkExtent2D         maxBlockMatchWindow;
} VkPhysicalDeviceImageProcessing2PropertiesQCOM;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **maxBlockMatchWindow** is a **VkExtent2D** describing the largest dimensions (**width** and **height**) that **can** be specified for the block match window.

If the **VkPhysicalDeviceImageProcessing2PropertiesQCOM** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

These are properties of the image processing2 information of a physical device.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageProcessing2PropertiesQCOM-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_2_PROPERTIES_QCOM**

Structure Chaining

Extends the structure

- **VkPhysicalDeviceProperties2**

The **VkPhysicalDeviceLayeredDriverPropertiesMSFT** structure is defined as:

```
// Provided by VK_MSFT_layered_driver
typedef struct VkPhysicalDeviceLayeredDriverPropertiesMSFT {
    VkStructureType    sType;
    void*              pNext;
    VkLayeredDriverUnderlyingApiMSFT    underlyingAPI;
} VkPhysicalDeviceLayeredDriverPropertiesMSFT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **underlyingAPI** is a **VkLayeredDriverUnderlyingApiMSFT** value indicating which underlying API is used to implement the layered driver, or **VK_LAYERED_DRIVER_UNDERLYING_API_NONE_MSFT** if the driver is not layered.

These are properties of the driver layering information of a physical device.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceLayeredDriverPropertiesMSFT-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LAYERED_DRIVER_PROPERTIES_MSFT

Structure Chaining

Extends the structure

- [VkPhysicalDeviceProperties2](#)

Underlying APIs which **may** be returned in [VkPhysicalDeviceLayeredDriverPropertiesMSFT::underlyingAPI](#) are:

```
// Provided by VK_MSFT_layered_driver
typedef enum VkLayeredDriverUnderlyingApiMSFT {
    VK_LAYERED_DRIVER_UNDERLYING_API_NONE_MSFT = 0,
    VK_LAYERED_DRIVER_UNDERLYING_API_D3D12_MSFT = 1,
} VkLayeredDriverUnderlyingApiMSFT;
```

The [VkPhysicalDeviceSchedulingControlsPropertiesARM](#) structure is defined as:

```
// Provided by VK_ARM_scheduling_controls
typedef struct VkPhysicalDeviceSchedulingControlsPropertiesARM {
    VkStructureType          sType;
    void*                    pNext;
    VkPhysicalDeviceSchedulingControlsFlagsARM schedulingControlsFlags;
} VkPhysicalDeviceSchedulingControlsPropertiesARM;
```

- [schedulingControlsFlags](#) specifies the specific scheduling controls that a physical device supports.

If the [VkPhysicalDeviceSchedulingControlsPropertiesARM](#) structure is included in the [pNext](#) chain of the [VkPhysicalDeviceProperties2](#) structure passed to [vkGetPhysicalDeviceProperties2](#), it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSchedulingControlsPropertiesARM-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_PROPERTIES_ARM

Structure Chaining

Extends the structure

- [VkPhysicalDeviceProperties2](#)

Bits which **can** be set in [VkPhysicalDeviceSchedulingControlsPropertiesARM::schedulingControlsFlags](#), specifying supported scheduling controls, are:

```
// Provided by VK_ARM_scheduling_controls
// Flag bits for VkPhysicalDeviceSchedulingControlsFlagBitsARM
typedef VkFlags64 VkPhysicalDeviceSchedulingControlsFlagBitsARM;
static const VkPhysicalDeviceSchedulingControlsFlagBitsARM
VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_SHADER_CORE_COUNT_ARM = 0x00000001ULL;
static const VkPhysicalDeviceSchedulingControlsFlagBitsARM
VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_DISPATCH_PARAMETERS_ARM = 0x00000002ULL;
```

- [VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_SHADER_CORE_COUNT_ARM](#) specifies that a [VkDeviceQueueShaderCoreControlCreateInfoARM](#) structure **may** be included in the **pNext** chain of a [VkDeviceQueueCreateInfo](#) or [VkDeviceCreateInfo](#) structure.
- [VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_DISPATCH_PARAMETERS_ARM](#) specifies that a [vkCmdSetDispatchParametersARM](#) command **may** be recorded in a command buffer and that properties returned in [VkPhysicalDeviceSchedulingControlsDispatchParametersPropertiesARM](#) are valid.

```
// Provided by VK_ARM_scheduling_controls
typedef VkFlags64 VkPhysicalDeviceSchedulingControlsFlagsARM;
```

[VkPhysicalDeviceSchedulingControlsFlagsARM](#) is a bitmask type for setting a mask of zero or more [VkPhysicalDeviceSchedulingControlsFlagBitsARM](#).

The [VkPhysicalDeviceSchedulingControlsDispatchParametersPropertiesARM](#) structure is defined as:

```
// Provided by VK_ARM_scheduling_controls
typedef struct VkPhysicalDeviceSchedulingControlsDispatchParametersPropertiesARM {
    VkStructureType    sType;
    void*              pNext;
    uint32_t            schedulingControlsMaxWarpsCount;
    uint32_t            schedulingControlsMaxQueuedBatchesCount;
    uint32_t            schedulingControlsMaxWorkGroupBatchSize;
} VkPhysicalDeviceSchedulingControlsDispatchParametersPropertiesARM;
```

- [schedulingControlsMaxWarpsCount](#) specifies the maximum number of warps that a shader core **can** run concurrently.
- [schedulingControlsMaxQueuedWorkgroupBatchesCount](#) specifies the maximum number of

workgroup batches that a shader core **can** queue.

- `schedulingControlsMaxWorkGroupBatchSize` specifies the maximum size of workgroup batches that **can** be requested using `VkDispatchParametersARM::workGroupBatchSize`.

If the `VkPhysicalDeviceSchedulingControlsDispatchParametersPropertiesARM` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If `VkPhysicalDeviceSchedulingControlsPropertiesARM::schedulingControlsFlags` does not contain `VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_DISPATCH_PARAMETERS_ARM` then `schedulingControlsMaxWarpCount` and `schedulingControlsMaxQueuedBatchesCount` are undefined.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSchedulingControlsDispatchParametersPropertiesARM-sType-sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_DISPATCH_PARAMETERS_PROPERTIES_ARM`

Structure Chaining

Extends the structure

- `VkPhysicalDeviceProperties2`

To query properties of queues available on a physical device, call:

WARNING

This functionality is superseded by `vkGetPhysicalDeviceQueueFamilyProperties2`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceQueueFamilyProperties(
    VkPhysicalDevice    physicalDevice,
    uint32_t*           pQueueFamilyPropertyCount,
    VkQueueFamilyProperties* pQueueFamilyProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pQueueFamilyPropertyCount` is a pointer to an integer related to the number of queue families available or queried, as described below.
- `pQueueFamilyProperties` is either `NULL` or a pointer to an array of `VkQueueFamilyProperties` structures.

If `pQueueFamilyProperties` is `NULL`, then the number of queue families available is returned in `pQueueFamilyPropertyCount`. Implementations **must** support at least one queue family. Otherwise, `pQueueFamilyPropertyCount` **must** point to a variable set by the application to the number of elements in the `pQueueFamilyProperties` array, and on return the variable is overwritten with the number of structures actually written to `pQueueFamilyProperties`. If `pQueueFamilyPropertyCount` is less than the number of queue families available, at most `pQueueFamilyPropertyCount` structures will be written.

Valid Usage (Implicit)

- `VOID-vkGetPhysicalDeviceQueueFamilyProperties-physicalDevice-parameter` `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- `VOID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyPropertyCount-parameter` `pQueueFamilyPropertyCount` **must** be a valid pointer to a `uint32_t` value
- `VOID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyProperties-parameter`
If the value referenced by `pQueueFamilyPropertyCount` is not 0, and `pQueueFamilyProperties` is not `NULL`, `pQueueFamilyProperties` **must** be a valid pointer to an array of `pQueueFamilyPropertyCount` `VkQueueFamilyProperties` structures

The `VkQueueFamilyProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkQueueFamilyProperties {
    VkQueueFlags    queueFlags;
    uint32_t        queueCount;
    uint32_t        timestampValidBits;
    VkExtent3D      minImageTransferGranularity;
} VkQueueFamilyProperties;
```

- `queueFlags` is a bitmask of `VkQueueFlagBits` indicating capabilities of the queues in this queue family.
- `queueCount` is the unsigned integer count of queues in this queue family. Each queue family **must** support at least one queue.
- `timestampValidBits` is the unsigned integer count of meaningful bits in the timestamps written via `vkCmdWriteTimestamp2` or `vkCmdWriteTimestamp`. The valid range for the count is 36 to 64 bits, or a value of 0, indicating no support for timestamps. Bits outside the valid range are guaranteed to be zeros.
- `minImageTransferGranularity` is the minimum granularity supported for image transfer operations on the queues in this queue family.

The value returned in `minImageTransferGranularity` has a unit of compressed texel blocks for images having a block-compressed format, and a unit of texels otherwise.

Possible values of `minImageTransferGranularity` are:

- (0,0,0) specifies that only whole mip levels **must** be transferred using the image transfer operations on the corresponding queues. In this case, the following restrictions apply to all offset and extent parameters of image transfer operations:
 - The **x**, **y**, and **z** members of a `VkOffset3D` parameter **must** always be zero.
 - The **width**, **height**, and **depth** members of a `VkExtent3D` parameter **must** always match the width, height, and depth of the image subresource corresponding to the parameter, respectively.
- (A_x , A_y , A_z) where A_x , A_y , and A_z are all integer powers of two. In this case the following restrictions apply to all image transfer operations:
 - **x**, **y**, and **z** of a `VkOffset3D` parameter **must** be integer multiples of A_x , A_y , and A_z , respectively.
 - **width** of a `VkExtent3D` parameter **must** be an integer multiple of A_x , or else **x** + **width** **must** equal the width of the image subresource corresponding to the parameter.
 - **height** of a `VkExtent3D` parameter **must** be an integer multiple of A_y , or else **y** + **height** **must** equal the height of the image subresource corresponding to the parameter.
 - **depth** of a `VkExtent3D` parameter **must** be an integer multiple of A_z , or else **z** + **depth** **must** equal the depth of the image subresource corresponding to the parameter.
 - If the format of the image corresponding to the parameters is one of the block-compressed formats then for the purposes of the above calculations the granularity **must** be scaled up by the compressed texel block dimensions.

Queues supporting graphics and/or compute and/or, if the `maintenance11` feature is supported, transfer operations, **must** report (1,1,1) in `minImageTransferGranularity`, meaning that there are no additional restrictions on the granularity of image transfer operations for these queues. Other queues supporting image transfer operations are only **required** to support whole mip level transfers, thus `minImageTransferGranularity` for queues belonging to such queue families **may** be (0,0,0).

If the `maintenance11` feature is supported, `VkQueueFamilyOptimalImageTransferGranularityPropertiesKHR::optimalImageTransferGranularity` **can** be used to determine the optimal image transfer granularity for a particular queue family.

The `Device Memory` section describes memory properties queried from the physical device.

For physical device feature queries see the `Features` chapter.

Bits which **may** be set in `VkQueueFamilyProperties::queueFlags`, indicating capabilities of queues in a queue family are:

```
// Provided by VK_VERSION_1_0
typedef enum VkQueueFlagBits {
    VK_QUEUE_GRAPHICS_BIT = 0x00000001,
    VK_QUEUE_COMPUTE_BIT = 0x00000002,
    VK_QUEUE_TRANSFER_BIT = 0x00000004,
    VK_QUEUE_SPARSE_BINDING_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_QUEUE_PROTECTED_BIT = 0x00000010,
    // Provided by VK_KHR_video_decode_queue
    VK_QUEUE_VIDEO_DECODE_BIT_KHR = 0x00000020,
    // Provided by VK_KHR_video_encode_queue
    VK_QUEUE_VIDEO_ENCODE_BIT_KHR = 0x00000040,
    // Provided by VK_NV_optical_flow
    VK_QUEUE_OPTICAL_FLOW_BIT_NV = 0x00000100,
    // Provided by VK_ARM_data_graph
    VK_QUEUE_DATA_GRAPH_BIT_ARM = 0x00000400,
} VkQueueFlagBits;
```

- [VK_QUEUE_GRAPHICS_BIT](#) specifies that queues in this queue family support graphics operations.
- [VK_QUEUE_COMPUTE_BIT](#) specifies that queues in this queue family support compute operations.
- [VK_QUEUE_TRANSFER_BIT](#) specifies that queues in this queue family support transfer operations.
- [VK_QUEUE_SPARSE_BINDING_BIT](#) specifies that queues in this queue family support sparse memory management operations (see [Sparse Resources](#)). If any of the sparse resource features are supported, then at least one queue family **must** support this bit.
- [VK_QUEUE_VIDEO_DECODE_BIT_KHR](#) specifies that queues in this queue family support [video decode operations](#).
- [VK_QUEUE_VIDEO_ENCODE_BIT_KHR](#) specifies that queues in this queue family support [video encode operations](#).
- [VK_QUEUE_OPTICAL_FLOW_BIT_NV](#) specifies that queues in this queue family support optical flow operations.
- [VK_QUEUE_DATA_GRAPH_BIT_ARM](#) specifies that queues in this queue family support [data graph operations](#).
- [VK_QUEUE_PROTECTED_BIT](#) specifies that queues in this queue family support the [VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT](#) bit. (see [Protected Memory](#)). If the physical device supports the [protectedMemory](#) feature, at least one of its queue families **must** support this bit.

At least one queue family of at least one physical device exposed by the implementation **must** support at least one of the following sets of operations:

- graphics operations
- compute operations

- video encode operations
- video decode operations

If an implementation exposes any queue family that supports graphics operations, at least one queue family of at least one physical device exposed by the implementation **must** support both graphics and compute operations.

Furthermore, if the `protectedMemory` physical device feature is supported, then at least one queue family of at least one physical device exposed by the implementation **must** support graphics operations, compute operations, and protected memory operations.

NOTE

All commands that are allowed on a queue that supports transfer operations are also allowed on a queue that supports either graphics or compute operations. Thus, if the capabilities of a queue family include `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, then reporting the `VK_QUEUE_TRANSFER_BIT` capability separately for that queue family is **optional**.

For further details see [Queues](#).

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueueFlags;
```

`VkQueueFlags` is a bitmask type for setting a mask of zero or more `VkQueueFlagBits`.

To query properties of queues available on a physical device, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceQueueFamilyProperties2(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);
```

```
// Provided by VK_KHR_get_physical_device_properties2
// Equivalent to vkGetPhysicalDeviceQueueFamilyProperties2
void vkGetPhysicalDeviceQueueFamilyProperties2KHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pQueueFamilyPropertyCount` is a pointer to an integer related to the number of queue families available or queried, as described in [vkGetPhysicalDeviceQueueFamilyProperties](#).
- `pQueueFamilyProperties` is either `NULL` or a pointer to an array of `VkQueueFamilyProperties2` structures.

`vkGetPhysicalDeviceQueueFamilyProperties2` behaves similarly to `vkGetPhysicalDeviceQueueFamilyProperties`, with the ability to return extended information in a `pNext` chain of output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyPropertyCount-parameter `pQueueFamilyPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyProperties-parameter
If the value referenced by `pQueueFamilyPropertyCount` is not 0, and `pQueueFamilyProperties` is not `NULL`, `pQueueFamilyProperties` **must** be a valid pointer to an array of `pQueueFamilyPropertyCount` `VkQueueFamilyProperties2` structures

The `VkQueueFamilyProperties2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkQueueFamilyProperties2 {
    VkStructureType    sType;
    void*              pNext;
    VkQueueFamilyProperties queueFamilyProperties;
} VkQueueFamilyProperties2;
```

```
// Provided by VK_KHR_get_physical_device_properties2
// Equivalent to VkQueueFamilyProperties2
typedef VkQueueFamilyProperties2 VkQueueFamilyProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queueFamilyProperties` is a `VkQueueFamilyProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceQueueFamilyProperties`.

Valid Usage (Implicit)

- VUID-VkQueueFamilyProperties2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_PROPERTIES_2`
- VUID-VkQueueFamilyProperties2-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkQueueFamilyCheckpointProperties2NV`, `VkQueueFamilyCheckpointPropertiesNV`, `VkQueueFamilyGlobalPriorityProperties`, `VkQueueFamilyOptimalImageTransferGranularityPropertiesKHR`,

VkQueueFamilyOwnershipTransferPropertiesKHR,
VkQueueFamilyQueryResultStatusPropertiesKHR, or VkQueueFamilyVideoPropertiesKHR

- VUID-VkQueueFamilyProperties2-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique

The **VkQueueFamilyGlobalPriorityProperties** structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkQueueFamilyGlobalPriorityProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           priorityCount;
    VkQueueGlobalPriority priorities[VK_MAX_GLOBAL_PRIORITY_SIZE];
} VkQueueFamilyGlobalPriorityProperties;
```

```
// Provided by VK_KHR_global_priority
// Equivalent to VkQueueFamilyGlobalPriorityProperties
typedef VkQueueFamilyGlobalPriorityProperties
VkQueueFamilyGlobalPriorityPropertiesKHR;
```

```
// Provided by VK_EXT_global_priority_query
// Equivalent to VkQueueFamilyGlobalPriorityProperties
typedef VkQueueFamilyGlobalPriorityProperties
VkQueueFamilyGlobalPriorityPropertiesEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **priorityCount** is the number of supported global queue priorities in this queue family, and it **must** be greater than 0.
- **priorities** is an array of **VK_MAX_GLOBAL_PRIORITY_SIZE** **VkQueueGlobalPriority** enums representing all supported global queue priorities in this queue family. The first **priorityCount** elements of the array will be valid.

If the **VkQueueFamilyGlobalPriorityProperties** structure is included in the **pNext** chain of the **VkQueueFamilyProperties2** structure passed to **vkGetPhysicalDeviceQueueFamilyProperties2**, it is filled in with the list of supported global queue priorities for the indicated family.

The valid elements of **priorities** **must** not contain any duplicate values.

The valid elements of **priorities** **must** be a continuous sequence of **VkQueueGlobalPriority** enums in ascending order.

NOTE

For example, returning **priorityCount** as 3 with supported **priorities** as **VK_QUEUE_GLOBAL_PRIORITY_LOW**, **VK_QUEUE_GLOBAL_PRIORITY_MEDIUM** and

`VK_QUEUE_GLOBAL_PRIORITY_REALTIME` is not allowed.

Valid Usage (Implicit)

- `VUID-VkQueueFamilyGlobalPriorityProperties-sType-sType`
`sType` must be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES`

Structure Chaining

Extends the structure

- `VkQueueFamilyProperties2`

`VK_MAX_GLOBAL_PRIORITY_SIZE` is the length of an array of `VkQueueGlobalPriority` enumerants representing supported queue priorities, as returned in `VkQueueFamilyGlobalPriorityProperties::priorities`.

```
#define VK_MAX_GLOBAL_PRIORITY_SIZE 16U
```

```
#define VK_MAX_GLOBAL_PRIORITY_SIZE_KHR VK_MAX_GLOBAL_PRIORITY_SIZE
```

```
#define VK_MAX_GLOBAL_PRIORITY_SIZE_EXT VK_MAX_GLOBAL_PRIORITY_SIZE
```

The `VkQueueFamilyCheckpointProperties2NV` structure is defined as:

```
// Provided by VK_NV_device_diagnostic_checkpoints with VK_VERSION_1_3 or  
VK_KHR_synchronization2  
typedef struct VkQueueFamilyCheckpointProperties2NV {  
    VkStructureType    sType;  
    void*              pNext;  
    VkPipelineStageFlags2 checkpointExecutionStageMask;  
} VkQueueFamilyCheckpointProperties2NV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `checkpointExecutionStageMask` is a mask indicating which pipeline stages the implementation can execute checkpoint markers in.

Additional queue family information can be queried by setting `VkQueueFamilyProperties2::pNext` to point to a `VkQueueFamilyCheckpointProperties2NV` structure.

Valid Usage (Implicit)

- VUID-VkQueueFamilyCheckpointProperties2NV-sType-sType
sType must be [VK_STRUCTURE_TYPE_QUEUE_FAMILY_CHECKPOINT_PROPERTIES_2_NV](#)

Structure Chaining

Extends the structure

- [VkQueueFamilyProperties2](#)

The [VkQueueFamilyCheckpointPropertiesNV](#) structure is defined as:

```
// Provided by VK_NV_device_diagnostic_checkpoints
typedef struct VkQueueFamilyCheckpointPropertiesNV {
    VkStructureType    sType;
    void*              pNext;
    VkPipelineStageFlags checkpointExecutionStageMask;
} VkQueueFamilyCheckpointPropertiesNV;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is [NULL](#) or a pointer to a structure extending this structure.
- **checkpointExecutionStageMask** is a mask indicating which pipeline stages the implementation can execute checkpoint markers in.

Additional queue family information can be queried by setting [VkQueueFamilyProperties2::pNext](#) to point to a [VkQueueFamilyCheckpointPropertiesNV](#) structure.

Valid Usage (Implicit)

- VUID-VkQueueFamilyCheckpointPropertiesNV-sType-sType
sType must be [VK_STRUCTURE_TYPE_QUEUE_FAMILY_CHECKPOINT_PROPERTIES_NV](#)

Structure Chaining

Extends the structure

- [VkQueueFamilyProperties2](#)

The [VkQueueFamilyVideoPropertiesKHR](#) structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkQueueFamilyVideoPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkVideoCodecOperationFlagsKHR videoCodecOperations;
} VkQueueFamilyVideoPropertiesKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **videoCodecOperations** is a bitmask of [VkVideoCodecOperationFlagBitsKHR](#) that indicates the set of video codec operations supported by the queue family.

If this structure is included in the **pNext** chain of the [VkQueueFamilyProperties2](#) structure passed to [vkGetPhysicalDeviceQueueFamilyProperties2](#), then it is filled with the set of video codec operations supported by the specified queue family.

Valid Usage (Implicit)

- VUID-VkQueueFamilyVideoPropertiesKHR-sType-sType
sType must be [VK_STRUCTURE_TYPE_QUEUE_FAMILY_VIDEO_PROPERTIES_KHR](#)

Structure Chaining

Extends the structure

- [VkQueueFamilyProperties2](#)

The [VkQueueFamilyQueryResultStatusPropertiesKHR](#) structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkQueueFamilyQueryResultStatusPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           queryResultStatusSupport;
} VkQueueFamilyQueryResultStatusPropertiesKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **queryResultStatusSupport** reports [VK_TRUE](#) if query type [VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR](#) and [VK_QUERY_RESULT_WITH_STATUS_BIT_KHR](#) are supported.

If this structure is included in the **pNext** chain of the [VkQueueFamilyProperties2](#) structure passed to [vkGetPhysicalDeviceQueueFamilyProperties2](#), then it is filled with information about whether

result status queries are supported by the specified queue family.

Valid Usage (Implicit)

- `VUID-VkQueueFamilyQueryResultStatusPropertiesKHR-sType-sType` must be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_QUERY_RESULT_STATUS_PROPERTIES_KHR`

Structure Chaining

Extends the structure

- `VkQueueFamilyProperties2`

To enumerate the performance query counters available on a queue family of a physical device, call:

```
// Provided by VK_KHR_performance_query
VkResult vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t                  queueFamilyIndex,
    uint32_t*                  pCounterCount,
    VkPerformanceCounterKHR*   pCounters,
    VkPerformanceCounterDescriptionKHR* pCounterDescriptions);
```

- `physicalDevice` is the handle to the physical device whose queue family performance query counter properties will be queried.
- `queueFamilyIndex` is the index into the queue family of the physical device we want to get properties for.
- `pCounterCount` is a pointer to an integer related to the number of counters available or queried, as described below.
- `pCounters` is either `NULL` or a pointer to an array of `VkPerformanceCounterKHR` structures.
- `pCounterDescriptions` is either `NULL` or a pointer to an array of `VkPerformanceCounterDescriptionKHR` structures.

If `pCounters` is `NULL` and `pCounterDescriptions` is `NULL`, then the number of counters available is returned in `pCounterCount`. Otherwise, `pCounterCount` must point to a variable set by the application to the number of elements in the `pCounters`, `pCounterDescriptions`, or both arrays and on return the variable is overwritten with the number of structures actually written out. If `pCounterCount` is less than the number of counters available, at most `pCounterCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available counters were returned.

Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterCount-parameter
`pCounterCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounters-parameter
If the value referenced by `pCounterCount` is not `0`, and `pCounters` is not `NULL`, `pCounters` **must** be a valid pointer to an array of `pCounterCount` `VkPerformanceCounterKHR` structures
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterDescriptions-parameter
If the value referenced by `pCounterCount` is not `0`, and `pCounterDescriptions` is not `NULL`, `pCounterDescriptions` **must** be a valid pointer to an array of `pCounterCount` `VkPerformanceCounterDescriptionKHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkPerformanceCounterKHR` structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterKHR {
    VkStructureType    sType;
    void*              pNext;
    VkPerformanceCounterUnitKHR    unit;
    VkPerformanceCounterScopeKHR    scope;
    VkPerformanceCounterStorageKHR    storage;
    uint8_t             uuid[VK_UUID_SIZE];
} VkPerformanceCounterKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **unit** is a [VkPerformanceCounterUnitKHR](#) specifying the unit that the counter data will record.
- **scope** is a [VkPerformanceCounterScopeKHR](#) specifying the scope that the counter belongs to.
- **storage** is a [VkPerformanceCounterStorageKHR](#) specifying the storage type that the counter's data uses.
- **uuid** is an array of size [VK_UUID_SIZE](#), containing 8-bit values that represent a universally unique identifier for the counter of the physical device.

Valid Usage (Implicit)

- VUID-VkPerformanceCounterKHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR](#)
- VUID-VkPerformanceCounterKHR-pNext-pNext
pNext **must** be **NULL**

Performance counters have an associated unit. This unit describes how to interpret the performance counter result.

The performance counter unit types which **may** be returned in [VkPerformanceCounterKHR::unit](#) are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterUnitKHR {
    VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR = 0,
    VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR = 1,
    VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR = 2,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR = 3,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR = 4,
    VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR = 5,
    VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR = 6,
    VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR = 7,
    VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR = 8,
    VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR = 9,
    VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR = 10,
} VkPerformanceCounterUnitKHR;
```

- [VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR](#) - the performance counter unit is a generic data point.
- [VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR](#) - the performance counter unit is a percentage (%).
- [VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR](#) - the performance counter unit is a value of nanoseconds (ns).
- [VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR](#) - the performance counter unit is a value of

bytes.

- [VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR](#) - the performance counter unit is a value of bytes/s.
- [VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR](#) - the performance counter unit is a temperature reported in Kelvin.
- [VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR](#) - the performance counter unit is a value of watts (W).
- [VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR](#) - the performance counter unit is a value of volts (V).
- [VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR](#) - the performance counter unit is a value of amps (A).
- [VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR](#) - the performance counter unit is a value of hertz (Hz).
- [VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR](#) - the performance counter unit is a value of cycles.

Performance counters have an associated scope. This scope describes the granularity of a performance counter.

The performance counter scope types which **may** be returned in [VkPerformanceCounterKHR::scope](#) are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterScopeKHR {
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR = 0,
    VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR = 1,
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR = 2,
    // VK_QUERY_SCOPE_COMMAND_BUFFER_KHR is a legacy alias
    VK_QUERY_SCOPE_COMMAND_BUFFER_KHR =
VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR,
    // VK_QUERY_SCOPE_RENDER_PASS_KHR is a legacy alias
    VK_QUERY_SCOPE_RENDER_PASS_KHR = VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR,
    // VK_QUERY_SCOPE_COMMAND_KHR is a legacy alias
    VK_QUERY_SCOPE_COMMAND_KHR = VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR,
} VkPerformanceCounterScopeKHR;
```

- [VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR](#) - the performance counter scope is a single complete command buffer.
- [VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR](#) - the performance counter scope is zero or more complete render passes. The performance query containing the performance counter **must** begin and end outside a render pass instance.
- [VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR](#) - the performance counter scope is zero or more commands.

Performance counters have an associated storage. This storage describes the payload of a counter

result.

The performance counter storage types which **may** be returned in `VkPerformanceCounterKHR` **::storage** are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterStorageKHR {
    VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR = 0,
    VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR = 1,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR = 2,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR = 3,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR = 4,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR = 5,
} VkPerformanceCounterStorageKHR;
```

- `VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR` - the performance counter storage is a 32-bit signed integer.
- `VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR` - the performance counter storage is a 64-bit signed integer.
- `VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR` - the performance counter storage is a 32-bit unsigned integer.
- `VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR` - the performance counter storage is a 64-bit unsigned integer.
- `VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR` - the performance counter storage is a 32-bit floating-point.
- `VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR` - the performance counter storage is a 64-bit floating-point.

The `VkPerformanceCounterDescriptionKHR` structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterDescriptionKHR {
    VkStructureType      sType;
    void*                pNext;
    VkPerformanceCounterDescriptionFlagsKHR flags;
    char                 name[VK_MAX_DESCRIPTION_SIZE];
    char                 category[VK_MAX_DESCRIPTION_SIZE];
    char                 description[VK_MAX_DESCRIPTION_SIZE];
} VkPerformanceCounterDescriptionKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPerformanceCounterDescriptionFlagBitsKHR` indicating the usage behavior for the counter.

- **name** is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the name of the counter.
- **category** is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the category of the counter.
- **description** is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the description of the counter.

Valid Usage (Implicit)

- VUID-VkPerformanceCounterDescriptionKHR-sType-sType
sType must be `VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR`
- VUID-VkPerformanceCounterDescriptionKHR-pNext-pNext
pNext must be `NULL`

Bits which **can** be set in `VkPerformanceCounterDescriptionKHR::flags`, specifying usage behavior of a performance counter, are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterDescriptionFlagBitsKHR {
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR = 0x00000001,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR = 0x00000002,
    // VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR is a legacy alias
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR =
VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR,
    // VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR is a legacy alias
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR =
VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR,
} VkPerformanceCounterDescriptionFlagBitsKHR;
```

- `VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR` specifies that recording the counter **may** have a noticeable performance impact.
- `VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR` specifies that concurrently recording the counter while other submitted command buffers are running **may** impact the accuracy of the recording.

```
// Provided by VK_KHR_performance_query
typedef VkFlags VkPerformanceCounterDescriptionFlagsKHR;
```

`VkPerformanceCounterDescriptionFlagsKHR` is a bitmask type for setting a mask of zero or more `VkPerformanceCounterDescriptionFlagBitsKHR`.

The `VkQueueFamilyOwnershipTransferPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_maintenance9
typedef struct VkQueueFamilyOwnershipTransferPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           optimalImageTransferToQueueFamilies;
} VkQueueFamilyOwnershipTransferPropertiesKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **optimalImageTransferToQueueFamilies** is a bitmask of queue family indices that indicates which queue families belonging to the same logical device support implicitly acquiring optimal image resources owned by this queue family, without the resources' contents becoming undefined.

If this structure is included in the **pNext** chain of the [VkQueueFamilyProperties2](#) structure passed to [vkGetPhysicalDeviceQueueFamilyProperties2](#), then it is filled with the queue family ownership properties for the specified queue family.

Valid Usage (Implicit)

- VUID-VkQueueFamilyOwnershipTransferPropertiesKHR-sType-sType **must** be [VK_STRUCTURE_TYPE_QUEUE_FAMILY_OWNERSHIP_TRANSFER_PROPERTIES_KHR](#)

Structure Chaining

Extends the structure

- [VkQueueFamilyProperties2](#)

The [VkQueueFamilyOptimalImageTransferGranularityPropertiesKHR](#) structure is defined as:

```
// Provided by VK_KHR_maintenance11
typedef struct VkQueueFamilyOptimalImageTransferGranularityPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkExtent3D         optimalImageTransferGranularity;
} VkQueueFamilyOptimalImageTransferGranularityPropertiesKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **optimalImageTransferGranularity** is the optimal granularity for image copy operations in this queue family.

If this structure is included in the **pNext** chain of the [VkQueueFamilyProperties2](#) structure passed to

[vkGetPhysicalDeviceQueueFamilyProperties2](#), then it is filled with the optimal image transfer granularity for the specified queue family.

The value returned in [optimalImageTransferGranularity](#) has a unit of compressed texel blocks for images having a block-compressed format, and a unit of texels otherwise.

Possible values of [optimalImageTransferGranularity](#) are:

- (0,0,0) specifies that an image copy operation is optimal only when copying whole mip levels, i.e. all of the following conditions are met:
 - The [x](#), [y](#), and [z](#) members of a [VkOffset3D](#) are zero.
 - The [width](#), [height](#), and [depth](#) members of a [VkExtent3D](#) parameter match the width, height, and depth of the image subresource corresponding to the parameter, respectively.
- (A_x , A_y , A_z) where A_x , A_y , and A_z are all integer powers of two. An image copy operation is optimal when all of the following conditions are met:
 - [width](#) of a [VkExtent3D](#) parameter is an integer multiple of A_x , or else $x + \text{width}$ equals the width of the image subresource corresponding to the parameter.
 - [height](#) of a [VkExtent3D](#) parameter is an integer multiple of A_y , or else $y + \text{height}$ equals the height of the image subresource corresponding to the parameter.
 - [depth](#) of a [VkExtent3D](#) parameter is an integer multiple of A_z , or else $z + \text{depth}$ equals the depth of the image subresource corresponding to the parameter.
 - If the format of the image corresponding to the parameters is one of the block-compressed formats then for the purposes of the above calculations the granularity **must** be scaled up by the compressed texel block dimensions.

NOTE

While it is not required that copies are optimal, there may be a performance cost for copies not aligned to [optimalImageTransferGranularity](#).

Valid Usage (Implicit)

- VUID-VkQueueFamilyOptimalImageTransferGranularityPropertiesKHR-sType-sType [sType](#) **must** be [VK_STRUCTURE_TYPE_QUEUE_FAMILY_OPTIMAL_IMAGE_TRANSFER_GRANULARITY_PROPERTIES_KHR](#)

Structure Chaining

Extends the structure

- [VkQueueFamilyProperties2](#)

To enumerate the by region performance counters available on a queue family of a physical device, call:

```
// Provided by VK_ARM_performance_counters_by_region
VkResult vkEnumeratePhysicalDeviceQueueFamilyPerformanceCountersByRegionARM(
    VkPhysicalDevice          physicalDevice,
    uint32_t                  queueFamilyIndex,
    uint32_t*                  pCounterCount,
    VkPerformanceCounterARM*   pCounters,
    VkPerformanceCounterDescriptionARM* pCounterDescriptions);
```

- **physicalDevice** is the handle to the physical device whose queue family by region performance counter properties will be queried.
- **queueFamilyIndex** is the index into the queue family of the physical device we want to get properties for.
- **pCounterCount** is a pointer to an integer related to the number of counters available or queried, as described below.
- **pCounters** is either **NULL** or a pointer to an array of **VkPerformanceCounterARM** structures.
- **pCounterDescriptions** is either **NULL** or a pointer to an array of **VkPerformanceCounterDescriptionARM** structures.

If **pCounters** is **NULL** and **pCounterDescriptions** is **NULL**, then the number of counters available is returned in **pCounterCount**. Otherwise, **pCounterCount** **must** point to a variable set by the application to the number of elements in the **pCounters**, **pCounterDescriptions**, or both arrays and on return the variable is overwritten with the number of structures actually written out. If **pCounterCount** is less than the number of counters available, at most **pCounterCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available counters were returned.

Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceCountersByRegionARM-physicalDevice-parameter
physicalDevice **must** be a valid **VkPhysicalDevice** handle
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceCountersByRegionARM-pCounterCount-parameter
pCounterCount **must** be a valid pointer to a **uint32_t** value
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceCountersByRegionARM-pCounters-parameter
If the value referenced by **pCounterCount** is not **0**, and **pCounters** is not **NULL**, **pCounters** **must** be a valid pointer to an array of **pCounterCount** **VkPerformanceCounterARM** structures
- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceCountersByRegionARM-pCounterDescriptions-parameter
If the value referenced by **pCounterCount** is not **0**, and **pCounterDescriptions** is not **NULL**, **pCounterDescriptions** **must** be a valid pointer to an array of **pCounterCount** **VkPerformanceCounterDescriptionARM** structures

Return Codes

Success

- [VK_INCOMPLETE](#)
- [VK_SUCCESS](#)

Failure

- [VK_ERROR_INITIALIZATION_FAILED](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkPerformanceCounterARM](#) structure is defined as:

```
// Provided by VK_ARM_performance_counters_by_region
typedef struct VkPerformanceCounterARM {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           counterID;
} VkPerformanceCounterARM;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [counterID](#) is an identifier for the counter of the physical device.

Valid Usage (Implicit)

- VUID-VkPerformanceCounterARM-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_ARM](#)
- VUID-VkPerformanceCounterARM-pNext-pNext
[pNext](#) **must** be [NULL](#)

The [VkPerformanceCounterDescriptionARM](#) structure is defined as:

```
// Provided by VK_ARM_performance_counters_by_region
typedef struct VkPerformanceCounterDescriptionARM {
    VkStructureType    sType;
    void*              pNext;
    VkPerformanceCounterDescriptionFlagsARM flags;
    char               name[VK_MAX_DESCRIPTION_SIZE];
} VkPerformanceCounterDescriptionARM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `name` is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the name of the counter.

Valid Usage (Implicit)

- VUID-VkPerformanceCounterDescriptionARM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_ARM`
- VUID-VkPerformanceCounterDescriptionARM-pNext-pNext
`pNext` **must** be `NULL`

```
// Provided by VK_ARM_performance_counters_by_region
typedef VkFlags VkPerformanceCounterDescriptionFlagsARM;
```

`VkPerformanceCounterDescriptionFlagsARM` is a bitmask type for setting a mask, but is currently reserved for future use.

5.2. Devices

Device objects represent logical connections to physical devices. Each device exposes a number of *queue families* each having one or more *queues*. All queues in a queue family support the same operations.

As described in [Physical Devices](#), a Vulkan application will first query for all physical devices in a system. Each physical device **can** then be queried for its capabilities, including its queue and queue family properties. Once an acceptable physical device is identified, an application will create a corresponding logical device. The created logical device is then the primary interface to the physical device.

How to enumerate the physical devices in a system and query those physical devices for their queue family properties is described in the [Physical Device Enumeration](#) section above.

A single logical device **can** be created from multiple physical devices, if those physical devices belong to the same device group. A *device group* is a set of physical devices that support accessing each other's memory and recording a single command buffer that **can** be executed on all the physical devices. Device groups are enumerated by calling `vkEnumeratePhysicalDeviceGroups`, and a logical device is created from a subset of the physical devices in a device group by passing the physical devices through `VkDeviceGroupDeviceCreateInfo`. For two physical devices to be in the same device group, they **must** support identical extensions, features, and properties.

NOTE

Physical devices in the same device group **must** be so similar because there are no rules for how different features/properties would interact. They **must** return the same values for nearly every invariant `vkGetPhysicalDevice*` feature, property,

capability, etc., but could potentially differ for certain queries based on things like having a different display connected, or a different compositor. The specification does not attempt to enumerate which state is in each category, because such a list would quickly become out of date.

To retrieve a list of the device groups present in the system, call:

```
// Provided by VK_VERSION_1_1
VkResult vkEnumeratePhysicalDeviceGroups(
    VkInstance          instance,
    uint32_t*           pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

```
// Provided by VK_KHR_device_group_creation
// Equivalent to vkEnumeratePhysicalDeviceGroups
VkResult vkEnumeratePhysicalDeviceGroupsKHR(
    VkInstance          instance,
    uint32_t*           pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

- `instance` is a handle to a Vulkan instance previously created with [vkCreateInstance](#).
- `pPhysicalDeviceGroupCount` is a pointer to an integer related to the number of device groups available or queried, as described below.
- `pPhysicalDeviceGroupProperties` is either `NULL` or a pointer to an array of [VkPhysicalDeviceGroupProperties](#) structures.

If `pPhysicalDeviceGroupProperties` is `NULL`, then the number of device groups available is returned in `pPhysicalDeviceGroupCount`. Otherwise, `pPhysicalDeviceGroupCount` **must** point to a variable set by the application to the number of elements in the `pPhysicalDeviceGroupProperties` array, and on return the variable is overwritten with the number of structures actually written to `pPhysicalDeviceGroupProperties`. If `pPhysicalDeviceGroupCount` is less than the number of device groups available, at most `pPhysicalDeviceGroupCount` structures will be written, and [VK_INCOMPLETE](#) will be returned instead of [VK_SUCCESS](#), to indicate that not all the available device groups were returned.

Every physical device **must** be in exactly one device group.

Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDeviceGroups-instance-parameter
`instance` **must** be a valid [VkInstance](#) handle
- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupCount-parameter
`pPhysicalDeviceGroupCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupProperties-parameter
If the value referenced by `pPhysicalDeviceGroupCount` is not `0`, and

`pPhysicalDeviceGroupProperties` is not `NULL`, `pPhysicalDeviceGroupProperties` **must** be a valid pointer to an array of `pPhysicalDeviceGroupCount` `VkPhysicalDeviceGroupProperties` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkPhysicalDeviceGroupProperties` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceGroupProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           physicalDeviceCount;
    VkPhysicalDevice    physicalDevices[VK_MAX_DEVICE_GROUP_SIZE];
    VkBool32           subsetAllocation;
} VkPhysicalDeviceGroupProperties;
```

```
// Provided by VK_KHR_device_group_creation
// Equivalent to VkPhysicalDeviceGroupProperties
typedef VkPhysicalDeviceGroupProperties VkPhysicalDeviceGroupPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `physicalDeviceCount` is the number of physical devices in the group.
- `physicalDevices` is an array of `VK_MAX_DEVICE_GROUP_SIZE` `VkPhysicalDevice` handles representing all physical devices in the group. The first `physicalDeviceCount` elements of the array will be valid.
- `subsetAllocation` specifies whether logical devices created from the group support allocating device memory on a subset of devices, via the `deviceMask` member of the `VkMemoryAllocateFlagsInfo`. If this is `VK_FALSE`, then all device memory allocations are made

across all physical devices in the group. If `physicalDeviceCount` is 1, then `subsetAllocation` must be `VK_FALSE`.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceGroupProperties-sType-sType`
`sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES`
- `VUID-VkPhysicalDeviceGroupProperties-pNext-pNext`
`pNext` must be `NULL`

`VK_MAX_DEVICE_GROUP_SIZE` is the length of an array containing `VkPhysicalDevice` handle values representing all physical devices in a group, as returned in `VkPhysicalDeviceGroupProperties::physicalDevices`.

```
#define VK_MAX_DEVICE_GROUP_SIZE 32U
```

```
#define VK_MAX_DEVICE_GROUP_SIZE_KHR VK_MAX_DEVICE_GROUP_SIZE
```

5.2.1. Device Creation

Logical devices are represented by `VkDevice` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkDevice)
```

A logical device is created as a *connection* to a physical device. To create a logical device, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateDevice(
    VkPhysicalDevice          physicalDevice,
    const VkDeviceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDevice*                 pDevice);
```

- `physicalDevice` must be one of the device handles returned from a call to `vkEnumeratePhysicalDevices` (see [Physical Device Enumeration](#)).
- `pCreateInfo` is a pointer to a `VkDeviceCreateInfo` structure containing information about how to create the device.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pDevice` is a pointer to a handle in which the created `VkDevice` is returned.

`vkCreateDevice` verifies that extensions and features requested in the `ppEnabledExtensionNames` and

`ppEnabledFeatures` members of `pCreateInfo`, respectively, are supported by the implementation. If any requested extension is not supported, `vkCreateDevice` **must** return `VK_ERROR_EXTENSION_NOT_PRESENT`. If any requested feature is not supported, `vkCreateDevice` **must** return `VK_ERROR_FEATURE_NOT_PRESENT`. Support for extensions **can** be checked before creating a device by querying `vkEnumerateDeviceExtensionProperties`. Support for features **can** similarly be checked by querying `vkGetPhysicalDeviceFeatures`.

After verifying and enabling the extensions the `VkDevice` object is created and returned to the application.

Multiple logical devices **can** be created from the same physical device. Logical device creation **may** fail due to lack of device-specific resources (in addition to other errors). If that occurs, `vkCreateDevice` will return `VK_ERROR_TOO_MANY_OBJECTS`.

Valid Usage

- VUID-vkCreateDevice-ppEnabledExtensionNames-01387
All [required device extensions](#) for each extension in the `VkDeviceCreateInfo::ppEnabledExtensionNames` list **must** also be present in that list

Valid Usage (Implicit)

- VUID-vkCreateDevice-physicalDevice-parameter
`physicalDevice` **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkCreateDevice-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid [VkDeviceCreateInfo](#) structure
- VUID-vkCreateDevice-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateDevice-pDevice-parameter
`pDevice` **must** be a valid pointer to a [VkDevice](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_EXTENSION_NOT_PRESENT](#)
- [VK_ERROR_FEATURE_NOT_PRESENT](#)
- [VK_ERROR_INITIALIZATION_FAILED](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_TOO_MANY_OBJECTS](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The `VkDeviceCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDeviceCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkDeviceCreateFlags       flags;
    uint32_t                  queueCreateInfoCount;
    const VkDeviceQueueCreateInfo* pQueueCreateInfos;
    // enabledLayerCount is legacy and not used
    uint32_t                  enabledLayerCount;
    // ppEnabledLayerNames is legacy and not used
    const char* const*        ppEnabledLayerNames;
    uint32_t                  enabledExtensionCount;
    const char* const*        ppEnabledExtensionNames;
    const VkPhysicalDeviceFeatures* pEnabledFeatures;
} VkDeviceCreateInfo;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `queueCreateInfoCount` is the unsigned integer size of the `pQueueCreateInfos` array. Refer to the [Queue Creation](#) section below for further details.
- `pQueueCreateInfos` is a pointer to an array of [VkDeviceQueueCreateInfo](#) structures describing the queues that are requested to be created along with the logical device. Refer to the [Queue Creation](#) section below for further details.
- `enabledLayerCount` is legacy and not used. Implementations **must** not access this parameter. It **must** be 0. See [Device Layers: Superseded via instance layers](#).
- `ppEnabledLayerNames` is legacy and not used. Implementations **must** not access this parameter. It **must** be `NULL`. See [Device Layers: Superseded via instance layers](#).
- `enabledExtensionCount` is the number of device extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable for the created device. See the [Extensions](#) section for further details.
- `pEnabledFeatures` is `NULL` or a pointer to a [VkPhysicalDeviceFeatures](#) structure containing boolean indicators of all the features to be enabled. Refer to the [Features](#) section for further details. This field is legacy. See [Physical Device Queries: Superseded via version 2](#).

Valid Usage

- VUID-VkDeviceCreateInfo-queueFamilyIndex-02802
The combination of the values in the `queueFamilyIndex` and `flags` members of each element of `pQueueCreateInfos` **must** be unique within `pQueueCreateInfos`
- VUID-VkDeviceCreateInfo-pQueueCreateInfos-06755
If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, the sum of their `queueCount` members **must** be less than or equal to the `queueCount` member of the `VkQueueFamilyProperties` structure, as returned by `vkGetPhysicalDeviceQueueFamilyProperties` in the `pQueueFamilyProperties[queueFamilyIndex]`
- VUID-VkDeviceCreateInfo-pQueueCreateInfos-06654
If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, then all of such elements **must** have the same global priority level, which **can** be specified explicitly by the including a `VkDeviceQueueGlobalPriorityCreateInfo` structure in the `pNext` chain, or by the implicit default value
- VUID-VkDeviceCreateInfo-pNext-00373
If the `pNext` chain includes a `VkPhysicalDeviceFeatures2` structure, then `pEnabledFeatures` **must** be `NULL`
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-01840
If `VkPhysicalDeviceProperties::apiVersion` advertises Vulkan 1.1 or later, `ppEnabledExtensionNames` **must** not contain `VK_AMD_negative_viewport_height`
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-00374
`ppEnabledExtensionNames` **must** not contain both `VK_KHR_maintenance1` and `VK_AMD_negative_viewport_height`
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-03328
`ppEnabledExtensionNames` **must** not contain both `VK_KHR_buffer_device_address` and `VK_EXT_buffer_device_address`
- VUID-VkDeviceCreateInfo-pNext-04748
If the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure and `VkPhysicalDeviceVulkan12Features::bufferDeviceAddress` is `VK_TRUE`, `ppEnabledExtensionNames` **must** not contain `VK_EXT_buffer_device_address`
- VUID-VkDeviceCreateInfo-pNext-02829
If the `pNext` chain includes a `VkPhysicalDeviceVulkan11Features` structure, then it **must** not include a `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDeviceMultiviewFeatures`, `VkPhysicalDeviceVariablePointersFeatures`, `VkPhysicalDeviceProtectedMemoryFeatures`, `VkPhysicalDeviceSamplerYcbcrConversionFeatures`, or `VkPhysicalDeviceShaderDrawParametersFeatures` structure
- VUID-VkDeviceCreateInfo-pNext-02830
If the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then it **must** not include a `VkPhysicalDevice8BitStorageFeatures`, `VkPhysicalDeviceShaderAtomicInt64Features`, `VkPhysicalDeviceShaderFloat16Int8Features`,

VkPhysicalDeviceDescriptorIndexingFeatures,
 VkPhysicalDeviceScalarBlockLayoutFeatures,
 VkPhysicalDeviceImagelessFramebufferFeatures,
 VkPhysicalDeviceUniformBufferStandardLayoutFeatures,
 VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures,
 VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures,
 VkPhysicalDeviceHostQueryResetFeatures,
 VkPhysicalDeviceTimelineSemaphoreFeatures,
 VkPhysicalDeviceBufferDeviceAddressFeatures, or
 VkPhysicalDeviceVulkanMemoryModelFeatures structure

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-04476
 If `ppEnabledExtensionNames` contains "VK_KHR_shader_draw_parameters" and the `pNext` chain includes a `VkPhysicalDeviceVulkan11Features` structure, then `VkPhysicalDeviceVulkan11Features::shaderDrawParameters` **must** be `VK_TRUE`
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02831
 If `ppEnabledExtensionNames` contains "VK_KHR_draw_indirect_count" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::drawIndirectCount` **must** be `VK_TRUE`
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02832
 If `ppEnabledExtensionNames` contains "VK_KHR_sampler_mirror_clamp_to_edge" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::samplerMirrorClampToEdge` **must** be `VK_TRUE`
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02833
 If `ppEnabledExtensionNames` contains "VK_EXT_descriptor_indexing" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::descriptorIndexing` **must** be `VK_TRUE`
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02834
 If `ppEnabledExtensionNames` contains "VK_EXT_sampler_filter_minmax" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::samplerFilterMinmax` **must** be `VK_TRUE`
- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02835
 If `ppEnabledExtensionNames` contains "VK_EXT_shader_viewport_index_layer" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::shaderOutputViewportIndex` and `VkPhysicalDeviceVulkan12Features::shaderOutputLayer` **must** both be `VK_TRUE`
- VUID-VkDeviceCreateInfo-pNext-06532
 If the `pNext` chain includes a `VkPhysicalDeviceVulkan13Features` structure, then it **must** not include a `VkPhysicalDeviceDynamicRenderingFeatures`, `VkPhysicalDeviceImageRobustnessFeatures`, `VkPhysicalDeviceInlineUniformBlockFeatures`, `VkPhysicalDeviceMaintenance4Features`, `VkPhysicalDevicePipelineCreationCacheControlFeatures`, `VkPhysicalDevicePrivateDataFeatures`, `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures`, `VkPhysicalDeviceShaderIntegerDotProductFeatures`, `VkPhysicalDeviceShaderTerminateInvocationFeatures`,

VkPhysicalDeviceSubgroupSizeControlFeatures,
VkPhysicalDeviceSynchronization2Features,
VkPhysicalDeviceTextureCompressionASTCHDRFeatures, or
VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures structure

- VUID-VkDeviceCreateInfo-pNext-10360

If the **pNext** chain includes a **VkPhysicalDeviceVulkan14Features** structure, then it **must** not include a **VkPhysicalDeviceGlobalPriorityQueryFeatures**, **VkPhysicalDeviceShaderSubgroupRotateFeatures**, **VkPhysicalDeviceShaderFloatControls2Features**, **VkPhysicalDeviceShaderExpectAssumeFeatures**, **VkPhysicalDeviceLineRasterizationFeatures**, **VkPhysicalDeviceVertexAttributeDivisorFeatures**, **VkPhysicalDeviceIndexTypeUint8Features**, **VkPhysicalDeviceDynamicRenderingLocalReadFeatures**, **VkPhysicalDeviceMaintenance5Features**, **VkPhysicalDeviceMaintenance6Features**, **VkPhysicalDevicePipelineProtectedAccessFeatures**, **VkPhysicalDevicePipelineRobustnessFeatures**, or **VkPhysicalDeviceHostImageCopyFeatures** structure

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-10858

If **ppEnabledExtensionNames** contains "VK_KHR_push_descriptor" and the **pNext** chain includes a **VkPhysicalDeviceVulkan14Features** structure, then **VkPhysicalDeviceVulkan14Features::pushDescriptor** **must** be **VK_TRUE**

- VUID-VkDeviceCreateInfo-pProperties-04451

If the **VK_KHR_portability_subset** extension is included in **pProperties** of **vkEnumerateDeviceExtensionProperties**, **ppEnabledExtensionNames** **must** include "VK_KHR_portability_subset"

- VUID-VkDeviceCreateInfo-shadingRateImage-04478

If the **shadingRateImage** feature is enabled, the **pipelineFragmentShadingRate** feature **must** not be enabled

- VUID-VkDeviceCreateInfo-shadingRateImage-04479

If the **shadingRateImage** feature is enabled, the **primitiveFragmentShadingRate** feature **must** not be enabled

- VUID-VkDeviceCreateInfo-shadingRateImage-04480

If the **shadingRateImage** feature is enabled, the **attachmentFragmentShadingRate** feature **must** not be enabled

- VUID-VkDeviceCreateInfo-fragmentDensityMap-04481

If the **fragmentDensityMap** feature is enabled, the **pipelineFragmentShadingRate** feature **must** not be enabled

- VUID-VkDeviceCreateInfo-fragmentDensityMap-04482

If the **fragmentDensityMap** feature is enabled, the **primitiveFragmentShadingRate** feature **must** not be enabled

- VUID-VkDeviceCreateInfo-fragmentDensityMap-04483

If the **fragmentDensityMap** feature is enabled, the **attachmentFragmentShadingRate** feature **must** not be enabled

- VUID-VkDeviceCreateInfo-None-04896
If the `sparseImageInt64Atomics` feature is enabled, `shaderImageInt64Atomics` **must** be enabled
- VUID-VkDeviceCreateInfo-None-04897
If the `sparseImageFloat32Atomics` feature is enabled, `shaderImageFloat32Atomics` **must** be enabled
- VUID-VkDeviceCreateInfo-None-04898
If the `sparseImageFloat32AtomicAdd` feature is enabled, `shaderImageFloat32AtomicAdd` **must** be enabled
- VUID-VkDeviceCreateInfo-sparseImageFloat32AtomicMinMax-04975
If the `sparseImageFloat32AtomicMinMax` feature is enabled, `shaderImageFloat32AtomicMinMax` **must** be enabled
- VUID-VkDeviceCreateInfo-robustBufferAccess-10247
If the `robustBufferAccess` feature is enabled, and `robustBufferAccessUpdateAfterBind` is `VK_FALSE`, then `descriptorBindingUniformBufferUpdateAfterBind`, `descriptorBindingStorageBufferUpdateAfterBind`, `descriptorBindingUniformTexelBufferUpdateAfterBind`, and `descriptorBindingStorageTexelBufferUpdateAfterBind` **must** not be enabled
- VUID-VkDeviceCreateInfo-None-08095
If the `descriptorBuffer` feature is enabled, `ppEnabledExtensionNames` **must** not contain `VK_AMD_shader_fragment_mask`
- VUID-VkDeviceCreateInfo-pNext-09396
If the `pNext` chain includes a `VkDeviceQueueShaderCoreControlCreateInfoARM` structure, then it **must** not be included in the `pNext` chain of any of the `VkDeviceQueueCreateInfo` structures in `pQueueCreateInfos`
- VUID-VkDeviceCreateInfo-pNext-09397
If the `pNext` chain includes a `VkDeviceQueueShaderCoreControlCreateInfoARM` structure then `VkPhysicalDeviceSchedulingControlsPropertiesARM::schedulingControlsFlags` **must** contain `VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_SHADER_CORE_COUNT_ARM`
- VUID-VkDeviceCreateInfo-None-10778
If the `maintenance9` feature is not supported, `queueCreateInfoCount` **must** be greater than 0
- VUID-VkDeviceCreateInfo-queueFamilyIndex-11831
If any element of `pQueueCreateInfos` specifies a `queueFamilyIndex` that supports `VK_QUEUE_DATA_GRAPH_BIT_ARM` and that `queueFamilyIndex` enumerates an engine through `vkGetPhysicalDeviceQueueFamilyDataGraphPropertiesARM` with type `VK_PHYSICAL_DEVICE_DATA_GRAPH_PROCESSING_ENGINE_TYPE_NEURAL_QCOM` or `VK_PHYSICAL_DEVICE_DATA_GRAPH_PROCESSING_ENGINE_TYPE_COMPUTE_QCOM`, a `VkPhysicalDeviceDataGraphModelFeaturesQCOM` structure **must** be included in `pNext` with `dataGraphModel` set to `VK_TRUE`
- VUID-VkDeviceCreateInfo-enabledLayerCount-12384
`enabledLayerCount` **must** be 0
- VUID-VkDeviceCreateInfo-ppEnabledLayerNames-12385
`ppEnabledLayerNames` **must** be `NULL`

Valid Usage (Implicit)

- VUID-VkDeviceCreateInfo-sType-sType

sType **must** be `VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO`

- VUID-VkDeviceCreateInfo-pNext-pNext

Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of `VkDeviceDeviceMemoryReportCreateInfoEXT`, `VkDeviceDiagnosticsConfigCreateInfoNV`, `VkDeviceGroupDeviceCreateInfo`, `VkDeviceMemoryOverallAllocationCreateInfoAMD`, `VkDevicePipelineBinaryInternalCacheControlKHR`, `VkDevicePrivateDataCreateInfo`, `VkDeviceQueueShaderCoreControlCreateInfoARM`, `VkExternalComputeQueueDeviceCreateInfoNV`, `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDevice4444FormatsFeaturesEXT`, `VkPhysicalDevice8BitStorageFeatures`, `VkPhysicalDeviceASTCDecodeFeaturesEXT`, `VkPhysicalDeviceAccelerationStructureFeaturesKHR`, `VkPhysicalDeviceAddressBindingReportFeaturesEXT`, `VkPhysicalDeviceAmigoProfilingFeaturesSEC`, `VkPhysicalDeviceAntiLagFeaturesAMD`, `VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT`, `VkPhysicalDeviceAttachmentFeedbackLoopLayoutFeaturesEXT`, `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT`, `VkPhysicalDeviceBorderColorSwizzleFeaturesEXT`, `VkPhysicalDeviceBufferDeviceAddressFeatures`, `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT`, `VkPhysicalDeviceClusterAccelerationStructureFeaturesNV`, `VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI`, `VkPhysicalDeviceCoherentMemoryFeaturesAMD`, `VkPhysicalDeviceColorWriteEnableFeaturesEXT`, `VkPhysicalDeviceCommandBufferInheritanceFeaturesNV`, `VkPhysicalDeviceComputeOccupancyPriorityFeaturesNV`, `VkPhysicalDeviceComputeShaderDerivativesFeaturesKHR`, `VkPhysicalDeviceConditionalRenderingFeaturesEXT`, `VkPhysicalDeviceCooperativeMatrix2FeaturesNV`, `VkPhysicalDeviceCooperativeMatrixConversionFeaturesQCOM`, `VkPhysicalDeviceCooperativeMatrixFeaturesKHR`, `VkPhysicalDeviceCooperativeMatrixFeaturesNV`, `VkPhysicalDeviceCooperativeVectorFeaturesNV`, `VkPhysicalDeviceCopyMemoryIndirectFeaturesKHR`, `VkPhysicalDeviceCopyMemoryIndirectFeaturesNV`, `VkPhysicalDeviceCornerSampledImageFeaturesNV`, `VkPhysicalDeviceCoverageReductionModeFeaturesNV`, `VkPhysicalDeviceCubicClampFeaturesQCOM`, `VkPhysicalDeviceCubicWeightsFeaturesQCOM`, `VkPhysicalDeviceCudaKernelLaunchFeaturesNV`, `VkPhysicalDeviceCustomBorderColorFeaturesEXT`, `VkPhysicalDeviceCustomResolveFeaturesEXT`, `VkPhysicalDeviceDataGraphFeaturesARM`, `VkPhysicalDeviceDataGraphModelFeaturesQCOM`, `VkPhysicalDeviceDataGraphNeuralAcceleratorStatisticsFeaturesARM`,

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupDeviceCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             physicalDeviceCount;
    const VkPhysicalDevice* pPhysicalDevices;
} VkDeviceGroupDeviceCreateInfo;
```

```
// Provided by VK_KHR_device_group_creation
// Equivalent to VkDeviceGroupDeviceCreateInfo
typedef VkDeviceGroupDeviceCreateInfo VkDeviceGroupDeviceCreateInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **physicalDeviceCount** is the number of elements in the **pPhysicalDevices** array.
- **pPhysicalDevices** is a pointer to an array of physical device handles belonging to the same device group.

The elements of the **pPhysicalDevices** array are an ordered list of the physical devices that the logical device represents. These **must** be a subset of a single device group, and need not be in the same order as they were enumerated. The order of the physical devices in the **pPhysicalDevices** array determines the *device index* of each physical device, with element *i* being assigned a device index of *i*. Certain commands and structures refer to one or more physical devices by using device indices or *device masks* formed using device indices.

A logical device created without using **VkDeviceGroupDeviceCreateInfo**, or with **physicalDeviceCount** equal to zero, is equivalent to a **physicalDeviceCount** of one and **pPhysicalDevices** pointing to the **physicalDevice** parameter to [vkCreateDevice](#). In particular, the device index of that physical device is zero.

Valid Usage

- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00375
Each element of **pPhysicalDevices** **must** be unique
- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00376
All elements of **pPhysicalDevices** **must** be in the same device group as enumerated by [vkEnumeratePhysicalDeviceGroups](#)
- VUID-VkDeviceGroupDeviceCreateInfo-physicalDeviceCount-00377
If **physicalDeviceCount** is not 0, the **physicalDevice** parameter of [vkCreateDevice](#) **must** be an element of **pPhysicalDevices**

Valid Usage (Implicit)

- VUID-VkDeviceGroupDeviceCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO`
- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-parameter
If `physicalDeviceCount` is not 0, `pPhysicalDevices` **must** be a valid pointer to an array of `physicalDeviceCount` valid `VkPhysicalDevice` handles

Structure Chaining

Extends the structure

- `VkDeviceCreateInfo`

To specify whether device memory allocation is allowed beyond the size reported by `VkPhysicalDeviceMemoryProperties`, add a `VkDeviceMemoryOverallocationCreateInfoAMD` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure. If this structure is not specified, it is as if the `VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD` value is used.

```
// Provided by VK_AMD_memory_overallocation_behavior
typedef struct VkDeviceMemoryOverallocationCreateInfoAMD {
    VkStructureType          sType;
    const void*              pNext;
    VkMemoryOverallocationBehaviorAMD overallocationBehavior;
} VkDeviceMemoryOverallocationCreateInfoAMD;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `overallocationBehavior` is the desired overallocation behavior.

Valid Usage (Implicit)

- VUID-VkDeviceMemoryOverallocationCreateInfoAMD-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_OVERALLOCATION_CREATE_INFO_AMD`
- VUID-VkDeviceMemoryOverallocationCreateInfoAMD-overallocationBehavior-parameter
`overallocationBehavior` **must** be a valid `VkMemoryOverallocationBehaviorAMD` value

Structure Chaining

Extends the structure

- `VkDeviceCreateInfo`

Possible values for `VkDeviceMemoryOverallocationCreateInfoAMD::overallocationBehavior` include:

```
// Provided by VK_AMD_memory_overallocation_behavior
typedef enum VkMemoryOverallocationBehaviorAMD {
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD = 0,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD = 1,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD = 2,
} VkMemoryOverallocationBehaviorAMD;
```

- `VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD` lets the implementation decide if overallocation is allowed.
- `VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD` specifies overallocation is allowed if platform permits.
- `VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD` specifies the application is not allowed to allocate device memory beyond the heap sizes reported by `VkPhysicalDeviceMemoryProperties`. Allocations that are not explicitly made by the application within the scope of the Vulkan instance are not accounted for.

When using the Nsight™ Aftermath SDK, to configure how device crash dumps are created, add a `VkDeviceDiagnosticsConfigCreateInfoNV` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure.

```
// Provided by VK_NV_device_diagnostics_config
typedef struct VkDeviceDiagnosticsConfigCreateInfoNV {
    VkStructureType      sType;
    const void*          pNext;
    VkDeviceDiagnosticsConfigFlagsNV flags;
} VkDeviceDiagnosticsConfigCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkDeviceDiagnosticsConfigFlagBitsNV` specifying additional parameters for configuring diagnostic tools.

Valid Usage (Implicit)

- VUID-VkDeviceDiagnosticsConfigCreateInfoNV-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_DEVICE_DIAGNOSTICS_CONFIG_CREATE_INFO_NV`
- VUID-VkDeviceDiagnosticsConfigCreateInfoNV-flags-parameter
`flags` must be a valid combination of `VkDeviceDiagnosticsConfigFlagBitsNV` values

Structure Chaining

Extends the structure

- [VkDeviceCreateInfo](#)

Bits which **can** be set in [VkDeviceDiagnosticsConfigCreateInfoNV::flags](#) include:

```
// Provided by VK_NV_device_diagnostics_config
typedef enum VkDeviceDiagnosticsConfigFlagBitsNV {
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_DEBUG_INFO_BIT_NV = 0x00000001,
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_RESOURCE_TRACKING_BIT_NV = 0x00000002,
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_AUTOMATIC_CHECKPOINTS_BIT_NV = 0x00000004,
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_ERROR_REPORTING_BIT_NV = 0x00000008,
} VkDeviceDiagnosticsConfigFlagBitsNV;
```

- [VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_DEBUG_INFO_BIT_NV](#) enables the generation of debug information for shaders.
- [VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_RESOURCE_TRACKING_BIT_NV](#) enables driver side tracking of resources (images, buffers, etc.) used to augment the device fault information.
- [VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_AUTOMATIC_CHECKPOINTS_BIT_NV](#) enables automatic insertion of [diagnostic checkpoints](#) for draw calls, dispatches, trace rays, and copies. The CPU call stack at the time of the command will be associated as the marker data for the automatically inserted checkpoints.
- [VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_ERROR_REPORTING_BIT_NV](#) enables shader error reporting.

```
// Provided by VK_NV_device_diagnostics_config
typedef VkFlags VkDeviceDiagnosticsConfigFlagsNV;
```

[VkDeviceDiagnosticsConfigFlagsNV](#) is a bitmask type for setting a mask of zero or more [VkDeviceDiagnosticsConfigFlagBitsNV](#).

To register callbacks for underlying device memory events of type [VkDeviceMemoryReportEventTypeEXT](#), add one or multiple [VkDeviceDeviceMemoryReportCreateInfoEXT](#) structures to the [pNext](#) chain of the [VkDeviceCreateInfo](#) structure.

```
// Provided by VK_EXT_device_memory_report
typedef struct VkDeviceDeviceMemoryReportCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkDeviceMemoryReportFlagsEXT flags;
    PFN_vkDeviceMemoryReportCallbackEXT pfnUserCallback;
    void*                    pUserData;
} VkDeviceDeviceMemoryReportCreateInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is 0 and reserved for future use.
- **pfnUserCallback** is the application callback function to call.
- **pUserData** is **NULL** or an application-defined user data pointer to be passed to the callback.

The callback **may** be called from multiple threads simultaneously.

The callback **must** be called only once by the implementation when a [VkDeviceMemoryReportEventTypeEXT](#) event occurs.

NOTE

The callback could be called from a background thread other than the thread calling the Vulkan commands.

Valid Usage (Implicit)

- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-sType-sType **must** be [VK_STRUCTURE_TYPE_DEVICE_DEVICE_MEMORY_REPORT_CREATE_INFO_EXT](#)
- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-flags-zero bitmask **must** be 0
- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-pfnUserCallback-parameter **pfnUserCallback** **must** be a valid [PFN_vkDeviceMemoryReportCallbackEXT](#) value

Structure Chaining

Extends the structure

- [VkDeviceCreateInfo](#)

The prototype for the [VkDeviceDeviceMemoryReportCreateInfoEXT::pfnUserCallback](#) function implemented by the application is:

```
// Provided by VK_EXT_device_memory_report
typedef void (*PFN_vkDeviceMemoryReportCallbackEXT)(
    const VkDeviceMemoryReportCallbackDataEXT* pCallbackData,
    void* pUserData);
```

- `pCallbackData` contains all the callback related data in the `VkDeviceMemoryReportCallbackDataEXT` structure.
- `pUserData` is the application-defined user data pointer, equal to the value of `VkDeviceMemoryReportCreateInfoEXT::pUserData` specified when the `VkDevice` object was created.

The callback **must** not make calls to any Vulkan commands.

The definition of `VkDeviceMemoryReportCallbackDataEXT` is:

```
// Provided by VK_EXT_device_memory_report
typedef struct VkDeviceMemoryReportCallbackDataEXT {
    VkStructureType          sType;
    void*                    pNext;
    VkDeviceMemoryReportFlagsEXT flags;
    VkDeviceMemoryReportEventTypeEXT type;
    uint64_t                 memoryObjectId;
    VkDeviceSize             size;
    VkObjectType             objectType;
    uint64_t                 objectHandle;
    uint32_t                 heapIndex;
} VkDeviceMemoryReportCallbackDataEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is 0 and reserved for future use.
- `type` is a `VkDeviceMemoryReportEventTypeEXT` type specifying the type of event reported in this `VkDeviceMemoryReportCallbackDataEXT` structure.
- `memoryObjectId` is the unique id for the underlying memory object as described below.
- `size` is the size of the memory object in bytes. If `type` is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT` or `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT`, `size` is a valid `VkDeviceSize` value. Otherwise, `size` is undefined.
- `objectType` is a `VkObjectType` value specifying the type of the object associated with this device memory report event. If `type` is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT` or

VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT, `objectType` is a valid `VkObjectType` enum. Otherwise, `objectType` is undefined.

- `objectHandle` is the object this device memory report event is attributed to. If `type` is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT` or `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT`, `objectHandle` is a valid Vulkan handle of the type associated with `objectType` as defined in the `VkObjectType` and `Vulkan Handle Relationship` table. Otherwise, `objectHandle` is undefined.
- `heapIndex` describes which memory heap this device memory allocation is made from. If `type` is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT` or `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT`, `heapIndex` corresponds to one of the valid heaps from the `VkPhysicalDeviceMemoryProperties` structure. Otherwise, `heapIndex` is undefined.

`memoryObjectId` is used to avoid double-counting on the same memory object.

If an internally-allocated device memory object or a `VkDeviceMemory` **cannot** be exported, `memoryObjectId` **must** be unique in the `VkDevice`.

If an internally-allocated device memory object or a `VkDeviceMemory` supports being exported, `memoryObjectId` **must** be unique system wide.

If an internal device memory object or a `VkDeviceMemory` is backed by an imported external memory object, `memoryObjectId` **must** be unique system wide.

Implementor's Note

If the heap backing an internally-allocated device memory **cannot** be used to back `VkDeviceMemory`, implementations **can** advertise that heap with no types.

NOTE

This structure should only be considered valid during the lifetime of the triggered callback.

For `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT` and `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT` events, `objectHandle` usually will not yet exist when the application or tool receives the callback. `objectHandle` will only exist when the create or allocate call that triggered the event returns, and if the allocation or import ends up failing `objectHandle` will not ever exist.

Valid Usage (Implicit)

- VUID-VkDeviceMemoryReportCallbackDataEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_REPORT_CALLBACK_DATA_EXT`
- VUID-VkDeviceMemoryReportCallbackDataEXT-pNext-pNext

pNext must be **NULL**

```
// Provided by VK_EXT_device_memory_report
typedef VkFlags VkDeviceMemoryReportFlagsEXT;
```

VkDeviceMemoryReportFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of **VkDeviceMemoryReportCallbackDataEXT::type**, specifying event types which cause the device driver to call the callback, are:

```
// Provided by VK_EXT_device_memory_report
typedef enum VkDeviceMemoryReportEventTypeEXT {
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT = 0,
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT = 1,
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT = 2,
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT = 3,
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT = 4,
} VkDeviceMemoryReportEventTypeEXT;
```

- **VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT** specifies this event corresponds to the allocation of an internal device memory object or a **VkDeviceMemory**.
- **VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT** specifies this event corresponds to the deallocation of an internally-allocated device memory object or a **VkDeviceMemory**.
- **VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT** specifies this event corresponds to the import of an external memory object.
- **VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT** specifies this event is the release of an imported external memory object.
- **VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT** specifies this event corresponds to the failed allocation of an internal device memory object or a **VkDeviceMemory**.

To reserve private data storage slots, add a **VkDevicePrivateDataCreateInfo** structure to the **pNext** chain of the **VkDeviceCreateInfo** structure. Reserving slots in this manner is not strictly necessary, but doing so **may** improve performance.

```
// Provided by VK_VERSION_1_3
typedef struct VkDevicePrivateDataCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           privateDataSlotRequestCount;
} VkDevicePrivateDataCreateInfo;
```

```
// Provided by VK_EXT_private_data
// Equivalent to VkDevicePrivateDataCreateInfo
typedef VkDevicePrivateDataCreateInfo VkDevicePrivateDataCreateInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **privateDataSlotRequestCount** is the amount of slots to reserve.

Valid Usage (Implicit)

- VUID-VkDevicePrivateDataCreateInfo-sType-sType
sType must be [VK_STRUCTURE_TYPE_DEVICE_PRIVATE_DATA_CREATE_INFO](#)

Structure Chaining

Extends the structure

- [VkDeviceCreateInfo](#)

To disable the implementation's internal pipeline cache, add a [VkDevicePipelineBinaryInternalCacheControlKHR](#) structure to the **pNext** chain of the [VkDeviceCreateInfo](#) structure.

```
// Provided by VK_KHR_pipeline_binary
typedef struct VkDevicePipelineBinaryInternalCacheControlKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           disableInternalCache;
} VkDevicePipelineBinaryInternalCacheControlKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **disableInternalCache** specifies whether or not to disable the implementation's internal pipeline cache.

If the [VkDeviceCreateInfo::pNext](#) chain does not include this structure, then **disableInternalCache** defaults to [VK_FALSE](#).

Valid Usage

- VUID-VkDevicePipelineBinaryInternalCacheControlKHR-disableInternalCache-09602
If [VkPhysicalDevicePipelineBinaryPropertiesKHR::pipelineBinaryInternalCacheControl](#) is [VK_FALSE](#), **disableInternalCache** must be [VK_FALSE](#)

Valid Usage (Implicit)

- VUID-VkDevicePipelineBinaryInternalCacheControlKHR-sType-sType **must** be `VK_STRUCTURE_TYPE_DEVICE_PIPELINE_BINARY_INTERNAL_CACHE_CONTROL_KHR`

Structure Chaining

Extends the structure

- [VkDeviceCreateInfo](#)

The number of shader cores used by all the queues of a device **can** be controlled by adding a `VkDeviceQueueShaderCoreControlCreateInfoARM` structure to the `pNext` chain of the [VkDeviceCreateInfo](#) structure.

5.2.2. Device Use

The following is a high-level list of `VkDevice` uses along with references on where to find more information:

- Creation of queues. See the [Queues](#) section below for further details.
- Creation and tracking of various synchronization constructs. See [Synchronization and Cache Control](#) for further details.
- Allocating, freeing, and managing memory. See [Memory Allocation](#) and [Resource Creation](#) for further details.
- Creation and destruction of command buffers and command buffer pools. See [Command Buffers](#) for further details.
- Creation, destruction, and management of graphics state. See [Pipelines](#) and [Resource Descriptors](#), among others, for further details.

5.2.3. Lost Device

A logical device **may** become *lost* for a number of implementation-specific reasons, indicating that pending and future command execution **may** fail and cause resources and backing memory to become undefined.

Typical reasons for device loss will include things like execution timing out (to prevent denial of service), power management events, platform resource management, implementation errors.

NOTE

Applications not adhering to [valid usage](#) may also result in device loss being reported, however this is not guaranteed. Even if device loss is reported, the system may be in an unrecoverable state, and further usage of the API is still considered invalid.

When this happens, certain commands will return [VK_ERROR_DEVICE_LOST](#). After any such event, the logical device is considered *lost*. It is not possible to reset the logical device to a non-lost state, however the lost state is specific to a logical device ([VkDevice](#)), and the corresponding physical device ([VkPhysicalDevice](#)) **may** be otherwise unaffected.

In some cases, the physical device **may** also be lost, and attempting to create a new logical device will fail, returning [VK_ERROR_DEVICE_LOST](#). This is usually indicative of a problem with the underlying implementation, or its connection to the host. If the physical device has not been lost, and a new logical device is successfully created from that physical device, it **must** be in the non-lost state.

NOTE

Whilst logical device loss **may** be recoverable, in the case of physical device loss, it is unlikely that an application will be able to recover unless additional, unaffected physical devices exist on the system. The error is largely informational and intended only to inform the application that a platform issue has occurred, and **should** be investigated further. For example, underlying hardware **may** have developed a fault or become physically disconnected from the rest of the system. In many cases, physical device loss **may** cause other more serious issues such as the operating system crashing; in which case it **may** not be reported via the Vulkan API.

When a device is lost, its child objects are not implicitly destroyed and their handles are still valid. Those objects **must** still be destroyed before their parents or the device **can** be destroyed (see the [Object Lifetime](#) section). The host address space corresponding to device memory mapped using [vkMapMemory](#) is still valid, and host memory accesses to these mapped regions are still valid, but the contents are undefined. It is still legal to call any API command on the device and child objects.

Once a device is lost, command execution **may** fail, and certain commands that return a [VkResult](#) **may** return [VK_ERROR_DEVICE_LOST](#). These commands can be identified by the inclusion of [VK_ERROR_DEVICE_LOST](#) in the Return Codes section for each command. Commands that do not allow runtime errors **must** still operate correctly for valid usage and, if applicable, return valid data.

Commands that wait indefinitely for device execution (namely [vkDeviceWaitIdle](#), [vkQueueWaitIdle](#), [vkWaitForFences](#) or [vkAcquireNextImageKHR](#) with a maximum [timeout](#), and [vkGetQueryPoolResults](#) with the [VK_QUERY_RESULT_WAIT_BIT](#) bit set in [flags](#)) **must** return in finite time even in the case of a lost device, and return either [VK_SUCCESS](#) or [VK_ERROR_DEVICE_LOST](#). For any command that **may** return [VK_ERROR_DEVICE_LOST](#), for the purpose of determining whether a command buffer is in the [pending state](#), or whether resources are considered in-use by the device, a return value of [VK_ERROR_DEVICE_LOST](#) is equivalent to [VK_SUCCESS](#).

If a device was created with the [maintenance5](#) feature enabled, and any device command returns [VK_ERROR_DEVICE_LOST](#), then all device commands for which [VK_ERROR_DEVICE_LOST](#) is a valid return value and which happen-after it on the same host thread **must** return [VK_ERROR_DEVICE_LOST](#).

Device commands executing on other threads **must** begin returning [VK_ERROR_DEVICE_LOST](#) within finite time.

The content of any external memory objects that have been exported from or imported to a lost device become undefined. Objects on other logical devices or in other APIs which are associated with the same underlying memory resource as the external memory objects on the lost device are unaffected other than their content becoming undefined. The layout of subresources of images on other logical devices that are bound to `VkDeviceMemory` objects associated with the same underlying memory resources as external memory objects on the lost device becomes `VK_IMAGE_LAYOUT_UNDEFINED`.

The state of `VkSemaphore` objects on other logical devices created by [importing a semaphore payload](#) with temporary permanence which was exported from the lost device is undefined. The state of `VkSemaphore` objects on other logical devices that permanently share a semaphore payload with a `VkSemaphore` object on the lost device is undefined, and remains undefined following any subsequent signal operations. Implementations **must** ensure pending and subsequently submitted wait operations on such semaphores behave as defined in [Semaphore State Requirements For Wait Operations](#) for external semaphores not in a valid state for a wait operation.

5.2.4. Device Destruction

To destroy a device, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyDevice(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

To ensure that no work is active on the device, `vkDeviceWaitIdle` **can** be used to gate the destruction of the device. Prior to destroying a device, an application is responsible for destroying/freeing any Vulkan objects with explicit `vkDestroy*` or `vkFree*` commands that were created using that device as the first parameter of the corresponding `vkCreate*` or `vkAllocate*` command.

NOTE

The lifetime of each of these objects is bound by the lifetime of the `VkDevice` object. Therefore, to avoid resource leaks, it is critical that an application explicitly free all of these resources prior to calling `vkDestroyDevice`.

Valid Usage

- VUID-vkDestroyDevice-device-05137
All child objects created on `device` that can be destroyed or freed **must** have been destroyed or freed prior to destroying `device`
- VUID-vkDestroyDevice-device-00379
If `VkAllocationCallbacks` were provided when `device` was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroyDevice-device-00380

If no `VkAllocationCallbacks` were provided when `device` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyDevice-device-parameter
If `device` is not `NULL`, `device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyDevice-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

Host Synchronization

- Host access to `device` **must** be externally synchronized
- Host access to all `VkQueue` objects created from `device` **must** be externally synchronized

5.3. Queues

5.3.1. Queue Family Properties

As discussed in the [Physical Device Enumeration](#) section above, the `vkGetPhysicalDeviceQueueFamilyProperties` command is used to retrieve details about the queue families and queues supported by a device.

Each index in the `pQueueFamilyProperties` array returned by `vkGetPhysicalDeviceQueueFamilyProperties` describes a unique queue family on that physical device. These indices are used when creating queues, and they correspond directly with the `queueFamilyIndex` that is passed to the `vkCreateDevice` command via the `VkDeviceQueueCreateInfo` structure as described in the [Queue Creation](#) section below.

Grouping of queue families within a physical device is implementation-dependent.

NOTE

The general expectation is that a physical device groups all queues of matching capabilities into a single family. However, while implementations **should** do this, it is possible that a physical device **may** return two separate queue families with the same capabilities.

Once an application has identified a physical device with the queue(s) that it desires to use, it will create those queues in conjunction with a logical device. This is described in the following section.

5.3.2. Queue Creation

Creating a logical device also creates the queues associated with that device. The queues to create

are described by a set of [VkDeviceQueueCreateInfo](#) structures that are passed to [vkCreateDevice](#) in [pQueueCreateInfos](#). Queues **cannot** be independently destroyed, and are instead destroyed with the [VkDevice](#) that they were created from.

Queues are represented by [VkQueue](#) handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkQueue)
```

The [VkDeviceQueueCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDeviceQueueCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t            queueFamilyIndex;
    uint32_t            queueCount;
    const float*        pQueuePriorities;
} VkDeviceQueueCreateInfo;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [flags](#) is a bitmask indicating behavior of the queues.
- [queueFamilyIndex](#) is an unsigned integer indicating the index of the queue family in which to create the queues on this device. This index corresponds to the index of an element of the [pQueueFamilyProperties](#) array that was returned by [vkGetPhysicalDeviceQueueFamilyProperties](#).
- [queueCount](#) is an unsigned integer specifying the number of queues to create in the queue family indicated by [queueFamilyIndex](#), and with the behavior specified by [flags](#).
- [pQueuePriorities](#) is a pointer to an array of [queueCount](#) normalized floating-point values, specifying priorities of work that will be submitted to each created queue. See [Queue Priority](#) for more information.

Some queue families support functionality which requires a device feature or extension to be enabled, as indicated by the [VkQueueFamilyProperties::queueFlags](#) member. Applications **may** create such queues and submit [queue submission commands](#) to them without enabling the corresponding feature or extension, but **must** not utilize the specific functionality that they did not enable.

For example, [sparse memory management operations](#) **can** be performed on queues from queue families exposing the [VK_QUEUE_SPARSE_BINDING_BIT](#) bit, provided the [sparseBinding](#) feature is enabled. If a queue family supports both the [VK_QUEUE_SPARSE_BINDING_BIT](#) and [VK_QUEUE_TRANSFER_BIT](#) bits, applications **may** create a queue from this family and issue transfer operations without enabling the [sparseBinding](#) feature.

Valid Usage

- VUID-VkDeviceQueueCreateInfo-queueFamilyIndex-00381
`queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties`
- VUID-VkDeviceQueueCreateInfo-queueCount-00382
`queueCount` **must** be less than or equal to the `queueCount` member of the `VkQueueFamilyProperties` structure, as returned by `vkGetPhysicalDeviceQueueFamilyProperties` in the `pQueueFamilyProperties[queueFamilyIndex]`
- VUID-VkDeviceQueueCreateInfo-pQueuePriorities-00383
Each element of `pQueuePriorities` **must** be between `0.0` and `1.0` inclusive
- VUID-VkDeviceQueueCreateInfo-flags-02861
If the `protectedMemory` feature is not enabled, the `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT` bit of `flags` **must** not be set
- VUID-VkDeviceQueueCreateInfo-flags-06449
If `flags` includes `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT`, `queueFamilyIndex` **must** be the index of a queue family that includes the `VK_QUEUE_PROTECTED_BIT` capability
- VUID-VkDeviceQueueCreateInfo-pNext-09398
If the `pNext` chain includes a `VkDeviceQueueShaderCoreControlCreateInfoARM` structure then `VkPhysicalDeviceSchedulingControlsPropertiesARM::schedulingControlsFlags` **must** contain `VK_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_SHADER_CORE_COUNT_ARM`
- VUID-VkDeviceQueueCreateInfo-internallySynchronizedQueues-12348
If the `internallySynchronizedQueues` feature is not enabled, `flags` **must** not include `VK_DEVICE_QUEUE_CREATE INTERNALLY SYNCHRONIZED_BIT_KHR`

Valid Usage (Implicit)

- VUID-VkDeviceQueueCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO`
- VUID-VkDeviceQueueCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceQueueGlobalPriorityCreateInfo` or `VkDeviceQueueShaderCoreControlCreateInfoARM`
- VUID-VkDeviceQueueCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkDeviceQueueCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkDeviceQueueCreateFlagBits` values
- VUID-VkDeviceQueueCreateInfo-pQueuePriorities-parameter
`pQueuePriorities` **must** be a valid pointer to an array of `queueCount` float values
- VUID-VkDeviceQueueCreateInfo-queueCount-arraylength
`queueCount` **must** be greater than `0`

Bits which **can** be set in `VkDeviceQueueCreateInfo::flags`, specifying usage behavior of a queue, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkDeviceQueueCreateFlagBits {
    // Provided by VK_VERSION_1_1
    VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT = 0x00000001,
    // Provided by VK_KHR_internally_synchronized_queues
    VK_DEVICE_QUEUE_CREATE_INTERNALLY_SYNCHRONIZED_BIT_KHR = 0x00000004,
} VkDeviceQueueCreateFlagBits;
```

- `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT` specifies that the device queue is a protected-capable queue.
- `VK_DEVICE_QUEUE_CREATE_INTERNALLY_SYNCHRONIZED_BIT_KHR` specifies that the device queue is internally synchronized and does not require external synchronization.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceQueueCreateFlags;
```

`VkDeviceQueueCreateFlags` is a bitmask type for setting a mask of zero or more `VkDeviceQueueCreateFlagBits`.

Queues **can** be created with a system-wide priority by adding a `VkDeviceQueueGlobalPriorityCreateInfo` structure to the `pNext` chain of `VkDeviceQueueCreateInfo`.

The `VkDeviceQueueGlobalPriorityCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkDeviceQueueGlobalPriorityCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkQueueGlobalPriority globalPriority;
} VkDeviceQueueGlobalPriorityCreateInfo;
```

```
// Provided by VK_KHR_global_priority
// Equivalent to VkDeviceQueueGlobalPriorityCreateInfo
typedef VkDeviceQueueGlobalPriorityCreateInfo
VkDeviceQueueGlobalPriorityCreateInfoKHR;
```

```
// Provided by VK_EXT_global_priority
// Equivalent to VkDeviceQueueGlobalPriorityCreateInfo
typedef VkDeviceQueueGlobalPriorityCreateInfo
VkDeviceQueueGlobalPriorityCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `globalPriority` is the system-wide priority associated to these queues as specified by `VkQueueGlobalPriority`

Queues created without specifying `VkDeviceQueueGlobalPriorityCreateInfo` will default to `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM`.

Valid Usage (Implicit)

- VUID-VkDeviceQueueGlobalPriorityCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO`
- VUID-VkDeviceQueueGlobalPriorityCreateInfo-globalPriority-parameter
`globalPriority` **must** be a valid `VkQueueGlobalPriority` value

Structure Chaining

Extends the structure

- `VkDeviceQueueCreateInfo`

Possible values of `VkDeviceQueueGlobalPriorityCreateInfo::globalPriority`, specifying a system-wide priority level are:

```
// Provided by VK_VERSION_1_4
typedef enum VkQueueGlobalPriority {
    VK_QUEUE_GLOBAL_PRIORITY_LOW = 128,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM = 256,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH = 512,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME = 1024,
// Provided by VK_EXT_global_priority
    VK_QUEUE_GLOBAL_PRIORITY_LOW_EXT = VK_QUEUE_GLOBAL_PRIORITY_LOW,
// Provided by VK_EXT_global_priority
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT = VK_QUEUE_GLOBAL_PRIORITY_MEDIUM,
// Provided by VK_EXT_global_priority
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_EXT = VK_QUEUE_GLOBAL_PRIORITY_HIGH,
// Provided by VK_EXT_global_priority
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_EXT = VK_QUEUE_GLOBAL_PRIORITY_REALTIME,
// Provided by VK_KHR_global_priority
    VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR = VK_QUEUE_GLOBAL_PRIORITY_LOW,
// Provided by VK_KHR_global_priority
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR = VK_QUEUE_GLOBAL_PRIORITY_MEDIUM,
// Provided by VK_KHR_global_priority
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR = VK_QUEUE_GLOBAL_PRIORITY_HIGH,
// Provided by VK_KHR_global_priority
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR = VK_QUEUE_GLOBAL_PRIORITY_REALTIME,
} VkQueueGlobalPriority;
```

```
// Provided by VK_KHR_global_priority
// Equivalent to VkQueueGlobalPriority
typedef VkQueueGlobalPriority VkQueueGlobalPriorityKHR;
```

```
// Provided by VK_EXT_global_priority
// Equivalent to VkQueueGlobalPriority
typedef VkQueueGlobalPriority VkQueueGlobalPriorityEXT;
```

Priority values are sorted in ascending order. A comparison operation on the enum values can be used to determine the priority order.

- [VK_QUEUE_GLOBAL_PRIORITY_LOW](#) is below the system default. Useful for non-interactive tasks.
- [VK_QUEUE_GLOBAL_PRIORITY_MEDIUM](#) is the system default priority.
- [VK_QUEUE_GLOBAL_PRIORITY_HIGH](#) is above the system default.
- [VK_QUEUE_GLOBAL_PRIORITY_REALTIME](#) is the highest priority. Useful for critical tasks.

Queues with higher system priority **may** be allotted more processing time than queues with lower priority. An implementation **may** allow a higher-priority queue to starve a lower-priority queue until the higher-priority queue has no further commands to execute.

Priorities imply no ordering or scheduling constraints.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

The global priority level of a queue takes precedence over the per-process queue priority ([VkDeviceQueueCreateInfo::pQueuePriorities](#)).

Abuse of this feature **may** result in starving the rest of the system of implementation resources. Therefore, the driver implementation **may** deny requests to acquire a priority above the default priority ([VK_QUEUE_GLOBAL_PRIORITY_MEDIUM](#)) if the caller does not have sufficient privileges. In this scenario [VK_ERROR_NOT_PERMITTED](#) is returned.

The driver implementation **may** fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario [VK_ERROR_INITIALIZATION_FAILED](#) is returned.

If the [globalPriorityQuery](#) feature is enabled and the requested global priority is not reported via [VkQueueFamilyGlobalPriorityProperties](#), the driver implementation **must** fail the queue creation. In this scenario, [VK_ERROR_INITIALIZATION_FAILED](#) is returned.

The number of shader cores used by a queue **can** be controlled by adding a [VkDeviceQueueShaderCoreControlCreateInfoARM](#) structure to the [pNext](#) chain of [VkDeviceQueueCreateInfo](#) structures.

The [VkDeviceQueueShaderCoreControlCreateInfoARM](#) structure is defined as:

```
// Provided by VK_ARM_scheduling_controls
typedef struct VkDeviceQueueShaderCoreControlCreateInfoARM {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           shaderCoreCount;
} VkDeviceQueueShaderCoreControlCreateInfoARM;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [shaderCoreCount](#) is the number of shader cores this queue uses.

Queues created without specifying [VkDeviceQueueShaderCoreControlCreateInfoARM](#) will default to using all the shader cores available.

Valid Usage

- VUID-VkDeviceQueueShaderCoreControlCreateInfoARM-shaderCoreCount-09399
[shaderCoreCount](#) **must** be greater than 0 and less than or equal to the total number of shader cores as reported via [VkPhysicalDeviceShaderCoreBuiltinsPropertiesARM::shaderCoreCount](#)

Valid Usage (Implicit)

- VUID-VkDeviceQueueShaderCoreControlCreateInfoARM-sType-sType **must** be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_SHADER_CORE_CONTROL_CREATE_INFO_ARM`

Structure Chaining

Extends the structures

- `VkDeviceCreateInfo`
- `VkDeviceQueueCreateInfo`

To retrieve a handle to a `VkQueue` object, call:

```
// Provided by VK_VERSION_1_0
void vkGetDeviceQueue(
    VkDevice          device,
    uint32_t          queueFamilyIndex,
    uint32_t          queueIndex,
    VkQueue*          pQueue);
```

- `device` is the logical device that owns the queue.
- `queueFamilyIndex` is the index of the queue family to which the queue belongs.
- `queueIndex` is the index within this queue family of the queue to retrieve.
- `pQueue` is a pointer to a `VkQueue` object that will be filled with the handle for the requested queue.

`vkGetDeviceQueue` **must** only be used to get queues that were created with the `flags` parameter of `VkDeviceQueueCreateInfo` set to zero. To get queues that were created with a non-zero `flags` parameter use `vkGetDeviceQueue2`.

Valid Usage

- VUID-vkGetDeviceQueue-queueFamilyIndex-00384
`queueFamilyIndex` **must** be one of the queue family indices specified when `device` was created, via the `VkDeviceQueueCreateInfo` structure
- VUID-vkGetDeviceQueue-queueIndex-00385
`queueIndex` **must** be less than the value of `VkDeviceQueueCreateInfo::queueCount` for the queue family indicated by `queueFamilyIndex` when `device` was created
- VUID-vkGetDeviceQueue-flags-01841
`VkDeviceQueueCreateInfo::flags` **must** have been zero when `device` was created

Valid Usage (Implicit)

- VUID-vkGetDeviceQueue-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkGetDeviceQueue-pQueue-parameter
pQueue must be a valid pointer to a [VkQueue](#) handle

To retrieve a handle to a [VkQueue](#) object with specific [VkDeviceQueueCreateFlags](#) creation flags, call:

```
// Provided by VK_VERSION_1_1
void vkGetDeviceQueue2(
    VkDevice          device,
    const VkDeviceQueueInfo2* pQueueInfo,
    VkQueue*          pQueue);
```

- **device** is the logical device that owns the queue.
- **pQueueInfo** is a pointer to a [VkDeviceQueueInfo2](#) structure, describing parameters of the device queue to be retrieved.
- **pQueue** is a pointer to a [VkQueue](#) object that will be filled with the handle for the requested queue.

Valid Usage (Implicit)

- VUID-vkGetDeviceQueue2-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkGetDeviceQueue2-pQueueInfo-parameter
pQueueInfo must be a valid pointer to a valid [VkDeviceQueueInfo2](#) structure
- VUID-vkGetDeviceQueue2-pQueue-parameter
pQueue must be a valid pointer to a [VkQueue](#) handle

The [VkDeviceQueueInfo2](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceQueueInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t            queueFamilyIndex;
    uint32_t            queueIndex;
} VkDeviceQueueInfo2;
```

- **sType** is a [VkStructureType](#) value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure. The `pNext` chain of `VkDeviceQueueInfo2` **can** be used to provide additional device queue parameters to `vkGetDeviceQueue2`.
- `flags` is a `VkDeviceQueueCreateFlags` value indicating the flags used to create the device queue.
- `queueFamilyIndex` is the index of the queue family to which the queue belongs.
- `queueIndex` is the index of the queue to retrieve from within the set of queues that share both the queue family and flags specified.

The queue returned by `vkGetDeviceQueue2` **must** have the same `flags` value from this structure as that used at device creation time in a `VkDeviceQueueCreateInfo` structure.

NOTE

Normally, if you create both protected-capable and non-protected-capable queues with the same family, they are treated as separate lists of queues and `queueIndex` is relative to the start of the list of queues specified by both `queueFamilyIndex` and `flags`. However, for historical reasons, some implementations may exhibit different behavior. These divergent implementations instead concatenate the lists of queues and treat `queueIndex` as relative to the start of the first list of queues with the given `queueFamilyIndex`. This only matters in cases where an application has created both protected-capable and non-protected-capable queues from the same queue family.

For such divergent implementations, the maximum value of `queueIndex` is equal to the sum of `VkDeviceQueueCreateInfo::queueCount` minus one, for all `VkDeviceQueueCreateInfo` structures that share a common `queueFamilyIndex`.

Such implementations will return `NULL` for either the protected or unprotected queues when calling `vkGetDeviceQueue2` with `queueIndex` in the range zero to `VkDeviceQueueCreateInfo::queueCount` minus one. In cases where these implementations returned `NULL`, the corresponding queues are instead located in the extended range described in the preceding two paragraphs.

This behavior will not be observed on any driver that has passed Vulkan conformance test suite version 1.3.3.0, or any subsequent version. This information can be found by querying `VkPhysicalDeviceDriverProperties::conformanceVersion`.

Valid Usage

- VUID-VkDeviceQueueInfo2-queueFamilyIndex-01842
`queueFamilyIndex` **must** be one of the queue family indices specified when `device` was created, via the `VkDeviceQueueCreateInfo` structure
- VUID-VkDeviceQueueInfo2-flags-06225
`flags` **must** be equal to `VkDeviceQueueCreateInfo::flags` for a `VkDeviceQueueCreateInfo` structure for the queue family indicated by `queueFamilyIndex` when `device` was created
- VUID-VkDeviceQueueInfo2-queueIndex-01843
`queueIndex` **must** be less than `VkDeviceQueueCreateInfo::queueCount` for the corresponding queue family and flags indicated by `queueFamilyIndex` and `flags` when `device` was created

Valid Usage (Implicit)

- VUID-VkDeviceQueueInfo2-sType-sType
sType must be [VK_STRUCTURE_TYPE_DEVICE_QUEUE_INFO_2](#)
- VUID-VkDeviceQueueInfo2-pNext-pNext
pNext must be `NULL`
- VUID-VkDeviceQueueInfo2-flags-parameter
flags must be a valid combination of [VkDeviceQueueCreateFlagBits](#) values

5.3.3. Queue Family Index

The queue family index is used in multiple places in Vulkan in order to tie operations to a specific family of queues.

When retrieving a handle to the queue via [vkGetDeviceQueue](#), the queue family index is used to select which queue family to retrieve the [VkQueue](#) handle from as described in the previous section.

When creating a [VkCommandPool](#) object (see [Command Pools](#)), a queue family index is specified in the [VkCommandPoolCreateInfo](#) structure. Command buffers from this pool **can** only be submitted on queues corresponding to this queue family.

When creating [VkImage](#) (see [Images](#)) and [VkBuffer](#) (see [Buffers](#)) resources, a set of queue families is included in the [VkImageCreateInfo](#) and [VkBufferCreateInfo](#) structures to specify the queue families that **can** access the resource.

When inserting a [VkBufferMemoryBarrier](#) or [VkImageMemoryBarrier](#) (see [Pipeline Barriers](#)), a source and destination queue family index is specified to allow the ownership of a buffer or image to be transferred from one queue family to another. See the [Resource Sharing](#) section for details.

5.3.4. Queue Priority

Each queue is assigned a priority, as set in the [VkDeviceQueueCreateInfo](#) structures when creating the device. The priority of each queue is a normalized floating-point value between 0.0 and 1.0, which is then translated to a discrete priority level by the implementation. Higher values indicate a higher priority, with 0.0 being the lowest priority and 1.0 being the highest.

Within the same device, queues with higher priority **may** be allotted more processing time than queues with lower priority. The implementation makes no guarantees with regards to ordering or scheduling among queues with the same priority, other than the constraints defined by any [explicit synchronization primitives](#). The implementation makes no guarantees with regards to queues across different devices.

An implementation **may** allow a higher-priority queue to starve a lower-priority queue on the same [VkDevice](#) until the higher-priority queue has no further commands to execute. The relationship of queue priorities **must** not cause queues on one [VkDevice](#) to starve queues on another [VkDevice](#).

No specific guarantees are made about higher priority queues receiving more processing time or

better quality of service than lower priority queues.

Queue Performance Hints

Each queue has performance hint state, which defaults to [VK_PERF_HINT_TYPE_DEFAULT_QCOM](#) when creating them with device.

Applications **can** set a performance hint on the queue to influence the power and performance settings for the operation of the device while the queue is active. This state persists for the lifetime of the queue object and resets when the queue is destroyed or replaced when another performance hint is set on queue.

Determination of whether or not a queue is active is implementation-dependent. Submitting commands to an inactive queue reapplies the queue's current performance hint state to device.

To set a performance hint on a [VkQueue](#) object, call:

```
// Provided by VK_QCOM_queue_perf_hint
VkResult vkQueueSetPerfHintQCOM(
    VkQueue queue,
    const VkPerfHintInfoQCOM* pPerfHintInfo);
```

- `queue` is the queue to set the performance hint on.
- `pPerfHintInfo` is a pointer to a [VkPerfHintInfoQCOM](#) structure, describing the performance hint to set.

Valid Usage

- VUID-vkQueueSetPerfHintQCOM-queuePerfHint-12387
The `queuePerfHint` feature **must** be enabled
- VUID-vkQueueSetPerfHintQCOM-queue-12388
`queue` **must** support at least one of the queue types specified in [VkPhysicalDeviceQueuePerfHintPropertiesQCOM::supportedQueues](#)

Valid Usage (Implicit)

- VUID-vkQueueSetPerfHintQCOM-queue-parameter
`queue` **must** be a valid [VkQueue](#) handle
- VUID-vkQueueSetPerfHintQCOM-pPerfHintInfo-parameter
`pPerfHintInfo` **must** be a valid pointer to a valid [VkPerfHintInfoQCOM](#) structure

Host Synchronization

- Host access to `queue` **must** be externally synchronized if it was not created with

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
-	-	-	Any	-

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkPerfHintInfoQCOM](#) structure is defined as:

```
// Provided by VK_QCOM_queue_perf_hint
typedef struct VkPerfHintInfoQCOM {
    VkStructureType    sType;
    void*              pNext;
    VkPerfHintTypeQCOM type;
    uint32_t           scale;
} VkPerfHintInfoQCOM;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [type](#) is a [VkPerfHintTypeQCOM](#) value indicating the type of performance hint to apply.
- [scale](#) is a normalized fixed-point scale factor.

The device has two global frequency constraints, f_{min} and f_{max} , that can be influenced by the [VK_PERF_HINT_TYPE_FREQUENCY_MIN_QCOM](#), [VK_PERF_HINT_TYPE_FREQUENCY_MAX_QCOM](#), and [VK_PERF_HINT_TYPE_FREQUENCY_SCALED_QCOM](#) performance hints. These constraints determine the range of clock frequencies that the platform performance algorithms **may** select from. If no constraints are set, f_{min} and f_{max} are set to the minimum and maximum frequencies the device can support, F_{min} and F_{max} respectively.

The f_{min} constraint applied by [VK_PERF_HINT_TYPE_FREQUENCY_SCALED_QCOM](#) is calculated with the following:

$$f_{min} = \lfloor \frac{scale}{100} \times F_{max} \rfloor$$

The implementation rounds f_{min} down to the next available lower frequency the device supports, clamped to F_{min} .

The global frequency constraints are determined by combining the performance hints from all of the device's active queues of all processes on the host. Performance hints that influence device frequency are ranked, where a higher ranked hint supersedes all lower ranked hints. These are listed in order of highest rank to lowest:

- `VK_PERF_HINT_TYPE_FREQUENCY_MAX_QCOM`
- `VK_PERF_HINT_TYPE_FREQUENCY_SCALED_QCOM` and `scale` equal to `100`
- `VK_PERF_HINT_TYPE_FREQUENCY_SCALED_QCOM` and `scale` equal to `99`
- `VK_PERF_HINT_TYPE_FREQUENCY_SCALED_QCOM` and `scale` equal to `98`
- ...
- `VK_PERF_HINT_TYPE_FREQUENCY_SCALED_QCOM` and `scale` equal to `0`
- `VK_PERF_HINT_TYPE_DEFAULT_QCOM`
- `VK_PERF_HINT_TYPE_FREQUENCY_MIN_QCOM`

This means that `VK_PERF_HINT_TYPE_FREQUENCY_MIN_QCOM` only takes effect if all of the device's other active queues running on the host also have the `VK_PERF_HINT_TYPE_FREQUENCY_MIN_QCOM` hint applied.

NOTE

If any queue is active that never had a performance hint applied and therefore is in the `VK_PERF_HINT_TYPE_DEFAULT_QCOM` state, it will supersede in setting the constraints over `VK_PERF_HINT_TYPE_FREQUENCY_MIN_QCOM`. This is necessary to avoid negatively impacting performance for normal queues while a low power queue is active.

Valid Usage

- VUID-VkPerfHintInfoQCOM-type-12389
If `type` is not `VK_PERF_HINT_TYPE_FREQUENCY_SCALED_QCOM`, `scale` **must** equal `0`
- VUID-VkPerfHintInfoQCOM-scale-12390
`scale` **must** be less than or equal to `100`

Valid Usage (Implicit)

- VUID-VkPerfHintInfoQCOM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PERF_HINT_INFO_QCOM`
- VUID-VkPerfHintInfoQCOM-pNext-pNext
`pNext` **must** be `NULL`

- VUID-VkPerfHintInfoQCOM-type-parameter
type must be a valid [VkPerfHintTypeQCOM](#) value

Possible values of [VkPerfHintInfoQCOM::type](#), specifying the type of performance hint to apply, are:

```
// Provided by VK_QCOM_queue_perf_hint
typedef enum VkPerfHintTypeQCOM {
    VK_PERF_HINT_TYPE_DEFAULT_QCOM = 0,
    VK_PERF_HINT_TYPE_FREQUENCY_MIN_QCOM = 1,
    VK_PERF_HINT_TYPE_FREQUENCY_MAX_QCOM = 2,
    VK_PERF_HINT_TYPE_FREQUENCY_SCALED_QCOM = 3,
} VkPerfHintTypeQCOM;
```

- [VK_PERF_HINT_TYPE_DEFAULT_QCOM](#) resets the performance hint state back to default for the queue.
- [VK_PERF_HINT_TYPE_FREQUENCY_MIN_QCOM](#) specifies the queue **should** prioritize power and sets the frequency constraints f_{\min} and f_{\max} to F_{\min} .
- [VK_PERF_HINT_TYPE_FREQUENCY_MAX_QCOM](#) specifies the queue **should** prioritize performance and sets the frequency constraints f_{\min} and f_{\max} to F_{\max} .
- [VK_PERF_HINT_TYPE_FREQUENCY_SCALED_QCOM](#) specifies the queue **should** be balanced between performance and power and sets the frequency constraint f_{\min} by applying a scale factor to F_{\max} . No constraint is applied to f_{\max} .

5.3.5. Queue Submission

Work is submitted to a queue via *queue submission* commands such as [vkQueueSubmit2](#) or [vkQueuePresentKHR](#) or [vkQueueSubmit](#). Queue submission commands define a set of *queue operations* to be executed by the underlying physical device, including synchronization with semaphores and fences.

Submission commands take as parameters a target queue, zero or more *batches* of work, and an **optional** fence to signal upon completion. Each batch consists of three distinct parts:

1. Zero or more semaphores to wait on before execution of the rest of the batch.
 - If present, these describe a [semaphore wait operation](#).
2. Zero or more work items to execute.
 - If present, these describe a *queue operation* matching the work described.
3. Zero or more semaphores to signal upon completion of the work items.
 - If present, these describe a [semaphore signal operation](#).

If a fence is present in a queue submission, it describes a [fence signal operation](#).

All work described by a queue submission command **must** be submitted to the queue before the command returns.

Sparse Memory Binding

In Vulkan it is possible to sparsely bind memory to buffers and images as described in the [Sparse Resource](#) chapter. Sparse memory binding is a queue operation. A queue whose flags include the `VK_QUEUE_SPARSE_BINDING_BIT` **must** be able to support the mapping of a virtual address to a physical address on the device. This causes an update to the page table mappings on the device. This update **must** be synchronized on a queue to avoid corrupting page table mappings during execution of graphics commands. By binding the sparse memory resources on queues, all commands that are dependent on the updated bindings are synchronized to only execute after the binding is updated. See the [Synchronization and Cache Control](#) chapter for how this synchronization is accomplished.

5.3.6. Queue Destruction

Queues are created along with a logical device during `vkCreateDevice`. All queues associated with a logical device are destroyed when `vkDestroyDevice` is called on that device.

Chapter 6. Command Buffers

Command buffers are objects used to record commands which **can** be subsequently submitted to a device queue for execution. There are two levels of command buffers - *primary command buffers*, which **can** execute secondary command buffers, and which are submitted to queues, and *secondary command buffers*, which **can** be executed by primary command buffers, and which are not directly submitted to queues.

Command buffers are represented by `VkCommandBuffer` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkCommandBuffer)
```

Recorded commands include commands to bind pipelines and descriptor sets to the command buffer, commands to modify dynamic state, commands to draw (for graphics rendering), commands to dispatch (for compute), commands to execute secondary command buffers (for primary command buffers only), commands to copy buffers and images, and other commands.

Each command buffer manages state independently of other command buffers. There is no inheritance of state across primary and secondary command buffers, or between secondary command buffers. When a command buffer begins recording, all state in that command buffer is undefined. When secondary command buffer(s) are recorded to execute on a primary command buffer, the secondary command buffer inherits no state from the primary command buffer, and all state of the primary command buffer is undefined after an execute secondary command buffer command is recorded, with the following exception(s):

- If the primary command buffer is inside a render pass instance, then the render pass and subpass state is not disturbed by executing secondary command buffers.
- If the primary command buffer has a descriptor heap bound, and the address of that descriptor heap is specified in `VkCommandBufferInheritanceDescriptorHeapInfoEXT` for every secondary command buffer, that heap binding is not disturbed by executing secondary command buffers.

For state dependent commands (such as draws and dispatches), any state consumed by those commands **must** not be undefined.

`VkCommandBufferInheritanceViewportScissorInfoNV` defines an exception allowing limited inheritance of dynamic viewport and scissor state.

Unless otherwise specified, and without explicit synchronization, the various commands submitted to a queue via command buffers **may** execute in arbitrary order relative to each other, and/or concurrently. Also, the memory side effects of those commands **may** not be directly visible to other commands without explicit memory dependencies. This is true within a command buffer, and across command buffers submitted to a given queue. See [the synchronization chapter](#) for information on [implicit](#) and explicit synchronization between commands.

6.1. Command Buffer Lifecycle

Each command buffer is always in one of the following states:

Initial

Command buffers in the *initial state* **can** only be transitioned to the recording state, or freed. When a command buffer is [allocated](#), it is in the *initial state*. Command buffers in any state other than the pending state **can** be transitioned to the initial state by calling [vkResetCommandPool](#) on the pool they were allocated from. Command buffers allocated from a command pool created with [VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT](#) and in any state other than the pending state **can** also be transitioned to the initial state by calling [vkResetCommandBuffer](#).

Recording

Command buffers in the *recording state* **can** be used to record commands via [vkCmd*](#) commands, be reset, or be freed. Command buffers in the initial state **can** be transitioned to the recording state by [vkBeginCommandBuffer](#). Command buffers allocated from a command pool created with [VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT](#) in the invalid, recording, or executable state **can** also be transitioned to the recording state by [vkBeginCommandBuffer](#).

Executable

A command buffer in the *executable state* **can** be [submitted for execution](#), reset, freed, or [recorded to another command buffer](#). Command buffers in the recording state are transitioned to the executable state by [vkEndCommandBuffer](#). Command buffers in the pending state that were recorded without the [VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT](#) flag immediately return to the executable state as the final command in the command buffer completes all execution, which can be observed via [synchronization commands](#).

Pending

A command buffer in the *pending state* **must** not be modified by the application, as it **may** be executing on the device. Command buffers in the pending state that were recorded without the [VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT](#) flag, or with the [VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT](#) flag, **must** not be submitted to the device for execution. Command buffers in the executable state **can** be transitioned to the pending state by [queue submission commands](#). Once commands in the command buffer have completed all execution, the command buffer is immediately in either the executable state, or in the invalid state if it was recorded with the [VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT](#) flag. A [synchronization](#) command **can** be used to detect when command execution is complete.

Invalid

A command buffer in the *invalid state* **can** be reset or freed. Command buffers in any state other than the pending state will transition to the invalid state if any memory or object, other than [VkCommandPool](#), that **may** be accessed when the command buffer is accessed (e.g. an object bound to the command buffer) is destroyed or freed. Command buffers in any state other than the pending state will transition to the invalid state if any command buffer executed within it via [vkCmdExecuteCommands](#) transitions to any state other than the pending or executable state. Command buffers in the pending state that were recorded without the [VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT](#) flag are immediately invalid as the

final command in the command buffer completes all execution, which can be observed via [synchronization commands](#).

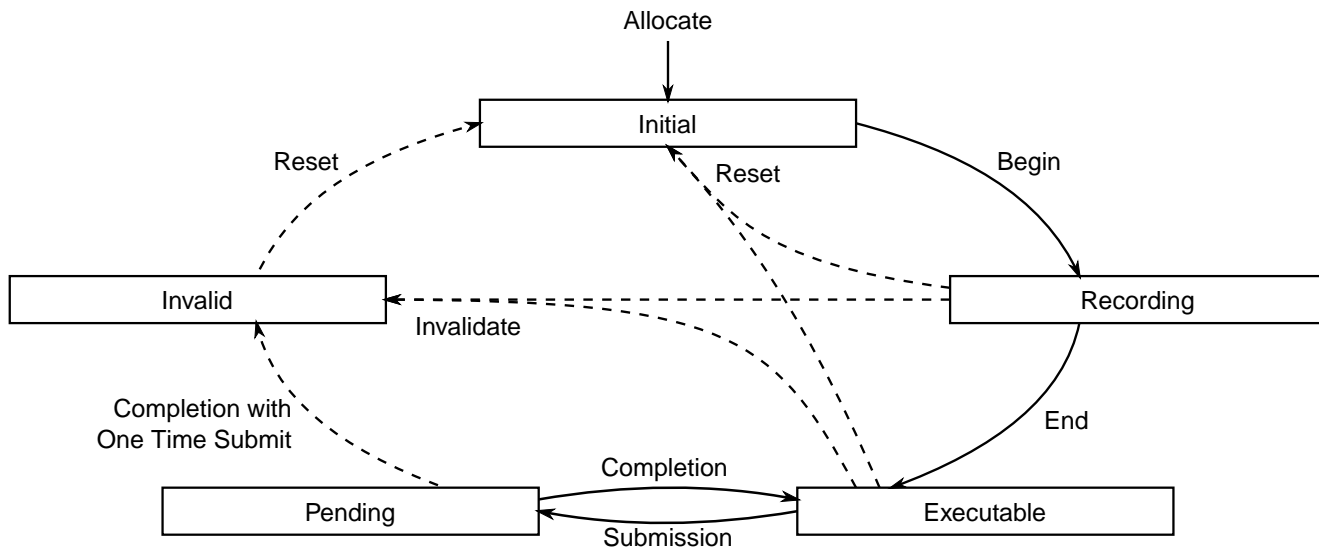

Figure 1. Lifecycle of a command buffer

NOTE

The pending state is tied entirely to the status of execution of a command buffer’s commands; once all commands are finished executing, the command buffer is in the subsequent state (executable or invalid) with no further intervention.

Detection of the final command in a command buffer completing all stages of execution (i.e. `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`) with a [synchronization command](#) is sufficient to ensure the command buffer is in the expected state.

[Secondary command buffers](#) can be recorded to a primary command buffer via `vkCmdExecuteCommands`. This partially ties the lifecycle of the two command buffers together - if the primary is submitted to a queue, both the primary and any secondaries recorded to it move to the *pending* state. Similarly, once execution of the primary completes, it completes for any command buffer recorded within it.

NOTE

Resetting or freeing a primary command buffer removes the lifecycle linkage to all secondary command buffers that were recorded into it.

6.2. Command Pools

Command pools are opaque objects that command buffer memory is allocated from, and which allow the implementation to amortize the cost of resource creation across multiple command buffers. Command pools are externally synchronized, meaning that a command pool **must** not be used concurrently in multiple threads. That includes use via recording commands on any command buffers allocated from the pool, as well as operations that allocate, free, and reset command buffers or the pool itself.

Command pools are represented by `VkCommandPool` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCommandPool)
```

To create a command pool, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateCommandPool(
    VkDevice                                device,
    const VkCommandPoolCreateInfo*          pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkCommandPool*                          pCommandPool);
```

- **device** is the logical device that creates the command pool.
- **pCreateInfo** is a pointer to a [VkCommandPoolCreateInfo](#) structure specifying the state of the command pool object.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pCommandPool** is a pointer to a [VkCommandPool](#) handle in which the created pool is returned.

Valid Usage

- VUID-vkCreateCommandPool-queueFamilyIndex-01937
pCreateInfo->queueFamilyIndex **must** be the index of a queue family available in the logical device **device**

Valid Usage (Implicit)

- VUID-vkCreateCommandPool-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateCommandPool-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkCommandPoolCreateInfo](#) structure
- VUID-vkCreateCommandPool-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateCommandPool-pCommandPool-parameter
pCommandPool **must** be a valid pointer to a [VkCommandPool](#) handle
- VUID-vkCreateCommandPool-device-queuecount
The device **must** have been created with at least **1** queue

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkCommandPoolCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandPoolCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkCommandPoolCreateFlags flags;
    uint32_t             queueFamilyIndex;
} VkCommandPoolCreateInfo;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [flags](#) is a bitmask of [VkCommandPoolCreateFlagBits](#) indicating usage behavior for the pool and command buffers allocated from it.
- [queueFamilyIndex](#) designates a queue family as described in section [Queue Family Properties](#). All command buffers allocated from this command pool **must** be submitted on queues from the same queue family.

Valid Usage

- VUID-VkCommandPoolCreateInfo-flags-02860

If the [protectedMemory](#) feature is not enabled, the [VK_COMMAND_POOL_CREATE_PROTECTED_BIT](#) bit of [flags](#) **must** not be set

- VUID-VkCommandPoolCreateInfo-pNext-09908

If the [pNext](#) chain includes a [VkDataGraphProcessingEngineCreateInfoARM](#) structure, then [queueFamilyIndex](#) **must** designate a queue family that supports [VK_QUEUE_DATA_GRAPH_BIT_ARM](#)

- VUID-VkCommandPoolCreateInfo-pNext-09909

If the [pNext](#) chain includes a [VkDataGraphProcessingEngineCreateInfoARM](#) structure, each member of [pProcessingEngines](#) **must** be identical to [VkQueueFamilyDataGraphPropertiesARM::engine](#) retrieved from [vkGetPhysicalDeviceQueueFamilyDataGraphPropertiesARM](#) with [queueFamilyIndex](#) and

the `physicalDevice` that was used to create `device`

- VUID-VkCommandPoolCreateInfo-queueFamilyIndex-11830

If `queueFamilyIndex` designates a queue family that supports `VK_QUEUE_DATA_GRAPH_BIT_ARM` and enumerates a foreign engine through `vkGetPhysicalDeviceQueueFamilyDataGraphPropertiesARM` with type `VK_PHYSICAL_DEVICE_DATA_GRAPH_PROCESSING_ENGINE_TYPE_NEURAL_QCOM` or `VK_PHYSICAL_DEVICE_DATA_GRAPH_PROCESSING_ENGINE_TYPE_COMPUTE_QCOM`, the `pNext` chain must include `VkDataGraphProcessingEngineCreateInfoARM` with `VkPhysicalDeviceDataGraphProcessingEngineARM::isForeign` set to `VK_TRUE` for all elements of `pProcessingEngines`

Valid Usage (Implicit)

- VUID-VkCommandPoolCreateInfo-sType-sType

`sType` must be `VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO`

- VUID-VkCommandPoolCreateInfo-pNext-pNext

`pNext` must be `NULL` or a pointer to a valid instance of `VkDataGraphProcessingEngineCreateInfoARM`

- VUID-VkCommandPoolCreateInfo-sType-unique

The `sType` value of each structure in the `pNext` chain must be unique

- VUID-VkCommandPoolCreateInfo-flags-parameter

`flags` must be a valid combination of `VkCommandPoolCreateFlagBits` values

Bits which can be set in `VkCommandPoolCreateInfo::flags`, specifying usage behavior for a command pool, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolCreateFlagBits {
    VK_COMMAND_POOL_CREATE_TRANSIENT_BIT = 0x00000001,
    VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT = 0x00000002,
    // Provided by VK_VERSION_1_1
    VK_COMMAND_POOL_CREATE_PROTECTED_BIT = 0x00000004,
} VkCommandPoolCreateFlagBits;
```

- `VK_COMMAND_POOL_CREATE_TRANSIENT_BIT` specifies that command buffers allocated from the pool will be short-lived, meaning that they will be reset or freed in a relatively short timeframe. This flag may be used by the implementation to control memory allocation behavior within the pool.
- `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` allows any command buffer allocated from a pool to be individually reset to the initial state; either by calling `vkResetCommandBuffer`, or via the implicit reset when calling `vkBeginCommandBuffer`. If this flag is not set on a pool, then `vkResetCommandBuffer` must not be called for any command buffer allocated from that pool.

- [VK_COMMAND_POOL_CREATE_PROTECTED_BIT](#) specifies that command buffers allocated from the pool are protected command buffers.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolCreateFlags;
```

[VkCommandPoolCreateFlags](#) is a bitmask type for setting a mask of zero or more [VkCommandPoolCreateFlagBits](#).

To trim a command pool, call:

```
// Provided by VK_VERSION_1_1
void vkTrimCommandPool(
    VkDevice                device,
    VkCommandPool           commandPool,
    VkCommandPoolTrimFlags  flags);
```

```
// Provided by VK_KHR_maintenance1
// Equivalent to vkTrimCommandPool
void vkTrimCommandPoolKHR(
    VkDevice                device,
    VkCommandPool           commandPool,
    VkCommandPoolTrimFlags  flags);
```

- [device](#) is the logical device that owns the command pool.
- [commandPool](#) is the command pool to trim.
- [flags](#) is reserved for future use.

Trimming a command pool recycles unused memory from the command pool back to the system. Command buffers allocated from the pool are not affected by the command.

This command provides applications with some control over the internal memory allocations used by command pools.

NOTE Unused memory normally arises from command buffers that have been recorded and later reset, such that they are no longer using the memory. On reset, a command buffer can return memory to its command pool, but the only way to release memory from a command pool to the system requires calling [vkResetCommandPool](#), which cannot be executed while any command buffers from that pool are still in use. Subsequent recording operations into command buffers will reuse this memory but since total memory requirements fluctuate over time, unused memory can accumulate.

In this situation, trimming a command pool **may** be useful to return unused memory back to the system, returning the total outstanding memory allocated by the pool back to a more “average” value.

Implementations utilize many internal allocation strategies that make it impossible to guarantee that all unused memory is released back to the system. For instance, an implementation of a command pool **may** involve allocating memory in bulk from the system and sub-allocating from that memory. In such an implementation any live command buffer that holds a reference to a bulk allocation would prevent that allocation from being freed, even if only a small proportion of the bulk allocation is in use.

In most cases trimming will result in a reduction in allocated but unused memory, but it does not guarantee the “ideal” behavior.

Trimming **may** be an expensive operation, and **should** not be called frequently. Trimming **should** be treated as a way to relieve memory pressure after application-known points when there exists enough unused memory that the cost of trimming is “worth” it.

Valid Usage (Implicit)

- VUID-vkTrimCommandPool-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkTrimCommandPool-commandPool-parameter
commandPool **must** be a valid [VkCommandPool](#) handle
- VUID-vkTrimCommandPool-flags-zeroBitmask
flags **must** be 0
- VUID-vkTrimCommandPool-commandPool-parent
commandPool **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **commandPool** **must** be externally synchronized

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkCommandPoolTrimFlags;
```

```
// Provided by VK_KHR_maintenance1
// Equivalent to VkCommandPoolTrimFlags
typedef VkCommandPoolTrimFlags VkCommandPoolTrimFlagsKHR;
```

VkCommandPoolTrimFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To reset a command pool, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetCommandPool(
    VkDevice                device,
    VkCommandPool           commandPool,
    VkCommandPoolResetFlags flags);
```

- **device** is the logical device that owns the command pool.
- **commandPool** is the command pool to reset.
- **flags** is a bitmask of [VkCommandPoolResetFlagBits](#) controlling the reset operation.

Resetting a command pool recycles all of the resources from all of the command buffers allocated from the command pool back to the command pool. All command buffers that have been allocated from the command pool are put in the [initial state](#).

Any primary command buffer allocated from another [VkCommandPool](#) that is in the [recording or executable state](#) and has a secondary command buffer allocated from **commandPool** recorded into it, becomes [invalid](#).

Valid Usage

- VUID-vkResetCommandPool-commandPool-00040
All **VkCommandBuffer** objects allocated from **commandPool** **must** not be in the [pending state](#)

Valid Usage (Implicit)

- VUID-vkResetCommandPool-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkResetCommandPool-commandPool-parameter
commandPool **must** be a valid [VkCommandPool](#) handle
- VUID-vkResetCommandPool-flags-parameter
flags **must** be a valid combination of [VkCommandPoolResetFlagBits](#) values
- VUID-vkResetCommandPool-commandPool-parent
commandPool **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **commandPool** **must** be externally synchronized

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

Bits which **can** be set in [vkResetCommandPool::flags](#), controlling the reset operation, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolResetFlagBits {
    VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandPoolResetFlagBits;
```

- [VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT](#) specifies that resetting a command pool recycles all of the resources from the command pool back to the system.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolResetFlags;
```

[VkCommandPoolResetFlags](#) is a bitmask type for setting a mask of zero or more [VkCommandPoolResetFlagBits](#).

To destroy a command pool, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyCommandPool(
    VkDevice          device,
    VkCommandPool     commandPool,
    const VkAllocationCallbacks* pAllocator);
```

- [device](#) is the logical device that destroys the command pool.
- [commandPool](#) is the handle of the command pool to destroy.
- [pAllocator](#) controls host memory allocation as described in the [Memory Allocation](#) chapter.

When a pool is destroyed, all command buffers allocated from the pool are [freed](#).

Any primary command buffer allocated from another [VkCommandPool](#) that is in the [recording or executable state](#) and has a secondary command buffer allocated from [commandPool](#) recorded into it, becomes [invalid](#).

Valid Usage

- VUID-vkDestroyCommandPool-commandPool-00041
All `VkCommandBuffer` objects allocated from `commandPool` **must** not be in the `pending state`
- VUID-vkDestroyCommandPool-commandPool-00042
If `VkAllocationCallbacks` were provided when `commandPool` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyCommandPool-commandPool-00043
If no `VkAllocationCallbacks` were provided when `commandPool` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyCommandPool-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyCommandPool-commandPool-parameter
If `commandPool` is not `VK_NULL_HANDLE`, `commandPool` **must** be a valid `VkCommandPool` handle
- VUID-vkDestroyCommandPool-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyCommandPool-commandPool-parent
If `commandPool` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `commandPool` **must** be externally synchronized

6.3. Command Buffer Allocation and Management

To allocate command buffers, call:

```
// Provided by VK_VERSION_1_0
VkResult vkAllocateCommandBuffers(
    VkDevice device,
    const VkCommandBufferAllocateInfo* pAllocateInfo,
    VkCommandBuffer* pCommandBuffers);
```

- `device` is the logical device that owns the command pool.
- `pAllocateInfo` is a pointer to a `VkCommandBufferAllocateInfo` structure describing parameters

of the allocation. `commandPool` **may** be accessed any time one of the resulting command buffers is accessed.

- `pCommandBuffers` is a pointer to an array of `VkCommandBuffer` handles in which the resulting command buffer objects are returned. The array **must** be at least the length specified by the `commandBufferCount` member of `pAllocateInfo`. Each allocated command buffer begins in the initial state.

`vkAllocateCommandBuffers` **can** be used to allocate multiple command buffers. If the allocation of any of those command buffers fails, the implementation **must** free all successfully allocated command buffer objects from this command, set all entries of the `pCommandBuffers` array to `NULL` and return the error.

NOTE

Filling `pCommandBuffers` with `NULL` values on failure is an exception to the default error behavior that output parameters will have undefined contents.

When command buffers are first allocated, they are in the `initial state`.

Valid Usage (Implicit)

- VUID-vkAllocateCommandBuffers-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkAllocateCommandBuffers-pAllocateInfo-parameter
`pAllocateInfo` **must** be a valid pointer to a valid `VkCommandBufferAllocateInfo` structure
- VUID-vkAllocateCommandBuffers-pCommandBuffers-parameter
`pCommandBuffers` **must** be a valid pointer to an array of `pAllocateInfo->commandBufferCount` `VkCommandBuffer` handles
- VUID-vkAllocateCommandBuffers-device-queuecount
The device **must** have been created with at least `1` queue
- VUID-vkAllocateCommandBuffers-pAllocateInfo::commandBufferCount-arraylength
`pAllocateInfo->commandBufferCount` **must** be greater than `0`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkCommandBufferAllocateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferAllocateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkCommandPool        commandPool;
    VkCommandBufferLevel level;
    uint32_t             commandBufferCount;
} VkCommandBufferAllocateInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **commandPool** is the command pool from which the command buffers are allocated.
- **level** is a [VkCommandBufferLevel](#) value specifying the command buffer level.
- **commandBufferCount** is the number of command buffers to allocate from the pool.

Valid Usage (Implicit)

- VUID-VkCommandBufferAllocateInfo-sType-sType
sType must be [VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO](#)
- VUID-VkCommandBufferAllocateInfo-pNext-pNext
pNext must be `NULL`
- VUID-VkCommandBufferAllocateInfo-commandPool-parameter
commandPool must be a valid [VkCommandPool](#) handle
- VUID-VkCommandBufferAllocateInfo-level-parameter
level must be a valid [VkCommandBufferLevel](#) value

Host Synchronization

- Host access to **commandPool** **must** be externally synchronized

Possible values of [VkCommandBufferAllocateInfo::level](#), specifying the command buffer level, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferLevel {
    VK_COMMAND_BUFFER_LEVEL_PRIMARY = 0,
    VK_COMMAND_BUFFER_LEVEL_SECONDARY = 1,
} VkCommandBufferLevel;
```

- [VK_COMMAND_BUFFER_LEVEL_PRIMARY](#) specifies a primary command buffer.
- [VK_COMMAND_BUFFER_LEVEL_SECONDARY](#) specifies a secondary command buffer.

To reset a command buffer, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetCommandBuffer(
    VkCommandBuffer                commandBuffer,
    VkCommandBufferResetFlags      flags);
```

- **commandBuffer** is the command buffer to reset. The command buffer **can** be in any state other than **pending**, and is moved into the **initial state**.
- **flags** is a bitmask of **VkCommandBufferResetFlagBits** controlling the reset operation.

Any primary command buffer that is in the **recording or executable state** and has **commandBuffer** recorded into it, becomes **invalid**.

After a command buffer is reset, any objects or memory specified by commands recorded into the command buffer **must** no longer be accessed when the command buffer is accessed by the implementation.

Valid Usage

- VUID-vkResetCommandBuffer-commandBuffer-00045
commandBuffer **must** not be in the **pending state**
- VUID-vkResetCommandBuffer-commandBuffer-00046
commandBuffer **must** have been allocated from a pool that was created with the **VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT**

Valid Usage (Implicit)

- VUID-vkResetCommandBuffer-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkResetCommandBuffer-flags-parameter
flags **must** be a valid combination of **VkCommandBufferResetFlagBits** values

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Return Codes

Success

- **VK_SUCCESS**

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

Bits which **can** be set in [vkResetCommandBuffer::flags](#), controlling the reset operation, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferResetFlagBits {
    VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandBufferResetFlagBits;
```

- [VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT](#) specifies that most or all memory resources currently owned by the command buffer **should** be returned to the parent command pool. If this flag is not set, then the command buffer **may** hold onto memory resources and reuse them when recording commands. [commandBuffer](#) is moved to the [initial state](#).

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandBufferResetFlags;
```

[VkCommandBufferResetFlags](#) is a bitmask type for setting a mask of zero or more [VkCommandBufferResetFlagBits](#).

To free command buffers, call:

```
// Provided by VK_VERSION_1_0
void vkFreeCommandBuffers(
    VkDevice                device,
    VkCommandPool            commandPool,
    uint32_t                commandBufferCount,
    const VkCommandBuffer*  pCommandBuffers);
```

- [device](#) is the logical device that owns the command pool.
- [commandPool](#) is the command pool from which the command buffers were allocated.
- [commandBufferCount](#) is the length of the [pCommandBuffers](#) array.
- [pCommandBuffers](#) is a pointer to an array of handles of command buffers to free.

Any primary command buffer that is in the [recording or executable state](#) and has any element of [pCommandBuffers](#) recorded into it, becomes [invalid](#).

Valid Usage

- VUID-vkFreeCommandBuffers-pCommandBuffers-00047

All elements of `pCommandBuffers` **must** not be in the `pending` state

- VUID-vkFreeCommandBuffers-pCommandBuffers-00048
`pCommandBuffers` **must** be a valid pointer to an array of `commandBufferCount` `VkCommandBuffer` handles, each element of which **must** either be a valid handle or `NULL`

Valid Usage (Implicit)

- VUID-vkFreeCommandBuffers-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkFreeCommandBuffers-commandPool-parameter
`commandPool` **must** be a valid `VkCommandPool` handle
- VUID-vkFreeCommandBuffers-commandBufferCount-arraylength
`commandBufferCount` **must** be greater than 0
- VUID-vkFreeCommandBuffers-commandPool-parent
`commandPool` **must** have been created, allocated, or retrieved from `device`
- VUID-vkFreeCommandBuffers-pCommandBuffers-parent
Each element of `pCommandBuffers` that is a valid handle **must** have been created, allocated, or retrieved from `commandPool`

Host Synchronization

- Host access to `commandPool` **must** be externally synchronized
- Host access to each member of `pCommandBuffers` **must** be externally synchronized

6.4. Command Buffer Recording

To begin recording a command buffer, call:

```
// Provided by VK_VERSION_1_0
VkResult vkBeginCommandBuffer(
    VkCommandBuffer          commandBuffer,
    const VkCommandBufferBeginInfo* pBeginInfo);
```

- `commandBuffer` is the handle of the command buffer which is to be put in the recording state.
- `pBeginInfo` is a pointer to a `VkCommandBufferBeginInfo` structure defining additional information about how the command buffer begins recording.

Valid Usage

- VUID-vkBeginCommandBuffer-commandBuffer-00049
`commandBuffer` **must** not be in the `recording` or `pending` state

- VUID-vkBeginCommandBuffer-commandBuffer-00050
If `commandBuffer` was allocated from a `VkCommandPool` which did not have the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, `commandBuffer` **must** be in the `initial state`
- VUID-vkBeginCommandBuffer-commandBuffer-00051
If `commandBuffer` is a secondary command buffer, the `pInheritanceInfo` member of `pBeginInfo` **must** be a valid `VkCommandBufferInheritanceInfo` structure
- VUID-vkBeginCommandBuffer-commandBuffer-00052
If `commandBuffer` is a secondary command buffer and either the `occlusionQueryEnable` member of the `pInheritanceInfo` member of `pBeginInfo` is `VK_FALSE`, or the `occlusionQueryPrecise` feature is not enabled, then `pBeginInfo->pInheritanceInfo->queryFlags` **must** not contain `VK_QUERY_CONTROL_PRECISE_BIT`
- VUID-vkBeginCommandBuffer-commandBuffer-02840
If `commandBuffer` is a primary command buffer, then `pBeginInfo->flags` **must** not set both the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` and the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flags

Valid Usage (Implicit)

- VUID-vkBeginCommandBuffer-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkBeginCommandBuffer-pBeginInfo-parameter
`pBeginInfo` **must** be a valid pointer to a valid `VkCommandBufferBeginInfo` structure

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkCommandBufferBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferBeginInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkCommandBufferUsageFlags flags;
    const VkCommandBufferInheritanceInfo* pInheritanceInfo;
} VkCommandBufferBeginInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkCommandBufferUsageFlagBits` specifying usage behavior for the command buffer.
- `pInheritanceInfo` is a pointer to a `VkCommandBufferInheritanceInfo` structure, used if `commandBuffer` is a secondary command buffer. If this is a primary command buffer, then this value is ignored.

Valid Usage

- VUID-VkCommandBufferBeginInfo-flags-09123
If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-VkCommandBufferBeginInfo-flags-00055
If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `framebuffer` member of `pInheritanceInfo` **must** be either `VK_NULL_HANDLE`, or a valid `VkFramebuffer` that is compatible with the `renderPass` member of `pInheritanceInfo`
- VUID-VkCommandBufferBeginInfo-flags-09240
If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `dynamicRendering` feature is not enabled, the `renderPass` member of `pInheritanceInfo` **must** not be `VK_NULL_HANDLE`
- VUID-VkCommandBufferBeginInfo-flags-06002
If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `renderPass` member of `pInheritanceInfo` is `VK_NULL_HANDLE`, the `pNext` chain of `pInheritanceInfo` **must** include a `VkCommandBufferInheritanceRenderingInfo` structure
- VUID-VkCommandBufferBeginInfo-flags-06003
If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `renderPass` member of `pInheritanceInfo` is `VK_NULL_HANDLE`, and the `pNext` chain of `pInheritanceInfo` includes a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, the `colorAttachmentCount` member of that structure **must** be equal to the value of `VkCommandBufferInheritanceRenderingInfo::colorAttachmentCount`
- VUID-VkCommandBufferBeginInfo-flags-06000
If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the

`renderPass` member of `pInheritanceInfo` is not `VK_NULL_HANDLE`, the `renderPass` member of `pInheritanceInfo` **must** be a valid `VkRenderPass`

- VUID-VkCommandBufferBeginInfo-flags-06001

If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `renderPass` member of `pInheritanceInfo` is not `VK_NULL_HANDLE`, the `subpass` member of `pInheritanceInfo` **must** be a valid subpass index within the `renderPass` member of `pInheritanceInfo`

- VUID-VkCommandBufferBeginInfo-flags-10617

If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `renderPass` member of `pInheritanceInfo` is not `VK_NULL_HANDLE`, and `renderPass` was created with tile shading enabled, `VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM` **must** be included in `VkRenderPassTileShadingCreateInfoQCOM::flags`

- VUID-VkCommandBufferBeginInfo-flags-10618

If `flags` does not contain `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `renderPass` member of `pInheritanceInfo` is `VK_NULL_HANDLE`, or `renderPass` was not created with tile shading enabled, `VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM` **must** not be included in `VkRenderPassTileShadingCreateInfoQCOM::flags`

- VUID-VkCommandBufferBeginInfo-flags-10619

If `VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM` is included in `VkRenderPassTileShadingCreateInfoQCOM::flags`, `VkRenderPassTileShadingCreateInfoQCOM::tileApronSize` **must** be equal to the `tileApronSize` used to create `renderPass`

Valid Usage (Implicit)

- VUID-VkCommandBufferBeginInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO`

- VUID-VkCommandBufferBeginInfo-pNext-pNext

`pNext` **must** be `NULL` or a pointer to a valid instance of `VkDeviceGroupCommandBufferBeginInfo`

- VUID-VkCommandBufferBeginInfo-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkCommandBufferBeginInfo-flags-parameter

`flags` **must** be a valid combination of `VkCommandBufferUsageFlagBits` values

Bits which **can** be set in `VkCommandBufferBeginInfo::flags`, specifying usage behavior for a command buffer, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferUsageFlagBits {
    VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT = 0x00000001,
    VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT = 0x00000002,
    VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT = 0x00000004,
} VkCommandBufferUsageFlagBits;
```

- [VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT](#) specifies that each recording of the command buffer will only be submitted once, and the command buffer will be reset and recorded again between each submission.
- [VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT](#) specifies that a secondary command buffer is considered to be entirely inside a render pass. If this is a primary command buffer, then this bit is ignored.
- [VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT](#) specifies that a command buffer **can** be resubmitted to any queue of the same queue family while it is in the *pending state*, and recorded into multiple primary command buffers.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandBufferUsageFlags;
```

[VkCommandBufferUsageFlags](#) is a bitmask type for setting a mask of zero or more [VkCommandBufferUsageFlagBits](#).

If the command buffer is a secondary command buffer, then the [VkCommandBufferInheritanceInfo](#) structure defines any state that will be inherited from the primary command buffer:

```
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferInheritanceInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkRenderPass          renderPass;
    uint32_t              subpass;
    VkFramebuffer         framebuffer;
    VkBool32              occlusionQueryEnable;
    VkQueryControlFlags   queryFlags;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkCommandBufferInheritanceInfo;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is `NULL` or a pointer to a structure extending this structure.
- [renderPass](#) is a [VkRenderPass](#) object defining which render passes the [VkCommandBuffer](#) will be [compatible](#) with and **can** be executed within.
- [subpass](#) is the index of the subpass within the render pass instance that the [VkCommandBuffer](#) will be executed within.

- **framebuffer** **can** refer to the [VkFramebuffer](#) object that the [VkCommandBuffer](#) will be rendering to if it is executed within a render pass instance. It **can** be [VK_NULL_HANDLE](#) if the framebuffer is not known.

NOTE

Specifying the exact framebuffer that the secondary command buffer will be executed with **may** result in better performance at command buffer execution time.

- **occlusionQueryEnable** specifies whether the command buffer **can** be executed while an occlusion query is active in the primary command buffer. If this is [VK_TRUE](#), then this command buffer **can** be executed whether the primary command buffer has an occlusion query active or not. If this is [VK_FALSE](#), then the primary command buffer **must** not have an occlusion query active.
- **queryFlags** specifies the query flags that **can** be used by an active occlusion query in the primary command buffer when this secondary command buffer is executed. If this value includes the [VK_QUERY_CONTROL_PRECISE_BIT](#) bit, then the active query **can** return boolean results or actual sample counts. If this bit is not set, then the active query **must** not use the [VK_QUERY_CONTROL_PRECISE_BIT](#) bit.
- **pipelineStatistics** is a bitmask of [VkQueryPipelineStatisticFlagBits](#) specifying the set of pipeline statistics that **can** be counted by an active query in the primary command buffer when this secondary command buffer is executed. If this value includes a given bit, then this command buffer **can** be executed whether the primary command buffer has a pipeline statistics query active that includes this bit or not. If this value excludes a given bit, then the active pipeline statistics query **must** not be from a query pool that counts that statistic.

If the [VkCommandBuffer](#) will not be executed within a render pass instance, or if the render pass instance was begun with [vkCmdBeginRendering](#), **renderPass**, **subpass**, and **framebuffer** are ignored.

Valid Usage

- VUID-VkCommandBufferInheritanceInfo-occlusionQueryEnable-00056
If the **inheritedQueries** feature is not enabled, **occlusionQueryEnable** **must** be [VK_FALSE](#)
- VUID-VkCommandBufferInheritanceInfo-queryFlags-00057
If the **inheritedQueries** feature is enabled, **queryFlags** **must** be a valid combination of [VkQueryControlFlagBits](#) values
- VUID-VkCommandBufferInheritanceInfo-queryFlags-02788
If the **inheritedQueries** feature is not enabled, **queryFlags** **must** be 0
- VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-02789
If the **pipelineStatisticsQuery** feature is enabled, **pipelineStatistics** **must** be a valid combination of [VkQueryPipelineStatisticFlagBits](#) values
- VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-00058
If the **pipelineStatisticsQuery** feature is not enabled, **pipelineStatistics** **must** be 0

Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO`
- VUID-VkCommandBufferInheritanceInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkAttachmentSampleCountInfoAMD`, `VkCommandBufferInheritanceConditionalRenderingInfoEXT`, `VkCommandBufferInheritanceDescriptorHeapInfoEXT`, `VkCommandBufferInheritanceRenderPassTransformInfoQCOM`, `VkCommandBufferInheritanceRenderingInfo`, `VkCommandBufferInheritanceViewportScissorInfoNV`, `VkCustomResolveCreateInfoEXT`, `VkExternalFormatANDROID`, `VkExternalFormatOHOS`, `VkMultiviewPerViewAttributesInfoNVX`, `VkRenderPassTileShadingCreateInfoQCOM`, `VkRenderingAttachmentLocationInfo`, `VkRenderingInputAttachmentIndexInfo`, or `VkTileMemoryBindInfoQCOM`
- VUID-VkCommandBufferInheritanceInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkCommandBufferInheritanceInfo-commonparent
Both of `framebuffer`, and `renderPass` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

NOTE

On some implementations, not using the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` bit enables command buffers to be patched in-place if needed, rather than creating a copy of the command buffer.

If a command buffer is in the `invalid, or executable state`, and the command buffer was allocated from a command pool with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, then `vkBeginCommandBuffer` implicitly resets the command buffer, behaving as if `vkResetCommandBuffer` had been called with `VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT` not set. After the implicit reset, `commandBuffer` is moved to the `recording state`.

If the `commandBufferInheritance` feature is enabled, all graphics and compute state including bound pipeline state, bound shader objects, bound vertex and index buffers, bound descriptor sets and push constants, descriptor heaps and push data, and all previously set dynamic state is inherited by the secondary command buffer from the primary or secondary command buffer that executes it. Furthermore, all of the state set by this secondary command buffer is inherited back to the primary or secondary command buffer that executes it. If the `commandBufferInheritance` feature is not enabled there is a limited amount of inheritance of state into the secondary command buffer as specified below.

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceConditionalRenderingInfoEXT` structure, then that structure controls whether a command buffer **can** be executed while conditional rendering is `active` in the primary

command buffer.

The `VkCommandBufferInheritanceConditionalRenderingInfoEXT` structure is defined as:

```
// Provided by VK_EXT_conditional_rendering
typedef struct VkCommandBufferInheritanceConditionalRenderingInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           conditionalRenderingEnable;
} VkCommandBufferInheritanceConditionalRenderingInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `conditionalRenderingEnable` specifies whether the command buffer **can** be executed while conditional rendering is active in the primary command buffer. If this is `VK_TRUE`, then this command buffer **can** be executed whether the primary command buffer has active conditional rendering or not. If this is `VK_FALSE`, then the primary command buffer **must** not have conditional rendering active.

If this structure is not present, the behavior is as if `conditionalRenderingEnable` is `VK_FALSE`.

Valid Usage

- VUID-VkCommandBufferInheritanceConditionalRenderingInfoEXT-conditionalRenderingEnable-01977

If the `inheritedConditionalRendering` feature is not enabled, `conditionalRenderingEnable` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceConditionalRenderingInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_CONDITIONAL_RENDERING_INFO_EXT`

Structure Chaining

Extends the structure

- `VkCommandBufferInheritanceInfo`

To begin recording a secondary command buffer compatible with execution inside a render pass using `render` `pass` `transform`, add the `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` to the `pNext` chain of `VkCommandBufferInheritanceInfo` structure passed to the `vkBeginCommandBuffer` command

specifying the parameters for transformed rasterization.

The `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` structure is defined as:

```
// Provided by VK_QCOM_render_pass_transform
typedef struct VkCommandBufferInheritanceRenderPassTransformInfoQCOM {
    VkStructureType          sType;
    const void*              pNext;
    VkSurfaceTransformFlagBitsKHR transform;
    VkRect2D                  renderArea;
} VkCommandBufferInheritanceRenderPassTransformInfoQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `transform` is a `VkSurfaceTransformFlagBitsKHR` value describing the transform to be applied to the render pass.
- `renderArea` is the render area that is affected by the command buffer.

When the secondary is recorded to execute within a render pass instance using `vkCmdExecuteCommands`, the render pass transform parameters of the secondary command buffer **must** be consistent with the render pass transform parameters specified for the render pass instance. In particular, the `transform` and `renderArea` for command buffer **must** be identical to the `transform` and `renderArea` of the render pass instance.

Valid Usage

- VUID-VkCommandBufferInheritanceRenderPassTransformInfoQCOM-transform-02864
`transform` **must** be `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`,
`VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR`,
`VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR`, or
`VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR`

Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceRenderPassTransformInfoQCOM-sType-sType
`sType` **must** be
`VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDER_PASS_TRANSFORM_I`
`NFO_QCOM`

Structure Chaining

Extends the structure

- `VkCommandBufferInheritanceInfo`

The `VkCommandBufferInheritanceViewportScissorInfoNV` structure is defined as:

```
// Provided by VK_NV_inherited_viewport_scissor
typedef struct VkCommandBufferInheritanceViewportScissorInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           viewportScissor2D;
    uint32_t           viewportDepthCount;
    const VkViewport*   pViewportDepths;
} VkCommandBufferInheritanceViewportScissorInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `viewportScissor2D` specifies whether the listed dynamic state is inherited.
- `viewportDepthCount` specifies the maximum number of viewports to inherit. When `viewportScissor2D` is `VK_FALSE`, the behavior is as if this value is zero.
- `pViewportDepths` is a pointer to a `VkViewport` structure specifying the expected depth range for each inherited viewport.

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceViewportScissorInfoNV` structure, then that structure controls whether a command buffer **can** inherit the following state from other command buffers:

- `VK_DYNAMIC_STATE_SCISSOR`
- `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`
- `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT`
- `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT`
- `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT`

as well as the following state, with restrictions on inherited depth values and viewport count:

- `VK_DYNAMIC_STATE_VIEWPORT`
- `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`

If `viewportScissor2D` is `VK_FALSE`, then the command buffer does not inherit the listed dynamic state, and **should** set this state itself. If this structure is not present, the behavior is as if `viewportScissor2D` is `VK_FALSE`.

If `viewportScissor2D` is `VK_TRUE`, then the listed dynamic state is inherited, and the command buffer **must** not set this state, except that the viewport and scissor count **may** be set by binding a graphics pipeline that does not specify this state as dynamic.

NOTE

Due to this restriction, applications **should** ensure either all or none of the graphics pipelines bound in this secondary command buffer use dynamic viewport/scissor counts.

When the command buffer is executed as part of the execution of a `vkCmdExecuteCommands` command, the inherited state (if enabled) is determined by the following procedure, performed separately for each dynamic state, and separately for each value for dynamic state that consists of multiple values (e.g. multiple viewports).

- With *i* being the index of the executed command buffer in the `pCommandBuffers` array of `vkCmdExecuteCommands`, if *i* > 0 and any secondary command buffer from index 0 to *i*-1 modifies the state, the inherited state is provisionally set to the final value set by the last such secondary command buffer. Binding a graphics pipeline defining the state statically is equivalent to setting the state to an undefined value.
- Otherwise, the tentative inherited state is that of the primary command buffer at the point the `vkCmdExecuteCommands` command was recorded; if the state is undefined, then so is the provisional inherited state.
- If the provisional inherited state is an undefined value, then the state is not inherited.
- If the provisional inherited state is a viewport, with *n* being its viewport index, then if *n* ≥ `viewportDepthCount`, or if either `VkViewport::minDepth` or `VkViewport::maxDepth` are not equal to the respective values of the *n*th element of `pViewportDepths`, then the state is not inherited.
- If the provisional inherited state passes both checks, then it becomes the actual inherited state.

NOTE

There is no support for inheriting dynamic state from a secondary command buffer executed as part of a different `vkCmdExecuteCommands` command.

Valid Usage

- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04782
If the `inheritedViewportScissor2D` feature is not enabled, `viewportScissor2D` **must** be `VK_FALSE`
- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04783
If the `multiViewport` feature is not enabled and `viewportScissor2D` is `VK_TRUE`, then `viewportDepthCount` **must** be 1
- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04784
If `viewportScissor2D` is `VK_TRUE`, then `viewportDepthCount` **must** be greater than 0
- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04785
If `viewportScissor2D` is `VK_TRUE`, then `pViewportDepths` **must** be a valid pointer to an array of `viewportDepthCount` valid `VkViewport` structures, except any requirements on *x*, *y*, *width*, and *height* do not apply
- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04786
If `viewportScissor2D` is `VK_TRUE`, then the command buffer **must** be recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`

Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-sType-sType

`sType` must be
`VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_VIEWPORT_SCISSOR_INFO_N`
`V`

Structure Chaining

Extends the structure

- `VkCommandBufferInheritanceInfo`

The `VkCommandBufferInheritanceRenderingInfo` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferInheritanceRenderingInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkRenderingFlags    flags;
    uint32_t           viewMask;
    uint32_t           colorAttachmentCount;
    const VkFormat*     pColorAttachmentFormats;
    VkFormat            depthAttachmentFormat;
    VkFormat            stencilAttachmentFormat;
    VkSampleCountFlagBits rasterizationSamples;
} VkCommandBufferInheritanceRenderingInfo;
```

```
// Provided by VK_KHR_dynamic_rendering
// Equivalent to VkCommandBufferInheritanceRenderingInfo
typedef VkCommandBufferInheritanceRenderingInfo
VkCommandBufferInheritanceRenderingInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `flags` is a bitmask of `VkRenderingFlagBits` used by the render pass instance.
- `viewMask` is the view mask used for rendering.
- `colorAttachmentCount` is the number of color attachments specified in the render pass instance.
- `pColorAttachmentFormats` is a pointer to an array of `VkFormat` values defining the format of color attachments.
- `depthAttachmentFormat` is a `VkFormat` value defining the format of the depth attachment.
- `stencilAttachmentFormat` is a `VkFormat` value defining the format of the stencil attachment.
- `rasterizationSamples` is a `VkSampleCountFlagBits` specifying the number of samples used in rasterization.

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a

`VkCommandBufferInheritanceRenderingInfo` structure, then that structure controls parameters of dynamic render pass instances that the `VkCommandBuffer` **can** be executed within. If `VkCommandBufferInheritanceInfo::renderPass` is not `VK_NULL_HANDLE`, or `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is not specified in `VkCommandBufferBeginInfo::flags`, parameters of this structure are ignored.

If `colorAttachmentCount` is `0` and the `variableMultisampleRate` feature is enabled, `rasterizationSamples` is ignored.

If `depthAttachmentFormat`, `stencilAttachmentFormat`, or any element of `pColorAttachmentFormats` is `VK_FORMAT_UNDEFINED`, it indicates that the corresponding attachment is unused within the render pass and writes to those attachments are discarded.

Valid Usage

- VUID-VkCommandBufferInheritanceRenderingInfo-colorAttachmentCount-06004
If `colorAttachmentCount` is not `0`, `rasterizationSamples` **must** be a valid `VkSampleCountFlagBits` value
- VUID-VkCommandBufferInheritanceRenderingInfo-variableMultisampleRate-06005
If the `variableMultisampleRate` feature is not enabled, `rasterizationSamples` **must** be a valid `VkSampleCountFlagBits` value
- VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06540
If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it **must** be a format that includes a depth component
- VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06007
If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it **must** be a format with potential format features that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkCommandBufferInheritanceRenderingInfo-pColorAttachmentFormats-06492
If any element of `pColorAttachmentFormats` is not `VK_FORMAT_UNDEFINED`, it **must** be a format with potential format features that include `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`, or `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV` if the `LinearColorAttachment` feature is enabled
- VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-06541
If `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it **must** be a format that includes a stencil aspect
- VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-06199
If `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it **must** be a format with potential format features that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06200
If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED` and `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, `depthAttachmentFormat` **must** equal `stencilAttachmentFormat`
- VUID-VkCommandBufferInheritanceRenderingInfo-multiview-06008

If the **multiview** feature is not enabled, **viewMask** **must** be 0

- VUID-VkCommandBufferInheritanceRenderingInfo-viewMask-06009
The index of the most significant bit in **viewMask** **must** be less than **maxMultiviewViewCount**

Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceRenderingInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDERING_INFO**
- VUID-VkCommandBufferInheritanceRenderingInfo-flags-parameter
flags **must** be a valid combination of **VkRenderingFlagBits** values
- VUID-VkCommandBufferInheritanceRenderingInfo-pColorAttachmentFormats-parameter
If **colorAttachmentCount** is not 0, **pColorAttachmentFormats** **must** be a valid pointer to an array of **colorAttachmentCount** valid **VkFormat** values
- VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-parameter
depthAttachmentFormat **must** be a valid **VkFormat** value
- VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-parameter
stencilAttachmentFormat **must** be a valid **VkFormat** value
- VUID-VkCommandBufferInheritanceRenderingInfo-rasterizationSamples-parameter
If **rasterizationSamples** is not 0, **rasterizationSamples** **must** be a valid **VkSampleCountFlagBits** value

Structure Chaining

Extends the structure

- **VkCommandBufferInheritanceInfo**

The **VkAttachmentSampleCountInfoAMD** or **VkAttachmentSampleCountInfoNV** structure is defined as:

```
// Provided by VK_AMD_mixed_attachment_samples with VK_VERSION_1_3 or
VK_KHR_dynamic_rendering
typedef struct VkAttachmentSampleCountInfoAMD {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           colorAttachmentCount;
    const VkSampleCountFlagBits* pColorAttachmentSamples;
    VkSampleCountFlagBits depthStencilAttachmentSamples;
} VkAttachmentSampleCountInfoAMD;
```

```
// Provided by VK_NV_framebuffer_mixed_samples with VK_VERSION_1_3 or
VK_KHR_dynamic_rendering
// Equivalent to VkAttachmentSampleCountInfoAMD
typedef VkAttachmentSampleCountInfoAMD VkAttachmentSampleCountInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `colorAttachmentCount` is the number of color attachments specified in a render pass instance.
- `pColorAttachmentSamples` is a pointer to an array of `VkSampleCountFlagBits` values defining the sample count of color attachments.
- `depthStencilAttachmentSamples` is a `VkSampleCountFlagBits` value defining the sample count of a depth/stencil attachment.

If `VkCommandBufferInheritanceInfo::renderPass` is `VK_NULL_HANDLE`, `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is specified in `VkCommandBufferBeginInfo::flags`, and the `pNext` chain of `VkCommandBufferInheritanceInfo` includes `VkAttachmentSampleCountInfoAMD`, then this structure defines the sample counts of each attachment within the render pass instance. If `VkAttachmentSampleCountInfoAMD` is not included, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` is used as the sample count for each attachment. If `VkCommandBufferInheritanceInfo::renderPass` is not `VK_NULL_HANDLE`, or `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is not specified in `VkCommandBufferBeginInfo::flags`, parameters of this structure are ignored.

`VkAttachmentSampleCountInfoAMD` can also be included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`. When a graphics pipeline is created without a `VkRenderPass`, if this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it specifies the sample count of attachments used for rendering. If this structure is not specified, and the pipeline does not include a `VkRenderPass`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` is used as the sample count for each attachment. If a graphics pipeline is created with a valid `VkRenderPass`, parameters of this structure are ignored.

Valid Usage (Implicit)

- VUID-VkAttachmentSampleCountInfoAMD-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_ATTACHMENT_SAMPLE_COUNT_INFO_AMD`

Structure Chaining

Extends the structures

- `VkCommandBufferInheritanceInfo`
- `VkGraphicsPipelineCreateInfo`

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a

`VkCommandBufferInheritanceDescriptorHeapInfoEXT` structure, then that structure indicates that the secondary will use the same descriptor heaps as the primary command buffer.

The `VkCommandBufferInheritanceDescriptorHeapInfoEXT` structure is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkCommandBufferInheritanceDescriptorHeapInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    const VkBindHeapInfoEXT* pSamplerHeapBindInfo;
    const VkBindHeapInfoEXT* pResourceHeapBindInfo;
} VkCommandBufferInheritanceDescriptorHeapInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pSamplerHeapBindInfo` specifies the `VkBindHeapInfoEXT` of the sampler heap bound using `vkCmdBindSamplerHeapEXT` in the primary. If this is `NULL`, it indicates that no sampler heap is bound.
- `pResourceHeapBindInfo` specifies the `VkBindHeapInfoEXT` of the resource heap bound using `vkCmdBindResourceHeapEXT` in the primary. If this is `NULL`, it indicates that no resource heap is bound.

If this structure is not present, the behavior is as if `pSamplerHeapBindInfo` and `pResourceHeapBindInfo` were both `NULL`.

Valid Usage

- VUID-VkCommandBufferInheritanceDescriptorHeapInfoEXT-descriptorHeap-11200
If the `descriptorHeap` feature is not enabled, `pSamplerHeapBindInfo` **must** be `NULL`
- VUID-VkCommandBufferInheritanceDescriptorHeapInfoEXT-descriptorHeap-11201
If the `descriptorHeap` feature is not enabled, `pResourceHeapBindInfo` **must** be `NULL`
- VUID-VkCommandBufferInheritanceDescriptorHeapInfoEXT-pSamplerHeapBindInfo-11470
If `pSamplerHeapBindInfo` is not `NULL`, `pSamplerHeapBindInfo->heapRange` **must** be a device address range allocated to the application from a buffer created with the `VK_BUFFER_USAGE_DESCRIPTOR_HEAP_BIT_EXT` usage flag set
- VUID-VkCommandBufferInheritanceDescriptorHeapInfoEXT-pResourceHeapBindInfo-11471
If `pResourceHeapBindInfo` is not `NULL`, `pResourceHeapBindInfo->heapRange` **must** be a device address range allocated to the application from a buffer created with the `VK_BUFFER_USAGE_DESCRIPTOR_HEAP_BIT_EXT` usage flag set

Valid Usage (Implicit)

- `VOID-VkCommandBufferInheritanceDescriptorHeapInfoEXT-sType-sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_DESCRIPTOR_HEAP_INFO_EXT`
- `VOID-VkCommandBufferInheritanceDescriptorHeapInfoEXT-pSamplerHeapBindInfo-parameter`
If `pSamplerHeapBindInfo` is not `NULL`, `pSamplerHeapBindInfo` **must** be a valid pointer to a valid `VkBindHeapInfoEXT` structure
- `VOID-VkCommandBufferInheritanceDescriptorHeapInfoEXT-pResourceHeapBindInfo-parameter`
If `pResourceHeapBindInfo` is not `NULL`, `pResourceHeapBindInfo` **must** be a valid pointer to a valid `VkBindHeapInfoEXT` structure

Structure Chaining

Extends the structure

- `VkCommandBufferInheritanceInfo`

Once recording starts, an application records a sequence of commands (`vkCmd*`) to set state in the command buffer, draw, dispatch, and other commands.

Several commands can also be recorded indirectly from `VkBuffer` content, see [Device-Generated Commands](#).

To complete recording of a command buffer, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEndCommandBuffer(
    VkCommandBuffer                commandBuffer);
```

- `commandBuffer` is the command buffer to complete recording.

The command buffer **must** have been in the [recording state](#), and, if successful, is moved to the [executable state](#).

If there was an error during recording, the application will be notified by an unsuccessful return code returned by `vkEndCommandBuffer`, and the command buffer will be moved to the [invalid state](#).

In case the application recorded one or more [video encode operations](#) into the command buffer, implementations **may** return the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video

compression standard or the implementation.

NOTE

Applications **should** not rely on the [VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR](#) error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.

Valid Usage

- VUID-vkEndCommandBuffer-commandBuffer-00059
commandBuffer **must** be in the [recording state](#)
- VUID-vkEndCommandBuffer-commandBuffer-00060
If **commandBuffer** is a primary command buffer, there **must** not be an active render pass instance
- VUID-vkEndCommandBuffer-commandBuffer-00061
All queries made [active](#) during the recording of **commandBuffer** **must** have been made inactive
- VUID-vkEndCommandBuffer-None-01978
Conditional rendering **must** not be [active](#)
- VUID-vkEndCommandBuffer-None-06991
There **must** be no video session object bound
- VUID-vkEndCommandBuffer-commandBuffer-01815
If **commandBuffer** is a secondary command buffer, there **must** not be an outstanding [vkCmdBeginDebugUtilsLabelEXT](#) command recorded to **commandBuffer** that has not previously been ended by a call to [vkCmdEndDebugUtilsLabelEXT](#)
- VUID-vkEndCommandBuffer-commandBuffer-00062
If **commandBuffer** is a secondary command buffer, there **must** not be an outstanding [vkCmdDebugMarkerBeginEXT](#) command recorded to **commandBuffer** that has not previously been ended by a call to [vkCmdDebugMarkerEndEXT](#)
- VUID-vkEndCommandBuffer-commandBuffer-12372
commandBuffer **must** not have any shader instrumentation [active](#)

Valid Usage (Implicit)

- VUID-vkEndCommandBuffer-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

When a command buffer is in the executable state, it **can** be submitted to a queue for execution.

6.5. Command Buffer Submission

NOTE

Submission can be a high overhead operation, and applications **should** attempt to batch work together into as few calls to [vkQueueSubmit](#) or [vkQueueSubmit2](#) as possible.

To submit command buffers to a queue, call:

```
// Provided by VK_VERSION_1_3
VkResult vkQueueSubmit2(
    VkQueue          queue,
    uint32_t         submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence          fence);
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to vkQueueSubmit2
VkResult vkQueueSubmit2KHR(
    VkQueue          queue,
    uint32_t         submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence          fence);
```

- [queue](#) is the queue that the command buffers will be submitted to.
- [submitCount](#) is the number of elements in the [pSubmits](#) array.
- [pSubmits](#) is a pointer to an array of [VkSubmitInfo2](#) structures, each specifying a command buffer submission batch. Command buffers and semaphores specified in this array **may** be accessed at any point until the [queue operations](#) they define complete execution on the device.
- [fence](#) is an **optional** handle to a fence to be signaled once all submitted command buffers have

completed execution. If **fence** is not **VK_NULL_HANDLE**, it defines a **fence signal operation**. If it is not **VK_NULL_HANDLE**, **fence** **may** be accessed at any point until this command completes on the device.

vkQueueSubmit2 is a **queue submission command**, with each batch defined by an element of **pSubmits**.

The first **synchronization scope** of each **semaphore signal operation** defined by this command includes every command in the same batch that the signal operation is defined in, and all commands that occur earlier in **submission order**. The scope is limited by the **stageMask** member of the **VkSemaphoreSubmitInfo** used to define each such operation.

The second **synchronization scope** of each **semaphore wait operation** defined by this command includes every command in the same batch that the wait operation is defined in, and all commands that occur later in **submission order**. The scope is limited by the **stageMask** member of the **VkSemaphoreSubmitInfo** used to define each such operation.

If any command buffer submitted to this queue is in the **executable state**, it is moved to the **pending state**. Once execution of all submissions of a command buffer complete, it moves from the **pending state**, back to the **executable state**. If a command buffer was recorded with the **VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT** flag, it instead moves back to the **invalid state**.

If **vkQueueSubmit2** fails, it **may** return **VK_ERROR_OUT_OF_HOST_MEMORY** or **VK_ERROR_OUT_OF_DEVICE_MEMORY**. If it does, the implementation **must** ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by **pSubmits** is unaffected by the call or its failure. If **vkQueueSubmit2** fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return **VK_ERROR_DEVICE_LOST**. See [Lost Device](#).

Valid Usage

- VUID-vkQueueSubmit2-fence-04894
If **fence** is not **VK_NULL_HANDLE**, **fence** **must** be unsignaled
- VUID-vkQueueSubmit2-fence-04895
If **fence** is not **VK_NULL_HANDLE**, **fence** **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-vkQueueSubmit2-synchronization2-03866
The **synchronization2** feature **must** be enabled
- VUID-vkQueueSubmit2-commandBuffer-03867
If a command recorded into the **commandBuffer** member of any element of the **pCommandBufferInfos** member of any element of **pSubmits** referenced a **VkEvent**, that event **must** not be referenced by a command that has been submitted to another queue and is still in the **pending state**
- VUID-vkQueueSubmit2-semaphore-03868
The **semaphore** member of any binary semaphore element of the **pSignalSemaphoreInfos** member of any element of **pSubmits** **must** be unsignaled when the semaphore signal operation it defines is executed on the device

- VUID-vkQueueSubmit2-stageMask-03869
The **stageMask** member of any element of the **pSignalSemaphoreInfos** member of any element of **pSubmits** **must** only include pipeline stages that are supported by the queue family which **queue** belongs to
- VUID-vkQueueSubmit2-stageMask-03870
The **stageMask** member of any element of the **pWaitSemaphoreInfos** member of any element of **pSubmits** **must** only include pipeline stages that are supported by the queue family which **queue** belongs to
- VUID-vkQueueSubmit2-semaphore-03871
When a semaphore wait operation for a binary semaphore is executed, as defined by the **semaphore** member of any element of the **pWaitSemaphoreInfos** member of any element of **pSubmits**, there **must** be no other queues waiting on the same semaphore
- VUID-vkQueueSubmit2-semaphore-03873
The **semaphore** member of any element of the **pWaitSemaphoreInfos** member of any element of **pSubmits** that was created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_BINARY** **must** reference a semaphore signal operation that has been submitted for execution and any **semaphore signal operations** on which it depends **must** have also been submitted for execution
- VUID-vkQueueSubmit2-commandBuffer-03874
The **commandBuffer** member of any element of the **pCommandBufferInfos** member of any element of **pSubmits** **must** be in the **pending or executable state**
- VUID-vkQueueSubmit2-commandBuffer-03875
If a command recorded into the **commandBuffer** member of any element of the **pCommandBufferInfos** member of any element of **pSubmits** was not recorded with the **VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT**, it **must** not be in the **pending state**
- VUID-vkQueueSubmit2-commandBuffer-03876
Any **secondary command buffers recorded** into the **commandBuffer** member of any element of the **pCommandBufferInfos** member of any element of **pSubmits** **must** be in the **pending or executable state**
- VUID-vkQueueSubmit2-commandBuffer-03877
If any **secondary command buffers recorded** into the **commandBuffer** member of any element of the **pCommandBufferInfos** member of any element of **pSubmits** was not recorded with the **VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT**, it **must** not be in the **pending state**
- VUID-vkQueueSubmit2-commandBuffer-03878
The **commandBuffer** member of any element of the **pCommandBufferInfos** member of any element of **pSubmits** **must** have been allocated from a **VkCommandPool** that was created for the same queue family **queue** belongs to
- VUID-vkQueueSubmit2-commandBuffer-03879
If a command recorded into the **commandBuffer** member of any element of the **pCommandBufferInfos** member of any element of **pSubmits** includes a **Queue Family Ownership Transfer Acquire Operation**, there **must** exist a previously submitted **Queue Family Ownership Transfer Release Operation** on a queue in the queue family identified

by the acquire operation, with parameters matching the acquire operation as defined in the definition of such [acquire operations](#), and which happens before the acquire operation

- VUID-vkQueueSubmit2-commandBuffer-10910

If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` includes a [Queue Family Ownership Transfer Acquire Operation](#), the affected resource **must** not be modified in any way between the last matching release operation and the acquire operation

- VUID-vkQueueSubmit2-commandBuffer-03880

If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was a `vkCmdBeginQuery` whose `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the [profiling lock](#) **must** have been held continuously on the `VkDevice` that `queue` was retrieved from, throughout recording of those command buffers

- VUID-vkQueueSubmit2-queue-06447

If `queue` was not created with `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT`, the `flags` member of any element of `pSubmits` **must** not include `VK_SUBMIT_PROTECTED_BIT_KHR`

Valid Usage (Implicit)

- VUID-vkQueueSubmit2-queue-parameter

`queue` **must** be a valid [VkQueue](#) handle

- VUID-vkQueueSubmit2-pSubmits-parameter

If `submitCount` is not 0, `pSubmits` **must** be a valid pointer to an array of `submitCount` valid [VkSubmitInfo2](#) structures

- VUID-vkQueueSubmit2-fence-parameter

If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be a valid [VkFence](#) handle

- VUID-vkQueueSubmit2-commonparent

Both of `fence`, and `queue` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to `queue` **must** be externally synchronized if it was not created with `VK_DEVICE_QUEUE_CREATE INTERNALLY SYNCHRONIZED_BIT_KHR`

- Host access to `fence` **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
-	-	-	Any	-

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkSubmitInfo2](#) structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkSubmitInfo2 {
    VkStructureType          sType;
    const void*              pNext;
    VkSubmitFlags            flags;
    uint32_t                 waitSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pWaitSemaphoreInfos;
    uint32_t                 commandBufferInfoCount;
    const VkCommandBufferSubmitInfo* pCommandBufferInfos;
    uint32_t                 signalSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pSignalSemaphoreInfos;
} VkSubmitInfo2;
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to VkSubmitInfo2
typedef VkSubmitInfo2 VkSubmitInfo2KHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [flags](#) is a bitmask of [VkSubmitFlagBits](#).
- [waitSemaphoreInfoCount](#) is the number of elements in [pWaitSemaphoreInfos](#).

- `pWaitSemaphoreInfos` is a pointer to an array of `VkSemaphoreSubmitInfo` structures defining semaphore wait operations.
- `commandBufferInfoCount` is the number of elements in `pCommandBufferInfos` and the number of command buffers to execute in the batch.
- `pCommandBufferInfos` is a pointer to an array of `VkCommandBufferSubmitInfo` structures describing command buffers to execute in the batch.
- `signalSemaphoreInfoCount` is the number of elements in `pSignalSemaphoreInfos`.
- `pSignalSemaphoreInfos` is a pointer to an array of `VkSemaphoreSubmitInfo` describing semaphore signal operations.

Valid Usage

- VUID-VkSubmitInfo2-semaphore-03881
If the same semaphore is used as the `semaphore` member of both an element of `pSignalSemaphoreInfos` and `pWaitSemaphoreInfos`, and that semaphore is a timeline semaphore, the `value` member of the `pSignalSemaphoreInfos` element **must** be greater than the `value` member of the `pWaitSemaphoreInfos` element
- VUID-VkSubmitInfo2-semaphore-03882
If the `semaphore` member of any element of `pSignalSemaphoreInfos` is a timeline semaphore, the `value` member of that element **must** have a value greater than the current value of the semaphore when the semaphore signal operation is executed
- VUID-VkSubmitInfo2-semaphore-03883
If the `semaphore` member of any element of `pSignalSemaphoreInfos` is a timeline semaphore, the `value` member of that element **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`
- VUID-VkSubmitInfo2-semaphore-03884
If the `semaphore` member of any element of `pWaitSemaphoreInfos` is a timeline semaphore, the `value` member of that element **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`
- VUID-VkSubmitInfo2-flags-03886
If `flags` includes `VK_SUBMIT_PROTECTED_BIT`, all elements of `pCommandBuffers` **must** be protected command buffers
- VUID-VkSubmitInfo2-flags-03887
If `flags` does not include `VK_SUBMIT_PROTECTED_BIT`, each element of `pCommandBuffers` **must** not be a protected command buffer
- VUID-VkSubmitInfo2-commandBuffer-06192
If any `commandBuffer` member of an element of `pCommandBufferInfos` contains any resumed render pass instances, they **must** be suspended by a render pass instance earlier in submission order within `pCommandBufferInfos`
- VUID-VkSubmitInfo2-commandBuffer-06010
If any `commandBuffer` member of an element of `pCommandBufferInfos` contains any

suspended render pass instances, they **must** be resumed by a render pass instance later in submission order within `pCommandBufferInfos`

- VUID-VkSubmitInfo2-commandBuffer-06011

If any `commandBuffer` member of an element of `pCommandBufferInfos` contains any suspended render pass instances, there **must** be no action or synchronization commands between that render pass instance and the render pass instance that resumes it

- VUID-VkSubmitInfo2-commandBuffer-06012

If any `commandBuffer` member of an element of `pCommandBufferInfos` contains any suspended render pass instances, there **must** be no render pass instances between that render pass instance and the render pass instance that resumes it

- VUID-VkSubmitInfo2-variableSampleLocations-06013

If the `variableSampleLocations` limit is not supported, and any `commandBuffer` member of an element of `pCommandBufferInfos` contains any suspended render pass instances, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, **must** use the same sample locations

- VUID-VkSubmitInfo2-pNext-09682

If the `pNext` chain of this structure includes a `VkFrameBoundaryTensorsARM` structure then it **must** also include a `VkFrameBoundaryEXT` structure

- VUID-VkSubmitInfo2-pCommandBufferInfos-09933

If at least one `VkCommandBufferSubmitInfo` structure in `pCommandBufferInfos` references a `commandBuffer` allocated from a pool that was created with a `VkDataGraphProcessingEngineCreateInfoARM` structure in the `pNext` chain of `VkCommandPoolCreateInfo` that included a foreign data graph processing engine in its `pProcessingEngines` member, then `pWaitSemaphoreInfos` and `pSignalSemaphoreInfos` **must** only reference `semaphore` objects that were created from external handle types reported as supported in a `VkQueueFamilyDataGraphProcessingEnginePropertiesARM::foreignSemaphoreHandleTypes` structure via `vkGetPhysicalDeviceQueueFamilyDataGraphProcessingEnginePropertiesARM` with a `queueFamilyIndex` matching the one the command pool was created for, for all the foreign data graph processing engines that were part of the `VkDataGraphProcessingEngineCreateInfoARM` used to create the command pool

Valid Usage (Implicit)

- VUID-VkSubmitInfo2-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_SUBMIT_INFO_2`

- VUID-VkSubmitInfo2-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkFrameBoundaryEXT`, `VkFrameBoundaryTensorsARM`, `VkLatencySubmissionPresentIdNV`, `VkPerformanceQuerySubmitInfoKHR`, `VkWin32KeyedMutexAcquireReleaseInfoKHR`, or `VkWin32KeyedMutexAcquireReleaseInfoNV`

- VUID-VkSubmitInfo2-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- `VOID-VkSubmitInfo2-flags-parameter`
`flags` **must** be a valid combination of `VkSubmitFlagBits` values
- `VOID-VkSubmitInfo2-pWaitSemaphoreInfos-parameter`
If `waitSemaphoreInfoCount` is not 0, `pWaitSemaphoreInfos` **must** be a valid pointer to an array of `waitSemaphoreInfoCount` valid `VkSemaphoreSubmitInfo` structures
- `VOID-VkSubmitInfo2-pCommandBufferInfos-parameter`
If `commandBufferInfoCount` is not 0, `pCommandBufferInfos` **must** be a valid pointer to an array of `commandBufferInfoCount` valid `VkCommandBufferSubmitInfo` structures
- `VOID-VkSubmitInfo2-pSignalSemaphoreInfos-parameter`
If `signalSemaphoreInfoCount` is not 0, `pSignalSemaphoreInfos` **must** be a valid pointer to an array of `signalSemaphoreInfoCount` valid `VkSemaphoreSubmitInfo` structures

Bits which **can** be set in `VkSubmitInfo2::flags`, specifying submission behavior, are:

```
// Provided by VK_VERSION_1_3
typedef enum VkSubmitFlagBits {
    VK_SUBMIT_PROTECTED_BIT = 0x00000001,
    // Provided by VK_KHR_synchronization2
    VK_SUBMIT_PROTECTED_BIT_KHR = VK_SUBMIT_PROTECTED_BIT,
} VkSubmitFlagBits;
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to VkSubmitFlagBits
typedef VkSubmitFlagBits VkSubmitFlagBitsKHR;
```

- `VK_SUBMIT_PROTECTED_BIT` specifies that this batch is a protected submission.

```
// Provided by VK_VERSION_1_3
typedef VkFlags VkSubmitFlags;
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to VkSubmitFlags
typedef VkSubmitFlags VkSubmitFlagsKHR;
```

`VkSubmitFlags` is a bitmask type for setting a mask of zero or more `VkSubmitFlagBits`.

The `VkSemaphoreSubmitInfo` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkSemaphoreSubmitInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkSemaphore           semaphore;
    uint64_t              value;
    VkPipelineStageFlags2 stageMask;
    uint32_t              deviceIndex;
} VkSemaphoreSubmitInfo;
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to VkSemaphoreSubmitInfo
typedef VkSemaphoreSubmitInfo VkSemaphoreSubmitInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **semaphore** is a [VkSemaphore](#) affected by this operation.
- **value** is either the value used to signal **semaphore** or the value waited on by **semaphore**, if **semaphore** is a timeline semaphore. Otherwise it is ignored.
- **stageMask** is a [VkPipelineStageFlags2](#) mask of pipeline stages which limit the first synchronization scope of a semaphore signal operation, or second synchronization scope of a semaphore wait operation as described in the [semaphore wait operation](#) and [semaphore signal operation](#) sections of [the synchronization chapter](#).
- **deviceIndex** is the index of the device within a device group that executes the semaphore wait or signal operation.

Whether this structure defines a semaphore wait or signal operation is defined by how it is used. The first [synchronization scope](#) of a [semaphore signal operation](#) or the second synchronization scope of a [semaphore wait operation](#) defined by this structure are limited to operations in stages indicated by **stageMask**.

Valid Usage

- VUID-VkSemaphoreSubmitInfo-stageMask-03929
If the **geometryShader** feature is not enabled, **stageMask** **must** not contain [VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT](#)
- VUID-VkSemaphoreSubmitInfo-stageMask-03930
If the **tessellationShader** feature is not enabled, **stageMask** **must** not contain [VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT](#) or [VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT](#)
- VUID-VkSemaphoreSubmitInfo-stageMask-03931
If the **conditionalRendering** feature is not enabled, **stageMask** **must** not contain [VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT](#)

- VUID-VkSemaphoreSubmitInfo-stageMask-03932
If the `fragmentDensityMap` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkSemaphoreSubmitInfo-stageMask-03933
If the `transformFeedback` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-VkSemaphoreSubmitInfo-stageMask-03934
If the `meshShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`
- VUID-VkSemaphoreSubmitInfo-stageMask-03935
If the `taskShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
- VUID-VkSemaphoreSubmitInfo-stageMask-07316
If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkSemaphoreSubmitInfo-stageMask-04957
If the `subpassShading` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`
- VUID-VkSemaphoreSubmitInfo-stageMask-04995
If the `invocationMask` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`
- VUID-VkSemaphoreSubmitInfo-stageMask-07946
If neither the `VK_NV_ray_tracing` extension or the `rayTracingPipeline` feature are enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkSemaphoreSubmitInfo-stageMask-10751
If the `accelerationStructure` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`
- VUID-VkSemaphoreSubmitInfo-stageMask-10752
If the `rayTracingMaintenance1` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`
- VUID-VkSemaphoreSubmitInfo-stageMask-10753
If the `micromap` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`
- VUID-VkSemaphoreSubmitInfo-device-03888
If the `device` that `semaphore` was created on is not a device group, `deviceIndex` **must** be 0
- VUID-VkSemaphoreSubmitInfo-device-03889
If the `device` that `semaphore` was created on is a device group, `deviceIndex` **must** be a valid device index

Valid Usage (Implicit)

- VUID-VkSemaphoreSubmitInfo-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_SEMAPHORE_SUBMIT_INFO](#)
- VUID-VkSemaphoreSubmitInfo-pNext-pNext
pNext **must** be `NULL`
- VUID-VkSemaphoreSubmitInfo-semaphore-parameter
semaphore **must** be a valid [VkSemaphore](#) handle
- VUID-VkSemaphoreSubmitInfo-stageMask-parameter
stageMask **must** be a valid combination of [VkPipelineStageFlagBits2](#) values

The [VkCommandBufferSubmitInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkCommandBuffer    commandBuffer;
    uint32_t           deviceMask;
} VkCommandBufferSubmitInfo;
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to VkCommandBufferSubmitInfo
typedef VkCommandBufferSubmitInfo VkCommandBufferSubmitInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **commandBuffer** is a [VkCommandBuffer](#) to be submitted for execution.
- **deviceMask** is a bitmask indicating which devices in a device group execute the command buffer. A **deviceMask** of `0` is equivalent to setting all bits corresponding to valid devices in the group to `1`.

Valid Usage

- VUID-VkCommandBufferSubmitInfo-commandBuffer-03890
commandBuffer **must** not have been allocated with [VK_COMMAND_BUFFER_LEVEL_SECONDARY](#)
- VUID-VkCommandBufferSubmitInfo-deviceMask-03891
If **deviceMask** is not `0`, it **must** be a valid device mask
- VUID-VkCommandBufferSubmitInfo-commandBuffer-09445
If any render pass instance in **commandBuffer** was recorded with a [VkRenderPassStripeBeginInfoARM](#) structure in its pNext chain and did not specify the [VK_RENDERING_RESUMING_BIT](#) flag, a [VkRenderPassStripeSubmitInfoARM](#) **must** be

included in the `pNext` chain

- VUID-VkCommandBufferSubmitInfo-pNext-09446

If a `VkRenderPassStripeSubmitInfoARM` is included in the `pNext` chain, the value of `VkRenderPassStripeSubmitInfoARM::stripeSemaphoreInfoCount` **must** be equal to the sum of the `VkRenderPassStripeBeginInfoARM::stripeInfoCount` parameters provided to render pass instances recorded in `commandBuffer` that did not specify the `VK_RENDERING_RESUMING_BIT` flag

Valid Usage (Implicit)

- VUID-VkCommandBufferSubmitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_SUBMIT_INFO`
- VUID-VkCommandBufferSubmitInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkRenderPassStripeSubmitInfoARM`
- VUID-VkCommandBufferSubmitInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkCommandBufferSubmitInfo-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle

The `VkRenderPassStripeSubmitInfoARM` structure is defined as:

```
// Provided by VK_ARM_render_pass_striped
typedef struct VkRenderPassStripeSubmitInfoARM {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           stripeSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pStripeSemaphoreInfos;
} VkRenderPassStripeSubmitInfoARM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stripeSemaphoreInfoCount` is the number of semaphores used to signal stripe completion in the render pass instances in the submitted command buffer.
- `pStripeSemaphoreInfos` is a pointer to an array of `stripeSemaphoreInfoCount` `VkSemaphoreSubmitInfo` structures describing the semaphores used to signal stripe completion.

This structure can be included in the `pNext` chain of `VkCommandBufferSubmitInfo` to provide a set of semaphores to be signaled for each striped render pass instance.

The elements of `pStripeSemaphoreInfos` are mapped to render pass instances in `VkCommandBufferSubmitInfo::commandBuffer` in submission order and in stripe order within each render pass instance. Each semaphore in `pStripeSemaphoreInfos` is signaled when the

implementation has completed execution of the associated stripe. In a render pass instance that has multiview enabled, the stripe includes all views in the view mask. In a render pass instance with `layerCount` greater than 1, the stripe includes all layers.

Render pass instances that specify the `VK_RENDERING_RESUMING_BIT` will not have any elements of `pStripeSemaphoreInfos` mapped to them. Instead, for suspending and resuming render pass instances, this mapping is done for the first suspending render pass instance, and the per-stripe semaphores are only signaled for the last resuming render pass instance.

Valid Usage

- VUID-VkRenderPassStripeSubmitInfoARM-semaphore-09447
The `semaphore` member of each element of `pStripeSemaphoreInfos` **must** have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`

Valid Usage (Implicit)

- VUID-VkRenderPassStripeSubmitInfoARM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_STRIPE_SUBMIT_INFO_ARM`
- VUID-VkRenderPassStripeSubmitInfoARM-pStripeSemaphoreInfos-parameter
`pStripeSemaphoreInfos` **must** be a valid pointer to an array of `stripeSemaphoreInfoCount` valid `VkSemaphoreSubmitInfo` structures
- VUID-VkRenderPassStripeSubmitInfoARM-stripeSemaphoreInfoCount-arraylength
`stripeSemaphoreInfoCount` **must** be greater than 0

Structure Chaining

Extends the structure

- `VkCommandBufferSubmitInfo`

To submit command buffers to a queue, call:

WARNING

This functionality is superseded by `vkQueueSubmit2`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
VkResult vkQueueSubmit(
    VkQueue          queue,
    uint32_t         submitCount,
    const VkSubmitInfo* pSubmits,
    VkFence          fence);
```

- `queue` is the queue that the command buffers will be submitted to.

- `submitCount` is the number of elements in the `pSubmits` array.
- `pSubmits` is a pointer to an array of `VkSubmitInfo` structures, each specifying a command buffer submission batch. Command buffers and semaphores specified in this array **may** be accessed at any point until the `queue operations` they define complete execution on the device.
- `fence` is an **optional** handle to a fence to be signaled once all submitted command buffers have completed execution. If `fence` is not `VK_NULL_HANDLE`, it defines a `fence signal operation`. If it is not `VK_NULL_HANDLE`, `fence` **may** be accessed at any point until this command completes on the device.

`vkQueueSubmit` is a `queue submission command`, with each batch defined by an element of `pSubmits`. Batches begin execution in the order they appear in `pSubmits`, but **may** complete out of order.

The order that batches appear in `pSubmits` is used to determine `submission order`, and thus all the `implicit ordering guarantees` that respect it. Other than these implicit ordering guarantees and any `explicit synchronization primitives`, these batches **may** overlap or otherwise execute out of order.

Fence operations submitted with `vkQueueSubmit` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the `fence` sections of [the synchronization chapter](#).

The first `synchronization scope` of each `semaphore signal operation` defined by this command includes every command in the same batch that the signal operation is defined in, and all commands that occur earlier in `submission order`.

The second `synchronization scope` of each `semaphore wait operation` defined by this command includes every command in the same batch that the wait operation is defined in, and all commands that occur later in `submission order`. The scope is limited by the `pWaitDstStageMask` for each batch, as described in `VkSubmitInfo`.

If any command buffer submitted to this queue is in the `executable state`, it is moved to the `pending state`. Once execution of all submissions of a command buffer complete, it moves from the `pending state`, back to the `executable state`. If a command buffer was recorded with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` flag, it instead moves to the `invalid state`.

If `vkQueueSubmit` fails, it **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation **must** ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by `pSubmits` is unaffected by the call or its failure. If `vkQueueSubmit` fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return `VK_ERROR_DEVICE_LOST`. See [Lost Device](#).

Valid Usage

- VUID-vkQueueSubmit-fence-00063
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be unsignaled
- VUID-vkQueueSubmit-fence-00064
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** not be associated with any other queue

command that has not yet completed execution on that queue

- VUID-vkQueueSubmit-pCommandBuffers-00065

Any calls to [vkCmdSetEvent](#), [vkCmdResetEvent](#) or [vkCmdWaitEvents](#) that have been recorded into any of the command buffer elements of the [pCommandBuffers](#) member of any element of [pSubmits](#), **must** not reference any [VkEvent](#) that is referenced by any of those commands in a command buffer that has been submitted to another queue and is still in the *pending state*

- VUID-vkQueueSubmit-pWaitDstStageMask-00066

Any stage flag included in any element of the [pWaitDstStageMask](#) member of any element of [pSubmits](#) **must** be a pipeline stage supported by one of the capabilities of [queue](#), as specified in the [table of supported pipeline stages](#)

- VUID-vkQueueSubmit-pSignalSemaphores-00067

Each binary semaphore element of the [pSignalSemaphores](#) member of any element of [pSubmits](#) **must** be unsignaled when the semaphore signal operation it defines is executed on the device

- VUID-vkQueueSubmit-pWaitSemaphores-00068

When a semaphore wait operation referring to a binary semaphore defined by any element of the [pWaitSemaphores](#) member of any element of [pSubmits](#) executes on [queue](#), there **must** be no other queues waiting on the same semaphore

- VUID-vkQueueSubmit-pWaitSemaphores-03238

All elements of the [pWaitSemaphores](#) member of all elements of [pSubmits](#) created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_BINARY](#) **must** reference a semaphore signal operation that has been submitted for execution and any [semaphore signal operations](#) on which it depends **must** have also been submitted for execution

- VUID-vkQueueSubmit-pCommandBuffers-00070

Each element of the [pCommandBuffers](#) member of each element of [pSubmits](#) **must** be in the [pending or executable state](#)

- VUID-vkQueueSubmit-pCommandBuffers-00071

If any element of the [pCommandBuffers](#) member of any element of [pSubmits](#) was not recorded with the [VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT](#), it **must** not be in the [pending state](#)

- VUID-vkQueueSubmit-pCommandBuffers-00072

Any [secondary command buffers recorded](#) into any element of the [pCommandBuffers](#) member of any element of [pSubmits](#) **must** be in the [pending or executable state](#)

- VUID-vkQueueSubmit-pCommandBuffers-00073

If any [secondary command buffers recorded](#) into any element of the [pCommandBuffers](#) member of any element of [pSubmits](#) was not recorded with the [VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT](#), it **must** not be in the [pending state](#)

- VUID-vkQueueSubmit-pCommandBuffers-00074

Each element of the [pCommandBuffers](#) member of each element of [pSubmits](#) **must** have been allocated from a [VkCommandPool](#) that was created for the same queue family [queue](#) belongs to

- VUID-vkQueueSubmit-pSubmits-02207
If any element of `pSubmits->pCommandBuffers` includes a [Queue Family Ownership Transfer Acquire Operation](#), there **must** exist a previously submitted [Queue Family Ownership Transfer Release Operation](#) on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such [acquire operations](#), and which happens-before the acquire operation
- VUID-vkQueueSubmit-pSubmits-10911
If any element of `pSubmits->pCommandBuffers` includes a [Queue Family Ownership Transfer Acquire Operation](#), the affected resource **must** not be modified in any way between the last matching release operation and the acquire operation
- VUID-vkQueueSubmit-pCommandBuffers-03220
If a command recorded into any element of `pCommandBuffers` was a `vkCmdBeginQuery` whose `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the [profiling lock](#) **must** have been held continuously on the `VkDevice` that `queue` was retrieved from, throughout recording of those command buffers
- VUID-vkQueueSubmit-pSubmits-02808
Any resource created with `VK_SHARING_MODE_EXCLUSIVE` that is read by an operation specified by `pSubmits` **must** not be owned by any queue family other than the one which `queue` belongs to, at the time it is executed
- VUID-vkQueueSubmit-pSubmits-04626
Any resource created with `VK_SHARING_MODE_CONCURRENT` that is accessed by an operation specified by `pSubmits` **must** have included the queue family of `queue` at resource creation time
- VUID-vkQueueSubmit-queue-06448
If `queue` was not created with `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT`, there **must** be no element of `pSubmits` that includes a `VkProtectedSubmitInfo` structure in its `pNext` chain with `protectedSubmit` equal to `VK_TRUE`

Valid Usage (Implicit)

- VUID-vkQueueSubmit-queue-parameter
`queue` **must** be a valid [VkQueue](#) handle
- VUID-vkQueueSubmit-pSubmits-parameter
If `submitCount` is not 0, `pSubmits` **must** be a valid pointer to an array of `submitCount` valid [VkSubmitInfo](#) structures
- VUID-vkQueueSubmit-fence-parameter
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be a valid [VkFence](#) handle
- VUID-vkQueueSubmit-commonparent
Both of `fence`, and `queue` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to **queue** **must** be externally synchronized if it was not created with [VK_DEVICE_QUEUE_CREATE INTERNALLY SYNCHRONIZED_BIT_KHR](#)
- Host access to **fence** **must** be externally synchronized

Command Properties

The [VkSubmitInfo](#) structure is defined as:

WARNING

This functionality is superseded by [VkSubmitInfo2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkSubmitInfo {
    VkStructureType           sType;
    const void*               pNext;
    uint32_t                  waitSemaphoreCount;
    const VkSemaphore*        pWaitSemaphores;
    const VkPipelineStageFlags* pWaitDstStageMask;
    uint32_t                  commandBufferCount;
    const VkCommandBuffer*    pCommandBuffers;
    uint32_t                  signalSemaphoreCount;
    const VkSemaphore*        pSignalSemaphores;
} VkSubmitInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores upon which to wait before executing the command buffers for the batch.
- `pWaitSemaphores` is a pointer to an array of `VkSemaphore` handles upon which to wait before the command buffers for this batch begin execution. If semaphores to wait on are provided, they define a [semaphore wait operation](#).
- `pWaitDstStageMask` is a pointer to an array of pipeline stages at which each corresponding semaphore wait will occur.
- `commandBufferCount` is the number of command buffers to execute in the batch.
- `pCommandBuffers` is a pointer to an array of `VkCommandBuffer` handles to execute in the batch.
- `signalSemaphoreCount` is the number of semaphores to be signaled once the commands specified in `pCommandBuffers` have completed execution.
- `pSignalSemaphores` is a pointer to an array of `VkSemaphore` handles which will be signaled when the command buffers for this batch have completed execution. If semaphores to be signaled are provided, they define a [semaphore signal operation](#).

The order that command buffers appear in `pCommandBuffers` is used to determine [submission order](#), and thus all the [implicit ordering guarantees](#) that respect it. Other than these implicit ordering guarantees and any [explicit synchronization primitives](#), these command buffers **may** overlap or otherwise execute out of order.

The second [synchronization scope](#) of each [semaphore wait operation](#) defined by this structure is limited to operations in stages indicated by the corresponding element of `pWaitDstStageMask`.

A common scenario for using `pWaitDstStageMask` with values other than `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` is when synchronizing a window system presentation operation against subsequent command buffers which render the next frame. In this case, a presentation image **must** not be overwritten until the presentation operation completes, but other pipeline stages **can** execute without waiting. A mask of `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` prevents subsequent color attachment writes from executing until the semaphore signals. Some implementations **may** be able to execute transfer operations and/or pre-rasterization work before the semaphore is signaled.

NOTE

If an image layout transition needs to be performed on a presentable image before it is used in a framebuffer, that **can** be performed as the first operation submitted to the queue after acquiring the image, and **should** not prevent other work from overlapping with the presentation operation. For example, a `VkImageMemoryBarrier` could use:

- `srcStageMask` = `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `srcAccessMask` = 0
- `dstStageMask` = `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`

- `dstAccessMask` = `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT` | `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.
- `oldLayout` = `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- `newLayout` = `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

Alternatively, `oldLayout` can be `VK_IMAGE_LAYOUT_UNDEFINED`, if the image's contents need not be preserved.

This barrier accomplishes a dependency chain between previous presentation operations and subsequent color attachment output operations, with the layout transition performed in between, and does not introduce a dependency between previous work and any `pre-rasterization` `shader` `stages`. More precisely, the semaphore signals after the presentation operation completes, the semaphore wait stalls the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage, and there is a dependency from that same stage to itself with the layout transition performed in between.

Valid Usage

- VUID-VkSubmitInfo-pWaitDstStageMask-04090
If the `geometryShader` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-VkSubmitInfo-pWaitDstStageMask-04091
If the `tesseellationShader` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkSubmitInfo-pWaitDstStageMask-04092
If the `conditionalRendering` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-VkSubmitInfo-pWaitDstStageMask-04093
If the `fragmentDensityMap` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkSubmitInfo-pWaitDstStageMask-04094
If the `transformFeedback` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-VkSubmitInfo-pWaitDstStageMask-04095
If the `meshShader` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-VkSubmitInfo-pWaitDstStageMask-04096
If the `taskShader` feature is not enabled, `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
- VUID-VkSubmitInfo-pWaitDstStageMask-07318
If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `pWaitDstStageMask` **must** not contain

VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkSubmitInfo-pWaitDstStageMask-03937

If the **synchronization2** feature is not enabled, **pWaitDstStageMask** **must** not be 0

- VUID-VkSubmitInfo-pWaitDstStageMask-07949

If neither the **VK_NV_ray_tracing** extension or the **rayTracingPipeline** feature are enabled, **pWaitDstStageMask** **must** not contain **VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR**

- VUID-VkSubmitInfo-pWaitDstStageMask-10754

If the **accelerationStructure** feature is not enabled, **pWaitDstStageMask** **must** not contain **VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR**

- VUID-VkSubmitInfo-pCommandBuffers-00075

Each element of **pCommandBuffers** **must** not have been allocated with **VK_COMMAND_BUFFER_LEVEL_SECONDARY**

- VUID-VkSubmitInfo-pWaitDstStageMask-00078

Each element of **pWaitDstStageMask** **must** not include **VK_PIPELINE_STAGE_HOST_BIT**

- VUID-VkSubmitInfo-pWaitSemaphores-03239

If any element of **pWaitSemaphores** or **pSignalSemaphores** was created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE**, then the **pNext** chain **must** include a **VkTimelineSemaphoreSubmitInfo** structure

- VUID-VkSubmitInfo-pNext-03240

If the **pNext** chain of this structure includes a **VkTimelineSemaphoreSubmitInfo** structure and any element of **pWaitSemaphores** was created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE**, then its **waitSemaphoreValueCount** member **must** equal **waitSemaphoreCount**

- VUID-VkSubmitInfo-pNext-03241

If the **pNext** chain of this structure includes a **VkTimelineSemaphoreSubmitInfo** structure and any element of **pSignalSemaphores** was created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE**, then its **signalSemaphoreValueCount** member **must** equal **signalSemaphoreCount**

- VUID-VkSubmitInfo-pSignalSemaphores-03242

For each element of **pSignalSemaphores** created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE** the corresponding element of **VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues** **must** have a value greater than the current value of the semaphore when the **semaphore signal operation** is executed

- VUID-VkSubmitInfo-pWaitSemaphores-03243

For each element of **pWaitSemaphores** created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE** the corresponding element of **VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues** **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than **maxTimelineSemaphoreValueDifference**

- VUID-VkSubmitInfo-pSignalSemaphores-03244

For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`

- VUID-VkSubmitInfo-pNext-04120

If the `pNext` chain of this structure does not include a `VkProtectedSubmitInfo` structure with `protectedSubmit` set to `VK_TRUE`, then each element of the `pCommandBuffers` array **must** be an unprotected command buffer

- VUID-VkSubmitInfo-pNext-04148

If the `pNext` chain of this structure includes a `VkProtectedSubmitInfo` structure with `protectedSubmit` set to `VK_TRUE`, then each element of the `pCommandBuffers` array **must** be a protected command buffer

- VUID-VkSubmitInfo-pCommandBuffers-06193

If `pCommandBuffers` contains any `resumed render pass instances`, they **must** be suspended by a render pass instance earlier in submission order within `pCommandBuffers`

- VUID-VkSubmitInfo-pCommandBuffers-06014

If `pCommandBuffers` contains any `suspended render pass instances`, they **must** be resumed by a render pass instance later in submission order within `pCommandBuffers`

- VUID-VkSubmitInfo-pCommandBuffers-06015

If `pCommandBuffers` contains any `suspended render pass instances`, there **must** be no action or synchronization commands executed in a primary or `secondary` command buffer between that render pass instance and the render pass instance that resumes it

- VUID-VkSubmitInfo-pCommandBuffers-06016

If `pCommandBuffers` contains any `suspended render pass instances`, there **must** be no render pass instances between that render pass instance and the render pass instance that resumes it

- VUID-VkSubmitInfo-variableSampleLocations-06017

If the `variableSampleLocations` limit is not supported, and any element of `pCommandBuffers` contains any `suspended render pass instances`, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, **must** use the same sample locations

- VUID-VkSubmitInfo-pNext-09683

If the `pNext` chain of this structure includes a `VkFrameBoundaryTensorsARM` structure then it **must** also include a `VkFrameBoundaryEXT` structure

- VUID-VkSubmitInfo-pCommandBufferInfos-09942

If at least one `VkCommandBufferSubmitInfo` structure in `pCommandBufferInfos` references a `commandBuffer` allocated from a pool that was created with a `VkDataGraphProcessingEngineCreateInfoARM` structure in the `pNext` chain of `VkCommandPoolCreateInfo` that included a foreign data graph processing engine in its `pProcessingEngines` member, then `pWaitSemaphoreInfos` and `pSignalSemaphoreInfos` **must** only reference `semaphore` objects that were created from external handle types reported as

supported in a `VkQueueFamilyDataGraphProcessingEnginePropertiesARM::foreignSemaphoreHandleTypes` structure via `vkGetPhysicalDeviceQueueFamilyDataGraphProcessingEnginePropertiesARM` with a `queueFamilyIndex` matching the one the command pool was created for, for all the foreign data graph processing engines that were part of the `VkDataGraphProcessingEngineCreateInfoARM` used to create the command pool

Valid Usage (Implicit)

- VUID-VkSubmitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SUBMIT_INFO`
- VUID-VkSubmitInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkAmigoProfilingSubmitInfoSEC`, `VkD3D12FenceSubmitInfoKHR`, `VkDeviceGroupSubmitInfo`, `VkFrameBoundaryEXT`, `VkFrameBoundaryTensorsARM`, `VkLatencySubmissionPresentIdNV`, `VkPerformanceQuerySubmitInfoKHR`, `VkProtectedSubmitInfo`, `VkThrottleHintSubmitInfoSEC`, `VkTimelineSemaphoreSubmitInfo`, `VkWin32KeyedMutexAcquireReleaseInfoKHR`, or `VkWin32KeyedMutexAcquireReleaseInfoNV`
- VUID-VkSubmitInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkSubmitInfo-pWaitSemaphores-parameter
If `waitSemaphoreCount` is not 0, `pWaitSemaphores` **must** be a valid pointer to an array of `waitSemaphoreCount` valid `VkSemaphore` handles
- VUID-VkSubmitInfo-pWaitDstStageMask-parameter
If `waitSemaphoreCount` is not 0, `pWaitDstStageMask` **must** be a valid pointer to an array of `waitSemaphoreCount` valid combinations of `VkPipelineStageFlagBits` values
- VUID-VkSubmitInfo-pCommandBuffers-parameter
If `commandBufferCount` is not 0, `pCommandBuffers` **must** be a valid pointer to an array of `commandBufferCount` valid `VkCommandBuffer` handles
- VUID-VkSubmitInfo-pSignalSemaphores-parameter
If `signalSemaphoreCount` is not 0, `pSignalSemaphores` **must** be a valid pointer to an array of `signalSemaphoreCount` valid `VkSemaphore` handles
- VUID-VkSubmitInfo-commonparent
Each of the elements of `pCommandBuffers`, the elements of `pSignalSemaphores`, and the elements of `pWaitSemaphores` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

To specify the values to use when waiting for and signaling semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, add a `VkTimelineSemaphoreSubmitInfo` structure to the `pNext` chain of the `VkSubmitInfo` structure when using `vkQueueSubmit` or the `VkBindSparseInfo` structure when using `vkQueueBindSparse`. The `VkTimelineSemaphoreSubmitInfo`

structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkTimelineSemaphoreSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreValueCount;
    const uint64_t*     pWaitSemaphoreValues;
    uint32_t           signalSemaphoreValueCount;
    const uint64_t*     pSignalSemaphoreValues;
} VkTimelineSemaphoreSubmitInfo;
```

```
// Provided by VK_KHR_timeline_semaphore
// Equivalent to VkTimelineSemaphoreSubmitInfo
typedef VkTimelineSemaphoreSubmitInfo VkTimelineSemaphoreSubmitInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **waitSemaphoreValueCount** is the number of semaphore wait values specified in **pWaitSemaphoreValues**.
- **pWaitSemaphoreValues** is a pointer to an array of **waitSemaphoreValueCount** values for the corresponding semaphores in **VkSubmitInfo::pWaitSemaphores** to wait for.
- **signalSemaphoreValueCount** is the number of semaphore signal values specified in **pSignalSemaphoreValues**.
- **pSignalSemaphoreValues** is a pointer to an array **signalSemaphoreValueCount** values for the corresponding semaphores in **VkSubmitInfo::pSignalSemaphores** to set when signaled.

If the semaphore in **VkSubmitInfo::pWaitSemaphores** or **VkSubmitInfo::pSignalSemaphores** corresponding to an entry in **pWaitSemaphoreValues** or **pSignalSemaphoreValues** respectively was not created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE**, the implementation **must** ignore the value in the **pWaitSemaphoreValues** or **pSignalSemaphoreValues** entry.

Valid Usage (Implicit)

- VUID-VkTimelineSemaphoreSubmitInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO**
- VUID-VkTimelineSemaphoreSubmitInfo-pWaitSemaphoreValues-parameter
If **waitSemaphoreValueCount** is not **0**, and **pWaitSemaphoreValues** is not **NULL**, **pWaitSemaphoreValues** **must** be a valid pointer to an array of **waitSemaphoreValueCount** **uint64_t** values
- VUID-VkTimelineSemaphoreSubmitInfo-pSignalSemaphoreValues-parameter
If **signalSemaphoreValueCount** is not **0**, and **pSignalSemaphoreValues** is not **NULL**, **pSignalSemaphoreValues** **must** be a valid pointer to an array of **signalSemaphoreValueCount** **uint64_t** values

Structure Chaining

Extends the structures

- [VkBindSparseInfo](#)
- [VkSubmitInfo](#)

To specify the values to use when waiting for and signaling semaphores whose [current payload](#) refers to a Direct3D 12 fence, add a [VkD3D12FenceSubmitInfoKHR](#) structure to the [pNext](#) chain of the [VkSubmitInfo](#) structure. The [VkD3D12FenceSubmitInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkD3D12FenceSubmitInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreValuesCount;
    const uint64_t*     pWaitSemaphoreValues;
    uint32_t           signalSemaphoreValuesCount;
    const uint64_t*     pSignalSemaphoreValues;
} VkD3D12FenceSubmitInfoKHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is `NULL` or a pointer to a structure extending this structure.
- [waitSemaphoreValuesCount](#) is the number of semaphore wait values specified in [pWaitSemaphoreValues](#).
- [pWaitSemaphoreValues](#) is a pointer to an array of [waitSemaphoreValuesCount](#) values for the corresponding semaphores in [VkSubmitInfo::pWaitSemaphores](#) to wait for.
- [signalSemaphoreValuesCount](#) is the number of semaphore signal values specified in [pSignalSemaphoreValues](#).
- [pSignalSemaphoreValues](#) is a pointer to an array of [signalSemaphoreValuesCount](#) values for the corresponding semaphores in [VkSubmitInfo::pSignalSemaphores](#) to set when signaled.

If the semaphore in [VkSubmitInfo::pWaitSemaphores](#) or [VkSubmitInfo::pSignalSemaphores](#) corresponding to an entry in [pWaitSemaphoreValues](#) or [pSignalSemaphoreValues](#) respectively does not currently have a [payload](#) referring to a Direct3D 12 fence, the implementation **must** ignore the value in the [pWaitSemaphoreValues](#) or [pSignalSemaphoreValues](#) entry.

NOTE

As the introduction of the external semaphore handle type [VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT](#) predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_BINARY](#) is preserved for backwards compatibility. However, applications **should** prefer importing such handle types into semaphores created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_TIMELINE](#), and use the [VkTimelineSemaphoreSubmitInfo](#)

structure instead of the `VkD3D12FenceSubmitInfoKHR` structure to specify the values to use when waiting for and signaling such semaphores.

Valid Usage

- VUID-VkD3D12FenceSubmitInfoKHR-waitSemaphoreValuesCount-00079
`waitSemaphoreValuesCount` **must** be the same value as `VkSubmitInfo::waitSemaphoreCount`, where this structure is in the `pNext` chain of a `VkSubmitInfo` structure
- VUID-VkD3D12FenceSubmitInfoKHR-signalSemaphoreValuesCount-00080
`signalSemaphoreValuesCount` **must** be the same value as `VkSubmitInfo::signalSemaphoreCount`, where this structure is in the `pNext` chain of a `VkSubmitInfo` structure

Valid Usage (Implicit)

- VUID-VkD3D12FenceSubmitInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_D3D12_FENCE_SUBMIT_INFO_KHR`
- VUID-VkD3D12FenceSubmitInfoKHR-pWaitSemaphoreValues-parameter
If `waitSemaphoreValuesCount` is not 0, and `pWaitSemaphoreValues` is not NULL, `pWaitSemaphoreValues` **must** be a valid pointer to an array of `waitSemaphoreValuesCount` `uint64_t` values
- VUID-VkD3D12FenceSubmitInfoKHR-pSignalSemaphoreValues-parameter
If `signalSemaphoreValuesCount` is not 0, and `pSignalSemaphoreValues` is not NULL, `pSignalSemaphoreValues` **must** be a valid pointer to an array of `signalSemaphoreValuesCount` `uint64_t` values

Structure Chaining

Extends the structure

- `VkSubmitInfo`

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism **may** be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They **can** only be used if the imported resource was created with the `D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX` flag.

To acquire keyed mutexes before submitted work and/or release them after, add a `VkWin32KeyedMutexAcquireReleaseInfoKHR` structure to the `pNext` chain of the `VkSubmitInfo` structure.

The `VkWin32KeyedMutexAcquireReleaseInfoKHR` structure is defined as:

```
// Provided by VK_KHR_win32_keyed_mutex
typedef struct VkWin32KeyedMutexAcquireReleaseInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             acquireCount;
    const VkDeviceMemory* pAcquireSyncs;
    const uint64_t*       pAcquireKeys;
    const uint32_t*       pAcquireTimeouts;
    uint32_t             releaseCount;
    const VkDeviceMemory* pReleaseSyncs;
    const uint64_t*       pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `acquireCount` is the number of entries in the `pAcquireSyncs`, `pAcquireKeys`, and `pAcquireTimeouts` arrays.
- `pAcquireSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pAcquireKeys` is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in `pAcquireSyncs`.
- `pAcquireTimeouts` is a pointer to an array of timeout values, in millisecond units, for each acquire specified in `pAcquireKeys`.
- `releaseCount` is the number of entries in the `pReleaseSyncs` and `pReleaseKeys` arrays.
- `pReleaseSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pReleaseKeys` is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in `pReleaseSyncs`.

Valid Usage

- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-00081
Each member of `pAcquireSyncs` and `pReleaseSyncs` **must** be a device memory object imported by setting `VkImportMemoryWin32HandleInfoKHR::handleType` to `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`

Valid Usage (Implicit)

- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-sType-sType
`sType` **must** be

VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_KHR

- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-parameter
If `acquireCount` is not 0, `pAcquireSyncs` **must** be a valid pointer to an array of `acquireCount` valid `VkDeviceMemory` handles
- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireKeys-parameter
If `acquireCount` is not 0, `pAcquireKeys` **must** be a valid pointer to an array of `acquireCount` `uint64_t` values
- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireTimeouts-parameter
If `acquireCount` is not 0, `pAcquireTimeouts` **must** be a valid pointer to an array of `acquireCount` `uint32_t` values
- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseSyncs-parameter
If `releaseCount` is not 0, `pReleaseSyncs` **must** be a valid pointer to an array of `releaseCount` valid `VkDeviceMemory` handles
- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseKeys-parameter
If `releaseCount` is not 0, `pReleaseKeys` **must** be a valid pointer to an array of `releaseCount` `uint64_t` values
- VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-commonparent
Both of the elements of `pAcquireSyncs`, and the elements of `pReleaseSyncs` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Structure Chaining

Extends the structures

- `VkSubmitInfo`
- `VkSubmitInfo2`

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism **may** be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They **can** only be used if the imported resource was created with the `D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX` flag.

To acquire keyed mutexes before submitted work and/or release them after, add a `VkWin32KeyedMutexAcquireReleaseInfoNV` structure to the `pNext` chain of the `VkSubmitInfo` structure.

The `VkWin32KeyedMutexAcquireReleaseInfoNV` structure is defined as:

```
// Provided by VK_NV_win32_keyed_mutex
typedef struct VkWin32KeyedMutexAcquireReleaseInfoNV {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             acquireCount;
    const VkDeviceMemory* pAcquireSyncs;
    const uint64_t*       pAcquireKeys;
    const uint32_t*       pAcquireTimeoutMilliseconds;
    uint32_t             releaseCount;
    const VkDeviceMemory* pReleaseSyncs;
    const uint64_t*       pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `acquireCount` is the number of entries in the `pAcquireSyncs`, `pAcquireKeys`, and `pAcquireTimeoutMilliseconds` arrays.
- `pAcquireSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pAcquireKeys` is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in `pAcquireSyncs`.
- `pAcquireTimeoutMilliseconds` is a pointer to an array of timeout values, in millisecond units, for each acquire specified in `pAcquireKeys`.
- `releaseCount` is the number of entries in the `pReleaseSyncs` and `pReleaseKeys` arrays.
- `pReleaseSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pReleaseKeys` is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in `pReleaseSyncs`.

Valid Usage (Implicit)

- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-sType-sType **must** be `VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_NV`
- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireSyncs-parameter
If `acquireCount` is not 0, `pAcquireSyncs` **must** be a valid pointer to an array of `acquireCount` valid `VkDeviceMemory` handles
- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireKeys-parameter
If `acquireCount` is not 0, `pAcquireKeys` **must** be a valid pointer to an array of `acquireCount` `uint64_t` values
- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireTimeoutMilliseconds-

parameter

If `acquireCount` is not 0, `pAcquireTimeoutMilliseconds` **must** be a valid pointer to an array of `acquireCount` `uint32_t` values

- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pReleaseSyncs-parameter
If `releaseCount` is not 0, `pReleaseSyncs` **must** be a valid pointer to an array of `releaseCount` valid `VkDeviceMemory` handles
- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pReleaseKeys-parameter
If `releaseCount` is not 0, `pReleaseKeys` **must** be a valid pointer to an array of `releaseCount` `uint64_t` values
- VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-commonparent
Both of the elements of `pAcquireSyncs`, and the elements of `pReleaseSyncs` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Structure Chaining

Extends the structures

- `VkSubmitInfo`
- `VkSubmitInfo2`

If the `pNext` chain of `VkSubmitInfo` includes a `VkProtectedSubmitInfo` structure, then the structure indicates whether the batch is protected. The `VkProtectedSubmitInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkProtectedSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           protectedSubmit;
} VkProtectedSubmitInfo;
```

- `protectedSubmit` specifies whether the batch is protected. If `protectedSubmit` is `VK_TRUE`, the batch is protected. If `protectedSubmit` is `VK_FALSE`, the batch is unprotected. If the `VkSubmitInfo::pNext` chain does not include this structure, the batch is unprotected.

Valid Usage (Implicit)

- VUID-VkProtectedSubmitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PROTECTED_SUBMIT_INFO`

Structure Chaining

Extends the structure

- [VkSubmitInfo](#)

If the `pNext` chain of [VkSubmitInfo](#) includes a [VkDeviceGroupSubmitInfo](#) structure, then that structure includes device indices and masks specifying which physical devices execute semaphore operations and command buffers.

The [VkDeviceGroupSubmitInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreCount;
    const uint32_t*     pWaitSemaphoreDeviceIndices;
    uint32_t           commandBufferCount;
    const uint32_t*     pCommandBufferDeviceMasks;
    uint32_t           signalSemaphoreCount;
    const uint32_t*     pSignalSemaphoreDeviceIndices;
} VkDeviceGroupSubmitInfo;
```

```
// Provided by VK_KHR_device_group
// Equivalent to VkDeviceGroupSubmitInfo
typedef VkDeviceGroupSubmitInfo VkDeviceGroupSubmitInfoKHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of elements in the `pWaitSemaphoreDeviceIndices` array.
- `pWaitSemaphoreDeviceIndices` is a pointer to an array of `waitSemaphoreCount` device indices indicating which physical device executes the semaphore wait operation in the corresponding element of [VkSubmitInfo::pWaitSemaphores](#).
- `commandBufferCount` is the number of elements in the `pCommandBufferDeviceMasks` array.
- `pCommandBufferDeviceMasks` is a pointer to an array of `commandBufferCount` device masks indicating which physical devices execute the command buffer in the corresponding element of [VkSubmitInfo::pCommandBuffers](#). A physical device executes the command buffer if the corresponding bit is set in the mask.
- `signalSemaphoreCount` is the number of elements in the `pSignalSemaphoreDeviceIndices` array.
- `pSignalSemaphoreDeviceIndices` is a pointer to an array of `signalSemaphoreCount` device indices indicating which physical device executes the semaphore signal operation in the corresponding element of [VkSubmitInfo::pSignalSemaphores](#).

If this structure is not present, semaphore operations and command buffers execute on device index zero.

Valid Usage

- VUID-VkDeviceGroupSubmitInfo-waitSemaphoreCount-00082
`waitSemaphoreCount` **must** equal `VkSubmitInfo::waitSemaphoreCount`
- VUID-VkDeviceGroupSubmitInfo-commandBufferCount-00083
`commandBufferCount` **must** equal `VkSubmitInfo::commandBufferCount`
- VUID-VkDeviceGroupSubmitInfo-signalSemaphoreCount-00084
`signalSemaphoreCount` **must** equal `VkSubmitInfo::signalSemaphoreCount`
- VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-00085
All elements of `pWaitSemaphoreDeviceIndices` and `pSignalSemaphoreDeviceIndices` **must** be valid device indices
- VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-00086
All elements of `pCommandBufferDeviceMasks` **must** be valid device masks

Valid Usage (Implicit)

- VUID-VkDeviceGroupSubmitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SUBMIT_INFO`
- VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-parameter
If `waitSemaphoreCount` is not 0, `pWaitSemaphoreDeviceIndices` **must** be a valid pointer to an array of `waitSemaphoreCount` `uint32_t` values
- VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-parameter
If `commandBufferCount` is not 0, `pCommandBufferDeviceMasks` **must** be a valid pointer to an array of `commandBufferCount` `uint32_t` values
- VUID-VkDeviceGroupSubmitInfo-pSignalSemaphoreDeviceIndices-parameter
If `signalSemaphoreCount` is not 0, `pSignalSemaphoreDeviceIndices` **must** be a valid pointer to an array of `signalSemaphoreCount` `uint32_t` values

Structure Chaining

Extends the structure

- `VkSubmitInfo`

If the `pNext` chain of `VkSubmitInfo` includes a `VkPerformanceQuerySubmitInfoKHR` structure, then the structure indicates which counter pass is active for the batch in that submit.

The `VkPerformanceQuerySubmitInfoKHR` structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceQuerySubmitInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           counterPassIndex;
} VkPerformanceQuerySubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `counterPassIndex` specifies which counter pass index is active.

If the `VkSubmitInfo::pNext` chain does not include this structure, the batch defaults to use counter pass index 0.

Valid Usage

- VUID-VkPerformanceQuerySubmitInfoKHR-counterPassIndex-03221
`counterPassIndex` **must** be less than the number of counter passes required by any queries within the batch. The required number of counter passes for a performance query is obtained by calling `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`

Valid Usage (Implicit)

- VUID-VkPerformanceQuerySubmitInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR`

Structure Chaining

Extends the structures

- `VkSubmitInfo`
- `VkSubmitInfo2`

6.6. Queue Forward Progress

When using binary semaphores, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application on any queue. After any call to `vkQueueSubmit` (or other queue operation), for every queued wait on a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` there **must** be a prior signal of that semaphore that will not be consumed by a different wait on the semaphore.

When using timeline semaphores, wait-before-signal behavior is well-defined and applications **can** submit work via `vkQueueSubmit` defining a `timeline semaphore wait operation` before submitting a

corresponding [semaphore signal operation](#). For each [timeline semaphore wait operation](#) defined by a call to `vkQueueSubmit`, the application **must** ensure that a corresponding [semaphore signal operation](#) is executed before forward progress can be made.

If a command buffer submission waits for any events to be signaled, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application. Events signaled by the host **must** be signaled before the command buffer waits on those events.

NOTE

The ability for commands to wait on the host to set an events was originally added to allow low-latency updates to resources between host and device. However, to ensure quality of service, implementations would necessarily detect extended stalls in execution and timeout after a short period. As this period is not defined in the Vulkan specification, it is impossible to correctly validate any application with any wait period. Since the original users of this functionality were highly limited and platform-specific, this functionality is now considered defunct and should not be used.

6.7. Secondary Command Buffer Execution

Secondary command buffers **must** not be directly submitted to a queue. To record a secondary command buffer to execute as part of a primary command buffer, call:

```
// Provided by VK_VERSION_1_0
void vkCmdExecuteCommands(
    VkCommandBuffer          commandBuffer,
    uint32_t                 commandBufferCount,
    const VkCommandBuffer*   pCommandBuffers);
```

- `commandBuffer` is a handle to a primary command buffer that the secondary command buffers are executed in.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of `commandBufferCount` secondary command buffer handles, which are recorded to execute in the primary command buffer in the order they are listed in the array.

If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, and it was recorded into any other primary command buffer which is currently in the [executable or recording state](#), that primary command buffer becomes [invalid](#).

If the `nestedCommandBuffer` feature is enabled it is valid usage for `vkCmdExecuteCommands` to also be recorded to a [secondary command buffer](#).

Valid Usage

- VUID-vkCmdExecuteCommands-pCommandBuffers-00088
Each element of `pCommandBuffers` **must** have been allocated with a `level` of `VK_COMMAND_BUFFER_LEVEL_SECONDARY`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00089
Each element of `pCommandBuffers` **must** be in the `pending or executable state`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00091
If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not be in the `pending state`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00092
If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not have already been recorded to `commandBuffer`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00093
If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not appear more than once in `pCommandBuffers`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00094
Each element of `pCommandBuffers` **must** have been allocated from a `VkCommandPool` that was created for the same queue family as the `VkCommandPool` from which `commandBuffer` was allocated
- VUID-vkCmdExecuteCommands-pCommandBuffers-00096
If this command is called within a render pass instance, each element of `pCommandBuffers` **must** have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00099
If this command is called within a render pass instance, and any element of `pCommandBuffers` was recorded with `VkCommandBufferInheritanceInfo::framebuffer` not equal to `VK_NULL_HANDLE`, that `VkFramebuffer` **must** match the `VkFramebuffer` used in the current render pass instance
- VUID-vkCmdExecuteCommands-contents-09680
If this command is called within a render pass instance begun with `vkCmdBeginRenderPass`, and `vkCmdNextSubpass` has not been called in the current render pass instance, the `contents` parameter of `vkCmdBeginRenderPass` **must** have been `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS`, or `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT`
- VUID-vkCmdExecuteCommands-None-09681
If this command is called within a render pass instance begun with `vkCmdBeginRenderPass`, and `vkCmdNextSubpass` has been called in the current render pass instance, the `contents` parameter of the last call to `vkCmdNextSubpass` **must** have been `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS`, or `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR`

- VUID-vkCmdExecuteCommands-pCommandBuffers-06019
If this command is called within a render pass instance begun with `vkCmdBeginRenderPass`, each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::subpass` set to the index of the subpass which the given command buffer will be executed in
- VUID-vkCmdExecuteCommands-pBeginInfo-06020
If this command is called within a render pass instance begun with `vkCmdBeginRenderPass`, the render passes specified in the `pBeginInfo->pInheritanceInfo->renderPass` members of the `vkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` **must** be `compatible` with the current render pass
- VUID-vkCmdExecuteCommands-pNext-02865
If this command is called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` in the `pNext` chain of `VkCommandBufferBeginInfo`
- VUID-vkCmdExecuteCommands-pNext-02866
If this command is called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceRenderPassTransformInfoQCOM::transform` identical to `VkRenderPassTransformBeginInfoQCOM::transform`
- VUID-vkCmdExecuteCommands-pNext-02867
If this command is called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceRenderPassTransformInfoQCOM::renderArea` identical to `VkRenderPassBeginInfo::renderArea`
- VUID-vkCmdExecuteCommands-pCommandBuffers-00100
If `vkCmdExecuteCommands` is not being called within a render pass instance, each element of `pCommandBuffers` **must** not have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`
- VUID-vkCmdExecuteCommands-commandBuffer-00101
If the `inheritedQueries` feature is not enabled, `commandBuffer` **must** not have any queries `active`
- VUID-vkCmdExecuteCommands-commandBuffer-00102
If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query `active`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::occlusionQueryEnable` set to `VK_TRUE`
- VUID-vkCmdExecuteCommands-commandBuffer-00103
If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query `active`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::queryFlags` having all bits set that are set for the query
- VUID-vkCmdExecuteCommands-commandBuffer-00104

If `commandBuffer` has a `VK_QUERY_TYPE_PIPELINE_STATISTICS` query `active`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::pipelineStatistics` having all bits set that are set in the `VkQueryPool` the query uses

- VUID-vkCmdExecuteCommands-pCommandBuffers-00105
Each element of `pCommandBuffers` **must** not begin any query types that are `active` in `commandBuffer`
- VUID-vkCmdExecuteCommands-commandBuffer-07594
`commandBuffer` **must** not have any queries other than `VK_QUERY_TYPE_OCCLUSION` and `VK_QUERY_TYPE_PIPELINE_STATISTICS` `active`
- VUID-vkCmdExecuteCommands-commandBuffer-01820
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` **must** be a protected command buffer
- VUID-vkCmdExecuteCommands-commandBuffer-01821
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` **must** be an unprotected command buffer
- VUID-vkCmdExecuteCommands-None-02286
This command **must** not be recorded when transform feedback is active
- VUID-vkCmdExecuteCommands-commandBuffer-06533
If this command is called within a render pass instance and any recorded command in `commandBuffer` in the current subpass will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` **must** not read from the memory backing that image subresource in any other way
- VUID-vkCmdExecuteCommands-commandBuffer-06534
If this command is called within a render pass instance and any recorded command in `commandBuffer` in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` **must** not write to that image subresource as an attachment
- VUID-vkCmdExecuteCommands-pCommandBuffers-06535
If this command is called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index **must** not read from the memory backing that image subresource in any other way
- VUID-vkCmdExecuteCommands-pCommandBuffers-06536
If this command is called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index **must** not write to that image subresource as an attachment
- VUID-vkCmdExecuteCommands-pCommandBuffers-06021
If `pCommandBuffers` contains any `suspended render pass instances`, there **must** be no action or synchronization commands between that render pass instance and any render pass instance that resumes it

- VUID-vkCmdExecuteCommands-pCommandBuffers-06022
If `pCommandBuffers` contains any `suspended render pass instances`, there **must** be no render pass instances between that render pass instance and any render pass instance that resumes it
- VUID-vkCmdExecuteCommands-variableSampleLocations-06023
If the `variableSampleLocations` limit is not supported, and any element of `pCommandBuffers` contains any `suspended render pass instances`, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, **must** use the same sample locations
- VUID-vkCmdExecuteCommands-flags-06024
If this command is called within a render pass instance begun with `vkCmdBeginRendering`, its `VkRenderingInfo::flags` parameter **must** have included `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`
- VUID-vkCmdExecuteCommands-pBeginInfo-06025
If this command is called within a render pass instance begun with `vkCmdBeginRendering`, the render passes specified in the `pBeginInfo->pInheritanceInfo->renderPass` members of the `VkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` **must** be `VK_NULL_HANDLE`
- VUID-vkCmdExecuteCommands-flags-06026
If this command is called within a render pass instance begun with `vkCmdBeginRendering`, the `flags` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the `VkRenderingInfo::flags` parameter to `vkCmdBeginRendering`, excluding `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`
- VUID-vkCmdExecuteCommands-colorAttachmentCount-06027
If this command is called within a render pass instance begun with `vkCmdBeginRendering`, the `colorAttachmentCount` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the `VkRenderingInfo::colorAttachmentCount` parameter to `vkCmdBeginRendering`
- VUID-vkCmdExecuteCommands-imageView-06028
If this command is called within a render pass instance begun with `vkCmdBeginRendering`, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the corresponding element of the `pColorAttachmentFormats` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the format used to create that image view
- VUID-vkCmdExecuteCommands-imageView-07606
If this command is called within a render pass instance begun with `vkCmdBeginRendering`, if the `imageView` member of an element of the `VkRenderingInfo`

::pColorAttachments parameter to vkCmdBeginRendering is VK_NULL_HANDLE, the corresponding element of the pColorAttachmentFormats member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers **must** be VK_FORMAT_UNDEFINED

- VUID-vkCmdExecuteCommands-pDepthAttachment-06029

If this command is called within a render pass instance begun with vkCmdBeginRendering, if the VkRenderingInfo::pDepthAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of the depthAttachmentFormat member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers **must** be equal to the format used to create that image view

- VUID-vkCmdExecuteCommands-pStencilAttachment-06030

If this command is called within a render pass instance begun with vkCmdBeginRendering, if the VkRenderingInfo::pStencilAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of the stencilAttachmentFormat member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers **must** be equal to the format used to create that image view

- VUID-vkCmdExecuteCommands-pDepthAttachment-06774

If this command is called within a render pass instance begun with vkCmdBeginRendering and the VkRenderingInfo::pDepthAttachment->imageView parameter to vkCmdBeginRendering was VK_NULL_HANDLE, the value of the depthAttachmentFormat member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers **must** be VK_FORMAT_UNDEFINED

- VUID-vkCmdExecuteCommands-pStencilAttachment-06775

If this command is called within a render pass instance begun with vkCmdBeginRendering and the VkRenderingInfo::pStencilAttachment->imageView parameter to vkCmdBeginRendering was VK_NULL_HANDLE, the value of the stencilAttachmentFormat member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers **must** be VK_FORMAT_UNDEFINED

- VUID-vkCmdExecuteCommands-pCommandBuffers-11500

If the current render pass instance was begun with vkCmdBeginRendering and contains a custom resolve, then each element of pCommandBuffers **must** have been recorded with a VkCustomResolveCreateInfoEXT struct chained to its VkCommandBufferInheritanceInfo

- VUID-vkCmdExecuteCommands-pCommandBuffers-11501

If the current render pass instance was begun with vkCmdBeginRendering and does not contain a custom resolve, then each element of pCommandBuffers **must** not have been recorded with a VkCustomResolveCreateInfoEXT struct chained to its VkCommandBufferInheritanceInfo

- VUID-vkCmdExecuteCommands-pCommandBuffers-11502
If the current render pass instance was begun with `vkCmdBeginRendering` and `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, then each element of `pCommandBuffers` **must** have been recorded with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_TRUE`
- VUID-vkCmdExecuteCommands-pCommandBuffers-11503
If the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, and `vkCmdBeginCustomResolveEXT` has not been recorded in the render pass instance, then each element of `pCommandBuffers` **must** have been recorded with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_FALSE`
- VUID-vkCmdExecuteCommands-colorAttachmentCount-11532
If this command is called within a render pass instance begun with `vkCmdBeginRendering` that contains a custom resolve, the `colorAttachmentCount` member of the `VkCustomResolveCreateInfoEXT` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the `VkRenderingInfo::colorAttachmentCount` parameter to `vkCmdBeginRendering`
- VUID-vkCmdExecuteCommands-resolveImageView-11533
If this command is called within a render pass instance begun with `vkCmdBeginRendering` that contains a custom resolve, if the `resolveImageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the corresponding element of the `pColorAttachmentFormats` member of the `VkCustomResolveCreateInfoEXT` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the format used to create that image view
- VUID-vkCmdExecuteCommands-resolveImageView-11534
If this command is called within a render pass instance begun with `vkCmdBeginRendering` that contains a custom resolve, if the `resolveImageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is `VK_NULL_HANDLE`, the corresponding element of the `pColorAttachmentFormats` member of the `VkCustomResolveCreateInfoEXT` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdExecuteCommands-pDepthAttachment-11535
If this command is called within a render pass instance begun with `vkCmdBeginRendering`, if the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of the `depthAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the format used to create that image view
- VUID-vkCmdExecuteCommands-pStencilAttachment-11536
If this command is called within a render pass instance begun with `vkCmdBeginRendering` that contains a custom resolve, if the `VkRenderingInfo`

`::pStencilAttachment->resolveImageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of the `stencilAttachmentFormat` member of the `VkCustomResolveCreateInfoEXT` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the format used to create that image view

- VUID-vkCmdExecuteCommands-pDepthAttachment-11537

If this command is called within a render pass instance begun with `vkCmdBeginRendering` that contains a custom resolve and the `VkRenderingInfo::pDepthAttachment->resolveImageView` parameter to `vkCmdBeginRendering` was `VK_NULL_HANDLE`, the value of the `depthAttachmentFormat` member of the `VkCustomResolveCreateInfoEXT` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteCommands-pStencilAttachment-11538

If this command is called within a render pass instance begun with `vkCmdBeginRendering` that contains a custom resolve and the `VkRenderingInfo::pStencilAttachment->resolveImageView` parameter to `vkCmdBeginRendering` was `VK_NULL_HANDLE`, the value of the `stencilAttachmentFormat` member of the `VkCustomResolveCreateInfoEXT` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteCommands-resolveImageView-11526

If this command is called within a render pass instance begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, and the `resolveImageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` **must** be equal to the sample count used to create that `resolveImageView`

- VUID-vkCmdExecuteCommands-pDepthAttachment-11527

If this command is called within a render pass instance begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, and the `VkRenderingInfo::pDepthAttachment->resolveImageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pStencilAttachment-11528

If this command is called within a render pass instance begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, and the `VkRenderingInfo::pStencilAttachment->resolveImageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-viewMask-06031

If this command is called within a render pass instance begun with `vkCmdBeginRendering`, the `viewMask` member of the

`VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the `VkRenderingInfo::viewMask` parameter to `vkCmdBeginRendering`

- VUID-vkCmdExecuteCommands-pNext-06032

If this command is called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the corresponding element of the `pColorAttachmentSamples` member of the `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06033

If this command is called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of the `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06034

If this command is called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `VkRenderingInfo::pStencilAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of the `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06035

If this command is called within a render pass instance begun with `vkCmdBeginRendering`, and the `pNext` chain of `VkCommandBufferInheritanceInfo` does not include a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06036

If this command is called within a render pass instance begun with

`vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` does not include a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and if the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06037

If this command is called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` does not include a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and if the `VkRenderingInfo::pStencilAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` **must** be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-09299

If this command is called within a render pass instance begun with `vkCmdBeginRendering`, with any color attachment using a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`, the `pNext` chain of `VkCommandBufferInheritanceInfo` used to create each element of `pCommandBuffers` **must** include a `VkExternalFormatANDROID` structure with an `externalFormat` matching that used to create the resolve attachment in the render pass

- VUID-vkCmdExecuteCommands-pNext-09300

If this command is called within a render pass instance begun with `vkCmdBeginRendering` with any color attachment using a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`, and the `pNext` chain of `VkCommandBufferInheritanceInfo` does not include a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` **must** be `VK_SAMPLE_COUNT_1_BIT`

- VUID-vkCmdExecuteCommands-commandBuffer-09375

`commandBuffer` **must** not be a `secondary command buffer` unless the `nestedCommandBuffer` feature is enabled

- VUID-vkCmdExecuteCommands-nestedCommandBuffer-09376

If the `nestedCommandBuffer` feature is enabled, and `commandBuffer` is a `secondary command buffer`, the `command buffer nesting level` of each element of `pCommandBuffers` **must** be less than `maxCommandBufferNestingLevel`

- VUID-vkCmdExecuteCommands-nestedCommandBufferRendering-09377

If the `nestedCommandBufferRendering` feature is not enabled, and `commandBuffer` is a `secondary command buffer`, `commandBuffer` **must** not have been recorded with `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`

- VUID-vkCmdExecuteCommands-nestedCommandBufferSimultaneousUse-09378

If the `nestedCommandBufferSimultaneousUse` feature is not enabled, and `commandBuffer` is a `secondary command buffer`, each element of `pCommandBuffers` **must** not have been

recorded with [VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT](#)

- VUID-vkCmdExecuteCommands-pCommandBuffers-09504

If this command is called within a render pass instance begun with [vkCmdBeginRendering](#), the color attachment mapping state specified by [VkRenderingAttachmentLocationInfo](#) in the inheritance info of each element of [pCommandBuffers](#) and in the current state of [commandBuffer](#) **must** match

- VUID-vkCmdExecuteCommands-pCommandBuffers-09505

If this command is called within a render pass instance begun with [vkCmdBeginRendering](#), the input attachment mapping state specified by [VkRenderingInputAttachmentIndexInfo](#) in the inheritance info of each element of [pCommandBuffers](#) and in the current state of [commandBuffer](#) **must** match

- VUID-vkCmdExecuteCommands-memory-10724

If this command is called within a render pass instance, the size of [memory](#) member of the [VkTileMemoryBindInfoQCOM](#) structure included in the [pNext](#) chain of [VkCommandBufferBeginInfo::pInheritanceInfo](#) used to begin recording each element of [pCommandBuffers](#) **must** be equal to the active bound [bound tile memory object](#) in [commandBuffer](#)

- VUID-vkCmdExecuteCommands-pCommandBuffers-10620

If this command is being recorded within a render pass instance with [tile shading](#) enabled, all elements of [pCommandBuffers](#) **must** have been recorded with [VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM](#) included in [VkRenderPassTileShadingCreateInfoQCOM::flags](#)

- VUID-vkCmdExecuteCommands-pCommandBuffers-10621

If the [per-tile execution model](#) is enabled, all elements of [pCommandBuffers](#) **must** have been recorded with [VK_TILE_SHADING_RENDER_PASS_PER_TILE_EXECUTION_BIT_QCOM](#) included in [VkRenderPassTileShadingCreateInfoQCOM::flags](#)

- VUID-vkCmdExecuteCommands-tileApronSize-10622

If this command is being recorded within a render pass instance, the [tileApronSize](#) used to create the render pass instance **must** equal the [VkRenderPassTileShadingCreateInfoQCOM::tileApronSize](#) used to record all elements of [pCommandBuffers](#)

- VUID-vkCmdExecuteCommands-pCommandBuffers-10623

If any element of [pCommandBuffers](#) was recorded with [VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM](#) included in [VkRenderPassTileShadingCreateInfoQCOM::flags](#), this command **must** be recorded in a render pass that has tile shading enabled

- VUID-vkCmdExecuteCommands-pCommandBuffers-10624

If any element of [pCommandBuffers](#) was recorded with [VK_TILE_SHADING_RENDER_PASS_PER_TILE_EXECUTION_BIT_QCOM](#) included in [VkRenderPassTileShadingCreateInfoQCOM::flags](#), [per-tile execution model](#) **must** be enabled

- VUID-vkCmdExecuteCommands-tileApronSize-10625

If this command is not being recorded into a render pass instance, the [VkRenderPassTileShadingCreateInfoQCOM::tileApronSize](#) that was recorded into all

elements of `pCommandBuffers` **must** equal `(0,0)`

- VUID-vkCmdExecuteCommands-commandBuffer-11351

If there is a sampler descriptor heap bound to `commandBuffer`, each element of `pCommandBuffers` **must** have been recorded with a value of `VkCommandBufferInheritanceDescriptorHeapInfoEXT::pSamplerHeapBindInfo` that is either `NULL` or a pointer to a bind info that is identical to that set via the last call to `vkCmdBindSamplerHeapEXT`

- VUID-vkCmdExecuteCommands-commandBuffer-11352

If there is a resource descriptor heap bound to `commandBuffer`, each element of `pCommandBuffers` **must** have been recorded with a value of `VkCommandBufferInheritanceDescriptorHeapInfoEXT::pResourceHeapBindInfo` that is either `NULL` or a pointer to a bind info that is identical to that set via the last call to `vkCmdBindResourceHeapEXT`

- VUID-vkCmdExecuteCommands-commandBuffer-11473

If there is no sampler descriptor heap bound to `commandBuffer`, each element of `pCommandBuffers` **must** have been recorded with a value of `VkCommandBufferInheritanceDescriptorHeapInfoEXT::pSamplerHeapBindInfo` set to `NULL`

- VUID-vkCmdExecuteCommands-commandBuffer-11474

If there is no resource descriptor heap bound to `commandBuffer`, each element of `pCommandBuffers` **must** have been recorded with a value of `VkCommandBufferInheritanceDescriptorHeapInfoEXT::pResourceHeapBindInfo` set to `NULL`

- VUID-vkCmdExecuteCommands-commandBuffer-12373

`commandBuffer` **must** not have any shader instrumentation `active`

Valid Usage (Implicit)

- VUID-vkCmdExecuteCommands-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdExecuteCommands-pCommandBuffers-parameter

`pCommandBuffers` **must** be a valid pointer to an array of `commandBufferCount` valid `VkCommandBuffer` handles

- VUID-vkCmdExecuteCommands-commandBuffer-recording

`commandBuffer` **must** be in the `recording` state

- VUID-vkCmdExecuteCommands-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, or `VK_QUEUE_TRANSFER_BIT` operations

- VUID-vkCmdExecuteCommands-videocoding

This command **must** only be called outside of a video coding scope

- VUID-vkCmdExecuteCommands-commandBufferCount-arraylength

`commandBufferCount` **must** be greater than `0`

- VUID-vkCmdExecuteCommands-commonparent

Both of `commandBuffer`, and the elements of `pCommandBuffers` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Indirection

Conditional Rendering

`vkCmdExecuteCommands` is not affected by [conditional rendering](#)

6.8. Nested Command Buffers

In addition to secondary command buffer execution from primary command buffers, an implementation **may** support [nested command buffers](#), which enable secondary command buffers to be executed from other secondary command buffers. If the `nestedCommandBuffer` feature is enabled, the implementation supports [nested command buffers](#).

Nested command buffer execution works the same as primary-to-secondary execution, except that it is subject to some additional implementation-defined limits.

Each secondary command buffer has a [command buffer nesting level](#), which is determined at `vkEndCommandBuffer` time and evaluated at `vkCmdExecuteCommands` time. A secondary command buffer that executes no other secondary command buffers has a [command buffer nesting level](#) of zero. Otherwise, the [command buffer nesting level](#) of a secondary command buffer is equal to the maximum nesting level of all secondary command buffers executed by that command buffer plus one. Some implementations **may** have a limit on the maximum nesting level of secondary command buffers that **can** be recorded. This limit is advertised in `maxCommandBufferNestingLevel`.

If the `nestedCommandBufferRendering` feature is enabled, the implementation supports calling `vkCmdExecuteCommands` inside secondary command buffers recorded with `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`. If the `nestedCommandBufferSimultaneousUse` feature is enabled, the implementation supports calling `vkCmdExecuteCommands` with secondary command buffers recorded with `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`.

Whenever `vkCmdExecuteCommands` is recorded inside a secondary command buffer recorded with `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, each member of `pCommandBuffers` **must** have been recorded with a `VkCommandBufferBeginInfo` with `VkCommandBufferInheritanceInfo` compatible with the `VkCommandBufferInheritanceInfo` of the command buffer into which the `vkCmdExecuteCommands` call is being recorded. The `VkCommandBufferInheritanceRenderingInfo` structures are compatible when the `VkCommandBufferInheritanceRenderingInfo::renderpass` are `compatible`, or if they are `VK_NULL_HANDLE` then the `VkCommandBufferInheritanceRenderingInfo` members match, and all other members of `VkCommandBufferInheritanceRenderingInfo` match. This requirement applies recursively, down to the most nested command buffer and up to the command buffer where the render pass was originally begun.

6.9. Command Buffer Device Mask

Each command buffer has a piece of state storing the current device mask of the command buffer. This mask controls which physical devices within the logical device all subsequent commands will execute on, including state-setting commands, action commands, and synchronization commands.

Scissor, exclusive scissor, and viewport state (excluding the count of each) **can** be different values on each physical device (only when set as dynamic state), and each physical device will render using its local copy of the state. Other state is shared between physical devices, such that all physical devices use the most recently set values for the state. However, when recording an action command that uses a piece of state, the most recent command that set that state **must** have included all physical devices that execute the action command in its current device mask.

The command buffer's device mask is orthogonal to the `pCommandBufferDeviceMasks` member of `VkDeviceGroupSubmitInfo`. Commands only execute on a physical device if the device index is set in both device masks.

If the `pNext` chain of `VkCommandBufferBeginInfo` includes a `VkDeviceGroupCommandBufferBeginInfo` structure, then that structure includes an initial device mask for the command buffer.

The `VkDeviceGroupCommandBufferBeginInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupCommandBufferBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceMask;
} VkDeviceGroupCommandBufferBeginInfo;
```

```
// Provided by VK_KHR_device_group
// Equivalent to VkDeviceGroupCommandBufferBeginInfo
typedef VkDeviceGroupCommandBufferBeginInfo VkDeviceGroupCommandBufferBeginInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **deviceMask** is the initial value of the command buffer's device mask.

The initial device mask also acts as an upper bound on the set of devices that **can** ever be in the device mask in the command buffer.

If this structure is not present, the initial value of a command buffer's device mask includes all physical devices in the logical device when the command buffer begins recording.

Valid Usage

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00106
deviceMask **must** be a valid device mask value
- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00107
deviceMask **must** not be zero

Valid Usage (Implicit)

- VUID-VkDeviceGroupCommandBufferBeginInfo-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_DEVICE_GROUP_COMMAND_BUFFER_BEGIN_INFO](#)

Structure Chaining

Extends the structure

- [VkCommandBufferBeginInfo](#)

To update the current device mask of a command buffer, call:

```
// Provided by VK_VERSION_1_1
void vkCmdSetDeviceMask(
    VkCommandBuffer          commandBuffer,
    uint32_t                 deviceMask);
```

```
// Provided by VK_KHR_device_group
// Equivalent to vkCmdSetDeviceMask
void vkCmdSetDeviceMaskKHR(
    VkCommandBuffer                      commandBuffer,
    uint32_t                             deviceMask);
```

- **commandBuffer** is command buffer whose current device mask is modified.
- **deviceMask** is the new value of the current device mask.

deviceMask is used to filter out subsequent commands from executing on all physical devices whose bit indices are not set in the mask, except commands beginning a render pass instance, commands transitioning to the next subpass in the render pass instance, and commands ending a render pass instance, which always execute on the set of physical devices whose bit indices are included in the **deviceMask** member of the [VkDeviceGroupRenderPassBeginInfo](#) structure passed to the command beginning the corresponding render pass instance.

Valid Usage

- VUID-vkCmdSetDeviceMask-deviceMask-00108
deviceMask must be a valid device mask value
- VUID-vkCmdSetDeviceMask-deviceMask-00109
deviceMask must not be zero
- VUID-vkCmdSetDeviceMask-deviceMask-00110
deviceMask must not include any set bits that were not in the [VkDeviceGroupCommandBufferBeginInfo::deviceMask](#) value when the command buffer began recording
- VUID-vkCmdSetDeviceMask-deviceMask-00111
If [vkCmdSetDeviceMask](#) is called inside a render pass instance, **deviceMask must** not include any set bits that were not in the [VkDeviceGroupRenderPassBeginInfo::deviceMask](#) value when the render pass instance began recording

Valid Usage (Implicit)

- VUID-vkCmdSetDeviceMask-commandBuffer-parameter
commandBuffer must be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetDeviceMask-commandBuffer-recording
commandBuffer must be in the [recording state](#)
- VUID-vkCmdSetDeviceMask-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_COMPUTE_BIT](#), [VK_QUEUE_GRAPHICS_BIT](#), or [VK_QUEUE_TRANSFER_BIT](#) operations

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	State

Conditional Rendering

`vkCmdSetDeviceMask` is not affected by [conditional rendering](#)

Chapter 7. Synchronization and Cache Control

Synchronization of access to resources is primarily the responsibility of the application in Vulkan. The order of execution of commands with respect to the host and other commands on the device has few implicit guarantees, and needs to be explicitly specified. Memory caches and other optimizations are also explicitly managed, requiring that the flow of data through the system is largely under application control.

Whilst some implicit guarantees exist between commands, five explicit synchronization mechanisms are exposed by Vulkan:

Fences

Fences **can** be used to communicate to the host that execution of some task on the device has completed, controlling resource access between host and device.

Semaphores

Semaphores **can** be used to control resource access across multiple queues.

Events

Events provide a fine-grained synchronization primitive which **can** be signaled either within a command buffer or by the host, and **can** be waited upon within a command buffer or queried on the host. Events **can** be used to control resource access within a single queue.

Pipeline Barriers

Pipeline barriers also provide synchronization control within a command buffer, but at a single point, rather than with separate signal and wait operations. Pipeline barriers **can** be used to control resource access within a single queue.

Render Pass Objects

Render pass objects provide a synchronization framework for rendering tasks, built upon the concepts in this chapter. Many cases that would otherwise need an application to use other synchronization primitives **can** be expressed more efficiently as part of a render pass. Render pass objects **can** be used to control resource access within a single queue.

7.1. Execution and Memory Dependencies

An *operation* is an arbitrary amount of work to be executed on the host, a device, or an external entity such as a presentation engine. Synchronization commands introduce explicit *execution dependencies*, and *memory dependencies* between two sets of operations defined by the command's two *synchronization scopes*.

The synchronization scopes define which other operations a synchronization command is able to create execution dependencies with. Any type of operation that is not in a synchronization command's synchronization scopes will not be included in the resulting dependency. For example, for many synchronization commands, the synchronization scopes **can** be limited to just operations executing in specific [pipeline stages](#), which allows other pipeline stages to be excluded from a

dependency. Other scoping options are possible, depending on the particular command.

An *execution dependency* is a guarantee that for two sets of operations, the first set **must** happen-before the second set. If an operation happens-before another operation, then the first operation **must** complete before the second operation is initiated. More precisely:

- Let **Ops₁** and **Ops₂** be separate sets of operations.
- Let **Sync** be a synchronization command.
- Let **Scope_{1st}** and **Scope_{2nd}** be the synchronization scopes of **Sync**.
- Let **ScopedOps₁** be the intersection of sets **Ops₁** and **Scope_{1st}**.
- Let **ScopedOps₂** be the intersection of sets **Ops₂** and **Scope_{2nd}**.
- Submitting **Ops₁**, **Sync** and **Ops₂** for execution, in that order, will result in execution dependency **ExeDep** between **ScopedOps₁** and **ScopedOps₂**.
- Execution dependency **ExeDep** guarantees that **ScopedOps₁** happen-before **ScopedOps₂**.

An *execution dependency chain* is a sequence of execution dependencies that form a happens-before relation between the first dependency's **ScopedOps₁** and the final dependency's **ScopedOps₂**. For each consecutive pair of execution dependencies, a chain exists if the intersection of **Scope_{2nd}** in the first dependency and **Scope_{1st}** in the second dependency is not an empty set. The formation of a single execution dependency from an execution dependency chain can be described by substituting the following in the description of execution dependencies:

- Let **Sync** be a set of synchronization commands that generate an execution dependency chain.
- Let **Scope_{1st}** be the first synchronization scope of the first command in **Sync**.
- Let **Scope_{2nd}** be the second synchronization scope of the last command in **Sync**.

Execution dependencies alone are not sufficient to guarantee that values resulting from writes in one set of operations **can** be read from another set of operations.

Three additional types of operations are used to control memory access. *Availability operations* cause the values generated by specified memory write accesses to become *available* to a memory domain for future access. Any available value remains available until a subsequent write to the same memory location occurs (whether it is made available or not) or the memory is freed. *Memory domain operations* cause writes that are available to a source memory domain to become available to a destination memory domain (an example of this is making writes available to the host domain available to the device domain). *Visibility operations* cause values available to a memory domain to become *visible* to specified memory accesses.

Availability, visibility, memory domains, and memory domain operations are formally defined in the [Availability and Visibility](#) section of the [Memory Model](#) chapter. Which API operations perform each of these operations is defined in [Availability, Visibility, and Domain Operations](#).

A *memory dependency* is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation.

- The availability operation happens-before the visibility operation.
- The visibility operation happens-before the second set of operations.

Once written values are made visible to a particular type of memory access, they **can** be read or written by that type of memory access. Most synchronization commands in Vulkan define a memory dependency.

The specific memory accesses that are made available and visible are defined by the *access scopes* of a memory dependency. Any type of access that is in a memory dependency's first access scope and occurs in **ScopedOps₁** is made available. Any type of access that is in a memory dependency's second access scope and occurs in **ScopedOps₂** has any available writes made visible to it. Any type of operation that is not in a synchronization command's access scopes will not be included in the resulting dependency.

A memory dependency enforces availability and visibility of memory accesses and execution order between two sets of operations. Adding to the description of [execution dependency chains](#):

- Let **MemOps₁** be the set of memory accesses performed by **ScopedOps₁**.
- Let **MemOps₂** be the set of memory accesses performed by **ScopedOps₂**.
- Let **AccessScope_{1st}** be the first access scope of the first command in the **Sync** chain.
- Let **AccessScope_{2nd}** be the second access scope of the last command in the **Sync** chain.
- Let **ScopedMemOps₁** be the intersection of sets **MemOps₁** and **AccessScope_{1st}**.
- Let **ScopedMemOps₂** be the intersection of sets **MemOps₂** and **AccessScope_{2nd}**.
- Submitting **Ops₁**, **Sync**, and **Ops₂** for execution, in that order, will result in a memory dependency **MemDep** between **ScopedOps₁** and **ScopedOps₂**.
- Memory dependency **MemDep** guarantees that:
 - Memory writes in **ScopedMemOps₁** are made available.
 - Available memory writes, including those from **ScopedMemOps₁**, are made visible to **ScopedMemOps₂**.

NOTE

Execution and memory dependencies are used to solve data hazards, i.e. to ensure that read and write operations occur in a well-defined order. Write-after-read hazards can be solved with just an execution dependency, but read-after-write and write-after-write hazards need appropriate memory dependencies to be included between them. If an application does not include dependencies to solve these hazards, it results in a [data race](#).

7.1.1. Image Layout Transitions

Image subresources **can** be transitioned from one [layout](#) to another as part of a [memory dependency](#) (e.g. by using an [image memory barrier](#)). When a layout transition is specified in a memory dependency, it happens-after the availability operations in the memory dependency, and happens-before the visibility operations. Image layout transitions **may** perform read and write accesses on all memory bound to the image subresource range, so applications **must** ensure that all memory writes have been made [available](#) before a layout transition is executed. Available memory

is automatically made visible to a layout transition, and writes performed by a layout transition are automatically made available.

Layout transitions always apply to a particular image subresource range, and specify both an old layout and new layout. The old layout **must** either be [VK_IMAGE_LAYOUT_UNDEFINED](#), or match the current layout of the image subresource range. If the old layout matches the current layout of the image subresource range, the transition preserves the contents of that range. If the old layout is [VK_IMAGE_LAYOUT_UNDEFINED](#), the contents of that range **may** be discarded.

NOTE	<p>Image layout transitions with VK_IMAGE_LAYOUT_UNDEFINED allow the implementation to discard the image subresource range, which can provide performance or power benefits. Tile-based architectures may be able to avoid flushing tile data to memory, and immediate style renderers may be able to achieve fast metadata clears to reinitialize frame buffer compression state, or similar.</p> <p>If the contents of an attachment are not needed after a render pass completes, then applications should use VK_ATTACHMENT_STORE_OP_DONT_CARE.</p>
-------------	--

As image layout transitions **may** perform read and write accesses on the memory bound to the image, if the image subresource affected by the layout transition is bound to peer memory for any device in the current device mask then the memory heap the bound memory comes from **must** support the [VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT](#) and [VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT](#) capabilities as returned by [vkGetDeviceGroupPeerMemoryFeatures](#).

NOTE	<p>Applications must ensure that layout transitions happen-after all operations accessing the image with the old layout, and happen-before any operations that will access the image with the new layout. Layout transitions are potentially read/write operations, so not defining appropriate memory dependencies to guarantee this will result in a data race.</p>
-------------	--

Image layout transitions interact with [memory aliasing](#).

Layout transitions that are performed via image memory barriers execute in their entirety in [submission order](#), relative to other image layout transitions submitted to the same queue, including those performed by [render passes](#). This ordering of image layout transitions only applies if the implementation performs actual read/write operations during the transition. An application **must** not rely on ordering of image layout transitions to influence ordering of other commands.

The image layout of each image subresource of a depth/stencil image created with [VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT](#) is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus when the **image** member of an [image memory barrier](#) is an image created with this flag the application **can** chain a [VkSampleLocationsInfoEXT](#) structure to the **pNext** chain of [VkImageMemoryBarrier2](#) or [VkImageMemoryBarrier](#) to specify the sample locations to use during any image layout transition.

If the [VkSampleLocationsInfoEXT](#) structure does not match the sample location state last used to render to the image subresource range specified by [subresourceRange](#), or if no [VkSampleLocationsInfoEXT](#) structure is present, then the contents of the given image subresource

range becomes undefined as if `oldLayout` would equal `VK_IMAGE_LAYOUT_UNDEFINED`.

7.1.2. Pipeline Stages

The work performed by an [action command](#) consists of multiple operations, which are performed as a sequence of logically independent steps known as *pipeline stages*. The exact pipeline stages executed depend on the particular command that is used, and current command buffer state when the command was recorded.

NOTE

Operations performed by synchronization commands (e.g. [availability and visibility operations](#)) are not executed by a defined pipeline stage. However other commands can still synchronize with them by using the [synchronization scopes](#) to create a [dependency chain](#).

Execution of operations across pipeline stages **must** adhere to [implicit ordering guarantees](#), particularly including [pipeline stage order](#). Otherwise, execution across pipeline stages **may** overlap or execute out of order with regards to other stages, unless otherwise enforced by an execution dependency.

Several of the synchronization commands include pipeline stage parameters, restricting the [synchronization scopes](#) for that command to just those stages. This allows fine grained control over the exact execution dependencies and accesses performed by action commands. Implementations **should** use these pipeline stages to avoid unnecessary stalls or cache flushing.

Bits which **can** be set in a `VkPipelineStageFlags2` mask, specifying stages of execution, are:

```
// Provided by VK_VERSION_1_3
// Flag bits for VkPipelineStageFlagBits2
typedef VkFlags64 VkPipelineStageFlagBits2;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT =
0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT =
0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT =
0x00000004ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT =
0x00000008ULL;
static const VkPipelineStageFlagBits2
VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010ULL;
static const VkPipelineStageFlagBits2
VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT =
0x00000040ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT =
0x00000080ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT =
0x00000100ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT =
```

```

0x00000200ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT
= 0x00000400ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT =
0x00000800ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT =
0x00001000ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TRANSFER_BIT =
0x00001000ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT =
0x00002000ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_HOST_BIT = 0x00004000ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT =

```

- [VK_PIPELINE_STAGE_2_NONE](#) specifies no stages of execution.
- [VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT](#) specifies the stage of the pipeline where indirect command parameters are consumed. This stage also includes reading commands written by [vkCmdPreprocessGeneratedCommandsNV](#). This stage also includes reading commands written by [vkCmdPreprocessGeneratedCommandsEXT](#).
- [VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT](#) specifies the task shader stage.

- `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT` specifies the mesh shader stage.
- `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT` specifies the stage of the pipeline where index buffers are consumed.
- `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT` specifies the stage of the pipeline where vertex buffers are consumed.
- `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT` is equivalent to the logical OR of:
 - `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`
 - `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`
- `VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT` specifies the vertex shader stage.
- `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` specifies the tessellation control shader stage.
- `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT` specifies the tessellation evaluation shader stage.
- `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT` specifies the geometry shader stage.
- `VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT` is equivalent to specifying all supported pre-rasterization shader stages:
 - `VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
 - `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`
 - `VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` specifies the fragment shader stage.
- `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes [render pass load operations](#) for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes [render pass store operations](#) for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` specifies the stage of the pipeline where final color values are output from the pipeline. This stage includes [blending](#), [logic operations](#), [render pass load](#) and [store operations](#) for color attachments, [render pass multisample resolve operations](#), and [vkCmdClearAttachments](#).
- `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT` specifies the compute shader stage.
- `VK_PIPELINE_STAGE_2_HOST_BIT` specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a

command buffer.

- `VK_PIPELINE_STAGE_2_COPY_BIT` specifies the execution of all [copy commands](#), including `vkCmdCopyQueryPoolResults`.
- `VK_PIPELINE_STAGE_2_BLIT_BIT` specifies the execution of `vkCmdBlitImage`.
- `VK_PIPELINE_STAGE_2_RESOLVE_BIT` specifies the execution of `vkCmdResolveImage`.
- `VK_PIPELINE_STAGE_2_CLEAR_BIT` specifies the execution of [clear commands](#), with the exception of `vkCmdClearAttachments`.
- `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT` is equivalent to specifying all of:
 - `VK_PIPELINE_STAGE_2_COPY_BIT`
 - `VK_PIPELINE_STAGE_2_BLIT_BIT`
 - `VK_PIPELINE_STAGE_2_RESOLVE_BIT`
 - `VK_PIPELINE_STAGE_2_CLEAR_BIT`
 - `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`
- `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR` specifies the execution of the ray tracing shader stages.
- `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` specifies the execution of acceleration structure commands or acceleration structure copy commands.
- `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` specifies the execution of acceleration structure copy commands.
- `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT` specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
 - `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`
 - `VK_PIPELINE_STAGE_2_COPY_INDIRECT_BIT_KHR`
 - `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
 - `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`
 - `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`
 - `VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`
 - `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`
 - `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`
 - `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`
 - `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`
 - `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- [VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR](#)
- [VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT](#)
- [VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI](#)
- [VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI](#)
- [VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI](#)
- [VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT](#) specifies all operations performed by all commands supported on the queue it is used with.
- [VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT](#) specifies the stage of the pipeline where the predicate of conditional rendering is consumed.
- [VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT](#) specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.
- [VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV](#) specifies the stage of the pipeline where device-side generation of commands via [vkCmdPreprocessGeneratedCommandsNV](#) is handled.
- [VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_EXT](#) specifies the stage of the pipeline where device-side generation of commands via [vkCmdPreprocessGeneratedCommandsEXT](#) is handled.
- [VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR](#) specifies the stage of the pipeline where the [fragment shading rate attachment](#) or [shading rate image](#) is read to determine the fragment shading rate for portions of a rasterized primitive.
- [VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT](#) specifies the stage of the pipeline where the fragment density map is read to [generate the fragment areas](#).
- [VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI](#) specifies the stage of the pipeline where the invocation mask image is read by the implementation to optimize the ray dispatch.
- [VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR](#) specifies the execution of [video decode operations](#).
- [VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR](#) specifies the execution of [video encode operations](#).
- [VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV](#) specifies the stage of the pipeline where [optical flow operation](#) are performed.
- [VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI](#) specifies the subpass shading shader stage.
- [VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT](#) specifies the execution of [micromap commands](#).
- [VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI](#) specifies the cluster culling shader stage.
- [VK_PIPELINE_STAGE_2_CONVERT_COOPERATIVE_VECTOR_MATRIX_BIT_NV](#) specifies the execution of [vkCmdConvertCooperativeVectorMatrixNV](#).
- [VK_PIPELINE_STAGE_2_COPY_INDIRECT_BIT_KHR](#) specifies the stage of the pipeline where indirect copy commands ([vkCmdCopyMemoryIndirect*](#) and

vkCmdCopyMemoryToImageIndirect*) parameters are consumed.

- [VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT](#) is equivalent to [VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT](#) with [VkAccessFlags2](#) set to 0 when specified in the second synchronization scope, but equivalent to [VK_PIPELINE_STAGE_2_NONE](#) in the first scope.
- [VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT](#) is equivalent to [VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT](#) with [VkAccessFlags2](#) set to 0 when specified in the first synchronization scope, but equivalent to [VK_PIPELINE_STAGE_2_NONE](#) in the second scope.

NOTE

The [TOP](#) and [BOTTOM](#) pipeline stages are legacy, and applications should prefer [VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT](#) and [VK_PIPELINE_STAGE_2_NONE](#).

NOTE

The [VkPipelineStageFlags2](#) bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how [VkPipelineStageFlagBits](#) is defined. The first 31 values are common to both, and are interchangeable.

[VkPipelineStageFlags2](#) is a bitmask type for setting a mask of zero or more [VkPipelineStageFlagBits2](#) flags:

```
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkPipelineStageFlags2;
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to VkPipelineStageFlags2
typedef VkPipelineStageFlags2 VkPipelineStageFlags2KHR;
```

Bits which **can** be set in a [VkPipelineStageFlags](#) mask, specifying stages of execution, are:

WARNING

This functionality is superseded by [VkPipelineStageFlagBits2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef enum VkPipelineStageFlagBits {

} VkPipelineStageFlagBits;

```

These values all have the same meaning as the equivalently named values for [VkPipelineStageFlags2](#).

- [VK_PIPELINE_STAGE_NONE](#) specifies no stages of execution.

- `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT` specifies the stage of the pipeline where `VkDrawIndirect*` / `VkDispatchIndirect*` / `VkTraceRaysIndirect*` data structures are consumed. This stage also includes reading commands written by `vkCmdExecuteGeneratedCommandsNV`. This stage also includes reading commands written by `vkCmdExecuteGeneratedCommandsEXT`.
- `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT` specifies the task shader stage.
- `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT` specifies the mesh shader stage.
- `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` specifies the stage of the pipeline where vertex and index buffers are consumed.
- `VK_PIPELINE_STAGE_VERTEX_SHADER_BIT` specifies the vertex shader stage.
- `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` specifies the tessellation control shader stage.
- `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT` specifies the tessellation evaluation shader stage.
- `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT` specifies the geometry shader stage.
- `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` specifies the fragment shader stage.
- `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes `render pass load operations` for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes `render pass store operations` for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` specifies the stage of the pipeline after blending where the final color values are output from the pipeline. This stage includes `blending`, `logic operations`, `render pass load` and `store` operations for color attachments, `render pass multisample resolve operations`, and `vkCmdClearAttachments`.
- `VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT` specifies the execution of a compute shader.
- `VK_PIPELINE_STAGE_TRANSFER_BIT` specifies the following commands:
 - All `copy commands`, including `vkCmdCopyQueryPoolResults`
 - `vkCmdBlitImage2` and `vkCmdBlitImage`
 - `vkCmdResolveImage2` and `vkCmdResolveImage`
 - All `clear commands`, with the exception of `vkCmdClearAttachments`
- `VK_PIPELINE_STAGE_HOST_BIT` specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.
- `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` specifies the execution of `vkCmdBuildAccelerationStructureNV`, `vkCmdCopyAccelerationStructureNV`, `vkCmdWriteAccelerationStructuresPropertiesNV`, `vkCmdBuildAccelerationStructuresKHR`, `vkCmdBuildAccelerationStructuresIndirectKHR`, `vkCmdCopyAccelerationStructureKHR`, `vkCmdCopyAccelerationStructureToMemoryKHR`,

`vkCmdCopyMemoryToAccelerationStructureKHR`, and
`vkCmdWriteAccelerationStructuresPropertiesKHR`.

- `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR` specifies the execution of the ray tracing shader stages, via `vkCmdTraceRaysNV`, `vkCmdTraceRaysKHR`, or `vkCmdTraceRaysIndirectKHR`
- `VK_PIPELINE_STAGE_2_MEMORY_DECOMPRESSION_BIT_EXT` specifies the execution of decompression commands with `vkCmdDecompressMemoryEXT` and `vkCmdDecompressMemoryIndirectCountEXT`.
- `VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT` specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
 - `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT`
 - `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
 - `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
 - `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT`
 - `VK_PIPELINE_STAGE_VERTEX_SHADER_BIT`
 - `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT`
 - `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
 - `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
 - `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT`
 - `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`
 - `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT`
 - `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
 - `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
 - `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
 - `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
 - `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` specifies all operations performed by all commands supported on the queue it is used with.
- `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT` specifies the stage of the pipeline where the predicate of conditional rendering is consumed.
- `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.
- `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV` specifies the stage of the pipeline where device-side preprocessing for generated commands via `vkCmdPreprocessGeneratedCommandsNV` is handled.
- `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_EXT` specifies the stage of the pipeline where device-side preprocessing for generated commands via `vkCmdPreprocessGeneratedCommandsEXT` is handled.

- [VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR](#) specifies the stage of the pipeline where the [fragment shading rate attachment](#) or [shading rate image](#) is read to determine the fragment shading rate for portions of a rasterized primitive.
- [VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT](#) specifies the stage of the pipeline where the fragment density map is read to [generate the fragment areas](#).
- [VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT](#) is equivalent to [VK_PIPELINE_STAGE_ALL_COMMANDS_BIT](#) with [VkAccessFlags](#) set to 0 when specified in the second synchronization scope, but specifies no stage of execution when specified in the first scope.
- [VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT](#) is equivalent to [VK_PIPELINE_STAGE_ALL_COMMANDS_BIT](#) with [VkAccessFlags](#) set to 0 when specified in the first synchronization scope, but specifies no stage of execution when specified in the second scope.

WARNING

This functionality is superseded by [VkPipelineStageFlags2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineStageFlags;
```

[VkPipelineStageFlags](#) is a bitmask type for setting a mask of zero or more [VkPipelineStageFlagBits](#).

If a synchronization command includes a source stage mask, its first [synchronization scope](#) only includes execution of the pipeline stages specified in that mask and any [logically earlier](#) stages. Its first [access scope](#) only includes memory accesses performed by pipeline stages explicitly specified in the source stage mask.

If a synchronization command includes a destination stage mask, its second [synchronization scope](#) only includes execution of the pipeline stages specified in that mask and any [logically later](#) stages. Its second [access scope](#) only includes memory accesses performed by pipeline stages explicitly specified in the destination stage mask.

NOTE

Note that [access scopes](#) do not interact with the logically earlier or later stages for either scope - only the stages the application specifies are considered part of each access scope.

Certain pipeline stages are only available on queues that support a particular set of operations. The following table lists, for each pipeline stage flag, which queue capability flag **must** be supported by the queue. When multiple flags are enumerated in the second column of the table, it means that the pipeline stage is supported on the queue if it supports any of the listed capability flags. For further details on queue capabilities see [Physical Device Enumeration](#) and [Queues](#).

Table 3. Supported Pipeline Stage Flags

Pipeline stage flag	Required queue capability flag
VK_PIPELINE_STAGE_2_NONE	None required
VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT	None required
VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_COPY_INDIRECT_BIT_KHR	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT	VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT	None required
VK_PIPELINE_STAGE_2_HOST_BIT	None required
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT	None required
VK_PIPELINE_STAGE_2_COPY_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT

Pipeline stage flag	Required queue capability flag
VK_PIPELINE_STAGE_2_RESOLVE_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_BLIT_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_CLEAR_BIT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR	VK_QUEUE_VIDEO_DECODE_BIT_KHR
VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR	VK_QUEUE_VIDEO_ENCODE_BIT_KHR
VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_EXT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_MEMORY_DECOMPRESSION_BIT_EXT	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR	VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR	VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT	VK_QUEUE_GRAPHICS_BIT

Pipeline stage flag	Required queue capability flag
VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT	VK_QUEUE_COMPUTE_BIT
VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI	VK_QUEUE_GRAPHICS_BIT
VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV	VK_QUEUE_OPTICAL_FLOW_BIT_NV
VK_PIPELINE_STAGE_2_CONVERT_COOPERATIVE_VECTOR_MATRIX_BIT_NV	VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT or VK_QUEUE_TRANSFER_BIT
VK_PIPELINE_STAGE_2_DATA_GRAPH_BIT_ARM	VK_QUEUE_DATA_GRAPH_BIT_ARM

Pipeline stages that execute as a result of a command logically complete execution in a specific order, such that completion of a logically later pipeline stage **must** not happen-before completion of a logically earlier stage. This means that including any stage in the source stage mask for a particular synchronization command also implies that any logically earlier stages are included in **Scope_{1st}** for that command.

Similarly, initiation of a logically earlier pipeline stage **must** not happen-after initiation of a logically later pipeline stage. Including any given stage in the destination stage mask for a particular synchronization command also implies that any logically later stages are included in **Scope_{2nd}** for that command.

NOTE

Implementations **may** not support synchronization at every pipeline stage for every synchronization operation. If a pipeline stage that an implementation does not support synchronization for appears in a source stage mask, it **may** substitute any logically later stage in its place for the first synchronization scope. If a pipeline stage that an implementation does not support synchronization for appears in a destination stage mask, it **may** substitute any logically earlier stage in its place for the second synchronization scope.

For example, if an implementation is unable to signal an event immediately after vertex shader execution is complete, it **may** instead signal the event after color attachment output has completed.

If an implementation makes such a substitution, it **must** not affect the semantics of execution or memory dependencies or image and buffer memory barriers.

Graphics pipelines are executable on queues supporting `VK_QUEUE_GRAPHICS_BIT`. Stages executed by graphics pipelines **can** only be specified in commands recorded for queues supporting `VK_QUEUE_GRAPHICS_BIT`.

The graphics primitive pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`
- `VK_PIPELINE_STAGE_2_COPY_INDIRECT_BIT_KHR`
- `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`
- `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`
- `VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`

The graphics mesh pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`
- `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
- `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`

For the compute pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`
- `VK_PIPELINE_STAGE_2_COPY_INDIRECT_BIT_KHR`

- [VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT](#)

For the subpass shading pipeline, the following stages occur in this order:

- [VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI](#)

For graphics pipeline commands executing in a render pass with a fragment density map attachment, the following pipeline stage where the fragment density map read happens has no particular order relative to the other stages, except that it is logically earlier than [VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT](#):

- [VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT](#)
- [VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT](#)

The conditional rendering stage is formally part of both the graphics, and the compute pipeline. The pipeline stage where the predicate read happens has unspecified order relative to other stages of these pipelines:

- [VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT](#)

For the transfer pipeline, the following stages occur in this order:

- [VK_PIPELINE_STAGE_2_COPY_INDIRECT_BIT_KHR](#)
- [VK_PIPELINE_STAGE_2_TRANSFER_BIT](#)

For host operations, only one pipeline stage occurs, so no order is guaranteed:

- [VK_PIPELINE_STAGE_2_HOST_BIT](#)

For the command preprocessing pipeline, the following stages occur in this order:

- [VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_EXT](#)

For the decompression pipeline, the following stages occur in this order:

- [VK_PIPELINE_STAGE_2_MEMORY_DECOMPRESSION_BIT_EXT](#)

For acceleration structure build operations, only one pipeline stage occurs, so no order is guaranteed:

- [VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR](#)

For acceleration structure copy operations, only one pipeline stage occurs, so no order is guaranteed:

- [VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR](#)

For opacity micromap build operations, only one pipeline stage occurs, so no order is guaranteed:

- [VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT](#)

For the ray tracing pipeline, the following stages occur in this order:

- [VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT](#)
- [VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR](#)

For the video decode pipeline, the following stages occur in this order:

- [VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR](#)

For the video encode pipeline, the following stages occur in this order:

- [VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR](#)

For the data graph pipeline, the following stages occur in this order:

- [VK_PIPELINE_STAGE_2_DATA_GRAPH_BIT_ARM](#)

7.1.3. Access Types

Memory in Vulkan **can** be accessed from within shader invocations and via some fixed-function stages of the pipeline. The *access type* is a function of the [descriptor type](#) used, or how a fixed-function stage accesses memory.

Some synchronization commands take sets of access types as parameters to define the [access scopes](#) of a memory dependency. If a synchronization command includes a *source access mask*, its first [access scope](#) only includes accesses via the access types specified in that mask. Similarly, if a synchronization command includes a *destination access mask*, its second [access scope](#) only includes accesses via the access types specified in that mask.

Bits which **can** be set in the `srcAccessMask` and `dstAccessMask` members of [VkMemoryBarrier2KHR](#), [VkImageMemoryBarrier2KHR](#), and [VkBufferMemoryBarrier2KHR](#), specifying access behavior, are:

```
// Provided by VK_VERSION_1_3
// Flag bits for VkAccessFlagBits2
typedef VkFlags64 VkAccessFlagBits2;
static const VkAccessFlagBits2 VK_ACCESS_2_NONE = 0ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT = 0x00000001ULL;

- [VK_ACCESS_2_NONE](#) specifies no accesses.
- [VK_ACCESS_2_MEMORY_READ_BIT](#) specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all **READ** access flags that are valid where it is used.
- [VK_ACCESS_2_MEMORY_WRITE_BIT](#) specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all **WRITE** access flags that are valid where it is used.
- [VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT](#) specifies read access to command data read from indirect buffers as part of an indirect build, trace, drawing or dispatch command. Such access occurs in the [VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT](#) pipeline stage. It also specifies read access to command data read from indirect buffers as part of a copy command with access occurring in the [VK_PIPELINE_STAGE_2_COPY_INDIRECT_BIT_KHR](#) pipeline stage.
- [VK_ACCESS_2_INDEX_READ_BIT](#) specifies read access to an index buffer as part of an indexed drawing command, bound by [vkCmdBindIndexBuffer2](#) and [vkCmdBindIndexBuffer](#). Such access occurs in the [VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT](#) pipeline stage.
- [VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT](#) specifies read access to a vertex buffer as part of a drawing command, bound by [vkCmdBindVertexBuffers](#). Such access occurs in the [VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT](#) pipeline stage.
- [VK_ACCESS_2_UNIFORM_READ_BIT](#) specifies read access to a [uniform buffer](#) in any shader pipeline stage.
- [VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT](#) specifies read access to an [input attachment](#) within a render pass during subpass shading or fragment shading. Such access occurs in the [VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI](#) or [VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT](#) pipeline stage.
- [VK_ACCESS_2_SHADER_SAMPLED_READ_BIT](#) specifies read access to a [uniform texel buffer](#) or [sampled image](#) in any shader pipeline stage.
- [VK_ACCESS_2_SHADER_STORAGE_READ_BIT](#) specifies read access to a [storage buffer](#), [physical storage buffer](#), [storage texel buffer](#), or [storage image](#) in any shader pipeline stage.
- [VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR](#) specifies read access to a [shader binding table](#) in any shader pipeline stage.
- [VK_ACCESS_2_SHADER_READ_BIT](#) is equivalent to the logical OR of:

- `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`
- `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`
- `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`
- `VK_ACCESS_2_SHADER_TILE_ATTACHMENT_READ_BIT_QCOM`
- `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT` specifies write access to a [storage buffer](#), [physical storage buffer](#), [storage texel buffer](#), or [storage image](#) in any shader pipeline stage.
- `VK_ACCESS_2_SHADER_WRITE_BIT` is equivalent to `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`.
- `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT` specifies read access to a [color attachment](#), such as via [blending](#) (other than [advanced blend operations](#)), [logic operations](#) or certain [render pass load operations](#) in the `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage or via [fragment shader tile image reads](#) in the `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT` specifies write access to a [color attachment](#) during a [render pass](#) or via certain render pass [load](#), [store](#), and [multisample resolve](#) operations. This includes [multisample resolve](#) operations for depth/stencil resolve attachments. Such access occurs in the `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.
- `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT` specifies read access to a [depth/stencil attachment](#), via [depth or stencil operations](#) or certain [render pass load operations](#) in the `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT` pipeline stages or via [fragment shader tile image reads](#) in the `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT` specifies write access to a [depth/stencil attachment](#), via [depth or stencil operations](#) or certain render pass [load](#) and [store](#) operations. Such access occurs in the `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT` pipeline stages.
- `VK_ACCESS_2_TRANSFER_READ_BIT` specifies read access to an image or buffer in a [copy](#) operation. Such access occurs in the `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, or `VK_PIPELINE_STAGE_2_RESOLVE_BIT` pipeline stages.
- `VK_ACCESS_2_TRANSFER_WRITE_BIT` specifies write access to an image or buffer in a [clear](#) or [copy](#) operation. Such access occurs in the `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_CLEAR_BIT`, or `VK_PIPELINE_STAGE_2_RESOLVE_BIT` pipeline stages.
- `VK_ACCESS_2_HOST_READ_BIT` specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_2_HOST_BIT` pipeline stage.
- `VK_ACCESS_2_HOST_WRITE_BIT` specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_2_HOST_BIT` pipeline stage.
- `VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT` specifies read access to a predicate as part of conditional rendering. Such access occurs in the `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT` pipeline stage.

- [VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT](#) specifies write access to a transform feedback buffer made when transform feedback is active. Such access occurs in the [VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT](#) pipeline stage.
- [VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT](#) specifies read access to a transform feedback counter buffer which is read when [vkCmdBeginTransformFeedbackEXT](#) executes. Such access occurs in the [VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT](#) pipeline stage.
- [VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT](#) specifies write access to a transform feedback counter buffer which is written when [vkCmdEndTransformFeedbackEXT](#) executes. Such access occurs in the [VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT](#) pipeline stage.
- [VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV](#) specifies reads from buffer inputs to [vkCmdPreprocessGeneratedCommandsNV](#). Such access occurs in the [VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV](#) pipeline stage.
- [VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV](#) specifies writes to the target command buffer preprocess outputs. Such access occurs in the [VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV](#) pipeline stage.
- [VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_EXT](#) specifies reads from buffer inputs to [vkCmdPreprocessGeneratedCommandsEXT](#). Such access occurs in the [VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_EXT](#) pipeline stage.
- [VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_EXT](#) specifies writes to the target command buffer preprocess outputs. Such access occurs in the [VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_EXT](#) pipeline stage.
- [VK_ACCESS_2_MEMORY_DECOMPRESSION_READ_BIT_EXT](#) specifies read access to memory in decompression commands [vkCmdDecompressMemoryEXT](#) and [vkCmdDecompressMemoryIndirectCountEXT](#). Such access occurs in [VK_PIPELINE_STAGE_2_MEMORY_DECOMPRESSION_BIT_EXT](#) pipeline stage.
- [VK_ACCESS_2_MEMORY_DECOMPRESSION_WRITE_BIT_EXT](#) specifies write access to memory in decompression commands [vkCmdDecompressMemoryEXT](#) and [vkCmdDecompressMemoryIndirectCountEXT](#). Such access occurs in [VK_PIPELINE_STAGE_2_MEMORY_DECOMPRESSION_BIT_EXT](#) pipeline stage.
- [VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT](#) specifies read access to color attachments, including advanced blend operations. Such access occurs in the [VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT](#) pipeline stage.
- [VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI](#) specifies read access to an invocation mask image in the [VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI](#) pipeline stage.
- [VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR](#) specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an [acceleration structure scratch buffer](#) as part of a build command. Such access occurs in the [VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR](#) pipeline stage or [VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR](#) pipeline stage.
- [VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR](#) specifies write access to an acceleration structure or [acceleration structure scratch buffer](#) as part of a build or copy

command. Such access occurs in the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.

- `VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT` specifies read access to a [fragment density map attachment](#) during dynamic fragment density map operations. Such access occurs in the `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT` pipeline stage.
- `VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR` specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` pipeline stage.
- `VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV` specifies read access to a shading rate image during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV` pipeline stage. It is equivalent to `VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR`.
- `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR` specifies read access to an image or buffer resource in a video decode operation. Such access occurs in the `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR` pipeline stage.
- `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR` specifies write access to an image or buffer resource in a video decode operation. Such access occurs in the `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR` pipeline stage.
- `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR` specifies read access to an image or buffer resource in a video encode operation. Such access occurs in the `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR` pipeline stage.
- `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR` specifies write access to an image or buffer resource in a video encode operation. Such access occurs in the `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR` pipeline stage.
- `VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT` specifies read access to a [descriptor buffer](#) in any shader pipeline stage.
- `VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV` specifies read access to an image or buffer resource as part of a [optical flow operation](#). Such access occurs in the `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV` pipeline stage.
- `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV` specifies write access to an image or buffer resource as part of a [optical flow operation](#). Such access occurs in the `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV` pipeline stage.
- `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT` specifies write access to a micromap object. Such access occurs in the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage.
- `VK_ACCESS_2_MICROMAP_READ_BIT_EXT` specifies read access to a micromap object. Such access occurs in the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` and `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stages.
- `VK_ACCESS_2_SHADER_TILE_ATTACHMENT_READ_BIT_QCOM` specifies read access to a [tile attachment](#). Such access occurs in the `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` or `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT` pipeline stages.
- `VK_ACCESS_2_SHADER_TILE_ATTACHMENT_WRITE_BIT_QCOM` specifies write access to a [tile attachment](#). Such access occurs in the `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` or

[VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT](#) pipeline stages.

- [VK_ACCESS_2_DATA_GRAPH_READ_BIT_ARM](#) specifies read access to resources in the [VK_PIPELINE_STAGE_2_DATA_GRAPH_BIT_ARM](#) pipeline stage.
- [VK_ACCESS_2_DATA_GRAPH_WRITE_BIT_ARM](#) specifies write access to resources in the [VK_PIPELINE_STAGE_2_DATA_GRAPH_BIT_ARM](#) pipeline stage.
- [VK_ACCESS_2_SAMPLER_HEAP_READ_BIT_EXT](#) specifies read access to a sampler heap in any shader pipeline stage.
- [VK_ACCESS_2_RESOURCE_HEAP_READ_BIT_EXT](#) specifies read access to a resource heap in any shader pipeline stage.

Certain access types are only performed by a subset of pipeline stages, as described in more detail for [VkAccessFlagBits](#). The [Supported Access Types](#) table lists, for each access flag, which pipeline stages **can** perform that type of access.

NOTE

In situations where an application wishes to select all access types for a given set of pipeline stages, [VK_ACCESS_2_MEMORY_READ_BIT](#) or [VK_ACCESS_2_MEMORY_WRITE_BIT](#) can be used. This is particularly useful when specifying stages that only have a single access type.

NOTE

The [VkAccessFlags2](#) bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how [VkAccessFlagBits](#) is defined. The first 31 values are common to both, and are interchangeable.

[VkAccessFlags2](#) is a bitmask type for setting a mask of zero or more [VkAccessFlagBits2](#):

```
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkAccessFlags2;
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to VkAccessFlags2
typedef VkAccessFlags2 VkAccessFlags2KHR;
```

An application **can** link a [VkMemoryBarrierAccessFlags3KHR](#) structure in the [pNext](#) chain of [VkMemoryBarrier2](#), [VkBufferMemoryBarrier2](#), or [VkImageMemoryBarrier2](#) to provide additional access flags beyond those available in [VkAccessFlagBits2](#).

The [VkMemoryBarrierAccessFlags3KHR](#) structure is defined as:

```
// Provided by VK_KHR_maintenance8
typedef struct VkMemoryBarrierAccessFlags3KHR {
    VkStructureType    sType;
    const void*        pNext;
    VkAccessFlags3KHR  srcAccessMask3;
    VkAccessFlags3KHR  dstAccessMask3;
} VkMemoryBarrierAccessFlags3KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcAccessMask3** is a [VkAccessFlags3KHR](#) mask of access flags to be included in the [first access scope](#).
- **dstAccessMask3** is a [VkAccessFlags3KHR](#) mask of access flags to be included in the [second access scope](#).

Valid Usage (Implicit)

- VUID-VkMemoryBarrierAccessFlags3KHR-sType-sType **sType** **must** be [VK_STRUCTURE_TYPE_MEMORY_BARRIER_ACCESS_FLAGS_3_KHR](#)
- VUID-VkMemoryBarrierAccessFlags3KHR-srcAccessMask3-parameter **srcAccessMask3** **must** be a valid combination of [VkAccessFlagBits3KHR](#) values
- VUID-VkMemoryBarrierAccessFlags3KHR-dstAccessMask3-parameter **dstAccessMask3** **must** be a valid combination of [VkAccessFlagBits3KHR](#) values

Structure Chaining

Extends the structures

- [VkBufferMemoryBarrier2](#)
- [VkImageMemoryBarrier2](#)
- [VkMemoryRangeBarriersInfoKHR](#)
- [VkSubpassDependency2](#)

Bits which **can** be set in the **srcAccessMask3** and **dstAccessMask3** members of [VkMemoryBarrierAccessFlags3KHR](#), specifying access behavior, are:

```
// Provided by VK_KHR_maintenance8
// Flag bits for VkAccessFlagBits3KHR
typedef VkFlags64 VkAccessFlagBits3KHR;
static const VkAccessFlagBits3KHR VK_ACCESS_3_NONE_KHR = 0ULL;
```

- [VK_ACCESS_3_NONE_KHR](#) specifies no additional accesses.

`VkAccessFlags3KHR` is a bitmask type for setting a mask of zero or more `VkAccessFlagBits3KHR`:

```
// Provided by VK_KHR_maintenance8
typedef VkFlags64 VkAccessFlags3KHR;
```

When a `VkMemoryBarrierAccessFlags3KHR` structure is linked in the `pNext` field of `VkMemoryBarrier2`, `VkBufferMemoryBarrier2`, or `VkImageMemoryBarrier2`, the flags specified in the `srcAccessMask3` and `dstAccessMask3` fields are considered in addition to the flags in the `srcAccessMask` and `dstAccessMask` fields, respectively, to allow up to 128 total access types to be specified for the first or second `access scope`.

NOTE

When `VkAccessFlagBits3KHR` and `VkAccessFlagBits2` are used together, the two sets of 64 flags bits are combined together into 128 flag bits (effectively OR'ing them together). This is different from `VkAccessFlagBits2` and `VkAccessFlagBits`, where the 64 bit `VkAccessFlagBits2` extends and *replaces* the 32 bit `VkAccessFlagBits`.

Bits which **can** be set in the `srcAccessMask` and `dstAccessMask` members of `VkSubpassDependency`, `VkSubpassDependency2`, `VkMemoryBarrier`, `VkBufferMemoryBarrier`, and `VkImageMemoryBarrier`, specifying access behavior, are:

WARNING

This functionality is superseded by `VkAccessFlagBits2`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef enum VkAccessFlagBits {
    VK_ACCESS_INDIRECT_COMMAND_READ_BIT = 0x00000001,

// Provided by VK_KHR_synchronization2
VK_ACCESS_NONE_KHR = VK_ACCESS_NONE,
} VkAccessFlagBits;

```

These values all have the same meaning as the equivalently named values for [VkAccessFlags2](#).

- [VK_ACCESS_NONE](#) specifies no accesses.
- [VK_ACCESS_MEMORY_READ_BIT](#) specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all **READ** access flags that are valid where it is used.
- [VK_ACCESS_MEMORY_WRITE_BIT](#) specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all **WRITE** access flags that are valid where it is used.
- [VK_ACCESS_INDIRECT_COMMAND_READ_BIT](#) specifies read access to indirect command data read as part of an indirect build, trace, drawing or dispatching command. Such access occurs in the [VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT](#) pipeline stage.
- [VK_ACCESS_INDEX_READ_BIT](#) specifies read access to an index buffer as part of an indexed

drawing command, bound by `vkCmdBindIndexBuffer2` and `vkCmdBindIndexBuffer`. Such access occurs in the `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` pipeline stage.

- `VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT` specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffers`. Such access occurs in the `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` pipeline stage.
- `VK_ACCESS_UNIFORM_READ_BIT` specifies read access to a `uniform buffer` in any shader pipeline stage.
- `VK_ACCESS_INPUT_ATTACHMENT_READ_BIT` specifies read access to an `input attachment` within a render pass during subpass shading or fragment shading. Such access occurs in the `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI` or `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_SHADER_READ_BIT` specifies read access to a `uniform texel buffer`, `sampled image`, `storage buffer`, `physical storage buffer`, `shader binding table`, `storage tensor`, `storage texel buffer`, or `storage image` in any shader pipeline stage.
- `VK_ACCESS_SHADER_WRITE_BIT` specifies write access to a `storage buffer`, `physical storage buffer`, `storage tensor`, `storage texel buffer`, or `storage image` in any shader pipeline stage.
- `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT` specifies read access to a `color attachment`, such as via `blending` (other than `advanced blend operations`), `logic operations` or certain `render pass load operations` in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage or via `fragment shader tile image reads` in the `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT` specifies write access to a `color attachment` during a `render pass` or via certain render pass `load`, `store`, and `multisample resolve` operations. This includes `multisample resolve` operations for depth/stencil resolve attachments. Such access occurs in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.
- `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT` specifies read access to a `depth/stencil attachment`, via `depth` or `stencil operations` or certain `render pass load operations` in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages or via `fragment shader tile image reads` in the `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage.
- `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT` specifies write access to a `depth/stencil attachment`, via `depth` or `stencil operations` or certain render pass `load` and `store` operations. Such access occurs in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages.
- `VK_ACCESS_TRANSFER_READ_BIT` specifies read access to an image, tensor, or buffer in a `copy` operation. Such access occurs in the `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT` pipeline stage.
- `VK_ACCESS_TRANSFER_WRITE_BIT` specifies write access to an image, tensor, or buffer in a `clear` or `copy` operation. Such access occurs in the `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT` pipeline stage.
- `VK_ACCESS_HOST_READ_BIT` specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_HOST_BIT` pipeline stage.
- `VK_ACCESS_HOST_WRITE_BIT` specifies write access by a host operation. Accesses of this type

are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_HOST_BIT` pipeline stage.

- `VK_ACCESS_CONDITIONAL_RENDERING_READ_BIT_EXT` specifies read access to a predicate as part of conditional rendering. Such access occurs in the `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT` pipeline stage.
- `VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT` specifies write access to a transform feedback buffer made when transform feedback is active. Such access occurs in the `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` pipeline stage.
- `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT` specifies read access to a transform feedback counter buffer which is read when `vkCmdBeginTransformFeedbackEXT` executes. Such access occurs in the `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` pipeline stage.
- `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT` specifies write access to a transform feedback counter buffer which is written when `vkCmdEndTransformFeedbackEXT` executes. Such access occurs in the `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` pipeline stage.
- `VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV` specifies reads from buffer inputs to `vkCmdPreprocessGeneratedCommandsNV`. Such access occurs in the `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV` pipeline stage.
- `VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV` specifies writes to the target command buffer preprocess outputs in `vkCmdPreprocessGeneratedCommandsNV`. Such access occurs in the `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV` pipeline stage.
- `VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_EXT` specifies reads from buffer inputs to `vkCmdPreprocessGeneratedCommandsEXT`. Such access occurs in the `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_EXT` pipeline stage.
- `VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_EXT` specifies writes to the target command buffer preprocess outputs in `vkCmdPreprocessGeneratedCommandsEXT`. Such access occurs in the `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_EXT` pipeline stage.
- `VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT` specifies read access to color attachments, including advanced blend operations. Such access occurs in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.
- `VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI` specifies read access to an invocation mask image in the `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI` pipeline stage.
- `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an `acceleration structure scratch buffer` as part of a build command. Such access occurs in the `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR` pipeline stage or `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.
- `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` specifies write access to an acceleration structure or `acceleration structure scratch buffer` as part of a build or copy command. Such access occurs in the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.
- `VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT` specifies read access to a `fragment`

density map attachment during dynamic fragment density map operations. Such access occurs in the `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT` pipeline stage.

- `VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR` specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` pipeline stage.
- `VK_ACCESS_SHADING_RATE_IMAGE_READ_BIT_NV` specifies read access to a shading rate image during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV` pipeline stage. It is equivalent to `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

Certain access types are only performed by a subset of pipeline stages. Any synchronization command that takes both stage masks and access masks uses both to define the **access scopes** - only the specified access types performed by the specified stages are included in the access scope. An application **must** not specify an access flag in a synchronization command if it does not include a pipeline stage in the corresponding stage mask that is able to perform accesses of that type. The following table lists, for each access flag, which pipeline stages **can** perform that type of access.

Table 4. Supported Access Types

Access flag	Supported pipeline stages
<code>VK_ACCESS_2_NONE</code> , <code>VK_ACCESS_NONE</code>	Any
<code>VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT</code> , <code>VK_ACCESS_INDIRECT_COMMAND_READ_BIT</code>	<code>VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT</code> , <code>VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR</code> , <code>VK_PIPELINE_STAGE_2_COPY_INDIRECT_BIT_KHR</code>
<code>VK_ACCESS_2_INDEX_READ_BIT</code> , <code>VK_ACCESS_INDEX_READ_BIT</code>	<code>VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT</code> , <code>VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT</code>
<code>VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT</code> , <code>VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT</code>	<code>VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT</code> , <code>VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT</code>

Access flag	Supported pipeline stages
VK_ACCESS_2_UNIFORM_READ_BIT, VK_ACCESS_UNIFORM_READ_BIT	VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT, VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT, VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT, VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR, VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT, VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT, , VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI, VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI
VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, VK_ACCESS_INPUT_ATTACHMENT_READ_BIT	VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI

Access flag	Supported pipeline stages
VK_ACCESS_2_SHADER_READ_BIT, VK_ACCESS_SHADER_READ_BIT	VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT, VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT, VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT, VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT, VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR, VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT, VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT, , VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI, VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI
VK_ACCESS_2_SHADER_WRITE_BIT, VK_ACCESS_SHADER_WRITE_BIT	VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT, VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT, VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT, VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR, VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT, VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT, , VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI, VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI

Access flag	Supported pipeline stages
VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, VK_ACCESS_COLOR_ATTACHMENT_READ_BIT	VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT
VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT	VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT
VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT, VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT	VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT
VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT, VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT	VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT
VK_ACCESS_2_TRANSFER_READ_BIT, VK_ACCESS_TRANSFER_READ_BIT	VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT, VK_PIPELINE_STAGE_2_CONVERT_COOPERATIVE_VECTOR_MATRIX_BIT_NV
VK_ACCESS_2_TRANSFER_WRITE_BIT, VK_ACCESS_TRANSFER_WRITE_BIT	VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT, VK_PIPELINE_STAGE_2_CONVERT_COOPERATIVE_VECTOR_MATRIX_BIT_NV

Access flag	Supported pipeline stages
VK_ACCESS_2_HOST_READ_BIT, VK_ACCESS_HOST_READ_BIT	VK_PIPELINE_STAGE_2_HOST_BIT
VK_ACCESS_2_HOST_WRITE_BIT, VK_ACCESS_HOST_WRITE_BIT	VK_PIPELINE_STAGE_2_HOST_BIT

Access flag	Supported pipeline stages
VK_ACCESS_2_RESOURCE_HEAP_READ_BIT_EXT	VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT, VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT, VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT, VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT, VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR, VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT, VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT, , VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI, VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI

WARNING

This functionality is superseded by [VkAccessFlags2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkAccessFlags;
```

[VkAccessFlags](#) is a bitmask type for setting a mask of zero or more [VkAccessFlagBits](#).

If a memory object does not have the [VK_MEMORY_PROPERTY_HOST_COHERENT_BIT](#) property, then [vkFlushMappedMemoryRanges](#) **must** be called in order to guarantee that writes to the memory object from the host are made available to the host domain, where they **can** be further made available to the device domain via a domain operation. Similarly, [vkInvalidateMappedMemoryRanges](#) **must** be called to guarantee that writes which are available to the host domain are made visible to host operations.

If the memory object does have the [VK_MEMORY_PROPERTY_HOST_COHERENT_BIT](#) property flag, writes to the memory object from the host are automatically made available to the host domain. Similarly, writes made available to the host domain are automatically made visible to the host.

NOTE

[Queue submission commands](#) automatically perform a [domain operation from host to device](#) for all writes performed before the command executes, so in most cases an explicit memory barrier is not needed for this case. In the few circumstances where a submit does not occur between the host write and the device read access, writes **can** be made available by using an explicit memory barrier.

7.1.4. Framebuffer Region Dependencies

Pipeline stages that operate on, or with respect to, the framebuffer are collectively the *framebuffer-space* pipeline stages. These stages are:

- `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT`
- `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`

For commands recorded where the `per-tile execution model` is enabled, the `VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT` and `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT` are included as framebuffer-space pipeline stages.

For these pipeline stages, an execution or memory dependency from the first set of operations to the second set **can** either be a single *framebuffer-global* dependency, or split into multiple *framebuffer-local* dependencies. A dependency with non-framebuffer-space pipeline stages is neither framebuffer-global nor framebuffer-local.

Framebuffer-global dependencies require synchronization from all framebuffer operations in the first `synchronization scope` to all framebuffer operations in the second synchronization scope.

Framebuffer-local dependencies instead partition the framebuffer operations into *framebuffer regions*, and dependencies are only formed between framebuffer regions with overlapping (x, y, layer, view, sample) coordinates. How a framebuffer-local dependency is partitioned depends on the nature of the dependency and what is being synchronized, as outlined below.

- If the `VK_DEPENDENCY_BY_REGION_BIT` flag is specified in a synchronization command, each region in that dependency covers a single (x,y,layer) position.
 - If the dependency is between two operations where the sample counts match, `VK_RENDERING_FRAGMENT_REGION_BIT_EXT` is not also specified, and the operations are not both in subpasses specified with `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_EXT`, the regions are further split to only cover a single sample.
 - If the dependency is between commands that enable `tile shading`, instead of a single (x,y) position, each region covers multiple (x,y) positions according to the tile size and the specified apron.
- If the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag is specified in a synchronization command, each region covers a single (view).
- Each region in an automatic framebuffer-local dependency inserted between framebuffer-space operations performed by pipelines created with `VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT`, `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT`, or `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`, covers a single (x,y,layer,sample) position.

If none of the above conditions partitions the regions across one of the x, y, layer, view, or sample dimensions, all coordinates for that dimension are included in each region. If this is true for all of those dimensions, the dependency is framebuffer-global.

NOTE

Framebuffer-local dependencies are more efficient for most architectures; particularly tile-based architectures - which can keep framebuffer-regions entirely in on-chip registers and thus avoid external bandwidth across such a dependency. Including a framebuffer-global dependency in your rendering will usually force all implementations to flush data to memory, or to a higher level cache, breaking any potential locality optimizations.

NOTE

It does not matter whether a framebuffer local dependency is within a single render pass or between two different render passes - the dependencies are always between regions with overlapping framebuffer coordinates.

7.1.5. Device-Local Dependencies

Dependencies **can** be either device-local or non-device-local. A device-local dependency acts as multiple separate dependencies, one for each physical device that executes the synchronization command, where each dependency only includes operations from that physical device in both synchronization scopes. A non-device-local dependency is a single dependency where both synchronization scopes include operations from all physical devices that participate in the synchronization command. For subpass dependencies, all physical devices in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` participate in the dependency, and for pipeline barriers all physical devices that are set in the command buffer's current device mask participate in the dependency.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag, then it defines a non-device-local dependency for that synchronization command. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag is not specified, then it defines device-local dependencies for that synchronization command, for all participating physical devices.

Semaphore and event dependencies are device-local and only execute on the one physical device that performs the dependency.

7.2. Implicit Synchronization Guarantees

A small number of implicit ordering guarantees are provided by Vulkan, ensuring that the order in which commands are submitted is meaningful, and avoiding unnecessary complexity in common operations.

Submission order is a fundamental ordering in Vulkan, giving meaning to the order in which [action and synchronization commands](#) are recorded and submitted to a single queue. Explicit and implicit ordering guarantees between commands in Vulkan all work on the premise that this ordering is meaningful. This order does not itself define any execution or memory dependencies; synchronization commands and other orderings within the API use this ordering to define their scopes.

Submission order for any given set of commands is based on the order in which they were recorded to command buffers and then submitted. This order is determined as follows:

1. The initial order is determined by the order in which `vkQueueSubmit` and `vkQueueSubmit2` commands are executed on the host, for a single queue, from first to last.
2. The order in which `VkSubmitInfo` structures are specified in the `pSubmits` parameter of `vkQueueSubmit`, or in which `VkSubmitInfo2` structures are specified in the `pSubmits` parameter of `vkQueueSubmit2`, from lowest index to highest.
3. The order in which command buffers are specified in the `pCommandBuffers` member of `VkSubmitInfo` or `VkSubmitInfo2` from lowest index to highest.
4. The order in which commands outside of a render pass were recorded to a command buffer on the host, from first to last.
5. The order in which commands inside a single subpass were recorded to a command buffer on the host, from first to last.

NOTE

When using a `render pass object` with multiple subpasses, commands in different subpasses have no defined submission order relative to each other, regardless of the order in which the subpasses were recorded. Commands within a subpass are still ordered relative to other commands in the same subpass, and those outside of the render pass.

`State commands` do not execute any operations on the device, instead they set the state of the command buffer when they execute on the host, in the order that they are recorded. `Action commands` consume the current state of the command buffer when they are recorded, and will execute state changes on the device as required to match the recorded state.

The order of `primitives passing through the graphics pipeline` and `image layout transitions as part of an image memory barrier` provide additional guarantees based on submission order.

Execution of `pipeline stages` within a given command also has a loose ordering, dependent only on a single command.

Signal operation order is a fundamental ordering in Vulkan, giving meaning to the order in which semaphore and fence signal operations occur when submitted to a single queue. The signal operation order for queue operations is determined as follows:

1. The initial order is determined by the order in which `vkQueueSubmit` and `vkQueueSubmit2` commands are executed on the host, for a single queue, from first to last.
2. The order in which `VkSubmitInfo` structures are specified in the `pSubmits` parameter of `vkQueueSubmit`, or in which `VkSubmitInfo2` structures are specified in the `pSubmits` parameter of `vkQueueSubmit2`, from lowest index to highest.
3. The fence signal operation defined by the `fence` parameter of the following commands and the `VkAcquireNextImageInfoKHR::fence` member of the variable referred to by the `pAcquireInfo` parameter of `vkAcquireNextImage2KHR` is ordered after all semaphore signal operations defined by that command:

- `vkQueueSubmit`

- [vkQueueSubmit2](#)
- [vkQueueBindSparse](#)
- [vkAcquireNextImageKHR](#)

Semaphore signal operations defined by a single [VkSubmitInfo](#) or [VkSubmitInfo2](#) or [VkBindSparseInfo](#) structure are unordered with respect to other semaphore signal operations defined within the same structure.

The [vkSignalSemaphore](#) command does not execute on a queue but instead performs the signal operation from the host. The semaphore signal operation defined by executing a [vkSignalSemaphore](#) command happens-after the [vkSignalSemaphore](#) command is invoked and happens-before the command returns.

NOTE

When signaling timeline semaphores, it is the responsibility of the application to ensure that they are ordered such that the semaphore value is strictly increasing. Because the first synchronization scope for a semaphore signal operation contains all semaphore signal operations which occur earlier in submission order, all semaphore signal operations contained in any given batch are guaranteed to happen-after all semaphore signal operations contained in any previous batches. However, no ordering guarantee is provided between the semaphore signal operations defined within a single batch. This, combined with the requirement that timeline semaphore values strictly increase, means that it is invalid to signal the same timeline semaphore twice within a single batch.

If an application wishes to ensure that some semaphore signal operation happens-after some other semaphore signal operation, it can submit a separate batch containing only semaphore signal operations, which will happen-after the semaphore signal operations in any earlier batches.

When signaling a semaphore from the host, the only ordering guarantee is that the signal operation happens-after when [vkSignalSemaphore](#) is called and happens-before it returns. Therefore, it is invalid to call [vkSignalSemaphore](#) while there are any outstanding signal operations on that semaphore from any queue submissions unless those queue submissions have some dependency which ensures that they happen-after the host signal operation. One example of this would be if the pending signal operation is, itself, waiting on the same semaphore at a lower value and the call to [vkSignalSemaphore](#) signals that lower value. Furthermore, if there are two or more processes or threads signaling the same timeline semaphore from the host, the application must ensure that the [vkSignalSemaphore](#) with the lower semaphore value returns before [vkSignalSemaphore](#) is called with the higher value.

7.3. Fences

Fences are a synchronization primitive that **can** be used to insert a dependency from a queue to the host. Fences have two states - signaled and unsignaled. A fence **can** be signaled as part of the execution of a [queue submission](#) command. Fences **can** be unsignaled on the host with [vkResetFences](#). Fences **can** be waited on by the host with the [vkWaitForFences](#) command, and the

current state **can** be queried with [vkGetFenceStatus](#).

The internal data of a fence **may** include a reference to any resources and pending work associated with signal or unsignal operations performed on that fence object, collectively referred to as the fence's *payload*. Mechanisms to import and export that internal data to and from fences are provided [below](#). These mechanisms indirectly enable applications to share fence state between two or more fences and other synchronization primitives across process and API boundaries.

Fences are represented by [VkFence](#) handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFence)
```

To create a fence, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateFence(
    VkDevice                                device,
    const VkFenceCreateInfo*                pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkFence*                                 pFence);
```

- [device](#) is the logical device that creates the fence.
- [pCreateInfo](#) is a pointer to a [VkFenceCreateInfo](#) structure containing information about how the fence is to be created.
- [pAllocator](#) controls host memory allocation as described in the [Memory Allocation](#) chapter.
- [pFence](#) is a pointer to a handle in which the resulting fence object is returned.

Valid Usage (Implicit)

- VUID-vkCreateFence-device-parameter
[device](#) **must** be a valid [VkDevice](#) handle
- VUID-vkCreateFence-pCreateInfo-parameter
[pCreateInfo](#) **must** be a valid pointer to a valid [VkFenceCreateInfo](#) structure
- VUID-vkCreateFence-pAllocator-parameter
If [pAllocator](#) is not `NULL`, [pAllocator](#) **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateFence-pFence-parameter
[pFence](#) **must** be a valid pointer to a [VkFence](#) handle
- VUID-vkCreateFence-device-queuecount
The device **must** have been created with at least `1` queue

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkFenceCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkFenceCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkFenceCreateFlags flags;
} VkFenceCreateInfo;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [flags](#) is a bitmask of [VkFenceCreateFlagBits](#) specifying the initial state and behavior of the fence.

Valid Usage (Implicit)

- VUID-VkFenceCreateInfo-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_FENCE_CREATE_INFO](#)
- VUID-VkFenceCreateInfo-pNext-pNext
Each [pNext](#) member of any structure (including this one) in the [pNext](#) chain **must** be either [NULL](#) or a pointer to a valid instance of [VkExportFenceCreateInfo](#) or [VkExportFenceWin32HandleInfoKHR](#)
- VUID-VkFenceCreateInfo-sType-unique
The [sType](#) value of each structure in the [pNext](#) chain **must** be unique
- VUID-VkFenceCreateInfo-flags-parameter
[flags](#) **must** be a valid combination of [VkFenceCreateFlagBits](#) values

```
// Provided by VK_VERSION_1_0
typedef enum VkFenceCreateFlagBits {
    VK_FENCE_CREATE_SIGNALED_BIT = 0x00000001,
} VkFenceCreateFlagBits;
```

- [VK_FENCE_CREATE_SIGNALED_BIT](#) specifies that the fence object is created in the signaled state. Otherwise, it is created in the unsignaled state.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkFenceCreateFlags;
```

[VkFenceCreateFlags](#) is a bitmask type for setting a mask of zero or more [VkFenceCreateFlagBits](#).

To create a fence whose payload **can** be exported to external handles, add a [VkExportFenceCreateInfo](#) structure to the [pNext](#) chain of the [VkFenceCreateInfo](#) structure. The [VkExportFenceCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExportFenceCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkExternalFenceHandleTypeFlags handleTypes;
} VkExportFenceCreateInfo;
```

```
// Provided by VK_KHR_external_fence
// Equivalent to VkExportFenceCreateInfo
typedef VkExportFenceCreateInfo VkExportFenceCreateInfoKHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [handleTypes](#) is a bitmask of [VkExternalFenceHandleTypeFlagBits](#) specifying one or more fence handle types the application **can** export from the resulting fence. The application **can** request multiple handle types for the same fence.

Valid Usage

- VUID-VkExportFenceCreateInfo-handleTypes-01446

The bits in [handleTypes](#) **must** be supported and compatible, as reported by [VkExternalFenceProperties](#)

Valid Usage (Implicit)

- VUID-VkExportFenceCreateInfo-sType-sType
sType must be [VK_STRUCTURE_TYPE_EXPORT_FENCE_CREATE_INFO](#)
- VUID-VkExportFenceCreateInfo-handleTypes-parameter
handleTypes must be a valid combination of [VkExternalFenceHandleTypeFlagBits](#) values

Structure Chaining

Extends the structure

- [VkFenceCreateInfo](#)

To specify additional attributes of NT handles exported from a fence, add a [VkExportFenceWin32HandleInfoKHR](#) structure to the **pNext** chain of the [VkFenceCreateInfo](#) structure. The [VkExportFenceWin32HandleInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_external_fence_win32
typedef struct VkExportFenceWin32HandleInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD                dwAccess;
    LPCWSTR              name;
} VkExportFenceWin32HandleInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pAttributes** is a pointer to a Windows **SECURITY_ATTRIBUTES** structure specifying security attributes of the handle.
- **dwAccess** is a **DWORD** specifying access rights of the handle.
- **name** is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created fence.

If [VkExportFenceCreateInfo](#) is not included in the same **pNext** chain, this structure is ignored.

If [VkExportFenceCreateInfo](#) is included in the **pNext** chain of [VkFenceCreateInfo](#) with a Windows **handleType**, but either [VkExportFenceWin32HandleInfoKHR](#) is not included in the **pNext** chain, or it is included but **pAttributes** is **NULL**, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”¹. Further, if the structure is not present, the access rights will be

DXGI_SHARED_RESOURCE_READ | DXGI_SHARED_RESOURCE_WRITE

for handles of the following types:

[VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT](#)

<https://docs.microsoft.com/en-us/windows/win32/sync/synchronization-object-security-and-access-rights>

Valid Usage

- VUID-VkExportFenceWin32HandleInfoKHR-handleTypes-01447

If `VkExportFenceCreateInfo::handleTypes` does not include `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`, a `VkExportFenceWin32HandleInfoKHR` structure **must** not be included in the `pNext` chain of `VkFenceCreateInfo`

Valid Usage (Implicit)

- VUID-VkExportFenceWin32HandleInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_FENCE_WIN32_HANDLE_INFO_KHR`
- VUID-VkExportFenceWin32HandleInfoKHR-pAttributes-parameter
If `pAttributes` is not `NULL`, `pAttributes` **must** be a valid pointer to a valid `SECURITY_ATTRIBUTES` value

Structure Chaining

Extends the structure

- `VkFenceCreateInfo`

To export a Windows handle representing the state of a fence, call:

```
// Provided by VK_KHR_external_fence_win32
VkResult vkGetFenceWin32HandleKHR(
    VkDevice device,
    const VkFenceGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- `device` is the logical device that created the fence being exported.
- `pGetWin32HandleInfo` is a pointer to a `VkFenceGetWin32HandleInfoKHR` structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the fence state.

For handle types defined as NT handles, the handles returned by `vkGetFenceWin32HandleKHR` are owned by the application. To avoid leaking resources, the application **must** release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a fence **may** have side effects depending on the transference of

the specified handle type, as described in [Importing Fence Payloads](#).

Valid Usage (Implicit)

- VUID-vkGetFenceWin32HandleKHR-device-parameter **device** must be a valid [VkDevice](#) handle
- VUID-vkGetFenceWin32HandleKHR-pGetWin32HandleInfo-parameter **pGetWin32HandleInfo** must be a valid pointer to a valid [VkFenceGetWin32HandleInfoKHR](#) structure
- VUID-vkGetFenceWin32HandleKHR-pHandle-parameter **pHandle** must be a valid pointer to a **HANDLE** value

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_TOO_MANY_OBJECTS](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkFenceGetWin32HandleInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_external_fence_win32
typedef struct VkFenceGetWin32HandleInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkFence            fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetWin32HandleInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is [NULL](#) or a pointer to a structure extending this structure.
- **fence** is the fence from which state will be exported.
- **handleType** is a [VkExternalFenceHandleTypeFlagBits](#) value specifying the type of handle requested.

The properties of the handle returned depend on the value of **handleType**. See [VkExternalFenceHandleTypeFlagBits](#) for a description of the properties of the defined external fence handle types.

Valid Usage

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01448
handleType **must** have been included in `VkExportFenceCreateInfo::handleTypes` when the **fence**'s current payload was created
- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01449
If **handleType** is defined as an NT handle, `vkGetFenceWin32HandleKHR` **must** be called no more than once for each valid unique combination of **fence** and **handleType**
- VUID-VkFenceGetWin32HandleInfoKHR-fence-01450
fence **must** not currently have its payload replaced by an imported payload as described below in [Importing Fence Payloads](#) unless that imported payload's handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for **handleType**
- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01451
If **handleType** refers to a handle type with copy payload transference semantics, **fence** **must** be signaled, or have an associated [fence signal operation](#) pending execution
- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01452
handleType **must** be defined as an NT handle or a global share handle

Valid Usage (Implicit)

- VUID-VkFenceGetWin32HandleInfoKHR-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_FENCE_GET_WIN32_HANDLE_INFO_KHR`
- VUID-VkFenceGetWin32HandleInfoKHR-pNext-pNext
pNext **must** be `NULL`
- VUID-VkFenceGetWin32HandleInfoKHR-fence-parameter
fence **must** be a valid `VkFence` handle
- VUID-VkFenceGetWin32HandleInfoKHR-handleType-parameter
handleType **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

To export a POSIX file descriptor representing the payload of a fence, call:

```
// Provided by VK_KHR_external_fence_fd
VkResult vkGetFenceFdKHR(
    VkDevice          device,
    const VkFenceGetFdInfoKHR* pGetFdInfo,
    int*              pFd);
```

- **device** is the logical device that created the fence being exported.
- **pGetFdInfo** is a pointer to a `VkFenceGetFdInfoKHR` structure containing parameters of the export operation.
- **pFd** will return the file descriptor representing the fence payload.

Each call to `vkGetFenceFdKHR` **must** create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor when it is no longer needed.

NOTE

Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a fence payload.

If `pGetFdInfo->handleType` is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` and the fence is signaled at the time `vkGetFenceFdKHR` is called, `pFd` **may** return the value `-1` instead of a valid file descriptor.

Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a fence **may** have side effects depending on the transference of the specified handle type, as described in [Importing Fence State](#).

Valid Usage (Implicit)

- VUID-vkGetFenceFdKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetFenceFdKHR-pGetFdInfo-parameter
`pGetFdInfo` **must** be a valid pointer to a valid `VkFenceGetFdInfoKHR` structure
- VUID-vkGetFenceFdKHR-pFd-parameter
`pFd` **must** be a valid pointer to an `int` value

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkFenceGetFdInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_fence_fd
typedef struct VkFenceGetFdInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkFence                  fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetFdInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **fence** is the fence from which state will be exported.
- **handleType** is a [VkExternalFenceHandleTypeFlagBits](#) value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of **handleType**. See [VkExternalFenceHandleTypeFlagBits](#) for a description of the properties of the defined external fence handle types.

Valid Usage

- VUID-VkFenceGetFdInfoKHR-handleType-01453
handleType **must** have been included in [VkExportFenceCreateInfo::handleTypes](#) when **fence**'s current payload was created
- VUID-VkFenceGetFdInfoKHR-handleType-01454
If **handleType** refers to a handle type with copy payload transference semantics, **fence** **must** be signaled, or have an associated [fence signal operation](#) pending execution
- VUID-VkFenceGetFdInfoKHR-fence-01455
fence **must** not currently have its payload replaced by an imported payload as described below in [Importing Fence Payloads](#) unless that imported payload's handle type was included in [VkExternalFenceProperties::exportFromImportedHandleTypes](#) for **handleType**
- VUID-VkFenceGetFdInfoKHR-handleType-01456
handleType **must** be defined as a POSIX file descriptor handle

Valid Usage (Implicit)

- VUID-VkFenceGetFdInfoKHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_FENCE_GET_FD_INFO_KHR](#)
- VUID-VkFenceGetFdInfoKHR-pNext-pNext
pNext **must** be **NULL**
- VUID-VkFenceGetFdInfoKHR-fence-parameter
fence **must** be a valid [VkFence](#) handle
- VUID-VkFenceGetFdInfoKHR-handleType-parameter

`handleType` **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

To destroy a fence, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyFence(
    VkDevice          device,
    VkFence           fence,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the fence.
- `fence` is the handle of the fence to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyFence-fence-01120
All [queue submission](#) commands that refer to `fence` **must** have completed execution
- VUID-vkDestroyFence-fence-01121
If `VkAllocationCallbacks` were provided when `fence` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyFence-fence-01122
If no `VkAllocationCallbacks` were provided when `fence` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyFence-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyFence-fence-parameter
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be a valid `VkFence` handle
- VUID-vkDestroyFence-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyFence-fence-parent
If `fence` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `fence` **must** be externally synchronized

To query the status of a fence from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkGetFenceStatus(
    VkDevice          device,
    VkFence           fence);
```

- **device** is the logical device that owns the fence.
- **fence** is the handle of the fence to query.

Upon success, **vkGetFenceStatus** returns the status of the fence object, with the following return codes:

Table 5. Fence Object Status Codes

Status	Meaning
VK_SUCCESS	The fence specified by fence is signaled.
VK_NOT_READY	The fence specified by fence is unsignaled.
VK_ERROR_DEVICE_LOST	The device has been lost. See Lost Device .

If a [queue submission](#) command is pending execution, then the value returned by this command **may** immediately be out of date.

If the device has been lost (see [Lost Device](#)), **vkGetFenceStatus** **may** return any of the above status codes. If the device has been lost and **vkGetFenceStatus** is called repeatedly, it will eventually return either [VK_SUCCESS](#) or [VK_ERROR_DEVICE_LOST](#).

Valid Usage (Implicit)

- VUID-vkGetFenceStatus-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetFenceStatus-fence-parameter **fence** **must** be a valid [VkFence](#) handle
- VUID-vkGetFenceStatus-fence-parent **fence** **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- [VK_NOT_READY](#)
- [VK_SUCCESS](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

To set the state of fences to unsignaled from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetFences(
    VkDevice          device,
    uint32_t          fenceCount,
    const VkFence*    pFences);
```

- `device` is the logical device that owns the fences.
- `fenceCount` is the number of fences to reset.
- `pFences` is a pointer to an array of fence handles to reset.

If any member of `pFences` currently has its [payload imported](#) with temporary permanence, that fence's prior permanent payload is first restored. The remaining operations described therefore operate on the restored payload.

When [vkResetFences](#) is executed on the host, it defines a *fence unsignal operation* for each fence, which resets the fence to the unsignaled state.

If any member of `pFences` is already in the unsignaled state when [vkResetFences](#) is executed, then [vkResetFences](#) has no effect on that fence.

Valid Usage

- VUID-vkResetFences-pFences-01123
Each element of `pFences` **must** not be currently associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkResetFences-device-parameter
`device` **must** be a valid [VkDevice](#) handle
- VUID-vkResetFences-pFences-parameter
`pFences` **must** be a valid pointer to an array of `fenceCount` valid [VkFence](#) handles
- VUID-vkResetFences-fenceCount-arraylength
`fenceCount` **must** be greater than 0

- VUID-vkResetFences-pFences-parent
Each element of **pFences** **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to each member of **pFences** **must** be externally synchronized

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

When a fence is submitted to a queue as part of a **queue submission** command, it defines a memory dependency on the batches that were submitted as part of that command, and defines a *fence signal operation* which sets the fence to the signaled state.

The first **synchronization scope** includes every batch submitted in the same **queue submission** command. Fence signal operations that are defined by **vkQueueSubmit** or **vkQueueSubmit2** additionally include in the first synchronization scope all commands that occur earlier in **submission order**. Fence signal operations that are defined by **vkQueueSubmit** or **vkQueueSubmit2** or **vkQueueBindSparse** additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in **signal operation order**.

The second **synchronization scope** only includes the fence signal operation.

The first **access scope** includes all memory access performed by the device.

The second **access scope** is empty.

To wait for one or more fences to enter the signaled state on the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkWaitForFences(
    VkDevice          device,
    uint32_t          fenceCount,
    const VkFence*    pFences,
    VkBool32          waitAll,
    uint64_t           timeout);
```

- **device** is the logical device that owns the fences.

- `fenceCount` is the number of fences to wait on.
- `pFences` is a pointer to an array of `fenceCount` fence handles.
- `waitAll` is the condition that **must** be satisfied to successfully unblock the wait. If `waitAll` is `VK_TRUE`, then the condition is that all fences in `pFences` are signaled. Otherwise, the condition is that at least one fence in `pFences` is signaled.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

If the condition is satisfied when `vkWaitForFences` is called, then `vkWaitForFences` returns immediately. If the condition is not satisfied at the time `vkWaitForFences` is called, then `vkWaitForFences` will block and wait until the condition is satisfied or the `timeout` has expired, whichever is sooner.

If `timeout` is zero, then `vkWaitForFences` does not wait, but simply returns the current state of the fences. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the `timeout` has expired, `vkWaitForFences` returns `VK_SUCCESS`. Otherwise, `vkWaitForFences` returns `VK_TIMEOUT` after the `timeout` has expired.

If device loss occurs (see [Lost Device](#)) before the timeout has expired, `vkWaitForFences` **must** return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

NOTE

While we guarantee that `vkWaitForFences` **must** return in finite time, no guarantees are made that it returns immediately upon device loss. However, the application can reasonably expect that the delay will be on the order of seconds and that calling `vkWaitForFences` will not result in a permanently (or seemingly permanently) dead process.

Valid Usage (Implicit)

- VUID-vkWaitForFences-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkWaitForFences-pFences-parameter
`pFences` **must** be a valid pointer to an array of `fenceCount` valid `VkFence` handles
- VUID-vkWaitForFences-fenceCount-arraylength
`fenceCount` **must** be greater than 0
- VUID-vkWaitForFences-pFences-parent
Each element of `pFences` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- [VK_SUCCESS](#)
- [VK_TIMEOUT](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

An execution dependency is defined by waiting for a fence to become signaled, either via [vkWaitForFences](#) or by polling on [vkGetFenceStatus](#).

The first [synchronization scope](#) includes only the fence signal operation.

The second [synchronization scope](#) includes the host operations of [vkWaitForFences](#) or [vkGetFenceStatus](#) indicating that the fence has become signaled.

NOTE

Signaling a fence and waiting on the host does not guarantee that the results of memory accesses will be visible to the host, as the access scope of a memory dependency defined by a fence only includes device access. A [memory barrier](#) or other memory dependency **must** be used to guarantee this. See the description of [host access types](#) for more information.

7.3.1. Alternate Methods to Signal Fences

Besides submitting a fence to a queue as part of a [queue submission](#) command, a fence **may** also be signaled when a particular event occurs on a device or display.

To create a fence that will be signaled when an event occurs on a device, call:

```
// Provided by VK_EXT_display_control
VkResult vkRegisterDeviceEventEXT(
    VkDevice                                device,
    const VkDeviceEventInfoEXT*             pDeviceEventInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkFence*                                pFence);
```

- **device** is a logical device on which the event **may** occur.
- **pDeviceEventInfo** is a pointer to a [VkDeviceEventInfoEXT](#) structure describing the event of interest to the application.

- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pFence` is a pointer to a handle in which the resulting fence object is returned.

Valid Usage (Implicit)

- VUID-vkRegisterDeviceEventEXT-device-parameter
`device` **must** be a valid [VkDevice](#) handle
- VUID-vkRegisterDeviceEventEXT-pDeviceEventInfo-parameter
`pDeviceEventInfo` **must** be a valid pointer to a valid [VkDeviceEventInfoEXT](#) structure
- VUID-vkRegisterDeviceEventEXT-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkRegisterDeviceEventEXT-pFence-parameter
`pFence` **must** be a valid pointer to a [VkFence](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkDeviceEventInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkDeviceEventInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceEventTypeEXT deviceEvent;
} VkDeviceEventInfoEXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceEvent` is a [VkDeviceEventTypeEXT](#) value specifying when the fence will be signaled.

Valid Usage (Implicit)

- VUID-VkDeviceEventInfoEXT-sType-sType
`sType` **must** be [VK_STRUCTURE_TYPE_DEVICE_EVENT_INFO_EXT](#)

- VUID-VkDeviceEventInfoEXT-pNext-pNext
pNext must be **NULL**
- VUID-VkDeviceEventInfoEXT-deviceEvent-parameter
deviceEvent must be a valid **VkDeviceEventTypeEXT** value

Possible values of **VkDeviceEventInfoEXT::deviceEvent**, specifying when a fence will be signaled, are:

```
// Provided by VK_EXT_display_control
typedef enum VkDeviceEventTypeEXT {
    VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT = 0,
} VkDeviceEventTypeEXT;
```

- **VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT** specifies that the fence is signaled when a display is plugged into or unplugged from the specified device. Applications **can** use this notification to determine when they need to re-enumerate the available displays on a device.

To create a fence that will be signaled when an event occurs on a **VkDisplayKHR** object, call:

```
// Provided by VK_EXT_display_control
VkResult vkRegisterDisplayEventEXT(
    VkDevice          device,
    VkDisplayKHR      display,
    const VkDisplayEventInfoEXT* pDisplayEventInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFence*          pFence);
```

- **device** is a logical device associated with **display**
- **display** is the display on which the event **may** occur.
- **pDisplayEventInfo** is a pointer to a **VkDisplayEventInfoEXT** structure describing the event of interest to the application.
- **pAllocator** controls host memory allocation as described in the **Memory Allocation** chapter.
- **pFence** is a pointer to a handle in which the resulting fence object is returned.

Valid Usage (Implicit)

- VUID-vkRegisterDisplayEventEXT-device-parameter
device must be a valid **VkDevice** handle
- VUID-vkRegisterDisplayEventEXT-display-parameter
display must be a valid **VkDisplayKHR** handle
- VUID-vkRegisterDisplayEventEXT-pDisplayEventInfo-parameter
pDisplayEventInfo must be a valid pointer to a valid **VkDisplayEventInfoEXT** structure
- VUID-vkRegisterDisplayEventEXT-pAllocator-parameter

If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkRegisterDisplayEventEXT-pFence-parameter
`pFence` **must** be a valid pointer to a `VkFence` handle
- VUID-vkRegisterDisplayEventEXT-commonparent
Both of `device`, and `display` **must** have been created, allocated, or retrieved from the same `VkPhysicalDevice`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplayEventInfoEXT` structure is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkDisplayEventInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkDisplayEventTypeEXT displayEvent;
} VkDisplayEventInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayEvent` is a `VkDisplayEventTypeEXT` specifying when the fence will be signaled.

Valid Usage (Implicit)

- VUID-VkDisplayEventInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT`
- VUID-VkDisplayEventInfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDisplayEventInfoEXT-displayEvent-parameter
`displayEvent` **must** be a valid `VkDisplayEventTypeEXT` value

Possible values of `VkDisplayEventInfoEXT::displayEvent`, specifying when a fence will be signaled, are:

```
// Provided by VK_EXT_display_control
typedef enum VkDisplayEventTypeEXT {
    VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT = 0,
} VkDisplayEventTypeEXT;
```

- [VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT](#) specifies that the fence is signaled when the first pixel of the next display refresh cycle leaves the display engine for the display.

7.3.2. Importing Fence Payloads

Applications **can** import a fence payload into an existing fence using an external fence handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the fence will be *restored* to its permanent state the next time that fence is passed to [vkResetFences](#).

NOTE

Restoring a fence to its prior permanent payload is a distinct operation from resetting a fence payload. See [vkResetFences](#) for more detail.

Performing a subsequent temporary import on a fence before resetting it has no effect on this requirement; the next unsignal of the fence **must** still restore its last permanent state. A permanent payload import behaves as if the target fence was destroyed, and a new fence was created with the same handle but the imported payload. Because importing a fence payload temporarily or permanently detaches the existing payload from a fence, similar usage restrictions to those applied to [vkDestroyFence](#) are applied to any command that imports a fence payload. Which of these import types is used is referred to as the import operation's *permanence*. Each handle type supports either one or both types of permanence.

The implementation **must** perform the import operation by either referencing or copying the payload referred to by the specified external fence handle, depending on the handle's type. The import method used is referred to as the handle type's *transference*. When using handle types with reference transference, importing a payload to a fence adds the fence to the set of all fences sharing that payload. This set includes the fence from which the payload was exported. Fence signaling, waiting, and resetting operations performed on any fence in the set **must** behave as if the set were a single fence. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Fence signaling, waiting, and resetting operations performed on the target of copy imports **must** not affect any other fence or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence's payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence's prior permanent payload will be restored.

NOTE

The tables [Handle Types Supported by VkImportFenceWin32HandleInfoKHR](#) and [Handle Types Supported by VkImportFenceFdInfoKHR](#) define the permanence and transference of each handle type.

[External synchronization](#) allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for fences sharing a payload across processes, satisfying the external synchronization requirements of [VkFence](#) parameters as if all fences in the set were the same object is sometimes infeasible. Satisfying valid usage constraints on the state of a fence would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific fence handle, not to its payload. For distinct fence objects which share a payload:

- If multiple commands which queue a signal operation, or which unsignal a fence, are called concurrently, behavior will be as if the commands were called in an arbitrary sequential order.
- If a queue submission command is called with a fence that is sharing a payload, and the payload is already associated with another queue command that has not yet completed execution, either one or both of the commands will cause the fence to become signaled when they complete execution.
- If a fence payload is reset while it is associated with a queue command that has not yet completed execution, the payload will become unsignaled, but **may** become signaled again when the command completes execution.
- In the preceding cases, any of the devices associated with the fences sharing the payload **may** be lost, or any of the queue submission or fence reset commands **may** return [VK_ERROR_INITIALIZATION_FAILED](#).

Other than these non-deterministic results, behavior is well defined. In particular:

- The implementation **must** not crash or enter an internally inconsistent state where future valid Vulkan commands might cause undefined results,
- Timeouts on future wait commands on fences sharing the payload **must** be effective.

NOTE

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared fence for more than synchronizing access to the shared memory. For example, a process should not use a fence with shared payload to tell when commands it submitted to a queue have completed and objects used by those commands may be destroyed, since the other process can accidentally or maliciously cause the fence to signal before the commands actually complete.

When a fence is using an imported payload, its [VkExportFenceCreateInfo::handleTypes](#) value is specified when creating the fence from which the payload was exported, rather than specified when creating the fence. Additionally, [VkExternalFenceProperties::exportFromImportedHandleTypes](#) restricts which handle types **can** be exported from such a fence based on the specific handle type used to import the current payload. Passing a fence to [vkAcquireNextImageKHR](#) is equivalent to temporarily importing a fence payload to that fence.

NOTE

Because the exportable handle types of an imported fence correspond to its current imported payload, and [vkAcquireNextImageKHR](#) behaves the same as a temporary import operation for which the source fence is opaque to the application, applications have no way of determining whether any external handle types **can** be exported from a fence in this state. Therefore, applications **must** not attempt to

export handles from fences using a temporarily imported payload from [vkAcquireNextImageKHR](#).

When importing a fence payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations **must** perform sufficient validation of external handles to ensure that the operation results in a valid fence which will not cause program termination, device loss, queue stalls, host thread stalls, or corruption of other resources when used as allowed according to its import parameters. If the external handle provided does not meet these requirements, the implementation **must** fail the fence payload import operation with the error code [VK_ERROR_INVALID_EXTERNAL_HANDLE](#).

To import a fence payload from a Windows handle, call:

```
// Provided by VK_KHR_external_fence_win32
VkResult vkImportFenceWin32HandleKHR(
    VkDevice device,
    const VkImportFenceWin32HandleInfoKHR* pImportFenceWin32HandleInfo);
```

- **device** is the logical device that created the fence.
- **pImportFenceWin32HandleInfo** is a pointer to a [VkImportFenceWin32HandleInfoKHR](#) structure specifying the fence and import parameters.

Importing a fence payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application **must** release ownership using the **CloseHandle** system call when the handle is no longer needed.

Applications **can** import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- VUID-vkImportFenceWin32HandleKHR-fence-04448
fence must not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportFenceWin32HandleKHR-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkImportFenceWin32HandleKHR-pImportFenceWin32HandleInfo-parameter
pImportFenceWin32HandleInfo must be a valid pointer to a valid [VkImportFenceWin32HandleInfoKHR](#) structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_INVALID_EXTERNAL_HANDLE](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkImportFenceWin32HandleInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_external_fence_win32
typedef struct VkImportFenceWin32HandleInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkFence              fence;
    VkFenceImportFlags    flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    HANDLE               handle;
    LPCWSTR              name;
} VkImportFenceWin32HandleInfoKHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [fence](#) is the fence into which the state will be imported.
- [flags](#) is a bitmask of [VkFenceImportFlagBits](#) specifying additional parameters for the fence payload import operation.
- [handleType](#) is a [VkExternalFenceHandleTypeFlagBits](#) value specifying the type of [handle](#).
- [handle](#) is [NULL](#) or the external handle to import.
- [name](#) is [NULL](#) or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by [handleType](#) are:

Table 6. Handle Types Supported by [VkImportFenceWin32HandleInfoKHR](#)

Handle Type	Transference	Permanence Supported
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT	Reference	Temporary,Permanent

Handle Type	Transference	Permanence Supported
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT	Reference	Temporary,Permanent

Valid Usage

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01457
handleType **must** be a value included in the [Handle Types Supported by VkImportFenceWin32HandleInfoKHR](#) table
- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01459
If **handleType** is not [VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT](#), **name** **must** be **NULL**
- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01460
If **handle** is **NULL**, **name** **must** name a valid synchronization primitive of the type specified by **handleType**
- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01461
If **name** is **NULL**, **handle** **must** be a valid handle of the type specified by **handleType**
- VUID-VkImportFenceWin32HandleInfoKHR-handle-01462
If **handle** is not **NULL**, **name** **must** be **NULL**
- VUID-VkImportFenceWin32HandleInfoKHR-handle-01539
If **handle** is not **NULL**, it **must** obey any requirements listed for **handleType** in [external fence handle types compatibility](#)
- VUID-VkImportFenceWin32HandleInfoKHR-name-01540
If **name** is not **NULL**, it **must** obey any requirements listed for **handleType** in [external fence handle types compatibility](#)

Valid Usage (Implicit)

- VUID-VkImportFenceWin32HandleInfoKHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_IMPORT_FENCE_WIN32_HANDLE_INFO_KHR](#)
- VUID-VkImportFenceWin32HandleInfoKHR-pNext-pNext
pNext **must** be **NULL**
- VUID-VkImportFenceWin32HandleInfoKHR-fence-parameter
fence **must** be a valid [VkFence](#) handle
- VUID-VkImportFenceWin32HandleInfoKHR-flags-parameter
flags **must** be a valid combination of [VkFenceImportFlagBits](#) values

Host Synchronization

- Host access to **fence** **must** be externally synchronized

To import a fence payload from a POSIX file descriptor, call:

```
// Provided by VK_KHR_external_fence_fd
VkResult vkImportFenceFdKHR(
    VkDevice device,
    const VkImportFenceFdInfoKHR* pImportFenceFdInfo);
```

- **device** is the logical device that created the fence.
- **pImportFenceFdInfo** is a pointer to a [VkImportFenceFdInfoKHR](#) structure specifying the fence and import parameters.

Importing a fence payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- VUID-vkImportFenceFdKHR-fence-01463
fence must not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportFenceFdKHR-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkImportFenceFdKHR-pImportFenceFdInfo-parameter
pImportFenceFdInfo must be a valid pointer to a valid [VkImportFenceFdInfoKHR](#) structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_INVALID_EXTERNAL_HANDLE](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkImportFenceFdInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_external_fence_fd
typedef struct VkImportFenceFdInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkFence                  fence;
    VkFenceImportFlags       flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    int                      fd;
} VkImportFenceFdInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **fence** is the fence into which the payload will be imported.
- **flags** is a bitmask of [VkFenceImportFlagBits](#) specifying additional parameters for the fence payload import operation.
- **handleType** is a [VkExternalFenceHandleTypeFlagBits](#) value specifying the type of **fd**.
- **fd** is the external handle to import.

The handle types supported by **handleType** are:

Table 7. Handle Types Supported by [VkImportFenceFdInfoKHR](#)

Handle Type	Transference	Permanence Supported
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT	Reference	Temporary,Permanent
VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT	Copy	Temporary

Valid Usage

- VUID-VkImportFenceFdInfoKHR-handleType-01464
handleType **must** be a value included in the [Handle Types Supported by VkImportFenceFdInfoKHR](#) table
- VUID-VkImportFenceFdInfoKHR-fd-01541
fd **must** obey any requirements listed for **handleType** in [external fence handle types compatibility](#)
- VUID-VkImportFenceFdInfoKHR-handleType-07306
If **handleType** refers to a handle type with copy payload transference semantics, **flags** **must** contain [VK_FENCE_IMPORT_TEMPORARY_BIT](#)

If **handleType** is [VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT](#), the special value `-1` for **fd** is treated like a valid sync file descriptor referring to an object that has already signaled. The import

operation will succeed and the **VkFence** will have a temporarily imported payload as if a valid file descriptor had been provided.

NOTE

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a **-1** file descriptor when exporting a **VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT** from a **VkFence** which is signaled.

Valid Usage (Implicit)

- **VUID-VkImportFenceFdInfoKHR-sType-sType**
sType must be **VK_STRUCTURE_TYPE_IMPORT_FENCE_FD_INFO_KHR**
- **VUID-VkImportFenceFdInfoKHR-pNext-pNext**
pNext must be **NULL**
- **VUID-VkImportFenceFdInfoKHR-fence-parameter**
fence must be a valid **VkFence** handle
- **VUID-VkImportFenceFdInfoKHR-flags-parameter**
flags must be a valid combination of **VkFenceImportFlagBits** values
- **VUID-VkImportFenceFdInfoKHR-handleType-parameter**
handleType must be a valid **VkExternalFenceHandleTypeFlagBits** value

Host Synchronization

- Host access to **fence** must be externally synchronized

Bits which **can** be set in

- **VkImportFenceWin32HandleInfoKHR::flags**
- **VkImportFenceFdInfoKHR::flags**

specifying additional parameters of a fence import operation are:

```
// Provided by VK_VERSION_1_1
typedef enum VkFenceImportFlagBits {
    VK_FENCE_IMPORT_TEMPORARY_BIT = 0x00000001,
    // Provided by VK_KHR_external_fence
    VK_FENCE_IMPORT_TEMPORARY_BIT_KHR = VK_FENCE_IMPORT_TEMPORARY_BIT,
} VkFenceImportFlagBits;
```

```
// Provided by VK_KHR_external_fence
// Equivalent to VkFenceImportFlagBits
typedef VkFenceImportFlagBits VkFenceImportFlagBitsKHR;
```

- [VK_FENCE_IMPORT_TEMPORARY_BIT](#) specifies that the fence payload will be imported only temporarily, as described in [Importing Fence Payloads](#), regardless of the permanence of [handleType](#).

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkFenceImportFlags;
```

```
// Provided by VK_KHR_external_fence
// Equivalent to VkFenceImportFlags
typedef VkFenceImportFlags VkFenceImportFlagsKHR;
```

[VkFenceImportFlags](#) is a bitmask type for setting a mask of zero or more [VkFenceImportFlagBits](#).

7.4. Semaphores

Semaphores are a synchronization primitive that **can** be used to insert a dependency between queue operations or between a queue operation and the host. [Binary semaphores](#) have two states - signaled and unsignaled. [Timeline semaphores](#) have a strictly increasing 64-bit unsigned integer payload and are signaled with respect to a particular reference value. A semaphore **can** be signaled after execution of a queue operation is completed, and a queue operation **can** wait for a semaphore to become signaled before it begins execution. A timeline semaphore **can** additionally be signaled from the host with the [vkSignalSemaphore](#) command and waited on from the host with the [vkWaitSemaphores](#) command.

The internal data of a semaphore **may** include a reference to any resources and pending work associated with signal or unsignal operations performed on that semaphore object, collectively referred to as the semaphore's *payload*. Mechanisms to import and export that internal data to and from semaphores are provided [below](#). These mechanisms indirectly enable applications to share semaphore state between two or more semaphores and other synchronization primitives across process and API boundaries.

Semaphores are represented by [VkSemaphore](#) handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSemaphore)
```

To create a semaphore, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateSemaphore(
    VkDevice                                device,
    const VkSemaphoreCreateInfo*            pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkSemaphore*                            pSemaphore);
```

- **device** is the logical device that creates the semaphore.
- **pCreateInfo** is a pointer to a [VkSemaphoreCreateInfo](#) structure containing information about how the semaphore is to be created.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pSemaphore** is a pointer to a handle in which the resulting semaphore object is returned.

Valid Usage (Implicit)

- VUID-vkCreateSemaphore-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateSemaphore-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkSemaphoreCreateInfo](#) structure
- VUID-vkCreateSemaphore-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateSemaphore-pSemaphore-parameter
pSemaphore **must** be a valid pointer to a [VkSemaphore](#) handle
- VUID-vkCreateSemaphore-device-queuecount
The device **must** have been created with at least **1** queue

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkSemaphoreCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSemaphoreCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkSemaphoreCreateFlags flags;
} VkSemaphoreCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.

Valid Usage

- VUID-VkSemaphoreCreateInfo-pNext-06789

If the **pNext** chain includes a **VkExportMetalObjectCreateInfoEXT** structure, its **exportObjectType** member **must** be **VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT**

Valid Usage (Implicit)

- VUID-VkSemaphoreCreateInfo-sType-sType
sType must be **VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO**
- VUID-VkSemaphoreCreateInfo-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of **VkExportMetalObjectCreateInfoEXT**, **VkExportSemaphoreCreateInfo**, **VkExportSemaphoreWin32HandleInfoKHR**, **VkImportMetalSharedEventInfoEXT**, **VkQueryLowLatencySupportNV**, or **VkSemaphoreTypeCreateInfo**
- VUID-VkSemaphoreCreateInfo-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique, with the exception of structures of type **VkExportMetalObjectCreateInfoEXT**
- VUID-VkSemaphoreCreateInfo-flags-zero-bitmask
flags must be **0**

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSemaphoreCreateFlags;
```

VkSemaphoreCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The **VkSemaphoreTypeCreateInfo** structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreTypeCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphoreType    semaphoreType;
    uint64_t           initialValue;
} VkSemaphoreTypeCreateInfo;
```

```
// Provided by VK_KHR_timeline_semaphore
// Equivalent to VkSemaphoreTypeCreateInfo
typedef VkSemaphoreTypeCreateInfo VkSemaphoreTypeCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphoreType` is a `VkSemaphoreType` value specifying the type of the semaphore.
- `initialValue` is the initial payload value if `semaphoreType` is `VK_SEMAPHORE_TYPE_TIMELINE`.

To create a semaphore of a specific type, add a `VkSemaphoreTypeCreateInfo` structure to the `VkSemaphoreCreateInfo::pNext` chain.

If no `VkSemaphoreTypeCreateInfo` structure is included in the `pNext` chain of `VkSemaphoreCreateInfo`, then the created semaphore will have a default `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.

Valid Usage

- VUID-VkSemaphoreTypeCreateInfo-timelineSemaphore-03252
If the `timelineSemaphore` feature is not enabled, `semaphoreType` **must** not equal `VK_SEMAPHORE_TYPE_TIMELINE`
- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-03279
If `semaphoreType` is `VK_SEMAPHORE_TYPE_BINARY`, `initialValue` **must** be zero

Valid Usage (Implicit)

- VUID-VkSemaphoreTypeCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO`
- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-parameter
`semaphoreType` **must** be a valid `VkSemaphoreType` value

Structure Chaining

Extends the structures

- [VkPhysicalDeviceExternalSemaphoreInfo](#)
- [VkSemaphoreCreateInfo](#)

Possible values of [VkSemaphoreTypeCreateInfo::semaphoreType](#), specifying the type of a semaphore, are:

```
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreType {
    VK_SEMAPHORE_TYPE_BINARY = 0,
    VK_SEMAPHORE_TYPE_TIMELINE = 1,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_TYPE_BINARY_KHR = VK_SEMAPHORE_TYPE_BINARY,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_TYPE_TIMELINE_KHR = VK_SEMAPHORE_TYPE_TIMELINE,
} VkSemaphoreType;
```

```
// Provided by VK_KHR_timeline_semaphore
// Equivalent to VkSemaphoreType
typedef VkSemaphoreType VkSemaphoreTypeKHR;
```

- [VK_SEMAPHORE_TYPE_BINARY](#) specifies a *binary semaphore* type that has a boolean payload indicating whether the semaphore is currently signaled or unsignaled. When created, the semaphore is in the unsignaled state.
- [VK_SEMAPHORE_TYPE_TIMELINE](#) specifies a *timeline semaphore* type that has a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. When created, the semaphore payload has the value given by the `initialValue` field of [VkSemaphoreTypeCreateInfo](#).

To create a semaphore whose payload **can** be exported to external handles, add a [VkExportSemaphoreCreateInfo](#) structure to the `pNext` chain of the [VkSemaphoreCreateInfo](#) structure. The [VkExportSemaphoreCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExportSemaphoreCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkExternalSemaphoreHandleTypeFlags handleTypes;
} VkExportSemaphoreCreateInfo;
```

```
// Provided by VK_KHR_external_semaphore
// Equivalent to VkExportSemaphoreCreateInfo
typedef VkExportSemaphoreCreateInfo VkExportSemaphoreCreateInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **handleTypes** is a bitmask of [VkExternalSemaphoreHandleTypeFlagBits](#) specifying one or more semaphore handle types the application **can** export from the resulting semaphore. The application **can** request multiple handle types for the same semaphore.

Valid Usage

- VUID-VkExportSemaphoreCreateInfo-handleTypes-01124
The bits in **handleTypes** **must** be supported and compatible, as reported by [VkExternalSemaphoreProperties](#)

Valid Usage (Implicit)

- VUID-VkExportSemaphoreCreateInfo-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO](#)
- VUID-VkExportSemaphoreCreateInfo-handleTypes-parameter
handleTypes **must** be a valid combination of [VkExternalSemaphoreHandleTypeFlagBits](#) values

Structure Chaining

Extends the structure

- [VkSemaphoreCreateInfo](#)

To specify additional attributes of NT handles exported from a semaphore, add a [VkExportSemaphoreWin32HandleInfoKHR](#) structure to the **pNext** chain of the [VkSemaphoreCreateInfo](#) structure. The [VkExportSemaphoreWin32HandleInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkExportSemaphoreWin32HandleInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD              dwAccess;
    LPCWSTR            name;
} VkExportSemaphoreWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- `dwAccess` is a `DWORD` specifying access rights of the handle.
- `name` is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created semaphore.

If `VkExportSemaphoreCreateInfo` is not included in the same `pNext` chain, this structure is ignored.

If `VkExportSemaphoreCreateInfo` is included in the `pNext` chain of `VkSemaphoreCreateInfo` with a Windows `handleType`, but either `VkExportSemaphoreWin32HandleInfoKHR` is not included in the `pNext` chain, or it is included but `pAttributes` is `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”¹. Further, if the structure is not present, the access rights used depend on the handle type.

For handles of the following types:

`VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT`

The implementation **must** ensure the access rights allow both signal and wait operations on the semaphore.

For handles of the following types:

`VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`

The access rights **must** be:

`GENERIC_ALL`

1

<https://docs.microsoft.com/en-us/windows/win32/sync/synchronization-object-security-and-access-rights>

Valid Usage

- VUID-VkExportSemaphoreWin32HandleInfoKHR-handleTypes-01125

If `VkExportSemaphoreCreateInfo::handleTypes` does not include `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`, `VkExportSemaphoreWin32HandleInfoKHR` **must** not be included in the `pNext` chain of `VkSemaphoreCreateInfo`

Valid Usage (Implicit)

- VUID-VkExportSemaphoreWin32HandleInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR`
- VUID-VkExportSemaphoreWin32HandleInfoKHR-pAttributes-parameter
If `pAttributes` is not `NULL`, `pAttributes` **must** be a valid pointer to a valid `SECURITY_ATTRIBUTES` value

Structure Chaining

Extends the structure

- [VkSemaphoreCreateInfo](#)

To export a Windows handle representing the payload of a semaphore, call:

```
// Provided by VK_KHR_external_semaphore_win32
VkResult vkGetSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkSemaphoreGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetWin32HandleInfo` is a pointer to a [VkSemaphoreGetWin32HandleInfoKHR](#) structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the semaphore state.

For handle types defined as NT handles, the handles returned by `vkGetSemaphoreWin32HandleKHR` are owned by the application. To avoid leaking resources, the application **must** release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a semaphore **may** have side effects depending on the transference of the specified handle type, as described in [Importing Semaphore Payloads](#).

Valid Usage (Implicit)

- VUID-vkGetSemaphoreWin32HandleKHR-device-parameter
`device` **must** be a valid [VkDevice](#) handle
- VUID-vkGetSemaphoreWin32HandleKHR-pGetWin32HandleInfo-parameter
`pGetWin32HandleInfo` **must** be a valid pointer to a valid [VkSemaphoreGetWin32HandleInfoKHR](#) structure
- VUID-vkGetSemaphoreWin32HandleKHR-pHandle-parameter
`pHandle` **must** be a valid pointer to a `HANDLE` value

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_TOO_MANY_OBJECTS](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkSemaphoreGetWin32HandleInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkSemaphoreGetWin32HandleInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkSemaphore              semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetWin32HandleInfoKHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [semaphore](#) is the semaphore from which state will be exported.
- [handleType](#) is a [VkExternalSemaphoreHandleTypeFlagBits](#) value specifying the type of handle requested.

The properties of the handle returned depend on the value of [handleType](#). See [VkExternalSemaphoreHandleTypeFlagBits](#) for a description of the properties of the defined external semaphore handle types.

Valid Usage

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01126
[handleType](#) **must** have been included in [VkExportSemaphoreCreateInfo::handleTypes](#) when the [semaphore](#)'s current payload was created
- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01127
If [handleType](#) is defined as an NT handle, [vkGetSemaphoreWin32HandleKHR](#) **must** be called no more than once for each valid unique combination of [semaphore](#) and [handleType](#)
- VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-01128
[semaphore](#) **must** not currently have its payload replaced by an imported payload as described below in [Importing Semaphore Payloads](#) unless that imported payload's handle type was included in [VkExternalSemaphoreProperties::exportFromImportedHandleTypes](#) for

handleType

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01129
If **handleType** refers to a handle type with copy payload transference semantics, as defined below in [Importing Semaphore Payloads](#), there **must** be no queue waiting on **semaphore**
- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01130
If **handleType** refers to a handle type with copy payload transference semantics, **semaphore** **must** be signaled, or have an associated [semaphore signal operation](#) pending execution
- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01131
handleType **must** be defined as an NT handle or a global share handle

Valid Usage (Implicit)

- VUID-VkSemaphoreGetWin32HandleInfoKHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_SEMAPHORE_GET_WIN32_HANDLE_INFO_KHR](#)
- VUID-VkSemaphoreGetWin32HandleInfoKHR-pNext-pNext
pNext **must** be `NULL`
- VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-parameter
semaphore **must** be a valid [VkSemaphore](#) handle
- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-parameter
handleType **must** be a valid [VkExternalSemaphoreHandleTypeFlagBits](#) value

The [VkQueryLowLatencySupportNV](#) structure is defined as:

```
// Provided by VK_NV_low_latency
typedef struct VkQueryLowLatencySupportNV {
    VkStructureType    sType;
    const void*        pNext;
    void*              pQueriedLowLatencyData;
} VkQueryLowLatencySupportNV;
```

This structure describes the following feature:

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pQueriedLowLatencyData** is used for NVIDIA Reflex Support.

Valid Usage (Implicit)

- VUID-VkQueryLowLatencySupportNV-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_QUERY_LOW_LATENCY_SUPPORT_NV](#)
- VUID-VkQueryLowLatencySupportNV-pQueriedLowLatencyData-parameter
pQueriedLowLatencyData **must** be a pointer value

Structure Chaining

Extends the structure

- [VkSemaphoreCreateInfo](#)

To export a POSIX file descriptor representing the payload of a semaphore, call:

```
// Provided by VK_KHR_external_semaphore_fd
VkResult vkGetSemaphoreFdKHR(
    VkDevice          device,
    const VkSemaphoreGetFdInfoKHR* pGetFdInfo,
    int*              pFd);
```

- **device** is the logical device that created the semaphore being exported.
- **pGetFdInfo** is a pointer to a [VkSemaphoreGetFdInfoKHR](#) structure containing parameters of the export operation.
- **pFd** will return the file descriptor representing the semaphore payload.

Each call to **vkGetSemaphoreFdKHR** **must** create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor when it is no longer needed.

NOTE

Ownership can be released in many ways. For example, the application can call **close()** on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an **execve** system call is made.

Exporting a file descriptor from a semaphore **may** have side effects depending on the transference of the specified handle type, as described in [Importing Semaphore State](#).

Valid Usage (Implicit)

- VUID-vkGetSemaphoreFdKHR-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetSemaphoreFdKHR-pGetFdInfo-parameter
pGetFdInfo **must** be a valid pointer to a valid [VkSemaphoreGetFdInfoKHR](#) structure
- VUID-vkGetSemaphoreFdKHR-pFd-parameter
pFd **must** be a valid pointer to an **int** value

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_TOO_MANY_OBJECTS](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkSemaphoreGetFdInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkSemaphoreGetFdInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkSemaphore              semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetFdInfoKHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [semaphore](#) is the semaphore from which state will be exported.
- [handleType](#) is a [VkExternalSemaphoreHandleTypeFlagBits](#) value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of [handleType](#). See [VkExternalSemaphoreHandleTypeFlagBits](#) for a description of the properties of the defined external semaphore handle types.

Valid Usage

- VUID-VkSemaphoreGetFdInfoKHR-handleType-01132
[handleType](#) **must** have been included in [VkExportSemaphoreCreateInfo::handleTypes](#) when [semaphore](#)'s current payload was created
- VUID-VkSemaphoreGetFdInfoKHR-semaphore-01133
[semaphore](#) **must** not currently have its payload replaced by an imported payload as described below in [Importing Semaphore Payloads](#) unless that imported payload's handle type was included in [VkExternalSemaphoreProperties::exportFromImportedHandleTypes](#) for [handleType](#)
- VUID-VkSemaphoreGetFdInfoKHR-handleType-01134
If [handleType](#) refers to a handle type with copy payload transference semantics, as defined

below in [Importing Semaphore Payloads](#), there **must** be no queue waiting on **semaphore**

- VUID-VkSemaphoreGetFdInfoKHR-handleType-01135
If **handleType** refers to a handle type with copy payload transference semantics, **semaphore** **must** be signaled, or have an associated [semaphore signal operation](#) pending execution
- VUID-VkSemaphoreGetFdInfoKHR-handleType-01136
handleType **must** be defined as a POSIX file descriptor handle
- VUID-VkSemaphoreGetFdInfoKHR-handleType-03253
If **handleType** refers to a handle type with copy payload transference semantics, **semaphore** **must** have been created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_BINARY](#)
- VUID-VkSemaphoreGetFdInfoKHR-handleType-03254
If **handleType** refers to a handle type with copy payload transference semantics, **semaphore** **must** have an associated semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends **must** have also been submitted for execution

Valid Usage (Implicit)

- VUID-VkSemaphoreGetFdInfoKHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR](#)
- VUID-VkSemaphoreGetFdInfoKHR-pNext-pNext
pNext **must** be `NULL`
- VUID-VkSemaphoreGetFdInfoKHR-semaphore-parameter
semaphore **must** be a valid [VkSemaphore](#) handle
- VUID-VkSemaphoreGetFdInfoKHR-handleType-parameter
handleType **must** be a valid [VkExternalSemaphoreHandleTypeFlagBits](#) value

To export a Zircon event handle representing the payload of a semaphore, call:

```
// Provided by VK_FUCHSIA_external_semaphore
VkResult vkGetSemaphoreZirconHandleFUCHSIA(
    VkDevice device,
    const VkSemaphoreGetZirconHandleInfoFUCHSIA* pGetZirconHandleInfo,
    zx_handle_t* pZirconHandle);
```

- **device** is the logical device that created the semaphore being exported.
- **pGetZirconHandleInfo** is a pointer to a [VkSemaphoreGetZirconHandleInfoFUCHSIA](#) structure containing parameters of the export operation.
- **pZirconHandle** will return the Zircon event handle representing the semaphore payload.

Each call to **vkGetSemaphoreZirconHandleFUCHSIA** **must** create a Zircon event handle and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the Zircon event handle when it is no longer needed.

NOTE

Ownership can be released in many ways. For example, the application can call `zx_handle_close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Exporting a Zircon event handle from a semaphore **may** have side effects depending on the transference of the specified handle type, as described in [Importing Semaphore State](#).

Valid Usage (Implicit)

- `VOID-vkGetSemaphoreZirconHandleFUCHSIA-device-parameter`
`device` **must** be a valid [VkDevice](#) handle
- `VOID-vkGetSemaphoreZirconHandleFUCHSIA-pGetZirconHandleInfo-parameter`
`pGetZirconHandleInfo` **must** be a valid pointer to a valid [VkSemaphoreGetZirconHandleInfoFUCHSIA](#) structure
- `VOID-vkGetSemaphoreZirconHandleFUCHSIA-pZirconHandle-parameter`
`pZirconHandle` **must** be a valid pointer to a `zx_handle_t` value

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_TOO_MANY_OBJECTS](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkSemaphoreGetZirconHandleInfoFUCHSIA](#) structure is defined as:

```
// Provided by VK_FUCHSIA_external_semaphore
typedef struct VkSemaphoreGetZirconHandleInfoFUCHSIA {
    VkStructureType          sType;
    const void*              pNext;
    VkSemaphore              semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetZirconHandleInfoFUCHSIA;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is a [VkExternalSemaphoreHandleTypeFlagBits](#) value specifying the type of handle

requested.

The properties of the Zircon event handle returned depend on the value of `handleType`. See [VkExternalSemaphoreHandleTypeFlagBits](#) for a description of the properties of the defined external semaphore handle types.

Valid Usage

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04758
`handleType` **must** have been included in `VkExportSemaphoreCreateInfo::handleTypes` when `semaphore`'s current payload was created
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-04759
`semaphore` **must** not currently have its payload replaced by an imported payload as described below in [Importing Semaphore Payloads](#) unless that imported payload's handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04760
If `handleType` refers to a handle type with copy payload transference semantics, as defined below in [Importing Semaphore Payloads](#), there **must** be no queue waiting on `semaphore`
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04761
If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` **must** be signaled, or have an associated [semaphore signal operation](#) pending execution
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04762
`handleType` **must** be defined as a Zircon event handle
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-04763
`semaphore` **must** have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`

Valid Usage (Implicit)

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_ZIRCON_HANDLE_INFO_FUCHSIA`
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-parameter
`semaphore` **must** be a valid `VkSemaphore` handle
- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-parameter
`handleType` **must** be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

To destroy a semaphore, call:

```
// Provided by VK_VERSION_1_0
void vkDestroySemaphore(
    VkDevice          device,
    VkSemaphore       semaphore,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the semaphore.
- **semaphore** is the handle of the semaphore to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroySemaphore-semaphore-05149
All submitted batches that refer to **semaphore** **must** have completed execution
- VUID-vkDestroySemaphore-semaphore-01138
If **VkAllocationCallbacks** were provided when **semaphore** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroySemaphore-semaphore-01139
If no **VkAllocationCallbacks** were provided when **semaphore** was created, **pAllocator** **must** be **NULL**

Valid Usage (Implicit)

- VUID-vkDestroySemaphore-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkDestroySemaphore-semaphore-parameter
If **semaphore** is not **VK_NULL_HANDLE**, **semaphore** **must** be a valid **VkSemaphore** handle
- VUID-vkDestroySemaphore-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid **VkAllocationCallbacks** structure
- VUID-vkDestroySemaphore-semaphore-parent
If **semaphore** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **semaphore** **must** be externally synchronized

7.4.1. Semaphore Signaling

When a batch is submitted to a queue via a [queue submission](#), and it includes semaphores to be

signaled, it defines a memory dependency on the batch, and defines *semaphore signal operations* which set the semaphores to the signaled state.

In case of semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the semaphore is considered signaled with respect to the counter value set to be signaled as specified in `VkTimelineSemaphoreSubmitInfo` or `VkSemaphoreSignalInfo`.

The first *synchronization scope* of a semaphore signal operation is defined by the command which defines it.

The second *synchronization scope* includes only the semaphore signal operation.

The first *access scope* includes all memory access performed by the device.

The second *access scope* is empty.

7.4.2. Semaphore Waiting

When a batch is submitted to a queue via a *queue submission*, and it includes semaphores to be waited on, it defines a memory dependency between prior semaphore signal operations and the batch, and defines *semaphore wait operations*.

Such semaphore wait operations set the semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` to the unsignaled state. In case of semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` a prior semaphore signal operation defines a memory dependency with a semaphore wait operation if the value the semaphore is signaled with is greater than or equal to the value the semaphore is waited with, thus the semaphore will continue to be considered signaled with respect to the counter value waited on as specified in `VkTimelineSemaphoreSubmitInfo`.

The first *synchronization scope* of any wait semaphore operation includes one *semaphore signal operation* for each semaphore waited on by this batch. The specific signal operation waited on for each semaphore **must** meet the following criteria:

- for binary semaphores, the signal operation is either earlier in *submission order* on the same queue, or is submitted by a command whose host operation happens-before this batch is submitted on the host
- for binary semaphores, no wait operation exists that happens-after the signal operation and happens-before this wait operation
- the signal operation is not guaranteed to happen-after the semaphore wait operation in this batch
- for timeline semaphores, the signal value is greater than or equal to the wait value

If multiple semaphore signal operations meet these criteria, any of those operations **may** be included in the first *synchronization scope*. When waiting on a binary semaphore, applications **must** ensure that exactly one semaphore signal operation meets these criteria.

The second *synchronization scope* of a wait operation is defined by each command.

The first [access scope](#) is empty.

The second [access scope](#) includes all memory access performed by the device.

The semaphore wait operation happens-after the first set of operations in the execution dependency, and happens-before the second set of operations in the execution dependency.

NOTE

Unlike timeline semaphores, fences or events, waiting for a binary semaphore also unsignals that semaphore when the wait completes. Applications **must** ensure that between two such wait operations, the semaphore is signaled again, with execution dependencies used to ensure these occur in order. Binary semaphore waits and signals should thus occur in discrete 1:1 pairs.

7.4.3. Semaphore State Requirements for Wait Operations

Before waiting on a semaphore, the application **must** ensure the semaphore is in a valid state for a wait operation. Specifically, when a [semaphore wait operation](#) is submitted to a queue:

- A binary semaphore **must** be signaled, or have an associated [semaphore signal operation](#) that is pending execution.
- Any [semaphore signal operations](#) on which the pending binary semaphore signal operation depends **must** also be completed or pending execution.
- There **must** be no other queue waiting on the same binary semaphore when the operation executes.

7.4.4. Host Operations on Semaphores

In addition to [semaphore signal operations](#) and [semaphore wait operations](#) submitted to device queues, timeline semaphores support the following host operations:

- Query the current counter value of the semaphore using the [vkGetSemaphoreCounterValue](#) command.
- Wait for a set of semaphores to reach particular counter values using the [vkWaitSemaphores](#) command.
- Signal the semaphore with a particular counter value from the host using the [vkSignalSemaphore](#) command.

To query the current counter value of a semaphore created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_TIMELINE](#) from the host, call:

```
// Provided by VK_VERSION_1_2
VkResult vkGetSemaphoreCounterValue(
    VkDevice           device,
    VkSemaphore        semaphore,
    uint64_t*          pValue);
```

```
// Provided by VK_KHR_timeline_semaphore
// Equivalent to vkGetSemaphoreCounterValue
VkResult vkGetSemaphoreCounterValueKHR(
    VkDevice          device,
    VkSemaphore        semaphore,
    uint64_t*         pValue);
```

- **device** is the logical device that owns the semaphore.
- **semaphore** is the handle of the semaphore to query.
- **pValue** is a pointer to a 64-bit integer value in which the current counter value of the semaphore is returned.

NOTE

If a [queue submission](#) command is pending execution, then the value returned by this command **may** immediately be out of date.

Valid Usage

- VUID-vkGetSemaphoreCounterValue-semaphore-03255
semaphore must have been created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_TIMELINE](#)

Valid Usage (Implicit)

- VUID-vkGetSemaphoreCounterValue-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkGetSemaphoreCounterValue-semaphore-parameter
semaphore must be a valid [VkSemaphore](#) handle
- VUID-vkGetSemaphoreCounterValue-pValue-parameter
pValue must be a valid pointer to a [uint64_t](#) value
- VUID-vkGetSemaphoreCounterValue-semaphore-parent
semaphore must have been created, allocated, or retrieved from **device**

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)

- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

To wait for a set of semaphores created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_TIMELINE](#) to reach particular counter values on the host, call:

```
// Provided by VK_VERSION_1_2
VkResult vkWaitSemaphores(
    VkDevice                device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t                timeout);
```

```
// Provided by VK_KHR_timeline_semaphore
// Equivalent to vkWaitSemaphores
VkResult vkWaitSemaphoresKHR(
    VkDevice                device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t                timeout);
```

- **device** is the logical device that owns the semaphores.
- **pWaitInfo** is a pointer to a [VkSemaphoreWaitInfo](#) structure containing information about the wait condition.
- **timeout** is the timeout period in units of nanoseconds. **timeout** is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

If the condition is satisfied when **vkWaitSemaphores** is called, then **vkWaitSemaphores** returns immediately. If the condition is not satisfied at the time **vkWaitSemaphores** is called, then **vkWaitSemaphores** will block and wait until the condition is satisfied or the **timeout** has expired, whichever is sooner.

If **timeout** is zero, then **vkWaitSemaphores** does not wait, but simply returns information about the current state of the semaphores. [VK_TIMEOUT](#) will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the **timeout** has expired, **vkWaitSemaphores** returns [VK_SUCCESS](#). Otherwise, **vkWaitSemaphores** returns [VK_TIMEOUT](#) after the **timeout** has expired.

If device loss occurs (see [Lost Device](#)) before the timeout has expired, **vkWaitSemaphores** **must** return in finite time with either [VK_SUCCESS](#) or [VK_ERROR_DEVICE_LOST](#).

Valid Usage (Implicit)

- VUID-vkWaitSemaphores-device-parameter **device** **must** be a valid [VkDevice](#) handle

- VUID-vkWaitSemaphores-pWaitInfo-parameter
pWaitInfo **must** be a valid pointer to a valid [VkSemaphoreWaitInfo](#) structure

Return Codes

Success

- [VK_SUCCESS](#)
- [VK_TIMEOUT](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkSemaphoreWaitInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreWaitInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphoreWaitFlags flags;
    uint32_t           semaphoreCount;
    const VkSemaphore* pSemaphores;
    const uint64_t*     pValues;
} VkSemaphoreWaitInfo;
```

```
// Provided by VK_KHR_timeline_semaphore
// Equivalent to VkSemaphoreWaitInfo
typedef VkSemaphoreWaitInfo VkSemaphoreWaitInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkSemaphoreWaitFlagBits](#) specifying additional parameters for the semaphore wait operation.
- **semaphoreCount** is the number of semaphores to wait on.
- **pSemaphores** is a pointer to an array of **semaphoreCount** semaphore handles to wait on.
- **pValues** is a pointer to an array of **semaphoreCount** timeline semaphore values.

Valid Usage

- VUID-VkSemaphoreWaitInfo-pSemaphores-03256

All of the elements of `pSemaphores` **must** reference a semaphore that was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`

Valid Usage (Implicit)

- VUID-VkSemaphoreWaitInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO`
- VUID-VkSemaphoreWaitInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkSemaphoreWaitInfo-flags-parameter
`flags` **must** be a valid combination of `VkSemaphoreWaitFlagBits` values
- VUID-VkSemaphoreWaitInfo-pSemaphores-parameter
`pSemaphores` **must** be a valid pointer to an array of `semaphoreCount` valid `VkSemaphore` handles
- VUID-VkSemaphoreWaitInfo-pValues-parameter
`pValues` **must** be a valid pointer to an array of `semaphoreCount uint64_t` values
- VUID-VkSemaphoreWaitInfo-semaphoreCount-arraylength
`semaphoreCount` **must** be greater than `0`

Bits which **can** be set in `VkSemaphoreWaitInfo::flags`, specifying additional parameters of a semaphore wait operation, are:

```
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreWaitFlagBits {
    VK_SEMAPHORE_WAIT_ANY_BIT = 0x00000001,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_WAIT_ANY_BIT_KHR = VK_SEMAPHORE_WAIT_ANY_BIT,
} VkSemaphoreWaitFlagBits;
```

```
// Provided by VK_KHR_timeline_semaphore
// Equivalent to VkSemaphoreWaitFlagBits
typedef VkSemaphoreWaitFlagBits VkSemaphoreWaitFlagBitsKHR;
```

- `VK_SEMAPHORE_WAIT_ANY_BIT` specifies that the semaphore wait condition is that at least one of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` has reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`. If `VK_SEMAPHORE_WAIT_ANY_BIT` is not set, the semaphore wait condition is that all of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` have reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`.

```
// Provided by VK_VERSION_1_2
typedef VkFlags VkSemaphoreWaitFlags;
```

```
// Provided by VK_KHR_timeline_semaphore
// Equivalent to VkSemaphoreWaitFlags
typedef VkSemaphoreWaitFlags VkSemaphoreWaitFlagsKHR;
```

`VkSemaphoreWaitFlags` is a bitmask type for setting a mask of zero or more `VkSemaphoreWaitFlagBits`.

To signal a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` with a particular counter value, on the host, call:

```
// Provided by VK_VERSION_1_2
VkResult vkSignalSemaphore(
    VkDevice                                device,
    const VkSemaphoreSignalInfo*            pSignalInfo);
```

```
// Provided by VK_KHR_timeline_semaphore
// Equivalent to vkSignalSemaphore
VkResult vkSignalSemaphoreKHR(
    VkDevice                                device,
    const VkSemaphoreSignalInfo*            pSignalInfo);
```

- `device` is the logical device that owns the semaphore.
- `pSignalInfo` is a pointer to a `VkSemaphoreSignalInfo` structure containing information about the signal operation.

When `vkSignalSemaphore` is executed on the host, it defines and immediately executes a *semaphore signal operation* which sets the timeline semaphore to the given value.

The first synchronization scope is defined by the host execution model, but includes execution of `vkSignalSemaphore` on the host and anything that happened-before it.

The second synchronization scope is empty.

Valid Usage (Implicit)

- VUID-vkSignalSemaphore-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkSignalSemaphore-pSignalInfo-parameter
`pSignalInfo` **must** be a valid pointer to a valid `VkSemaphoreSignalInfo` structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkSemaphoreSignalInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreSignalInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphore        semaphore;
    uint64_t           value;
} VkSemaphoreSignalInfo;
```

```
// Provided by VK_KHR_timeline_semaphore
// Equivalent to VkSemaphoreSignalInfo
typedef VkSemaphoreSignalInfo VkSemaphoreSignalInfoKHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is `NULL` or a pointer to a structure extending this structure.
- [semaphore](#) is the handle of the semaphore to signal.
- [value](#) is the value to signal.

Valid Usage

- VUID-VkSemaphoreSignalInfo-semaphore-03257
[semaphore](#) **must** have been created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_TIMELINE](#)
- VUID-VkSemaphoreSignalInfo-value-03258
[value](#) **must** have a value greater than the current value of the semaphore
- VUID-VkSemaphoreSignalInfo-value-03259
[value](#) **must** be less than the value of any pending semaphore signal operations
- VUID-VkSemaphoreSignalInfo-value-03260
[value](#) **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on [semaphore](#) by more

than `maxTimelineSemaphoreValueDifference`

Valid Usage (Implicit)

- `VOID-VkSemaphoreSignalInfo-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_SIGNAL_INFO`
- `VOID-VkSemaphoreSignalInfo-pNext-pNext`
`pNext` **must** be `NULL`
- `VOID-VkSemaphoreSignalInfo-semaphore-parameter`
`semaphore` **must** be a valid `VkSemaphore` handle

7.4.5. Importing Semaphore Payloads

Applications **can** import a semaphore payload into an existing semaphore using an external semaphore handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the implementation **must** restore the semaphore to its prior permanent state after submitting the next semaphore wait operation. Performing a subsequent temporary import on a semaphore before performing a semaphore wait has no effect on this requirement; the next wait submitted on the semaphore **must** still restore its last permanent state. A permanent payload import behaves as if the target semaphore was destroyed, and a new semaphore was created with the same handle but the imported payload. Because importing a semaphore payload temporarily or permanently detaches the existing payload from a semaphore, similar usage restrictions to those applied to `vkDestroySemaphore` are applied to any command that imports a semaphore payload. Which of these import types is used is referred to as the import operation's *permanence*. Each handle type supports either one or both types of permanence.

The implementation **must** perform the import operation by either referencing or copying the payload referred to by the specified external semaphore handle, depending on the handle's type. The import method used is referred to as the handle type's *transference*. When using handle types with reference transference, importing a payload to a semaphore adds the semaphore to the set of all semaphores sharing that payload. This set includes the semaphore from which the payload was exported. Semaphore signaling and waiting operations performed on any semaphore in the set **must** behave as if the set were a single semaphore. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Semaphore signaling and waiting operations performed on the target of copy imports **must** not affect any other semaphore or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a semaphore payload to a handle with copy transference has the same side effects on the source semaphore's payload as executing a semaphore wait operation. If the semaphore was using a temporarily imported payload, the semaphore's prior permanent payload will be restored.

NOTE

The permanence and transference of handle types can be found in:

- [Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`](#)
- [Handle Types Supported by `VkImportSemaphoreFdInfoKHR`](#)
- [Handle Types Supported by `VkImportSemaphoreZirconHandleInfoFUCHSIA`](#)

[External synchronization](#) allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for semaphores sharing a payload across processes, satisfying the external synchronization requirements of `VkSemaphore` parameters as if all semaphores in the set were the same object is sometimes infeasible. Satisfying the [wait operation state requirements](#) would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific semaphore handle, not to its payload. For distinct semaphore objects which share a payload, if the semaphores are passed to separate queue submission commands concurrently, behavior will be as if the commands were called in an arbitrary sequential order. If the [wait operation state requirements](#) are violated for the shared payload by a queue submission command, or if a signal operation is queued for a shared payload that is already signaled or has a pending signal operation, effects **must** be limited to one or more of the following:

- Returning `VK_ERROR_INITIALIZATION_FAILED` from the command which resulted in the violation.
- Losing the logical device on which the violation occurred immediately or at a future time, resulting in a `VK_ERROR_DEVICE_LOST` error from subsequent commands, including the one causing the violation.
- Continuing execution of the violating command or operation as if the semaphore wait completed successfully after an implementation-dependent timeout. In this case, the state of the payload becomes undefined, and future operations on semaphores sharing the payload will be subject to these same rules. The semaphore **must** be destroyed or have its payload replaced by an import operation to again have a well-defined state.

NOTE

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared semaphore for more than synchronizing access to the shared memory. For example, a process should not use a shared semaphore as part of an execution dependency chain that, when complete, leads to objects being destroyed, if it does not trust other processes sharing the semaphore payload.

When a semaphore is using an imported payload, its `VkExportSemaphoreCreateInfo::handleTypes` value is specified when creating the semaphore from which the payload was exported, rather than specified when creating the semaphore. Additionally, `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` restricts which handle types **can** be exported from such a semaphore based on the specific handle type used to import the current payload. Passing a semaphore to `vkAcquireNextImageKHR` is equivalent to temporarily importing a semaphore payload to that semaphore.

NOTE

Because the exportable handle types of an imported semaphore correspond to its current imported payload, and `vkAcquireNextImageKHR` behaves the same as a temporary import operation for which the source semaphore is opaque to the

application, applications have no way of determining whether any external handle types **can** be exported from a semaphore in this state. Therefore, applications **must** not attempt to export external handles from semaphores using a temporarily imported payload from [vkAcquireNextImageKHR](#).

When importing a semaphore payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations **must** perform sufficient validation of external handles to ensure that the operation results in a valid semaphore which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its import parameters, and excepting those side effects allowed for violations of the [valid semaphore state for wait operations](#) rules. If the external handle provided does not meet these requirements, the implementation **must** fail the semaphore payload import operation with the error code [VK_ERROR_INVALID_EXTERNAL_HANDLE](#).

In addition, when importing a semaphore payload that is not compatible with the payload type corresponding to the [VkSemaphoreType](#) the semaphore was created with, the implementation **may** fail the semaphore payload import operation with the error code [VK_ERROR_INVALID_EXTERNAL_HANDLE](#).

NOTE

As the introduction of the external semaphore handle type [VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT](#) predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_BINARY](#) is preserved for backwards compatibility. However, applications **should** prefer importing such handle types into semaphores created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_TIMELINE](#).

To import a semaphore payload from a Windows handle, call:

```
// Provided by VK_KHR_external_semaphore_win32
VkResult vkImportSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkImportSemaphoreWin32HandleInfoKHR* pImportSemaphoreWin32HandleInfo);
```

- [device](#) is the logical device that created the semaphore.
- [pImportSemaphoreWin32HandleInfo](#) is a pointer to a [VkImportSemaphoreWin32HandleInfoKHR](#) structure specifying the semaphore and import parameters.

Importing a semaphore payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application **must** release ownership using the [CloseHandle](#) system call when the handle is no longer needed.

Applications **can** import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage (Implicit)

- VUID-vkImportSemaphoreWin32HandleKHR-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkImportSemaphoreWin32HandleKHR-pImportSemaphoreWin32HandleInfo-parameter **pImportSemaphoreWin32HandleInfo** **must** be a valid pointer to a valid [VkImportSemaphoreWin32HandleInfoKHR](#) structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_INVALID_EXTERNAL_HANDLE](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkImportSemaphoreWin32HandleInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkImportSemaphoreWin32HandleInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphore         semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    HANDLE              handle;
    LPCWSTR             name;
} VkImportSemaphoreWin32HandleInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is [NULL](#) or a pointer to a structure extending this structure.
- **semaphore** is the semaphore into which the payload will be imported.
- **flags** is a bitmask of [VkSemaphoreImportFlagBits](#) specifying additional parameters for the semaphore payload import operation.
- **handleType** is a [VkExternalSemaphoreHandleTypeFlagBits](#) value specifying the type of **handle**.
- **handle** is [NULL](#) or the external handle to import.
- **name** is [NULL](#) or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by `handleType` are:

Table 8. Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT</code>	Reference	Temporary,Permanent
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT</code>	Reference	Temporary,Permanent
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT</code>	Reference	Temporary,Permanent

Valid Usage

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01140
`handleType` **must** be a value included in the [Handle Types Supported by VkImportSemaphoreWin32HandleInfoKHR](#) table
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01466
If `handleType` is not `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`, `name` **must** be `NULL`
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01467
If `handle` is `NULL`, `name` **must** name a valid synchronization primitive of the type specified by `handleType`
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01468
If `name` is `NULL`, `handle` **must** be a valid handle of the type specified by `handleType`
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handle-01469
If `handle` is not `NULL`, `name` **must** be `NULL`
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handle-01542
If `handle` is not `NULL`, it **must** obey any requirements listed for `handleType` in [external semaphore handle types compatibility](#)
- VUID-VkImportSemaphoreWin32HandleInfoKHR-name-01543
If `name` is not `NULL`, it **must** obey any requirements listed for `handleType` in [external semaphore handle types compatibility](#)
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03261
If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, the `VkSemaphoreCreateInfo::flags` field **must** match that of the semaphore from which `handle` or `name` was exported
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03262
If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, the

`VkSemaphoreTypeCreateInfo::semaphoreType` field **must** match that of the semaphore from which `handle` or `name` was exported

- VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-03322
If `flags` contains `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field of the semaphore from which `handle` or `name` was exported **must** not be `VK_SEMAPHORE_TYPE_TIMELINE`

Valid Usage (Implicit)

- VUID-VkImportSemaphoreWin32HandleInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR`
- VUID-VkImportSemaphoreWin32HandleInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkImportSemaphoreWin32HandleInfoKHR-semaphore-parameter
`semaphore` **must** be a valid `VkSemaphore` handle
- VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-parameter
`flags` **must** be a valid combination of `VkSemaphoreImportFlagBits` values

Host Synchronization

- Host access to `semaphore` **must** be externally synchronized

To import a semaphore payload from a POSIX file descriptor, call:

```
// Provided by VK_KHR_external_semaphore_fd
VkResult vkImportSemaphoreFdKHR(
    VkDevice device,
    const VkImportSemaphoreFdInfoKHR* pImportSemaphoreFdInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreFdInfo` is a pointer to a `VkImportSemaphoreFdInfoKHR` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- VUID-vkImportSemaphoreFdKHR-semaphore-01142
semaphore **must** not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportSemaphoreFdKHR-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkImportSemaphoreFdKHR-pImportSemaphoreFdInfo-parameter
pImportSemaphoreFdInfo **must** be a valid pointer to a valid [VkImportSemaphoreFdInfoKHR](#) structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_INVALID_EXTERNAL_HANDLE](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkImportSemaphoreFdInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkImportSemaphoreFdInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphore        semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    int                fd;
} VkImportSemaphoreFdInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is [NULL](#) or a pointer to a structure extending this structure.
- **semaphore** is the semaphore into which the payload will be imported.
- **flags** is a bitmask of [VkSemaphoreImportFlagBits](#) specifying additional parameters for the semaphore payload import operation.
- **handleType** is a [VkExternalSemaphoreHandleTypeFlagBits](#) value specifying the type of **fd**.

- `fd` is the external handle to import.

The handle types supported by `handleType` are:

Table 9. Handle Types Supported by `VkImportSemaphoreFdInfoKHR`

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT</code>	Reference	Temporary, Permanent
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT</code>	Copy	Temporary

Valid Usage

- VUID-VkImportSemaphoreFdInfoKHR-handleType-01143
`handleType` **must** be a value included in the [Handle Types Supported by VkImportSemaphoreFdInfoKHR](#) table
- VUID-VkImportSemaphoreFdInfoKHR-fd-01544
`fd` **must** obey any requirements listed for `handleType` in [external semaphore handle types compatibility](#)
- VUID-VkImportSemaphoreFdInfoKHR-handleType-03263
If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreCreateInfo::flags` field **must** match that of the semaphore from which `fd` was exported
- VUID-VkImportSemaphoreFdInfoKHR-handleType-07307
If `handleType` refers to a handle type with copy payload transference semantics, `flags` **must** contain `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`
- VUID-VkImportSemaphoreFdInfoKHR-handleType-03264
If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field **must** match that of the semaphore from which `fd` was exported
- VUID-VkImportSemaphoreFdInfoKHR-flags-03323
If `flags` contains `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field of the semaphore from which `fd` was exported **must** not be `VK_SEMAPHORE_TYPE_TIMELINE`

If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT`, the special value `-1` for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkSemaphore` will have a temporarily imported payload as if a valid file descriptor had been provided.

NOTE

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid

sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a `-1` file descriptor when exporting a `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT` from a `VkSemaphore` which is signaled.

Valid Usage (Implicit)

- `VUID-VkImportSemaphoreFdInfoKHR-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR`
- `VUID-VkImportSemaphoreFdInfoKHR-pNext-pNext`
`pNext` **must** be `NULL`
- `VUID-VkImportSemaphoreFdInfoKHR-semaphore-parameter`
`semaphore` **must** be a valid `VkSemaphore` handle
- `VUID-VkImportSemaphoreFdInfoKHR-flags-parameter`
`flags` **must** be a valid combination of `VkSemaphoreImportFlagBits` values
- `VUID-VkImportSemaphoreFdInfoKHR-handleType-parameter`
`handleType` **must** be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

Host Synchronization

- Host access to `semaphore` **must** be externally synchronized

To import a semaphore payload from a Zircon event handle, call:

```
// Provided by VK_FUCHSIA_external_semaphore
VkResult vkImportSemaphoreZirconHandleFUCHSIA(
    VkDevice device,
    const VkImportSemaphoreZirconHandleInfoFUCHSIA* pImportSemaphoreZirconHandleInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreZirconHandleInfo` is a pointer to a `VkImportSemaphoreZirconHandleInfoFUCHSIA` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a Zircon event handle transfers ownership of the handle from the application to the Vulkan implementation. The application **must** not perform any operations on the handle after a successful import.

Applications **can** import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-semaphore-04764
semaphore **must** not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkImportSemaphoreZirconHandleFUCHSIA-pImportSemaphoreZirconHandleInfo-parameter
pImportSemaphoreZirconHandleInfo **must** be a valid pointer to a valid [VkImportSemaphoreZirconHandleInfoFUCHSIA](#) structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_INVALID_EXTERNAL_HANDLE](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkImportSemaphoreZirconHandleInfoFUCHSIA](#) structure is defined as:

```
// Provided by VK_FUCHSIA_external_semaphore
typedef struct VkImportSemaphoreZirconHandleInfoFUCHSIA {
    VkStructureType             sType;
    const void*                 pNext;
    VkSemaphore                 semaphore;
    VkSemaphoreImportFlags       flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    zx_handle_t                 zirconHandle;
} VkImportSemaphoreZirconHandleInfoFUCHSIA;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **semaphore** is the semaphore into which the payload will be imported.
- **flags** is a bitmask of [VkSemaphoreImportFlagBits](#) specifying additional parameters for the

semaphore payload import operation.

- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of `zirconHandle`.
- `zirconHandle` is the external handle to import.

The handle types supported by `handleType` are:

Table 10. Handle Types Supported by `VkImportSemaphoreZirconHandleInfoFUCHSIA`

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA</code>	Reference	Temporary,Permanent

Valid Usage

- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-handleType-04765
`handleType` **must** be a value included in the [Handle Types Supported by VkImportSemaphoreZirconHandleInfoFUCHSIA](#) table
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-zirconHandle-04766
`zirconHandle` **must** obey any requirements listed for `handleType` in [external semaphore handle types compatibility](#)
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-zirconHandle-04767
`zirconHandle` **must** have `ZX_RIGHTS_BASIC` and `ZX_RIGHTS_SIGNAL` rights
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-semaphoreType-04768
The `VkSemaphoreTypeCreateInfo::semaphoreType` field **must** not be `VK_SEMAPHORE_TYPE_TIMELINE`

Valid Usage (Implicit)

- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_ZIRCON_HANDLE_INFO_FUCHSIA`
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-semaphore-parameter
`semaphore` **must** be a valid `VkSemaphore` handle
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-flags-parameter
`flags` **must** be a valid combination of `VkSemaphoreImportFlagBits` values
- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-handleType-parameter
`handleType` **must** be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

Host Synchronization

- Host access to **semaphore** **must** be externally synchronized

Bits which **can** be set in

- `VkImportSemaphoreWin32HandleInfoKHR::flags`
- `VkImportSemaphoreFdInfoKHR::flags`
- `VkImportSemaphoreZirconHandleInfoFUCHSIA::flags`

specifying additional parameters of a semaphore import operation are:

```
// Provided by VK_VERSION_1_1
typedef enum VkSemaphoreImportFlagBits {
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT = 0x00000001,
    // Provided by VK_KHR_external_semaphore
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT_KHR = VK_SEMAPHORE_IMPORT_TEMPORARY_BIT,
} VkSemaphoreImportFlagBits;
```

```
// Provided by VK_KHR_external_semaphore
// Equivalent to VkSemaphoreImportFlagBits
typedef VkSemaphoreImportFlagBits VkSemaphoreImportFlagBitsKHR;
```

These bits have the following meanings:

- `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT` specifies that the semaphore payload will be imported only temporarily, as described in [Importing Semaphore Payloads](#), regardless of the permanence of `handleType`.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkSemaphoreImportFlags;
```

```
// Provided by VK_KHR_external_semaphore
// Equivalent to VkSemaphoreImportFlags
typedef VkSemaphoreImportFlags VkSemaphoreImportFlagsKHR;
```

`VkSemaphoreImportFlags` is a bitmask type for setting a mask of zero or more `VkSemaphoreImportFlagBits`.

7.5. Events

Events are a synchronization primitive that **can** be used to insert a fine-grained dependency between commands submitted to the same queue, or between the host and a queue. Events **must**

not be used to insert a dependency between commands submitted to different queues. Events have two states - signaled and unsignaled. An application **can** signal or unsignal an event either on the host or on the device. A device **can** be made to wait for an event to become signaled before executing further operations. No command exists to wait for an event to become signaled on the host, but the current state of an event **can** be queried.

Events are represented by `VkEvent` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkEvent)
```

To create an event, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateEvent(
    VkDevice                                device,
    const VkEventCreateInfo*                pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkEvent*                                 pEvent);
```

- `device` is the logical device that creates the event.
- `pCreateInfo` is a pointer to a `VkEventCreateInfo` structure containing information about how the event is to be created.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pEvent` is a pointer to a handle in which the resulting event object is returned.

When created, the event object is in the unsignaled state.

Valid Usage

- VUID-vkCreateEvent-device-09672
`device` **must** support at least one queue family with one of the `VK_QUEUE_VIDEO_ENCODE_BIT_KHR`, `VK_QUEUE_VIDEO_DECODE_BIT_KHR`, `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` capabilities
- VUID-vkCreateEvent-events-04468
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::events` is `VK_FALSE`, then the implementation does not support `events`, and `vkCreateEvent` **must** not be used

Valid Usage (Implicit)

- VUID-vkCreateEvent-device-parameter
`device` **must** be a valid `VkDevice` handle

- VUID-vkCreateEvent-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkEventCreateInfo](#) structure
- VUID-vkCreateEvent-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateEvent-pEvent-parameter
pEvent **must** be a valid pointer to a [VkEvent](#) handle
- VUID-vkCreateEvent-device-queuecount
The device **must** have been created with at least **1** queue

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkEventCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkEventCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkEventCreateFlags  flags;
} VkEventCreateInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkEventCreateFlagBits](#) defining additional creation parameters.

Valid Usage

- VUID-VkEventCreateInfo-pNext-06790
If the **pNext** chain includes a [VkExportMetalObjectCreateInfoEXT](#) structure, its **exportObjectType** member **must** be [VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT](#)

Valid Usage (Implicit)

- VUID-VkEventCreateInfo-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_EVENT_CREATE_INFO](#)
- VUID-VkEventCreateInfo-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of [VkExportMetalObjectCreateInfoEXT](#) or [VkImportMetalSharedEventInfoEXT](#)
- VUID-VkEventCreateInfo-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique, with the exception of structures of type [VkExportMetalObjectCreateInfoEXT](#)
- VUID-VkEventCreateInfo-flags-parameter
flags **must** be a valid combination of [VkEventCreateFlagBits](#) values

```
// Provided by VK_VERSION_1_0
typedef enum VkEventCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_EVENT_CREATE_DEVICE_ONLY_BIT = 0x00000001,
    // Provided by VK_KHR_synchronization2
    VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR = VK_EVENT_CREATE_DEVICE_ONLY_BIT,
} VkEventCreateFlagBits;
```

- [VK_EVENT_CREATE_DEVICE_ONLY_BIT](#) specifies that host event commands will not be used with this event.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkEventCreateFlags;
```

VkEventCreateFlags is a bitmask type for setting a mask of [VkEventCreateFlagBits](#).

To destroy an event, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyEvent(
    VkDevice          device,
    VkEvent           event,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the event.
- **event** is the handle of the event to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyEvent-event-01145
All submitted commands that refer to **event** **must** have completed execution
- VUID-vkDestroyEvent-event-01146
If **VkAllocationCallbacks** were provided when **event** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyEvent-event-01147
If no **VkAllocationCallbacks** were provided when **event** was created, **pAllocator** **must** be **NULL**

Valid Usage (Implicit)

- VUID-vkDestroyEvent-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkDestroyEvent-event-parameter
If **event** is not **VK_NULL_HANDLE**, **event** **must** be a valid **VkEvent** handle
- VUID-vkDestroyEvent-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid **VkAllocationCallbacks** structure
- VUID-vkDestroyEvent-event-parent
If **event** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **event** **must** be externally synchronized

To query the state of an event from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkGetEventStatus(
    VkDevice          device,
    VkEvent           event);
```

- **device** is the logical device that owns the event.
- **event** is the handle of the event to query.

Upon success, **vkGetEventStatus** returns the state of the event object with the following return codes:

Table 11. Event Object Status Codes

Status	Meaning
VK_EVENT_SET	The event specified by event is signaled.
VK_EVENT_RESET	The event specified by event is unsignaled.

If a **vkCmdSetEvent** or **vkCmdResetEvent** command is in a command buffer that is in the **pending state**, then the value returned by this command **may** immediately be out of date.

The state of an event **can** be updated by the host. The state of the event is immediately changed, and subsequent calls to **vkGetEventStatus** will return the new state. If an event is already in the requested state, then updating it to the same state has no effect.

Valid Usage

- VUID-vkGetEventStatus-event-03940
event must not have been created with **VK_EVENT_CREATE_DEVICE_ONLY_BIT**

Valid Usage (Implicit)

- VUID-vkGetEventStatus-device-parameter
device must be a valid **VkDevice** handle
- VUID-vkGetEventStatus-event-parameter
event must be a valid **VkEvent** handle
- VUID-vkGetEventStatus-event-parent
event must have been created, allocated, or retrieved from **device**

Return Codes

Success

- **VK_EVENT_RESET**
- **VK_EVENT_SET**

Failure

- **VK_ERROR_DEVICE_LOST**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

To set the state of an event to signaled from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkSetEvent(
    VkDevice          device,
    VkEvent            event);
```

- **device** is the logical device that owns the event.
- **event** is the event to set.

When **vkSetEvent** is executed on the host, it defines an *event signal operation* which sets the event to the signaled state.

If **event** is already in the signaled state when **vkSetEvent** is executed, then **vkSetEvent** has no effect, and no event signal operation occurs.

NOTE

If a command buffer is waiting for an event to be signaled from the host, the application must signal the event before submitting the command buffer, as described in the [queue forward progress](#) section.

Valid Usage

- VUID-vkSetEvent-event-03941
event must not have been created with [VK_EVENT_CREATE_DEVICE_ONLY_BIT](#)
- VUID-vkSetEvent-event-09543
event must not be waited on by a command buffer in the [pending state](#)

Valid Usage (Implicit)

- VUID-vkSetEvent-device-parameter
device must be a valid [VkDevice](#) handle
- VUID-vkSetEvent-event-parameter
event must be a valid [VkEvent](#) handle
- VUID-vkSetEvent-event-parent
event must have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **event must** be externally synchronized

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

To set the state of an event to unsignaled from the host, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetEvent(
    VkDevice          device,
    VkEvent           event);
```

- **device** is the logical device that owns the event.
- **event** is the event to reset.

When [vkResetEvent](#) is executed on the host, it defines an *event unsignal operation* which resets the event to the unsignaled state.

If **event** is already in the unsignaled state when [vkResetEvent](#) is executed, then [vkResetEvent](#) has no effect, and no event unsignal operation occurs.

Valid Usage

- VUID-vkResetEvent-event-03821
There **must** be an execution dependency between [vkResetEvent](#) and the execution of any [vkCmdWaitEvents](#) that includes **event** in its **pEvents** parameter
- VUID-vkResetEvent-event-03822
There **must** be an execution dependency between [vkResetEvent](#) and the execution of any [vkCmdWaitEvents2](#) that includes **event** in its **pEvents** parameter
- VUID-vkResetEvent-event-03823
event **must** not have been created with [VK_EVENT_CREATE_DEVICE_ONLY_BIT](#)

Valid Usage (Implicit)

- VUID-vkResetEvent-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkResetEvent-event-parameter
event **must** be a valid [VkEvent](#) handle
- VUID-vkResetEvent-event-parent
event **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **event** **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The state of an event **can** also be updated on the device by commands inserted in command buffers.

To signal an event from a device, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetEvent2(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    const VkDependencyInfo*  pDependencyInfo);
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to vkCmdSetEvent2
void vkCmdSetEvent2KHR(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    const VkDependencyInfo*  pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be signaled.
- `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the first scopes of this operation.

When `vkCmdSetEvent2` is submitted to a queue, it defines the first half of memory dependencies defined by `pDependencyInfo`, as well as an event signal operation which sets the event to the signaled state. A memory dependency is defined between the event signal operation and commands that occur earlier in submission order.

The first `synchronization scope` and `access scope` are defined by the union of all the memory

dependencies defined by `pDependencyInfo`, and are applied to all operations that occur earlier in submission order. Queue family ownership transfers and image layout transitions defined by `pDependencyInfo` are also included in the first scopes.

The second `synchronization scope` includes only the event signal operation, and any `queue family ownership transfers` and `image layout transitions` defined by `pDependencyInfo`.

The second `access scope` includes only `queue family ownership transfers` and `image layout transitions`.

If `VK_DEPENDENCY_ASYMMETRIC_EVENT_BIT_KHR` is not set in `pDependencyInfo->dependencyFlags`, future `vkCmdWaitEvents2` commands rely on all values of each element in `pDependencyInfo` matching exactly with those used to signal the corresponding event. If `VK_DEPENDENCY_ASYMMETRIC_EVENT_BIT_KHR` is set, `vkCmdSetEvent2` **must** only include the `source stage mask` of the first synchronization scope in `pDependencyInfo->pMemoryBarriers[0].srcStageMask`. `vkCmdWaitEvents` **must** not be used to wait on the result of a signal operation defined by `vkCmdSetEvent2`.

NOTE

The extra information provided by `vkCmdSetEvent2` compared to `vkCmdSetEvent` allows implementations to more efficiently schedule the operations required to satisfy the requested dependencies. With `vkCmdSetEvent`, the full dependency information is not known until `vkCmdWaitEvents` is recorded, forcing implementations to insert the required operations at that point and not before.

If `event` is already in the signaled state when `vkCmdSetEvent2` is executed on the device, then `vkCmdSetEvent2` has no effect, no event signal operation occurs, and no dependency is generated.

Valid Usage

- VUID-vkCmdSetEvent2-synchronization2-03824
The `synchronization2` feature **must** be enabled
- VUID-vkCmdSetEvent2-dependencyFlags-03825
The `dependencyFlags` member of `pDependencyInfo` **must** be `0` or `VK_DEPENDENCY_ASYMMETRIC_EVENT_BIT_KHR`
- VUID-vkCmdSetEvent2-srcStageMask-09391
The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** not include `VK_PIPELINE_STAGE_2_HOST_BIT`
- VUID-vkCmdSetEvent2-dstStageMask-09392
The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** not include `VK_PIPELINE_STAGE_2_HOST_BIT`
- VUID-vkCmdSetEvent2-commandBuffer-03826
The current device mask of `commandBuffer` **must** include exactly one physical device
- VUID-vkCmdSetEvent2-srcStageMask-03827
The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`,

or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- VUID-vkCmdSetEvent2-dstStageMask-03828

The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- VUID-vkCmdSetEvent2-dependencyFlags-10785

If the `dependencyFlags` member of `pDependencyInfo` includes `VK_DEPENDENCY_ASYMMETRIC_EVENT_BIT_KHR`, the `bufferMemoryBarrierCount` and `imageMemoryBarrierCount` members of `pDependencyInfo` **must** be 0

- VUID-vkCmdSetEvent2-dependencyFlags-10786

If the `dependencyFlags` member of `pDependencyInfo` includes `VK_DEPENDENCY_ASYMMETRIC_EVENT_BIT_KHR`, the `memoryBarrierCount` member of `pDependencyInfo` **must** be 1

- VUID-vkCmdSetEvent2-dependencyFlags-10787

If the `dependencyFlags` member of `pDependencyInfo` includes `VK_DEPENDENCY_ASYMMETRIC_EVENT_BIT_KHR`, the `srcAccessMask`, `dstStageMask`, and `dstAccessMask` members of `pDependencyInfo->pMemoryBarriers[0]` **must** be 0

Valid Usage (Implicit)

- VUID-vkCmdSetEvent2-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetEvent2-event-parameter

`event` **must** be a valid `VkEvent` handle

- VUID-vkCmdSetEvent2-pDependencyInfo-parameter

`pDependencyInfo` **must** be a valid pointer to a valid `VkDependencyInfo` structure

- VUID-vkCmdSetEvent2-commandBuffer-recording

`commandBuffer` **must** be in the `recording state`

- VUID-vkCmdSetEvent2-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, `VK_QUEUE_VIDEO_DECODE_BIT_KHR`, or `VK_QUEUE_VIDEO_ENCODE_BIT_KHR` operations

- VUID-vkCmdSetEvent2-renderpass

This command **must** only be called outside of a render pass instance

- VUID-vkCmdSetEvent2-suspended

This command **must** not be called between suspended render pass instances

- VUID-vkCmdSetEvent2-commonparent

Both of `commandBuffer`, and `event` **must** have been created, allocated, or retrieved from the

same [VkDevice](#)

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_VIDEO_DECODE_BIT_KHR VK_QUEUE_VIDEO_ENCODE_BIT_KHR	Synchronization

Conditional Rendering

vkCmdSetEvent2 is not affected by [conditional rendering](#)

The **VkDependencyInfo** structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkDependencyInfo {
    VkStructureType             sType;
    const void*                 pNext;
    VkDependencyFlags           dependencyFlags;
    uint32_t                    memoryBarrierCount;
    const VkMemoryBarrier2*     pMemoryBarriers;
    uint32_t                    bufferMemoryBarrierCount;
    const VkBufferMemoryBarrier2* pBufferMemoryBarriers;
    uint32_t                    imageMemoryBarrierCount;
    const VkImageMemoryBarrier2* pImageMemoryBarriers;
} VkDependencyInfo;
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to VkDependencyInfo
typedef VkDependencyInfo VkDependencyInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **dependencyFlags** is a bitmask of [VkDependencyFlagBits](#) specifying how execution and memory dependencies are formed.
- **memoryBarrierCount** is the length of the **pMemoryBarriers** array.
- **pMemoryBarriers** is a pointer to an array of [VkMemoryBarrier2](#) structures defining memory dependencies between any memory accesses.
- **bufferMemoryBarrierCount** is the length of the **pBufferMemoryBarriers** array.
- **pBufferMemoryBarriers** is a pointer to an array of [VkBufferMemoryBarrier2](#) structures defining memory dependencies between buffer ranges.
- **imageMemoryBarrierCount** is the length of the **pImageMemoryBarriers** array.
- **pImageMemoryBarriers** is a pointer to an array of [VkImageMemoryBarrier2](#) structures defining memory dependencies between image subresources.

This structure defines a set of [memory dependencies](#), as well as [queue family ownership transfer operations](#) and [image layout transitions](#).

Each member of **pMemoryBarriers**, **pBufferMemoryBarriers**, and **pImageMemoryBarriers** defines a separate [memory dependency](#).

Valid Usage

- VUID-VkDependencyInfo-pMemoryBarriers-10605
For each element of **pMemoryBarriers**, the **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkDependencyInfo-pMemoryBarriers-10606
For each element of **pMemoryBarriers**, **pNext** **must** be either **NULL** or a pointer to a valid instance of [VkMemoryBarrierAccessFlags3KHR](#)
- VUID-VkDependencyInfo-pNext-09754
If a [VkTensorDependencyInfoARM](#) structure is included in the **pNext** chain, a [VkTensorMemoryBarrierARM](#) structure **must** not be included in the **pNext** chain

Valid Usage (Implicit)

- VUID-VkDependencyInfo-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_DEPENDENCY_INFO](#)
- VUID-VkDependencyInfo-pNext-pNext

Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of **VkMemoryRangeBarriersInfoKHR**, **VkTensorDependencyInfoARM**, or **VkTensorMemoryBarrierARM**

- VUID-VkDependencyInfo-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkDependencyInfo-dependencyFlags-parameter
dependencyFlags **must** be a valid combination of **VkDependencyFlagBits** values
- VUID-VkDependencyInfo-pMemoryBarriers-parameter
If **memoryBarrierCount** is not 0, **pMemoryBarriers** **must** be a valid pointer to an array of **memoryBarrierCount** valid **VkMemoryBarrier2** structures
- VUID-VkDependencyInfo-pBufferMemoryBarriers-parameter
If **bufferMemoryBarrierCount** is not 0, **pBufferMemoryBarriers** **must** be a valid pointer to an array of **bufferMemoryBarrierCount** valid **VkBufferMemoryBarrier2** structures
- VUID-VkDependencyInfo-pImageMemoryBarriers-parameter
If **imageMemoryBarrierCount** is not 0, **pImageMemoryBarriers** **must** be a valid pointer to an array of **imageMemoryBarrierCount** valid **VkImageMemoryBarrier2** structures

To set the state of an event to signaled from a device, call:

WARNING

This functionality is superseded by **vkCmdSetEvent2**. See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkCmdSetEvent(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    VkPipelineStageFlags     stageMask);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **event** is the event that will be signaled.
- **stageMask** specifies the **source stage mask** used to determine the first **synchronization scope**.

vkCmdSetEvent behaves identically to **vkCmdSetEvent2**, except that it does not define an access scope, and **must** only be used with **vkCmdWaitEvents**, not **vkCmdWaitEvents2**.

Valid Usage

- VUID-vkCmdSetEvent-stageMask-04090
If the **geometryShader** feature is not enabled, **stageMask** **must** not contain **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT**
- VUID-vkCmdSetEvent-stageMask-04091
If the **tessellationShader** feature is not enabled, **stageMask** **must** not contain **VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT** or

VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-vkCmdSetEvent-stageMask-04092

If the **conditionalRendering** feature is not enabled, **stageMask** **must** not contain [VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT](#)

- VUID-vkCmdSetEvent-stageMask-04093

If the **fragmentDensityMap** feature is not enabled, **stageMask** **must** not contain [VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT](#)

- VUID-vkCmdSetEvent-stageMask-04094

If the **transformFeedback** feature is not enabled, **stageMask** **must** not contain [VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT](#)

- VUID-vkCmdSetEvent-stageMask-04095

If the **meshShader** feature is not enabled, **stageMask** **must** not contain [VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT](#)

- VUID-vkCmdSetEvent-stageMask-04096

If the **taskShader** feature is not enabled, **stageMask** **must** not contain [VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT](#)

- VUID-vkCmdSetEvent-stageMask-07318

If neither of the **shadingRateImage** or the **attachmentFragmentShadingRate** features are enabled, **stageMask** **must** not contain [VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR](#)

- VUID-vkCmdSetEvent-stageMask-03937

If the **synchronization2** feature is not enabled, **stageMask** **must** not be 0

- VUID-vkCmdSetEvent-stageMask-07949

If neither the [VK_NV_ray_tracing](#) extension or the **rayTracingPipeline** feature are enabled, **stageMask** **must** not contain [VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR](#)

- VUID-vkCmdSetEvent-stageMask-10754

If the **accelerationStructure** feature is not enabled, **stageMask** **must** not contain [VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR](#)

- VUID-vkCmdSetEvent-stageMask-06457

Any pipeline stage included in **stageMask** **must** be supported by the capabilities of the queue family specified by the **queueFamilyIndex** member of the [VkCommandPoolCreateInfo](#) structure that was used to create the [VkCommandPool](#) that **commandBuffer** was allocated from, as specified in the [table of supported pipeline stages](#)

- VUID-vkCmdSetEvent-stageMask-01149

stageMask **must** not include [VK_PIPELINE_STAGE_HOST_BIT](#)

- VUID-vkCmdSetEvent-commandBuffer-01152

The current device mask of **commandBuffer** **must** include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdSetEvent-commandBuffer-parameter

commandBuffer **must** be a valid [VkCommandBuffer](#) handle

- VUID-vkCmdSetEvent-event-parameter
event **must** be a valid [VkEvent](#) handle
- VUID-vkCmdSetEvent-stageMask-parameter
stageMask **must** be a valid combination of [VkPipelineStageFlagBits](#) values
- VUID-vkCmdSetEvent-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdSetEvent-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_COMPUTE_BIT](#), [VK_QUEUE_GRAPHICS_BIT](#), [VK_QUEUE_VIDEO_DECODE_BIT_KHR](#), or [VK_QUEUE_VIDEO_ENCODE_BIT_KHR](#) operations
- VUID-vkCmdSetEvent-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdSetEvent-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdSetEvent-commonparent
Both of **commandBuffer**, and **event** **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_VIDEO_DECODE_BIT_KHR VK_QUEUE_VIDEO_ENCODE_BIT_KHR	Synchronization

Conditional Rendering

vkCmdSetEvent is not affected by [conditional rendering](#)

To unsignal the event from a device, call:

```
// Provided by VK_VERSION_1_3
void vkCmdResetEvent2(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    VkPipelineStageFlags2    stageMask);
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to vkCmdResetEvent2
void vkCmdResetEvent2KHR(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    VkPipelineStageFlags2    stageMask);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **event** is the event that will be unsignaled.
- **stageMask** is a [VkPipelineStageFlags2](#) mask of pipeline stages used to determine the first [synchronization scope](#).

When [vkCmdResetEvent2](#) is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and defines an event unsignal operation which resets the event to the unsignaled state.

The first [synchronization scope](#) includes all commands that occur earlier in [submission order](#). The synchronization scope is limited to operations by **stageMask** or stages that are [logically earlier](#) than **stageMask**.

The second [synchronization scope](#) includes only the event unsignal operation.

If **event** is already in the unsignaled state when [vkCmdResetEvent2](#) is executed on the device, then this command has no effect, no event unsignal operation occurs, and no execution dependency is generated.

Valid Usage

- VUID-vkCmdResetEvent2-stageMask-03929
If the **geometryShader** feature is not enabled, **stageMask** **must** not contain [VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT](#)
- VUID-vkCmdResetEvent2-stageMask-03930
If the **tessellationShader** feature is not enabled, **stageMask** **must** not contain

VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT
VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

or

- VUID-vkCmdResetEvent2-stageMask-03931
If the **conditionalRendering** feature is not enabled, **stageMask** **must** not contain VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT
- VUID-vkCmdResetEvent2-stageMask-03932
If the **fragmentDensityMap** feature is not enabled, **stageMask** **must** not contain VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT
- VUID-vkCmdResetEvent2-stageMask-03933
If the **transformFeedback** feature is not enabled, **stageMask** **must** not contain VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT
- VUID-vkCmdResetEvent2-stageMask-03934
If the **meshShader** feature is not enabled, **stageMask** **must** not contain VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT
- VUID-vkCmdResetEvent2-stageMask-03935
If the **taskShader** feature is not enabled, **stageMask** **must** not contain VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT
- VUID-vkCmdResetEvent2-stageMask-07316
If neither of the **shadingRateImage** or the **attachmentFragmentShadingRate** features are enabled, **stageMask** **must** not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
- VUID-vkCmdResetEvent2-stageMask-04957
If the **subpassShading** feature is not enabled, **stageMask** **must** not contain VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI
- VUID-vkCmdResetEvent2-stageMask-04995
If the **invocationMask** feature is not enabled, **stageMask** **must** not contain VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI
- VUID-vkCmdResetEvent2-stageMask-07946
If neither the **VK_NV_ray_tracing** extension or the **rayTracingPipeline** feature are enabled, **stageMask** **must** not contain VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR
- VUID-vkCmdResetEvent2-stageMask-10751
If the **accelerationStructure** feature is not enabled, **stageMask** **must** not contain VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR
- VUID-vkCmdResetEvent2-stageMask-10752
If the **rayTracingMaintenance1** feature is not enabled, **stageMask** **must** not contain VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR
- VUID-vkCmdResetEvent2-stageMask-10753
If the **micromap** feature is not enabled, **stageMask** **must** not contain VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT
- VUID-vkCmdResetEvent2-synchronization2-03829
The **synchronization2** feature **must** be enabled
- VUID-vkCmdResetEvent2-stageMask-03830

stageMask **must** not include [VK_PIPELINE_STAGE_2_HOST_BIT](#)

- VUID-vkCmdResetEvent2-event-03831

There **must** be an execution dependency between [vkCmdResetEvent2](#) and the execution of any [vkCmdWaitEvents](#) that includes **event** in its **pEvents** parameter

- VUID-vkCmdResetEvent2-event-03832

There **must** be an execution dependency between [vkCmdResetEvent2](#) and the execution of any [vkCmdWaitEvents2](#) that includes **event** in its **pEvents** parameter

- VUID-vkCmdResetEvent2-commandBuffer-03833

commandBuffer's current device mask **must** include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdResetEvent2-commandBuffer-parameter

commandBuffer **must** be a valid [VkCommandBuffer](#) handle

- VUID-vkCmdResetEvent2-event-parameter

event **must** be a valid [VkEvent](#) handle

- VUID-vkCmdResetEvent2-stageMask-parameter

stageMask **must** be a valid combination of [VkPipelineStageFlagBits2](#) values

- VUID-vkCmdResetEvent2-commandBuffer-recording

commandBuffer **must** be in the [recording state](#)

- VUID-vkCmdResetEvent2-commandBuffer-cmdpool

The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_COMPUTE_BIT](#), [VK_QUEUE_GRAPHICS_BIT](#), [VK_QUEUE_VIDEO_DECODE_BIT_KHR](#), or [VK_QUEUE_VIDEO_ENCODE_BIT_KHR](#) operations

- VUID-vkCmdResetEvent2-renderpass

This command **must** only be called outside of a render pass instance

- VUID-vkCmdResetEvent2-suspended

This command **must** not be called between suspended render pass instances

- VUID-vkCmdResetEvent2-commonparent

Both of **commandBuffer**, and **event** **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized

- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_VIDEO_DECODE_BIT_KHR VK_QUEUE_VIDEO_ENCODE_BIT_KHR	Synchronization

Conditional Rendering

`vkCmdResetEvent2` is not affected by [conditional rendering](#)

To set the state of an event to unsignaled from a device, call:

WARNING

This functionality is superseded by [vkCmdResetEvent2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkCmdResetEvent(
    VkCommandBuffer          commandBuffer,
    VkEvent                  event,
    VkPipelineStageFlags     stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a bitmask of [VkPipelineStageFlagBits](#) specifying the [source stage mask](#) used to determine when the `event` is unsignaled.

`vkCmdResetEvent` behaves identically to [vkCmdResetEvent2](#).

Valid Usage

- VOID-vkCmdResetEvent-stageMask-04090
If the `geometryShader` feature is not enabled, `stageMask` **must** not contain [VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT](#)
- VOID-vkCmdResetEvent-stageMask-04091

If the `tessellationShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdResetEvent-stageMask-04092

If the `conditionalRendering` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-vkCmdResetEvent-stageMask-04093

If the `fragmentDensityMap` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-vkCmdResetEvent-stageMask-04094

If the `transformFeedback` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-vkCmdResetEvent-stageMask-04095

If the `meshShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- VUID-vkCmdResetEvent-stageMask-04096

If the `taskShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- VUID-vkCmdResetEvent-stageMask-07318

If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdResetEvent-stageMask-03937

If the `synchronization2` feature is not enabled, `stageMask` **must** not be `0`

- VUID-vkCmdResetEvent-stageMask-07949

If neither the `VK_NV_ray_tracing` extension or the `rayTracingPipeline` feature are enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdResetEvent-stageMask-10754

If the `accelerationStructure` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

- VUID-vkCmdResetEvent-stageMask-06458

Any pipeline stage included in `stageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)

- VUID-vkCmdResetEvent-stageMask-01153

`stageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`

- VUID-vkCmdResetEvent-event-03834

There **must** be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter

- VUID-vkCmdResetEvent-event-03835

There **must** be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents2` that includes `event` in its `pEvents` parameter

- VUID-vkCmdResetEvent-commandBuffer-01157
`commandBuffer`'s current device mask **must** include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdResetEvent-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdResetEvent-event-parameter
`event` **must** be a valid `VkEvent` handle
- VUID-vkCmdResetEvent-stageMask-parameter
`stageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-vkCmdResetEvent-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdResetEvent-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, `VK_QUEUE_VIDEO_DECODE_BIT_KHR`, or `VK_QUEUE_VIDEO_ENCODE_BIT_KHR` operations
- VUID-vkCmdResetEvent-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdResetEvent-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdResetEvent-commonparent
Both of `commandBuffer`, and `event` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_VIDEO_DECODE_BIT_KHR VK_QUEUE_VIDEO_ENCODE_BIT_KHR	Synchronization

Conditional Rendering

vkCmdResetEvent is not affected by [conditional rendering](#)

To wait for one or more events to enter the signaled state on a device, call:

```
// Provided by VK_VERSION_1_3
void vkCmdWaitEvents2(
    VkCommandBuffer          commandBuffer,
    uint32_t                 eventCount,
    const VkEvent*           pEvents,
    const VkDependencyInfo*  pDependencyInfos);
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to vkCmdWaitEvents2
void vkCmdWaitEvents2KHR(
    VkCommandBuffer          commandBuffer,
    uint32_t                 eventCount,
    const VkEvent*           pEvents,
    const VkDependencyInfo*  pDependencyInfos);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of `eventCount` events to wait on.
- `pDependencyInfos` is a pointer to an array of `eventCount` `VkDependencyInfo` structures, defining the second [synchronization scope](#).

When `vkCmdWaitEvents2` is submitted to a queue, it inserts memory dependencies according to the

elements of `pDependencyInfos` and each corresponding element of `pEvents`. `vkCmdWaitEvents2` **must** not be used to wait on event signal operations occurring on other queues, or signal operations executed by `vkCmdSetEvent`.

The first `synchronization scope` and `access scope` of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred earlier in `submission order` than the last event signal operation on element `i` of `pEvents`.

Signal operations for an event at index `i` are only included if:

- The event was signaled by a `vkCmdSetEvent2` command that occurred earlier in `submission order` with a `dependencyInfo` parameter exactly equal to the element of `pDependencyInfos` at index `i`; or
- The event was created without `VK_EVENT_CREATE_DEVICE_ONLY_BIT`, and the first `synchronization scope` defined by the element of `pDependencyInfos` at index `i` only includes host operations (`VK_PIPELINE_STAGE_2_HOST_BIT`).

The second `synchronization scope` and `access scope` of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred later in `submission order` than `vkCmdWaitEvents2`.

NOTE

`vkCmdWaitEvents2` is used with `vkCmdSetEvent2` to define a memory dependency between two sets of action commands, roughly in the same way as pipeline barriers, but split into two commands such that work between the two **may** execute unhindered.

NOTE

Applications should be careful to avoid race conditions when using events. There is no direct ordering guarantee between `vkCmdSetEvent2` and `vkCmdResetEvent2`, `vkCmdResetEvent`, or `vkCmdSetEvent`. Another execution dependency (e.g. a pipeline barrier or semaphore with `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`) is needed to prevent such a race condition.

Valid Usage

- VUID-vkCmdWaitEvents2-image-09373

If `vkCmdWaitEvents2` is called within a render pass instance using a `VkRenderPass` object, and the `image` member of any image memory barrier is a color resolve attachment, the corresponding color attachment **must** be `VK_ATTACHMENT_UNUSED`

- VUID-vkCmdWaitEvents2-image-09374

If `vkCmdWaitEvents2` is called within a render pass instance using a `VkRenderPass` object, and the `image` member of any image memory barrier is a color resolve attachment, it **must** have been created with a non-zero `VkExternalFormatANDROID::externalFormat` value

- VUID-vkCmdWaitEvents2-oldLayout-01181

If `vkCmdWaitEvents2` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command **must** be equal

- VUID-vkCmdWaitEvents2-srcQueueFamilyIndex-01182
If `vkCmdWaitEvents2` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command **must** be equal
- VUID-vkCmdWaitEvents2-synchronization2-03836
The `synchronization2` feature **must** be enabled
- VUID-vkCmdWaitEvents2-pEvents-03837
Members of `pEvents` **must** not have been signaled by `vkCmdSetEvent`
- VUID-vkCmdWaitEvents2-pEvents-10788
For each element *i* of `pEvents`, if the `dependencyFlags` member of the *i*th element of `pDependencyInfos` does not include `VK_DEPENDENCY_ASYMMETRIC_EVENT_BIT_KHR`, and if that event is signaled by `vkCmdSetEvent2`, that command's `dependencyInfo` parameter **must** be exactly equal to the *i*th element of `pDependencyInfos`
- VUID-vkCmdWaitEvents2-pEvents-10789
For each element *i* of `pEvents`, if the `dependencyFlags` member of the *i*th element of `pDependencyInfos` includes `VK_DEPENDENCY_ASYMMETRIC_EVENT_BIT_KHR`, that event **must** be signaled by `vkCmdSetEvent2` with `VK_DEPENDENCY_ASYMMETRIC_EVENT_BIT_KHR`
- VUID-vkCmdWaitEvents2-pEvents-10790
For each element *i* of `pEvents`, if the `dependencyFlags` member of the *i*th element of `pDependencyInfos` includes `VK_DEPENDENCY_ASYMMETRIC_EVENT_BIT_KHR`, the union of `srcStageMask` members of all elements of `pMemoryBarriers`, `pBufferMemoryBarriers`, and `pImageMemoryBarriers` of the *i*th element of `pDependencyInfos` **must** equal `pDependencyInfos->pMemoryBarriers[0].srcStageMask` in the `vkCmdSetEvent2` command
- VUID-vkCmdWaitEvents2-pEvents-03839
For each element *i* of `pEvents`, if that event is signaled by `vkSetEvent`, barriers in the *i*th element of `pDependencyInfos` **must** include only host operations in their first `synchronization scope`
- VUID-vkCmdWaitEvents2-pEvents-03840
For each element *i* of `pEvents`, if barriers in the *i*th element of `pDependencyInfos` include only host operations, the *i*th element of `pEvents` **must** be signaled before `vkCmdWaitEvents2` is executed
- VUID-vkCmdWaitEvents2-pEvents-03841
For each element *i* of `pEvents`, if barriers in the *i*th element of `pDependencyInfos` do not include host operations, the *i*th element of `pEvents` **must** be signaled by a corresponding `vkCmdSetEvent2` that occurred earlier in `submission order`
- VUID-vkCmdWaitEvents2-srcStageMask-03842
The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfos` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from
- VUID-vkCmdWaitEvents2-dstStageMask-03843
The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfos` **must** only include pipeline stages

valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- VUID-vkCmdWaitEvents2-dependencyFlags-10394

The `dependencyFlags` member of any element of `pDependencyInfo` **must** not include any of the following bits:

- `VK_DEPENDENCY_BY_REGION_BIT`
- `VK_DEPENDENCY_DEVICE_GROUP_BIT`
- `VK_DEPENDENCY_VIEW_LOCAL_BIT`
- `VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT`

- VUID-vkCmdWaitEvents2-maintenance8-10205

If the `maintenance8` feature is not enabled, the `dependencyFlags` members of any element of `pDependencyInfos` **must** not include `VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR`

- VUID-vkCmdWaitEvents2-dependencyFlags-03844

If this command is called inside a render pass instance, the `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfos` **must** not include `VK_PIPELINE_STAGE_2_HOST_BIT`

- VUID-vkCmdWaitEvents2-commandBuffer-03846

`commandBuffer`'s current device mask **must** include exactly one physical device

- VUID-vkCmdWaitEvents2-None-10654

This command **must** not be recorded when `per-tile execution model` is enabled

Valid Usage (Implicit)

- VUID-vkCmdWaitEvents2-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdWaitEvents2-pEvents-parameter

`pEvents` **must** be a valid pointer to an array of `eventCount` valid `VkEvent` handles

- VUID-vkCmdWaitEvents2-pDependencyInfos-parameter

`pDependencyInfos` **must** be a valid pointer to an array of `eventCount` valid `VkDependencyInfo` structures

- VUID-vkCmdWaitEvents2-commandBuffer-recording

`commandBuffer` **must** be in the `recording state`

- VUID-vkCmdWaitEvents2-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, `VK_QUEUE_VIDEO_DECODE_BIT_KHR`, or `VK_QUEUE_VIDEO_ENCODE_BIT_KHR` operations

- VUID-vkCmdWaitEvents2-suspended

This command **must** not be called between suspended render pass instances

- VUID-vkCmdWaitEvents2-eventCount-arraylength

`eventCount` **must** be greater than 0

- VUID-vkCmdWaitEvents2-commonparent
Both of `commandBuffer`, and the elements of `pEvents` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_VIDEO_DECODE_BIT_KHR VK_QUEUE_VIDEO_ENCODE_BIT_KHR	Synchronization

Conditional Rendering

`vkCmdWaitEvents2` is not affected by [conditional rendering](#)

To wait for one or more events to enter the signaled state on a device, call:

WARNING

This functionality is superseded by [vkCmdWaitEvents2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkCmdWaitEvents(
    VkCommandBuffer                commandBuffer,
    uint32_t                       eventCount,
    const VkEvent*                 pEvents,
    VkPipelineStageFlags           srcStageMask,
    VkPipelineStageFlags           dstStageMask,
    uint32_t                       memoryBarrierCount,
    const VkMemoryBarrier*         pMemoryBarriers,
    uint32_t                       bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier*   pBufferMemoryBarriers,
    uint32_t                       imageMemoryBarrierCount,
    const VkImageMemoryBarrier*    pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of event object handles to wait on.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [source stage mask](#).
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [destination stage mask](#).
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdWaitEvents` is largely similar to `vkCmdWaitEvents2`, but **can** only wait on signal operations defined by `vkCmdSetEvent`. As `vkCmdSetEvent` does not define any access scopes, `vkCmdWaitEvents` defines the first access scope for each event signal operation in addition to its own access scopes.

NOTE	Since <code>vkCmdSetEvent</code> does not have any dependency information beyond a stage mask, implementations do not have the same opportunity to perform availability and visibility operations or image layout transitions in advance as they do with <code>vkCmdSetEvent2</code> and <code>vkCmdWaitEvents2</code> .
-------------	--

When `vkCmdWaitEvents` is submitted to a queue, it defines a memory dependency between prior event signal operations on the same queue or the host, and subsequent commands. `vkCmdWaitEvents` **must** not be used to wait on event signal operations occurring on other queues.

The first synchronization scope only includes event signal operations that operate on members of `pEvents`, and the operations that happened-before the event signal operations. Event signal operations performed by `vkCmdSetEvent` that occur earlier in [submission order](#) are included in the first synchronization scope, if the [logically latest](#) pipeline stage in their `stageMask` parameter is [logically earlier](#) than or equal to the [logically latest](#) pipeline stage in `srcStageMask`. Event signal

operations performed by `vkSetEvent` are only included in the first synchronization scope if `VK_PIPELINE_STAGE_HOST_BIT` is included in `srcStageMask`.

The second `synchronization scope` includes all commands that occur later in `submission order`. The second synchronization scope is limited to operations on the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`.

The first `access scope` is limited to accesses in the pipeline stages determined by the `source stage mask` specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of `memory barriers`. If no memory barriers are specified, then the first access scope includes no accesses.

The second `access scope` is limited to accesses in the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of `memory barriers`. If no memory barriers are specified, then the second access scope includes no accesses.

Valid Usage

- VUID-vkCmdWaitEvents-srcStageMask-04090
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-vkCmdWaitEvents-srcStageMask-04091
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdWaitEvents-srcStageMask-04092
If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-vkCmdWaitEvents-srcStageMask-04093
If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-vkCmdWaitEvents-srcStageMask-04094
If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-vkCmdWaitEvents-srcStageMask-04095
If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-vkCmdWaitEvents-srcStageMask-04096
If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
- VUID-vkCmdWaitEvents-srcStageMask-07318
If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are

- enabled, `srcStageMask` **must** not contain
[VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR](#)
- VUID-vkCmdWaitEvents-srcStageMask-03937
 If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be 0
 - VUID-vkCmdWaitEvents-srcStageMask-07949
 If neither the `VK_NV_ray_tracing` extension or the `rayTracingPipeline` feature are enabled, `srcStageMask` **must** not contain [VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR](#)
 - VUID-vkCmdWaitEvents-srcStageMask-10754
 If the `accelerationStructure` feature is not enabled, `srcStageMask` **must** not contain [VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR](#)
 - VUID-vkCmdWaitEvents-srcAccessMask-06257
 If the `rayQuery` feature is not enabled and a memory barrier `srcAccessMask` includes [VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR](#), `srcStageMask` **must** include [VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR](#),
[VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR](#), or
[VK_PIPELINE_STAGE_ALL_COMMANDS_BIT](#)
 - VUID-vkCmdWaitEvents-dstStageMask-04090
 If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain [VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT](#)
 - VUID-vkCmdWaitEvents-dstStageMask-04091
 If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain [VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT](#) or
[VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT](#)
 - VUID-vkCmdWaitEvents-dstStageMask-04092
 If the `conditionalRendering` feature is not enabled, `dstStageMask` **must** not contain [VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT](#)
 - VUID-vkCmdWaitEvents-dstStageMask-04093
 If the `fragmentDensityMap` feature is not enabled, `dstStageMask` **must** not contain [VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT](#)
 - VUID-vkCmdWaitEvents-dstStageMask-04094
 If the `transformFeedback` feature is not enabled, `dstStageMask` **must** not contain [VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT](#)
 - VUID-vkCmdWaitEvents-dstStageMask-04095
 If the `meshShader` feature is not enabled, `dstStageMask` **must** not contain [VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT](#)
 - VUID-vkCmdWaitEvents-dstStageMask-04096
 If the `taskShader` feature is not enabled, `dstStageMask` **must** not contain [VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT](#)
 - VUID-vkCmdWaitEvents-dstStageMask-07318
 If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `dstStageMask` **must** not contain
[VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR](#)

- VUID-vkCmdWaitEvents-dstStageMask-03937
If the [synchronization2](#) feature is not enabled, [dstStageMask](#) **must** not be 0
- VUID-vkCmdWaitEvents-dstStageMask-07949
If neither the [VK_NV_ray_tracing](#) extension or the [rayTracingPipeline](#) feature are enabled, [dstStageMask](#) **must** not contain [VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR](#)
- VUID-vkCmdWaitEvents-dstStageMask-10754
If the [accelerationStructure](#) feature is not enabled, [dstStageMask](#) **must** not contain [VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR](#)
- VUID-vkCmdWaitEvents-dstAccessMask-06257
If the [rayQuery](#) feature is not enabled and a memory barrier [dstAccessMask](#) includes [VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR](#), [dstStageMask](#) **must** include [VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR](#),
[VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR](#), or
[VK_PIPELINE_STAGE_ALL_COMMANDS_BIT](#)
- VUID-vkCmdWaitEvents-srcAccessMask-02815
The [srcAccessMask](#) member of each element of [pMemoryBarriers](#) **must** only include access flags that are supported by one or more of the pipeline stages in [srcStageMask](#), as specified in the [table of supported access types](#)
- VUID-vkCmdWaitEvents-dstAccessMask-02816
The [dstAccessMask](#) member of each element of [pMemoryBarriers](#) **must** only include access flags that are supported by one or more of the pipeline stages in [dstStageMask](#), as specified in the [table of supported access types](#)
- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02817
For each element of [pBufferMemoryBarriers](#), if its [srcQueueFamilyIndex](#) and [dstQueueFamilyIndex](#) members are equal, or if its [srcQueueFamilyIndex](#) is the queue family index that was used to create the command pool that [commandBuffer](#) was allocated from, then its [srcAccessMask](#) member **must** only contain access flags that are supported by one or more of the pipeline stages in [srcStageMask](#), as specified in the [table of supported access types](#)
- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02818
For each element of [pBufferMemoryBarriers](#), if its [srcQueueFamilyIndex](#) and [dstQueueFamilyIndex](#) members are equal, or if its [dstQueueFamilyIndex](#) is the queue family index that was used to create the command pool that [commandBuffer](#) was allocated from, then its [dstAccessMask](#) member **must** only contain access flags that are supported by one or more of the pipeline stages in [dstStageMask](#), as specified in the [table of supported access types](#)
- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02819
For each element of [pImageMemoryBarriers](#), if its [srcQueueFamilyIndex](#) and [dstQueueFamilyIndex](#) members are equal, or if its [srcQueueFamilyIndex](#) is the queue family index that was used to create the command pool that [commandBuffer](#) was allocated from, then its [srcAccessMask](#) member **must** only contain access flags that are supported by one or more of the pipeline stages in [srcStageMask](#), as specified in the [table of supported access types](#)

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02820
For each element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)
- VUID-vkCmdWaitEvents-image-09373
If `vkCmdWaitEvents` is called within a render pass instance using a `VkRenderPass` object, and the `image` member of any image memory barrier is a color resolve attachment, the corresponding color attachment **must** be `VK_ATTACHMENT_UNUSED`
- VUID-vkCmdWaitEvents-image-09374
If `vkCmdWaitEvents` is called within a render pass instance using a `VkRenderPass` object, and the `image` member of any image memory barrier is a color resolve attachment, it **must** have been created with a non-zero `VkExternalFormatANDROID::externalFormat` value
- VUID-vkCmdWaitEvents-oldLayout-01181
If `vkCmdWaitEvents` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command **must** be equal
- VUID-vkCmdWaitEvents-srcQueueFamilyIndex-01182
If `vkCmdWaitEvents` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command **must** be equal
- VUID-vkCmdWaitEvents-srcStageMask-06459
Any pipeline stage included in `srcStageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)
- VUID-vkCmdWaitEvents-dstStageMask-06460
Any pipeline stage included in `dstStageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)
- VUID-vkCmdWaitEvents-srcStageMask-01158
`srcStageMask` **must** be the bitwise OR of the `stageMask` parameter used in previous calls to `vkCmdSetEvent` with any of the elements of `pEvents` and `VK_PIPELINE_STAGE_HOST_BIT` if any of the elements of `pEvents` was set using `vkSetEvent`
- VUID-vkCmdWaitEvents-srcStageMask-07308
If this command is called inside a render pass instance, `srcStageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`
- VUID-vkCmdWaitEvents-srcQueueFamilyIndex-02803
The `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any element of `pBufferMemoryBarriers` or `pImageMemoryBarriers` **must** be equal

- VUID-vkCmdWaitEvents-commandBuffer-01167
`commandBuffer`'s current device mask **must** include exactly one physical device
- VUID-vkCmdWaitEvents-pEvents-03847
Elements of `pEvents` **must** not have been signaled by `vkCmdSetEvent2`
- VUID-vkCmdWaitEvents-None-10655
This command **must** not be recorded when `per-tile execution model` is enabled

Valid Usage (Implicit)

- VUID-vkCmdWaitEvents-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdWaitEvents-pEvents-parameter
`pEvents` **must** be a valid pointer to an array of `eventCount` valid `VkEvent` handles
- VUID-vkCmdWaitEvents-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-vkCmdWaitEvents-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-vkCmdWaitEvents-pMemoryBarriers-parameter
If `memoryBarrierCount` is not 0, `pMemoryBarriers` **must** be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures
- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-parameter
If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` **must** be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures
- VUID-vkCmdWaitEvents-pImageMemoryBarriers-parameter
If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` **must** be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures
- VUID-vkCmdWaitEvents-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdWaitEvents-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, `VK_QUEUE_VIDEO_DECODE_BIT_KHR`, or `VK_QUEUE_VIDEO_ENCODE_BIT_KHR` operations
- VUID-vkCmdWaitEvents-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdWaitEvents-eventCount-arraylength
`eventCount` **must** be greater than 0
- VUID-vkCmdWaitEvents-commonparent
Both of `commandBuffer`, and the elements of `pEvents` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_VIDEO_DECODE_BIT_KHR VK_QUEUE_VIDEO_ENCODE_BIT_KHR	Synchronization

Conditional Rendering

`vkCmdWaitEvents` is not affected by [conditional rendering](#)

7.6. Pipeline Barriers

To record a pipeline barrier, call:

```
// Provided by VK_VERSION_1_3
void vkCmdPipelineBarrier2(
    VkCommandBuffer          commandBuffer,
    const VkDependencyInfo*  pDependencyInfo);
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to vkCmdPipelineBarrier2
void vkCmdPipelineBarrier2KHR(
    VkCommandBuffer          commandBuffer,
    const VkDependencyInfo*  pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.

- `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the scopes of this operation.

When `vkCmdPipelineBarrier2` is submitted to a queue, it defines memory dependencies between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

The first `synchronization scope` and `access scope` of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred earlier in `submission order`.

The second `synchronization scope` and `access scope` of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred later in `submission order`.

If `vkCmdPipelineBarrier2` is recorded within a render pass instance, the synchronization scopes are limited to a subset of operations within the same subpass or render pass instance.

Valid Usage

- VUID-vkCmdPipelineBarrier2-None-07889
If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, the render pass **must** have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include `VK_DEPENDENCY_BY_REGION_BIT` if this command does not, does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT` if this command does not, and has `synchronization scopes` and `access scopes` that are all supersets of the scopes defined in this command
- VUID-vkCmdPipelineBarrier2-bufferMemoryBarrierCount-01178
If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, it **must** not include any buffer memory barriers
- VUID-vkCmdPipelineBarrier2-image-04073
If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, the `image` member of any image memory barrier included in this command **must** be an attachment used in the current subpass both as an input attachment, and as either a color, color resolve, or depth/stencil attachment
- VUID-vkCmdPipelineBarrier2-None-07890
If `vkCmdPipelineBarrier2` is called within a render pass instance, and the source stage masks of any memory barriers include `framebuffer-space stages`, destination stage masks of all memory barriers **must** only include `framebuffer-space stages`
- VUID-vkCmdPipelineBarrier2-dependencyFlags-07891
If `vkCmdPipelineBarrier2` is called within a render pass instance, and the source stage masks of any memory barriers include `framebuffer-space stages`, then `dependencyFlags` **must** include `VK_DEPENDENCY_BY_REGION_BIT`
- VUID-vkCmdPipelineBarrier2-None-07892
If `vkCmdPipelineBarrier2` is called within a render pass instance, the source and destination stage masks of any memory barriers **must** only include graphics pipeline stages
- VUID-vkCmdPipelineBarrier2-dependencyFlags-01186

If `vkCmdPipelineBarrier2` is called outside of a render pass instance, the dependency flags **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier2-None-07893

If `vkCmdPipelineBarrier2` is called inside a render pass instance, and there is more than one view in the current subpass, dependency flags **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier2-None-09553

If none of the `shaderTileImageColorReadAccess`, `shaderTileImageStencilReadAccess`, or `shaderTileImageDepthReadAccess` features are enabled, and the `dynamicRenderingLocalRead` feature is not enabled, `vkCmdPipelineBarrier2` **must** not be called within a render pass instance started with `vkCmdBeginRendering`

- VUID-vkCmdPipelineBarrier2-None-09554

If the `dynamicRenderingLocalRead` feature is not enabled, and `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, there **must** be no buffer or image memory barriers specified by this command

- VUID-vkCmdPipelineBarrier2-None-09586

If the `dynamicRenderingLocalRead` feature is not enabled, and `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, memory barriers specified by this command **must** only include `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, or `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT` in their access masks

- VUID-vkCmdPipelineBarrier2-image-09555

If `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, and the `image` member of any image memory barrier is used as an attachment in the current render pass instance, it **must** be in the `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ` or `VK_IMAGE_LAYOUT_GENERAL` layout

- VUID-vkCmdPipelineBarrier2-srcStageMask-09556

If `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, this command **must** only specify `framebuffer-space` stages in `srcStageMask` and `dstStageMask`

- VUID-vkCmdPipelineBarrier2-image-09373

If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, and the `image` member of any image memory barrier is a color resolve attachment, the corresponding color attachment **must** be `VK_ATTACHMENT_UNUSED`

- VUID-vkCmdPipelineBarrier2-image-09374

If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, and the `image` member of any image memory barrier is a color resolve attachment, it **must** have been created with a non-zero `VkExternalFormatANDROID::externalFormat` value

- VUID-vkCmdPipelineBarrier2-oldLayout-01181

If `vkCmdPipelineBarrier2` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command **must** be

equal

- VUID-vkCmdPipelineBarrier2-srcQueueFamilyIndex-01182

If `vkCmdPipelineBarrier2` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command **must** be equal

- VUID-vkCmdPipelineBarrier2-synchronization2-03848

The `synchronization2` feature **must** be enabled

- VUID-vkCmdPipelineBarrier2-srcStageMask-09673

The `srcStageMask` member of any element of the `pMemoryBarriers` member of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- VUID-vkCmdPipelineBarrier2-dstStageMask-09674

The `dstStageMask` member of any element of the `pMemoryBarriers` member of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- VUID-vkCmdPipelineBarrier2-srcStageMask-09675

If a buffer or image memory barrier does not specify an `acquire operation`, or if it does but `pDependencyInfo->dependencyFlags` includes `VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR`, the respective `srcStageMask` member of the element of the `pBufferMemoryBarriers` or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- VUID-vkCmdPipelineBarrier2-dstStageMask-09676

If a buffer or image memory barrier does not specify an `release operation`, or if it does but `pDependencyInfo->dependencyFlags` includes `VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR`, the respective `dstStageMask` member of the element of the `pBufferMemoryBarriers` or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- VUID-vkCmdPipelineBarrier2-srcQueueFamilyIndex-10387

If a buffer or image memory barrier specifies a `queue family ownership transfer operation`, either the `srcQueueFamilyIndex` or `dstQueueFamilyIndex` member of the element of the `pBufferMemoryBarriers` or `pImageMemoryBarriers` members of `pDependencyInfo` and the queue family index that was used to create the command pool that `commandBuffer` was allocated from **must** be equal

Valid Usage (Implicit)

- VUID-vkCmdPipelineBarrier2-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdPipelineBarrier2-pDependencyInfo-parameter

`pDependencyInfo` **must** be a valid pointer to a valid `VkDependencyInfo` structure

- `VUID-vkCmdPipelineBarrier2-commandBuffer-recording`
`commandBuffer` **must** be in the `recording` state
- `VUID-vkCmdPipelineBarrier2-commandBuffer-cmdpool`
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, `VK_QUEUE_TRANSFER_BIT`, `VK_QUEUE_VIDEO_DECODE_BIT_KHR`, or `VK_QUEUE_VIDEO_ENCODE_BIT_KHR` operations
- `VUID-vkCmdPipelineBarrier2-suspended`
This command **must** not be called between suspended render pass instances

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Both	<code>VK_QUEUE_COMPUTE_BIT</code> <code>VK_QUEUE_GRAPHICS_BIT</code> <code>VK_QUEUE_TRANSFER_BIT</code> <code>VK_QUEUE_VIDEO_DECODE_BIT_KHR</code> <code>VK_QUEUE_VIDEO_ENCODE_BIT_KHR</code>	Synchronization

Conditional Rendering

`vkCmdPipelineBarrier2` is not affected by `conditional rendering`

To record a pipeline barrier, call:

WARNING

This functionality is superseded by `vkCmdPipelineBarrier2`. See [Legacy](#)

[Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkCmdPipelineBarrier(
    VkCommandBuffer                commandBuffer,
    VkPipelineStageFlags           srcStageMask,
    VkPipelineStageFlags           dstStageMask,
    VkDependencyFlags              dependencyFlags,
    uint32_t                       memoryBarrierCount,
    const VkMemoryBarrier*         pMemoryBarriers,
    uint32_t                       bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier*   pBufferMemoryBarriers,
    uint32_t                       imageMemoryBarrierCount,
    const VkImageMemoryBarrier*    pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [source stages](#).
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the [destination stages](#).
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdPipelineBarrier` operates almost identically to `vkCmdPipelineBarrier2`, except that the scopes and barriers are defined as direct parameters rather than being defined by a `VkDependencyInfo`.

When `vkCmdPipelineBarrier` is submitted to a queue, it defines a memory dependency between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the first [synchronization scope](#) includes all commands that occur earlier in [submission order](#). If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the first synchronization scope includes only commands that occur earlier in [submission order](#) within the same subpass. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the [source stage mask](#) specified by `srcStageMask`.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the second [synchronization scope](#) includes all commands that occur later in [submission order](#). If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the second synchronization scope includes only commands that occur later in [submission order](#) within the same subpass. In either case, the second

synchronization scope is limited to operations on the pipeline stages determined by the [destination stage mask](#) specified by `dstStageMask`.

The first [access scope](#) is limited to accesses in the pipeline stages determined by the [source stage mask](#) specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of [memory barriers](#). If no memory barriers are specified, then the first access scope includes no accesses.

The second [access scope](#) is limited to accesses in the pipeline stages determined by the [destination stage mask](#) specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of [memory barriers](#). If no memory barriers are specified, then the second access scope includes no accesses.

If `dependencyFlags` includes `VK_DEPENDENCY_BY_REGION_BIT`, then any dependency between framebuffer-space pipeline stages is [framebuffer-local](#) - otherwise it is [framebuffer-global](#).

Valid Usage

- VUID-vkCmdPipelineBarrier-srcStageMask-04090
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-vkCmdPipelineBarrier-srcStageMask-04091
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-vkCmdPipelineBarrier-srcStageMask-04092
If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-vkCmdPipelineBarrier-srcStageMask-04093
If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-vkCmdPipelineBarrier-srcStageMask-04094
If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-vkCmdPipelineBarrier-srcStageMask-04095
If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-vkCmdPipelineBarrier-srcStageMask-04096
If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
- VUID-vkCmdPipelineBarrier-srcStageMask-07318
If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `srcStageMask` **must** not contain

VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdPipelineBarrier-srcStageMask-03937

If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be 0

- VUID-vkCmdPipelineBarrier-srcStageMask-07949

If neither the `VK_NV_ray_tracing` extension or the `rayTracingPipeline` feature are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdPipelineBarrier-srcStageMask-10754

If the `accelerationStructure` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

- VUID-vkCmdPipelineBarrier-srcAccessMask-06257

If the `rayQuery` feature is not enabled and a memory barrier `srcAccessMask` includes `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`,
`VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, or
`VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04090

If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04091

If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or
`VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04092

If the `conditionalRendering` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04093

If the `fragmentDensityMap` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04094

If the `transformFeedback` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04095

If the `meshShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04096

If the `taskShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-07318

If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdPipelineBarrier-dstStageMask-03937

If the `synchronization2` feature is not enabled, `dstStageMask` **must** not be 0

- VUID-vkCmdPipelineBarrier-dstStageMask-07949

If neither the `VK_NV_ray_tracing` extension or the `rayTracingPipeline` feature are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdPipelineBarrier-dstStageMask-10754

If the `accelerationStructure` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

- VUID-vkCmdPipelineBarrier-dstAccessMask-06257

If the `rayQuery` feature is not enabled and a memory barrier `dstAccessMask` includes `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`,
`VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, or
`VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`

- VUID-vkCmdPipelineBarrier-srcAccessMask-02815

The `srcAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdPipelineBarrier-dstAccessMask-02816

The `dstAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02817

For each element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02818

For each element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02819

For each element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02820

For each element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)

- VUID-vkCmdPipelineBarrier-image-09373

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, and the `image` member of any image memory barrier is a color resolve attachment, the corresponding color attachment **must** be `VK_ATTACHMENT_UNUSED`

- VUID-vkCmdPipelineBarrier-image-09374

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, and the `image` member of any image memory barrier is a color resolve attachment, it **must** have been created with a non-zero `VkExternalFormatANDROID::externalFormat` value

- VUID-vkCmdPipelineBarrier-oldLayout-01181

If `vkCmdPipelineBarrier` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command **must** be equal

- VUID-vkCmdPipelineBarrier-srcQueueFamilyIndex-01182

If `vkCmdPipelineBarrier` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command **must** be equal

- VUID-vkCmdPipelineBarrier-None-07889

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, the render pass **must** have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include `VK_DEPENDENCY_BY_REGION_BIT` if this command does not, does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT` if this command does not, and has [synchronization scopes](#) and [access scopes](#) that are all supersets of the scopes defined in this command

- VUID-vkCmdPipelineBarrier-bufferMemoryBarrierCount-01178

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, it **must** not include any buffer memory barriers

- VUID-vkCmdPipelineBarrier-image-04073

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, the `image` member of any image memory barrier included in this command **must** be an attachment used in the current subpass both as an input attachment, and as either a color, color resolve, or depth/stencil attachment

- VUID-vkCmdPipelineBarrier-None-07890

If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include [framebuffer-space stages](#), destination stage masks of all memory barriers **must** only include [framebuffer-space stages](#)

- VUID-vkCmdPipelineBarrier-dependencyFlags-07891

If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include `framebuffer-space` stages, then `dependencyFlags` **must** include `VK_DEPENDENCY_BY_REGION_BIT`

- VUID-vkCmdPipelineBarrier-None-07892

If `vkCmdPipelineBarrier` is called within a render pass instance, the source and destination stage masks of any memory barriers **must** only include graphics pipeline stages

- VUID-vkCmdPipelineBarrier-dependencyFlags-01186

If `vkCmdPipelineBarrier` is called outside of a render pass instance, the dependency flags **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier-None-07893

If `vkCmdPipelineBarrier` is called inside a render pass instance, and there is more than one view in the current subpass, dependency flags **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier-None-09553

If none of the `shaderTileImageColorReadAccess`, `shaderTileImageStencilReadAccess`, or `shaderTileImageDepthReadAccess` features are enabled, and the `dynamicRenderingLocalRead` feature is not enabled, `vkCmdPipelineBarrier` **must** not be called within a render pass instance started with `vkCmdBeginRendering`

- VUID-vkCmdPipelineBarrier-None-09554

If the `dynamicRenderingLocalRead` feature is not enabled, and `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, there **must** be no buffer or image memory barriers specified by this command

- VUID-vkCmdPipelineBarrier-None-09586

If the `dynamicRenderingLocalRead` feature is not enabled, and `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, memory barriers specified by this command **must** only include `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, or `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT` in their access masks

- VUID-vkCmdPipelineBarrier-image-09555

If `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, and the `image` member of any image memory barrier is used as an attachment in the current render pass instance, it **must** be in the `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ` or `VK_IMAGE_LAYOUT_GENERAL` layout

- VUID-vkCmdPipelineBarrier-srcStageMask-09556

If `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, this command **must** only specify `framebuffer-space` stages in `srcStageMask` and `dstStageMask`

- VUID-vkCmdPipelineBarrier-oldLayout-10758

If called within a render pass instance using a `VkRenderPass` object, the `oldLayout` member of any image memory barrier included in this command **must** be equal to the layout that the corresponding attachment uses during the subpass

- VUID-vkCmdPipelineBarrier-oldLayout-10759

If called within a render pass instance started with `vkCmdBeginRendering`, the `oldLayout` member of any image memory barrier included in this command **must** be equal to the layout that the corresponding attachment uses during the render pass instance

- VUID-vkCmdPipelineBarrier-srcStageMask-06461

Any pipeline stage included in `srcStageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)

- VUID-vkCmdPipelineBarrier-dstStageMask-06462

Any pipeline stage included in `dstStageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)

- VUID-vkCmdPipelineBarrier-srcStageMask-09633

If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_HOST_BIT`, for each element of `pImageMemoryBarriers`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be equal

- VUID-vkCmdPipelineBarrier-srcStageMask-09634

If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_HOST_BIT`, for each element of `pBufferMemoryBarriers`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be equal

- VUID-vkCmdPipelineBarrier-srcQueueFamilyIndex-10388

If a buffer or image memory barrier specifies a [queue family ownership transfer operation](#), either the `srcQueueFamilyIndex` or `dstQueueFamilyIndex` member and the queue family index that was used to create the command pool that `commandBuffer` was allocated from **must** be equal

- VUID-vkCmdPipelineBarrier-maintenance8-10206

If the `maintenance8` feature is not enabled, `dependencyFlags` **must** not include `VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR`

Valid Usage (Implicit)

- VUID-vkCmdPipelineBarrier-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdPipelineBarrier-srcStageMask-parameter

`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values

- VUID-vkCmdPipelineBarrier-dstStageMask-parameter

`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values

- VUID-vkCmdPipelineBarrier-dependencyFlags-parameter

`dependencyFlags` **must** be a valid combination of `VkDependencyFlagBits` values

- VUID-vkCmdPipelineBarrier-pMemoryBarriers-parameter

If `memoryBarrierCount` is not 0, `pMemoryBarriers` **must** be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-parameter
If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` **must** be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures
- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-parameter
If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` **must** be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures
- VUID-vkCmdPipelineBarrier-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdPipelineBarrier-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, `VK_QUEUE_GRAPHICS_BIT`, `VK_QUEUE_TRANSFER_BIT`, `VK_QUEUE_VIDEO_DECODE_BIT_KHR`, or `VK_QUEUE_VIDEO_ENCODE_BIT_KHR` operations
- VUID-vkCmdPipelineBarrier-suspended
This command **must** not be called between suspended render pass instances

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Both	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT VK_QUEUE_VIDEO_DECODE_BIT_KHR VK_QUEUE_VIDEO_ENCODE_BIT_KHR	Synchronization

Conditional Rendering

`vkCmdPipelineBarrier` is not affected by [conditional rendering](#)

Bits which **can** be set in `vkCmdPipelineBarrier::dependencyFlags`, specifying how execution and memory dependencies are formed, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkDependencyFlagBits {
    VK_DEPENDENCY_BY_REGION_BIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_DEVICE_GROUP_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_VIEW_LOCAL_BIT = 0x00000002,
    // Provided by VK_EXT_attachment_feedback_loop_layout
    VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT = 0x00000008,
    // Provided by VK_KHR_maintenance8
    VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR = 0x00000020,
    // Provided by VK_KHR_maintenance9
    VK_DEPENDENCY_ASYMMETRIC_EVENT_BIT_KHR = 0x00000040,
    // Provided by VK_KHR_multiview
    VK_DEPENDENCY_VIEW_LOCAL_BIT_KHR = VK_DEPENDENCY_VIEW_LOCAL_BIT,
    // Provided by VK_KHR_device_group
    VK_DEPENDENCY_DEVICE_GROUP_BIT_KHR = VK_DEPENDENCY_DEVICE_GROUP_BIT,
} VkDependencyFlagBits;
```

- [VK_DEPENDENCY_BY_REGION_BIT](#) specifies that dependencies will be split into multiple [framebuffer-local regions](#) according to the (x,y,layer,sample) coordinates.
- [VK_DEPENDENCY_VIEW_LOCAL_BIT](#) specifies that dependencies will be split into multiple [framebuffer-local regions](#) according to the view.
- [VK_DEPENDENCY_DEVICE_GROUP_BIT](#) specifies that dependencies are [non-device-local](#).
- [VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT](#) specifies that the render pass will write to and read from the same image with [feedback loop enabled](#).
- [VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR](#) specifies that source and destination stages are not ignored when performing a [queue family ownership transfer](#).
- [VK_DEPENDENCY_ASYMMETRIC_EVENT_BIT_KHR](#) specifies that the access scopes of [vkCmdSetEvent2](#) and [vkCmdWaitEvents2](#) do not need to match for a given event when it is specified in both commands, and the access scope of [vkCmdSetEvent2](#) is empty.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDependencyFlags;
```

`VkDependencyFlags` is a bitmask type for setting a mask of zero or more [VkDependencyFlagBits](#).

7.7. Memory Barriers

Memory barriers are used to explicitly control access to buffer and image subresource ranges. Memory barriers are used to [transfer ownership between queue families](#), [change image layouts](#), and define [availability and visibility operations](#). They explicitly define the [access types](#) and buffer and image subresource ranges that are included in the [access scopes](#) of a memory dependency that is created by a synchronization command that includes them.

7.7.1. Global Memory Barriers

Global memory barriers apply to memory accesses involving all memory objects that exist at the time of its execution.

The `VkMemoryBarrier2` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkMemoryBarrier2 {
    VkStructureType    sType;
    const void*        pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2     srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2     dstAccessMask;
} VkMemoryBarrier2;
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to VkMemoryBarrier2
typedef VkMemoryBarrier2 VkMemoryBarrier2KHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a [VkPipelineStageFlags2](#) mask of pipeline stages to be included in the [first synchronization scope](#).
- `srcAccessMask` is a [VkAccessFlags2](#) mask of access flags to be included in the [first access scope](#).
- `dstStageMask` is a [VkPipelineStageFlags2](#) mask of pipeline stages to be included in the [second synchronization scope](#).
- `dstAccessMask` is a [VkAccessFlags2](#) mask of access flags to be included in the [second access scope](#).

This structure defines a [memory dependency](#) affecting all device memory.

The first [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by the source stage mask and source access mask.

The second [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by destination stage mask and destination access mask.

Valid Usage

- VUID-VkMemoryBarrier2-srcStageMask-03929
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- VUID-VkMemoryBarrier2-srcStageMask-03930
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkMemoryBarrier2-srcStageMask-03931
If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-VkMemoryBarrier2-srcStageMask-03932
If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkMemoryBarrier2-srcStageMask-03933
If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-VkMemoryBarrier2-srcStageMask-03934
If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`

`dstStageMask` **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`,
`VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`,
`VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or
`VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-dstAccessMask-03914

If `dstAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `dstStageMask` **must** include
`VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`,

VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT,
VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR,
VK_PIPELINE_STAGE_2_CONVERT_COOPERATIVE_VECTOR_MATRIX_BIT_NV, or
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03915

If **dstAccessMask** includes VK_ACCESS_2_TRANSFER_WRITE_BIT, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_CONVERT_COOPERATIVE_VECTOR_MATRIX_BIT_NV, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03916

If **dstAccessMask** includes VK_ACCESS_2_HOST_READ_BIT, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03917

If **dstAccessMask** includes VK_ACCESS_2_HOST_WRITE_BIT, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03918

If **dstAccessMask** includes VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03919

If **dstAccessMask** includes VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03920

If **dstAccessMask** includes VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-04747

If **dstAccessMask** includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03922

If **dstAccessMask** includes

VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03923

If **dstAccessMask** includes VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-04994

If **dstAccessMask** includes VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

- VUID-VkMemoryBarrier2-dstAccessMask-03924

If **dstAccessMask** includes VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03925

If **dstAccessMask** includes VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03926

If **dstAccessMask** includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT or VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03927

If **dstAccessMask** includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, and the **rayQuery** feature is enabled, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR, one of the stages, VK_PIPELINE_STAGE_2_SHADER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03928

If **dstAccessMask** includes VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-06256

If **dstAccessMask** includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, and the **rayQuery** feature is not enabled, **dstStageMask** **must** include VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,

VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, or
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-07272
If `dstAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkMemoryBarrier2-dstAccessMask-04858
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`
- VUID-VkMemoryBarrier2-dstAccessMask-04859
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`
- VUID-VkMemoryBarrier2-dstAccessMask-04860
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`
- VUID-VkMemoryBarrier2-dstAccessMask-04861
If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`
- VUID-VkMemoryBarrier2-dstAccessMask-07455
If `dstAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`
- VUID-VkMemoryBarrier2-dstAccessMask-07456
If `dstAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`
- VUID-VkMemoryBarrier2-dstAccessMask-07457
If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`
- VUID-VkMemoryBarrier2-dstAccessMask-07458
If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`
- VUID-VkMemoryBarrier2-dstAccessMask-08118
If `dstAccessMask` includes `VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkMemoryBarrier2-dstAccessMask-10670
If `dstAccessMask` includes `VK_ACCESS_2_SHADER_TILE_ATTACHMENT_READ_BIT_QCOM`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` or `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT`
- VUID-VkMemoryBarrier2-dstAccessMask-10671
If `dstAccessMask` includes `VK_ACCESS_2_SHADER_TILE_ATTACHMENT_WRITE_BIT_QCOM`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` or

VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-11771
If `dstAccessMask` includes `VK_ACCESS_2_MEMORY_DECOMPRESSION_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_MEMORY_DECOMPRESSION_BIT_EXT`
- VUID-VkMemoryBarrier2-dstAccessMask-11772
If `dstAccessMask` includes `VK_ACCESS_2_MEMORY_DECOMPRESSION_WRITE_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_MEMORY_DECOMPRESSION_BIT_EXT`
- VUID-VkMemoryBarrier2-dstAccessMask-11294
If `dstAccessMask` includes `VK_ACCESS_2_SAMPLER_HEAP_READ_BIT_EXT` or `VK_ACCESS_2_RESOURCE_HEAP_READ_BIT_EXT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

Valid Usage (Implicit)

- VUID-VkMemoryBarrier2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_BARRIER_2`
- VUID-VkMemoryBarrier2-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkMemoryBarrier2-srcAccessMask-parameter
`srcAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values
- VUID-VkMemoryBarrier2-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkMemoryBarrier2-dstAccessMask-parameter
`dstAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values

Structure Chaining

Extends the structure

- `VkSubpassDependency2`

The `VkMemoryBarrier` structure is defined as:

WARNING

This functionality is superseded by `VkMemoryBarrier2`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryBarrier {
    VkStructureType    sType;
    const void*        pNext;
    VkAccessFlags       srcAccessMask;
    VkAccessFlags       dstAccessMask;
} VkMemoryBarrier;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of [VkAccessFlagBits](#) specifying a [source access mask](#).
- **dstAccessMask** is a bitmask of [VkAccessFlagBits](#) specifying a [destination access mask](#).

The first [access scope](#) is limited to access types in the [source access mask](#) specified by **srcAccessMask** and, if a [VkMemoryBarrierAccessFlags3KHR](#) is passed in **pNext**, **srcAccessMask3**.

The second [access scope](#) is limited to access types in the [destination access mask](#) specified by **dstAccessMask** and, if a [VkMemoryBarrierAccessFlags3KHR](#) is passed in **pNext**, **dstAccessMask3**.

Valid Usage (Implicit)

- VUID-VkMemoryBarrier-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_MEMORY_BARRIER](#)
- VUID-VkMemoryBarrier-pNext-pNext
pNext **must** be **NULL**
- VUID-VkMemoryBarrier-srcAccessMask-parameter
srcAccessMask **must** be a valid combination of [VkAccessFlagBits](#) values
- VUID-VkMemoryBarrier-dstAccessMask-parameter
dstAccessMask **must** be a valid combination of [VkAccessFlagBits](#) values

7.7.2. Memory Range Barriers

Memory range barriers only apply to memory accesses involving a specific device address range. That is, a memory dependency formed from a memory range barrier is [scoped](#) to access via the specified device address range. Memory range barriers **can** also be used to define a [queue family ownership transfer](#) for the specified device address range.

The [VkMemoryRangeBarriersInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_device_address_commands
typedef struct VkMemoryRangeBarriersInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 memoryRangeBarrierCount;
    const VkMemoryRangeBarrierKHR* pMemoryRangeBarriers;
} VkMemoryRangeBarriersInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryRangeBarrierCount` is the length of the `pMemoryRangeBarriers` array
- `pMemoryRangeBarriers` is a pointer to an array of `VkMemoryRangeBarrierKHR` structures defining memory dependencies between accesses to specified memory ranges.

When this structure is included in the `pNext` chain of `VkDependencyInfo`, it defines a set of `memory dependencies`, as well as `queue family ownership transfer operations`, for a specified set of memory ranges.

If this structure is not included in the `pNext` chain of `VkDependencyInfo`, it is equivalent to specifying it with a `memoryRangeBarrierCount` of 0.

Each member of `pMemoryRangeBarriers` defines a separate `memory dependency`.

Valid Usage (Implicit)

- VUID-VkMemoryRangeBarriersInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_RANGE_BARRIERS_INFO_KHR`
- VUID-VkMemoryRangeBarriersInfoKHR-pMemoryRangeBarriers-parameter
If `memoryRangeBarrierCount` is not 0, `pMemoryRangeBarriers` **must** be a valid pointer to an array of `memoryRangeBarrierCount` valid `VkMemoryRangeBarrierKHR` structures

Structure Chaining

Extends the structure

- `VkDependencyInfo`

The `VkMemoryRangeBarrierKHR` structure is defined as:

```
// Provided by VK_KHR_device_address_commands
typedef struct VkMemoryRangeBarrierKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2       srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2       dstAccessMask;
    uint32_t             srcQueueFamilyIndex;
    uint32_t             dstQueueFamilyIndex;
    VkDeviceAddressRangeKHR addressRange;
    VkAddressCommandFlagsKHR addressFlags;
} VkMemoryRangeBarrierKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcStageMask** is a **VkPipelineStageFlags2** mask of pipeline stages to be included in the **first synchronization scope**.
- **srcAccessMask** is a **VkAccessFlags2** mask of access flags to be included in the **first access scope**.
- **dstStageMask** is a **VkPipelineStageFlags2** mask of pipeline stages to be included in the **second synchronization scope**.
- **dstAccessMask** is a **VkAccessFlags2** mask of access flags to be included in the **second access scope**.
- **srcQueueFamilyIndex** is the source queue family for a **queue family ownership transfer**.
- **dstQueueFamilyIndex** is the destination queue family for a **queue family ownership transfer**.
- **addressRange** is a **VkDeviceAddressRangeKHR** structure specifying the address range affected by the barrier.
- **addressFlags** is a **VkAddressCommandFlagsKHR** value defining the flags for the address range.

This structure defines a **memory dependency** limited to an address range, and **can** define a **queue family ownership transfer operation** for that range.

The first **synchronization scope** and **access scope** described by this structure include only operations and memory accesses specified by **srcStageMask** and **srcAccessMask**.

The second **synchronization scope** and **access scope** described by this structure include only operations and memory accesses specified by **dstStageMask** and **dstAccessMask**.

Both **access scopes** are limited to only memory accesses to memory in **addressRange**.

If the buffer from which **address** was queried was created with a sharing mode of **VK_SHARING_MODE_EXCLUSIVE**, and **srcQueueFamilyIndex** is not equal to **dstQueueFamilyIndex**, this memory range barrier defines a **queue family ownership transfer operation**. When executed on a queue in the family identified by **srcQueueFamilyIndex**, this barrier defines a **queue family release operation** for the specified address range, and the second synchronization scope does not apply to this operation. When executed on a queue in the family identified by **dstQueueFamilyIndex**, this

barrier defines a [queue family acquire operation](#) for the specified address range, and the first synchronization scope does not apply to this operation.

A [queue family ownership transfer operation](#) is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in [Queue Family Ownership Transfer](#). A [queue family release operation](#) is defined when `dstQueueFamilyIndex` is one of those values, and a [queue family acquire operation](#) is defined when `srcQueueFamilyIndex` is one of those values.

Valid Usage

- VUID-VkMemoryRangeBarrierKHR-addressRange-13097
If the range specified by `addressRange` is not bound completely to memory when accessed, `addressFlags` **must** not include `VK_ADDRESS_COMMAND_FULLY_BOUND_BIT_KHR`
- VUID-VkMemoryRangeBarrierKHR-addressRange-13098
If the buffer from which the range specified by `addressRange` was created with `VK_BUFFER_CREATE_PROTECTED_BIT`, and `protectedNoFault` is not supported, `addressFlags` **must** include `VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR`
- VUID-VkMemoryRangeBarrierKHR-addressRange-13099
If the buffer from which the range specified by `addressRange` was created without `VK_BUFFER_CREATE_PROTECTED_BIT`, and `protectedNoFault` is not supported, `addressFlags` **must** not include `VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR`
- VUID-VkMemoryRangeBarrierKHR-addressFlags-13100

<code>addressFlags</code>	must	not	include	both
<code>VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR</code>				and
<code>VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR</code>				
- VUID-VkMemoryRangeBarrierKHR-addressRange-13122
If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT`, `addressFlags` **must** include `VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR` or `VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR`
- VUID-VkMemoryRangeBarrierKHR-addressRange-13123
If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created without `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT`, `addressFlags` **must** not include `VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR`
- VUID-VkMemoryRangeBarrierKHR-addressFlags-13101

<code>addressFlags</code>	must	not	include	both
<code>VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR</code>				and
<code>VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR</code>				
- VUID-VkMemoryRangeBarrierKHR-addressRange-13124
If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created with `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT`, `addressFlags` **must**

include `VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR` or `VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR`

- VUID-VkMemoryRangeBarrierKHR-addressRange-13125

If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created without `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT`, `addressFlags` **must** not include `VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR`

- VUID-VkMemoryRangeBarrierKHR-srcStageMask-03929

If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- VUID-VkMemoryRangeBarrierKHR-srcStageMask-03930

If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-VkMemoryRangeBarrierKHR-srcStageMask-03931

If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-VkMemoryRangeBarrierKHR-srcStageMask-03932

If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-VkMemoryRangeBarrierKHR-srcStageMask-03933

If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-VkMemoryRangeBarrierKHR-srcStageMask-03934

If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`

- VUID-VkMemoryRangeBarrierKHR-srcStageMask-03935

If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`

- VUID-VkMemoryRangeBarrierKHR-srcStageMask-07316

If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkMemoryRangeBarrierKHR-srcStageMask-04957

If the `subpassShading` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`

- VUID-VkMemoryRangeBarrierKHR-srcStageMask-04995

If the `invocationMask` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`

- VUID-VkMemoryRangeBarrierKHR-srcStageMask-07946

If neither the `VK_NV_ray_tracing` extension or the `rayTracingPipeline` feature are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkMemoryRangeBarrierKHR-srcStageMask-10751
If the `accelerationStructure` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`
- VUID-VkMemoryRangeBarrierKHR-srcStageMask-10752
If the `rayTracingMaintenance1` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`
- VUID-VkMemoryRangeBarrierKHR-srcStageMask-10753
If the `micromap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`
- VUID-VkMemoryRangeBarrierKHR-srcAccessMask-03900
If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_COPY_INDIRECT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryRangeBarrierKHR-srcAccessMask-03901
If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryRangeBarrierKHR-srcAccessMask-03902
If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryRangeBarrierKHR-srcAccessMask-03903
If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkMemoryRangeBarrierKHR-srcAccessMask-03904
If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkMemoryRangeBarrierKHR-srcAccessMask-03905
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkMemoryRangeBarrierKHR-srcAccessMask-03906
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` **must**

include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`,
`VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the
`VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryRangeBarrierKHR-srcAccessMask-03907

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `srcStageMask` **must** include
`VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`,
`VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the
`VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkMemoryRangeBarrierKHR-srcAccessMask-07454

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `srcStageMask` **must** include
`VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`,
`VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`,
`VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`,
`VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`, or one of the

- VUID-VkMemoryRangeBarrierKHR-None-09097
If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, **srcQueueFamilyIndex** **must** not be `VK_QUEUE_FAMILY_EXTERNAL`
- VUID-VkMemoryRangeBarrierKHR-None-09098
If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, **dstQueueFamilyIndex** **must** not be `VK_QUEUE_FAMILY_EXTERNAL`
- VUID-VkMemoryRangeBarrierKHR-srcQueueFamilyIndex-09099
If the `VK_EXT_queue_family_foreign` extension is not enabled **srcQueueFamilyIndex** **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`
- VUID-VkMemoryRangeBarrierKHR-dstQueueFamilyIndex-09100
If the `VK_EXT_queue_family_foreign` extension is not enabled **dstQueueFamilyIndex** **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`
- VUID-VkMemoryRangeBarrierKHR-address-13087
If the buffer from which **address** was queried was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and **srcQueueFamilyIndex** and **dstQueueFamilyIndex** are not equal, **srcQueueFamilyIndex** **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family
- VUID-VkMemoryRangeBarrierKHR-address-13088
If the buffer from which **address** was queried was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and **srcQueueFamilyIndex** and **dstQueueFamilyIndex** are not equal, **dstQueueFamilyIndex** **must** be `VK_QUEUE_FAMILY_EXTERNAL`,

[VK_QUEUE_FAMILY_FOREIGN_EXT](#), or a valid queue family

- VUID-VkMemoryRangeBarrierKHR-srcStageMask-13089

If either `srcStageMask` or `dstStageMask` includes [VK_PIPELINE_STAGE_2_HOST_BIT](#), `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be equal

Valid Usage (Implicit)

- VUID-VkMemoryRangeBarrierKHR-sType-sType
`sType` **must** be [VK_STRUCTURE_TYPE_MEMORY_RANGE_BARRIER_KHR](#)
- VUID-VkMemoryRangeBarrierKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkMemoryRangeBarrierKHR-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of [VkPipelineStageFlagBits2](#) values
- VUID-VkMemoryRangeBarrierKHR-srcAccessMask-parameter
`srcAccessMask` **must** be a valid combination of [VkAccessFlagBits2](#) values
- VUID-VkMemoryRangeBarrierKHR-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of [VkPipelineStageFlagBits2](#) values
- VUID-VkMemoryRangeBarrierKHR-dstAccessMask-parameter
`dstAccessMask` **must** be a valid combination of [VkAccessFlagBits2](#) values
- VUID-VkMemoryRangeBarrierKHR-addressFlags-parameter
`addressFlags` **must** be a valid combination of [VkAddressCommandFlagBitsKHR](#) values

7.7.3. Buffer Memory Barriers

Buffer memory barriers only apply to memory accesses involving a specific buffer range. That is, a memory dependency formed from a buffer memory barrier is [scoped](#) to access via the specified buffer range. Buffer memory barriers **can** also be used to define a [queue family ownership transfer](#) for the specified buffer range.

The [VkBufferMemoryBarrier2](#) structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkBufferMemoryBarrier2 {
    VkStructureType      sType;
    const void*          pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2       srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2       dstAccessMask;
    uint32_t             srcQueueFamilyIndex;
    uint32_t             dstQueueFamilyIndex;
    VkBuffer              buffer;
    VkDeviceSize          offset;
    VkDeviceSize          size;
} VkBufferMemoryBarrier2;
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to VkBufferMemoryBarrier2
typedef VkBufferMemoryBarrier2 VkBufferMemoryBarrier2KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcStageMask** is a [VkPipelineStageFlags2](#) mask of pipeline stages to be included in the [first synchronization scope](#).
- **srcAccessMask** is a [VkAccessFlags2](#) mask of access flags to be included in the [first access scope](#).
- **dstStageMask** is a [VkPipelineStageFlags2](#) mask of pipeline stages to be included in the [second synchronization scope](#).
- **dstAccessMask** is a [VkAccessFlags2](#) mask of access flags to be included in the [second access scope](#).
- **srcQueueFamilyIndex** is the source queue family for a [queue family ownership transfer](#).
- **dstQueueFamilyIndex** is the destination queue family for a [queue family ownership transfer](#).
- **buffer** is a handle to the buffer whose backing memory is affected by the barrier.
- **offset** is an offset in bytes into the backing memory for **buffer**; this is relative to the base offset as bound to the buffer (see [vkBindBufferMemory](#)).
- **size** is a size in bytes of the affected area of backing memory for **buffer**, or [VK_WHOLE_SIZE](#) to use the range from **offset** to the end of the buffer.

This structure defines a [memory dependency](#) limited to a range of a buffer, and **can** define a [queue family ownership transfer operation](#) for that range.

The [first synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by the source stage mask and the source access mask.

The [second synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by the destination stage mask and the destination access

mask.

Both [access scopes](#) are limited to only memory accesses to [buffer](#) in the range defined by [offset](#) and [size](#).

If [buffer](#) was created with [VK_SHARING_MODE_EXCLUSIVE](#), and [srcQueueFamilyIndex](#) is not equal to [dstQueueFamilyIndex](#), this memory barrier defines a [queue family ownership transfer operation](#). When executed on a queue in the family identified by [srcQueueFamilyIndex](#), this barrier defines a [queue family release operation](#) for the specified buffer range, and if [VkDependencyInfoKHR::dependencyFlags](#) did not include [VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR](#), the second synchronization scope does not apply to this operation. When executed on a queue in the family identified by [dstQueueFamilyIndex](#), this barrier defines a [queue family acquire operation](#) for the specified buffer range, and if [VkDependencyInfoKHR::dependencyFlags](#) did not include [VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR](#), the first synchronization scope does not apply to this operation.

A [queue family ownership transfer operation](#) is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in [Queue Family Ownership Transfer](#). A [queue family release operation](#) is defined when [dstQueueFamilyIndex](#) is one of those values, and a [queue family acquire operation](#) is defined when [srcQueueFamilyIndex](#) is one of those values.

Valid Usage

- VUID-VkBufferMemoryBarrier2-srcStageMask-03929
If the [geometryShader](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT](#)
- VUID-VkBufferMemoryBarrier2-srcStageMask-03930
If the [tessellationShader](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT](#) or [VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT](#)
- VUID-VkBufferMemoryBarrier2-srcStageMask-03931
If the [conditionalRendering](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT](#)
- VUID-VkBufferMemoryBarrier2-srcStageMask-03932
If the [fragmentDensityMap](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT](#)
- VUID-VkBufferMemoryBarrier2-srcStageMask-03933
If the [transformFeedback](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT](#)
- VUID-VkBufferMemoryBarrier2-srcStageMask-03934
If the [meshShader](#) feature is not enabled, [srcStageMask](#) **must** not contain [VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT](#)
- VUID-VkBufferMemoryBarrier2-srcStageMask-03935
If the [taskShader](#) feature is not enabled, [srcStageMask](#) **must** not contain

VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT

- VUID-VkBufferMemoryBarrier2-srcStageMask-07316

If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcStageMask-04957

If the `subpassShading` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`

- VUID-VkBufferMemoryBarrier2-srcStageMask-04995

If the `invocationMask` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`

- VUID-VkBufferMemoryBarrier2-srcStageMask-07946

If neither the `VK_NV_ray_tracing` extension or the `rayTracingPipeline` feature are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcStageMask-10751

If the `accelerationStructure` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcStageMask-10752

If the `rayTracingMaintenance1` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcStageMask-10753

If the `micromap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03900

If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_COPY_INDIRECT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03901

If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03902

If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03903

If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`,

VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT,
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

or

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03904
If **srcAccessMask** includes VK_ACCESS_2_UNIFORM_READ_BIT, **srcStageMask** **must** include
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT,
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the
VK_PIPELINE_STAGE_2_SHADER_BIT stages
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03905
If **srcAccessMask** includes VK_ACCESS_2_SHADER_SAMPLED_READ_BIT, **srcStageMask** **must**
include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT,
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the
VK_PIPELINE_STAGE_2_SHADER_BIT stages
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03906
If **srcAccessMask** includes VK_ACCESS_2_SHADER_STORAGE_READ_BIT, **srcStageMask** **must**
include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT,
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the
VK_PIPELINE_STAGE_2_SHADER_BIT stages
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03907
If **srcAccessMask** includes VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT, **srcStageMask** **must**
must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT,
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the
VK_PIPELINE_STAGE_2_SHADER_BIT stages
- VUID-VkBufferMemoryBarrier2-srcAccessMask-07454
If **srcAccessMask** includes VK_ACCESS_2_SHADER_READ_BIT, **srcStageMask** **must** include
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT,
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT,
VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT, or one of the
VK_PIPELINE_STAGE_2_SHADER_BIT stages
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03909
If **srcAccessMask** includes VK_ACCESS_2_SHADER_WRITE_BIT, **srcStageMask** **must** include
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT,
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the
VK_PIPELINE_STAGE_2_SHADER_BIT stages
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03910
If **srcAccessMask** includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, **srcStageMask**
must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT
- VUID-VkBufferMemoryBarrier2-srcAccessMask-03911
If **srcAccessMask** includes VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, **srcStageMask**
must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03912
If **srcAccessMask** includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, **srcStageMask** **must** include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or

- VUID-VkBufferMemoryBarrier2-srcAccessMask-10670
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_TILE_ATTACHMENT_READ_BIT_QCOM`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` or `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT`
- VUID-VkBufferMemoryBarrier2-srcAccessMask-10671
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_TILE_ATTACHMENT_WRITE_BIT_QCOM`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` or `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT`
- VUID-VkBufferMemoryBarrier2-srcAccessMask-11771
If `srcAccessMask` includes `VK_ACCESS_2_MEMORY_DECOMPRESSION_READ_BIT_EXT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_MEMORY_DECOMPRESSION_BIT_EXT`
- VUID-VkBufferMemoryBarrier2-srcAccessMask-11772
If `srcAccessMask` includes `VK_ACCESS_2_MEMORY_DECOMPRESSION_WRITE_BIT_EXT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_MEMORY_DECOMPRESSION_BIT_EXT`
- VUID-VkBufferMemoryBarrier2-srcAccessMask-11294
If `srcAccessMask` includes `VK_ACCESS_2_SAMPLER_HEAP_READ_BIT_EXT` or `VK_ACCESS_2_RESOURCE_HEAP_READ_BIT_EXT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkBufferMemoryBarrier2-dstStageMask-03929
If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- VUID-VkBufferMemoryBarrier2-dstStageMask-03930
If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkBufferMemoryBarrier2-dstStageMask-03931
If the `conditionalRendering` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-VkBufferMemoryBarrier2-dstStageMask-03932
If the `fragmentDensityMap` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkBufferMemoryBarrier2-dstStageMask-03933

If the `transformFeedback` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-VkBufferMemoryBarrier2-dstStageMask-03934

If the `meshShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`

- VUID-VkBufferMemoryBarrier2-dstStageMask-03935

If the `taskShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`

- VUID-VkBufferMemoryBarrier2-dstStageMask-07316

If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-dstStageMask-04957

If the `subpassShading` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`

- VUID-VkBufferMemoryBarrier2-dstStageMask-04995

If the `invocationMask` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`

- VUID-VkBufferMemoryBarrier2-dstStageMask-07946

If neither the `VK_NV_ray_tracing` extension or the `rayTracingPipeline` feature are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-dstStageMask-10751

If the `accelerationStructure` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-dstStageMask-10752

If the `rayTracingMaintenance1` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-dstStageMask-10753

If the `micromap` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03900

If `dstAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_COPY_INDIRECT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03901

If `dstAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03902

If `dstAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03903

If `dstAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03904

If `dstAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03905

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03906

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03907

If **buffer** was created with a sharing mode of **VK_SHARING_MODE_EXCLUSIVE**, and **srcQueueFamilyIndex** and **dstQueueFamilyIndex** are not equal, **dstQueueFamilyIndex** **must** be **VK_QUEUE_FAMILY_EXTERNAL**, **VK_QUEUE_FAMILY_FOREIGN_EXT**, or a valid queue family

- VUID-VkBufferMemoryBarrier2-None-09097

If the **VK_KHR_external_memory** extension is not enabled, and the value of **VkApplicationInfo::apiVersion** used to create the **VkInstance** is not greater than or equal to Version 1.1, **srcQueueFamilyIndex** **must** not be **VK_QUEUE_FAMILY_EXTERNAL**

- VUID-VkBufferMemoryBarrier2-None-09098

If the **VK_KHR_external_memory** extension is not enabled, and the value of **VkApplicationInfo::apiVersion** used to create the **VkInstance** is not greater than or equal to Version 1.1, **dstQueueFamilyIndex** **must** not be **VK_QUEUE_FAMILY_EXTERNAL**

- VUID-VkBufferMemoryBarrier2-srcQueueFamilyIndex-09099

If the **VK_EXT_queue_family_foreign** extension is not enabled **srcQueueFamilyIndex** **must** not be **VK_QUEUE_FAMILY_FOREIGN_EXT**

- VUID-VkBufferMemoryBarrier2-dstQueueFamilyIndex-09100

If the **VK_EXT_queue_family_foreign** extension is not enabled **dstQueueFamilyIndex** **must** not be **VK_QUEUE_FAMILY_FOREIGN_EXT**

- VUID-VkBufferMemoryBarrier2-srcStageMask-03851

If either **srcStageMask** or **dstStageMask** includes **VK_PIPELINE_STAGE_2_HOST_BIT**, **srcQueueFamilyIndex** and **dstQueueFamilyIndex** **must** be equal

Valid Usage (Implicit)

- VUID-VkBufferMemoryBarrier2-sType-sType

sType **must** be **VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER_2**

- VUID-VkBufferMemoryBarrier2-pNext-pNext

Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of **VkExternalMemoryAcquireUnmodifiedEXT** or **VkMemoryBarrierAccessFlags3KHR**

- VUID-VkBufferMemoryBarrier2-sType-unique

The **sType** value of each structure in the **pNext** chain **must** be unique

- VUID-VkBufferMemoryBarrier2-srcStageMask-parameter

srcStageMask **must** be a valid combination of **VkPipelineStageFlagBits2** values

- VUID-VkBufferMemoryBarrier2-srcAccessMask-parameter
srcAccessMask **must** be a valid combination of [VkAccessFlagBits2](#) values
- VUID-VkBufferMemoryBarrier2-dstStageMask-parameter
dstStageMask **must** be a valid combination of [VkPipelineStageFlagBits2](#) values
- VUID-VkBufferMemoryBarrier2-dstAccessMask-parameter
dstAccessMask **must** be a valid combination of [VkAccessFlagBits2](#) values
- VUID-VkBufferMemoryBarrier2-buffer-parameter
buffer **must** be a valid [VkBuffer](#) handle

The [VkBufferMemoryBarrier](#) structure is defined as:

WARNING

This functionality is superseded by [VkBufferMemoryBarrier2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkBufferMemoryBarrier {
    VkStructureType    sType;
    const void*        pNext;
    VkAccessFlags       srcAccessMask;
    VkAccessFlags       dstAccessMask;
    uint32_t            srcQueueFamilyIndex;
    uint32_t            dstQueueFamilyIndex;
    VkBuffer            buffer;
    VkDeviceSize        offset;
    VkDeviceSize        size;
} VkBufferMemoryBarrier;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of [VkAccessFlagBits](#) specifying a [source access mask](#).
- **dstAccessMask** is a bitmask of [VkAccessFlagBits](#) specifying a [destination access mask](#).
- **srcQueueFamilyIndex** is the source queue family for a [queue family ownership transfer](#).
- **dstQueueFamilyIndex** is the destination queue family for a [queue family ownership transfer](#).
- **buffer** is a handle to the buffer whose backing memory is affected by the barrier.
- **offset** is an offset in bytes into the backing memory for **buffer**; this is relative to the base offset as bound to the buffer (see [vkBindBufferMemory](#)).
- **size** is a size in bytes of the affected area of backing memory for **buffer**, or [VK_WHOLE_SIZE](#) to use the range from **offset** to the end of the buffer.

The first [access scope](#) is limited to access to memory through the specified buffer range, via access types in the [source access mask](#) specified by **srcAccessMask** and, if a [VkMemoryBarrierAccessFlags3KHR](#) is passed in **pNext**, **srcAccessMask3**. If the source access mask includes [VK_ACCESS_HOST_WRITE_BIT](#), a [memory domain operation](#) is performed where available

memory in the host domain is also made available to the device domain.

The second [access scope](#) is limited to access to memory through the specified buffer range, via access types in the [destination access mask](#) specified by [dstAccessMask](#) and, if a [VkMemoryBarrierAccessFlags3KHR](#) is passed in [pNext](#), [dstAccessMask3](#). If the destination access mask includes [VK_ACCESS_HOST_WRITE_BIT](#) or [VK_ACCESS_HOST_READ_BIT](#), a [memory domain operation](#) is performed where available memory in the device domain is also made available to the host domain.

NOTE

Host writes to device memory that was allocated without [VK_MEMORY_PROPERTY_HOST_COHERENT_BIT](#) have to be flushed with [vkFlushMappedMemoryRanges](#) before they can be accessed safely on the device. Similarly, device writes to such memory have to be invalidated with [vkInvalidateMappedMemoryRanges](#) before they can be accessed safely on the host.

Memory allocated with [VK_MEMORY_PROPERTY_HOST_COHERENT_BIT](#) does not need to have these additional operations performed.

If [srcQueueFamilyIndex](#) is not equal to [dstQueueFamilyIndex](#), and [srcQueueFamilyIndex](#) is equal to the current queue family, then the memory barrier defines a [queue family release operation](#) for the specified buffer range, and if [dependencyFlags](#) did not include [VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR](#), the second synchronization scope of the calling command does not apply to this operation.

If [dstQueueFamilyIndex](#) is not equal to [srcQueueFamilyIndex](#), and [dstQueueFamilyIndex](#) is equal to the current queue family, then the memory barrier defines a [queue family acquire operation](#) for the specified buffer range, and if [dependencyFlags](#) did not include [VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR](#), the first synchronization scope of the calling command does not apply to this operation.

Valid Usage

- VUID-VkBufferMemoryBarrier-offset-01187
[offset](#) **must** be less than the size of [buffer](#)
- VUID-VkBufferMemoryBarrier-size-01188
If [size](#) is not equal to [VK_WHOLE_SIZE](#), [size](#) **must** be greater than 0
- VUID-VkBufferMemoryBarrier-size-01189
If [size](#) is not equal to [VK_WHOLE_SIZE](#), [size](#) **must** be less than or equal to the size of [buffer](#) minus [offset](#)
- VUID-VkBufferMemoryBarrier-buffer-01931
If [buffer](#) is non-sparse then it **must** be bound completely and contiguously to a single [VkDeviceMemory](#) object
- VUID-VkBufferMemoryBarrier-buffer-09095
If [buffer](#) was created with a sharing mode of [VK_SHARING_MODE_EXCLUSIVE](#), and [srcQueueFamilyIndex](#) and [dstQueueFamilyIndex](#) are not equal, [srcQueueFamilyIndex](#) **must** be [VK_QUEUE_FAMILY_EXTERNAL](#), [VK_QUEUE_FAMILY_FOREIGN_EXT](#), or a valid queue

family

- VUID-VkBufferMemoryBarrier-buffer-09096

If **buffer** was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and **srcQueueFamilyIndex** and **dstQueueFamilyIndex** are not equal, **dstQueueFamilyIndex** **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family

- VUID-VkBufferMemoryBarrier-None-09097

If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, **srcQueueFamilyIndex** **must** not be `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkBufferMemoryBarrier-None-09098

If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, **dstQueueFamilyIndex** **must** not be `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkBufferMemoryBarrier-srcQueueFamilyIndex-09099

If the `VK_EXT_queue_family_foreign` extension is not enabled **srcQueueFamilyIndex** **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`

- VUID-VkBufferMemoryBarrier-dstQueueFamilyIndex-09100

If the `VK_EXT_queue_family_foreign` extension is not enabled **dstQueueFamilyIndex** **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`

- VUID-VkBufferMemoryBarrier-None-09049

If the `synchronization2` feature is not enabled, and **buffer** was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, at least one of **srcQueueFamilyIndex** and **dstQueueFamilyIndex** **must** be `VK_QUEUE_FAMILY_IGNORED`

- VUID-VkBufferMemoryBarrier-None-09050

If the `synchronization2` feature is not enabled, and **buffer** was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, **srcQueueFamilyIndex** **must** be `VK_QUEUE_FAMILY_IGNORED` or `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkBufferMemoryBarrier-None-09051

If the `synchronization2` feature is not enabled, and **buffer** was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, **dstQueueFamilyIndex** **must** be `VK_QUEUE_FAMILY_IGNORED` or `VK_QUEUE_FAMILY_EXTERNAL`

Valid Usage (Implicit)

- VUID-VkBufferMemoryBarrier-sType-sType

sType **must** be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER`

- VUID-VkBufferMemoryBarrier-pNext-pNext

pNext **must** be `NULL` or a pointer to a valid instance of `VkExternalMemoryAcquireUnmodifiedEXT`

- VUID-VkBufferMemoryBarrier-sType-unique

The **sType** value of each structure in the **pNext** chain **must** be unique

- VUID-VkBufferMemoryBarrier-buffer-parameter
buffer **must** be a valid [VkBuffer](#) handle

[VK_WHOLE_SIZE](#) is a special value indicating that the entire remaining length of a buffer or allocation following a given **offset** should be used. It **can** be specified for [VkBufferMemoryBarrier::size](#), [vkMapMemory::size](#), and other similar structures.

```
#define VK_WHOLE_SIZE          (~0ULL)
```

7.7.4. Image Memory Barriers

Image memory barriers only apply to memory accesses involving a specific image subresource range. That is, a memory dependency formed from an image memory barrier is [scoped](#) to access via the specified image subresource range. Image memory barriers **can** also be used to define [image layout transitions](#) or a [queue family ownership transfer](#) for the specified image subresource range.

The [VkImageMemoryBarrier2](#) structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkImageMemoryBarrier2 {
    VkStructureType    sType;
    const void*        pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2     srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2     dstAccessMask;
    VkImageLayout       oldLayout;
    VkImageLayout       newLayout;
    uint32_t            srcQueueFamilyIndex;
    uint32_t            dstQueueFamilyIndex;
    VkImage             image;
    VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier2;
```

```
// Provided by VK_KHR_synchronization2
// Equivalent to VkImageMemoryBarrier2
typedef VkImageMemoryBarrier2 VkImageMemoryBarrier2KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcStageMask** is a [VkPipelineStageFlags2](#) mask of pipeline stages to be included in the [first synchronization scope](#).
- **srcAccessMask** is a [VkAccessFlags2](#) mask of access flags to be included in the [first access scope](#).

- `dstStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the [second synchronization scope](#).
- `dstAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the [second access scope](#).
- `oldLayout` is the old layout in an [image layout transition](#).
- `newLayout` is the new layout in an [image layout transition](#).
- `srcQueueFamilyIndex` is the source queue family for a [queue family ownership transfer](#).
- `dstQueueFamilyIndex` is the destination queue family for a [queue family ownership transfer](#).
- `image` is a handle to the image affected by this barrier.
- `subresourceRange` describes the [image subresource range](#) within `image` that is affected by this barrier.

This structure defines a [memory dependency](#) limited to an image subresource range, and **can** define a [queue family ownership transfer operation](#) and [image layout transition](#) for that subresource range.

The first [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by the source stage mask and the source access mask.

The second [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by the destination stage mask and the destination access mask.

Both [access scopes](#) are limited to only memory accesses to `image` in the subresource range defined by `subresourceRange`.

If `image` was created with `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, this memory barrier defines a [queue family ownership transfer operation](#). When executed on a queue in the family identified by `srcQueueFamilyIndex`, this barrier defines a [queue family release operation](#) for the specified image subresource range, and if `VkDependencyInfoKHR::dependencyFlags` did not include `VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR`, the second synchronization scope does not apply to this operation. When executed on a queue in the family identified by `dstQueueFamilyIndex`, this barrier defines a [queue family acquire operation](#) for the specified image subresource range, and if `VkDependencyInfoKHR::dependencyFlags` did not include `VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR`, the first synchronization scope does not apply to this operation.

A [queue family ownership transfer operation](#) is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in [Queue Family Ownership Transfer](#). A [queue family release operation](#) is defined when `dstQueueFamilyIndex` is one of those values, and a [queue family acquire operation](#) is defined when `srcQueueFamilyIndex` is one of those values.

If `oldLayout` is not equal to `newLayout`, then the memory barrier defines an [image layout transition](#) for the specified image subresource range. If this memory barrier defines a [queue family ownership transfer operation](#), the layout transition is only executed once between the queues.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are equal and `oldLayout` and `newLayout` are also equal, the layout values are ignored and the image contents are preserved regardless of the values of `oldLayout`, `newLayout`, and the current layout of the image.

If `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` and the `maintenance9` feature is enabled, the `baseArrayLayer` and `layerCount` members of `subresourceRange` specify the subset of slices of the 3D image affected by the memory barrier, including the layout transition. Any slices of a 3D image not included in `subresourceRange` are not affected by the memory barrier and remain in their existing layout.

NOTE

Enabling the `maintenance9` feature modifies the behavior of image barriers targeting 3D images created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`. Previously, a `layerCount` equal to 1 would cover the entire 3D image, but this has a different meaning when the `maintenance9` feature is enabled. Linking this behavioral change solely to the `maintenance9` feature caused an unintended break in forward-compatibility. Validation layers are expected to flag a warning for the scenario where the `maintenance9` feature is not enabled, and the application uses `layerCount` equal to 1 on this kind of 3D image. `layerCount` can be set to `VK_REMAINING_ARRAY_LAYERS` instead, which has the same semantics with or without the extension. This validation check should make it feasible for software to avoid any breaking changes should the `maintenance9` feature be enabled in the future, either explicitly by application or by a layer outside the control of the application.

If `image` has a `multi-planar format` and the image is *disjoint*, then including `VK_IMAGE_ASPECT_COLOR_BIT` in the `aspectMask` member of `subresourceRange` is equivalent to including `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, and (for three-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`.

Valid Usage

- VUID-VkImageMemoryBarrier2-srcStageMask-03929
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- VUID-VkImageMemoryBarrier2-srcStageMask-03930
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkImageMemoryBarrier2-srcStageMask-03931
If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-VkImageMemoryBarrier2-srcStageMask-03932
If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkImageMemoryBarrier2-srcStageMask-03933
If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain

VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-VkImageMemoryBarrier2-srcStageMask-03934
If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`
- VUID-VkImageMemoryBarrier2-srcStageMask-03935
If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
- VUID-VkImageMemoryBarrier2-srcStageMask-07316
If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkImageMemoryBarrier2-srcStageMask-04957
If the `subpassShading` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`
- VUID-VkImageMemoryBarrier2-srcStageMask-04995
If the `invocationMask` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`
- VUID-VkImageMemoryBarrier2-srcStageMask-07946
If neither the `VK_NV_ray_tracing` extension or the `rayTracingPipeline` feature are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkImageMemoryBarrier2-srcStageMask-10751
If the `accelerationStructure` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`
- VUID-VkImageMemoryBarrier2-srcStageMask-10752
If the `rayTracingMaintenance1` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`
- VUID-VkImageMemoryBarrier2-srcStageMask-10753
If the `micromap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`
- VUID-VkImageMemoryBarrier2-srcAccessMask-03900
If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_COPY_INDIRECT_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkImageMemoryBarrier2-srcAccessMask-03901
If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `srcStageMask` **must** include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
- VUID-VkImageMemoryBarrier2-srcAccessMask-03902
If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `srcStageMask`

must include VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03903

If **srcAccessMask** includes VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03904

If **srcAccessMask** includes VK_ACCESS_2_UNIFORM_READ_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03905

If **srcAccessMask** includes VK_ACCESS_2_SHADER_SAMPLED_READ_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03906

If **srcAccessMask** includes VK_ACCESS_2_SHADER_STORAGE_READ_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03907

If **srcAccessMask** includes VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-07454

If **srcAccessMask** includes VK_ACCESS_2_SHADER_READ_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03909

If **srcAccessMask** includes VK_ACCESS_2_SHADER_WRITE_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03910

If **srcAccessMask** includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or

VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03911

If **srcAccessMask** includes VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03912

If **srcAccessMask** includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03913

If **srcAccessMask** includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03914

If **srcAccessMask** includes VK_ACCESS_2_TRANSFER_READ_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_CONVERT_COOPERATIVE_VECTOR_MATRIX_BIT_NV, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03915

If **srcAccessMask** includes VK_ACCESS_2_TRANSFER_WRITE_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_CONVERT_COOPERATIVE_VECTOR_MATRIX_BIT_NV, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03916

If **srcAccessMask** includes VK_ACCESS_2_HOST_READ_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03917

If **srcAccessMask** includes VK_ACCESS_2_HOST_WRITE_BIT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03918

If **srcAccessMask** includes VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT, **srcStageMask** **must** include VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or

VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03919

If **srcAccessMask** includes VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT,
srcStageMask **must** include
VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03920

If **srcAccessMask** includes VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT,
srcStageMask **must** include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or

If **dstAccessMask** includes `VK_ACCESS_2_SHADER_TILE_ATTACHMENT_READ_BIT_QCOM`, **dstStageMask** **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` or `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT`
- VUID-VkImageMemoryBarrier2-dstAccessMask-10671
If **dstAccessMask** includes `VK_ACCESS_2_SHADER_TILE_ATTACHMENT_WRITE_BIT_QCOM`, **dstStageMask** **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` or `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT`
- VUID-VkImageMemoryBarrier2-dstAccessMask-11771
If **dstAccessMask** includes `VK_ACCESS_2_MEMORY_DECOMPRESSION_READ_BIT_EXT`, **dstStageMask** **must** include `VK_PIPELINE_STAGE_2_MEMORY_DECOMPRESSION_BIT_EXT`
- VUID-VkImageMemoryBarrier2-dstAccessMask-11772
If **dstAccessMask** includes `VK_ACCESS_2_MEMORY_DECOMPRESSION_WRITE_BIT_EXT`, **dstStageMask** **must** include `VK_PIPELINE_STAGE_2_MEMORY_DECOMPRESSION_BIT_EXT`
- VUID-VkImageMemoryBarrier2-dstAccessMask-11294
If **dstAccessMask** includes `VK_ACCESS_2_SAMPLER_HEAP_READ_BIT_EXT` or `VK_ACCESS_2_RESOURCE_HEAP_READ_BIT_EXT`, **dstStageMask** **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
- VUID-VkImageMemoryBarrier2-oldLayout-01197
If layouts are not ignored, **oldLayout** **must** be `VK_IMAGE_LAYOUT_UNDEFINED` or the

current layout of the image subresources affected by the barrier

- VUID-VkImageMemoryBarrier2-newLayout-01198

If layouts are not ignored, **newLayout** must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- VUID-VkImageMemoryBarrier2-image-09117

If **image** was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and **srcQueueFamilyIndex** and **dstQueueFamilyIndex** are not equal, **srcQueueFamilyIndex** must be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family

- VUID-VkImageMemoryBarrier2-image-09118

If **image** was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and **srcQueueFamilyIndex** and **dstQueueFamilyIndex** are not equal, **dstQueueFamilyIndex** must be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family

- VUID-VkImageMemoryBarrier2-None-09097

If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, **srcQueueFamilyIndex** must not be `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkImageMemoryBarrier2-None-09098

If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, **dstQueueFamilyIndex** must not be `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-09099

If the `VK_EXT_queue_family_foreign` extension is not enabled **srcQueueFamilyIndex** must not be `VK_QUEUE_FAMILY_FOREIGN_EXT`

- VUID-VkImageMemoryBarrier2-dstQueueFamilyIndex-09100

If the `VK_EXT_queue_family_foreign` extension is not enabled **dstQueueFamilyIndex** must not be `VK_QUEUE_FAMILY_FOREIGN_EXT`

- VUID-VkImageMemoryBarrier2-subresourceRange-01486

subresourceRange.baseMipLevel must be less than the **mipLevels** specified in `VkImageCreateInfo` when **image** was created

- VUID-VkImageMemoryBarrier2-subresourceRange-01724

If **subresourceRange.levelCount** is not `VK_REMAINING_MIP_LEVELS`, **subresourceRange.baseMipLevel + subresourceRange.levelCount** must be less than or equal to the **mipLevels** specified in `VkImageCreateInfo` when **image** was created

- VUID-VkImageMemoryBarrier2-subresourceRange-01488

If **image** is not a 3D image or was created without `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, or the **maintenance9** feature is not enabled, **subresourceRange.baseArrayLayer** must be less than the **arrayLayers** specified in `VkImageCreateInfo` when **image** was created

- VUID-VkImageMemoryBarrier2-maintenance9-10798

If the **maintenance9** feature is enabled and **image** is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, **subresourceRange.baseArrayLayer**

must be less than the depth computed from `baseMipLevel` and `extent.depth` specified in `VkImageCreateInfo` when `image` was created, according to the formula defined in [Image Mip Level Sizing](#)

- VUID-VkImageMemoryBarrier2-maintenance9-10799

If the `maintenance9` feature is enabled and `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set and either `subresourceRange.baseArrayLayer` is not equal to 0 or `subresourceRange.layerCount` is not equal to `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.levelCount` **must** be 1

- VUID-VkImageMemoryBarrier2-subresourceRange-01725

If `image` is not a 3D image or was created without `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, or the `maintenance9` feature is not enabled, and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.baseArrayLayer` + `subresourceRange.layerCount` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created

- VUID-VkImageMemoryBarrier2-maintenance9-10800

If the `maintenance9` feature is enabled, `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, and `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, `subresourceRange.baseArrayLayer` + `subresourceRange.layerCount` **must** be less than or equal to the depth computed from `baseMipLevel` and `extent.depth` specified in `VkImageCreateInfo` when `image` was created, according to the formula defined in [Image Mip Level Sizing](#)

- VUID-VkImageMemoryBarrier2-image-01932

If `image` is non-sparse then the image or each specified *disjoint* plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkImageMemoryBarrier2-image-09241

If `image` has a color format that is single-plane, then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkImageMemoryBarrier2-image-09242

If `image` has a color format and is not *disjoint*, then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkImageMemoryBarrier2-image-01672

If `image` has a `multi-planar format` and the image is *disjoint*, then the `aspectMask` member of `subresourceRange` **must** include at least one `multi-planar aspect mask` bit or `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkImageMemoryBarrier2-image-03320

If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is not enabled, then the `aspectMask` member of `subresourceRange` **must** include both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkImageMemoryBarrier2-image-03319

If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is enabled, then the `aspectMask` member of `subresourceRange` **must** include either or both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkImageMemoryBarrier2-image-10749
If **image** has a depth-only format then the **aspectMask** member of **subresourceRange** **must** be **VK_IMAGE_ASPECT_DEPTH_BIT**
- VUID-VkImageMemoryBarrier2-image-10750
If **image** has a stencil-only format then the **aspectMask** member of **subresourceRange** **must** be **VK_IMAGE_ASPECT_STENCIL_BIT**
- VUID-VkImageMemoryBarrier2-aspectMask-08702
If the **aspectMask** member of **subresourceRange** includes **VK_IMAGE_ASPECT_DEPTH_BIT**, **oldLayout** and **newLayout** **must** not be one of **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**
- VUID-VkImageMemoryBarrier2-aspectMask-08703
If the **aspectMask** member of **subresourceRange** includes **VK_IMAGE_ASPECT_STENCIL_BIT**, **oldLayout** and **newLayout** **must** not be one of **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**
- VUID-VkImageMemoryBarrier2-subresourceRange-09601
subresourceRange.aspectMask **must** be valid for the **format** the **image** was created with
- VUID-VkImageMemoryBarrier2-oldLayout-01208
If **layouts** are not ignored, **oldLayout** or **newLayout** is **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL** then **image** **must** have been created with the **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** usage flag set
- VUID-VkImageMemoryBarrier2-oldLayout-01209
If **layouts** are not ignored, **oldLayout** or **newLayout** is **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL** then **image** **must** have been created with the **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT** usage flag set
- VUID-VkImageMemoryBarrier2-oldLayout-01210
If **layouts** are not ignored, **oldLayout** or **newLayout** is **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** then **image** **must** have been created with the **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT** usage flag set
- VUID-VkImageMemoryBarrier2-oldLayout-01211
If **layouts** are not ignored, **oldLayout** or **newLayout** is **VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL** then **image** **must** have been created with the **VK_IMAGE_USAGE_SAMPLED_BIT** or **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT** usage flag set
- VUID-VkImageMemoryBarrier2-oldLayout-01212
If **layouts** are not ignored, **oldLayout** or **newLayout** is **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL** then **image** **must** have been created with the **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** usage flag set
- VUID-VkImageMemoryBarrier2-oldLayout-01213
If **layouts** are not ignored, **oldLayout** or **newLayout** is **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL** then **image** **must** have been created with the **VK_IMAGE_USAGE_TRANSFER_DST_BIT** usage flag set

- VUID-VkImageMemoryBarrier2-oldLayout-10767
If the `zeroInitializeDeviceMemory` feature is not enabled, `oldLayout` **must** not be `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT`
- VUID-VkImageMemoryBarrier2-oldLayout-10768
If `oldLayout` is `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT`, then all subresources **must** be included in the barrier
- VUID-VkImageMemoryBarrier2-oldLayout-01658
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-VkImageMemoryBarrier2-oldLayout-01659
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04065
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` then `image` **must** have been created with at least one of the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flags set
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04066
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04067
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with at least one of the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flags set
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04068
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-VkImageMemoryBarrier2-synchronization2-07793
If the `synchronization2` feature is not enabled, `oldLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkImageMemoryBarrier2-synchronization2-07794
If the `synchronization2` feature is not enabled, `newLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03938
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL`, `image` **must** have been created with the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03939
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL`, `image` **must** have been created with at least one of the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flags set
- VUID-VkImageMemoryBarrier2-oldLayout-02088
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` usage flag set
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07120
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR` usage flag set
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07121
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR` usage flag set
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07122
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` usage flag set
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07123
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` usage flag set
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07124
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR` usage flag set
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07125
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR` usage flag set
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-10287
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_QUANTIZATION_MAP_KHR` then `image` **must** have been created with the

VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or
VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR usage flags set

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07006
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then `image` **must** have been created with either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flags set, and the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage flags set, and the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage flag set
- VUID-VkImageMemoryBarrier2-attachmentFeedbackLoopLayout-07313
If the `attachmentFeedbackLoopLayout` feature is not enabled, `newLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`
- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-09550
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ` then `image` **must** have been created with either the `VK_IMAGE_USAGE_STORAGE_BIT` usage flag set, or with both the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flag and either of the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flags set
- VUID-VkImageMemoryBarrier2-dynamicRenderingLocalRead-09551
If the `dynamicRenderingLocalRead` feature is not enabled, `oldLayout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ`
- VUID-VkImageMemoryBarrier2-dynamicRenderingLocalRead-09552
If the `dynamicRenderingLocalRead` feature is not enabled, `newLayout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ`
- VUID-VkImageMemoryBarrier2-srcStageMask-03854
If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be equal
- VUID-VkImageMemoryBarrier2-srcStageMask-03855
If `srcStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a `queue family ownership transfer` or `oldLayout` and `newLayout` define an `image layout transition`, `oldLayout` **must** be one of `VK_IMAGE_LAYOUT_PREINITIALIZED`, `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT`, `VK_IMAGE_LAYOUT_UNDEFINED`, or `VK_IMAGE_LAYOUT_GENERAL`

Valid Usage (Implicit)

- VUID-VkImageMemoryBarrier2-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER_2`
- VUID-VkImageMemoryBarrier2-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkExternalMemoryAcquireUnmodifiedEXT`,

[VkMemoryBarrierAccessFlags3KHR](#), or [VkSampleLocationsInfoEXT](#)

- VUID-VkImageMemoryBarrier2-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkImageMemoryBarrier2-srcStageMask-parameter
srcStageMask **must** be a valid combination of [VkPipelineStageFlagBits2](#) values
- VUID-VkImageMemoryBarrier2-srcAccessMask-parameter
srcAccessMask **must** be a valid combination of [VkAccessFlagBits2](#) values
- VUID-VkImageMemoryBarrier2-dstStageMask-parameter
dstStageMask **must** be a valid combination of [VkPipelineStageFlagBits2](#) values
- VUID-VkImageMemoryBarrier2-dstAccessMask-parameter
dstAccessMask **must** be a valid combination of [VkAccessFlagBits2](#) values
- VUID-VkImageMemoryBarrier2-oldLayout-parameter
oldLayout **must** be a valid [VkImageLayout](#) value
- VUID-VkImageMemoryBarrier2-newLayout-parameter
newLayout **must** be a valid [VkImageLayout](#) value
- VUID-VkImageMemoryBarrier2-image-parameter
image **must** be a valid [VkImage](#) handle
- VUID-VkImageMemoryBarrier2-subresourceRange-parameter
subresourceRange **must** be a valid [VkImageSubresourceRange](#) structure

The [VkImageMemoryBarrier](#) structure is defined as:

WARNING

This functionality is superseded by [VkImageMemoryBarrier2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkImageMemoryBarrier {
    VkStructureType    sType;
    const void*        pNext;
    VkAccessFlags       srcAccessMask;
    VkAccessFlags       dstAccessMask;
    VkImageLayout       oldLayout;
    VkImageLayout       newLayout;
    uint32_t            srcQueueFamilyIndex;
    uint32_t            dstQueueFamilyIndex;
    VkImage             image;
    VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of [VkAccessFlagBits](#) specifying a [source access mask](#).

- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [destination access mask](#).
- `oldLayout` is the old layout in an [image layout transition](#).
- `newLayout` is the new layout in an [image layout transition](#).
- `srcQueueFamilyIndex` is the source queue family for a [queue family ownership transfer](#).
- `dstQueueFamilyIndex` is the destination queue family for a [queue family ownership transfer](#).
- `image` is a handle to the image affected by this barrier.
- `subresourceRange` describes the [image subresource range](#) within `image` that is affected by this barrier.

The first [access scope](#) is limited to access to memory through the specified image subresource range, via access types in the [source access mask](#) specified by `srcAccessMask`. If `srcAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT`, memory writes performed by that access type are also made visible, as that access type is not performed through a resource.

The second [access scope](#) is limited to access to memory through the specified image subresource range, via access types in the [destination access mask](#) specified by `dstAccessMask`. If `dstAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT` or `VK_ACCESS_HOST_READ_BIT`, available memory writes are also made visible to accesses of those types, as those access types are not performed through a resource.

If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, and `srcQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a [queue family release operation](#) for the specified image subresource range, and if `dependencyFlags` did not include `VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR`, the second synchronization scope of the calling command does not apply to this operation.

If `dstQueueFamilyIndex` is not equal to `srcQueueFamilyIndex`, and `dstQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a [queue family acquire operation](#) for the specified image subresource range, and if `dependencyFlags` did not include `VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR`, the first synchronization scope of the calling command does not apply to this operation.

If the `synchronization2` feature is not enabled or `oldLayout` is not equal to `newLayout`, `oldLayout` and `newLayout` define an [image layout transition](#) for the specified image subresource range.

If the `synchronization2` feature is enabled, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are equal, and `oldLayout` and `newLayout` are also equal, the layout values are ignored and the image contents are preserved regardless of the values of `oldLayout`, `newLayout`, and the current layout of the image.

If `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` and the `maintenance9` feature is enabled, the `baseArrayLayer` and `layerCount` members of `subresourceRange` specify the subset of slices of the 3D image affected by the memory barrier, including the layout transition. Any slices of a 3D image not included in `subresourceRange` are not affected by the memory barrier and remain in their existing layout.

If `image` has a [multi-planar format](#) and the image is *disjoint*, then including `VK_IMAGE_ASPECT_COLOR_BIT` in the `aspectMask` member of `subresourceRange` is equivalent to

including `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, and (for three-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`.

Valid Usage

- VUID-VkImageMemoryBarrier-oldLayout-01197
If `layouts are not ignored`, `oldLayout` **must** be `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources affected by the barrier
- VUID-VkImageMemoryBarrier-newLayout-01198
If `layouts are not ignored`, `newLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT` or `VK_IMAGE_LAYOUT_PREINITIALIZED`
- VUID-VkImageMemoryBarrier-image-09117
If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `srcQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family
- VUID-VkImageMemoryBarrier-image-09118
If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_EXTERNAL`, `VK_QUEUE_FAMILY_FOREIGN_EXT`, or a valid queue family
- VUID-VkImageMemoryBarrier-None-09097
If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `srcQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL`
- VUID-VkImageMemoryBarrier-None-09098
If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_EXTERNAL`
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-09099
If the `VK_EXT_queue_family_foreign` extension is not enabled `srcQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`
- VUID-VkImageMemoryBarrier-dstQueueFamilyIndex-09100
If the `VK_EXT_queue_family_foreign` extension is not enabled `dstQueueFamilyIndex` **must** not be `VK_QUEUE_FAMILY_FOREIGN_EXT`
- VUID-VkImageMemoryBarrier-subresourceRange-01486
`subresourceRange.baseMipLevel` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkImageMemoryBarrier-subresourceRange-01724
If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` **must** be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkImageMemoryBarrier-subresourceRange-01488

If `image` is not a 3D image or was created without `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, or the `maintenance9` feature is not enabled, `subresourceRange.baseArrayLayer` **must** be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created

- VUID-VkImageMemoryBarrier-maintenance9-10798

If the `maintenance9` feature is enabled and `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, `subresourceRange.baseArrayLayer` **must** be less than the depth computed from `baseMipLevel` and `extent.depth` specified in `VkImageCreateInfo` when `image` was created, according to the formula defined in [Image Mip Level Sizing](#)

- VUID-VkImageMemoryBarrier-maintenance9-10799

If the `maintenance9` feature is enabled and `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set and either `subresourceRange.baseArrayLayer` is not equal to 0 or `subresourceRange.layerCount` is not equal to `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.levelCount` **must** be 1

- VUID-VkImageMemoryBarrier-subresourceRange-01725

If `image` is not a 3D image or was created without `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, or the `maintenance9` feature is not enabled, and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.baseArrayLayer` + `subresourceRange.layerCount` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created

- VUID-VkImageMemoryBarrier-maintenance9-10800

If the `maintenance9` feature is enabled, `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, and `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, `subresourceRange.baseArrayLayer` + `subresourceRange.layerCount` **must** be less than or equal to the depth computed from `baseMipLevel` and `extent.depth` specified in `VkImageCreateInfo` when `image` was created, according to the formula defined in [Image Mip Level Sizing](#)

- VUID-VkImageMemoryBarrier-image-01932

If `image` is non-sparse then the image or each specified *disjoint* plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkImageMemoryBarrier-image-09241

If `image` has a color format that is single-plane, then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkImageMemoryBarrier-image-09242

If `image` has a color format and is not *disjoint*, then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkImageMemoryBarrier-image-01672

If `image` has a [multi-planar format](#) and the image is *disjoint*, then the `aspectMask` member of `subresourceRange` **must** include at least one [multi-planar aspect mask](#) bit or `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkImageMemoryBarrier-image-03320

If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is not enabled, then the `aspectMask` member of

`subresourceRange` **must** include both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkImageMemoryBarrier-image-03319

If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is enabled, then the `aspectMask` member of `subresourceRange` **must** include either or both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkImageMemoryBarrier-image-10749

If `image` has a depth-only format then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_DEPTH_BIT`

- VUID-VkImageMemoryBarrier-image-10750

If `image` has a stencil-only format then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkImageMemoryBarrier-aspectMask-08702

If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_DEPTH_BIT`, `oldLayout` and `newLayout` **must** not be one of `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkImageMemoryBarrier-aspectMask-08703

If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, `oldLayout` and `newLayout` **must** not be one of `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

- VUID-VkImageMemoryBarrier-subresourceRange-09601

`subresourceRange.aspectMask` **must** be valid for the `format` the `image` was created with

- VUID-VkImageMemoryBarrier-oldLayout-01208

If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` usage flag set

- VUID-VkImageMemoryBarrier-oldLayout-01209

If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-VkImageMemoryBarrier-oldLayout-01210

If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-VkImageMemoryBarrier-oldLayout-01211

If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flag set

- VUID-VkImageMemoryBarrier-oldLayout-01212
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag set
- VUID-VkImageMemoryBarrier-oldLayout-01213
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag set
- VUID-VkImageMemoryBarrier-oldLayout-10767
If the `zeroInitializeDeviceMemory` feature is not enabled, `oldLayout` **must** not be `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT`
- VUID-VkImageMemoryBarrier-oldLayout-10768
If `oldLayout` is `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT`, then all subresources **must** be included in the barrier
- VUID-VkImageMemoryBarrier-oldLayout-01658
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-VkImageMemoryBarrier-oldLayout-01659
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04065
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` then `image` **must** have been created with at least one of the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flags set
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04066
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04067
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with at least one of the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flags set
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04068
If layouts are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-VkImageMemoryBarrier-synchronization2-07793
If the `synchronization2` feature is not enabled, `oldLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkImageMemoryBarrier-synchronization2-07794
If the `synchronization2` feature is not enabled, `newLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03938
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL`, `image` **must** have been created with the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03939
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL`, `image` **must** have been created with at least one of the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flags set
- VUID-VkImageMemoryBarrier-oldLayout-02088
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` usage flag set
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07120
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR` usage flag set
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07121
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR` usage flag set
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07122
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` usage flag set
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07123
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` usage flag set
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07124
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR` usage flag set

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07125
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR` usage flag set
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-10287
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_QUANTIZATION_MAP_KHR` then `image` **must** have been created with the `VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR` or `VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR` usage flags set
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07006
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then `image` **must** have been created with either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flags set, and the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage flags set, and the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage flag set
- VUID-VkImageMemoryBarrier-attachmentFeedbackLoopLayout-07313
If the `attachmentFeedbackLoopLayout` feature is not enabled, `newLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`
- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-09550
If `layouts` are not ignored, `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ` then `image` **must** have been created with either the `VK_IMAGE_USAGE_STORAGE_BIT` usage flag set, or with both the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flag and either of the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flags set
- VUID-VkImageMemoryBarrier-dynamicRenderingLocalRead-09551
If the `dynamicRenderingLocalRead` feature is not enabled, `oldLayout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ`
- VUID-VkImageMemoryBarrier-dynamicRenderingLocalRead-09552
If the `dynamicRenderingLocalRead` feature is not enabled, `newLayout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ`
- VUID-VkImageMemoryBarrier-None-09052
If the `synchronization2` feature is not enabled, and `image` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, at least one of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_IGNORED`
- VUID-VkImageMemoryBarrier-None-09053
If the `synchronization2` feature is not enabled, and `image` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, `srcQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_IGNORED` or `VK_QUEUE_FAMILY_EXTERNAL`
- VUID-VkImageMemoryBarrier-None-09054
If the `synchronization2` feature is not enabled, and `image` was created with a sharing mode

of `VK_SHARING_MODE_CONCURRENT`, `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_IGNORED` or `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkImageMemoryBarrier-dstQueueFamilyIndex-12331

If `dstQueueFamilyIndex` is `VK_QUEUE_FAMILY_EXTERNAL` and `image` was created with `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT` in `VkExternalMemoryImageCreateInfo::handleTypes`, `newLayout` **must** be `VK_IMAGE_LAYOUT_GENERAL`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-12332

If `srcQueueFamilyIndex` is `VK_QUEUE_FAMILY_EXTERNAL` and `image` was created with `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT` in `VkExternalMemoryImageCreateInfo::handleTypes`, `oldLayout` **must** be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_UNDEFINED`

Valid Usage (Implicit)

- VUID-VkImageMemoryBarrier-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER`

- VUID-VkImageMemoryBarrier-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkExternalMemoryAcquireUnmodifiedEXT` or `VkSampleLocationsInfoEXT`

- VUID-VkImageMemoryBarrier-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkImageMemoryBarrier-oldLayout-parameter

`oldLayout` **must** be a valid `VkImageLayout` value

- VUID-VkImageMemoryBarrier-newLayout-parameter

`newLayout` **must** be a valid `VkImageLayout` value

- VUID-VkImageMemoryBarrier-image-parameter

`image` **must** be a valid `VkImage` handle

- VUID-VkImageMemoryBarrier-subresourceRange-parameter

`subresourceRange` **must** be a valid `VkImageSubresourceRange` structure

To facilitate usage of images whose memory is initialized on the host, Vulkan allows image layout transitions to be performed by the host as well, albeit supporting limited layouts.

To perform an image layout transition on the host, call:

```
// Provided by VK_VERSION_1_4
VkResult vkTransitionImageLayout(
    VkDevice          device,
    uint32_t          transitionCount,
    const VkHostImageLayoutTransitionInfo* pTransitions);
```

```
// Provided by VK_EXT_host_image_copy
// Equivalent to vkTransitionImageLayout
VkResult vkTransitionImageLayoutEXT(
    VkDevice          device,
    uint32_t          transitionCount,
    const VkHostImageLayoutTransitionInfo* pTransitions);
```

- **device** is the device which owns **pTransitions[i].image**.
- **transitionCount** is the number of image layout transitions to perform.
- **pTransitions** is a pointer to an array of **VkHostImageLayoutTransitionInfo** structures specifying the image and **subresource ranges** within them to transition.

Valid Usage (Implicit)

- VUID-vkTransitionImageLayout-device-parameter **device** **must** be a valid **VkDevice** handle
- VUID-vkTransitionImageLayout-pTransitions-parameter **pTransitions** **must** be a valid pointer to an array of **transitionCount** valid **VkHostImageLayoutTransitionInfo** structures
- VUID-vkTransitionImageLayout-transitionCount-arraylength **transitionCount** **must** be greater than **0**

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_INITIALIZATION_FAILED**
- **VK_ERROR_MEMORY_MAP_FAILED**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The `VkHostImageLayoutTransitionInfo` structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkHostImageLayoutTransitionInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkImage              image;
    VkImageLayout        oldLayout;
    VkImageLayout        newLayout;
    VkImageSubresourceRange subresourceRange;
} VkHostImageLayoutTransitionInfo;
```

```
// Provided by VK_EXT_host_image_copy
// Equivalent to VkHostImageLayoutTransitionInfo
typedef VkHostImageLayoutTransitionInfo VkHostImageLayoutTransitionInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is a handle to the image affected by this layout transition.
- `oldLayout` is the old layout in an [image layout transition](#).
- `newLayout` is the new layout in an [image layout transition](#).
- `subresourceRange` describes the [image subresource range](#) within `image` that is affected by this layout transition.

`vkTransitionImageLayout` does not check whether the device memory associated with an image is currently in use before performing the layout transition. The application **must** guarantee that any previously submitted command that reads from or writes to this subresource has completed before the host performs the layout transition. The memory of `image` is accessed by the host as if [coherent](#).

If `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` and the `maintenance9` feature is enabled, the `baseArrayLayer` and `layerCount` members of `subresourceRange` specify the subset of slices of the 3D image affected by the memory barrier, including the layout transition. Any slices of a 3D image not included in `subresourceRange` are not affected by the memory barrier and remain in their existing layout.

NOTE

Image layout transitions performed on the host do not require queue family ownership transfers as the physical layout of the image will not vary between queue families for the layouts supported by this function.

NOTE

If the device has written to the image memory, it is not automatically made available to the host. Before this command can be called, a memory barrier for this image **must** have been issued on the device with the second [synchronization scope](#) including `VK_PIPELINE_STAGE_HOST_BIT` and `VK_ACCESS_HOST_READ_BIT`.

Because queue submissions [automatically make host memory visible to the device](#),

there would not be a need for a memory barrier before using the results of this layout transition on the device.

Valid Usage

- VUID-VkHostImageLayoutTransitionInfo-image-09055
`image` **must** have been created with the `VK_IMAGE_USAGE_HOST_TRANSFER_BIT` usage flag set
- VUID-VkHostImageLayoutTransitionInfo-subresourceRange-01486
`subresourceRange.baseMipLevel` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkHostImageLayoutTransitionInfo-subresourceRange-01724
If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` **must** be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkHostImageLayoutTransitionInfo-subresourceRange-01488
If `image` is not a 3D image or was created without `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, or the `maintenance9` feature is not enabled, `subresourceRange.baseArrayLayer` **must** be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkHostImageLayoutTransitionInfo-maintenance9-10798
If the `maintenance9` feature is enabled and `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, `subresourceRange.baseArrayLayer` **must** be less than the depth computed from `baseMipLevel` and `extent.depth` specified in `VkImageCreateInfo` when `image` was created, according to the formula defined in [Image Mip Level Sizing](#)
- VUID-VkHostImageLayoutTransitionInfo-maintenance9-10799
If the `maintenance9` feature is enabled and `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set and either `subresourceRange.baseArrayLayer` is not equal to 0 or `subresourceRange.layerCount` is not equal to `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.levelCount` **must** be 1
- VUID-VkHostImageLayoutTransitionInfo-subresourceRange-01725
If `image` is not a 3D image or was created without `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, or the `maintenance9` feature is not enabled, and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.baseArrayLayer + subresourceRange.layerCount` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkHostImageLayoutTransitionInfo-maintenance9-10800
If the `maintenance9` feature is enabled, `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, and `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, `subresourceRange.baseArrayLayer + subresourceRange.layerCount` **must** be less than or equal to the depth computed from `baseMipLevel` and `extent.depth` specified in `VkImageCreateInfo` when `image` was created, according to the formula defined in [Image Mip Level Sizing](#)

- VUID-VkHostImageLayoutTransitionInfo-image-01932
If **image** is non-sparse then the image or each specified *disjoint* plane **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-VkHostImageLayoutTransitionInfo-image-09241
If **image** has a color format that is single-plane, then the **aspectMask** member of **subresourceRange** **must** be **VK_IMAGE_ASPECT_COLOR_BIT**
- VUID-VkHostImageLayoutTransitionInfo-image-09242
If **image** has a color format and is not *disjoint*, then the **aspectMask** member of **subresourceRange** **must** be **VK_IMAGE_ASPECT_COLOR_BIT**
- VUID-VkHostImageLayoutTransitionInfo-image-01672
If **image** has a **multi-planar format** and the image is *disjoint*, then the **aspectMask** member of **subresourceRange** **must** include at least one **multi-planar aspect mask** bit or **VK_IMAGE_ASPECT_COLOR_BIT**
- VUID-VkHostImageLayoutTransitionInfo-image-03320
If **image** has a depth/stencil format with both depth and stencil and the **separateDepthStencilLayouts** feature is not enabled, then the **aspectMask** member of **subresourceRange** **must** include both **VK_IMAGE_ASPECT_DEPTH_BIT** and **VK_IMAGE_ASPECT_STENCIL_BIT**
- VUID-VkHostImageLayoutTransitionInfo-image-03319
If **image** has a depth/stencil format with both depth and stencil and the **separateDepthStencilLayouts** feature is enabled, then the **aspectMask** member of **subresourceRange** **must** include either or both **VK_IMAGE_ASPECT_DEPTH_BIT** and **VK_IMAGE_ASPECT_STENCIL_BIT**
- VUID-VkHostImageLayoutTransitionInfo-image-10749
If **image** has a depth-only format then the **aspectMask** member of **subresourceRange** **must** be **VK_IMAGE_ASPECT_DEPTH_BIT**
- VUID-VkHostImageLayoutTransitionInfo-image-10750
If **image** has a stencil-only format then the **aspectMask** member of **subresourceRange** **must** be **VK_IMAGE_ASPECT_STENCIL_BIT**
- VUID-VkHostImageLayoutTransitionInfo-aspectMask-08702
If the **aspectMask** member of **subresourceRange** includes **VK_IMAGE_ASPECT_DEPTH_BIT**, **oldLayout** and **newLayout** **must** not be one of **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**
- VUID-VkHostImageLayoutTransitionInfo-aspectMask-08703
If the **aspectMask** member of **subresourceRange** includes **VK_IMAGE_ASPECT_STENCIL_BIT**, **oldLayout** and **newLayout** **must** not be one of **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**
- VUID-VkHostImageLayoutTransitionInfo-subresourceRange-09601
subresourceRange.aspectMask **must** be valid for the **format** the **image** was created with
- VUID-VkHostImageLayoutTransitionInfo-oldLayout-01208
If **oldLayout** or **newLayout** is **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL** then

image **must** have been created with the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` usage flag set

- VUID-VkHostImageLayoutTransitionInfo-oldLayout-01209

If `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` then **image** **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-VkHostImageLayoutTransitionInfo-oldLayout-01210

If `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then **image** **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-VkHostImageLayoutTransitionInfo-oldLayout-01211

If `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then **image** **must** have been created with the `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flag set

- VUID-VkHostImageLayoutTransitionInfo-oldLayout-01212

If `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then **image** **must** have been created with the `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag set

- VUID-VkHostImageLayoutTransitionInfo-oldLayout-01213

If `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then **image** **must** have been created with the `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag set

- VUID-VkHostImageLayoutTransitionInfo-oldLayout-10767

If the `zeroInitializeDeviceMemory` feature is not enabled, `oldLayout` **must** not be `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT`

- VUID-VkHostImageLayoutTransitionInfo-oldLayout-10768

If `oldLayout` is `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT`, then all subresources **must** be included in the barrier

- VUID-VkHostImageLayoutTransitionInfo-oldLayout-01658

If `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` then **image** **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-VkHostImageLayoutTransitionInfo-oldLayout-01659

If `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then **image** **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-04065

If `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` then **image** **must** have been created with at least one of the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flags set

- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-04066
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` then **image** **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-04067
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then **image** **must** have been created with at least one of the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flags set
- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-04068
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` then **image** **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-VkHostImageLayoutTransitionInfo-synchronization2-07793
If the **synchronization2** feature is not enabled, **oldLayout** **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkHostImageLayoutTransitionInfo-synchronization2-07794
If the **synchronization2** feature is not enabled, **newLayout** **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-03938
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL`, **image** **must** have been created with the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-03939
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL`, **image** **must** have been created with at least one of the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flags set
- VUID-VkHostImageLayoutTransitionInfo-oldLayout-02088
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR` then **image** **must** have been created with the `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` usage flag set
- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-07120
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR` then **image** **must** have been created with the `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR` usage flag set
- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-07121
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR` then **image** **must** have been created with the `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`

usage flag set

- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-07122
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR` then **image must** have been created with the `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` usage flag set
- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-07123
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR` then **image must** have been created with the `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` usage flag set
- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-07124
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR` then **image must** have been created with the `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR` usage flag set
- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-07125
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` then **image must** have been created with the `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR` usage flag set
- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-10287
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_QUANTIZATION_MAP_KHR` then **image must** have been created with the `VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR` or `VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR` usage flags set
- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-07006
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then **image must** have been created with either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flags set, and the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage flags set, and the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage flag set
- VUID-VkHostImageLayoutTransitionInfo-attachmentFeedbackLoopLayout-07313
If the **attachmentFeedbackLoopLayout** feature is not enabled, **newLayout must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`
- VUID-VkHostImageLayoutTransitionInfo-srcQueueFamilyIndex-09550
If **oldLayout** or **newLayout** is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ` then **image must** have been created with either the `VK_IMAGE_USAGE_STORAGE_BIT` usage flag set, or with both the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flag and either of the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flags set
- VUID-VkHostImageLayoutTransitionInfo-dynamicRenderingLocalRead-09551
If the **dynamicRenderingLocalRead** feature is not enabled, **oldLayout must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ`
- VUID-VkHostImageLayoutTransitionInfo-dynamicRenderingLocalRead-09552

If the `dynamicRenderingLocalRead` feature is not enabled, `newLayout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ`

- VUID-VkHostImageLayoutTransitionInfo-oldLayout-09229
`oldLayout` **must** be either `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources as specified in `subresourceRange`
- VUID-VkHostImageLayoutTransitionInfo-oldLayout-09230
If `oldLayout` is not `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`, it **must** be one of the layouts in `VkPhysicalDeviceHostImageCopyProperties::pCopySrcLayouts`
- VUID-VkHostImageLayoutTransitionInfo-newLayout-09057
`newLayout` **must** be one of the layouts in `VkPhysicalDeviceHostImageCopyProperties::pCopyDstLayouts`

Valid Usage (Implicit)

- VUID-VkHostImageLayoutTransitionInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_HOST_IMAGE_LAYOUT_TRANSITION_INFO`
- VUID-VkHostImageLayoutTransitionInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkHostImageLayoutTransitionInfo-image-parameter
`image` **must** be a valid `VkImage` handle
- VUID-VkHostImageLayoutTransitionInfo-oldLayout-parameter
`oldLayout` **must** be a valid `VkImageLayout` value
- VUID-VkHostImageLayoutTransitionInfo-newLayout-parameter
`newLayout` **must** be a valid `VkImageLayout` value
- VUID-VkHostImageLayoutTransitionInfo-subresourceRange-parameter
`subresourceRange` **must** be a valid `VkImageSubresourceRange` structure

7.7.5. Tensor Memory Barriers

Tensor memory barriers only apply to memory accesses involving a specific tensor. That is, a memory dependency formed from a tensor memory barrier is `scoped` to access via the specified tensor. Tensor memory barriers **can** also be used to define a `queue family ownership transfer` for the specified tensor.

The `VkTensorMemoryBarrierARM` structure is defined as:

```
// Provided by VK_ARM_tensors
typedef struct VkTensorMemoryBarrierARM {
    VkStructureType      sType;
    const void*          pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2       srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2       dstAccessMask;
    uint32_t             srcQueueFamilyIndex;
    uint32_t             dstQueueFamilyIndex;
    VkTensorARM          tensor;
} VkTensorMemoryBarrierARM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the [first synchronization scope](#).
- `srcAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the [first access scope](#).
- `dstStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the [second synchronization scope](#).
- `dstAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the [second access scope](#).
- `srcQueueFamilyIndex` is the source queue family for a [queue family ownership transfer](#).
- `dstQueueFamilyIndex` is the destination queue family for a [queue family ownership transfer](#).
- `tensor` is a handle to the tensor whose backing memory is affected by the barrier.

The first [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by `srcStageMask` and `srcAccessMask`.

The second [synchronization scope](#) and [access scope](#) described by this structure include only operations and memory accesses specified by `dstStageMask` and `dstAccessMask`.

Both [access scopes](#) are limited to only memory accesses to `tensor`.

If `tensor` was created with `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, this memory barrier defines a [queue family transfer operation](#). When executed on a queue in the family identified by `srcQueueFamilyIndex`, this barrier defines a [queue family release operation](#) for the specified tensor, and the second synchronization and access scopes do not synchronize operations on that queue. When executed on a queue in the family identified by `dstQueueFamilyIndex`, this barrier defines a [queue family acquire operation](#) for the specified tensor, and the first synchronization and access scopes do not synchronize operations on that queue.

A [queue family transfer operation](#) is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in [Queue Family Ownership Transfer](#). A [queue family release operation](#) is defined when `dstQueueFamilyIndex` is one of those values, and a [queue family acquire operation](#) is defined when

`srcQueueFamilyIndex` is one of those values.

Valid Usage

- VUID-VkTensorMemoryBarrierARM-tensor-09755
If `tensor` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** both be `VK_QUEUE_FAMILY_IGNORED`
- VUID-VkTensorMemoryBarrierARM-tensor-09756
If `tensor` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** both be either `VK_QUEUE_FAMILY_IGNORED`, or a valid queue family (see [Queue Family Properties](#))
- VUID-VkTensorMemoryBarrierARM-tensor-09757
If `tensor` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not `VK_QUEUE_FAMILY_IGNORED`, at least one of them **must** be the same as the family of the queue that will execute this barrier
- VUID-VkTensorMemoryBarrierARM-tensor-09758
If `tensor` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

Valid Usage (Implicit)

- VUID-VkTensorMemoryBarrierARM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_TENSOR_MEMORY_BARRIER_ARM`
- VUID-VkTensorMemoryBarrierARM-srcStageMask-parameter
`srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkTensorMemoryBarrierARM-srcAccessMask-parameter
`srcAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values
- VUID-VkTensorMemoryBarrierARM-dstStageMask-parameter
`dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-VkTensorMemoryBarrierARM-dstAccessMask-parameter
`dstAccessMask` **must** be a valid combination of `VkAccessFlagBits2` values
- VUID-VkTensorMemoryBarrierARM-tensor-parameter
`tensor` **must** be a valid `VkTensorARM` handle

Structure Chaining

Extends the structure

- `VkDependencyInfo`

The `VkTensorDependencyInfoARM` structure is defined as:

```
// Provided by VK_ARM_tensors
typedef struct VkTensorDependencyInfoARM {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                  tensorMemoryBarrierCount;
    const VkTensorMemoryBarrierARM* pTensorMemoryBarriers;
} VkTensorDependencyInfoARM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `tensorMemoryBarrierCount` is the length of the `pTensorMemoryBarriers` array.
- `pTensorMemoryBarriers` is a pointer to an array of `VkTensorMemoryBarrierARM` structures defining memory dependencies between tensors.

Valid Usage (Implicit)

- VUID-VkTensorDependencyInfoARM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_TENSOR_DEPENDENCY_INFO_ARM`
- VUID-VkTensorDependencyInfoARM-pTensorMemoryBarriers-parameter
`pTensorMemoryBarriers` **must** be a valid pointer to an array of `tensorMemoryBarrierCount` valid `VkTensorMemoryBarrierARM` structures
- VUID-VkTensorDependencyInfoARM-tensorMemoryBarrierCount-arraylength
`tensorMemoryBarrierCount` **must** be greater than 0

Structure Chaining

Extends the structure

- `VkDependencyInfo`

7.7.6. Queue Family Ownership Transfer

Resources created with a `VkSharingMode` of `VK_SHARING_MODE_EXCLUSIVE` **must** have their ownership explicitly transferred from one queue family to another in order to access their content in a well-defined manner on a queue in a different queue family.

The special queue family index `VK_QUEUE_FAMILY_IGNORED` indicates that a queue family parameter or member is ignored.

```
#define VK_QUEUE_FAMILY_IGNORED          (~0U)
```

Resources shared with external APIs or instances using external memory **must** also explicitly manage ownership transfers between local and external queues (or equivalent constructs in

external APIs) regardless of the [VkSharingMode](#) specified when creating them.

The special queue family index [VK_QUEUE_FAMILY_EXTERNAL](#) represents any queue external to the resource's current Vulkan instance, as long as the queue uses the same underlying device group or physical device, and the same driver version as the resource's [VkDevice](#), as indicated by [VkPhysicalDeviceIDProperties::deviceUUID](#) and [VkPhysicalDeviceIDProperties::driverUUID](#).

```
#define VK_QUEUE_FAMILY_EXTERNAL        (~1U)
```

```
#define VK_QUEUE_FAMILY_EXTERNAL_KHR    VK_QUEUE_FAMILY_EXTERNAL
```

The special queue family index [VK_QUEUE_FAMILY_FOREIGN_EXT](#) represents any queue external to the resource's current Vulkan instance, regardless of the queue's underlying physical device or driver version. This includes, for example, queues for fixed-function image processing devices, media codec devices, and display devices, as well as all queues that use the same underlying device group or physical device, and the same driver version as the resource's [VkDevice](#).

```
#define VK_QUEUE_FAMILY_FOREIGN_EXT    (~2U)
```

If memory dependencies are correctly expressed between uses of such a resource between two queues in different families, but no ownership transfer is defined, the contents of that resource are undefined for any read accesses performed by the second queue family.

NOTE	If an application does not need the contents of a resource to remain valid when transferring from one queue family to another, then the ownership transfer should be skipped.
NOTE	Applications should expect transfers to/from VK_QUEUE_FAMILY_FOREIGN_EXT to be more expensive than transfers to/from VK_QUEUE_FAMILY_EXTERNAL_KHR .

A queue family ownership transfer consists of two distinct parts:

1. Release exclusive ownership from the source queue family
2. Acquire exclusive ownership for the destination queue family

An application **must** ensure that these operations occur in the correct order by defining an execution dependency between them, e.g. using a semaphore.

A *release operation* is used to release exclusive ownership of a range of a buffer or image subresource range. A release operation is defined by executing a [buffer memory barrier](#) (for a buffer range) or an [image memory barrier](#) (for an image subresource range) using a pipeline barrier command, on a queue from the source queue family. The [srcQueueFamilyIndex](#) parameter of the barrier **must** be the source queue family index, and the [dstQueueFamilyIndex](#) parameter to the destination queue family index. The destination access mask is ignored for such a barrier, such that no visibility operation is executed - the value of this mask does not affect the validity of the barrier.

The release operation happens-after the availability operation. If `dependencyFlags` does not include `VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR`, `dstStageMask` is also ignored for such a barrier as defined by [buffer memory ownership transfer](#) and [image memory ownership transfer](#). After a release operation is performed, the contents and image layout (if applicable) of the released resource are undefined until a matching acquire operation is performed.

NOTE

It is valid to never call the acquire operation after a release, and instead simply start using the resource on any queue (even the releasing queue), but the contents should be reinitialized before being read. In the case of images, an image layout transition away from `VK_IMAGE_LAYOUT_UNDEFINED` is also required. Executing an acquire operation after this without another release is invalid.

An *acquire operation* is used to acquire exclusive ownership of a range of a buffer or image subresource range. An acquire operation is defined by executing a [buffer memory barrier](#) (for a buffer range) or an [image memory barrier](#) (for an image subresource range) using a pipeline barrier command, on a queue from the destination queue family. The buffer range or image subresource range specified in an acquire operation **must** match exactly that of a previous release operation. The `srcQueueFamilyIndex` parameter of the barrier **must** be the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. The source access mask is ignored for such a barrier, such that no availability operation is executed - the value of this mask does not affect the validity of the barrier. The acquire operation happens-before the visibility operation. If `dependencyFlags` does not include `VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR`, `srcStageMask` is also ignored for such a barrier as defined by [buffer memory ownership transfer](#) and [image memory ownership transfer](#). Applications **must** not execute an acquire operation on any resource where it has been modified in any way other than a matching release operation.

NOTE

Whilst it is not invalid to provide destination or source access masks for memory barriers used for release or acquire operations, respectively, they have no practical effect. Access after a release operation has undefined results, and so visibility for those accesses has no practical effect. Similarly, write access before an acquire operation will produce undefined results for future access, so availability of those writes has no practical use. In an earlier version of the specification, these were required to match on both sides - but this was subsequently relaxed. These masks **should** be set to 0.

NOTE

To ensure that an acquire and release operation are valid, the release operation must happen-before the acquire operation. Often, semaphores are used for this directly, with the semaphore signaling after a release and then waiting before an acquire. Prior to the introduction of `VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR`, `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` is the only valid stage to wait on or wait for these operations, as the acquire and release operations do not occur in a defined stage. When `VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR` is specified however, these can be synchronized with the stages which would

otherwise be ignored, as these stages now synchronize the acquire and release operations, providing a way to avoid full pipeline stalls.

If the transfer is via an image memory barrier, and an [image layout transition](#) is desired, then the values of `oldLayout` and `newLayout` in the *release operation*'s memory barrier **must** be equal to values of `oldLayout` and `newLayout` in the *acquire operation*'s memory barrier. Although the image layout transition is submitted twice, it will only be executed once. A layout transition specified in this way happens-after the *release operation* and happens-before the *acquire operation*.

If the values of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are equal, no ownership transfer is performed, and the barrier operates as if they were both set to `VK_QUEUE_FAMILY_IGNORED`.

Queue family ownership transfers **may** perform read and write accesses on all memory bound to the image subresource or buffer range, so applications **must** ensure that all memory writes have been made [available](#) before a queue family ownership transfer is executed. Available memory is automatically made visible to queue family release and acquire operations, and writes performed by those operations are automatically made available.

Once a queue family has acquired ownership of a buffer range or image subresource range of a `VK_SHARING_MODE_EXCLUSIVE` resource, its contents are undefined to other queue families unless ownership is transferred. The contents of any portion of another resource which aliases memory that is bound to the transferred buffer or image subresource range are undefined after a release or acquire operation.

NOTE

Because [events](#) **cannot** be used directly for inter-queue synchronization, and because `vkCmdSetEvent` does not have the queue family index or memory barrier parameters needed by a *release operation*, the release and acquire operations of a queue family ownership transfer **can** only be performed using `vkCmdPipelineBarrier`.

An *acquire operation* **may** have a performance penalty when acquiring ownership of a subresource range from one of the special queue families reserved for external memory ownership transfers described above. The application **can** reduce the performance penalty in some cases by adding a `VkExternalMemoryAcquireUnmodifiedEXT` structure to the `pNext` chain of the *acquire operation*'s memory barrier structure.

The `VkExternalMemoryAcquireUnmodifiedEXT` structure is defined as:

```
// Provided by VK_EXT_external_memory_acquire_unmodified
typedef struct VkExternalMemoryAcquireUnmodifiedEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           acquireUnmodifiedMemory;
} VkExternalMemoryAcquireUnmodifiedEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `acquireUnmodifiedMemory` specifies, if `VK_TRUE`, that no range of `VkDeviceMemory` bound to the resource of the memory barrier's subresource range was modified at any time since the resource's most recent release of ownership to the queue family specified by the memory barrier's `srcQueueFamilyIndex`. If `VK_FALSE`, it specifies nothing.

If the application releases ownership of the subresource range to one of the special queue families reserved for external memory ownership transfers with a memory barrier structure, and later re-acquires ownership from the same queue family with a memory barrier structure, and if no range of `VkDeviceMemory` bound to the resource was modified at any time between the *release operation* and the *acquire operation*, then the application **should** add a `VkExternalMemoryAcquireUnmodifiedEXT` structure to the `pNext` chain of the *acquire operation's* memory barrier structure because this **may** reduce the performance penalty.

This structure is ignored if `acquireUnmodifiedMemory` is `VK_FALSE`. In particular, `VK_FALSE` does *not* specify that memory was modified.

This structure is ignored if the memory barrier's `srcQueueFamilyIndex` is not a special queue family reserved for external memory ownership transfers.

NOTE

The method by which the application determines whether memory was modified between the *release operation* and *acquire operation* is outside the scope of Vulkan.

For any Vulkan operation that accesses a resource, the application **must** not assume the implementation accesses the resource's memory as read-only, even for *apparently* read-only operations such as transfer commands and shader reads.

The validity of `VkExternalMemoryAcquireUnmodifiedEXT::acquireUnmodifiedMemory` is independent of memory ranges outside the ranges of `VkDeviceMemory` bound to the resource. In particular, it is independent of any implementation-private memory associated with the resource.

Valid Usage

- VUID-VkExternalMemoryAcquireUnmodifiedEXT-acquireUnmodifiedMemory-08922
If `acquireUnmodifiedMemory` is `VK_TRUE`, and the memory barrier's `srcQueueFamilyIndex` is a special queue family reserved for external memory ownership transfers (as described in [Queue Family Ownership Transfer](#)), then each range of `VkDeviceMemory` bound to the resource **must** have remained unmodified during all time since the resource's most recent release of ownership to the queue family

Valid Usage (Implicit)

- VUID-VkExternalMemoryAcquireUnmodifiedEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_ACQUIRE_UNMODIFIED_EXT`

Structure Chaining

Extends the structures

- [VkBufferMemoryBarrier](#)
- [VkBufferMemoryBarrier2](#)
- [VkImageMemoryBarrier](#)
- [VkImageMemoryBarrier2](#)

7.8. Wait Idle Operations

To wait on the host for the completion of outstanding queue operations for a given queue, call:

```
// Provided by VK_VERSION_1_0
VkResult vkQueueWaitIdle(
    VkQueue queue);
```

- **queue** is the queue on which to wait.

vkQueueWaitIdle is equivalent to having submitted a valid fence to every previously executed [queue submission command](#) that accepts a fence, then waiting for all of those fences to signal using [vkWaitForFences](#) with an infinite timeout and **waitAll** set to [VK_TRUE](#).

NOTE

Even though [vkQueuePresentKHR](#) does not have a fence parameter, it does accept a fence through [VkSwapchainPresentFenceInfoEXT](#).

Valid Usage (Implicit)

- VUID-vkQueueWaitIdle-queue-parameter **queue** must be a valid [VkQueue](#) handle

Host Synchronization

- Host access to **queue** must be externally synchronized if it was not created with [VK_DEVICE_QUEUE_CREATE INTERNALLY SYNCHRONIZED_BIT_KHR](#)

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
-	-	-	Any	-

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

To wait on the host for the completion of outstanding queue operations for all queues on a given logical device, call:

```
// Provided by VK_VERSION_1_0
VkResult vkDeviceWaitIdle(
    VkDevice device);
```

- **device** is the logical device to idle.

vkDeviceWaitIdle is equivalent to calling **vkQueueWaitIdle** for all queues owned by **device**.

Valid Usage (Implicit)

- VUID-vkDeviceWaitIdle-device-parameter **device** **must** be a valid [VkDevice](#) handle

Host Synchronization

- Host access to all [VkQueue](#) objects created from **device** that are not created with [VK_DEVICE_QUEUE_CREATE INTERNALLY SYNCHRONIZED_BIT_KHR](#) **must** be externally synchronized

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

7.9. Host Write Ordering Guarantees

When batches of command buffers are submitted to a queue via a [queue submission command](#), it defines a memory dependency with prior host operations, and execution of command buffers submitted to the queue.

The first [synchronization scope](#) includes execution of [vkQueueSubmit](#) on the host and anything that happened-before it, as defined by the host memory model.

NOTE

Some systems allow writes that do not directly integrate with the host memory model; these have to be synchronized by the application manually. One example of this is non-temporal store instructions on x86; to ensure these happen-before submission, applications should call [_mm_sfence\(\)](#).

The second [synchronization scope](#) includes all commands submitted in the same [queue submission](#), and all commands that occur later in [submission order](#).

The first [access scope](#) includes all host writes to mappable device memory that are available to the host memory domain.

The second [access scope](#) includes all memory access performed by the device.

7.10. Synchronization and Multiple Physical Devices

If a logical device includes more than one physical device, then fences, semaphores, and events all still have a single instance of the signaled state.

A fence becomes signaled when all physical devices complete the necessary queue operations.

Semaphore wait and signal operations all include a device index that is the sole physical device that performs the operation. These indices are provided in the [VkDeviceGroupSubmitInfo](#) and [VkDeviceGroupBindSparseInfo](#) structures. Semaphores are not exclusively owned by any physical device. For example, a semaphore can be signaled by one physical device and then waited on by a different physical device.

An event **can** only be waited on by the same physical device that signaled it (or the host).

7.11. Calibrated Timestamps

In order to be able to correlate the time a particular operation took place at on timelines of different time domains (e.g. a device operation vs. a host operation), Vulkan allows querying calibrated timestamps from multiple time domains.

To query calibrated timestamps from a set of time domains, call:

```
// Provided by VK_KHR_calibrated_timestamps
VkResult vkGetCalibratedTimestampsKHR(
    VkDevice          device,
    uint32_t          timestampCount,
    const VkCalibratedTimestampInfoKHR* pTimestampInfos,
    uint64_t*          pTimestamps,
    uint64_t*          pMaxDeviation);
```

```
// Provided by VK_EXT_calibrated_timestamps
// Equivalent to vkGetCalibratedTimestampsKHR
VkResult vkGetCalibratedTimestampsEXT(
    VkDevice          device,
    uint32_t          timestampCount,
    const VkCalibratedTimestampInfoKHR* pTimestampInfos,
    uint64_t*          pTimestamps,
    uint64_t*          pMaxDeviation);
```

- **device** is the logical device used to perform the query.
- **timestampCount** is the number of timestamps to query.
- **pTimestampInfos** is a pointer to an array of **timestampCount** [VkCalibratedTimestampInfoKHR](#) structures, describing the time domains the calibrated timestamps should be captured from.
- **pTimestamps** is a pointer to an array of **timestampCount** 64-bit unsigned integer values in which the requested calibrated timestamp values are returned.
- **pMaxDeviation** is a pointer to a 64-bit unsigned integer value in which the strictly positive maximum deviation, in nanoseconds, of the calibrated timestamp values is returned.

NOTE

The maximum deviation **may** vary between calls to [vkGetCalibratedTimestampsKHR](#) even for the same set of time domains due to implementation and platform specific reasons. It is the application's responsibility to assess whether the returned maximum deviation makes the timestamp values suitable for any particular purpose and **can** choose to re-issue the timestamp calibration call pursuing a lower deviation value.

Calibrated timestamp values **can** be extrapolated to estimate future coinciding timestamp values, however, depending on the nature of the time domains and other properties of the platform extrapolating values over a sufficiently long period of time **may** no longer be accurate enough to fit any particular purpose, so applications are expected to re-calibrate the timestamps on a regular basis.

Valid Usage

- VUID-vkGetCalibratedTimestampsKHR-timeDomain-09246
The **timeDomain** value of each [VkCalibratedTimestampInfoKHR](#) in **pTimestampInfos** **must** be

unique except for those with a value of `VK_TIME_DOMAIN_PRESENT_STAGE_LOCAL_EXT`

Valid Usage (Implicit)

- `VUID-vkGetCalibratedTimestampsKHR-device-parameter`
`device` **must** be a valid `VkDevice` handle
- `VUID-vkGetCalibratedTimestampsKHR-pTimestampInfos-parameter`
`pTimestampInfos` **must** be a valid pointer to an array of `timestampCount` valid `VkCalibratedTimestampInfoKHR` structures
- `VUID-vkGetCalibratedTimestampsKHR-pTimestamps-parameter`
`pTimestamps` **must** be a valid pointer to an array of `timestampCount` `uint64_t` values
- `VUID-vkGetCalibratedTimestampsKHR-pMaxDeviation-parameter`
`pMaxDeviation` **must** be a valid pointer to a `uint64_t` value
- `VUID-vkGetCalibratedTimestampsKHR-timestampCount-arraylength`
`timestampCount` **must** be greater than `0`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkCalibratedTimestampInfoKHR` structure is defined as:

```
// Provided by VK_KHR_calibrated_timestamps
typedef struct VkCalibratedTimestampInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkTimeDomainKHR    timeDomain;
} VkCalibratedTimestampInfoKHR;
```

```
// Provided by VK_EXT_calibrated_timestamps
// Equivalent to VkCalibratedTimestampInfoKHR
typedef VkCalibratedTimestampInfoKHR VkCalibratedTimestampInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `timeDomain` is a `VkTimeDomainKHR` value specifying the time domain from which the calibrated timestamp value should be returned.

Valid Usage

- VUID-VkCalibratedTimestampInfoKHR-timeDomain-02354
`timeDomain` **must** be one of the `VkTimeDomainKHR` values returned by `vkGetPhysicalDeviceCalibrateableTimeDomainsKHR`
- VUID-VkCalibratedTimestampInfoKHR-timeDomain-12227
If `timeDomain` is `VK_TIME_DOMAIN_SWAPCHAIN_LOCAL_EXT` or `VK_TIME_DOMAIN_PRESENT_STAGE_LOCAL_EXT`, the `pNext` chain **must** include a `VkSwapchainCalibratedTimestampInfoEXT` structure

Valid Usage (Implicit)

- VUID-VkCalibratedTimestampInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_CALIBRATED_TIMESTAMP_INFO_KHR`
- VUID-VkCalibratedTimestampInfoKHR-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkSwapchainCalibratedTimestampInfoEXT`
- VUID-VkCalibratedTimestampInfoKHR-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkCalibratedTimestampInfoKHR-timeDomain-parameter
`timeDomain` **must** be a valid `VkTimeDomainKHR` value

The set of supported time domains consists of:

```
// Provided by VK_KHR_calibrated_timestamps
typedef enum VkTimeDomainKHR {
    VK_TIME_DOMAIN_DEVICE_KHR = 0,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR = 1,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR = 2,
    VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR = 3,
// Provided by VK_EXT_present_timing
    VK_TIME_DOMAIN_PRESENT_STAGE_LOCAL_EXT = 1000208000,
// Provided by VK_EXT_present_timing
    VK_TIME_DOMAIN_SWAPCHAIN_LOCAL_EXT = 1000208001,
// Provided by VK_EXT_calibrated_timestamps
    VK_TIME_DOMAIN_DEVICE_EXT = VK_TIME_DOMAIN_DEVICE_KHR,
// Provided by VK_EXT_calibrated_timestamps
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_EXT = VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR,
// Provided by VK_EXT_calibrated_timestamps
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_EXT = VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR,
// Provided by VK_EXT_calibrated_timestamps
    VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_EXT =
VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR,
} VkTimeDomainKHR;
```

```
// Provided by VK_EXT_calibrated_timestamps
// Equivalent to VkTimeDomainKHR
typedef VkTimeDomainKHR VkTimeDomainEXT;
```

- [VK_TIME_DOMAIN_DEVICE_KHR](#) specifies the device time domain. Timestamp values in this time domain use the same units and are comparable with device timestamp values captured using [vkCmdWriteTimestamp](#) or [vkCmdWriteTimestamp2](#) and are defined to be incrementing according to the [timestampPeriod](#) of the device.
- [VK_TIME_DOMAIN_PRESENT_STAGE_LOCAL_EXT](#) specifies a time domain unique to a particular swapchain and a specific present stage. Timestamp values in this time domain are in units of nanosecond and are comparable only with other values from the same swapchain and present stage.
- [VK_TIME_DOMAIN_SWAPCHAIN_LOCAL_EXT](#) specifies a time domain unique to a particular swapchain. Timestamp values in this time domain are in units of nanosecond and are comparable only with other values from the same swapchain.
- [VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR](#) specifies the CLOCK_MONOTONIC time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX `clock_gettime` API as computed by this example:

NOTE	An implementation supporting VK_KHR_calibrated_timestamps or VK_EXT_calibrated_timestamps will use the same time domain for all its VkQueue so that timestamp values reported for VK_TIME_DOMAIN_DEVICE_KHR can be matched to any timestamp captured through vkCmdWriteTimestamp or
-------------	---

vkCmdWriteTimestamp2.

```
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

- [VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR](#) specifies the `CLOCK_MONOTONIC_RAW` time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX `clock_gettime` API as computed by this example:

```
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC_RAW, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

- [VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR](#) specifies the performance counter (QPC) time domain available on Windows. Timestamp values in this time domain are in the same units as those provided by the Windows `QueryPerformanceCounter` API and are comparable with platform timestamp values captured using that API as computed by this example:

```
LARGE_INTEGER counter;
QueryPerformanceCounter(&counter);
return counter.QuadPart;
```

The `VkSwapchainCalibratedTimestampInfoEXT` structure is defined as:

```
// Provided by VK_EXT_present_timing
typedef struct VkSwapchainCalibratedTimestampInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkSwapchainKHR       swapchain;
    VkPresentStageFlagsEXT presentStage;
    uint64_t             timeDomainId;
} VkSwapchainCalibratedTimestampInfoEXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchain` is the swapchain to retrieve the swapchain-local timestamp from.
- `presentStage` is zero or a [VkPresentStageFlagsEXT](#) value used to identify a single present stage when calibrating a timestamp in the [VK_TIME_DOMAIN_PRESENT_STAGE_LOCAL_EXT](#) time domain.
- `timeDomainId` is the id for the opaque time domain being calibrated.

`timeDomainId` **must** be an id previously reported by `vkGetSwapchainTimeDomainPropertiesEXT` for `swapchain`. If the `timeDomainId` is no longer supported by the `swapchain`, implementations **may** report zero as the calibrated timestamp value.

Valid Usage

- VUID-VkSwapchainCalibratedTimestampInfoEXT-timeDomain-12228
If the `timeDomain` member of the `VkCalibratedTimestampInfoKHR` structure in this structure's `pNext` chain is `VK_TIME_DOMAIN_PRESENT_STAGE_LOCAL_EXT`, `presentStage` **must** specify one and only one present stage

Valid Usage (Implicit)

- VUID-VkSwapchainCalibratedTimestampInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_CALIBRATED_TIMESTAMP_INFO_EXT`
- VUID-VkSwapchainCalibratedTimestampInfoEXT-swapchain-parameter
`swapchain` **must** be a valid `VkSwapchainKHR` handle
- VUID-VkSwapchainCalibratedTimestampInfoEXT-presentStage-parameter
`presentStage` **must** be a valid combination of `VkPresentStageFlagBitsEXT` values

Structure Chaining

Extends the structure

- `VkCalibratedTimestampInfoKHR`

Chapter 8. Render Pass

Draw commands **must** be recorded within a *render pass instance*. Each render pass instance defines a set of image resources, referred to as *attachments*, used during rendering.

To begin a render pass instance, call:

```
// Provided by VK_VERSION_1_3
void vkCmdBeginRendering(
    VkCommandBuffer          commandBuffer,
    const VkRenderingInfo*   pRenderingInfo);
```

```
// Provided by VK_KHR_dynamic_rendering
// Equivalent to vkCmdBeginRendering
void vkCmdBeginRenderingKHR(
    VkCommandBuffer          commandBuffer,
    const VkRenderingInfo*   pRenderingInfo);
```

- **commandBuffer** is the command buffer in which to record the command.
- **pRenderingInfo** is a pointer to a **VkRenderingInfo** structure specifying details of the render pass instance to begin.

After beginning a render pass instance, the command buffer is ready to record **draw commands**.

If **pRenderingInfo->flags** includes **VK_RENDERING_RESUMING_BIT** then this render pass is resumed from a render pass instance that has been suspended earlier in **submission order**.

If there is an instance of **VkTileMemorySizeInfoQCOM** included in the **pNext** chain of **VkRenderingInfo**, the structure is ignored.

Valid Usage

- VUID-vkCmdBeginRendering-dynamicRendering-06446
The **dynamicRendering** feature **must** be enabled
- VUID-vkCmdBeginRendering-commandBuffer-06068
If **commandBuffer** is a secondary command buffer, and the **nestedCommandBuffer** feature is not enabled, **pRenderingInfo->flags** **must** not include **VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT**
- VUID-vkCmdBeginRendering-commandBuffer-10914
If **commandBuffer** is a secondary command buffer, **VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT** **must** not have been set in **VkCommandBufferBeginInfo::flags** when **commandBuffer** began
- VUID-vkCmdBeginRendering-pRenderingInfo-09588
If **pRenderingInfo->pDepthAttachment** is not **NULL** and **pRenderingInfo->pDepthAttachment->imageView** is not **VK_NULL_HANDLE**, when **pRenderingInfo->pDepthAttachment->imageView**

is accessed it **must** be in the layout specified by `pRenderingInfo->pDepthAttachment->imageView`

- VUID-vkCmdBeginRendering-pRenderingInfo-09589

If `pRenderingInfo->pDepthAttachment` is not `NULL`, `pRenderingInfo->pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, and `pRenderingInfo->pDepthAttachment->resolveImageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pDepthAttachment->resolveImageView` **must** be in the layout specified by `pRenderingInfo->pDepthAttachment->resolveImageLayout`

- VUID-vkCmdBeginRendering-pRenderingInfo-09590

If `pRenderingInfo->pStencilAttachment` is not `NULL` and `pRenderingInfo->pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, when `pRenderingInfo->pStencilAttachment->imageView` is accessed it **must** be in the layout specified by `pRenderingInfo->pStencilAttachment->imageLayout`

- VUID-vkCmdBeginRendering-pRenderingInfo-09591

If `pRenderingInfo->pStencilAttachment` is not `NULL`, `pRenderingInfo->pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, and `pRenderingInfo->pStencilAttachment->resolveImageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pStencilAttachment->resolveImageView` **must** be in the layout specified by `pRenderingInfo->pStencilAttachment->resolveImageLayout`

- VUID-vkCmdBeginRendering-pRenderingInfo-09592

For each element of `pRenderingInfo->pColorAttachments`, if `imageView` is not `VK_NULL_HANDLE`, when that image view is accessed it **must** be in the layout specified by the `imageLayout` member of that same element of `pRenderingInfo->pColorAttachments`

- VUID-vkCmdBeginRendering-pRenderingInfo-09593

For each element of `pRenderingInfo->pColorAttachments`, if either `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`, or `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, and `resolveImageView` is not `VK_NULL_HANDLE`, `resolveImageView` **must** be in the layout specified by `resolveImageLayout`

- VUID-vkCmdBeginRendering-flags-10641

If `VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM` is included in `VkRenderPassTileShadingCreateInfoQCOM::flags`, `commandBuffer` **must** not have been recorded with `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`

- VUID-vkCmdBeginRendering-flags-10642

`VkRenderPassTileShadingCreateInfoQCOM::flags` **must** not include `VK_TILE_SHADING_RENDER_PASS_PER_TILE_EXECUTION_BIT_QCOM`

- VUID-vkCmdBeginRendering-pRenderingInfo-11750

If `pRenderingInfo->flags` contains `VK_RENDERING_LOCAL_READ_CONCURRENT_ACCESS_CONTROL_BIT_KHR`, `maintenance10` **must** be enabled

- VUID-vkCmdBeginRendering-pRenderingInfo-11751

If `pRenderingInfo->flags` does not contain `VK_RENDERING_LOCAL_READ_CONCURRENT_ACCESS_CONTROL_BIT_KHR`, attachments

must

not

specify

VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR

- VUID-vkCmdBeginRendering-imageView-12276

If `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` is not equal to `VK_NULL_HANDLE`, when `imageView` is accessed it **must** be in the layout specified by `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageLayout`

- VUID-vkCmdBeginRendering-imageView-12277

If `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` is not equal to `VK_NULL_HANDLE`, when `imageView` is accessed it **must** be in the layout specified by `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageLayout`

Valid Usage (Implicit)

- VUID-vkCmdBeginRendering-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginRendering-pRenderingInfo-parameter
`pRenderingInfo` **must** be a valid pointer to a valid `VkRenderingInfo` structure
- VUID-vkCmdBeginRendering-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdBeginRendering-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdBeginRendering-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdBeginRendering-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdBeginRendering-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	VK_QUEUE_GRAP HICS_BIT	Action State

Conditional Rendering

vkCmdBeginRendering is not affected by [conditional rendering](#)

The `VkRenderingInfo` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkRenderingInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkRenderingFlags      flags;
    VkRect2D              renderArea;
    uint32_t              layerCount;
    uint32_t              viewMask;
    uint32_t              colorAttachmentCount;
    const VkRenderingAttachmentInfo* pColorAttachments;
    const VkRenderingAttachmentInfo* pDepthAttachment;
    const VkRenderingAttachmentInfo* pStencilAttachment;
} VkRenderingInfo;
```

```
// Provided by VK_KHR_dynamic_rendering, VK_QCOM_tile_properties with
VK_KHR_dynamic_rendering or VK_VERSION_1_3
// Equivalent to VkRenderingInfo
typedef VkRenderingInfo VkRenderingInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkRenderingFlagBits`.
- `renderArea` is the render area that is affected by the render pass instance.
- `layerCount` is the number of layers rendered to in each attachment when `viewMask` is 0.
- `viewMask` is a bitfield of view indices describing which views are active during rendering, when it is not 0.
- `colorAttachmentCount` is the number of elements in `pColorAttachments`.
- `pColorAttachments` is a pointer to an array of `colorAttachmentCount` `VkRenderingAttachmentInfo`

structures describing any color attachments used.

- `pDepthAttachment` is a pointer to a `VkRenderingAttachmentInfo` structure describing a depth attachment.
- `pStencilAttachment` is a pointer to a `VkRenderingAttachmentInfo` structure describing a stencil attachment.

If `viewMask` is not 0, multiview is enabled.

If there is an instance of `VkDeviceGroupRenderPassBeginInfo` included in the `pNext` chain and its `deviceRenderAreaCount` member is not 0, then `renderArea` is ignored, and the render area is defined per-device by that structure.

If multiview is enabled, and the `multiviewPerViewRenderAreas` feature is enabled, and there is an instance of `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` included in the `pNext` chain with `perViewRenderAreaCount` not equal to 0, then the elements of `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM::pPerViewRenderAreas` override `renderArea` and define a render area for each view. In this case, `renderArea` **must** be an area at least as large as the union of all the per-view render areas.

Each element of the `pColorAttachments` array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of `X`, then it uses the attachment provided in `pColorAttachments[X]`. If the `imageView` member of any element of `pColorAttachments` is `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`, writes to the corresponding location by a fragment are discarded.

The `aspectMask` of any image view specified for `pDepthAttachment` or `pStencilAttachment` is ignored. Instead, depth attachments are automatically treated as if `VK_IMAGE_ASPECT_DEPTH_BIT` was specified for their aspect masks, and stencil attachments are automatically treated as if `VK_IMAGE_ASPECT_STENCIL_BIT` was specified for their aspect masks.

Valid Usage

- VUID-VkRenderingInfo-viewMask-06069
If `viewMask` is 0, `layerCount` **must** not be 0
- VUID-VkRenderingInfo-multisampledRenderToSingleSampled-06857
If none of the following are enabled:
 - The `VK_AMD_mixed_attachment_samples` extension
 - The `VK_NV_framebuffer_mixed_samples` extension
 - The `multisampledRenderToSingleSampled` feature

`imageView` members of `pDepthAttachment`, `pStencilAttachment`, and elements of `pColorAttachments` that are not `VK_NULL_HANDLE` **must** have been created with the same `sampleCount`

- VUID-VkRenderingInfo-imageView-09429
`imageView` members of elements of `pColorAttachments` that are not `VK_NULL_HANDLE`

must have been created with the same `sampleCount` , if the `multisampledRenderToSingleSampled` feature is not enabled

- VUID-VkRenderingInfo-None-08994

If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0, `renderArea.extent.width` **must** be greater than 0

- VUID-VkRenderingInfo-None-08995

If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0, `renderArea.extent.height` **must** be greater than 0

- VUID-VkRenderingInfo-imageView-06858

If `multisampled-render-to-single-sampled` is enabled, then all attachments referenced by `imageView` members of `pDepthAttachment`, `pStencilAttachment`, and elements of `pColorAttachments` that are not `VK_NULL_HANDLE` **must** have a sample count that is either `VK_SAMPLE_COUNT_1_BIT` or equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`

- VUID-VkRenderingInfo-imageView-06859

If `multisampled-render-to-single-sampled` is enabled, then all attachments referenced by `imageView` members of `pDepthAttachment`, `pStencilAttachment`, and elements of `pColorAttachments` that are not `VK_NULL_HANDLE` and have a sample count of `VK_SAMPLE_COUNT_1_BIT` **must** have been created with `VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT` in their `VkImageCreateInfo::flags`

- VUID-VkRenderingInfo-pNext-06077

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` **must** be greater than or equal to 0

- VUID-VkRenderingInfo-pNext-06078

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` **must** be greater than or equal to 0

- VUID-VkRenderingInfo-pNext-07815

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the sum of `renderArea.extent.width` and `renderArea.offset.x` **must** be less than or equal to `maxFramebufferWidth`

- VUID-VkRenderingInfo-pNext-07816

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the sum of `renderArea.extent.height` and `renderArea.offset.y` **must** be less than or equal to `maxFramebufferHeight`

- VUID-VkRenderingInfo-pNext-06079

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the width of the `imageView` member of each element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` **must** be greater than or equal to `renderArea.offset.x` + `renderArea.extent.width`

- VUID-VkRenderingInfo-pNext-06080

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the height of the `imageView` member of each element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` **must** be greater than or equal to `renderArea.offset.y + renderArea.extent.height`

- VUID-VkRenderingInfo-pNext-06083

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the width of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` **must** be greater than or equal to the sum of the `offset.x` and `extent.width` members of each element of `pDeviceRenderAreas`

- VUID-VkRenderingInfo-pNext-06084

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the height of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` **must** be greater than or equal to the sum of the `offset.y` and `extent.height` members of each element of `pDeviceRenderAreas`

- VUID-VkRenderingInfo-pDepthAttachment-06085

If neither `pDepthAttachment` or `pStencilAttachment` are `NULL` and the `imageView` member of either structure is not `VK_NULL_HANDLE`, the `imageView` member of each structure **must** be the same

- VUID-VkRenderingInfo-pDepthAttachment-06086

If neither `pDepthAttachment` or `pStencilAttachment` are `NULL`, and the `resolveMode` member of each is not `VK_RESOLVE_MODE_NONE`, the `resolveImageView` member of each structure **must** be the same

- VUID-VkRenderingInfo-colorAttachmentCount-06087

If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, that `imageView` **must** have been created with the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` usage flag set

- VUID-VkRenderingInfo-colorAttachmentCount-09476

If `colorAttachmentCount` is not 0 and there is an element of `pColorAttachments` with either its `resolveMode` member set to `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`, or its `imageView` member not `VK_NULL_HANDLE`, and its `resolveMode` member not set to `VK_RESOLVE_MODE_NONE`, the `resolveImageView` member of that element of `pColorAttachments` **must** have been created with the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` usage flag set

- VUID-VkRenderingInfo-pDepthAttachment-06547

If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->imageView` **must** have been created with a format that includes a depth component

- VUID-VkRenderingInfo-pDepthAttachment-06088

If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->imageView` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-VkRenderingInfo-pDepthAttachment-09477

If `pDepthAttachment` is not `NULL` and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageView` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-VkRenderingInfo-pStencilAttachment-06548

If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->imageView` **must** have been created with a format that includes a stencil aspect

- VUID-VkRenderingInfo-pStencilAttachment-06089

If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->imageView` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-VkRenderingInfo-pStencilAttachment-09478

If `pStencilAttachment` is not `NULL` and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageView` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-VkRenderingInfo-colorAttachmentCount-06090

If `colorAttachmentCount` is not `0` and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, the `layout` member of that element of `pColorAttachments` **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderingInfo-colorAttachmentCount-06091

If `colorAttachmentCount` is not `0` and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, if the `resolveMode` member of that element of `pColorAttachments` is not `VK_RESOLVE_MODE_NONE`, its `resolveImageLayout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderingInfo-pDepthAttachment-06092

If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->layout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- VUID-VkRenderingInfo-pDepthAttachment-06093

If `pDepthAttachment` is not `NULL`, `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- VUID-VkRenderingInfo-pStencilAttachment-06094

If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->layout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- VUID-VkRenderingInfo-flags-11514

If `flags` contains `VK_RENDERING_CUSTOM_RESOLVE_BIT_EXT` or `VK_RENDERING_FRAGMENT_REGION_BIT_EXT`, then the `customResolve` feature **must** be enabled

- VUID-VkRenderingInfo-pColorAttachments-11515

For any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment`, if `resolveMode` contains `VK_RESOLVE_MODE_CUSTOM_BIT_EXT`, then `flags` **must** contain `VK_RENDERING_CUSTOM_RESOLVE_BIT_EXT`

- VUID-VkRenderingInfo-flags-11516

If `flags` contains `VK_RENDERING_CUSTOM_RESOLVE_BIT_EXT`, then for any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment`, `resolveMode` **must** be `VK_RESOLVE_MODE_CUSTOM_BIT_EXT` or `VK_RESOLVE_MODE_NONE`

- VUID-VkRenderingInfo-pStencilAttachment-06095

If `pStencilAttachment` is not `NULL`, `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- VUID-VkRenderingInfo-layerCount-07817

`layerCount` **must** be less than or equal to `maxFramebufferLayers`

- VUID-VkRenderingInfo-viewMask-10859

If `viewMask` is `0`, each `pColorAttachment->imageView` and `pColorAttachment->resolveImageView` that is not `VK_NULL_HANDLE` **must** have a `layerCount` that is greater than or equal to `VkRenderingInfo::layerCount`

- VUID-VkRenderingInfo-viewMask-10860

If `viewMask` is `0`, each `pDepthAttachment->imageView` and `pDepthAttachment->resolveImageView` that is not `VK_NULL_HANDLE` **must** have a `layerCount` that is greater than or equal to `VkRenderingInfo::layerCount`

- VUID-VkRenderingInfo-viewMask-10861

If `viewMask` is `0`, each `pStencilAttachment->imageView` and `pStencilAttachment->resolveImageView` that is not `VK_NULL_HANDLE` **must** have a `layerCount` that is greater than or equal to `VkRenderingInfo::layerCount`

- VUID-VkRenderingInfo-viewMask-12403

If `viewMask` is not `0`, each `pColorAttachment->imageView` and `pColorAttachment->resolveImageView` that is not `VK_NULL_HANDLE` **must** have a `layerCount` that is greater than the index of the most significant bit in `viewMask`

- VUID-VkRenderingInfo-viewMask-12404

If `viewMask` is not `0`, each `pDepthAttachment->imageView` and `pDepthAttachment->resolveImageView` that is not `VK_NULL_HANDLE` **must** have a `layerCount` that is greater than the index of the most significant bit in `viewMask`

- VUID-VkRenderingInfo-viewMask-12405

If `viewMask` is not `0`, each `pStencilAttachment->imageView` and `pStencilAttachment->resolveImageView` that is not `VK_NULL_HANDLE` **must** have a `layerCount` that is greater than the index of the most significant bit in `viewMask`

- VUID-VkRenderingInfo-colorAttachmentCount-06096

If `colorAttachmentCount` is not `0` and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, the `layout` member of that element of `pColorAttachments` **must** not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderingInfo-colorAttachmentCount-06097
If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, if the `resolveMode` member of that element of `pColorAttachments` is not `VK_RESOLVE_MODE_NONE`, its `resolveImageLayout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkRenderingInfo-pDepthAttachment-06098
If `pDepthAttachment` is not `NULL`, `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
- VUID-VkRenderingInfo-pStencilAttachment-06099
If `pStencilAttachment` is not `NULL`, `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkRenderingInfo-colorAttachmentCount-06100
If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, the `layout` member of that element of `pColorAttachments` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkRenderingInfo-colorAttachmentCount-06101
If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, if the `resolveMode` member of that element of `pColorAttachments` is not `VK_RESOLVE_MODE_NONE`, its `resolveImageLayout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkRenderingInfo-pDepthAttachment-07732
If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->layout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkRenderingInfo-pDepthAttachment-07733
If `pDepthAttachment` is not `NULL`, `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkRenderingInfo-pStencilAttachment-07734
If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->layout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-pStencilAttachment-07735

If `pStencilAttachment` is not `NULL`, `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

- VUID-VkRenderingInfo-pDepthAttachment-06102

If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->resolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes`

- VUID-VkRenderingInfo-pStencilAttachment-06103

If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->resolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes`

- VUID-VkRenderingInfo-pDepthAttachment-06104

If `pDepthAttachment` or `pStencilAttachment` are both not `NULL`, `pDepthAttachment->imageView` and `pStencilAttachment->imageView` are both not `VK_NULL_HANDLE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_FALSE`, the `resolveMode` of both structures **must** be the same value

- VUID-VkRenderingInfo-pDepthAttachment-06105

If `pDepthAttachment` or `pStencilAttachment` are both not `NULL`, `pDepthAttachment->imageView` and `pStencilAttachment->imageView` are both not `VK_NULL_HANDLE`, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and the `resolveMode` of neither structure is `VK_RESOLVE_MODE_NONE`, the `resolveMode` of both structures **must** be the same value

- VUID-VkRenderingInfo-colorAttachmentCount-06106

`colorAttachmentCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxColorAttachments`

- VUID-VkRenderingInfo-imageView-06107

If the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and the `fragmentDensityMapNonSubsampledImages` feature is not enabled, valid `imageView` and `resolveImageView` members of `pDepthAttachment`, `pStencilAttachment`, and each element of `pColorAttachments` **must** be a `VkImageView` created with `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

- VUID-VkRenderingInfo-imageView-06108

If the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is not `0`, `imageView` **must** have a `layerCount` greater than the index of the most significant bit in `viewMask`

- VUID-VkRenderingInfo-imageView-06109

If the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is `0`,

imageView must have a **layerCount** equal to 1

- VUID-VkRenderingInfo-pNext-06112

If the **pNext** chain does not contain **VkDeviceGroupRenderPassBeginInfo** or its **deviceRenderAreaCount** member is equal to 0 and the **imageView** member of a **VkRenderingFragmentDensityMapAttachmentInfoEXT** structure included in the **pNext** chain is not **VK_NULL_HANDLE**, **imageView** must have a width greater than or equal to $\lceil \frac{\text{renderArea}_x + \text{renderArea}_{width}}{\text{maxFragmentDensityTexelSize}_{width}} \rceil$

- VUID-VkRenderingInfo-pNext-06114

If the **pNext** chain does not contain **VkDeviceGroupRenderPassBeginInfo** or its **deviceRenderAreaCount** member is equal to 0 and the **imageView** member of a **VkRenderingFragmentDensityMapAttachmentInfoEXT** structure included in the **pNext** chain is not **VK_NULL_HANDLE**, **imageView** must have a height greater than or equal to $\lceil \frac{\text{renderArea}_y + \text{renderArea}_{height}}{\text{maxFragmentDensityTexelSize}_{height}} \rceil$

- VUID-VkRenderingInfo-pNext-06113

If the **pNext** chain contains a **VkDeviceGroupRenderPassBeginInfo** structure, its **deviceRenderAreaCount** member is not 0, and the **imageView** member of a **VkRenderingFragmentDensityMapAttachmentInfoEXT** structure included in the **pNext** chain is not **VK_NULL_HANDLE**, **imageView** must have a width greater than or equal to $\lceil \frac{\text{pDeviceRenderAreas}_x + \text{pDeviceRenderAreas}_{width}}{\text{maxFragmentDensityTexelSize}_{width}} \rceil$ for each element of **pDeviceRenderAreas**

- VUID-VkRenderingInfo-pNext-06115

If the **pNext** chain contains a **VkDeviceGroupRenderPassBeginInfo** structure, its **deviceRenderAreaCount** member is not 0, and the **imageView** member of a **VkRenderingFragmentDensityMapAttachmentInfoEXT** structure included in the **pNext** chain is not **VK_NULL_HANDLE**, **imageView** must have a height greater than or equal to $\lceil \frac{\text{pDeviceRenderAreas}_y + \text{pDeviceRenderAreas}_{height}}{\text{maxFragmentDensityTexelSize}_{height}} \rceil$ for each element of **pDeviceRenderAreas**

- VUID-VkRenderingInfo-imageView-06116

If the **imageView** member of a **VkRenderingFragmentDensityMapAttachmentInfoEXT** structure included in the **pNext** chain is not **VK_NULL_HANDLE**, it must not be equal to the **imageView** or **resolveImageView** member of **pDepthAttachment**, **pStencilAttachment**, or any element of **pColorAttachments**

- VUID-VkRenderingInfo-flags-10826

If **flags** contains **VK_RENDERING_PER_LAYER_FRAGMENT_DENSITY_BIT_VALVE**, then **layerCount** must be less than or equal to **maxFragmentDensityMapLayers**

- VUID-VkRenderingInfo-fragmentDensityMapLayered-10827

If the **fragmentDensityMapLayered** feature is not enabled, **flags** must not contain **VK_RENDERING_PER_LAYER_FRAGMENT_DENSITY_BIT_VALVE**

- VUID-VkRenderingInfo-pNext-06119

If the **maintenance7** feature is not enabled or the **robustFragmentShadingRateAttachmentAccess** limit is **VK_FALSE** or the **imageView** member of a **VkRenderingFragmentShadingRateAttachmentInfoKHR** structure was created with **VkImageSubresourceRange::baseMipLevel** greater than 0, the **pNext** chain does not contain **VkDeviceGroupRenderPassBeginInfo** or its **deviceRenderAreaCount** member is equal to 0, and the **imageView** member of a **VkRenderingFragmentShadingRateAttachmentInfoKHR** structure included in the **pNext** chain is not **VK_NULL_HANDLE**, **imageView** must have a width greater than or equal to $\lceil \frac{\text{renderArea}_x + \text{renderArea}_{width}}{\text{shadingRateAttachmentTexelSize}_{width}} \rceil$

- VUID-VkRenderingInfo-pNext-06121

If the `maintenance7` feature is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0 and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` **must** have a height greater than or equal to $\lceil \frac{renderArea_y + renderArea_{height}}{shadingRateAttachmentTexelSize_{height}} \rceil$

- VUID-VkRenderingInfo-pNext-06120

If the `maintenance7` feature is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` **must** have a width greater than or equal to $\lceil \frac{pDeviceRenderAreas_x + pDeviceRenderAreas_{width}}{shadingRateAttachmentTexelSize_{width}} \rceil$ for each element of `pDeviceRenderAreas`

- VUID-VkRenderingInfo-pNext-06122

If the `maintenance7` feature is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` **must** have a height greater than or equal to $\lceil \frac{pDeviceRenderAreas_y + pDeviceRenderAreas_{height}}{shadingRateAttachmentTexelSize_{height}} \rceil$ for each element of `pDeviceRenderAreas`

- VUID-VkRenderingInfo-imageView-06123

If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is 0, `imageView` **must** have a `layerCount` that is either equal to 1 or greater than or equal to `VkRenderingInfo::layerCount`

- VUID-VkRenderingInfo-imageView-06124

If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is not 0, `imageView` **must** have a `layerCount` that is either equal to 1 or greater than the index of the most significant bit in `viewMask`

- VUID-VkRenderingInfo-imageView-06125

If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, it **must** not be equal to the `imageView` or `resolveImageView` member of `pDepthAttachment`, `pStencilAttachment`, or any element of `pColorAttachments`

- VUID-VkRenderingInfo-imageView-06126

If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, it **must** not be equal to the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain

- VUID-VkRenderingInfo-multiview-06127

If the `multiview` feature is not enabled, `viewMask` **must** be 0

- VUID-VkRenderingInfo-viewMask-06128

The index of the most significant bit in `viewMask` **must** be less than `maxMultiviewViewCount`

- VUID-VkRenderingInfo-perViewRenderAreaCount-07857

If the `perViewRenderAreaCount` member of a `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` structure included in the `pNext` chain is not 0, then the `multiviewPerViewRenderAreas` feature **must** be enabled

- VUID-VkRenderingInfo-perViewRenderAreaCount-07858

If the `perViewRenderAreaCount` member of a `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` structure included in the `pNext` chain is not 0, then `renderArea` **must** specify a render area that includes the union of all per view render areas

- VUID-VkRenderingInfo-None-09044

Valid attachments specified by this structure **must** not be bound to memory locations that are bound to any other valid attachments specified by this structure

- VUID-VkRenderingInfo-flags-10012

If `flags` includes `VK_RENDERING_CONTENTS_INLINE_BIT_KHR` then at least one of the following features **must** be enabled

- `maintenance7`
- `nestedCommandBuffer`

- VUID-VkRenderingInfo-pDepthAttachment-09318

`pDepthAttachment->resolveMode` **must** not be `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`

- VUID-VkRenderingInfo-pStencilAttachment-09319

`pStencilAttachment->resolveMode` **must** not be `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`

- VUID-VkRenderingInfo-colorAttachmentCount-09320

If `colorAttachmentCount` is not 1, the `resolveMode` member of any element of `pColorAttachments` **must** not be `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`

- VUID-VkRenderingInfo-resolveMode-09321

If the `resolveMode` of any element of `pColorAttachments` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`, `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` **must** be `VK_NULL_HANDLE`

- VUID-VkRenderingInfo-resolveMode-09322

If the `resolveMode` of any element of `pColorAttachments` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`,

VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView must be VK_NULL_HANDLE

- VUID-VkRenderingInfo-pNext-09535
If the pNext chain contains a VkRenderPassStripeBeginInfoARM structure, the union of stripe areas defined by the elements of VkRenderPassStripeBeginInfoARM::pStripeInfos must cover the renderArea
- VUID-VkRenderingInfo-colorAttachmentCount-09479
If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, that imageView must have been created with the identity swizzle
- VUID-VkRenderingInfo-colorAttachmentCount-09480
If colorAttachmentCount is not 0, and there is an element of pColorAttachments with either its resolveMode member set to VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID, or its imageView member not set to VK_NULL_HANDLE and its resolveMode member not set to VK_RESOLVE_MODE_NONE, the resolveImageView member of that element of pColorAttachments must have been created with the identity swizzle
- VUID-VkRenderingInfo-pDepthAttachment-09481
If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->imageView must have been created with the identity swizzle
- VUID-VkRenderingInfo-pDepthAttachment-09482
If pDepthAttachment is not NULL, pDepthAttachment->imageView is not VK_NULL_HANDLE, and pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageView must have been created with the identity swizzle
- VUID-VkRenderingInfo-pStencilAttachment-09483
If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->imageView must have been created with the identity swizzle
- VUID-VkRenderingInfo-pStencilAttachment-09484
If pStencilAttachment is not NULL, pStencilAttachment->imageView is not VK_NULL_HANDLE, and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageView must have been created with the identity swizzle
- VUID-VkRenderingInfo-imageView-09485
If the imageView member of a VkRenderingFragmentShadingRateAttachmentInfoKHR structure included in the pNext chain is not VK_NULL_HANDLE, it must have been created with the identity swizzle
- VUID-VkRenderingInfo-imageView-09486
If the imageView member of a VkRenderingFragmentDensityMapAttachmentInfoEXT structure included in the pNext chain is not VK_NULL_HANDLE, it must have been created with the identity swizzle
- VUID-VkRenderingInfo-imageView-10643
If the imageView member of a VkRenderingFragmentDensityMapAttachmentInfoEXT structure included in the pNext chain is not VK_NULL_HANDLE, VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM must not be included in

VkRenderPassTileShadingCreateInfoQCOM::flags

- VUID-VkRenderingInfo-resolveMode-10644

If the `resolveMode` of any element of `pColorAttachments` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`, `VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM` **must** not be included in `VkRenderPassTileShadingCreateInfoQCOM::flags`

Valid Usage (Implicit)

- VUID-VkRenderingInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_RENDERING_INFO`

- VUID-VkRenderingInfo-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupRenderPassBeginInfo`, `VkMultisampledRenderToSingleSampledInfoEXT`, `VkMultiviewPerViewAttributesInfoNVX`, `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM`, `VkRenderPassPerformanceCountersByRegionBeginInfoARM`, `VkRenderPassStripeBeginInfoARM`, `VkRenderPassTileShadingCreateInfoQCOM`, `VkRenderingFragmentDensityMapAttachmentInfoEXT`, `VkRenderingFragmentShadingRateAttachmentInfoKHR`, or `VkTileMemorySizeInfoQCOM`

- VUID-VkRenderingInfo-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkRenderingInfo-flags-parameter

`flags` **must** be a valid combination of `VkRenderingFlagBits` values

- VUID-VkRenderingInfo-pColorAttachments-parameter

If `colorAttachmentCount` is not 0, `pColorAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkRenderingAttachmentInfo` structures

- VUID-VkRenderingInfo-pDepthAttachment-parameter

If `pDepthAttachment` is not `NULL`, `pDepthAttachment` **must** be a valid pointer to a valid `VkRenderingAttachmentInfo` structure

- VUID-VkRenderingInfo-pStencilAttachment-parameter

If `pStencilAttachment` is not `NULL`, `pStencilAttachment` **must** be a valid pointer to a valid `VkRenderingAttachmentInfo` structure

Bits which **can** be set in `VkRenderingInfo::flags` describing additional properties of the render pass are:

```

// Provided by VK_VERSION_1_3
typedef enum VkRenderingFlagBits {
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT = 0x00000001,
    VK_RENDERING_SUSPENDING_BIT = 0x00000002,
    VK_RENDERING_RESUMING_BIT = 0x00000004,
    // Provided by VK_EXT_legacy_dithering with (VK_KHR_dynamic_rendering or
    VK_VERSION_1_3) and (VK_KHR_maintenance5 or VK_VERSION_1_4)
    VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT = 0x00000008,
    // Provided by VK_KHR_maintenance7
    VK_RENDERING_CONTENTS_INLINE_BIT_KHR = 0x00000010,
    // Provided by VK_VALVE_fragment_density_map_layered
    VK_RENDERING_PER_LAYER_FRAGMENT_DENSITY_BIT_VALVE = 0x00000020,
    // Provided by VK_EXT_custom_resolve with VK_KHR_dynamic_rendering or VK_VERSION_1_3
    VK_RENDERING_FRAGMENT_REGION_BIT_EXT = 0x00000040,
    // Provided by VK_EXT_custom_resolve with VK_KHR_dynamic_rendering or VK_VERSION_1_3
    VK_RENDERING_CUSTOM_RESOLVE_BIT_EXT = 0x00000080,
    // Provided by VK_KHR_maintenance10 with (VK_VERSION_1_4 or
    VK_KHR_dynamic_rendering_local_read) and (VK_VERSION_1_3 or VK_KHR_dynamic_rendering)
    VK_RENDERING_LOCAL_READ_CONCURRENT_ACCESS_CONTROL_BIT_KHR = 0x00000100,
    // Provided by VK_KHR_dynamic_rendering
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT_KHR =
VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT,
    // Provided by VK_KHR_dynamic_rendering
    VK_RENDERING_SUSPENDING_BIT_KHR = VK_RENDERING_SUSPENDING_BIT,
    // Provided by VK_KHR_dynamic_rendering
    VK_RENDERING_RESUMING_BIT_KHR = VK_RENDERING_RESUMING_BIT,
    // Provided by VK_EXT_nested_command_buffer
    VK_RENDERING_CONTENTS_INLINE_BIT_EXT = VK_RENDERING_CONTENTS_INLINE_BIT_KHR,
} VkRenderingFlagBits;

```

```

// Provided by VK_KHR_dynamic_rendering
// Equivalent to VkRenderingFlagBits
typedef VkRenderingFlagBits VkRenderingFlagBitsKHR;

```

- [VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT](#) specifies that contents for the render pass instance will be recorded in secondary command buffers, and [vkCmdExecuteCommands](#) is the only valid command in the command buffer until [vkCmdEndRendering2KHR](#) or [vkCmdEndRendering](#). If the [nestedCommandBuffer](#) feature is enabled, the contents **can** come from both inline and [vkCmdExecuteCommands](#).
- [VK_RENDERING_RESUMING_BIT](#) specifies that the render pass instance is resuming an earlier suspended render pass instance.
- [VK_RENDERING_SUSPENDING_BIT](#) specifies that the render pass instance will be suspended.
- [VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT](#) specifies that [Legacy Dithering](#) is enabled for the render pass instance.
- [VK_RENDERING_CONTENTS_INLINE_BIT_KHR](#) specifies that contents for the render pass instance **can** be recorded inline within the current command buffer. This **can** be combined with

the [VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT](#) bit to allow contents to be recorded both inline and in secondary command buffers.

- [VK_RENDERING_PER_LAYER_FRAGMENT_DENSITY_BIT_VALVE](#) specifies that the render pass **can** be used with layered fragment density maps.
- [VK_RENDERING_LOCAL_READ_CONCURRENT_ACCESS_CONTROL_BIT_KHR](#) specifies that [VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR](#) will always be specified for any attachment which invokes the behavior described by [that flag](#).
- [VK_RENDERING_FRAGMENT_REGION_BIT_EXT](#) specifies that the render pass **can** access samples which are not covered in its [SampleMask](#).
- [VK_RENDERING_CUSTOM_RESOLVE_BIT_EXT](#) specifies that the render pass contains a custom resolve. When this bit is set, [vkCmdBeginCustomResolveEXT](#) **can** be called.

The contents of [pRenderingInfo](#) **must** match between suspended render pass instances and the render pass instances that resume them, other than the presence or absence of the [VK_RENDERING_RESUMING_BIT](#), [VK_RENDERING_SUSPENDING_BIT](#), and [VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT](#) flags. No action or synchronization commands, or other render pass instances, are allowed between suspending and resuming render pass instances.

```
// Provided by VK_VERSION_1_3
typedef VkFlags VkRenderingFlags;
```

```
// Provided by VK_KHR_dynamic_rendering
// Equivalent to VkRenderingFlags
typedef VkRenderingFlags VkRenderingFlagsKHR;
```

[VkRenderingFlags](#) is a bitmask type for setting a mask of zero or more [VkRenderingFlagBits](#).

The [VkRenderingAttachmentInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkRenderingAttachmentInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkImageView           imageView;
    VkImageLayout         imageLayout;
    VkResolveModeFlagBits resolveMode;
    VkImageView           resolveImageView;
    VkImageLayout         resolveImageLayout;
    VkAttachmentLoadOp     loadOp;
    VkAttachmentStoreOp    storeOp;
    VkClearValue          clearValue;
} VkRenderingAttachmentInfo;
```

```
// Provided by VK_KHR_dynamic_rendering
// Equivalent to VkRenderingAttachmentInfo
typedef VkRenderingAttachmentInfo VkRenderingAttachmentInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **imageView** is the image view that will be used for rendering.
- **imageLayout** is the layout that **imageView** will be in during rendering.
- **resolveMode** is a **VkResolveModeFlagBits** value defining how data written to **imageView** will be resolved into **resolveImageView**.
- **resolveImageView** is an image view used to write resolved data at the end of rendering.
- **resolveImageLayout** is the layout that **resolveImageView** will be in during rendering.
- **loadOp** is a **VkAttachmentLoadOp** value defining the **load operation** for the attachment.
- **storeOp** is a **VkAttachmentStoreOp** value defining the **store operation** for the attachment.
- **clearValue** is a **VkClearColorValue** structure defining values used to clear **imageView** when **loadOp** is **VK_ATTACHMENT_LOAD_OP_CLEAR**.

Values in **imageView** are loaded and stored according to the values of **loadOp** and **storeOp**, within the render area for each device specified in **VkRenderingInfo**. If **imageView** is **VK_NULL_HANDLE**, and **resolveMode** is not **VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID**, other members of this structure are ignored; writes to this attachment will be discarded, and no **load**, **store**, or **multisample resolve** operations will be performed.

If **resolveMode** is **VK_RESOLVE_MODE_NONE**, then **resolveImageView** is ignored. If **resolveMode** is not **VK_RESOLVE_MODE_NONE**, and **resolveImageView** is not **VK_NULL_HANDLE**, a **render pass multisample resolve operation** is defined for the attachment subresource. If **resolveMode** is **VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID**, and the **nullColorAttachmentWithExternalFormatResolve** limit is **VK_TRUE**, values are only undefined once **load operations** have completed.

The contents of a resolve attachment within the render area become undefined at the time **vkCmdBeginCustomResolveEXT** is called if all of the following conditions are true:

- **VK_RENDERING_CUSTOM_RESOLVE_BIT_EXT** is set.
- The attachment sets **resolveMode** to **VK_RESOLVE_MODE_CUSTOM_BIT_EXT**.

This affects color, depth, and stencil attachments. In addition, there is an implicit **store operation** of **VK_ATTACHMENT_STORE_OP_STORE** for these attachments.

NOTE

The resolve mode and store operation are independent; it is valid to write both resolved and unresolved values, and equally valid to discard the unresolved values while writing the resolved ones.

Store and resolve operations are only performed at the end of a render pass instance that does not

specify the `VK_RENDERING_SUSPENDING_BIT_KHR` flag. If the `VK_RENDERING_CUSTOM_RESOLVE_BIT_EXT` is specified and an attachment uses the `VK_RESOLVE_MODE_CUSTOM_BIT_EXT` resolve mode, the resolve attachment will only be written by draws recorded following a call to `vkCmdBeginCustomResolveEXT`.

Load operations are only performed at the beginning of a render pass instance that does not specify the `VK_RENDERING_RESUMING_BIT_KHR` flag.

Image contents at the end of a suspended render pass instance remain defined for access by a resuming render pass instance.

If the `nullColorAttachmentWithExternalFormatResolve` limit is `VK_TRUE`, and `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`, values in the color attachment will be loaded from the resolve attachment at the start of rendering, and **may** also be reloaded any time after a resolve occurs or the resolve attachment is written to; if this occurs it **must** happen-before any writes to the color attachment are performed which happen-after the resolve that triggers this. If any color component in the external format is subsampled, values will be read from the nearest sample in the image when they are loaded.

Valid Usage

- VUID-VkRenderingAttachmentInfo-imageView-06129

If `imageView` is not `VK_NULL_HANDLE` and has a non-integer color format, `resolveMode` **must** be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_CUSTOM_BIT_EXT` or `VK_RESOLVE_MODE_AVERAGE_BIT`

- VUID-VkRenderingAttachmentInfo-imageView-06130

If `imageView` is not `VK_NULL_HANDLE` and has an integer color format, `resolveMode` **must** be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_CUSTOM_BIT_EXT` or `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT`

- VUID-VkRenderingAttachmentInfo-imageView-06861

If all of the following are true:

- `imageView` is not `VK_NULL_HANDLE`
- `resolveMode` is not `VK_RESOLVE_MODE_NONE`
- the `pNext` chain of `VkRenderingInfo` does not include a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`

`imageView` **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkRenderingAttachmentInfo-imageView-06862

If all of the following are true:

- `imageView` is not `VK_NULL_HANDLE`
- `resolveMode` is not `VK_RESOLVE_MODE_NONE`
- the `pNext` chain of `VkRenderingInfo` does not include a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the

`multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`

`resolveImageView` **must** not be `VK_NULL_HANDLE`

- VUID-VkRenderingAttachmentInfo-imageView-06863

If `imageView` is not `VK_NULL_HANDLE`, `resolveMode` is not `VK_RESOLVE_MODE_NONE`, the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`, and `imageView` has a sample count of `VK_SAMPLE_COUNT_1_BIT`, `resolveImageView` **must** be `VK_NULL_HANDLE`

- VUID-VkRenderingAttachmentInfo-None-12256

If all of the following are true:

- `imageView` is not `VK_NULL_HANDLE`
- `imageView` has a sample count of `VK_SAMPLE_COUNT_1_BIT`
- the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`

then `resolveMode` **must** not be `VK_RESOLVE_MODE_NONE`

- VUID-VkRenderingAttachmentInfo-imageView-06864

If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageView` **must** have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkRenderingAttachmentInfo-imageView-06865

If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is neither `VK_RESOLVE_MODE_CUSTOM_BIT_EXT` nor `VK_RESOLVE_MODE_NONE`, `imageView` and `resolveImageView` **must** have the same `VkFormat`

- VUID-VkRenderingAttachmentInfo-imageView-06135

If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- VUID-VkRenderingAttachmentInfo-imageView-06136

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- VUID-VkRenderingAttachmentInfo-imageView-06137

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` or

VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingAttachmentInfo-imageView-06138

If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` **must** not be `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV`

- VUID-VkRenderingAttachmentInfo-imageView-06139

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV`

- VUID-VkRenderingAttachmentInfo-imageView-06140

If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` **must** not be `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`

- VUID-VkRenderingAttachmentInfo-imageView-06141

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`

- VUID-VkRenderingAttachmentInfo-imageView-06142

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkRenderingAttachmentInfo-imageView-06143

If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` **must** not be `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`

- VUID-VkRenderingAttachmentInfo-imageView-06144

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`

- VUID-VkRenderingAttachmentInfo-imageView-10780

If `feedback loop is enabled` for the attachment identified by `imageView`, then `imageView` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT`, either `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and either `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT`

- VUID-VkRenderingAttachmentInfo-imageView-06145

If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` **must** not be `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

- VUID-VkRenderingAttachmentInfo-imageView-06146

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` **must** not be `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

- VUID-VkRenderingAttachmentInfo-externalFormatResolve-09323

If the `externalFormatResolve` feature is not enabled, `resolveMode` **must** not be `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`

- VUID-VkRenderingAttachmentInfo-resolveMode-09324

If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`,

`resolveImageView` **must** be a valid image view

- VUID-VkRenderingAttachmentInfo-nullColorAttachmentWithExternalFormatResolve-09325

If the `nullColorAttachmentWithExternalFormatResolve` property is `VK_TRUE` and `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`, `resolveImageView` **must** have been created with an image with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkRenderingAttachmentInfo-resolveMode-09326

If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`, `resolveImageView` **must** have been created with an external format specified by `VkExternalFormatANDROID`

- VUID-VkRenderingAttachmentInfo-resolveMode-09327

If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`, `resolveImageView` **must** have been created with a `subresourceRange.layerCount` of 1

- VUID-VkRenderingAttachmentInfo-resolveMode-09328

If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID` and `nullColorAttachmentWithExternalFormatResolve` is `VK_TRUE`, `imageView` **must** be `VK_NULL_HANDLE`

- VUID-VkRenderingAttachmentInfo-resolveMode-09329

If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID` and `nullColorAttachmentWithExternalFormatResolve` is `VK_FALSE`, `imageView` **must** be a valid `VkImageView`

- VUID-VkRenderingAttachmentInfo-resolveMode-09330

If `resolveMode` is `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID` and `nullColorAttachmentWithExternalFormatResolve` is `VK_FALSE`, `imageView` **must** have a format equal to the value of `VkAndroidHardwareBufferFormatResolvePropertiesANDROID::colorAttachmentFormat` as returned by a call to `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer that was used to create `resolveImageView`

- VUID-VkRenderingAttachmentInfo-resolveImageView-10728

If `resolveImageView` is not `VK_NULL_HANDLE`, the underlying resource must not be bound to a `VkDeviceMemory` object allocated from a `VkMemoryHeap` with the `VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM` property

- VUID-VkRenderingAttachmentInfo-pNext-11752

If the `pNext` chain includes a `VkRenderingAttachmentFlagsInfoKHR` structure, and `flags` includes `VK_RENDERING_ATTACHMENT_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` or `VK_RENDERING_ATTACHMENT_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`, `imageView` **must** have a format using sRGB encoding

- VUID-VkRenderingAttachmentInfo-pNext-11753

If the `pNext` chain includes a `VkRenderingAttachmentFlagsInfoKHR` structure, and `flags` includes `VK_RENDERING_ATTACHMENT_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` or `VK_RENDERING_ATTACHMENT_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`,

resolveMode must be equal to `VK_RESOLVE_MODE_AVERAGE_BIT`

- VUID-VkRenderingAttachmentInfo-pNext-11754

If the **pNext** chain includes a `VkRenderingAttachmentFlagsInfoKHR` structure, and **flags** includes `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR`, **imageView** must have an image that was created with the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flag set

Valid Usage (Implicit)

- VUID-VkRenderingAttachmentInfo-sType-sType

sType must be `VK_STRUCTURE_TYPE_RENDERING_ATTACHMENT_INFO`

- VUID-VkRenderingAttachmentInfo-pNext-pNext

Each **pNext** member of any structure (including this one) in the **pNext** chain must be either `NULL` or a pointer to a valid instance of `VkAttachmentFeedbackLoopInfoEXT` or `VkRenderingAttachmentFlagsInfoKHR`

- VUID-VkRenderingAttachmentInfo-sType-unique

The **sType** value of each structure in the **pNext** chain must be unique

- VUID-VkRenderingAttachmentInfo-imageView-parameter

If **imageView** is not `VK_NULL_HANDLE`, **imageView** must be a valid `VkImageView` handle

- VUID-VkRenderingAttachmentInfo-imageLayout-parameter

imageLayout must be a valid `VkImageLayout` value

- VUID-VkRenderingAttachmentInfo-resolveMode-parameter

If **resolveMode** is not `0`, **resolveMode** must be a valid `VkResolveModeFlagBits` value

- VUID-VkRenderingAttachmentInfo-resolveImageView-parameter

If **resolveImageView** is not `VK_NULL_HANDLE`, **resolveImageView** must be a valid `VkImageView` handle

- VUID-VkRenderingAttachmentInfo-resolveImageLayout-parameter

resolveImageLayout must be a valid `VkImageLayout` value

- VUID-VkRenderingAttachmentInfo-loadOp-parameter

loadOp must be a valid `VkAttachmentLoadOp` value

- VUID-VkRenderingAttachmentInfo-storeOp-parameter

storeOp must be a valid `VkAttachmentStoreOp` value

- VUID-VkRenderingAttachmentInfo-clearValue-parameter

clearValue must be a valid `VkClearValue` union

- VUID-VkRenderingAttachmentInfo-commonparent

Both of **imageView**, and **resolveImageView** that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

To specify an attachment as an *input attachment* or to specify resolve operation flags, the `VkRenderingAttachmentFlagsInfoKHR` structure can be added to the **pNext** chain of `VkRenderingAttachmentInfo`.

The `VkRenderingAttachmentFlagsInfoKHR` structure is defined as:

```
// Provided by VK_KHR_maintenance10
typedef struct VkRenderingAttachmentFlagsInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkRenderingAttachmentFlagsKHR flags;
} VkRenderingAttachmentFlagsInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkRenderingAttachmentFlagsKHR`

Valid Usage

- VUID-VkRenderingAttachmentFlagsInfoKHR-flags-11755
`flags` **must** not include `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR` if the `dynamicRenderingLocalRead` feature is not enabled
- VUID-VkRenderingAttachmentFlagsInfoKHR-flags-11756
If `flags` includes `VK_RENDERING_ATTACHMENT_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR`, `flags` **must** not include `VK_RENDERING_ATTACHMENT_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`
- VUID-VkRenderingAttachmentFlagsInfoKHR-flags-11757
If `flags` includes `VK_RENDERING_ATTACHMENT_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` or `VK_RENDERING_ATTACHMENT_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`, `resolveSrgbFormatSupportsTransferFunctionControl` **must** be `VK_TRUE`

Valid Usage (Implicit)

- VUID-VkRenderingAttachmentFlagsInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDERING_ATTACHMENT_FLAGS_INFO_KHR`
- VUID-VkRenderingAttachmentFlagsInfoKHR-flags-parameter
`flags` **must** be a valid combination of `VkRenderingAttachmentFlagBitsKHR` values

Structure Chaining

Extends the structure

- `VkRenderingAttachmentInfo`

Bits which **can** be set in `VkRenderingAttachmentFlagsInfoKHR::flags`, describing additional properties of a rendering attachment, are:

```
// Provided by VK_KHR_maintenance10
typedef enum VkRenderingAttachmentFlagBitsKHR {
    // Provided by VK_KHR_maintenance10 with (VK_VERSION_1_4 or
    VK_KHR_dynamic_rendering_local_read) and (VK_VERSION_1_3 or VK_KHR_dynamic_rendering)
    VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR = 0x00000001,
    // Provided by VK_KHR_maintenance10 with VK_VERSION_1_3 or VK_KHR_dynamic_rendering
    VK_RENDERING_ATTACHMENT_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_maintenance10 with VK_VERSION_1_3 or VK_KHR_dynamic_rendering
    VK_RENDERING_ATTACHMENT_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR = 0x00000004,
} VkRenderingAttachmentFlagBitsKHR;
```

- `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR` specifies that the attachment **can** be used concurrently as both an input attachment and a write-only attachment during the render pass, creating a feedback loop while processing a fragment, and without a `VK_DEPENDENCY_BY_REGION_BIT` barrier separating the write attachment and input attachment usage. Using this flag does not remove the general requirement to use a `VK_DEPENDENCY_BY_REGION_BIT` barrier to resolve hazards when two different fragments accesses a particular attachment region, where one of them performs an attachment write, and a subsequent fragment performs an input attachment read. If `VK_RENDERING_LOCAL_READ_CONCURRENT_ACCESS_CONTROL_BIT_KHR` is specified in the rendering info, this flag **must** be set for an attachment to be used concurrently as an input attachment and a write attachment in this manner. If `VK_RENDERING_LOCAL_READ_CONCURRENT_ACCESS_CONTROL_BIT_KHR` is not specified in the rendering info, this flag is implied to be set for any attachment which has a combination of image layouts and image view usage flags which support input attachment usage.
- `VK_RENDERING_ATTACHMENT_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` specifies that resolve operations happening to an sRGB encoded attachment **must** not convert samples from nonlinear to linear before averaging.
- `VK_RENDERING_ATTACHMENT_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR` specifies that resolve operations happening to an sRGB encoded attachment **must** convert samples from nonlinear to linear before averaging.

NOTE

`VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR` is intended to give implementations similar information as a subpass where an attachment could be used as both a color attachment and input attachment. Some implementations require extra work to make this scenario work beyond just considering the image layouts. Implementations which have no such considerations may treat this flag as a noop. The primary use case for this flag is to enable feedback loops inside a single shader.

Applications are encouraged to use `VK_RENDERING_LOCAL_READ_CONCURRENT_ACCESS_CONTROL_BIT_KHR` if `maintenance10` is available and they use feedback loops with `VK_KHR_dynamic_rendering_local_read`. Feedback loops are still allowed when not

using the rendering flag, but the performance implication was an oversight in the original definition of [VK_KHR_dynamic_rendering_local_read](#).

NOTE

In some scenarios, resolving sRGB in nonlinear space instead of the expected linear space can improve perceptual aliasing at the cost of inaccurate color blending.

```
// Provided by VK_KHR_maintenance10
typedef VkFlags VkRenderingAttachmentFlagsKHR;
```

[VkRenderingAttachmentFlagsKHR](#) is a bitmask type for setting a mask of zero or more [VkRenderingAttachmentFlagBitsKHR](#).

To [enable feedback loop](#) for an attachment, the [VkAttachmentFeedbackLoopInfoEXT](#) structure **can** be added to the [pNext](#) chain of [VkRenderingAttachmentInfo](#).

The [VkAttachmentFeedbackLoopInfoEXT](#) structure is defined as:

```
// Provided by VK_KHR_unified_image_layouts with
VK_EXT_attachment_feedback_loop_layout and (VK_VERSION_1_3 or
VK_KHR_dynamic_rendering)
typedef struct VkAttachmentFeedbackLoopInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32            feedbackLoopEnable;
} VkAttachmentFeedbackLoopInfoEXT;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [feedbackLoopEnable](#) specifies that [feedback loop is enabled](#) for the attachment identified by [VkRenderingAttachmentInfo::imageView](#).

Valid Usage

- VUID-VkAttachmentFeedbackLoopInfoEXT-unifiedImageLayouts-10782
If the [unifiedImageLayouts](#) feature is not enabled, [feedbackLoopEnable](#) **must** be [VK_FALSE](#)

Valid Usage (Implicit)

- VUID-VkAttachmentFeedbackLoopInfoEXT-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_ATTACHMENT_FEEDBACK_LOOP_INFO_EXT](#)

Structure Chaining

Extends the structure

- [VkRenderingAttachmentInfo](#)

The [VkRenderingFragmentShadingRateAttachmentInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_fragment_shading_rate with VK_VERSION_1_3 or
VK_KHR_dynamic_rendering
typedef struct VkRenderingFragmentShadingRateAttachmentInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkImageView         imageView;
    VkImageLayout       imageLayout;
    VkExtent2D          shadingRateAttachmentTexelSize;
} VkRenderingFragmentShadingRateAttachmentInfoKHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is `NULL` or a pointer to a structure extending this structure.
- [imageView](#) is the image view that will be used as a fragment shading rate attachment.
- [imageLayout](#) is the layout that [imageView](#) will be in during rendering.
- [shadingRateAttachmentTexelSize](#) specifies the number of pixels corresponding to each texel in [imageView](#).

This structure can be included in the [pNext](#) chain of [VkRenderingInfo](#) to define a [fragment shading rate attachment](#). If [imageView](#) is `VK_NULL_HANDLE`, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

Valid Usage

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06147
If [imageView](#) is not `VK_NULL_HANDLE`, [layout](#) **must** be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06148
If [imageView](#) is not `VK_NULL_HANDLE`, it **must** have been created with the `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` usage flag set
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06149
If [imageView](#) is not `VK_NULL_HANDLE`, [shadingRateAttachmentTexelSize.width](#) **must** be a power of two value
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06150
If [imageView](#) is not `VK_NULL_HANDLE`, [shadingRateAttachmentTexelSize.width](#) **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.width`

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06151
If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` **must** be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06152
If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be a power of two value
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06153
If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.height`
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06154
If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.height`
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06155
If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06156
If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

Valid Usage (Implicit)

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-parameter
If `imageView` is not `VK_NULL_HANDLE`, `imageView` **must** be a valid `VkImageView` handle
- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageLayout-parameter
`imageLayout` **must** be a valid `VkImageLayout` value

Structure Chaining

Extends the structure

- `VkRenderingInfo`

The `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure is defined as:

```
// Provided by VK_EXT_fragment_density_map with VK_VERSION_1_3 or
VK_KHR_dynamic_rendering
typedef struct VkRenderingFragmentDensityMapAttachmentInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkImageView         imageView;
    VkImageLayout       imageLayout;
} VkRenderingFragmentDensityMapAttachmentInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageView` is the image view that will be used as a fragment density map attachment.
- `imageLayout` is the layout that `imageView` will be in during rendering.

This structure can be included in the `pNext` chain of `VkRenderingInfo` to define a fragment density map. If this structure is not included in the `pNext` chain, `imageView` is treated as `VK_NULL_HANDLE`.

Valid Usage

- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-06157
If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` **must** be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`
- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-06158
If `imageView` is not `VK_NULL_HANDLE`, it **must** have been created with the `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT` usage flag set
- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-06159
If `imageView` is not `VK_NULL_HANDLE`, it **must** not have been created with `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`
- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-apiVersion-07908
If the `multiview` feature is not enabled, `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, and `imageView` is not `VK_NULL_HANDLE`, it **must** have a `layerCount` equal to 1

Valid Usage (Implicit)

- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_INFO_EXT`
- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-parameter
`imageView` **must** be a valid `VkImageView` handle
- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageLayout-parameter
`imageLayout` **must** be a valid `VkImageLayout` value

Structure Chaining

Extends the structure

- [VkRenderingInfo](#)

To query the render area granularity for a render pass instance, call:

```
// Provided by VK_VERSION_1_4
void vkGetRenderingAreaGranularity(
    VkDevice          device,
    const VkRenderingAreaInfo* pRenderingAreaInfo,
    VkExtent2D*       pGranularity);
```

```
// Provided by VK_KHR_maintenance5
// Equivalent to vkGetRenderingAreaGranularity
void vkGetRenderingAreaGranularityKHR(
    VkDevice          device,
    const VkRenderingAreaInfo* pRenderingAreaInfo,
    VkExtent2D*       pGranularity);
```

- **device** is the logical device that owns the render pass instance.
- **pRenderingAreaInfo** is a pointer to a [VkRenderingAreaInfo](#) structure specifying details of the render pass instance to query the render area granularity for.
- **pGranularity** is a pointer to a [VkExtent2D](#) structure in which the granularity is returned.

The conditions leading to an optimal **renderArea** are:

- the **offset.x** member in **renderArea** is a multiple of the **width** member of the returned [VkExtent2D](#) (the horizontal granularity).
- the **offset.y** member in **renderArea** is a multiple of the **height** member of the returned [VkExtent2D](#) (the vertical granularity).
- either the **extent.width** member in **renderArea** is a multiple of the horizontal granularity or **offset.x+extent.width** is equal to the **width** of each attachment used in the render pass instance.
- either the **extent.height** member in **renderArea** is a multiple of the vertical granularity or **offset.y+extent.height** is equal to the **height** of each attachment used in the render pass instance.

Valid Usage (Implicit)

- VUID-vkGetRenderingAreaGranularity-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetRenderingAreaGranularity-pRenderingAreaInfo-parameter **pRenderingAreaInfo** **must** be a valid pointer to a valid [VkRenderingAreaInfo](#) structure

- VUID-vkGetRenderingAreaGranularity-pGranularity-parameter **pGranularity** **must** be a valid pointer to a [VkExtent2D](#) structure

The `VkRenderingAreaInfo` structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkRenderingAreaInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           viewMask;
    uint32_t           colorAttachmentCount;
    const VkFormat*    pColorAttachmentFormats;
    VkFormat           depthAttachmentFormat;
    VkFormat           stencilAttachmentFormat;
} VkRenderingAreaInfo;
```

```
// Provided by VK_KHR_maintenance5
// Equivalent to VkRenderingAreaInfo
typedef VkRenderingAreaInfo VkRenderingAreaInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **viewMask** is the viewMask used for rendering.
- **colorAttachmentCount** is the number of entries in **pColorAttachmentFormats**
- **pColorAttachmentFormats** is a pointer to an array of [VkFormat](#) values defining the format of color attachments used in the render pass instance.
- **depthAttachmentFormat** is a [VkFormat](#) value defining the format of the depth attachment used in the render pass instance.
- **stencilAttachmentFormat** is a [VkFormat](#) value defining the format of the stencil attachment used in the render pass instance.

Valid Usage (Implicit)

- VUID-VkRenderingAreaInfo-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_RENDERING_AREA_INFO`
- VUID-VkRenderingAreaInfo-pNext-pNext
pNext **must** be `NULL`

The `VkRenderPassStripeBeginInfoARM` structure is defined as:

```
// Provided by VK_ARM_render_pass_striped
typedef struct VkRenderPassStripeBeginInfoARM {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 stripeInfoCount;
    const VkRenderPassStripeInfoARM* pStripeInfos;
} VkRenderPassStripeBeginInfoARM;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **stripeInfoCount** is the number of stripes in this render pass instance
- **pStripeInfos** is a pointer to an array of **stripeInfoCount** [VkRenderPassStripeInfoARM](#) structures describing the stripes used by the render pass instance.

This structure can be included in the **pNext** chain of [VkRenderPassBeginInfo](#) or [VkRenderingInfo](#) to define how the render pass instance is split into stripes.

Valid Usage

- VUID-VkRenderPassStripeBeginInfoARM-stripeInfoCount-09450
stripeInfoCount **must** be less than or equal to **VkPhysicalDeviceRenderPassStripedPropertiesARM::maxRenderPassStripes**
- VUID-VkRenderPassStripeBeginInfoARM-stripeArea-09451
The **stripeArea** defined by each element of **pStripeInfos** **must** not overlap the **stripeArea** of any other element

Valid Usage (Implicit)

- VUID-VkRenderPassStripeBeginInfoARM-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_RENDER_PASS_STRIPE_BEGIN_INFO_ARM](#)
- VUID-VkRenderPassStripeBeginInfoARM-pStripeInfos-parameter
pStripeInfos **must** be a valid pointer to an array of **stripeInfoCount** valid [VkRenderPassStripeInfoARM](#) structures
- VUID-VkRenderPassStripeBeginInfoARM-stripeInfoCount-arraylength
stripeInfoCount **must** be greater than **0**

Structure Chaining

Extends the structures

- [VkRenderPassBeginInfo](#)
- [VkRenderingInfo](#)

The `VkRenderPassStripeInfoARM` structure is defined as:

```
// Provided by VK_ARM_render_pass_striped
typedef struct VkRenderPassStripeInfoARM {
    VkStructureType    sType;
    const void*        pNext;
    VkRect2D           stripeArea;
} VkRenderPassStripeInfoARM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stripeArea` is the stripe area, and is described in more detail below.

`stripeArea` is the render area that is affected by this stripe of the render pass instance. It **must** be a subregion of the `renderArea` of the render pass instance.

Valid Usage

- VUID-VkRenderPassStripeInfoARM-stripeArea-09452
`stripeArea.offset.x` **must** be a multiple of `VkPhysicalDeviceRenderPassStripedPropertiesARM::renderPassStripeGranularity.width`
- VUID-VkRenderPassStripeInfoARM-stripeArea-09453
`stripeArea.extent.width` **must** be a multiple of `VkPhysicalDeviceRenderPassStripedPropertiesARM::renderPassStripeGranularity.width`, or the sum of `stripeArea.offset.x` and `stripeArea.extent.width` **must** be equal to the `renderArea.extent.width` of the render pass instance
- VUID-VkRenderPassStripeInfoARM-stripeArea-09454
`stripeArea.offset.y` **must** be a multiple of `VkPhysicalDeviceRenderPassStripedPropertiesARM::renderPassStripeGranularity.height`
- VUID-VkRenderPassStripeInfoARM-stripeArea-09455
`stripeArea.extent.height` **must** be a multiple of `VkPhysicalDeviceRenderPassStripedPropertiesARM::renderPassStripeGranularity.height`, or the sum of `stripeArea.offset.y` and `stripeArea.extent.height` **must** be equal to the `renderArea.extent.height` of the render pass instance

Valid Usage (Implicit)

- VUID-VkRenderPassStripeInfoARM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_STRIPE_INFO_ARM`
- VUID-VkRenderPassStripeInfoARM-pNext-pNext
`pNext` **must** be `NULL`

The `VkRenderPassPerformanceCountersByRegionBeginInfoARM` structure is defined as:

```
// Provided by VK_ARM_performance_counters_by_region
typedef struct VkRenderPassPerformanceCountersByRegionBeginInfoARM {
    VkStructureType      sType;
    void*                pNext;
    uint32_t             counterAddressCount;
    const VkDeviceAddress* pCounterAddresses;
    VkBool32             serializeRegions;
    uint32_t             counterIndexCount;
    uint32_t*            pCounterIndices;
} VkRenderPassPerformanceCountersByRegionBeginInfoARM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `counterAddressCount` is the number of entries in the `pCounterAddresses` array.
- `pCounterAddresses` is a pointer to an array of `VkDeviceAddress` where performance counter data will be written.
- `serializeRegions` controls whether the implementation serializes the execution of each region.
- `counterIndexCount` is the number of entries in the `pCounterIndices` array.
- `pCounterIndices` is a pointer to an array of `VkPerformanceCounterARM::counterID` values, as enumerated by `vkEnumeratePhysicalDeviceQueueFamilyPerformanceCountersByRegionARM`, to enable in this render pass instance.

Performance counters values are written to each element of `pCounterAddresses` in an implementation-dependent manner. These writes execute in the `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.

The index into this array is calculated as:

```
uint32_t index = s * L + l;
```

where `s` is the physical subpass index, `L` is the maximum number of views or layers in the current render pass instance, and `l` is the index of the current view or layer.

When using a render pass object with multiple subpasses, an implementation **may** merge one more subpasses. The physical subpass index represents the index into the set of subpasses that remain after such merge operations are done.

NOTE

The `VK_EXT_subpass_merge_feedback` extension can be used to determine which if any subpasses have been merged. The physical subpass index is equal to the `postMergeIndex` value provided in `VkRenderPassSubpassFeedbackInfoEXT`.

Within each element of `pCounterAddresses`, counter values are written in framebuffer-space order if `VkPhysicalDevicePerformanceCountersByRegionPropertiesARM::identityTransformOrder` is `VK_TRUE`.

Each counter value is written as an unsigned 32-bit integer value.

If the render pass has a fragment density map, performance counter values are only written for regions where the fragment area is unchanged.

Valid Usage

- VUID-VkRenderPassPerformanceCountersByRegionBeginInfoARM-counterAddressCount-11815
`counterAddressCount` **must** be equal to $S \times L$, where S is the number of subpasses in the current render pass instance, and L is the number of layers in the current render pass instance or the index of the most significant bit of any view mask in the current render pass instance
- VUID-VkRenderPassPerformanceCountersByRegionBeginInfoARM-pCounterAddresses-11816
For each element of `pCounterAddresses` that is not `0`, if the buffer from which it was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkRenderPassPerformanceCountersByRegionBeginInfoARM-pCounterAddresses-11817
For each element of `pCounterAddresses[i]`, all device addresses between `pCounterAddresses[i]` and `pCounterAddresses[i]` plus $N - 1$, **must** be in the buffer device address range of the same buffer, where N is given by $N = \text{align}([w / rsw] \times \text{align}(c \times \text{sizeof}(\text{uint32_t}), ra), rsa) \times [h / rsh]$, where w is the value of `VkRenderingInfo::renderArea.extent.width`, h is the value of `VkRenderingInfo::renderArea.extent.height`, rsw is the value of `VkPhysicalDevicePerformanceCountersByRegionPropertiesARM::performanceCounterRegionSize.width`, rsh is the value of `VkPhysicalDevicePerformanceCountersByRegionPropertiesARM::performanceCounterRegionSize.height`, c is the value of `counterIndexCount`, ra is the value of `VkPhysicalDevicePerformanceCountersByRegionPropertiesARM::regionAlignment`, and rsa is the value of `VkPhysicalDevicePerformanceCountersByRegionPropertiesARM::rowStrideAlignment`
- VUID-VkRenderPassPerformanceCountersByRegionBeginInfoARM-counterIndexCount-11818
`counterIndexCount` **must** be less than or equal to `VkPhysicalDevicePerformanceCountersByRegionPropertiesARM::maxPerRegionPerformanceCounters`

Valid Usage (Implicit)

- VUID-VkRenderPassPerformanceCountersByRegionBeginInfoARM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_PERFORMANCE_COUNTERS_BY_REGION_BEGIN_INFO_ARM`

- VUID-VkRenderPassPerformanceCountersByRegionBeginInfoARM-pCounterAddresses-parameter
`pCounterAddresses` **must** be a valid pointer to an array of `counterAddressCount` `VkDeviceAddress` values
- VUID-VkRenderPassPerformanceCountersByRegionBeginInfoARM-pCounterIndices-parameter
`pCounterIndices` **must** be a valid pointer to an array of `counterIndexCount` `uint32_t` values
- VUID-VkRenderPassPerformanceCountersByRegionBeginInfoARM-counterAddressCount-arraylength
`counterAddressCount` **must** be greater than 0
- VUID-VkRenderPassPerformanceCountersByRegionBeginInfoARM-counterIndexCount-arraylength
`counterIndexCount` **must** be greater than 0

Structure Chaining

Extends the structures

- `VkRenderPassBeginInfo`
- `VkRenderingInfo`

To begin resolving attachments using render pass draws, call:

```
// Provided by VK_EXT_custom_resolve with VK_KHR_dynamic_rendering or VK_VERSION_1_3
void vkCmdBeginCustomResolveEXT(
    VkCommandBuffer                commandBuffer,
    const VkBeginCustomResolveInfoEXT* pBeginCustomResolveInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pBeginCustomResolveInfo` is an optional struct with which to extend functionality.

Following this call, any `resolveImageView` with `resolveMode` set to `VK_RESOLVE_MODE_CUSTOM_BIT_EXT` will be written by outputs which would otherwise have written to the `imageView` image until the end of the current render pass instance.

Following this call, the fragment area **may** be reduced to (1,1) if a fragment density map is attached. If this occurs, reads of input attachments mapped to a color, depth, or stencil attachment return the value for the original larger fragment containing the smaller fragment. Reads of input attachments not mapped to a color, depth, or stencil attachment use the new fragment area.

NOTE

Because the content of any depth/stencil resolve attachment as well as any color resolve attachment is undefined at the beginning of a resolve operation, any depth testing, stencil testing, or blending operation which sources these undefined values also has undefined result value.

During a custom resolve pass, multiple fragment invocations writing to the same (x, y, layer, view, sample) coordinate, i.e. overdraw, will produce undefined behavior.

NOTE

Implementations are allowed to implement custom resolve attachment writes through other mechanisms than framebuffer attachment writes, which would normally obey rules of rasterization order.

Valid Usage

- VUID-vkCmdBeginCustomResolveEXT-commandBuffer-11517
The current render pass instance **must** have been started or resumed by [vkCmdBeginRendering](#) in this [commandBuffer](#)
- VUID-vkCmdBeginCustomResolveEXT-None-11518
[vkCmdBeginCustomResolveEXT](#) **must** not have already been recorded in the current render pass instance
- VUID-vkCmdBeginCustomResolveEXT-None-11519
The current render pass instance **must** have specified [VK_RENDERING_CUSTOM_RESOLVE_BIT_EXT](#)
- VUID-vkCmdBeginCustomResolveEXT-None-11520
The current render pass instance **must** not have specified [VK_RENDERING_SUSPENDING_BIT](#)

Valid Usage (Implicit)

- VUID-vkCmdBeginCustomResolveEXT-commandBuffer-parameter
[commandBuffer](#) **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdBeginCustomResolveEXT-pBeginCustomResolveInfo-parameter
If [pBeginCustomResolveInfo](#) is not NULL, [pBeginCustomResolveInfo](#) **must** be a valid pointer to a valid [VkBeginCustomResolveInfoEXT](#) structure
- VUID-vkCmdBeginCustomResolveEXT-commandBuffer-recording
[commandBuffer](#) **must** be in the [recording state](#)
- VUID-vkCmdBeginCustomResolveEXT-commandBuffer-cmdpool
The [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdBeginCustomResolveEXT-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdBeginCustomResolveEXT-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdBeginCustomResolveEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_GRAP HICS_BIT	Action

Conditional Rendering

`vkCmdBeginCustomResolveEXT` is affected by [conditional rendering](#)

The `VkBeginCustomResolveInfoEXT` structure is defined as:

```
// Provided by VK_EXT_custom_resolve with VK_KHR_dynamic_rendering or VK_VERSION_1_3
typedef struct VkBeginCustomResolveInfoEXT {
    VkStructureType    sType;
    void*              pNext;
} VkBeginCustomResolveInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

Valid Usage (Implicit)

- VUID-VkBeginCustomResolveInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BEGIN_CUSTOM_RESOLVE_INFO_EXT`

To end a render pass instance, call:

```
// Provided by VK_VERSION_1_3
void vkCmdEndRendering(
    VkCommandBuffer                commandBuffer);
```

```
// Provided by VK_KHR_dynamic_rendering
// Equivalent to vkCmdEndRendering
void vkCmdEndRenderingKHR(
    VkCommandBuffer                                commandBuffer);
```

- `commandBuffer` is the command buffer in which to record the command.

If the value of `pRenderingInfo->flags` used to begin this render pass instance included `VK_RENDERING_SUSPENDING_BIT`, then this render pass is suspended and will be resumed later in [submission order](#).

There is no implicit ordering between separate render passes, even in the same command buffer, and even when the attachments match. Some applications rely on the continuation of [rasterization order](#) between multiple render passes with attachments defined in the same way, in order to perform non-rendering operations (such as copies or compute operations) between draw calls, but this has never been required by the specification. There is also no explicit barrier currently in the API that provides the guarantee that applications rely on without additional performance penalties.

NOTE

New applications should avoid relying on this ordering until an appropriate barrier is added to the API.

Implementations where applications are performing this splitting are encouraged to continue supporting this guarantee until a suitable barrier is added to the API.

Existing applications relying on this ordering should expect that it will continue working on platforms where it currently does. Once a new extension adds support for a new barrier, developers are encouraged to adapt their applications to use this when available.

Valid Usage

- VUID-vkCmdEndRendering-None-06161
The current render pass instance **must** have been begun with [vkCmdBeginRendering](#)
- VUID-vkCmdEndRendering-commandBuffer-06162
The current render pass instance **must** have been begun in `commandBuffer`
- VUID-vkCmdEndRendering-None-06781
This command **must** not be recorded when transform feedback is active
- VUID-vkCmdEndRendering-None-06999
If `vkCmdBeginQuery*` was called within the render pass, the corresponding `vkCmdEndQuery*` **must** have been called subsequently within the same subpass
- VUID-vkCmdEndRendering-None-10645
This command **must** not be recorded when [per-tile execution model](#) is enabled

Valid Usage (Implicit)

- VUID-vkCmdEndRendering-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdEndRendering-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdEndRendering-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdEndRendering-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdEndRendering-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdEndRendering-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_GRAPHICS_BIT VK_QUEUE_VIDEO_CODING_BIT	Action State

Conditional Rendering

`vkCmdEndRendering` is not affected by `conditional rendering`

To end a render pass instance, call:

```
// Provided by VK_KHR_maintenance10
void vkCmdEndRendering2KHR(
    VkCommandBuffer                    commandBuffer,
    const VkRenderingEndInfoKHR*       pRenderingEndInfo);
```

```
// Provided by VK_EXT_fragment_density_map_offset
// Equivalent to vkCmdEndRendering2KHR
void vkCmdEndRendering2EXT(
    VkCommandBuffer                      commandBuffer,
    const VkRenderingEndInfoKHR*         pRenderingEndInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderingEndInfo` is `NULL` or a pointer to a `VkRenderingEndInfoKHR` structure containing information about how the render pass will be ended.

If the value of `pRenderingInfo->flags` used to begin this render pass instance included `VK_RENDERING_SUSPENDING_BIT`, then this render pass is suspended and will be resumed later in submission order.

There is no implicit ordering between separate render passes, even in the same command buffer, and even when the attachments match. Some applications rely on the continuation of `rasterization order` between multiple render passes with attachments defined in the same way, in order to perform non-rendering operations (such as copies or compute operations) between draw calls, but this has never been required by the specification. There is also no explicit barrier currently in the API that provides the guarantee that applications rely on without additional performance penalties.

NOTE

New applications should avoid relying on this ordering until an appropriate barrier is added to the API.

Implementations where applications are performing this splitting are encouraged to continue supporting this guarantee until a suitable barrier is added to the API.

Existing applications relying on this ordering should expect that it will continue working on platforms where it currently does. Once a new extension adds support for a new barrier, developers are encouraged to adapt their applications to use this when available.

Valid Usage

- VUID-vkCmdEndRendering2KHR-None-10610
The current render pass instance **must** have been begun with `vkCmdBeginRendering`
- VUID-vkCmdEndRendering2KHR-commandBuffer-10611
The current render pass instance **must** have been begun in `commandBuffer`
- VUID-vkCmdEndRendering2KHR-None-10612
This command **must** not be recorded when transform feedback is active
- VUID-vkCmdEndRendering2KHR-None-10613
If `vkCmdBeginQuery*` was called within the render pass, the corresponding `vkCmdEndQuery*` **must** have been called subsequently within the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndRendering2KHR-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdEndRendering2KHR-pRenderingEndInfo-parameter
If `pRenderingEndInfo` is not `NULL`, `pRenderingEndInfo` **must** be a valid pointer to a valid `VkRenderingEndInfoKHR` structure
- VUID-vkCmdEndRendering2KHR-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdEndRendering2KHR-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdEndRendering2KHR-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdEndRendering2KHR-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdEndRendering2KHR-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_GRAPHICS_BIT	Action State

Conditional Rendering

`vkCmdEndRendering2KHR` is not affected by [conditional rendering](#)

The `VkRenderingEndInfoKHR` structure is defined as:

```
// Provided by VK_KHR_maintenance10
typedef struct VkRenderingEndInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
} VkRenderingEndInfoKHR;
```

```
// Provided by VK_EXT_fragment_density_map_offset
// Equivalent to VkRenderingEndInfoKHR
typedef VkRenderingEndInfoKHR VkRenderingEndInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

Valid Usage (Implicit)

- VUID-VkRenderingEndInfoKHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_RENDERING_END_INFO_KHR](#)
- VUID-VkRenderingEndInfoKHR-pNext-pNext
pNext **must** be **NULL** or a pointer to a valid instance of [VkRenderPassFragmentDensityMapOffsetEndInfoEXT](#)
- VUID-VkRenderingEndInfoKHR-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique

NOTE

For more complex rendering graphs, it is possible to pre-define a static *render pass* object, which as well as allowing draw commands, allows the definition of framebuffer-local dependencies between multiple subpasses. These objects have a lot of setup cost compared to [vkCmdBeginRendering](#), but use of subpass dependencies can confer important performance benefits on some devices.

The [VkTilePropertiesQCOM](#) structure is defined as:

```
// Provided by VK_QCOM_tile_properties
typedef struct VkTilePropertiesQCOM {
    VkStructureType    sType;
    void*              pNext;
    VkExtent3D         tileSize;
    VkExtent2D         apronSize;
    VkOffset2D         origin;
} VkTilePropertiesQCOM;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **tileSize** is the dimensions of a tile, with width and height describing the width and height of a tile in pixels, and depth corresponding to the number of slices the tile spans.
- **apronSize** is the dimension of the **apron**.
- **origin** is the top-left corner of the first tile in attachment space.

All tiles will be tightly packed around the first tile, with edges being multiples of tile width and/or height from the origin.

The **tileSize** is guaranteed to be a multiple of **tileGranularity**.

Valid Usage (Implicit)

- VUID-VkTilePropertiesQCOM-sType-sType
sType must be **VK_STRUCTURE_TYPE_TILE_PROPERTIES_QCOM**
- VUID-VkTilePropertiesQCOM-pNext-pNext
pNext must be **NULL**

To query the tile properties when using dynamic rendering, call:

```
// Provided by VK_QCOM_tile_properties
VkResult vkGetDynamicRenderingTilePropertiesQCOM(
    VkDevice device,
    const VkRenderingInfo* pRenderingInfo,
    VkTilePropertiesQCOM* pProperties);
```

- **device** is a logical device associated with the render pass.
- **pRenderingInfo** is a pointer to the **VkRenderingInfo** structure specifying details of the render pass instance in dynamic rendering.
- **pProperties** is a pointer to a **VkTilePropertiesQCOM** structure in which the properties are returned.

Valid Usage (Implicit)

- VUID-vkGetDynamicRenderingTilePropertiesQCOM-device-parameter
device must be a valid **VkDevice** handle
- VUID-vkGetDynamicRenderingTilePropertiesQCOM-pRenderingInfo-parameter
pRenderingInfo must be a valid pointer to a valid **VkRenderingInfo** structure
- VUID-vkGetDynamicRenderingTilePropertiesQCOM-pProperties-parameter
pProperties must be a valid pointer to a **VkTilePropertiesQCOM** structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

8.1. Render Pass Objects

A render pass object represents a collection of attachments, subpasses, and dependencies between the subpasses, and describes how the attachments are used over the course of the subpasses.

Render passes are represented by [VkRenderPass](#) handles:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkRenderPass)
```

An *attachment description* describes the properties of an attachment including its format, sample count, and how its contents are treated at the beginning and end of each render pass instance.

A *subpass* represents a phase of rendering that reads and writes a subset of the attachments in a render pass. Rendering commands are recorded into a particular subpass of a render pass instance.

A *subpass description* describes the subset of attachments that is involved in the execution of a subpass. Each subpass **can** read from some attachments as *input attachments*, write to some as *color attachments* or *depth/stencil attachments*, perform *shader resolve operations* to *color_attachments* or *depth/stencil_attachments*, and perform *multisample resolve operations* to *resolve attachments*. A subpass description **can** also include a set of *preserve attachments*, which are attachments that are not read or written by the subpass but whose contents **must** be preserved throughout the subpass.

A subpass *uses an attachment* if the attachment is a color, depth/stencil, resolve, depth/stencil resolve, fragment shading rate, or input attachment for that subpass (as determined by the [pColorAttachments](#), [pDepthStencilAttachment](#), [pResolveAttachments](#), [VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment](#), [VkFragmentShadingRateAttachmentInfoKHR::pFragmentShadingRateAttachment->attachment](#), and [pInputAttachments](#) members of [VkSubpassDescription](#), respectively). A subpass does not use an attachment if that attachment is preserved by the subpass. The *first use of an attachment* is in the lowest numbered subpass that uses that attachment. Similarly, the *last use of an attachment* is in the highest numbered subpass that uses that attachment.

The subpasses in a render pass all render to the same dimensions, and fragments for pixel (x,y,layer) in one subpass **can** only read attachment contents written by previous subpasses at that same (x,y,layer) location. For multi-pixel fragments, the pixel read from an input attachment is selected from the pixels covered by that fragment in an implementation-dependent manner. However, this selection **must** be made consistently for any fragment with the same shading rate for the lifetime of the [VkDevice](#).

NOTE

By describing a complete set of subpasses in advance, render passes provide the implementation an opportunity to optimize the storage and transfer of attachment data between subpasses.

In practice, this means that subpasses with a simple framebuffer-space dependency **may** be merged into a single tiled rendering pass, keeping the attachment data on-chip for the duration of a render pass instance. However, it is also quite common for a render pass to only contain a single subpass.

Subpass dependencies describe [execution and memory dependencies](#) between subpasses.

A *subpass dependency chain* is a sequence of subpass dependencies in a render pass, where the source subpass of each subpass dependency (after the first) equals the destination subpass of the previous dependency.

Execution of subpasses **may** overlap or execute out of order with regards to other subpasses, unless otherwise enforced by an execution dependency. Each subpass only respects [submission order](#) for commands recorded in the same subpass, and the [vkCmdBeginRenderPass](#) and [vkCmdEndRenderPass](#) commands that delimit the render pass - commands within other subpasses are not included. This affects most other [implicit ordering guarantees](#).

A render pass describes the structure of subpasses and attachments independent of any specific image views for the attachments. The specific image views that will be used for the attachments, and their dimensions, are specified in [VkFramebuffer](#) objects. Framebuffers are created with respect to a specific render pass that the framebuffer is compatible with (see [Render Pass Compatibility](#)). Collectively, a render pass and a framebuffer define the complete render target state for one or more subpasses as well as the algorithmic dependencies between the subpasses.

The various pipeline stages of the drawing commands for a given subpass **may** execute concurrently and/or out of order, both within and across drawing commands, whilst still respecting [pipeline order](#). However for a given (x,y,layer,sample) sample location, certain per-sample operations are performed in [rasterization order](#).

[VK_ATTACHMENT_UNUSED](#) is a constant indicating that a render pass attachment is not used.

```
#define VK_ATTACHMENT_UNUSED (~0U)
```

8.2. Render Pass Creation

To create a render pass, call:

WARNING

This functionality is superseded by [vkCreateRenderPass2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
VkResult vkCreateRenderPass(
    VkDevice                                device,
    const VkRenderPassCreateInfo*          pCreateInfo,
    const VkAllocationCallbacks*          pAllocator,
    VkRenderPass*                          pRenderPass);
```

- **device** is the logical device that creates the render pass.
- **pCreateInfo** is a pointer to a [VkRenderPassCreateInfo](#) structure describing the parameters of the render pass.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pRenderPass** is a pointer to a [VkRenderPass](#) handle in which the resulting render pass object is returned.

Valid Usage

- VUID-vkCreateRenderPass-device-10000
device **must** support at least one queue family with the [VK_QUEUE_GRAPHICS_BIT](#) capability
- VUID-vkCreateRenderPass-flags-10646
[VkRenderPassTileShadingCreateInfoQCOM::flags](#) **must** not include [VK_TILE_SHADING_RENDER_PASS_PER_TILE_EXECUTION_BIT_QCOM](#)

Valid Usage (Implicit)

- VUID-vkCreateRenderPass-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateRenderPass-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkRenderPassCreateInfo](#) structure
- VUID-vkCreateRenderPass-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateRenderPass-pRenderPass-parameter
pRenderPass **must** be a valid pointer to a [VkRenderPass](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkRenderPassCreateInfo](#) structure is defined as:

WARNING

This functionality is superseded by [VkRenderPassCreateInfo2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkRenderPassCreateFlags flags;
    uint32_t             attachmentCount;
    const VkAttachmentDescription* pAttachments;
    uint32_t             subpassCount;
    const VkSubpassDescription* pSubpasses;
    uint32_t             dependencyCount;
    const VkSubpassDependency* pDependencies;
} VkRenderPassCreateInfo;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of [VkRenderPassCreateFlagBits](#)
- `attachmentCount` is the number of attachments used by this render pass.
- `pAttachments` is a pointer to an array of `attachmentCount` [VkAttachmentDescription](#) structures describing the attachments used by the render pass.
- `subpassCount` is the number of subpasses to create.
- `pSubpasses` is a pointer to an array of `subpassCount` [VkSubpassDescription](#) structures describing each subpass.
- `dependencyCount` is the number of memory dependencies between pairs of subpasses.
- `pDependencies` is a pointer to an array of `dependencyCount` [VkSubpassDependency](#) structures describing dependencies between pairs of subpasses.

NOTE

Care should be taken to avoid a data race here; if any subpasses access attachments with overlapping memory locations, and one of those accesses is a write, a subpass dependency needs to be included between them.

Valid Usage

- VUID-VkRenderPassCreateInfo-attachment-00834

If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, then it **must** be less than `attachmentCount`

- VUID-VkRenderPassCreateInfo-fragmentDensityMapAttachment-06471

If the `pNext` chain includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure and the `fragmentDensityMapAttachment` member is not `VK_ATTACHMENT_UNUSED`, then `attachment` **must** be less than `attachmentCount`

- VUID-VkRenderPassCreateInfo-fragmentDensityMapLayered-10828

If the `fragmentDensityMapLayered` feature is not enabled, `flags` **must** not contain `VK_RENDER_PASS_CREATE_PER_LAYER_FRAGMENT_DENSITY_BIT_VALVE`

- VUID-VkRenderPassCreateInfo-pAttachments-00836

For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderPassCreateInfo-pAttachments-02511

For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderPassCreateInfo-pAttachments-01566

For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- VUID-VkRenderPassCreateInfo-pAttachments-01567

For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderPassCreateInfo-pNext-01926

If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `subpass` member of each element of its `pAspectReferences` member **must** be less than `subpassCount`

- VUID-VkRenderPassCreateInfo-pNext-01927

If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure,

the `inputAttachmentIndex` member of each element of its `pAspectReferences` member **must** be less than the value of `inputAttachmentCount` in the element of `pSubpasses` identified by its `subpass` member

- VUID-VkRenderPassCreateInfo-pNext-01963

If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, for any element of the `pInputAttachments` member of any element of `pSubpasses` where the `attachment` member is not `VK_ATTACHMENT_UNUSED`, the `aspectMask` member of the corresponding element of `VkRenderPassInputAttachmentAspectCreateInfo::pAspectReferences` **must** only include aspects that are present in images of the format specified by the element of `pAttachments` at `attachment`

- VUID-VkRenderPassCreateInfo-pNext-01928

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and its `subpassCount` member is not zero, that member **must** be equal to the value of `subpassCount`

- VUID-VkRenderPassCreateInfo-pNext-01929

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, if its `dependencyCount` member is not zero, it **must** be equal to `dependencyCount`

- VUID-VkRenderPassCreateInfo-pNext-01930

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, for each non-zero element of `pViewOffsets`, the `srcSubpass` and `dstSubpass` members of `pDependencies` at the same index **must** not be equal

- VUID-VkRenderPassCreateInfo-pNext-02512

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, for each element of `pDependencies` with a `dependencyFlags` member that does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`, the corresponding element of the `pViewOffsets` member of that `VkRenderPassMultiviewCreateInfo` instance **must** be 0

- VUID-VkRenderPassCreateInfo-pNext-02513

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, elements of its `pViewMasks` member **must** either all be 0, or all not be 0

- VUID-VkRenderPassCreateInfo-pNext-02514

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and each element of its `pViewMasks` member is 0, the `dependencyFlags` member of each element of `pDependencies` **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-VkRenderPassCreateInfo-pNext-02515

If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and each element of its `pViewMasks` member is 0, its `correlationMaskCount` member **must** be 0

- VUID-VkRenderPassCreateInfo-pDependencies-00837

For each element of `pDependencies`, if the `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `srcStageMask` member of that dependency **must** be `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` or a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the source subpass

- VUID-VkRenderPassCreateInfo-pDependencies-00838

For each element of `pDependencies`, if the `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `dstStageMask` member of that dependency **must** be `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` or a pipeline stage supported by the `pipeline`

identified by the `pipelineBindPoint` member of the destination subpass

- VUID-VkRenderPassCreateInfo-pDependencies-06866

For each element of `pDependencies`, if its `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, it **must** be less than `subpassCount`

- VUID-VkRenderPassCreateInfo-pDependencies-06867

For each element of `pDependencies`, if its `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, it **must** be less than `subpassCount`

- VUID-VkRenderPassCreateInfo-pResolveAttachments-10647

If any element of `pResolveAttachments` of any element of `pSubpasses` references an attachment description with a format of `VK_FORMAT_UNDEFINED`, `VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM` **must** not be included in `VkRenderPassTileShadingCreateInfoQCOM::flags`

- VUID-VkRenderPassCreateInfo-fragmentDensityMapAttachment-10648

If `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM` **must** not be included in `VkRenderPassTileShadingCreateInfoQCOM::flags`

- VUID-VkRenderPassCreateInfo-None-10915

If any subpass preserves an attachment, there **must** be a subpass dependency from a prior subpass which uses or preserves that attachment

Valid Usage (Implicit)

- VUID-VkRenderPassCreateInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO`

- VUID-VkRenderPassCreateInfo-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkRenderPassFragmentDensityMapCreateInfoEXT`, `VkRenderPassInputAttachmentAspectCreateInfo`, `VkRenderPassMultiviewCreateInfo`, `VkRenderPassTileShadingCreateInfoQCOM`, or `VkTileMemorySizeInfoQCOM`

- VUID-VkRenderPassCreateInfo-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkRenderPassCreateInfo-flags-parameter

`flags` **must** be a valid combination of `VkRenderPassCreateFlagBits` values

- VUID-VkRenderPassCreateInfo-pAttachments-parameter

If `attachmentCount` is not `0`, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkAttachmentDescription` structures

- VUID-VkRenderPassCreateInfo-pSubpasses-parameter

`pSubpasses` **must** be a valid pointer to an array of `subpassCount` valid `VkSubpassDescription` structures

- VUID-VkRenderPassCreateInfo-pDependencies-parameter

If `dependencyCount` is not `0`, `pDependencies` **must** be a valid pointer to an array of `dependencyCount` valid `VkSubpassDependency` structures

- `VUID-VkRenderPassCreateInfo-subpassCount-arraylength`
`subpassCount` **must** be greater than 0

Bits which **can** be set in `VkRenderPassCreateInfo::flags`, describing additional properties of the render pass, are:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef enum VkRenderPassCreateFlagBits {
    // Provided by VK_QCOM_render_pass_transform
    VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM = 0x00000002,
    // Provided by VK_VALVE_fragment_density_map_layered
    VK_RENDER_PASS_CREATE_PER_LAYER_FRAGMENT_DENSITY_BIT_VALVE = 0x00000004,
} VkRenderPassCreateFlagBits;
```

- `VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM` specifies that the created render pass is compatible with [render pass transform](#).
- `VK_RENDER_PASS_CREATE_PER_LAYER_FRAGMENT_DENSITY_BIT_VALVE` specifies that the created render pass is usable with layered fragment density maps.

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkRenderPassCreateFlags;
```

`VkRenderPassCreateFlags` is a bitmask type for setting a mask of zero or more `VkRenderPassCreateFlagBits`.

If the `VkRenderPassCreateInfo::pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, then that structure includes an array of view masks, view offsets, and correlation masks for the render pass.

The `VkRenderPassMultiviewCreateInfo` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassMultiviewCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           subpassCount;
    const uint32_t*     pViewMasks;
    uint32_t           dependencyCount;
    const int32_t*      pViewOffsets;
    uint32_t           correlationMaskCount;
    const uint32_t*     pCorrelationMasks;
} VkRenderPassMultiviewCreateInfo;
```

```
// Provided by VK_KHR_multiview
// Equivalent to VkRenderPassMultiviewCreateInfo
typedef VkRenderPassMultiviewCreateInfo VkRenderPassMultiviewCreateInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **subpassCount** is zero or the number of subpasses in the render pass.
- **pViewMasks** is a pointer to an array of **subpassCount** view masks, where each mask is a bitfield of view indices describing which views rendering is broadcast to in each subpass, when multiview is enabled. If **subpassCount** is zero, each view mask is treated as zero.
- **dependencyCount** is zero or the number of dependencies in the render pass.
- **pViewOffsets** is a pointer to an array of **dependencyCount** view offsets, one for each dependency. If **dependencyCount** is zero, each dependency's view offset is treated as zero. Each view offset controls which views in the source subpass the views in the destination subpass depend on.
- **correlationMaskCount** is zero or the number of correlation masks.
- **pCorrelationMasks** is a pointer to an array of **correlationMaskCount** view masks indicating sets of views that **may** be more efficient to render concurrently.

When a subpass uses a non-zero view mask, *multiview* functionality is considered to be enabled. Multiview is all-or-nothing for a render pass - that is, either all subpasses **must** have a non-zero view mask (though some subpasses **may** have only one view) or all **must** be zero. Multiview causes all drawing and clear commands in the subpass to behave as if they were broadcast to each view, where a view is represented by one layer of the framebuffer attachments. All draws and clears are broadcast to each *view index* whose bit is set in the view mask. The view index is provided in the **ViewIndex** shader input variable, and color, depth/stencil, and input attachments all read/write the layer of the framebuffer corresponding to the view index.

If the view mask is zero for all subpasses, multiview is considered to be disabled and all drawing commands execute normally, without this additional broadcasting.

Some implementations **may** not support multiview in conjunction with **mesh shaders**, **geometry shaders** or **tessellation shaders**.

When multiview is enabled, the [VK_DEPENDENCY_VIEW_LOCAL_BIT](#) bit in a dependency **can** be used to express a view-local dependency, meaning that each view in the destination subpass depends on a single view in the source subpass. Unlike pipeline barriers, a subpass dependency **can** potentially have a different view mask in the source subpass and the destination subpass. If the dependency is view-local, then each view (dstView) in the destination subpass depends on the view `dstView + pViewOffsets[dependency]` in the source subpass. If there is not such a view in the source subpass, then this dependency does not affect that view in the destination subpass. If the dependency is not view-local, then all views in the destination subpass depend on all views in the source subpass, and the view offset is ignored. A non-zero view offset is not allowed in a self-dependency.

The elements of `pCorrelationMasks` are a set of masks of views indicating that views in the same mask **may** exhibit spatial coherency between the views, making it more efficient to render them concurrently. Correlation masks **must** not have a functional effect on the results of the multiview rendering.

When multiview is enabled, at the beginning of each subpass all non-render pass state is undefined. In particular, each time [vkCmdBeginRenderPass](#) or [vkCmdNextSubpass](#) is called the graphics pipeline **must** be bound, any relevant descriptor sets or vertex/index buffers **must** be bound, and any relevant dynamic state or push constants **must** be set before they are used.

A multiview subpass **can** declare that its shaders will write per-view attributes for all views in a single invocation, by setting the [VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX](#) bit in the subpass description. The only supported per-view attributes are position and viewport mask, and per-view position and viewport masks are written to output array variables decorated with `PositionPerViewNV` and `ViewportMaskPerViewNV`, respectively. If the [VK_NV_viewport_array2](#) extension is not supported and enabled, `ViewportMaskPerViewNV` **must** not be used. Values written to elements of `PositionPerViewNV` and `ViewportMaskPerViewNV` **must** not depend on the `ViewIndex`. The shader **must** also write to an output variable decorated with `Position`, and the value written to `Position` **must** equal the value written to `PositionPerViewNV[ViewIndex]`. Similarly, if `ViewportMaskPerViewNV` is written to then the shader **must** also write to an output variable decorated with `ViewportMaskNV`, and the value written to `ViewportMaskNV` **must** equal the value written to `ViewportMaskPerViewNV[ViewIndex]`. Implementations will either use values taken from `Position` and `ViewportMaskNV` and invoke the shader once for each view, or will use values taken from `PositionPerViewNV` and `ViewportMaskPerViewNV` and invoke the shader fewer times. The values written to `Position` and `ViewportMaskNV` **must** not depend on the values written to `PositionPerViewNV` and `ViewportMaskPerViewNV`, or vice versa (to allow compilers to eliminate the unused outputs). All attributes that do not have `*PerViewNV` counterparts **must** not depend on `ViewIndex`.

Per-view attributes are all-or-nothing for a subpass. That is, all pipelines compiled against a subpass that includes the [VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX](#) bit **must** write per-view attributes to the `*PerViewNV[]` shader outputs, in addition to the non-per-view (e.g. `Position`) outputs. Pipelines compiled against a subpass that does not include this bit **must** not include the `*PerViewNV[]` outputs in their interfaces.

Valid Usage

- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-00841

Each view index **must** not be set in more than one element of `pCorrelationMasks`

- VUID-VkRenderPassMultiviewCreateInfo-multiview-06555

If the `multiview` feature is not enabled, each element of `pViewMasks` **must** be 0

- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-06697

The index of the most significant bit in each element of `pViewMasks` **must** be less than `maxMultiviewViewCount`

Valid Usage (Implicit)

- VUID-VkRenderPassMultiviewCreateInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_MULTIVIEW_CREATE_INFO`

- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-parameter

If `subpassCount` is not 0, `pViewMasks` **must** be a valid pointer to an array of `subpassCount` `uint32_t` values

- VUID-VkRenderPassMultiviewCreateInfo-pViewOffsets-parameter

If `dependencyCount` is not 0, `pViewOffsets` **must** be a valid pointer to an array of `dependencyCount` `int32_t` values

- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-parameter

If `correlationMaskCount` is not 0, `pCorrelationMasks` **must** be a valid pointer to an array of `correlationMaskCount` `uint32_t` values

Structure Chaining

Extends the structure

- `VkRenderPassCreateInfo`

The `VkMultiviewPerViewAttributesInfoNVX` structure is defined as:

```
// Provided by VK_NVX_multiview_per_view_attributes with VK_VERSION_1_3 or
VK_KHR_dynamic_rendering
typedef struct VkMultiviewPerViewAttributesInfoNVX {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           perViewAttributes;
    VkBool32           perViewAttributesPositionXOnly;
} VkMultiviewPerViewAttributesInfoNVX;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `perViewAttributes` specifies that shaders compiled for this pipeline write the attributes for all views in a single invocation of each vertex processing stage. All pipelines executed within a render pass instance that includes this bit **must** write per-view attributes to the `*PerViewNV[]`

shader outputs, in addition to the non-per-view (e.g. [Position](#)) outputs.

- [perViewAttributesPositionXOnly](#) specifies that shaders compiled for this pipeline use per-view positions which only differ in value in the x component. Per-view viewport mask **can** also be used.

When dynamic render pass instances are being used, instead of specifying [VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX](#) or [VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX](#) in the subpass description flags, the per-attribute properties of the render pass instance **must** be specified by the [VkMultiviewPerViewAttributesInfoNVX](#) structure. Include the [VkMultiviewPerViewAttributesInfoNVX](#) structure in the [pNext](#) chain of [VkGraphicsPipelineCreateInfo](#) when creating a graphics pipeline for dynamic rendering, [VkRenderingInfo](#) when starting a dynamic render pass instance, and [VkCommandBufferInheritanceInfo](#) when specifying the dynamic render pass instance parameters for secondary command buffers.

Valid Usage (Implicit)

- VUID-VkMultiviewPerViewAttributesInfoNVX-sType-sType [sType](#) **must** be [VK_STRUCTURE_TYPE_MULTIVIEW_PER_VIEW_ATTRIBUTES_INFO_NVX](#)

Structure Chaining

Extends the structures

- [VkCommandBufferInheritanceInfo](#)
- [VkGraphicsPipelineCreateInfo](#)
- [VkRenderingInfo](#)

If the [VkRenderPassCreateInfo::pNext](#) chain includes a [VkRenderPassFragmentDensityMapCreateInfoEXT](#) structure, then that structure includes a fragment density map attachment for the render pass.

The [VkRenderPassFragmentDensityMapCreateInfoEXT](#) structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#) and [VK_KHR_dynamic_rendering_local_read](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_fragment_density_map
typedef struct VkRenderPassFragmentDensityMapCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkAttachmentReference fragmentDensityMapAttachment;
} VkRenderPassFragmentDensityMapCreateInfoEXT;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityMapAttachment` is the fragment density map to use for the render pass.

The fragment density map is read at an implementation-dependent time with the following constraints determined by the attachment's image view `flags`:

- `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT` specifies that the fragment density map will be read by the device during `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT` specifies that the fragment density map will be read by the host during `vkEndCommandBuffer` of the primary command buffer that the render pass is recorded into
- Otherwise the fragment density map will be read by the host during `vkCmdBeginRenderPass`

The fragment density map **may** additionally be read by the device during `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT` for any mode.

If this structure is not present, it is as if `fragmentDensityMapAttachment` was given as `VK_ATTACHMENT_UNUSED`.

Valid Usage

- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02548
If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` **must** not be an element of `VkSubpassDescription::pInputAttachments`, `VkSubpassDescription::pColorAttachments`, `VkSubpassDescription::pResolveAttachments`, `VkSubpassDescription::pDepthStencilAttachment`, or `VkSubpassDescription::pPreserveAttachments` for any subpass
- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02549
If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `layout` **must** be equal to `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`, or `VK_IMAGE_LAYOUT_GENERAL`
- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02550
If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` **must** reference an attachment with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_LOAD` or `VK_ATTACHMENT_LOAD_OP_DONT_CARE`
- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02551
If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` **must** reference an attachment with a `storeOp` equal to `VK_ATTACHMENT_STORE_OP_DONT_CARE`

Valid Usage (Implicit)

- `VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_FRAGMENT_DENSITY_MAP_CREATE_INFO_EXT`
- `VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-parameter` `fragmentDensityMapAttachment` must be a valid `VkAttachmentReference` structure

Structure Chaining

Extends the structures

- `VkRenderPassCreateInfo`
- `VkRenderPassCreateInfo2`

The `VkAttachmentDescription` structure is defined as:

WARNING

This functionality is superseded by `VkAttachmentDescription2`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentDescription {
    VkAttachmentDescriptionFlags    flags;
    VkFormat                       format;
    VkSampleCountFlagBits          samples;
    VkAttachmentLoadOp              loadOp;
    VkAttachmentStoreOp             storeOp;
    VkAttachmentLoadOp              stencilLoadOp;
    VkAttachmentStoreOp             stencilStoreOp;
    VkImageLayout                  initialLayout;
    VkImageLayout                   finalLayout;
} VkAttachmentDescription;
```

- `flags` is a bitmask of `VkAttachmentDescriptionFlagBits` specifying additional properties of the attachment.
- `format` is a `VkFormat` value specifying the format of the image view that will be used for the attachment.
- `samples` is a `VkSampleCountFlagBits` value specifying the number of samples of the image.
- `loadOp` is a `VkAttachmentLoadOp` value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- `storeOp` is a `VkAttachmentStoreOp` value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.

- `stencilLoadOp` is a `VkAttachmentLoadOp` value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- `stencilStoreOp` is a `VkAttachmentStoreOp` value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- `initialLayout` is the layout the attachment image subresource will be in when a render pass instance begins.
- `finalLayout` is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

If the attachment uses a color format, then `loadOp` and `storeOp` are used, and `stencilLoadOp` and `stencilStoreOp` are ignored. If the format has depth and/or stencil components, `loadOp` and `storeOp` apply only to the depth data, while `stencilLoadOp` and `stencilStoreOp` define how the stencil data is handled. `loadOp` and `stencilLoadOp` define the `load operations` for the attachment. `storeOp` and `stencilStoreOp` define the `store operations` for the attachment. If an attachment is not used by any subpass, `loadOp`, `storeOp`, `stencilStoreOp`, and `stencilLoadOp` will be ignored for that attachment, and no load or store ops will be performed. However, any transition specified by `initialLayout` and `finalLayout` will still be executed.

If `flags` includes `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, then the attachment is treated as if it shares physical memory with another attachment in the same render pass. This information limits the ability of the implementation to reorder certain operations (like layout transitions and the `loadOp`) such that it is not improperly reordered against other uses of the same physical memory via a different attachment. This is described in more detail below.

If a render pass uses multiple attachments that alias the same device memory, those attachments **must** each include the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit in their attachment description flags. Attachments aliasing the same memory occurs in multiple ways:

- Multiple attachments being assigned the same image view as part of framebuffer creation.
- Attachments using distinct image views that correspond to the same image subresource of an image.
- Attachments using views of distinct image subresources which are bound to overlapping memory ranges.

NOTE

Render passes **must** include subpass dependencies (either directly or via a subpass dependency chain) between any two subpasses that operate on the same attachment or aliasing attachments and those subpass dependencies **must** include execution and memory dependencies separating uses of the aliases, if at least one of those subpasses writes to one of the aliases. These dependencies **must** not include the `VK_DEPENDENCY_BY_REGION_BIT` if the aliases are views of distinct image subresources which overlap in memory.

Multiple attachments that alias the same memory **must** not be used in a single subpass. A given attachment index **must** not be used multiple times in a single subpass, with one exception: two subpass attachments **can** use the same attachment index if at least one use is as an input attachment and neither use is as a resolve or preserve attachment. In other words, the same view **can** be used simultaneously as an input and color or depth/stencil attachment, but **must** not be

used as multiple color or depth/stencil attachments nor as resolve or preserve attachments.

If a set of attachments alias each other, then all except the first to be used in the render pass **must** use an **initialLayout** of `VK_IMAGE_LAYOUT_UNDEFINED`, since the earlier uses of the other aliases make their contents undefined. Once an alias has been used and a different alias has been used after it, the first alias **must** not be used in any later subpasses. However, an application **can** assign the same image view to multiple aliasing attachment indices, which allows that image view to be used multiple times even if other aliases are used in between.

NOTE

Once an attachment needs the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit, there **should** be no additional cost of introducing additional aliases, and using these additional aliases **may** allow more efficient clearing of the attachments on multiple uses via `VK_ATTACHMENT_LOAD_OP_CLEAR`.

Valid Usage

- VUID-VkAttachmentDescription-format-06699

If **format** includes a color or depth component and **loadOp** is `VK_ATTACHMENT_LOAD_OP_LOAD`, then **initialLayout** **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`

- VUID-VkAttachmentDescription-finalLayout-00843

finalLayout **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- VUID-VkAttachmentDescription-format-03280

If **format** is a color format, **initialLayout** **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription-format-03281

If **format** is a depth/stencil format, **initialLayout** **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- VUID-VkAttachmentDescription-format-03282

If **format** is a color format, **finalLayout** **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription-format-03283

If **format** is a depth/stencil format, **finalLayout** **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- VUID-VkAttachmentDescription-format-06487

If **format** is a color format, **initialLayout** **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- VUID-VkAttachmentDescription-format-06488

If **format** is a color format, **finalLayout** **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- VUID-VkAttachmentDescription-separateDepthStencilLayouts-03284
If the `separateDepthStencilLayouts` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`,
- VUID-VkAttachmentDescription-separateDepthStencilLayouts-03285
If the `separateDepthStencilLayouts` feature is not enabled, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`,
- VUID-VkAttachmentDescription-format-03286
If `format` is a color format, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription-format-03287
If `format` is a color format, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription-format-06906
If `format` is a depth/stencil format which includes both depth and stencil components, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription-format-06907
If `format` is a depth/stencil format which includes both depth and stencil components, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription-format-03290
If `format` is a depth/stencil format which includes only the depth component, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription-format-03291
If `format` is a depth/stencil format which includes only the depth component, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription-synchronization2-06908
If the `synchronization2` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or
`VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkAttachmentDescription-synchronization2-06909
If the `synchronization2` feature is not enabled, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkAttachmentDescription-attachmentFeedbackLoopLayout-07309
If the `attachmentFeedbackLoopLayout` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`
- VUID-VkAttachmentDescription-attachmentFeedbackLoopLayout-07310
If the `attachmentFeedbackLoopLayout` feature is not enabled, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`
- VUID-VkAttachmentDescription-samples-08745
`samples` **must** be a valid `VkSampleCountFlagBits` value that is set in `imageCreateSampleCounts` (as defined in [Image Creation Limits](#)) for the given `format`
- VUID-VkAttachmentDescription-dynamicRenderingLocalRead-09544
If the `dynamicRenderingLocalRead` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ`
- VUID-VkAttachmentDescription-dynamicRenderingLocalRead-09545
If the `dynamicRenderingLocalRead` feature is not enabled, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ`
- VUID-VkAttachmentDescription-flags-11773
If `flags` includes `VK_ATTACHMENT_DESCRIPTION_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR`, `flags` **must** not include `VK_ATTACHMENT_DESCRIPTION_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`
- VUID-VkAttachmentDescription-flags-11774
If `flags` includes `VK_ATTACHMENT_DESCRIPTION_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` or `VK_ATTACHMENT_DESCRIPTION_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`, `resolveSrgbFormatSupportsTransferFunctionControl` **must** be `VK_TRUE`
- VUID-VkAttachmentDescription-flags-11775
If `flags` includes `VK_ATTACHMENT_DESCRIPTION_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` or `VK_ATTACHMENT_DESCRIPTION_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`, `maintenance10` **must** be enabled
- VUID-VkAttachmentDescription-flags-11776
If `flags` includes `VK_ATTACHMENT_DESCRIPTION_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` or `VK_ATTACHMENT_DESCRIPTION_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`, `format` **must** use sRGB encoding
- VUID-VkAttachmentDescription-flags-11777
If `flags` includes `VK_ATTACHMENT_DESCRIPTION_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` or `VK_ATTACHMENT_DESCRIPTION_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`, `samples` **must** be `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkAttachmentDescription-format-06698
format **must** not be `VK_FORMAT_UNDEFINED`
- VUID-VkAttachmentDescription-format-06700
If **format** includes a stencil component and **stencilLoadOp** is `VK_ATTACHMENT_LOAD_OP_LOAD`, then **initialLayout** **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`
- VUID-VkAttachmentDescription-format-03292
If **format** is a depth/stencil format which includes only the stencil component, **initialLayout** **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription-format-03293
If **format** is a depth/stencil format which includes only the stencil component, **finalLayout** **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription-format-06242
If **format** is a depth/stencil format which includes both depth and stencil components, **initialLayout** **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`
- VUID-VkAttachmentDescription-format-06243
If **format** is a depth/stencil format which includes both depth and stencil components, **finalLayout** **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

Valid Usage (Implicit)

- VUID-VkAttachmentDescription-flags-parameter
flags **must** be a valid combination of `VkAttachmentDescriptionFlagBits` values
- VUID-VkAttachmentDescription-format-parameter
format **must** be a valid `VkFormat` value
- VUID-VkAttachmentDescription-samples-parameter
samples **must** be a valid `VkSampleCountFlagBits` value
- VUID-VkAttachmentDescription-loadOp-parameter
loadOp **must** be a valid `VkAttachmentLoadOp` value
- VUID-VkAttachmentDescription-storeOp-parameter
storeOp **must** be a valid `VkAttachmentStoreOp` value
- VUID-VkAttachmentDescription-stencilLoadOp-parameter
stencilLoadOp **must** be a valid `VkAttachmentLoadOp` value
- VUID-VkAttachmentDescription-stencilStoreOp-parameter
stencilStoreOp **must** be a valid `VkAttachmentStoreOp` value
- VUID-VkAttachmentDescription-initialLayout-parameter
initialLayout **must** be a valid `VkImageLayout` value
- VUID-VkAttachmentDescription-finalLayout-parameter

`finalLayout` **must** be a valid `VkImageLayout` value

Bits which **can** be set in `VkAttachmentDescription::flags`, describing additional properties of the attachment, are:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentDescriptionFlagBits {
    VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT = 0x00000001,
    // Provided by VK_KHR_maintenance10
    VK_ATTACHMENT_DESCRIPTION_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_maintenance10
    VK_ATTACHMENT_DESCRIPTION_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR = 0x00000004,
} VkAttachmentDescriptionFlagBits;
```

- `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` specifies that the attachment aliases the same device memory as other attachments.
- `VK_ATTACHMENT_DESCRIPTION_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` specifies that resolve operations happening to an sRGB encoded attachment **must** not convert samples from nonlinear to linear before averaging.
- `VK_ATTACHMENT_DESCRIPTION_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR` specifies that resolve operations happening to an sRGB encoded attachment **must** convert samples from nonlinear to linear before averaging.

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkAttachmentDescriptionFlags;
```

`VkAttachmentDescriptionFlags` is a bitmask type for setting a mask of zero or more `VkAttachmentDescriptionFlagBits`.

The `VkRenderPassInputAttachmentAspectCreateInfo` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassInputAttachmentAspectCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 aspectReferenceCount;
    const VkInputAttachmentAspectReference* pAspectReferences;
} VkRenderPassInputAttachmentAspectCreateInfo;
```

```
// Provided by VK_KHR_maintenance2
// Equivalent to VkRenderPassInputAttachmentAspectCreateInfo
typedef VkRenderPassInputAttachmentAspectCreateInfo
VkRenderPassInputAttachmentAspectCreateInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **aspectReferenceCount** is the number of elements in the **pAspectReferences** array.
- **pAspectReferences** is a pointer to an array of **aspectReferenceCount** **VkInputAttachmentAspectReference** structures containing a mask describing which aspect(s) **can** be accessed for a given input attachment within a given subpass.

To specify which aspects of an input attachment **can** be read, add a **VkRenderPassInputAttachmentAspectCreateInfo** structure to the **pNext** chain of the **VkRenderPassCreateInfo** structure:

An application **can** access any aspect of an input attachment that does not have a specified aspect mask in the **pAspectReferences** array. Otherwise, an application **must** not access aspect(s) of an input attachment other than those in its specified aspect mask.

Valid Usage (Implicit)

- VUID-VkRenderPassInputAttachmentAspectCreateInfo-sType-sType **must** be **VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO**
- VUID-VkRenderPassInputAttachmentAspectCreateInfo-pAspectReferences-parameter **pAspectReferences** **must** be a valid pointer to an array of **aspectReferenceCount** valid **VkInputAttachmentAspectReference** structures
- VUID-VkRenderPassInputAttachmentAspectCreateInfo-aspectReferenceCount-arraylength **aspectReferenceCount** **must** be greater than 0

Structure Chaining

Extends the structure

- **VkRenderPassCreateInfo**

The `VkInputAttachmentAspectReference` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_1
typedef struct VkInputAttachmentAspectReference {
    uint32_t      subpass;
    uint32_t      inputAttachmentIndex;
    VkImageAspectFlags aspectMask;
} VkInputAttachmentAspectReference;
```

```
// Provided by VK_KHR_maintenance2
// Equivalent to VkInputAttachmentAspectReference
typedef VkInputAttachmentAspectReference VkInputAttachmentAspectReferenceKHR;
```

- `subpass` is an index into the `pSubpasses` array of the parent `VkRenderPassCreateInfo` structure.
- `inputAttachmentIndex` is an index into the `pInputAttachments` of the specified subpass.
- `aspectMask` is a mask of which aspect(s) **can** be accessed within the specified subpass.

This structure specifies an aspect mask for a specific input attachment of a specific subpass in the render pass.

`subpass` and `inputAttachmentIndex` index into the render pass as:

```
pCreateInfo->pSubpasses[subpass].pInputAttachments[inputAttachmentIndex]
```

Valid Usage

- VUID-VkInputAttachmentAspectReference-aspectMask-01964
`aspectMask` **must** not include `VK_IMAGE_ASPECT_METADATA_BIT`
- VUID-VkInputAttachmentAspectReference-aspectMask-02250
`aspectMask` **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index *i*

Valid Usage (Implicit)

- VUID-VkInputAttachmentAspectReference-aspectMask-parameter
`aspectMask` **must** be a valid combination of `VkImageAspectFlagBits` values
- VUID-VkInputAttachmentAspectReference-aspectMask-requiredbitmask
`aspectMask` **must** not be 0

The `VkSubpassDescription` structure is defined as:

WARNING

This functionality is superseded by [VkSubpassDescription2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDescription {
    VkSubpassDescriptionFlags    flags;
    VkPipelineBindPoint          pipelineBindPoint;
    uint32_t                     inputAttachmentCount;
    const VkAttachmentReference* pInputAttachments;
    uint32_t                     colorAttachmentCount;
    const VkAttachmentReference* pColorAttachments;
    const VkAttachmentReference* pResolveAttachments;
    const VkAttachmentReference* pDepthStencilAttachment;
    uint32_t                     preserveAttachmentCount;
    const uint32_t*              pPreserveAttachments;
} VkSubpassDescription;
```

- `flags` is a bitmask of [VkSubpassDescriptionFlagBits](#) specifying usage of the subpass.
- `pipelineBindPoint` is a [VkPipelineBindPoint](#) value specifying the pipeline type supported for this subpass.
- `inputAttachmentCount` is the number of input attachments.
- `pInputAttachments` is a pointer to an array of [VkAttachmentReference](#) structures defining the input attachments for this subpass and their layouts.
- `colorAttachmentCount` is the number of color attachments.
- `pColorAttachments` is a pointer to an array of `colorAttachmentCount` [VkAttachmentReference](#) structures defining the color attachments for this subpass and their layouts.
- `pResolveAttachments` is `NULL` or a pointer to an array of `colorAttachmentCount` [VkAttachmentReference](#) structures defining the resolve attachments for this subpass and their layouts.
- `pDepthStencilAttachment` is a pointer to a [VkAttachmentReference](#) structure specifying the depth/stencil attachment for this subpass and its layout.
- `preserveAttachmentCount` is the number of preserved attachments.
- `pPreserveAttachments` is a pointer to an array of `preserveAttachmentCount` render pass attachment indices identifying attachments that are not used by this subpass, but whose contents **must** be preserved throughout the subpass.

Each element of the `pInputAttachments` array corresponds to an input attachment index in a fragment shader, i.e. if a shader declares an image variable decorated with a `InputAttachmentIndex` value of `X`, then it uses the attachment provided in `pInputAttachments[X]`. Input attachments **must** also be bound to the pipeline in a descriptor set. If the `attachment` member of any element of `pInputAttachments` is [VK_ATTACHMENT_UNUSED](#), the application **must** not read from the corresponding input attachment index. Fragment shaders **can** use subpass input variables to access the contents of an input attachment at the fragment's (x_f, y_f) framebuffer coordinates and layer. Input attachments **must** not be used by any subpasses within a render pass that enables [render](#)

pass transform.

Each element of the `pColorAttachments` array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of `X`, then it uses the attachment provided in `pColorAttachments[X]`. If the `attachment` member of any element of `pColorAttachments` is `VK_ATTACHMENT_UNUSED`, or if `Color Write Enable` has been disabled for the corresponding attachment index, then writes to the corresponding location by a fragment shader are discarded.

If `flags` does not include `VK_SUBPASS_DESCRIPTION_CUSTOM_RESOLVE_BIT_EXT`, and if `pResolveAttachments` is not `NULL`, each of its elements corresponds to a color attachment (the element in `pColorAttachments` at the same index), and a `multisample resolve operation` is defined for each attachment unless the resolve attachment index is `VK_ATTACHMENT_UNUSED`.

Similarly, if `flags` does not include `VK_SUBPASS_DESCRIPTION_CUSTOM_RESOLVE_BIT_EXT`, and `VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, it corresponds to the depth/stencil attachment in `pDepthStencilAttachment`, and `multisample resolve operation` for depth and stencil are defined by `VkSubpassDescriptionDepthStencilResolve::depthResolveMode` and `VkSubpassDescriptionDepthStencilResolve::stencilResolveMode`, respectively. If `VkSubpassDescriptionDepthStencilResolve::depthResolveMode` is `VK_RESOLVE_MODE_NONE` or the `pDepthStencilResolveAttachment` does not have a depth aspect, no resolve operation is performed for the depth attachment. If `VkSubpassDescriptionDepthStencilResolve::stencilResolveMode` is `VK_RESOLVE_MODE_NONE` or the `pDepthStencilResolveAttachment` does not have a stencil aspect, no resolve operation is performed for the stencil attachment.

If the image subresource range referenced by the depth/stencil attachment is created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`, then the `multisample resolve operation` uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` for the subpass.

If `pDepthStencilAttachment` is `NULL`, or if its attachment index is `VK_ATTACHMENT_UNUSED`, it indicates that no depth/stencil attachment will be used in the subpass.

Following this call, if the `customResolve` feature is enabled the fragment area **may** be reduced to (1,1) if a fragment density map is attached to the render pass. If this occurs, reads of input attachments **may** return the value for the original larger fragment containing the smaller fragment or use the new fragment area.

The contents of an attachment within the render area become undefined at the start of a subpass `S` if all of the following conditions are true:

- The attachment is used as a color, depth/stencil, or resolve attachment in any subpass in the render pass.
- There is a subpass `S1` that uses or preserves the attachment, and a subpass dependency from `S1` to `S`.
- The attachment is not used or preserved in subpass `S`.

In addition, the contents of an attachment within the render area become undefined at the start of a subpass **S** if all of the following conditions are true:

- `VK_SUBPASS_DESCRIPTION_CUSTOM_RESOLVE_BIT_EXT` is set.
- The attachment is used as a color or depth/stencil in the subpass.

For color attachments, this operation will be performed in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage, with any image accesses performed via `VK_ACCESS_INPUT_ATTACHMENT_READ_BIT`, `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`, and `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`. For depth/stencil attachments, this operation **may** be performed in either the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stage, with any image accesses performed via `VK_ACCESS_INPUT_ATTACHMENT_READ_BIT`, `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, and `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`.

Once the contents of an attachment become undefined in subpass **S**, they remain undefined for subpasses in subpass dependency chains starting with subpass **S** until they are written again. However, they remain valid for subpasses in other subpass dependency chains starting with subpass **S**₁ if all subpasses in each chain use or preserve the attachment.

NOTE

If a subpass has multiple dependency chains where some of the chains preserve the attachment, and others do not, the contents of the attachment are undefined for that subpass.

Valid Usage

- VUID-VkSubpassDescription-attachment-06912

If the `attachment` member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`.

- VUID-VkSubpassDescription-attachment-06913

If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`.

- VUID-VkSubpassDescription-attachment-06914

If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`.

- VUID-VkSubpassDescription-attachment-06915

If the `attachment` member of `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or

VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription-attachment-06916

If the **attachment** member of an element of **pColorAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL**

- VUID-VkSubpassDescription-attachment-06917

If the **attachment** member of an element of **pResolveAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL**

- VUID-VkSubpassDescription-attachment-06918

If the **attachment** member of an element of **pInputAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL**

- VUID-VkSubpassDescription-attachment-06919

If the **attachment** member of an element of **pColorAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL**, or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**

- VUID-VkSubpassDescription-attachment-06920

If the **attachment** member of an element of **pResolveAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL**, or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**

- VUID-VkSubpassDescription-attachment-06921

If the **attachment** member of an element of **pInputAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR**

- VUID-VkSubpassDescription-attachment-06922

If the **attachment** member of an element of **pColorAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR**

- VUID-VkSubpassDescription-attachment-06923

If the **attachment** member of an element of **pResolveAttachments** is not **VK_ATTACHMENT_UNUSED**, its **layout** member **must** not be **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR**

- VUID-VkSubpassDescription-flags-10683

If **flags** includes **VK_SUBPASS_DESCRIPTION_TILE_SHADING_APRON_BIT_QCOM**, the

render pass **must** have been created with a `VkRenderPassTileShadingCreateInfoQCOM::tileApronSize` greater than `(0,0)`

- VUID-VkSubpassDescription-inputAttachmentCount-12293
`inputAttachmentCount` **must** be less than or equal to `maxPerStageDescriptorInputAttachments`
- VUID-VkSubpassDescription-colorAttachmentCount-00845
`colorAttachmentCount` **must** be less than or equal to `maxColorAttachments`
- VUID-VkSubpassDescription-loadOp-00846
If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then `loadOp` **must** not be `VK_ATTACHMENT_LOAD_OP_CLEAR`
- VUID-VkSubpassDescription-pipelineBindPoint-04952
`pipelineBindPoint` **must** be `VK_PIPELINE_BIND_POINT_GRAPHICS` or `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`
- VUID-VkSubpassDescription-pResolveAttachments-00847
If `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not be `VK_ATTACHMENT_UNUSED`
- VUID-VkSubpassDescription-pResolveAttachments-00848
If `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkSubpassDescription-pResolveAttachments-00849
If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` **must** have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkSubpassDescription-pResolveAttachments-00850
If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` **must** have the same `VkFormat` as its corresponding color attachment
- VUID-VkSubpassDescription-pColorAttachments-09430
All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have the same sample count
- VUID-VkSubpassDescription-pInputAttachments-02647
All attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` contain at least `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkSubpassDescription-pColorAttachments-02648
All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`
- VUID-VkSubpassDescription-pResolveAttachments-02649
All attachments in `pResolveAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` contain

VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pDepthStencilAttachment-02650

If `pDepthStencilAttachment` is not `NULL` and the attachment is not `VK_ATTACHMENT_UNUSED` then it **must** have an image format whose `potential format features` contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkSubpassDescription-linearColorAttachment-06496

If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` **must** contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`

- VUID-VkSubpassDescription-linearColorAttachment-06497

If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` **must** contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`

- VUID-VkSubpassDescription-linearColorAttachment-06498

If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pResolveAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` **must** contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`

- VUID-VkSubpassDescription-None-09431

If either of the following is enabled:

- The `VK_AMD_mixed_attachment_samples` extension
- The `VK_NV_framebuffer_mixed_samples` extension

all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have a sample count that is smaller than or equal to the sample count of `pDepthStencilAttachment` if it is not `VK_ATTACHMENT_UNUSED`

- VUID-VkSubpassDescription-pDepthStencilAttachment-01418

If none of the following are enabled:

- The `VK_AMD_mixed_attachment_samples` extension
- The `VK_NV_framebuffer_mixed_samples` extension

all attachments in `pDepthStencilAttachment` and `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have the same sample count

- VUID-VkSubpassDescription-attachment-00853

Each element of `pPreserveAttachments` **must** not be `VK_ATTACHMENT_UNUSED`

- VUID-VkSubpassDescription-pPreserveAttachments-00854

Each element of `pPreserveAttachments` **must** not also be an element of any other member of the subpass description

- VUID-VkSubpassDescription-layout-02519

If any attachment is used by more than one `VkAttachmentReference` member, then each

use **must** use the same **layout**

- VUID-VkSubpassDescription-flags-00856

If **flags** includes **VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX**, it **must** also include **VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX**

- VUID-VkSubpassDescription-flags-03341

If **flags** includes **VK_SUBPASS_DESCRIPTION_CUSTOM_RESOLVE_BIT_EXT**, and if **pResolveAttachments** is not **NULL**, then each resolve attachment **must** be **VK_ATTACHMENT_UNUSED**

- VUID-VkSubpassDescription-flags-03343

If **flags** includes **VK_SUBPASS_DESCRIPTION_CUSTOM_RESOLVE_BIT_EXT**, then the subpass **must** be the last subpass in a subpass dependency chain

- VUID-VkSubpassDescription-pInputAttachments-02868

If the render pass is created with **VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM** each of the elements of **pInputAttachments** **must** be **VK_ATTACHMENT_UNUSED**

- VUID-VkSubpassDescription-pDepthStencilAttachment-04438

pDepthStencilAttachment and **pColorAttachments** **must** not contain references to the same attachment

Valid Usage (Implicit)

- VUID-VkSubpassDescription-flags-parameter

flags **must** be a valid combination of **VkSubpassDescriptionFlagBits** values

- VUID-VkSubpassDescription-pipelineBindPoint-parameter

pipelineBindPoint **must** be a valid **VkPipelineBindPoint** value

- VUID-VkSubpassDescription-pInputAttachments-parameter

If **inputAttachmentCount** is not 0, **pInputAttachments** **must** be a valid pointer to an array of **inputAttachmentCount** valid **VkAttachmentReference** structures

- VUID-VkSubpassDescription-pColorAttachments-parameter

If **colorAttachmentCount** is not 0, **pColorAttachments** **must** be a valid pointer to an array of **colorAttachmentCount** valid **VkAttachmentReference** structures

- VUID-VkSubpassDescription-pResolveAttachments-parameter

If **colorAttachmentCount** is not 0, and **pResolveAttachments** is not **NULL**, **pResolveAttachments** **must** be a valid pointer to an array of **colorAttachmentCount** valid **VkAttachmentReference** structures

- VUID-VkSubpassDescription-pDepthStencilAttachment-parameter

If **pDepthStencilAttachment** is not **NULL**, **pDepthStencilAttachment** **must** be a valid pointer to a valid **VkAttachmentReference** structure

- VUID-VkSubpassDescription-pPreserveAttachments-parameter

If **preserveAttachmentCount** is not 0, **pPreserveAttachments** **must** be a valid pointer to an array of **preserveAttachmentCount** **uint32_t** values

Bits which **can** be set in **VkSubpassDescription::flags**, specifying usage of the subpass, are:

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef enum VkSubpassDescriptionFlagBits {
    // Provided by VK_NVX_multiview_per_view_attributes
    VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX = 0x00000001,
    // Provided by VK_NVX_multiview_per_view_attributes
    VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX = 0x00000002,
    // Provided by VK_QCOM_tile_shading
    VK_SUBPASS_DESCRIPTION_TILE_SHADING_APRON_BIT_QCOM = 0x00000100,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT =
0x00000010,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT =
0x00000020,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT =
0x00000040,

    VK_SUBPASS_DESCRIPTION_ENABLE_LEGACY_DITHERING_BIT_EXT = 0x00000080,
    // Provided by VK_EXT_custom_resolve
    VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_EXT = 0x00000004,
    // Provided by VK_EXT_custom_resolve
    VK_SUBPASS_DESCRIPTION_CUSTOM_RESOLVE_BIT_EXT = 0x00000008,
    // Provided by VK_QCOM_render_pass_shader_resolve
    VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM =
VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_EXT,
    // Provided by VK_QCOM_render_pass_shader_resolve
    VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM =
VK_SUBPASS_DESCRIPTION_CUSTOM_RESOLVE_BIT_EXT,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_ARM =
VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM =
VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM =
VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT,
} VkSubpassDescriptionFlagBits;
```

- [VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX](#) specifies that shaders compiled for this subpass write the attributes for all views in a single invocation of each [pre-rasterization shader stage](#). All pipelines compiled against a subpass that includes this bit **must** write per-view attributes to the `*PerViewNV[]` shader outputs, in addition to the non-per-view (e.g. [Position](#)) outputs.

- [VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX](#) specifies that shaders compiled for this subpass use per-view positions which only differ in value in the x component. Per-view viewport mask **can** also be used.
- [VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_EXT](#) specifies that the framebuffer region is the fragment region, that is, the minimum region dependencies are by pixel rather than by sample, such that any fragment shader invocation **can** access any sample associated with that fragment shader invocation.
- [VK_SUBPASS_DESCRIPTION_CUSTOM_RESOLVE_BIT_EXT](#) specifies that the subpass performs shader resolve operations.
- [VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT](#) specifies that this subpass supports pipelines created with [VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT](#).
- [VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT](#) specifies that this subpass supports pipelines created with [VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT](#).
- [VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT](#) specifies that this subpass supports pipelines created with [VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT](#).
- [VK_SUBPASS_DESCRIPTION_ENABLE_LEGACY_DITHERING_BIT_EXT](#) specifies that [Legacy Dithering](#) is enabled for this subpass.
- [VK_SUBPASS_DESCRIPTION_TILE_SHADING_APRON_BIT_QCOM](#) specifies that [apron regions](#) **can** be read within this subpass when [tile shading is enabled](#).

NOTE

Shader resolve operations allow for custom resolve operations, but overdrawing pixels **may** have a performance and/or power cost. Furthermore, since the content of any depth stencil attachment or color attachment is undefined at the beginning of a shader resolve subpass, any depth testing, stencil testing, or blending operation which sources these undefined values also has undefined result value.

NOTE

There is no equivalent to [VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT](#), [VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT](#), or [VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT](#) for render pass instances begun with [vkCmdBeginRendering](#). For such render passes, only the corresponding pipeline flags are specified.

WARNING

This functionality is superseded by [Vulkan Version 1.2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSubpassDescriptionFlags;
```

`VkSubpassDescriptionFlags` is a bitmask type for setting a mask of zero or more `VkSubpassDescriptionFlagBits`.

The `VkAttachmentReference` structure is defined as:

WARNING

This functionality is superseded by `VkAttachmentReference2`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentReference {
    uint32_t      attachment;
    VkImageLayout layout;
} VkAttachmentReference;
```

- `attachment` is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is not used.
- `layout` is a `VkImageLayout` value specifying the layout the attachment uses during the subpass.

Valid Usage

- VUID-VkAttachmentReference-layout-03077
If `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- VUID-VkAttachmentReference-separateDepthStencilLayouts-03313
If the `separateDepthStencilLayouts` feature is not enabled, and `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`,
- VUID-VkAttachmentReference-synchronization2-06910
If the `synchronization2` feature is not enabled, `layout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkAttachmentReference-attachmentFeedbackLoopLayout-07311
If the `attachmentFeedbackLoopLayout` feature is not enabled, `layout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`
- VUID-VkAttachmentReference-dynamicRenderingLocalRead-09546
If the `dynamicRenderingLocalRead` feature is not enabled, `layout` **must** not be

Valid Usage (Implicit)

- VUID-VkAttachmentReference-layout-parameter **layout** must be a valid [VkImageLayout](#) value

[VK_SUBPASS_EXTERNAL](#) is a special subpass index value expanding synchronization scope outside a subpass. It is described in more detail by [VkSubpassDependency](#).

```
#define VK_SUBPASS_EXTERNAL          (~0U)
```

The [VkSubpassDependency](#) structure is defined as:

WARNING

This functionality is superseded by [VkSubpassDependency2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDependency {
    uint32_t          srcSubpass;
    uint32_t          dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags      srcAccessMask;
    VkAccessFlags      dstAccessMask;
    VkDependencyFlags  dependencyFlags;
} VkSubpassDependency;
```

- **srcSubpass** is the subpass index of the first subpass in the dependency, or [VK_SUBPASS_EXTERNAL](#).
- **dstSubpass** is the subpass index of the second subpass in the dependency, or [VK_SUBPASS_EXTERNAL](#).
- **srcStageMask** is a bitmask of [VkPipelineStageFlagBits](#) specifying the [source stage mask](#). If set to [VK_PIPELINE_STAGE_ALL_COMMANDS_BIT](#), it is equivalent to setting it to [VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT](#).
- **dstStageMask** is a bitmask of [VkPipelineStageFlagBits](#) specifying the [destination stage mask](#). If set to [VK_PIPELINE_STAGE_ALL_COMMANDS_BIT](#), it is equivalent to setting it to [VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT](#).
- **srcAccessMask** is a bitmask of [VkAccessFlagBits](#) specifying a [source access mask](#).
- **dstAccessMask** is a bitmask of [VkAccessFlagBits](#) specifying a [destination access mask](#).
- **dependencyFlags** is a bitmask of [VkDependencyFlagBits](#).

If **srcSubpass** is equal to **dstSubpass** then the [VkSubpassDependency](#) does not directly define a

dependency. Instead, it enables pipeline barriers to be used in a render pass instance within the identified subpass, where the scopes of one pipeline barrier **must** be a subset of those described by one subpass dependency. Subpass dependencies specified in this way that include **framebuffer-space stages** in the **srcStageMask** **must** only include **framebuffer-space stages** in **dstStageMask**, and **must** include **VK_DEPENDENCY_BY_REGION_BIT**. When a subpass dependency is specified in this way for a subpass that has more than one view in its view mask, its **dependencyFlags** **must** include **VK_DEPENDENCY_VIEW_LOCAL_BIT**.

If **srcSubpass** and **dstSubpass** are not equal, when a render pass instance which includes a subpass dependency is submitted to a queue, it defines a **dependency** between the subpasses identified by **srcSubpass** and **dstSubpass**.

If **srcSubpass** is equal to **VK_SUBPASS_EXTERNAL**, the first **synchronization scope** includes commands that occur earlier in **submission order** than the **vkCmdBeginRenderPass** used to begin the render pass instance. Otherwise, the first set of commands includes all commands submitted as part of the subpass instance identified by **srcSubpass** and any **load**, **store**, or **multisample resolve** operations on attachments used in **srcSubpass**. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the **source stage mask** specified by **srcStageMask**.

If **dstSubpass** is equal to **VK_SUBPASS_EXTERNAL**, the second **synchronization scope** includes commands that occur later in **submission order** than the **vkCmdEndRenderPass** used to end the render pass instance. Otherwise, the second set of commands includes all commands submitted as part of the subpass instance identified by **dstSubpass** and any **load**, **store**, and **multisample resolve** operations on attachments used in **dstSubpass**. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the **destination stage mask** specified by **dstStageMask**.

The first **access scope** is limited to accesses in the pipeline stages determined by the **source stage mask** specified by **srcStageMask**. It is also limited to access types in the **source access mask** specified by **srcAccessMask**.

The second **access scope** is limited to accesses in the pipeline stages determined by the **destination stage mask** specified by **dstStageMask**. It is also limited to access types in the **destination access mask** specified by **dstAccessMask**.

The **availability and visibility operations** defined by a subpass dependency affect the execution of **image layout transitions** within the render pass.

NOTE

For non-attachment resources, the memory dependency expressed by subpass dependency is nearly identical to that of a **VkMemoryBarrier** (with matching **srcAccessMask** and **dstAccessMask** parameters) submitted as a part of a **vkCmdPipelineBarrier** (with matching **srcStageMask** and **dstStageMask** parameters). The only difference being that its scopes are limited to the identified subpasses rather than potentially affecting everything before and after.

For attachments however, subpass dependencies work more like a **VkImageMemoryBarrier** defined similarly to the **VkMemoryBarrier** above, the queue family indices set to **VK_QUEUE_FAMILY_IGNORED**, and layouts as follows:

- The equivalent to `oldLayout` is the attachment's layout according to the subpass description for `srcSubpass`.
- The equivalent to `newLayout` is the attachment's layout according to the subpass description for `dstSubpass`.

Valid Usage

- VUID-VkSubpassDependency-srcStageMask-04090
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-VkSubpassDependency-srcStageMask-04091
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkSubpassDependency-srcStageMask-04092
If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-VkSubpassDependency-srcStageMask-04093
If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkSubpassDependency-srcStageMask-04094
If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-VkSubpassDependency-srcStageMask-04095
If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-VkSubpassDependency-srcStageMask-04096
If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
- VUID-VkSubpassDependency-srcStageMask-07318
If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkSubpassDependency-srcStageMask-03937
If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be 0
- VUID-VkSubpassDependency-srcStageMask-07949
If neither the `VK_NV_ray_tracing` extension or the `rayTracingPipeline` feature are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`
- VUID-VkSubpassDependency-srcStageMask-10754
If the `accelerationStructure` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`
- VUID-VkSubpassDependency-dstStageMask-04090

If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-VkSubpassDependency-dstStageMask-04091

If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-VkSubpassDependency-dstStageMask-04092

If the `conditionalRendering` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-VkSubpassDependency-dstStageMask-04093

If the `fragmentDensityMap` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-VkSubpassDependency-dstStageMask-04094

If the `transformFeedback` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-VkSubpassDependency-dstStageMask-04095

If the `meshShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- VUID-VkSubpassDependency-dstStageMask-04096

If the `taskShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- VUID-VkSubpassDependency-dstStageMask-07318

If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkSubpassDependency-dstStageMask-03937

If the `synchronization2` feature is not enabled, `dstStageMask` **must** not be `0`

- VUID-VkSubpassDependency-dstStageMask-07949

If neither the `VK_NV_ray_tracing` extension or the `rayTracingPipeline` feature are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkSubpassDependency-dstStageMask-10754

If the `accelerationStructure` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

- VUID-VkSubpassDependency-srcSubpass-00864

`srcSubpass` **must** be less than or equal to `dstSubpass`, unless one of them is `VK_SUBPASS_EXTERNAL`, to avoid cyclic dependencies and ensure a valid execution order

- VUID-VkSubpassDependency-srcSubpass-00865

`srcSubpass` and `dstSubpass` **must** not both be equal to `VK_SUBPASS_EXTERNAL`

- VUID-VkSubpassDependency-srcSubpass-06809

If `srcSubpass` is equal to `dstSubpass` and `srcStageMask` includes a `framebuffer-space` stage, `dstStageMask` **must** only contain `framebuffer-space` stages

- VUID-VkSubpassDependency-srcAccessMask-00868

Any access flag included in **srcAccessMask** **must** be supported by one of the pipeline stages in **srcStageMask**, as specified in the [table of supported access types](#)

- VUID-VkSubpassDependency-dstAccessMask-00869

Any access flag included in **dstAccessMask** **must** be supported by one of the pipeline stages in **dstStageMask**, as specified in the [table of supported access types](#)

- VUID-VkSubpassDependency-srcSubpass-02243

If **srcSubpass** equals **dstSubpass**, and **srcStageMask** and **dstStageMask** both include a [framebuffer-space](#) stage, then **dependencyFlags** **must** include [VK_DEPENDENCY_BY_REGION_BIT](#)

- VUID-VkSubpassDependency-dependencyFlags-02520

If **dependencyFlags** includes [VK_DEPENDENCY_VIEW_LOCAL_BIT](#), **srcSubpass** **must** not be equal to [VK_SUBPASS_EXTERNAL](#)

- VUID-VkSubpassDependency-dependencyFlags-02521

If **dependencyFlags** includes [VK_DEPENDENCY_VIEW_LOCAL_BIT](#), **dstSubpass** **must** not be equal to [VK_SUBPASS_EXTERNAL](#)

- VUID-VkSubpassDependency-srcSubpass-00872

If **srcSubpass** equals **dstSubpass** and that subpass has more than one bit set in the view mask, then **dependencyFlags** **must** include [VK_DEPENDENCY_VIEW_LOCAL_BIT](#)

- VUID-VkSubpassDependency-dependencyFlags-10203

dependencyFlags **must** not include [VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR](#)

Valid Usage (Implicit)

- VUID-VkSubpassDependency-srcStageMask-parameter

srcStageMask **must** be a valid combination of [VkPipelineStageFlagBits](#) values

- VUID-VkSubpassDependency-dstStageMask-parameter

dstStageMask **must** be a valid combination of [VkPipelineStageFlagBits](#) values

- VUID-VkSubpassDependency-srcAccessMask-parameter

srcAccessMask **must** be a valid combination of [VkAccessFlagBits](#) values

- VUID-VkSubpassDependency-dstAccessMask-parameter

dstAccessMask **must** be a valid combination of [VkAccessFlagBits](#) values

- VUID-VkSubpassDependency-dependencyFlags-parameter

dependencyFlags **must** be a valid combination of [VkDependencyFlagBits](#) values

When multiview is enabled, the execution of the multiple views of one subpass **may** not occur simultaneously or even back-to-back, and rather **may** be interleaved with the execution of other subpasses. The load and store operations apply to attachments on a per-view basis. For example, an attachment using [VK_ATTACHMENT_LOAD_OP_CLEAR](#) will have each view cleared on first use, but the first use of one view may be temporally distant from the first use of another view.

NOTE

A good mental model for multiview is to think of a multiview subpass as if it were a

collection of individual (per-view) subpasses that are logically grouped together and described as a single multiview subpass in the API. Similarly, a multiview attachment can be thought of like several individual attachments that happen to be layers in a single image. A view-local dependency between two multiview subpasses acts like a set of one-to-one dependencies between corresponding pairs of per-view subpasses. A view-global dependency between two multiview subpasses acts like a set of $N \times M$ dependencies between all pairs of per-view subpasses in the source and destination. Thus, it is a more compact representation which also makes clear the commonality and reuse that is present between views in a subpass. This interpretation motivates the answers to questions like “when does the load op apply” - it is on the first use of each view of an attachment, as if each view was a separate attachment.

The content of each view follows the description in [attachment content behavior](#). In particular, if an attachment is preserved, all views within the attachment are preserved.

If any two subpasses of a render pass activate transform feedback to the same bound transform feedback buffers, a subpass dependency **must** be included (either directly or via some intermediate subpasses) between them.

If there is no subpass dependency from [VK_SUBPASS_EXTERNAL](#) to the first subpass that uses an attachment, then an implicit subpass dependency exists from [VK_SUBPASS_EXTERNAL](#) to the first subpass it is used in. The implicit subpass dependency only exists if there exists an automatic layout transition away from [initialLayout](#). The subpass dependency operates as if defined with the following parameters:

```
VkSubpassDependency implicitDependency = {
    .srcSubpass = VK_SUBPASS_EXTERNAL,
    .dstSubpass = firstSubpass, // First subpass attachment is used in
    .srcStageMask = VK_PIPELINE_STAGE_NONE,
    .dstStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
    .srcAccessMask = 0,
    .dstAccessMask = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT |
                    VK_ACCESS_COLOR_ATTACHMENT_READ_BIT |
                    VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT |
                    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
    .dependencyFlags = 0
};
```

Similarly, if there is no subpass dependency from the last subpass that uses an attachment to [VK_SUBPASS_EXTERNAL](#), then an implicit subpass dependency exists from the last subpass it is used in to [VK_SUBPASS_EXTERNAL](#). The implicit subpass dependency only exists if there exists an automatic layout transition into [finalLayout](#). The subpass dependency operates as if defined with the following parameters:

```
VkSubpassDependency implicitDependency = {
```

```

        .srcSubpass = lastSubpass, // Last subpass attachment is used in
        .dstSubpass = VK_SUBPASS_EXTERNAL,
        .srcStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
        .dstStageMask = VK_PIPELINE_STAGE_NONE,
        .srcAccessMask = VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                        VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
        .dstAccessMask = 0,
        .dependencyFlags = 0
    };

```

As subpasses **may** overlap or execute out of order with regards to other subpasses unless a subpass dependency chain describes otherwise, the layout transitions required between subpasses **cannot** be known to an application. Instead, an application provides the layout that each attachment **must** be in at the start and end of a render pass, and the layout it **must** be in during each subpass it is used in. The implementation then **must** execute layout transitions between subpasses in order to guarantee that the images are in the layouts required by each subpass, and in the final layout at the end of the render pass.

Automatic layout transitions apply to the entire image subresource attached to the framebuffer. If multiview is not enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the number of layers specified by `VkFramebufferCreateInfo::layers`. If multiview is enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the layers corresponding to views which are used by some subpass in the render pass, even if that subpass does not reference the given attachment. If the `maintenance9` feature is not enabled, and the attachment view is a 2D or 2D array view of a 3D image, even if the attachment view only refers to a subset of the slices of the selected mip level of the 3D image, automatic layout transitions apply to the entire subresource referenced which is the entire mip level in this case. If the attachment view is a 2D or 2D array view of a 3D image and `maintenance9` feature is enabled, layout transitions apply only to the subresource the attachment view refers to.

Automatic layout transitions away from the layout used in a subpass happen-after the availability operations for all dependencies with that subpass as the `srcSubpass`.

Automatic layout transitions into the layout used in a subpass happen-before the visibility operations for all dependencies with that subpass as the `dstSubpass`.

Automatic layout transitions away from `initialLayout` happen-after the availability operations for all dependencies with a `srcSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `dstSubpass` uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions away from `initialLayout` happen-after the availability operations for all dependencies with a `srcSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `dstSubpass` uses any aliased attachment.

Automatic layout transitions into `finalLayout` happen-before the visibility operations for all dependencies with a `dstSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `srcSubpass` uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions into `finalLayout` happen-before the visibility operations for all dependencies with a `dstSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `srcSubpass` uses any aliased attachment.

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with [VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT](#) is dependent on the last sample locations used to render to the attachment, thus automatic layout transitions use the sample locations state specified in [VkRenderPassSampleLocationsBeginInfoEXT](#).

Automatic layout transitions of an attachment referring to a depth/stencil image created with [VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT](#) use the sample locations the image subresource range referenced by the attachment was last rendered with. If the current render pass does not use the attachment as a depth/stencil attachment in any subpass that happens-before, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pAttachmentInitialSampleLocations` array for which the `attachmentIndex` member equals the attachment index of the attachment, if one is specified. Otherwise, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` array for which the `subpassIndex` member equals the index of the subpass that last used the attachment as a depth/stencil attachment, if one is specified.

If no sample locations state has been specified for an automatic layout transition performed on an attachment referring to a depth/stencil image created with [VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT](#) the contents of the depth aspect of the depth/stencil attachment become undefined as if the layout of the attachment was transitioned from the [VK_IMAGE_LAYOUT_UNDEFINED](#) layout.

If two subpasses use the same attachment, and both subpasses use the attachment in a read-only layout, no subpass dependency needs to be specified between those subpasses. If an implementation treats those layouts separately, it **must** insert an implicit subpass dependency between those subpasses to separate the uses in each layout. The subpass dependency operates as if defined with the following parameters:

```
// Used for input attachments
VkPipelineStageFlags inputAttachmentStages = VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT;
VkAccessFlags inputAttachmentDstAccess = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT;

// Used for depth/stencil attachments
VkPipelineStageFlags depthStencilAttachmentStages =
VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT |
VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT;
VkAccessFlags depthStencilAttachmentDstAccess =
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT;

VkSubpassDependency implicitDependency = {
    .srcSubpass = firstSubpass;
    .dstSubpass = secondSubpass;
    .srcStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .dstStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .srcAccessMask = 0;
    .dstAccessMask = inputAttachmentDstAccess | depthStencilAttachmentDstAccess;
    .dependencyFlags = 0;
```

```
};
```

When drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#), the application **must** specify which types of attachments that are written to during a render pass will also be accessed as non-attachments in the render pass.

To [dynamically set](#) whether a pipeline **can** access a resource as a non-attachment while it is also used as an attachment that is written to, call:

```
// Provided by VK_EXT_attachment_feedback_loop_dynamic_state
void vkCmdSetAttachmentFeedbackLoopEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkImageAspectFlags       aspectMask);
```

- [commandBuffer](#) is the command buffer into which the command will be recorded.
- [aspectMask](#) specifies the types of attachments for which feedback loops will be enabled. Attachment types whose aspects are not included in [aspectMask](#) will have feedback loops disabled.

For attachments that are written to in a render pass, only attachments with the aspects specified in [aspectMask](#) **can** be accessed as non-attachments by subsequent [drawing commands](#).

Valid Usage

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-attachmentFeedbackLoopDynamicState-08862
The [attachmentFeedbackLoopDynamicState](#) feature **must** be enabled
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-aspectMask-08863
[aspectMask](#) **must** only include [VK_IMAGE_ASPECT_NONE](#), [VK_IMAGE_ASPECT_COLOR_BIT](#), [VK_IMAGE_ASPECT_DEPTH_BIT](#), and [VK_IMAGE_ASPECT_STENCIL_BIT](#)
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-attachmentFeedbackLoopLayout-08864
If the [attachmentFeedbackLoopLayout](#) feature is not enabled, [aspectMask](#) **must** be [VK_IMAGE_ASPECT_NONE](#)

Valid Usage (Implicit)

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-parameter [commandBuffer](#) **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-aspectMask-parameter [aspectMask](#) **must** be a valid combination of [VkImageAspectFlagBits](#) values
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-recording

`commandBuffer` **must** be in the [recording state](#)

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-vidcoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT VK_QUEUE_VIDEO_CODING_BIT	State

Conditional Rendering

`vkCmdSetAttachmentFeedbackLoopEnableEXT` is not affected by [conditional rendering](#)

A more extensible version of render pass creation is also defined below.

To create a render pass, call:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
VkResult vkCreateRenderPass2(
    VkDevice                                device,
    const VkRenderPassCreateInfo2*          pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkRenderPass*                            pRenderPass);
```

```
// Provided by VK_KHR_create_renderpass2
// Equivalent to vkCreateRenderPass2
VkResult vkCreateRenderPass2KHR(
    VkDevice                                device,
    const VkRenderPassCreateInfo2*          pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkRenderPass*                            pRenderPass);
```

- **device** is the logical device that creates the render pass.
- **pCreateInfo** is a pointer to a [VkRenderPassCreateInfo2](#) structure describing the parameters of the render pass.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pRenderPass** is a pointer to a [VkRenderPass](#) handle in which the resulting render pass object is returned.

This command is functionally identical to [vkCreateRenderPass](#), but includes extensible sub-structures that include **sType** and **pNext** parameters, allowing them to be more easily extended.

Valid Usage

- VUID-vkCreateRenderPass2-device-10001
device **must** support at least one queue family with the [VK_QUEUE_GRAPHICS_BIT](#) capability
- VUID-vkCreateRenderPass2-flags-10649
[VkRenderPassTileShadingCreateInfoQCOM::flags](#) **must** not include [VK_TILE_SHADING_RENDER_PASS_PER_TILE_EXECUTION_BIT_QCOM](#)

Valid Usage (Implicit)

- VUID-vkCreateRenderPass2-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateRenderPass2-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkRenderPassCreateInfo2](#) structure
- VUID-vkCreateRenderPass2-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateRenderPass2-pRenderPass-parameter
pRenderPass **must** be a valid pointer to a [VkRenderPass](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkRenderPassCreateInfo2](#) structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassCreateInfo2 {
    VkStructureType      sType;
    const void*          pNext;
    VkRenderPassCreateFlags flags;
    uint32_t              attachmentCount;
    const VkAttachmentDescription2* pAttachments;
    uint32_t              subpassCount;
    const VkSubpassDescription2* pSubpasses;
    uint32_t              dependencyCount;
    const VkSubpassDependency2* pDependencies;
    uint32_t              correlatedViewMaskCount;
    const uint32_t*       pCorrelatedViewMasks;
} VkRenderPassCreateInfo2;
```

```
// Provided by VK_KHR_create_renderpass2
// Equivalent to VkRenderPassCreateInfo2
typedef VkRenderPassCreateInfo2 VkRenderPassCreateInfo2KHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of [VkRenderPassCreateFlagBits](#)
- `attachmentCount` is the number of attachments used by this render pass.
- `pAttachments` is a pointer to an array of `attachmentCount` [VkAttachmentDescription2](#) structures describing the attachments used by the render pass.
- `subpassCount` is the number of subpasses to create.

- `pSubpasses` is a pointer to an array of `subpassCount` `VkSubpassDescription2` structures describing each subpass.
- `dependencyCount` is the number of dependencies between pairs of subpasses.
- `pDependencies` is a pointer to an array of `dependencyCount` `VkSubpassDependency2` structures describing dependencies between pairs of subpasses.
- `correlatedViewMaskCount` is the number of correlation masks.
- `pCorrelatedViewMasks` is a pointer to an array of view masks indicating sets of views that **may** be more efficient to render concurrently.

Parameters defined by this structure with the same name as those in `VkRenderPassCreateInfo` have the identical effect to those parameters; the child structures are variants of those used in `VkRenderPassCreateInfo` which add `sType` and `pNext` parameters, allowing them to be extended.

If the `VkSubpassDescription2::viewMask` member of any element of `pSubpasses` is not zero, *multiview* functionality is considered to be enabled for this render pass.

`correlatedViewMaskCount` and `pCorrelatedViewMasks` have the same effect as `VkRenderPassMultiviewCreateInfo::correlationMaskCount` and `VkRenderPassMultiviewCreateInfo::pCorrelationMasks`, respectively.

Valid Usage

- VUID-VkRenderPassCreateInfo2-None-03049
If any two subpasses operate on attachments with overlapping ranges of the same `VkDeviceMemory` object, and at least one subpass writes to that area of `VkDeviceMemory`, a subpass dependency **must** be included (either directly or via some intermediate subpasses) between them
- VUID-VkRenderPassCreateInfo2-attachment-03050
If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or the attachment indexed by any element of `pPreserveAttachments` in any element of `pSubpasses` is bound to a range of a `VkDeviceMemory` object that overlaps with any other attachment in any subpass (including the same subpass), the `VkAttachmentDescription2` structures describing them **must** include `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` in `flags`
- VUID-VkRenderPassCreateInfo2-attachment-03051
If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, then it **must** be less than `attachmentCount`
- VUID-VkRenderPassCreateInfo2-fragmentDensityMapAttachment-06472
If the `pNext` chain includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure and the `fragmentDensityMapAttachment` member is not `VK_ATTACHMENT_UNUSED`, then `attachment` **must** be less than `attachmentCount`
- VUID-VkRenderPassCreateInfo2-fragmentDensityMapLayered-10829
If the `fragmentDensityMapLayered` feature is not enabled, `flags` **must** not contain

VK_RENDER_PASS_CREATE_PER_LAYER_FRAGMENT_DENSITY_BIT_VALVE

- VUID-VkRenderPassCreateInfo2-pSubpasses-06473

If the `pSubpasses` `pNext` chain includes a `VkSubpassDescriptionDepthStencilResolve` structure and the `pDepthStencilResolveAttachment` member is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, then `attachment` **must** be less than `attachmentCount`

- VUID-VkRenderPassCreateInfo2-pAttachments-02522

For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- VUID-VkRenderPassCreateInfo2-pAttachments-02523

For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderPassCreateInfo2-pDependencies-03054

For each element of `pDependencies`, if the `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `srcStageMask` member of that dependency **must** be `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` or a pipeline stage supported by the pipeline identified by the `pipelineBindPoint` member of the source subpass

- VUID-VkRenderPassCreateInfo2-pDependencies-03055

For each element of `pDependencies`, if the `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `dstStageMask` member of that dependency **must** be `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` or a pipeline stage supported by the pipeline identified by the `pipelineBindPoint` member of the destination subpass

- VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-03056

The set of bits included in any element of `pCorrelatedViewMasks` **must** not overlap with the set of bits included in any other element of `pCorrelatedViewMasks`

- VUID-VkRenderPassCreateInfo2-viewMask-03057

If the `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` is `0`, `correlatedViewMaskCount` **must** be `0`

- VUID-VkRenderPassCreateInfo2-viewMask-03058

The `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` **must** either all be `0`, or all not be `0`

- VUID-VkRenderPassCreateInfo2-viewMask-03059

If the `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` is `0`, the `dependencyFlags` member of any element of `pDependencies` **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-VkRenderPassCreateInfo2-pDependencies-03060

For each element of `pDependencies` where its `srcSubpass` member equals its `dstSubpass` member, if the `viewMask` member of the corresponding element of `pSubpasses` includes more than one bit, its `dependencyFlags` member **must** include

VK_DEPENDENCY_VIEW_LOCAL_BIT

- VUID-VkRenderPassCreateInfo2-attachment-02525

If the **attachment** member of any element of the **pInputAttachments** member of any element of **pSubpasses** is not **VK_ATTACHMENT_UNUSED**, the **aspectMask** member of that element of **pInputAttachments** **must** only include aspects that are present in images of the format specified by the element of **pAttachments** specified by **attachment**

- VUID-VkRenderPassCreateInfo2-srcSubpass-02526

The **srcSubpass** member of each element of **pDependencies** **must** be less than **subpassCount**

- VUID-VkRenderPassCreateInfo2-dstSubpass-02527

The **dstSubpass** member of each element of **pDependencies** **must** be less than **subpassCount**

- VUID-VkRenderPassCreateInfo2-pAttachments-04585

If any element of **pAttachments** is used as a fragment shading rate attachment in any subpass, it **must** not be used as any other attachment in the render pass

- VUID-VkRenderPassCreateInfo2-pAttachments-09387

If any element of **pAttachments** is used as a fragment shading rate attachment, the **loadOp** for that attachment **must** not be **VK_ATTACHMENT_LOAD_OP_CLEAR**

- VUID-VkRenderPassCreateInfo2-flags-04521

If **flags** includes **VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM**, an element of **pSubpasses** includes an instance of **VkFragmentShadingRateAttachmentInfoKHR** in its **pNext** chain, and the **pFragmentShadingRateAttachment** member of that structure is not equal to **NULL**, the **attachment** member of **pFragmentShadingRateAttachment** **must** be **VK_ATTACHMENT_UNUSED**

- VUID-VkRenderPassCreateInfo2-pAttachments-04586

If any element of **pAttachments** is used as a fragment shading rate attachment in any subpass, it **must** have an image format whose **potential format features** contain **VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**

- VUID-VkRenderPassCreateInfo2-attachment-06244

If the **attachment** member of the **pDepthStencilAttachment** member of an element of **pSubpasses** is not **VK_ATTACHMENT_UNUSED**, the **layout** member of that same structure is either **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**, and the **pNext** chain of that structure does not include a **VkAttachmentReferenceStencilLayout** structure, then the element of **pAttachments** with an index equal to **attachment** **must** not have a **format** that includes both depth and stencil components

- VUID-VkRenderPassCreateInfo2-attachment-06245

If the **attachment** member of the **pDepthStencilAttachment** member of an element of **pSubpasses** is not **VK_ATTACHMENT_UNUSED** and the **layout** member of that same structure is either **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**, then the element of **pAttachments** with an index equal to **attachment** **must** have a **format** that includes only a stencil component

- VUID-VkRenderPassCreateInfo2-attachment-06246

If the **attachment** member of the **pDepthStencilAttachment** member of an element of **pSubpasses** is not **VK_ATTACHMENT_UNUSED** and the **layout** member of that same

structure is either `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, then the element of `pAttachments` with an index equal to `attachment` **must** not have a `format` that includes only a stencil component

- VUID-VkRenderPassCreateInfo2-pResolveAttachments-09331

If any element of `pResolveAttachments` of any element of `pSubpasses` references an attachment description with a format of `VK_FORMAT_UNDEFINED`, `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment->attachment` **must** be `VK_ATTACHMENT_UNUSED`

- VUID-VkRenderPassCreateInfo2-pResolveAttachments-10650

If any element of `pResolveAttachments` of any element of `pSubpasses` references an attachment description with a format of `VK_FORMAT_UNDEFINED`, `VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM` **must** not be included in `VkRenderPassTileShadingCreateInfoQCOM::flags`

- VUID-VkRenderPassCreateInfo2-fragmentDensityMapAttachment-10651

If `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM` **must** not be included in `VkRenderPassTileShadingCreateInfoQCOM::flags`

- VUID-VkRenderPassCreateInfo2-None-10916

If any subpass preserves an attachment, there **must** be a subpass dependency from a prior subpass which uses or preserves that attachment

Valid Usage (Implicit)

- VUID-VkRenderPassCreateInfo2-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO_2`

- VUID-VkRenderPassCreateInfo2-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkRenderPassCreationControlEXT`, `VkRenderPassCreationFeedbackCreateInfoEXT`, `VkRenderPassFragmentDensityMapCreateInfoEXT`, `VkRenderPassTileShadingCreateInfoQCOM`, or `VkTileMemorySizeInfoQCOM`

- VUID-VkRenderPassCreateInfo2-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkRenderPassCreateInfo2-flags-parameter

`flags` **must** be a valid combination of `VkRenderPassCreateFlagBits` values

- VUID-VkRenderPassCreateInfo2-pAttachments-parameter

If `attachmentCount` is not 0, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkAttachmentDescription2` structures

- VUID-VkRenderPassCreateInfo2-pSubpasses-parameter

`pSubpasses` **must** be a valid pointer to an array of `subpassCount` valid `VkSubpassDescription2` structures

- VUID-VkRenderPassCreateInfo2-pDependencies-parameter

If `dependencyCount` is not 0, `pDependencies` **must** be a valid pointer to an array of `dependencyCount` valid `VkSubpassDependency2` structures

- VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-parameter

If `correlatedViewMaskCount` is not 0, `pCorrelatedViewMasks` **must** be a valid pointer to an array of `correlatedViewMaskCount` `uint32_t` values

- VUID-VkRenderPassCreateInfo2-subpassCount-arraylength
`subpassCount` **must** be greater than 0

The `VkAttachmentDescription2` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescription2 {
    VkStructureType          sType;
    const void*              pNext;
    VkAttachmentDescriptionFlags flags;
    VkFormat                 format;
    VkSampleCountFlagBits    samples;
    VkAttachmentLoadOp        loadOp;
    VkAttachmentStoreOp       storeOp;
    VkAttachmentLoadOp        stencilLoadOp;
    VkAttachmentStoreOp       stencilStoreOp;
    VkImageLayout             initialLayout;
    VkImageLayout             finalLayout;
} VkAttachmentDescription2;
```

```
// Provided by VK_KHR_create_renderpass2
// Equivalent to VkAttachmentDescription2
typedef VkAttachmentDescription2 VkAttachmentDescription2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkAttachmentDescriptionFlagBits` specifying additional properties of the attachment.
- `format` is a `VkFormat` value specifying the format of the image that will be used for the attachment.
- `samples` is a `VkSampleCountFlagBits` value specifying the number of samples of the image.
- `loadOp` is a `VkAttachmentLoadOp` value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- `storeOp` is a `VkAttachmentStoreOp` value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.

- `stencilLoadOp` is a `VkAttachmentLoadOp` value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- `stencilStoreOp` is a `VkAttachmentStoreOp` value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- `initialLayout` is the layout the attachment image subresource will be in when a render pass instance begins.
- `finalLayout` is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

Parameters defined by this structure with the same name as those in `VkAttachmentDescription` have the identical effect to those parameters.

If the `separateDepthStencilLayouts` feature is enabled, and `format` is a depth/stencil format, `initialLayout` and `finalLayout` **can** be set to a layout that only specifies the layout of the depth aspect.

If the `pNext` chain includes a `VkAttachmentDescriptionStencilLayout` structure, then the `stencilInitialLayout` and `stencilFinalLayout` members specify the initial and final layouts of the stencil aspect of a depth/stencil format, and `initialLayout` and `finalLayout` only apply to the depth aspect. For depth-only formats, the `VkAttachmentDescriptionStencilLayout` structure is ignored. For stencil-only formats, the initial and final layouts of the stencil aspect are taken from the `VkAttachmentDescriptionStencilLayout` structure if present, or `initialLayout` and `finalLayout` if not present.

If `format` is a depth/stencil format, and either `initialLayout` or `finalLayout` does not specify a layout for the stencil aspect, then the application **must** specify the initial and final layouts of the stencil aspect by including a `VkAttachmentDescriptionStencilLayout` structure in the `pNext` chain.

`loadOp` and `storeOp` are ignored for fragment shading rate attachments. No access to the shading rate attachment is performed in `loadOp` and `storeOp`. Instead, access to `VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR` is performed as fragments are rasterized.

Valid Usage

- VUID-VkAttachmentDescription2-format-06699

If `format` includes a color or depth component and `loadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`

- VUID-VkAttachmentDescription2-finalLayout-00843

`finalLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- VUID-VkAttachmentDescription2-format-03280

If `format` is a color format, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription2-format-03281
If **format** is a depth/stencil format, **initialLayout** **must** not be [VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL](#)
- VUID-VkAttachmentDescription2-format-03282
If **format** is a color format, **finalLayout** **must** not be [VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL](#) or [VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL](#)
- VUID-VkAttachmentDescription2-format-03283
If **format** is a depth/stencil format, **finalLayout** **must** not be [VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL](#)
- VUID-VkAttachmentDescription2-format-06487
If **format** is a color format, **initialLayout** **must** not be [VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL](#) or [VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL](#)
- VUID-VkAttachmentDescription2-format-06488
If **format** is a color format, **finalLayout** **must** not be [VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL](#) or [VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL](#)
- VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03284
If the **separateDepthStencilLayouts** feature is not enabled, **initialLayout** **must** not be [VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL](#), [VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL](#), [VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL](#), or [VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL](#),
- VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03285
If the **separateDepthStencilLayouts** feature is not enabled, **finalLayout** **must** not be [VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL](#), [VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL](#), [VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL](#), or [VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL](#),
- VUID-VkAttachmentDescription2-format-03286
If **format** is a color format, **initialLayout** **must** not be [VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL](#), [VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL](#), [VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL](#), or [VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL](#)
- VUID-VkAttachmentDescription2-format-03287
If **format** is a color format, **finalLayout** **must** not be [VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL](#), [VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL](#), [VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL](#), or [VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL](#)
- VUID-VkAttachmentDescription2-format-06906
If **format** is a depth/stencil format which includes both depth and stencil components,

`initialLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription2-format-06907

If `format` is a depth/stencil format which includes both depth and stencil components, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription2-format-03290

If `format` is a depth/stencil format which includes only the depth component, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription2-format-03291

If `format` is a depth/stencil format which includes only the depth component, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription2-synchronization2-06908

If the `synchronization2` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkAttachmentDescription2-synchronization2-06909

If the `synchronization2` feature is not enabled, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07309

If the `attachmentFeedbackLoopLayout` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`

- VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07310

If the `attachmentFeedbackLoopLayout` feature is not enabled, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`

- VUID-VkAttachmentDescription2-samples-08745

`samples` **must** be a valid `VkSampleCountFlagBits` value that is set in `imageCreateSampleCounts` (as defined in [Image Creation Limits](#)) for the given `format`

- VUID-VkAttachmentDescription2-dynamicRenderingLocalRead-09544

If the `dynamicRenderingLocalRead` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ`

- VUID-VkAttachmentDescription2-dynamicRenderingLocalRead-09545

If the `dynamicRenderingLocalRead` feature is not enabled, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ`

- VUID-VkAttachmentDescription2-flags-11773

If `flags` includes `VK_ATTACHMENT_DESCRIPTION_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR`, `flags` **must** not include `VK_ATTACHMENT_DESCRIPTION_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`

- VUID-VkAttachmentDescription2-flags-11774

- If `flags` includes `VK_ATTACHMENT_DESCRIPTION_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` or `VK_ATTACHMENT_DESCRIPTION_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`, `resolveSrgbFormatSupportsTransferFunctionControl` **must** be `VK_TRUE`
- VUID-VkAttachmentDescription2-flags-11775

If `flags` includes `VK_ATTACHMENT_DESCRIPTION_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` or `VK_ATTACHMENT_DESCRIPTION_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`, `maintenance10` **must** be enabled
- VUID-VkAttachmentDescription2-flags-11776

If `flags` includes `VK_ATTACHMENT_DESCRIPTION_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` or `VK_ATTACHMENT_DESCRIPTION_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`, `format` **must** use sRGB encoding
- VUID-VkAttachmentDescription2-flags-11777

If `flags` includes `VK_ATTACHMENT_DESCRIPTION_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` or `VK_ATTACHMENT_DESCRIPTION_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR`, `samples` **must** be `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkAttachmentDescription2-pNext-06704

If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure, `format` includes a stencil component, and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`
- VUID-VkAttachmentDescription2-pNext-06705

If the `pNext` chain includes a `VkAttachmentDescriptionStencilLayout` structure, `format` includes a stencil component, and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `VkAttachmentDescriptionStencilLayout::stencilInitialLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`
- VUID-VkAttachmentDescription2-format-06249

If `format` is a depth/stencil format which includes both depth and stencil components, and `initialLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, the `pNext` chain **must** include a `VkAttachmentDescriptionStencilLayout` structure
- VUID-VkAttachmentDescription2-format-06250

If `format` is a depth/stencil format which includes both depth and stencil components, and `finalLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, the `pNext` chain **must** include a `VkAttachmentDescriptionStencilLayout` structure
- VUID-VkAttachmentDescription2-format-06247

If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure and `format` only includes a stencil component, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription2-format-06248
If the **pNext** chain does not include a [VkAttachmentDescriptionStencilLayout](#) structure and **format** only includes a stencil component, **finalLayout** **must** not be [VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL](#) or [VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL](#)
- VUID-VkAttachmentDescription2-format-09332
If the **externalFormatResolve** feature is not enabled, **format** **must** not be [VK_FORMAT_UNDEFINED](#)
- VUID-VkAttachmentDescription2-format-09334
If **format** is [VK_FORMAT_UNDEFINED](#), there **must** be a [VkExternalFormatANDROID](#) structure in the **pNext** chain with a **externalFormat** that is not equal to 0

Valid Usage (Implicit)

- VUID-VkAttachmentDescription2-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_2](#)
- VUID-VkAttachmentDescription2-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either [NULL](#) or a pointer to a valid instance of [VkAttachmentDescriptionStencilLayout](#), [VkExternalFormatANDROID](#), or [VkExternalFormatOHOS](#)
- VUID-VkAttachmentDescription2-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkAttachmentDescription2-flags-parameter
flags **must** be a valid combination of [VkAttachmentDescriptionFlagBits](#) values
- VUID-VkAttachmentDescription2-format-parameter
format **must** be a valid [VkFormat](#) value
- VUID-VkAttachmentDescription2-samples-parameter
samples **must** be a valid [VkSampleCountFlagBits](#) value
- VUID-VkAttachmentDescription2-loadOp-parameter
loadOp **must** be a valid [VkAttachmentLoadOp](#) value
- VUID-VkAttachmentDescription2-storeOp-parameter
storeOp **must** be a valid [VkAttachmentStoreOp](#) value
- VUID-VkAttachmentDescription2-stencilLoadOp-parameter
stencilLoadOp **must** be a valid [VkAttachmentLoadOp](#) value
- VUID-VkAttachmentDescription2-stencilStoreOp-parameter
stencilStoreOp **must** be a valid [VkAttachmentStoreOp](#) value
- VUID-VkAttachmentDescription2-initialLayout-parameter
initialLayout **must** be a valid [VkImageLayout](#) value
- VUID-VkAttachmentDescription2-finalLayout-parameter
finalLayout **must** be a valid [VkImageLayout](#) value

The `VkAttachmentDescriptionStencilLayout` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescriptionStencilLayout {
    VkStructureType    sType;
    void*              pNext;
    VkImageLayout       stencilInitialLayout;
    VkImageLayout       stencilFinalLayout;
} VkAttachmentDescriptionStencilLayout;
```

```
// Provided by VK_KHR_separate_depth_stencil_layouts
// Equivalent to VkAttachmentDescriptionStencilLayout
typedef VkAttachmentDescriptionStencilLayout VkAttachmentDescriptionStencilLayoutKHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stencilInitialLayout` is the layout the stencil aspect of the attachment image subresource will be in when a render pass instance begins.
- `stencilFinalLayout` is the layout the stencil aspect of the attachment image subresource will be transitioned to when a render pass instance ends.

Valid Usage

- VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-03308
`stencilInitialLayout` **must** not be [VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL](#),
[VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL](#),
[VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL](#),
[VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL](#),
[VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL](#),

[VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL](#)
- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03309
`stencilFinalLayout` **must** not be [VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL](#),
[VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL](#),
[VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL](#),
[VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL](#),
[VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL](#),
[VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL](#), or
[VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL](#)
- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03310
`stencilFinalLayout` **must** not be [VK_IMAGE_LAYOUT_UNDEFINED](#) or

[VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT](#) or [VK_IMAGE_LAYOUT_PREINITIALIZED](#)

Valid Usage (Implicit)

- VUID-VkAttachmentDescriptionStencilLayout-sType-sType
`sType` **must** be [VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_STENCIL_LAYOUT](#)
- VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-parameter
`stencilInitialLayout` **must** be a valid [VkImageLayout](#) value
- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-parameter
`stencilFinalLayout` **must** be a valid [VkImageLayout](#) value

Structure Chaining

Extends the structure

- [VkAttachmentDescription2](#)

The [VkSubpassDescription2](#) structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescription2 {
    VkStructureType      sType;
    const void*          pNext;
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint  pipelineBindPoint;
    uint32_t             viewMask;
    uint32_t             inputAttachmentCount;
    const VkAttachmentReference2* pInputAttachments;
    uint32_t             colorAttachmentCount;
    const VkAttachmentReference2* pColorAttachments;
    const VkAttachmentReference2* pResolveAttachments;
    const VkAttachmentReference2* pDepthStencilAttachment;
    uint32_t             preserveAttachmentCount;
    const uint32_t*       pPreserveAttachments;
} VkSubpassDescription2;
```

```
// Provided by VK_KHR_create_renderpass2
// Equivalent to VkSubpassDescription2
typedef VkSubpassDescription2 VkSubpassDescription2KHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSubpassDescriptionFlagBits` specifying usage of the subpass.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the pipeline type supported for this subpass.
- `viewMask` is a bitfield of view indices describing which views rendering is broadcast to in this subpass, when multiview is enabled.
- `inputAttachmentCount` is the number of input attachments.
- `pInputAttachments` is a pointer to an array of `VkAttachmentReference2` structures defining the input attachments for this subpass and their layouts.
- `colorAttachmentCount` is the number of color attachments.
- `pColorAttachments` is a pointer to an array of `colorAttachmentCount` `VkAttachmentReference2` structures defining the color attachments for this subpass and their layouts.
- `pResolveAttachments` is `NULL` or a pointer to an array of `colorAttachmentCount` `VkAttachmentReference2` structures defining the resolve attachments for this subpass and their layouts.
- `pDepthStencilAttachment` is a pointer to a `VkAttachmentReference2` structure specifying the depth/stencil attachment for this subpass and its layout.
- `preserveAttachmentCount` is the number of preserved attachments.
- `pPreserveAttachments` is a pointer to an array of `preserveAttachmentCount` render pass attachment indices identifying attachments that are not used by this subpass, but whose contents **must** be preserved throughout the subpass.

Parameters defined by this structure with the same name as those in `VkSubpassDescription` have the identical effect to those parameters.

`viewMask` has the same effect for the described subpass as `VkRenderPassMultiviewCreateInfo::pViewMasks` has on each corresponding subpass.

If a `VkFragmentShadingRateAttachmentInfoKHR` structure is included in the `pNext` chain, `pFragmentShadingRateAttachment` is not `NULL`, and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the identified attachment defines a fragment shading rate attachment for that subpass.

If any element of `pResolveAttachments` is an image specified with an `VkExternalFormatANDROID`, values in the corresponding color attachment will be resolved to the resolve attachment in the same manner as specified for `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID`.

If the `nullColorAttachmentWithExternalFormatResolve` limit is `VK_TRUE`, values in the color attachment will be loaded from the resolve attachment at the start of rendering, and **may** also be reloaded any time after a resolve occurs or the resolve attachment is written to; if this occurs it **must** happen-before any writes to the color attachment are performed which happen-after the resolve that triggers this. If any color component in the external format is subsampled, values will be read from the nearest sample in the image when they are loaded. If the color attachment is also used as an input attachment, the same behavior applies.

Setting the color attachment to [VK_ATTACHMENT_UNUSED](#) when an external resolve attachment is used and the [nullColorAttachmentWithExternalFormatResolve](#) limit is [VK_TRUE](#) will not result in color attachment writes to be discarded for that attachment.

When [nullColorAttachmentWithExternalFormatResolve](#) is [VK_TRUE](#), the color output from the subpass can still be read via an input attachment; but the application cannot bind an image view for the color attachment as there is no such image view bound. Instead to access the data as an input attachment applications **can** use the resolve attachment in its place - using the resolve attachment image for the descriptor, and setting the corresponding element of [pInputAttachments](#) to the index of the resolve attachment.

Loads or input attachment reads from the resolve attachment are performed as if using a [VkSamplerYcbcrConversionCreateInfo](#) with the following parameters:

```
VkSamplerYcbcrConversionCreateInfo createInfo = {
    .sType = VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_CREATE_INFO,
    .pNext = NULL,
    .format = VK_FORMAT_UNDEFINED,
    .ycbcrModel = VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY,
    .ycbcrRange = VK_SAMPLER_YCBCR_RANGE_ITU_FULL,
    .components = {
        .r = VK_COMPONENT_SWIZZLE_B
        .g = VK_COMPONENT_SWIZZLE_R
        .b = VK_COMPONENT_SWIZZLE_G
        .a = VK_COMPONENT_SWIZZLE_IDENTITY},
    .xChromaOffset = properties.chromaOffsetX,
    .yChromaOffset = properties.chromaOffsetY,
    .chromaFilter = VK_FILTER_NEAREST,
    .forceExplicitReconstruction = ... };
```

where [properties](#) is equal to [VkPhysicalDeviceExternalFormatResolvePropertiesANDROID](#) returned by the device and [forceExplicitReconstruction](#) is effectively ignored as the [VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY](#) model is used. The applied swizzle is the same effective swizzle that would be applied by the [VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY](#) model, but no range expansion is applied.

Valid Usage

- VUID-VkSubpassDescription2-attachment-06912

If the [attachment](#) member of an element of [pInputAttachments](#) is not [VK_ATTACHMENT_UNUSED](#), its [layout](#) member **must** not be [VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL](#) or [VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL](#)

- VUID-VkSubpassDescription2-attachment-06913

If the [attachment](#) member of an element of [pColorAttachments](#) is not [VK_ATTACHMENT_UNUSED](#), its [layout](#) member **must** not be

VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06914

If the **attachment** member of an element of **pResolveAttachments** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06915

If the **attachment** member of **pDepthStencilAttachment** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06916

If the **attachment** member of an element of **pColorAttachments** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06917

If the **attachment** member of an element of **pResolveAttachments** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06918

If the **attachment** member of an element of **pInputAttachments** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06919

If the **attachment** member of an element of **pColorAttachments** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06920

If the **attachment** member of an element of **pResolveAttachments** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription2-attachment-06921

If the **attachment** member of an element of **pInputAttachments** is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR

- VUID-VkSubpassDescription2-attachment-06922
If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkSubpassDescription2-attachment-06923
If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** not be `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`
- VUID-VkSubpassDescription2-flags-10683
If `flags` includes `VK_SUBPASS_DESCRIPTION_TILE_SHADING_APRON_BIT_QCOM`, the render pass **must** have been created with a `VkRenderPassTileShadingCreateInfoQCOM::tileApronSize` greater than `(0,0)`
- VUID-VkSubpassDescription2-inputAttachmentCount-12293
`inputAttachmentCount` **must** be less than or equal to `maxPerStageDescriptorInputAttachments`
- VUID-VkSubpassDescription2-colorAttachmentCount-00845
`colorAttachmentCount` **must** be less than or equal to `maxColorAttachments`
- VUID-VkSubpassDescription2-loadOp-00846
If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then `loadOp` **must** not be `VK_ATTACHMENT_LOAD_OP_CLEAR`
- VUID-VkSubpassDescription2-attachment-06251
If the `attachment` member of `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED` and its `pNext` chain includes a `VkAttachmentReferenceStencilLayout` structure, the `layout` member of `pDepthStencilAttachment` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- VUID-VkSubpassDescription2-pipelineBindPoint-04953
`pipelineBindPoint` **must** be `VK_PIPELINE_BIND_POINT_GRAPHICS` or `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`
- VUID-VkSubpassDescription2-pResolveAttachments-03067
If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` **must** have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkSubpassDescription2-externalFormatResolve-09335
If the `externalFormatResolve` feature is not enabled and `pResolveAttachments` is not `NULL`, for each resolve attachment that does not have the value `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not have the value `VK_ATTACHMENT_UNUSED`
- VUID-VkSubpassDescription2-nullColorAttachmentWithExternalFormatResolve-09336
If the `nullColorAttachmentWithExternalFormatResolve` property is `VK_FALSE` and `pResolveAttachments` is not `NULL`, for each resolve attachment that has a format of `VK_FORMAT_UNDEFINED`, the corresponding color attachment **must** not have the value `VK_ATTACHMENT_UNUSED`
- VUID-VkSubpassDescription2-nullColorAttachmentWithExternalFormatResolve-09337
If the `nullColorAttachmentWithExternalFormatResolve` property is `VK_TRUE` and

`pResolveAttachments` is not `NULL`, for each resolve attachment that has a format of `VK_FORMAT_UNDEFINED`, the corresponding color attachment **must** have the value `VK_ATTACHMENT_UNUSED`

- VUID-VkSubpassDescription2-externalFormatResolve-09338

If the `externalFormatResolve` feature is not enabled and `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkSubpassDescription2-externalFormatResolve-09339

If the `externalFormatResolve` feature is not enabled, each element of `pResolveAttachments` **must** have the same `VkFormat` as its corresponding color attachment

- VUID-VkSubpassDescription2-multisampledRenderToSingleSampled-06869

If the `multisampledRenderToSingleSampled` feature is not enabled, all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have the same sample count

- VUID-VkSubpassDescription2-pInputAttachments-02897

All attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` and any of the following is true:

- the `externalFormatResolve` feature is not enabled
- the `nullColorAttachmentWithExternalFormatResolve` property is `VK_FALSE`
- does not have a non-zero value of `VkExternalFormatANDROID::externalFormat`

must have image formats whose `potential format features` contain at least `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-pColorAttachments-02898

All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-pResolveAttachments-09343

All attachments in `pResolveAttachments` that are not `VK_ATTACHMENT_UNUSED` and do not have an image format of `VK_FORMAT_UNDEFINED` **must** have image formats whose `potential format features` contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-pDepthStencilAttachment-02900

If `pDepthStencilAttachment` is not `NULL` and the attachment is not `VK_ATTACHMENT_UNUSED` then it **must** have an image format whose `potential format features` contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-linearColorAttachment-06499

If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have image formats whose `potential format features` **must** contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`

- VUID-VkSubpassDescription2-linearColorAttachment-06500

If the `linearColorAttachment` feature is enabled and the image is created with

VK_IMAGE_TILING_LINEAR, all attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED **must** have image formats whose potential format features **must** contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV

- VUID-VkSubpassDescription2-linearColorAttachment-06501

If the linearColorAttachment feature is enabled and the image is created with VK_IMAGE_TILING_LINEAR, all attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED **must** have image formats whose potential format features **must** contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV

- VUID-VkSubpassDescription2-None-09456

If either of the following is enabled:

- The VK_AMD_mixed_attachment_samples extension
- The VK_NV_framebuffer_mixed_samples extension

all attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED **must** have a sample count that is smaller than or equal to the sample count of pDepthStencilAttachment if it is not VK_ATTACHMENT_UNUSED

- VUID-VkSubpassDescription2-pNext-06870

If the pNext chain includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then all attachments in pColorAttachments and pDepthStencilAttachment that are not VK_ATTACHMENT_UNUSED **must** have a sample count that is either VK_SAMPLE_COUNT_1_BIT or equal to VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples

- VUID-VkSubpassDescription2-pNext-06871

If the pNext chain includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, and pDepthStencilAttachment is not NULL, does not have the value VK_ATTACHMENT_UNUSED, and has a sample count of VK_SAMPLE_COUNT_1_BIT, the pNext chain **must** also include a VkSubpassDescriptionDepthStencilResolve structure with pDepthStencilResolveAttachment that is either NULL or has the value VK_ATTACHMENT_UNUSED

- VUID-VkSubpassDescription2-multisampledRenderToSingleSampled-06872

If none of the following are enabled:

- The VK_AMD_mixed_attachment_samples extension
- The VK_NV_framebuffer_mixed_samples extension
- The multisampledRenderToSingleSampled feature

all attachments in pDepthStencilAttachment and pColorAttachments that are not VK_ATTACHMENT_UNUSED **must** have the same sample count

- VUID-VkSubpassDescription2-attachment-03073

Each element of pPreserveAttachments **must** not be VK_ATTACHMENT_UNUSED

- VUID-VkSubpassDescription2-pPreserveAttachments-03074

Each element of pPreserveAttachments **must** not also be an element of any other member of the subpass description

- VUID-VkSubpassDescription2-layout-02528
If any attachment is used by more than one `VkAttachmentReference2` member, then each use **must** use the same `layout`
- VUID-VkSubpassDescription2-flags-03076
If `flags` includes `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX`, it **must** also include `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX`
- VUID-VkSubpassDescription2-attachment-02799
If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** be a valid combination of `VkImageAspectFlagBits`
- VUID-VkSubpassDescription2-attachment-02800
If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** not be `0`
- VUID-VkSubpassDescription2-attachment-02801
If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** not include `VK_IMAGE_ASPECT_METADATA_BIT`
- VUID-VkSubpassDescription2-attachment-04563
If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`
- VUID-VkSubpassDescription2-pDepthStencilAttachment-04440
An attachment **must** not be used in both `pDepthStencilAttachment` and `pColorAttachments`
- VUID-VkSubpassDescription2-multiview-06558
If the `multiview` feature is not enabled, `viewMask` **must** be `0`
- VUID-VkSubpassDescription2-viewMask-06706
The index of the most significant bit in `viewMask` **must** be less than `maxMultiviewViewCount`
- VUID-VkSubpassDescription2-externalFormatResolve-09344
If the `externalFormatResolve` feature is enabled, `pResolveAttachments` is not `NULL`, and `colorAttachmentCount` is not `1`, any element of `pResolveAttachments` that is not `VK_ATTACHMENT_UNUSED`, **must** not have a format of `VK_FORMAT_UNDEFINED`
- VUID-VkSubpassDescription2-externalFormatResolve-09345
If the `externalFormatResolve` feature is enabled, `pResolveAttachments` is not `NULL`, any element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED` and has a format of `VK_FORMAT_UNDEFINED`, and the corresponding element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, the color attachment **must** have a `samples` value of `1`
- VUID-VkSubpassDescription2-externalFormatResolve-09346
If the `externalFormatResolve` feature is enabled, `pResolveAttachments` is not `NULL`, and any element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED` and has a format of `VK_FORMAT_UNDEFINED`, `viewMask` **must** be `0`
- VUID-VkSubpassDescription2-externalFormatResolve-09347
If the `externalFormatResolve` feature is enabled, `pResolveAttachments` is not `NULL`, and any element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED` and has a format of

VK_FORMAT_UNDEFINED, VkFragmentShadingRateAttachmentInfoKHR
::pFragmentShadingRateAttachment **must** either be NULL or a VkAttachmentReference2 structure with an attachment value of VK_ATTACHMENT_UNUSED

- VUID-VkSubpassDescription2-externalFormatResolve-09348
If the externalFormatResolve feature is enabled, pResolveAttachments is not NULL, and any element of pResolveAttachments is not VK_ATTACHMENT_UNUSED and has a format of VK_FORMAT_UNDEFINED, elements of pInputAttachments referencing either a color attachment or resolve attachment used in this subpass **must** not include VK_IMAGE_ASPECT_PLANE_i_BIT for any index *i* in its aspectMask
- VUID-VkSubpassDescription2-flags-04907
If flags includes VK_SUBPASS_DESCRIPTION_CUSTOM_RESOLVE_BIT_EXT, and if pResolveAttachments is not NULL, then each resolve attachment **must** be VK_ATTACHMENT_UNUSED
- VUID-VkSubpassDescription2-flags-04908
If flags includes VK_SUBPASS_DESCRIPTION_CUSTOM_RESOLVE_BIT_EXT, and if pDepthStencilResolveAttachment is not NULL, then the depth/stencil resolve attachment **must** be VK_ATTACHMENT_UNUSED
- VUID-VkSubpassDescription2-flags-04909
If flags includes VK_SUBPASS_DESCRIPTION_CUSTOM_RESOLVE_BIT_EXT, then the subpass **must** be the last subpass in a subpass dependency chain

Valid Usage (Implicit)

- VUID-VkSubpassDescription2-sType-sType
sType **must** be VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2
- VUID-VkSubpassDescription2-pNext-pNext
Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkFragmentShadingRateAttachmentInfoKHR, VkMultisampledRenderToSingleSampledInfoEXT, VkRenderPassCreationControlEXT, VkRenderPassSubpassFeedbackCreateInfoEXT, or VkSubpassDescriptionDepthStencilResolve
- VUID-VkSubpassDescription2-sType-unique
The sType value of each structure in the pNext chain **must** be unique
- VUID-VkSubpassDescription2-flags-parameter
flags **must** be a valid combination of VkSubpassDescriptionFlagBits values
- VUID-VkSubpassDescription2-pipelineBindPoint-parameter
pipelineBindPoint **must** be a valid VkPipelineBindPoint value
- VUID-VkSubpassDescription2-pInputAttachments-parameter
If inputAttachmentCount is not 0, pInputAttachments **must** be a valid pointer to an array of inputAttachmentCount valid VkAttachmentReference2 structures
- VUID-VkSubpassDescription2-pColorAttachments-parameter
If colorAttachmentCount is not 0, pColorAttachments **must** be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference2 structures

- VUID-VkSubpassDescription2-pResolveAttachments-parameter
If `colorAttachmentCount` is not 0, and `pResolveAttachments` is not `NULL`, `pResolveAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference2` structures
- VUID-VkSubpassDescription2-pDepthStencilAttachment-parameter
If `pDepthStencilAttachment` is not `NULL`, `pDepthStencilAttachment` **must** be a valid pointer to a valid `VkAttachmentReference2` structure
- VUID-VkSubpassDescription2-pPreserveAttachments-parameter
If `preserveAttachmentCount` is not 0, `pPreserveAttachments` **must** be a valid pointer to an array of `preserveAttachmentCount` `uint32_t` values

The `VkSubpassDescriptionDepthStencilResolve` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescriptionDepthStencilResolve {
    VkStructureType          sType;
    const void*              pNext;
    VkResolveModeFlagBits    depthResolveMode;
    VkResolveModeFlagBits    stencilResolveMode;
    const VkAttachmentReference2* pDepthStencilResolveAttachment;
} VkSubpassDescriptionDepthStencilResolve;
```

```
// Provided by VK_KHR_depth_stencil_resolve
// Equivalent to VkSubpassDescriptionDepthStencilResolve
typedef VkSubpassDescriptionDepthStencilResolve
VkSubpassDescriptionDepthStencilResolveKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `depthResolveMode` is a `VkResolveModeFlagBits` value describing the depth resolve mode.
- `stencilResolveMode` is a `VkResolveModeFlagBits` value describing the stencil resolve mode.
- `pDepthStencilResolveAttachment` is `NULL` or a pointer to a `VkAttachmentReference2` structure defining the depth/stencil resolve attachment for this subpass and its layout.

If the `pNext` chain of `VkSubpassDescription2` includes a `VkSubpassDescriptionDepthStencilResolve` structure, then that structure describes [multisample resolve operations](#) for the depth/stencil attachment in a subpass. If this structure is not included in the `pNext` chain of `VkSubpassDescription2`, or if it is and either `pDepthStencilResolveAttachment` is `NULL` or its attachment index is `VK_ATTACHMENT_UNUSED`, it indicates that no depth/stencil resolve attachment will be used in the subpass.

Valid Usage

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03177
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `pDepthStencilAttachment` **must** not be `NULL` or have the value `VK_ATTACHMENT_UNUSED`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03179
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `pDepthStencilAttachment` **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03180
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `pDepthStencilResolveAttachment` **must** have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-02651
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` then it **must** have an image format whose `potential format features` contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03181
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` and `VkFormat` of `pDepthStencilResolveAttachment` has a depth component, then the `VkFormat` of `pDepthStencilAttachment` **must** have a depth component with the same number of bits and `numeric format`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03182
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, and `VkFormat` of `pDepthStencilResolveAttachment` has a stencil component, then the `VkFormat` of `pDepthStencilAttachment` **must** have a stencil component with the same number of bits and `numeric format`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03178
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` **must** not both be `VK_RESOLVE_MODE_NONE`
- VUID-VkSubpassDescriptionDepthStencilResolve-depthResolveMode-03183
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` and the `VkFormat` of `pDepthStencilResolveAttachment` has a depth component, then the value of `depthResolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes` or `VK_RESOLVE_MODE_NONE`
- VUID-VkSubpassDescriptionDepthStencilResolve-stencilResolveMode-03184
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` and the `VkFormat` of `pDepthStencilResolveAttachment` has a stencil component, then the value of `stencilResolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes` or `VK_RESOLVE_MODE_NONE`

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03185
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, the `VkFormat` of `pDepthStencilResolveAttachment` has both depth and stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_FALSE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03186
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, the `VkFormat` of `pDepthStencilResolveAttachment` has both depth and stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE` and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_TRUE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical or one of them **must** be `VK_RESOLVE_MODE_NONE`
- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06873
If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure, the `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, and `pDepthStencilAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` **must** not both be `VK_RESOLVE_MODE_NONE`
- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06874
If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, and `pDepthStencilAttachment` is not `NULL`, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` that has a depth component, then the value of `depthResolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes` or `VK_RESOLVE_MODE_NONE`
- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06875
If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, and `pDepthStencilAttachment` is not `NULL`, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` with a stencil component, then the value of `stencilResolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes` or `VK_RESOLVE_MODE_NONE`
- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06876
If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, `pDepthStencilAttachment` is not `NULL`, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` with both depth and stencil components, and both `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` are `VK_FALSE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06877

If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, `pDepthStencilAttachment` is not `NULL`, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` with both depth and stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_TRUE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical or one of them **must** be `VK_RESOLVE_MODE_NONE`

Valid Usage (Implicit)

- VUID-VkSubpassDescriptionDepthStencilResolve-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_DEPTH_STENCIL_RESOLVE`
- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-parameter
If `pDepthStencilResolveAttachment` is not `NULL`, `pDepthStencilResolveAttachment` **must** be a valid pointer to a valid `VkAttachmentReference2` structure

Structure Chaining

Extends the structure

- `VkSubpassDescription2`

The `VkFragmentShadingRateAttachmentInfoKHR` structure is defined as:

WARNING

This functionality is superseded by Vulkan Version 1.4 and `VK_KHR_dynamic_rendering_local_read`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkFragmentShadingRateAttachmentInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    const VkAttachmentReference2* pFragmentShadingRateAttachment;
    VkExtent2D                shadingRateAttachmentTexelSize;
} VkFragmentShadingRateAttachmentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pFragmentShadingRateAttachment` is `NULL` or a pointer to a `VkAttachmentReference2` structure defining the fragment shading rate attachment for this subpass.

- `shadingRateAttachmentTexelSize` specifies the size of the portion of the framebuffer corresponding to each texel in `pFragmentShadingRateAttachment`.

If no shading rate attachment is specified, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

Valid Usage

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04524
If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, its `layout` member **must** be equal to `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`
- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04525
If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` **must** be a power of two value
- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04526
If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.width`
- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04527
If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` **must** be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`
- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04528
If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` **must** be a power of two value
- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04529
If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.height`
- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04530
If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` **must** be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.height`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04531

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04532

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

Valid Usage (Implicit)

- VUID-VkFragmentShadingRateAttachmentInfoKHR-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-parameter

If `pFragmentShadingRateAttachment` is not `NULL`, `pFragmentShadingRateAttachment` **must** be a valid pointer to a valid `VkAttachmentReference2` structure

Structure Chaining

Extends the structure

- `VkSubpassDescription2`

If the `pNext` chain of `VkSubpassDescription2` or `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure, then that structure describes how multisampled rendering is performed on single sampled attachments in that subpass.

The `VkMultisampledRenderToSingleSampledInfoEXT` structure is defined as:

```
// Provided by VK_EXT_multisampled_render_to_single_sampled
typedef struct VkMultisampledRenderToSingleSampledInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           multisampledRenderToSingleSampledEnable;
    VkSampleCountFlagBits rasterizationSamples;
} VkMultisampledRenderToSingleSampledInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `multisampledRenderToSingleSampledEnable` controls whether multisampled rendering to single-sampled attachments is performed as described [below](#).
- `rasterizationSamples` is a `VkSampleCountFlagBits` specifying the number of samples used in rasterization.

Valid Usage

- VUID-VkMultisampledRenderToSingleSampledInfoEXT-rasterizationSamples-06878
The value of `rasterizationSamples` **must** not be `VK_SAMPLE_COUNT_1_BIT`
- VUID-VkMultisampledRenderToSingleSampledInfoEXT-pNext-06880
If added to the `pNext` chain of `VkRenderingInfo`, each `imageView` member of any element of `VkRenderingInfo::pColorAttachments`, `VkRenderingInfo::pDepthAttachment`, or `VkRenderingInfo::pStencilAttachment` that is not `VK_NULL_HANDLE` **must** have a format that supports the sample count specified in `rasterizationSamples`

Valid Usage (Implicit)

- VUID-VkMultisampledRenderToSingleSampledInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_INFO_EXT`
- VUID-VkMultisampledRenderToSingleSampledInfoEXT-rasterizationSamples-parameter
`rasterizationSamples` **must** be a valid `VkSampleCountFlagBits` value

Structure Chaining

Extends the structures

- `VkRenderingInfo`
- `VkSubpassDescription2`

If the `pNext` chain of `VkSubpassDescription2` or `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, the graphics pipelines **must** have `VkGraphicsPipelineCreateInfo::rasterizationSamples` equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`, and the subpass attachments **can** have a sample count of `VK_SAMPLE_COUNT_1_BIT`. For attachments with a sample count of `VK_SAMPLE_COUNT_1_BIT`, multisampled rendering is performed to an intermediate multisampled image with `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples` samples, implicitly allocated by the implementation for the duration of the subpass. For such attachments:

- If `loadOp` equals to `VK_ATTACHMENT_LOAD_OP_LOAD`, samples of the implicit image are initialized by replicating the value from the corresponding pixel in the attachment.

- If `storeOp` or `stencilStoreOp` is equal to `VK_ATTACHMENT_STORE_OP_STORE`, the implicit image is implicitly resolved prior to storage in the attachment.

Memory constraints due to high primitive counts **may** result in an implicit split of the subpass. This is the equivalent of partial rasterization of geometry in a render pass that ends in `storeOp` and `stencilStoreOp` equal to `VK_ATTACHMENT_STORE_OP_STORE`, followed by another render pass with `loadOp` and `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_LOAD` with appropriate barriers in between. When `VkMultisampledRenderToSingleSampledInfoEXT` is used, the implementation is allowed to resolve attachments with a sample count of `VK_SAMPLE_COUNT_1_BIT` and lose multisampled data on such splits. The implementation **may** similarly split the render pass at subpass boundaries even if they use the same value for `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`.

The `VkAttachmentReference2` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReference2 {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           attachment;
    VkImageLayout       layout;
    VkImageAspectFlags aspectMask;
} VkAttachmentReference2;
```

```
// Provided by VK_KHR_create_renderpass2
// Equivalent to VkAttachmentReference2
typedef VkAttachmentReference2 VkAttachmentReference2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachment` is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo2::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is not used.
- `layout` is a `VkImageLayout` value specifying the layout the attachment uses during the subpass.
- `aspectMask` is a mask of which aspect(s) **can** be accessed within the specified subpass as an input attachment.

Parameters defined by this structure with the same name as those in `VkAttachmentReference` have the identical effect to those parameters.

`aspectMask` is ignored when this structure is used to describe anything other than an input attachment reference.

If the `separateDepthStencilLayouts` feature is enabled, and `attachment` has a depth/stencil format, `layout` **can** be set to a layout that only specifies the layout of the depth aspect.

If `layout` only specifies the layout of the depth aspect of the attachment, the layout of the stencil aspect is specified by the `stencilLayout` member of a `VkAttachmentReferenceStencilLayout` structure included in the `pNext` chain. Otherwise, `layout` describes the layout for all relevant image aspects.

Valid Usage

- VUID-VkAttachmentReference2-layout-03077

If `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

- VUID-VkAttachmentReference2-separateDepthStencilLayouts-03313

If the `separateDepthStencilLayouts` feature is not enabled, and `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`,

- VUID-VkAttachmentReference2-synchronization2-06910

If the `synchronization2` feature is not enabled, `layout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkAttachmentReference2-attachmentFeedbackLoopLayout-07311

If the `attachmentFeedbackLoopLayout` feature is not enabled, `layout` **must** not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`

- VUID-VkAttachmentReference2-dynamicRenderingLocalRead-09546

If the `dynamicRenderingLocalRead` feature is not enabled, `layout` **must** not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ`

Valid Usage (Implicit)

- VUID-VkAttachmentReference2-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_2`

- VUID-VkAttachmentReference2-pNext-pNext

`pNext` **must** be `NULL` or a pointer to a valid instance of `VkAttachmentReferenceStencilLayout`

- VUID-VkAttachmentReference2-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkAttachmentReference2-layout-parameter

`layout` **must** be a valid `VkImageLayout` value

The `VkAttachmentReferenceStencilLayout` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReferenceStencilLayout {
    VkStructureType    sType;
    void*              pNext;
    VkImageLayout      stencilLayout;
} VkAttachmentReferenceStencilLayout;
```

```
// Provided by VK_KHR_separate_depth_stencil_layouts
// Equivalent to VkAttachmentReferenceStencilLayout
typedef VkAttachmentReferenceStencilLayout VkAttachmentReferenceStencilLayoutKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stencilLayout` is a `VkImageLayout` value specifying the layout the stencil aspect of the attachment uses during the subpass.

Valid Usage

- VUID-VkAttachmentReferenceStencilLayout-stencilLayout-03318
`stencilLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`,
`VK_IMAGE_LAYOUT_PREINITIALIZED`,
`VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`,
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, or
`VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

Valid Usage (Implicit)

- VUID-VkAttachmentReferenceStencilLayout-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_STENCIL_LAYOUT`
- VUID-VkAttachmentReferenceStencilLayout-stencilLayout-parameter
`stencilLayout` **must** be a valid `VkImageLayout` value

Structure Chaining

Extends the structure

- [VkAttachmentReference2](#)

The [VkSubpassDependency2](#) structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDependency2 {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           srcSubpass;
    uint32_t           dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags       srcAccessMask;
    VkAccessFlags       dstAccessMask;
    VkDependencyFlags    dependencyFlags;
    int32_t             viewOffset;
} VkSubpassDependency2;
```

```
// Provided by VK_KHR_create_renderpass2
// Equivalent to VkSubpassDependency2
typedef VkSubpassDependency2 VkSubpassDependency2KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcSubpass** is the subpass index of the first subpass in the dependency, or [VK_SUBPASS_EXTERNAL](#).
- **dstSubpass** is the subpass index of the second subpass in the dependency, or [VK_SUBPASS_EXTERNAL](#).
- **srcStageMask** is a bitmask of [VkPipelineStageFlagBits](#) specifying the [source stage mask](#). If set to [VK_PIPELINE_STAGE_ALL_COMMANDS_BIT](#), it is equivalent to setting it to [VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT](#).
- **dstStageMask** is a bitmask of [VkPipelineStageFlagBits](#) specifying the [destination stage mask](#). If set to [VK_PIPELINE_STAGE_ALL_COMMANDS_BIT](#), it is equivalent to setting it to [VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT](#).
- **srcAccessMask** is a bitmask of [VkAccessFlagBits](#) specifying a [source access mask](#).
- **dstAccessMask** is a bitmask of [VkAccessFlagBits](#) specifying a [destination access mask](#).

- `dependencyFlags` is a bitmask of `VkDependencyFlagBits`.
- `viewOffset` controls which views in the source subpass the views in the destination subpass depend on.

Parameters defined by this structure with the same name as those in `VkSubpassDependency` have the identical effect to those parameters.

`viewOffset` has the same effect for the described subpass dependency as `VkRenderPassMultiviewCreateInfo::pViewOffsets` has on each corresponding subpass dependency.

If a `VkMemoryBarrier2` is included in the `pNext` chain, `srcStageMask`, `dstStageMask`, `srcAccessMask`, and `dstAccessMask` parameters are ignored. The synchronization and access scopes instead are defined by the parameters of `VkMemoryBarrier2`. If either `srcStageMask` or `dstStageMask` are set to `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`, it is equivalent to setting `VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT`.

Valid Usage

- VUID-VkSubpassDependency2-srcStageMask-04090
If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- VUID-VkSubpassDependency2-srcStageMask-04091
If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- VUID-VkSubpassDependency2-srcStageMask-04092
If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
- VUID-VkSubpassDependency2-srcStageMask-04093
If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- VUID-VkSubpassDependency2-srcStageMask-04094
If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- VUID-VkSubpassDependency2-srcStageMask-04095
If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`
- VUID-VkSubpassDependency2-srcStageMask-04096
If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`
- VUID-VkSubpassDependency2-srcStageMask-07318
If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-VkSubpassDependency2-srcStageMask-03937

If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be 0

- VUID-VkSubpassDependency2-srcStageMask-07949

If neither the `VK_NV_ray_tracing` extension or the `rayTracingPipeline` feature are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkSubpassDependency2-srcStageMask-10754

If the `accelerationStructure` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

- VUID-VkSubpassDependency2-dstStageMask-04090

If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-VkSubpassDependency2-dstStageMask-04091

If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-VkSubpassDependency2-dstStageMask-04092

If the `conditionalRendering` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-VkSubpassDependency2-dstStageMask-04093

If the `fragmentDensityMap` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-VkSubpassDependency2-dstStageMask-04094

If the `transformFeedback` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-VkSubpassDependency2-dstStageMask-04095

If the `meshShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- VUID-VkSubpassDependency2-dstStageMask-04096

If the `taskShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- VUID-VkSubpassDependency2-dstStageMask-07318

If neither of the `shadingRateImage` or the `attachmentFragmentShadingRate` features are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkSubpassDependency2-dstStageMask-03937

If the `synchronization2` feature is not enabled, `dstStageMask` **must** not be 0

- VUID-VkSubpassDependency2-dstStageMask-07949

If neither the `VK_NV_ray_tracing` extension or the `rayTracingPipeline` feature are enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkSubpassDependency2-dstStageMask-10754

If the `accelerationStructure` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

- VUID-VkSubpassDependency2-srcSubpass-03084

srcSubpass **must** be less than or equal to **dstSubpass**, unless one of them is **VK_SUBPASS_EXTERNAL**, to avoid cyclic dependencies and ensure a valid execution order

- VUID-VkSubpassDependency2-srcSubpass-03085
srcSubpass and **dstSubpass** **must** not both be equal to **VK_SUBPASS_EXTERNAL**
- VUID-VkSubpassDependency2-srcSubpass-06810
If **srcSubpass** is equal to **dstSubpass** and **srcStageMask** includes a **framebuffer-space** stage, **dstStageMask** **must** only contain **framebuffer-space** stages
- VUID-VkSubpassDependency2-srcAccessMask-03088
Any access flag included in **srcAccessMask** **must** be supported by one of the pipeline stages in **srcStageMask**, as specified in the [table of supported access types](#)
- VUID-VkSubpassDependency2-dstAccessMask-03089
Any access flag included in **dstAccessMask** **must** be supported by one of the pipeline stages in **dstStageMask**, as specified in the [table of supported access types](#)
- VUID-VkSubpassDependency2-dependencyFlags-03090
If **dependencyFlags** includes **VK_DEPENDENCY_VIEW_LOCAL_BIT**, **srcSubpass** **must** not be equal to **VK_SUBPASS_EXTERNAL**
- VUID-VkSubpassDependency2-dependencyFlags-03091
If **dependencyFlags** includes **VK_DEPENDENCY_VIEW_LOCAL_BIT**, **dstSubpass** **must** not be equal to **VK_SUBPASS_EXTERNAL**
- VUID-VkSubpassDependency2-srcSubpass-02245
If **srcSubpass** equals **dstSubpass**, and **srcStageMask** and **dstStageMask** both include a **framebuffer-space** stage, then **dependencyFlags** **must** include **VK_DEPENDENCY_BY_REGION_BIT**
- VUID-VkSubpassDependency2-viewOffset-02530
If **viewOffset** is not equal to 0, **srcSubpass** **must** not be equal to **dstSubpass**
- VUID-VkSubpassDependency2-dependencyFlags-03092
If **dependencyFlags** does not include **VK_DEPENDENCY_VIEW_LOCAL_BIT**, **viewOffset** **must** be 0
- VUID-VkSubpassDependency2-dependencyFlags-10204
dependencyFlags **must** not include **VK_DEPENDENCY_QUEUE_FAMILY_OWNERSHIP_TRANSFER_USE_ALL_STAGES_BIT_KHR**

Valid Usage (Implicit)

- VUID-VkSubpassDependency2-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_SUBPASS_DEPENDENCY_2**
- VUID-VkSubpassDependency2-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of **VkMemoryBarrier2** or **VkMemoryBarrierAccessFlags3KHR**
- VUID-VkSubpassDependency2-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique

- VUID-VkSubpassDependency2-srcStageMask-parameter
srcStageMask **must** be a valid combination of [VkPipelineStageFlagBits](#) values
- VUID-VkSubpassDependency2-dstStageMask-parameter
dstStageMask **must** be a valid combination of [VkPipelineStageFlagBits](#) values
- VUID-VkSubpassDependency2-srcAccessMask-parameter
srcAccessMask **must** be a valid combination of [VkAccessFlagBits](#) values
- VUID-VkSubpassDependency2-dstAccessMask-parameter
dstAccessMask **must** be a valid combination of [VkAccessFlagBits](#) values
- VUID-VkSubpassDependency2-dependencyFlags-parameter
dependencyFlags **must** be a valid combination of [VkDependencyFlagBits](#) values

To destroy a render pass, call:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkDestroyRenderPass(
    VkDevice          device,
    VkRenderPass      renderPass,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the render pass.
- **renderPass** is the handle of the render pass to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyRenderPass-renderPass-00873
All submitted commands that refer to **renderPass** **must** have completed execution
- VUID-vkDestroyRenderPass-renderPass-00874
If **VkAllocationCallbacks** were provided when **renderPass** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyRenderPass-renderPass-00875
If no **VkAllocationCallbacks** were provided when **renderPass** was created, **pAllocator** **must** be **NULL**

Valid Usage (Implicit)

- VUID-vkDestroyRenderPass-device-parameter
device **must** be a valid [VkDevice](#) handle

- VUID-vkDestroyRenderPass-renderPass-parameter
If `renderPass` is not `VK_NULL_HANDLE`, `renderPass` **must** be a valid `VkRenderPass` handle
- VUID-vkDestroyRenderPass-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyRenderPass-renderPass-parent
If `renderPass` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `renderPass` **must** be externally synchronized

8.3. Render Pass Compatibility

Framebuffers and graphics pipelines are created based on a specific render pass object. They **must** only be used with that render pass object, or one compatible with it.

Two attachment references are compatible if they have matching format and sample count, or are both `VK_ATTACHMENT_UNUSED`.

Two arrays of attachment references are compatible if all corresponding pairs of attachments are compatible. If the arrays are of different lengths, attachment references not present in the smaller array are treated as `VK_ATTACHMENT_UNUSED`. If the pointer that would contain the reference is `NULL`, the attachment reference is treated as `VK_ATTACHMENT_UNUSED`.

Two render passes are compatible if their corresponding color, input, resolve, and depth/stencil attachment references are compatible and if they are otherwise identical except for:

- Initial and final image layout in attachment descriptions
- Load and store operations in attachment descriptions
- Image layout in attachment references
- The `VK_ATTACHMENT_DESCRIPTION_RESOLVE_SKIP_TRANSFER_FUNCTION_BIT_KHR` inclusion of
- The `VK_ATTACHMENT_DESCRIPTION_RESOLVE_ENABLE_TRANSFER_FUNCTION_BIT_KHR` inclusion of

As an additional special case, if two render passes have a single subpass, the resolve attachment reference and depth/stencil resolve mode compatibility requirements are ignored.

A framebuffer is compatible with a render pass if it was created using the same render pass or a compatible render pass.

8.4. Framebuffers

Render passes operate in conjunction with *framebuffers*. Framebuffers represent a collection of specific memory attachments that a render pass instance uses.

Framebuffers are represented by `VkFramebuffer` handles:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFramebuffer)
```

To create a framebuffer, call:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
VkResult vkCreateFramebuffer(
    VkDevice                                device,
    const VkFramebufferCreateInfo*          pCreateInfo,
    const VkAllocationCallbacks*            pAllocator,
    VkFramebuffer*                          pFramebuffer);
```

- `device` is the logical device that creates the framebuffer.
- `pCreateInfo` is a pointer to a `VkFramebufferCreateInfo` structure describing additional information about framebuffer creation.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pFramebuffer` is a pointer to a `VkFramebuffer` handle in which the resulting framebuffer object is returned.

Valid Usage

- VUID-vkCreateFramebuffer-device-10002
`device` **must** support at least one queue family with the `VK_QUEUE_GRAPHICS_BIT` capability
- VUID-vkCreateFramebuffer-pCreateInfo-02777
If `pCreateInfo->flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `attachmentCount` is not 0, each element of `pCreateInfo->pAttachments` **must** have been created on `device`

Valid Usage (Implicit)

- VUID-vkCreateFramebuffer-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateFramebuffer-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkFramebufferCreateInfo](#) structure
- VUID-vkCreateFramebuffer-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateFramebuffer-pFramebuffer-parameter
pFramebuffer **must** be a valid pointer to a [VkFramebuffer](#) handle
- VUID-vkCreateFramebuffer-device-queuecount
The device **must** have been created with at least **1** queue

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkFramebufferCreateInfo](#) structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkFramebufferCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkFramebufferCreateFlags flags;
    VkRenderPass        renderPass;
    uint32_t            attachmentCount;
    const VkImageView*  pAttachments;
    uint32_t            width;
    uint32_t            height;
    uint32_t            layers;
} VkFramebufferCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkFramebufferCreateFlagBits`
- `renderPass` is a render pass defining what render passes the framebuffer will be compatible with. See [Render Pass Compatibility](#) for details. The implementation **must** not access this object outside of the duration of the command this structure is passed to.
- `attachmentCount` is the number of attachments.
- `pAttachments` is a pointer to an array of `VkImageView` handles, each of which will be used as the corresponding attachment in a render pass instance. If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, this parameter is ignored.
- `width`, `height` and `layers` define the dimensions of the framebuffer. If the render pass uses multiview, then `layers` **must** be one and each attachment requires a number of layers that is greater than the maximum bit index set in the view mask in the subpasses in which it is used.

For any depth/stencil attachments used by this framebuffer in `pAttachments`, or set later through `VkRenderPassAttachmentBeginInfoKHR::pAttachments`, the `aspectMask` is ignored.

It is legal for a subpass to use no color or depth/stencil attachments, either because it has no attachment references or because all of them are `VK_ATTACHMENT_UNUSED`. This kind of subpass **can** use shader side effects such as image stores and atomics to produce an output. In this case, the subpass continues to use the `width`, `height`, and `layers` of the framebuffer to define the dimensions of the rendering area, and the `rasterizationSamples` from each pipeline's `VkPipelineMultisampleStateCreateInfo` to define the number of samples used in rasterization; however, if `VkPhysicalDeviceFeatures::variableMultisampleRate` is `VK_FALSE`, then all pipelines to be bound with the subpass **must** have the same value for `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. In all such cases, `rasterizationSamples` **must** be a valid `VkSampleCountFlagBits` value that is set in `VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts`.

Valid Usage

- VUID-VkFramebufferCreateInfo-attachmentCount-00876
`attachmentCount` **must** be equal to the attachment count specified in `renderPass`
- VUID-VkFramebufferCreateInfo-flags-02778
If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` and `attachmentCount` is not 0, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkImageView` handles
- VUID-VkFramebufferCreateInfo-pAttachments-00877
If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a color attachment or resolve attachment by `renderPass` **must** have been created with the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` usage flag set
- VUID-VkFramebufferCreateInfo-pAttachments-02633
If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a depth/stencil attachment by `renderPass` **must** have been

created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-VkFramebufferCreateInfo-pAttachments-02634

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a depth/stencil resolve attachment by `renderPass` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-VkFramebufferCreateInfo-pAttachments-00879

If `renderpass` is not `VK_NULL_HANDLE`, `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as an input attachment by `renderPass` **must** have been created with the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flag set

- VUID-VkFramebufferCreateInfo-pAttachments-02552

Each element of `pAttachments` that is used as a fragment density map attachment by `renderPass` **must** not have been created with a `flags` value including `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

- VUID-VkFramebufferCreateInfo-renderPass-02553

If `renderPass` has a fragment density map attachment and the `fragmentDensityMapNonSubsampledImages` feature is not enabled, each element of `pAttachments` **must** have been created with a `flags` value including `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT` unless that element is the fragment density map attachment

- VUID-VkFramebufferCreateInfo-renderPass-10830

If `renderPass` was created with `VK_RENDER_PASS_CREATE_PER_LAYER_FRAGMENT_DENSITY_BIT_VALVE`, then `layers` **must** be less than or equal to `maxFragmentDensityMapLayers`

- VUID-VkFramebufferCreateInfo-pAttachments-12327

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, then each element of `pAttachments` that is used as a resolve attachment by `renderPass` **must** not be bound to a `VkDeviceMemory` object allocated from a `VkMemoryHeap` with the `VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM` property

- VUID-VkFramebufferCreateInfo-pAttachments-00880

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` **must** have been created with a `VkFormat` value that matches the `VkFormat` specified by the corresponding `VkAttachmentDescription` in `renderPass`

- VUID-VkFramebufferCreateInfo-pAttachments-00881

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` **must** have been created with a `samples` value that matches the `samples` value specified by the corresponding `VkAttachmentDescription` in `renderPass`

- VUID-VkFramebufferCreateInfo-flags-04533

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as an input, color, resolve, or depth/stencil attachment by `renderPass` **must** have been created with a `VkImageCreateInfo::extent.width` greater than or equal to `width`

- VUID-VkFramebufferCreateInfo-flags-04534

If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of **pAttachments** that is used as an input, color, resolve, or depth/stencil attachment by **renderPass** **must** have been created with a **VkImageCreateInfo::extent.height** greater than or equal to **height**

- VUID-VkFramebufferCreateInfo-flags-04535

If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of **pAttachments** that is used as an input, color, resolve, or depth/stencil attachment by **renderPass** **must** have been created with a **VkImageViewCreateInfo::subresourceRange.layerCount** greater than or equal to **layers**

- VUID-VkFramebufferCreateInfo-renderPass-04536

If **renderPass** was specified with non-zero view masks, each element of **pAttachments** that is used as an input, color, resolve, or depth/stencil attachment by **renderPass** **must** have a **layerCount** greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-renderPass-02746

Each element of **pAttachments** that is referenced by **fragmentDensityMapAttachment** **must** have a **layerCount** equal to 1 or if **renderPass** was specified with non-zero view masks, greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-pAttachments-02555

If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, an element of **pAttachments** that is referenced by **fragmentDensityMapAttachment** **must** have a width at least as large as $\lceil \frac{\text{width}}{\text{maxFragmentDensityTexelSize}_{\text{width}}} \rceil$

- VUID-VkFramebufferCreateInfo-pAttachments-02556

If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, an element of **pAttachments** that is referenced by **fragmentDensityMapAttachment** **must** have a height at least as large as $\lceil \frac{\text{height}}{\text{maxFragmentDensityTexelSize}_{\text{height}}} \rceil$

- VUID-VkFramebufferCreateInfo-flags-04537

If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, and **renderPass** was specified with non-zero view masks, each element of **pAttachments** that is used as a **fragment shading rate attachment** by **renderPass** **must** have a **layerCount** that is either 1, or greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-flags-04538

If **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, and **renderPass** was not specified with non-zero view masks, each element of **pAttachments** that is used as a **fragment shading rate attachment** by **renderPass** **must** have a **layerCount** that is either 1, or greater than **layers**

- VUID-VkFramebufferCreateInfo-flags-04539

If the **maintenance7** feature is not enabled or the **robustFragmentShadingRateAttachmentAccess** limit is **VK_FALSE** or the **imageView** member of a **VkRenderingFragmentShadingRateAttachmentInfoKHR** structure was created with **VkImageSubresourceRange::baseMipLevel** greater than 0, **flags** does not include **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, an element of **pAttachments** that is used as a **fragment shading rate attachment** **must** have a width at least as large as $\lceil \text{width} / \text{texelWidth} \rceil$, where **texelWidth** is the largest value of **shadingRateAttachmentTexelSize.width** in a **VkFragmentShadingRateAttachmentInfoKHR** which references that attachment

- VUID-VkFramebufferCreateInfo-flags-04540
If the `maintenance7` feature is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, an element of `pAttachments` that is used as a `fragment shading rate attachment` **must** have a height at least as large as $\lceil \text{height} / \text{texelHeight} \rceil$, where `texelHeight` is the largest value of `shadingRateAttachmentTexelSize.height` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment
- VUID-VkFramebufferCreateInfo-pAttachments-00883
If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` **must** only specify a single mip level
- VUID-VkFramebufferCreateInfo-pAttachments-00884
If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` **must** have been created with the identity swizzle
- VUID-VkFramebufferCreateInfo-width-00885
`width` **must** be greater than 0
- VUID-VkFramebufferCreateInfo-width-00886
`width` **must** be less than or equal to `maxFramebufferWidth`
- VUID-VkFramebufferCreateInfo-height-00887
`height` **must** be greater than 0
- VUID-VkFramebufferCreateInfo-height-00888
`height` **must** be less than or equal to `maxFramebufferHeight`
- VUID-VkFramebufferCreateInfo-layers-00889
`layers` **must** be greater than 0
- VUID-VkFramebufferCreateInfo-layers-00890
`layers` **must** be less than or equal to `maxFramebufferLayers`
- VUID-VkFramebufferCreateInfo-renderPass-02531
If `renderPass` was specified with non-zero view masks, `layers` **must** be 1
- VUID-VkFramebufferCreateInfo-pAttachments-00891
If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is a 2D or 2D array image view taken from a 3D image **must** not be a depth/stencil format
- VUID-VkFramebufferCreateInfo-flags-03189
If the `imagelessFramebuffer` feature is not enabled, `flags` **must** not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`
- VUID-VkFramebufferCreateInfo-flags-03190
If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `pNext` chain **must** include a `VkFramebufferAttachmentsCreateInfo` structure
- VUID-VkFramebufferCreateInfo-flags-03191
If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `attachmentImageInfoCount` member of a `VkFramebufferAttachmentsCreateInfo` structure in

the `pNext` chain **must** be equal to either zero or `attachmentCount`

- VUID-VkFramebufferCreateInfo-flags-04541

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `width` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as an input, color, resolve, or depth/stencil attachment in `renderPass` **must** be greater than or equal to `width`

- VUID-VkFramebufferCreateInfo-flags-04542

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `height` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as an input, color, resolve, or depth/stencil attachment in `renderPass` **must** be greater than or equal to `height`

- VUID-VkFramebufferCreateInfo-flags-03196

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `width` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is referenced by `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment` in `renderPass` **must** be greater than or equal to $\lceil \frac{\text{width}}{\text{maxFragmentDensityTexelSize}_{\text{width}}} \rceil$

- VUID-VkFramebufferCreateInfo-flags-03197

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `height` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that is referenced by `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment` in `renderPass` **must** be greater than or equal to $\lceil \frac{\text{height}}{\text{maxFragmentDensityTexelSize}_{\text{height}}} \rceil$

- VUID-VkFramebufferCreateInfo-flags-04543

If the `maintenance7` feature is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `width` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a `fragment shading rate attachment` **must** be greater than or equal to $\lceil \text{width} / \text{texelWidth} \rceil$, where `texelWidth` is the largest value of `shadingRateAttachmentTexelSize.width` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment

- VUID-VkFramebufferCreateInfo-flags-04544

If the `maintenance7` feature is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `height` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a `fragment shading rate attachment` **must** be greater than or equal to $\lceil \text{height} / \text{texelHeight} \rceil$, where `texelHeight` is the largest value of `shadingRateAttachmentTexelSize.height` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment

- VUID-VkFramebufferCreateInfo-flags-04545

If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, the **layerCount** member of any element of the **pAttachmentImageInfos** member of a **VkFramebufferAttachmentsCreateInfo** structure in the **pNext** chain that is used as a **fragment shading rate attachment** **must** be either **1**, or greater than or equal to **layers**

- VUID-VkFramebufferCreateInfo-flags-04587

If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT** and **renderPass** was specified with non-zero view masks, the **layerCount** member of any element of the **pAttachmentImageInfos** member of a **VkFramebufferAttachmentsCreateInfo** structure in the **pNext** chain that is used as a **fragment shading rate attachment** **must** be either **1**, or greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-renderPass-03198

If **multiview** is enabled for **renderPass** and **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, the **layerCount** member of any element of the **pAttachmentImageInfos** member of a **VkFramebufferAttachmentsCreateInfo** structure included in the **pNext** chain used as an input, color, resolve, or depth/stencil attachment in **renderPass** **must** be greater than the maximum bit index set in the view mask in the subpasses in which it is used in **renderPass**

- VUID-VkFramebufferCreateInfo-renderPass-04546

If **multiview** is not enabled for **renderPass** and **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, the **layerCount** member of any element of the **pAttachmentImageInfos** member of a **VkFramebufferAttachmentsCreateInfo** structure included in the **pNext** chain used as an input, color, resolve, or depth/stencil attachment in **renderPass** **must** be greater than or equal to **layers**

- VUID-VkFramebufferCreateInfo-flags-03201

If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, the **usage** member of any element of the **pAttachmentImageInfos** member of a **VkFramebufferAttachmentsCreateInfo** structure included in the **pNext** chain that refers to an attachment used as a color attachment or resolve attachment by **renderPass** **must** include **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT**

- VUID-VkFramebufferCreateInfo-flags-03202

If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, the **usage** member of any element of the **pAttachmentImageInfos** member of a **VkFramebufferAttachmentsCreateInfo** structure included in the **pNext** chain that refers to an attachment used as a depth/stencil attachment by **renderPass** **must** include **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT**

- VUID-VkFramebufferCreateInfo-flags-03203

If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, the **usage** member of any element of the **pAttachmentImageInfos** member of a **VkFramebufferAttachmentsCreateInfo** structure included in the **pNext** chain that refers to an attachment used as a depth/stencil resolve attachment by **renderPass** **must** include **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT**

- VUID-VkFramebufferCreateInfo-flags-03204

If **flags** includes **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, the **usage** member of any element of the **pAttachmentImageInfos** member of a **VkFramebufferAttachmentsCreateInfo**

structure included in the `pNext` chain that refers to an attachment used as an input attachment by `renderPass` **must** include `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-VkFramebufferCreateInfo-flags-03205

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, at least one element of the `pViewFormats` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain **must** be equal to the corresponding value of `VkAttachmentDescription::format` used to create `renderPass`

- VUID-VkFramebufferCreateInfo-flags-04113

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` **must** have been created with `VkImageViewCreateInfo::viewType` not equal to `VK_IMAGE_VIEW_TYPE_3D`

- VUID-VkFramebufferCreateInfo-flags-04548

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a fragment shading rate attachment by `renderPass` **must** have been created with the `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` usage flag set

- VUID-VkFramebufferCreateInfo-flags-04549

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a fragment shading rate attachment by `renderPass` **must** include `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkFramebufferCreateInfo-samples-06881

If `multisampled-render-to-single-sampled` is enabled for any subpass, all color, depth/stencil, and input attachments used in that subpass which have `VkAttachmentDescription::samples` or `VkAttachmentDescription2::samples` equal to `VK_SAMPLE_COUNT_1_BIT` **must** have been created with `VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT` in their `VkImageCreateInfo::flags`

- VUID-VkFramebufferCreateInfo-samples-07009

If `multisampled-render-to-single-sampled` is enabled for any subpass, all color, depth/stencil, and input attachments used in that subpass which have `VkAttachmentDescription::samples` or `VkAttachmentDescription2::samples` equal to `VK_SAMPLE_COUNT_1_BIT` **must** have a format that supports the sample count specified in `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`

- VUID-VkFramebufferCreateInfo-nullColorAttachmentWithExternalFormatResolve-09349

If the `nullColorAttachmentWithExternalFormatResolve` is `VK_FALSE`, and `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the format of the color attachment for each subpass in `renderPass` that includes an external format image as a resolve attachment **must** have a format equal to the value of `VkAndroidHardwareBufferFormatResolvePropertiesANDROID::colorAttachmentFormat` as returned by a call to `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer that was used to create the image view use as its resolve attachment

- VUID-VkFramebufferCreateInfo-pAttachments-09350

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, then if an element of `pAttachments` has a format of `VK_FORMAT_UNDEFINED`, it **must** have been created with a `VkExternalFormatANDROID::externalFormat` value identical to that provided in the `VkExternalFormatANDROID::externalFormat` specified by the corresponding `VkAttachmentDescription2` in `renderPass`

Valid Usage (Implicit)

- `VUID-VkFramebufferCreateInfo-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO`
- `VUID-VkFramebufferCreateInfo-pNext-pNext`
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkFramebufferAttachmentsCreateInfo`
- `VUID-VkFramebufferCreateInfo-sType-unique`
The `sType` value of each structure in the `pNext` chain **must** be unique
- `VUID-VkFramebufferCreateInfo-flags-parameter`
`flags` **must** be a valid combination of `VkFramebufferCreateFlagBits` values
- `VUID-VkFramebufferCreateInfo-renderPass-parameter`
`renderPass` **must** be a valid `VkRenderPass` handle
- `VUID-VkFramebufferCreateInfo-commonparent`
Both of `renderPass`, and the elements of `pAttachments` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkFramebufferAttachmentsCreateInfo` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentsCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           attachmentImageInfoCount;
    const VkFramebufferAttachmentImageInfo* pAttachmentImageInfos;
} VkFramebufferAttachmentsCreateInfo;
```

```
// Provided by VK_KHR_imageless_framebuffer
// Equivalent to VkFramebufferAttachmentsCreateInfo
typedef VkFramebufferAttachmentsCreateInfo VkFramebufferAttachmentsCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `attachmentImageInfoCount` is the number of attachments being described.
- `pAttachmentImageInfos` is a pointer to an array of `VkFramebufferAttachmentImageInfo` structures, each structure describing a number of parameters of the corresponding attachment in a render pass instance.

Valid Usage (Implicit)

- VUID-VkFramebufferAttachmentsCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENTS_CREATE_INFO`
- VUID-VkFramebufferAttachmentsCreateInfo-pAttachmentImageInfos-parameter
If `attachmentImageInfoCount` is not 0, `pAttachmentImageInfos` **must** be a valid pointer to an array of `attachmentImageInfoCount` valid `VkFramebufferAttachmentImageInfo` structures

Structure Chaining

Extends the structure

- `VkFramebufferCreateInfo`

The `VkFramebufferAttachmentImageInfo` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentImageInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImageCreateFlags  flags;
    VkImageUsageFlags   usage;
    uint32_t            width;
    uint32_t            height;
    uint32_t            layerCount;
    uint32_t            viewFormatCount;
    const VkFormat*     pViewFormats;
} VkFramebufferAttachmentImageInfo;
```

```
// Provided by VK_KHR_imageless_framebuffer
// Equivalent to VkFramebufferAttachmentImageInfo
typedef VkFramebufferAttachmentImageInfo VkFramebufferAttachmentImageInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkImageCreateFlagBits`, matching the value of `VkImageCreateInfo::flags`

used to create an image that will be used with this framebuffer.

- **usage** is a bitmask of **VkImageUsageFlagBits**, matching the value of **VkImageCreateInfo::usage** used to create an image used with this framebuffer.
- **width** is the width of the image view used for rendering.
- **height** is the height of the image view used for rendering.
- **layerCount** is the number of array layers of the image view used for rendering.
- **viewFormatCount** is the number of entries in the **pViewFormats** array, matching the value of **VkImageFormatListCreateInfo::viewFormatCount** used to create an image used with this framebuffer.
- **pViewFormats** is a pointer to an array of **VkFormat** values specifying all of the formats which **can** be used when creating views of the image, matching the value of **VkImageFormatListCreateInfo::pViewFormats** used to create an image used with this framebuffer.

Images that **can** be used with the framebuffer when beginning a render pass, as specified by **VkRenderPassAttachmentBeginInfo**, **must** be created with parameters that are identical to those specified here.

Valid Usage

- VUID-VkFramebufferAttachmentImageInfo-viewFormatCount-09536
If **viewFormatCount** is not 0, and the render pass is not being used with an external format resolve attachment, each element of **pViewFormats** **must** not be **VK_FORMAT_UNDEFINED**

Valid Usage (Implicit)

- VUID-VkFramebufferAttachmentImageInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENT_IMAGE_INFO**
- VUID-VkFramebufferAttachmentImageInfo-pNext-pNext
pNext **must** be **NULL**
- VUID-VkFramebufferAttachmentImageInfo-flags-parameter
flags **must** be a valid combination of **VkImageCreateFlagBits** values
- VUID-VkFramebufferAttachmentImageInfo-usage-parameter
usage **must** be a valid combination of **VkImageUsageFlagBits** values
- VUID-VkFramebufferAttachmentImageInfo-usage-requiredbitmask
usage **must** not be 0
- VUID-VkFramebufferAttachmentImageInfo-pViewFormats-parameter
If **viewFormatCount** is not 0, **pViewFormats** **must** be a valid pointer to an array of **viewFormatCount** valid **VkFormat** values

Bits which **can** be set in **VkFramebufferCreateInfo::flags**, specifying options for framebuffers, are:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef enum VkFramebufferCreateFlagBits {
    // Provided by VK_VERSION_1_2
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT = 0x00000001,
    // Provided by VK_KHR_imageless_framebuffer
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR = VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT,
} VkFramebufferCreateFlagBits;
```

- [VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT](#) specifies that image views are not specified, and only attachment compatibility information will be provided via a [VkFramebufferAttachmentImageInfo](#) structure.

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkFramebufferCreateFlags;
```

[VkFramebufferCreateFlags](#) is a bitmask type for setting a mask of zero or more [VkFramebufferCreateFlagBits](#).

To destroy a framebuffer, call:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkDestroyFramebuffer(
    VkDevice          device,
    VkFramebuffer     framebuffer,
    const VkAllocationCallbacks* pAllocator);
```

- [device](#) is the logical device that destroys the framebuffer.
- [framebuffer](#) is the handle of the framebuffer to destroy.
- [pAllocator](#) controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyFramebuffer-framebuffer-00892
All submitted commands that refer to [framebuffer](#) **must** have completed execution

- VUID-vkDestroyFramebuffer-framebuffer-00893
If `VkAllocationCallbacks` were provided when `framebuffer` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyFramebuffer-framebuffer-00894
If no `VkAllocationCallbacks` were provided when `framebuffer` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyFramebuffer-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyFramebuffer-framebuffer-parameter
If `framebuffer` is not `VK_NULL_HANDLE`, `framebuffer` **must** be a valid `VkFramebuffer` handle
- VUID-vkDestroyFramebuffer-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyFramebuffer-framebuffer-parent
If `framebuffer` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `framebuffer` **must** be externally synchronized

8.5. Render Pass Load Operations

Render pass load operations define the initial values of an attachment during a render pass instance.

Load operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` pipeline stage. Load operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. The load operation for each sample in an attachment happens-before any recorded command which accesses the sample in that render pass instance via that attachment or an alias. In a render pass object with multiple `subpasses`, load operations are performed in the first subpass which uses an attachment.

NOTE

Because load operations always happen first, external synchronization with attachment access only needs to synchronize the load operations with previous commands; not the operations within the render pass instance. This does not apply when using `VK_ATTACHMENT_LOAD_OP_NONE`.

Load operations only update values within the defined render area for the render pass instance. However, any writes performed by a load operation (as defined by its access masks) to a given attachment **may** read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, if the [maintenance7](#) feature is not enabled or `separateDepthStencilAttachmentAccess` is `VK_FALSE`, writes to one aspect **may** also result in read-modify-write operations for the other aspect. If the subresource is bound to an attachment with [feedback loop enabled](#), implementations **must** not access pixels outside of the render area.

NOTE

As entire subresources could be accessed by load operations, applications cannot safely access values outside of the render area during a render pass instance when a load operation that modifies values is used.

Load operations that **can** be used for a render pass are:

```
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentLoadOp {
    VK_ATTACHMENT_LOAD_OP_LOAD = 0,
    VK_ATTACHMENT_LOAD_OP_CLEAR = 1,
    VK_ATTACHMENT_LOAD_OP_DONT_CARE = 2,
    // Provided by VK_VERSION_1_4
    VK_ATTACHMENT_LOAD_OP_NONE = 1000400000,
    // Provided by VK_EXT_load_store_op_none
    VK_ATTACHMENT_LOAD_OP_NONE_EXT = VK_ATTACHMENT_LOAD_OP_NONE,
    // Provided by VK_KHR_load_store_op_none
    VK_ATTACHMENT_LOAD_OP_NONE_KHR = VK_ATTACHMENT_LOAD_OP_NONE,
} VkAttachmentLoadOp;
```

- [VK_ATTACHMENT_LOAD_OP_LOAD](#) specifies that the previous contents of the image within the render area will be preserved as the initial values. For attachments with a depth/stencil format, this uses the access type [VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT](#). For attachments with a color format, this uses the access type [VK_ACCESS_COLOR_ATTACHMENT_READ_BIT](#).
- [VK_ATTACHMENT_LOAD_OP_CLEAR](#) specifies that the contents within the render area will be cleared to a uniform value, which is specified when a render pass instance is begun. For attachments with a depth/stencil format, this uses the access type [VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT](#). For attachments with a color format, this uses the access type [VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT](#).
- [VK_ATTACHMENT_LOAD_OP_DONT_CARE](#) specifies that the previous contents within the area need not be preserved; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type [VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT](#). For attachments with a color format, this uses the access type [VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT](#).
- [VK_ATTACHMENT_LOAD_OP_NONE](#) specifies that the previous contents of the image will be undefined inside the render pass. No access type is used as the image is not accessed.

During a render pass instance, input and color attachments with color formats that have a component size of 8, 16, or 32 bits **must** be represented in the attachment's format throughout the

instance. Attachments with other floating- or fixed-point color formats, or with depth components **may** be represented in a format with a precision higher than the attachment format, but **must** be represented with the same range. When such a component is loaded via the `loadOp`, it will be converted into an implementation-dependent format used by the render pass. Such components **must** be converted from the render pass format, to the format of the attachment, before they are resolved or stored at the end of a render pass instance via `storeOp`. Conversions occur as described in [Numeric Representation and Computation](#) and [Fixed-Point Data Conversions](#).

8.6. Render Pass Store Operations

Render pass store operations define how values written to an attachment during a render pass instance are stored to memory.

Store operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stage. Store operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. The store operation for each sample in an attachment happens-after any recorded command which accesses the sample via that attachment or an alias. In a render pass object with multiple [subpasses](#), store operations are performed in the last subpass which uses an attachment.

NOTE

Because store operations always happen after other accesses in a render pass instance, external synchronization with attachment access in an earlier render pass only needs to synchronize with the store operations; not the operations within the render pass instance. This does not apply when using `VK_ATTACHMENT_STORE_OP_NONE`.

Store operations only update values within the defined render area for the render pass instance. However, any writes performed by a store operation (as defined by its access masks) to a given attachment **may** read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, if `separateDepthStencilAttachmentAccess` is `VK_FALSE`, writes to one aspect **may** also result in read-modify-write operations for the other aspect. If the subresource is bound to an attachment with [feedback loop enabled](#), implementations **must** not access pixels outside of the render area.

NOTE

As entire subresources could be accessed by store operations, applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a store operation that modifies values is used.

Possible values of `VkAttachmentDescription::storeOp` and `stencilStoreOp`, specifying how the contents of the attachment are treated, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentStoreOp {
    VK_ATTACHMENT_STORE_OP_STORE = 0,
    VK_ATTACHMENT_STORE_OP_DONT_CARE = 1,
// Provided by VK_VERSION_1_3
    VK_ATTACHMENT_STORE_OP_NONE = 1000301000,
// Provided by VK_KHR_dynamic_rendering, VK_KHR_load_store_op_none
    VK_ATTACHMENT_STORE_OP_NONE_KHR = VK_ATTACHMENT_STORE_OP_NONE,
// Provided by VK_QCOM_render_pass_store_ops
    VK_ATTACHMENT_STORE_OP_NONE_QCOM = VK_ATTACHMENT_STORE_OP_NONE,
// Provided by VK_EXT_load_store_op_none
    VK_ATTACHMENT_STORE_OP_NONE_EXT = VK_ATTACHMENT_STORE_OP_NONE,
} VkAttachmentStoreOp;
```

- [VK_ATTACHMENT_STORE_OP_STORE](#) specifies the contents generated during the render pass and within the render area are written to memory. For attachments with a depth/stencil format, this uses the access type [VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT](#). For attachments with a color format, this uses the access type [VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT](#).
- [VK_ATTACHMENT_STORE_OP_DONT_CARE](#) specifies the contents within the render area are not needed after rendering, and **may** be discarded; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type [VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT](#). For attachments with a color format, this uses the access type [VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT](#).
- [VK_ATTACHMENT_STORE_OP_NONE](#) specifies the contents within the render area are not accessed by the store operation as long as no values are written to the attachment during the render pass. If values are written during the render pass, this behaves identically to [VK_ATTACHMENT_STORE_OP_DONT_CARE](#) and with matching access semantics.

NOTE [VK_ATTACHMENT_STORE_OP_DONT_CARE](#) **can** cause contents generated during previous render passes to be discarded before reaching memory, even if no write to the attachment occurs during the current render pass.

8.7. Render Pass Multisample Resolve Operations

Fixed-function render pass multisample resolve operations combine sample values from a single pixel in a multisample attachment and store the result to the corresponding pixel in a single sample attachment.

NOTE Because [VK_RESOLVE_MODE_CUSTOM_BIT_EXT](#) specifies that the attachment will be resolved by shaders in the render pass instead of fixed-function operations, resolve operations with [VK_RESOLVE_MODE_CUSTOM_BIT_EXT](#) do not count as fixed-function multisample resolve operations.

Fixed-function multisample resolve operations for attachments execute in the [VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT](#) pipeline stage. A final resolve operation

for all pixels in the render area happens-after any recorded command which writes a pixel via the multisample attachment to be resolved or an explicit alias of it in the subpass that it is specified. Any single sample attachment specified for use in a fixed-function multisample resolve operation **may** have its contents modified at any point once rendering begins for the render pass instance. Reads from the multisample attachment can be synchronized with [VK_ACCESS_COLOR_ATTACHMENT_READ_BIT](#). Access to the single sample attachment can be synchronized with [VK_ACCESS_COLOR_ATTACHMENT_READ_BIT](#) and [VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT](#). These pipeline stage and access types are used whether the attachments are color or depth/stencil attachments.

When using render pass objects, a subpass dependency specified with the above pipeline stages and access flags will ensure synchronization with fixed-function multisample resolve operations for any attachments that were last accessed by that subpass. This allows later subpasses to read resolved values as input attachments.

Fixed-function resolve operations only update values within the defined render area for the render pass instance. However, any writes performed by a resolve operation (as defined by its access masks) to a given attachment **may** read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, if [separateDepthStencilAttachmentAccess](#) is [VK_FALSE](#), writes to one aspect **may** also result in read-modify-write operations for the other aspect. If the subresource is bound to an attachment with [feedback loop enabled](#), implementations **must** not access pixels outside of the render area.

NOTE

As entire subresources could be accessed by fixed-function multisample resolve operations, applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a multisample resolve operation is performed.

Multisample values in a multisample attachment are combined according to the resolve mode used:

```

// Provided by VK_VERSION_1_2
typedef enum VkResolveModeFlagBits {
    VK_RESOLVE_MODE_NONE = 0,
    VK_RESOLVE_MODE_SAMPLE_ZERO_BIT = 0x00000001,
    VK_RESOLVE_MODE_AVERAGE_BIT = 0x00000002,
    VK_RESOLVE_MODE_MIN_BIT = 0x00000004,
    VK_RESOLVE_MODE_MAX_BIT = 0x00000008,
    // Provided by VK_ANDROID_external_format_resolve with VK_KHR_dynamic_rendering or
    VK_VERSION_1_3
    VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID = 0x00000010,
    // Provided by VK_EXT_custom_resolve with VK_KHR_dynamic_rendering or VK_VERSION_1_3
    VK_RESOLVE_MODE_CUSTOM_BIT_EXT = 0x00000020,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_NONE_KHR = VK_RESOLVE_MODE_NONE,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_SAMPLE_ZERO_BIT_KHR = VK_RESOLVE_MODE_SAMPLE_ZERO_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_AVERAGE_BIT_KHR = VK_RESOLVE_MODE_AVERAGE_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_MIN_BIT_KHR = VK_RESOLVE_MODE_MIN_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_MAX_BIT_KHR = VK_RESOLVE_MODE_MAX_BIT,
    // Provided by VK_ANDROID_external_format_resolve with VK_KHR_dynamic_rendering or
    VK_VERSION_1_3
    // VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID is a legacy alias
    VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID =
VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID,
} VkResolveModeFlagBits;

```

```

// Provided by VK_KHR_depth_stencil_resolve
// Equivalent to VkResolveModeFlagBits
typedef VkResolveModeFlagBits VkResolveModeFlagBitsKHR;

```

- [VK_RESOLVE_MODE_NONE](#) specifies that no resolve operation is done.
- [VK_RESOLVE_MODE_SAMPLE_ZERO_BIT](#) specifies that result of the resolve operation is equal to the value of sample 0.
- [VK_RESOLVE_MODE_AVERAGE_BIT](#) specifies that result of the resolve operation is the average of the sample values.
- [VK_RESOLVE_MODE_MIN_BIT](#) specifies that result of the resolve operation is the minimum of the sample values.
- [VK_RESOLVE_MODE_MAX_BIT](#) specifies that result of the resolve operation is the maximum of the sample values.
- [VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID](#) specifies that rather than a multisample resolve, a single sampled color attachment will be downsampled into a Y'C_BC_R format image specified by an external Android format. Unlike other resolve modes,

implementations can resolve multiple times during rendering, or even bypass writing to the color attachment altogether, as long as the final value is resolved to the resolve attachment. Values in the G, B, and R channels of the color attachment will be written to the Y, C_B, and C_R channels of the external format image, respectively. Chroma values are calculated as if sampling with a linear filter from the color attachment at full rate, at the location the chroma values sit according to [VkPhysicalDeviceExternalFormatResolvePropertiesANDROID::externalFormatResolveChromaOffsetX](#), [VkPhysicalDeviceExternalFormatResolvePropertiesANDROID::externalFormatResolveChromaOffsetY](#), and the chroma sample rate of the resolved image.

- [VK_RESOLVE_MODE_CUSTOM_BIT_EXT](#) specifies that the attachment will be resolved by shaders in the render pass instead of fixed-function operations.

If no resolve mode is otherwise specified, [VK_RESOLVE_MODE_AVERAGE_BIT](#) is used.

If [VK_RESOLVE_MODE_AVERAGE_BIT](#) is used, and the source format is a floating-point or normalized type, the sample values for each pixel are resolved with implementation-defined numerical precision.

If the [numeric format](#) of the resolve attachment uses sRGB encoding, the implementation **should** convert samples from nonlinear to linear before averaging samples as described in the “sRGB EOTF” section of the [Khronos Data Format Specification](#). In this case, the implementation **must** convert the linear averaged value to nonlinear before writing the resolved result to resolve attachment. If the [maintenance10](#) feature is enabled, whether a nonlinear to linear conversion happens for sRGB resolve is defined by [resolveSrgbFormatAppliesTransferFunction](#). This behavior **can** be overridden with appropriate [VK_*RESOLVE{SKIP,ENABLE}_TRANSFER_FUNCTION_BIT_KHR](#) flag usage.

NOTE

No range compression or Y'C_BC_R model conversion is performed by [VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_BIT_ANDROID](#); applications have to do these conversions themselves. Value outputs are expected to match those that would be read through a Y'C_BC_R sampler using [VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY](#). The color space that the values should be in is defined by the platform and is not exposed via Vulkan.

```
// Provided by VK_VERSION_1_2
typedef VkFlags VkResolveModeFlags;
```

```
// Provided by VK_KHR_depth_stencil_resolve
// Equivalent to VkResolveModeFlags
typedef VkResolveModeFlags VkResolveModeFlagsKHR;
```

[VkResolveModeFlags](#) is a bitmask type for setting a mask of zero or more [VkResolveModeFlagBits](#).

8.8. Render Pass Commands

An application records the commands for a render pass instance one subpass at a time, by beginning a render pass instance, iterating over the subpasses to record commands for that subpass, and then ending the render pass instance.

To begin a render pass instance, call:

WARNING

This functionality is superseded by [vkCmdBeginRenderPass2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkCmdBeginRenderPass(
    VkCommandBuffer                commandBuffer,
    const VkRenderPassBeginInfo*   pRenderPassBegin,
    VkSubpassContents              contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a [VkRenderPassBeginInfo](#) structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `contents` is a [VkSubpassContents](#) value specifying how the commands in the first subpass will be provided.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

Valid Usage

- VUID-vkCmdBeginRenderPass-initialLayout-00895
If any of the `initialLayout` or `finalLayout` member of the [VkAttachmentDescription](#) structures or the `layout` member of the [VkAttachmentReference](#) structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is [VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL](#) then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the [VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT](#) usage flag set
- VUID-vkCmdBeginRenderPass-initialLayout-01758
If any of the `initialLayout` or `finalLayout` member of the [VkAttachmentDescription](#) structures or the `layout` member of the [VkAttachmentReference](#) structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is [VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL](#), [VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL](#), [VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL](#), or [VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL](#) then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of

`pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-vkCmdBeginRenderPass-initialLayout-02842

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-vkCmdBeginRenderPass-stencilInitialLayout-02843

If any of the `stencilInitialLayout` or `stencilFinalLayout` member of the `VkAttachmentDescriptionStencilLayout` structures or the `stencilLayout` member of the `VkAttachmentReferenceStencilLayout` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-vkCmdBeginRenderPass-initialLayout-00897

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flags set

- VUID-vkCmdBeginRenderPass-initialLayout-00898

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag set

- VUID-vkCmdBeginRenderPass-initialLayout-00899

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag set

- VUID-vkCmdBeginRenderPass-initialLayout-00900
If the `initialLayout` member of any of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` **must** be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin`
- VUID-vkCmdBeginRenderPass-srcStageMask-06451
The `srcStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from
- VUID-vkCmdBeginRenderPass-dstStageMask-06452
The `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from
- VUID-vkCmdBeginRenderPass-framebuffer-02532
For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments **must** have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set
- VUID-vkCmdBeginRenderPass-framebuffer-09045
If any attachments specified in `framebuffer` are used by `renderPass` and are bound to overlapping memory locations, there **must** be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass
- VUID-vkCmdBeginRenderPass-initialLayout-07000
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flags set, and either the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage flags set
- VUID-vkCmdBeginRenderPass-initialLayout-07001
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the

[VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT](#) usage flag set

- VUID-vkCmdBeginRenderPass-initialLayout-09537

If any of the [initialLayout](#) or [finalLayout](#) member of the [VkAttachmentDescription](#) structures or the [layout](#) member of the [VkAttachmentReference](#) structures specified when creating the render pass specified in the [renderPass](#) member of [pRenderPassBegin](#) is [VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ](#) then the corresponding attachment image view of the framebuffer specified in the [framebuffer](#) member of [pRenderPassBegin](#) **must** have been created with either the [VK_IMAGE_USAGE_STORAGE_BIT](#) usage flag set, or both the [VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT](#) and either of [VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT](#) or [VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT](#) usage flags set

- VUID-vkCmdBeginRenderPass-contents-09640

If [contents](#) is [VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR](#), then at least one of the following features **must** be enabled:

- [maintenance7](#)
- [nestedCommandBuffer](#)

Valid Usage (Implicit)

- VUID-vkCmdBeginRenderPass-commandBuffer-parameter
[commandBuffer](#) **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdBeginRenderPass-pRenderPassBegin-parameter
[pRenderPassBegin](#) **must** be a valid pointer to a valid [VkRenderPassBeginInfo](#) structure
- VUID-vkCmdBeginRenderPass-contents-parameter
[contents](#) **must** be a valid [VkSubpassContents](#) value
- VUID-vkCmdBeginRenderPass-commandBuffer-recording
[commandBuffer](#) **must** be in the [recording state](#)
- VUID-vkCmdBeginRenderPass-commandBuffer-cmdpool
The [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdBeginRenderPass-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdBeginRenderPass-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdBeginRenderPass-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdBeginRenderPass-bufferlevel
[commandBuffer](#) **must** be a primary [VkCommandBuffer](#)

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Outside	Outside	VK_QUEUE_GRAPHICS_BIT HICS_BIT	Action State Synchronization

Conditional Rendering

`vkCmdBeginRenderPass` is not affected by [conditional rendering](#)

To begin a render pass, call:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
void vkCmdBeginRenderPass2(
    VkCommandBuffer                commandBuffer,
    const VkRenderPassBeginInfo*   pRenderPassBegin,
    const VkSubpassBeginInfo*      pSubpassBeginInfo);
```

```
// Provided by VK_KHR_create_renderpass2
// Equivalent to vkCmdBeginRenderPass2
void vkCmdBeginRenderPass2KHR(
    VkCommandBuffer                commandBuffer,
    const VkRenderPassBeginInfo*   pRenderPassBegin,
    const VkSubpassBeginInfo*      pSubpassBeginInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses. After recording this command, the render pass and framebuffer **may** be accessed at any point that `commandBuffer` is in the recording or pending state until it is reset.

- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

Valid Usage

- VUID-vkCmdBeginRenderPass2-framebuffer-02779
Both the `framebuffer` and `renderPass` members of `pRenderPassBegin` **must** have been created on the same `VkDevice` that `commandBuffer` was allocated on
- VUID-vkCmdBeginRenderPass2-initialLayout-03094
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` usage flag set
- VUID-vkCmdBeginRenderPass2-initialLayout-03096
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-vkCmdBeginRenderPass2-initialLayout-02844
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set
- VUID-vkCmdBeginRenderPass2-stencilInitialLayout-02845
If any of the `stencilInitialLayout` or `stencilFinalLayout` member of the `VkAttachmentDescriptionStencilLayout` structures or the `stencilLayout` member of the `VkAttachmentReferenceStencilLayout` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is

`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flag set

- VUID-vkCmdBeginRenderPass2-initialLayout-03097

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage flags set

- VUID-vkCmdBeginRenderPass2-initialLayout-03098

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag set

- VUID-vkCmdBeginRenderPass2-initialLayout-03099

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag set

- VUID-vkCmdBeginRenderPass2-initialLayout-03100

If the `initialLayout` member of any of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` **must** be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin`

- VUID-vkCmdBeginRenderPass2-srcStageMask-06453

The `srcStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from

- VUID-vkCmdBeginRenderPass2-dstStageMask-06454

The `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from

- VUID-vkCmdBeginRenderPass2-framebuffer-02533
For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments **must** have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set
- VUID-vkCmdBeginRenderPass2-framebuffer-09046
If any attachments specified in `framebuffer` are used by `renderPass` and are bound to overlapping memory locations, there **must** be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass
- VUID-vkCmdBeginRenderPass2-initialLayout-07002
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flags set, and either the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage flags set
- VUID-vkCmdBeginRenderPass2-initialLayout-07003
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage flag set
- VUID-vkCmdBeginRenderPass2-initialLayout-09538
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with either the `VK_IMAGE_USAGE_STORAGE_BIT` usage flag set, or both the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` and either of the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage flags set
- VUID-vkCmdBeginRenderPass2-flags-10652
If `VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM` was included in the `VkRenderPassTileShadingCreateInfoQCOM::flags` used to create the `renderPass`, `commandBuffer` **must** not have been recorded with `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`

Valid Usage (Implicit)

- VUID-vkCmdBeginRenderPass2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginRenderPass2-pRenderPassBegin-parameter
`pRenderPassBegin` **must** be a valid pointer to a valid `VkRenderPassBeginInfo` structure
- VUID-vkCmdBeginRenderPass2-pSubpassBeginInfo-parameter
`pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfo` structure
- VUID-vkCmdBeginRenderPass2-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdBeginRenderPass2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdBeginRenderPass2-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdBeginRenderPass2-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdBeginRenderPass2-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdBeginRenderPass2-bufferlevel
`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Outside	Outside	VK_QUEUE_GRAPHICS_BIT	Action State Synchronization

Conditional Rendering

`vkCmdBeginRenderPass2` is not affected by `conditional rendering`

The `VkRenderPassBeginInfo` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkRenderPass        renderPass;
    VkFramebuffer        framebuffer;
    VkRect2D            renderArea;
    uint32_t            clearValueCount;
    const VkClearValue* pClearValues;
} VkRenderPassBeginInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `renderPass` is the render pass to begin an instance of.
- `framebuffer` is the framebuffer containing the attachments that are used with the render pass.
- `renderArea` is the render area that is affected by the render pass instance, and is described in more detail below.
- `clearValueCount` is the number of elements in `pClearValues`.
- `pClearValues` is a pointer to an array of `clearValueCount` `VkClearValue` structures containing clear values for each attachment, if the attachment uses a `loadOp` value of `VK_ATTACHMENT_LOAD_OP_CLEAR` or if the attachment has a depth/stencil format and uses a `stencilLoadOp` value of `VK_ATTACHMENT_LOAD_OP_CLEAR`. The array is indexed by attachment number. Only elements corresponding to cleared attachments are used. Other elements of `pClearValues` are ignored.

`renderArea` is the render area that is affected by the render pass instance. The effects of attachment load, store, and multisample resolve operations are restricted to the pixels whose x and y coordinates fall within the render area on all attachments. The render area extends to all layers of `framebuffer`. The application **must** ensure (using scissor if necessary) that all rendering is contained within the render area. The render area, after any transform specified by `VkRenderPassTransformBeginInfoQCOM::transform` is applied, **must** be contained within the framebuffer dimensions.

If `render pass transform` is enabled, then `renderArea` **must** equal the framebuffer pre-transformed dimensions. After `renderArea` has been transformed by `VkRenderPassTransformBeginInfoQCOM::transform`, the resulting render area **must** be equal to the framebuffer dimensions.

If multiview is enabled in `renderPass`, and `multiviewPerViewRenderAreas` feature is enabled, and there is an instance of `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` included in the `pNext` chain with `perViewRenderAreaCount` not equal to `0`, then the elements of

`VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM::pPerViewRenderAreas` override `renderArea` and define a render area for each view. In this case, `renderArea` **must** be an area at least as large as the union of all the per-view render areas.

If the `subpassShading` feature is enabled, then `renderArea` **must** equal the framebuffer dimensions.

NOTE

There **may** be a performance cost for using a render area smaller than the framebuffer, unless it matches the render area granularity for the render pass.

Valid Usage

- VUID-VkRenderPassBeginInfo-clearValueCount-00902
`clearValueCount` **must** be greater than the largest attachment index in `renderPass` specifying a `loadOp` (or `stencilLoadOp`, if the attachment has a depth/stencil format) of `VK_ATTACHMENT_LOAD_OP_CLEAR`
- VUID-VkRenderPassBeginInfo-clearValueCount-04962
If `clearValueCount` is not 0, `pClearValues` **must** be a valid pointer to an array of `clearValueCount` `VkClearColor` unions
- VUID-VkRenderPassBeginInfo-renderPass-00904
`renderPass` **must** be `compatible` with the `renderPass` member of the `VkFramebufferCreateInfo` structure specified when creating `framebuffer`
- VUID-VkRenderPassBeginInfo-None-08996
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.width` **must** be greater than 0
- VUID-VkRenderPassBeginInfo-None-08997
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.height` **must** be greater than 0
- VUID-VkRenderPassBeginInfo-pNext-02850
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` **must** be greater than or equal to 0
- VUID-VkRenderPassBeginInfo-pNext-02851
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` **must** be greater than or equal to 0
- VUID-VkRenderPassBeginInfo-pNext-02852
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x + renderArea.extent.width` **must** be less than or equal to `VkFramebufferCreateInfo::width` the `framebuffer` was created with
- VUID-VkRenderPassBeginInfo-pNext-02853
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its

`deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y + renderArea.extent.height` **must** be less than or equal to `VkFramebufferCreateInfo::height` the `framebuffer` was created with

- VUID-VkRenderPassBeginInfo-pNext-02856

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.x + extent.width` of each element of `pDeviceRenderAreas` **must** be less than or equal to `VkFramebufferCreateInfo::width` the `framebuffer` was created with

- VUID-VkRenderPassBeginInfo-pNext-02857

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.y + extent.height` of each element of `pDeviceRenderAreas` **must** be less than or equal to `VkFramebufferCreateInfo::height` the `framebuffer` was created with

- VUID-VkRenderPassBeginInfo-framebuffer-03207

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that did not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and the `pNext` chain includes a `VkRenderPassAttachmentBeginInfo` structure, its `attachmentCount` **must** be zero

- VUID-VkRenderPassBeginInfo-framebuffer-03208

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `attachmentCount` of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be equal to the value of `VkFramebufferAttachmentsCreateInfo::attachmentImageInfoCount` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-02780

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** have been created on the same `VkDevice` as `framebuffer` and `renderPass`

- VUID-VkRenderPassBeginInfo-framebuffer-03209

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageCreateInfo::flags` equal to the `flags` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-12328

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each `pAttachments` member of `VkRenderPassAttachmentBeginInfo` that is used as a resolve attachment by `renderPass` **must** not be bound to a `VkDeviceMemory` object allocated from a `VkMemoryHeap` with the `VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM` property

- VUID-VkRenderPassBeginInfo-framebuffer-04627

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` with an `inherited usage` equal to the `usage` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create

framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03211

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` with a width equal to the `width` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-03212

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` with a height equal to the `height` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-03213

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageViewCreateInfo::subresourceRange.layerCount` equal to the `layerCount` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-03214

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageFormatListCreateInfo::viewFormatCount` equal to the `viewFormatCount` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-03215

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a set of elements in `VkImageFormatListCreateInfo::pViewFormats` equal to the set of elements in the `pViewFormats` member of the corresponding element of `VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos` used to create `framebuffer`

- VUID-VkRenderPassBeginInfo-framebuffer-03216

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageViewCreateInfo::format` equal to the corresponding value of `VkAttachmentDescription::format` in `renderPass`

- VUID-VkRenderPassBeginInfo-framebuffer-09353

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and the

`nullColorAttachmentWithExternalFormatResolve` is `VK_FALSE`, the format of the color attachment for each subpass that includes an external format image as a resolve attachment **must** have a format equal to the value of `VkAndroidHardwareBufferFormatResolvePropertiesANDROID::colorAttachmentFormat` as returned by a call to `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer that was used to create the image view use as its resolve attachment

- VUID-VkRenderPassBeginInfo-framebuffer-09354

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkExternalFormatANDROID::externalFormat` equal to `VkExternalFormatANDROID::externalFormat` in the `pNext` chain of the corresponding `VkAttachmentDescription2` structure used to create `renderPass`

- VUID-VkRenderPassBeginInfo-framebuffer-09047

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageCreateInfo::samples` equal to the corresponding value of `VkAttachmentDescription::samples` in `renderPass`, or `VK_SAMPLE_COUNT_1_BIT` if `renderPass` was created with `VkMultisampledRenderToSingleSampledInfoEXT` structure in the `pNext` chain with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`

- VUID-VkRenderPassBeginInfo-pNext-02869

If the `pNext` chain includes `VkRenderPassTransformBeginInfoQCOM`, `renderArea.offset` **must** equal (0,0)

- VUID-VkRenderPassBeginInfo-pNext-02870

If the `pNext` chain includes `VkRenderPassTransformBeginInfoQCOM`, `renderArea.extent` transformed by `VkRenderPassTransformBeginInfoQCOM::transform` **must** equal the `framebuffer` dimensions

- VUID-VkRenderPassBeginInfo-perViewRenderAreaCount-07859

If the `perViewRenderAreaCount` member of a `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` structure included in the `pNext` chain is not 0, then the `multiviewPerViewRenderAreas` feature **must** be enabled

- VUID-VkRenderPassBeginInfo-perViewRenderAreaCount-07860

If the `perViewRenderAreaCount` member of a `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` structure included in the `pNext` chain is not 0, then `renderArea` **must** specify a render area that includes the union of all per view render areas

- VUID-VkRenderPassBeginInfo-pNext-09539

If the `pNext` chain contains a `VkRenderPassStripeBeginInfoARM` structure, the union of stripe areas defined by the elements of `VkRenderPassStripeBeginInfoARM::pStripeInfos` **must** cover the `renderArea`

Valid Usage (Implicit)

- VUID-VkRenderPassBeginInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO`
- VUID-VkRenderPassBeginInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupRenderPassBeginInfo`, `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM`, `VkRenderPassAttachmentBeginInfo`, `VkRenderPassPerformanceCountersByRegionBeginInfoARM`, `VkRenderPassSampleLocationsBeginInfoEXT`, `VkRenderPassStripeBeginInfoARM`, or `VkRenderPassTransformBeginInfoQCOM`
- VUID-VkRenderPassBeginInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkRenderPassBeginInfo-renderPass-parameter
`renderPass` **must** be a valid `VkRenderPass` handle
- VUID-VkRenderPassBeginInfo-framebuffer-parameter
`framebuffer` **must** be a valid `VkFramebuffer` handle
- VUID-VkRenderPassBeginInfo-commonparent
Both of `framebuffer`, and `renderPass` **must** have been created, allocated, or retrieved from the same `VkDevice`

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource, thus preserving the contents of such depth/stencil attachments across subpass boundaries requires the application to specify these sample locations whenever a layout transition of the attachment **may** occur. This information **can** be provided by adding a `VkRenderPassSampleLocationsBeginInfoEXT` structure to the `pNext` chain of `VkRenderPassBeginInfo`.

The `VkRenderPassSampleLocationsBeginInfoEXT` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#) and [VK_KHR_dynamic_rendering_local_read](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_sample_locations
typedef struct VkRenderPassSampleLocationsBeginInfoEXT {
    VkStructureType                sType;
    const void*                    pNext;
    uint32_t                       attachmentInitialSampleLocationsCount;
    const VkAttachmentSampleLocationsEXT* pAttachmentInitialSampleLocations;
    uint32_t                       postSubpassSampleLocationsCount;
    const VkSubpassSampleLocationsEXT* pPostSubpassSampleLocations;
} VkRenderPassSampleLocationsBeginInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **attachmentInitialSampleLocationsCount** is the number of elements in the **pAttachmentInitialSampleLocations** array.
- **pAttachmentInitialSampleLocations** is a pointer to an array of **attachmentInitialSampleLocationsCount** **VkAttachmentSampleLocationsEXT** structures specifying the attachment indices and their corresponding sample location state. Each element of **pAttachmentInitialSampleLocations** **can** specify the sample location state to use in the automatic layout transition performed to transition a depth/stencil attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.
- **postSubpassSampleLocationsCount** is the number of elements in the **pPostSubpassSampleLocations** array.
- **pPostSubpassSampleLocations** is a pointer to an array of **postSubpassSampleLocationsCount** **VkSubpassSampleLocationsEXT** structures specifying the subpass indices and their corresponding sample location state. Each element of **pPostSubpassSampleLocations** **can** specify the sample location state to use in the automatic layout transition performed to transition the depth/stencil attachment used by the specified subpass to the image layout specified in a dependent subpass or to the final layout of the attachment in case the specified subpass is the last subpass using that attachment. In addition, if **VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations** is **VK_FALSE**, each element of **pPostSubpassSampleLocations** **must** specify the sample location state that matches the sample locations used by all pipelines that will be bound to a command buffer during the specified subpass. If **variableSampleLocations** is **VK_TRUE**, the sample locations used for rasterization do not depend on **pPostSubpassSampleLocations**.

Valid Usage (Implicit)

- VUID-VkRenderPassSampleLocationsBeginInfoEXT-sType-sType **must** be **VK_STRUCTURE_TYPE_RENDER_PASS_SAMPLE_LOCATIONS_BEGIN_INFO_EXT**
- VUID-VkRenderPassSampleLocationsBeginInfoEXT-pAttachmentInitialSampleLocations-parameter
If **attachmentInitialSampleLocationsCount** is not 0, **pAttachmentInitialSampleLocations** **must**

be a valid pointer to an array of `attachmentInitialSampleLocationsCount` valid `VkAttachmentSampleLocationsEXT` structures

- VUID-VkRenderPassSampleLocationsBeginInfoEXT-pPostSubpassSampleLocations-parameter

If `postSubpassSampleLocationsCount` is not 0, `pPostSubpassSampleLocations` **must** be a valid pointer to an array of `postSubpassSampleLocationsCount` valid `VkSubpassSampleLocationsEXT` structures

Structure Chaining

Extends the structure

- `VkRenderPassBeginInfo`

The `VkAttachmentSampleLocationsEXT` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#) and [VK_KHR_dynamic_rendering_local_read](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_sample_locations
typedef struct VkAttachmentSampleLocationsEXT {
    uint32_t      attachmentIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkAttachmentSampleLocationsEXT;
```

- `attachmentIndex` is the index of the attachment for which the sample locations state is provided.
- `sampleLocationsInfo` is the sample locations state to use for the layout transition of the given attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.

If the image referenced by the framebuffer attachment at index `attachmentIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` then the values specified in `sampleLocationsInfo` are ignored.

Valid Usage

- VUID-VkAttachmentSampleLocationsEXT-attachmentIndex-01531
`attachmentIndex` **must** be less than the `attachmentCount` specified in `VkRenderPassCreateInfo` the render pass specified by `VkRenderPassBeginInfo::renderPass` was created with

Valid Usage (Implicit)

- VUID-VkAttachmentSampleLocationsEXT-sampleLocationsInfo-parameter `sampleLocationsInfo` **must** be a valid `VkSampleLocationsInfoEXT` structure

The `VkSubpassSampleLocationsEXT` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#) and `VK_KHR_dynamic_rendering_local_read`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_sample_locations
typedef struct VkSubpassSampleLocationsEXT {
    uint32_t          subpassIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkSubpassSampleLocationsEXT;
```

- `subpassIndex` is the index of the subpass for which the sample locations state is provided.
- `sampleLocationsInfo` is the sample locations state to use for the layout transition of the depth/stencil attachment away from the image layout the attachment is used with in the subpass specified in `subpassIndex`.

If the image referenced by the depth/stencil attachment used in the subpass identified by `subpassIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` or if the subpass does not use a depth/stencil attachment, and `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_TRUE` then the values specified in `sampleLocationsInfo` are ignored.

Valid Usage

- VUID-VkSubpassSampleLocationsEXT-subpassIndex-01532 `subpassIndex` **must** be less than the `subpassCount` specified in `VkRenderPassCreateInfo` the render pass specified by `VkRenderPassBeginInfo::renderPass` was created with

Valid Usage (Implicit)

- VUID-VkSubpassSampleLocationsEXT-sampleLocationsInfo-parameter `sampleLocationsInfo` **must** be a valid `VkSampleLocationsInfoEXT` structure

To begin a render pass instance with `render pass transform` enabled, add the `VkRenderPassTransformBeginInfoQCOM` to the `pNext` chain of `VkRenderPassBeginInfo` structure passed to the `vkCmdBeginRenderPass` command specifying the render pass transform.

The `VkRenderPassTransformBeginInfoQCOM` structure is defined as:

```
// Provided by VK_QCOM_render_pass_transform
typedef struct VkRenderPassTransformBeginInfoQCOM {
    VkStructureType      sType;
    const void*          pNext;
    VkSurfaceTransformFlagBitsKHR transform;
} VkRenderPassTransformBeginInfoQCOM;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **transform** is a [VkSurfaceTransformFlagBitsKHR](#) value describing the transform to be applied to rasterization.

Valid Usage

- VUID-VkRenderPassTransformBeginInfoQCOM-transform-02871
transform **must** be [VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR](#),
[VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR](#),
[VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR](#), or
[VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR](#)
- VUID-VkRenderPassTransformBeginInfoQCOM-flags-02872
The **renderpass** **must** have been created with [VkRenderPassCreateInfo::flags](#) containing [VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM](#)

Valid Usage (Implicit)

- VUID-VkRenderPassTransformBeginInfoQCOM-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_RENDER_PASS_TRANSFORM_BEGIN_INFO_QCOM](#)

Structure Chaining

Extends the structure

- [VkRenderPassBeginInfo](#)

The tile properties queried using [VK_QCOM_tile_properties](#) depend on the size of the reserved tile memory by the application. This size **can** be specified by the following structure to [VkRenderPassCreateInfo](#), [VkRenderPassCreateInfo2](#) , or [VkRenderingInfo](#) to specify the reserved tile memory size for the render pass object.

For dynamic render passes, this structure **can** be attached to the **pNext** member of [VkRenderingInfo](#) passed to [vkGetDynamicRenderingTilePropertiesQCOM](#).

The [VkTileMemorySizeInfoQCOM](#) structure is defined as:

```
// Provided by VK_QCOM_tile_memory_heap with VK_QCOM_tile_properties
typedef struct VkTileMemorySizeInfoQCOM {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceSize       size;
} VkTileMemorySizeInfoQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `size` is the size in bytes of tile memory used by the render pass or preserved for later use.

The returned tile properties are invalid if the `size` is not equal to the `bound tile memory's` allocation size when the render pass is executed.

If this structure is not provided, the `size` of the reserved region defaults to `0`.

NOTE

Tile memory is reserved for application use by binding tile memory objects to the command buffer.

The size provided by this command is informational only for use when evaluating tile properties. If the application does not need to query the tile properties, then this size **can** be safely omitted.

Valid Usage

- VUID-VkTileMemorySizeInfoQCOM-size-10729
`size` must be less than or equal to the largest size memory heap with the `VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM` property

Valid Usage (Implicit)

- VUID-VkTileMemorySizeInfoQCOM-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_TILE_MEMORY_SIZE_INFO_QCOM`

Structure Chaining

Extends the structures

- `VkRenderPassCreateInfo`
- `VkRenderPassCreateInfo2`
- `VkRenderingInfo`

The `VkSubpassBeginInfo` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkSubpassContents  contents;
} VkSubpassBeginInfo;
```

```
// Provided by VK_KHR_create_renderpass2
// Equivalent to VkSubpassBeginInfo
typedef VkSubpassBeginInfo VkSubpassBeginInfoKHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `contents` is a [VkSubpassContents](#) value specifying how the commands in the next subpass will be provided.

Valid Usage

- VUID-VkSubpassBeginInfo-contents-09382

If `contents` is [VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR](#), then at least one of the following features **must** be enabled:

- `maintenance7`
- `nestedCommandBuffer`

Valid Usage (Implicit)

- VUID-VkSubpassBeginInfo-sType-sType
`sType` **must** be [VK_STRUCTURE_TYPE_SUBPASS_BEGIN_INFO](#)
- VUID-VkSubpassBeginInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkSubpassBeginInfo-contents-parameter
`contents` **must** be a valid [VkSubpassContents](#) value

Possible values of [vkCmdBeginRenderPass::contents](#), specifying how the commands in the first subpass will be provided, are:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy](#)

[Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
typedef enum VkSubpassContents {
    VK_SUBPASS_CONTENTS_INLINE = 0,
    VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS = 1,
    // Provided by VK_KHR_maintenance7
    VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR = 1000451000,
    // Provided by VK_EXT_nested_command_buffer
    VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT =
VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR,
} VkSubpassContents;
```

- [VK_SUBPASS_CONTENTS_INLINE](#) specifies that the contents of the subpass will be recorded inline in the primary command buffer, and secondary command buffers **must** not be executed within the subpass.
- [VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS](#) specifies that the contents are recorded in secondary command buffers that will be called from the primary command buffer, and [vkCmdExecuteCommands](#) is the only valid command in the command buffer until [vkCmdNextSubpass](#) or [vkCmdEndRenderPass](#).
- [VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR](#) specifies that the contents of the subpass **can** be recorded both inline and in secondary command buffers executed from this command buffer with [vkCmdExecuteCommands](#).

If the `pNext` chain of [VkRenderPassBeginInfo](#) or [VkRenderingInfo](#) includes a [VkDeviceGroupRenderPassBeginInfo](#) structure, then that structure includes a device mask and set of render areas for the render pass instance.

The [VkDeviceGroupRenderPassBeginInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupRenderPassBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceMask;
    uint32_t           deviceRenderAreaCount;
    const VkRect2D*    pDeviceRenderAreas;
} VkDeviceGroupRenderPassBeginInfo;
```

```
// Provided by VK_KHR_device_group
// Equivalent to VkDeviceGroupRenderPassBeginInfo
typedef VkDeviceGroupRenderPassBeginInfo VkDeviceGroupRenderPassBeginInfoKHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `deviceMask` is the device mask for the render pass instance.
- `deviceRenderAreaCount` is the number of elements in the `pDeviceRenderAreas` array.
- `pDeviceRenderAreas` is a pointer to an array of `VkRect2D` structures defining the render area for each physical device.

The `deviceMask` serves several purposes. It is an upper bound on the set of physical devices that **can** be used during the render pass instance, and the initial device mask when the render pass instance begins. In addition, commands transitioning to the next subpass in a render pass instance and commands ending the render pass instance, and, accordingly render pass `load`, `store`, and `multisample resolve` operations and subpass dependencies corresponding to the render pass instance, are executed on the physical devices included in the device mask provided here.

If `deviceRenderAreaCount` is not zero, then the elements of `pDeviceRenderAreas` override the value of `VkRenderPassBeginInfo::renderArea`, and provide a render area specific to each physical device. These render areas serve the same purpose as `VkRenderPassBeginInfo::renderArea`, including controlling the region of attachments that are cleared by `VK_ATTACHMENT_LOAD_OP_CLEAR` and that are resolved into resolve attachments.

If this structure is not present, the render pass instance's device mask is the value of `VkDeviceGroupCommandBufferBeginInfo::deviceMask`. If this structure is not present or if `deviceRenderAreaCount` is zero, `VkRenderPassBeginInfo::renderArea` is used for all physical devices.

Valid Usage

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00905
`deviceMask` **must** be a valid device mask value
- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00906
`deviceMask` **must** not be zero
- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00907
`deviceMask` **must** be a subset of the command buffer's initial device mask
- VUID-VkDeviceGroupRenderPassBeginInfo-deviceRenderAreaCount-00908
`deviceRenderAreaCount` **must** either be zero or equal to the number of physical devices in the logical device
- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06166
The `offset.x` member of any element of `pDeviceRenderAreas` **must** be greater than or equal to 0
- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06167
The `offset.y` member of any element of `pDeviceRenderAreas` **must** be greater than or equal to 0
- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06168
The sum of the `offset.x` and `extent.width` members of any element of `pDeviceRenderAreas` **must** be less than or equal to `maxFramebufferWidth`
- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06169
The sum of the `offset.y` and `extent.height` members of any element of `pDeviceRenderAreas` **must** be less than or equal to `maxFramebufferHeight`

- VUID-VkDeviceGroupRenderPassBeginInfo-extent-08998
The `extent.width` member of any element of `pDeviceRenderAreas` **must** be greater than 0
- VUID-VkDeviceGroupRenderPassBeginInfo-extent-08999
The `extent.height` member of any element of `pDeviceRenderAreas` **must** be greater than 0

Valid Usage (Implicit)

- VUID-VkDeviceGroupRenderPassBeginInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO`
- VUID-VkDeviceGroupRenderPassBeginInfo-pDeviceRenderAreas-parameter
If `deviceRenderAreaCount` is not 0, `pDeviceRenderAreas` **must** be a valid pointer to an array of `deviceRenderAreaCount` `VkRect2D` structures

Structure Chaining

Extends the structures

- `VkRenderPassBeginInfo`
- `VkRenderingInfo`

The `VkRenderPassAttachmentBeginInfo` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassAttachmentBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           attachmentCount;
    const VkImageView* pAttachments;
} VkRenderPassAttachmentBeginInfo;
```

```
// Provided by VK_KHR_imageless_framebuffer
// Equivalent to VkRenderPassAttachmentBeginInfo
typedef VkRenderPassAttachmentBeginInfo VkRenderPassAttachmentBeginInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentCount` is the number of attachments.
- `pAttachments` is a pointer to an array of `VkImageView` handles, each of which will be used as the corresponding attachment in the render pass instance.

Valid Usage

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03218
Each element of **pAttachments** **must** only specify a single mip level
- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03219
Each element of **pAttachments** **must** have been created with the **identity swizzle**
- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-04114
Each element of **pAttachments** **must** have been created with **VkImageViewCreateInfo::viewType** not equal to **VK_IMAGE_VIEW_TYPE_3D**
- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-07010
If **multisampled-render-to-single-sampled** is enabled for any subpass, all element of **pAttachments** which have a sample count equal to **VK_SAMPLE_COUNT_1_BIT** **must** have a format that supports the sample count specified in **VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples**

Valid Usage (Implicit)

- VUID-VkRenderPassAttachmentBeginInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_RENDER_PASS_ATTACHMENT_BEGIN_INFO**
- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-parameter
If **attachmentCount** is not 0, **pAttachments** **must** be a valid pointer to an array of **attachmentCount** valid **VkImageView** handles

Structure Chaining

Extends the structure

- **VkRenderPassBeginInfo**

If a render pass instance enables multiview and if the **multiviewPerViewRenderAreas** feature is enabled, the **VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM** structure **can** be included in the **pNext** chain of **VkRenderPassBeginInfo** or **VkRenderingInfo**

The **VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM** structure is defined as:

```
// Provided by VK_QCOM_multiview_per_view_render_areas
typedef struct VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           perViewRenderAreaCount;
    const VkRect2D*    pPerViewRenderAreas;
} VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `perViewRenderAreaCount` is the number of elements in the `pPerViewRenderAreas` array.
- `pPerViewRenderAreas` is a pointer to an array of `VkRect2D` structures defining the render area for each view.

If `perViewRenderAreaCount` is not zero, then the elements of `pPerViewRenderAreas` override the value of `VkRenderPassBeginInfo::renderArea` or `VkRenderingInfo::renderArea` and define per-view render areas for the individual views of a multiview render pass. The render area for the view with *view index* `i` is specified by `pPerViewRenderAreas[i]`.

The per-view render areas define per-view regions of attachments that are loaded, stored, and resolved according to the `loadOp`, `storeOp`, and `resolveMode` values of the render pass instance. When per-view render areas are defined, the value of `VkRenderPassBeginInfo::renderArea` or `VkRenderingInfo::renderArea` **must** be a render area that includes the union of all per-view render areas, **may** be used by the implementation for optimizations, but does not affect loads, stores, or resolves.

If this structure is present and if `perViewRenderAreaCount` is not zero, then `perViewRenderAreaCount` **must** be at least one greater than the most significant bit set in any element of `VkRenderPassMultiviewCreateInfo::pViewMasks`. or `VkRenderingInfo::viewMask`

If this structure is not present or if `perViewRenderAreaCount` is zero, `VkRenderPassBeginInfo::renderArea` or `VkRenderingInfo::renderArea` is used for all views.

Valid Usage

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07861
The `offset.x` member of any element of `pPerViewRenderAreas` **must** be greater than or equal to 0
- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07862
The `offset.y` member of any element of `pPerViewRenderAreas` **must** be greater than or equal to 0
- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07863
The sum of the `offset.x` and `extent.width` members of any element of `pPerViewRenderAreas` **must** be less than or equal to `maxFramebufferWidth`
- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07864
The sum of the `offset.y` and `extent.height` members of any element of `pPerViewRenderAreas` **must** be less than or equal to `maxFramebufferHeight`
- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-pNext-07865
If this structure is in the `pNext` chain of `VkRenderPassBeginInfo` and if the render pass object included an element in `VkRenderPassMultiviewCreateInfo::pViewMasks` that set bit `n`, then `perViewRenderAreaCount` **must** be at least equal to `n+1`
- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-pNext-07866
If this structure is in the `pNext` chain of `VkRenderingInfo` and if `VkRenderingInfo::viewMask`

set bit `n`, then `perViewRenderAreaCount` **must** be at least equal to `n+1`

Valid Usage (Implicit)

- `VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-sType-sType` `sType` **must** be `VK_STRUCTURE_TYPE_MULTIVIEW_PER_VIEW_RENDER_AREAS_RENDER_PASS_BEGIN_INFO_QCOM`
- `VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-pPerViewRenderAreas-parameter`
If `perViewRenderAreaCount` is not 0, `pPerViewRenderAreas` **must** be a valid pointer to an array of `perViewRenderAreaCount` `VkRect2D` structures

Structure Chaining

Extends the structures

- `VkRenderPassBeginInfo`
- `VkRenderingInfo`

To query the render area granularity, call:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkGetRenderAreaGranularity(
    VkDevice          device,
    VkRenderPass      renderPass,
    VkExtent2D*       pGranularity);
```

- `device` is the logical device that owns the render pass.
- `renderPass` is a handle to a render pass.
- `pGranularity` is a pointer to a `VkExtent2D` structure in which the granularity is returned.

The conditions leading to an optimal `renderArea` are:

- the `offset.x` member in `renderArea` is a multiple of the `width` member of the returned `VkExtent2D` (the horizontal granularity).
- the `offset.y` member in `renderArea` is a multiple of the `height` member of the returned `VkExtent2D` (the vertical granularity).
- either the `extent.width` member in `renderArea` is a multiple of the horizontal granularity or `offset.x+extent.width` is equal to the `width` of the `framebuffer` in the `VkRenderPassBeginInfo`.

- either the `extent.height` member in `renderArea` is a multiple of the vertical granularity or `offset.y+extent.height` is equal to the `height` of the `framebuffer` in the `VkRenderPassBeginInfo`.

Subpass dependencies are not affected by the render area, and apply to the entire image subresources attached to the framebuffer as specified in the description of [automatic layout transitions](#). Similarly, pipeline barriers are valid even if their effect extends outside the render area.

Valid Usage (Implicit)

- VUID-vkGetRenderAreaGranularity-device-parameter `device` **must** be a valid `VkDevice` handle
- VUID-vkGetRenderAreaGranularity-renderPass-parameter `renderPass` **must** be a valid `VkRenderPass` handle
- VUID-vkGetRenderAreaGranularity-pGranularity-parameter `pGranularity` **must** be a valid pointer to a `VkExtent2D` structure
- VUID-vkGetRenderAreaGranularity-renderPass-parent `renderPass` **must** have been created, allocated, or retrieved from `device`

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

WARNING

This functionality is superseded by `vkCmdNextSubpass2`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkCmdNextSubpass(
    VkCommandBuffer          commandBuffer,
    VkSubpassContents        contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `contents` specifies how the commands in the next subpass will be provided, in the same fashion as the corresponding parameter of `vkCmdBeginRenderPass`.

The subpass index for a render pass begins at zero when `vkCmdBeginRenderPass` is recorded, and increments each time `vkCmdNextSubpass` is recorded.

After transitioning to the next subpass, the application **can** record the commands for that subpass.

Valid Usage

- VUID-vkCmdNextSubpass-None-00909
The current subpass index **must** be less than the number of subpasses in the render pass minus one

- VUID-vkCmdNextSubpass-None-02349

This command **must** not be recorded when transform feedback is active

Valid Usage (Implicit)

- VUID-vkCmdNextSubpass-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdNextSubpass-contents-parameter
`contents` **must** be a valid `VkSubpassContents` value
- VUID-vkCmdNextSubpass-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdNextSubpass-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdNextSubpass-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdNextSubpass-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdNextSubpass-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdNextSubpass-bufferlevel
`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Inside	Outside	VK_QUEUE_GRAPHICS_BIT	Action State Synchronization

Conditional Rendering

vkCmdNextSubpass is not affected by [conditional rendering](#)

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
void vkCmdNextSubpass2(
    VkCommandBuffer                commandBuffer,
    const VkSubpassBeginInfo*      pSubpassBeginInfo,
    const VkSubpassEndInfo*        pSubpassEndInfo);
```

```
// Provided by VK_KHR_create_renderpass2
// Equivalent to vkCmdNextSubpass2
void vkCmdNextSubpass2KHR(
    VkCommandBuffer                commandBuffer,
    const VkSubpassBeginInfo*      pSubpassBeginInfo,
    const VkSubpassEndInfo*        pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pSubpassBeginInfo` is a pointer to a [VkSubpassBeginInfo](#) structure containing information about the subpass which is about to begin rendering.
- `pSubpassEndInfo` is a pointer to a [VkSubpassEndInfo](#) structure containing information about how the previous subpass will be ended.

`vkCmdNextSubpass2` is semantically identical to [vkCmdNextSubpass](#), except that it is extensible, and that `contents` is provided as part of an extensible structure instead of as a flat parameter.

Valid Usage

- VUID-vkCmdNextSubpass2-None-03102
The current subpass index **must** be less than the number of subpasses in the render pass minus one
- VUID-vkCmdNextSubpass2-None-02350
This command **must** not be recorded when transform feedback is active

Valid Usage (Implicit)

- VUID-vkCmdNextSubpass2-commandBuffer-parameter

`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdNextSubpass2-pSubpassBeginInfo-parameter
`pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfo` structure
- VUID-vkCmdNextSubpass2-pSubpassEndInfo-parameter
`pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfo` structure
- VUID-vkCmdNextSubpass2-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdNextSubpass2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdNextSubpass2-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdNextSubpass2-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdNextSubpass2-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdNextSubpass2-bufferlevel
`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Inside	Outside	VK_QUEUE_GRAPHICS_BIT	Action State Synchronization

Conditional Rendering

`vkCmdNextSubpass2` is not affected by `conditional rendering`

To record a command to end a render pass instance after recording the commands for the last subpass, call:

WARNING

This functionality is superseded by [vkCmdEndRenderPass2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkCmdEndRenderPass(
    VkCommandBuffer                      commandBuffer);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.

Ending a render pass instance performs any multisample resolve operations on the final subpass.

There is no implicit ordering between separate render passes, even in the same command buffer, and even when the attachments match. Some applications rely on the continuation of [rasterization order](#) between multiple render passes with attachments defined in the same way, in order to perform non-rendering operations (such as copies or compute operations) between draw calls, but this has never been required by the specification. There is also no explicit barrier currently in the API that provides the guarantee that applications rely on without additional performance penalties.

NOTE

New applications should avoid relying on this ordering until an appropriate barrier is added to the API.

Implementations where applications are performing this splitting are encouraged to continue supporting this guarantee until a suitable barrier is added to the API.

Existing applications relying on this ordering should expect that it will continue working on platforms where it currently does. Once a new extension adds support for a new barrier, developers are encouraged to adapt their applications to use this when available.

Valid Usage

- VUID-vkCmdEndRenderPass-None-00910
The current subpass index **must** be equal to the number of subpasses in the render pass minus one
- VUID-vkCmdEndRenderPass-None-02351
This command **must** not be recorded when transform feedback is active
- VUID-vkCmdEndRenderPass-None-06170
The current render pass instance **must** not have been begun with [vkCmdBeginRendering](#)
- VUID-vkCmdEndRenderPass-None-07004
If [vkCmdBeginQuery*](#) was called within a subpass of the render pass, the corresponding [vkCmdEndQuery*](#) **must** have been called subsequently within the same subpass
- VUID-vkCmdEndRenderPass-None-10653
This command **must** not be recorded when [per-tile execution model](#) is enabled

Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdEndRenderPass-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdEndRenderPass-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdEndRenderPass-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdEndRenderPass-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdEndRenderPass-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdEndRenderPass-bufferlevel
`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Inside	Outside	VK_QUEUE_GRAPHICS_BIT	Action State Synchronization

Conditional Rendering

`vkCmdEndRenderPass` is not affected by [conditional rendering](#)

To record a command to end a render pass instance after recording the commands for the last subpass, call:

WARNING | This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy](#)

[Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
void vkCmdEndRenderPass2(
    VkCommandBuffer                commandBuffer,
    const VkSubpassEndInfo*        pSubpassEndInfo);
```

```
// Provided by VK_KHR_create_renderpass2
// Equivalent to vkCmdEndRenderPass2
void vkCmdEndRenderPass2KHR(
    VkCommandBuffer                commandBuffer,
    const VkSubpassEndInfo*        pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.
- `pSubpassEndInfo` is a pointer to a [VkSubpassEndInfo](#) structure containing information about how the last subpass will be ended.

`vkCmdEndRenderPass2` is semantically identical to [vkCmdEndRenderPass](#), except that it is extensible.

There is no implicit ordering between separate render passes, even in the same command buffer, and even when the attachments match. Some applications rely on the continuation of [rasterization order](#) between multiple render passes with attachments defined in the same way, in order to perform non-rendering operations (such as copies or compute operations) between draw calls, but this has never been required by the specification. There is also no explicit barrier currently in the API that provides the guarantee that applications rely on without additional performance penalties.

NOTE

New applications should avoid relying on this ordering until an appropriate barrier is added to the API.

Implementations where applications are performing this splitting are encouraged to continue supporting this guarantee until a suitable barrier is added to the API.

Existing applications relying on this ordering should expect that it will continue working on platforms where it currently does. Once a new extension adds support for a new barrier, developers are encouraged to adapt their applications to use this when available.

Valid Usage

- VUID-vkCmdEndRenderPass2-None-03103
The current subpass index **must** be equal to the number of subpasses in the render pass minus one
- VUID-vkCmdEndRenderPass2-None-02352

This command **must** not be recorded when transform feedback is active

- VUID-vkCmdEndRenderPass2-None-06171

The current render pass instance **must** not have been begun with [vkCmdBeginRendering](#)

- VUID-vkCmdEndRenderPass2-None-07005

If [vkCmdBeginQuery*](#) was called within a subpass of the render pass, the corresponding [vkCmdEndQuery*](#) **must** have been called subsequently within the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass2-commandBuffer-parameter

[commandBuffer](#) **must** be a valid [VkCommandBuffer](#) handle

- VUID-vkCmdEndRenderPass2-pSubpassEndInfo-parameter

[pSubpassEndInfo](#) **must** be a valid pointer to a valid [VkSubpassEndInfo](#) structure

- VUID-vkCmdEndRenderPass2-commandBuffer-recording

[commandBuffer](#) **must** be in the [recording state](#)

- VUID-vkCmdEndRenderPass2-commandBuffer-cmdpool

The [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations

- VUID-vkCmdEndRenderPass2-renderpass

This command **must** only be called inside of a render pass instance

- VUID-vkCmdEndRenderPass2-suspended

This command **must** not be called between suspended render pass instances

- VUID-vkCmdEndRenderPass2-videocoding

This command **must** only be called outside of a video coding scope

- VUID-vkCmdEndRenderPass2-bufferlevel

[commandBuffer](#) **must** be a primary [VkCommandBuffer](#)

Host Synchronization

- Host access to [commandBuffer](#) **must** be externally synchronized
- Host access to the [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Inside	Outside	VK_QUEUE_GRAPHICS_BIT	Action State Synchronization

Conditional Rendering

vkCmdEndRenderPass2 is not affected by [conditional rendering](#)

The `VkSubpassEndInfo` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_2
typedef struct VkSubpassEndInfo {
    VkStructureType    sType;
    const void*        pNext;
} VkSubpassEndInfo;
```

```
// Provided by VK_KHR_create_renderpass2
// Equivalent to VkSubpassEndInfo
typedef VkSubpassEndInfo VkSubpassEndInfoKHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

Valid Usage (Implicit)

- VUID-VkSubpassEndInfo-sType-sType
`sType` **must** be [VK_STRUCTURE_TYPE_SUBPASS_END_INFO](#)
- VUID-VkSubpassEndInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of [VkRenderPassFragmentDensityMapOffsetEndInfoEXT](#)
- VUID-VkSubpassEndInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique

If the [VkSubpassEndInfo::pNext](#) chain or [VkRenderingEndInfoEXT::pNext](#) chain includes a [VkRenderPassFragmentDensityMapOffsetEndInfoEXT](#) structure, then that structure includes an array of fragment density map offsets per layer for the render pass.

The [VkRenderPassFragmentDensityMapOffsetEndInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_fragment_density_map_offset
typedef struct VkRenderPassFragmentDensityMapOffsetEndInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           fragmentDensityOffsetCount;
    const VkOffset2D*   pFragmentDensityOffsets;
} VkRenderPassFragmentDensityMapOffsetEndInfoEXT;
```

```
// Provided by VK_QCOM_fragment_density_map_offset
// Equivalent to VkRenderPassFragmentDensityMapOffsetEndInfoEXT
typedef VkRenderPassFragmentDensityMapOffsetEndInfoEXT
VkSubpassFragmentDensityMapOffsetEndInfoQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityOffsetCount` is the number of offsets being specified.
- `pFragmentDensityOffsets` is a pointer to an array of `VkOffset2D` structs, each of which describes the offset per layer.

The array elements are given per `layer` as defined by `Fetch Density Value`, where `index = layer`. Each (x,y) offset is in framebuffer pixels and shifts the fetch of the fragment density map by that amount. Offsets can be positive or negative.

If neither the `VkSubpassEndInfo::pNext` chain for the last subpass of a render pass nor the `VkRenderingEndInfoEXT::pNext` chain of a dynamic render pass include `VkRenderPassFragmentDensityMapOffsetEndInfoEXT`, or if `fragmentDensityOffsetCount` is zero, then the offset (0,0) is used for `Fetch Density Value`.

Valid Usage

- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-fragmentDensityMapOffsets-06503
If the `fragmentDensityMapOffset` feature is not enabled or fragment density map is not enabled in the render pass, `fragmentDensityOffsetCount` **must** equal 0
- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-fragmentDensityMapAttachment-06504
If `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED` and was not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_EXT`, `fragmentDensityOffsetCount` **must** equal 0
- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-pDepthStencilAttachment-06505
If the depth or stencil attachments for the render pass are used and were not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_EXT`,

`fragmentDensityOffsetCount` **must** equal 0

- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-pInputAttachments-06506
If any used input attachments for the render pass were not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_EXT`,
`fragmentDensityOffsetCount` **must** equal 0
- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-pColorAttachments-06507
If any used color attachments for the render pass were not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_EXT`,
`fragmentDensityOffsetCount` **must** equal 0
- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-pResolveAttachments-06508
If any used resolve attachments for the render pass were not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_EXT`,
`fragmentDensityOffsetCount` **must** equal 0
- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-pPreserveAttachments-06509
If any used preserve attachments for the render pass were not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_EXT`,
`fragmentDensityOffsetCount` **must** equal 0
- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-fragmentDensityOffsetCount-06510
If `fragmentDensityOffsetCount` is not 0 and multiview is enabled for the render pass,
`fragmentDensityOffsetCount` **must** equal the `layerCount` that was specified in creating the fragment density map attachment view
- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-fragmentDensityOffsetCount-06511
If `fragmentDensityOffsetCount` is not 0 and multiview is not enabled for the render pass,
`fragmentDensityOffsetCount` **must** equal 1
- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-x-06512
The `x` component of each element of `pFragmentDensityOffsets` **must** be an integer multiple of `fragmentDensityOffsetGranularity.width`
- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-y-06513
The `y` component of each element of `pFragmentDensityOffsets` **must** be an integer multiple of `fragmentDensityOffsetGranularity.height`
- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-pFragmentDensityOffsets-10730
Each element of `pFragmentDensityOffsets` **must** be identical for every `vkCmdEndRendering2KHR` call made in a render pass

Valid Usage (Implicit)

- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_FRAGMENT_DENSITY_MAP_OFFSET_END_INFO_EXT`

- VUID-VkRenderPassFragmentDensityMapOffsetEndInfoEXT-pFragmentDensityOffsets-parameter

If `fragmentDensityOffsetCount` is not 0, `pFragmentDensityOffsets` **must** be a valid pointer to an array of `fragmentDensityOffsetCount` `VkOffset2D` structures

Structure Chaining

Extends the structures

- `VkRenderingEndInfoKHR`
- `VkSubpassEndInfo`

8.9. Render Pass Creation Feedback

A `VkRenderPassCreationControlEXT` structure **can** be included in the `pNext` chain of `VkRenderPassCreateInfo2` or `pNext` chain of `VkSubpassDescription2`. The `VkRenderPassCreationControlEXT` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#) and `VK_KHR_dynamic_rendering_local_read`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassCreationControlEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           disallowMerging;
} VkRenderPassCreationControlEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `disallowMerging` is a boolean value indicating whether subpass merging will be disabled.

If a `VkRenderPassCreationControlEXT` structure is included in the `pNext` chain of `VkRenderPassCreateInfo2` and its value of `disallowMerging` is `VK_TRUE`, the implementation will disable subpass merging for the entire render pass. If a `VkRenderPassCreationControlEXT` structure is included in the `pNext` chain of `VkSubpassDescription2` and its value of `disallowMerging` is `VK_TRUE`, the implementation will disable merging the described subpass with previous subpasses in the render pass.

Valid Usage (Implicit)

- VUID-VkRenderPassCreationControlEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATION_CONTROL_EXT`

Structure Chaining

Extends the structures

- [VkRenderPassCreateInfo2](#)
- [VkSubpassDescription2](#)

To obtain feedback about the creation of a render pass, include a [VkRenderPassCreationFeedbackCreateInfoEXT](#) structure in the [pNext](#) chain of [VkRenderPassCreateInfo2](#). The [VkRenderPassCreationFeedbackCreateInfoEXT](#) structure is defined as:

WARNING This functionality is superseded by [Vulkan Version 1.4](#) and [VK_KHR_dynamic_rendering_local_read](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassCreationFeedbackCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkRenderPassCreationFeedbackInfoEXT* pRenderPassFeedback;
} VkRenderPassCreationFeedbackCreateInfoEXT;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [pRenderPassFeedback](#) is a pointer to a [VkRenderPassCreationFeedbackInfoEXT](#) structure in which feedback is returned.

Valid Usage (Implicit)

- VUID-VkRenderPassCreationFeedbackCreateInfoEXT-sType-sType [sType](#) **must** be [VK_STRUCTURE_TYPE_RENDER_PASS_CREATION_FEEDBACK_CREATE_INFO_EXT](#)
- VUID-VkRenderPassCreationFeedbackCreateInfoEXT-pRenderPassFeedback-parameter [pRenderPassFeedback](#) **must** be a valid pointer to a [VkRenderPassCreationFeedbackInfoEXT](#) structure

Structure Chaining

Extends the structure

- [VkRenderPassCreateInfo2](#)

The [VkRenderPassCreationFeedbackInfoEXT](#) structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#) and [VK_KHR_dynamic_rendering_local_read](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassCreationFeedbackInfoEXT {
    uint32_t    postMergeSubpassCount;
} VkRenderPassCreationFeedbackInfoEXT;
```

- `postMergeSubpassCount` is the subpass count after merge.

Feedback about the creation of a subpass **can** be obtained by including a `VkRenderPassSubpassFeedbackCreateInfoEXT` structure in the `pNext` chain of [VkSubpassDescription2](#). `VkRenderPassSubpassFeedbackCreateInfoEXT` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#) and [VK_KHR_dynamic_rendering_local_read](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassSubpassFeedbackCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkRenderPassSubpassFeedbackInfoEXT* pSubpassFeedback;
} VkRenderPassSubpassFeedbackCreateInfoEXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pSubpassFeedback` is a pointer to a [VkRenderPassSubpassFeedbackInfoEXT](#) structure in which feedback is returned.

Valid Usage (Implicit)

- VUID-VkRenderPassSubpassFeedbackCreateInfoEXT-sType-sType `sType` **must** be [VK_STRUCTURE_TYPE_RENDER_PASS_SUBPASS_FEEDBACK_CREATE_INFO_EXT](#)
- VUID-VkRenderPassSubpassFeedbackCreateInfoEXT-pSubpassFeedback-parameter `pSubpassFeedback` **must** be a valid pointer to a [VkRenderPassSubpassFeedbackInfoEXT](#) structure

Structure Chaining

Extends the structure

- [VkSubpassDescription2](#)

The `VkRenderPassSubpassFeedbackInfoEXT` structure is defined as:

WARNING

This functionality is superseded by [Vulkan Version 1.4](#) and [VK_KHR_dynamic_rendering_local_read](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassSubpassFeedbackInfoEXT {
    VkSubpassMergeStatusEXT    subpassMergeStatus;
    char                        description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t                    postMergeIndex;
} VkRenderPassSubpassFeedbackInfoEXT;
```

- `subpassMergeStatus` is a [VkSubpassMergeStatusEXT](#) value specifying information about whether the subpass is merged with the previous subpass and the reason why it is not merged.
- `description` is an array of [VK_MAX_DESCRIPTION_SIZE](#) `char` containing a null-terminated UTF-8 string which provides additional details.
- `postMergeIndex` is the subpass index after the subpass merging.

Possible values of `VkRenderPassSubpassFeedbackInfoEXT:subpassMergeStatus` are:

```
// Provided by VK_EXT_subpass_merge_feedback
typedef enum VkSubpassMergeStatusEXT {
    VK_SUBPASS_MERGE_STATUS_MERGED_EXT = 0,
    VK_SUBPASS_MERGE_STATUS_DISALLOWED_EXT = 1,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SIDE_EFFECTS_EXT = 2,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SAMPLES_MISMATCH_EXT = 3,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_VIEWS_MISMATCH_EXT = 4,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_ALIASING_EXT = 5,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPENDENCIES_EXT = 6,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INCOMPATIBLE_INPUT_ATTACHMENT_EXT = 7,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_TOO_MANY_ATTACHMENTS_EXT = 8,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INSUFFICIENT_STORAGE_EXT = 9,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPTH_STENCIL_COUNT_EXT = 10,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_RESOLVE_ATTACHMENT_REUSE_EXT = 11,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SINGLE_SUBPASS_EXT = 12,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_UNSPECIFIED_EXT = 13,
} VkSubpassMergeStatusEXT;
```

- [VK_SUBPASS_MERGE_STATUS_MERGED_EXT](#) specifies that the subpass is merged with a

previous subpass.

- [VK_SUBPASS_MERGE_STATUS_DISALLOWED_EXT](#) specifies that the subpass is not merged because merging was disabled using [VkRenderPassCreationControlEXT](#). If the render pass does not allow subpass merging, then all subpass statuses are set to this value. If a subpass description does not allow subpass merging, then only that subpass's status is set to this value.
- [VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SIDE_EFFECTS_EXT](#) specifies that the subpass is not merged because it contains side effects.
- [VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SAMPLES_MISMATCH_EXT](#) specifies that the subpass is not merged because sample count is not compatible with the previous subpass.
- [VK_SUBPASS_MERGE_STATUS_NOT_MERGED_VIEWS_MISMATCH_EXT](#) specifies that the subpass is not merged because view masks do not match with previous subpass.
- [VK_SUBPASS_MERGE_STATUS_NOT_MERGED_ALIASING_EXT](#) specifies that the subpass is not merged because of attachments aliasing between them.
- [VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPENDENCIES_EXT](#) specifies that the subpass is not merged because subpass dependencies do not allow merging.
- [VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INCOMPATIBLE_INPUT_ATTACHMENT_EXT](#) specifies that the subpass is not merged because input attachment is not a color attachment from previous subpass or the formats are incompatible.
- [VK_SUBPASS_MERGE_STATUS_NOT_MERGED_TOO_MANY_ATTACHMENTS_EXT](#) specifies that the subpass is not merged because of too many attachments.
- [VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INSUFFICIENT_STORAGE_EXT](#) specifies that the subpass is not merged because of insufficient memory.
- [VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPTH_STENCIL_COUNT_EXT](#) specifies that the subpass is not merged because of too many depth/stencil attachments.
- [VK_SUBPASS_MERGE_STATUS_NOT_MERGED_RESOLVE_ATTACHMENT_REUSE_EXT](#) specifies that the subpass is not merged because a resolve attachment is reused as an input attachment in a subsequent subpass.
- [VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SINGLE_SUBPASS_EXT](#) specifies that the subpass is not merged because the render pass has only one subpass.
- [VK_SUBPASS_MERGE_STATUS_NOT_MERGED_UNSPECIFIED_EXT](#) specifies that the subpass is not merged for unspecified reasons. Implementations **should** return this value when no other [VkSubpassMergeStatusEXT](#) value is appropriate.

8.10. Common Render Pass Data Races (Informative)

Due to the complexity of how rendering is performed, there are several ways an application can accidentally introduce a data race, usually by doing something that may seem benign but actually cannot be supported. This section indicates a number of the more common cases as guidelines to help avoid them.

8.10.1. Sampling From a Read-Only Attachment

Vulkan includes read-only layouts for depth/stencil images, that allow the images to be both read during a render pass for the purposes of depth/stencil tests, and read as a non-attachment.

However, because `VK_ATTACHMENT_STORE_OP_STORE` and `VK_ATTACHMENT_STORE_OP_DONT_CARE` may perform write operations, even if no recorded command writes to an attachment, reading from an image while also using it as an attachment with these store operations can result in a data race. If the reads from the non-attachment are performed in a fragment shader where the accessed samples match those covered by the fragment shader, no data race will occur as store operations are guaranteed to operate after fragment shader execution for the set of samples the fragment covers. Notably, input attachments can also be used for this case. Reading other samples or in any other shader stage can result in unexpected behavior due to the potential for a data race, and validation errors should be generated for doing so. In practice, many applications have shipped reading samples outside of the covered fragment without any observable issue, but there is no guarantee that this will always work, and it is not advisable to rely on this in new or re-worked code bases. As `VK_ATTACHMENT_STORE_OP_NONE` is guaranteed to perform no writes, applications wishing to read an image as both an attachment and a non-attachment should make use of this store operation, coupled with a load operation that also performs no writes.

8.10.2. Non-Overlapping Access Between Resources

When relying on non-overlapping accesses between attachments and other resources, it is important to note that `load` and `store` operations have fairly wide alignment requirements - potentially affecting entire subresources and adjacent depth/stencil aspects. This makes it invalid to access a non-attachment subresource that is simultaneously being used as an attachment where either access performs a write operation.

The only exception to this is if a subresource is explicitly specified for use as a feedback loop attachment. Feedback loop is enabled for an attachment if either of the following conditions are satisfied:

- The corresponding attachment is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout
- For the attachment identified by `VkRenderingAttachmentInfo::imageView`, `VkAttachmentFeedbackLoopInfoEXT::feedbackLoopEnable` is `VK_TRUE`

In that case the overlap is defined to occur at a per-pixel granularity, and applications can read data from pixels outside the render area without introducing a data race.

In addition to the attachment layout requirements, extra state **must** be set for non-attachment uses to be valid. For every image aspect accessed with feedback loops, one of the following conditions **must** be satisfied:

- The feedback loop attachment is a color attachment, and the bound pipeline was created with `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT`.
- The feedback loop attachment is a depth-stencil attachment, and the bound pipeline was created with

[VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT](#).

- There is no bound pipeline or the bound pipeline was created with [VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT](#) and the `aspectMask` state in [vkCmdSetAttachmentFeedbackLoopEnableEXT](#) has been set and not subsequently `invalidated` in the current command buffer, and `aspectMask` includes all aspects which require feedback loop.

8.10.3. Depth/Stencil and Input Attachments

When rendering to only the depth OR stencil aspect of an image, an input attachment accessing the other aspect will not cause a data race only under very specific conditions. To avoid a data race, the aspect not being written **must** be in a read-only layout, and writes to it **must** be disabled in the draw state. For example, to read from stencil while writing depth, the attachment **must** be in [VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL](#) (or equivalent), and the stencil write mask **must** be 0. Similarly to read from depth while writing stencil, the attachment **must** be in [VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL](#) (or equivalent), and depth write enable **must** be [VK_FALSE](#).

8.10.4. Synchronization Options

There are several synchronization options available to synchronize between accesses to resources within a render pass. Some of the options are outlined below:

- A [VkSubpassDependency](#) in a render pass object can synchronize attachment writes and [multisample resolve operations](#) from a prior subpass for subsequent input attachment reads.
- A [vkCmdPipelineBarrier](#) inside a subpass can synchronize prior attachment writes in the subpass with subsequent input attachment reads.
- A [vkCmdPipelineBarrier](#) inside a subpass can synchronize prior attachment writes in the subpass with subsequent non-attachment reads if [feedback loop is enabled](#) for the attachment.
- If a subresource is used as a color and input attachment, and the pipeline performing the read was `created` with [VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT](#)
- If a subresource is used as a depth and input attachment, and the pipeline performing the read was `created` with [VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT](#)
- If a subresource is used as a stencil and input attachment, and the pipeline performing the read was `created` with [VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT](#)
- If a subresource is used as two separate non-attachment resources, writes to a pixel or individual sample in a fragment shader can be synchronized with access to the same pixel or sample in another fragment shader by using one of the [fragment interlock](#) execution modes.

8.11. Tile Shading Render Pass

Tile shading **can** be enabled within a render pass.

To enable tile shading for a render pass object, add a [VkRenderPassTileShadingCreateInfoQCOM](#) to the **pNext** chain of [VkRenderPassCreateInfo](#) or [VkRenderPassCreateInfo2](#). To enable tile shading for a dynamic render pass, add a [VkRenderPassTileShadingCreateInfoQCOM](#) to the **pNext** chain of [VkRenderingInfo](#). To execute a secondary command buffer within a render pass, add a [VkRenderPassTileShadingCreateInfoQCOM](#) to the **pNext** chain of [VkCommandBufferInheritanceInfo](#) when the secondary command buffer is recorded.

The [VkRenderPassTileShadingCreateInfoQCOM](#) structure is defined as:

```
// Provided by VK_QCOM_tile_shading
typedef struct VkRenderPassTileShadingCreateInfoQCOM {
    VkStructureType          sType;
    const void*              pNext;
    VkTileShadingRenderPassFlagsQCOM flags;
    VkExtent2D               tileApronSize;
} VkRenderPassTileShadingCreateInfoQCOM;
```

- **sType** is a [VkStructureType](#) value identifying this structure
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkTileShadingRenderPassFlagBitsQCOM](#).
- **tileApronSize** is a [VkExtent2D](#) describing the is size of the [tiling apron](#) in each dimension.

If this structure is not present, the render pass will have **flags** set to `0` and **tileApronSize** is set to `(0,0)`.

Valid Usage

- VUID-VkRenderPassTileShadingCreateInfoQCOM-tileShading-10658
If the **tileShading** feature is not enabled, [VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM](#) **must** not be included in **flags**
- VUID-VkRenderPassTileShadingCreateInfoQCOM-flags-10659
If [VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM](#) is not included in **flags** or the **tileShadingApron** feature is not enabled, **tileApronSize** **must** be `(0,0)`
- VUID-VkRenderPassTileShadingCreateInfoQCOM-flags-10660
If [VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM](#) is not included in **flags**, or neither the [tileShadingPerTileDispatch](#) and [tileShadingPerTileDraw](#) features are enabled, **flags** **must** not include [VK_TILE_SHADING_RENDER_PASS_PER_TILE_EXECUTION_BIT_QCOM](#)
- VUID-VkRenderPassTileShadingCreateInfoQCOM-tileShadingAnisotropicApron-10661
If the **tileShadingAnisotropicApron** feature is not enabled, **tileApronSize.x** and **must** be equal to **tileApronSize.y**

- VUID-VkRenderPassTileShadingCreateInfoQCOM-tileApronSize-10662
`tileApronSize.x` **must** be less than or equal to `maxApronSize`
- VUID-VkRenderPassTileShadingCreateInfoQCOM-tileApronSize-10663
`tileApronSize.y` **must** be less than or equal to `maxApronSize`

Valid Usage (Implicit)

- VUID-VkRenderPassTileShadingCreateInfoQCOM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_TILE_SHADING_CREATE_INFO_QCOM`
- VUID-VkRenderPassTileShadingCreateInfoQCOM-flags-parameter
`flags` **must** be a valid combination of `VkTileShadingRenderPassFlagBitsQCOM` values

Structure Chaining

Extends the structures

- `VkCommandBufferInheritanceInfo`
- `VkRenderPassCreateInfo`
- `VkRenderPassCreateInfo2`
- `VkRenderingInfo`

Bits which **can** be set in `VkRenderPassTileShadingCreateInfoQCOM::flags` describing additional properties of the render pass are:

```
// Provided by VK_QCOM_tile_shading
typedef enum VkTileShadingRenderPassFlagBitsQCOM {
    VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM = 0x00000001,
    VK_TILE_SHADING_RENDER_PASS_PER_TILE_EXECUTION_BIT_QCOM = 0x00000002,
} VkTileShadingRenderPassFlagBitsQCOM;
```

- `VK_TILE_SHADING_RENDER_PASS_ENABLE_BIT_QCOM` specifies that the render pass has tile shading enabled.
- `VK_TILE_SHADING_RENDER_PASS_PER_TILE_EXECUTION_BIT_QCOM` specifies that the secondary command buffer will be executed within a `per-tile execution block`.

```
// Provided by VK_QCOM_tile_shading
typedef VkFlags VkTileShadingRenderPassFlagsQCOM;
```

`VkTileShadingRenderPassFlagsQCOM` is a bitmask type for setting a mask of zero or more `VkTileShadingRenderPassFlagBitsQCOM`.

8.11.1. Tile Attachment Variables

Within a [tile shading render pass](#), fragment and compute shader invocations **can** use the [Tile Attachment Interface](#) to perform load/store, operations on *storage tile attachment* variables, to perform load operations on *input tile attachment* variables, and to perform sampling operations on *sampled tile attachment* variables. *Storage tile attachment*, *sampled tile attachment*, and *input tile attachment* variables **must** be declared and used as described in the tile attachment interface.

8.11.2. Tiling Aprons

In a render pass that [enables](#) tile shading, a *tiling apron* **can** be enabled by setting [VkRenderPassTileShadingCreateInfoQCOM::tileApronSize](#) to a value other than (0,0). Additionally, subpass **flags** **must** include [VK_SUBPASS_DESCRIPTION_TILE_SHADING_APRON_BIT_QCOM](#) if the render pass is not a dynamic render pass or the apron size for that subpass will be (0,0). The tile apron enables shader invocations to load from tile attachment variables at a location that is outside the current tile. The **width** and **height** value of [tileApronSize](#) specifies the number of pixels in the horizontal and vertical directions that are included in the apron region. For example, (1,1) means that the apron region extends the top, bottom, left, and right margins of the tile by 1 pixel. The [tileApronSize](#) **must** not exceed [VkPhysicalDeviceTileShadingPropertiesQCOM::maxApronSize](#).

NOTE

A good mental model for the tiling apron is to think of it as enabling "overlapping tiles". The top/bottom and left/right margins of each tile are extended to include a few pixels of the adjacent tiles. Those pixels that are outside the original tile extents, but within the apron extents are "apron pixels". In a render pass that enables tile shading, apron pixels will be initialized by the [VkAttachmentLoadOp](#), and **may** be updated by any draw within the render pass, but are always discarded and never written by [VkAttachmentStoreOp](#). Apron pixels **can** be read as a result of using [OpImageRead](#), [OpImageSparseRead](#), [OpImageSample*](#), [OpImageSparseSample*](#), [OpImage*Gather](#), [OpImageSparse*Gather](#), [OpImageSampleWeightedQCOM](#), [OpImageBoxFilterQCOM](#), [OpImageBlockMatch*QCOM](#), [OpImageFetch](#), or [OpImageSparseFetch](#) but **cannot** be written using [OpImageWrite](#) or with atomic operations using [OpImageTexelPointer](#).

For image processing use cases, the tiling apron allows fragment and compute shader invocations to read or sample color attachment pixels within the neighborhood of a given fragment, even if the given fragment is close to a tile edge.

Enabling the apron **may** reduce the GPU efficiency, with larger apron sizes having a greater potential impact. Aprons **should** be enabled only when needing to access pixels outside the tile.

8.11.3. Tile Attachment Coordinate Validation

Image operations that access a tile attachment **can** use normalized, unnormalized, or integer texel coordinates, but the final set of (i,j,[k]) integer texel coordinates accessed in [texel filtering](#) **must** be within the extents of the current tile and apron as well as within the render pass [renderArea](#). Any out of bounds shader access will result in poison.

The `robustImageAccess` and `robustImageAccess2` features do not apply to tile attachment accesses.

The built-in variables `TileOffsetQCOM`, `TileApronSizeQCOM`, and `TileDimensionQCOM` define the extent of the current tile and apron.

For *storage tile attachment* stores using `OpImageWrite` and with an `Image` operand from storage class `TileAttachmentQCOM`, the `Coordinate` operand O_s **must** specify a framebuffer location within the render pass `renderArea` and within the extent of the tile.

$$\begin{aligned}O_{min} &= \max(O_{ra}, O_t) \\O_{max} &= \min((O_{ra} + E_{ra}), (O_t + Size_t)) \\O_{min} &\leq O_s < O_{max}\end{aligned}$$

For *storage tile attachment* using `OpImageRead` or `OpImageSparseRead`, or *input tile attachment* loads using `OpImageRead`, and with an `Image` operand from storage class `TileAttachmentQCOM`, the `Coordinate` operand O_l **must** specify a framebuffer location within the render pass `renderArea` and within the combined extent of the tile and apron.

$$\begin{aligned}O_{min} &= \max(O_{ra}, O_t - Size_a) \\O_{max} &= \min((O_{ra} + E_{ra}), (O_t + Size_t + Size_a)) \\O_{min} &\leq O_l < O_{max}\end{aligned}$$

where:

O_s represents `offset` operand to `OpImageWrite`

O_l represents `offset` operand to `OpImageRead`

O_t represents `TileOffsetQCOM`

$Size_t$ represents `TileDimensionQCOM`

O_{ra} represents the render pass `renderArea.offset`

E_{ra} represents the render pass `renderArea.extent`

$Size_a$ represents `TileApronSizeQCOM`

For *storage tile attachment* atomic operations using `OpImageTexelPointer`, the `Coordinate` operand

must specify a framebuffer location within the render pass **RenderArea** and within the extent of the tile. The **Coordinate** **must** not point to the apron region.

When accessing a *sampled tile attachment* using **OpImageSample***, **OpImageSparseSample***, **OpImageFetch**, **OpImageSparseFetch***, **OpImageSampleWeightedQCOM**, **OpImageBoxFilterQCOM**, **OpImageBlockMatch*QCOM**, **OpImage*Gather**, or **OpImageSparse*Gather**, and with an **Image** operand from storage class **TileAttachmentQCOM**, the **Coordinate** operand **must** not result in any texels accessed that are outside the **renderArea** or outside the combined extent of the tile and apron.

NOTE

It is the application's responsibility to guarantee that the instruction and texture coordinates do not cause any out of bounds texels to be accessed as a result of loads, stores, atomics, or the sampling filter. In practice, this may require that the coordinates are clamped in the shader code.

8.11.4. Tile Shading Fragment Regions

If *tile shading* is **enabled** for a render pass instance, then **framebuffer-local dependencies** defined using **VK_DEPENDENCY_BY_REGION_BIT** specify a **framebuffer region** equal to the region covered by the *active tile*.

When **per-tile execution model** is enabled an *active tile* is associated with each of the per-tile command invocations with an extent described by shader built-in variables **TileOffsetQCOM**, **TileDimensionQCOM**, and **TileApronSizeQCOM**. Otherwise, the extent of the *active tile* is defined by the tile exposed by **VK_QCOM_tile_properties** that contains the framebuffer coordinate (*x*, *y*, *z*) of the fragment being processed.

NOTE

Without tile shading the **framebuffer region** described by **VK_DEPENDENCY_BY_REGION_BIT** must be assumed by applications to be no larger than a single pixel or single sample.

The larger tile-sized **framebuffer region** provided by tile shading allows applications to achieve increased rendering efficiency on some tiling architectures. It enables synchronization commands with a framebuffer-local dependency to be used for a dependency across fragments with different framebuffer coordinates, as long as the fragments are located within the same tile. In this situation, it avoids an otherwise required framebuffer-global dependency and corresponding data flushing to memory as noted in the **synchronization chapter**.

8.11.5. Per-Tile Execution Model

Within a **tile shading render pass** instance, the per-tile execution model can be enabled.

To enable the per-tile execution model, call:

```
// Provided by VK_QCOM_tile_shading
void vkCmdBeginPerTileExecutionQCOM(
    VkCommandBuffer                      commandBuffer,
    const VkPerTileBeginInfoQCOM*       pPerTileBeginInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pPerTileBeginInfo` is a pointer to a `VkPerTileBeginInfoQCOM` structure containing information about how the *per-tile execution model* is started.

When *per-tile execution model* is enabled, recorded `vkCmdDraw*` or `vkCmdDispatch*` commands are invoked per tile. That is, the recorded draw or dispatch is invoked exactly once for each *covered tile*. The set of *covered tiles* for a given render pass instance consists of the set of render pass tiles, which **can** be queried with `VK_QCOM_tile_properties`, that are completely or partially covered by the `renderArea` for the render pass instance. The draw or dispatch commands **may** be invoked for uncovered tiles.

Each per-tile command invocation is associated with a single tile, the *active tile*. These per-tile invocations are not specified to execute in any particular order, but the size and offset of the *active tile* is available via shader built-ins.

When *per-tile execution model* is enabled, the following restrictions apply:

- Transform feedback commands such as `vkCmdBeginTransformFeedbackEXT`, `vkCmdEndTransformFeedbackEXT`, `vkCmdBeginQueryIndexedEXT`, and `vkCmdEndQueryIndexedEXT`, **must** not be recorded.
- Query commands such as `vkCmdWriteTimestamp`, `vkCmdDebugMarkerBeginEXT`, `vkCmdDebugMarkerEndEXT`, `vkCmdDebugMarkerInsertEXT`, `vkCmdBeginQuery`, and `vkCmdEndQuery`, **must** not be recorded.
- Event commands such as `vkCmdWaitEvents2` and `vkCmdWaitEvents` **must** not be recorded.
- Render pass clears like `vkCmdClearAttachments` **must** not be recorded
- Access of an attachment with layout `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` as provided by `VK_EXT_attachment_feedback_loop_layout` is disallowed
- Any commands that would cause a invocations of one of the following shader stages are not allowed
 - tessellation
 - geometry
 - ray tracing
 - mesh shading

Valid Usage

- VUID-vkCmdBeginPerTileExecutionQCOM-None-10664
The current render pass **must** be a [tile shading render pass](#)

- VUID-vkCmdBeginPerTileExecutionQCOM-None-10665
The [tileShadingPerTileDispatch](#) or [tileShadingPerTileDraw](#) feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdBeginPerTileExecutionQCOM-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdBeginPerTileExecutionQCOM-pPerTileBeginInfo-parameter
pPerTileBeginInfo **must** be a valid pointer to a valid [VkPerTileBeginInfoQCOM](#) structure
- VUID-vkCmdBeginPerTileExecutionQCOM-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdBeginPerTileExecutionQCOM-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_COMPUTE_BIT](#), or [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdBeginPerTileExecutionQCOM-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdBeginPerTileExecutionQCOM-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

vkCmdBeginPerTileExecutionQCOM is not affected by [conditional rendering](#)

The [VkPerTileBeginInfoQCOM](#) structure is defined as:

```
// Provided by VK_QCOM_tile_shading
typedef struct VkPerTileBeginInfoQCOM {
    VkStructureType    sType;
    const void*        pNext;
} VkPerTileBeginInfoQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

Valid Usage (Implicit)

- VUID-VkPerTileBeginInfoQCOM-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PER_TILE_BEGIN_INFO_QCOM`
- VUID-VkPerTileBeginInfoQCOM-pNext-pNext
`pNext` **must** be `NULL`

To disable per-tile execution model, call:

```
// Provided by VK_QCOM_tile_shading
void vkCmdEndPerTileExecutionQCOM(
    VkCommandBuffer          commandBuffer,
    const VkPerTileEndInfoQCOM* pPerTileEndInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pPerTileEndInfo` is a pointer to a `VkPerTileEndInfoQCOM` structure containing information about how the *per-tile execution model* is ended.

This command disables *per-tile execution model*.

Valid Usage

- VUID-vkCmdEndPerTileExecutionQCOM-None-10666
The *per-tile execution model* **must** have been enabled in the current render pass
- VUID-vkCmdEndPerTileExecutionQCOM-None-10667
The current render pass **must** be a `tile shading render pass`

Valid Usage (Implicit)

- VUID-vkCmdEndPerTileExecutionQCOM-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdEndPerTileExecutionQCOM-pPerTileEndInfo-parameter
`pPerTileEndInfo` **must** be a valid pointer to a valid `VkPerTileEndInfoQCOM` structure

- VUID-vkCmdEndPerTileExecutionQCOM-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdEndPerTileExecutionQCOM-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support [VK_QUEUE_COMPUTE_BIT](#), or [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdEndPerTileExecutionQCOM-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdEndPerTileExecutionQCOM-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdEndPerTileExecutionQCOM` is not affected by [conditional rendering](#)

The `VkPerTileEndInfoQCOM` structure is defined as:

```
// Provided by VK_QCOM_tile_shading
typedef struct VkPerTileEndInfoQCOM {
    VkStructureType    sType;
    const void*        pNext;
} VkPerTileEndInfoQCOM;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

Valid Usage (Implicit)

- VUID-VkPerTileEndInfoQCOM-sType-sType
sType must be `VK_STRUCTURE_TYPE_PER_TILE_END_INFO_QCOM`
- VUID-VkPerTileEndInfoQCOM-pNext-pNext
pNext must be `NULL`

8.11.6. Area-Based Dispatch

When the [per-tile execution model](#) is enabled, the command `vkCmdDispatchTileQCOM` **can** be used to provide an area-based dispatch, where the implementation determines the work group count and size based on the tile size and a given shading rate.

Chapter 9. Shaders

A shader specifies programmable operations that execute for each vertex, control point, tessellated vertex, primitive, fragment, or workgroup in the corresponding stage(s) of the graphics and compute pipelines.

Graphics pipelines include vertex shader execution as a result of [primitive assembly](#), followed, if enabled, by tessellation control and evaluation shaders operating on [patches](#), geometry shaders, if enabled, operating on primitives, and fragment shaders, if present, operating on fragments generated by [Rasterization](#). In this specification, vertex, tessellation control, tessellation evaluation and geometry shaders are collectively referred to as [pre-rasterization shader stages](#) and occur in the logical pipeline before rasterization. The fragment shader occurs logically after rasterization.

Only the compute shader stage is included in a compute pipeline. Compute shaders operate on compute invocations in a workgroup.

Shaders **can** read from input variables, and read from and write to output variables. Input and output variables **can** be used to transfer data between shader stages, or to allow the shader to interact with values that exist in the execution environment. Similarly, the execution environment provides constants describing capabilities.

Shader variables are associated with execution environment-provided inputs and outputs using *built-in* decorations in the shader. The available decorations for each stage are documented in the following subsections.

9.1. Shader Objects

Shaders **may** be compiled and linked into pipeline objects as described in [Pipelines](#) chapter, or if the `shaderObject` feature is enabled they **may** be compiled into individual per-stage *shader objects* which **can** be bound on a command buffer independently from one another. Unlike pipelines, shader objects are not intrinsically tied to any specific set of state. Instead, state is specified dynamically in the command buffer.

Each shader object represents a single compiled shader stage, which **may optionally** be linked with one or more other stages.

Shader objects are represented by `VkShaderEXT` handles:

```
// Provided by VK_EXT_shader_object
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderEXT)
```

9.1.1. Shader Object Creation

Shader objects **may** be created from shader code provided as SPIR-V, or in an opaque, implementation-defined binary format specific to the physical device.

To create one or more shader objects, call:

```
// Provided by VK_EXT_shader_object
VkResult vkCreateShadersEXT(
    VkDevice                                device,
    uint32_t                                createInfoCount,
    const VkShaderCreateInfoEXT*            pCreateInfos,
    const VkAllocationCallbacks*            pAllocator,
    VkShaderEXT*                            pShaders);
```

- **device** is the logical device that creates the shader objects.
- **createInfoCount** is the length of the **pCreateInfos** and **pShaders** arrays.
- **pCreateInfos** is a pointer to an array of **VkShaderCreateInfoEXT** structures.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pShaders** is a pointer to an array of **VkShaderEXT** handles in which the resulting shader objects are returned.

When this function returns, whether or not it succeeds, it is guaranteed that every element of **pShaders** will have been overwritten by either **VK_NULL_HANDLE** or a valid **VkShaderEXT** handle.

This means that whenever shader creation fails, the application **can** determine which shader the returned error pertains to by locating the first **VK_NULL_HANDLE** element in **pShaders**. It also means that an application **can** reliably clean up from a failed call by iterating over the **pShaders** array and destroying every element that is not **VK_NULL_HANDLE**.

Valid Usage

- VUID-vkCreateShadersEXT-stage-09670
If the **stage** member of any element of **pCreateInfos** is **VK_SHADER_STAGE_COMPUTE_BIT**, **device** **must** support at least one queue family with the **VK_QUEUE_COMPUTE_BIT** capability
- VUID-vkCreateShadersEXT-stage-09671
If the **stage** member of any element of **pCreateInfos** is **VK_SHADER_STAGE_TASK_BIT_EXT**, **VK_SHADER_STAGE_MESH_BIT_EXT**, **VK_SHADER_STAGE_VERTEX_BIT**, **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT**, **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT**, **VK_SHADER_STAGE_GEOMETRY_BIT**, or **VK_SHADER_STAGE_FRAGMENT_BIT**, **device** **must** support at least one queue family with the **VK_QUEUE_GRAPHICS_BIT** capability
- VUID-vkCreateShadersEXT-None-08400
The **shaderObject** feature **must** be enabled
- VUID-vkCreateShadersEXT-pCreateInfos-08402
If the **flags** member of any element of **pCreateInfos** includes **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT**, the **flags** member of all other elements of **pCreateInfos** whose **stage** is **VK_SHADER_STAGE_VERTEX_BIT**, **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT**, **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT**,

VK_SHADER_STAGE_GEOMETRY_BIT, or VK_SHADER_STAGE_FRAGMENT_BIT **must** also include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

- VUID-vkCreateShadersEXT-pCreateInfo-08403

If the **flags** member of any element of **pCreateInfo** includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, the **flags** member of all other elements of **pCreateInfo** whose **stage** is VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT **must** also include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

- VUID-vkCreateShadersEXT-pCreateInfo-08404

If the **flags** member of any element of **pCreateInfo** whose **stage** is VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, there **must** be no member of **pCreateInfo** whose **flags** member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT and whose **stage** is any of VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_GEOMETRY_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, or VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

- VUID-vkCreateShadersEXT-pCreateInfo-08405

If there is any element of **pCreateInfo** whose **stage** is VK_SHADER_STAGE_MESH_BIT_EXT and whose **flags** member includes both VK_SHADER_CREATE_LINK_STAGE_BIT_EXT and VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT, there **must** be no element of **pCreateInfo** whose **stage** is VK_SHADER_STAGE_TASK_BIT_EXT and whose **flags** member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

- VUID-vkCreateShadersEXT-pCreateInfo-08409

For each element of **pCreateInfo** whose **flags** member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, if there is any other element of **pCreateInfo** whose **stage** is logically later than the **stage** of the former and whose **flags** member also includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, the **nextStage** of the former **must** be equal to the **stage** of the element with the logically earliest **stage** following the **stage** of the former whose **flags** member also includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

- VUID-vkCreateShadersEXT-pCreateInfo-08410

The **stage** member of each element of **pCreateInfo** whose **flags** member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT **must** be unique

- VUID-vkCreateShadersEXT-pCreateInfo-08411

The **codeType** member of all elements of **pCreateInfo** whose **flags** member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT **must** be the same

- VUID-vkCreateShadersEXT-pCreateInfo-12224

If **pCreateInfo** contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements' **flags** include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements' **codeType** is VK_SHADER_CODE_TYPE_SPIRV_EXT, at least one **must** contain an **OpExecutionMode** instruction specifying the orientation of triangles generated by the tessellator

- VUID-vkCreateShadersEXT-pCreateInfo-12225

If **pCreateInfo** contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and

VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements' flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements' codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, at least one **must** contain an OpExecutionMode instruction specifying the spacing of segments on the edges of tessellated primitives

- VUID-vkCreateShadersEXT-pCreateInfo-08867

If pCreateInfo contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements' flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements' codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and both stages contains an OpExecutionMode instruction specifying the type of subdivision, they **must** be the same

- VUID-vkCreateShadersEXT-pCreateInfo-08868

If pCreateInfo contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements' flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements' codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and both stages contains an OpExecutionMode instruction specifying the orientation of triangles, they **must** be the same

- VUID-vkCreateShadersEXT-pCreateInfo-08870

If pCreateInfo contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements' flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements' codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and both stages contains an OpExecutionMode instruction specifying the spacing of segments on the edges of tessellated primitives, they **must** be the same

- VUID-vkCreateShadersEXT-pCreateInfo-08871

If pCreateInfo contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements' flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements' codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and both stages contains an OpExecutionMode instruction specifying the output patch size, they **must** be the same

- VUID-vkCreateShadersEXT-pCreateInfo-09632

If pCreateInfo contains a VK_SHADER_STAGE_MESH_BIT_EXT with codeType of VK_SHADER_CODE_TYPE_SPIRV_EXT and VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT is not set, then the mesh shader's entry point **must** not declare a variable with a DrawIndex BuiltIn decoration

- VUID-vkCreateShadersEXT-pCreateInfo-11413

If any element of pCreateInfo sets VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT and includes embedded sampler mappings, there **must** be less than $(\text{maxSamplerAllocationCount} - (\text{minSamplerHeapReservedRangeWithEmbedded} / \text{samplerDescriptorSize}))$ VkSampler objects currently created on the device

- VUID-vkCreateShadersEXT-pCreateInfo-11428

If any element of pCreateInfo sets VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT

and includes embedded sampler mappings, this command **must** not cause the total number of unique embedded samplers in pipelines and shaders on this device to exceed `maxDescriptorHeapEmbeddedSamplers`

- VUID-vkCreateShadersEXT-flags-11472

If the `flags` member of any element of `pCreateInfo`s includes `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` and `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`, the `flags` member of all other elements of `pCreateInfo`s whose `stage` is `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, `VK_SHADER_STAGE_TASK_BIT_EXT`, `VK_SHADER_STAGE_MESH_BIT_EXT`, or `VK_SHADER_STAGE_FRAGMENT_BIT` **must** also include `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`

Valid Usage (Implicit)

- VUID-vkCreateShadersEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateShadersEXT-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to an array of `createInfoCount` valid `VkShaderCreateInfoEXT` structures
- VUID-vkCreateShadersEXT-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateShadersEXT-pShaders-parameter
`pShaders` **must** be a valid pointer to an array of `createInfoCount` `VkShaderEXT` handles
- VUID-vkCreateShadersEXT-createInfoCount-arraylength
`createInfoCount` **must** be greater than `0`

Return Codes

Success

- `VK_INCOMPATIBLE_SHADER_BINARY_EXT`
- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkShaderCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_shader_object
typedef struct VkShaderCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkShaderCreateFlagsEXT   flags;
    VkShaderStageFlagBits    stage;
    VkShaderStageFlags       nextStage;
    VkShaderCodeTypeEXT      codeType;
    size_t                   codeSize;
    const void*              pCode;
    const char*              pName;
    uint32_t                 setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t                 pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
    const VkSpecializationInfo* pSpecializationInfo;
} VkShaderCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkShaderCreateFlagBitsEXT` describing additional parameters of the shader.
- `stage` is a `VkShaderStageFlagBits` value specifying a single shader stage.
- `nextStage` is a bitmask of `VkShaderStageFlagBits` specifying which stages **can** be used as a logically next bound stage when drawing with the shader bound. A value of zero indicates this shader stage **must** be the last one.
- `codeType` is a `VkShaderCodeTypeEXT` value specifying the type of the shader code pointed to be `pCode`.
- `codeSize` is the size in bytes of the shader code pointed to be `pCode`.
- `pCode` is a pointer to the shader code to use to create the shader.
- `pName` is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
- `setLayoutCount` is the number of descriptor set layouts pointed to by `pSetLayouts`.
- `pSetLayouts` is a pointer to an array of `VkDescriptorSetLayout` objects used by the shader stage. The implementation **must** not access these objects outside of the duration of the command this structure is passed to.
- `pushConstantRangeCount` is the number of push constant ranges pointed to by `pPushConstantRanges`.
- `pPushConstantRanges` is a pointer to an array of `VkPushConstantRange` structures used by the shader stage.
- `pSpecializationInfo` is a pointer to a `VkSpecializationInfo` structure, as described in

Specialization Constants, or **NULL**.

When determining [pipeline layout compatibility](#), compatibility is determined as if a the shader was created with a pipeline layout object that was created with identical values of **setLayoutCount**, **pSetLayouts**, **pushConstantRangeCount**, and **pPushConstantRanges**, and with **VkPipelineLayoutCreateInfo::flags** set to 0. If **flags** includes **VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT**, the shader is not considered created with a pipeline layout.

When specifying descriptor heap mappings, only mappings corresponding to bindings that are actually present in the SPIR-V shader affect compilation. Mappings are ignored when **codeType** is **VK_SHADER_CODE_TYPE_BINARY_EXT**. The resulting compiled binary from two different SPIR-V shaders which would have identical bit patterns **must** remain identical even if the mapping entries vary in any of the following ways:

- Different numbers of unused mapping structures
- Different binding counts for unused bindings
- Unused parameters in mapping structures (e.g. sampler offsets)
- Ignored parameters in mapping structures
- Different order of mapping structures, used or unused

NOTE

Calculating the same offset in a mapping via different parameter values is not guaranteed to provide identical results.

Valid Usage

- VUID-VkShaderCreateInfoEXT-codeSize-08735
If **codeType** is **VK_SHADER_CODE_TYPE_SPIRV_EXT**, **codeSize** **must** be a multiple of 4
- VUID-VkShaderCreateInfoEXT-pCode-08736
If **codeType** is **VK_SHADER_CODE_TYPE_SPIRV_EXT**, **pCode** **must** point to valid SPIR-V code, formatted and packed as described by the [Khronos SPIR-V Specification](#)
- VUID-VkShaderCreateInfoEXT-pCode-08737
If **codeType** is **VK_SHADER_CODE_TYPE_SPIRV_EXT**, **pCode** **must** adhere to the validation rules described by the [Validation Rules within a Module](#) section of the [SPIR-V Environment](#) appendix
- VUID-VkShaderCreateInfoEXT-pCode-08738
If **codeType** is **VK_SHADER_CODE_TYPE_SPIRV_EXT**, **pCode** **must** declare the **Shader** capability for SPIR-V code
- VUID-VkShaderCreateInfoEXT-pCode-08739
If **codeType** is **VK_SHADER_CODE_TYPE_SPIRV_EXT**, **pCode** **must** not declare any capability that is not supported by the API, as described by the [Capabilities](#) section of the [SPIR-V Environment](#) appendix
- VUID-VkShaderCreateInfoEXT-pCode-08740
If **codeType** is **VK_SHADER_CODE_TYPE_SPIRV_EXT**, and **pCode** declares any of the

capabilities listed in the [SPIR-V Environment](#) appendix, one of the corresponding requirements **must** be satisfied

- VUID-VkShaderCreateInfoEXT-pCode-08741

If `codeType` is [VK_SHADER_CODE_TYPE_SPIRV_EXT](#), `pCode` **must** not declare any SPIR-V extension that is not supported by the API, as described by the [Extension](#) section of the [SPIR-V Environment](#) appendix

- VUID-VkShaderCreateInfoEXT-pCode-08742

If `codeType` is [VK_SHADER_CODE_TYPE_SPIRV_EXT](#), and `pCode` declares any of the SPIR-V extensions listed in the [SPIR-V Environment](#) appendix, one of the corresponding requirements **must** be satisfied

- VUID-VkShaderCreateInfoEXT-descriptorHeap-11314

If the `descriptorHeap` feature is not enabled, `VkShaderDescriptorSetAndBindingMappingInfoEXT::mappingCount` **must** be 0

- VUID-VkShaderCreateInfoEXT-pNext-11315

If the `pNext` chain specifies a `descriptor mapping` using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT](#), the mapped resource in the shader **must** be a variable with a structure type decorated with `Block` in the `Uniform Storage Class`

- VUID-VkShaderCreateInfoEXT-pNext-11316

If the `pNext` chain specifies a `descriptor mapping` using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT](#), the mapped structure **must** not be larger than the sum of `pushDataOffset` used in the mapping and `maxPushDataSize`

- VUID-VkShaderCreateInfoEXT-pNext-11317

If the `pNext` chain specifies a `descriptor mapping` using [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT](#), the sum of mapped structure size and `shaderRecordDataOffset` used in the mapping **must** not be larger than `maxShaderGroupStride`

- VUID-VkShaderCreateInfoEXT-pNext-11318

If the `pNext` chain specifies a `descriptor mapping` using [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), the mapped resource in the shader **must** be one of:

- A variable with a structure type decorated with `Block` in the `Uniform Storage Class`
- A variable with a structure type decorated with `BufferBlock` in the `Uniform Storage Class`
- A variable with a structure type decorated with `Block` in the `StorageBuffer Storage Class`
- A `OpTypeAccelerationStructureKHR` variable
- A `OpTypeAccelerationStructureNV` variable

- VUID-VkShaderCreateInfoEXT-pNext-11378

If the `pNext` chain specifies a descriptor mapping using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, the `OpArrayLength` or `OpUntypedArrayLengthKHR` instruction **must** not be used on that resource

- VUID-VkShaderCreateInfoEXT-pNext-11399

If the `pNext` chain specifies a descriptor mapping using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_CONSTANT_OFFSET_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, and the mapped resource declaration is an array, the `pEmbeddedSampler` member of the corresponding mapping structure **must** be `NULL`

- VUID-VkShaderCreateInfoEXT-flags-08412

If `stage` is not `VK_SHADER_STAGE_TASK_BIT_EXT`, `VK_SHADER_STAGE_MESH_BIT_EXT`, `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, or `VK_SHADER_STAGE_FRAGMENT_BIT`, `flags` **must** not include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-08486

If `stage` is not `VK_SHADER_STAGE_FRAGMENT_BIT`, `flags` **must** not include `VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-08487

If the `attachmentFragmentShadingRate` feature is not enabled, `flags` **must** not include `VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-08488

If `stage` is not `VK_SHADER_STAGE_FRAGMENT_BIT`, `flags` **must** not include `VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-08489

If the `fragmentDensityMap` feature is not enabled, `flags` **must** not include `VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-09404

If `flags` includes `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT`, the `subgroupSizeControl` feature **must** be enabled

- VUID-VkShaderCreateInfoEXT-flags-09405

If `flags` includes `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`, the `computeFullSubgroups` feature **must** be enabled

- VUID-VkShaderCreateInfoEXT-flags-11005

If `flags` includes `VK_SHADER_CREATE_INDIRECT_BINDABLE_BIT_EXT`, then the `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT::deviceGeneratedCommands` feature **must** be enabled

- VUID-VkShaderCreateInfoEXT-flags-11006

If **flags** includes `VK_SHADER_CREATE_INDIRECT_BINDABLE_BIT_EXT`, then the identified entry point **must** not specify `Xfb` execution mode

- VUID-VkShaderCreateInfoEXT-flags-08992

If **flags** includes `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`, **stage** **must** be one of `VK_SHADER_STAGE_MESH_BIT_EXT`, `VK_SHADER_STAGE_TASK_BIT_EXT`, or `VK_SHADER_STAGE_COMPUTE_BIT`

- VUID-VkShaderCreateInfoEXT-flags-08485

If **stage** is not `VK_SHADER_STAGE_COMPUTE_BIT`, **flags** **must** not include `VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-08414

If **stage** is not `VK_SHADER_STAGE_MESH_BIT_EXT`, **flags** **must** not include `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-08416

If **flags** includes both `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` and `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`, the local workgroup size in the X dimension of the shader **must** be a multiple of `maxSubgroupSize`

- VUID-VkShaderCreateInfoEXT-flags-08417

If **flags** includes `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` but not `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` and no `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure is included in the `pNext` chain, the local workgroup size in the X dimension of the shader **must** be a multiple of `subgroupSize`

- VUID-VkShaderCreateInfoEXT-stage-08418

stage **must** not be `VK_SHADER_STAGE_ALL_GRAPHICS` or `VK_SHADER_STAGE_ALL`

- VUID-VkShaderCreateInfoEXT-stage-08419

If the `tessellationShader` feature is not enabled, **stage** **must** not be `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- VUID-VkShaderCreateInfoEXT-stage-08420

If the `geometryShader` feature is not enabled, **stage** **must** not be `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-VkShaderCreateInfoEXT-stage-08421

If the `taskShader` feature is not enabled, **stage** **must** not be `VK_SHADER_STAGE_TASK_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-stage-08422

If the `meshShader` feature is not enabled, **stage** **must** not be `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-stage-08425

stage **must** not be `VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI`

- VUID-VkShaderCreateInfoEXT-stage-08426

stage **must** not be `VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI`

- VUID-VkShaderCreateInfoEXT-nextStage-08427

If **stage** is `VK_SHADER_STAGE_VERTEX_BIT`, **nextStage** **must** not include any bits other

than `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, and `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-VkShaderCreateInfoEXT-nextStage-08428

If the `tessellationShader` feature is not enabled, `nextStage` **must** not include `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- VUID-VkShaderCreateInfoEXT-nextStage-08429

If the `geometryShader` feature is not enabled, `nextStage` **must** not include `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-VkShaderCreateInfoEXT-nextStage-08430

If `stage` is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `nextStage` **must** not include any bits other than `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- VUID-VkShaderCreateInfoEXT-nextStage-08431

If `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `nextStage` **must** not include any bits other than `VK_SHADER_STAGE_GEOMETRY_BIT` and `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-VkShaderCreateInfoEXT-nextStage-08433

If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, `nextStage` **must** not include any bits other than `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-VkShaderCreateInfoEXT-nextStage-08434

If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT` or `VK_SHADER_STAGE_COMPUTE_BIT`, `nextStage` **must** be 0

- VUID-VkShaderCreateInfoEXT-nextStage-08435

If `stage` is `VK_SHADER_STAGE_TASK_BIT_EXT`, `nextStage` **must** not include any bits other than `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-nextStage-08436

If `stage` is `VK_SHADER_STAGE_MESH_BIT_EXT`, `nextStage` **must** not include any bits other than `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-VkShaderCreateInfoEXT-pName-08440

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pName` **must** be the name of an `OpEntryPoint` in `pCode` with an execution model that matches `stage`

- VUID-VkShaderCreateInfoEXT-pCode-08492

If `codeType` is `VK_SHADER_CODE_TYPE_BINARY_EXT`, `pCode` **must** be aligned to 16 bytes

- VUID-VkShaderCreateInfoEXT-pCode-08493

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** be aligned to 4 bytes

- VUID-VkShaderCreateInfoEXT-pCode-08448

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes any variable in its interface that is declared with the `ClipDistance BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxClipDistances`

- VUID-VkShaderCreateInfoEXT-pCode-08449

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes any variable in its interface that is declared with the `CullDistance BuiltIn` decoration, that

variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxCullDistances`

- VUID-VkShaderCreateInfoEXT-pCode-08450

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes variables in its interface that are declared with the `ClipDistance BuiltIn` decoration and variables in its interface that are declared with the `CullDistance BuiltIn` decoration, those variables **must** not have array sizes which sum to more than `VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances`

- VUID-VkShaderCreateInfoEXT-pCode-08451

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes any variable in its interface that is declared with the `SampleMask BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxSampleMaskWords`

- VUID-VkShaderCreateInfoEXT-pCode-08453

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, and the identified entry point has an `OpExecutionMode` instruction specifying a patch size with `OutputVertices`, the patch size **must** be greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

- VUID-VkShaderCreateInfoEXT-pCode-08454

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction specifying a maximum output vertex count that is greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxGeometryOutputVertices`

- VUID-VkShaderCreateInfoEXT-pCode-08455

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction specifying an invocation count that is greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxGeometryShaderInvocations`

- VUID-VkShaderCreateInfoEXT-pCode-08456

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is a `pre-rasterization shader stage`, and the identified entry point writes to `Layer` for any primitive, it **must** write the same value to `Layer` for all vertices of a given primitive

- VUID-VkShaderCreateInfoEXT-pCode-08457

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is a `pre-rasterization shader stage`, and the identified entry point writes to `ViewportIndex` for any primitive, it **must** write the same value to `ViewportIndex` for all vertices of a given primitive

- VUID-VkShaderCreateInfoEXT-pCode-08459

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragDepth` in any execution path, all execution paths that are not exclusive to helper invocations **must** either discard the fragment, or write or initialize the value of `FragDepth`

- VUID-VkShaderCreateInfoEXT-pCode-08460

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, the shader code in `pCode` **must** be valid as described by the [Khronos SPIR-V Specification](#) after applying the specializations provided in `pSpecializationInfo`, if any, and then converting all specialization constants into fixed constants

- VUID-VkShaderCreateInfoEXT-codeType-08872

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` **must** contain an `OpExecutionMode` instruction specifying the type of subdivision

- VUID-VkShaderCreateInfoEXT-codeType-12226

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `pCode` **must** contain an `OpExecutionMode` instruction specifying the output patch size

- VUID-VkShaderCreateInfoEXT-pPushConstantRanges-10063

Any two elements of `pPushConstantRanges` **must** not include the same stage in `stageFlags`

- VUID-VkShaderCreateInfoEXT-codeType-10064

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `flags` does not include `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` and if a push constant block is declared in a shader, then an element of `pPushConstantRanges->stageFlags` **must** match `stage`

- VUID-VkShaderCreateInfoEXT-codeType-10065

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `flags` does not include `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` and if a push constant block is declared in a shader, the block must be contained inside the element of `pPushConstantRanges` that matches the stage

- VUID-VkShaderCreateInfoEXT-codeType-10383

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `flags` does not include `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` and a `resource variable` is declared in a shader, the corresponding descriptor set in `pSetLayouts` **must** match the shader stage

- VUID-VkShaderCreateInfoEXT-codeType-10384

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `flags` does not include `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` and a `resource variable` is declared in a shader, and the descriptor type is not `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, the corresponding descriptor set in `pSetLayouts` **must** match the descriptor type

- VUID-VkShaderCreateInfoEXT-codeType-10385

If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `flags` does not include `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` and a `resource variable` is declared in a shader as an array, the corresponding descriptor set in `pSetLayouts` **must** match the descriptor count

- VUID-VkShaderCreateInfoEXT-setLayoutCount-13359

If `setLayoutCount` is not 0, `pSetLayouts` is not `NULL`, and `flags` does not include `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR`, then `pSetLayouts` must be a valid pointer to an array of `setLayoutCount` valid `VkDescriptorSetLayout` handles

- VUID-VkShaderCreateInfoEXT-setLayoutCount-13360

If `setLayoutCount` is not 0, `pSetLayouts` is not `NULL`, and `flags` includes

`VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR`, then `pSetLayouts` must be a valid pointer to an array of `setLayoutCount` `VkDescriptorSetLayout` or `VK_NULL_HANDLE` handles

- VUID-VkShaderCreateInfoEXT-codeType-10386
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `flags` does not include `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` and a `resource variable` is declared in a shader as an array of descriptors, then the descriptor type of that variable **must** not be `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`
- VUID-VkShaderCreateInfoEXT-flags-11758
If `shader64BitIndexing` feature is not enabled, `flags` **must** not contain `VK_SHADER_CREATE_64_BIT_INDEXING_BIT_EXT`
- VUID-VkShaderCreateInfoEXT-setLayoutCount-12257
`setLayoutCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxBoundDescriptorSets`
- VUID-VkShaderCreateInfoEXT-flags-11290
If `flags` includes `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`, `setLayoutCount` **must** be 0
- VUID-VkShaderCreateInfoEXT-flags-11291
If `flags` includes `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`, `pSetLayouts` **must** be `NULL`
- VUID-VkShaderCreateInfoEXT-flags-11370
If `flags` includes `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`, `pushConstantRangeCount` **must** be 0
- VUID-VkShaderCreateInfoEXT-flags-11371
If `flags` includes `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`, `pPushConstantRanges` **must** be `NULL`
- VUID-VkShaderCreateInfoEXT-flags-11292
If `flags` includes `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`, and `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, all shader variables in the `shader resource interface` with a `DescriptorSet` and `Binding` decoration **must** have a mapping declared in `VkShaderDescriptorSetAndBindingMappingInfoEXT::pMappings`

Valid Usage (Implicit)

- VUID-VkShaderCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT`
- VUID-VkShaderCreateInfoEXT-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkCustomResolveCreateInfoEXT`, `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo`, `VkShaderDescriptorSetAndBindingMappingInfoEXT`, or `VkValidationFeaturesEXT`
- VUID-VkShaderCreateInfoEXT-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkShaderCreateInfoEXT-flags-parameter
flags **must** be a valid combination of [VkShaderCreateFlagBitsEXT](#) values
- VUID-VkShaderCreateInfoEXT-stage-parameter
stage **must** be a valid [VkShaderStageFlagBits](#) value
- VUID-VkShaderCreateInfoEXT-nextStage-parameter
nextStage **must** be a valid combination of [VkShaderStageFlagBits](#) values
- VUID-VkShaderCreateInfoEXT-codeType-parameter
codeType **must** be a valid [VkShaderCodeTypeEXT](#) value
- VUID-VkShaderCreateInfoEXT-pCode-parameter
pCode **must** be a valid pointer to an array of **codeSize** bytes
- VUID-VkShaderCreateInfoEXT-pName-parameter
If **pName** is not **NULL**, **pName** **must** be a null-terminated UTF-8 string
- VUID-VkShaderCreateInfoEXT-pPushConstantRanges-parameter
If **pushConstantRangeCount** is not **0**, and **pPushConstantRanges** is not **NULL**, **pPushConstantRanges** **must** be a valid pointer to an array of **pushConstantRangeCount** valid [VkPushConstantRange](#) structures
- VUID-VkShaderCreateInfoEXT-pSpecializationInfo-parameter
If **pSpecializationInfo** is not **NULL**, **pSpecializationInfo** **must** be a valid pointer to a valid [VkSpecializationInfo](#) structure
- VUID-VkShaderCreateInfoEXT-codeSize-arraylength
codeSize **must** be greater than **0**

```
// Provided by VK_EXT_shader_object
typedef VkFlags VkShaderCreateFlagsEXT;
```

VkShaderCreateFlagsEXT is a bitmask type for setting a mask of zero or more [VkShaderCreateFlagBitsEXT](#).

Possible values of the **flags** member of [VkShaderCreateInfoEXT](#) specifying how a shader object is created, are:

```

// Provided by VK_EXT_shader_object
typedef enum VkShaderCreateFlagBitsEXT {
    VK_SHADER_CREATE_LINK_STAGE_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_descriptor_heap with VK_EXT_shader_object
    VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT = 0x00000400,
    // Provided by VK_KHR_maintenance5 with VK_ARM_shader_instrumentation,
    // VK_EXT_shader_object with VK_ARM_shader_instrumentation
    VK_SHADER_CREATE_INSTRUMENT_SHADER_BIT_ARM = 0x00000800,
    // Provided by VK_EXT_shader_object with VK_EXT_subgroup_size_control or
    // VK_VERSION_1_3
    VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT = 0x00000002,
    // Provided by VK_EXT_shader_object with VK_EXT_subgroup_size_control or
    // VK_VERSION_1_3
    VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT = 0x00000004,
    // Provided by VK_EXT_shader_object with VK_EXT_mesh_shader or VK_NV_mesh_shader
    VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT = 0x00000008,
    // Provided by VK_EXT_shader_object with VK_KHR_device_group or VK_VERSION_1_1
    VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT = 0x00000010,
    // Provided by VK_KHR_fragment_shading_rate with VK_EXT_shader_object
    VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT = 0x00000020,
    // Provided by VK_EXT_fragment_density_map with VK_EXT_shader_object
    VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT = 0x00000040,
    // Provided by VK_EXT_device_generated_commands
    VK_SHADER_CREATE_INDIRECT_BINDABLE_BIT_EXT = 0x00000080,
    // Provided by VK_EXT_shader_64bit_indexing
    VK_SHADER_CREATE_64_BIT_INDEXING_BIT_EXT = 0x00008000,
    // Provided by VK_KHR_maintenance11 with VK_EXT_shader_object
    VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR = 0x00040000,
} VkShaderCreateFlagBitsEXT;

```

- [VK_SHADER_CREATE_LINK_STAGE_BIT_EXT](#) specifies that a shader is linked to all other shaders created in the same [vkCreateShadersEXT](#) call whose [VkShaderCreateInfoEXT](#) structures' **flags** include [VK_SHADER_CREATE_LINK_STAGE_BIT_EXT](#).
- [VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT](#) specifies that the **SubgroupSize** may vary in a task, mesh, or compute shader.
- [VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT](#) specifies that the subgroup sizes **must** be launched with all invocations active in a task, mesh, or compute shader.
- [VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT](#) specifies that a mesh shader **must** only be used without a task shader. Otherwise, the mesh shader **must** only be used with a task shader.
- [VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT](#) specifies that a compute shader **can** be used with [vkCmdDispatchBase](#) with a non-zero base workgroup.
- [VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT](#) specifies that a fragment shader **can** be used with a fragment shading rate attachment.
- [VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT](#) specifies that a fragment shader **can** be used with a fragment density map attachment.
- [VK_SHADER_CREATE_INDIRECT_BINDABLE_BIT_EXT](#) specifies that the shader **can** be used in

combination with [Device-Generated Commands](#).

- [VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR](#) specifies that implementations **must** ensure that the properties and/or absence of a particular descriptor set do not influence any other descriptor sets for the shader. This allows shader objects to be created with a subset of the total descriptor sets.
- [VK_SHADER_CREATE_64_BIT_INDEXING_BIT_EXT](#) specifies that the shader enables [64-bit indexing](#).
- [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) specifies that the shader will use descriptor heap mappings instead of descriptor set layouts.

NOTE

The behavior of [VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT](#) and [VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT](#) differs subtly from the behavior of [VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR](#) and [VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT](#) in that the shader bit allows, but does not require the shader to be used with that type of attachment. This means that the application need not create multiple shaders when it does not know in advance whether the shader will be used with or without the attachment type, or when it needs the same shader to be compatible with usage both with and without. This **may** come at some performance cost on some implementations, so applications **should** still only set bits that are actually necessary.

Shader objects **can** be created using different types of shader code. Possible values of [VkShaderCreateInfoEXT::codeType](#), are:

```
// Provided by VK_EXT_shader_object
typedef enum VkShaderCodeTypeEXT {
    VK_SHADER_CODE_TYPE_BINARY_EXT = 0,
    VK_SHADER_CODE_TYPE_SPIRV_EXT = 1,
} VkShaderCodeTypeEXT;
```

- [VK_SHADER_CODE_TYPE_BINARY_EXT](#) specifies shader code in an opaque, implementation-defined binary format specific to the physical device.
- [VK_SHADER_CODE_TYPE_SPIRV_EXT](#) specifies shader code in SPIR-V format.

9.1.2. Binary Shader Code

Binary shader code **can** be retrieved from a shader object using the command:

```
// Provided by VK_EXT_shader_object
VkResult vkGetShaderBinaryDataEXT(
    VkDevice          device,
    VkShaderEXT       shader,
    size_t*           pDataSize,
    void*             pData);
```

- **device** is the logical device that shader object was created from.
- **shader** is the shader object to retrieve binary shader code from.
- **pDataSize** is a pointer to a **size_t** value related to the size of the binary shader code, as described below.
- **pData** is either **NULL** or a pointer to a buffer.

If **pData** is **NULL**, then the size of the binary shader code of the shader object, in bytes, is returned in **pDataSize**. Otherwise, **pDataSize** **must** point to a variable set by the application to the size of the buffer, in bytes, pointed to by **pData**, and on return the variable is overwritten with the amount of data actually written to **pData**. If **pDataSize** is less than the size of the binary shader code, nothing is written to **pData**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**.

NOTE

The behavior of this command when **pDataSize** is too small differs from how some other getter-type commands work in Vulkan. Because shader binary data is only usable in its entirety, it would never be useful for the implementation to return partial data. Because of this, nothing is written to **pData** unless **pDataSize** is large enough to fit the data in its entirety.

This behavior is not consistent with the behavior described in [Opaque Binary Data Results](#), for historical reasons.

If the amount of data available is larger than the passed **pDataSize**, the query returns a **VK_INCOMPLETE** success status instead of a **VK_ERROR_NOT_ENOUGH_SPACE_KHR** error status.

Binary shader code retrieved using **vkGetShaderBinaryDataEXT** **can** be passed to a subsequent call to **vkCreateShadersEXT** on a compatible physical device by specifying **VK_SHADER_CODE_TYPE_BINARY_EXT** in the **codeType** member of **VkShaderCreateInfoEXT**.

The shader code returned by repeated calls to this function with the same **VkShaderEXT** is guaranteed to be invariant for the lifetime of the **VkShaderEXT** object.

Valid Usage

- VUID-vkGetShaderBinaryDataEXT-None-08461
The **shaderObject** feature **must** be enabled
- VUID-vkGetShaderBinaryDataEXT-None-08499
If **pData** is not **NULL**, it **must** be aligned to **16** bytes

Valid Usage (Implicit)

- VUID-vkGetShaderBinaryDataEXT-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetShaderBinaryDataEXT-shader-parameter **shader** **must** be a valid [VkShaderEXT](#) handle
- VUID-vkGetShaderBinaryDataEXT-pDataSize-parameter **pDataSize** **must** be a valid pointer to a [size_t](#) value
- VUID-vkGetShaderBinaryDataEXT-pData-parameter
If the value referenced by **pDataSize** is not 0, and **pData** is not **NULL**, **pData** **must** be a valid pointer to an array of **pDataSize** bytes
- VUID-vkGetShaderBinaryDataEXT-shader-parent **shader** **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- [VK_INCOMPLETE](#)
- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

9.1.3. Binary Shader Compatibility

Binary shader compatibility means that binary shader code returned from a call to [vkGetShaderBinaryDataEXT](#) **can** be passed to a later call to [vkCreateShadersEXT](#), potentially on a different logical and/or physical device, and that this will result in the successful creation of a shader object functionally equivalent to the shader object that the code was originally queried from.

Binary shader code queried from [vkGetShaderBinaryDataEXT](#) is not guaranteed to be compatible across all devices, but implementations are required to provide some compatibility guarantees. Applications **may** determine binary shader compatibility using either (or both) of two mechanisms.

Guaranteed compatibility of shader binaries is expressed through a combination of the [shaderBinaryUUID](#) and [shaderBinaryVersion](#) members of the [VkPhysicalDeviceShaderObjectPropertiesEXT](#) structure queried from a physical device. Binary shaders retrieved from a physical device with a certain [shaderBinaryUUID](#) are guaranteed to be compatible with all other physical devices reporting the same [shaderBinaryUUID](#) and the same or

higher `shaderBinaryVersion`.

Whenever a new version of an implementation incorporates any changes that affect the output of `vkGetShaderBinaryDataEXT`, the implementation **should** either increment `shaderBinaryVersion` if binary shader code retrieved from older versions remains compatible with the new implementation, or else replace `shaderBinaryUUID` with a new value if backward compatibility has been broken. Binary shader code queried from a device with a matching `shaderBinaryUUID` and lower `shaderBinaryVersion` relative to the device on which `vkCreateShadersEXT` is being called **may** be suboptimal for the new device in ways that do not change shader functionality, but it is still guaranteed to be usable to successfully create the shader object(s).

NOTE

Implementations are encouraged to share `shaderBinaryUUID` between devices and driver versions to the maximum extent their hardware naturally allows, and are **strongly** discouraged from ever changing the `shaderBinaryUUID` for the same hardware except unless absolutely necessary.

In addition to the shader compatibility guarantees described above, it is valid for an application to call `vkCreateShadersEXT` with binary shader code created on a device with a different or unknown `shaderBinaryUUID` and/or higher `shaderBinaryVersion`. In this case, the implementation **may** use any unspecified means of its choosing to determine whether the provided binary shader code is usable. If it is, `vkCreateShadersEXT` **must** return `VK_SUCCESS`, and the created shader object is guaranteed to be valid. Otherwise, in the absence of some error, `vkCreateShadersEXT` **must** return `VK_INCOMPATIBLE_SHADER_BINARY_EXT` to indicate that the provided binary shader code is not compatible with the device.

9.1.4. Binding Shader Objects

Once shader objects have been created, they **can** be bound to the command buffer using the command:

```
// Provided by VK_EXT_shader_object
void vkCmdBindShadersEXT(
    VkCommandBuffer          commandBuffer,
    uint32_t                 stageCount,
    const VkShaderStageFlagBits* pStages,
    const VkShaderEXT*        pShaders);
```

- `commandBuffer` is the command buffer that the shader object will be bound to.
- `stageCount` is the length of the `pStages` and `pShaders` arrays.
- `pStages` is a pointer to an array of `VkShaderStageFlagBits` values specifying one stage per array index that is affected by the corresponding value in the `pShaders` array.
- `pShaders` is a pointer to an array of `VkShaderEXT` handles and/or `VK_NULL_HANDLE` values describing the shader binding operations to be performed on each stage in `pStages`.

When binding linked shaders, an application **may** bind them in any combination of one or more calls to `vkCmdBindShadersEXT` (i.e., shaders that were created linked together do not need to be bound

in the same `vkCmdBindShadersEXT` call).

Any shader object bound to a particular stage **may** be unbound by setting its value in `pShaders` to `VK_NULL_HANDLE`. If `pShaders` is `NULL`, `vkCmdBindShadersEXT` behaves as if `pShaders` was an array of `stageCount` `VK_NULL_HANDLE` values (i.e., any shaders bound to the stages specified in `pStages` are unbound).

Valid Usage

- VUID-vkCmdBindShadersEXT-None-08462
The `shaderObject` feature **must** be enabled
- VUID-vkCmdBindShadersEXT-pStages-08463
Every element of `pStages` **must** be unique
- VUID-vkCmdBindShadersEXT-pStages-08464
`pStages` **must** not contain `VK_SHADER_STAGE_ALL_GRAPHICS` or `VK_SHADER_STAGE_ALL`
- VUID-vkCmdBindShadersEXT-pStages-08465
`pStages` **must** not contain `VK_SHADER_STAGE_RAYGEN_BIT_KHR`, `VK_SHADER_STAGE_ANY_HIT_BIT_KHR`, `VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR`, `VK_SHADER_STAGE_MISS_BIT_KHR`, `VK_SHADER_STAGE_INTERSECTION_BIT_KHR`, or `VK_SHADER_STAGE_CALLABLE_BIT_KHR`
- VUID-vkCmdBindShadersEXT-pStages-08467
`pStages` **must** not contain `VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI`
- VUID-vkCmdBindShadersEXT-pStages-08468
`pStages` **must** not contain `VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI`
- VUID-vkCmdBindShadersEXT-pShaders-08469
For each element of `pStages`, if `pShaders` is not `NULL`, and the element of the `pShaders` array with the same index is not `VK_NULL_HANDLE`, it **must** have been created with a `stage` equal to the corresponding element of `pStages`
- VUID-vkCmdBindShadersEXT-pShaders-08470
If `pStages` contains both `VK_SHADER_STAGE_TASK_BIT_EXT` and `VK_SHADER_STAGE_VERTEX_BIT`, and `pShaders` is not `NULL`, and the same index in `pShaders` as `VK_SHADER_STAGE_TASK_BIT_EXT` in `pStages` is not `VK_NULL_HANDLE`, the same index in `pShaders` as `VK_SHADER_STAGE_VERTEX_BIT` in `pStages` **must** be `VK_NULL_HANDLE`
- VUID-vkCmdBindShadersEXT-pShaders-08471
If `pStages` contains both `VK_SHADER_STAGE_MESH_BIT_EXT` and `VK_SHADER_STAGE_VERTEX_BIT`, and `pShaders` is not `NULL`, and the same index in `pShaders` as `VK_SHADER_STAGE_MESH_BIT_EXT` in `pStages` is not `VK_NULL_HANDLE`, the same index in `pShaders` as `VK_SHADER_STAGE_VERTEX_BIT` in `pStages` **must** be `VK_NULL_HANDLE`
- VUID-vkCmdBindShadersEXT-pShaders-08476
If `pStages` contains `VK_SHADER_STAGE_COMPUTE_BIT`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- VUID-vkCmdBindShadersEXT-pShaders-08477
If `pStages` contains `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, or `VK_SHADER_STAGE_FRAGMENT_BIT`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdBindShadersEXT-pShaders-08478
If `pStages` contains `VK_SHADER_STAGE_MESH_BIT_EXT` or `VK_SHADER_STAGE_TASK_BIT_EXT`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

Valid Usage (Implicit)

- VUID-vkCmdBindShadersEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBindShadersEXT-pStages-parameter
`pStages` **must** be a valid pointer to an array of `stageCount` valid `VkShaderStageFlagBits` values
- VUID-vkCmdBindShadersEXT-pShaders-parameter
If `pShaders` is not `NULL`, `pShaders` **must** be a valid pointer to an array of `stageCount` valid or `VK_NULL_HANDLE` `VkShaderEXT` handles
- VUID-vkCmdBindShadersEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdBindShadersEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdBindShadersEXT-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdBindShadersEXT-stageCount-arraylength
`stageCount` **must** be greater than 0
- VUID-vkCmdBindShadersEXT-commonparent
Both of `commandBuffer`, and the elements of `pShaders` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT HICS_BIT	State

Conditional Rendering

vkCmdBindShadersEXT is not affected by [conditional rendering](#)

9.1.5. Setting State

Whenever shader objects are used to issue drawing commands, the appropriate [dynamic state](#) setting commands **must** have been called to set the relevant state in the command buffer prior to drawing:

- [vkCmdSetViewportWithCount](#)
- [vkCmdSetScissorWithCount](#)
- [vkCmdSetRasterizerDiscardEnable](#)

If a shader is bound to the [VK_SHADER_STAGE_VERTEX_BIT](#) stage, the following commands **must** have been called in the command buffer prior to drawing:

- [vkCmdSetVertexInputEXT](#)
- [vkCmdSetPrimitiveTopology](#)
- [vkCmdSetPrimitiveRestartEnable](#)

If a shader is bound to the [VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT](#) stage, the following command **must** have been called in the command buffer prior to drawing:

- [vkCmdSetPatchControlPointsEXT](#), if [primitiveTopology](#) is [VK_PRIMITIVE_TOPOLOGY_PATCH_LIST](#)

If a shader is bound to the [VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT](#) stage, the following command **must** have been called in the command buffer prior to drawing:

- [vkCmdSetTessellationDomainOriginEXT](#)

If [rasterizerDiscardEnable](#) is [VK_FALSE](#), the following commands **must** have been called in the command buffer prior to drawing:

- [vkCmdSetRasterizationSamplesEXT](#)

- `vkCmdSetSampleMaskEXT`
- `vkCmdSetAlphaToCoverageEnableEXT`
- `vkCmdSetAlphaToOneEnableEXT`, if the `alphaToOne` feature is enabled
- `vkCmdSetPolygonModeEXT`
- `vkCmdSetLineWidth`, if the `effective rasterization input topology` is in `line topology class`
- `vkCmdSetCullMode`
- `vkCmdSetFrontFace`
- `vkCmdSetDepthTestEnable`
- `vkCmdSetDepthWriteEnable`, if `depthTestEnable` is `VK_TRUE`
- `vkCmdSetDepthCompareOp`, if `depthTestEnable` is `VK_TRUE`
- `vkCmdSetDepthBoundsTestEnable`, if the `depthBounds` feature is enabled
- `vkCmdSetDepthBounds`, if `depthBoundsTestEnable` is `VK_TRUE`
- `vkCmdSetDepthBiasEnable`
- `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT`, if `depthBiasEnable` is `VK_TRUE`
- `vkCmdSetDepthClampEnableEXT`, if the `depthClamp` feature is enabled
- `vkCmdSetStencilTestEnable`
- `vkCmdSetStencilOp`, if `stencilTestEnable` is `VK_TRUE`
- `vkCmdSetStencilCompareMask`, if `stencilTestEnable` is `VK_TRUE`
- `vkCmdSetStencilWriteMask`, if `stencilTestEnable` is `VK_TRUE`
- `vkCmdSetStencilReference`, if `stencilTestEnable` is `VK_TRUE`

If a shader is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetLogicOpEnableEXT`, if the `logicOp` feature is enabled
- `vkCmdSetLogicOpEXT`, if `logicOpEnable` is `VK_TRUE`
- `vkCmdSetColorBlendEnableEXT` and `vkCmdSetColorWriteMaskEXT`, if color attachments are bound, with values set for every color attachment in the render pass instance active at draw time
- `vkCmdSetColorBlendEquationEXT` or `vkCmdSetColorBlendAdvancedEXT`, if color attachments are bound, for every attachment whose index in `pColorBlendEnables` is a pointer to a value of `VK_TRUE`
- `vkCmdSetBlendConstants`, if any index in `pColorBlendEnables` is `VK_TRUE`, and the same index in `pColorBlendEquations` is a `VkColorBlendEquationEXT` structure with any `VkBlendFactor` member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`

If the `pipelineFragmentShadingRate` feature is enabled, and `rasterizerDiscardEnable` is `VK_FALSE`, the

following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetFragmentShadingRateKHR`

If the `geometryStreams` feature is enabled, and a shader is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetRasterizationStreamEXT`

If the `VK_EXT_discard_rectangles` extension is enabled, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetDiscardRectangleEnableEXT`
- `vkCmdSetDiscardRectangleModeEXT`, if `discardRectangleEnable` is `VK_TRUE`
- `vkCmdSetDiscardRectangleEXT`, if `discardRectangleEnable` is `VK_TRUE`

If the `VK_EXT_conservative_rasterization` extension is enabled, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetConservativeRasterizationModeEXT`
- `vkCmdSetExtraPrimitiveOverestimationSizeEXT`, if `conservativeRasterizationMode` is `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`

If the `depthClipEnable` feature is enabled, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetDepthClipEnableEXT`

If the `VK_EXT_sample_locations` extension is enabled, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetSampleLocationsEnableEXT`
- `vkCmdSetSampleLocationsEXT`, if `sampleLocationsEnable` is `VK_TRUE`

If the `VK_EXT_provoking_vertex` extension is enabled, and `rasterizerDiscardEnable` is `VK_FALSE`, and a shader is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetProvokingVertexModeEXT`

If any of the `stippledRectangularLines`, `stippledBresenhamLines`, or `stippledSmoothLines` features are enabled, and `rasterizerDiscardEnable` is `VK_FALSE`, and if the `effective rasterization input topology` is in line `topology class`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetLineRasterizationModeEXT`
- `vkCmdSetLineStippleEnableEXT`

- `vkCmdSetLineStipple`, if `stippledLineEnable` is `VK_TRUE`

If the `depthClipControl` feature is enabled, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetDepthClipNegativeOneToOneEXT`

If the `colorWriteEnable` feature is enabled, and a shader is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetColorWriteEnableEXT`, with values set for every color attachment in the render pass instance active at draw time

If the `attachmentFeedbackLoopDynamicState` feature is enabled, and a shader is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetAttachmentFeedbackLoopEnableEXT`

If the `VK_NV_clip_space_w_scaling` extension is enabled, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetViewportWScalingEnableNV`
- `vkCmdSetViewportWScalingNV`, if `viewportWScalingEnable` is `VK_TRUE`

If the `depthClamp` and `depthClampControl` features are enabled, and `depthClampEnable` is `VK_TRUE`, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetDepthClampRangeEXT`

If the `VK_NV_viewport_swizzle` extension is enabled, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetViewportSwizzleNV`

If the `VK_NV_fragment_coverage_to_color` extension is enabled, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetCoverageToColorEnableNV`
- `vkCmdSetCoverageToColorLocationNV`, if `coverageToColorEnable` is `VK_TRUE`

If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetCoverageModulationModeNV`
- `vkCmdSetCoverageModulationTableEnableNV`, if `coverageModulationMode` is not `VK_COVERAGE_MODULATION_MODE_NONE_NV`

- `vkCmdSetCoverageModulationTableNV`, if `coverageModulationTableEnable` is `VK_TRUE`

If the `coverageReductionMode` feature is enabled, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetCoverageReductionModeNV`

If the `representativeFragmentTest` feature is enabled, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetRepresentativeFragmentTestEnableNV`

If the `shadingRateImage` feature is enabled, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetCoarseSampleOrderNV`
- `vkCmdSetShadingRateImageEnableNV`
- `vkCmdSetViewportShadingRatePaletteNV`, if `shadingRateImageEnable` is `VK_TRUE`

If the `exclusiveScissor` feature is enabled, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetExclusiveScissorEnableNV`
- `vkCmdSetExclusiveScissorNV`, if any value in `pExclusiveScissorEnables` is `VK_TRUE`

State **can** be set either at any time before or after shader objects are bound, but all required state **must** be set prior to issuing drawing commands.

If the `commandBufferInheritance` feature is enabled, graphics and compute state is inherited from the previously executed command buffer in the queue. Any valid state inherited in this way does not need to be set again in the current command buffer.

9.1.6. Interaction With Pipelines

Calling `vkCmdBindShadersEXT` causes the pipeline bind points `corresponding to each stage` in `pStages` to be disturbed, meaning that any `pipelines` that had previously been bound to those pipeline bind points are no longer bound.

If `VK_PIPELINE_BIND_POINT_GRAPHICS` is disturbed (i.e., if `pStages` contains any graphics stage), any graphics pipeline state that the previously bound pipeline did not specify as `dynamic` becomes undefined, and **must** be set in the command buffer before issuing drawing commands using shader objects.

Calls to `vkCmdBindPipeline` likewise disturb the shader stage(s) corresponding to `pipelineBindPoint`, meaning that any shaders that had previously been bound to any of those stages are no longer bound, even if the pipeline was created without shaders for some of those stages.

9.1.7. Shader Object Destruction

To destroy a shader object, call:

```
// Provided by VK_EXT_shader_object
void vkDestroyShaderEXT(
    VkDevice          device,
    VkShaderEXT       shader,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the shader object.
- **shader** is the handle of the shader object to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

Destroying a shader object used by one or more command buffers in the [recording or executable state](#) causes those command buffers to move into the *invalid state*.

Valid Usage

- VUID-vkDestroyShaderEXT-None-08481
The **shaderObject** feature **must** be enabled
- VUID-vkDestroyShaderEXT-shader-08482
All submitted commands that refer to **shader** **must** have completed execution
- VUID-vkDestroyShaderEXT-pAllocator-08483
If **VkAllocationCallbacks** were provided when **shader** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyShaderEXT-pAllocator-08484
If no **VkAllocationCallbacks** were provided when **shader** was created, **pAllocator** **must** be **NULL**

Valid Usage (Implicit)

- VUID-vkDestroyShaderEXT-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkDestroyShaderEXT-shader-parameter
If **shader** is not **VK_NULL_HANDLE**, **shader** **must** be a valid **VkShaderEXT** handle
- VUID-vkDestroyShaderEXT-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid **VkAllocationCallbacks** structure
- VUID-vkDestroyShaderEXT-shader-parent
If **shader** is a valid handle, it **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **shader** **must** be externally synchronized

9.2. Shader Modules

Shader modules contain *shader code* and one or more entry points. Shaders are selected from a shader module by specifying an entry point as part of [pipeline](#) creation. The stages of a pipeline **can** use shaders that come from different modules. The shader code defining a shader module **must** be in the SPIR-V format, as described by the [Vulkan Environment for SPIR-V](#) appendix.

Shader modules are represented by **VkShaderModule** handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderModule)
```

To create a shader module, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateShaderModule(
    VkDevice                                device,
    const VkShaderModuleCreateInfo*         pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkShaderModule*                         pShaderModule);
```

- **device** is the logical device that creates the shader module.
- **pCreateInfo** is a pointer to a [VkShaderModuleCreateInfo](#) structure.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pShaderModule** is a pointer to a [VkShaderModule](#) handle in which the resulting shader module object is returned.

Once a shader module has been created, any entry points it contains **can** be used in pipeline shader stages as described in [Compute Pipelines](#) and [Graphics Pipelines](#) .

NOTE

If the **maintenance5** feature is enabled, shader module creation can be omitted entirely. Instead, applications should provide the [VkShaderModuleCreateInfo](#) structure directly in to pipeline creation by chaining it to [VkPipelineShaderStageCreateInfo](#). This avoids the overhead of creating and managing an additional object.

Valid Usage

- VUID-vkCreateShaderModule-pCreateInfo-06904

If `pCreateInfo` is not `NULL`, `pCreateInfo->pNext` **must** be `NULL` or a pointer to a valid instance of

- `VkShaderModuleValidationCacheCreateInfoEXT`
- `VkValidationFeaturesEXT`

Valid Usage (Implicit)

- VUID-vkCreateShaderModule-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateShaderModule-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkShaderModuleCreateInfo` structure
- VUID-vkCreateShaderModule-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateShaderModule-pShaderModule-parameter
`pShaderModule` **must** be a valid pointer to a `VkShaderModule` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INVALID_SHADER_NV`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkShaderModuleCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkShaderModuleCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkShaderModuleCreateFlags flags;
    size_t              codeSize;
    const uint32_t*     pCode;
} VkShaderModuleCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `codeSize` is the size, in bytes, of the code pointed to by `pCode`.
- `pCode` is a pointer to code that is used to create the shader module. The type and format of the code is determined from the content of the memory addressed by `pCode`.

Valid Usage

- VUID-VkShaderModuleCreateInfo-codeSize-08735
If `pCode` is a pointer to SPIR-V code, `codeSize` **must** be a multiple of 4
- VUID-VkShaderModuleCreateInfo-pCode-08736
If `pCode` is a pointer to SPIR-V code, `pCode` **must** point to valid SPIR-V code, formatted and packed as described by the [Khronos SPIR-V Specification](#)
- VUID-VkShaderModuleCreateInfo-pCode-08737
If `pCode` is a pointer to SPIR-V code, `pCode` **must** adhere to the validation rules described by the [Validation Rules within a Module](#) section of the [SPIR-V Environment](#) appendix
- VUID-VkShaderModuleCreateInfo-pCode-08738
If `pCode` is a pointer to SPIR-V code, `pCode` **must** declare the `Shader` capability for SPIR-V code
- VUID-VkShaderModuleCreateInfo-pCode-08739
If `pCode` is a pointer to SPIR-V code, `pCode` **must** not declare any capability that is not supported by the API, as described by the [Capabilities](#) section of the [SPIR-V Environment](#) appendix
- VUID-VkShaderModuleCreateInfo-pCode-08740
If `pCode` is a pointer to SPIR-V code, and `pCode` declares any of the capabilities listed in the [SPIR-V Environment](#) appendix, one of the corresponding requirements **must** be satisfied
- VUID-VkShaderModuleCreateInfo-pCode-08741
If `pCode` is a pointer to SPIR-V code, `pCode` **must** not declare any SPIR-V extension that is not supported by the API, as described by the [Extension](#) section of the [SPIR-V Environment](#) appendix
- VUID-VkShaderModuleCreateInfo-pCode-08742
If `pCode` is a pointer to SPIR-V code, and `pCode` declares any of the SPIR-V extensions listed in the [SPIR-V Environment](#) appendix, one of the corresponding requirements **must** be satisfied
- VUID-VkShaderModuleCreateInfo-pCode-07912
If the `VK_NV_glsl_shader` extension is not enabled, `pCode` **must** be a pointer to SPIR-V code
- VUID-VkShaderModuleCreateInfo-pCode-01379
If `pCode` is a pointer to GLSL code, it **must** be valid GLSL code written to the `GL_KHR_vulkan_glsl` GLSL extension specification
- VUID-VkShaderModuleCreateInfo-codeSize-01085
`codeSize` **must** be greater than 0

Valid Usage (Implicit)

- `VUID-VkShaderModuleCreateInfo-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO`
- `VUID-VkShaderModuleCreateInfo-flags-zeroBitmask`
`flags` **must** be `0`
- `VUID-VkShaderModuleCreateInfo-pCode-parameter`
`pCode` **must** be a valid pointer to an array of $\frac{\text{codeSize}}{4}$ `uint32_t` values

Structure Chaining

Extends the structures

- `VkDataGraphPipelineCreateInfoARM`
- `VkPipelineShaderStageCreateInfo`

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderModuleCreateFlags;
```

`VkShaderModuleCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To use a `VkValidationCacheEXT` to cache shader validation results, add a `VkShaderModuleValidationCacheCreateInfoEXT` structure to the `pNext` chain of the `VkShaderModuleCreateInfo` structure, specifying the cache object to use.

The `VkShaderModuleValidationCacheCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_validation_cache
typedef struct VkShaderModuleValidationCacheCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkValidationCacheEXT validationCache;
} VkShaderModuleValidationCacheCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `validationCache` is the validation cache object from which the results of prior validation attempts will be written, and to which new validation results for this `VkShaderModule` will be written (if not already present). The implementation **must** not access this object outside of the duration of the command this structure is passed to.

Valid Usage (Implicit)

- VUID-VkShaderModuleValidationCacheCreateInfoEXT-sType-sType **must** be [VK_STRUCTURE_TYPE_SHADER_MODULE_VALIDATION_CACHE_CREATE_INFO_EXT](#)
- VUID-VkShaderModuleValidationCacheCreateInfoEXT-validationCache-parameter **validationCache** **must** be a valid [VkValidationCacheEXT](#) handle

Structure Chaining

Extends the structures

- [VkPipelineShaderStageCreateInfo](#)
- [VkShaderModuleCreateInfo](#)

To destroy a shader module, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyShaderModule(
    VkDevice          device,
    VkShaderModule    shaderModule,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the shader module.
- **shaderModule** is the handle of the shader module to destroy.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

A shader module **can** be destroyed while pipelines created using its shaders are still in use.

Valid Usage

- VUID-vkDestroyShaderModule-shaderModule-01092
If **VkAllocationCallbacks** were provided when **shaderModule** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyShaderModule-shaderModule-01093
If no **VkAllocationCallbacks** were provided when **shaderModule** was created, **pAllocator** **must** be **NULL**

Valid Usage (Implicit)

- VUID-vkDestroyShaderModule-device-parameter **device** **must** be a valid [VkDevice](#) handle

- VUID-vkDestroyShaderModule-shaderModule-parameter
If `shaderModule` is not `VK_NULL_HANDLE`, `shaderModule` **must** be a valid `VkShaderModule` handle
- VUID-vkDestroyShaderModule-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyShaderModule-shaderModule-parent
If `shaderModule` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `shaderModule` **must** be externally synchronized

9.3. Shader Module Identifiers

Shader modules have unique identifiers associated with them. To query an implementation provided identifier, call:

```
// Provided by VK_EXT_shader_module_identifier
void vkGetShaderModuleIdentifierEXT(
    VkDevice                device,
    VkShaderModule          shaderModule,
    VkShaderModuleIdentifierEXT* pIdentifier);
```

- `device` is the logical device that created the shader module.
- `shaderModule` is the handle of the shader module.
- `pIdentifier` is a pointer to the returned `VkShaderModuleIdentifierEXT`.

The identifier returned by the implementation **must** only depend on `shaderIdentifierAlgorithmUUID` and information provided in the `VkShaderModuleCreateInfo` which created `shaderModule`. The implementation **may** return equal identifiers for two different `VkShaderModuleCreateInfo` structures if the difference does not affect pipeline compilation. Identifiers are only meaningful on different `VkDevice` objects if the device the identifier was queried from had the same `shaderModuleIdentifierAlgorithmUUID` as the device consuming the identifier.

Valid Usage

- VUID-vkGetShaderModuleIdentifierEXT-shaderModuleIdentifier-06884
`shaderModuleIdentifier` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetShaderModuleIdentifierEXT-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetShaderModuleIdentifierEXT-shaderModule-parameter **shaderModule** **must** be a valid [VkShaderModule](#) handle
- VUID-vkGetShaderModuleIdentifierEXT-pIdentifier-parameter **pIdentifier** **must** be a valid pointer to a [VkShaderModuleIdentifierEXT](#) structure
- VUID-vkGetShaderModuleIdentifierEXT-shaderModule-parent **shaderModule** **must** have been created, allocated, or retrieved from **device**

[VkShaderModuleCreateInfo](#) structures have unique identifiers associated with them. To query an implementation provided identifier, call:

```
// Provided by VK_EXT_shader_module_identifier
void vkGetShaderModuleCreateInfoIdentifierEXT(
    VkDevice device,
    const VkShaderModuleCreateInfo* pCreateInfo,
    VkShaderModuleIdentifierEXT* pIdentifier);
```

- **device** is the logical device that **can** create a [VkShaderModule](#) from **pCreateInfo**.
- **pCreateInfo** is a pointer to a [VkShaderModuleCreateInfo](#) structure.
- **pIdentifier** is a pointer to the returned [VkShaderModuleIdentifierEXT](#).

The identifier returned by implementation **must** only depend on **shaderIdentifierAlgorithmUUID** and information provided in the [VkShaderModuleCreateInfo](#). The implementation **may** return equal identifiers for two different [VkShaderModuleCreateInfo](#) structures if the difference does not affect pipeline compilation. Identifiers are only meaningful on different [VkDevice](#) objects if the device the identifier was queried from had the same **shaderModuleIdentifierAlgorithmUUID** as the device consuming the identifier.

The identifier returned by the implementation in [vkGetShaderModuleCreateInfoIdentifierEXT](#) **must** be equal to the identifier returned by [vkGetShaderModuleIdentifierEXT](#) given equivalent definitions of [VkShaderModuleCreateInfo](#) and any chained **pNext** structures.

Valid Usage

- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-shaderModuleIdentifier-06885 **shaderModuleIdentifier** feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-device-parameter

device **must** be a valid [VkDevice](#) handle

- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkShaderModuleCreateInfo](#) structure
- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-pIdentifier-parameter
pIdentifier **must** be a valid pointer to a [VkShaderModuleIdentifierEXT](#) structure

[VkShaderModuleIdentifierEXT](#) represents a shader module identifier returned by the implementation.

```
// Provided by VK_EXT_shader_module_identifier
typedef struct VkShaderModuleIdentifierEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           identifierSize;
    uint8_t            identifier[VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT];
} VkShaderModuleIdentifierEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **identifierSize** is the size, in bytes, of valid data returned in **identifier**.
- **identifier** is a buffer of opaque data specifying an identifier.

Any returned values beyond the first **identifierSize** bytes are undefined. Implementations **must** return an **identifierSize** greater than 0, and less-or-equal to [VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT](#).

Two identifiers are considered equal if **identifierSize** is equal and the first **identifierSize** bytes of **identifier** compare equal.

Implementations **may** return a different **identifierSize** for different modules. Implementations **should** ensure that **identifierSize** is large enough to uniquely define a shader module.

Valid Usage (Implicit)

- VUID-VkShaderModuleIdentifierEXT-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_SHADER_MODULE_IDENTIFIER_EXT](#)
- VUID-VkShaderModuleIdentifierEXT-pNext-pNext
pNext **must** be `NULL`

[VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT](#) is the length in bytes of a shader module identifier, as returned in [VkShaderModuleIdentifierEXT::identifierSize](#).

```
#define VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT 32U
```

9.4. Binding Shaders

Before a shader can be used it **must** be first bound to the command buffer.

Calling `vkCmdBindPipeline` binds all stages corresponding to the `VkPipelineBindPoint`. Calling `vkCmdBindShadersEXT` binds all stages in `pStages`

The following table describes the relationship between shader stages and pipeline bind points:

Shader stage	Pipeline bind point	behavior controlled
<ul style="list-style-type: none">• <code>VK_SHADER_STAGE_VERTEX_BIT</code>• <code>VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT</code>• <code>VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT</code>• <code>VK_SHADER_STAGE_GEOMETRY_BIT</code>• <code>VK_SHADER_STAGE_FRAGMENT_BIT</code>• <code>VK_SHADER_STAGE_TASK_BIT_EXT</code>• <code>VK_SHADER_STAGE_MESH_BIT_EXT</code>	<code>VK_PIPELINE_BIND_POINT_GRAPHICS</code>	all drawing commands
<ul style="list-style-type: none">• <code>VK_SHADER_STAGE_COMPUTE_BIT</code>	<code>VK_PIPELINE_BIND_POINT_COMPUTE</code>	all dispatch commands

9.5. Shader Execution

At each stage of the pipeline, multiple invocations of a shader **may** execute simultaneously. Further, invocations of a single shader produced as the result of different commands **may** execute simultaneously. The relative execution order of invocations of the same shader type is undefined. Shader invocations **may** complete in a different order than that in which the primitives they originated from were drawn or dispatched by the application. However, fragment shader outputs are written to attachments in [rasterization order](#).

The relative execution order of invocations of different shader types is largely undefined. However, when invoking a shader whose inputs are generated from a previous pipeline stage, the shader invocations from the previous stage are guaranteed to have executed far enough to generate input values for all required [shader inputs](#).

NOTE

This execution ordering guarantee is limited to variables in the shader input and output interface and payloads sent between stages. In particular, stores or atomic operations on storage buffers or images are not part of these interfaces and such operations in a previous pipeline stage are not guaranteed to be visible in the subsequent pipeline stage.

9.5.1. Shader Termination

A shader invocation that is *terminated* has finished executing instructions.

Executing [OpReturn](#) in the entry point, or executing [OpTerminateInvocation](#) in any function will terminate an invocation. Implementations **may** also terminate a shader invocation when [OpKill](#) is executed in any function; otherwise it becomes a [helper invocation](#).

In addition to the above conditions, [helper invocations](#) **may** be terminated when all non-helper invocations in the same [derivative group](#) either terminate or become [helper invocations](#).

A shader stage for a given command completes execution when all invocations for that stage have terminated.

NOTE

Depending on the implementation, [OpKill](#) will be functionally equivalent to either [OpTerminateInvocation](#) or [OpDemoteToHelperInvocation](#). To obtain the most predictable behavior, shader authors should use [OpTerminateInvocation](#) or [OpDemoteToHelperInvocation](#) rather than [OpKill](#) wherever possible.

9.6. Shader Out-of-Bounds Memory Access

Shader accesses to memory are not automatically bounds checked by the implementation. Applications **must** not execute operations that would access out of bounds memory locations unless

some form of bounds checking is enabled. An access is considered out of bounds if any part of the access is outside of any specified memory range, whether that is the array length specified in a shader or a range specified in the API (e.g. descriptor size).

NOTE

External tooling such as the Vulkan Validation Layers can be used to help validate that accesses are not out of bounds.

An access **can** be independently out of bounds for each range that applies; if one is bounds checked and the others are not, behavior is still undefined.

For example, given the following shader declaration

NOTE

```
// Buffer type
struct MySSBO {
    uint32_t data[2];
};
```

accessing `data` at an index greater than 1 is undefined behavior, whether the underlying buffer is bigger than that or not.

Vulkan provides functionality that enables automatic bounds checking in some cases, as outlined below.

NOTE

Automatic bounds checking can be used to ensure that accesses outside of certain bounds have predictable results, acting as a safety net for untrusted code, or simply as a way for applications to avoid their own bounds checks. While there may be a performance cost for enabling these features, they should not be slower than an application performing equivalent checks. Automatic checks do not necessarily account for all possible bounds - e.g. [Robust Buffer Access](#) will not prevent undefined behavior in the buffer access example in the prior note.

9.6.1. Robust Buffer Access

Robust buffer access **can** be enabled by specifying `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS` in `VkPipelineRobustnessCreateInfo`, or specifying `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT` and enabling the `robustBufferAccess` feature.

When robust buffer access is enabled, access to a buffer via a descriptor is bounds checked against the range specified for the descriptor, and access to vertex input data is bounds checked against the bound vertex buffer range. Reads from a vertex input **may** instead be bounds checked against a range rounded down to the nearest multiple of the stride of its binding.

NOTE

The range of a descriptor is not necessarily equivalent to the size of the underlying resource; applications may suballocate descriptors from larger buffers, for instance. The APIs specifying the descriptor range vary between resource types and

descriptor interfaces, but for example include the ranges specified by [VkDescriptorBufferInfo](#) or [VkBufferViewCreateInfo](#).

If any vertex input read is outside of the checked range, all other vertex input reads through the same binding in the same shader invocation **may** behave as if they were outside of the checked range.

If any access to a uniform, storage, uniform texel, or storage texel buffer is outside of the checked range, any access of the same type (write, read-modify-write, or read) to the same buffer that is less than 16 bytes away from the first access **may** behave as if it is also outside of the checked range.

Any non-atomic access to a uniform, storage, uniform texel, or storage texel buffer wider than 32-bits **may** be treated as multiple 32-bit accesses that are separately bounds checked.

Writes to a storage or storage texel buffer outside of the checked range will either be discarded, or modify values within the memory range(s) bound to the underlying buffer (including outside of the checked range). They will not modify any other memory.

NOTE

Non-atomic writes outside of the checked range **can** lead to data races, as the application has no control over where the data will be written.

Atomic read-modify-write operations to a storage or storage texel buffer outside of the checked range will behave the same as a write outside of the checked range, but will return an undefined value.

Reading a uniform, storage, uniform texel, or storage texel buffer outside of the checked range will return one of the following values:

- Values from anywhere within the memory range(s) bound to the underlying buffer object, which **may** include bytes beyond the size of the buffer itself.
- Zero values
- For 4-component vectors, a value of (0,0,0,x), where x is any of
 - 0, 1, or the maximum positive integer value for integer components
 - 0.0 or 1.0 for floating-point components
- The value of the last store to the same out-of-bounds location in the same shader invocation.
 - Using the **Volatile/VolatileTexel** memory/image operand, the **Volatile** memory semantic, or the **Volatile** decoration to load the value will prevent prior stored values from being returned.

NOTE

Getting the value of the previous store is possible as implementations are free to optimize multiple accesses in the general case. There are several ways this **can** be prevented, but using volatile loads is by far the simplest.

Reads from a vertex input outside of the checked range will produce one of the following values:

- Values from anywhere within the memory range(s) bound to the underlying buffer object, which **may** include bytes beyond the size of the buffer itself, converted via [input extraction](#).

- Zero values, converted via [input extraction](#).
- Zero values
- For 4-component vectors, a value of (0,0,0,x), where x is any of
 - 0, 1, or the maximum positive integer value for integer components
 - 0.0 or 1.0 for floating-point components

Accesses via `OpCooperativeMatrixLoadNV` and `OpCooperativeMatrixStoreNV` are only bounds checked in the above manner if the `VkPhysicalDeviceCooperativeMatrixFeaturesNV::cooperativeMatrixRobustBufferAccess` feature is enabled.

Accesses via `OpCooperativeMatrixLoadKHR` and `OpCooperativeMatrixStoreKHR` are only bounds checked in the above manner if the `VkPhysicalDeviceCooperativeMatrixFeaturesKHR::cooperativeMatrixRobustBufferAccess` feature is enabled.

Accesses using `OpCooperativeVector*` instructions are not bounds-checked.

9.6.2. Robust Buffer Access 2

Robust buffer access 2 can be enabled by specifying `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2` in `VkPipelineRobustnessCreateInfo`, or specifying `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT` and enabling the `robustBufferAccess2` feature.

When robust buffer access 2 is enabled, access to a buffer via a descriptor is bounds checked against the range specified for the descriptor, and access to vertex input data is bounds checked against the bound vertex buffer range, similarly to [Robust Buffer Access](#), but with tighter bounds on the results.

Accesses to a uniform buffer **may** instead be bounds checked against a range rounded up to `robustUniformBufferAccessSizeAlignment`. Accesses inside the aligned range **may** behave as if they are in bounds, even if they are outside of the unaligned descriptor range, and access memory accordingly. The same is true for accesses to a storage buffer, using the `robustStorageBufferAccessSizeAlignment` limit instead.

NOTE	To avoid unexpected data races between neighboring descriptor ranges, applications may wish to ensure suballocated ranges of buffers are aligned to these limits.
-------------	---

Any access to a uniform, storage, uniform texel, or storage texel buffer wider than 32-bits **may** be treated as multiple 32-bit accesses that are separately bounds checked.

NOTE	Accesses to null descriptors are not considered out-of-bounds and have separate behavior controlled by the <code>nullDescriptor</code> feature.
-------------	---

Writes to a storage or storage texel buffer outside of the checked range will not modify any memory.

Atomic read-modify-write operations to a storage or storage texel buffer outside of the checked range will behave the same as a write outside of the checked range, but will return an undefined value.

Reads from a uniform or storage buffer outside of the checked range will return zero values. If a value was previously written to the same out of bounds location in the same shader invocation, that value **may** be returned instead; using the `Volatile/VolatileTexel` memory/image operand, the `Volatile` memory semantic, or the `Volatile` decoration to load the value will prevent prior stored values from being returned.

Reading a uniform texel or storage texel buffer outside of the checked range will produce zero values, but `component substitution` will still be applied based on the buffer view's format, with the resulting value returned to the shader. If a value was previously written to the same out of bounds location in the same shader invocation, that value **may** be returned instead; using the `Volatile/VolatileTexel` memory/image operand, the `Volatile` memory semantic, or the `Volatile` decoration to load the value will prevent prior stored values from being returned.

Reads from a vertex input outside of the checked range will produce zero values, but `input extraction` will still be applied, filling missing G, B, or A components with (0,0,1).

Accesses via `OpCooperativeMatrixLoadNV` and `OpCooperativeMatrixStoreNV` are only bounds checked in the above manner if the `VkPhysicalDeviceCooperativeMatrixFeaturesNV::cooperativeMatrixRobustBufferAccess` feature is enabled.

Accesses via `OpCooperativeMatrixLoadKHR` and `OpCooperativeMatrixStoreKHR` are only bounds checked in the above manner if the `VkPhysicalDeviceCooperativeMatrixFeaturesKHR::cooperativeMatrixRobustBufferAccess` feature is enabled.

Accesses using `OpCooperativeVector*` instructions are not bounds-checked.

9.6.3. Image Sampling

Sampling operations on an image descriptor are always well-defined when coordinates exceeding the dimensions specified for the descriptor are accessed, as described in the [Wrapping Operation](#) section.

9.6.4. Robust Image Access

Robust image access **can** be enabled by specifying `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS` in `VkPipelineRobustnessCreateInfo`, or specifying `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT` and enabling the `robustImageAccess` feature.

If robust image access is enabled, accesses to image descriptors are bounds checked against the image view dimensions specified for the descriptor.

Writes or atomic read-modify-write operations to a storage image outside of the checked dimensions will not modify any memory.

Reads, atomic read-modify-write operations, or fetches from images outside of the checked dimensions will return zero values, with (0,0,1) or (0,0,0) values [inserted for missing G, B, or A components](#) based on the format.

If a value was previously written to the same out of bounds location in the same shader invocation, that value **may** be returned instead; using the `VolatileTexel` image operand, the `Volatile` memory semantic, or the `Volatile` decoration to load the value will prevent prior stored values from being returned.

9.6.5. Robust Image Access 2

NOTE

This is largely identical to [Robust Image Access](#); the only difference being that the alpha channel must be replaced with 1, rather than 1 or 0, for out of bounds texel access.

Robust image access 2 **can** be enabled by specifying `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2` in `VkPipelineRobustnessCreateInfo`, or specifying `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT` and enabling the `robustImageAccess2` feature.

If robust image access 2 is enabled, accesses to image descriptors are bounds checked against the image view dimensions specified for the descriptor.

Writes or atomic read-modify-write operations to a storage image outside of the checked dimensions will not modify any memory.

Reads, atomic read-modify-write operations, or fetches from images outside of the checked dimensions will return zero values, with (0,0,1) values [inserted for missing G, B, or A components](#) based on the format.

If a value was previously written to the same out of bounds location in the same shader invocation, that value **may** be returned instead; using the `VolatileTexel` image operand, the `Volatile` memory semantic, or the `Volatile` decoration to load the value will prevent prior stored values from being returned.

9.7. Shader Memory Access Ordering

The order in which image or buffer memory is read or written by shaders is largely undefined. For some shader types (vertex, tessellation evaluation, and in some cases, fragment), even the number of shader invocations that **may** perform loads and stores is undefined.

In particular, the following rules apply:

- [Vertex](#) and [tessellation evaluation](#) shaders will be invoked at least once for each unique vertex, as defined in those sections.
- [Fragment](#) shaders will be invoked zero or more times, as defined in that section.
- The relative execution order of invocations of the same shader type is undefined. A store issued

by a shader when working on primitive B might complete prior to a store for primitive A, even if primitive A is specified prior to primitive B. This applies even to fragment shaders; while fragment shader outputs are always written to the framebuffer in [rasterization order](#), stores executed by fragment shader invocations are not.

- The relative execution order of invocations of different shader types is largely undefined.

NOTE

The above limitations on shader invocation order make some forms of synchronization between shader invocations within a single set of primitives unimplementable. For example, having one invocation poll memory written by another invocation assumes that the other invocation has been launched and will complete its writes in finite time.

The [Memory Model](#) appendix defines the terminology and rules for how to correctly communicate between shader invocations, such as when a write is [Visible-To](#) a read, and what constitutes a [Data Race](#). Applications **must** not cause a data race.

9.8. Shader Inputs and Outputs

Data is passed into and out of shaders using variables with input or output storage class, respectively. User-defined inputs and outputs are connected between stages by matching their [Location](#) decorations. Additionally, data **can** be provided by or communicated to special functions provided by the execution environment using [BuiltIn](#) decorations.

In many cases, the same [BuiltIn](#) decoration **can** be used in multiple shader stages with similar meaning. The specific behavior of variables decorated as [BuiltIn](#) is documented in the following sections.

9.9. Task Shaders

Task shaders operate in conjunction with the mesh shaders to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Its primary purpose is to create a variable amount of subsequent mesh shader invocations.

Task shaders are invoked via the execution of the [programmable mesh shading](#) pipeline.

The task shader has no fixed-function inputs other than variables identifying the specific workgroup and invocation. In the [TaskNV Execution Model](#) the number of mesh shader workgroups to create is specified via a [TaskCountNV](#) decorated output variable. In the [TaskEXT Execution Model](#) the number of mesh shader workgroups to create is specified via the [OpEmitMeshTasksEXT](#) instruction.

The task shader can write additional outputs to task memory, which can be read by all of the mesh shader workgroups it created.

9.9.1. Task Shader Execution

Task workloads are formed from groups of work items called workgroups and processed by the task shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Task shaders execute in *global workgroups* which

are divided into a number of *local workgroups* with a size that **can** be set by assigning a value to the `LocalSize` or `LocalSizeId` execution mode or via an object decorated by the `WorkgroupSize` decoration. An invocation within a local workgroup **can** share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup. If the subpass includes multiple views in its view mask, a Task shader using `TaskEXT Execution Model` **may** be invoked separately for each view.

9.10. Mesh Shaders

Mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Each workgroup emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

Mesh shaders are invoked via the execution of the [programmable mesh shading](#) pipeline.

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written to task memory by the task shader that spawned the mesh shader's workgroup. The mesh shader can operate without a task shader as well.

The invocations of the mesh shader workgroup write an output mesh, comprising a set of primitives with per-primitive attributes, a set of vertices with per-vertex attributes, and an array of indices identifying the mesh vertices that belong to each primitive. The primitives of this mesh are then processed by subsequent graphics pipeline stages, where the outputs of the mesh shader form an interface with the fragment shader.

9.10.1. Mesh Shader Execution

Mesh workloads are formed from groups of work items called workgroups and processed by the mesh shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Mesh shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that **can** be set by assigning a value to the `LocalSize` or `LocalSizeId` execution mode or via an object decorated by the `WorkgroupSize` decoration. An invocation within a local workgroup **can** share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

The *global workgroups* may be generated explicitly via the API, or implicitly through the task shader's work creation mechanism. If the subpass includes multiple views in its view mask, a Mesh shader using `MeshEXT Execution Model` **may** be invoked separately for each view.

9.11. Cluster Culling Shaders

Cluster Culling shaders are invoked via the execution of the [Programmable Cluster Culling Shading](#) pipeline.

The only inputs available to the cluster culling shader are variables identifying the specific workgroup and invocation.

Cluster Culling shaders operate in workgroups to perform cluster-based culling and produce zero

or more cluster drawing command that will be processed by subsequent stages of the graphics pipeline.

The Cluster Drawing Command (CDC) is very similar to the MDI command, invocations in workgroup can emit zero or more CDC to draw zero or more visible cluster.

9.11.1. Cluster Culling Shader Execution

Cluster Culling workloads are formed from groups of work items called workgroups and processed by the cluster culling shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Cluster Culling shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that **can** be set by assigning a value to the `LocalSize` or `LocalSizeId` execution mode or via an object decorated by the `WorkgroupSize` decoration. An invocation within a local workgroup **can** share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.12. Vertex Shaders

Each vertex shader invocation operates on one vertex and its associated `vertex attribute` data, and outputs one vertex and associated data. Graphics pipelines using primitive shading **must** include a vertex shader, and the vertex shader stage is always the first shader stage in the graphics pipeline.

9.12.1. Vertex Shader Execution

A vertex shader **must** be executed at least once for each vertex specified by a drawing command. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view. During execution, the shader is presented with the index of the vertex and instance for which it has been invoked. Input variables declared in the vertex shader are filled by the implementation with the values of vertex attributes associated with the invocation being executed.

If the same vertex is specified multiple times in a drawing command (e.g. by including the same index value multiple times in an index buffer) the implementation **may** reuse the results of vertex shading if it can statically determine that the vertex shader invocations will produce identical results.

NOTE

It is implementation-dependent when and if results of vertex shading are reused, and thus how many times the vertex shader will be executed. This is true also if the vertex shader contains stores or atomic operations (see `vertexPipelineStoresAndAtomics`).

9.13. Tessellation Control Shaders

The tessellation control shader is used to read an input patch provided by the application and to produce an output patch. Each tessellation control shader invocation operates on an input patch (after all control points in the patch are processed by a vertex shader) and its associated data, and outputs a single control point of the output patch and its associated data, and **can** also output

additional per-patch data. The input patch is sized according to the `patchControlPoints` member of `VkPipelineTessellationStateCreateInfo`, as part of input assembly.

The input patch can also be dynamically sized with `patchControlPoints` parameter of `vkCmdSetPatchControlPointsEXT`.

To [dynamically set](#) the number of control points per patch, call:

```
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
void vkCmdSetPatchControlPointsEXT(
    VkCommandBuffer          commandBuffer,
    uint32_t                 patchControlPoints);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `patchControlPoints` specifies the number of control points per patch.

This command sets the number of control points per patch for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineTessellationStateCreateInfo::patchControlPoints` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetPatchControlPointsEXT-None-09422
At least one of the following **must** be true:
 - The `extendedDynamicState2PatchControlPoints` feature is enabled
 - The `shaderObject` feature is enabled
- VUID-vkCmdSetPatchControlPointsEXT-patchControlPoints-04874
`patchControlPoints` **must** be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

Valid Usage (Implicit)

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetPatchControlPointsEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS HICS_BIT	State

Conditional Rendering

`vkCmdSetPatchControlPointsEXT` is not affected by [conditional rendering](#)

The size of the output patch is controlled by the `OpExecutionMode OutputVertices` specified in the tessellation control or tessellation evaluation shaders, which **must** be specified in at least one of the shaders. The size of the input and output patches **must** each be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`.

9.13.1. Tessellation Control Shader Execution

A tessellation control shader is invoked at least once for each *output* vertex in a patch. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

Inputs to the tessellation control shader are generated by the vertex shader. Each invocation of the tessellation control shader **can** read the attributes of any incoming vertices and their associated data. The invocations corresponding to a given patch execute logically in parallel, with undefined relative execution order. However, the `OpControlBarrier` instruction **can** be used to provide limited control of the execution order by synchronizing invocations within a patch, effectively dividing tessellation control shader execution into a set of phases. Tessellation control shaders will read undefined values if one invocation reads a per-vertex or per-patch output written by another invocation at any point during the same phase, or if two invocations attempt to write different values to the same per-patch output in a single phase.

9.14. Tessellation Evaluation Shaders

The Tessellation Evaluation Shader operates on an input patch of control points and their associated data, and a single input barycentric coordinate indicating the invocation's relative position within the subdivided patch, and outputs a single vertex and its associated data.

9.14.1. Tessellation Evaluation Shader Execution

A tessellation evaluation shader is invoked at least once for each unique vertex generated by the tessellator. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

9.15. Geometry Shaders

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

9.15.1. Geometry Shader Execution

A geometry shader is invoked at least once for each primitive produced by the tessellation stages, or at least once for each primitive generated by [primitive assembly](#) when tessellation is not in use. A shader can request that the geometry shader runs multiple [instances](#). A geometry shader is invoked at least once for each instance. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

9.16. Fragment Shaders

Fragment shaders are invoked as a [fragment operation](#) in a graphics pipeline. Each fragment shader invocation operates on a single fragment and its associated data. With few exceptions, fragment shaders do not have access to any data associated with other fragments and are considered to execute in isolation of fragment shader invocations associated with other fragments.

9.17. Compute Shaders

Compute shaders are invoked via [dispatching commands](#). In general, they have access to similar resources as shader stages executing as part of a graphics pipeline.
