Release Information

For information on the change history and known issues for this release, see the **Release notes** in the **System Register XML for A-profile architecture (2025-06).**

Proprietary Notice

This document is protected by copyright and other related rights and the practice or implementation of the information contained in this document may be protected by one or more patents or pending patent applications. No part of this document may be reproduced in any form by any means without the express prior written permission of Arm. **No license, express or implied, by estoppel or otherwise to any intellectual property rights is granted by this document unless specifically stated.**

Your access to the information in this document is conditional upon your acceptance that you will not use or permit others to use the information for the purposes of determining whether the subject matter of this document infringes any third party patents.

The content of this document is informational only. Any solutions presented herein are subject to changing conditions, information, scope, and data. This document was produced using reasonable efforts based on information available as of the date of issue of this document. The scope of information in this document may exceed that which Arm is required to provide, and such additional information is merely intended to further assist the recipient and does not represent Arm's view of the scope of its obligations. You acknowledge and agree that you possess the necessary expertise in system security and functional safety and that you shall be solely responsible for compliance with all legal, regulatory, safety and security related requirements concerning your products, notwithstanding any information or support that may be provided by Arm herein. In addition, you are responsible for any applications which are used in conjunction with any Arm technology described in this document, and to minimize risks, adequate design and operating safeguards should be provided for by you.

This document may include technical inaccuracies or typographical errors. THIS DOCUMENT IS PROVIDED "AS IS". ARM PROVIDES NO REPRESENTATIONS AND NO WARRANTIES, EXPRESS, IMPLIED OR STATUTORY, INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY, SATISFACTORY QUALITY, NON-INFRINGEMENT OR FITNESS FOR A PARTICULAR PURPOSE WITH RESPECT TO THE DOCUMENT. For the avoidance of doubt, Arm makes no representation with respect to, and has undertaken no analysis to identify or understand the scope and content of, patents, copyrights, trade secrets, or other rights.

TO THE EXTENT NOT PROHIBITED BY LAW, IN NO EVENT WILL ARM BE LIABLE FOR ANY DAMAGES, INCLUDING WITHOUT LIMITATION ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, PUNITIVE, OR CONSEQUENTIAL DAMAGES, HOWEVER CAUSED AND REGARDLESS OF THE THEORY OF LIABILITY, ARISING OUT OF ANY USE OF THIS DOCUMENT, EVEN IF ARM HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Reference by Arm to any third party's products or services within this document is not an express or implied approval or endorsement of the use thereof.

This document consists solely of commercial items. You shall be responsible for ensuring that any use, duplication or disclosure of this document complies fully with any relevant export laws and regulations to assure that this document or any portion thereof is not exported, directly or indirectly, in violation of such export laws. Use of the word "partner" in reference to Arm's customers is not intended to create or refer to any partnership relationship with any other company. Arm may make changes to this document at any time and without notice.

This document may be translated into other languages for convenience, and you agree that if there is any conflict between the English version of this document and any translation, the terms of the English version of the Agreement shall prevail.

The validity, construction and performance of this License shall be governed by English Law.

Arm Limited. Company 02557590 registered in England.
110 Fulbourn Road, Cambridge, England CB1 9NJ.

PRE-20349
8 March 2024

Confidentiality Status

This document is Non-Confidential. The right to use, copy and disclose this document may be subject to license restrictions in accordance with the terms of the agreement entered into by Arm and the party that Arm delivered this document to.

Product Status

The information relating to the 2024 Extensions and the rest of the A-profile Architecture is at Beta quality. Beta quality means that all major features of the specification are described, but some details might be missing.

Progressive Terminology Commitment

Previous issues of this document included terms that can be offensive. We have replaced these terms. If you find offensive terms in this document, please contact `terms@arm.com`.

Feedback on this document

If you have any comments or queries about this document, create a ticket at `https://support.developer.arm.com`.

As part of the ticket, include:

- The title, *Arm® Architecture for A-profile architecture*.
- The number, DDI 0601.
- The section name to which your comments refer.
- The page number(s) to which your comments refer.
- The rule identifier(s) to which your comments refer if applicable.
- A concise explanation of your comments.

Arm also welcomes general suggestions for additions and improvements.

ACCDATA_EL1, Accelerator Data

The ACCDATA_EL1 characteristics are:

Purpose

Holds the lower 32 bits of the data that is stored by an ST64BV0, Single-copy atomic 64-byte EL0 store instruction.

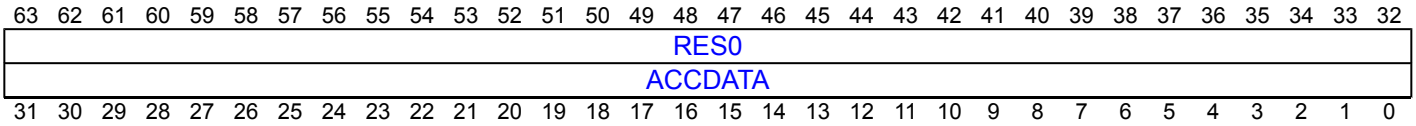
Configuration

This register is present only when FEAT_LS64_ACCDATA is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ACCDATA_EL1 are UNDEFINED.

Attributes

ACCDATA_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

ACCDATA, bits [31:0]

Accelerator Data field. Holds bits[31:0] of the data that is stored by an ST64BV0 instruction.

Accessing ACCDATA_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

ACTLR_EL1, Auxiliary Control Register (EL1)

The ACTLR_EL1 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

Note

Arm recommends the contents of this register have no effect on the PE when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, and instead the configuration and control fields are provided by the ACTLR_EL2 register. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

Configuration

AArch64 System register ACTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ACTLR[31:0].

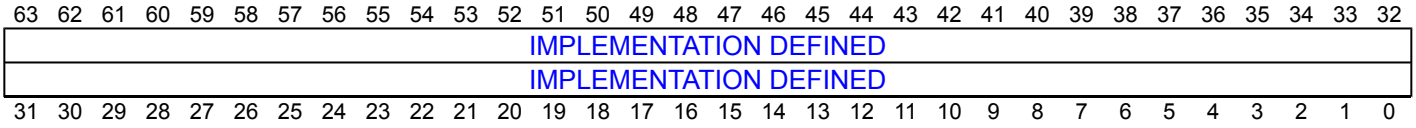
AArch64 System register ACTLR_EL1 bits [63:32] are architecturally mapped to AArch32 System register ACTLR2[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ACTLR_EL1 are UNDEFINED.

Attributes

ACTLR_EL1 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ACTLR_EL1

If the IMPLEMENTATION DEFINED ACTLR_EL12 accessor is implemented, the following behaviors are also implemented:

- MRS/MSR to ACTLR_EL1 from EL2 when the Effective value of HCR_EL2.E2H is 1 accesses ACTLR_EL2.
- MRS/MSR to ACTLR_EL1 from EL1 when the Effective value of HCR_EL2.{NV2, NV1, NV} is {1,0,1} accesses ACTLR_EL1 directly and is not transformed to a memory access.
- MRS/MSR to ACTLRALIAS_EL1 behaves in the same way as ACTLR_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ACTLR_EL1
```

op0	op1	CRn	CRm	op2

0b11	0b000	0b0001	0b0000	0b001

ACTLR_EL2, Auxiliary Control Register (EL2)

The ACTLR_EL2 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for EL2.

Note

Arm recommends the contents of this register are updated to apply to EL0 when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, gaining configuration and control fields from the ACTLR_EL1. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

Configuration

AArch64 System register ACTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HACTLR[31:0].

AArch64 System register ACTLR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HACTLR2[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ACTLR_EL2 are UNDEFINED.

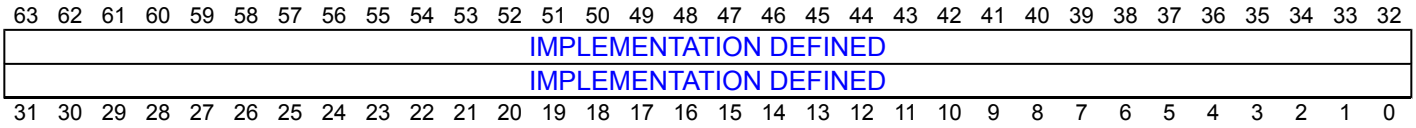
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ACTLR_EL2 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ACTLR_EL2

ACTLR_EL3, Auxiliary Control Register (EL3)

The ACTLR_EL3 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for EL3.

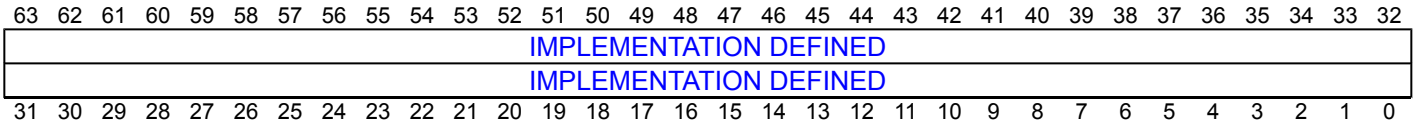
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ACTLR_EL3 are UNDEFINED.

Attributes

ACTLR_EL3 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ACTLR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ACTLR_EL3
```

AFSR0_EL1, Auxiliary Fault Status Register 0 (EL1)

The AFSR0_EL1 characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL1.

Configuration

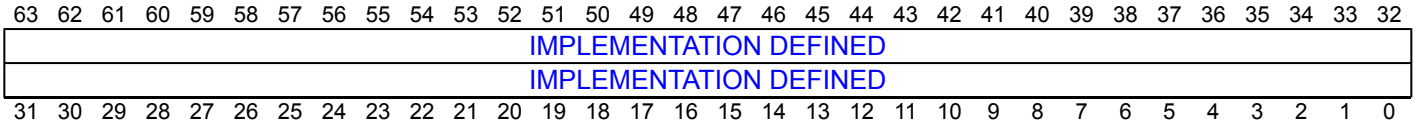
AArch64 System register AFSR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ADFSR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to AFSR0_EL1 are UNDEFINED.

Attributes

AFSR0_EL1 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AFSR0_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name AFSR0_EL1 or AFSR0_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

AFSR0_EL2, Auxiliary Fault Status Register 0 (EL2)

The AFSR0_EL2 characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL2.

Configuration

AArch64 System register AFSR0_EL2 bits [31:0] are architecturally mapped to AArch32 System register HADFSR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to AFSR0_EL2 are UNDEFINED.

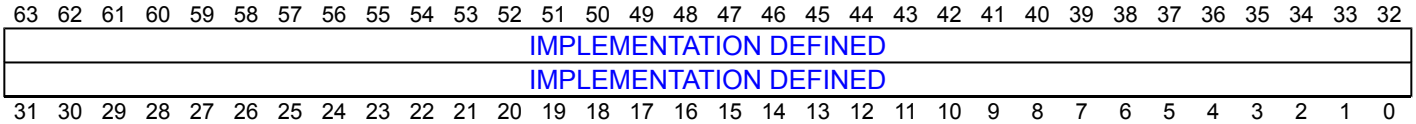
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

AFSR0_EL2 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AFSR0_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name AFSR0_EL2 or AFSR0_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```

AFSR1_EL3, Auxiliary Fault Status Register 1 (EL3)

The AFSR1_EL3 characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL3.

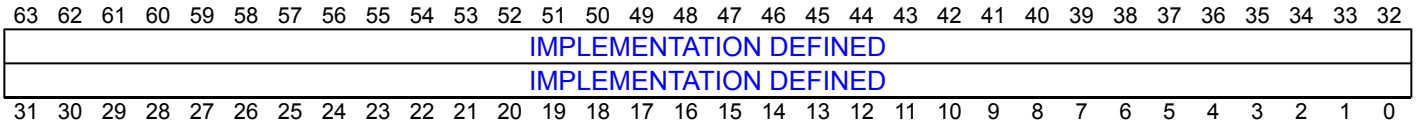
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to AFSR1_EL3 are UNDEFINED.

Attributes

AFSR1_EL3 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AFSR1_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AFSR1_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0101	0b0001	0b001

AIDR_EL1, Auxiliary ID Register

The AIDR_EL1 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED identification information.

The value of this register must be interpreted in conjunction with the value of MIDR_EL1.

Configuration

AArch64 System register AIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register AIDR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to AIDR_EL1 are UNDEFINED.

Attributes

AIDR_EL1 is a 64-bit register.

Field descriptions

ALLINT, All Interrupt Mask Bit

The ALLINT characteristics are:

Purpose

Allows access to the all interrupt mask bit.

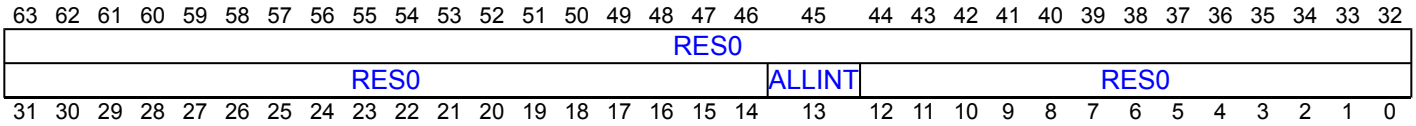
Configuration

This register is present only when FEAT_NMI is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ALLINT are UNDEFINED.

Attributes

ALLINT is a 64-bit register.

Field descriptions



Bits [63:14]

Reserved, RES0.

ALLINT, bit [13]

All interrupt mask. An interrupt is controlled by PSTATE.ALLINT when all of the following apply:

- SCTLR_ELx.NMI is 1.
- The interrupt is targeted at ELx.
- Execution is at ELx.

ALLINT	Meaning
0b0	This control does not cause any interrupts to be masked.
0b1	If SCTLR_ELx.NMI is 1 and execution is at ELx, an IRQ or FIQ interrupt that is targeted to ELx, with or without Superpriority, is masked.

The value of this bit is set to the inverse value in the SCTLR_ELx.SPINTMASK field on taking an exception to ELx.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [12:0]

Reserved, RES0.

Accessing ALLINT

Accesses to this register use the following encodings in the System register encoding space:

AMAIR_EL1, Auxiliary Memory Attribute Indirection Register (EL1)

The AMAIR_EL1 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR_EL1.

Configuration

AArch64 System register AMAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register AMAIR0[31:0].

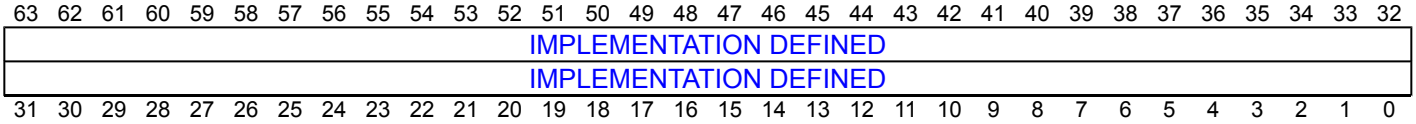
AArch64 System register AMAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register AMAIR1[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to AMAIR_EL1 are UNDEFINED.

Attributes

AMAIR_EL1 is a 64-bit register.

Field descriptions



AMAIR_EL1 is permitted to be cached in a TLB.

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMAIR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name AMAIR_EL1 or AMAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMAIR_EL1

AMCFGR_EL0, Activity Monitors Configuration Register

The AMCFGR_EL0 characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configuration

AArch64 System register AMCFGR_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMCFGR[31:0].

AArch64 System register AMCFGR_EL0 bits [31:0] are architecturally mapped to External register AMCFGR[31:0] when FEAT_AMU_EXT32 is implemented.

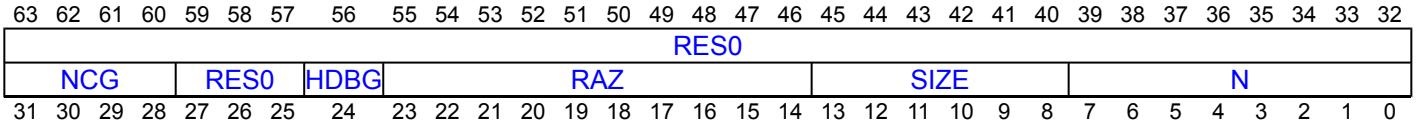
AArch64 System register AMCFGR_EL0 bits [63:0] are architecturally mapped to External register AMCFGR[63:0] when FEAT_AMU_EXT64 is implemented.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR_EL0 are UNDEFINED.

Attributes

AMCFGR_EL0 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

NCG, bits [31:28]

Defines the number of counter groups implemented, minus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NCG	Meaning
0b0000	One counter group implemented.
0b0001	Two counter groups implemented.

All other values are reserved.

Access to this field is **RO**.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

This feature must be supported, and so this bit is `0b1`.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HDBG	Meaning
`0b0`	AMCR_EL0.HDBG is RES0.
`0b1`	AMCR_EL0.HDBG is read/write.

Access to this field is **RO**.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of the activity monitor event counters, minus one.

The counters are 64-bit, so the value of this field is `0b111111`.

This field is used by software to determine the spacing of the counters in the memory-map. The counters are at doubleword-aligned addresses.

Reads as `0b111111`.

Access to this field is **RO**.

N, bits [7:0]

Defines the number of activity monitor event counters implemented in all groups, minus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMCFGR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMCFGR_EL0
```

AMCG1IDR_EL0, Activity Monitors Counter Group 1 Identification Register

The AMCG1IDR_EL0 characteristics are:

Purpose

Defines which auxiliary counters are implemented, and which of them have a corresponding virtual offset register, AMEVCNTVOFF1<n>_EL2 implemented.

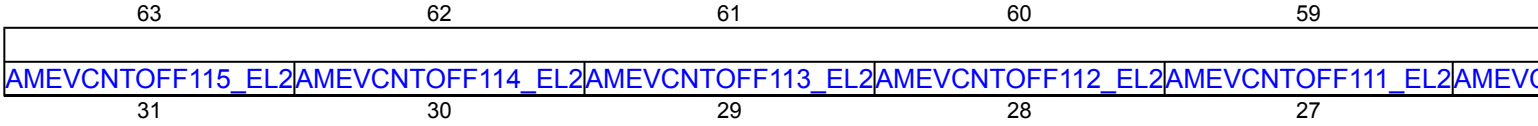
Configuration

This register is present only when FEAT_AMUv1p1 is implemented. Otherwise, direct accesses to AMCG1IDR_EL0 are UNDEFINED.

Attributes

AMCG1IDR_EL0 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

AMEVCNTOFF1<n>_EL2, bit [n+16], for n = 15 to 0

Indicates which implemented auxiliary counters have a corresponding virtual offset register, AMEVCNTVOFF1<n>_EL2 implemented.

AMEVCNTOFF1<n>_EL2	Meaning
0b0	AMEVCNTR1<n>_EL0 does not have an offset, or is not implemented.
0b1	The offset AMEVCNTVOFF1<n>_EL2 is implemented for AMEVCNTR1<n>_EL0.

AMEVCNTR1<n>_EL0, bit [n], for n = 15 to 0

Indicates which auxiliary counters AMEVCNTR1<n>_EL0 are implemented.

AMEVCNTR1<n>_EL0	Meaning
0b0	AMEVCNTR1<n>_EL0 is not implemented.
0b1	AMEVCNTR1<n>_EL0 is implemented.

Accessing AMCG1IDR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMCG1IDR_EL0
```

AMCGCR_EL0, Activity Monitors Counter Group Configuration Register

The AMCGCR_EL0 characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configuration

AArch64 System register AMCGCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMCGCR[31:0].

AArch64 System register AMCGCR_EL0 bits [31:0] are architecturally mapped to External register AMCGCR[31:0] when FEAT_AMU_EXT32 is implemented.

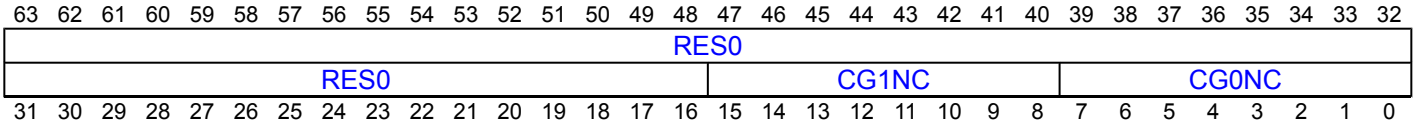
AArch64 System register AMCGCR_EL0 bits [63:0] are architecturally mapped to External register AMCGCR[63:0] when FEAT_AMU_EXT64 is implemented.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR_EL0 are UNDEFINED.

Attributes

AMCGCR_EL0 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CG1NC	Meaning
0x00..0x10	The number of counters.

All other values are reserved.

Access to this field is **RO**.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as 0x04.

Access to this field is **RO**.

Accessing AMCGCR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMCGCR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b010

```

AMCNTENCLR0_EL0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0_EL0 characteristics are:

Purpose

Disable control bits for the architected activity monitors event counters, AMEVCNTR0<n>_EL0.

Configuration

AArch64 System register AMCNTENCLR0_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR0[31:0].

AArch64 System register AMCNTENCLR0_EL0 bits [31:0] are architecturally mapped to External register AMCNTENCLR0[31:0].

AArch64 System register AMCNTENCLR0_EL0 bits [31:0] are architecturally mapped to External register AMCNTENCLR[31:0].

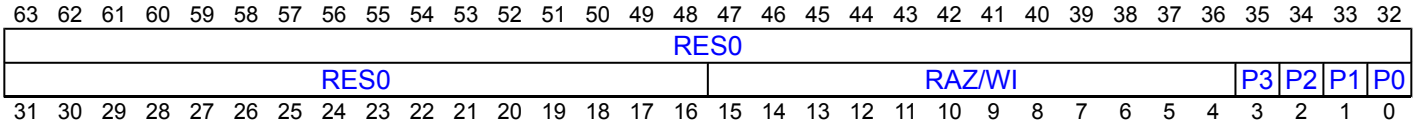
AArch64 System register AMCNTENCLR0_EL0 bits [31:0] are architecturally mapped to External register AMCNTENSET0[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0_EL0 are UNDEFINED.

Attributes

AMCNTENCLR0_EL0 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for AMEVCNTR0<n>_EL0.

Note

AMCGCR_EL0.CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR0<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR0<n>_EL0 is enabled. When written, disables AMEVCNTR0<n>_EL0.

The reset behavior of this field is:

- On an AMU reset, this field resets to '0'.

Accessing this field has the following behavior:

- When n >= 4, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1C**.

Accessing AMCNTENCLR0_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMCNTENCLR0_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b100

```

AMCNTENCLR1_EL0, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1_EL0 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>_EL0.

Configuration

AArch64 System register AMCNTENCLR1_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR1[31:0].

AArch64 System register AMCNTENCLR1_EL0 bits [31:0] are architecturally mapped to External register AMCNTENCLR1[31:0].

AArch64 System register AMCNTENCLR1_EL0 bits [31:0] are architecturally mapped to External register AMCNTENSET1[31:0].

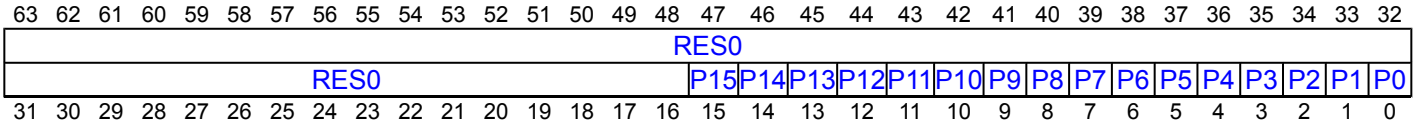
AArch64 System register AMCNTENCLR1_EL0 bits [31:0] are architecturally mapped to External register AMCNTENCLR[63:32].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1_EL0 are UNDEFINED.

Attributes

AMCNTENCLR1_EL0 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter disable bit for AMEVCNTR1<n>_EL0.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR1<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR1<n>_EL0 is enabled. When written, disables AMEVCNTR1<n>_EL0.

The reset behavior of this field is:

- On an AMU reset, this field resets to '0'.

Accessing this field has the following behavior:

- When n >= UInt(AMCGCR_EL0.CG1NC), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1C**.

Accessing AMCNTENCLR1_EL0

If there are no auxiliary monitor event counters implemented, reads and writes of AMCNTENCLR1_EL0 are UNDEFINED.

Note

There are no implemented auxiliary activity monitor event counters when AMCFGR_EL0.NCG == 0b0000.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMCNTENCLR1_EL0
```

AArch64 System register AMCNTENSET1_EL0 bits [31:0] are architecturally mapped to External register AMCNTENCLR1[31:0].

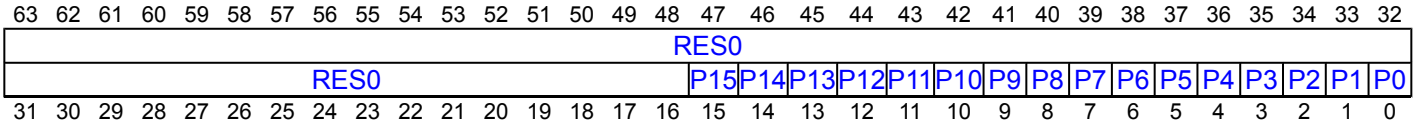
AArch64 System register AMCNTENSET1_EL0 bits [31:0] are architecturally mapped to External register AMCNTENSET[63:32].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1_EL0 are UNDEFINED.

Attributes

AMCNTENSET1_EL0 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter enable bit for AMEVCNTR1<n>_EL0.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR1<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR1<n>_EL0 is enabled. When written, enables AMEVCNTR1<n>_EL0.

The reset behavior of this field is:

- On an AMU reset, this field resets to '0'.

Accessing this field has the following behavior:

- When n >= UInt(AMCGCR_EL0.CG1NC), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1S**.

Accessing AMCNTENSET1_EL0

If there are no auxiliary monitor event counters implemented, reads and writes of AMCNTENSET1_EL0 are UNDEFINED.

Note

There are no implemented auxiliary activity monitor event counters when AMCFGR_EL0.NCG == 0b0000.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMCNTENSET1_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0011	0b001

```

AMCR_EL0, Activity Monitors Control Register

The AMCR_EL0 characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configuration

AArch64 System register AMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMCR[31:0].

AArch64 System register AMCR_EL0 bits [31:0] are architecturally mapped to External register AMCR[31:0] when FEAT_AMU_EXT32 is implemented.

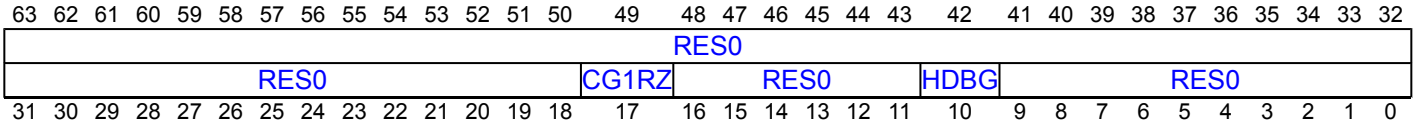
AArch64 System register AMCR_EL0 bits [63:0] are architecturally mapped to External register AMCR[63:0] when FEAT_AMU_EXT64 is implemented.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR_EL0 are UNDEFINED.

Attributes

AMCR_EL0 is a 64-bit register.

Field descriptions



Bits [63:18]

Reserved, RES0.

CG1RZ, bit [17]

When FEAT_AMUv1p1 is implemented:

Counter Group 1 Read Zero.

CG1RZ	Meaning
0b0	System register reads of AMEVCNTR1<n>_EL0 return the event count at all implemented and enabled Exception levels.
0b1	If the current Exception level is the highest implemented Exception level, system register reads of AMEVCNTR1<n>_EL0 return the event count. Otherwise, reads of AMEVCNTR1<n>_EL0 return a zero value.

Note

Reads from the memory-mapped view are unaffected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

HDBG	Meaning
0b0	Activity monitors do not halt counting when the PE is halted in Debug state.
0b1	Activity monitors halt counting when the PE is halted in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing AMCR_EL0

Accesses to this register use the following encodings in the System register encoding space:

AMEVCNTR0<n>_EL0, Activity Monitors Event Counter Registers 0, n = 0 - 3

The AMEVCNTR0<n>_EL0 characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configuration

AArch64 System register AMEVCNTR0<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMEVCNTR0<n>[31:0].

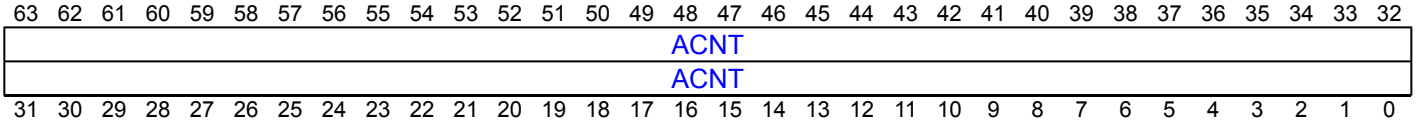
AArch64 System register AMEVCNTR0<n>_EL0 bits [63:0] are architecturally mapped to External register AMEVCNTR0<n>[63:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n>_EL0 are UNDEFINED.

Attributes

AMEVCNTR0<n>_EL0 is a 64-bit register.

Field descriptions



ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 3.

If all of the following are true, reads of the AMEVCNTR0<n>_EL0 registers from EL0 or EL1 return (PCount<63:0> - AMEVCNTVOFF0<n>_EL2<63:0>), where PCount is the physical count returned when AMEVCNTR0<n>_EL0 is read from EL2 or EL3:

- FEAT_AMUv1p1 is implemented.
- HCR_EL2.AMVOFFEN and SCR_EL3.AMVOFFEN are 1.
- EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On an AMU reset, this field resets to '0000000000000000000000000000000000000000000000000000000000000000'.

Accessing AMEVCNTR0<n>_EL0

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n>_EL0 are UNDEFINED.

Note

AMCGCR_EL0.CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMEVCNTR0<m>_EL0 ; Where m = 0-3
```

op0	op1	CRn	CRm	op2

AMEVCNTR1<n>_EL0, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n>_EL0 characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configuration

AArch64 System register AMEVCNTR1<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMEVCNTR1<n>[31:0].

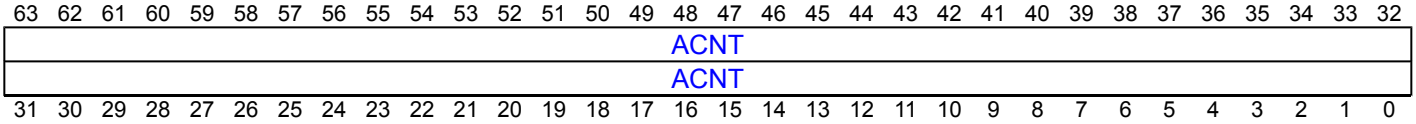
AArch64 System register AMEVCNTR1<n>_EL0 bits [63:0] are architecturally mapped to External register AMEVCNTR1<n>[63:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n>_EL0 are UNDEFINED.

Attributes

AMEVCNTR1<n>_EL0 is a 64-bit register.

Field descriptions



ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If all of the following are true, reads of the AMEVCNTR1<n>_EL0 registers from EL0 or EL1 return (PCount<63:0> - AMEVCNTVOFF1<n>_EL2<63:0>), where PCount is the physical count returned when AMEVCNTR1<n>_EL0 is read from EL2 or EL3:

- FEAT_AMUv1p1 is implemented.
- HCR_EL2.AMVOFFEN and SCR_EL3.AMVOFFEN are 1.
- AMCR_EL0.CG1RZ is 0.
- EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On an AMU reset, this field resets to '0000000000000000000000000000000000000000000000000000000000000000'.

Accessing AMEVCNTR1<n>_EL0

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n>_EL0 are UNDEFINED.

Note

AMCGCR_EL0.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMEVCNTR1<m>_EL0 ; Where m = 0-15

AMEVCNTVOFF0<n>_EL2, Activity Monitors Event Counter Virtual Offset Registers 0, n = 0 - 15

The AMEVCNTVOFF0<n>_EL2 characteristics are:

Purpose

Holds the 64-bit virtual offset for architected activity monitor events.

Configuration

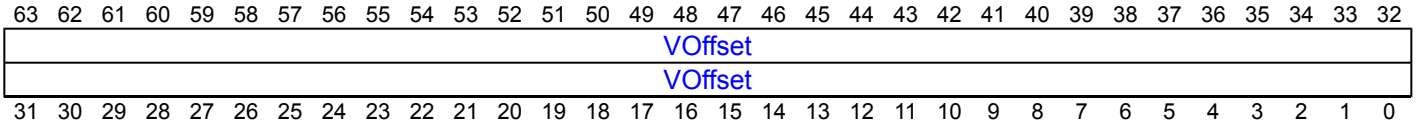
This register is present only when FEAT_AMUv1p1 is implemented. Otherwise, direct accesses to AMEVCNTVOFF0<n>_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

AMEVCNTVOFF0<n>_EL2 is a 64-bit register.

Field descriptions



VOffset, bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVCNTVOFF0<n>_EL2

If <n> is not 0, 2 or 3, reads and writes of AMEVCNTVOFF0<n>_EL2 are UNDEFINED.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMEVCNTVOFF0<m>_EL2 ; Where m = 0-15
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1101	0b100:m[3]	m[2:0]

```
integer m = UInt(CRm<0>:op2<2:0>);

AMEVCNTVOFF1<n>_EL2, Activity Monitors Event Counter Virtual Offset Registers 1, n = 0 - 15

The AMEVCNTVOFF1<n>_EL2 characteristics are:

Purpose

Holds the 64-bit virtual offset for auxiliary activity monitor events.

Configuration

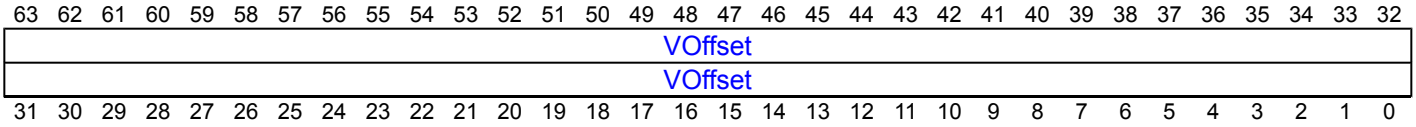
This register is present only when FEAT_AMUv1p1 is implemented. Otherwise, direct accesses to AMEVCNTVOFF1<n>_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

AMEVCNTVOFF1<n>_EL2 is a 64-bit register.

Field descriptions



VOffset, bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVCNTVOFF1<n>_EL2

Note

AMCG1IDR_EL0 identifies which auxiliary activity monitor event counters have a corresponding virtual offset implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMEVCNTVOFF1<m>_EL2 ; Where m = 0-15
```

AMEVTYPER0<n>_EL0, Activity Monitors Event Type Registers 0, n = 0 - 3

The AMEVTYPER0<n>_EL0 characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter AMEVCNTR0<n>_EL0 counts.

Configuration

AArch64 System register AMEVTYPER0<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER0<n>[31:0].

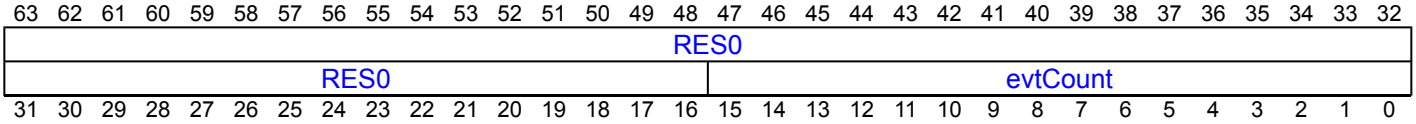
AArch64 System register AMEVTYPER0<n>_EL0 bits [31:0] are architecturally mapped to External register AMEVTYPER0<n>[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n>_EL0 are UNDEFINED.

Attributes

AMEVTYPER0<n>_EL0 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>_EL0. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

evtCount	Meaning	Applies when
0x0011	Processor frequency cycles.	When n == 0
0x4004	Constant frequency cycles.	When n == 1
0x0008	Instructions retired.	When n == 2
0x4005	Memory stall cycles.	When n == 3

Access to this field is **RO**.

Accessing AMEVTYPER0<n>_EL0

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPER0<n>_EL0 are UNDEFINED.

Note

AMCGCR_EL0.CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMEVTYPER0<m>_EL0 ; Where m = 0-3
```

op0	op1	CRn	CRm	op2

AMEVTYPER1<n>_EL0, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n>_EL0 characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter AMEVCNTR1<n>_EL0 counts.

Configuration

AArch64 System register AMEVTYPER1<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER1<n>[31:0].

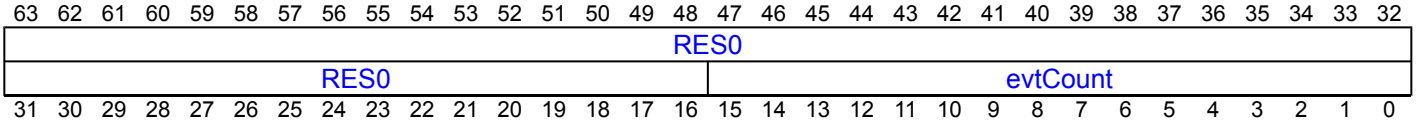
AArch64 System register AMEVTYPER1<n>_EL0 bits [31:0] are architecturally mapped to External register AMEVTYPER1<n>[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n>_EL0 are UNDEFINED.

Attributes

AMEVTYPER1<n>_EL0 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1<n>_EL0.

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter AMEVCNTR1<n>_EL0, then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by AMEVCNTR1<n>_EL0 might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter AMEVCNTR1<n>_EL0 is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVTYPER1<n>_EL0

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n>_EL0 are UNDEFINED.

Note

AMCGCR_EL0.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMEVTYPER1<m>_EL0 ; Where m = 0-15
```

AMUSERENR_EL0, Activity Monitors User Enable Register

The AMUSERENR_EL0 characteristics are:

Purpose

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configuration

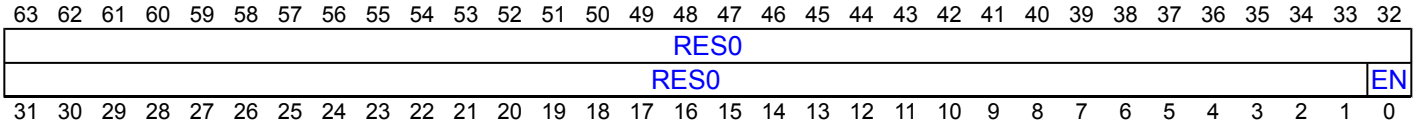
AArch64 System register AMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMUSERENR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR_EL0 are UNDEFINED.

Attributes

AMUSERENR_EL0 is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

EN, bit [0]

Traps EL0 accesses to the activity monitors registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value `0x18`:
  - AMCFGR_EL0, AMCGCR_EL0, AMCNTENCLR0_EL0, AMCNTENCLR1_EL0, AMCNTENSET0_EL0, AMCNTENSET1_EL0, AMCR_EL0, AMEVCNTR0<n>_EL0, AMEVCNTR1<n>_EL0, AMEVTYPER0<n>_EL0, and AMEVTYPER1<n>_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value `0x03`, MRRC and MCRR accesses are trapped and reported using EC syndrome value `0x04`:
  - AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVCNTR0<n>, AMEVCNTR1<n>, AMEVTYPER0<n>, and AMEVTYPER1<n>.

EN	Meaning
`0b0`	EL0 accesses to the activity monitors registers are trapped.
`0b1`	This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0.

Note

- AMUSERENR_EL0 can always be read at EL0 and is not governed by this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMUSERENR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMUSERENR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b011

APAS, Associate PA space

The APAS characteristics are:

Purpose

Associate a location with a specified PA space, for locations that are protected by a memory-side PAS filter.

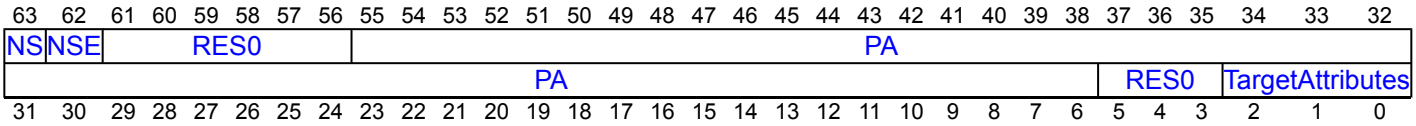
Configuration

This instruction is present only when FEAT_RME_GPC3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to APAS are UNDEFINED.

Attributes

APAS is a 64-bit System instruction.

Field descriptions



NS, bit [63]

Together with the NSE field, selects the target physical address space.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

NSE, bit [62]

Together with the NS field, selects the target physical address space.

For a description of the values derived by evaluating NS and NSE together, see .NS.

Bits [61:56]

Reserved, RES0.

PA, bits [55:6]

Bits [55:6] of the Physical Address.

Bits of Xt corresponding to physical address bits above the implemented physical address size indicated in ID_AA64MMFR0_EL1.PARange are RES0. For example, if 44 bits of PA space are implemented then Xt[55:44] are RES0.

Bits [5:3]

Reserved, RES0.

TargetAttributes, bits [2:0]

The Target Attributes field is encoded as follows:

TargetAttributes	Meaning
0b000	Default behavior applies.
0b001..0b111	IMPLEMENTATION DEFINED.

Executing APAS

This instruction is not subject to any translation, permission checks, or granule protection checks.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
APAS <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b110	0b0111	0b0000	0b000

```

APDAKeyHi_EL1, Pointer Authentication Key A for Data (bits[127:64])

The APDAKeyHi_EL1 characteristics are:

Purpose

Holds bits[127:64] of key A used for authentication of data pointer values.

Note

The term APDAKey_EL1 is used to describe the concatenation of APDAKeyHi_EL1: APDAKeyLo_EL1.

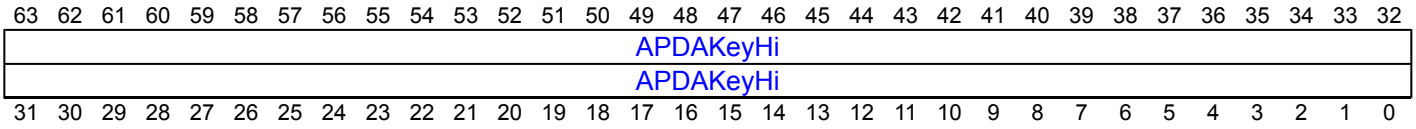
Configuration

This register is present only when FEAT_PAuth is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to APDAKeyHi_EL1 are UNDEFINED.

Attributes

APDAKeyHi_EL1 is a 64-bit register.

Field descriptions



APDAKeyHi, bits [63:0]

64 bit value, bits[127:64] of the 128 bit pointer authentication key value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing APDAKeyHi_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, APDAKeyHi_EL1
```

op0	op1	CRn	CRm	op2

APGAKeyHi_EL1, Pointer Authentication Key A for Code (bits[127:64])

The APGAKeyHi_EL1 characteristics are:

Purpose

Holds bits[127:64] of key used for generic pointer authentication code.

Note

The term APGAKey_EL1 is used to describe the concatenation of APGAKeyHi_EL1: APGAKeyLo_EL1.

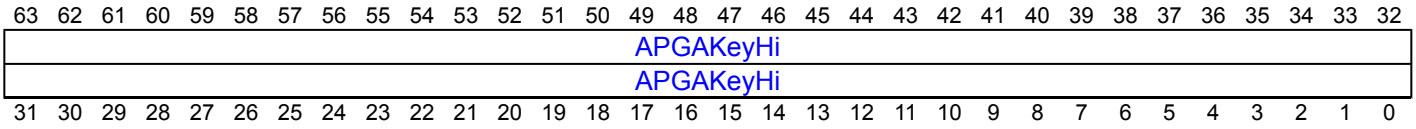
Configuration

This register is present only when FEAT_PAuth is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to APGAKeyHi_EL1 are UNDEFINED.

Attributes

APGAKeyHi_EL1 is a 64-bit register.

Field descriptions



APGAKeyHi, bits [63:0]

64 bit value, bits[127:64] of the 128 bit pointer authentication key value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing APGAKeyHi_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, APGAKeyHi_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0011	0b001

```

APIBKeyLo_EL1, Pointer Authentication Key B for Instruction (bits[63:0])

The APIBKeyLo_EL1 characteristics are:

Purpose

Holds bits[63:0] of key B used for authentication of instruction pointer values.

Note

The term APIBKey_EL1 is used to describe the concatenation of APIBKeyHi_EL1: APIBKeyLo_EL1.

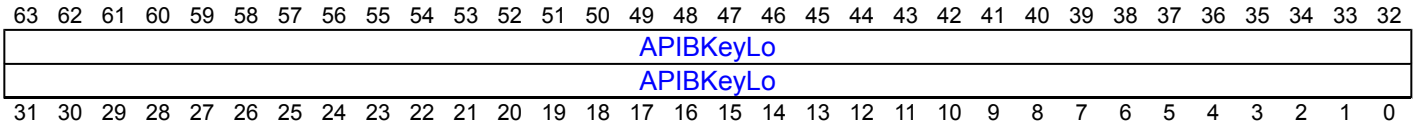
Configuration

This register is present only when FEAT_PAuth is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to APIBKeyLo_EL1 are UNDEFINED.

Attributes

APIBKeyLo_EL1 is a 64-bit register.

Field descriptions



APIBKeyLo, bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing APIBKeyLo_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, APIBKeyLo_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0001	0b010

AT S12E0R, Address Translate Stages 1 and 2 EL0 Read

The AT S12E0R characteristics are:

Purpose

Performs stage 1 and 2 address translation, with permissions as if reading from the given virtual address from EL0, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current Effective value of SCR_EL3.{NSE, NS}:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime.
- Otherwise, the EL1&0 translation regime.

When FEAT_RME is implemented, if the Effective value of SCR_EL3.{NSE, NS} is a reserved value, this instruction is UNDEFINED at EL3.

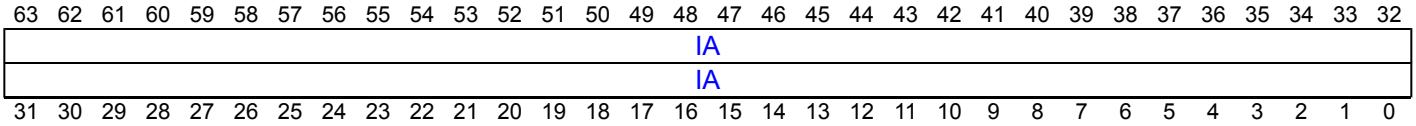
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to AT S12E0R are UNDEFINED.

Attributes

AT S12E0R is a 64-bit System instruction.

Field descriptions



IA, bits [63:0]

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

Executing AT S12E0R

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
AT S12E0R, <Xt>

AT S1E1A, Address Translate Stage 1 EL1 Without Permission checks

The AT S1E1A characteristics are:

Purpose

Performs a stage 1 address translation, while ignoring the permission checks using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current Effective value of SCR_EL3.{NSE, NS}:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime, accessed from EL1.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime, accessed from EL2.
- Otherwise, the EL1&0 translation regime, accessed from EL1.

When FEAT_RME is implemented, if the Effective value of SCR_EL3.{NSE, NS} is a reserved value, this instruction is UNDEFINED at EL3.

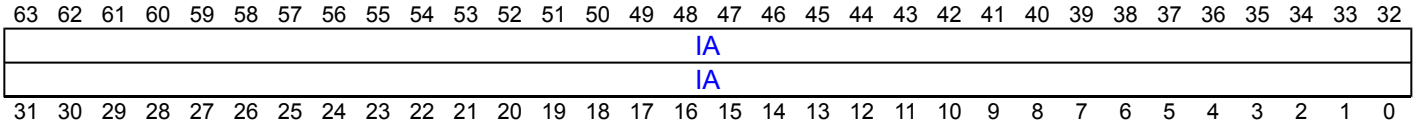
Configuration

This instruction is present only when FEAT_ATS1A is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to AT S1E1A are UNDEFINED.

Attributes

AT S1E1A is a 64-bit System instruction.

Field descriptions



IA, bits [63:0]

Input address for translation. The resulting address can be read from the PAR_EL1.

Executing AT S1E1A

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
AT S1E1A, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1001	0b010

```
if !(IsFeatureImplemented(FEAT_ATS1A) && IsFeatureImplemented(FEAT_AA64)) then

AT S1E1R, Address Translate Stage 1 EL1 Read

The AT S1E1R characteristics are:

Purpose

Performs stage 1 address translation, with permissions as if reading from the given virtual address from EL1, or from EL2 if the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current Effective value of SCR_EL3.{NSE, NS}:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime, accessed from EL1.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime, accessed from EL2.
- Otherwise, the EL1&0 translation regime, accessed from EL1.

When FEAT_RME is implemented, if the Effective value of SCR_EL3.{NSE, NS} is a reserved value, this instruction is UNDEFINED at EL3.

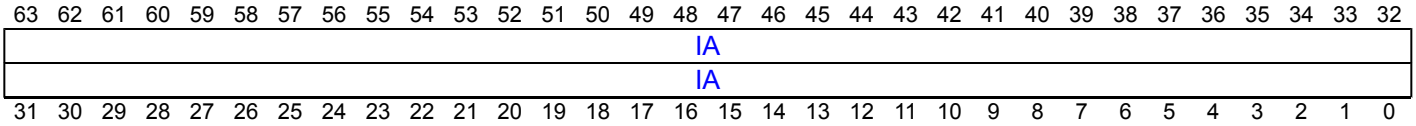
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to AT S1E1R are UNDEFINED.

Attributes

AT S1E1R is a 64-bit System instruction.

Field descriptions



IA, bits [63:0]

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

Executing AT S1E1R

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
AT S1E1R, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1000	0b000

AT S1E1RP, Address Translate Stage 1 EL1 Read PAN

The AT S1E1RP characteristics are:

Purpose

Performs a stage 1 address translation, where the value of PSTATE.PAN determines if a read from a location will generate a Permission fault for a privileged access, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current Effective value of SCR_EL3.{NSE, NS}:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime, accessed from EL1.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime, accessed from EL2.
- Otherwise, the EL1&0 translation regime, accessed from EL1.

When FEAT_RME is implemented, if the Effective value of SCR_EL3.{NSE, NS} is a reserved value, this instruction is UNDEFINED at EL3.

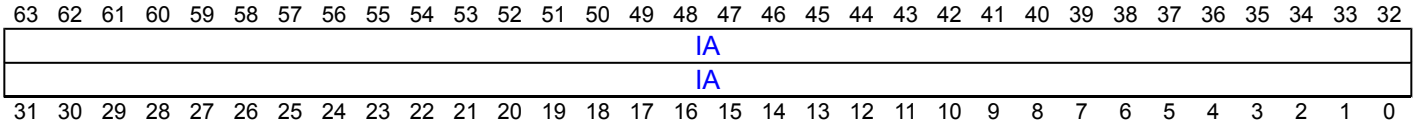
Configuration

This instruction is present only when FEAT_PAN2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to AT S1E1RP are UNDEFINED.

Attributes

AT S1E1RP is a 64-bit System instruction.

Field descriptions



IA, bits [63:0]

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

AT S1E1W, Address Translate Stage 1 EL1 Write

The AT S1E1W characteristics are:

Purpose

Performs stage 1 address translation, with permissions as if writing to the given virtual address from EL1, or from EL2 if the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current Effective value of SCR_EL3.{NSE, NS}:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime, accessed from EL1.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime, accessed from EL2.
- Otherwise, the EL1&0 translation regime, accessed from EL1.

When FEAT_RME is implemented, if the Effective value of SCR_EL3.{NSE, NS} is a reserved value, this instruction is UNDEFINED at EL3.

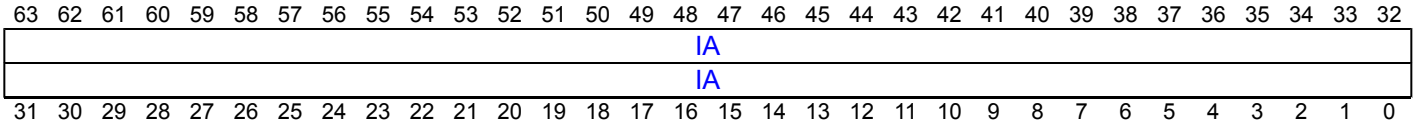
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to AT S1E1W are UNDEFINED.

Attributes

AT S1E1W is a 64-bit System instruction.

Field descriptions



IA, bits [63:0]

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

BRB IALL, Invalidate the Branch Record Buffer

The BRB IALL characteristics are:

Purpose

Invalidates all Branch records in the Branch Record Buffer.

Configuration

This instruction is present only when FEAT_BRBE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to BRB IALL are UNDEFINED.

Attributes

BRB IALL is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing BRB IALL

Rt should be encoded as `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

BRB INJ, Branch Record Injection into the Branch Record Buffer

The BRB INJ characteristics are:

Purpose

Injects the Branch Record held in BRBINFINJ_EL1, BRBSRCINJ_EL1, and BRBTGTINJ_EL1 into the Branch Record Buffer.

Configuration

This instruction is present only when FEAT_BRBE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to BRB INJ are UNDEFINED.

Attributes

BRB INJ is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing BRB INJ

Rt should be encoded as `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

`BRB INJ`

op0	op1	CRn	CRm	op2
0b01	0b001	0b0111	0b0010	0b101

```

BRBCR_EL1, Branch Record Buffer Control Register (EL1)

The BRBCR_EL1 characteristics are:

Purpose

Controls the Branch Record Buffer.

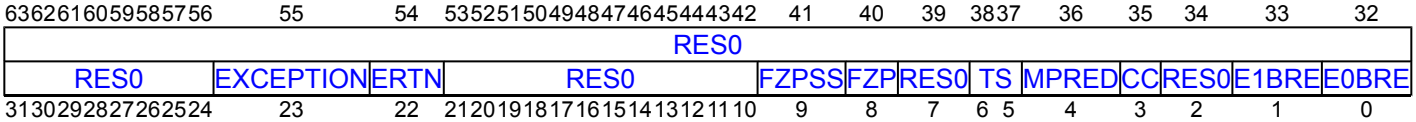
Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBCR_EL1 are UNDEFINED.

Attributes

BRBCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

EXCEPTION, bit [23]

Enable the recording of entry to EL1 via an exception.

EXCEPTION	Meaning
0b0	Disable the recording of Branch records for exceptions when taken to EL1.
0b1	Enable the recording of Branch records for exceptions when taken to EL1.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

ERTN, bit [22]

Allow the recording Branch records for exception return instructions from EL1.

ERTN	Meaning
0b0	Disable the recording Branch records for exception return instructions from EL1.
0b1	Enable the recording Branch records for exception return instructions from EL1.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Bits [21:10]

Reserved, RES0.

FZPSS, bit [9]

When FEAT_PMUv3_SS is implemented:

Freeze BRBE on PMU Snapshot.

FZPSS	Meaning
0b0	Branch recording is not affected by this control.
0b1	If either EL2 is not implemented or BRBCR_EL2.FZPSS is 1, then a BRBE freeze event occurs when a successful Capture event occurs.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FZP, bit [8]

When FEAT_PMUv3 is implemented:

Freeze BRBE on PMU overflow.

FZP	Meaning
0b0	Branch recording is not affected by this control.
0b1	A BRBE freeze event occurs when the PE is in a Non-prohibited region, BRBFCR_EL1.PAUSED is 0, and any of the following applies: • For any event counter PMEVCNTR<m>_EL0 in the first range, PMOVSCLR_EL0[m] is 1, and either FEAT_SEBEP is not implemented or PMEVTYPER<m>_EL0.SYNC is 0. • FEAT_PMUv3_ICNTR is implemented, PMOVSCLR_EL0.F0 is 1, and either FEAT_SEBEP is not implemented or PMICFILTR_EL0.SYNC is 0. For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control.

TS	Meaning	Applies when
0b01	Virtual timestamp. The BRBE recorded timestamp is the physical counter value, minus the value of CNTVOFF_EL2.	
0b10	Guest physical timestamp. The BRBE recorded timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2: • EL3 is implemented and SCR_EL3.ECVEn == 0. • EL2 is implemented and CNTHCTL_EL2.ECV == 0. • FEAT_ECV_POFF is not implemented.	When FEAT_ECV is implemented
0b11	Physical timestamp. The BRBE recorded timestamp is the physical counter value.	

All other values are reserved.

This field is ignored by the PE when EL2 is implemented and BRBCR_EL2.TS != 0b00.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

MPRED, bit [4]

Mask the recording of mispredicts.

MPRED	Meaning
0b0	Disable the recording of mispredict information.
0b1	Allow the recording of mispredict information.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

CC, bit [3]

Enable the recording of cycle count information.

CC	Meaning
0b0	Disable the recording of cycle count information.
0b1	Allow the recording of cycle count information.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E1BRE, bit [1]

EL1 Branch recording enable.

E1BRE	Meaning
0b0	Branch recording prohibited at EL1.
0b1	Branch recording enabled at EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

E0BRE, bit [0]

EL0 Branch recording enable.

E0BRE	Meaning
0b0	Branch recording prohibited at EL0.
0b1	Branch recording enabled at EL0.

This field is ignored by the PE when all of the following are true:

- HCR_EL2.TGE == 1.
- EL2 is implemented and enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing BRBCR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name BRBCR_EL1 or BRBCR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, BRBCR_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b1001	0b0000	0b000

BRBCR_EL2, Branch Record Buffer Control Register (EL2)

The BRBCR_EL2 characteristics are:

Purpose

Controls the Branch Record Buffer.

Configuration

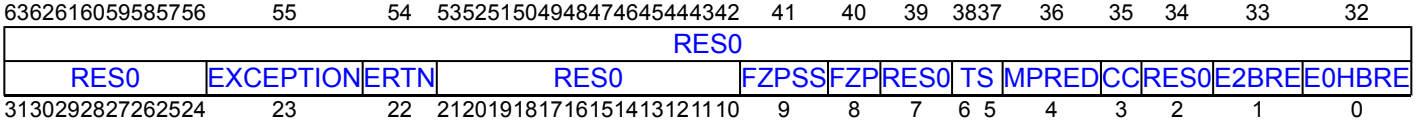
This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

BRBCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

EXCEPTION, bit [23]

Enable the recording of entry to EL2 via an exception.

EXCEPTION	Meaning
0b0	Disable the recording of Branch records for exceptions when taken to EL2.
0b1	Enable the recording of Branch records for exceptions when taken to EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

ERTN, bit [22]

Allow the recording Branch records for exception return instructions from EL2.

ERTN	Meaning
0b0	Disable the recording Branch records for exception return instructions from EL2.
0b1	Enable the recording Branch records for exception return instructions from EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Bits [21:10]

Reserved, RES0.

FZPSS, bit [9]

When FEAT_PMUv3_SS is implemented:

Freeze BRBE on PMU Snapshot.

FZPSS	Meaning
0b0	Branch recording is not affected by this control.
0b1	If BRBCR_EL1.FZPSS is 1, then a BRBE freeze event occurs when a PMU snapshot occurs.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FZP, bit [8]

When FEAT_PMUv3 is implemented:

Freeze BRBE on PMU overflow.

FZP	Meaning
0b0	Branch recording is not affected by this control.
0b1	A BRBE freeze event occurs when the PE is in a Non-prohibited region, BRBFCR_EL1.PAUSED is 0, and all the following are true for any event counter PMEVCNTR<m>_EL0 in the second range: • PMOVSCLR_EL0[m] is 1. • Either FEAT_SEBEP is not implemented or PMEVTYPER<m>_EL0.SYNC is 0. For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control.

TS	Meaning	Applies when
0b00	Timestamp controlled by BRBCR_EL1.TS.	
0b01	Virtual timestamp. The BRBE recorded timestamp is the physical counter value, minus the value of CNTVOFF_EL2.	
0b10	Guest physical timestamp. The BRBE recorded timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2: • EL3 is implemented and SCR_EL3.ECVEn == 0. • EL2 is implemented and CNTHCTL_EL2.ECV == 0. • FEAT_ECV_POFF is not implemented.	When FEAT_ECV is implemented
0b11	Physical timestamp. The BRBE recorded timestamp is the physical counter value.	

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

MPRED, bit [4]

Mask the recording of mispredicts.

MPRED	Meaning
0b0	Disable the recording of mispredict information.
0b1	Allow the recording of mispredict information.

If EL2 is not implemented, then the Effective value of this field is 1, other than for a direct read of the register.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

CC, bit [3]

Enable the recording of cycle count information.

CC	Meaning
0b0	Disable the recording of cycle count information.
0b1	Allow the recording of cycle count information.

If EL2 is not implemented, then the Effective value of this field is 1, other than for a direct read of the register.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E2BRE, bit [1]

EL2 Branch recording enable.

E2BRE	Meaning
0b0	Branch recording prohibited at EL2.
0b1	Branch recording enabled at EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

E0HBRE, bit [0]

EL0 Branch recording enable.

E0HBRE	Meaning
0b0	Branch recording prohibited at EL0 when HCR_EL2.TGE == 1.
0b1	Branch recording enabled at EL0 when HCR_EL2.TGE == 1.

This field is ignored by the PE when any of the following are true:

- HCR_EL2.TGE == 0.
- EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing BRBCR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name BRBCR_EL2 or BRBCR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, BRBCR_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b1001	0b0000	0b000

BRBFCR_EL1, Branch Record Buffer Function Control Register

The BRBFCR_EL1 characteristics are:

Purpose

Functional controls for the Branch Record Buffer.

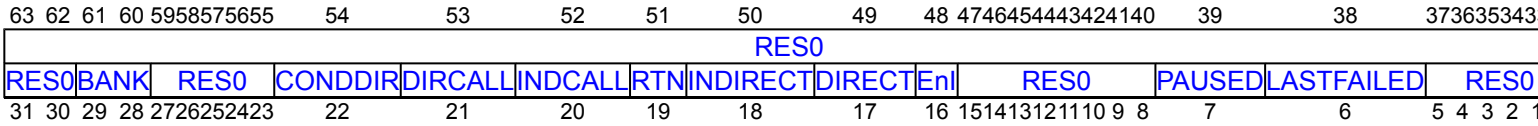
Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBFCR_EL1 are UNDEFINED.

Attributes

BRBFCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:30]

Reserved, RES0.

BANK, bits [29:28]

Branch record buffer bank access control.

BANK	Meaning
0b00	Select branch records 0 to 31.
0b01	Select branch records 32 to 63.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:23]

Reserved, RES0.

CONDDIR, bit [22]

Match on conditional direct branch instructions.

CONDDIR	Meaning
0b0	Do not match on conditional direct branch instructions.
0b1	Match on conditional direct branch instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

DIRCALL, bit [21]

Match on direct branch with link instructions.

DIRCALL	Meaning
0b0	Do not match on direct branch with link instructions.
0b1	Match on direct branch with link instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

INDCALL, bit [20]

Match on indirect branch with link instructions.

INDCALL	Meaning
0b0	Do not match on indirect branch with link instructions.
0b1	Match on indirect branch with link instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

RTN, bit [19]

Match on function return instructions.

RTN	Meaning
0b0	Do not match on function return instructions.
0b1	Match on function return instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

INDIRECT, bit [18]

Match on indirect branch instructions.

INDIRECT	Meaning
0b0	Do not match on indirect branch instructions.
0b1	Match on indirect branch instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

DIRECT, bit [17]

Match on unconditional direct branch instructions.

DIRECT	Meaning
0b0	Do not match on unconditional direct branch instructions.
0b1	Match on unconditional direct branch instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

EnI, bit [16]

Include or exclude matches.

EnI	Meaning
0b0	Include records for matches, and exclude records for non-matches.
0b1	Exclude records for matches, and include records for non-matches.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Bits [15:8]

Reserved, RES0.

PAUSED, bit [7]

Branch recording Paused status.

PAUSED	Meaning
0b0	Branch recording is not Paused.
0b1	Branch recording is Paused.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

LASTFAILED, bit [6]

When FEAT_TME is implemented:

Indicates transaction failure or cancellation.

LASTFAILED	Meaning
0b0	Indicates that no transactions in a non-prohibited region have failed or been canceled since the last Branch record was generated.
0b1	Indicates that at least one transaction in a non-prohibited region has failed or been canceled since the last Branch record was generated.

The reset behavior of this field is:

- On a Cold reset, when FEAT_BRBEv1p1 is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:0]

Reserved, RES0.

Accessing BRBFCR_EL1

BRBIDR0_EL1, Branch Record Buffer ID0 Register

The BRBIDR0_EL1 characteristics are:

Purpose

Indicates the features of the branch buffer unit.

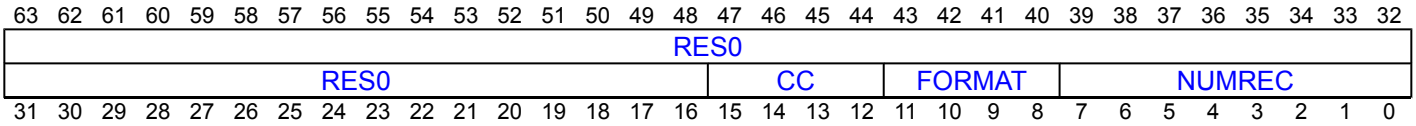
Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBIDR0_EL1 are UNDEFINED.

Attributes

BRBIDR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

CC, bits [15:12]

Cycle counter support. Defined values are:

CC	Meaning
0b0101	20-bit cycle counter implemented.

All other values are reserved.

Access to this field is **RO**.

FORMAT, bits [11:8]

Data format of records of the Branch record buffer. Defined values are:

FORMAT	Meaning
0b0000	Format 0.

All other values are reserved.

Access to this field is **RO**.

NUMREC, bits [7:0]

Number of records supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMREC	Meaning
0x08	8 branch records implemented.
0x10	16 branch records implemented.
0x20	32 branch records implemented.
0x40	64 branch records implemented.

All other values are reserved.

Access to this field is **RO**.

Accessing BRBIDR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, BRBIDR0_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b1001	0b0010	0b000

```

BRBINFINJ_EL1, Branch Record Buffer Information Injection Register

The BRBINFINJ_EL1 characteristics are:

Purpose

The information of a Branch record for injection.

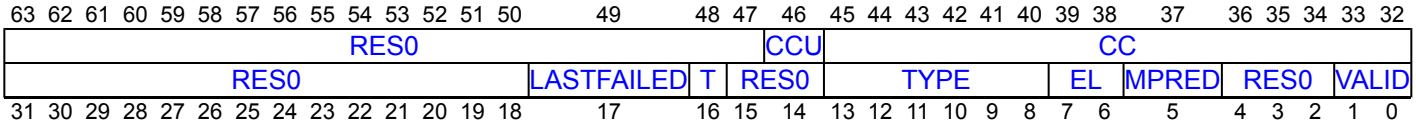
Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBINFINJ_EL1 are UNDEFINED.

Attributes

BRBINFINJ_EL1 is a 64-bit register.

Field descriptions



Bits [63:47]

Reserved, RES0.

CCU, bit [46]

The number of PE clock cycles since the last Branch record entry is UNKNOWN.

CCU	Meaning
0b0	Indicates that the number of PE clock cycles since the last Branch record is indicated by BRBINFINJ_EL1.CC.
0b1	Indicates that the number of PE clock cycles since the last Branch record is UNKNOWN.

The value in this field is only valid when BRBINFINJ_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINFINJ_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

CC, bits [45:32]

The number of PE clock cycles since the last Branch record entry.

The format of this field uses a mantissa and exponent to express the cycle count value, as follows:

- CC bits[7:0] indicate the mantissa M.
- CC bits[13:8] indicate the exponent E.

The cycle count is expressed using the following function:

if IsZero(E) then UInt(M) else UInt('1':M:Zeros(UInt(E)-1))

If required, the cycle count is rounded to a multiple of $2^{(E-1)}$ towards zero before being encoded.

A value of all ones in both the mantissa and exponent indicates the cycle count value exceeded the size of the cycle counter.

The value in this field is only valid when BRBINFINJ_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES0** if any the following are true:
  - BRBINFINJ_EL1.CCU == 1.
  - BRBINFINJ_EL1.VALID == 0b00.
- Otherwise, access to this field is **RW**.

Bits [31:18]

Reserved, RES0.

LASTFAILED, bit [17]

When FEAT_TME is implemented:

Indicates transaction failure or cancellation.

LASTFAILED	Meaning
0b0	Indicates that no transactions in a non-prohibited region have failed or been canceled between the previous Branch record and this Branch record.
0b1	Indicates that at least one transaction in a non-prohibited region has failed or been canceled between the previous Branch record and this Branch record.

The value in this field is only valid when BRBINFINJ_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINFINJ_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

T, bit [16]

When FEAT_TME is implemented:

Transactional state.

T	Meaning
0b0	The branch or exception was not executed in Transactional state.
0b1	The branch or exception was executed in Transactional state.

The value in this field is only valid when BRBINFINJ_EL1.VALID == 0b10 or BRBINFINJ_EL1.VALID == 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES0** if any the following are true:
  - BRBINFINJ_EL1.VALID == 0b00.
  - BRBINFINJ_EL1.VALID == 0b01.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

Bits [15:14]

Reserved, RES0.

TYPE, bits [13:8]

Branch type.

TYPE	Meaning
0b000000	Unconditional direct branch, excluding Branch with link.
0b000001	Indirect branch, excluding Branch with link, Return from subroutine, and Exception return.
0b000010	Direct Branch with link.
0b000011	Indirect Branch with link.
0b000101	Return from subroutine.
0b000111	Exception return.
0b001000	Conditional direct branch.
0b100001	Debug halt.
0b100010	Call.
0b100011	Trap.
0b100100	SError.
0b100110	Instruction debug.
0b100111	Data debug.
0b101010	Alignment.
0b101011	Inst Fault.
0b101100	Data Fault.
0b101110	IRQ.
0b101111	FIQ.
0b110000	IMPLEMENTATION DEFINED exception to EL3.
0b111001	Debug State Exit.

All other values are reserved.

The value in this field is only valid when BRBINFINJ_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINFINJ_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

EL, bits [7:6]

The Exception level at the target address.

EL	Meaning	Applies when
0b00	EL0.	
0b01	EL1.	
0b10	EL2.	
0b11	EL3.	When FEAT_BRBEv1p1 is implemented

The value in this field is only valid when BRBINFINJ_EL1.VALID == 0b11 or BRBINFINJ_EL1.VALID == 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES0** if any the following are true:
  - BRBINFINJ_EL1.VALID == 0b00.
  - BRBINFINJ_EL1.VALID == 0b10.
- Otherwise, access to this field is **RW**.

MPRED, bit [5]

Branch mispredict.

MPRED	Meaning
0b0	Branch was correctly predicted or the result of the prediction was not captured.
0b1	Branch was incorrectly predicted.

The value in this field is only valid when BRBINFINJ_EL1.VALID == 0b11 or BRBINFINJ_EL1.VALID == 0b10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES0** if any the following are true:
  - BRBINFINJ_EL1.VALID == 0b00.
  - BRBINFINJ_EL1.VALID == 0b01.
  - BRBINFINJ_EL1.TYPE[5] == 1.
- Otherwise, access to this field is **RW**.

Bits [4:2]

Reserved, RES0.

VALID, bits [1:0]

The Branch record is valid.

VALID	Meaning
0b00	This Branch record is not valid. The values of following fields are not valid: • BRBTGTINJ_EL1.ADDRESS. • BRBSRCINJ_EL1.ADDRESS. • BRBINFINJ_EL1.MPRED. • BRBINFINJ_EL1.LASTFAILED. • BRBINFINJ_EL1.T. • BRBINFINJ_EL1.EL. • BRBINFINJ_EL1.TYPE. • BRBINFINJ_EL1.CC. • BRBINFINJ_EL1.CCU.
0b01	This Branch record is valid. The values of following fields are not valid: • BRBSRCINJ_EL1.ADDRESS. • BRBINFINJ_EL1.T. • BRBINFINJ_EL1.MPRED.
0b10	This Branch record is valid. The values of following fields are not valid: • BRBTGTINJ_EL1.ADDRESS. • BRBINFINJ_EL1.EL.
0b11	This Branch record is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing BRBINFINJ_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

BRBINF<n>_EL1, Branch Record Buffer Information Register <n>, n = 0 - 31

The BRBINF<n>_EL1 characteristics are:

Purpose

The information for Branch record n + (BRBFCR_EL1.BANK × 32).

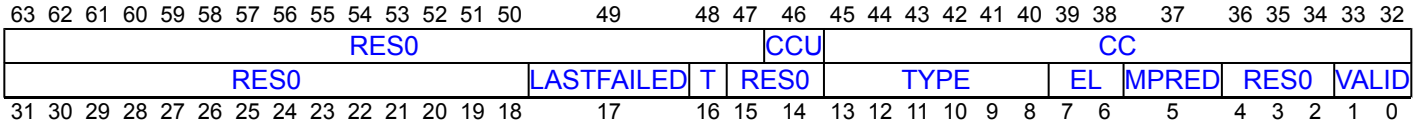
Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBINF<n>_EL1 are UNDEFINED.

Attributes

BRBINF<n>_EL1 is a 64-bit register.

Field descriptions



Bits [63:47]

Reserved, RES0.

CCU, bit [46]

The number of PE clock cycles since the last Branch record entry is UNKNOWN.

CCU	Meaning
0b0	Indicates that the number of PE clock cycles since the last Branch record is indicated by BRBINF<n>_EL1.CC.
0b1	Indicates that the number of PE clock cycles since the last Branch record is UNKNOWN.

The value in this field is only valid when BRBINF<n>_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINF<n>_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RO**.

CC, bits [45:32]

The number of PE clock cycles since the last Branch record entry.

The format of this field uses a mantissa and exponent to express the cycle count value, as follows:

- CC bits[7:0] indicate the mantissa M.
- CC bits[13:8] indicate the exponent E.

The cycle count is expressed using the following function:

if IsZero(E) then UInt(M) else UInt('1':M:Zeros(UInt(E)-1))

If required, the cycle count is rounded to a multiple of $2^{(E-1)}$ towards zero before being encoded.

A value of all ones in both the mantissa and exponent indicates the cycle count value exceeded the size of the cycle counter.

The value in this field is only valid when BRBINF<n>_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES0** if any the following are true:
  - BRBINF<n>_EL1.CCU == 1.
  - BRBINF<n>_EL1.VALID == 0b00.
- Otherwise, access to this field is **RO**.

Bits [31:18]

Reserved, RES0.

LASTFAILED, bit [17]

When FEAT_TME is implemented:

Indicates transaction failure or cancellation.

LASTFAILED	Meaning
0b0	Indicates that no transactions in a non-prohibited region have failed or been canceled between the previous Branch record and this Branch record.
0b1	Indicates that at least one transaction in a non-prohibited region has failed or been canceled between the previous Branch record and this Branch record.

The value in this field is only valid when BRBINF<n>_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINF<n>_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

T, bit [16]

When FEAT_TME is implemented:

Transactional state.

T	Meaning
0b0	The branch or exception was not executed in Transactional state.
0b1	The branch or exception was executed in Transactional state.

The value in this field is only valid when BRBINF<n>_EL1.VALID == 0b10 or BRBINF<n>_EL1.VALID == 0b11.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES0** if any the following are true:
  - BRBINF<n>_EL1.VALID == 0b00.
  - BRBINF<n>_EL1.VALID == 0b01.
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [15:14]

Reserved, RES0.

TYPE, bits [13:8]

Branch type.

TYPE	Meaning
0b000000	Unconditional direct branch, excluding Branch with link.
0b000001	Indirect branch, excluding Branch with link, Return from subroutine, and Exception return.
0b000010	Direct Branch with link.
0b000011	Indirect Branch with link.
0b000101	Return from subroutine.
0b000111	Exception return.
0b001000	Conditional direct branch.
0b100001	Debug halt.
0b100010	Call.
0b100011	Trap.
0b100100	SError.
0b100110	Instruction debug.
0b100111	Data debug.
0b101010	Alignment.
0b101011	Inst Fault.
0b101100	Data Fault.
0b101110	IRQ.
0b101111	FIQ.
0b110000	IMPLEMENTATION DEFINED exception to EL3.
0b111001	Debug State Exit.

All other values are reserved.

The value in this field is only valid when BRBINF<n>_EL1.VALID != 0b00.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINF<n>_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RO**.

EL, bits [7:6]

The Exception level at the target address.

EL	Meaning	Applies when
0b00	EL0.	
0b01	EL1.	
0b10	EL2.	
0b11	EL3.	When FEAT_BRBEv1p1 is implemented

The value in this field is only valid when BRBINF<n>_EL1.VALID == 0b11 or BRBINF<n>_EL1.VALID == 0b01.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES0** if any the following are true:
  - BRBINF<n>_EL1.VALID == 0b00.
  - BRBINF<n>_EL1.VALID == 0b10.
- Otherwise, access to this field is **RO**.

MPRED, bit [5]

Branch mispredict.

MPRED	Meaning
0b0	Branch was correctly predicted or the result of the prediction was not captured.
0b1	Branch was incorrectly predicted.

The value in this field is only valid when BRBINF<n>_EL1.VALID == 0b11 or BRBINF<n>_EL1.VALID == 0b10.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES0** if any the following are true:
  - BRBINF<n>_EL1.VALID == 0b00.
  - BRBINF<n>_EL1.VALID == 0b01.
  - BRBINF<n>_EL1.TYPE[5] == 1.
- Otherwise, access to this field is **RO**.

Bits [4:2]

Reserved, RES0.

VALID, bits [1:0]

The Branch record is valid.

VALID	Meaning
0b00	This Branch record is not valid. The values of following fields are not valid: • BRBTGT<n>_EL1.ADDRESS. • BRBSRC<n>_EL1.ADDRESS. • BRBINF<n>_EL1.MPRED. • BRBINF<n>_EL1.LASTFAILED. • BRBINF<n>_EL1.T. • BRBINF<n>_EL1.EL. • BRBINF<n>_EL1.TYPE. • BRBINF<n>_EL1.CC. • BRBINF<n>_EL1.CCU.
0b01	This Branch record is valid. The values of following fields are not valid: • BRBSRC<n>_EL1.ADDRESS. • BRBINF<n>_EL1.T. • BRBINF<n>_EL1.MPRED.
0b10	This Branch record is valid. The values of following fields are not valid: • BRBTGT<n>_EL1.ADDRESS. • BRBINF<n>_EL1.EL.
0b11	This Branch record is valid.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing BRBINF<n>_EL1

BRBINF<n>_EL1 reads-as-zero if n + (BRBFCR_EL1.BANK × 32) >= BRBIDR0_EL1.NUMREC.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, BRBINF<m>_EL1 ; Where m = 0-31
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b1000	m[3:0]	m[4]:0b00

```
integer m = UInt(op2<2>:CRm<3:0>);

BRBSRCINJ_EL1, Branch Record Buffer Source Address Injection Register

The BRBSRCINJ_EL1 characteristics are:

Purpose

The source address of a Branch record for injection.

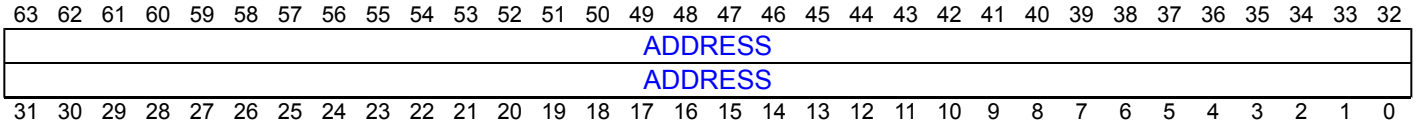
Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBSRCINJ_EL1 are UNDEFINED.

Attributes

BRBSRCINJ_EL1 is a 64-bit register.

Field descriptions



ADDRESS, bits [63:0]

Source virtual address of the Branch record.

When a direct write occurs with a value with ADDRESS bits [63:P] indicating an invalid address, an UNKNOWN value which indicates an invalid address is written to bits [63:P].

An invalid address is:

- For an address in a translation regime with 2 VA ranges, with bits [63:P] not all zeroes or all ones.
- For an address in a translation regime with a single VA range, with bits [63:P] not all zeroes.

P is defined as:

- 56, when FEAT_LVA3 is implemented.
- 52, when FEAT_LVA is implemented.
- 48, otherwise.

The value in bits [P-1:0] is the value written.

When a direct write occurs with a value with ADDRESS bits [63:P] indicating a valid address, the written value is written to bits [63:0], and a read of the register returns the written value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES0** if any the following are true:
  - BRBINFINJ_EL1.VALID == 0b00.
  - BRBINFINJ_EL1.VALID == 0b01.
- Otherwise, access to this field is **RW**.

BRBTGTINJ_EL1, Branch Record Buffer Target Address Injection Register

The BRBTGTINJ_EL1 characteristics are:

Purpose

The target address of a Branch record for injection.

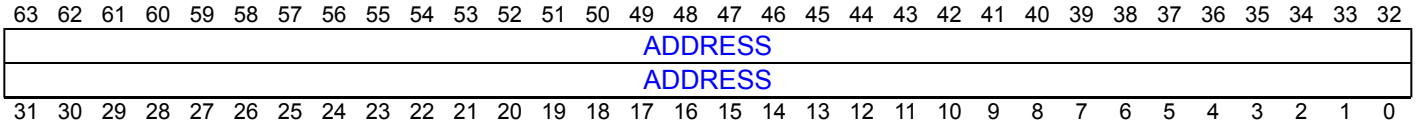
Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBTGTINJ_EL1 are UNDEFINED.

Attributes

BRBTGTINJ_EL1 is a 64-bit register.

Field descriptions



ADDRESS, bits [63:0]

Target virtual address of the Branch record.

When a direct write occurs with a value with ADDRESS bits [63:P] indicating an invalid address, an UNKNOWN value which indicates an invalid address is written to bits [63:P].

An invalid address is:

- For an address in a translation regime with 2 VA ranges, with bits [63:P] not all zeroes or all ones.
- For an address in a translation regime with a single VA range, with bits [63:P] not all zeroes.

P is defined as:

- 56, when FEAT_LVA3 is implemented.
- 52, when FEAT_LVA is implemented.
- 48, otherwise.

The value in bits [P-1:0] is the value written.

When a direct write occurs with a value with ADDRESS bits [63:P] indicating a valid address, the written value is written to bits [63:0], and a read of the register returns the written value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES0** if any the following are true:
  - BRBINFINJ_EL1.VALID == 0b00.
  - BRBINFINJ_EL1.VALID == 0b10.
- Otherwise, access to this field is **RW**.

BRBTGT<n>_EL1, Branch Record Buffer Target Address Register <n>, n = 0 - 31

The BRBTGT<n>_EL1 characteristics are:

Purpose

The target address of Branch record n + (BRBFCR_EL1.BANK × 32).

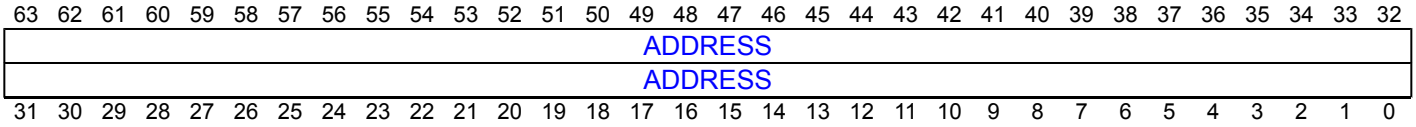
Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBTGT<n>_EL1 are UNDEFINED.

Attributes

BRBTGT<n>_EL1 is a 64-bit register.

Field descriptions



ADDRESS, bits [63:0]

Target virtual address of the Branch record.

When an indirect write occurs with a value with ADDRESS bits [63:P] indicating an invalid address, an UNKNOWN value which indicates an invalid address is written to bits [63:P].

An invalid address is:

- For an address in a translation regime with 2 VA ranges, with bits [63:P] not all zeroes or all ones.
- For an address in a translation regime with a single VA range, with bits [63:P] not all zeroes.

P is defined as:

- 56, when FEAT_LVA3 is implemented.
- 52, when FEAT_LVA is implemented.
- 48, otherwise.

The value in bits [P-1:0] is the value written.

When an indirect write occurs with a value with ADDRESS bits [63:P] indicating a valid address, the written value is written to bits [63:0], and a read of the register returns the written value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES0** if any the following are true:
  - BRBINF<n>_EL1.VALID == 0b00.
  - BRBINF<n>_EL1.VALID == 0b10.
- Otherwise, access to this field is **RO**.

Accessing BRBTGT<n>_EL1

BRBTGT<n>_EL1 is RES0 if n + (BRBFCR_EL1.BANK × 32) >= BRBIDR0_EL1.NUMREC.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, BRBTGT<m>_EL1 ; Where m = 0-31
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b1000	m[3:0]	m[4]:0b10

```
integer m = UInt(op2<2>:CRm<3:0>);

BRBTS_EL1, Branch Record Buffer Timestamp Register

The BRBTS_EL1 characteristics are:

Purpose

Captures the Timestamp value on a BRBE freeze event.

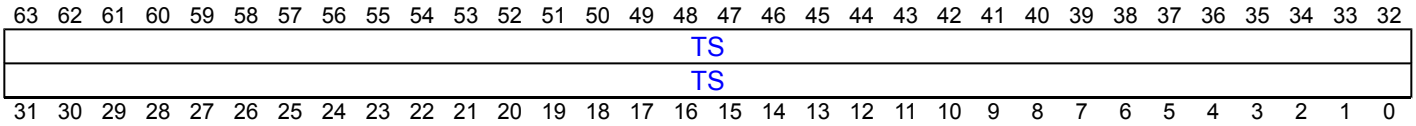
Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBTS_EL1 are UNDEFINED.

Attributes

BRBTS_EL1 is a 64-bit register.

Field descriptions



TS, bits [63:0]

Timestamp value at the time of a BRBE freeze event.

The reset behavior of this field is:

- On a Warm reset, when FEAT_BRBEv1p1 is not implemented, this field resets to '0000000000000000000000000000000000000000000000000000000000000000'.

When FEAT_BRBEv1p1 is implemented, Arm recommends that this field is preserved on a Warm reset, but it is IMPLEMENTATION DEFINED whether this field resets to 0 or is preserved.

When FEAT_BRBEv1p1 is implemented, on a Cold reset it is IMPLEMENTATION DEFINED whether this field resets to an architecturally UNKNOWN value.

Accessing BRBTS_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

CCSIDR2_EL1, Current Cache Size ID Register 2

The CCSIDR2_EL1 characteristics are:

Purpose

Provides the information about the architecture of the currently selected cache from bits[63:32] of CCSIDR_EL1.

Configuration

AArch64 System register CCSIDR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register CCSIDR2[31:0].

This register is present only when FEAT_CCIDX is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to CCSIDR2_EL1 are UNDEFINED.

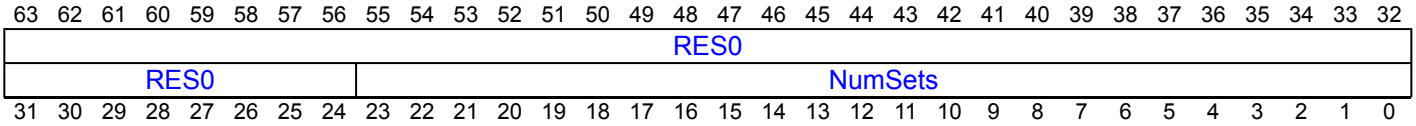
In an implementation which does not support AArch32 at EL1, it is IMPLEMENTATION DEFINED whether reading this register gives an UNKNOWN value or is UNDEFINED.

The implementation includes one CCSIDR2_EL1 for each cache that it can access. CSSELR_EL1 selects which Cache Size ID Register is accessible.

Attributes

CCSIDR2_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

NumSets, bits [23:0]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Accessing CCSIDR2_EL1

If CSSELR_EL1.{TnD, Level, InD} is programmed to a cache level that is not implemented, then on a read of the CCSIDR2_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR2_EL1 read is treated as NOP.
- The CCSIDR2_EL1 read is UNDEFINED. If FEAT_IDST is implemented, this is permitted to be reported with EC syndrome value `0x18`.
- The CCSIDR2_EL1 read returns an UNKNOWN value.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CCSIDR2_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b010

```
if !(IsFeatureImplemented(FEAT_CCIDX) && IsFeatureImplemented(FEAT_AA64)) then
    UnimplementedIDRegister();
elsif PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID2 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_EVT) && HCR_EL2.TID4 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = CCSIDR2_EL1;
elsif PSTATE.EL == EL2 then
    X[t, 64] = CCSIDR2_EL1;
elsif PSTATE.EL == EL3 then
    X[t, 64] = CCSIDR2_EL1;
```

CCSIDR_EL1, Current Cache Size ID Register

The CCSIDR_EL1 characteristics are:

Purpose

Provides information about the architecture of the currently selected cache.

Configuration

AArch64 System register CCSIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CCSIDR[31:0].

AArch64 System register CCSIDR_EL1 bits [63:32] are architecturally mapped to AArch32 System register CCSIDR2[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CCSIDR_EL1 are UNDEFINED.

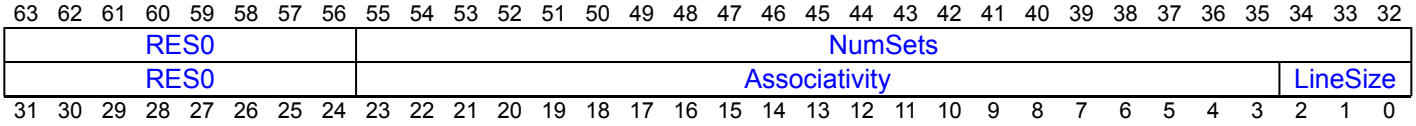
The implementation includes one CCSIDR_EL1 for each cache that it can access. CSSELR_EL1 selects which Cache Size ID Register is accessible.

Attributes

CCSIDR_EL1 is a 64-bit register.

Field descriptions

When FEAT_CCIDX is implemented:



Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [63:56]

Reserved, RES0.

NumSets, bits [55:32]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Bits [31:24]

Reserved, RES0.

Associativity, bits [23:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log_2(Number of bytes in cache line)) - 4. For example:

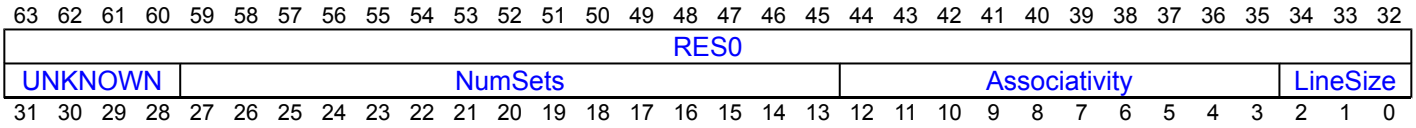
- For a line length of 16 bytes: $Log_2(16) = 4$, LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes: $Log_2(32) = 5$, LineSize entry = 1.

Note

The C++ 17 specification has two defined parameters relating to the granularity of memory that does not interfere. For generic software and tools, Arm will set the hardware_destructive_interference_size parameter to 256 bytes and the hardware_constructive_interference_size parameter to 64 bytes.

When FEAT_MTE2 is implemented, where a cache only holds Allocation tags, this field is RES0.

Otherwise:



Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [63:32]

Reserved, RES0.

Bits [31:28]

Reserved, UNKNOWN.

NumSets, bits [27:13]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Associativity, bits [12:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log_2(Number of bytes in cache line)) - 4. For example:

- For a line length of 16 bytes: $Log_2(16) = 4$, LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes: $Log_2(32) = 5$, LineSize entry = 1.

When FEAT_MTE2 is implemented, where a cache only holds Allocation tags, this field is RES0.

Note

The C++ 17 specification has two defined parameters relating to the granularity of memory that does not interfere. For generic software and tools, Arm will set the

hardware_destructive_interference_size parameter to 256 bytes and the hardware_constructive_interference_size parameter to 64 bytes.

Accessing CCSIDR_EL1

If CSSELR_EL1.{TnD, Level, InD} is programmed to a cache level that is not implemented, then on a read of the CCSIDR_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR_EL1 read is treated as NOP.
- The CCSIDR_EL1 read is UNDEFINED. If FEAT_IDST is implemented, this is permitted to be reported with EC syndrome value `0x18`.
- The CCSIDR_EL1 read returns an UNKNOWN value.

CFP RCTX, Control Flow Prediction Restriction by Context

The CFP RCTX characteristics are:

Purpose

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Control flow predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

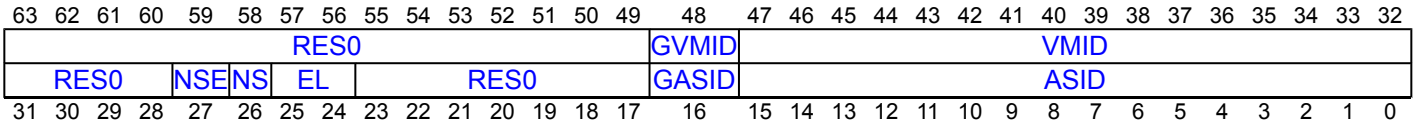
Configuration

This instruction is present only when FEAT_SPECRES is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to CFP RCTX are UNDEFINED.

Attributes

CFP RCTX is a 64-bit System instruction.

Field descriptions



Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, this field is treated as the current VMID.

When the instruction is executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:28]

Reserved, RES0.

NSE, bit [27]

When FEAT_RME is implemented:

Together with the NS field, selects the Security state.

For a description of the values derived by evaluating NS and NSE together, see CFP_RCTX.NS.

Otherwise:

Reserved, RES0.

NS, bit [26]

When FEAT_RME is implemented:

Together with the NSE field, selects the Security state.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Some Effective values are determined by the current Security state:

- When executed in Secure state, the Effective value of NSE is 0.
- When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.
- When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

This instruction is treated as a NOP when executed at EL3 and either:

- CFP_RCTX.{NSE, NS} selects a reserved value.
- CFP_RCTX.{NSE, NS} == {1, 0} and CFP_RCTX.EL has a value other than 0b11.

Otherwise:

Security State.

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, or is specified to apply to a combination of Exception level and Security state that is not implemented, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing CFP RCTX

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
CFP RCTX, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b100

```
if !(IsFeatureImplemented(FEAT_SPECRES) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    if !ELIsInHost(EL0) && SCTLR_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    elsif EL2Enabled() && !ELIsInHost(EL0) && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) ||
SCR_EL3.FGTEn == '1') && HFGITR_EL2.CFPRCTX == '1' then

CLIDR_EL1, Cache Level ID Register

The CLIDR_EL1 characteristics are:

Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

Configuration

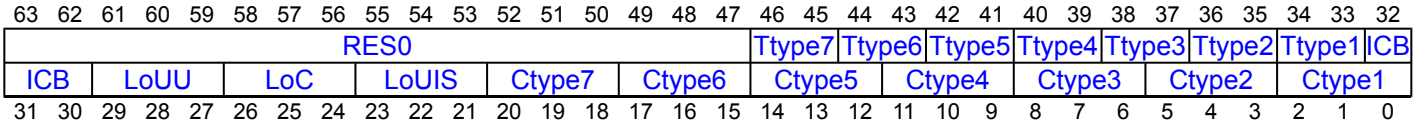
AArch64 System register CLIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CLIDR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CLIDR_EL1 are UNDEFINED.

Attributes

CLIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:47]

Reserved, RES0.

Ttype<n>, bits [2(n-1)+34:2(n-1)+33], for n = 7 to 1

When FEAT_MTE2 is implemented:

Tag cache type. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy.

Ttype<n>	Meaning
0b00	No Tag Cache.
0b01	Separate Allocation Tag Cache.
0b10	Unified Allocation Tag and Data cache, Allocation Tags and Data in unified lines.
0b11	Unified Allocation Tag and Data cache, Allocation Tags and Data in separate lines.

Otherwise:

Reserved, RES0.

ICB, bits [32:30]

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ICB	Meaning
0b000	Not disclosed by this mechanism.
0b001	L1 cache is the highest Inner Cacheable level.
0b010	L2 cache is the highest Inner Cacheable level.
0b011	L3 cache is the highest Inner Cacheable level.
0b100	L4 cache is the highest Inner Cacheable level.
0b101	L5 cache is the highest Inner Cacheable level.
0b110	L6 cache is the highest Inner Cacheable level.
0b111	L7 cache is the highest Inner Cacheable level.

Access to this field is **RO**.

LoUU, bits [29:27]

Level of Unification Uniprocessor for the cache hierarchy.

For a description of the values of this field, see Terminology for Clean, Invalidate, and Clean and Invalidate instructions.

Note

This field does not describe the requirements for instruction cache invalidation. See CTR_EL0.DIC.

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

LoC, bits [26:24]

Level of Coherence for the cache hierarchy.

For a description of the values of this field, see Terminology for Clean, Invalidate, and Clean and Invalidate instructions.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

LoUIS, bits [23:21]

Level of Unification Inner Shareable for the cache hierarchy.

For a description of the values of this field, see Terminology for Clean, Invalidate, and Clean and Invalidate instructions.

Note

This field does not describe the requirements for instruction cache invalidation. See CTR_EL0.DIC.

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 7 to 1

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

Ctype<n>	Meaning
0b000	No cache.
0b001	Instruction cache only.
0b010	Data cache only.
0b011	Separate instruction and data caches.
0b100	Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 0b000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 0b000, the values of Ctype4 to Ctype7 must be ignored.

Accessing CLIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CLIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b001

```

CNTFRQ_EL0, Counter-timer Frequency Register

The CNTFRQ_EL0 characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configuration

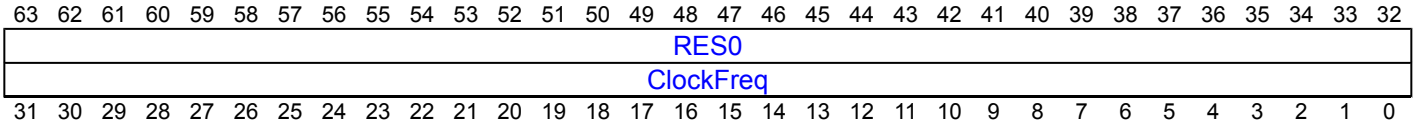
AArch64 System register CNTFRQ_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTFRQ[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CNTFRQ_EL0 are UNDEFINED.

Attributes

CNTFRQ_EL0 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

ClockFreq, bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTFRQ_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0000	0b000

```

CNTHCTL_EL2, Counter-timer Hypervisor Control Register

The CNTHCTL_EL2 characteristics are:

Purpose

Controls the generation of an event stream from the physical counter, and access from EL1 to the physical counter and the EL1 physical timer.

Configuration

AArch64 System register CNTHCTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHCTL[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CNTHCTL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

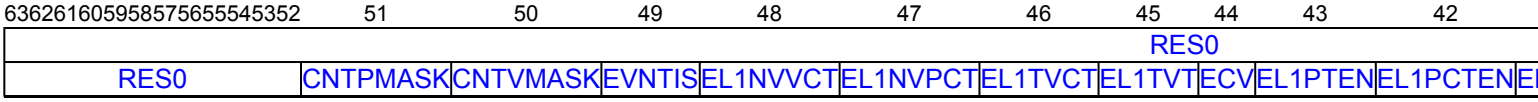
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

CNTHCTL_EL2 is a 64-bit register.

Field descriptions

When ELIsInHost(EL2):



Bits [63:20]

Reserved, RES0.

CNTPMASK, bit [19]

When FEAT_RME is implemented:

CNTPMASK	Meaning
0b0	This control has no effect on CNTP_CTL_EL0.IMASK.
0b1	CNTP_CTL_EL0.IMASK behaves as if set to 1 for all purposes other than a direct read of the field.

This bit is RES0 in Non-secure and Secure state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CNTVMASK, bit [18]

When FEAT_RME is implemented:

CNTVMASK	Meaning
0b0	This control has no effect on CNTV_CTL_EL0.IMASK.
0b1	CNTV_CTL_EL0.IMASK behaves as if set to 1 for all purposes other than a direct read of the field.

This bit is RES0 in Non-secure and Secure state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[15:0].
0b1	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVVCT, bit [16]

When FEAT_ECV is implemented:

When HCR_EL2.TGE is 0 and the Effective value of HCR_EL2.{NV2, NV1, NV} is {1, 0, 1}, traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2 as follows:

Accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2 and reported with EC syndrome value 0x18.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers are trapped to EL2.

If HCR_EL2.TGE is 1 or the Effective value of HCR_EL2.{NV2, NV1, NV} is not {1, 0, 1}, this control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVPCT, bit [15]

When FEAT_ECV is implemented:

When HCR_EL2.TGE is 0 and the Effective value of HCR_EL2.{NV2, NV1, NV} is {1, 0, 1}, traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2 as follows:

Accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02 are trapped to EL2 and reported with EC syndrome value `0x18`.

EL1NVPCT	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 accesses to the specified registers are trapped to EL2.

If HCR_EL2.TGE is 1 or the Effective value of HCR_EL2.{NV2, NV1, NV} is not {1, 0, 1}, this control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVCT, bit [14]

When FEAT_ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTVCT_EL0 and CNTVCTSS_EL0 are trapped to EL2 and reported using EC syndrome value `0x18`, unless they are trapped by CNTKCTL_EL1.EL0VCTEN.
- In AArch32 state, accesses to CNTVCT are trapped to EL2 and reported with EC syndrome value `0x04`, unless they are trapped by CNTKCTL_EL1.EL0VCTEN or CNTKCTL.PL0VCTEN.

EL1TVCT	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL0 and EL1 accesses to the specified registers are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

If HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]

When FEAT_ECV is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 and reported with EC syndrome value `0x18`, unless they are trapped by CNTKCTL_EL1.EL0VTEN:
  - CNTV_CTL_EL0.
  - CNTV_CVAL_EL0.
  - CNTV_TVAL_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value `0x03`, and MCRR and MRRC accesses are trapped to EL2 and reported using EC syndrome value `0x04`, unless they are trapped by CNTKCTL_EL1.EL0VTEN or CNTKCTL.PL0VTEN:
  - CNTV_CTL.
  - CNTV_CVAL.
  - CNTV_TVAL.

EL1TVT	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL0 and EL1 accesses to the specified registers are trapped to EL2.

If HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECV, bit [12]

When FEAT_ECV_POFF is implemented:

Enables the Enhanced Counter Virtualization functionality registers.

When the Enhanced Counter Virtualization is enabled, the behavior is as follows:

- An MRS to CNTPCT_EL0 from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - CNTPOFF_EL2<63:0>).
- The EL1 physical timer interrupt is triggered when ((PCount<63:0> - CNTPOFF_EL2<63:0>) - PCVal<63:0>) is greater than or equal to 0.

PCount<63:0> is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3.

PCVal<63:0> is the EL1 physical timer compare value for this timer.

ECV	Meaning
`0b0`	Enhanced Counter Virtualization functionality is disabled.
`0b1`	Enhanced Counter Virtualization functionality is enabled.

When HCR_EL2.TGE is 1 or SCR_EL3.{NS, EEL2} is {0, 0}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1PTEN, bit [11]

When HCR_EL2.TGE is 0, traps EL0 and EL1 accesses to the EL1 physical timer registers to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 and reported with EC syndrome value `0x18`, unless they are trapped by CNTKCTL_EL1.EL0PTEN:
  - CNTP_CTL_EL0.
  - CNTP_CVAL_EL0.
  - CNTP_TVAL_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value `0x03` and MRRC and MCRR accesses are trapped and reported using EC syndrome value `0x04`, unless they are trapped by CNTKCTL_EL1.EL0PTEN or CNTKCTL.PL0PTEN:
  - CNTP_CTL.
  - CNTP_CVAL.
  - CNTP_TVAL.

EL1PTEN	Meaning
`0b0`	EL0 and EL1 accesses to the specified registers are trapped to EL2.
`0b1`	This control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCTEN, bit [10]

When HCR_EL2.TGE is 0, traps EL0 and EL1 accesses to the EL1 physical counter registers to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTPCT_EL0 and CNTPCTSS_EL0 are trapped to EL2 and reported with EC syndrome value `0x18`, unless they are trapped by CNTKCTL_EL1.EL0PCTEN.
- In AArch32 state, MRRC or MCRR accesses to CNTPCT are trapped to EL2 and reported with EC syndrome value `0x04`, unless they are trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN.

EL1PCTEN	Meaning
`0b0`	EL0 and EL1 accesses to the specified registers are trapped to EL2.
`0b1`	This control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0PTEN, bit [9]

When HCR_EL2.TGE is 1, traps EL0 accesses to the physical timer registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 and reported with EC syndrome value `0x18`:
  - CNTP_CTL_EL0.
  - CNTP_CVAL_EL0.
  - CNTP_TVAL_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value `0x03` and MRRC and MCRR accesses are trapped and reported using EC syndrome value `0x04`:
  - CNTP_CTL.
  - CNTP_CVAL.
  - CNTP_TVAL.

EL0PTEN	Meaning
`0b0`	EL0 accesses to the specified registers are trapped to EL2.
`0b1`	This control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

When HCR_EL2.TGE is 1, traps EL0 accesses to the virtual timer registers to EL2 as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 and reported with EC syndrome value `0x18`:
  - CNTV_CTL_EL0.
  - CNTV_CVAL_EL0.
  - CNTV_TVAL_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value `0x03` and MRRC and MCRR accesses are trapped and reported using EC syndrome value `0x04`:
  - CNTV_CTL.
  - CNTV_CVAL.
  - CNTV_TVAL.

EL0VTEN	Meaning
`0b0`	EL0 accesses to the specified registers are trapped to EL2.
`0b1`	This control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of CNTPCT_EL0, as seen from EL2, is the trigger for the event stream generated from that counter when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of CNTPCT_EL0.

Otherwise, this field selects a trigger bit in the range 0 to 15 of CNTPCT_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the CNTPCT_EL0 trigger bit, as seen from EL2 and defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
`0b0`	A 0 to 1 transition of the trigger bit triggers an event.
`0b1`	A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from CNTPCT_EL0 as seen from EL2.

EVNTEN	Meaning
`0b0`	Disables the event stream.
`0b1`	Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0VCTEN, bit [1]

When HCR_EL2.TGE is 1, traps EL0 accesses to the frequency register and virtual counter registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 and reported with EC syndrome value `0x18`:
  - CNTVCT_EL0.
  - CNTVCTSS_EL0.
  - CNTFRQ_EL0 if CNTHCTL_EL2.EL0PCTEN is 0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value `0x03` and MRRC and MCRR accesses are trapped and reported using EC syndrome value `0x04`:
  - CNTVCT and if CNTHCTL.EL0PCTEN is 0, CNTFRQ.

EL0VCTEN	Meaning
`0b0`	EL0 accesses to the specified registers are trapped to EL2.
`0b1`	This control does not cause any instructions to be trapped.

If HCR_EL2.TGE is 0, the field is ignored for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Traps EL0 accesses to the frequency register and physical counter registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 and reported with EC syndrome value `0x18`:
  - CNTPCT_EL0.
  - CNTPCTSS_EL0.
  - CNTFRQ_EL0 if CNTHCTL_EL2.EL0VCTEN is 0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value `0x03` and MRRC and MCRR accesses are trapped and reported using EC syndrome value `0x04`:
  - CNTPCT and if CNTHCTL_EL2.EL0VCTEN is 0, CNTFRQ.

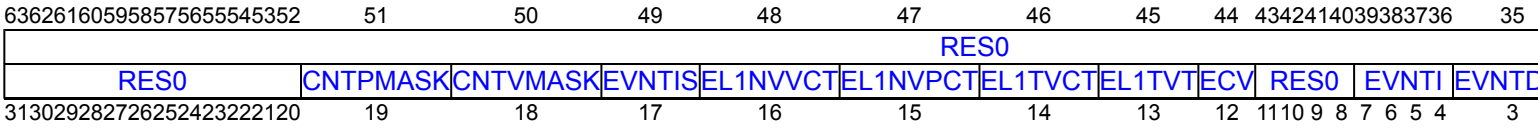
EL0PCTEN	Meaning
`0b0`	From AArch64 state: EL0 accesses to the specified registers are trapped to EL2.
`0b1`	This control does not cause any instructions to be trapped.

If HCR_EL2.TGE is 0, the control does not cause any instructions to be trapped for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



The following field descriptions apply in all Armv8.0 implementations.

The descriptions also explain the behavior when EL3 is implemented and EL2 is not implemented.

Bits [63:20]

Reserved, RES0.

CNTPMASK, bit [19]

When FEAT_RME is implemented:

CNTPMASK	Meaning
`0b0`	This control has no effect on CNTP_CTL_EL0.IMASK.
`0b1`	CNTP_CTL_EL0.IMASK behaves as if set to 1 for all purposes other than a direct read of the field.

This bit is RES0 in Non-secure and Secure state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CNTVMASK, bit [18]
When FEAT_RME is implemented:

CNTVMASK	Meaning
0b0	This control has no effect on CNTV_CTL_EL0.IMASK.
0b1	CNTV_CTL_EL0.IMASK behaves as if set to 1 for all purposes other than a direct read of the field.

This bit is RES0 in Non-secure and Secure state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVNTIS, bit [17]
When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[15:0].
0b1	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVVCT, bit [16]
When FEAT_ECV is implemented:

When the Effective value of HCR_EL2.{NV2, NV1, NV} is {1, 0, 1}, traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2 as follows:

Accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2 and reported with EC syndrome value 0x18.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers are trapped to EL2.

If the Effective value of HCR_EL2.{NV2, NV1, NV} is not {1, 0, 1}, this control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVPCT, bit [15]
When FEAT_ECV is implemented:

When the Effective value of HCR_EL2.{NV2, NV1, NV} is {1, 0, 1}, traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2 as follows:

Accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02 are trapped to EL2 and reported with EC syndrome value `0x18`.

EL1NVPCT	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 accesses to the specified registers are trapped to EL2.

If the Effective value of HCR_EL2.{NV2, NV1, NV} is not {1, 0, 1}, this control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVCT, bit [14]
When FEAT_ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTVCT_EL0 and CNTVCTSS_EL0 are trapped to EL2 and reported using EC syndrome value `0x18`, unless they are trapped by CNTKCTL_EL1.EL0VCTEN.
- In AArch32 state, accesses to CNTVCT are trapped to EL2 and reported using EC syndrome value `0x04`, unless they are trapped by CNTKCTL_EL1.EL0VCTEN or CNTKCTL.PL0VCTEN.

EL1TVCT	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL0 and EL1 accesses to the specified registers are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]
When FEAT_ECV is implemented:

If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 and reported with EC syndrome value `0x18`, unless they are trapped by CNTKCTL_EL1.EL0VTEN:
  - CNTV_CTL_EL0.
  - CNTV_CVAL_EL0.
  - CNTV_TVAL_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value `0x03` and MRRC and MCRR accesses are trapped and reported using EC syndrome value `0x04`, unless they are trapped by CNTKCTL_EL1.EL0VTEN or CNTKCTL.PL0VTEN:
  - CNTV_CTL.
  - CNTV_CVAL.
  - CNTV_TVAL.

EL1TVT	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL0 and EL1 accesses to the specified registers are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECV, bit [12]
When FEAT_ECV_POFF is implemented:

Enables the Enhanced Counter Virtualization functionality registers.

When the Enhanced Counter Virtualization is enabled, the behavior is as follows:

- An MRS to CNTPCT_EL0 from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - CNTPOFF_EL2<63:0>).
- The EL1 physical timer interrupt is triggered when ((PCount<63:0> - CNTPOFF_EL2<63:0>) - PCVal<63:0>) is greater than or equal to 0.

PCount is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3.

PCVal<63:0> is the EL1 physical timer compare value for this timer.

ECV	Meaning
`0b0`	Enhanced Counter Virtualization functionality is disabled.
`0b1`	Enhanced Counter Virtualization functionality is enabled.

When SCR_EL3.{NS, EEL2} is {0, 0} or if FEAT_ECV_POFF is not implemented, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [11:8]

Reserved, RES0.

EVNTI, bits [7:4]

Selects which bit of CNTPCT_EL0, as seen from EL2,is the trigger for the event stream generated from that counter when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of CNTPCT_EL0.

Otherwise, this field selects a trigger bit in the range 0 to 15 of CNTPCT_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the CNTPCT_EL0 trigger bit, as seen from EL2 and defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from CNTPCT_EL0 as seen from EL2.

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCEN, bit [1]

Traps EL0 and EL1 accesses to the EL1 physical timer registers to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTP_CTL_EL0, CNTP_CVAL_EL0, CNTP_TVAL_EL0 are trapped to EL2, reported using EC syndrome value 0x18, unless they are trapped by CNTKCTL_EL1.EL0PTEN.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, and MRRC and MCRR accesses are trapped to EL2, reported using EC syndrome value 0x04, unless they are trapped by CNTKCTL_EL1.EL0PTEN or CNTKCTL.PL0PTEN:
    - CNTP_CTL, CNTP_CVAL, CNTP_TVAL.

EL1PCEN	Meaning
0b0	EL0 and EL1 accesses to the specified registers are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCTEN, bit [0]

Traps EL0 and EL1 accesses to the EL1 physical counter registers to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTPCT_EL0 and CNTPCTSS_EL0 are trapped to EL2 and reported using EC syndrome value `0x18`, unless they are trapped by CNTKCTL_EL1.EL0PCTEN.
- In AArch32 state, MRRC or MCRR accesses to CNTPCT are trapped to EL2 and reported using EC syndrome value `0x04`, unless they are trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN.

EL1PCTEN	Meaning
`0b0`	EL0 and EL1 accesses to the specified registers are trapped to EL2.
`0b1`	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHCTL_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name CNTHCTL_EL2 or CNTKCTL_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTHCTL_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    X[t, 64] = CNTHCTL_EL2;
elsif PSTATE.EL == EL3 then
    X[t, 64] = CNTHCTL_EL2;
```

```
MSR CNTHCTL_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;

CNTHP_CTL_EL2, Counter-timer Hypervisor Physical Timer Control Register

The CNTHP_CTL_EL2 characteristics are:

Purpose

Control register for the EL2 physical timer.

Configuration

AArch64 System register CNTHP_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHP_CTL[31:0].

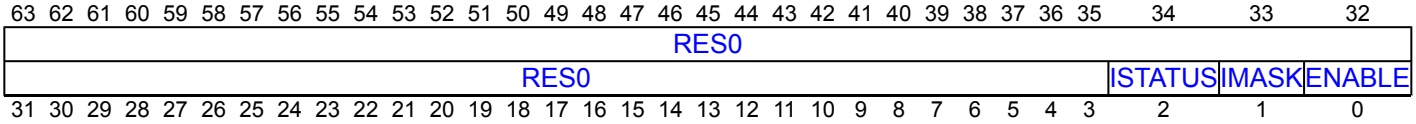
This register is present only when (EL3 is implemented or (EL3 is not implemented, EL2 is implemented, and FEAT_SEL2 is not implemented)) and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTHP_CTL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_CTL_EL2 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHP_TVAL_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_CTL_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name CNTHP_CTL_EL2 or CNTP_CTL_EL0 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTHP_CTL_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0010	0b001

```
if !((HaveEL(EL3) || (!HaveEL(EL3) && HaveEL(EL2) && !IsFeatureImplemented(FEAT_SEL2))) &&
IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

CNTHP_CVAL_EL2, Counter-timer Physical Timer CompareValue Register (EL2)

The CNTHP_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the EL2 physical timer.

Configuration

AArch64 System register CNTHP_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTHP_CVAL[63:0].

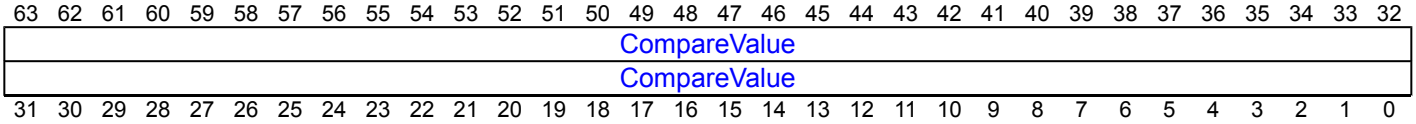
This register is present only when (EL3 is implemented or (EL3 is not implemented, EL2 is implemented, and FEAT_SEL2 is not implemented)) and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTHP_CVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_CVAL_EL2 is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When CNTHP_CTL_EL2.ENABLE is 1, and TimerConditionMet is TRUE for the EL2 physical timer, the timer condition is met and all of the following are true:

- CNTHP_CTL_EL2.ISTATUS is set to 1.
- If CNTHP_CTL_EL2.IMASK is 0, an interrupt is generated.

TimerConditionMet is defined by 'Operation of the CompareValue views of the timers'.

The CompareValue view of the timer acts like a 64-bit upcounter timer.

When CNTHP_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_CVAL_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name CNTHP_CVAL_EL2 or CNTP_CVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

CNTHP_TVAL_EL2, Counter-timer Physical Timer TimerValue Register (EL2)

The CNTHP_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the EL2 physical timer.

Configuration

AArch64 System register CNTHP_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHP_TVAL[31:0].

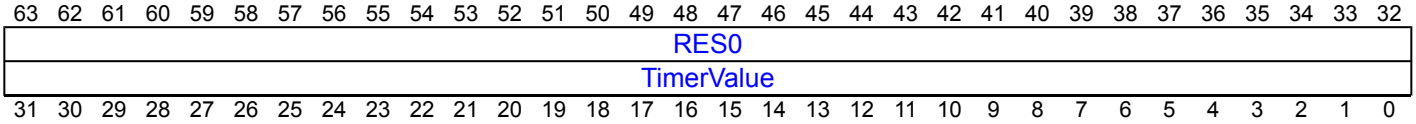
This register is present only when (EL3 is implemented or (EL3 is not implemented, EL2 is implemented, and FEAT_SEL2 is not implemented)) and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTHP_TVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_TVAL_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHP_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHP_CTL_EL2.ENABLE is 1, the value returned is (CNTHP_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHP_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHP_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHP_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHP_CTL_EL2.ISTATUS is set to 1.
- If CNTHP_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHP_CTL_EL2.ENABLE is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_TVAL_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name CNTHP_TVAL_EL2 or CNTP_TVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```

CNTHPS_CTL_EL2, Counter-timer Secure Physical Timer Control Register (EL2)

The CNTHPS_CTL_EL2 characteristics are:

Purpose

Control register for the Secure EL2 physical timer.

Configuration

AArch64 System register CNTHPS_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHPS_CTL[31:0].

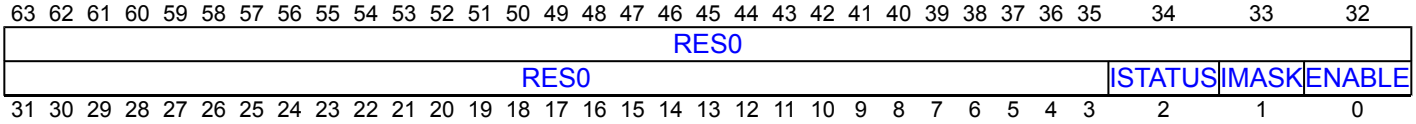
This register is present only when FEAT_SEL2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTHPS_CTL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHPS_CTL_EL2 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHPS_TVAL_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHPS_CTL_EL2

CNTHPS_CVAL_EL2, Counter-timer Secure Physical Timer CompareValue Register (EL2)

The CNTHPS_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the Secure EL2 physical timer.

Configuration

AArch64 System register CNTHPS_CVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHPS_CVAL[31:0].

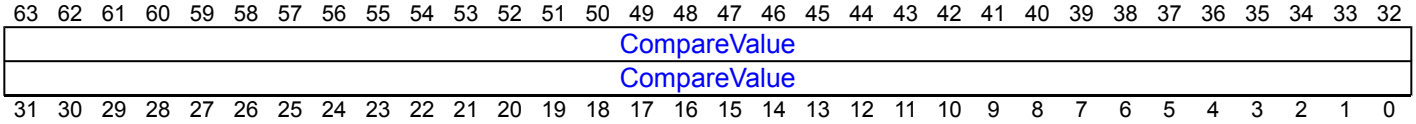
This register is present only when EL2 is implemented, FEAT_SEL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTHPS_CVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHPS_CVAL_EL2 is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When CNTHPS_CTL_EL2.ENABLE is 1, and TimerConditionMet is TRUE for the Secure EL2 physical timer, the timer condition is met and all of the following are true:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

TimerConditionMet is defined by 'Operation of the CompareValue views of the timers'.

The CompareValue view of the timer acts like a 64-bit upcounter timer.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHPS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHPS_CTL_EL2.ENABLE is 1, the value returned is (CNTHPS_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHPS_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHPS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHPS_TVAL_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTHPS_TVAL_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0101	0b000

```

CNTHV_CTL_EL2, Counter-timer Virtual Timer Control Register (EL2)

The CNTHV_CTL_EL2 characteristics are:

Purpose

Control register for the EL2 virtual timer.

Configuration

AArch64 System register CNTHV_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHV_CTL[31:0].

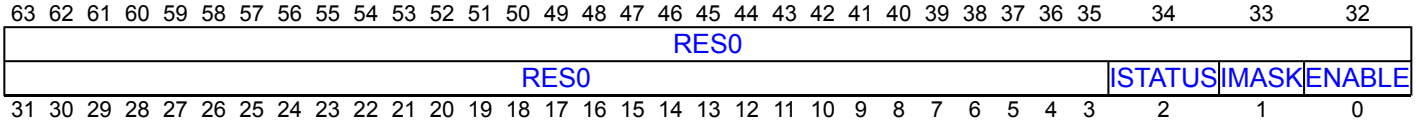
This register is present only when FEAT_VHE is implemented, (EL3 is implemented or (EL3 is not implemented and FEAT_SEL2 is not implemented)), and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTHV_CTL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHV_CTL_EL2 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHV_TVAL_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHV_CTL_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name CNTHV_CTL_EL2 or CNTV_CTL_EL0 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTHV_CTL_EL2

CNTHV_CVAL_EL2, Counter-timer Virtual Timer CompareValue Register (EL2)

The CNTHV_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the EL2 virtual timer.

Configuration

AArch64 System register CNTHV_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTHV_CVAL[63:0].

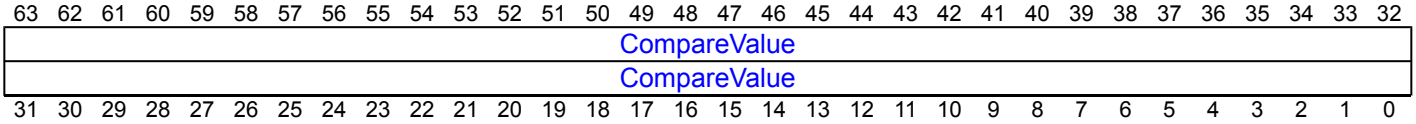
This register is present only when FEAT_VHE is implemented, (EL3 is implemented or (EL3 is not implemented and FEAT_SEL2 is not implemented)), and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTHV_CVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHV_CVAL_EL2 is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When CNTHV_CTL_EL2.ENABLE is 1, and TimerConditionMet is TRUE for the EL2 virtual timer, the timer condition is met and all of the following are true:

- CNTHV_CTL_EL2.ISTATUS is set to 1.
- If CNTHV_CTL_EL2.IMASK is 0, an interrupt is generated.

TimerConditionMet is defined by 'Operation of the CompareValue views of the timers'.

The CompareValue view of the timer acts like a 64-bit upcounter timer.

When CNTHV_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHV_CVAL_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name CNTHV_CVAL_EL2 or CNTV_CVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

CNTHV_TVAL_EL2, Counter-timer Virtual Timer TimerValue Register (EL2)

The CNTHV_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the EL2 virtual timer.

Configuration

AArch64 System register CNTHV_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHV_TVAL[31:0].

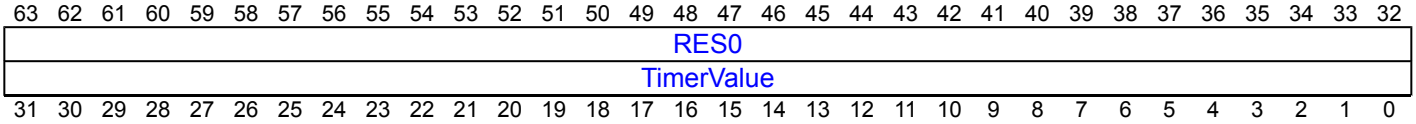
This register is present only when FEAT_VHE is implemented, (EL3 is implemented or (EL3 is not implemented and FEAT_SEL2 is not implemented)), and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTHV_TVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHV_TVAL_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHV_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHV_CTL_EL2.ENABLE is 1, the value returned is (CNTHV_CVAL_EL2 - CNTVCT_EL0).

On a write of this register, CNTHV_CVAL_EL2 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHV_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CNTHV_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHV_CTL_EL2.ISTATUS is set to 1.
- If CNTHV_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHV_CTL_EL2.ENABLE is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHV_TVAL_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name CNTHV_TVAL_EL2 or CNTV_TVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

CNTHVS_CTL_EL2, Counter-timer Secure Virtual Timer Control Register (EL2)

The CNTHVS_CTL_EL2 characteristics are:

Purpose

Control register for the Secure EL2 virtual timer.

Configuration

AArch64 System register CNTHVS_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHVS_CTL[31:0].

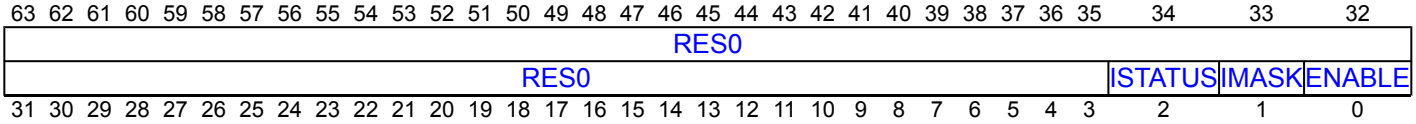
This register is present only when FEAT_SEL2 is implemented, FEAT_VHE is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTHVS_CTL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHVS_CTL_EL2 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the CNTHVS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the CNTHVS_CTL_EL2.ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHVS_TVAL_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CNTHVS_CVAL_EL2, Counter-timer Secure Virtual Timer CompareValue Register (EL2)

The CNTHVS_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the Secure EL2 virtual timer.

Configuration

AArch64 System register CNTHVS_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTHVS_CVAL[63:0].

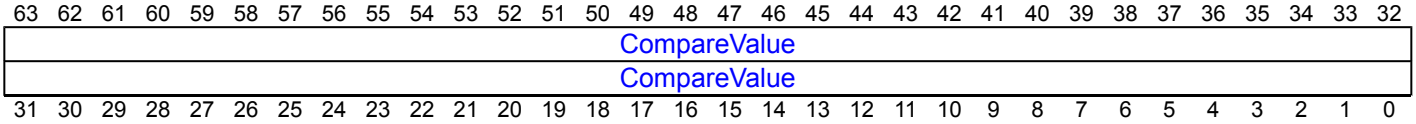
This register is present only when FEAT_SEL2 is implemented, FEAT_VHE is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTHVS_CVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHVS_CVAL_EL2 is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the Secure EL2 virtual timer CompareValue.

When CNTHVS_CTL_EL2.ENABLE is 1, and TimerConditionMet is TRUE for the Secure EL2 virtual timer, the timer condition is met and all of the following are true:

- CNTHVS_CTL_EL2.ISTATUS is set to 1.
- If CNTHVS_CTL_EL2.IMASK is 0, an interrupt is generated.

TimerConditionMet is defined by 'Operation of the CompareValue views of the timers'.

The CompareValue view of the timer acts like a 64-bit upcounter timer.

When CNTHVS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHVS_CVAL_EL2

Accesses to this register use the following encodings in the System register encoding space:

CNTHVS_TVAL_EL2, Counter-timer Secure Virtual Timer TimerValue Register (EL2)

The CNTHVS_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the Secure EL2 virtual timer.

Configuration

AArch64 System register CNTHVS_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHVS_TVAL[31:0].

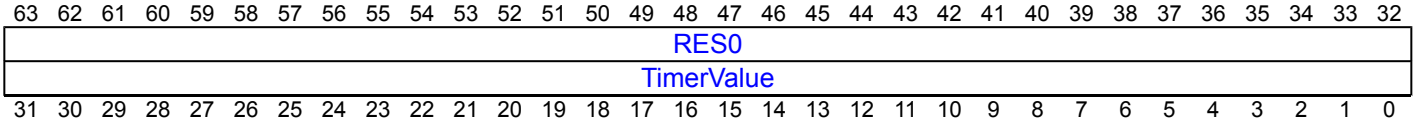
This register is present only when FEAT_SEL2 is implemented, FEAT_VHE is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTHVS_TVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHVS_TVAL_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHVS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHVS_CTL_EL2.ENABLE is 1, the value returned is (CNTHVS_CVAL_EL2 - CNTVCT_EL0).

On a write of this register, CNTHVS_CVAL_EL2 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHVS_CTL_EL2.ENABLE is 1, the timer condition is met when ((CNTVCT_EL0 - CNTHVS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHVS_CTL_EL2.ISTATUS is set to 1.
- If CNTHVS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL_EL2.ENABLE is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHVS_TVAL_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTHVS_TVAL_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0100	0b000

CNTKCTL_EL1, Counter-timer Kernel Control Register

The CNTKCTL_EL1 characteristics are:

Purpose

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this register does not cause any event stream from the virtual counter to be generated, and does not control access to the counters and timers. The access to counters and timers at EL0 is controlled by CNTHCTL_EL2.

When FEAT_VHE is not implemented, or when the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, this register controls the generation of an event stream from the virtual counter, and access from EL0 to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

Configuration

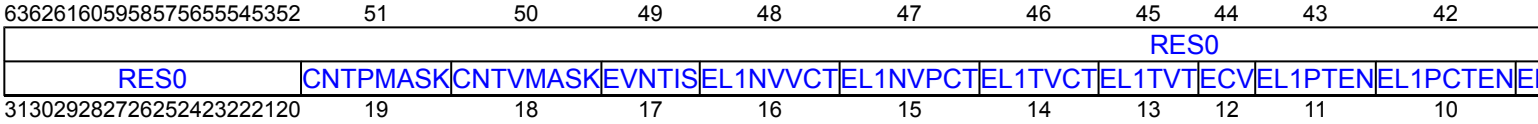
AArch64 System register CNTKCTL_EL1 bits [31:0] are architecturally mapped to AArch32 System register CNTKCTL[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CNTKCTL_EL1 are UNDEFINED.

Attributes

CNTKCTL_EL1 is a 64-bit register.

Field descriptions



Bits [63:20]

Reserved, RES0.

CNTPMASK, bit [19]

When FEAT_RME is implemented and FEAT_NV2p1 is implemented:

Reserved for software use in nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CNTVMASK, bit [18]

When FEAT_RME is implemented and FEAT_NV2p1 is implemented:

Reserved for software use in nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVNTIS, bit [17]
When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTKCTL_EL1.EVNTI field applies to CNTVCT_EL0[15:0].
0b1	The CNTKCTL_EL1.EVNTI field applies to CNTVCT_EL0[23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVVCT, bit [16]
When FEAT_ECV is implemented and FEAT_NV2p1 is implemented:

Reserved for software use in nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVPCT, bit [15]
When FEAT_ECV is implemented and FEAT_NV2p1 is implemented:

Reserved for software use in nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVCT, bit [14]
When FEAT_ECV is implemented and FEAT_NV2p1 is implemented:

Reserved for software use in nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]
When FEAT_ECV is implemented and FEAT_NV2p1 is implemented:

Reserved for software use in nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECV, bit [12]
When FEAT_ECV is implemented and FEAT_NV2p1 is implemented:

Reserved for software use in nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1PTEN, bit [11]
When FEAT_NV2p1 is implemented:

Reserved for software use in nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1PCTEN, bit [10]
When FEAT_NV2p1 is implemented:

Reserved for software use in nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL0PTEN, bit [9]

Traps EL0 accesses to the physical timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, the following registers are trapped and reported using EC syndrome value `0x18`:
  - CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value `0x03`, MRRC and MCRR accesses are trapped and reported using EC syndrome value `0x04`:
  - CNTP_CTL, CNTP_CVAL, CNTP_TVAL.

EL0PTEN	Meaning
`0b0`	EL0 accesses to the physical timer registers are trapped to EL1.
`0b1`	This control does not cause any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

Traps EL0 accesses to the virtual timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped and reported using EC syndrome value `0x18`:
  - CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value `0x03`, MRRC and MCRR accesses are trapped using EC syndrome value `0x04`:
  - CNTV_CTL, CNTV_CVAL, and CNTV_TVAL.

EL0VTEN	Meaning
`0b0`	EL0 accesses to the virtual timer registers are trapped.
`0b1`	This control does not cause any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of CNTVCT_EL0, as seen from EL1, is the trigger for the event stream generated from that counter when that stream is enabled.

If FEAT_ECV is implemented, and CNTKCTL_EL1.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of CNTVCT_EL0.

Otherwise, this field selects a trigger bit in the range 0 to 15 of CNTVCT_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the CNTVCT_EL0 trigger bit, as seen from EL1 and defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

When FEAT_VHE is not implemented, or the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, enables the generation of an event stream from CNTVCT_EL0 as seen from EL1.

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this control does not enable the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0VCTEN, bit [1]

Traps EL0 accesses to the frequency register and virtual counter registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
  - CNTVCT_EL0.
  - CNTVCTSS_EL0.
  - If CNTKCTL_EL1.EL0PCTEN is 0, CNTFRQ_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped and reported using EC syndrome value 0x04:
  - CNTVCT and if CNTKCTL_EL1.EL0PCTEN is 0, CNTFRQ.

EL0VCTEN	Meaning
0b0	EL0 accesses to the frequency register and virtual counter registers are trapped.
0b1	This control does not cause any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Traps EL0 accesses to the frequency register and physical counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, the following registers are trapped and reported using EC syndrome value 0x18:
  - CNTPCT_EL0
  - CNTPCTSS_EL0
  - If CNTKCTL_EL1.EL0VCTEN is 0, CNTFRQ_EL0.
- In AArch32 state, MCR or MRC accesses the following registers are trapped and reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped and reported using EC syndrome value 0x04:
  - CNTPCT and if CNTKCTL_EL1.EL0VCTEN is 0, CNTFRQ.

EL0PCTEN	Meaning
0b0	EL0 accesses to the frequency register and physical counter register are trapped.
0b1	This control does not cause any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTKCTL_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name CNTKCTL_EL1 or CNTKCTL_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTKCTL_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1110	0b0001	0b000

CNTP_CTL_EL0, Counter-timer Physical Timer Control Register

The CNTP_CTL_EL0 characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

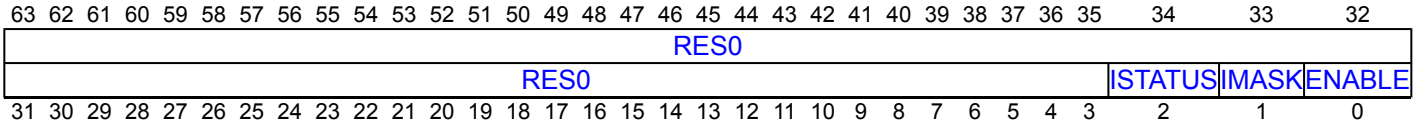
AArch64 System register CNTP_CTL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTP_CTL[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CNTP_CTL_EL0 are UNDEFINED.

Attributes

CNTP_CTL_EL0 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL_EL0 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CTL_EL0

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name CNTP_CTL_EL0 or CNTP_CTL_EL02 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTP_CTL_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0010	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then

CNTP_CVAL_EL0, Counter-timer Physical Timer CompareValue Register

The CNTP_CVAL_EL0 characteristics are:

Purpose

Holds the compare value for the EL1 physical timer.

Configuration

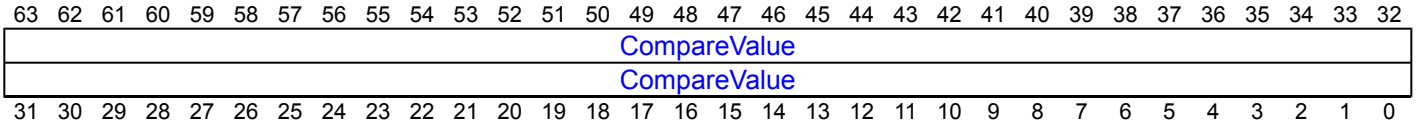
AArch64 System register CNTP_CVAL_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTP_CVAL[63:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CNTP_CVAL_EL0 are UNDEFINED.

Attributes

CNTP_CVAL_EL0 is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When CNTP_CTL_EL0.ENABLE is 1, and TimerConditionMet is TRUE for the EL1 physical timer, the timer condition is met and all of the following are true:

- CNTP_CTL_EL0.ISTATUS is set to 1.
- If CNTP_CTL_EL0.IMASK is 0, an interrupt is generated.

TimerConditionMet is defined by 'Operation of the CompareValue views of the timers'.

The CompareValue view of the timer acts like a 64-bit upcounter timer.

When CNTP_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL_EL0

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name CNTP_CVAL_EL0 or CNTP_CVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTP_CVAL_EL0

CNTP_TVAL_EL0, Counter-timer Physical Timer TimerValue Register

The CNTP_TVAL_EL0 characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configuration

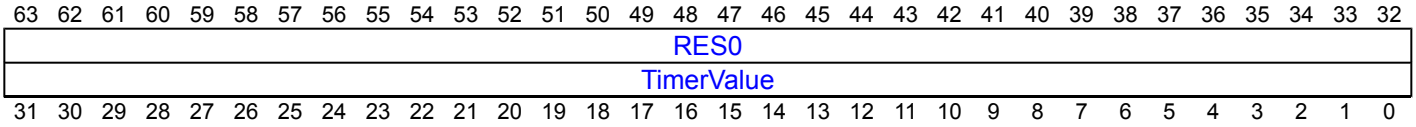
AArch64 System register CNTP_TVAL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTP_TVAL[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CNTP_TVAL_EL0 are UNDEFINED.

Attributes

CNTP_TVAL_EL0 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL_EL0.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL_EL0.ENABLE is 1, the value returned is (CNTP_CVAL_EL0 - CNTPCT_EL0).

On a write of this register, CNTP_CVAL_EL0 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTP_CVAL_EL0) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL_EL0.ISTATUS is set to 1.
- If CNTP_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTP_CTL_EL0.ENABLE is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

Note

The value of CNTPCT_EL0 used in these calculations is the value seen at the Exception level that the CNTPCT_EL0 register is being read or written from.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_TVAL_EL0

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name CNTP_TVAL_EL0 or CNTP_TVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other accessor name.

CNTPCT_EL0, Counter-timer Physical Count Register

The CNTPCT_EL0 characteristics are:

Purpose

Reads of CNTPCT_EL0 return the 64-bit physical count value minus a physical offset.

Configuration

AArch64 System register CNTPCT_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTPCT[63:0].

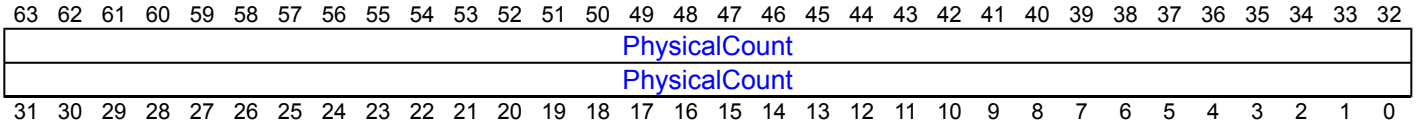
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CNTPCT_EL0 are UNDEFINED.

All reads to the CNTPCT_EL0 occur in program order relative to reads to CNTPCTSS_EL0 or CNTPCT_EL0.

Attributes

CNTPCT_EL0 is a 64-bit register.

Field descriptions



PhysicalCount, bits [63:0]

Physical count value.

If the access is not trapped and all of the following are true, then reads of CNTPCT_EL0 from EL0 or EL1 return (PhysicalCountInt<63:0> - CNTPOFF_EL2<63:0>):

- EL2 is implemented and enabled in the current Security state.
- CNTHCTL_EL2.ECV is 1.
- SCR_EL3.ECVEn is 1.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

Otherwise, reads of CNTPCT_EL0 return PhysicalCountInt<63:0>.

PhysicalCountInt is defined by 'The Physical Counter'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCT_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTPCT_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0000	0b001

```

CNTPCTSS_EL0, Counter-timer Self-Synchronized Physical Count Register

The CNTPCTSS_EL0 characteristics are:

Purpose

Holds the self-synchronized view of the 64-bit physical count value.

Configuration

AArch64 System register CNTPCTSS_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTPCTSS[63:0].

This register is present only when FEAT_ECV is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTPCTSS_EL0 are UNDEFINED.

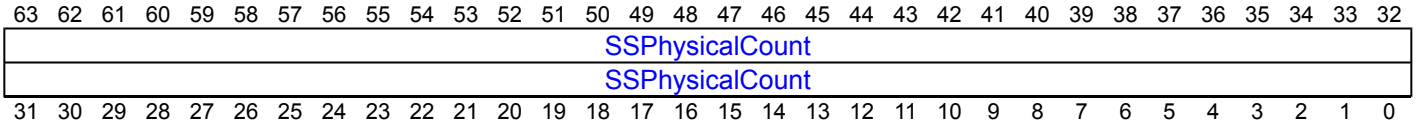
All reads to the CNTPCTSS_EL0 occur in program order relative to reads to CNTPCT_EL0 or CNTPCTSS_EL0.

This register is a view of the CNTPCT_EL0 register for which reads appear to occur in program order relative to other instructions, without the need for any explicit synchronization. Reads of this register return a value consistent with the counter not being read until the read instruction is known to be non-speculative.

Attributes

CNTPCTSS_EL0 is a 64-bit register.

Field descriptions



Physical count value.

If the access is not trapped and all of the following are true, then reads of CNTPCTSS_EL0 from EL0 or EL1 return (PhysicalCountInt<63:0> - CNTPOFF_EL2<63:0>):

- EL2 is implemented and enabled in the current Security state.
- CNTHCTL_EL2.ECV is 1.
- SCR_EL3.ECVEn is 1.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

Otherwise, reads of CNTPCTSS_EL0 return PhysicalCountInt<63:0>.

PhysicalCountInt is defined by 'The Physical Counter'.

SSPhysicalCount, bits [63:0]

Self-synchronized physical count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCTSS_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTPCTSS_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0000	0b101

CNTPOFF_EL2, Counter-timer Physical Offset Register

The CNTPOFF_EL2 characteristics are:

Purpose

Holds the 64-bit physical offset. This is the offset for the AArch64 EL1 physical timer and counter when Enhanced Counter Virtualization is enabled.

Configuration

This register is present only when FEAT_ECV_POFF is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTPOFF_EL2 are UNDEFINED.

The physical offset applies to:

- Direct reads of CNTPCT_EL0 from EL0 or EL1.
- Indirect reads of the physical counter by the EL1 physical timer. See 'The Generic Timer in AArch64 state'.
- Indirect reads of the physical counter for timestamps generated by profiling logic. See 'The Statistical Profiling Extension' and 'AArch64 Self-hosted Trace'.

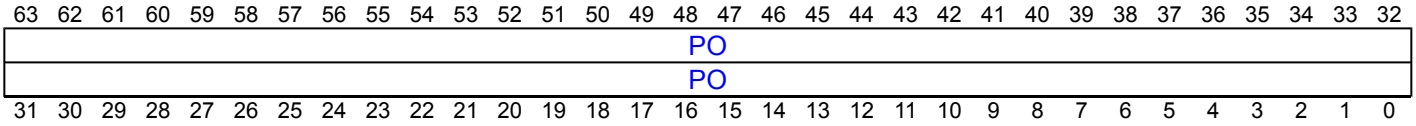
The physical offset only applies under conditions described by the relevant sections.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTPOFF_EL2 is a 64-bit register.

Field descriptions



PO, bits [63:0]

Physical offset.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPOFF_EL2

Accesses to this register use the following encodings in the System register encoding space:

CNTPS_CTL_EL1, Counter-timer Physical Secure Timer Control Register

The CNTPS_CTL_EL1 characteristics are:

Purpose

Control register for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

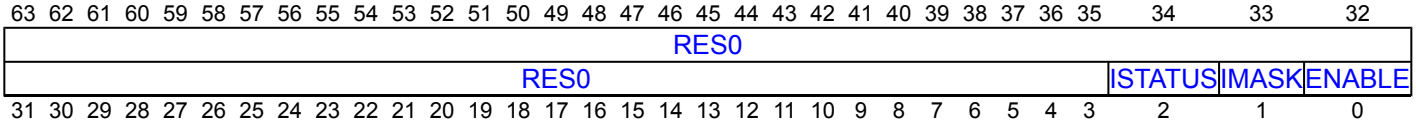
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTPS_CTL_EL1 are UNDEFINED.

Attributes

CNTPS_CTL_EL1 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTPS_TVAL_EL1 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPS_CTL_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTPS_CTL_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b111	0b1110	0b0010	0b001

CNTPS_CVAL_EL1, Counter-timer Physical Secure Timer CompareValue Register

The CNTPS_CVAL_EL1 characteristics are:

Purpose

Holds the compare value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

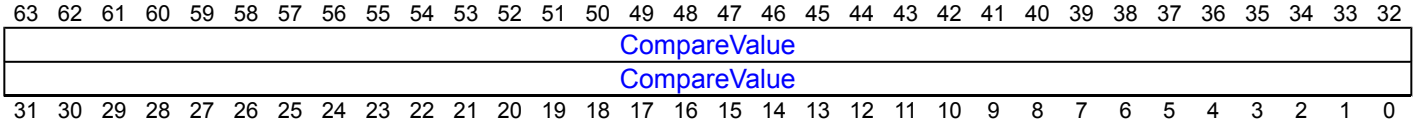
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTPS_CVAL_EL1 are UNDEFINED.

Attributes

CNTPS_CVAL_EL1 is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the secure physical timer CompareValue.

When CNTPS_CTL_EL1.ENABLE is 1, and TimerConditionMet is TRUE for the EL1 secure physical timer, the timer condition is met and all of the following are true:

- CNTPS_CTL_EL1.ISTATUS is set to 1.
- If CNTPS_CTL_EL1.IMASK is 0, an interrupt is generated.

TimerConditionMet is defined by 'Operation of the CompareValue views of the timers'.

The CompareValue view of the timer acts like a 64-bit upcounter timer.

When CNTPS_CTL_EL1.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPS_CVAL_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTPS_CVAL_EL1

CNTPS_TVAL_EL1, Counter-timer Physical Secure Timer TimerValue Register

The CNTPS_TVAL_EL1 characteristics are:

Purpose

Holds the timer value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

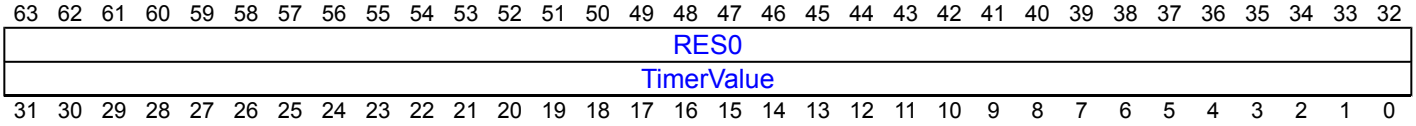
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTPS_TVAL_EL1 are UNDEFINED.

Attributes

CNTPS_TVAL_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the secure physical timer.

On a read of this register:

- If CNTPS_CTL_EL1.ENABLE is 0, the value returned is UNKNOWN.
- If CNTPS_CTL_EL1.ENABLE is 1, the value returned is (CNTPS_CVAL_EL1 - CNTPCT_EL0).

On a write of this register, CNTPS_CVAL_EL1 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTPS_CTL_EL1.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTPS_CVAL_EL1) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTPS_CTL_EL1.ISTATUS is set to 1.
- If CNTPS_CTL_EL1.IMASK is 0, an interrupt is generated.

When CNTPS_CTL_EL1.ENABLE is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPS_TVAL_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTPS_TVAL_EL1
```

CNTV_CTL_EL0, Counter-timer Virtual Timer Control Register

The CNTV_CTL_EL0 characteristics are:

Purpose

Control register for the virtual timer.

Configuration

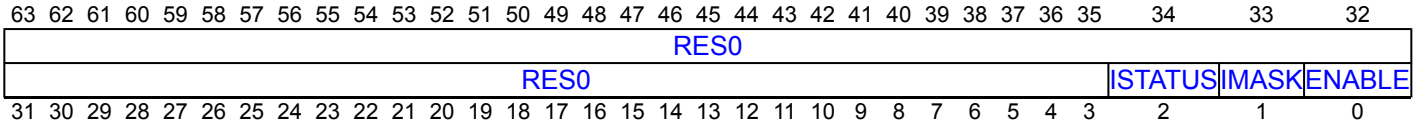
AArch64 System register CNTV_CTL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTV_CTL[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CNTV_CTL_EL0 are UNDEFINED.

Attributes

CNTV_CTL_EL0 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL_EL0 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CTL_EL0

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name CNTV_CTL_EL0 or CNTV_CTL_EL02 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTV_CTL_EL0

CNTV_CVAL_EL0, Counter-timer Virtual Timer CompareValue Register

The CNTV_CVAL_EL0 characteristics are:

Purpose

Holds the compare value for the virtual timer.

Configuration

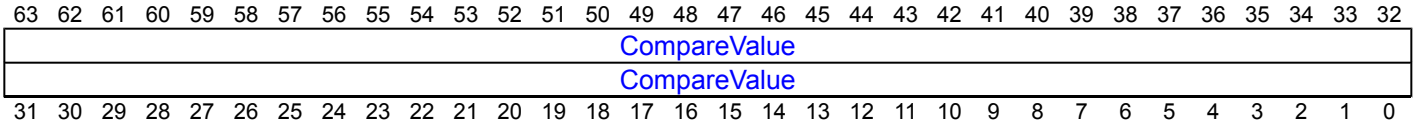
AArch64 System register CNTV_CVAL_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTV_CVAL[63:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CNTV_CVAL_EL0 are UNDEFINED.

Attributes

CNTV_CVAL_EL0 is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When CNTV_CTL_EL0.ENABLE is 1, and TimerConditionMet is TRUE for the EL1 virtual timer, the timer condition is met and all of the following are true:

- CNTV_CTL_EL0.ISTATUS is set to 1.
- If CNTV_CTL_EL0.IMASK is 0, an interrupt is generated.

TimerConditionMet is defined by 'Operation of the CompareValue views of the timers'.

The CompareValue view of the timer acts like a 64-bit upcounter timer.

When CNTV_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL_EL0

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name CNTV_CVAL_EL0 or CNTV_CVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTV_CVAL_EL0
```

op0	op1	CRn	CRm	op2

CNTV_TVAL_EL0, Counter-timer Virtual Timer TimerValue Register

The CNTV_TVAL_EL0 characteristics are:

Purpose

Holds the timer value for the EL1 virtual timer.

Configuration

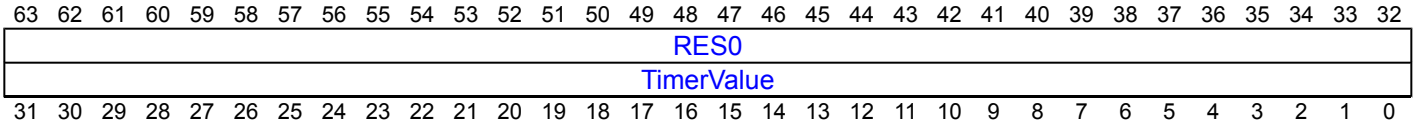
AArch64 System register CNTV_TVAL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTV_TVAL[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CNTV_TVAL_EL0 are UNDEFINED.

Attributes

CNTV_TVAL_EL0 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL1 virtual timer.

On a read of this register:

- If CNTV_CTL_EL0.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL_EL0.ENABLE is 1, the value returned is (CNTV_CVAL_EL0 - CNTVCT_EL0).

On a write of this register, CNTV_CVAL_EL0 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTV_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CNTV_CVAL_EL0) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL_EL0.ISTATUS is set to 1.
- If CNTV_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTV_CTL_EL0.ENABLE is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL_EL0

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name CNTV_TVAL_EL0 or CNTV_TVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTV_TVAL_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0011	0b000

CNTVCT_EL0, Counter-timer Virtual Count Register

The CNTVCT_EL0 characteristics are:

Purpose

Reads of CNTVCT_EL0 return the 64-bit physical count value minus a virtual offset.

Configuration

AArch64 System register CNTVCT_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTVCT[63:0].

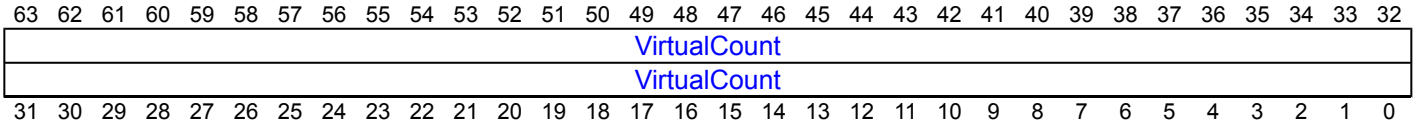
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CNTVCT_EL0 are UNDEFINED.

All reads to the CNTVCT_EL0 occur in program order relative to reads to CNTVCTSS_EL0 or CNTVCT_EL0.

Attributes

CNTVCT_EL0 is a 64-bit register.

Field descriptions



VirtualCount, bits [63:0]

Virtual count value.

When EL2 is implemented, if the access is not trapped, and any of the following are true, then reads of CNTVCT_EL0 from EL0 and EL1 return (PhysicalCountInt<63:0> - CNTVOFF_EL2<63:0>):

- All of the following are true:
  - The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
  - CNTVCT_EL0 is read from EL0.
- All of the following are true:
  - The Effective value of HCR_EL2.E2H is 0.
  - CNTVCT_EL0 is read from EL2.
- CNTVCT_EL0 is read from EL1 or EL3.

Otherwise reads of CNTVCT_EL0 return PhysicalCountInt<63:0>.

PhysicalCountInt is defined by 'The Physical Counter'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCT_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTVCT_EL0
```

op0	op1	CRn	CRm	op2

0b11	0b011	0b1110	0b0000	0b010

CNTVCTSS_EL0, Counter-timer Self-Synchronized Virtual Count Register

The CNTVCTSS_EL0 characteristics are:

Purpose

Reads of CNTVCTSS_EL0 return the 64-bit physical count value minus a virtual offset.

Configuration

AArch64 System register CNTVCTSS_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTVCTSS[63:0].

This register is present only when FEAT_ECV is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to CNTVCTSS_EL0 are UNDEFINED.

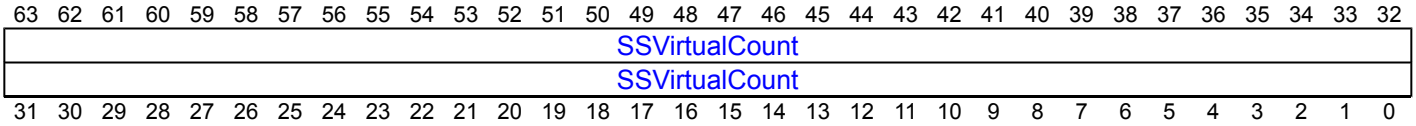
All reads to the CNTVCTSS_EL0 occur in program order relative to reads to CNTVCT_EL0 or CNTVCTSS_EL0.

This register is a view of the CNTVCT_EL0 register for which reads appear to occur in program order relative to other instructions, without the need for any explicit synchronization. Reads of this register return a value consistent with the counter not being read until the read instruction is known to be non-speculative.

Attributes

CNTVCTSS_EL0 is a 64-bit register.

Field descriptions



SSVirtualCount, bits [63:0]

Self-synchronized virtual count value.

When EL2 is implemented, if the access is not trapped, and any of the following are true, then reads of CNTVCTSS_EL0 from EL0 and EL1 return (PhysicalCountInt<63:0> - CNTVOFF_EL2<63:0>):

- All of the following are true:
  - The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
  - CNTVCTSS_EL0 is read from EL0.
- All of the following are true:
  - The Effective value of HCR_EL2.E2H is 0.
  - CNTVCTSS_EL0 is read from EL2.
- CNTVCTSS_EL0 is read from EL1 or EL3.

Otherwise reads of CNTVCTSS_EL0 return PhysicalCountInt<63:0>.

PhysicalCountInt is defined by 'The Physical Counter'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCTSS_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTVCTSS_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0000	0b110

```

CNTVOFF_EL2, Counter-timer Virtual Offset Register

The CNTVOFF_EL2 characteristics are:

Purpose

Holds the 64-bit virtual offset. This is the offset for the AArch64 virtual timers and counters.

Configuration

AArch64 System register CNTVOFF_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTVOFF[63:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CNTVOFF_EL2 are UNDEFINED.

The virtual offset applies to:

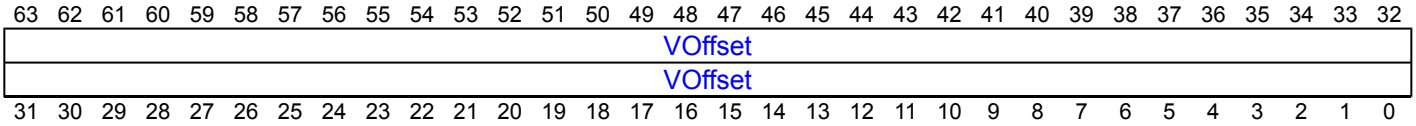
- Direct reads of CNTVCT_EL0.
- Indirect reads of the virtual counter by the EL1 virtual timer. See 'The Generic Timer in AArch64 state'.
- Indirect reads of the virtual counter for timestamps generated by profiling logic. See 'The Statistical Profiling Extension' and 'AArch64 Self-hosted Trace'.

The virtual offset only applies under conditions described by the relevant sections.

Attributes

CNTVOFF_EL2 is a 64-bit register.

Field descriptions



VOffset, bits [63:0]

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTVOFF_EL2
```

CONTEXTIDR_EL1, Context ID Register (EL1)

The CONTEXTIDR_EL1 characteristics are:

Purpose

Identifies the current Process Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

Configuration

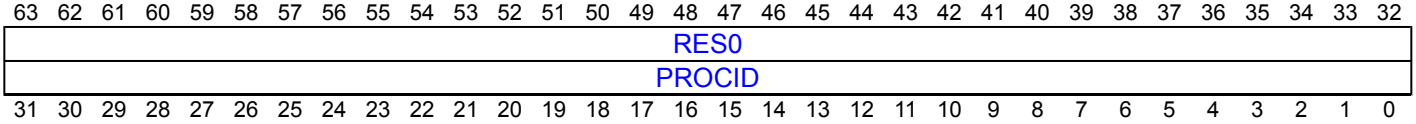
AArch64 System register CONTEXTIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CONTEXTIDR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CONTEXTIDR_EL1 are UNDEFINED.

Attributes

CONTEXTIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

Note

In AArch32 state, when TTBCR.EAE is set to 0, CONTEXTIDR.ASID holds the ASID.

In AArch64 state, CONTEXTIDR_EL1 is independent of the ASID, and for the EL1&0 translation regime either TTBR0_EL1 or TTBR1_EL1 holds the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CONTEXTIDR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name CONTEXTIDR_EL1 or CONTEXTIDR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CONTEXTIDR_EL1
```

COSP RCTX, Clear Other Speculative Prediction Restriction by Context

The COSP RCTX characteristics are:

Purpose

Clear Other Speculative Prediction Restriction by Context applies to all prediction resources not managed by other speculation restriction System instructions.

The actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control any predictions occurring after the instruction is complete and synchronized.

This instruction applies to all speculative access except:

- Cache Prefetch predictions.
- Control Flow predictions.
- Data Value predictions.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the PE that executed the original restriction instruction, and a subsequent Context Synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations, the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

This instruction applies to speculative accesses resulting from address predictions.

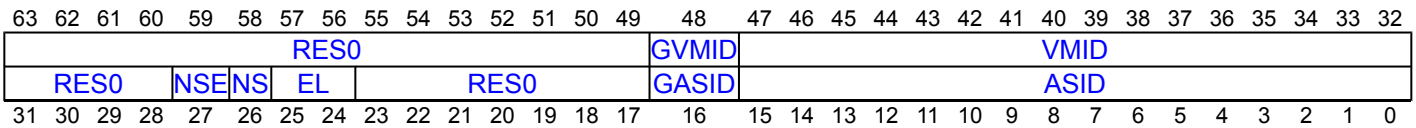
Configuration

This instruction is present only when FEAT_SPECRES2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to COSP RCTX are UNDEFINED.

Attributes

COSP RCTX is a 64-bit System instruction.

Field descriptions



Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 and EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, this field is treated as the current VMID.

When the instruction is executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:28]

Reserved, RES0.

NSE, bit [27]

When FEAT_RME is implemented:

Together with the NS field, selects the Security state.

For a description of the values derived by evaluating NS and NSE together, see COSP_RCTX.NS.

Otherwise:

Reserved, RES0.

NS, bit [26]

When FEAT_RME is implemented:

Together with the NSE field, selects the Security state.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Some Effective values are determined by the current Security state:

- When executed in Secure state, the Effective value of NSE is 0.
- When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.
- When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

This instruction is treated as a NOP when executed at EL3 and either:

- COSP_RCTX.{NSE, NS} selects a reserved value.
- COSP_RCTX.{NSE, NS} == {1, 0} and COSP_RCTX.EL has a value other than `0b11`.

Otherwise:

Security State.

NS	Meaning
`0b0`	Secure state.
`0b1`	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
`0b00`	EL0.
`0b01`	EL1.
`0b10`	EL2.
`0b11`	EL3.

If the instruction is executed at an Exception level lower than the specified level, or is specified to apply to a combination of Exception level and Security state that is not implemented, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs, or a specified ASID.

GASID	Meaning
`0b0`	Applies to specified ASID for an EL0 target execution context.
`0b1`	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies to an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing COSP RCTX

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
COSP RCTX, <Xt>
```

op0	op1	CRn	CRm	op2

0b01	0b011	0b0111	0b0011	0b110

```

CPACR_EL1, Architectural Feature Access Control Register

The CPACR_EL1 characteristics are:

Purpose

Controls access to trace, SME, Streaming SVE, SVE, and Advanced SIMD and floating-point functionality.

Configuration

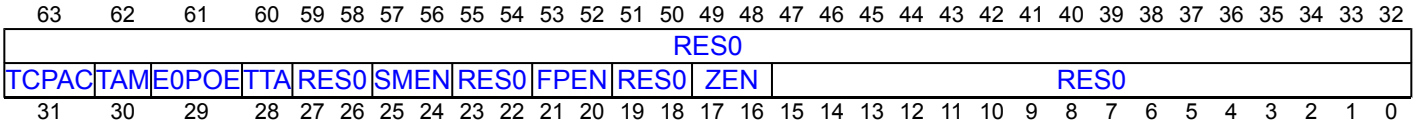
AArch64 System register CPACR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CPACR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CPACR_EL1 are UNDEFINED.

Attributes

CPACR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

When FEAT_NV2p1 is implemented:

Reserved for software use in nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TAM, bit [30]

When FEAT_AMUv1 is implemented and FEAT_NV2p1 is implemented:

Reserved for software use in nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0POE, bit [29]
When FEAT_S1POE is implemented:

Enable access to POR_EL0.

Traps EL0 accesses to POR_EL0, from AArch64 state only to EL1, or to EL2 when it is implemented and enabled in the current Security state and HCR_EL2.TGE is 1. The exception is reported using EC syndrome value 0x18.

E0POE	Meaning
0b0	This control causes EL0 access to POR_EL0 to be trapped.
0b1	This control does not cause any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTA, bit [28]
When System register access to the trace unit registers is implemented:

Traps EL0 and EL1 System register accesses to all implemented trace registers from both Execution states to EL1, or to EL2 when it is implemented and enabled in the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to trace registers are trapped, reported using EC syndrome value 0x18.
- In AArch32 state, MRC and MCR accesses to trace registers are trapped, reported using EC syndrome value 0x05.
- In AArch32 state, MRRC and MCRR accesses to trace registers are trapped, reported using EC syndrome value 0x0C.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	This control causes EL0 and EL1 System register accesses to all implemented trace registers to be trapped.

Note

- The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR_EL1.TTA is 1.
- The Arm architecture does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [27:26]

Reserved, RES0.

SMEN, bits [25:24]

When FEAT_SME is implemented:

Traps execution at EL1 and EL0 of SME instructions, SVE instructions when FEAT_SVE is not implemented or the PE is in Streaming SVE mode, and instructions that directly access the SVCR or SMCR_EL1 System registers to EL1, or to EL2 when EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE is 1.

When instructions that directly access the SVCR System register are trapped with reference to this control, the `MSR SVCRSM`, `MSR SVCRZA`, and `MSR SVCRSMZA` instructions are also trapped.

The exception is reported using EC syndrome value `0x1D`, with an ISS code of `0x0000000`.

This field does not affect whether Streaming SVE or SME register values are valid.

A trap taken as a result of CPACR_EL1.SMEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

SMEN	Meaning
`0b00`	This control causes execution of these instructions at EL1 and EL0 to be trapped.
`0b01`	This control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL1 to be trapped.
`0b10`	This control causes execution of these instructions at EL1 and EL0 to be trapped.
`0b11`	This control does not cause execution of any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:22]

Reserved, RES0.

FPEN, bits [21:20]

Traps execution at EL1 and EL0 of instructions that access the Advanced SIMD and floating-point registers from both Execution states to EL1, reported using EC syndrome value `0x07`, or to EL2 reported using EC syndrome value `0x00` when EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to FPMR, FPCR, FPSR, and any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- In AArch32 state, FPSCR, and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers.

Traps execution at EL1 and EL0 of SME and SVE instructions to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The exception is reported using EC syndrome value `0x07`.

A trap taken as a result of CPACR_EL1.SMEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

A trap taken as a result of CPACR_EL1.ZEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

FPEN	Meaning
0b00	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b01	This control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL1 to be trapped.
0b10	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

Writes to MVFR0, MVFR1, and MVFR2 from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

Note

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to FPSID, MVFR0, MVFR1, MVFR2, and FPEXC are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR_EL1.FPEN is not 0b11.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:18]

Reserved, RES0.

ZEN, bits [17:16]

When FEAT_SVE is implemented:

Traps execution at EL1 and EL0 of SVE instructions when the PE is not in Streaming SVE mode, and instructions that directly access the ZCR_EL1 System register to EL1, or to EL2 when EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE is 1.

The exception is reported using EC syndrome value 0x19.

A trap taken as a result of CPACR_EL1.ZEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

ZEN	Meaning
0b00	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b01	This control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL1 to be trapped.
0b10	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:0]

Reserved, RES0.

Accessing CPACR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name CPACR_EL1 or CPACR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to CPACR_EL1 are masked by CPACRMASK_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CPACR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b010

CPACRMASK_EL1, Architectural Feature Access Control Masking Register

The CPACRMASK_EL1 characteristics are:

Purpose

Mask register to prevent updates of fields in CPACR_EL1 on writes to CPACR_EL1 or CPACRALIAS_EL1.

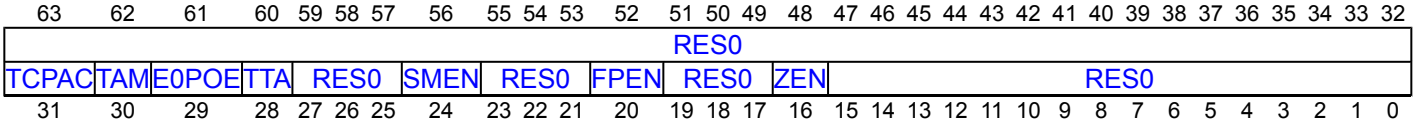
Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to CPACRMASK_EL1 are UNDEFINED.

Attributes

CPACRMASK_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

When FEAT_NV2p1 is implemented:

Mask bit for TCPAC.

TCPAC	Meaning
0b0	CPACR_EL1.TCPAC is writeable.
0b1	CPACR_EL1.TCPAC is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TAM, bit [30]

When FEAT_AMUv1 is implemented and FEAT_NV2p1 is implemented:

Mask bit for TAM.

TAM	Meaning
0b0	CPACR_EL1.TAM is writeable.
0b1	CPACR_EL1.TAM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0POE, bit [29]

When FEAT_S1POE is implemented:

Mask bit for E0POE.

E0POE	Meaning
0b0	CPACR_EL1.E0POE is writeable.
0b1	CPACR_EL1.E0POE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTA, bit [28]

When System register access to the trace unit registers is implemented:

Mask bit for TTA.

TTA	Meaning
0b0	CPACR_EL1.TTA is writeable.
0b1	CPACR_EL1.TTA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [27:25]

Reserved, RES0.

SMEN, bit [24]

When FEAT_SME is implemented:

Mask bit for SMEN.

SMEN	Meaning
0b0	CPACR_EL1.SMEN is writeable.
0b1	CPACR_EL1.SMEN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:21]

Reserved, RES0.

FPEN, bit [20]

Mask bit for FPEN.

FPEN	Meaning
0b0	CPACR_EL1.FPEN is writeable.
0b1	CPACR_EL1.FPEN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [19:17]

Reserved, RES0.

ZEN, bit [16]

When FEAT_SVE is implemented:

Mask bit for ZEN.

ZEN	Meaning
0b0	CPACR_EL1.ZEN is writeable.
0b1	CPACR_EL1.ZEN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:0]

Reserved, RES0.

Accessing CPACRMASK_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name CPACRMASK_EL1 or CPACRMASK_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CPACRMASK_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0100	0b010

```

CPP RCTX, Cache Prefetch Prediction Restriction by Context

The CPP RCTX characteristics are:

Purpose

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

The actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control cache prefetch predictions occurring after the instruction is complete and synchronized.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

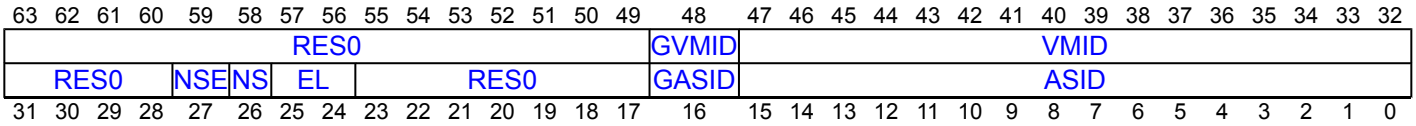
Configuration

This instruction is present only when FEAT_SPECRES is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to CPP RCTX are UNDEFINED.

Attributes

CPP RCTX is a 64-bit System instruction.

Field descriptions



Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 and EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, this field is treated as the current VMID.

When the instruction is executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:28]

Reserved, RES0.

NSE, bit [27]

When FEAT_RME is implemented:

Together with the NS field, selects the Security state.

For a description of the values derived by evaluating NS and NSE together, see CPP_RCTX.NS.

Otherwise:

Reserved, RES0.

NS, bit [26]

When FEAT_RME is implemented:

Together with the NSE field, selects the Security state.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Some Effective values are determined by the current Security state:

- When executed in Secure state, the Effective value of NSE is 0.
- When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.
- When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

This instruction is treated as a NOP when executed at EL3 and either:

- CPP_RCTX.{NSE, NS} selects a reserved value.
- CPP_RCTX.{NSE, NS} == {1, 0} and CPP_RCTX.EL has a value other than 0b11.

Otherwise:

Security State.

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, or is specified to apply to a combination of Exception level and Security state that is not implemented, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing CPP RCTX

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
CPP RCTX, <Xt>
```

op0	op1	CRn	CRm	op2

0b01	0b011	0b0111	0b0011	0b111

```
if !(IsFeatureImplemented(FEAT_SPECRES) && IsFeatureImplemented(FEAT_AA64)) then

CPTR_EL2, Architectural Feature Trap Register (EL2)

The CPTR_EL2 characteristics are:

Purpose

Controls trapping to EL2 of accesses to CPACR, CPACR_EL1, trace, Activity Monitor, SME, Streaming SVE, SVE, and Advanced SIMD and floating-point functionality.

Configuration

AArch64 System register CPTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HCPTR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CPTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

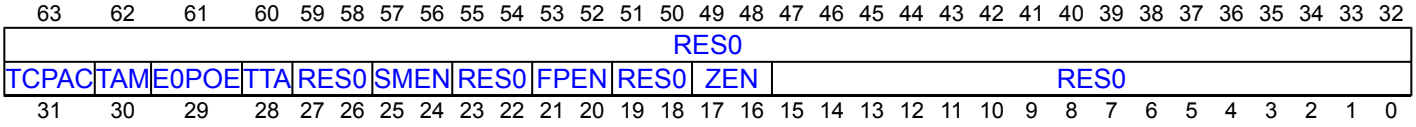
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

CPTR_EL2 is a 64-bit register.

Field descriptions

When ELIsInHost(EL2):



Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

In AArch64 state, traps accesses to CPACR_EL1 from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using EC syndrome value `0x18`.

In AArch32 state, traps accesses to CPACR from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using EC syndrome value `0x03`.

TCPAC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 accesses to CPACR_EL1 and CPACR are trapped to EL2, when EL2 is enabled in the current Security state.

When the Effective value of HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

Note

CPACR_EL1 and CPACR are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x18`:
  - AMUSERENR_EL0, AMCFGR_EL0, AMCGCR_EL0, AMCNTENCLR0_EL0, AMCNTENCLR1_EL0, AMCNTENSET0_EL0, AMCNTENSET1_EL0, AMCR_EL0, AMEVCNTR0<n>_EL0, AMEVCNTR1<n>_EL0, AMEVTYPER0<n>_EL0, and AMEVTYPER1<n>_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value `0x03`:
  - AMUSERENR, AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVTYPER0<n>, and AMEVTYPER1<n>.
- In AArch32 state, MRRC or MCRR accesses to AMEVCNTR0<n> and AMEVCNTR1<n>, are trapped to EL2, reported using EC syndrome value `0x04`.

TAM	Meaning
`0b0`	Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.
`0b1`	Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0POE, bit [29]

When FEAT_S1POE is implemented:

Enable access to POR_EL0.

Traps EL0 accesses to POR_EL0 to EL2, from AArch64 state only. The exception is reported using EC syndrome value `0x18`.

E0POE	Meaning
`0b0`	This control causes EL0 access to POR_EL0 to be trapped.
`0b1`	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTA, bit [28]

When System register access to the trace unit registers is implemented:

Traps System register accesses to all implemented trace registers from both Execution states to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1, and CRn<`0b1000` are trapped to EL2, reported using EC syndrome value `0x18`.

- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x05.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at EL0, EL1 or EL2, to execute a System register access to an implemented trace register is trapped to EL2, when EL2 is enabled in the current Security state, unless HCR_EL2.TGE is 0 and it is trapped by CPACR.NSTRCDIS or CPACR_EL1.TTA. When HCR_EL2.TGE is 1, any attempt at EL0 or EL2 to execute a System register access to an implemented trace register is trapped to EL2, when EL2 is enabled in the current Security state.

Note

The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the trace unit implements FEAT_ETMv4 or ETE, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.TTA is 1.

EL2 does not provide traps on trace register accesses through the optional Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [27:26]

Reserved, RES0.

SMEN, bits [25:24]

When FEAT_SME is implemented:

Traps execution at EL2, EL1, and EL0 of SME instructions, SVE instructions when FEAT_SVE is not implemented or the PE is in Streaming SVE mode, and instructions that directly access the SVCR, SMCR_EL1, or SMCR_EL2 System registers to EL2, when EL2 is enabled in the current Security state.

When instructions that directly access the SVCR System register are trapped with reference to this control, the MSR SVCRSM, MSR SVCRZA, and MSR SVCRSMZA instructions are also trapped.

The exception is reported using EC syndrome value 0x1D, with an ISS code of 0x0000000.

This field does not affect whether Streaming SVE or SME register values are valid.

A trap taken as a result of CPTR_EL2.SMEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

SMEN	Meaning
0b00	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b01	When HCR_EL2.TGE is 0, this control does not cause execution of any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL2 to be trapped.
0b10	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:22]

Reserved, RES0.

FPEN, bits [21:20]

Traps execution at EL2, EL1, and EL0 of instructions that access the Advanced SIMD and floating-point registers from both Execution states to EL2, when EL2 is enabled in the current Security state. The exception is reported using EC syndrome value 0x07.

Traps execution at EL2, EL1, and EL0 of SME and SVE instructions to EL2, when EL2 is enabled in the current Security state. The exception is reported using EC syndrome value 0x07.

When FEAT_FPMR is implemented, traps execution at EL2, EL1, and EL0 of instructions that access FPMR to EL2, when EL2 is enabled in the current Security state. The exception is reported using EC syndrome value 0x07

A trap taken as a result of CPTR_EL2.SMEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

A trap taken as a result of CPTR_EL2.ZEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

FPEN	Meaning
0b00	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b01	When HCR_EL2.TGE is 0, this control does not cause execution of any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL2 to be trapped.
0b10	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

Writes to MVFR0, MVFR1, and MVFR2 from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

Note

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to FPSID, MVFR0, MVFR1, MVFR2, and FPEXC are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.FPEN is not 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:18]

Reserved, RES0.

ZEN, bits [17:16]

When FEAT_SVE is implemented:

Traps execution at EL2, EL1, and EL0 of SVE instructions when the PE is not in Streaming SVE mode, and instructions that directly access the ZCR_EL1 or ZCR_EL2 System registers to EL2, when EL2 is enabled in the current Security state.

The exception is reported using EC syndrome value `0x19`.

A trap taken as a result of CPTR_EL2.ZEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

ZEN	Meaning
`0b00`	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
`0b01`	When HCR_EL2.TGE is 0, this control does not cause execution of any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL2 to be trapped.
`0b10`	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
`0b11`	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

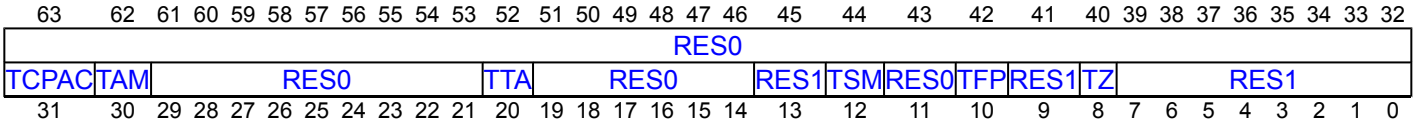
Otherwise:

Reserved, RES0.

Bits [15:0]

Reserved, RES0.

Otherwise:



This format applies in all Armv8.0 implementations.

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

In AArch64 state, traps accesses to CPACR_EL1 from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using EC syndrome value `0x18`.

In AArch32 state, traps accesses to CPACR from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using EC syndrome value `0x03`.

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the following registers are trapped to EL2, when EL2 is enabled in the current Security state: • CPACR_EL1. • CPACR.

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

Note

CPACR_EL1 and CPACR are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - AMUSERENR_EL0, AMCFGR_EL0, AMCGCR_EL0, AMCNTENCLR0_EL0, AMCNTENCLR1_EL0, AMCNTENSET0_EL0, AMCNTENSET1_EL0, AMCR_EL0, AMEVCNTR0<n>_EL0, AMEVCNTR1<n>_EL0, AMEVTYPER0<n>_EL0, and AMEVTYPER1<n>_EL0.
- In AArch32 state, MCR or MRC accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x03:
  - AMUSERENR, AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVTYPER0<n>, and AMEVTYPER1<n>.
- In AArch32 state, MCRR or MRRC accesses to AMEVCNTR0<n> and AMEVCNTR1<n>, are trapped to EL2, reported using EC syndrome value 0x04.

TAM	Meaning
0b0	Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

When System register access to the trace unit registers is implemented:

Traps System register accesses to all implemented trace registers from both Execution states to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x18.

- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x05.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at EL0, EL1, or EL2, to execute a System register access to an implemented trace register is trapped to EL2, when EL2 is enabled in the current Security state, unless it is trapped by one of the following controls: • CPACR_EL1.TTA. • CPACR.TRCDIS.

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.TTA is 1.
- EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:14]

Reserved, RES0.

Bit [13]

Reserved, RES1.

TSM, bit [12]

When FEAT_SME is implemented:

Traps execution at EL2, EL1, and EL0 of SME instructions, SVE instructions when FEAT_SVE is not implemented or the PE is in Streaming SVE mode, and instructions that directly access the SVCR, SMCR_EL1, or SMCR_EL2 System registers to EL2, when EL2 is enabled in the current Security state.

When instructions that directly access the SVCR System register are trapped with reference to this control, the MSR SVCRSM, MSR SVCRZA, and MSR SVCRSMZA instructions are also trapped.

The exception is reported using EC syndrome value 0x1D, with an ISS code of 0x0000000.

This field does not affect whether Streaming SVE or SME register values are valid.

A trap taken as a result of CPTR_EL2.TSM has precedence over a trap taken as a result of CPTR_EL2.TFP.

TSM	Meaning
0b0	This control does not cause execution of any instructions to be trapped.
0b1	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [11]

Reserved, RES0.

TFP, bit [10]

Traps execution of instructions which access the Advanced SIMD and floating-point functionality, from both Execution states to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x07`:
  - FPCR, FPSR, FPEXC32_EL2, and any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
  - If FEAT_FPMR is implemented, FPMR.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x07`:
  - MVFR0, MVFR1, MVFR2, FPSCR, FPEXC, and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers. For the purposes of this trap, the architecture defines a VMSR access to FPSID from EL1 or higher as an access to a SIMD and floating-point register. Otherwise, permitted VMSR accesses to FPSID are ignored.

Traps execution at the same Exception levels of SME and SVE instructions to EL2, when EL2 is enabled in the current Security state. The exception is reported using EC syndrome value `0x07`.

A trap taken as a result of CPTR_EL2.TSM has precedence over a trap taken as a result of CPTR_EL2.TFP.

A trap taken as a result of CPTR_EL2.TZ has precedence over a trap taken as a result of CPTR_EL2.TFP.

TFP	Meaning
`0b0`	This control does not cause execution of any instructions to be trapped.
`0b1`	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.

Note

FPEXC32_EL2 is not accessible from EL0 using AArch64.

FPSID, MVFR0, MVFR1, and FPEXC are not accessible from EL0 using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES1.

TZ, bit [8]

When FEAT_SVE is implemented:

Traps execution at EL2, EL1, and EL0 of SVE instructions when the PE is not in Streaming SVE mode, and instructions that directly access the ZCR_EL2 or ZCR_EL1 System registers to EL2, when EL2 is enabled in the current Security state.

The exception is reported using EC syndrome value `0x19`.

A trap taken as a result of CPTR_EL2.TZ has precedence over a trap taken as a result of CPTR_EL2.TFP.

TZ	Meaning
`0b0`	This control does not cause execution of any instructions to be trapped.
`0b1`	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [7:0]

Reserved, RES1.

Accessing CPTR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name CPTR_EL2 or CPACR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to CPTR_EL2 are masked by CPTRMASK_EL2.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CPTR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then

CPTR_EL3, Architectural Feature Trap Register (EL3)

The CPTR_EL3 characteristics are:

Purpose

Controls trapping to EL3 of accesses to CPACR, CPACR_EL1, HCPTR, CPTR_EL2, trace, Activity Monitor, SME, Streaming SVE, SVE, and Advanced SIMD and floating-point functionality.

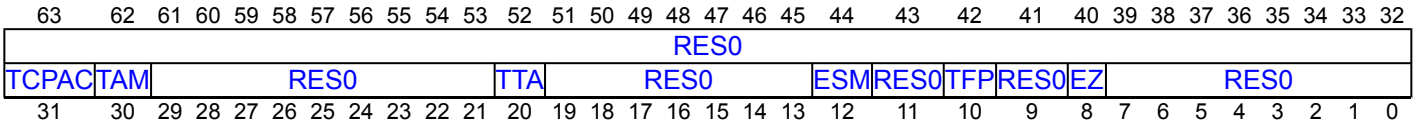
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to CPTR_EL3 are UNDEFINED.

Attributes

CPTR_EL3 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

Traps all of the following to EL3, from both Execution states and any Security state.

- EL2 accesses to CPTR_EL2, reported using EC syndrome value `0x18`, or HCPTR, reported using EC syndrome value `0x03`.
- EL2 and EL1 accesses to CPACR_EL1 reported using EC syndrome value `0x18`, or CPACR reported using EC syndrome value `0x03`.

When CPTR_EL3.TCPAC is:

TCPAC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL2 accesses to the CPTR_EL2 or HCPTR, and EL2 and EL1 accesses to the CPACR_EL1 or CPACR, are trapped to EL3, unless they are trapped by CPTR_EL2.TCPAC.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL2, EL1, and EL0 accesses to all Activity Monitor registers to EL3.

Accesses to the Activity Monitors registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value `0x18`:

        - AMUSERENR_EL0, AMCFGR_EL0, AMCGCR_EL0, AMCNTENCLR0_EL0, AMCNTENCLR1_EL0, AMCNTENSET0_EL0, AMCNTENSET1_EL0, AMCR_EL0, AMEVCNTR0<n>_EL0, AMEVCNTR1<n>_EL0, AMEVTYPER0<n>_EL0, and AMEVTYPER1<n>_EL0.

    - In AArch32 state, accesses with MRC or MCR to the following registers reported using EC syndrome value `0x03`:

        - AMUSERENR, AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVTYPER0<n>, and AMEVTYPER1<n>.

    - In AArch32 state, accesses with MRRC or MCRR to the following registers, reported using EC syndrome value `0x04`:

        - AMEVCNTR0<n>, AMEVCNTR1<n>.

TAM	Meaning
`0b0`	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are not trapped.
`0b1`	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are trapped to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

When System register access to the trace unit registers is implemented:

Traps System register accesses. Accesses to the trace registers, from all Exception levels, any Security state, and both Execution states are trapped to EL3 as follows:

- In AArch64 state, Trace registers with op0=2, op1=1, and CRn<`0b1000` are trapped to EL3 and reported using EC syndrome value `0x18`.
- In AArch32 state, accesses using MCR or MRC to the Trace registers with cpnum=14, opc1=1, and CRn<`0b1000` are reported using EC syndrome value `0x05`.

TTA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any System register access to the trace registers is trapped to EL3, unless it is trapped by CPACR.TRCDIS, CPACR_EL1.TTA, or CPTR_EL2.TTA.

Note

The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than this trap exception.

EL3 does not provide traps on trace register accesses through the Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, no side-effects occur before the exception is taken, see 'Configurable instruction controls'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:13]

Reserved, RES0.

ESM, bit [12]

When FEAT_SME is implemented:

Traps execution of SME instructions, SVE instructions when FEAT_SVE is not implemented or the PE is in Streaming SVE mode, and instructions that directly access the SMCR_EL1, SMCR_EL2, SMCR_EL3, SMPRI_EL1, SMPRIMAP_EL2, or SVCR System registers, from all Exception levels and any Security state, to EL3.

When instructions that directly access the SVCR System register are trapped with reference to this control, the `MSR SVCRSM`, `MSR SVCRZA`, and `MSR SVCRSMZA` instructions are also trapped.

When direct accesses to SMPRI_EL1 and SMPRIMAP_EL2 are trapped, the exception is reported using EC syndrome value `0x18`. Otherwise, the exception is reported using EC syndrome value `0x1D`, with an ISS code of `0x0000000`.

This field does not affect whether Streaming SVE or SME register values are valid.

A trap taken as a result of CPTR_EL3.ESM has precedence over a trap taken as a result of CPTR_EL3.TFP.

ESM	Meaning
`0b0`	This control causes execution of these instructions at all Exception levels to be trapped.
`0b1`	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES0.

TFP, bit [10]

Traps execution of instructions which access the Advanced SIMD and floating-point functionality, from all Exception levels, any Security state, and both Execution states, to EL3.

This includes the following registers, all reported using EC syndrome value `0x07`:

- FPCR, FPSR, FPEXC32_EL2, and any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-S31 registers.
- If FEAT_FPMR is implemented, FPMR.
- MVFR0, MVFR1, MVFR2, FPSCR, FPEXC, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers.
- VMSR accesses to FPSID.

Permitted VMSR accesses to FPSID are ignored, but for the purposes of this trap the architecture defines a VMSR access to the FPSID from EL1 or higher as an access to a SIMD and floating-point register.

Traps execution at all Exception levels of SME and SVE instructions to EL3 from any Security state. The exception is reported using EC syndrome value `0x07`.

A trap taken as a result of CPTR_EL3.ESM has precedence over a trap taken as a result of CPTR_EL3.TFP.

A trap taken as a result of CPTR_EL3.EZ has precedence over a trap taken as a result of CPTR_EL3.TFP.

TFP	Meaning
0b0	This control does not cause execution of any instructions to be trapped.
0b1	This control causes execution of these instructions at all Exception levels to be trapped.

Note

FPEXC32_EL2 is not accessible from EL0 using AArch64.

FPSID, MVFR0, MVFR1, and FPEXC are not accessible from EL0 using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

EZ, bit [8]
When FEAT_SVE is implemented:

Traps execution of SVE instructions when the PE is not in Streaming SVE mode, and instructions that directly access the ZCR_EL3, ZCR_EL2, or ZCR_EL1 System registers, from all Exception levels and any Security state, to EL3.

The exception is reported using EC syndrome value 0x19.

A trap taken as a result of CPTR_EL3.EZ has precedence over a trap taken as a result of CPTR_EL3.TFP.

EZ	Meaning
0b0	This control causes execution of these instructions at all Exception levels to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [7:0]

Reserved, RES0.

Accessing CPTR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CPTR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b010

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = CPTR_EL3;
```

```
MSR CPTR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b010

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then

CPTRMASK_EL2, Architectural Feature Trap Masking Register

The CPTRMASK_EL2 characteristics are:

Purpose

Mask register to prevent updates of fields in CPTR_EL2 on writes.

Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to CPTRMASK_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

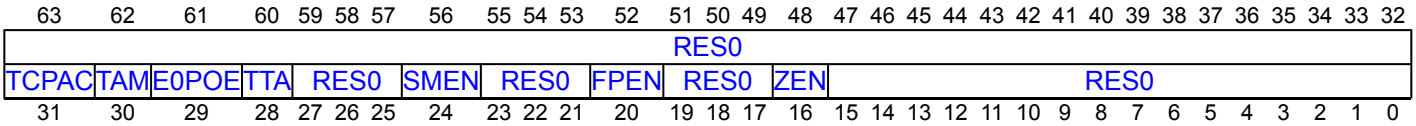
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

CPTRMASK_EL2 is a 64-bit register.

Field descriptions

When ELIsInHost(EL2):



Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

Mask bit for TCPAC.

TCPAC	Meaning
0b0	CPTR_EL2.TCPAC is writeable.
0b1	CPTR_EL2.TCPAC is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Mask bit for TAM.

TAM	Meaning
0b0	CPTR_EL2.TAM is writeable.
0b1	CPTR_EL2.TAM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0POE, bit [29]

When FEAT_S1POE is implemented:

Mask bit for E0POE.

E0POE	Meaning
0b0	CPTR_EL2.E0POE is writeable.
0b1	CPTR_EL2.E0POE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTA, bit [28]

When System register access to the trace unit registers is implemented:

Mask bit for TTA.

TTA	Meaning
0b0	CPTR_EL2.TTA is writeable.
0b1	CPTR_EL2.TTA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [27:25]

Reserved, RES0.

SMEN, bit [24]

When FEAT_SME is implemented:

Mask bit for SMEN.

SMEN	Meaning
0b0	CPTR_EL2.SMEN is writeable.
0b1	CPTR_EL2.SMEN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:21]

Reserved, RES0.

FPEN, bit [20]

Mask bit for FPEN.

FPEN	Meaning
0b0	CPTR_EL2.FPEN is writeable.
0b1	CPTR_EL2.FPEN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [19:17]

Reserved, RES0.

ZEN, bit [16]

When FEAT_SVE is implemented:

Mask bit for ZEN.

ZEN	Meaning
0b0	CPTR_EL2.ZEN is writeable.
0b1	CPTR_EL2.ZEN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

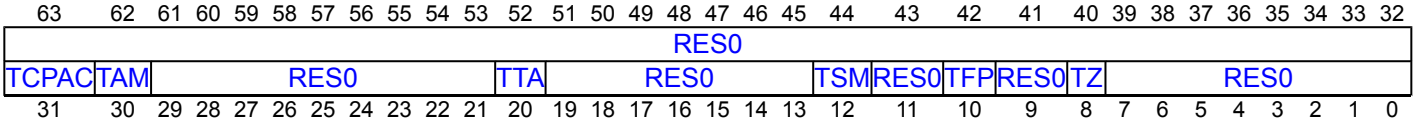
Otherwise:

Reserved, RES0.

Bits [15:0]

Reserved, RES0.

Otherwise:



This format applies in all Armv8.0 implementations.

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

Mask bit for TCPAC.

TCPAC	Meaning
0b0	CPTR_EL2.TCPAC is writeable.
0b1	CPTR_EL2.TCPAC is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Mask bit for TAM.

TAM	Meaning
0b0	CPTR_EL2.TAM is writeable.
0b1	CPTR_EL2.TAM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Mask bit for TTA.

TTA	Meaning
0b0	CPTR_EL2.TTA is writeable.
0b1	CPTR_EL2.TTA is not writeable.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL2, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [19:13]

Reserved, RES0.

TSM, bit [12]

When FEAT_SME is implemented:

Mask bit for TSM.

TSM	Meaning
0b0	CPTR_EL2.TSM is writeable.
0b1	CPTR_EL2.TSM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES0.

TFP, bit [10]

Mask bit for TFP.

TFP	Meaning
0b0	CPTR_EL2.TFP is writeable.
0b1	CPTR_EL2.TFP is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

TZ, bit [8]

When FEAT_SVE is implemented:

Mask bit for TZ.

TZ	Meaning
0b0	CPTR_EL2.TZ is writeable.
0b1	CPTR_EL2.TZ is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [7:0]

Reserved, RES0.

Accessing CPTRMASK_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name CPTRMASK_EL2 or CPTRMASK_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CPTRMASK_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0100	0b010

CSSELR_EL1, Cache Size Selection Register

The CSSELR_EL1 characteristics are:

Purpose

Selects the current Cache Size ID Register, CCSIDR_EL1, by specifying the required cache level and the cache type (either instruction or data cache).

Configuration

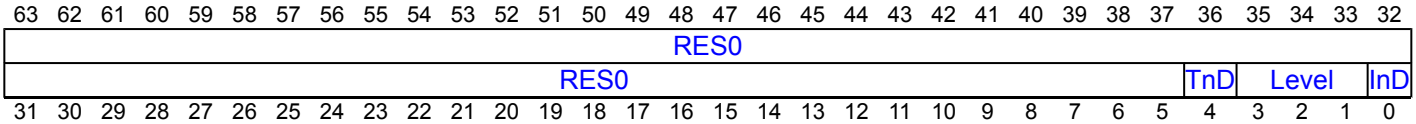
AArch64 System register CSSELR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CSSELR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CSSELR_EL1 are UNDEFINED.

Attributes

CSSELR_EL1 is a 64-bit register.

Field descriptions



Bits [63:5]

Reserved, RES0.

TnD, bit [4]

When FEAT_MTE2 is implemented:

Allocation Tag not Data bit.

TnD	Meaning
0b0	Data, Instruction or Unified cache.
0b1	Separate Allocation Tag cache.

When CSSELR_EL1.InD == 1, this bit is RES0.

If CSSELR_EL1.{TnD, Level, InD} is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR_EL1 is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Level, bits [3:1]

Cache level of required cache.

Level	Meaning
0b000	Level 1 cache.
0b001	Level 2 cache.
0b010	Level 3 cache.
0b011	Level 4 cache.
0b100	Level 5 cache.
0b101	Level 6 cache.
0b110	Level 7 cache.

All other values are reserved.

If CSSELR_EL1.{TnD, Level, InD} is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR_EL1 is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [0]

Instruction not Data bit.

InD	Meaning
0b0	Data or unified cache.
0b1	Instruction cache.

If CSSELR_EL1.{TnD, Level, InD} is programmed to a cache level that is not implemented, then a read of CSSELR_EL1 is CONSTRAINED UNPREDICTABLE, and returns UNKNOWN values for CSSELR_EL1.{Level, InD}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CSSELR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CSSELR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b010	0b0000	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID2 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_EVT) && HCR_EL2.TID4 == '1' then

CTR_EL0, Cache Type Register

The CTR_EL0 characteristics are:

Purpose

Provides information about the architecture of the caches.

Configuration

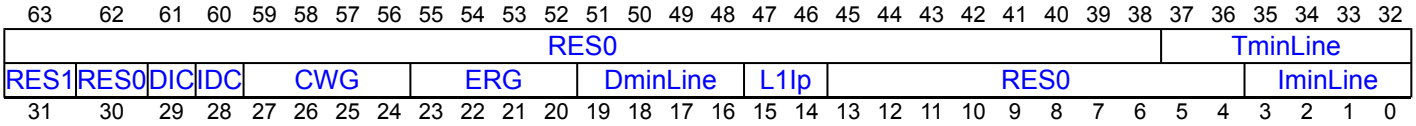
AArch64 System register CTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register CTR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CTR_EL0 are UNDEFINED.

Attributes

CTR_EL0 is a 64-bit register.

Field descriptions



Bits [63:38]

Reserved, RES0.

TminLine, bits [37:32]

When FEAT_MTE2 is implemented:

Tag minimum Line. Log_2 of the number of words covered by Allocation Tags in the smallest cache line of all caches which can contain Allocation tags that are controlled by the PE.

Note

- For an implementation with cache lines containing 64 bytes of data and 4 Allocation Tags, this will be $log_2(64/4) = 4$.
- For an implementation with Allocations Tags in separate cache lines of 128 Allocation Tags per line, this will be $log_2(128*16/4) = 9$.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

Bit [30]

Reserved, RES0.

DIC, bit [29]

Instruction cache invalidation requirements for data to instruction coherence.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DIC	Meaning
0b0	Instruction cache invalidation to the Point of Unification is required for data to instruction coherence.
0b1	Instruction cache invalidation to the Point of Unification is not required for data to instruction coherence.

All PEs in the same Inner Shareable shareability domain must have a common value of this field.

Note

If CTR_EL0.DIC is 1, instruction cache maintenance is not required after overwriting instructions, including for different VA aliases of the affected Locations, regardless of the value of CTR_EL0.L1Ip.

Access to this field is **RO**.

IDC, bit [28]

Data cache clean requirements for instruction to data coherence. The meaning of this bit is:

The value of this field is an IMPLEMENTATION DEFINED choice of:

IDC	Meaning
0b0	Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR_EL1.LoC == 0b000 or (CLIDR_EL1.LoUIS == 0b000 and CLIDR_EL1.LoUU == 0b000).
0b1	Data cache clean to the Point of Unification is not required for instruction to data coherence.

If CTR_EL0.DIC is 1 then the value reported in this field must also be 1.

The Effective value of IDC is 1 if any of the following are true:

- CTR_EL0.IDC == 1.
- CLIDR_EL1.LoC == 0b000.
- CLIDR_EL1.LoUIS == 0b000 and CLIDR_EL1.LoUU == 0b000.

All PEs in the same Inner Shareable shareability domain must have a common Effective value of IDC.

Access to this field is **RO**.

CWG, bits [27:24]

Cache writeback granule. Log_2 of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of 0b0000 indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than 0b1001 are reserved.

Arm recommends that an implementation that does not support cache write-back implements this field as 0b0001. This applies, for example, to an implementation that supports only write-through caches.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

ERG, bits [23:20]

Exclusives reservation granule, and, if FEAT_TME is implemented, transactional reservation granule. Log_2 of the number of words of the maximum size of the reservation granule for the Load-Exclusive and Store-Exclusive instructions, and, if FEAT_TME is implemented, for detecting transactional conflicts.

A value of `0b0000` indicates that this register does not provide granule information and the architectural maximum of 512 words (2KB) must be assumed.

Value `0b0001` and values greater than `0b1001` are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

DminLine, bits [19:16]

Log_2 of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

L1Ip, bits [15:14]

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1Ip	Meaning
`0b00`	Reserved.
`0b01`	ASID-tagged Virtual Index, Virtual Tag (AIVIVT).
`0b10`	Virtual Index, Physical Tag (VIPT).
`0b11`	Physical Index, Physical Tag (PIPT).

From Armv8.0, the value `0b01` is reserved.

Access to this field is **RO**.

Bits [13:4]

Reserved, RES0.

IminLine, bits [3:0]

Log_2 of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CTR_EL0
```

op0	op1	CRn	CRm	op2

0b11	0b011	0b0000	0b0000	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then
    UnimplementedIDRegister();
elsif PSTATE.EL == EL0 then
    if !ELIsInHost(EL0) && SCTLR_EL1.UCT == '0' then

CurrentEL, Current Exception Level

The CurrentEL characteristics are:

Purpose

Holds the current Exception level.

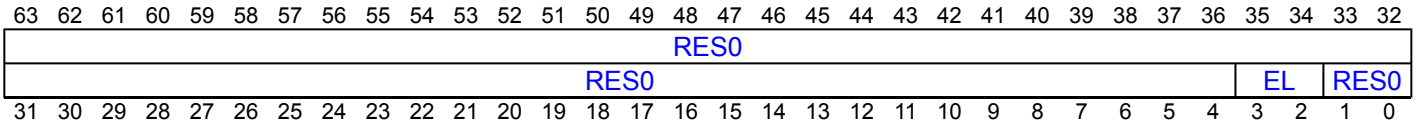
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to CurrentEL are UNDEFINED.

Attributes

CurrentEL is a 64-bit register.

Field descriptions



Bits [63:4]

Reserved, RES0.

EL, bits [3:2]

Current Exception level.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

When the Effective value of HCR_EL2.NV is 1, EL1 read accesses to the CurrentEL register return the value of 0b10 in this field.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '01'.
  - When the highest implemented Exception level is EL2, this field resets to '10'.
  - Otherwise, this field resets to '11'.

Bits [1:0]

Reserved, RES0.

Accessing CurrentEL

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CurrentEL
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0010	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

DACR32_EL2, Domain Access Control Register

The DACR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 DACR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register DACR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register DACR[31:0].

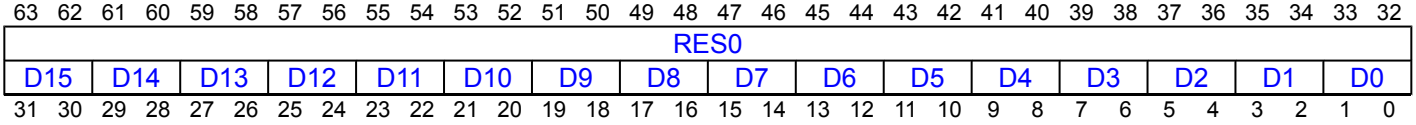
This register is present only when FEAT_AA32EL1 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to DACR32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Attributes

DACR32_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

D<n>, bits [2n+1:2n], for n = 15 to 0

Domain n access permission, where n = 0 to 15. Permitted values are:

D<n>	Meaning
0b00	No access. Any access to the domain generates a Domain fault.
0b01	Client. Accesses are checked against the permission bits in the translation tables.
0b11	Manager. Accesses are not checked against the permission bits in the translation tables.

The value 0b10 is reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DACR32_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DACR32_EL2
```

DAIF, Interrupt Mask Bits

The DAIF characteristics are:

Purpose

Allows access to the interrupt mask bits.

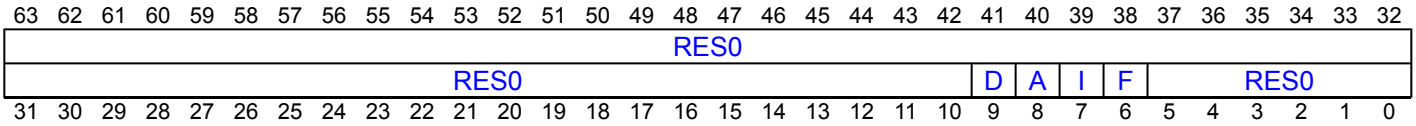
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DAIF are UNDEFINED.

Attributes

DAIF is a 64-bit register.

Field descriptions



Bits [63:10]

Reserved, RES0.

D, bit [9]

Process state D mask.

D	Meaning
0b0	Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are not masked.
0b1	Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are masked.

When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

A, bit [8]

SError exception mask bit.

A	Meaning
0b0	Exception not masked.
0b1	Exception masked.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

I, bit [7]

IRQ mask bit.

I	Meaning
0b0	Exception not masked.
0b1	Exception masked.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

F, bit [6]

FIQ mask bit.

F	Meaning
0b0	Exception not masked.
0b1	Exception masked.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Bits [5:0]

Reserved, RES0.

Accessing DAIF

Accesses to this register use the following encodings in the System register encoding space:

DBGAUTHSTATUS_EL1, Debug Authentication Status Register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

AArch64 System register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGAUTHSTATUS[31:0].

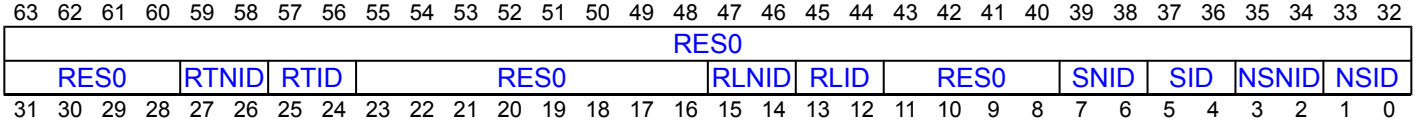
AArch64 System register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to External register DBGAUTHSTATUS_EL1[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DBGAUTHSTATUS_EL1 are UNDEFINED.

Attributes

DBGAUTHSTATUS_EL1 is a 64-bit register.

Field descriptions



Bits [63:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.
0b10	Implemented and disabled. ExternalRootInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalRootInvasiveDebugEnabled() == TRUE.

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 0b00.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.
0b10	Implemented and disabled. ExternalRealmInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalRealmInvasiveDebugEnabled() == TRUE.

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 0b00.

Bits [11:8]

Reserved, RES0.

SNID, bits [7:6]

When FEAT_Debugv8p4 is implemented:

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

Secure non-invasive debug.

SNID	Meaning
0b00	Secure state is not implemented.
0b10	Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

SID	Meaning
0b00	Secure state is not implemented.
0b10	Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSNID, bits [3:2]

When FEAT_Debugv8p4 is implemented:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Non-secure state is not implemented.
0b11	Implemented and enabled. EL3 is implemented or the Effective value of SCR_EL3.NS is 1.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Non-secure state is not implemented.
0b10	Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

NSID	Meaning
0b00	Non-secure state is not implemented.
0b10	Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

Accessing DBGAUTHSTATUS_EL1

Accesses to this register use the following encodings in the System register encoding space:

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 63

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>_EL1.

Configuration

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBCR<n>[31:0].

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to External register DBGBCR<n>_EL1[31:0].

AArch64 System register DBGBCR<n>_EL1 bits [63:32] are architecturally mapped to External register DBGBCR<n>_EL1[63:32] when FEAT_Debugv8p9 is implemented.

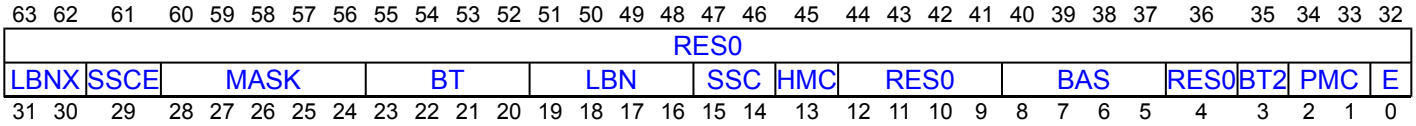
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DBGBCR<n>_EL1 are UNDEFINED.

If breakpoint n is not implemented, accesses to this register are UNDEFINED.

Attributes

DBGBCR<n>_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

LBNX, bits [31:30]

When FEAT_Debugv8p9 is implemented:

Linked Breakpoint Number.

For Linked address matching breakpoints, with DBGBCR<n>_EL1.LBN, specifies the index of the breakpoint linked to.

For all other breakpoint types, this field is ignored and reads of the register return an UNKNOWN value.

This field extends DBGBCR<n>_EL1.LBN to support up to 64 implemented breakpoints.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSCE, bit [29]

When FEAT_RME is implemented:

Security State Control Extended.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MASK, bits [28:24]

When FEAT_BWE is implemented:

Address Mask. Only address ranges up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00011..0b11111	Number of address bits masked.

All other values are reserved.

Indicates the number of masked address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

If any of the following apply then the behavior of the breakpoint is CONSTRAINED UNPREDICTABLE:

- DBGBCR<n>_EL1.MASK is a reserved value.
- DBGBCR<n>_EL1.MASK is zero, DBGBCR<n>_EL1.{BT2, BT} is {0, 0b010x} (address mismatch breakpoint without linking enabled), and AArch32 is not supported at EL1.
- DBGBCR<n>_EL1.MASK is a valid nonzero value and any of the following apply:
  - DBGBCR<n>_EL1.BAS is not 0b1111, and AArch32 is supported at EL0.
  - DBGBVR<n>_EL1[(MASK-1):0] is nonzero.
  - DBGBCR<n>_EL1.{BT2, BT} is {0, 0b0x1x} or {0, 0b1xxx} (Context matching breakpoint).

When any of these conditions apply, the breakpoint behaves as if one of the following:

- DBGBCR<n>_EL1.MASK has been programmed with a defined value, which might be 0b00000 (no mask), other than for a direct read of DBGBCR<n>_EL1.
- The breakpoint is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type.

With DBGBCR<n>_EL1.BT2 when implemented, specifies breakpoint type.

BT	Meaning	Applies when
0b0000	Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.	
0b0001	Linked instruction address match. As 0b0000, but linked to a breakpoint that has linking enabled.	
0b0010	Unlinked Context ID match. If the Effective value of HCR_EL2.E2H is 1, and either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL2. Otherwise, DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1.	When breakpoint n is context-aware
0b0011	As 0b0010, with linking enabled.	When breakpoint n is context-aware
0b0100	Unlinked instruction address mismatch. DBGBVR<n>_EL1 is the address of an instruction.	When FEAT_BWE is implemented
0b0101	Linked instruction address mismatch. As 0b0100, but linked to a breakpoint that has linking enabled.	When FEAT_BWE is implemented
0b0110	Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b0111	As 0b0110, with linking enabled.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b1000	Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.	When EL2 is implemented and breakpoint n is context-aware
0b1001	As 0b1000, with linking enabled.	When EL2 is implemented and breakpoint n is context-aware
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.	When EL2 is implemented and breakpoint n is context-aware
0b1011	As 0b1010, with linking enabled.	When EL2 is implemented and breakpoint n is context-aware
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBVR<n>_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b1101	As 0b1100, with linking enabled.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b1110	Unlinked Full Context ID match. DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.ContextID2 is compared against CONTEXTIDR_EL2.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b1111	As 0b1110, with linking enabled.	When EL2 is implemented,

	FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number.

For Linked address matching breakpoints, with DBGBCR<n>_EL1.LBNX when implemented, specifies the index of the breakpoint linked to.

For all other breakpoint types, this field is ignored and reads of the register return an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>_EL1.SSC.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When FEAT_AA32 is implemented:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions.
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions.
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions.

All other values are reserved. For more information, see 'Reserved DBGBCR<n>_EL1.BAS values'.

For more information on using the BAS field in address match breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [4]

Reserved, RES0.

BT2, bit [3]

When FEAT_ABLE is implemented and breakpoint n supports address breakpoint linking:

Breakpoint Type 2. With DBGBCR<n>_EL1.BT, specifies breakpoint type.

BT2	Meaning
0b0	As DBGBCR<n>_EL1.BT.
0b1	As DBGBCR<n>_EL1.BT, but with linking enabled. This value is only defined for the following DBGBCR<n>_EL1.BT values: 0b0000, 0b0001, 0b0100, and 0b0101. All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>_EL1.SSC.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint n.

E	Meaning
0b0	Breakpoint n disabled.
0b1	Breakpoint n enabled.

This field is ignored by the PE and treated as zero when all of the following are true:

- Any of the following are true:
  - `HaltOnBreakpointOrWatchpoint()` is FALSE and the Effective value of MDSCR_EL1.EMBWE is 0.
  - `HaltOnBreakpointOrWatchpoint()` is TRUE and the Effective value of EDSCR2.EHBWE is 0.
- FEAT_Debugv8p9 is implemented.
- n >= 16.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>_EL1

When FEAT_Debugv8p9 is implemented, a PE is permitted to support up to 64 implemented breakpoints.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DBGBCR<m>_EL1 ; Where m = 0-15
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	m[3:0]	0b101

```
integer m = UInt(CRm<3:0>);

if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif (!IsFeatureImplemented(FEAT_Debugv8p9) && m >= NUM_BREAKPOINTS) ||
(IsFeatureImplemented(FEAT_Debugv8p9) && m + (UInt(EffectiveMDSELR_EL1_BANK()) * 16) >=
NUM_BREAKPOINTS) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;

DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 63

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1.

Configuration

AArch64 System register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBVR<n>[31:0].

AArch64 System register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register DBGBXVR<n>[31:0].

AArch64 System register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to External register DBGBVR<n>_EL1[63:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DBGBVR<n>_EL1 are UNDEFINED.

How this register is interpreted depends on the value of DBGBCR<n>_EL1.BT.

- When DBGBCR<n>_EL1.BT is `0b000x`, this register holds a virtual address.
- When DBGBCR<n>_EL1.BT is `0b001x`, `0b011x`, or `0b110x`, this register holds a Context ID.
- When DBGBCR<n>_EL1.BT is `0b100x`, this register holds a VMID.
- When DBGBCR<n>_EL1.BT is `0b101x`, this register holds a VMID and a Context ID.
- When DBGBCR<n>_EL1.BT is `0b111x`, this register holds two Context ID values.

For other values of DBGBCR<n>_EL1.BT, this register is RES0.

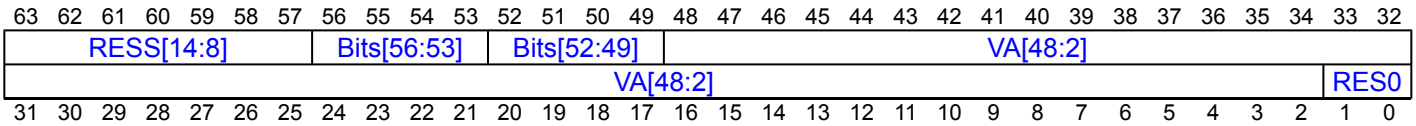
If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGBVR<n>_EL1 is a 64-bit register.

Field descriptions

When DBGBCR<n>_EL1.BT IN {0b000x}:



RESS[14:8], bits [63:57]

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONSTRAINED UNPREDICTABLE whether the PE ignores this field when comparing an address.
- If the breakpoint is not context-aware, it is IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

Bits[56:53]

When FEAT_LVA3 is implemented:

VA[56:53], bits [3:0] of bits [56:53]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[7:4], bits [3:0] of bits [56:53]

Extension to RESS[14:8]. For more information, see RESS[14:8].

Bits[52:49]

When FEAT_LVA is implemented:

VA[52:49], bits [3:0] of bits [52:49]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0], bits [3:0] of bits [52:49]

Extension to RESS[14:8]. For more information, see RESS[14:8].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA3 is implemented, (VA[56:53]:VA[52:49]) forms the upper part of the address value. If FEAT_LVA3 is not implemented, bits VA[56:53] are part of the RESS field.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. If FEAT_LVA is not implemented, bits [52:49] are part of the RESS field.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT IN {0b001x}:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
ContextID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when the Effective value of HCR_EL2.E2H is 1, and either:

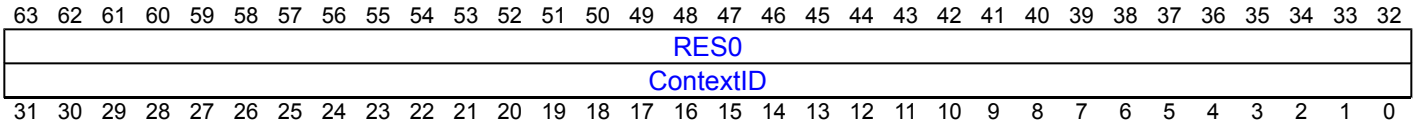
- The PE is executing at EL2.
- HCR_EL2.TGE is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT IN {0b011x}, EL2 is implemented, and FEAT_Debugv8p1 is implemented:



Bits [63:32]

Reserved, RES0.

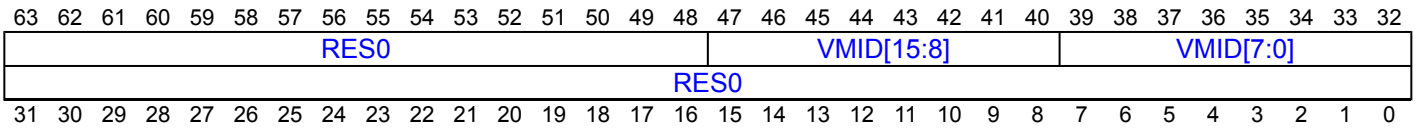
ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT IN {0b100x} and EL2 is implemented:



Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented, VTCR_EL2.VS == 1, and EL2 is using AArch64:

Extension to VMID[7:0]. For more information, see DBGBVR<n>_EL1.VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

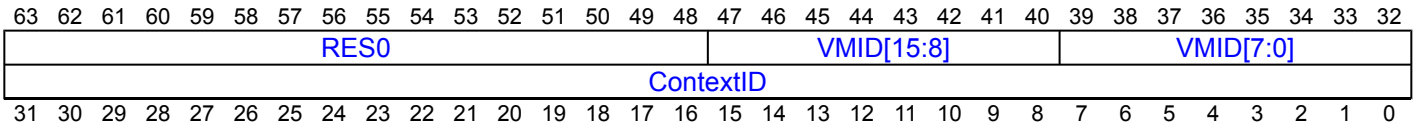
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT IN {0b101x} and EL2 is implemented:



Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented, VTCR_EL2.VS == 1, and EL2 is using AArch64:

Extension to VMID[7:0]. For more information, see DBGBVR<n>_EL1.VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

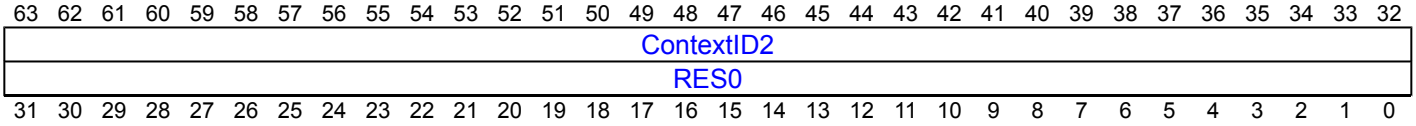
ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT IN {0b110x}, EL2 is implemented, and FEAT_Debugv8p1 is implemented:



ContextID2, bits [63:32]

Context ID value for comparison against CONTEXTIDR_EL2.

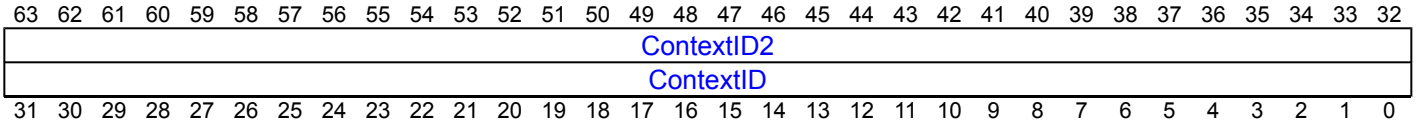
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT IN {0b111x}, EL2 is implemented, and FEAT_Debugv8p1 is implemented:



ContextID2, bits [63:32]

Context ID value for comparison against CONTEXTIDR_EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBVR<n>_EL1

When FEAT_Debugv8p9 is implemented, a PE is permitted to support up to 64 implemented breakpoints.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DBGBVR<m>_EL1 ; Where m = 0-15
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	m[3:0]	0b100

```
integer m = UInt(CRm<3:0>);

DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear Register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMSET_EL1 register.

Configuration

AArch64 System register DBGCLAIMCLR_EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[63:0].

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMSET_EL1[31:0].

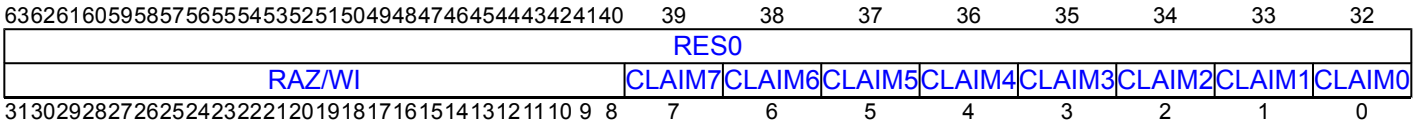
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DBGCLAIMCLR_EL1 are UNDEFINED.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

Bits [31:8]

Reserved, RAZ/WI.

CLAIM<m>, bit [m], for m = 7 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is **W1C**.

DBGDTR_EL0, Debug Data Transfer Register, half-duplex

The DBGDTR_EL0 characteristics are:

Purpose

Transfers 64 bits of data between the PE and an external debugger. Can transfer both ways using only a single register.

Configuration

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to External register DBGDTRRX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to External register DBGDTRTX_EL0[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0] when read.

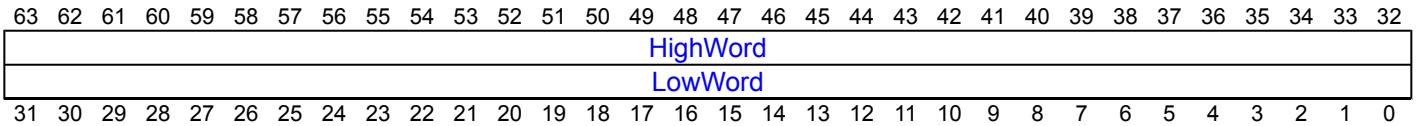
AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0] when read.

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DBGDTR_EL0 are UNDEFINED.

Attributes

DBGDTR_EL0 is a 64-bit register.

Field descriptions



HighWord, bits [63:32]

Writes to this register set DTRRX to the value in this field and do not change RXfull.

Reads of this register:

- If RXfull is 1, return the last value written to DTRTX.
- If RXfull is 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

LowWord, bits [31:0]

Writes to this register set DTRTX to the value in this field and set TXfull to 1.

Reads of this register:

- If RXfull is 1, return the last value written to DTRRX.
- If RXfull is 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

Accessing DBGDTR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DBGDTR_EL0
```

op0	op1	CRn	CRm	op2
0b10	0b011	0b0000	0b0100	0b000

DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

Configuration

AArch64 System register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0].

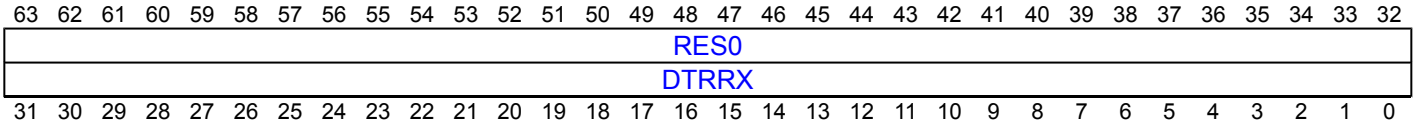
AArch64 System register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DBGDTRRX_EL0 are UNDEFINED.

Attributes

DBGDTRRX_EL0 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

DTRRX, bits [31:0]

DTRRX. Reads of this register:

- If RXfull is 1, return the last value written to DTRRX.
- If RXfull is 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRX_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DBGDTRRX_EL0
```

op0	op1	CRn	CRm	op2
0b10	0b011	0b0000	0b0101	0b000

```

DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

Configuration

AArch64 System register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0].

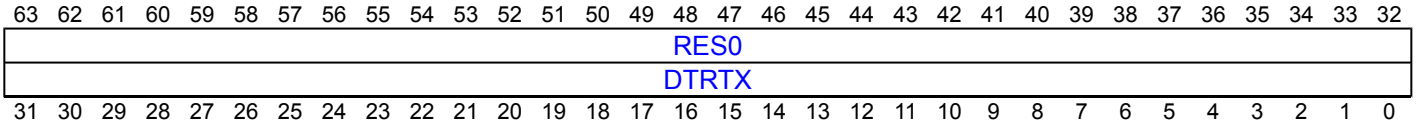
AArch64 System register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DBGDTRTX_EL0 are UNDEFINED.

Attributes

DBGDTRTX_EL0 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

DTRTX, bits [31:0]

DTRTX. Writes to this register:

- If TXfull is 1, DTRTX is set to an UNKNOWN value.
- If TXfull is 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

DBGPRCR_EL1, Debug Power Control Register

The DBGPRCR_EL1 characteristics are:

Purpose

Controls behavior of the PE on powerdown request.

Configuration

AArch64 System register DBGPRCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGPRCR[31:0].

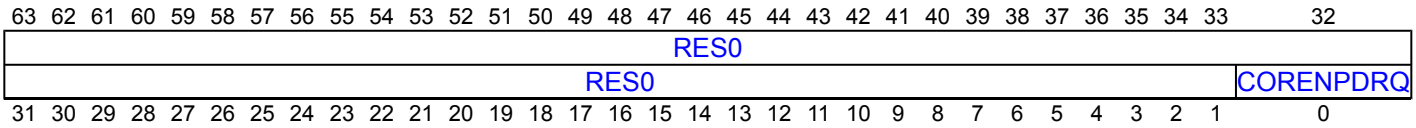
AArch64 System register DBGPRCR_EL1 bit [0] is architecturally mapped to External register EDPRCR[0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DBGPRCR_EL1 are UNDEFINED.

Attributes

DBGPRCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

CORENPDRQ, bit [0]

When FEAT_DoPD is implemented:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the **DBGNOPWRDWN** signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to its Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Otherwise:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the **DBGNOPWRDWN** signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in EDPRCR.COREPURQ.

DBGVCR32_EL2, Debug Vector Catch Register

The DBGVCR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register DBGVCR from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register DBGVCR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register DBGVCR[31:0].

This register is present only when FEAT_AA32EL1 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to DBGVCR32_EL2 are UNDEFINED.

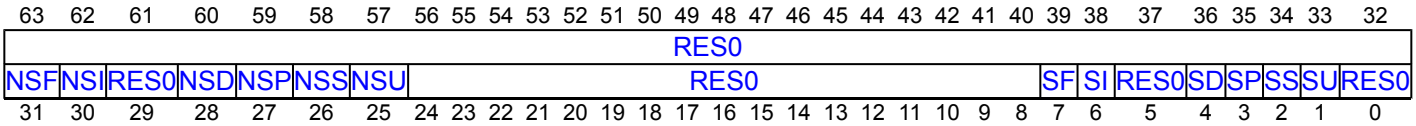
If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Attributes

DBGVCR32_EL2 is a 64-bit register.

Field descriptions

When EL3 is implemented:



Bits [63:32]

Reserved, RES0.

NSF, bit [31]

FIQ vector catch enable in Non-secure state.

The exception vector offset is `0x1C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is `0x18`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

NSD, bit [28]

Data Abort exception vector catch enable in Non-secure state.

The exception vector offset is `0x10`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSP, bit [27]

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is `0x0C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is `0x08`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is `0x04`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.

The exception vector offset is `0x1C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SI, bit [6]

IRQ vector catch enable in Secure state.

The exception vector offset is `0x18`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort exception vector catch enable in Secure state.

The exception vector offset is `0x10`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is `0x0C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is `0x08`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is `0x04`.

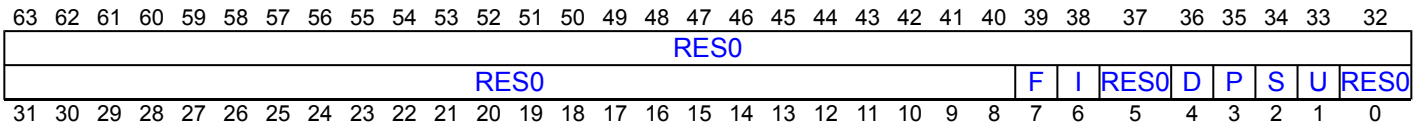
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

When EL3 is not implemented:



Bits [63:8]

Reserved, RES0.

F, bit [7]

FIQ vector catch enable.

The exception vector offset is `0x1C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [6]

IRQ vector catch enable.

The exception vector offset is `0x18`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

D, bit [4]

Data Abort exception vector catch enable.

The exception vector offset is `0x10`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P, bit [3]

Prefetch Abort vector catch enable.

The exception vector offset `0x0C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [2]

Supervisor Call (SVC) vector catch enable.

The exception vector offset is `0x08`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [1]

Undefined Instruction vector catch enable.

The exception vector offset is `0x04`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing DBGVCR32_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DBGVCR32_EL2
```

op0	op1	CRn	CRm	op2
0b10	0b100	0b0000	0b0111	0b000

```

DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 63

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

Configuration

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWCR<n>[31:0].

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to External register DBGWCR<n>_EL1[31:0].

AArch64 System register DBGWCR<n>_EL1 bits [63:32] are architecturally mapped to External register DBGWCR<n>_EL1[63:32] when FEAT_Debugv8p9 is implemented.

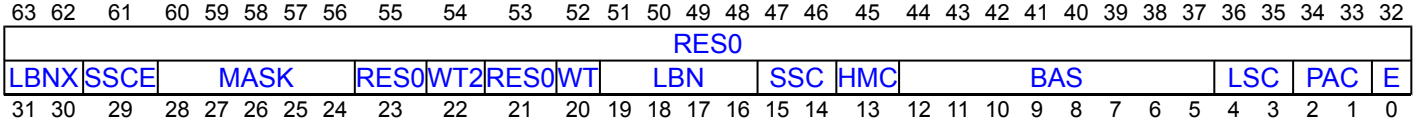
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DBGWCR<n>_EL1 are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWCR<n>_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

LBNX, bits [31:30]

When FEAT_Debugv8p9 is implemented:

Linked Breakpoint Number.

For Linked data address watchpoints, with DBGWCR<n>_EL1.LBN, specifies the index of the breakpoint linked to.

For all other watchpoint types, this field is ignored and reads of the register return an UNKNOWN value.

This field extends DBGWCR<n>_EL1.LBN to support up to 64 implemented breakpoints.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSCE, bit [29]

When FEAT_RME is implemented:

Security State Control Extended.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MASK, bits [28:24]

Address Mask. Only address ranges up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00011..0b11111	Number of address bits masked.

All other values are reserved.

Indicates the number of masked address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

If programmed with a reserved value, the watchpoint behaves as if one of the following:

- DBGWCR<n>_EL1.MASK has been programmed with a defined value, which might be 0b00000 (no mask), other than for a direct read of DBGWCR<n>_EL1.
- The watchpoint is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [23]

Reserved, RES0.

WT2, bit [22]

When FEAT_BWE2 is implemented:

Watchpoint Type 2. With DBGWCR<n>_EL1.WT, specifies watchpoint type.

WT2	Meaning
0b0	Watchpoint n is an address match watchpoint.
0b1	Watchpoint n is an address mismatch watchpoint.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked watchpoint.
0b1	Linked watchpoint.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number.

For Linked data address watchpoints, with DBGWCR<n>_EL1.LBNX when implemented, specifies the index of the breakpoint linked to.

For all other watchpoint types, this field is ignored and reads of the register return an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

For more information on the effect of programming the fields to a reserved value, see 'Reserved DBGWCR<n>_EL1.{SSC, HMC, PAC} values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

BAS	Description
xxxxxxx1	Match byte at DBGWVR<n>_EL1
xxxxxx1x	Match byte at DBGWVR<n>_EL1 + 1
xxxxx1xx	Match byte at DBGWVR<n>_EL1 + 2
xxxx1xxx	Match byte at DBGWVR<n>_EL1 + 3

In cases where DBGWVR<n>_EL1 addresses a double-word:

BAS	Description, if DBGWVR<n>_EL1[2] == 0
xxx1xxxx	Match byte at DBGWVR<n>_EL1 + 4
xx1xxxxx	Match byte at DBGWVR<n>_EL1 + 5
x1xxxxxx	Match byte at DBGWVR<n>_EL1 + 6
1xxxxxxx	Match byte at DBGWVR<n>_EL1 + 7

If DBGWVR<n>_EL1[2] == 1, only BAS[3:0] are used and BAS[7:4] are ignored. Arm deprecates setting DBGWVR<n>_EL1[2] == 1.

The valid values for BAS are nonzero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>_EL1.BAS values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n.

E	Meaning
0b0	Watchpoint n disabled.
0b1	Watchpoint n enabled.

This field is ignored by the PE and treated as zero when all of the following are true:

- Any of the following are true:
  - `HaltOnBreakpointOrWatchpoint()` is FALSE and the Effective value of MDSCR_EL1.EMBWE is 0.
  - `HaltOnBreakpointOrWatchpoint()` is TRUE and the Effective value of EDSCR2.EHBWE is 0.
- FEAT_Debugv8p9 is implemented.
- n >= 16.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGWCR<n>_EL1

When FEAT_Debugv8p9 is implemented, a PE is permitted to support up to 64 implemented watchpoints.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DBGWCR<m>_EL1 ; Where m = 0-15
```

DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 63

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

Configuration

AArch64 System register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWVR<n>[31:0].

AArch64 System register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to External register DBGWVR<n>_EL1[63:0].

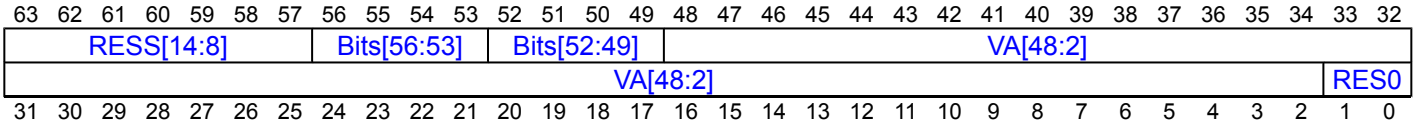
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DBGWVR<n>_EL1 are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions



RESS[14:8], bits [63:57]

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONSTRAINED UNPREDICTABLE whether the PE ignores this field when comparing an address.
- It is IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

Bits[56:53]

When FEAT_LVA3 is implemented:

VA[56:53], bits [3:0] of bits [56:53]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[7:4], bits [3:0] of bits [56:53]

Extension to RESS[14:8]. For more information, see RESS[14:8].

Bits[52:49]

When FEAT_LVA is implemented:

VA[52:49], bits [3:0] of bits [52:49]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0], bits [3:0] of bits [52:49]

Extension to RESS[14:8]. For more information, see RESS[14:8].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA3 is implemented, (VA[56:53]:VA[52:49]) forms the upper part of the address value. If FEAT_LVA3 is not implemented, bits VA[56:53] are part of the RESS field.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. If FEAT_LVA is not implemented, bits [52:49] are part of the RESS field.

Arm deprecates setting DBGWVR<n>_EL1[2] == 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGWVR<n>_EL1

When FEAT_Debugv8p9 is implemented, a PE is permitted to support up to 64 implemented watchpoints.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DBGWVR<m>_EL1 ; Where m = 0-15
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	m[3:0]	0b110

```
integer m = UInt(CRm<3:0>);

DC CGDSW, Clean of Data and Allocation Tags by Set/Way

The DC CGDSW characteristics are:

Purpose

Clean data and Allocation Tags in data cache by set/way.

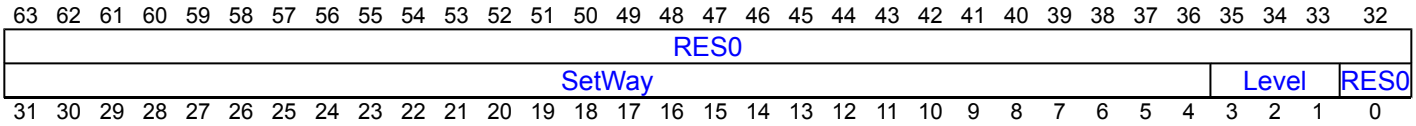
Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC CGDSW are UNDEFINED.

Attributes

DC CGDSW is a 64-bit System instruction.

Field descriptions



Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log_2(ASSOCIATIVITY), L = Log_2(LINELEN), B = (L + S), S = Log_2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing DC CGDSW

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:

- No cache lines.
- A single arbitrary cache line.
- Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CGDSW, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1010	0b110

DC CGDVAC, Clean of Data and Allocation Tags by VA to PoC

The DC CGDVAC characteristics are:

Purpose

Clean data and Allocation Tags in data cache by address to Point of Coherency.

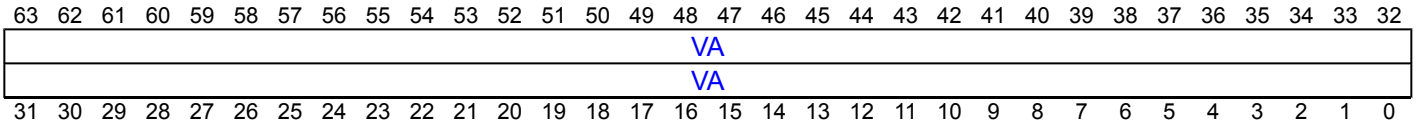
Configuration

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC CGDVAC are UNDEFINED.

Attributes

DC CGDVAC is a 64-bit System instruction.

Field descriptions



VA, bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DC CGDVAC

If EL0 access is enabled, when executed at EL0, the instruction may generate a Permission fault, subject to the constraints described in 'MMU faults generated by cache maintenance operations'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CGDVAC, <Xt>
```

op0	op1	CRn	CRm	op2

DC CGVADP, Clean of Allocation Tags by VA to PoDP

The DC CGVADP characteristics are:

Purpose

Clean Allocation tags by address to Point of Deep Persistence.

If the memory system does not identify a Point of Deep Persistence, then this instruction behaves as a DC CGVAP.

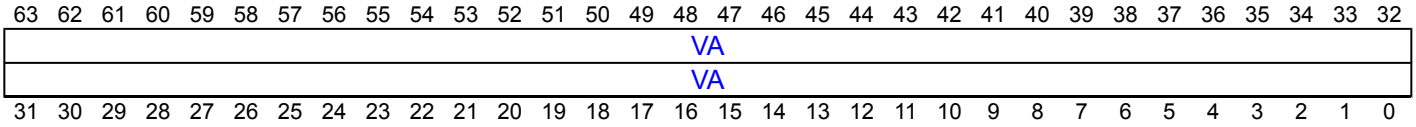
Configuration

This instruction is present only when FEAT_DPB2 is implemented and FEAT_MTE is implemented. Otherwise, direct accesses to DC CGVADP are UNDEFINED.

Attributes

DC CGVADP is a 64-bit System instruction.

Field descriptions



VA, bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DC CGVADP

If EL0 access is enabled, when executed at EL0, the instruction may generate a Permission fault, subject to the constraints described in 'MMU faults generated by cache maintenance operations'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CGVADP, <Xt>

DC CIGDPAE, Clean and invalidate of data and allocation tags by PA to PoE

The DC CIGDPAE characteristics are:

Purpose

Clean and invalidate of data and allocation tags by PA to PoE.

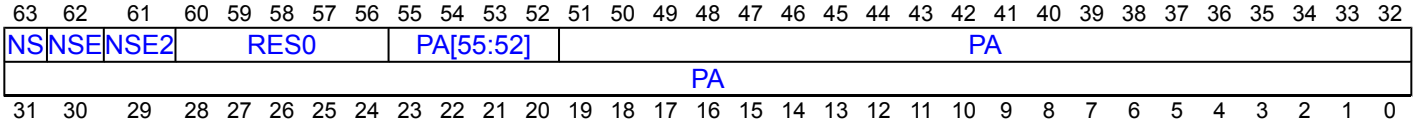
Configuration

This instruction is present only when FEAT_MEC is implemented, FEAT_MTE2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to DC CIGDPAE are UNDEFINED.

Attributes

DC CIGDPAE is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME_GDI is implemented:

Together with the NSE2 and NSE field, this field specifies the target physical address space.

NSE2	NSE	NS	Meaning
0b0	0b0	0b0	Reserved.
0b0	0b0	0b1	Reserved.
0b0	0b1	0b0	Reserved.
0b0	0b1	0b1	Realm.
0b1	0b0	0b0	System Agent.
0b1	0b0	0b1	NS Protected.
0b1	0b1	0b0	Reserved.
0b1	0b1	0b1	Reserved.

If {NSE2, NSE, NS} is reserved, then no cache entries are required to be cleaned or invalidated.

Otherwise:

Together with the NSE field, this field specifies the target physical address space.

NSE	NS	Meaning
0b0	0b0	Reserved.
0b0	0b1	Reserved.
0b1	0b0	Reserved.
0b1	0b1	Realm.

If {NSE, NS} is not {1, 1}, then no cache entries are required to be cleaned or invalidated.

NSE, bit [62]

If FEAT_RME_GDI is implemented, this field together with the NS and NSE2 fields, specifies the target physical address space.

Otherwise, this field and the NS field specify the physical address space

For a description of the values derived by evaluating NS, NSE, and NSE2 together, see DC CIGDPAE.NS.

NSE2, bit [61]

When FEAT_RME_GDI is implemented:

Together with the NS and NSE field, this field specifies the target physical address space.

For a description of the values derived by evaluating NS and NSE together, see DC CIGDPAE.NS.

Otherwise:

Reserved, RES0.

Bits [60:56]

Reserved, RES0.

PA[55:52], bits [55:52]

When FEAT_D128 is implemented:

Extension to PA[51:0] if ID_AA64MMFR0_EL1.PARange = 0111. For more information, see PA[51:0].

Otherwise:

Reserved, RES0.

PA, bits [51:0]

Physical address to use. No alignment restrictions apply to this PA.

Executing DC CIGDPAE

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CIGDPAE, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b0111	0b1110	0b111

```
if !(IsFeatureImplemented(FEAT_MEC) && IsFeatureImplemented(FEAT_MTE2) &&
IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    if !IsCurrentSecurityState(SS_Realm) then
        UNDEFINED;
    else
        AArch64.DC(X[t, 64], CacheType_Data_Tag, CacheOp_CleanInvalidate, CacheOpScope_PoE);
elsif PSTATE.EL == EL3 then
    AArch64.DC(X[t, 64], CacheType_Data_Tag, CacheOp_CleanInvalidate, CacheOpScope_PoE);
```

DC CIGDPAPA, Clean and Invalidate of Data and Allocation Tags by PA to PoPA

The DC CIGDPAPA characteristics are:

Purpose

Clean and Invalidate data and Allocation Tags in data cache by physical address to the Point of Physical Aliasing.

Note

This instruction cleans and invalidates all copies of the Location specified in the Xt argument, irrespective of any MECID associated with the Location. Memory accesses resulting from the Clean operation use the MECID associated with the cache entry.

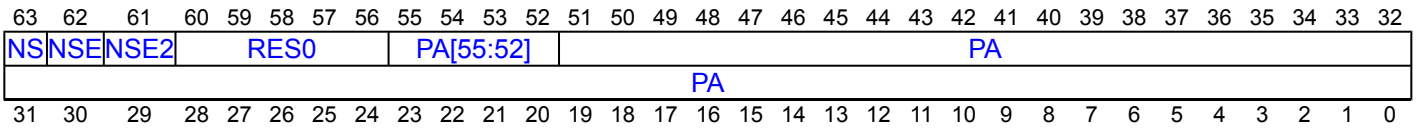
Configuration

This instruction is present only when FEAT_RME is implemented, FEAT_MTE2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to DC CIGDPAPA are UNDEFINED.

Attributes

DC CIGDPAPA is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME_GDI is implemented:

Together with the NSE2 and NSE field, this field specifies the target physical address space.

NSE2	NSE	NS	Meaning
0b0	0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b0	0b1	Non-secure.
0b0	0b1	0b0	Root.
0b0	0b1	0b1	Realm.
0b1	0b0	0b0	System Agent.
0b1	0b0	0b1	NS Protected.
0b1	0b1	0b0	Reserved.
0b1	0b1	0b1	Reserved.

If {NSE2, NSE, NS} is reserved, then no cache entries are required to be cleaned or invalidated.

Otherwise:

Together with the NSE field, this field specifies the target physical address space.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

If FEAT_SEL2 is not implemented, and {NSE, NS} == {0b0, 0b0}, then no cache entries are required to be cleaned or invalidated

NSE, bit [62]

If FEAT_RME_GDI is implemented, this field together with the NS and NSE2 fields, specifies the target physical address space.

Otherwise, this field and the NS field specify the physical address space

For a description of the values derived by evaluating NS, NSE, and NSE2 together, see DC CIGDPAPA.NS.

NSE2, bit [61]

When FEAT_RME_GDI is implemented:

Together with the NS and NSE field, this field specifies the target physical address space.

For a description of the values derived by evaluating NS and NSE together, see DC CIGDPAPA.NS.

Otherwise:

Reserved, RES0.

Bits [60:56]

Reserved, RES0.

PA[55:52], bits [55:52]

When FEAT_D128 is implemented:

Extension to PA[51:0] if ID_AA64MMFR0_EL1.PARange = 0111. For more information see PA[51:0].

Otherwise:

Reserved, RES0.

PA, bits [51:0]

Physical address to use. No alignment restrictions apply to this PA.

Executing DC CIGDPAPA

- This instruction is not subject to any translation, permission checks, or granule protection checks.
- This instruction affects all caches in the Outer Shareable shareability domain.
- This instruction has the same ordering, observability, and completion behavior as VA-based cache maintenance instructions issued to the Outer Shareable shareability domain.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC CIGDPAPA, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b110	0b0111	0b1110	0b101

```
if !(IsFeatureImplemented(FEAT_RME) && IsFeatureImplemented(FEAT_MTE2) &&
IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    AArch64.DC(X[t, 64], CacheType_Data_Tag, CacheOp_CleanInvalidate, CacheOpScope_PoPA);
```

DC CIGDSW, Clean and Invalidate of Data and Allocation Tags by Set/Way

The DC CIGDSW characteristics are:

Purpose

Clean and Invalidate data and Allocation Tags in data cache by set/way.

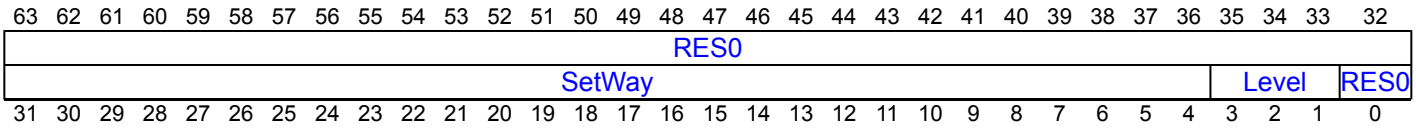
Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC CIGDSW are UNDEFINED.

Attributes

DC CIGDSW is a 64-bit System instruction.

Field descriptions



Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log_2(ASSOCIATIVITY), L = Log_2(LINELEN), B = (L + S), S = Log_2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing DC CIGDSW

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
    - No cache lines.
    - A single arbitrary cache line.
    - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CIGDSW, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1110	0b110

```
if !IsFeatureImplemented(FEAT_MTE2) then

DC CIGDVAC, Clean and Invalidate of Data and Allocation Tags by VA to PoC

The DC CIGDVAC characteristics are:

Purpose

Clean and Invalidate data and Allocation Tags in data cache by address to Point of Coherency.

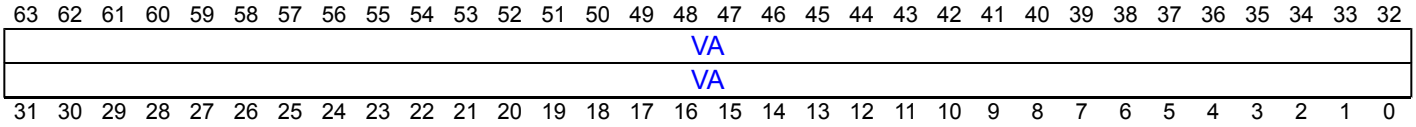
Configuration

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC CIGDVAC are UNDEFINED.

Attributes

DC CIGDVAC is a 64-bit System instruction.

Field descriptions



VA, bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DC CIGDVAC

If EL0 access is enabled, when executed at EL0, the instruction may generate a Permission fault, subject to the constraints described in 'MMU faults generated by cache maintenance operations'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```

DC CIGDVAOC, Clean and Invalidate of Data and Allocation Tags by VA to Outer Cache level

The DC CIGDVAOC characteristics are:

Purpose

Clean and invalidate of data and Allocation Tags in data cache by address to Outer cache level.

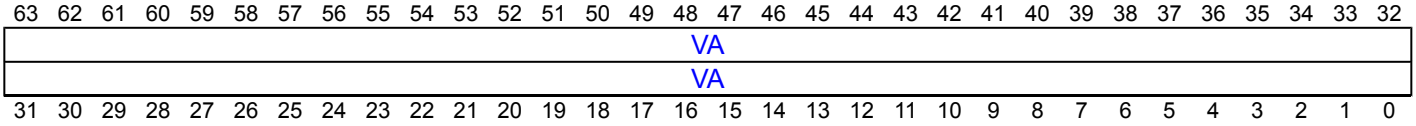
Configuration

This instruction is present only when FEAT_OCCMO is implemented, FEAT_MTE is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to DC CIGDVAOC are UNDEFINED.

Attributes

DC CIGDVAOC is a 64-bit System instruction.

Field descriptions



VA, bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DC CIGDVAOC

If EL0 access is enabled, when executed at EL0, the instruction may generate a Permission fault, subject to the constraints described in 'MMU faults generated by cache maintenance operations'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CIGDVAOC, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b1111	0b111

DC CIGDVAPS, Clean and Invalidate of Data and Allocation Tags by VA to PoPS

The DC CIGDVAPS characteristics are:

Purpose

Clean and Invalidate data and Allocation Tags in data cache by virtual address to the Point of Physical Storage.

Note

This instruction cleans and invalidates all copies of the Location specified in the Xt argument, irrespective of any MECID associated with the Location. Memory accesses resulting from the Clean operation use the MECID associated with the cache entry.

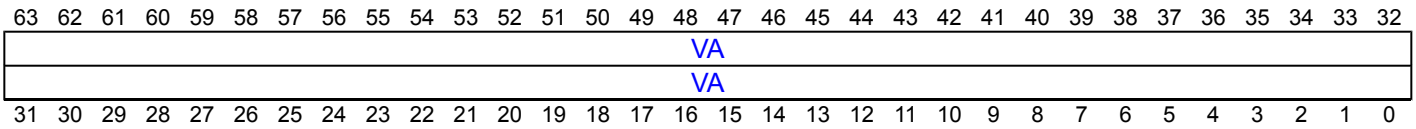
Configuration

This instruction is present only when FEAT_PoPS is implemented, FEAT_MTE2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to DC CIGDVAPS are UNDEFINED.

Attributes

DC CIGDVAPS is a 64-bit System instruction.

Field descriptions



VA, bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DC CIGDVAPS

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CIGDVAPS, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1111	0b101

```

DC CIGSW, Clean and Invalidate of Allocation Tags by Set/Way

The DC CIGSW characteristics are:

Purpose

Clean and Invalidate Allocation Tags in data cache by set/way.

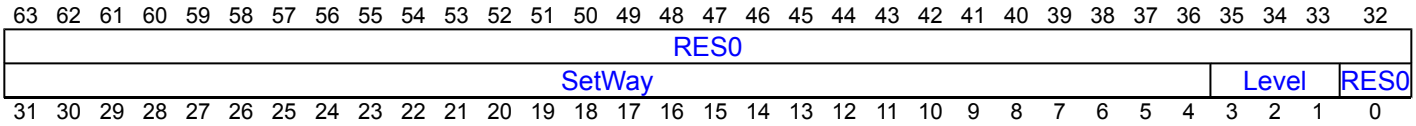
Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC CIGSW are UNDEFINED.

Attributes

DC CIGSW is a 64-bit System instruction.

Field descriptions



Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log_2(ASSOCIATIVITY), L = Log_2(LINELEN), B = (L + S), S = Log_2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing DC CIGSW

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:

- No cache lines.
- A single arbitrary cache line.
- Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CIGSW, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1110	0b100

DC CIPAE, Data or unified Cache line Clean and Invalidate by PA to PoE

The DC CIPAE characteristics are:

Purpose

Data or unified Cache line Clean and Invalidate by PA to PoE.

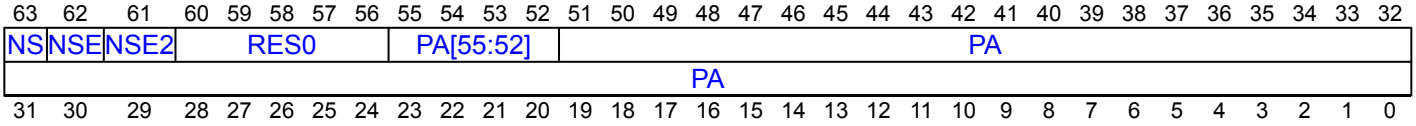
Configuration

This instruction is present only when FEAT_MEC is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to DC CIPAE are UNDEFINED.

Attributes

DC CIPAE is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME_GDI is implemented:

Together with the NSE2 and NSE field, this field specifies the target physical address space.

NSE2	NSE	NS	Meaning
0b0	0b0	0b0	Reserved.
0b0	0b0	0b1	Reserved.
0b0	0b1	0b0	Reserved.
0b0	0b1	0b1	Realm.
0b1	0b0	0b0	System Agent.
0b1	0b0	0b1	NS Protected.
0b1	0b1	0b0	Reserved.
0b1	0b1	0b1	Reserved.

If {NSE2, NSE, NS} is reserved, then no cache entries are required to be cleaned or invalidated.

Otherwise:

Together with the NSE field, this field specifies the target physical address space.

NSE	NS	Meaning
0b0	0b0	Reserved.
0b0	0b1	Reserved.
0b1	0b0	Reserved.
0b1	0b1	Realm.

If {NSE, NS} is not {1, 1}, then no cache entries are required to be cleaned or invalidated.

NSE, bit [62]

If FEAT_RME_GDI is implemented, this field together with the NS and NSE2 fields, specifies the target physical address space.

Otherwise, this field and the NS field specify the physical address space

For a description of the values derived by evaluating NS, NSE, and NSE2 together, see DC CIPAE.NS.

NSE2, bit [61]

When FEAT_RME_GDI is implemented:

Together with the NS and NSE field, this field specifies the target physical address space.

For a description of the values derived by evaluating NS and NSE together, see DC CIPAE.NS.

Otherwise:

Reserved, RES0.

Bits [60:56]

Reserved, RES0.

PA[55:52], bits [55:52]

When FEAT_D128 is implemented:

Extension to PA[51:0] if ID_AA64MMFR0_EL1.PARange = 0111. For more information see PA[51:0].

Otherwise:

Reserved, RES0.

PA, bits [51:0]

Physical address to use. No alignment restrictions apply to this PA.

Executing DC CIPAE

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CIPAE, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b0111	0b1110	0b000

```
if !(IsFeatureImplemented(FEAT_MEC) && IsFeatureImplemented(FEAT_AA64)) then

DC CIPAPA, Data or unified Cache line Clean and Invalidate by PA to PoPA

The DC CIPAPA characteristics are:

Purpose

Clean and Invalidate data cache by physical address to the Point of Physical Aliasing.

Note

This instruction cleans and invalidates all copies of the Location specified in the Xt argument, irrespective of any MECID associated with the Location. Memory accesses resulting from the Clean operation use the MECID associated with the cache entry.

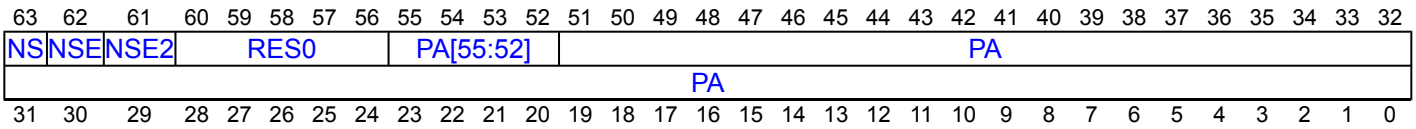
Configuration

This instruction is present only when FEAT_RME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to DC CIPAPA are UNDEFINED.

Attributes

DC CIPAPA is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME_GDI is implemented:

Together with the NSE2 and NSE field, this field specifies the target physical address space.

NSE2	NSE	NS	Meaning
0b0	0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b0	0b1	Non-secure.
0b0	0b1	0b0	Root.
0b0	0b1	0b1	Realm.
0b1	0b0	0b0	System Agent.
0b1	0b0	0b1	NS Protected.
0b1	0b1	0b0	Reserved.
0b1	0b1	0b1	Reserved.

If {NSE2, NSE, NS} is reserved, then no cache entries are required to be cleaned or invalidated.

Otherwise:

Together with the NSE field, this field specifies the target physical address space.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

If FEAT_SEL2 is not implemented, and {NSE, NS} == {0b0, 0b0}, then no cache entries are required to be cleaned or invalidated

NSE, bit [62]

If FEAT_RME_GDI is implemented, this field together with the NS and NSE2 fields, specifies the target physical address space.

Otherwise, this field and the NS field specify the physical address space

For a description of the values derived by evaluating NS, NSE, and NSE2 together, see DC CIPAPA.NS.

NSE2, bit [61]

When FEAT_RME_GDI is implemented:

Together with the NS and NSE field, this field specifies the target physical address space.

For a description of the values derived by evaluating NS and NSE together, see DC CIPAPA.NS.

Otherwise:

Reserved, RES0.

Bits [60:56]

Reserved, RES0.

PA[55:52], bits [55:52]

When FEAT_D128 is implemented:

Extension to PA[51:0] if ID_AA64MMFR0_EL1.PARange = 0111. For more information see PA[51:0].

Otherwise:

Reserved, RES0.

PA, bits [51:0]

Physical address to use. No alignment restrictions apply to this PA.

Executing DC CIPAPA

- This instruction is not subject to any translation, permission checks, or granule protection checks.
- This instruction affects all caches in the Outer Shareable shareability domain.
- This instruction has the same ordering, observability, and completion behavior as VA-based cache maintenance instructions issued to the Outer Shareable shareability domain.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC CIPAPA, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b110	0b0111	0b1110	0b001

```

DC CIVAOC, Data or unified Cache line Clean and Invalidate by VA to Outer Cache level

The DC CIVAOC characteristics are:

Purpose

Clean and Invalidate data cache by address to Outer cache level.

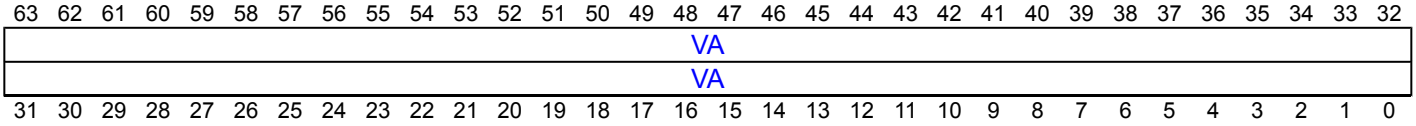
Configuration

This instruction is present only when FEAT_OCCMO is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to DC CIVAOC are UNDEFINED.

Attributes

DC CIVAOC is a 64-bit System instruction.

Field descriptions



VA, bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DC CIVAOC

If EL0 access is enabled, when executed at EL0, the instruction may generate a Permission fault, subject to the constraints described in 'MMU faults generated by cache maintenance operations'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CIVAOC, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b1111	0b000

DC CIVAPS, Clean and Invalidate of Data by VA to PoPS

The DC CIVAPS characteristics are:

Purpose

Clean and Invalidate data in data cache by virtual address to the Point of Physical Storage.

Note

This instruction cleans and invalidates all copies of the Location specified in the Xt argument, irrespective of any MECID associated with the Location. Memory accesses resulting from the Clean operation use the MECID associated with the cache entry.

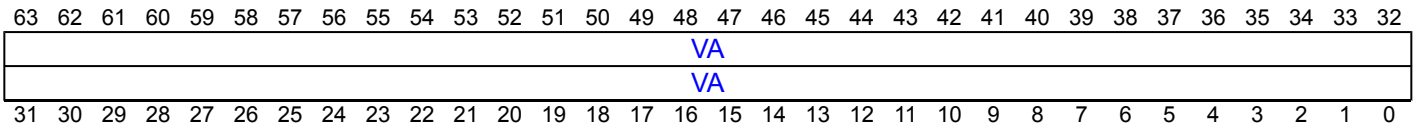
Configuration

This instruction is present only when FEAT_PoPS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to DC CIVAPS are UNDEFINED.

Attributes

DC CIVAPS is a 64-bit System instruction.

Field descriptions



VA, bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DC CIVAPS

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CIVAPS, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1111	0b001

```
if !(IsFeatureImplemented(FEAT_PoPS) && IsFeatureImplemented(FEAT_AA64)) then

DC CSW, Data or unified Cache line Clean by Set/Way

The DC CSW characteristics are:

Purpose

Clean data cache by set/way.

Configuration

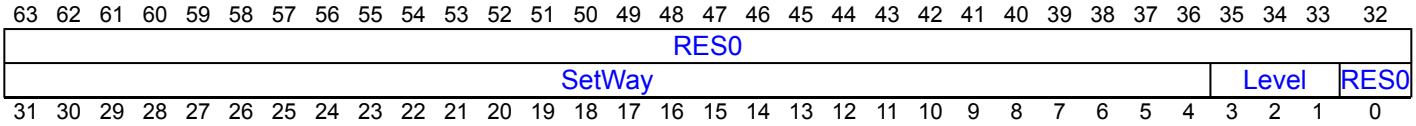
AArch64 System instruction DC CSW performs the same function as AArch32 System instruction DCCSW.

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DC CSW are UNDEFINED.

Attributes

DC CSW is a 64-bit System instruction.

Field descriptions



Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log_2(ASSOCIATIVITY), L = Log_2(LINELEN), B = (L + S), S = Log_2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing DC CSW

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
    - No cache lines.
    - A single arbitrary cache line.
    - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CSW, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1010	0b010

DC GVA, Data Cache set Allocation Tag by VA

The DC GVA characteristics are:

Purpose

Write a value to the Allocation Tags of a naturally aligned block of N bytes, where the size of N is identified in DCZID_EL0. The Allocation Tag used is determined by the input address.

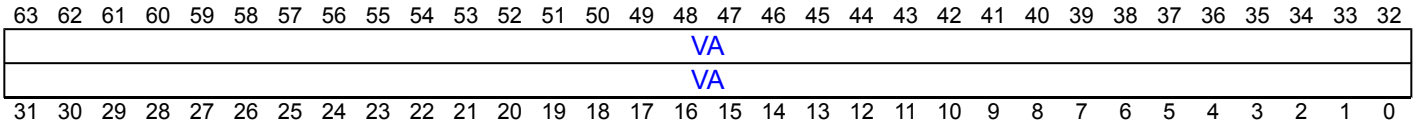
Configuration

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC GVA are UNDEFINED.

Attributes

DC GVA is a 64-bit System instruction.

Field descriptions



VA, bits [63:0]

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

Executing DC GVA

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous Data Abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is not set.

A DC GVA instruction to any type of Device memory is CONSTRAINED UNPREDICTABLE between:

- Not modifying Allocation tags at the specified addresses.
- Generating an Alignment Fault determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of stores to each Allocation Tag within the block being accessed, and so it:

- Generates a Permission fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC GVA, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0100	0b011

```

DC IGDSW, Invalidate of Data and Allocation Tags by Set/Way

The DC IGDSW characteristics are:

Purpose

Invalidate data and Allocation Tags in data cache by set/way.

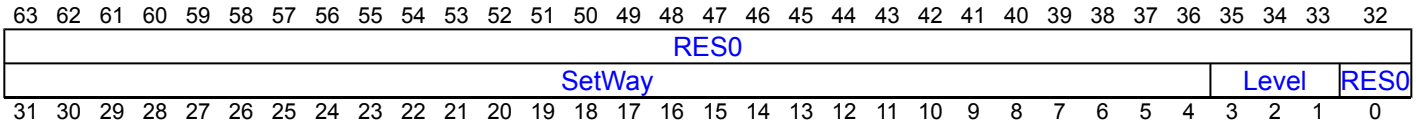
Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC IGDSW are UNDEFINED.

Attributes

DC IGDSW is a 64-bit System instruction.

Field descriptions



Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log_2(ASSOCIATIVITY), L = Log_2(LINELEN), B = (L + S), S = Log_2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing DC IGDSW

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:

- No cache lines.
- A single arbitrary cache line.
- Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC IGDSW, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0110	0b110

DC IGDVAC, Invalidate of Data and Allocation Tags by VA to PoC

The DC IGDVAC characteristics are:

Purpose

Invalidate data and Allocation Tags in data cache by address to Point of Coherency.

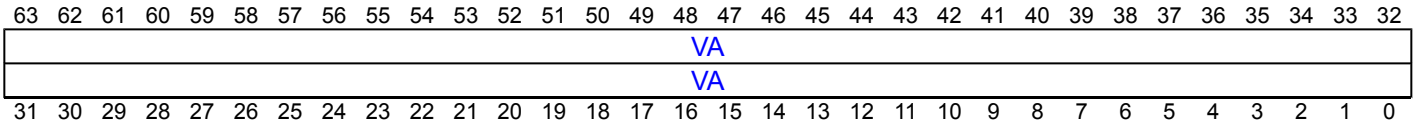
Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC IGDVAC are UNDEFINED.

Attributes

DC IGDVAC is a 64-bit System instruction.

Field descriptions



VA, bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DC IGDVAC

When the instruction is executed, it can generate a watchpoint, which is prioritized in the same way as other watchpoints. If a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 1.

This instruction requires write access permission to the VA, otherwise it generates a Permission fault, subject to the constraints described in 'MMU faults generated by cache maintenance operations'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC IGDVAC, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0110	0b101

DC ZVA, Data Cache Zero by VA

The DC ZVA characteristics are:

Purpose

Zero data cache by address. Zeroes a naturally aligned block of N bytes, where the size of N is identified in DCZID_EL0.

This instruction might have the poison-atomic property for IMPLEMENTATION DEFINED regions of physical memory.

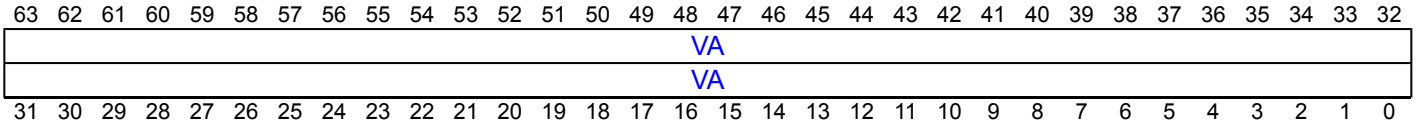
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DC ZVA are UNDEFINED.

Attributes

DC ZVA is a 64-bit System instruction.

Field descriptions



VA, bits [63:0]

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

Executing DC ZVA

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous Data Abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 0.

If the memory region being zeroed is any type of Device memory, this instruction generates an Alignment fault which is prioritized in the same way as other Alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of Stores to each byte within the block being accessed, and so it:

- Generates a Permission fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC ZVA, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0100	0b001

```

DCZID_EL0, Data Cache Zero ID Register

The DCZID_EL0 characteristics are:

Purpose

Indicates the block size that is written with byte values of 0 by the DC ZVA (Data Cache Zero by Address) System instruction.

If FEAT_MTE is implemented, this register also indicates the granularity at which the DC GVA and DC GZVA instructions write.

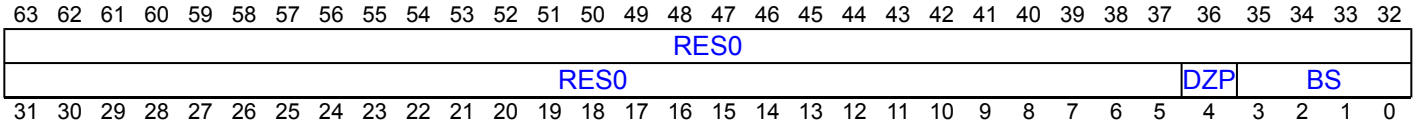
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DCZID_EL0 are UNDEFINED.

Attributes

DCZID_EL0 is a 64-bit register.

Field descriptions



Bits [63:5]

Reserved, RES0.

DZP, bit [4]

Data Zero Prohibited. This field indicates whether use of DC ZVA instructions is permitted or prohibited.

If FEAT_MTE is implemented, this field also indicates whether use of the DC GVA and DC GZVA instructions are permitted or prohibited.

DZP	Meaning
0b0	Instructions are permitted.
0b1	Instructions are prohibited.

The value read from this field is governed by the current Exception level and the values of the following fields:

- The Effective value of HCR_EL2.TDZ.
- When the Effective value of HCR_EL2.{E2H, TGE} != '11', SCTLR_EL1.DZE.
- When the Effective value of HCR_EL2.{E2H, TGE} == '11', SCTLR_EL2.DZE.

BS, bits [3:0]

Log_2 of the block size in words. The maximum size supported is 2KB, indicated by value 0b1001.

If FEAT_MTE2 is implemented, the minimum size supported is 16 bytes, indicated by value 0b0010.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing DCZID_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DCZID_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0000	0b0000	0b111

```
if !IsFeatureImplemented(FEAT_AA64) then
    UnimplementedIDRegister();
elsif PSTATE.EL == EL0 then
    if EL2Enabled() && !ELIsInHost(EL0) && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) ||
SCR_EL3.FGTEn == '1') && HFGRTR_EL2.DCZID_EL0 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = DCZID_EL0;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGRTR_EL2.DCZID_EL0 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = DCZID_EL0;
elsif PSTATE.EL == EL2 then
    X[t, 64] = DCZID_EL0;
elsif PSTATE.EL == EL3 then
    X[t, 64] = DCZID_EL0;
```

DISR_EL1, Deferred Interrupt Status Register

The DISR_EL1 characteristics are:

Purpose

Records that an SError exception has been consumed by an ESB instruction.

Configuration

AArch64 System register DISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DISR[31:0].

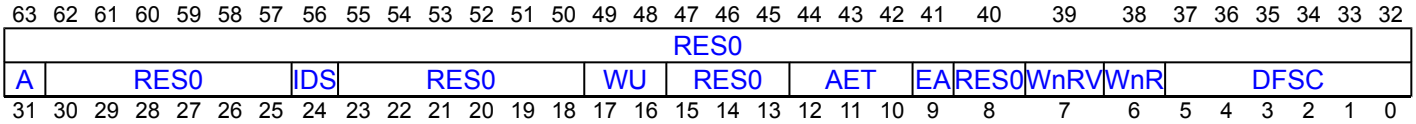
This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to DISR_EL1 are UNDEFINED.

Attributes

DISR_EL1 is a 64-bit register.

Field descriptions

When DISR_EL1.IDS == 0:



Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError exception. If the implementation does not include any sources of SError exception that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

Indicates the deferred SError exception type.

IDS	Meaning
0b0	Deferred error uses architecturally-defined format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:18]

Reserved, RES0.

WU, bits [17:16]

When FEAT_RASv2 is implemented:

Write update. See the description of ESR_ELx.WU for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:13]

Reserved, RES0.

AET, bits [12:10]

Asynchronous Error Type. See the description of ESR_ELx.AET for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort Type. See the description of ESR_ELx.EA for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

WnRV, bit [7]

When FEAT_RASv2 is implemented:

Write-not-Read Valid. See the description of ESR_ELx.WnRV for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WnR, bit [6]

When FEAT_RASv2 is implemented:

Write-not-Read. See the description of ESR_ELx.WnR for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

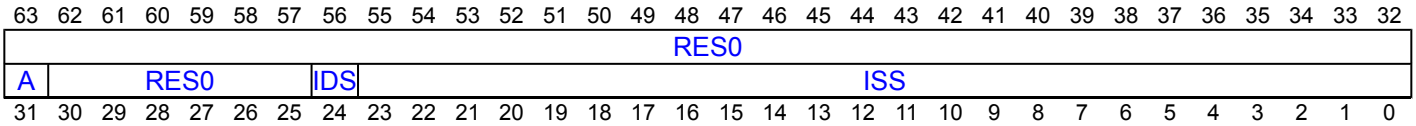
DFSC, bits [5:0]

Fault Status Code. See the description of ESR_ELx.DFSC for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When DISR_EL1.IDS == 1:



Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError exception. If the implementation does not include any sources of SError exception that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

Indicates the deferred SError exception type.

IDS	Meaning
0b1	Deferred error uses IMPLEMENTATION DEFINED format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

IMPLEMENTATION DEFINED syndrome. See the description of ESR_ELx[23:0] for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DISR_EL1

An indirect write to DISR_EL1 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR_EL1 occurring in program order after the ESB instruction.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DISR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0001	0b001

DIT, Data Independent Timing

The DIT characteristics are:

Purpose

Allows access to the Data Independent Timing bit.

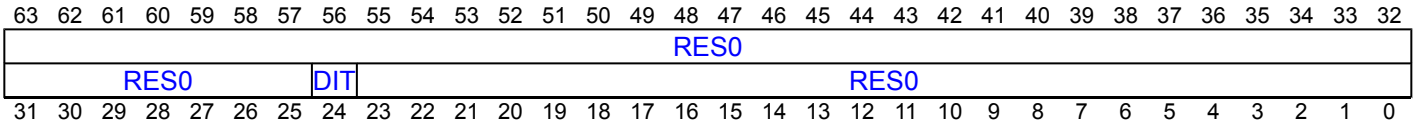
Configuration

This register is present only when FEAT_DIT is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to DIT are UNDEFINED.

Attributes

DIT is a 64-bit register.

Field descriptions



Bits [63:25]

Reserved, RES0.

DIT, bit [24]

Data Independent Timing.

DIT	Meaning
0b0	The architecture makes no statement about the timing properties of any instructions.
0b1	The architecture requires that: • The timing of every load and store instruction is insensitive to the value of the data being loaded or stored. • For certain data processing instructions, the instruction takes a time which is independent of: ◦ The values of the data supplied in any of its registers. ◦ The values of the NZCV flags. • For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on: ◦ The values of the data supplied in any of its registers. ◦ The values of the NZCV flags.

The instructions affected by this bit are:

- Branches, Exception Generating and System instructions: CFINV, and NOP.
- Data Processing -- Immediate:
  - Add/subtract (immediate): ADD, ADDS, SUB, and SUBS.
  - Bitfield: BFM, SBFM, and UBFM.
  - Extract: EXTR.
  - Logical (immediate): AND, ANDS, EOR, and ORR.
  - Min/max (immediate): SMAX, SMIN, UMAX, and UMIN.
  - Move wide (immediate): MOVK, MOVN, and MOVZ.
- Data Processing -- Register:
  - Add/subtract (extended register): ADD, ADDS, SUB, and SUBS.

    - Add/subtract (shifted register): `ADD`, `ADDS`, `SUB`, and `SUBS`.
    - Add/subtract (with carry): `ADC`, `ADCS`, `SBC`, and `SBCS`.
    - Conditional compare (immediate): `CCMN`, and `CCMP`.
    - Conditional compare (register): `CCMN`, and `CCMP`.
    - Conditional select: `CSEL`, `CSINC`, `CSINV`, and `CSNEG`.
    - Data-processing (1 source): `ABS`, `CLS`, `CLZ`, `CNT`, `CTZ`, `RBIT`, `REV16`, `REV32`, and `REV`.
    - Data-processing (2 source): `ASRV`, `CRC32B`, `CRC32CB`, `CRC32CH`, `CRC32CW`, `CRC32CX`, `CRC32H`, `CRC32W`, `CRC32X`, `LSLV`, `LSRV`, `RORV`, `SMAX`, `SMIN`, `UMAX`, and `UMIN`.
    - Data-processing (3 source): `MADD`, `MSUB`, `SMADDL`, `SMSUBL`, `SMULH`, `UMADDL`, `UMSUBL`, and `UMULH`.
    - Evaluate into flags: `SETF16`, and `SETF8`.
    - Logical (shifted register): `AND`, `ANDS`, `BIC`, `BICS`, `EON`, `EOR`, `ORN`, and `ORR`.
    - Rotate right into flags: `RMIF`.
- Data Processing -- Scalar Floating-Point and Advanced SIMD:
    - Advanced SIMD across lanes: `ADDV`, `SADDLV`, `SMAXV`, `SMINV`, `UADDLV`, `UMAXV`, and `UMINV`.
    - Advanced SIMD copy: `DUP`, `INS`, `SMOV`, and `UMOV`.
    - Advanced SIMD extract: `EXT`.
    - Advanced SIMD modified immediate: `BIC`, `MOVI`, `MVNI`, and `ORR`.
    - Advanced SIMD permute: `TRN1`, `TRN2`, `UZP1`, `UZP2`, `ZIP1`, and `ZIP2`.
    - Advanced SIMD scalar copy: `DUP`.
    - Advanced SIMD scalar pairwise: `ADDP`.
    - Advanced SIMD scalar shift by immediate: Advanced SIMD scalar shift by immediate: `SHL`, `SLI`, `SRSHR`, `SRI`, `SRSRA`, `SSHR`, `SSRA`, `URSHR`, `URSRA`, `USHR`, and `USRA`.
    - Advanced SIMD scalar three same: `ADD`, `CMEQ`, `CMGE`, `CMGT`, `CMHI`, `CMHS`, `CMTST`, `SQDMULH`, `SQRDMULH`, `SSHL`, `SUB`, and `USHL`.
    - Advanced SIMD scalar three same extra: `SQRDMLAH`.
    - Advanced SIMD scalar two-register miscellaneous: `ABS`, `CMEQ`, `CMGE`, `CMGT`, `CMLE`, `CMLT`, and `NEG`.
    - Advanced SIMD scalar x indexed element: `SQDMULH`, `SQRDMLAH`, and `SQRDMULH`.
    - Advanced SIMD shift by immediate: `RSHRN2`, `RSHRN`, `SHL`, `SHRN2`, `SHRN`, `SLI`, `SRI`, `SSHLL2`, `SSHLL`, `SSHR`, `SSRA`, `USHLL2`, `USHLL`, `USHR`, and `USRA`.
    - Advanced SIMD table lookup: `LUTI2`, `LUTI4`, `TBL`, and `TBX`.
    - Advanced SIMD three different: `ADDHN2`, `ADDHN`, `PMULL2`, `PMULL`, `RADDHN2`, `RADDHN`, `RSUBHN2`, `RSUBHN`, `SABAL2`, `SABAL`, `SABDL2`, `SABDL`, `SADDL2`, `SADDL`, `SADDW2`, `SADDW`, `SMLAL2`, `SMLAL`, `SMLSL2`, `SMLSL`, `SMULL2`, `SMULL`, `SSUBL2`, `SSUBL`, `SSUBW2`, `SSUBW`, `SUBHN2`, `SUBHN`, `UABAL2`, `UABAL`, `UABDL2`, `UABDL`, `UADDL2`, `UADDL`, `UADDW2`, `UADDW`, `UMLAL2`, `UMLAL`, `UMLSL2`, `UMLSL`, `UMULL2`, `UMULL`, `USUBL2`, `USUBL`, `USUBW2`, and `USUBW`.
    - Advanced SIMD three same: `ADD`, `ADDP`, `AND`, `BIC`, `BIF`, `BIT`, `BSL`, `CMEQ`, `CMGE`, `CMGT`, `CMHI`, `CMHS`, `CMTST`, `EOR`, `MLA`, `MLS`, `MUL`, `ORN`, `ORR`, `PMUL`, `SABA`, `SABD`, `SHADD`, `SHSUB`, `SMAX`, `SMAXP`, `SMIN`, `SMINP`, `SQDMULH`, `SQRDMULH`, `SSHL`, `SUB`, `UABA`, `UABD`, `UHADD`, `UHSUB`, `UMAX`, `UMAXP`, `UMIN`, `UMINP`, and `USHL`.
    - Advanced SIMD three-register extension: `SDOT`, `SMMLA`, `SQRDMLAH`, `UDOT`, `UMMLA`, `USDOT`, and `USMMLA`.
    - Advanced SIMD two-register miscellaneous: `ABS`, `CLS`, `CLZ`, `CMEQ`, `CMGE`, `CMGT`, `CMLE`, `CMLT`, `CNT`, `NEG`, `NOT`, `RBIT`, `REV16`, `REV32`, `REV64`, `SADALP`, `SADDLP`, `SHLL2`, `SHLL`, `UADALP`, `UADDLP`, `XTN2`, and `XTN`.
    - Advanced SIMD vector x indexed element: `MLA`, `MLS`, `MUL`, `SDOT`, `SMLAL2`, `SMLAL`, `SMLSL2`, `SMLSL`, `SMULL2`, `SMULL`, `SQDMULH`, `SQRDMLAH`, `SQRDMULH`, `SUDOT`, `UDOT`, `UMLAL2`, `UMLAL`, `UMLSL2`, `UMLSL`, `UMULL2`, `UMULL`, and `USDOT`.
    - Cryptographic AES: `AESD`, `AESE`, `AESIMC`, and `AESMC`.
    - Cryptographic four-register: `BCAX`, `EOR3`, and `SM3SS1`.
    - Cryptographic three-register SHA: `SHA1C`, `SHA1M`, `SHA1P`, `SHA1SU0`, `SHA256H2`, `SHA256H`, and `SHA256SU1`.
    - Cryptographic three-register SHA 512: `RAX1`, `SHA512H2`, `SHA512H`, `SHA512SU1`, `SM3PARTW1`, `SM3PARTW2`, and `SM4EKEY`.
    - Cryptographic three-register, imm2: `SM3TT1A`, `SM3TT1B`, `SM3TT2A`, and `SM3TT2B`.
    - Cryptographic three-register, imm6: `XAR`.
    - Cryptographic two-register SHA: `SHA1H`, `SHA1SU1`, and `SHA256SU0`.
    - Cryptographic two-register SHA 512: `SHA512SU0`, and `SM4E`.
    - Floating-point conditional select: `FCSEL`.
- Loads and Stores:
    - 128-bit atomic memory operations: `LDCLRP`, `LDCLRPA`, `LDCLRPAL`, `LDCLRPL`, `LDSETP`, `LDSETPA`, `LDSETPAL`, `LDSETPL`, `SWPP`, `SWPPA`, `SWPPAL`, and `SWPPL`.
    - Advanced SIMD load/store multiple structures: `LD1`, `LD2`, `LD3`, `LD4`, `ST1`, `ST2`, `ST3`, and `ST4`.
    - Advanced SIMD load/store multiple structures (post-indexed): `LD1`, `LD2`, `LD3`, `LD4`, `ST1`, `ST2`, `ST3`, and `ST4`.
    - Advanced SIMD load/store single structure: `LD1`, `LD1R`, `LD2`, `LD2R`, `LD3`, `LD3R`, `LD4`, `LD4R`, `LDAP1`, `ST1`, `ST2`, `ST3`, `ST4`, and `STL1`.
    - Advanced SIMD load/store single structure (post-indexed): `LD1`, `LD1R`, `LD2`, `LD2R`, `LD3`, `LD3R`, `LD4`, `LD4R`, `ST1`, `ST2`, `ST3`, and `ST4`.
    - Atomic memory operations: `LDADD`, `LDADDA`, `LDADDAB`, `LDADDAH`, `LDADDAL`, `LDADDALB`, `LDADDALH`, `LDADDB`, `LDADDH`, `LDADDL`, `LDADDLB`, `LDADDLH`, `LDAPR`, `LDAPRB`, `LDAPRH`, `LDCLR`, `LDCLRA`, `LDCLRAB`, `LDCLRAH`, `LDCLRAL`, `LDCLRALB`, `LDCLRALH`, `LDCLRB`, `LDCLRH`, `LDCLRL`, `LDCLRLB`, `LDCLRLH`, `LDEOR`, `LDEORA`, `LDEORAB`, `LDEORAH`, `LDEORAL`, `LDEORALB`, `LDEORALH`, `LDEORB`, `LDEORH`, `LDEORL`, `LDEORLB`, `LDEORLH`, `LDSET`, `LDSETA`,

LDSETAB, LDSETAH, LDSETAL, LDSETALB, LDSETALH, LDSETB, LDSETH, LDSETL, LDSETLB, LDSETLH, LDSMAX, LDSMAXA, LDSMAXAB, LDSMAXAH, LDSMAXAL, LDSMAXALB, LDSMAXALH, LDSMAXB, LDSMAXH, LDSMAXL, LDSMAXLB, LDSMAXLH, LDSMIN, LDSMINA, LDSMINAB, LDSMINAH, LDSMINAL, LDSMINALB, LDSMINALH, LDSMINB, LDSMINH, LDSMINL, LDSMINLB, LDSMINLH, LDUMAX, LDUMAXA, LDUMAXAB, LDUMAXAH, LDUMAXAL, LDUMAXALB, LDUMAXALH, LDUMAXB, LDUMAXH, LDUMAXL, LDUMAXLB, LDUMAXLH, LDUMIN, LDUMINA, LDUMINAB, LDUMINAH, LDUMINAL, LDUMINALB, LDUMINALH, LDUMINB, LDUMINH, LDUMINL, LDUMINLB, and LDUMINLH.
    - LDAPR/STLR (SIMD&FP): LDAPUR, and STLUR.
    - LDAPR/STLR (unscaled immediate): LDAPUR, LDAPURB, LDAPURH, LDAPURSB, LDAPURSH, LDAPURSW, STLUR, STLURB, and STLURH.
    - LDAPR/STLR (writeback): LDAPR, and STLR.
    - LDIAPP/STILP: LDIAPP, and STILP.
    - Load register (literal): LDR, and LDRSW.
    - Load/store exclusive pair: LDAXP, LDXP, STLXP, and STXP.
    - Load/store exclusive register: LDAXR, LDAXRB, LDAXRH, LDXR, LDXRB, LDXRH, STLXR, STLXRB, STLXRH, STXR, STXRB and STXRH.
    - Load/store no-allocate pair (offset): LDNP, and STNP.
    - Load/store ordered: LDAR, LDARB, LDARH, LDLAR, LDLARB, LDLARH, STLLR, STLLRB, STLLRH, STLR, STLRB, and STLRH.
    - Load/store register (immediate post-indexed): LDR, LDRB, LDRH, LDRSB, LDRSH, LDRSW, STR, STRB, and STRH.
    - Load/store register (immediate pre-indexed): LDR, LDRB, LDRH, LDRSB, LDRSH, LDRSW, STR, STRB, and STRH.
    - Load/store register (pac): LDRAA, and LDRAB.
    - Load/store register (register offset): LDR, LDRB, LDRH, LDRSB, LDRSH, LDRSW, STR, STRB, and STRH.
    - Load/store register (unprivileged): LDTR, LDTRB, LDTRH, LDTRSB, LDTRSH, LDTRSW, STTR, STTRB, and STTRH.
    - Load/store register (unscaled immediate): LDUR, LDURB, LDURH, LDURSB, LDURSH, LDURSW, STUR, STURB, and STURH.
    - Load/store register (unsigned immediate): LDR, LDRB, LDRH, LDRSB, LDRSH, LDRSW, STR, STRB, and STRH.
    - Load/store register pair (offset): LDP, LDPSW, and STP.
    - Load/store register pair (post-indexed): LDP, LDPSW, and STP.
    - Load/store register pair (pre-indexed): LDP, LDPSW, and STP.
- SME encodings:
    - SME Add Vector to Array: ADDHA, and ADDVA.
    - SME Integer Outer Product - 32 bit: SMOPA, SMOPS, SUMOPA, SUMOPS, UMOPA, UMOPS, USMOPA, and USMOPS.
    - SME Memory: LD1B, LD1D, LD1H, LD1Q, LD1W, LDR, ST1B, ST1D, ST1H, ST1Q, ST1W, and STR.
    - SME Move from Array: MOVA, and MOVAZ.
    - SME Move into Array: MOVA.
    - SME Outer Product - 64 bit:
        - SME Int16 outer product: SMOPA, SMOPS, SUMOPA, SUMOPS, UMOPA, UMOPS, USMOPA, and USMOPS.
    - SME zero array: ZERO.
    - SME2 Expand Lookup Table (Contiguous): LUTI2, and LUTI4.
    - SME2 Expand Lookup Table (Non-contiguous): LUTI2, and LUTI4.
    - SME2 Move Lookup Table: MOVT.
    - SME2 Multi-vector - Indexed (Four registers):
        - SME2 multi-vec indexed long MLA four sources: SMLAL, SMLSL, UMLAL, and UMLSL.
        - SME2 multi-vec indexed long long MLA four sources 32-bit: SMLALL, SMLSLL, SUMLALL, UMLALL, UMLSLL, and USMLALL.
        - SME2 multi-vec indexed long long MLA four sources 64-bit: SMLALL, SMLSLL, UMLALL, and UMLSLL.
        - SME2 multi-vec ternary indexed four registers 32-bit: SDOT, SUDOT, SUVDOT, SVDOT, UDOT, USDOT, USVDOT, and UVDOT.
        - SME2 multi-vec ternary indexed four registers 64-bit: SDOT, SVDOT, UDOT, and UVDOT.
    - SME2 Multi-vector - Indexed (One register):
        - SME2 multi-vec indexed long MLA one source: SMLAL, SMLSL, UMLAL, and UMLSL.
        - SME2 multi-vec indexed long long MLA one source 32-bit: SMLALL, SMLSLL, SUMLALL, UMLALL, UMLSLL, and USMLALL.
        - SME2 multi-vec indexed long long MLA one source 64-bit: SMLALL, SMLSLL, UMLALL, and UMLSLL.
    - SME2 Multi-vector - Indexed (Two registers):
        - SME2 multi-vec indexed long MLA two sources: SMLAL, SMLSL, UMLAL, and UMLSL.
        - SME2 multi-vec indexed long long MLA two sources 32-bit: SMLALL, SMLSLL, SUMLALL, UMLALL, UMLSLL, and USMLALL.
        - SME2 multi-vec indexed long long MLA two sources 64-bit: SMLALL, SMLSLL, UMLALL, and UMLSLL.
        - SME2 multi-vec ternary indexed two registers 32-bit: SDOT, SUDOT, SVDOT, UDOT, USDOT, and UVDOT.
        - SME2 multi-vec ternary indexed two registers 64-bit: SDOT, and UDOT.
    - SME2 Multi-vector - Memory (Contiguous): LD1B, LD1D, LD1H, LD1W, LDNT1B, LDNT1D, LDNT1H, LDNT1W, ST1B, ST1D, ST1H, ST1W, STNT1B, STNT1D, STNT1H, and STNT1W.
    - SME2 Multi-vector - Memory (Strided): LD1B, LD1D, LD1H, LD1W, LDNT1B, LDNT1D, LDNT1H, LDNT1W, ST1B, ST1D, ST1H, ST1W, STNT1B, STNT1D, STNT1H, and STNT1W.

    - SME2 Multi-vector - Multiple Array Vectors (Four registers):
        - SME2 multiple vectors binary int four registers: `ADD`, and `SUB`.
        - SME2 multiple vectors four-way dot product four registers: `SDOT`, and `UDOT`.
        - SME2 multiple vectors long MLA four sources: `SMLAL`, `SMLSL`, `UMLAL`, and `UMLSL`.
        - SME2 multiple vectors long long MLA four sources: `SMLALL`, `SMLSLL`, `UMLALL`, `UMLSLL`, and `USMLALL`.
        - SME2 multiple vectors mixed dot product four registers: `USDOT`.
        - SME2 multiple vectors ternary int four registers: `ADD`, and `SUB`.
        - SME2 multiple vectors two-way dot product four registers: `SDOT`, and `UDOT`.
    - SME2 Multi-vector - Multiple Array Vectors (Two registers):
        - SME2 multiple vectors binary int two registers: `ADD`, and `SUB`.
        - SME2 multiple vectors four-way dot product two registers: `SDOT`, and `UDOT`.
        - SME2 multiple vectors long MLA two sources: `SMLAL`, `SMLSL`, `UMLAL`, and `UMLSL`.
        - SME2 multiple vectors long long MLA two sources: `SMLALL`, `SMLSLL`, `UMLALL`, `UMLSLL`, and `USMLALL`.
        - SME2 multiple vectors mixed dot product two registers: `USDOT`.
        - SME2 multiple vectors ternary int two registers: `ADD`, and `SUB`.
        - SME2 multiple vectors two-way dot product two registers: `SDOT`, and `UDOT`.
    - SME2 Multi-vector - Multiple Vectors SVE Destructive (Four registers):
        - SME2 multiple vectors int min/max four registers: `SMAX`, `SMIN`, `UMAX`, and `UMIN`.
    - SME2 Multi-vector - Multiple Vectors SVE Destructive (Two registers):
        - SME2 multiple vectors int min/max two registers: `SMAX`, `SMIN`, `UMAX`, and `UMIN`.
    - SME2 Multi-vector - Multiple Vectors SVE Saturating Multiply (Four registers): `SQDMULH`.
    - SME2 Multi-vector - Multiple Vectors SVE Saturating Multiply (Two registers): `SQDMULH`.
    - SME2 Multi-vector - Multiple and Single Array Vectors (Four registers):
        - SME2 single-multi four-way dot product four registers: `SDOT`, and `UDOT`.
        - SME2 single-multi long MLA four sources: `SMLAL`, `SMLSL`, `UMLAL`, and `UMLSL`.
        - SME2 single-multi long long MLA four sources: `SMLALL`, `SMLSLL`, `SUMLALL`, `UMLALL`, `UMLSLL`, and `USMLALL`.
        - SME2 single-multi mixed dot product four registers: `SUDOT`, and `USDOT`.
        - SME2 single-multi ternary int four registers: `ADD`, and `SUB`.
        - SME2 single-multi two-way dot product four registers: `SDOT`, and `UDOT`.
    - SME2 Multi-vector - Multiple and Single Array Vectors (Two registers):
        - SME2 multiple and single vector long MLA one source: `SMLAL`, `SMLSL`, `UMLAL`, and `UMLSL`.
        - SME2 multiple and single vector long long FMA one source: `SMLALL`, `SMLSLL`, `UMLALL`, `UMLSLL`, and `USMLALL`.
        - SME2 single-multi four-way dot product two registers: `SDOT`, and `UDOT`.
        - SME2 single-multi long MLA two sources: `SMLAL`, `SMLSL`, `UMLAL`, and `UMLSL`.
        - SME2 single-multi long long MLA two sources: `SMLALL`, `SMLSLL`, `SUMLALL`, `UMLALL`, `UMLSLL`, and `USMLALL`.
        - SME2 single-multi mixed dot product two registers: `SUDOT`, and `USDOT`.
        - SME2 single-multi ternary int two registers: `ADD`, and `SUB`.
        - SME2 single-multi two-way dot product two registers: `SDOT`, and `UDOT`.
    - SME2 Multi-vector - Multiple and Single SVE Destructive (Four registers):
        - SME2 single-multi add four registers: `ADD`.
        - SME2 single-multi int min/max four registers: `SMAX`, `SMIN`, `UMAX`, and `UMIN`.
        - SME2 single-multi signed saturating doubling multiply high four registers: `SQDMULH`.
    - SME2 Multi-vector - Multiple and Single SVE Destructive (Two registers):
        - SME2 single-multi add two registers: `ADD`.
        - SME2 single-multi int min/max two registers: `SMAX`, `SMIN`, `UMAX`, and `UMIN`.
        - SME2 single-multi signed saturating doubling multiply high two registers: `SQDMULH`.
    - SME2 Multi-vector - SVE Constructive Binary:
        - SME2 multi-vec CLAMP four registers: `SCLAMP`, and `UCLAMP`.
        - SME2 multi-vec CLAMP two registers: `SCLAMP`, and `UCLAMP`.
        - SME2 multi-vec ZIP two registers: `UZP`, and `ZIP`.
        - SME2 multi-vec quadwords ZIP two registers: `UZP`, and `ZIP`.
    - SME2 Multi-vector - SVE Constructive Unary:
        - SME2 multi-vec ZIP four registers: `UZP`, and `ZIP`.
        - SME2 multi-vec quadwords ZIP four registers: `UZP`, and `ZIP`.
        - SME2 multi-vec unpack four registers: `SUNPK`, and `UUNPK`.
        - SME2 multi-vec unpack two registers: `SUNPK`, and `UUNPK`.
    - SME2 Multi-vector - SVE Select: `SEL`.
    - SME2 Multiple Zero: `ZERO`.
    - SME2 Outer Product - Misc:
        - SME2 32-bit binary outer product: `BMOPA`, and `BMOPS`.
    - SME2 zero lookup table: `ZERO`.
- SVE encodings:
    - SVE Address Generation: `ADR`.
    - SVE Bitwise Immediate: `AND`, `DUPM`, `EOR`, and `ORR`.

- SVE Bitwise Logical - Unpredicated: AND, BCAX, BIC, BSL1N, BSL2N, BSL, EOR3, EOR, NBSL, ORR, and XAR.
- SVE Bitwise Shift - Predicated:
  - SVE bitwise shift by immediate (predicated): ASR, ASRD, LSL, LSR, SRSHR, and URSHR.
  - SVE bitwise shift by vector (predicated): ASR, ASRR, LSL, LSLR, LSR, and LSRR.
  - SVE bitwise shift by wide elements (predicated): ASR, LSL, and LSR.
- SVE Bitwise Shift - Unpredicated: ASR, LSL, and LSR.
- SVE Element Count:
  - SVE element count: CNTB, CNTD, CNTH, and CNTW.
  - SVE inc/dec register by element count: DECB, DECD, DECH, DECW, INCB, INCD, INCH, and INCW.
  - SVE inc/dec vector by element count: DECD, DECH, DECW, INCD, INCH, and INCW.
- SVE Index Generation: INDEX.
- SVE Integer Arithmetic - Unpredicated:
  - SVE integer add/subtract vectors (unpredicated): ADD, and SUB.
- SVE Integer Binary Arithmetic - Predicated:
  - SVE bitwise logical operations (predicated): AND, BIC, EOR, and ORR.
  - SVE integer add/subtract vectors (predicated): ADD, SUB, and SUBR.
  - SVE integer min/max/difference (predicated): SABD, SMAX, SMIN, UABD, UMAX, and UMIN.
  - SVE integer multiply vectors (predicated): MUL, SMULH, and UMULH.
- SVE Integer Compare - Scalars: CTERMEQ, and CTERMNE.
- SVE Integer Compare - Signed Immediate: CMP<CC>.
- SVE Integer Compare - Unsigned Immediate: CMP<CC>.
- SVE Integer Compare - Vectors: CMP<CC>.
- SVE Integer Misc - Unpredicated: MOVPRFX.
- SVE Integer Multiply-Add - Predicated: MAD, MLA, MLS, and MSB.
- SVE Integer Multiply-Add - Unpredicated:
  - SVE integer dot product (unpredicated): SDOT, and UDOT.
  - SVE mixed sign dot product: USDOT.
  - SVE2 complex integer multiply-add: CMLA.
  - SVE2 integer multiply-add long: SMLALB, SMLALT, SMLSLB, SMLSLT, UMLALB, UMLALT, UMLSLB, and UMLSLT.
  - SVE2 saturating multiply-add high: SQRDMLAH.
- SVE Integer Reduction: ADDQV, ANDQV, ANDV, EORQV, EORV, MOVPRFX, ORQV, ORV, SADDV, SMAXQV, SMAXV, SMINQV, SMINV, UADDV, UMAXQV, UMAXV, UMINQV, and UMINV.
- SVE Integer Unary Arithmetic - Predicated:
  - SVE bitwise unary operations (predicated): CLS, CLZ, CNOT, CNT, and NOT.
  - SVE integer unary operations (predicated): ABS, NEG, SXTB, SXTH, SXTW, UXTB, UXTH, and UXTW.
- SVE Integer Wide Immediate - Predicated:
  - SVE copy integer immediate (predicated): CPY.
- SVE Integer Wide Immediate - Unpredicated:
  - SVE broadcast integer immediate (unpredicated): DUP.
  - SVE integer add/subtract immediate (unpredicated): ADD, SUB, and SUBR.
  - SVE integer min/max immediate (unpredicated): SMAX, SMIN, UMAX, and UMIN.
  - SVE integer multiply immediate (unpredicated): MUL.
- SVE Memory - 32-bit Gather and Unsized Contiguous:
  - SVE 32-bit gather load (scalar plus 32-bit unscaled offsets): LD1B, LD1H, LD1SB, LD1SH, and LD1W.
  - SVE 32-bit gather load (vector plus immediate): LD1B, LD1H, LD1SB, LD1SH, and LD1W.
  - SVE 32-bit gather load halfwords (scalar plus 32-bit scaled offsets): LD1H, and LD1SH.
  - SVE 32-bit gather load words (scalar plus 32-bit scaled offsets): LD1W.
  - SVE load and broadcast element: LD1RB, LD1RD, LD1RH, LD1RSB, LD1RSH, LD1RSW, and LD1RW.
  - SVE load predicate register: LDR.
  - SVE load vector register: LDR.
  - SVE2 32-bit gather non-temporal load (vector plus scalar): LDNT1B, LDNT1H, LDNT1SB, LDNT1SH, and LDNT1W.
- SVE Memory - 64-bit Gather:
  - SVE 64-bit gather load (scalar plus 32-bit unpacked scaled offsets): LD1D, LD1H, LD1SH, LD1SW, and LD1W.
  - SVE 64-bit gather load (scalar plus 64-bit scaled offsets): LD1D, LD1H, LD1SH, LD1SW, and LD1W.
  - SVE 64-bit gather load (scalar plus 64-bit unscaled offsets): LD1B, LD1D, LD1H, LD1SB, LD1SH, LD1SW, and LD1W.
  - SVE 64-bit gather load (scalar plus unpacked 32-bit unscaled offsets): LD1B, LD1D, LD1H, LD1SB, LD1SH, LD1SW, and LD1W.
  - SVE 64-bit gather load (vector plus immediate): LD1B, LD1D, LD1H, LD1SB, LD1SH, LD1SW, and LD1W.
  - SVE2 128-bit gather load (vector plus scalar): LD1Q.
  - SVE2 64-bit gather non-temporal load (vector plus scalar): LDNT1B, LDNT1D, LDNT1H, LDNT1SB, LDNT1SH, LDNT1SW, and LDNT1W.
- SVE Memory - Contiguous Load:
  - SVE contiguous load (quadwords, scalar plus immediate): LD1D, and LD1W.
  - SVE contiguous load (quadwords, scalar plus scalar): LD1D, and LD1W.

        - SVE contiguous load (scalar plus immediate): LD1B, LD1D, LD1H, LD1SB, LD1SH, LD1SW, and LD1W.
        - SVE contiguous load (scalar plus scalar): LD1B, LD1D, LD1H, LD1SB, LD1SH, LD1SW, and LD1W.
        - SVE contiguous non-temporal load (scalar plus immediate): LDNT1B, LDNT1D, LDNT1H, and LDNT1W.
        - SVE contiguous non-temporal load (scalar plus scalar): LDNT1B, LDNT1D, LDNT1H, and LDNT1W.
        - SVE load and broadcast quadword (scalar plus immediate): LD1ROB, LD1ROD, LD1ROH, LD1ROW, LD1RQB, LD1RQD, LD1RQH, and LD1RQW.
        - SVE load and broadcast quadword (scalar plus scalar): LD1ROB, LD1ROD, LD1ROH, LD1ROW, LD1RQB, LD1RQD, LD1RQH, and LD1RQW.
        - SVE load multiple structures (quadwords, scalar plus immediate): LD2Q, LD3Q, and LD4Q.
        - SVE load multiple structures (quadwords, scalar plus scalar): LD2Q, LD3Q, and LD4Q.
        - SVE load multiple structures (scalar plus immediate): LD2B, LD2D, LD2H, LD2W, LD3B, LD3D, LD3H, LD3W, LD4B, LD4D, LD4H, and LD4W.
        - SVE load multiple structures (scalar plus scalar): LD2B, LD2D, LD2H, LD2W, LD3B, LD3D, LD3H, LD3W, LD4B, LD4D, LD4H, and LD4W.
    - SVE Memory - Contiguous Store and Unsized Contiguous: ST1B, ST1D, ST1H, ST1W, ST2Q, ST3Q, ST4Q, and STR.
    - SVE Memory - Contiguous Store with Immediate Offset: ST1B, ST1D, ST1H, ST1W, ST2B, ST2D, ST2H, ST2W, ST3B, ST3D, ST3H, ST3W, ST4B, ST4D, ST4H, ST4W, STNT1B, STNT1D, STNT1H, and STNT1W.
    - SVE Memory - Non-temporal and Multi-register Contiguous Store: ST2B, ST2D, ST2H, ST2W, ST3B, ST3D, ST3H, ST3W, ST4B, ST4D, ST4H, ST4W, STNT1B, STNT1D, STNT1H, and STNT1W.
    - SVE Memory - Non-temporal and Quadword Scatter Store: ST1Q, STNT1B, STNT1D, STNT1H, and STNT1W.
    - SVE Memory - Scatter: ST1B, ST1D, ST1H, and ST1W.
    - SVE Memory - Scatter with Optional Sign Extend: ST1B, ST1D, ST1H, and ST1W.
    - SVE Misc: BDEP, BEXT, BGRP, EORBT, EORTB, SADDLBT, SMMLA, SSHLLB, SSHLLT, SSUBLBT, SSUBLTB, UMMLA, USHLLB, USHLLT, and USMMLA.
    - SVE Multiply - Indexed:
        - SVE integer dot product (indexed): SDOT, and UDOT.
        - SVE mixed sign dot product (indexed): SUDOT, and USDOT.
        - SVE2 complex integer multiply-add (indexed): CMLA.
        - SVE2 integer multiply (indexed): MUL.
        - SVE2 integer multiply long (indexed): SMULLB, SMULLT, UMULLB, and UMULLT.
        - SVE2 integer multiply-add (indexed): MLA, and MLS.
        - SVE2 integer multiply-add long (indexed): SMLALB, SMLALT, SMLSLB, SMLSLT, UMLALB, UMLALT, UMLSLB, and UMLSLT.
        - SVE2 saturating multiply high (indexed): SQDMULH, and SQRDMULH.
        - SVE2 saturating multiply-add high (indexed): SQRDMLAH.
    - SVE Permute Predicate:
        - SVE permute predicate elements: TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2.
        - SVE reverse predicate elements: REV.
    - SVE Permute Vector - Extract: EXT.
    - SVE Permute Vector - Indexed DUP: DUP.
    - SVE Permute Vector - Interleaving: TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2.
    - SVE Permute Vector - One Source Quadwords: DUPQ, and EXTQ.
    - SVE Permute Vector - Predicated:
        - SVE copy SIMD&FP scalar register to vector (predicated): CPY.
        - SVE copy general register to vector (predicated): CPY.
        - SVE reverse doublewords: REVD.
        - SVE reverse within elements: RBIT, REVB, REVH, and REVW.
    - SVE Permute Vector - Segments: TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2.
    - SVE Permute Vector - TBXQ: TBXQ.
    - SVE Permute Vector - Three Sources TBL: TBL, and TBX.
    - SVE Permute Vector - Two Sources Quadwords: TBLQ, UZPQ1, UZPQ2, ZIPQ1, and ZIPQ2.
    - SVE Permute Vector - Two Sources TBL: TBL.
    - SVE Permute Vector - Unpredicated:
        - SVE broadcast general register: DUP.
        - SVE insert SIMD&FP scalar register: INSR.
        - SVE insert general register: INSR.
        - SVE reverse vector elements: REV.
        - SVE unpack vector elements: SUNPKHI, SUNPKLO, UUNPKHI, and UUNPKLO.
    - SVE Predicate Logical Operations: AND, ANDS, BIC, BICS, EOR, EORS, NAND, NANDS, NOR, NORS, ORN, ORNS, ORR, ORRS, and SEL.
    - SVE Predicate Misc:
        - SVE predicate initialize: PTRUE, and PTRUES.
        - SVE predicate read from FFR (predicated): RDFFR, and RDFFRS.
        - SVE predicate read from FFR (unpredicated): RDFFR.
        - SVE predicate test: PTEST.
        - SVE predicate zero: PFALSE.

- SVE Predicate Select: PSEL.
- SVE Scalar Integer Compare - Predicate-as-counter: PTRUE.
- SVE Stack Allocation: ADDPL, ADDSPL, ADDSVL, ADDVL, RDSVL, and RDVL.
- SVE Vector Select: SEL.
- SVE Write FFR: SETFFR, and WRFFR.
- SVE integer clamp: SCLAMP, and UCLAMP.
- SVE two-way dot product: SDOT, and UDOT.
- SVE two-way dot product (indexed): SDOT, and UDOT.
- SVE2 Accumulate:
  - SVE2 bitwise shift and insert: SLI, and SRI.
  - SVE2 bitwise shift right and accumulate: SRSRA, SSRA, URSRA, and USRA.
  - SVE2 complex integer add: CADD.
  - SVE2 integer absolute difference and accumulate: SABA, and UABA.
  - SVE2 integer absolute difference and accumulate long: SABALB, SABALT, UABALB, and UABALT.
  - SVE2 integer add/subtract long with carry: ADCLB, ADCLT, SBCLB, and SBCLT.
- SVE2 Crypto Extensions: AESD, AESE, AESIMC, AESMC, RAX1, SM4E, and SM4EKEY.
- SVE2 Histogram Computation (Segment) and Lookup Table: LUTI2, and LUTI4.
- SVE2 Integer - Predicated:
  - SVE2 integer halving add/subtract (predicated): SHADD, SHSUB, SHSUBR, UHADD, UHSUB ,and UHSUBR.
  - SVE2 integer pairwise add and accumulate long: SADALP, and UADALP.
  - SVE2 integer pairwise arithmetic: ADDP, SMAXP, SMINP, UMAXP, and UMINP.
- SVE2 Integer Multiply - Unpredicated: MUL, PMUL, SMULH, SQDMULH, SQRDMULH, and UMULH.
- SVE2 Narrowing:
  - SVE2 bitwise shift right narrow: RSHRNB, RSHRNT, SHRNB, and SHRNT.
  - SVE2 integer add/subtract narrow high part: ADDHNB, ADDHNT, RADDHNB, RADDHNT, RSUBHNB, RSUBHNT, SUBHNB, and SUBHNT.
- SVE2 Widening Integer Arithmetic:
  - SVE2 integer add/subtract long: SABDLB, SABDLT, SADDLB, SADDLT, SSUBLB, SSUBLT, UABDLB, UABDLT, UADDLB, UADDLT, USUBLB, and USUBLT.
  - SVE2 integer add/subtract wide: SADDWB, SADDWT, SSUBWB, SSUBWT, UADDWB, UADDWT, USUBWB, and USUBWT.
  - SVE2 integer multiply long: PMULLB, PMULLT, SMULLB, SMULLT, UMULLB, and UMULLT.

Note

The architecture makes no statement about the timing properties when the PSTATE.DIT bit is not set. However, it is likely that many of these instructions have timing that is invariant of the data in many situations.

In particular, Arm strongly recommends that the Armv8.3 pointer authentication instructions do not have their timing dependent on the key value used in the pointer authentication in all cases, regardless of the PSTATE.DIT bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [23:0]

Reserved, RES0.

Accessing DIT

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DIT
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b101

```
if !(IsFeatureImplemented(FEAT_DIT) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    X[t, 64] = Zeros(39):PSTATE.DIT:Zeros(24);
elsif PSTATE.EL == EL1 then
    X[t, 64] = Zeros(39):PSTATE.DIT:Zeros(24);
elsif PSTATE.EL == EL2 then
    X[t, 64] = Zeros(39):PSTATE.DIT:Zeros(24);
elsif PSTATE.EL == EL3 then
    X[t, 64] = Zeros(39):PSTATE.DIT:Zeros(24);
```

MSR DIT, <Xt>

DLR_EL0, Debug Link Register

The DLR_EL0 characteristics are:

Purpose

In Debug state, holds the address to restart from.

Configuration

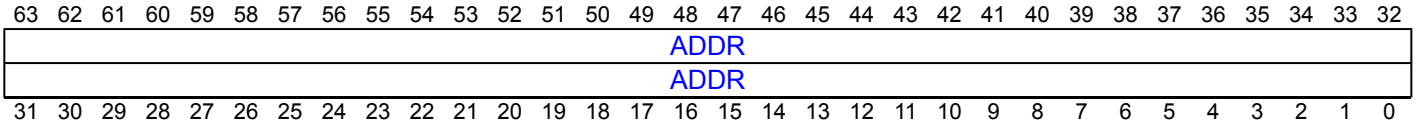
AArch64 System register DLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DLR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DLR_EL0 are UNDEFINED.

Attributes

DLR_EL0 is a 64-bit register.

Field descriptions



ADDR, bits [63:0]

Restart address.

Accessing DLR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DLR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif !Halted() then
    UNDEFINED;
else
    X[t, 64] = DLR_EL0;
```

```
MSR DLR_EL0, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif !Halted() then
    UNDEFINED;
else
    DLR_EL0 = X[t, 64];

DSPSR_EL0, Debug Saved Program Status Register

The DSPSR_EL0 characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configuration

AArch64 System register DSPSR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DSPSR[31:0].

AArch64 System register DSPSR_EL0 bits [63:32] are architecturally mapped to AArch32 System register DSPSR2[31:0] when FEAT_Debugv8p9 is implemented.

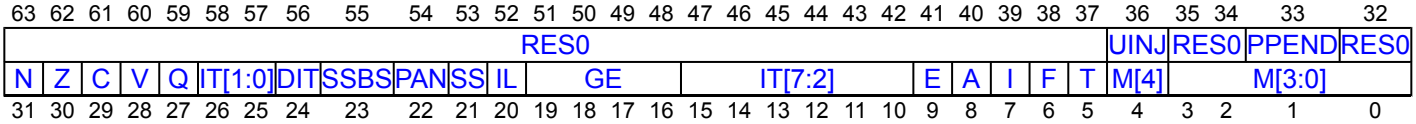
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to DSPSR_EL0 are UNDEFINED.

Attributes

DSPSR_EL0 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented and exiting Debug state to AArch32 state:



Bits [63:37]

Reserved, RES0.

UINJ, bit [36]

When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Copied to PSTATE.UINJ on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:34]

Reserved, RES0.

PPEND, bit [33]

When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Copied to PSTATE.PPEND on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Copied to PSTATE.N on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Copied to PSTATE.Z on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Copied to PSTATE.C on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Copied to PSTATE.V on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Copied to PSTATE.Q on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Copied to PSTATE.IT on exiting Debug state.

On exiting Debug state, DSPSR_EL0.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is DSPSR_EL0[26:25].
- IT[7:2] is DSPSR_EL0[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Copied to PSTATE.DIT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Copied to PSTATE.SSBS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Copied to PSTATE.PAN on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Copied to PSTATE.SS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Copied to PSTATE.IL on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Copied to PSTATE.GE on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR_EL0.E is RES0. If the implementation does not support little-endian operation, DSPSR_EL0.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Copied to PSTATE.A on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Copied to PSTATE.I on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Copied to PSTATE.F on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Copied to PSTATE.T on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Copied to PSTATE.nRW on exiting Debug state.

M[4]	Meaning
0b1	AArch32 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Copied to PSTATE.M[3:0] on exiting Debug state.

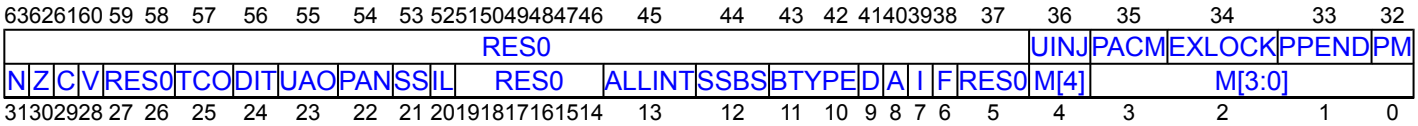
M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0110	Monitor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If DSPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_AA64 is implemented and entering or exiting Debug state from or to AArch64 state:



Bits [63:37]

Reserved, RES0.

UINJ, bit [36]

When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to the value of PSTATE.UINJ on entering Debug state, and copied to PSTATE.UINJ on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PACM, bit [35]

When FEAT_PAuth_LR is implemented:

PACM. Set to the value of PSTATE.PACM on entering Debug state, and copied to PSTATE.PACM on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLOCK, bit [34]
When FEAT_GCS is implemented:

Exception return state lock. Set to the value of PSTATE.EXLOCK on entering Debug state, and copied to PSTATE.EXLOCK on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PPEND, bit [33]
When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on entering Debug state, and conditionally copied to PSTATE.PPEND on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PM, bit [32]
When FEAT_EBEP is implemented:

Profiling exception mask bit. Set to the value of PSTATE.PM on entering Debug state, and copied to PSTATE.PM on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on entering Debug state, and copied to PSTATE.TCO on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

ALLINT, bit [13]

When FEAT_NMI is implemented:

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on entering Debug state, and copied to PSTATE.ALLINT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on entering Debug state, and copied to PSTATE.BTYPE on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on entering Debug state, and copied to PSTATE.D on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on entering Debug state from AArch64 state, and copied to PSTATE.nRW on exiting Debug state.

M[4]	Meaning
0b0	AArch64 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0.
0b0100	EL1 with SP_EL0 (EL1t).
0b0101	EL1 with SP_EL1 (EL1h).
0b1000	EL2 with SP_EL0 (EL2t).
0b1001	EL2 with SP_EL2 (EL2h).
0b1100	EL3 with SP_EL0 (EL3t).
0b1101	EL3 with SP_EL3 (EL3h).

Other values are reserved. If DSPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on entering Debug state and copied to PSTATE.EL on exiting Debug state.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on entering Debug state and copied to PSTATE.SP on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DSPSR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DSPSR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif !Halted() then
    UNDEFINED;
else
    X[t, 64] = DSPSR_EL0;
```

```
MSR DSPSR_EL0, <Xt>
```

op0	op1	CRn	CRm	op2

0b11	0b011	0b0100	0b0101	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif !Halted() then
    UNDEFINED;
else
    DSPSR_EL0 = X[t, 64];
```

DVP RCTX, Data Value Prediction Restriction by Context

The DVP RCTX characteristics are:

Purpose

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Note

The prediction of the PSTATE.{N,Z,C,V} values is not considered a data value for this purpose.

Data value predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

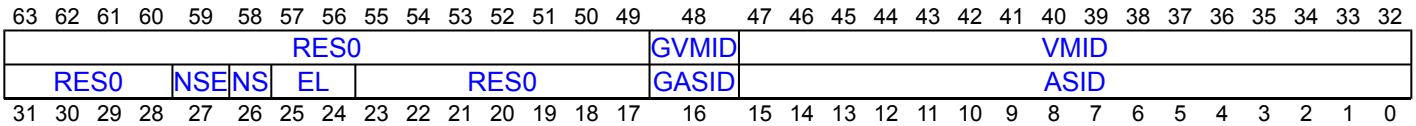
Configuration

This instruction is present only when FEAT_SPECRES is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to DVP RCTX are UNDEFINED.

Attributes

DVP RCTX is a 64-bit System instruction.

Field descriptions



Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, this field is treated as the current VMID.

When the instruction is executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:28]

Reserved, RES0.

NSE, bit [27]

When FEAT_RME is implemented:

Together with the NS field, selects the Security state.

For a description of the values derived by evaluating NS and NSE together, see DVP_RCTX.NS.

Otherwise:

Reserved, RES0.

NS, bit [26]

When FEAT_RME is implemented:

Together with the NSE field, selects the Security state.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Some Effective values are determined by the current Security state:

- When executed in Secure state, the Effective value of NSE is 0.
- When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.
- When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

This instruction is treated as a NOP when executed at EL3 and either:

- DVP_RCTX.{NSE, NS} selects a reserved value.
- DVP_RCTX.{NSE, NS} == {1, 0} and DVP_RCTX.EL has a value other than 0b11.

Otherwise:

Security State.

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, or is specified to apply to a combination of Exception level and Security state that is not implemented, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing DVP RCTX

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DVP RCTX, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b101

```
if !(IsFeatureImplemented(FEAT_SPECRES) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    if !ELIsInHost(EL0) && SCTLR_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    elsif EL2Enabled() && !ELIsInHost(EL0) && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) ||
SCR_EL3.FGTEn == '1') && HFGITR_EL2.DVPRCTX == '1' then

ELR_EL1, Exception Link Register (EL1)

The ELR_EL1 characteristics are:

Purpose

When taking an exception to EL1, holds the address to return to.

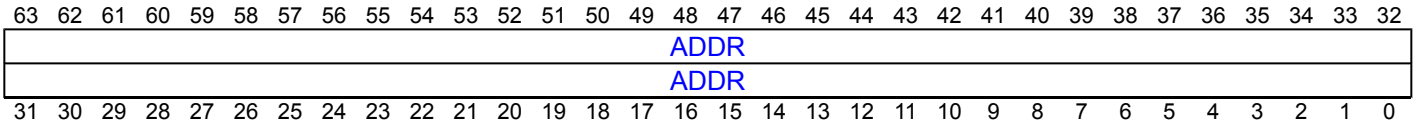
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ELR_EL1 are UNDEFINED.

Attributes

ELR_EL1 is a 64-bit register.

Field descriptions



ADDR, bits [63:0]

Return address.

An exception return from EL1 using AArch64 makes ELR_EL1 become UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ELR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name ELR_EL1 or ELR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ELR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0000	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then

ELR_EL2, Exception Link Register (EL2)

The ELR_EL2 characteristics are:

Purpose

When taking an exception to EL2, holds the address to return to.

Configuration

AArch64 System register ELR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ELR_hyp[31:0].

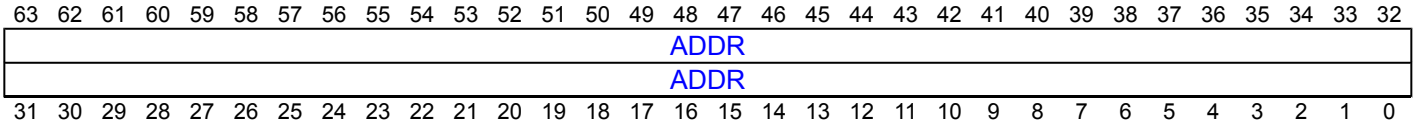
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ELR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ELR_EL2 is a 64-bit register.

Field descriptions



ADDR, bits [63:0]

Return address.

An exception return from EL2 using AArch64 makes ELR_EL2 become UNKNOWN.

When EL2 is in AArch32 Execution state and an exception is taken from EL0, EL1, or EL2 to EL3 and AArch64 execution, the upper 32-bits of ELR_EL2 are either set to 0 or hold the same value that they did before AArch32 execution. Which option is adopted is determined by an implementation, and might vary dynamically within an implementation. Correspondingly software must regard the value as being an UNKNOWN choice between the two values.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ELR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name ELR_EL2 or ELR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ELR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0000	0b001

ERRIDR_EL1, Error Record ID Register

The ERRIDR_EL1 characteristics are:

Purpose

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

Configuration

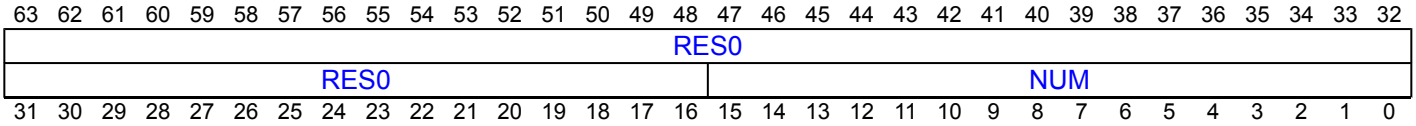
AArch64 System register ERRIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERRIDR[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRIDR_EL1 are UNDEFINED.

Attributes

ERRIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ERRIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0011	0b000

ERRSELR_EL1, Error Record Select Register

The ERRSELR_EL1 characteristics are:

Purpose

Selects an error record to be accessed through the Error Record System registers.

Configuration

AArch64 System register ERRSELR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERRSELR[31:0].

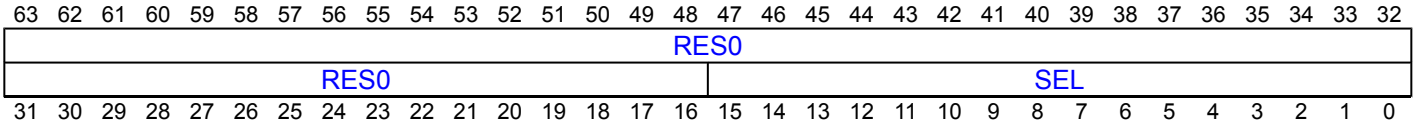
This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRSELR_EL1 are UNDEFINED.

If ERRIDR_EL1 indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR_EL1 is UNDEFINED or RES0.

Attributes

ERRSELR_EL1 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

SEL, bits [15:0]

Selects the error record accessed through the ERX registers.

For example, if ERRSELR_EL1.SEL is `0x0004`, then direct reads and writes of ERXSTATUS_EL1 access ERR4STATUS.

If ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then all of the following apply:

- The value read back from ERRSELR_EL1.SEL is UNKNOWN.
- One of the following occurs:
  - An UNKNOWN error record is selected.
  - The ERX*_EL1 registers are RAZ/WI.
  - ERX*_EL1 register reads and writes are NOPs.
  - ERX*_EL1 register reads and writes are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ERRSELR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERRSELR_EL1

ERXADDR_EL1, Selected Error Record Address Register

The ERXADDR_EL1 characteristics are:

Purpose

Accesses ERR<n>ADDR for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

AArch64 System register ERXADDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERXADDR[31:0].

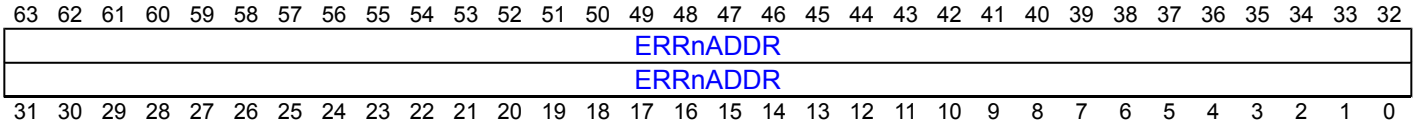
AArch64 System register ERXADDR_EL1 bits [63:32] are architecturally mapped to AArch32 System register ERXADDR2[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR_EL1 are UNDEFINED.

Attributes

ERXADDR_EL1 is a 64-bit register.

Field descriptions



ERRnADDR, bits [63:0]

ERXADDR_EL1 accesses ERR<n>ADDR, where <n> is the value in ERRSELR_EL1.SEL.

Accessing ERXADDR_EL1

If ERRIDR_EL1.NUM is `0x0000` or ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR_EL1 is RAZ/WI.
- Direct reads and writes of ERXADDR_EL1 are NOPs.
- Direct reads and writes of ERXADDR_EL1 are UNDEFINED.

ERR<n>ADDR describes additional constraints that also apply when ERR<n>ADDR is accessed through ERXADDR_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ERXADDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0100	0b011

```

ERXCTLR_EL1, Selected Error Record Control Register

The ERXCTLR_EL1 characteristics are:

Purpose

Accesses ERR<n>CTLR for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

AArch64 System register ERXCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERXCTLR[31:0].

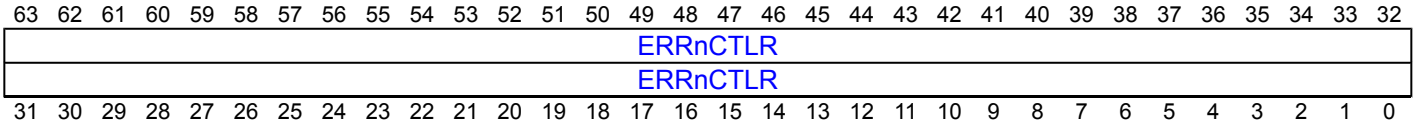
AArch64 System register ERXCTLR_EL1 bits [63:32] are architecturally mapped to AArch32 System register ERXCTLR2[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTLR_EL1 are UNDEFINED.

Attributes

ERXCTLR_EL1 is a 64-bit register.

Field descriptions



ERRnCTLR, bits [63:0]

ERXCTLR_EL1 accesses ERR<n>CTLR, where <n> is the value in ERRSELR_EL1.SEL.

Accessing ERXCTLR_EL1

If ERRIDR_EL1.NUM is `0x0000` or ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTLR_EL1 is RAZ/WI.
- Direct reads and writes of ERXCTLR_EL1 are NOPs.
- Direct reads and writes of ERXCTLR_EL1 are UNDEFINED.

If ERRSELR_EL1.SEL is not the index of the first error record owned by a node, then ERR<n>CTLR is not present, meaning reads and writes of ERXCTLR_EL1 are RES0.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ERXCTLR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0100	0b001

ERXGSR_EL1, Selected Error Record Group Status Register

The ERXGSR_EL1 characteristics are:

Purpose

Shows the status for the records in a group of error records.

Accesses ERRGSR for the group of error records <n> selected by ERRSELR_EL1.SEL[15:6].

Configuration

This register is present only when FEAT_RASv2 is implemented. Otherwise, direct accesses to ERXGSR_EL1 are UNDEFINED.

Attributes

ERXGSR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33

ERXMISC0_EL1, Selected Error Record Miscellaneous Register 0

The ERXMISC0_EL1 characteristics are:

Purpose

Accesses ERR<n>MISC0 for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

AArch64 System register ERXMISC0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERXMISC0[31:0].

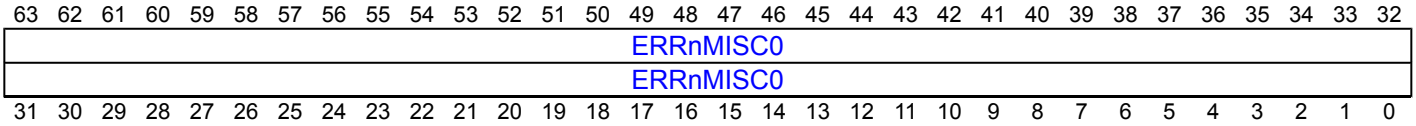
AArch64 System register ERXMISC0_EL1 bits [63:32] are architecturally mapped to AArch32 System register ERXMISC1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC0_EL1 are UNDEFINED.

Attributes

ERXMISC0_EL1 is a 64-bit register.

Field descriptions



ERRnMISC0, bits [63:0]

ERXMISC0_EL1 accesses ERR<n>MISC0, where <n> is the value in ERRSELR_EL1.SEL.

Accessing ERXMISC0_EL1

If ERRIDR_EL1.NUM is `0x0000` or ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC0_EL1 is RAZ/WI.
- Direct reads and writes of ERXMISC0_EL1 are NOPs.
- Direct reads and writes of ERXMISC0_EL1 are UNDEFINED.

ERR<n>MISC0 describes additional constraints that also apply when ERR<n>MISC0 is accessed through ERXMISC0_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ERXMISC0_EL1

ERXMISC1_EL1, Selected Error Record Miscellaneous Register 1

The ERXMISC1_EL1 characteristics are:

Purpose

Accesses ERR<n>MISC1 for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

AArch64 System register ERXMISC1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERXMISC2[31:0].

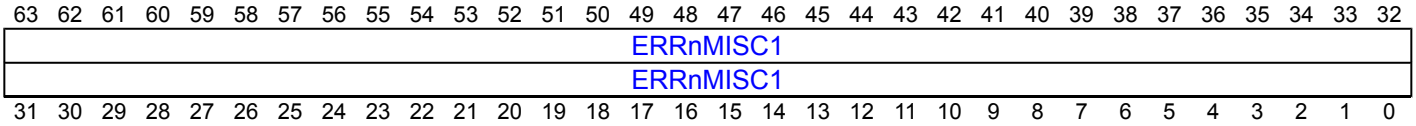
AArch64 System register ERXMISC1_EL1 bits [63:32] are architecturally mapped to AArch32 System register ERXMISC3[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC1_EL1 are UNDEFINED.

Attributes

ERXMISC1_EL1 is a 64-bit register.

Field descriptions



ERRnMISC1, bits [63:0]

ERXMISC1_EL1 accesses ERR<n>MISC1, where <n> is the value in ERRSELR_EL1.SEL.

Accessing ERXMISC1_EL1

If ERRIDR_EL1.NUM is `0x0000` or ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC1_EL1 is RAZ/WI.
- Direct reads and writes of ERXMISC1_EL1 are NOPs.
- Direct reads and writes of ERXMISC1_EL1 are UNDEFINED.

ERR<n>MISC1 describes additional constraints that also apply when ERR<n>MISC1 is accessed through ERXMISC1_EL1.

Accesses to this register use the following encodings in the System register encoding space:

ERXPFGCDN_EL1, Selected Pseudo-fault Generation Countdown Register

The ERXPFGCDN_EL1 characteristics are:

Purpose

Accesses ERR<n>PFGCDN for the error record <n> selected by ERRSELR_EL1.SEL.

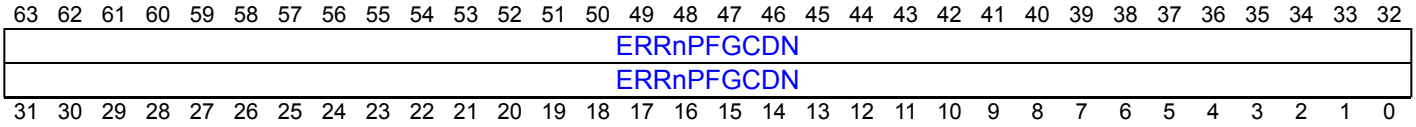
Configuration

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXPFGCDN_EL1 are UNDEFINED.

Attributes

ERXPFGCDN_EL1 is a 64-bit register.

Field descriptions



ERRnPFGCDN, bits [63:0]

ERXPFGCDN_EL1 accesses ERR<n>PFGCDN, where <n> is the value in ERRSELR_EL1.SEL.

Accessing ERXPFGCDN_EL1

If ERRIDR_EL1.NUM is `0x0000` or ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFGCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.

If ERRSELR_EL1.SEL selects an error record owned by a node that does not implement the Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.

Note

A node does not implement the Common Fault Injection Model Extension if ERR<q>FR.INJ reads as `0b00`. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in ERRSELR_EL1.SEL. If the node owns a single record then q = n.

If ERRSELR_EL1.SEL is not the index of the first error record owned by a node, then ERR<n>PFGCDN is not present, meaning reads and writes of ERXPFGCDN_EL1 are RES0.

ERR<n>PFGCDN describes additional constraints that also apply when ERR<n>PFGCDN is accessed through ERXPFGCDN_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ERXPFGCDN_EL1
```

ERXPFGCTL_EL1, Selected Pseudo-fault Generation Control Register

The ERXPFGCTL_EL1 characteristics are:

Purpose

Accesses ERR<n>PFGCTL for the error record <n> selected by ERRSELR_EL1.SEL.

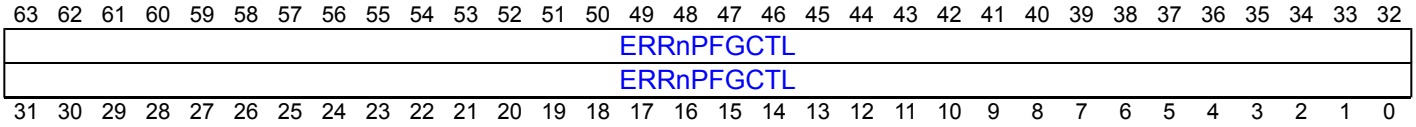
Configuration

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXPFGCTL_EL1 are UNDEFINED.

Attributes

ERXPFGCTL_EL1 is a 64-bit register.

Field descriptions



ERRnPFGCTL, bits [63:0]

ERXPFGCTL_EL1 accesses ERR<n>PFGCTL, where <n> is the value in ERRSELR_EL1.SEL.

Accessing ERXPFGCTL_EL1

If ERRIDR_EL1.NUM is `0x0000` or ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFGCTL_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCTL_EL1 are NOPs.
- Direct reads and writes of ERXPFGCTL_EL1 are UNDEFINED.

If ERRSELR_EL1.SEL selects an error record owned by a node that does not implement the Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGCTL_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCTL_EL1 are NOPs.
- Direct reads and writes of ERXPFGCTL_EL1 are UNDEFINED.

Note

A node does not implement the Common Fault Injection Model Extension if ERR<q>FR.INJ reads as `0b00`. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in ERRSELR_EL1.SEL. If the node owns a single record then q = n.

If ERRSELR_EL1.SEL is not the index of the first error record owned by a node, then ERR<n>PFGCTL is not present, meaning reads and writes of ERXPFGCTL_EL1 are RES0.

ERR<n>PFGCTL describes additional constraints that also apply when ERR<n>PFGCTL is accessed through ERXPFGCTL_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ERXPFGCTL_EL1
```

ERXPFGF_EL1, Selected Pseudo-fault Generation Feature Register

The ERXPFGF_EL1 characteristics are:

Purpose

Accesses ERR<n>PFGF for the error record <n> selected by ERRSELR_EL1.SEL.

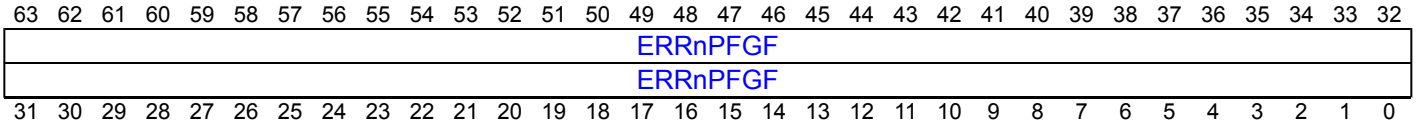
Configuration

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXPFGF_EL1 are UNDEFINED.

Attributes

ERXPFGF_EL1 is a 64-bit register.

Field descriptions



ERRnPFGF, bits [63:0]

ERXPFGF_EL1 accesses ERR<n>PFGF, where <n> is the value in ERRSELR_EL1.SEL.

Accessing ERXPFGF_EL1

If ERRIDR_EL1.NUM is `0x0000` or ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFGF_EL1 is RAZ.
- Direct reads of ERXPFGF_EL1 are NOPs.
- Direct reads of ERXPFGF_EL1 are UNDEFINED.

If ERRSELR_EL1.SEL selects an error record owned by a node that does not implement the Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGF_EL1 is RAZ.
- Direct reads of ERXPFGF_EL1 are NOPs.
- Direct reads of ERXPFGF_EL1 are UNDEFINED.

Note

A node does not implement the Common Fault Injection Model Extension if ERR<q>FR.INJ reads as `0b00`. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in ERRSELR_EL1.SEL. If the node owns a single record then q = n.

If ERRSELR_EL1.SEL is not the index of the first error record owned by a node, then ERR<n>PFGF is not present, meaning reads of ERXPFGF_EL1 are RES0.

ERR<n>PFGF describes additional constraints that also apply when ERR<n>PFGF is accessed through ERXPFGF_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ERXPFGF_EL1

ERXSTATUS_EL1, Selected Error Record Primary Status Register

The ERXSTATUS_EL1 characteristics are:

Purpose

Accesses ERR<n>STATUS for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

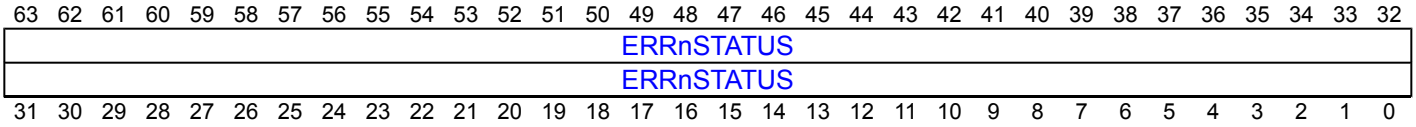
AArch64 System register ERXSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERXSTATUS[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXSTATUS_EL1 are UNDEFINED.

Attributes

ERXSTATUS_EL1 is a 64-bit register.

Field descriptions



ERRnSTATUS, bits [63:0]

ERXSTATUS_EL1 accesses ERR<n>STATUS, where <n> is the value in ERRSELR_EL1.SEL.

Accessing ERXSTATUS_EL1

If ERRIDR_EL1.NUM is `0x0000` or ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXSTATUS_EL1 is RAZ/WI.
- Direct reads and writes of ERXSTATUS_EL1 are NOPs.
- Direct reads and writes of ERXSTATUS_EL1 are UNDEFINED.

ERR<n>STATUS describes additional constraints that also apply when ERR<n>STATUS is accessed through ERXSTATUS_EL1.

ESR_EL1, Exception Syndrome Register (EL1)

The ESR_EL1 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL1.

Configuration

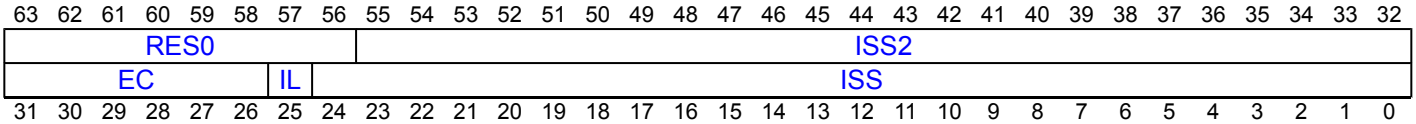
AArch64 System register ESR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DFSR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ESR_EL1 are UNDEFINED.

Attributes

ESR_EL1 is a 64-bit register.

Field descriptions



ESR_EL1 is made UNKNOWN as a result of an exception return from EL1.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL1, the value of ESR_EL1 is UNKNOWN. The value written to ESR_EL1 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

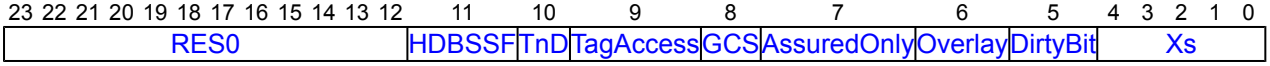
Bits [63:56]

Reserved, RES0.

ISS2, bits [55:32]

ISS2 encoding for an exception, the bit assignments are:

ISS2 encoding for an exception from a Data Abort



Bits [23:12]

Reserved, RES0.

HDBSSF, bit [11]

When FEAT_HDBSS is implemented, FEAT_NV is implemented, IsSecondStage(Fault), and DFSC == 0b0011xx || DFSC == 0b01001x || DFSC == 0b0101xx || DFSC == 0b10001x || DFSC == 0b1001xx:

Indicates that the fault was caused by the HDBSS.

When DFSC indicates a Permission fault, this field indicates whether that fault was caused by the HDBSS being full.

When DFSC indicates a synchronous External abort on translation table walk or hardware update of translation table, this field indicates whether the fault was caused by a write to the HDBSS.

When DFSC indicates a Granule Protection Fault on translation table walk or hardware update of translation table, this field indicates whether the fault was caused by a write to the HDBSS.

HDBSSF	Meaning
0b0	Fault was not caused by HDBSS.
0b1	Fault was caused by HDBSS.

This field only applies for stage 2 Permission faults.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TnD, bit [10]
When FEAT_MTE_CANONICAL_TAGS is implemented:

Tag not Data.

If a memory access generates a Data Abort for a stage 1 Permission fault, this field indicates whether the fault is due to an Allocation Tag access.

TnD	Meaning
0b0	Permission fault is not due to a write of an Allocation Tag to Canonically Tagged memory.
0b1	Permission fault is due to a write of an Allocation Tag to Canonically Tagged memory.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TagAccess, bit [9]
When FEAT_MTE_PERM is implemented and FEAT_NV is implemented:

NoTagAccess fault.

When EL2 provides information to EL1 regarding a Stage 2 Data Abort, this field indicates whether the fault is due to the NoTagAccess memory attribute.

TagAccess	Meaning
0b0	Permission fault is not due to the NoTagAccess memory attribute.
0b1	Permission fault is due to the NoTagAccess memory attribute.

For all other Data Aborts this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GCS, bit [8]
When FEAT_GCS is implemented:

Guarded Control Stack data access.

If a memory access generates a Data Abort, this field indicates whether the fault is due to a Guarded Control Stack data access.

GCS	Meaning
0b0	The Data Abort is not due to a Guarded control stack data access.
0b1	The Data Abort is due to a Guarded control stack data access. The ISV field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]
When FEAT_THE is implemented and FEAT_NV is implemented:

AssuredOnly flag.

If EL2 provides information regarding a stage 2 Data Abort to EL1, then this field holds information about the fault.

If this field is 1 and ESR_EL1.GCS is also 1 then the AssuredOnly check might have been the result of VTCR_EL2.GCSH configuration.

AssuredOnly	Meaning
0b0	The Data Abort is not due to AssuredOnly.
0b1	The Data Abort is due to AssuredOnly.

For all other Data Aborts this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [6]
When FEAT_S1POE is implemented:

Overlay flag.

If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]
When FEAT_S1PIE is implemented:

DirtyBit flag.

If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Xs, bits [4:0]
When FEAT_LS64 is implemented:

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

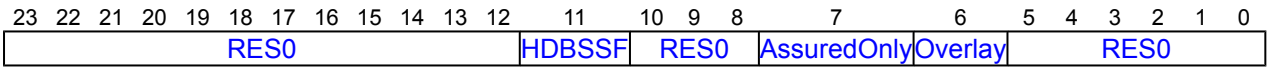
When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

Otherwise, this field is RES0.

Otherwise:

Reserved, RES0.

ISS2 encoding for an exception from an Instruction Abort



Bits [23:12]

Reserved, RES0.

HDBSSF, bit [11]

When FEAT_HDBSS is implemented and FEAT_NV is implemented:

Indicates that the fault was caused by the HDBSS.

When IFSC indicates a Permission fault, this field indicates whether that fault was caused by the HDBSS being full.

When IFSC indicates a synchronous External abort on translation table walk or hardware update of translation table, this field indicates whether the fault was caused by a write to the HDBSS.

When IFSC indicates a Granule Protection Fault on translation table walk or hardware update of translation table, this field indicates whether the fault was caused by a write to the HDBSS.

HDBSSF	Meaning
0b0	Fault was not caused by HDBSS.
0b1	Fault was caused by HDBSS.

This field only applies for stage 2 Permission faults.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [10:8]

Reserved, RES0.

AssuredOnly, bit [7]

When FEAT_THE is implemented and FEAT_NV is implemented:

AssuredOnly flag.

If EL2 provides information regarding a stage 2 Instruction Abort to EL1, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	The Instruction Abort is not due to AssuredOnly.
0b1	The Instruction Abort is due to AssuredOnly.

For all other Instruction Aborts this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [6]
When FEAT_S1POE is implemented:

Overlay flag.

If a memory access generates a Instruction Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Instruction Abort is not due to Overlay Permissions.
0b1	Instruction Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

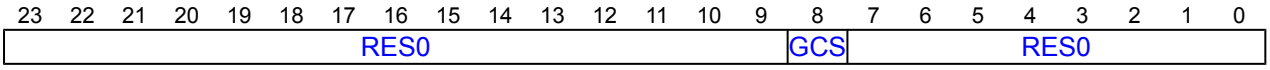
Otherwise:

Reserved, RES0.

Bits [5:0]

Reserved, RES0.

ISS2 encoding for an exception from a Watchpoint exception



Bits [23:9]

Reserved, RES0.

GCS, bit [8]
When FEAT_GCS is implemented:

Guarded control stack data access.

Indicates that the Watchpoint exception is due to a Guarded control stack data access.

GCS	Meaning
0b0	The Watchpoint exception is not due to a Guarded control stack data access.
0b1	The Watchpoint exception is due to a Guarded control stack data access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

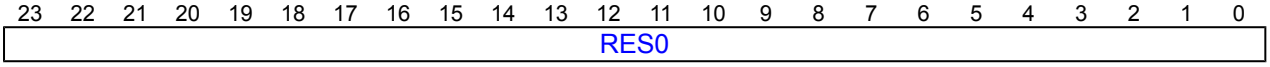
Otherwise:

Reserved, RES0.

Bits [7:0]

Reserved, RES0.

ISS2 encoding for all other exceptions



Bits [23:0]

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	ISS2	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	ISS2 encoding for all other exceptions	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WF* instruction	ISS2 encoding for all other exceptions	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC value 0b000000.	ISS encoding for an exception from an MCR or MRC access	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC value 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: • An STC to write data to memory from DBGDTRRXint. • An LDC to read data from memory to DBGDTRTXint.	ISS encoding for an exception from an LDC or STC instruction	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b000111	Access to SME, SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000.	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps	ISS2 encoding for all other exceptions	
0b001001	Trapped use of a Pointer authentication instruction.	ISS encoding for an exception from a trapped Pointer Authentication instruction	ISS2 encoding for all other exceptions	When FEAT_PAuth is implemented
0b001010	Trapped execution of any instruction not covered by other EC values.	ISS encoding for an exception from any other instruction	ISS2 encoding for all other exceptions	When FEAT_LS64 is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for an exception from an MCRR or MRRC access	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented

0b001101	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	ISS2 encoding for all other exceptions	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	ISS2 encoding for all other exceptions	
0b010001	SVC instruction execution in AArch32 state.	ISS encoding for an exception from HVC or SVC instruction execution	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b010100	Trapped MSRR, MRRS or System instruction execution in AArch64 state, that is not reported using EC value 0b000000.	ISS encoding for an exception from MSRR, MRRS, or 128-bit System instruction execution in AArch64 state	ISS2 encoding for all other exceptions	When FEAT_SYSREG128 is implemented or FEAT_SYSINSTR128 is implemented
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC values 0b000000, 0b000001, or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b011001	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC value 0b000000.	ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	ISS2 encoding for all other exceptions	When FEAT_SVE is implemented
0b011010	Trapped ERET, ERETAA, or ERETAB instruction execution.	ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction	ISS2 encoding for all other exceptions	When FEAT_FGT is implemented or FEAT_NV is implemented
0b011011	Exception from an access to a TSTART instruction at EL0 when SCTLR_EL1.TME0 == 0, EL0 when SCTLR_EL2.TME0 == 0, at EL1 when SCTLR_EL1.TME == 0, at EL2 when	ISS encoding for an exception from a TSTART instruction	ISS2 encoding for all other exceptions	When FEAT_TME is implemented

	SCTLR_EL2.TME == 0 or at EL3 when SCTLR_EL3.TME == 0.			
0b011100	Exception from a PAC Fail	ISS encoding for a PAC Fail exception	ISS2 encoding for all other exceptions	When FEAT_FPAC is implemented
0b011101	Access to SME functionality trapped as a result of CPACR_EL1.SMEN, CPTR_EL2.SMEN, CPTR_EL2.TSM, CPTR_EL3.ESM, or an attempted execution of an instruction that is illegal because of the value of PSTATE.SM or PSTATE.ZA, that is not reported using EC value 0b000000.	ISS encoding for an exception due to SME functionality	ISS2 encoding for all other exceptions	When FEAT_SME is implemented
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	ISS2 encoding for an exception from an Instruction Abort	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	ISS2 encoding for an exception from an Instruction Abort	
0b100010	PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	ISS2 encoding for all other exceptions	
0b100100	Data Abort exception from a lower Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	ISS2 encoding for an exception from a Data Abort	
0b100101	Data Abort exception taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External	ISS encoding for an exception from a Data Abort	ISS2 encoding for an exception from a Data Abort	

	aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.			
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	ISS2 encoding for all other exceptions	
0b100111	Memory Operation Exception.	ISS encoding for an exception from the Memory Copy and Memory Set instructions	ISS2 encoding for all other exceptions	When FEAT_MOPS is implemented
0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b101101	GCS exception.	ISS encoding for a GCS exception	ISS2 encoding for all other exceptions	When FEAT_GCS is implemented
0b101111	SError exception.	ISS encoding for an SError exception	ISS2 encoding for all other exceptions	
0b110000	Breakpoint exception from a lower Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	ISS2 encoding for all other exceptions	
0b110001	Breakpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	ISS2 encoding for all other exceptions	
0b110010	Software Step exception from a lower Exception level.	ISS encoding for an exception from a Software Step exception	ISS2 encoding for all other exceptions	

0b110011	Software Step exception taken without a change in Exception level.	ISS encoding for an exception from a Software Step exception	ISS2 encoding for all other exceptions	
0b110100	Watchpoint exception from a lower Exception level.	ISS encoding for an exception from a Watchpoint exception	ISS2 encoding for an exception from a Watchpoint exception	
0b110101	Watchpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Watchpoint exception	ISS2 encoding for an exception from a Watchpoint exception	
0b111000	BKPT instruction execution in AArch32 state.	ISS encoding for an exception from execution of a Breakpoint instruction	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b111100	BRK instruction execution in AArch64 state.	ISS encoding for an exception from execution of a Breakpoint instruction	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b111101	Profiling exception	ISS encoding for a Profiling exception	ISS2 encoding for all other exceptions	When FEAT_EBEP is implemented, or FEAT_SPE_EXC is implemented, or FEAT_TRBE_EXC is implemented

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: • An SError exception. • An Instruction Abort exception. • A PC alignment fault exception. • An SP alignment fault exception. • A Data Abort exception for which the value of the ISV bit is 0. • An Illegal Execution state exception. • Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: ◦ 0b0: 16-bit T32 BKPT instruction. ◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction. • An exception reported using EC value 0b000000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

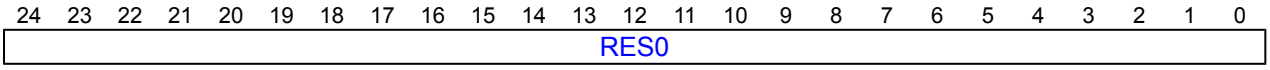
Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is `0b1111`, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value `0b11111`.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value `0b11111`.

ISS encoding for exceptions with an unknown reason



Bits [24:0]

Reserved, RES0.

Additional information for the ISS encoding for exceptions with an unknown reason

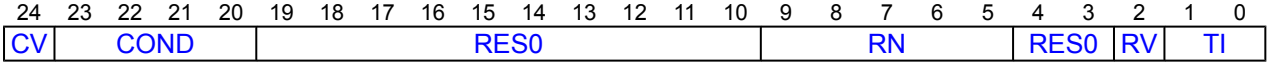
When an exception is reported using this EC value, the IL field is set to 1.

This EC value is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR_EL1.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
  - An SMC instruction when disabled by SCR_EL3.SMD.
  - An HLT instruction when disabled by EDSCR.HDE.
- Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSel.SP is 0.
- Attempted execution of an MSR or MRS instruction using a _EL12 register name when the Effective value of HCR_EL2.E2H is not 1.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  - A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon.

- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, and EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
- An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1. If the value of HCR_EL2.TGE is 0, this exception is reported using an ESR_EL1.EC value of `0b000111`.
- In Non-transactional state, attempted execution of a TCOMMIT instruction.

ISS encoding for an exception from a WF* instruction



CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:10]

Reserved, RES0.

RN, bits [9:5]

When FEAT_WFxT is implemented:

Register Number. Indicates the register number supplied for a `WFET` or `WFIT` instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

RV, bit [2]

When FEAT_WFxT is implemented:

Register field Valid.

If TI[1] == 1, then this field indicates whether RN holds a valid register number for the register argument to the trapped `WFET` or `WFIT` instruction.

RV	Meaning
`0b0`	Register field invalid.
`0b1`	Register field valid.

If TI[1] == 0, then this field is RES0.

This field is set to 1 on a trap on `WFET` or `WFIT`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
`0b00`	WFI trapped.	
`0b01`	WFE trapped.	
`0b10`	WFIT trapped.	When FEAT_WFxT is implemented
`0b11`	WFET trapped.	When FEAT_WFxT is implemented

When FEAT_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

The reset behavior of this field is:

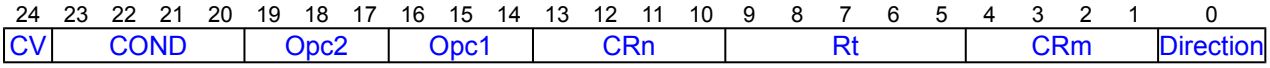
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from a WF* instruction

The following fields describe configuration settings for generating this exception:

- HCR.{TWE, TWI}.
- SCTLR_EL1.{nTWE, nTWI}.
- SCTLR_EL2.{nTWE, nTWI}.
- HCR_EL2.{TWE, TWI}.
- SCR_EL3.{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access



CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value `0b111`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

If the Rt value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
  - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
  - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value `0b0000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
`0b0`	Write to System register space. MCR instruction.
`0b1`	Read from System register space. MRC or VMRS instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from an MCR or MRC access

The following fields describe configuration settings for generating exceptions from an MCR or MRC access using coproc `0b1111`, that are reported using EC value `0b000011`:

- If FEAT_TIDCP1 is implemented, SCTLR_EL1.TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch32 state, trapped to EL1.
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, trapped to EL1 or EL2.
- HCR.{TRVM, TVM} and HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, trapped to EL2.
- HCR.TTLB and HCR_EL2.TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, trapped to EL2.
- HCR.{TSW, TPC, TPU} and HCR_EL2.{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, trapped to EL2.
- HCR.TAC and HCR_EL2.TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, trapped to EL2.
- HCR.TIDCP and HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, trapped to EL2.
- If FEAT_TIDCP1 is implemented, SCTLR_EL2.TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch32 state, trapped to EL2.
- HCR.{TID1, TID2, TID3} and HCR_EL2.{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, trapped to EL2.
- HCR2.TERR, for Non-secure accesses to error record registers at EL1 using AArch32 state, trapped to EL2.
- HCPTR.TCPAC and CPTR_EL2.TCPAC, for accesses to CPACR_EL1 or CPACR using AArch32 state, trapped to EL2.
- HSTR.T<n> and HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, trapped to EL2.
- CNTHCTL.PL1PCEN and CNTHCTL_EL2.EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- HDCR.TTRF, for Non-secure accesses to trace filter control registers from system registers using AArch32 state, trapped to EL2.
- HDCR.{TPM, TPMCR} and MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- HCPTR.TAM and CPTR_EL2.TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- CPTR_EL3.TCPAC, for accesses to CPACR from EL1 and EL2, and accesses to HCPTR from EL2 using AArch32 state, trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, trapped to EL3.
- If FEAT_FGT is implemented, access to some registers at EL0, trapped to EL2.

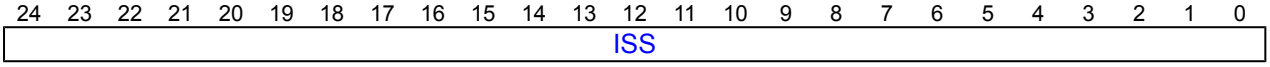
The following fields describe configuration settings for generating exceptions from an MCR or MRC access using coproc `0b1110`, that are reported using EC value `0b000101`:

- CPACR_EL1.TTA for accesses to trace registers, trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, trapped to EL1 or EL2.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- HCR.TID0 and HCR_EL2.TID0, for accesses to the JIDR register in the ID group 0 at EL0 and EL1 using AArch32, trapped to EL2.
- HCPTR.TTA and CPTR_EL2.TTA, for accesses to trace registers using AArch32, trapped to EL2.
- HDCR.TDRA and MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, trapped to EL2.
- HDCR.TDOSA and MDCR_EL2.TDOSA, for accesses to powerdown debug registers, using AArch32 state, trapped to EL2.
- HDCR.TDA and MDCR_EL2.TDA, for accesses to other debug registers, using AArch32 state, trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers using AArch32, trapped to EL3.
- MDCR_EL3.TDA, for accesses to other debug registers, using AArch32, trapped to EL3.

The following fields describe configuration settings for generating exceptions from a VMSR or VMRS access, that are reported using EC value `0b001000`:

- HCR.TID0 and HCR_EL2.TID0, for accesses to the FPSID register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- HCR.TID3 and HCR_EL2.TID3, for accesses to registers in ID group 3 including MVFR0, MVFR1 and MVFR2, VMRS access trapped to EL2.
- HCPTR.{TCP10, TCP11}, for Non-secure accesses to FPSCR, FPSID, FPEXC, MVFR0, MVFR1, and MVFR2, trapped to EL2.

ISS encoding for an exception from any other instruction

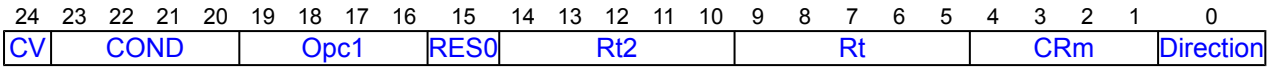


ISS, bits [24:0]

ISS	Meaning	Applies when
0b00000000000000000000000000	ST64BV instruction trapped.	When FEAT_LS64_V is implemented
0b00000000000000000000000001	ST64BV0 instruction trapped.	When FEAT_LS64_ACCDATA is implemented
0b00000000000000000000000010	LD64B or ST64B instruction trapped.	When FEAT_LS64 is implemented

All other values are reserved.

ISS encoding for an exception from an MCRR or MRRC access



CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.

        - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
    - For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

If the Rt2 value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt2 value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

If the Rt value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from an MCRR or MRRC access

The following fields describe configuration settings for generating exceptions from an MCRR or MRRC access using coproc 0b1111, that are reported using EC value 0b000100:

- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, trapped to EL1 or EL2.
- PMUSERENR_EL0.{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, trapped to EL1 or EL2.
- AMUSERENR_EL0.{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, trapped to EL1 or EL2.
- HCR.{TRVM, TVM} and HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, trapped to EL2.
- HCR2.TERR, for Non-secure accesses to error record registers at EL1 using AArch32 state, trapped to EL2.
- HSTR.T<n> and HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, trapped to EL2.
- CNTHCTL.{PL1PCEN, PL1PCTEN} and CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- HDCR.TPM and MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- HCPTR.TAM and CPTR_EL2.TAM, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, trapped to EL2.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, trapped to EL3.
- If FEAT_FGT is implemented, HDFGRTR_EL2.PMCCNTR_EL0 for MRRC access and HDFGWTR_EL2.PMCCNTR_EL0 for MCRR access to PMCCNTR at EL0, trapped to EL2.

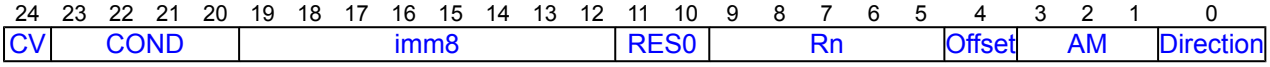
The following fields describe configuration settings for generating exceptions from an MCRR or MRRC access using coproc 0b1110, that are reported using EC value 0b001100:

- MDSCR_EL1.TDCC, for accesses to the Debug ROM registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, trapped to EL1 or EL2.
- HDCR.TDRA and MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, trapped to EL2.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch32, trapped to EL3.
- CPACR_EL1.TTA for accesses to trace registers using AArch32, trapped to EL1 or EL2.
- HCPTR.TTA and CPTR_EL2.TTA, for accesses to trace registers using AArch32, trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, trapped to EL3.

Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

ISS encoding for an exception from an LDC or STC instruction



CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer.

If the Rn value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rn value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
  - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
  - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
`0b0`	Subtract offset.
`0b1`	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
`0b000`	Immediate unindexed.
`0b001`	Immediate post-indexed.
`0b010`	Immediate offset.
`0b011`	Immediate pre-indexed.
`0b100`	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
`0b110`	For a trapped STC instruction, this encoding is reserved.

The values `0b101` and `0b111` are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behavior of this field is:

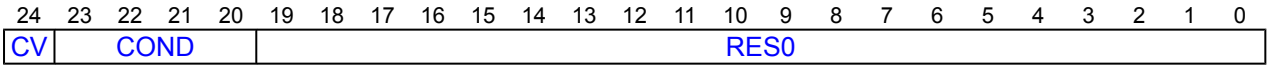
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from an LDC or STC instruction

The following fields describe the configuration settings from an LDC or STC access for the traps that are reported using EC value 0b000110:

- MDSCR_EL1.TDCC, for accesses to DBGDTRTXint and DBGDTRRXint, using AArch32 state, trapped to EL1 or EL2.
- HDCR.TDA and MDCR_EL2.TDA, for accesses to DBGDTRTXint and DBGDTRRXint, using AArch32 state, trapped to EL2.
- MDCR_EL3.TDA, for accesses to DBGDTRTXint and DBGDTRRXint, using AArch32 state, trapped to EL3.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps



The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.
- Execution of SME instructions.

For an implementation that does not include either SVE or support for Advanced SIMD and floating-point, the exception is reported using the EC value 0b000000.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:0]

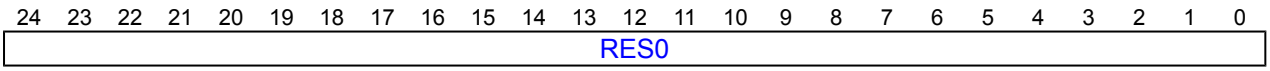
Reserved, RES0.

Additional information for the ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps

The following fields describe the configuration settings for the traps that are reported using EC value `0b000111`:

- HCPTR.{TCP10, TCP11}, for Non-secure accesses to Advanced SIMD and floating-point registers and instructions, trapped to EL2.
- HCPTR.TASE, for Non-secure accesses to Advanced SIMD functionality, trapped to EL2.
- CPACR_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
- CPTR_EL2.FPEN and CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
- CPTR_EL3.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ



The accesses covered by this trap include:

- Execution of SVE instructions when the PE is not in Streaming SVE mode.
- Accesses to the SVE System registers, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value `0b000000`.

Bits [24:0]

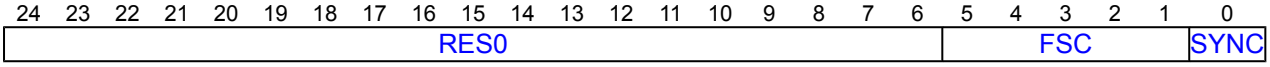
Reserved, RES0.

Additional information for the ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

The following fields describe the configuration settings for the traps that are reported using EC value `0b011001`:

- CPACR_EL1.ZEN, for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL1.
- CPTR_EL2.ZEN and CPTR_EL2.TZ, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- CPTR_EL3.EZ, for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

ISS encoding for a Profiling exception



Bits [24:6]

Reserved, RES0.

FSC, bits [5:1]

Indicates why the Profiling exception was generated.

FSC	Meaning	Applies when
0b00000	PMU Profiling exception. One of the following applies, and ESR_EL1.SYNC describes which: • The exception was generated because at least one PMU counter overflow status flag was 1, and was taken asynchronously. • The exception was generated because FEAT_SEBEP is implemented and PSTATE.PPEND was 1, and was taken synchronously.	When FEAT_EBEP is implemented
0b00001	Profiling Buffer management event. The exception was generated because PMBSR_EL1.S was 1.	When FEAT_SPE_EXC is implemented
0b00010	Trace buffer management event. The exception was generated because TRBSR_EL1.IRQ was 1.	When FEAT_TRBE_EXC is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SYNC, bit [0]

Indicates whether the Profiling exception was taken synchronously or asynchronously.

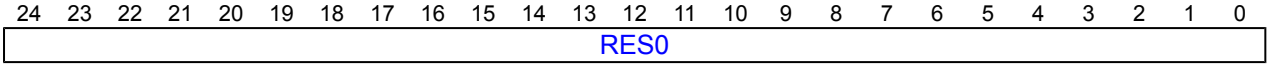
SYNC	Meaning	Applies when
0b0	The exception was taken asynchronously.	
0b1	The exception was taken synchronously.	When FEAT_SEBEP is implemented

If ESR_EL1.FSC does not indicate a PMU Profiling exception, or FEAT_SEBEP is not implemented, then the only permitted value is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault



Bits [24:0]

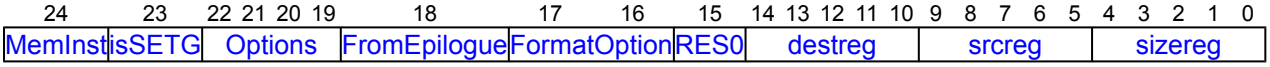
Reserved, RES0.

Additional information for the ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about PC alignment fault exceptions, see 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from the Memory Copy and Memory Set instructions



MemInst, bit [24]

Indicates the memory instruction class causing the exception.

MemInst	Meaning
0b0	CPYFE*, CPYFM*, CPYE*, and CPYM* instructions.
0b1	SETE*, SETM*, SETGE*, and SETGM* instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

isSETG, bit [23]

Indicates whether the instruction belongs to SETGM* or SETGE* class of instruction.

isSETG	Meaning
0b0	Not a SETGM* or SETGE* instruction.
0b1	SETGM* or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Options, bits [22:19]

Options : the Options field of the instruction.

For Memory Copy instructions, bits[22:19] forms the Options field, which holds the bits[15:12] of the instruction.

For Memory Set instructions:

- Bits[22:21] are RES0.
- Bits[20:19] form the Options field, which holds the bits[13:12] of the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FromEpilogue, bit [18]

Indicates whether the instruction belongs to the epilogue class of Memory Copy or Memory Set instructions.

FromEpilogue	Meaning
0b0	Not an epilogue instruction.
0b1	CPYE*, CPYFE*, SETE*, or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FormatOption, bits [17:16]

Reports the Option used to encode the initial Xs, Xd, and Xn register values provided to the instruction that generated the exception.

FormatOption	Meaning
0b00	Option B.
0b01	Option A.
0b10	Option A.
0b11	Option B.

For more information, see Memory Copy and Memory Set exceptions.

Note

This field was previously presented as two separate bits, WrongOption, bit[17] and OptionA, bit [16], which were already expected to be used together and not individually.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

destreg, bits [14:10]

The destination register value from the issued instruction, containing the destination address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

srcreg, bits [9:5]

The source register value from the issued instruction, containing either the source address or the source data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

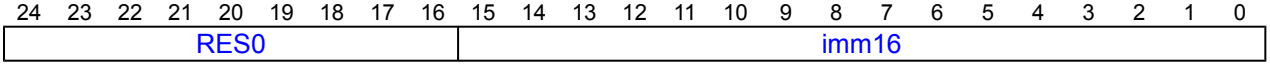
sizereg, bits [4:0]

The size register value from the issued instruction, containing the number of bytes to be transfered or set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from HVC or SVC instruction execution



Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from HVC or SVC instruction execution

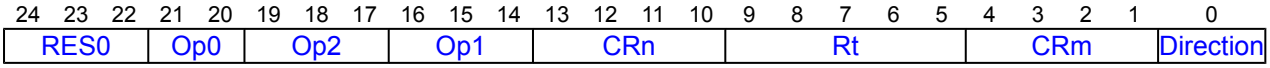
In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, HFGITR_EL2.{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state



Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

For system instructions which require that the opcode Rt field is set to `0b11111`, but where the trapped instruction has a different value of Rt, an implementation is permitted to return the value `0b11111`, instead of the value of Rt from the trapped instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
`0b0`	Write access, including MSR instructions.
`0b1`	Read access, including MRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

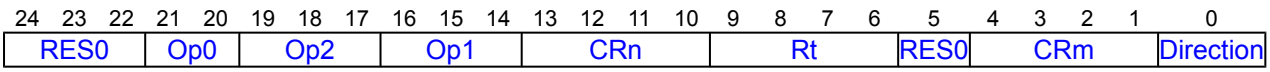
The following fields describe configuration settings for generating the exception that is reported using EC value `0b011000`:

- If FEAT_TIDCP1 is implemented, SCTLR_EL1.TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL1.
- SCTLR_EL1.UCI, for execution of cache maintenance instructions using AArch64 state, execution is trapped to EL1 or EL2.
- SCTLR_EL1.UCT, for accesses to CTR_EL0 using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.DZE, for execution of DC ZVA instructions using AArch64 state, execution is trapped to EL1 or EL2.
- SCTLR_EL1.UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- CPACR_EL1.TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- PMUSERENR_EL0, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TDZ, for execution of DC ZVA instructions using AArch64 state, execution is trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions using AArch64 state, execution is trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, execution is trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register, ACTLR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- If FEAT_TIDCP1 is implemented, SCTLR_EL2.TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- If FEAT_MTE2 is implemented, HCR_EL2.TID5, for accesses to GMID_EL1, using AArch64 state, MRS or MSR access at EL1, trapped to EL2.
- If FEAT_IDTE3 is implemented, SCR_EL3.TID3, for accesses to ID group 3 registers using AArch64 state, at EL1 and EL2, trapped to EL3.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TTRF, for accesses to the trace filter control register, TRFCR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.AT, for execution of AT S1E* instructions, using AArch64 state, execution is trapped to EL2.
- HCR_EL2.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- SCR_EL3.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TCPAC, for accesses to CPTR_EL2 and CPACR_EL1 using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TTRF, for accesses to the trace filter control registers, TRFCR_EL1 and TRFCR_EL2, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- If FEAT_SPE is implemented:
  - MDCR_EL3.NSPB for accesses to Statistical Profiling and Profiling Buffer control registers, using AArch64 state, MSR or MRS access at EL1 and EL2 trapped to EL3.
  - MDCR_EL2.TPMS for accesses to SPE registers, using AArch64 state, MSR or MRS access at EL1 trapped to EL2.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - HCR2.{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT_FGT is implemented:
  - SCR_EL3.FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - HFGRTR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - HFGITR_EL2 for execution of system instructions, MSR or MRS access trapped to EL2.
  - HDFGRTR_EL2 for reads and HDFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - HAFGRTR_EL2 for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.
- If FEAT_RNG_TRAP is implemented, SCR_EL3.TRNDR for reads of RNDR and RNDRRS using AArch64 state, MRS access trapped to EL3.
- If FEAT_SME is implemented:
  - CPTR_EL3.ESM, for MSR or MRS accesses to SMPRI_EL1 at EL1, EL2, and EL3, trapped to EL3.
  - CPTR_EL3.ESM, for MSR or MRS accesses to SMPRIMAP_EL2 at EL2 and EL3, trapped to EL3.
  - SCTLR_EL1.EnTP2, for MSR or MRS accesses to TPIDR2_EL0 at EL0, trapped to EL1 or EL2.
  - SCTLR_EL2.EnTP2, for MSR or MRS accesses to TPIDR2_EL0 at EL0, trapped to EL2.
  - SCR_EL3.EnTP2, for MSR or MRS accesses to TPIDR2_EL0 at EL0, EL1, and EL2, trapped to EL3.
- If FEAT_FPMR is implemented:

        - SCTLR_EL1.EnFPM, for accesses to FPMR at EL0, trapped to EL1 or EL2.
        - SCTLR_EL2.EnFPM, for accesses to FPMR at EL0, trapped to EL2.
        - HCRX_EL2.EnFPM, for accesses to FPMR at EL0 and EL1, trapped to EL2.
        - SCR_EL3.EnFPM, for accesses to FPMR at EL0, EL1, and EL2, trapped to EL3.
- If FEAT_NMI is implemented, HCRX_EL2.TALLINT, for MSR writes of ALLINT at EL1, trapped to EL2.
- If FEAT_FGT2 is implemented:
    - SCR_EL3.FGTEn2, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
    - HFGRTR2_EL2 for reads and HFGWTR2_EL2 for writes of registers, using AArch64 state, using MSR or MRS access at EL1 trapped to EL2.
    - HDFGRTR2_EL2 for reads and HDFGWTR2_EL2 for writes of registers, using AArch64 state, using MSR or MRS access at EL0 and EL1 trapped to EL2.
    - HFGITR2_EL2 for execution of system instructions, MSR or MRS access trapped to EL2.
- If FEAT_ITE is implemented, MDCR_EL3.EnITE, for accesses to Instrumentation trace registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_MEC is implemented, SCR_EL3.MECEn, for accesses to MECID registers at EL2, trapped to EL3.
- If FEAT_SPE_FDS is implemented, MDCR_EL3.EnPMS3 for accesses to SPE registers, using AArch64 state, MSR or MRS access at EL1 and EL2 trapped to EL3.
- If FEAT_SPE_nVM is implemented, MDCR_EL3.EnPMS4 for accesses to SPE registers, using AArch64 state, MSR or MRS access at EL1 and EL2 trapped to EL3.
- If FEAT_RASv2 is implemented, SCR_EL3.TWERR, for accesses to Error Record registers, MSR access at EL1 and EL2 trapped to EL3.
- If FEAT_Debugv8p9 is implemented, MDCR_EL3.EBWE for accesses of MDSELR_EL1, using AArch64 state, MRS or MSR access at EL2 and EL1 trapped to EL3.
- If FEAT_PMUv3p9, FEAT_SPMU, FEAT_EBEP, or FEAT_PMUv3_SS is implemented, MDCR_EL3.EnPM2, for accesses to PMU registers, using AArch64 state, MSR or MRS access at EL2, EL1, and EL0, trapped to EL3.
- If FEAT_PMUv3_SS is implemented, MDCR_EL3.EnPMSS, for accesses to PMU Snapshot registers, using AArch64 state, MSR or MRS access at EL2 and EL1 trapped to EL3.
- If FEAT_THE is implemented, SCR_EL3.RCWMASKEn for accesses to RCWMASK_EL1 and RCWSMASK_EL1, using AArch64 state, MSR or MRS access at EL2 and EL1 trapped to EL3.
- If FEAT_AIE is implemented, SCR_EL3.AIEn for accesses to Extended Memory Attribute registers, MSR or MRS access at EL2 and EL1 trapped to EL3.
- If FEAT_S1PIE, FEAT_S2PIE, FEAT_S1POE, or FEAT_S2POE is implemented, SCR_EL3.PIEn for accesses to Permission Indirection, Overlay registers, MSR or MRS access at EL2, EL1 and EL0 trapped to EL3.
- If FEAT_MPAM_PE_BW_CTRL is implemented, MPAMBW2_EL2.{nTRAP_MPAMBWIDR_EL1, nTRAP_MPAMBW0_EL1, nTRAP_MPAMBW1_EL1} for accesses to MPAMBW*_EL1 registers, using AArch64 state, MRS or MSR access at EL1, trapped to EL2.
- If FEAT_MPAM_PE_BW_CTRL and FEAT_SME are implemented, MPAMBW2_EL2.nTRAP_MPAMBWSM_EL1, for accesses to MPAMBWSM_EL1, using AArch64 state, MRS or MSR access at EL1, trapped to EL2.
- If FEAT_MPAM_PE_BW_CTRL is implemented, MPAMBW3_EL3.nTRAPLOWER, for accesses to MPAMBW_EL2 registers and MPAMBW_EL1 registers, using AArch64 state, MRS or MSR access at EL1, trapped to EL3.
- If FEAT_HACDBS is implemented, SCR_EL3.HACDBSEn, for accesses to HACDBSBR_EL2 and HACDBSCONS_EL2, using AArch64 state, MRS or MSR access at EL2, trapped to EL3.
- If FEAT_HDBSS is implemented, SCR_EL3.HDBSSEn, for accesses to HDBSSBR_EL2 and HDBSSPROD_EL2, using AArch64 state, MRS or MSR access at EL2, trapped to EL3.
- If FEAT_SRMASK is implemented, SCR_EL3.SRMASKEn, for MSR or MRS accesses at EL1 or EL2 to the MASK registers using AArch64 state, trapped to EL3.

ISS encoding for an exception from MSRR, MRRS, or 128-bit System instruction execution in AArch64 state



Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:6]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

Note

This value represents register pair of X[Rt:0], X[Rt:1].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, MSRR instructions.
0b1	Read access, MRRS instructions.

The reset behavior of this field is:

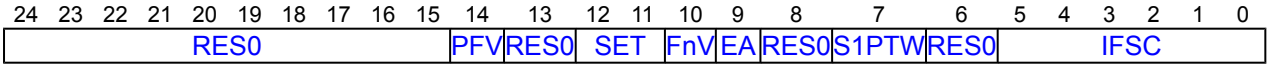
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from MSRR, MRRS, or 128-bit System instruction execution in AArch64 state

The following fields describe configuration settings for generating exceptions from an MSRR or MRRS access that are reported using EC value `0b010100`:

- If FEAT_FGT is implemented:
  - HFGRTR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, accesses at EL1 trapped to EL2.
- If FEAT_FGT2 is implemented:
  - HFGRTR2_EL2.nRCWSMASK_EL1 for reads and HFGWTR2_EL2.nRCWSMASK_EL1 for writes of RCWSMASK_EL1, using AArch64 state, accesses at EL1 trapped to EL2.
- If FEAT_SYSREG128 is implemented:
  - SCTLR2_EL1.EnIDCP128 for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL0 trapped to EL1.
  - SCTLR2_EL2.EnIDCP128 for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL0 trapped to EL2.
  - HCRX_EL2.EnIDCP128 for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL1 and EL0 trapped to EL2.
  - SCR_EL3.EnIDCP128 for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL2, EL1, and EL0 trapped to EL3.
- If FEAT_D128 is implemented:
  - HCR_EL2.{TRVM, TVM} for accesses to TTBR0_EL1 and TTBR1_EL1, accesses at EL1 and EL0 trapped to EL2.
  - HCRX_EL2.D128En for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL1 trapped to EL2.
  - SCR_EL3.D128En for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL2 and EL1 trapped to EL3.
- If FEAT_THE is implemented, SCR_EL3.RCWMASKEn for accesses to RCWMASK_EL1 and RCWSMASK_EL1, using AArch64 state, accesses at EL2 and EL1 trapped to EL3.

ISS encoding for an exception from an Instruction Abort



When FEAT_S1POE is implemented, if a memory access generates a Instruction Abort due to a Permission fault, the ISS2 encoding for an exception from an Instruction Abort includes further information about the exception.

Bits [24:15]

Reserved, RES0.

PFV, bit [14]

When FEAT_PFAR is implemented and (IFSC == 0b010000, or IFSC IN {0b01001x}, or IFSC IN {0b0101xx}):

PFAR Valid. Describes whether the PFAR_EL1 register is valid.

PFV	Meaning
0b0	PFAR_EL1 is UNKNOWN.
0b1	PFAR_EL1 is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [13]

Reserved, RES0.

SET, bits [12:11]

When FEAT_RAS is implemented and (IFSC == 0b010000, or IFSC IN {0b01001x}, or IFSC IN {0b0101xx}):

Synchronous Error Type. Describes the PE error state after taking the Instruction Abort exception.

SET	Meaning	Applies when
0b00	Recoverable state (UER).	
0b10	Uncontainable (UC).	When FEAT_RASv2 is not implemented
0b11	Restartable state (UEO).	

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External abort exception might result in a PE state that is not recoverable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented

0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

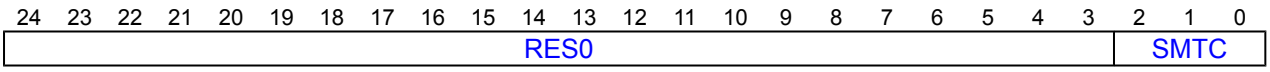
For more information about the lookup level associated with a fault, see 'The lookup level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception due to SME functionality



The accesses covered by this trap include:

- Execution of SME instructions.
- Execution of SVE and Advanced SIMD instructions, when the PE is in Streaming SVE mode.
- Direct accesses of SVCR, SMCR_EL1, SMCR_EL2, SMCR_EL3.

Bits [24:3]

Reserved, RES0.

SMTC, bits [2:0]

SME Trap Code. Identifies the reason for instruction trapping.

SMTC	Meaning	Applies when
0b000	Access to SME functionality trapped as a result of CPACR_EL1.SMEN, CPTR_EL2.SMEN, CPTR_EL2.TSM, or CPTR_EL3.ESM, that is not reported using EC value 0b000000.	
0b001	Advanced SIMD, SVE, or SVE2 instruction trapped because PSTATE.SM is 1.	
0b010	SME instruction trapped because PSTATE.SM is 0.	
0b011	SME instruction trapped because PSTATE.ZA is 0.	
0b100	Access to the SME2 ZT0 register trapped as a result of SMCR_EL1.EZT0, SMCR_EL2.EZT0, or SMCR_EL3.EZT0.	When FEAT_SME2 is implemented

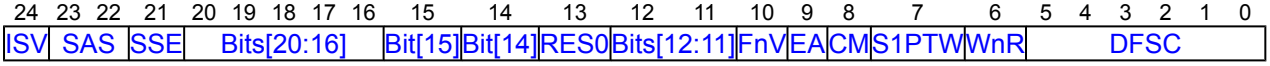
All other values are reserved.

Additional information for the ISS encoding for an exception due to SME functionality

The following fields describe the configuration settings for the traps that are reported using the EC value 0b011101:

- CPACR_EL1.SMEN, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access SVCR and SMCR_EL1 System registers at EL1 and EL0, trapped to EL1 or EL2.
- CPTR_EL2.SMEN and CPTR_EL2.TSM, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access SVCR, SMCR_EL1, SMCR_EL2 at EL2, EL1, and EL0, trapped to EL2.
- CPTR_EL3.ESM, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access SVCR, SMCR_EL1, SMCR_EL2, SMCR_EL3 from all Exception levels and any Security state, trapped to EL3.
- If FEAT_SME2 is implemented:
  - SMCR_EL1.EZT0, for accesses to ZT0 at EL1 and EL0, trapped to EL1 or EL2.
  - SMCR_EL2.EZT0, for accesses to ZT0 at EL2, EL1, and EL0, trapped to EL2.
  - SMCR_EL3.EZT0, for accesses to ZT0 at any Exception level, trapped to EL3.

ISS encoding for an exception from a Data Abort



The ISS2 encoding for an exception from a Data Abort includes further information about the exception when any of the following features are implemented:

- FEAT_LS64_V.
- FEAT_LS64_ACCDATA.
- FEAT_S1POE.
- FEAT_S1PIE.
- FEAT_GCS.
- FEAT_MTE_CANONICAL_TAGS.

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL1, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL1, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL1, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL1, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with `0b11111`, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
    - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
    - Is not performing register writeback.
    - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_MTE2 is implemented, for a synchronous Tag Check Fault abort taken to EL1, ESR_EL1.FnV is 0 and FAR_EL1 is valid.

When FEAT_MOPS is implemented, for a synchronous Data Abort on a Memory Copy and Memory Set instruction, ISV is 0.

When FEAT_MTE is implemented, for a synchronous Data Abort on an instruction that directly accesses Allocation Tags, ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]
When ISV == 1:

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
`0b00`	Byte
`0b01`	Halfword
`0b10`	Word
`0b11`	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is `0b11`.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is `0b11`.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is `0b11`.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSE, bit [21]
When ISV == 1:

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits[20:16]
When ISV == 1:

SRT, bits [4:0] of bits [20:16]

Syndrome Register Transfer. The register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ISV == 0, FEAT_RASv2 is implemented, and (DFSC == 0b010000, or DFSC IN {0b01001x}, or DFSC IN {0b0101xx}):

Bits [4:2] of bits [20:16]

Reserved, RES0.

WU, bits [1:0] of bits [20:16]

Write Update. Describes whether a store instruction that generated an External abort updated the location.

WU	Meaning
0b00	Not a store instruction or translation table update, or the location might have been updated.
0b10	Store instruction or translation table update that did not update the location.
0b11	Store instruction or translation table update that updated the location.

In the description of this field, a store instruction is any memory-writing instruction that explicitly performs a store. This includes instructions that both read and write memory.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[15]
When ISV == 1:

SF, bit [15]

Sixty Four bit general-purpose register transfer. Width of the register accessed by the instruction is 64-bit.

SF	Meaning
0b0	Instruction loads/stores a 32-bit general-purpose register.
0b1	Instruction loads/stores a 64-bit general-purpose register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ISV == 0:

FnP, bit [15]

FAR not Precise.

FnP	Meaning	Applies when
0b0	The FAR holds the faulting virtual address that generated the Data Abort.	
0b1	The FAR holds any virtual address within the naturally-aligned granule that contains the faulting virtual address that generated a Data Abort due to an SVE contiguous vector load/store instruction, or an SME load/store instruction. For more information about the naturally-aligned fault granule, see FAR_ELx (for example, FAR_EL1).	When FEAT_SME is implemented or FEAT_SVE is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[14]
When ISV == 1:

AR, bit [14]

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_PFAR is implemented and (DFSC == 0b010000, or DFSC IN {0b01001x}, or DFSC IN {0b0101xx}):

PFV, bit [14]

PFAR Valid. Describes whether the PFAR_EL1 register is valid.

PFV	Meaning
0b0	PFAR_EL1 is UNKNOWN.
0b1	PFAR_EL1 is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [13]

Reserved, RES0.

Bits[12:11]
When (DFSC IN {0b00xxxx} || DFSC IN {0b10101x}) && !(DFSC IN {0b0000xx}):

LST, bits [1:0] of bits [12:11]

Load/Store Type. Used when a Translation fault, Access flag fault, or Permission fault generates a Data Abort.

LST	Meaning	Applies when
0b00	The instruction that generated the Data Abort is not specified by this field.	
0b01	An ST64BV instruction generated the Data Abort.	When FEAT_LS64_V is implemented
0b10	An LD64B or ST64B instruction generated the Data Abort.	When FEAT_LS64 is implemented
0b11	An ST64BV0 instruction generated the Data Abort.	When FEAT_LS64_ACCDATA is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RAS is implemented and (DFSC == 0b010000, or DFSC IN {0b01001x}, or DFSC IN {0b0101xx}):

SET, bits [1:0] of bits [12:11]

Synchronous Error Type. Used when a synchronous External abort, not on a Translation table walk or hardware update of the Translation table, generated the Data Abort. Describes the PE error state after taking the Data Abort exception.

SET	Meaning	Applies when
0b00	Recoverable state (UER).	
0b10	Uncontainable (UC).	When FEAT_RASv2 is not implemented
0b11	Restartable state (UEO).	

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External abort exception might result in a PE state that is not recoverable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- If FEAT_RASv2 is implemented, an External abort on an Atomic access, reported with ESR_EL1.WU set to 0b00.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	

0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The lookup level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV	RES0												VECITR			IDF	RES0		IXF	UFF	OFF	DZF	IOF

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from an instruction that is performing floating-point operations on more than one lane of a vector.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from an instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

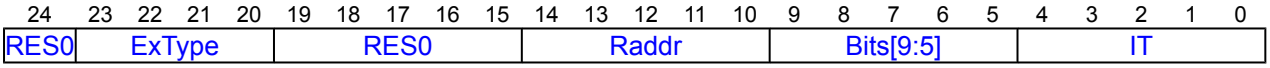
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from a trapped floating-point exception

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the FPCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for a GCS exception



Bit [24]

Reserved, RES0.

ExType, bits [23:20]

The first level classification of GCS exceptions.

ExType	Meaning
0b0000	The exception reported is a Guarded Control Stack Data Check Exception.
0b0001	The exception reported is an EXLOCK Exception.
0b0010	The exception reported is a trap exception on GCSSTR or GCSSTTR instruction execution.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:15]

Reserved, RES0.

Raddr, bits [14:10]

When ExType == 0b0010 :

Indicates the data address register number supplied in the instruction that has been trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits[9:5]

When ExType == 0b0000 :

Rn, bits [4:0] of bits [9:5]

Indicates a register number used by the instruction that caused the Guarded Control Stack Data Check Exception.

For a procedure return instruction reported with ESR_EL1.ISS.IT as 0b00000, contains the register number for the register which contains the target address of the branch.

For a GCSPOPM instruction reported with ESR_EL1.ISS.IT as 0b00001, contains the register number for the register which is the destination register of the instruction.

For a procedure return instruction reported with ESR_EL1.ISS.IT as `0b00010` or `0b00011`, contains the value `0b11110`, indicating X30.

For a GCSSS1 instruction reported with ESR_EL1.ISS.IT as `0b00100`, contains the register number for the register which is the input register of the instruction.

If ESR_EL1.ISS.IT is reported as `0b00101` or `0b01000`, this field is UNKNOWN

If ESR_EL1.ISS.IT is reported as `0b01001`, this field is `0b11111`

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ExType == 0b0010 :

Rvalue, bits [4:0] of bits [9:5]

Indicates the data value register number supplied in the instruction that has been trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IT, bits [4:0]
When ExType == 0b0000 :

Type of the instruction that caused the Guarded Control Stack Data Check Exception.

IT	Meaning
`0b00000`	Guarded Control Stack Data Check Exception is from a procedure return instruction without Pointer authentication.
`0b00001`	Guarded Control Stack Data Check Exception is from a GCSPOPM instruction.
`0b00010`	Guarded Control Stack Data Check Exception is from a procedure return instruction with Pointer authentication that uses key A.
`0b00011`	Guarded Control Stack Data Check Exception is from a procedure return instruction with Pointer authentication that uses key B.
`0b00100`	Guarded Control Stack Data Check Exception is from a GCSSS1 instruction.
`0b00101`	Guarded Control Stack Data Check Exception is from a GCSSS2 instruction.
`0b01000`	Guarded Control Stack Data Check Exception is from a GCSPOPCX instruction.
`0b01001`	Guarded Control Stack Data Check Exception is from a GCSPOPX instruction.

All other values are reserved

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

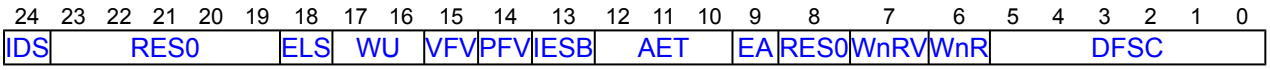
Reserved, RES0.

Additional information for the ISS encoding for a GCS exception

The following fields describe the configuration settings for the traps that are reported using EC value `0b101101` and ExType value `0b0010`:

- GCSCRE0_EL1.STREn
- GCSCR_EL1.STREn.
- GCSCR_EL2.STREn.
- GCSCR_EL3.STREn.
- HFGITR_EL2.nGCSSTR_EL1.

ISS encoding for an SError exception



Note

In earlier versions of the architecture, an SError exception is referred to as an SError interrupt or an asynchronous External abort exception.

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
`0b0`	Bits [23:0] of the ISS field holds the fields described in this encoding. **Note** If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.
`0b1`	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError exception.

Note

This field was previously called ISV.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:19]

Reserved, RES0.

ELS, bit [18]

When FEAT_RASv2 is implemented and DFSC == 0b010001:

Meaning of ELR_ELx.

ELS	Meaning
`0b0`	Asynchronous. Does not indicate the trigger for the exception.
`0b1`	Synchronous. The exception was triggered by the instruction at ELR_ELx.

SError exceptions that report this field is 1 are not required to be precise.

The ESR_EL1.AET field describes whether the exception is precise or imprecise.

Corrected, Recoverable or Restartable exceptions are precise. Unrecoverable or Uncontainable exceptions are imprecise.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WU, bits [17:16]
When FEAT_RASv2 is implemented and DFSC == 0b010001:

Write Update. Describes whether a store instruction that generated an External abort updated the location.

WU	Meaning
0b00	Not a store instruction or translation table update, or the location might have been updated.
0b10	Store instruction or translation table update that did not update the location.
0b11	Store instruction or translation table update that updated the location.

In the description of this field, a store instruction is any memory-writing instruction that explicitly performs a store. This includes instructions that both read and write memory.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VFV, bit [15]
When FEAT_RASv2 is implemented and DFSC == 0b010001:

FAR Valid. Indicates the FAR_EL1 register contains a valid virtual address.

VFV	Meaning
0b0	FAR_EL1 is not valid, and holds an UNKNOWN value.
0b1	FAR_EL1 contains a valid virtual address associated with the error.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PFV, bit [14]
When FEAT_PFAR is implemented and DFSC == 0b010001:

PFAR Valid. Describes whether the PFAR_EL1 register is valid.

PFV	Meaning
0b0	PFAR_EL1 is UNKNOWN.
0b1	PFAR_EL1 is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IESB, bit [13]
When FEAT_IESB is implemented and DFSC == 0b010001:

Implicit error synchronization event.

IESB	Meaning
0b0	The SError exception was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError exception was synchronized by the implicit error synchronization event and taken immediately.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]
When FEAT_RAS is implemented and DFSC == 0b010001:

Asynchronous Error Type.

Describes the PE error state after taking the SError exception.

AET	Meaning
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]
When FEAT_RAS is implemented and DFSC == 0b010001:

External abort type. Provides an IMPLEMENTATION DEFINED classification of External aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

WnRV, bit [7]
When FEAT_RASv2 is implemented and DFSC == 0b010001:

ESR_EL1.WnR valid.

WnRV	Meaning
0b0	ESR_EL1.WnR is not valid and has been set to 0b0.
0b1	ESR_EL1.WnR is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WnR, bit [6]
When FEAT_RASv2 is implemented and DFSC == 0b010001:

Write-not-Read. When the WnRV field is 0b1, indicates whether an exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Exception was caused by an instruction reading from a memory location.
0b1	Exception was caused by an instruction writing to a memory location.

Accessing this bit has the following behavior:

- This bit is RES0 if ESR_EL1.WnRV==0b0.
- This bit is not valid and reads UNKNOWN if an External abort on a Atomic access, reported with ESR_EL1.WU == 0b00.
- Otherwise RW.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DFSC, bits [5:0]

When FEAT_RAS is implemented:

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError exception.

All other values are reserved.

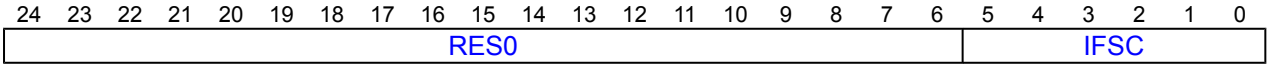
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception



Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behavior of this field is:

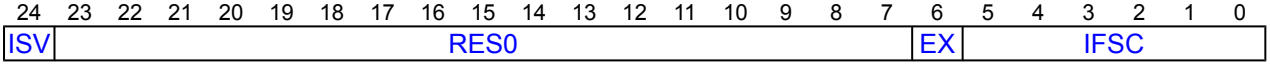
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

ISS encoding for an exception from a Software Step exception



ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

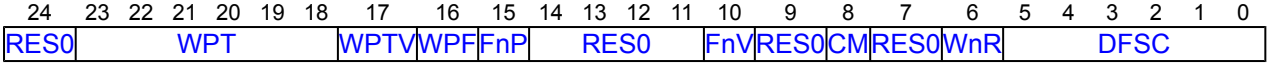
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from a Software Step exception

For more information about generating these exceptions, see 'Software Step exceptions'.

ISS encoding for an exception from a Watchpoint exception



Bit [24]

Reserved, RES0.

WPT, bits [23:18]

When FEAT_Debugv8p2 is implemented:

Watchpoint number.

All other values are reserved.

Otherwise:

Reserved, RES0.

WPTV, bit [17]

When FEAT_Debugv8p2 is implemented:

Watchpoint number Valid.

WPTV	Meaning
0b0	The WPT field is invalid, and holds an UNKNOWN value.
0b1	The WPT field is valid, and holds the number of a watchpoint that triggered a Watchpoint exception.

If FEAT_Debugv8p9 is implemented, value 0b0 is not permitted.

When a Watchpoint exception is triggered by a watchpoint match:

- If FEAT_Debugv8p9 is implemented or the PE sets any of FnV, FnP, or WPF to 1, then the PE sets WPTV to 1.
- Otherwise, the PE sets WPTV to an IMPLEMENTATION DEFINED value, 0 or 1.

Otherwise:

Reserved, RES0.

WPF, bit [16]

Watchpoint might be false-positive.

WPF	Meaning	Applies when
0b0	The watchpoint matched an address or address range that was accessed by the instruction.	
0b1	The watchpoint matched an address or address range that might not have been accessed by the instruction.	When FEAT_SVE is implemented or FEAT_SME is implemented

Arm strongly recommends that this bit is set to 0, other than when one of the following instructions might generate a watchpoint match for an address or address range that the instruction does not access:

- An SVE contiguous vector load/store instruction, when the PE is in Streaming SVE mode.
- An SME load/store instruction.

FnP, bit [15]

FAR not Precise.

This field only has meaning if the FAR is valid; that is, when the FnV field is 0. If the FnV field is 1, the FnP field is 0.

FnP	Meaning	Applies when
0b0	If the FnV field is 0, the FAR holds the virtual address of an access or set of contiguous accesses that triggered a Watchpoint exception.	
0b1	The FAR holds any address within the smallest implemented translation granule that contains the virtual address of an access or set of contiguous accesses that triggered a Watchpoint exception.	When FEAT_SVE is implemented or FEAT_SME is implemented

Bits [14:11]

Reserved, RES0.

FnV, bit [10]

FAR not Valid.

FnV	Meaning	Applies when
0b0	The FAR is valid, and its value is as described by the FnP field.	
0b1	The FAR is invalid, and holds an UNKNOWN value.	When FEAT_SVE is implemented or FEAT_SME is implemented

Bit [9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by the execution of a cache maintenance instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution does not cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

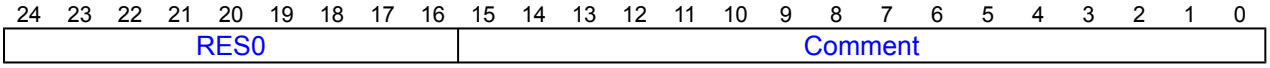
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from a Watchpoint exception

For more information about generating these exceptions, see 'Watchpoint exceptions'.

ISS encoding for an exception from execution of a Breakpoint instruction



Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

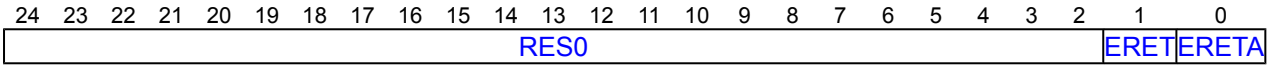
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from execution of a Breakpoint instruction

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction



This EC value applies when:

- FEAT_FGT is implemented.
- The Effective value of HCR_EL2.NV is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL1.

ERET	Meaning
0b0	ERET instruction trapped to EL1.
0b1	ERETAA or ERETAB instruction trapped to EL1.

If this bit is 0, the ERETA field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL1.

ERETA	Meaning
0b0	ERETAA instruction trapped to EL1.
0b1	ERETAB instruction trapped to EL1.

When the ERET field is 0, this bit is RES0.

The reset behavior of this field is:

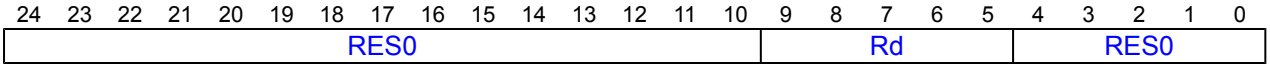
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction

For more information about generating these exceptions, see HCR_EL2.NV.

If FEAT_FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETAA, and ERETAB execution.

ISS encoding for an exception from a TSTART instruction



Bits [24:10]

Reserved, RES0.

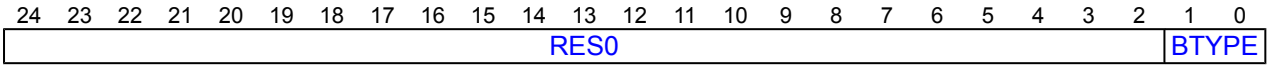
Rd, bits [9:5]

The Rd value from the issued instruction, the general purpose register used for the destination.

Bits [4:0]

Reserved, RES0.

ISS encoding for an exception from Branch Target Identification instruction



Bits [24:2]

Reserved, RES0.

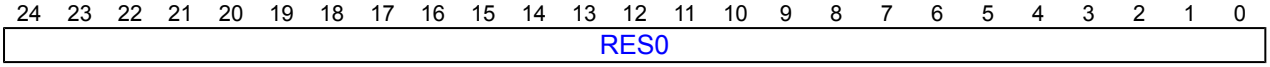
BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

Additional information for the ISS encoding for an exception from Branch Target Identification instruction

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ISS encoding for an exception from a trapped Pointer Authentication instruction



Bits [24:0]

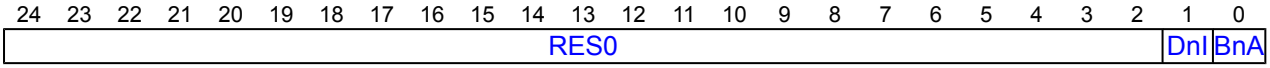
Reserved, RES0.

Additional information for the ISS encoding for an exception from a trapped Pointer Authentication instruction

For more information about generating these exceptions, see:

- HCR_EL2.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- SCR_EL3.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for a PAC Fail exception



Bits [24:2]

Reserved, RES0.

DnI, bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

DnI	Meaning
0b0	Instruction Key.
0b1	Data Key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BnA, bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

BnA	Meaning
0b0	A key.
0b1	B key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for a PAC Fail exception

The following instructions generate a PAC Fail exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTDA, AUTDZA.

- AUTDB, AUTDZB.
- AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIZA.
- AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZB.
- AUTIASPPC, AUTIASPPCR, AUTIA171615.
- AUTIBSPPC, AUTIBSPPCR, AUTIB171615.

If FEAT_FPACCOMBINE is implemented, the following instructions generate a PAC Fail exception when the Pointer Authentication Code (PAC) is incorrect:

- RETAA, RETAB.
- RETAASPPC, RETABSPPC.
- RETAASPPCR, RETABSPPCR.
- BLRAA, BLRAAZ, BLRAB, BLRABZ.
- BRAA, BRAB, BRAAZ, BRABZ.
- ERETAA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing ESR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name ESR_EL1 or ESR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ESR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0010	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);

ESR_EL2, Exception Syndrome Register (EL2)

The ESR_EL2 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL2.

Configuration

AArch64 System register ESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ESR_EL2 are UNDEFINED.

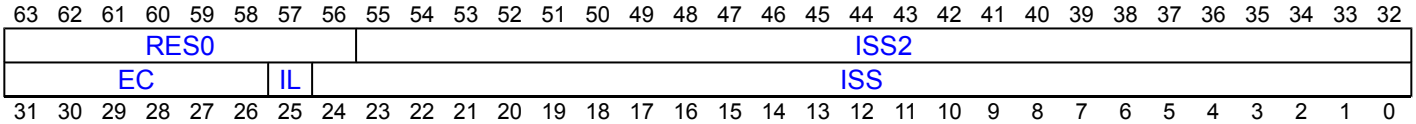
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ESR_EL2 is a 64-bit register.

Field descriptions



ESR_EL2 is made UNKNOWN as a result of an exception return from EL2.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of ESR_EL2 is UNKNOWN. The value written to ESR_EL2 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

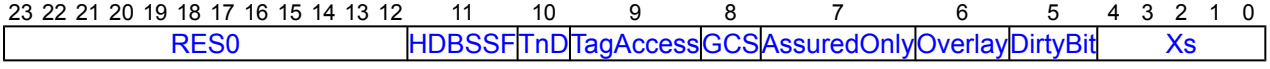
Bits [63:56]

Reserved, RES0.

ISS2, bits [55:32]

ISS2 encoding for an exception, the bit assignments are:

ISS2 encoding for an exception from a Data Abort



Bits [23:12]

Reserved, RES0.

HDBSSF, bit [11]

When FEAT_HDBSS is implemented, IsSecondStage(Fault), and DFSC == 0b0011xx || DFSC == 0b01001x || DFSC == 0b0101xx || DFSC == 0b10001x || DFSC == 0b1001xx:

When DFSC indicates a stage 2 Permission fault, this field indicates whether that fault was caused by the HDBSS being full.

When DFSC indicates a synchronous External abort on translation table walk or hardware update of translation table, this field indicates whether the fault was caused by a write to the HDBSS.

When DFSC indicates a Granule Protection Fault on translation table walk or hardware update of translation table, this field indicates whether the fault was caused by a write to the HDBSS.

HDBSSF	Meaning
0b0	Fault was not caused by HDBSS.
0b1	Fault was caused by HDBSS.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TnD, bit [10]

When FEAT_MTE_CANONICAL_TAGS is implemented:

Tag not Data.

If a memory access generates a Data Abort for a stage 1 Permission fault, this field indicates whether the fault is due to an Allocation Tag access.

TnD	Meaning
0b0	Permission fault is not due to a write of an Allocation Tag to Canonically Tagged memory.
0b1	Permission fault is due to a write of an Allocation Tag to Canonically Tagged memory.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TagAccess, bit [9]

When FEAT_MTE_PERM is implemented:

NoTagAccess fault.

If a memory access generates a Data Abort for a Permission fault, this field indicates whether the fault is due to the NoTagAccess memory attribute.

TagAccess	Meaning
0b0	Permission fault is not due to the NoTagAccess memory attribute.
0b1	Permission fault is due to the NoTagAccess memory attribute.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GCS, bit [8]
When FEAT_GCS is implemented:

Guarded Control Stack data access.

If a memory access generates a Data Abort, this field indicates whether the fault is due to a Guarded Control Stack data access.

GCS	Meaning
0b0	The Data Abort is not due to a Guarded control stack data access.
0b1	The Data Abort is due to a Guarded control stack data access. The ISV field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]
When FEAT_THE is implemented:

AssuredOnly flag.

If a memory access generates a Data Abort for a stage 2 Permission fault, this field holds information about the fault.

If this field is 1 and ESR_EL2.GCS is 1, then the AssuredOnly check might have been the result of VTCR_EL2.GCSH configuration.

AssuredOnly	Meaning
0b0	The Data Abort is not due to AssuredOnly.
0b1	The Data Abort is due to AssuredOnly.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [6]
When FEAT_S1POE is implemented or FEAT_S2POE is implemented:

Overlay flag.

If a memory access generates a Data Abort for a Permission fault, this field holds information about the fault.

Overlay	Meaning
0b0	The Data Abort is not due to Overlay Permissions.
0b1	The Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]
When FEAT_S1PIE is implemented or FEAT_S2PIE is implemented:

DirtyBit flag.

If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Xs, bits [4:0]
When FEAT_LS64 is implemented:

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

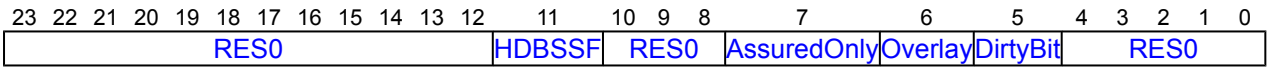
When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

Otherwise, this field is RES0.

Otherwise:

Reserved, RES0.

ISS2 encoding for an exception from an Instruction Abort



Bits [23:12]

Reserved, RES0.

HDBSSF, bit [11]

When FEAT_HDBSS is implemented:

Indicates that the fault was caused by the HDBSS.

When IFSC indicates a Permission fault, this field indicates whether the fault was caused by the HDBSS being full.

When IFSC indicates a synchronous External abort on translation table walk or hardware update of translation table, this field indicates whether the fault was caused by a write to the HDBSS.

When IFSC indicates a Granule Protection Fault on translation table walk or hardware update of translation table, this field indicates whether the fault was caused by a write to the HDBSS.

HDBSSF	Meaning
0b0	Fault was not caused by HDBSS.
0b1	Fault was caused by HDBSS.

This field only applies for stage 2 Permission faults.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [10:8]

Reserved, RES0.

AssuredOnly, bit [7]

When FEAT_THE is implemented:

AssuredOnly flag.

If a memory access generates a Instruction Abort for a Permission fault, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Instruction Abort is not due to AssuredOnly.
0b1	Instruction Abort is due to stage 2 AssuredOnly attribute.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [6]

When FEAT_S1POE is implemented or FEAT_S2POE is implemented:

Overlay flag.

If a memory access generates a Instruction Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Instruction Abort is not due to Overlay Permissions.
0b1	Instruction Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]

When FEAT_S2PIE is implemented:

DirtyBit flag.

If a write access to memory generates an Instruction Abort for a Permission fault using Indirect Permission, this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

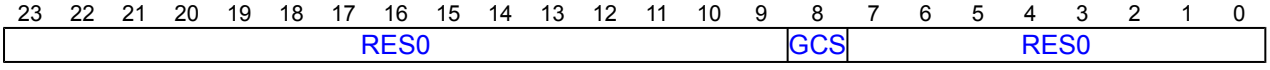
Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

ISS2 encoding for an exception from a Watchpoint exception



Bits [23:9]

Reserved, RES0.

GCS, bit [8]

When FEAT_GCS is implemented:

Guarded control stack data access.

Indicates that the Watchpoint exception is due to a Guarded control stack data access.

GCS	Meaning
0b0	The Watchpoint exception is not due to a Guarded control stack data access.
0b1	The Watchpoint exception is due to a Guarded control stack data access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

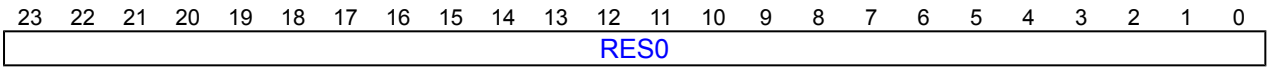
Otherwise:

Reserved, RES0.

Bits [7:0]

Reserved, RES0.

ISS2 encoding for all other exceptions



Bits [23:0]

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	ISS2	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	ISS2 encoding for all other exceptions	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WF* instruction	ISS2 encoding for all other exceptions	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC value 0b000000.	ISS encoding for an exception from an MCR or MRC access	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC value 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: • An STC to write data to memory from DBGDTRRXint. • An LDC to read data from memory to DBGDTRTXint.	ISS encoding for an exception from an LDC or STC instruction	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b000111	Access to SME, SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000.	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps	ISS2 encoding for all other exceptions	
0b001000	Trapped VMRS access, from ID group trap, that is not reported using EC value 0b000111.	ISS encoding for an exception from an MCR or MRC access	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b001001	Trapped use of a Pointer authentication instruction.	ISS encoding for an exception from a trapped Pointer Authentication instruction	ISS2 encoding for all other exceptions	When FEAT_PAuth is implemented
0b001010	Trapped execution of any instruction not covered by other EC values.	ISS encoding for an exception from any other instruction	ISS2 encoding for all other exceptions	When FEAT_LS64 is implemented, or FEAT_SPEv1p5 is implemented, or

				FEAT_TRBEv1p1 is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for an exception from an MCRR or MRRC access	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b001101	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	ISS2 encoding for all other exceptions	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	ISS2 encoding for all other exceptions	
0b010001	SVC instruction execution in AArch32 state. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TGE is 1.	ISS encoding for an exception from HVC or SVC instruction execution	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b010010	HVC instruction execution in AArch32 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b010011	SMC instruction execution in AArch32 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.	ISS encoding for an exception from SMC instruction execution in AArch32 state	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b010100	Trapped MSRR, MRRS or System instruction execution in AArch64 state, that is not reported using EC value 0b000000.	ISS encoding for an exception from MSRR, MRRS, or 128-bit System instruction execution in AArch64 state	ISS2 encoding for all other exceptions	When FEAT_SYSREG128 is implemented or FEAT_SYSINSTR128 is implemented
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b010110	HVC instruction execution in AArch64 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b010111	SMC instruction execution in AArch64 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.	ISS encoding for an exception from SMC instruction execution in AArch64 state	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC values 0b000000, 0b000001 or 0b000111.	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented

	This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values `0b000000`, `0b000001`, or `0b000111`.			
`0b011001`	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC value `0b000000`.	ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	ISS2 encoding for all other exceptions	When FEAT_SVE is implemented
`0b011010`	Trapped ERET, ERETAA, or ERETAB instruction execution.	ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction	ISS2 encoding for all other exceptions	When FEAT_FGT is implemented or FEAT_NV is implemented
`0b011011`	Exception from an access to a TSTART instruction at EL0 when SCTLR_EL1.TME0 == 0, EL0 when SCTLR_EL2.TME0 == 0, at EL1 when SCTLR_EL1.TME == 0, at EL2 when SCTLR_EL2.TME == 0 or at EL3 when SCTLR_EL3.TME == 0.	ISS encoding for an exception from a TSTART instruction	ISS2 encoding for all other exceptions	When FEAT_TME is implemented
`0b011100`	Exception from a PAC Fail	ISS encoding for a PAC Fail exception	ISS2 encoding for all other exceptions	When FEAT_FPAC is implemented
`0b011101`	Access to SME functionality trapped as a result of CPACR_EL1.SMEN, CPTR_EL2.SMEN, CPTR_EL2.TSM, CPTR_EL3.ESM, or an attempted execution of an instruction that is illegal because of the value of PSTATE.SM or PSTATE.ZA, that is not reported using EC value `0b000000`.	ISS encoding for an exception due to SME functionality	ISS2 encoding for all other exceptions	When FEAT_SME is implemented
`0b100000`	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	ISS2 encoding for an exception from an Instruction Abort	
`0b100001`	Instruction Abort taken without a change in Exception level.	ISS encoding for an exception from an Instruction Abort	ISS2 encoding for an exception	

	Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.		from an Instruction Abort	
0b100010	PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	ISS2 encoding for all other exceptions	
0b100100	Data Abort exception from a lower Exception level, excluding Data Abort exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. These Data Abort exceptions might be generated from Exception levels in any Execution state. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	ISS2 encoding for an exception from a Data Abort	
0b100101	Data Abort exception without a change in Exception level, or Data Abort exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	ISS2 encoding for an exception from a Data Abort	
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	ISS2 encoding for all other exceptions	
0b100111	Memory Operation Exception.	ISS encoding for an exception from the Memory Copy and Memory Set instructions	ISS2 encoding for all other exceptions	When FEAT_MOPS is implemented

0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b101101	GCS exception.	ISS encoding for a GCS exception	ISS2 encoding for all other exceptions	When FEAT_GCS is implemented
0b101111	SError exception.	ISS encoding for an SError exception	ISS2 encoding for all other exceptions	
0b110000	Breakpoint exception from a lower Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	ISS2 encoding for all other exceptions	
0b110001	Breakpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	ISS2 encoding for all other exceptions	
0b110010	Software Step exception from a lower Exception level.	ISS encoding for an exception from a Software Step exception	ISS2 encoding for all other exceptions	
0b110011	Software Step exception taken without a change in Exception level.	ISS encoding for an exception from a Software Step exception	ISS2 encoding for all other exceptions	
0b110100	Watchpoint from a lower Exception level, excluding Watchpoint Exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. These Watchpoint Exceptions might be generated from Exception	ISS encoding for an exception from a Watchpoint exception	ISS2 encoding for an exception from a Watchpoint exception	

	levels using any Execution state.			
0b110101	Watchpoint exceptions without a change in Exception level, or Watchpoint exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support.	ISS encoding for an exception from a Watchpoint exception	ISS2 encoding for an exception from a Watchpoint exception	
0b111000	BKPT instruction execution in AArch32 state.	ISS encoding for an exception from execution of a Breakpoint instruction	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b111010	Vector Catch exception from AArch32 state. The only case where a Vector Catch exception is taken to an Exception level that is using AArch64 is when the exception is routed to EL2 and EL2 is using AArch64.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b111100	BRK instruction execution in AArch64 state.	ISS encoding for an exception from execution of a Breakpoint instruction	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b111101	Profiling exception	ISS encoding for a Profiling exception	ISS2 encoding for all other exceptions	When FEAT_EBEP is implemented, or FEAT_SPE_EXC is implemented, or FEAT_TRBE_EXC is implemented

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: • An SError exception. • An Instruction Abort exception. • A PC alignment fault exception. • An SP alignment fault exception. • A Data Abort exception for which the value of the ISV bit is 0. • An Illegal Execution state exception. • Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: ◦ 0b0: 16-bit T32 BKPT instruction. ◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction. • An exception reported using EC value 0b000000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

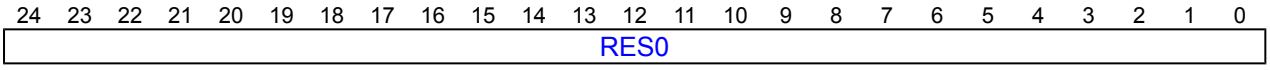
Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value 0b11111.

ISS encoding for exceptions with an unknown reason



Bits [24:0]

Reserved, RES0.

Additional information for the ISS encoding for exceptions with an unknown reason

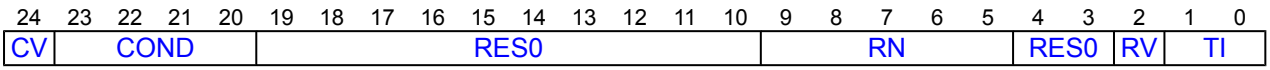
When an exception is reported using this EC value, the IL field is set to 1.

This EC value is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.

- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR_EL1.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
  - An SMC instruction when disabled by SCR_EL3.SMD.
  - An HLT instruction when disabled by EDSCR.HDE.
- Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSel.SP is 0.
- Attempted execution of an MSR or MRS instruction using a _EL12 register name when the Effective value of HCR_EL2.E2H is not 1.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  - A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, and EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
- An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1. If the value of HCR_EL2.TGE is 0, this exception is reported using an ESR_EL2.EC value of `0b000111`.
- In Non-transactional state, attempted execution of a TCOMMIT instruction.

ISS encoding for an exception from a WF* instruction



CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

        - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
        - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
    - For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:10]

Reserved, RES0.

RN, bits [9:5]

When FEAT_WFxT is implemented:

Register Number. Indicates the register number supplied for a `WFET` or `WFIT` instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

RV, bit [2]

When FEAT_WFxT is implemented:

Register field Valid.

If TI[1] == 1, then this field indicates whether RN holds a valid register number for the register argument to the trapped `WFET` or `WFIT` instruction.

RV	Meaning
`0b0`	Register field invalid.
`0b1`	Register field valid.

If TI[1] == 0, then this field is RES0.

This field is set to 1 on a trap on `WFET` or `WFIT`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFxT is implemented
0b11	WFET trapped.	When FEAT_WFxT is implemented

When FEAT_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

The reset behavior of this field is:

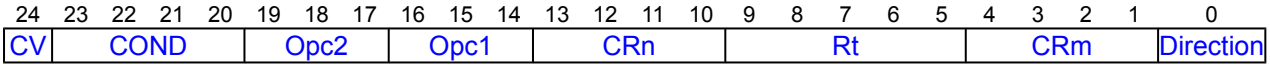
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from a WF* instruction

The following fields describe configuration settings for generating this exception:

- HCR.{TWE, TWI}.
- SCTLR_EL1.{nTWE, nTWI}.
- SCTLR_EL2.{nTWE, nTWI}.
- HCR_EL2.{TWE, TWI}.
- SCR_EL3.{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access



CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.

        - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
    - For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value `0b000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value `0b111`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

If the Rt value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from an MCR or MRC access

The following fields describe configuration settings for generating exceptions from an MCR or MRC access using coproc 0b1111, that are reported using EC value 0b000011:

- If FEAT_TIDCP1 is implemented, SCTLR_EL1.TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch32 state, trapped to EL1.
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, trapped to EL1 or EL2.
- HCR.{TRVM, TVM} and HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, trapped to EL2.
- HCR.TTLB and HCR_EL2.TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, trapped to EL2.
- HCR.{TSW, TPC, TPU} and HCR_EL2.{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, trapped to EL2.
- HCR.TAC and HCR_EL2.TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, trapped to EL2.
- HCR.TIDCP and HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, trapped to EL2.
- If FEAT_TIDCP1 is implemented, SCTLR_EL2.TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch32 state, trapped to EL2.
- HCR.{TID1, TID2, TID3} and HCR_EL2.{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, trapped to EL2.
- HCR2.TERR, for Non-secure accesses to error record registers at EL1 using AArch32 state, trapped to EL2.
- HCPTR.TCPAC and CPTR_EL2.TCPAC, for accesses to CPACR_EL1 or CPACR using AArch32 state, trapped to EL2.
- HSTR.T<n> and HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, trapped to EL2.
- CNTHCTL.PL1PCEN and CNTHCTL_EL2.EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- HDCR.TTRF, for Non-secure accesses to trace filter control registers from system registers using AArch32 state, trapped to EL2.
- HDCR.{TPM, TPMCR} and MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- HCPTR.TAM and CPTR_EL2.TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- CPTR_EL3.TCPAC, for accesses to CPACR from EL1 and EL2, and accesses to HCPTR from EL2 using AArch32 state, trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, trapped to EL3.
- If FEAT_FGT is implemented, access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions from an MCR or MRC access using coproc 0b1110, that are reported using EC value 0b000101:

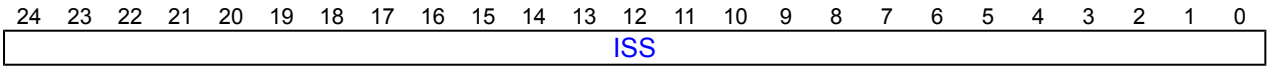
- CPACR_EL1.TTA for accesses to trace registers, trapped to EL1 or EL2.

- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, trapped to EL1 or EL2.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- HCR.TID0 and HCR_EL2.TID0, for accesses to the JIDR register in the ID group 0 at EL0 and EL1 using AArch32, trapped to EL2.
- HCPTR.TTA and CPTR_EL2.TTA, for accesses to trace registers using AArch32, trapped to EL2.
- HDCR.TDRA and MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, trapped to EL2.
- HDCR.TDOSA and MDCR_EL2.TDOSA, for accesses to powerdown debug registers, using AArch32 state, trapped to EL2.
- HDCR.TDA and MDCR_EL2.TDA, for accesses to other debug registers, using AArch32 state, trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers using AArch32, trapped to EL3.
- MDCR_EL3.TDA, for accesses to other debug registers, using AArch32, trapped to EL3.

The following fields describe configuration settings for generating exceptions from a VMSR or VMRS access, that are reported using EC value `0b001000`:

- HCR.TID0 and HCR_EL2.TID0, for accesses to the FPSID register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- HCR.TID3 and HCR_EL2.TID3, for accesses to registers in ID group 3 including MVFR0, MVFR1 and MVFR2, VMRS access trapped to EL2.
- HCPTR.{TCP10, TCP11}, for Non-secure accesses to FPSCR, FPSID, FPEXC, MVFR0, MVFR1, and MVFR2, trapped to EL2.

ISS encoding for an exception from any other instruction

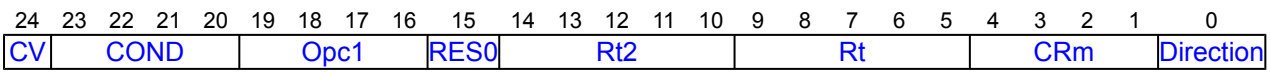


ISS, bits [24:0]

ISS	Meaning	Applies when
`0b00000000000000000000000000`	`ST64BV` instruction trapped.	When FEAT_LS64_V is implemented
`0b00000000000000000000000001`	`ST64BV0` instruction trapped.	When FEAT_LS64_ACCDATA is implemented
`0b00000000000000000000000010`	`LD64B` or `ST64B` instruction trapped.	When FEAT_LS64 is implemented
`0b00000000000000000000000011`	`TSB CSYNC` instruction trapped.	When FEAT_TRBEv1p1 is implemented
`0b00000000000000000000000100`	`PSB CSYNC` instruction trapped.	When FEAT_SPEv1p5 is implemented

All other values are reserved.

ISS encoding for an exception from an MCRR or MRRC access



CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

If the Rt2 value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt2 value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.

- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

If the Rt value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
`0b0`	Write to System register space. MCRR instruction.
`0b1`	Read from System register space. MRRC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from an MCRR or MRRC access

The following fields describe configuration settings for generating exceptions from an MCRR or MRRC access using coproc `0b1111`, that are reported using EC value `0b000100`:

- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, trapped to EL1 or EL2.
- PMUSERENR_EL0.{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, trapped to EL1 or EL2.

- AMUSERENR_EL0.{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, trapped to EL1 or EL2.
- HCR.{TRVM, TVM} and HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, trapped to EL2.
- HCR2.TERR, for Non-secure accesses to error record registers at EL1 using AArch32 state, trapped to EL2.
- HSTR.T<n> and HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, trapped to EL2.
- CNTHCTL.{PL1PCEN, PL1PCTEN} and CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- HDCR.TPM and MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- HCPTR.TAM and CPTR_EL2.TAM, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, trapped to EL2.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, trapped to EL3.
- If FEAT_FGT is implemented, HDFGRTR_EL2.PMCCNTR_EL0 for MRRC access and HDFGWTR_EL2.PMCCNTR_EL0 for MCRR access to PMCCNTR at EL0, trapped to EL2.

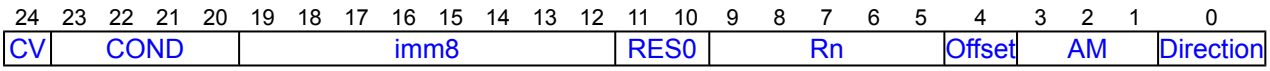
The following fields describe configuration settings for generating exceptions from an MCRR or MRRC access using coproc `0b1110`, that are reported using EC value `0b001100`:

- MDSCR_EL1.TDCC, for accesses to the Debug ROM registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, trapped to EL1 or EL2.
- HDCR.TDRA and MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, trapped to EL2.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch32, trapped to EL3.
- CPACR_EL1.TTA for accesses to trace registers using AArch32, trapped to EL1 or EL2.
- HCPTR.TTA and CPTR_EL2.TTA, for accesses to trace registers using AArch32, trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, trapped to EL3.

Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

ISS encoding for an exception from an LDC or STC instruction



CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer.

If the Rn value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rn value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
  - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
  - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behavior of this field is:

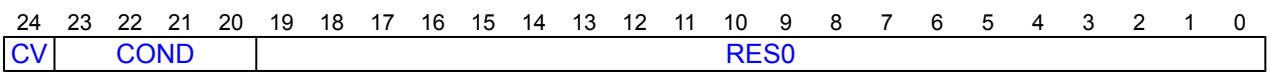
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from an LDC or STC instruction

The following fields describe the configuration settings from an LDC or STC access for the traps that are reported using EC value 0b000110:

- MDSCR_EL1.TDCC, for accesses to DBGDTRTXint and DBGDTRRXint, using AArch32 state, trapped to EL1 or EL2.
- HDCR.TDA and MDCR_EL2.TDA, for accesses to DBGDTRTXint and DBGDTRRXint, using AArch32 state, trapped to EL2.
- MDCR_EL3.TDA, for accesses to DBGDTRTXint and DBGDTRRXint, using AArch32 state, trapped to EL3.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps



The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.
- Execution of SME instructions.

For an implementation that does not include either SVE or support for Advanced SIMD and floating-point, the exception is reported using the EC value `0b000000`.

CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:0]

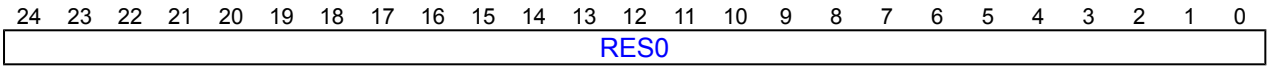
Reserved, RES0.

Additional information for the ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps

The following fields describe the configuration settings for the traps that are reported using EC value `0b000111`:

- HCPTR.{TCP10, TCP11}, for Non-secure accesses to Advanced SIMD and floating-point registers and instructions, trapped to EL2.
- HCPTR.TASE, for Non-secure accesses to Advanced SIMD functionality, trapped to EL2.
- CPACR_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
- CPTR_EL2.FPEN and CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
- CPTR_EL3.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ



The accesses covered by this trap include:

- Execution of SVE instructions when the PE is not in Streaming SVE mode.
- Accesses to the SVE System registers, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value `0b000000`.

Bits [24:0]

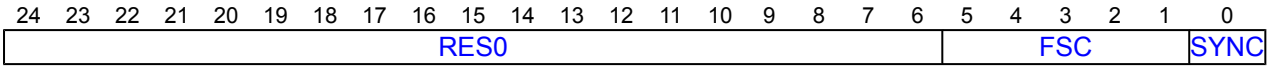
Reserved, RES0.

Additional information for the ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

The following fields describe the configuration settings for the traps that are reported using EC value `0b011001`:

- CPACR_EL1.ZEN, for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL1.
- CPTR_EL2.ZEN and CPTR_EL2.TZ, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- CPTR_EL3.EZ, for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

ISS encoding for a Profiling exception



Bits [24:6]

Reserved, RES0.

FSC, bits [5:1]

Indicates why the Profiling exception was generated.

FSC	Meaning	Applies when
0b00000	PMU Profiling exception. One of the following applies, and ESR_EL2.SYNC describes which: • The exception was generated because at least one PMU counter overflow status flag was 1, and was taken asynchronously. • The exception was generated because FEAT_SEBEP is implemented and PSTATE.PPEND was 1, and was taken synchronously.	When FEAT_EBEP is implemented
0b00001	Profiling Buffer management event. The exception was generated because PMBSR_EL2.S was 1.	When FEAT_SPE_EXC is implemented
0b00010	Trace buffer management event. The exception was generated because TRBSR_EL2.IRQ was 1.	When FEAT_TRBE_EXC is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SYNC, bit [0]

Indicates whether the Profiling exception was taken synchronously or asynchronously.

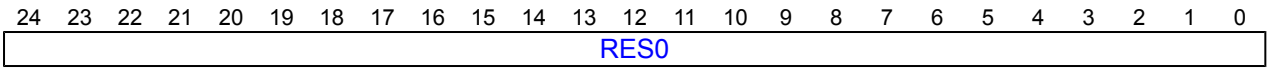
SYNC	Meaning	Applies when
0b0	The exception was taken asynchronously.	
0b1	The exception was taken synchronously.	When FEAT_SEBEP is implemented

If ESR_EL2.FSC does not indicate a PMU Profiling exception, or FEAT_SEBEP is not implemented, then the only permitted value is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault



Bits [24:0]

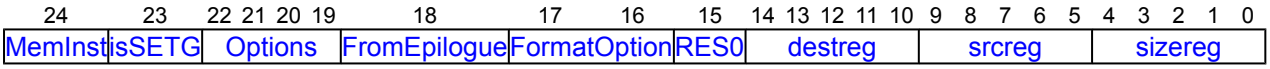
Reserved, RES0.

Additional information for the ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about PC alignment fault exceptions, see 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from the Memory Copy and Memory Set instructions



MemInst, bit [24]

Indicates the memory instruction class causing the exception.

MemInst	Meaning
0b0	CPYFE*, CPYFM*, CPYE*, and CPYM* instructions.
0b1	SETE*, SETM*, SETGE*, and SETGM* instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

isSETG, bit [23]

Indicates whether the instruction belongs to SETGM* or SETGE* class of instruction.

isSETG	Meaning
0b0	Not a SETGM* or SETGE* instruction.
0b1	SETGM* or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Options, bits [22:19]

Options : the Options field of the instruction.

For Memory Copy instructions, bits[22:19] forms the Options field, which holds the bits[15:12] of the instruction.

For Memory Set instructions:

- Bits[22:21] are RES0.
- Bits[20:19] form the Options field, which holds the bits[13:12] of the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FromEpilogue, bit [18]

Indicates whether the instruction belongs to the epilogue class of Memory Copy or Memory Set instructions.

FromEpilogue	Meaning
0b0	Not an epilogue instruction.
0b1	CPYE*, CPYFE*, SETE*, or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FormatOption, bits [17:16]

Reports the Option used to encode the initial Xs, Xd, and Xn register values provided to the instruction that generated the exception.

FormatOption	Meaning
0b00	Option B.
0b01	Option A.
0b10	Option A.
0b11	Option B.

For more information, see Memory Copy and Memory Set exceptions.

Note

This field was previously presented as two separate bits, WrongOption, bit[17] and OptionA, bit [16], which were already expected to be used together and not individually.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

destreg, bits [14:10]

The destination register value from the issued instruction, containing the destination address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

srcreg, bits [9:5]

The source register value from the issued instruction, containing either the source address or the source data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

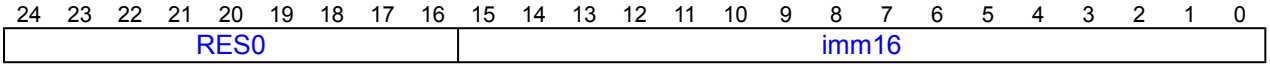
sizereg, bits [4:0]

The size register value from the issued instruction, containing the number of bytes to be transfered or set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from HVC or SVC instruction execution



Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from HVC or SVC instruction execution

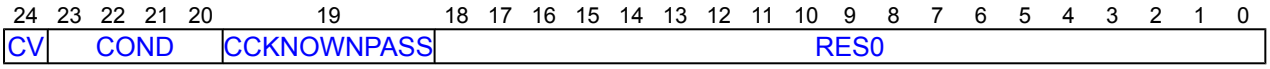
In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, HFGITR_EL2.{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state



For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:

        - With COND set to 0b1110, the value for unconditional.
        - With the COND value held in the instruction.
    - When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
        - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
        - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
    - For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

Note

In an implementation in which an SMC instruction that fails it code check is not trapped, this field can always return the value 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [18:0]

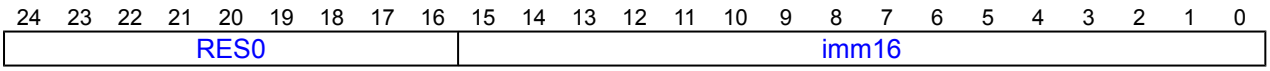
Reserved, RES0.

Additional information for the ISS encoding for an exception from SMC instruction execution in AArch32 state

HCR.TSC describes the configuration settings for trapping SMC instructions to EL2.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

ISS encoding for an exception from SMC instruction execution in AArch64 state



Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

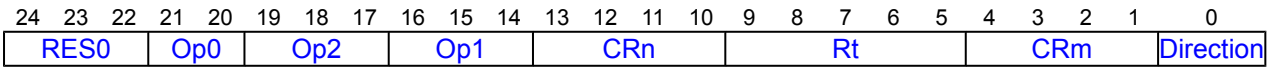
Additional information for the ISS encoding for an exception from SMC instruction execution in AArch64 state

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state



Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

For system instructions which require that the opcode Rt field is set to `0b11111`, but where the trapped instruction has a different value of Rt, an implementation is permitted to return the value `0b11111`, instead of the value of Rt from the trapped instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

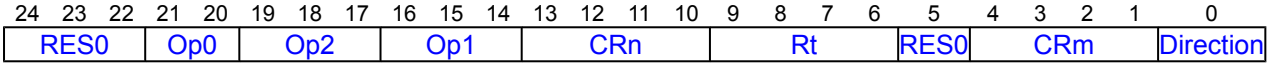
The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- If FEAT_TIDCP1 is implemented, SCTLR_EL1.TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL1.
- SCTLR_EL1.UCI, for execution of cache maintenance instructions using AArch64 state, execution is trapped to EL1 or EL2.
- SCTLR_EL1.UCT, for accesses to CTR_EL0 using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.DZE, for execution of DC ZVA instructions using AArch64 state, execution is trapped to EL1 or EL2.
- SCTLR_EL1.UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- CPACR_EL1.TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- PMUSERENR_EL0, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TDZ, for execution of DC ZVA instructions using AArch64 state, execution is trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions using AArch64 state, execution is trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, execution is trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register, ACTLR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- If FEAT_TIDCP1 is implemented, SCTLR_EL2.TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- If FEAT_MTE2 is implemented, HCR_EL2.TID5, for accesses to GMID_EL1, using AArch64 state, MRS or MSR access at EL1, trapped to EL2.
- If FEAT_IDTE3 is implemented, SCR_EL3.TID3, for accesses to ID group 3 registers using AArch64 state, at EL1 and EL2, trapped to EL3.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.

- MDCR_EL2.TTRF, for accesses to the trace filter control register, TRFCR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.AT, for execution of AT S1E* instructions, using AArch64 state, execution is trapped to EL2.
- HCR_EL2.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- SCR_EL3.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TCPAC, for accesses to CPTR_EL2 and CPACR_EL1 using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TTRF, for accesses to the trace filter control registers, TRFCR_EL1 and TRFCR_EL2, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- If FEAT_SPE is implemented:
  - MDCR_EL3.NSPB for accesses to Statistical Profiling and Profiling Buffer control registers, using AArch64 state, MSR or MRS access at EL1 and EL2 trapped to EL3.
  - MDCR_EL2.TPMS for accesses to SPE registers, using AArch64 state, MSR or MRS access at EL1 trapped to EL2.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - HCR2.{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT_FGT is implemented:
  - SCR_EL3.FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - HFGRTR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - HFGITR_EL2 for execution of system instructions, MSR or MRS access trapped to EL2.
  - HDFGRTR_EL2 for reads and HDFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - HAFGRTR_EL2 for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.
- If FEAT_RNG_TRAP is implemented, SCR_EL3.TRNDR for reads of RNDR and RNDRRS using AArch64 state, MRS access trapped to EL3.
- If FEAT_SME is implemented:
  - CPTR_EL3.ESM, for MSR or MRS accesses to SMPRI_EL1 at EL1, EL2, and EL3, trapped to EL3.
  - CPTR_EL3.ESM, for MSR or MRS accesses to SMPRIMAP_EL2 at EL2 and EL3, trapped to EL3.
  - SCTLR_EL1.EnTP2, for MSR or MRS accesses to TPIDR2_EL0 at EL0, trapped to EL1 or EL2.
  - SCTLR_EL2.EnTP2, for MSR or MRS accesses to TPIDR2_EL0 at EL0, trapped to EL2.
  - SCR_EL3.EnTP2, for MSR or MRS accesses to TPIDR2_EL0 at EL0, EL1, and EL2, trapped to EL3.
- If FEAT_FPMR is implemented:
  - SCTLR_EL1.EnFPM, for accesses to FPMR at EL0, trapped to EL1 or EL2.
  - SCTLR_EL2.EnFPM, for accesses to FPMR at EL0, trapped to EL2.
  - HCRX_EL2.EnFPM, for accesses to FPMR at EL0 and EL1, trapped to EL2.
  - SCR_EL3.EnFPM, for accesses to FPMR at EL0, EL1, and EL2, trapped to EL3.
- If FEAT_NMI is implemented, HCRX_EL2.TALLINT, for MSR writes of ALLINT at EL1, trapped to EL2.
- If FEAT_FGT2 is implemented:
  - SCR_EL3.FGTEn2, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - HFGRTR2_EL2 for reads and HFGWTR2_EL2 for writes of registers, using AArch64 state, using MSR or MRS access at EL1 trapped to EL2.
  - HDFGRTR2_EL2 for reads and HDFGWTR2_EL2 for writes of registers, using AArch64 state, using MSR or MRS access at EL0 and EL1 trapped to EL2.
  - HFGITR2_EL2 for execution of system instructions, MSR or MRS access trapped to EL2.
- If FEAT_ITE is implemented, MDCR_EL3.EnITE, for accesses to Instrumentation trace registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_MEC is implemented, SCR_EL3.MECEn, for accesses to MECID registers at EL2, trapped to EL3.
- If FEAT_SPE_FDS is implemented, MDCR_EL3.EnPMS3 for accesses to SPE registers, using AArch64 state, MSR or MRS access at EL1 and EL2 trapped to EL3.
- If FEAT_SPE_nVM is implemented, MDCR_EL3.EnPMS4 for accesses to SPE registers, using AArch64 state, MSR or MRS access at EL1 and EL2 trapped to EL3.

- If FEAT_RASv2 is implemented, SCR_EL3.TWERR, for accesses to Error Record registers, MSR access at EL1 and EL2 trapped to EL3.
- If FEAT_Debugv8p9 is implemented, MDCR_EL3.EBWE for accesses of MDSELR_EL1, using AArch64 state, MRS or MSR access at EL2 and EL1 trapped to EL3.
- If FEAT_PMUv3p9, FEAT_SPMU, FEAT_EBEP, or FEAT_PMUv3_SS is implemented, MDCR_EL3.EnPM2, for accesses to PMU registers, using AArch64 state, MSR or MRS access at EL2, EL1, and EL0, trapped to EL3.
- If FEAT_PMUv3_SS is implemented, MDCR_EL3.EnPMSS, for accesses to PMU Snapshot registers, using AArch64 state, MSR or MRS access at EL2 and EL1 trapped to EL3.
- If FEAT_THE is implemented, SCR_EL3.RCWMASKEn for accesses to RCWMASK_EL1 and RCWSMASK_EL1, using AArch64 state, MSR or MRS access at EL2 and EL1 trapped to EL3.
- If FEAT_AIE is implemented, SCR_EL3.AIEn for accesses to Extended Memory Attribute registers, MSR or MRS access at EL2 and EL1 trapped to EL3.
- If FEAT_S1PIE, FEAT_S2PIE, FEAT_S1POE, or FEAT_S2POE is implemented, SCR_EL3.PIEn for accesses to Permission Indirection, Overlay registers, MSR or MRS access at EL2, EL1 and EL0 trapped to EL3.
- If FEAT_MPAM_PE_BW_CTRL is implemented, MPAMBW2_EL2.{nTRAP_MPAMBWIDR_EL1, nTRAP_MPAMBW0_EL1, nTRAP_MPAMBW1_EL1} for accesses to MPAMBW*_EL1 registers, using AArch64 state, MRS or MSR access at EL1, trapped to EL2.
- If FEAT_MPAM_PE_BW_CTRL and FEAT_SME are implemented, MPAMBW2_EL2.nTRAP_MPAMBWSM_EL1, for accesses to MPAMBWSM_EL1, using AArch64 state, MRS or MSR access at EL1, trapped to EL2.
- If FEAT_MPAM_PE_BW_CTRL is implemented, MPAMBW3_EL3.nTRAPLOWER, for accesses to MPAMBW_EL2 registers and MPAMBW_EL1 registers, using AArch64 state, MRS or MSR access at EL1, trapped to EL3.
- If FEAT_HACDBS is implemented, SCR_EL3.HACDBSEn, for accesses to HACDBSBR_EL2 and HACDBSCONS_EL2, using AArch64 state, MRS or MSR access at EL2, trapped to EL3.
- If FEAT_HDBSS is implemented, SCR_EL3.HDBSSEn, for accesses to HDBSSBR_EL2 and HDBSSPROD_EL2, using AArch64 state, MRS or MSR access at EL2, trapped to EL3.
- If FEAT_SRMASK is implemented, SCR_EL3.SRMASKEn, for MSR or MRS accesses at EL1 or EL2 to the MASK registers using AArch64 state, trapped to EL3.

ISS encoding for an exception from MSRR, MRRS, or 128-bit System instruction execution in AArch64 state



Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:6]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

Note

This value represents register pair of X[Rt:0], X[Rt:1].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, MSRR instructions.
0b1	Read access, MRRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

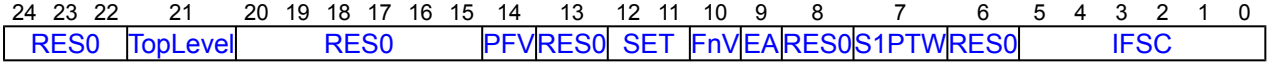
Additional information for the ISS encoding for an exception from MSRR, MRRS, or 128-bit System instruction execution in AArch64 state

The following fields describe configuration settings for generating exceptions from an MSRR or MRRS access that are reported using EC value 0b010100:

- If FEAT_FGT is implemented:
  - HFGRTR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, accesses at EL1 trapped to EL2.
- If FEAT_FGT2 is implemented:
  - HFGRTR2_EL2.nRCWSMASK_EL1 for reads and HFGWTR2_EL2.nRCWSMASK_EL1 for writes of RCWSMASK_EL1, using AArch64 state, accesses at EL1 trapped to EL2.
- If FEAT_SYSREG128 is implemented:
  - SCTLR2_EL1.EnIDCP128 for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL0 trapped to EL1.
  - SCTLR2_EL2.EnIDCP128 for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL0 trapped to EL2.
  - HCRX_EL2.EnIDCP128 for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL1 and EL0 trapped to EL2.

    - SCR_EL3.EnIDCP128 for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL2, EL1, and EL0 trapped to EL3.
- If FEAT_D128 is implemented:
    - HCR_EL2.{TRVM, TVM} for accesses to TTBR0_EL1 and TTBR1_EL1, accesses at EL1 and EL0 trapped to EL2.
    - HCRX_EL2.D128En for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL1 trapped to EL2.
    - SCR_EL3.D128En for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL2 and EL1 trapped to EL3.
- If FEAT_THE is implemented, SCR_EL3.RCWMASKEn for accesses to RCWMASK_EL1 and RCWSMASK_EL1, using AArch64 state, accesses at EL2 and EL1 trapped to EL3.

ISS encoding for an exception from an Instruction Abort



When FEAT_THE is implemented, if a memory access generates an Instruction Abort for AssuredOnly, the ISS2 encoding for an exception from an Instruction Abort includes further information about the exception.

When FEAT_S1POE or FEAT_S2POE is implemented, if a memory access generates an Instruction Abort due to a Permission fault, the ISS2 encoding for an exception from an Instruction Abort includes further information about the exception.

Bits [24:22]

Reserved, RES0.

TopLevel, bit [21]

When FEAT_THE is implemented:

Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [20:15]

Reserved, RES0.

PFV, bit [14]

When FEAT_PFAR is implemented:

PFAR Valid. Describes whether the PFAR_EL2 register is valid.

PFV	Meaning
0b0	PFAR_EL2 is UNKNOWN.
0b1	PFAR_EL2 is valid.

This field is valid only if the IFSC code is 0b10000, 0b01001x, or 0b0101xx.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [13]

Reserved, RES0.

SET, bits [12:11]
When FEAT_RAS is implemented and IFSC == 0b010000:

Synchronous Error Type. When IFSC is `0b010000`, describes the PE error state after taking the Instruction Abort exception.

SET	Meaning	Applies when
`0b00`	Recoverable state (UER).	
`0b10`	Uncontainable (UC).	When FEAT_RASv2 is not implemented
`0b11`	Restartable state (UEO).	

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External abort exception might result in a PE state that is not recoverable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]
When IFSC == 0b010000:

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
`0b0`	FAR is valid.
`0b1`	FAR is not valid, and holds an UNKNOWN value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented

0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

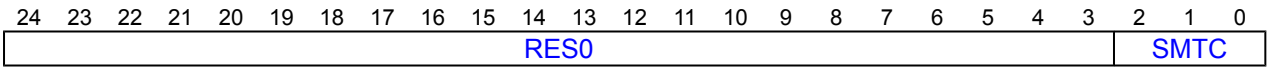
For more information about the lookup level associated with a fault, see 'The lookup level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception due to SME functionality



The accesses covered by this trap include:

- Execution of SME instructions.
- Execution of SVE and Advanced SIMD instructions, when the PE is in Streaming SVE mode.
- Direct accesses of SVCR, SMCR_EL1, SMCR_EL2, SMCR_EL3.

Bits [24:3]

Reserved, RES0.

SMTC, bits [2:0]

SME Trap Code. Identifies the reason for instruction trapping.

SMTC	Meaning	Applies when
0b000	Access to SME functionality trapped as a result of CPACR_EL1.SMEN, CPTR_EL2.SMEN, CPTR_EL2.TSM, or CPTR_EL3.ESM, that is not reported using EC value 0b000000.	
0b001	Advanced SIMD, SVE, or SVE2 instruction trapped because PSTATE.SM is 1.	
0b010	SME instruction trapped because PSTATE.SM is 0.	
0b011	SME instruction trapped because PSTATE.ZA is 0.	
0b100	Access to the SME2 ZT0 register trapped as a result of SMCR_EL1.EZT0, SMCR_EL2.EZT0, or SMCR_EL3.EZT0.	When FEAT_SME2 is implemented

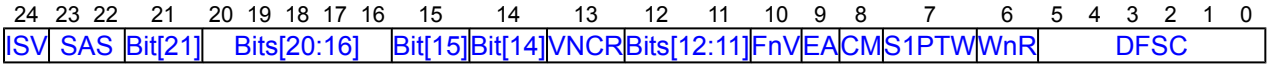
All other values are reserved.

Additional information for the ISS encoding for an exception due to SME functionality

The following fields describe the configuration settings for the traps that are reported using the EC value 0b011101:

- CPACR_EL1.SMEN, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access SVCR and SMCR_EL1 System registers at EL1 and EL0, trapped to EL1 or EL2.
- CPTR_EL2.SMEN and CPTR_EL2.TSM, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access SVCR, SMCR_EL1, SMCR_EL2 at EL2, EL1, and EL0, trapped to EL2.
- CPTR_EL3.ESM, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access SVCR, SMCR_EL1, SMCR_EL2, SMCR_EL3 from all Exception levels and any Security state, trapped to EL3.
- If FEAT_SME2 is implemented:
  - SMCR_EL1.EZT0, for accesses to ZT0 at EL1 and EL0, trapped to EL1 or EL2.
  - SMCR_EL2.EZT0, for accesses to ZT0 at EL2, EL1, and EL0, trapped to EL2.
  - SMCR_EL3.EZT0, for accesses to ZT0 at any Exception level, trapped to EL3.

ISS encoding for an exception from a Data Abort



The ISS2 encoding for an exception from a Data Abort includes further information about the exception when any of the following features are implemented:

- FEAT_LS64_V.
- FEAT_LS64_ACCDATA.
- FEAT_THE.
- FEAT_S1POE or FEAT_S2POE.
- FEAT_S1PIE or FEAT_S2PIE.
- FEAT_GCS.
- FEAT_MTE_CANONICAL_TAGS.
- FEAT_MTE_PERM.

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL2, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with `0b11111`, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
    - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
    - Is not performing register writeback.
    - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_MOPS is implemented, for a synchronous Data Abort on a Memory Copy and Memory Set instruction, ISV is 0.

When FEAT_MTE is implemented, for a synchronous Data Abort on an instruction that directly accesses Allocation Tags, ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]
When ISV == 1:

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
`0b00`	Byte
`0b01`	Halfword
`0b10`	Word
`0b11`	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is `0b11`.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is `0b11`.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is `0b11`.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[21]
When ISV == 1:

SSE, bit [21]

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ISV == 0 and FEAT_THE is implemented:

TopLevel, bit [21]

Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits[20:16]
When ISV == 1:

SRT, bits [4:0] of bits [20:16]

Syndrome Register Transfer. The register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ISV == 0, FEAT_RASv2 is implemented, and (DFSC == 0b010000, or DFSC IN {0b01001x}, or DFSC IN {0b0101xx}):

Bits [4:2] of bits [20:16]

Reserved, RES0.

WU, bits [1:0] of bits [20:16]

Write Update. Describes whether a store instruction that generated an External abort updated the location.

WU	Meaning
0b00	Not a store instruction or translation table update, or the location might have been updated.
0b10	Store instruction or translation table update that did not update the location.
0b11	Store instruction or translation table update that updated the location.

In the description of this field, a store instruction is any memory-writing instruction that explicitly performs a store. This includes instructions that both read and write memory.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[15]
When ISV == 1:

SF, bit [15]

Sixty Four bit general-purpose register transfer. Width of the register accessed by the instruction is 64-bit.

SF	Meaning
0b0	Instruction loads/stores a 32-bit general-purpose register.
0b1	Instruction loads/stores a 64-bit general-purpose register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ISV == 0:

FnP, bit [15]

FAR not Precise.

FnP	Meaning	Applies when
0b0	The FAR holds the faulting virtual address that generated the Data Abort.	
0b1	The FAR holds any virtual address within the naturally-aligned granule that contains the faulting virtual address that generated a Data Abort due to an SVE contiguous vector load/store instruction, or an SME load/store instruction. For more information about the naturally-aligned fault granule, see FAR_ELx (for example, FAR_EL1).	When FEAT_SME is implemented or FEAT_SVE is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[14]
When ISV == 1:

AR, bit [14]

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_PFAR is implemented, ISV == 0, and (DFSC == 0b010000, or DFSC IN {0b01001x}, or DFSC IN {0b0101xx}):

PFV, bit [14]

PFAR Valid. Describes whether the PFAR_EL2 register is valid.

PFV	Meaning
0b0	PFAR_EL2 is UNKNOWN.
0b1	PFAR_EL2 is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VNCR, bit [13]

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning	Applies when
0b0	The fault was not generated by the use of VNCR_EL2 by EL1 code.	
0b1	The fault was generated by the use of VNCR_EL2 by EL1 code.	When FEAT_NV2 is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits[12:11]
When (DFSC IN {0b00xxxx} || DFSC IN {0b10101x}) && !(DFSC IN {0b0000xx}):

LST, bits [1:0] of bits [12:11]

Load/Store Type. Used when a Translation fault, Access flag fault, or Permission fault generates a Data Abort.

LST	Meaning	Applies when
0b00	The instruction that generated the Data Abort is not specified by this field.	
0b01	An ST64BV instruction generated the Data Abort.	When FEAT_LS64_V is implemented
0b10	An LD64B or ST64B instruction generated the Data Abort.	When FEAT_LS64 is implemented
0b11	An ST64BV0 instruction generated the Data Abort.	When FEAT_LS64_ACCDATA is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RAS is implemented and (DFSC == 0b010000, or DFSC IN {0b01001x}, or DFSC IN {0b0101xx}):

SET, bits [1:0] of bits [12:11]

Synchronous Error Type. Used when a synchronous External abort, not on a Translation table walk or hardware update of the Translation table, generated the Data Abort. Describes the PE error state after taking the Data Abort exception.

SET	Meaning	Applies when
0b00	Recoverable state (UER).	
0b10	Uncontainable (UC). If FEAT_RASv2 is implemented, this value is reserved.	When FEAT_RASv2 is implemented
0b11	Restartable state (UEO).	

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External abort exception might result in a PE state that is not recoverable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- If FEAT_RASv2 is implemented, an External abort on an Atomic access, reported with ESR_EL2.WU set to 0b00.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	

0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The lookup level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV	RES0												VECITR			IDF	RES0		IXF	UFF	OFF	DZF	IOF

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from an instruction that is performing floating-point operations on more than one lane of a vector.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from an instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

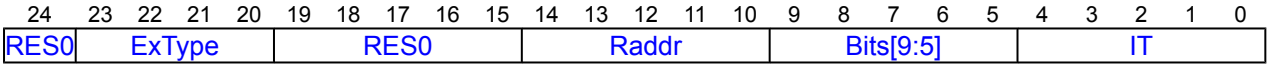
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from a trapped floating-point exception

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the FPCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for a GCS exception



Bit [24]

Reserved, RES0.

ExType, bits [23:20]

The first level classification of GCS exceptions.

ExType	Meaning
0b0000	The exception reported is a Guarded Control Stack Data Check Exception.
0b0001	The exception reported is an EXLOCK Exception.
0b0010	The exception reported is a trap exception on GCSSTR or GCSSTTR instruction execution.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:15]

Reserved, RES0.

Raddr, bits [14:10]

When ExType == 0b0010 :

Indicates the data address register number supplied in the instruction that has been trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits[9:5]

When ExType == 0b0000 :

Rn, bits [4:0] of bits [9:5]

Indicates a register number used by the instruction that caused the Guarded Control Stack Data Check Exception.

For a procedure return instruction reported with ESR_EL2.ISS.IT as 0b00000, contains the register number for the register which contains the target address of the branch.

For a GCSPOPM instruction reported with ESR_EL2.ISS.IT as 0b00001, contains the register number for the register which is the destination register of the instruction.

For a procedure return instruction reported with ESR_EL2.ISS.IT as `0b00010` or `0b00011`, contains the value `0b11110`, indicating X30.

For a GCSSS1 instruction reported with ESR_EL2.ISS.IT as `0b00100`, contains the register number for the register which is the input register of the instruction.

If ESR_EL2.ISS.IT is reported as `0b00101` or `0b01000`, this field is UNKNOWN

If ESR_EL2.ISS.IT is reported as `0b01001`, this field is `0b11111`

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ExType == 0b0010 :

Rvalue, bits [4:0] of bits [9:5]

Indicates the data value register number supplied in the instruction that has been trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IT, bits [4:0]
When ExType == 0b0000 :

Type of the instruction that caused the Guarded Control Stack Data Check Exception.

IT	Meaning
`0b00000`	Guarded Control Stack Data Check Exception is from a procedure return instruction without Pointer authentication.
`0b00001`	Guarded Control Stack Data Check Exception is from a GCSPOPM instruction.
`0b00010`	Guarded Control Stack Data Check Exception is from a procedure return instruction with Pointer authentication that uses key A.
`0b00011`	Guarded Control Stack Data Check Exception is from a procedure return instruction with Pointer authentication that uses key B.
`0b00100`	Guarded Control Stack Data Check Exception is from a GCSSS1 instruction.
`0b00101`	Guarded Control Stack Data Check Exception is from a GCSSS2 instruction.
`0b01000`	Guarded Control Stack Data Check Exception is from a GCSPOPCX instruction.
`0b01001`	Guarded Control Stack Data Check Exception is from a GCSPOPX instruction.

All other values are reserved

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

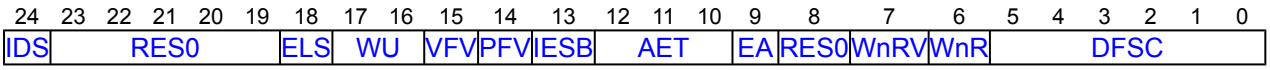
Reserved, RES0.

Additional information for the ISS encoding for a GCS exception

The following fields describe the configuration settings for the traps that are reported using EC value `0b101101` and ExType value `0b0010`:

- GCSCRE0_EL1.STREn
- GCSCR_EL1.STREn.
- GCSCR_EL2.STREn.
- GCSCR_EL3.STREn.
- HFGITR_EL2.nGCSSTR_EL1.

ISS encoding for an SError exception



Note

In earlier versions of the architecture, an SError exception is referred to as an SError interrupt or an asynchronous External abort exception.

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
`0b0`	Bits [23:0] of the ISS field holds the fields described in this encoding. **Note** If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.
`0b1`	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError exception.

Note

This field was previously called ISV.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:19]

Reserved, RES0.

ELS, bit [18]

When FEAT_RASv2 is implemented and DFSC == 0b010001:

Meaning of ELR_ELx.

ELS	Meaning
`0b0`	Asynchronous. Does not indicate the trigger for the exception.
`0b1`	Synchronous. The exception was triggered by the instruction at ELR_ELx.

SError exceptions that report this field is 1 are not required to be precise.

The ESR_EL2.AET field describes whether the exception is precise or imprecise.

Corrected, Recoverable or Restartable exceptions are precise. Unrecoverable or Uncontainable exceptions are imprecise.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WU, bits [17:16]
When FEAT_RASv2 is implemented and DFSC == 0b010001:

Write Update. Describes whether a store instruction that generated an External abort updated the location.

WU	Meaning
0b00	Not a store instruction or translation table update, or the location might have been updated.
0b10	Store instruction or translation table update that did not update the location.
0b11	Store instruction or translation table update that updated the location.

In the description of this field, a store instruction is any memory-writing instruction that explicitly performs a store. This includes instructions that both read and write memory.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VFV, bit [15]
When FEAT_RASv2 is implemented and DFSC == 0b010001:

FAR Valid. Indicates the FAR_EL2 register contains a valid virtual address.

VFV	Meaning
0b0	FAR_EL2 is not valid, and holds an UNKNOWN value.
0b1	FAR_EL2 contains a valid virtual address associated with the error.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PFV, bit [14]
When FEAT_PFAR is implemented and DFSC == 0b010001:

PFAR Valid. Describes whether the PFAR_EL2 register is valid.

PFV	Meaning
0b0	PFAR_EL2 is UNKNOWN.
0b1	PFAR_EL2 is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IESB, bit [13]
When FEAT_IESB is implemented and DFSC == 0b010001:

Implicit error synchronization event.

IESB	Meaning
0b0	The SError exception was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError exception was synchronized by the implicit error synchronization event and taken immediately.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]
When FEAT_RAS is implemented and DFSC == 0b010001:

Asynchronous Error Type.

Describes the PE error state after taking the SError exception.

AET	Meaning
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]
When FEAT_RAS is implemented and DFSC == 0b010001:

External abort type. Provides an IMPLEMENTATION DEFINED classification of External aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

WnRV, bit [7]
When FEAT_RASv2 is implemented and DFSC == 0b010001:

ESR_EL2.WnR valid.

WnRV	Meaning
0b0	ESR_EL2.WnR is not valid and has been set to 0b0.
0b1	ESR_EL2.WnR is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WnR, bit [6]
When FEAT_RASv2 is implemented and DFSC == 0b010001:

Write-not-Read. When the WnRV field is 0b1, indicates whether an exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Exception was caused by an instruction reading from a memory location.
0b1	Exception was caused by an instruction writing to a memory location.

Accessing this bit has the following behavior:

- This bit is RES0 if ESR_EL2.WnRV==0b0.
- This bit is not valid and reads UNKNOWN if an External abort on a Atomic access, reported with ESR_EL2.WU == 0b00.
- Otherwise RW.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DFSC, bits [5:0]

When FEAT_RAS is implemented:

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError exception.

All other values are reserved.

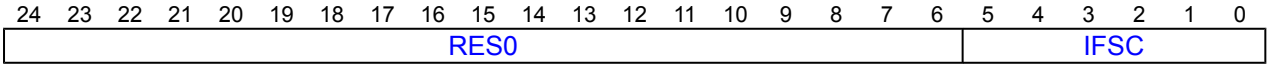
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception



Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behavior of this field is:

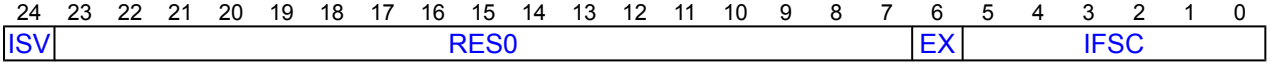
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

ISS encoding for an exception from a Software Step exception



ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

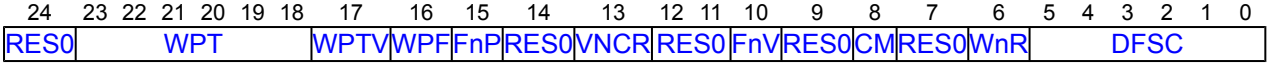
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from a Software Step exception

For more information about generating these exceptions, see 'Software Step exceptions'.

ISS encoding for an exception from a Watchpoint exception



Bit [24]

Reserved, RES0.

WPT, bits [23:18]

When FEAT_Debugv8p2 is implemented:

Watchpoint number.

All other values are reserved.

Otherwise:

Reserved, RES0.

WPTV, bit [17]

When FEAT_Debugv8p2 is implemented:

Watchpoint number Valid.

WPTV	Meaning
0b0	The WPT field is invalid, and holds an UNKNOWN value.
0b1	The WPT field is valid, and holds the number of a watchpoint that triggered a Watchpoint exception.

If FEAT_Debugv8p9 is implemented, value 0b0 is not permitted.

When a Watchpoint exception is triggered by a watchpoint match:

- If FEAT_Debugv8p9 is implemented or the PE sets any of FnV, FnP, or WPF to 1, then the PE sets WPTV to 1.
- Otherwise, the PE sets WPTV to an IMPLEMENTATION DEFINED value, 0 or 1.

Otherwise:

Reserved, RES0.

WPF, bit [16]

Watchpoint might be false-positive.

WPF	Meaning	Applies when
0b0	The watchpoint matched an address or address range that was accessed by the instruction.	
0b1	The watchpoint matched an address or address range that might not have been accessed by the instruction.	When FEAT_SVE is implemented or FEAT_SME is implemented

Arm strongly recommends that this bit is set to 0, other than when one of the following instructions might generate a watchpoint match for an address or address range that the instruction does not access:

- An SVE contiguous vector load/store instruction, when the PE is in Streaming SVE mode.
- An SME load/store instruction.

FnP, bit [15]

FAR not Precise.

This field only has meaning if the FAR is valid; that is, when the FnV field is 0. If the FnV field is 1, the FnP field is 0.

FnP	Meaning	Applies when
0b0	If the FnV field is 0, the FAR holds the virtual address of an access or set of contiguous accesses that triggered a Watchpoint exception.	
0b1	The FAR holds any address within the smallest implemented translation granule that contains the virtual address of an access or set of contiguous accesses that triggered a Watchpoint exception.	When FEAT_SVE is implemented or FEAT_SME is implemented

Bit [14]

Reserved, RES0.

VNCR, bit [13]

Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning	Applies when
0b0	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.	
0b1	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.	When FEAT_NV2 is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [12:11]

Reserved, RES0.

FnV, bit [10]

FAR not Valid.

FnV	Meaning	Applies when
0b0	The FAR is valid, and its value is as described by the FnP field.	
0b1	The FAR is invalid, and holds an UNKNOWN value.	When FEAT_SVE is implemented or FEAT_SME is implemented

Bit [9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by the execution of a cache maintenance instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution does not cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

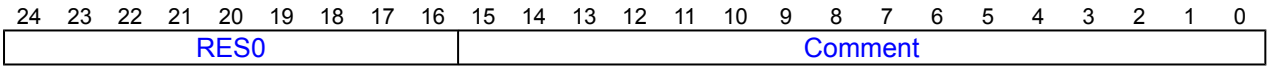
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from a Watchpoint exception

For more information about generating these exceptions, see 'Watchpoint exceptions'.

ISS encoding for an exception from execution of a Breakpoint instruction



Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

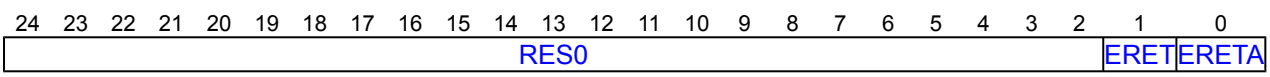
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from execution of a Breakpoint instruction

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction



This EC value applies when:

- FEAT_FGT is implemented.
- The Effective value of HCR_EL2.NV is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2.

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

The reset behavior of this field is:

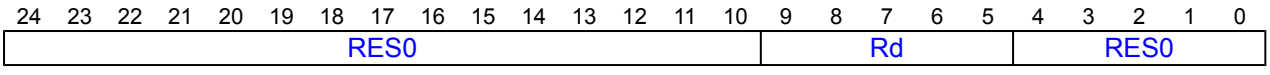
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction

For more information about generating these exceptions, see HCR_EL2.NV.

If FEAT_FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETAA, and ERETAB execution.

ISS encoding for an exception from a TSTART instruction



Bits [24:10]

Reserved, RES0.

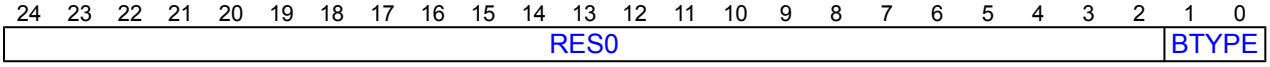
Rd, bits [9:5]

The Rd value from the issued instruction, the general purpose register used for the destination.

Bits [4:0]

Reserved, RES0.

ISS encoding for an exception from Branch Target Identification instruction



Bits [24:2]

Reserved, RES0.

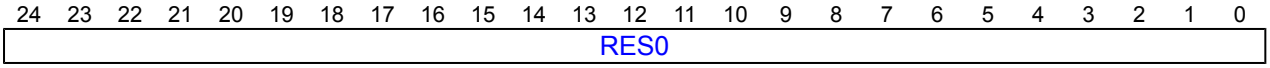
BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

Additional information for the ISS encoding for an exception from Branch Target Identification instruction

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ISS encoding for an exception from a trapped Pointer Authentication instruction



Bits [24:0]

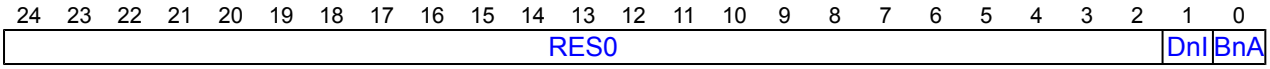
Reserved, RES0.

Additional information for the ISS encoding for an exception from a trapped Pointer Authentication instruction

For more information about generating these exceptions, see:

- HCR_EL2.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- SCR_EL3.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for a PAC Fail exception



Bits [24:2]

Reserved, RES0.

DnI, bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

DnI	Meaning
0b0	Instruction Key.
0b1	Data Key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BnA, bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

BnA	Meaning
0b0	A key.
0b1	B key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for a PAC Fail exception

The following instructions generate a PAC Fail exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTDA, AUTDZA.
- AUTDB, AUTDZB.
- AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIZA.
- AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZB.
- AUTIASPPC, AUTIASPPCR, AUTIA171615.
- AUTIBSPPC, AUTIBSPPCR, AUTIB171615.

If FEAT_FPACCOMBINE is implemented, the following instructions generate a PAC Fail exception when the Pointer Authentication Code (PAC) is incorrect:

- RETAA, RETAB.
- RETAASPPC, RETABSPPC.
- RETAASPPCR, RETABSPPCR.
- BLRAA, BLRAAZ, BLRAB, BLRABZ.
- BRAA, BRAB, BRAAZ, BRABZ.
- ERETAA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing ESR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name ESR_EL2 or ESR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ESR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0010	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'1x1'} then

ESR_EL3, Exception Syndrome Register (EL3)

The ESR_EL3 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL3.

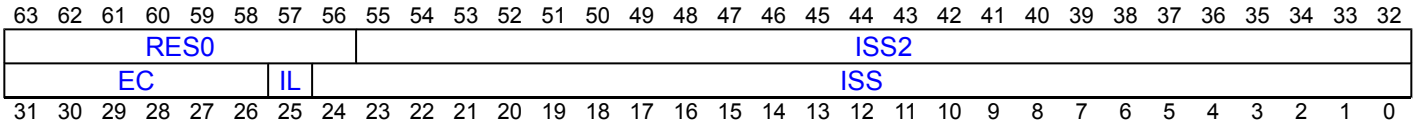
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ESR_EL3 are UNDEFINED.

Attributes

ESR_EL3 is a 64-bit register.

Field descriptions



ESR_EL3 is made UNKNOWN as a result of an exception return from EL3.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL3, the value of ESR_EL3 is UNKNOWN. The value written to ESR_EL3 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

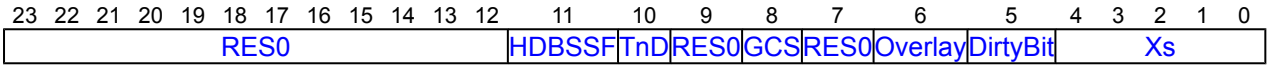
Bits [63:56]

Reserved, RES0.

ISS2, bits [55:32]

ISS2 encoding for an exception, the bit assignments are:

ISS2 encoding for an exception from a Data Abort



Bits [23:12]

Reserved, RES0.

HDBSSF, bit [11]

When FEAT_HDBSS is implemented, IsSecondStage(Fault), and DFSC == 0b0011xx || DFSC == 0b01001x || DFSC == 0b0101xx || DFSC == 0b10001x || DFSC == 0b1001xx:

Indicates that the fault was caused by the HDBSS.

When DFSC indicates a synchronous External abort on translation table walk or hardware update of translation table, this field indicates whether the fault was caused by a write to the HDBSS.

HDBSSF	Meaning
0b0	Fault was not caused by HDBSS.
0b1	Fault was caused by HDBSS.

This field only applies for stage 2 Permission faults.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TnD, bit [10]
When FEAT_MTE_CANONICAL_TAGS is implemented:

Tag not Data.

If a memory access generates a Data Abort for a stage 1 Permission fault, this field indicates whether the fault is due to an Allocation Tag access.

TnD	Meaning
0b0	Permission fault is not due to a write of an Allocation Tag to Canonically Tagged memory.
0b1	Permission fault is due to a write of an Allocation Tag to Canonically Tagged memory.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

GCS, bit [8]
When FEAT_GCS is implemented:

Guarded Control Stack data access.

If a memory access generates a Data Abort, this field indicates whether the fault is due to a Guarded Control Stack data access.

GCS	Meaning
0b0	The Data Abort is not due to a Guarded control stack data access.
0b1	The Data Abort is due to a Guarded control stack data access. The ISV field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

Overlay, bit [6]
When FEAT_S1POE is implemented:

Overlay flag.

If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]
When FEAT_S1PIE is implemented:

DirtyBit flag.

If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Xs, bits [4:0]
When FEAT_LS64 is implemented:

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

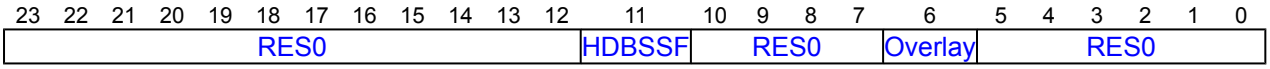
When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort exception for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

Otherwise, this field is RES0.

Otherwise:

Reserved, RES0.

ISS2 encoding for an exception from an Instruction Abort



Bits [23:12]

Reserved, RES0.

HDBSSF, bit [11]
When FEAT_HDBSS is implemented:

Indicates that the fault was caused by the HDBSS.

When IFSC indicates a synchronous External abort on translation table walk or hardware update of translation table, this field indicates whether the fault was caused by a write to the HDBSS.

HDBSSF	Meaning
0b0	Fault was not caused by HDBSS.
0b1	Fault was caused by HDBSS.

This field only applies for stage 2 Permission faults.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [10:7]

Reserved, RES0.

Overlay, bit [6]
When FEAT_S1POE is implemented:

Overlay flag.

If a memory access generates a Instruction Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Instruction Abort is not due to Overlay Permissions.
0b1	Instruction Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

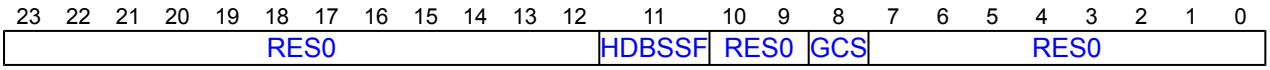
Otherwise:

Reserved, RES0.

Bits [5:0]

Reserved, RES0.

ISS2 encoding for a Granule Protection Check exception



Bits [23:12]

Reserved, RES0.

HDBSSF, bit [11]

When FEAT_HDBSS is implemented and IsSecondStage(Fault):

Indicates that the fault was caused by the HDBSS.

HDBSSF	Meaning
0b0	Fault was not caused by HDBSS.
0b1	Fault was caused by HDBSS.

This field only applies for stage 2 Permission faults.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [10:9]

Reserved, RES0.

GCS, bit [8]

When FEAT_GCS is implemented:

Guarded control stack data access.

Indicates that the Granule Protection Check Exception is due to a Guarded control stack data access.

GCS	Meaning
0b0	The Granule Protection Check Exception is not due to a Guarded control stack data access.
0b1	The Granule Protection Check Exception is due to a Guarded control stack data access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

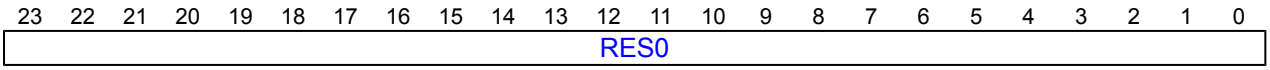
Otherwise:

Reserved, RES0.

Bits [7:0]

Reserved, RES0.

ISS2 encoding for all other exceptions



Bits [23:0]

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	ISS2	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	ISS2 encoding for all other exceptions	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WF* instruction	ISS2 encoding for all other exceptions	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC value 0b000000.	ISS encoding for an exception from an MCR or MRC access	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC value 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: • An STC to write data to memory from DBGDTRRXint. • An LDC to read data from memory to DBGDTRTXint.	ISS encoding for an exception from an LDC or STC instruction	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b000111	Access to SME, SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000.	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps	ISS2 encoding for all other exceptions	
0b001001	Trapped use of a Pointer authentication instruction.	ISS encoding for an exception from a trapped Pointer Authentication instruction	ISS2 encoding for all other exceptions	When FEAT_PAuth is implemented
0b001010	Trapped execution of any instruction not covered by other EC values.	ISS encoding for an exception from any other instruction	ISS2 encoding for all other exceptions	When FEAT_LS64 is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for an exception from an MCRR or MRRC access	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented

0b001101	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	ISS2 encoding for all other exceptions	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	ISS2 encoding for all other exceptions	
0b010011	SMC instruction execution in AArch32 state, when SMC is not disabled.	ISS encoding for an exception from SMC instruction execution in AArch32 state	ISS2 encoding for all other exceptions	When FEAT_AA32 is implemented
0b010100	Trapped MSRR, MRRS or System instruction execution in AArch64 state, that is not reported using EC value 0b000000.	ISS encoding for an exception from MSRR, MRRS, or 128-bit System instruction execution in AArch64 state	ISS2 encoding for all other exceptions	When FEAT_SYSREG128 is implemented or FEAT_SYSINSTR128 is implemented
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b010110	HVC instruction execution in AArch64 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b010111	SMC instruction execution in AArch64 state, when SMC is not disabled.	ISS encoding for an exception from SMC instruction execution in AArch64 state	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC values 0b000000, 0b000001 or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b011001	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC value 0b000000.	ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	ISS2 encoding for all other exceptions	When FEAT_SVE is implemented
0b011011	Exception from an access to a TSTART instruction at EL0 when SCTLR_EL1.TME0 == 0, EL0 when SCTLR_EL2.TME0 == 0, at EL1 when	ISS encoding for an exception from a TSTART instruction	ISS2 encoding for all other exceptions	When FEAT_TME is implemented

	SCTLR_EL1.TME == 0, at EL2 when SCTLR_EL2.TME == 0 or at EL3 when SCTLR_EL3.TME == 0.			
0b011100	Exception from a PAC Fail	ISS encoding for a PAC Fail exception	ISS2 encoding for all other exceptions	When FEAT_FPAC is implemented
0b011101	Access to SME functionality trapped as a result of CPACR_EL1.SMEN, CPTR_EL2.SMEN, CPTR_EL2.TSM, CPTR_EL3.ESM, or an attempted execution of an instruction that is illegal because of the value of PSTATE.SM or PSTATE.ZA, that is not reported using EC value 0b000000.	ISS encoding for an exception due to SME functionality	ISS2 encoding for all other exceptions	When FEAT_SME is implemented
0b011110	Granule Protection Check exception	ISS encoding for a Granule Protection Check exception	ISS2 encoding for a Granule Protection Check exception	When FEAT_RME is implemented
0b011111	IMPLEMENTATION DEFINED exception to EL3.	ISS encoding for an IMPLEMENTATION DEFINED exception to EL3	ISS2 encoding for all other exceptions	
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	ISS2 encoding for an exception from an Instruction Abort	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	ISS2 encoding for all other exceptions	
0b100010	PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	ISS2 encoding for all other exceptions	
0b100100	Data Abort exception from a lower Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including	ISS encoding for an exception from a Data Abort	ISS2 encoding for an exception from a Data Abort	

	synchronous parity or ECC errors. Not used for debug-related exceptions.			
0b100101	Data Abort exception taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	ISS2 encoding for an exception from a Data Abort	
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	ISS2 encoding for all other exceptions	
0b100111	Memory Operation Exception.	ISS encoding for an exception from the Memory Copy and Memory Set instructions	ISS2 encoding for all other exceptions	When FEAT_MOPS is implemented
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b101101	GCS exception.	ISS encoding for a GCS exception	ISS2 encoding for all other exceptions	When FEAT_GCS is implemented
0b101111	SError exception.	ISS encoding for an SError exception	ISS2 encoding for all other exceptions	
0b111100	BRK instruction execution in AArch64 state. This is reported in ESR_EL3 only if a BRK instruction is executed in EL3. This is the only debug exception that can be taken to EL3 when EL3 is using AArch64.	ISS encoding for an exception from execution of a Breakpoint instruction	ISS2 encoding for all other exceptions	When FEAT_AA64 is implemented
0b111101	Profiling exception	ISS encoding for a Profiling exception	ISS2 encoding for all other exceptions	When FEAT_EBEP is implemented, or FEAT_SPE_EXC is implemented, or FEAT_TRBE_EXC is implemented

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.

- Unused values in the range `0b101101` - `0b111111` (`0x2D` - `0x3F`) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
`0b0`	16-bit instruction trapped.
`0b1`	32-bit instruction trapped. This value is also used when the exception is one of the following: • An SError exception. • An Instruction Abort exception. • A PC alignment fault exception. • An SP alignment fault exception. • A Data Abort exception for which the value of the ISV bit is 0. • An Illegal Execution state exception. • Any debug exception except for Breakpoint instruction exceptions. • An exception reported using EC value `0b000000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

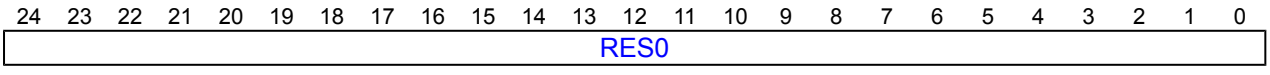
Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is `0b1111`, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value `0b11111`.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value `0b11111`.

ISS encoding for exceptions with an unknown reason



Bits [24:0]

Reserved, RES0.

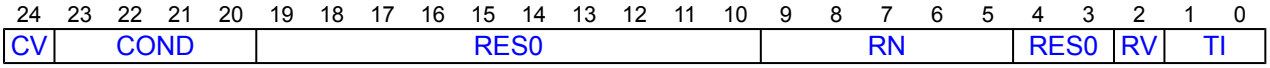
Additional information for the ISS encoding for exceptions with an unknown reason

When an exception is reported using this EC value, the IL field is set to 1.

This EC value is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
    - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
    - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
    - Instruction encodings that are unallocated.
    - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR_EL1.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
    - An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
    - An SMC instruction when disabled by SCR_EL3.SMD.
    - An HLT instruction when disabled by EDSCR.HDE.
- Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSel.SP is 0.
- Attempted execution of an MSR or MRS instruction using a _EL12 register name when the Effective value of HCR_EL2.E2H is not 1.
- Attempted execution, in Debug state, of:
    - A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
    - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
    - A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, and EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
- An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1. If the value of HCR_EL2.TGE is 0, this exception is reported using an ESR_EL3.EC value of `0b000111`.
- In Non-transactional state, attempted execution of a TCOMMIT instruction.

ISS encoding for an exception from a WF* instruction



CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:10]

Reserved, RES0.

RN, bits [9:5]

When FEAT_WFxT is implemented:

Register Number. Indicates the register number supplied for a `WFET` or `WFIT` instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

RV, bit [2]

When FEAT_WFxT is implemented:

Register field Valid.

If TI[1] == 1, then this field indicates whether RN holds a valid register number for the register argument to the trapped `WFET` or `WFIT` instruction.

RV	Meaning
`0b0`	Register field invalid.
`0b1`	Register field valid.

If TI[1] == 0, then this field is RES0.

This field is set to 1 on a trap on `WFET` or `WFIT`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFxT is implemented
0b11	WFET trapped.	When FEAT_WFxT is implemented

When FEAT_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

The reset behavior of this field is:

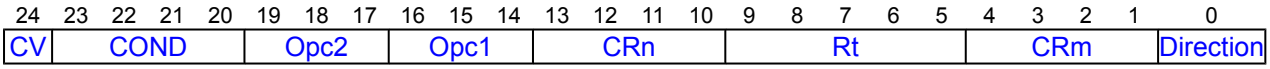
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from a WF* instruction

The following fields describe configuration settings for generating this exception:

- HCR.{TWE, TWI}.
- SCTLR_EL1.{nTWE, nTWI}.
- SCTLR_EL2.{nTWE, nTWI}.
- HCR_EL2.{TWE, TWI}.
- SCR_EL3.{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access



CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value `0b000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value `0b111`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

If the Rt value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:

- The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
- The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value `0b0000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
`0b0`	Write to System register space. MCR instruction.
`0b1`	Read from System register space. MRC or VMRS instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from an MCR or MRC access

The following fields describe configuration settings for generating exceptions from an MCR or MRC access using coproc `0b1111`, that are reported using EC value `0b000011`:

- If FEAT_TIDCP1 is implemented, SCTLR_EL1.TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch32 state, trapped to EL1.
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, trapped to EL1 or EL2.
- HCR.{TRVM, TVM} and HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, trapped to EL2.
- HCR.TTLB and HCR_EL2.TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, trapped to EL2.
- HCR.{TSW, TPC, TPU} and HCR_EL2.{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, trapped to EL2.
- HCR.TAC and HCR_EL2.TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, trapped to EL2.
- HCR.TIDCP and HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, trapped to EL2.
- If FEAT_TIDCP1 is implemented, SCTLR_EL2.TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch32 state, trapped to EL2.
- HCR.{TID1, TID2, TID3} and HCR_EL2.{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, trapped to EL2.
- HCR2.TERR, for Non-secure accesses to error record registers at EL1 using AArch32 state, trapped to EL2.
- HCPTR.TCPAC and CPTR_EL2.TCPAC, for accesses to CPACR_EL1 or CPACR using AArch32 state, trapped to EL2.
- HSTR.T<n> and HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, trapped to EL2.
- CNTHCTL.PL1PCEN and CNTHCTL_EL2.EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- HDCR.TTRF, for Non-secure accesses to trace filter control registers from system registers using AArch32 state, trapped to EL2.
- HDCR.{TPM, TPMCR} and MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- HCPTR.TAM and CPTR_EL2.TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, trapped to EL2.

- CPTR_EL3.TCPAC, for accesses to CPACR from EL1 and EL2, and accesses to HCPTR from EL2 using AArch32 state, trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, trapped to EL3.
- If FEAT_FGT is implemented, access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions from an MCR or MRC access using coproc `0b1110`, that are reported using EC value `0b000101`:

- CPACR_EL1.TTA for accesses to trace registers, trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, trapped to EL1 or EL2.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- HCR.TID0 and HCR_EL2.TID0, for accesses to the JIDR register in the ID group 0 at EL0 and EL1 using AArch32, trapped to EL2.
- HCPTR.TTA and CPTR_EL2.TTA, for accesses to trace registers using AArch32, trapped to EL2.
- HDCR.TDRA and MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, trapped to EL2.
- HDCR.TDOSA and MDCR_EL2.TDOSA, for accesses to powerdown debug registers, using AArch32 state, trapped to EL2.
- HDCR.TDA and MDCR_EL2.TDA, for accesses to other debug registers, using AArch32 state, trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers using AArch32, trapped to EL3.
- MDCR_EL3.TDA, for accesses to other debug registers, using AArch32, trapped to EL3.

The following fields describe configuration settings for generating exceptions from a VMSR or VMRS access, that are reported using EC value `0b001000`:

- HCR.TID0 and HCR_EL2.TID0, for accesses to the FPSID register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- HCR.TID3 and HCR_EL2.TID3, for accesses to registers in ID group 3 including MVFR0, MVFR1 and MVFR2, VMRS access trapped to EL2.
- HCPTR.{TCP10, TCP11}, for Non-secure accesses to FPSCR, FPSID, FPEXC, MVFR0, MVFR1, and MVFR2, trapped to EL2.

ISS encoding for an exception from any other instruction

ISS																								

ISS, bits [24:0]

ISS	Meaning	Applies when
`0b00000000000000000000000000`	`ST64BV` instruction trapped.	When FEAT_LS64_V is implemented
`0b00000000000000000000000001`	`ST64BV0` instruction trapped.	When FEAT_LS64_ACCDATA is implemented
`0b00000000000000000000000010`	`LD64B` or `ST64B` instruction trapped.	When FEAT_LS64 is implemented

All other values are reserved.

ISS encoding for an exception from an MCRR or MRRC access

CV	COND				Opc1				RES0	Rt2					Rt					CRm				Direction

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

If the Rt2 value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt2 value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.

- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

If the Rt value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
`0b0`	Write to System register space. MCRR instruction.
`0b1`	Read from System register space. MRRC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from an MCRR or MRRC access

The following fields describe configuration settings for generating exceptions from an MCRR or MRRC access using coproc `0b1111`, that are reported using EC value `0b000100`:

- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, trapped to EL1 or EL2.
- PMUSERENR_EL0.{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, trapped to EL1 or EL2.

- AMUSERENR_EL0.{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, trapped to EL1 or EL2.
- HCR.{TRVM, TVM} and HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, trapped to EL2.
- HCR2.TERR, for Non-secure accesses to error record registers at EL1 using AArch32 state, trapped to EL2.
- HSTR.T<n> and HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, trapped to EL2.
- CNTHCTL.{PL1PCEN, PL1PCTEN} and CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- HDCR.TPM and MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, trapped to EL2.
- HCPTR.TAM and CPTR_EL2.TAM, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, trapped to EL2.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, trapped to EL3.
- If FEAT_FGT is implemented, HDFGRTR_EL2.PMCCNTR_EL0 for MRRC access and HDFGWTR_EL2.PMCCNTR_EL0 for MCRR access to PMCCNTR at EL0, trapped to EL2.

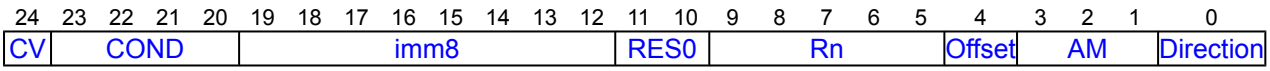
The following fields describe configuration settings for generating exceptions from an MCRR or MRRC access using coproc `0b1110`, that are reported using EC value `0b001100`:

- MDSCR_EL1.TDCC, for accesses to the Debug ROM registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, trapped to EL1 or EL2.
- HDCR.TDRA and MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, trapped to EL2.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch32, trapped to EL3.
- CPACR_EL1.TTA for accesses to trace registers using AArch32, trapped to EL1 or EL2.
- HCPTR.TTA and CPTR_EL2.TTA, for accesses to trace registers using AArch32, trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, trapped to EL3.

Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

ISS encoding for an exception from an LDC or STC instruction



CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer.

If the Rn value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rn value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
  - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
  - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behavior of this field is:

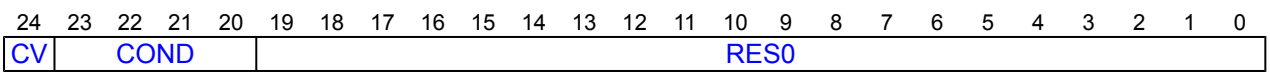
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from an LDC or STC instruction

The following fields describe the configuration settings from an LDC or STC access for the traps that are reported using EC value 0b000110:

- MDSCR_EL1.TDCC, for accesses to DBGDTRTXint and DBGDTRRXint, using AArch32 state, trapped to EL1 or EL2.
- HDCR.TDA and MDCR_EL2.TDA, for accesses to DBGDTRTXint and DBGDTRRXint, using AArch32 state, trapped to EL2.
- MDCR_EL3.TDA, for accesses to DBGDTRTXint and DBGDTRRXint, using AArch32 state, trapped to EL3.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps



The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.
- Execution of SME instructions.

For an implementation that does not include either SVE or support for Advanced SIMD and floating-point, the exception is reported using the EC value `0b000000`.

CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:0]

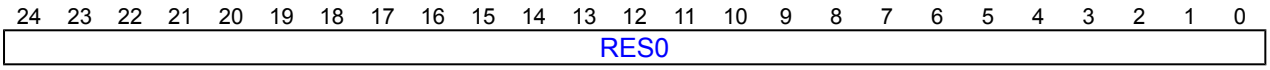
Reserved, RES0.

Additional information for the ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps

The following fields describe the configuration settings for the traps that are reported using EC value `0b000111`:

- HCPTR.{TCP10, TCP11}, for Non-secure accesses to Advanced SIMD and floating-point registers and instructions, trapped to EL2.
- HCPTR.TASE, for Non-secure accesses to Advanced SIMD functionality, trapped to EL2.
- CPACR_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
- CPTR_EL2.FPEN and CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
- CPTR_EL3.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ



The accesses covered by this trap include:

- Execution of SVE instructions when the PE is not in Streaming SVE mode.
- Accesses to the SVE System registers, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value `0b000000`.

Bits [24:0]

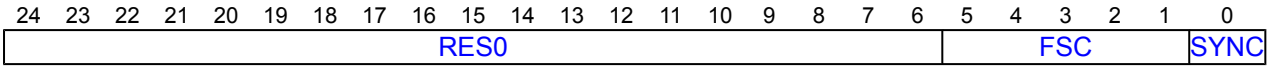
Reserved, RES0.

Additional information for the ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

The following fields describe the configuration settings for the traps that are reported using EC value `0b011001`:

- CPACR_EL1.ZEN, for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL1.
- CPTR_EL2.ZEN and CPTR_EL2.TZ, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- CPTR_EL3.EZ, for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

ISS encoding for a Profiling exception



Bits [24:6]

Reserved, RES0.

FSC, bits [5:1]

Indicates why the Profiling exception was generated.

FSC	Meaning	Applies when
0b00000	PMU Profiling exception. One of the following applies, and ESR_EL3.SYNC describes which: • The exception was generated because at least one PMU counter overflow status flag was 1, and was taken asynchronously. • The exception was generated because FEAT_SEBEP is implemented and PSTATE.PPEND was 1, and was taken synchronously.	When FEAT_EBEP is implemented
0b00001	Profiling Buffer management event. The exception was generated because PMBSR_EL3.S was 1.	When FEAT_SPE_EXC is implemented
0b00010	Trace buffer management event. The exception was generated because TRBSR_EL3.IRQ was 1.	When FEAT_TRBE_EXC is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SYNC, bit [0]

Indicates whether the Profiling exception was taken synchronously or asynchronously.

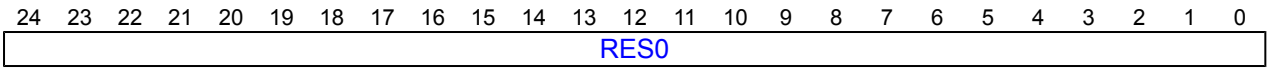
SYNC	Meaning	Applies when
0b0	The exception was taken asynchronously.	
0b1	The exception was taken synchronously.	When FEAT_SEBEP is implemented

If ESR_EL3.FSC does not indicate a PMU Profiling exception, or FEAT_SEBEP is not implemented, then the only permitted value is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault



Bits [24:0]

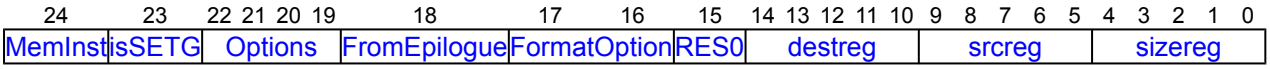
Reserved, RES0.

Additional information for the ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about PC alignment fault exceptions, see 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from the Memory Copy and Memory Set instructions



MemInst, bit [24]

Indicates the memory instruction class causing the exception.

MemInst	Meaning
0b0	CPYFE*, CPYFM*, CPYE*, and CPYM* instructions.
0b1	SETE*, SETM*, SETGE*, and SETGM* instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

isSETG, bit [23]

Indicates whether the instruction belongs to SETGM* or SETGE* class of instruction.

isSETG	Meaning
0b0	Not a SETGM* or SETGE* instruction.
0b1	SETGM* or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Options, bits [22:19]

Options : the Options field of the instruction.

For Memory Copy instructions, bits[22:19] forms the Options field, which holds the bits[15:12] of the instruction.

For Memory Set instructions:

- Bits[22:21] are RES0.
- Bits[20:19] form the Options field, which holds the bits[13:12] of the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FromEpilogue, bit [18]

Indicates whether the instruction belongs to the epilogue class of Memory Copy or Memory Set instructions.

FromEpilogue	Meaning
0b0	Not an epilogue instruction.
0b1	CPYE*, CPYFE*, SETE*, or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FormatOption, bits [17:16]

Reports the Option used to encode the initial Xs, Xd, and Xn register values provided to the instruction that generated the exception.

FormatOption	Meaning
0b00	Option B.
0b01	Option A.
0b10	Option A.
0b11	Option B.

For more information, see Memory Copy and Memory Set exceptions.

Note

This field was previously presented as two separate bits, WrongOption, bit[17] and OptionA, bit [16], which were already expected to be used together and not individually.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

destreg, bits [14:10]

The destination register value from the issued instruction, containing the destination address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

srcreg, bits [9:5]

The source register value from the issued instruction, containing either the source address or the source data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

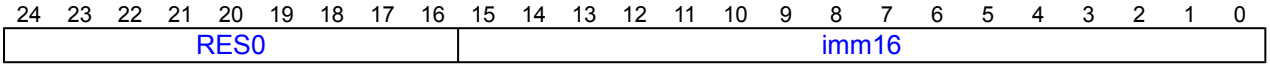
sizereg, bits [4:0]

The size register value from the issued instruction, containing the number of bytes to be transfered or set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from HVC or SVC instruction execution



Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from HVC or SVC instruction execution

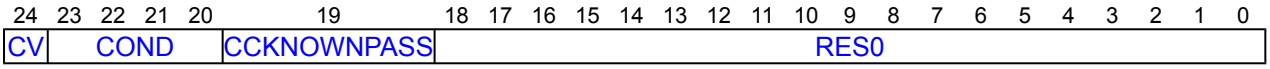
In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, HFGITR_EL2.{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state



For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:

        - With COND set to 0b1110, the value for unconditional.
        - With the COND value held in the instruction.
    - When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
        - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
        - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
    - For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

Note

In an implementation in which an SMC instruction that fails it code check is not trapped, this field can always return the value 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [18:0]

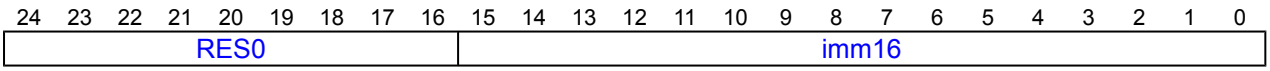
Reserved, RES0.

Additional information for the ISS encoding for an exception from SMC instruction execution in AArch32 state

HCR.TSC describes the configuration settings for trapping SMC instructions to EL2.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

ISS encoding for an exception from SMC instruction execution in AArch64 state



Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

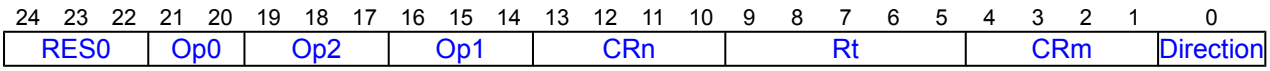
Additional information for the ISS encoding for an exception from SMC instruction execution in AArch64 state

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state



Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

For system instructions which require that the opcode Rt field is set to `0b11111`, but where the trapped instruction has a different value of Rt, an implementation is permitted to return the value `0b11111`, instead of the value of Rt from the trapped instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

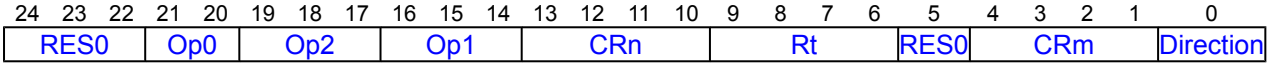
The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- If FEAT_TIDCP1 is implemented, SCTLR_EL1.TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL1.
- SCTLR_EL1.UCI, for execution of cache maintenance instructions using AArch64 state, execution is trapped to EL1 or EL2.
- SCTLR_EL1.UCT, for accesses to CTR_EL0 using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.DZE, for execution of DC ZVA instructions using AArch64 state, execution is trapped to EL1 or EL2.
- SCTLR_EL1.UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- CPACR_EL1.TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- PMUSERENR_EL0, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TDZ, for execution of DC ZVA instructions using AArch64 state, execution is trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions using AArch64 state, execution is trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, execution is trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register, ACTLR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- If FEAT_TIDCP1 is implemented, SCTLR_EL2.TIDCP, for EL0 accesses to IMPLEMENTATION DEFINED functionality using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- If FEAT_MTE2 is implemented, HCR_EL2.TID5, for accesses to GMID_EL1, using AArch64 state, MRS or MSR access at EL1, trapped to EL2.
- If FEAT_IDTE3 is implemented, SCR_EL3.TID3, for accesses to ID group 3 registers using AArch64 state, at EL1 and EL2, trapped to EL3.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.

- MDCR_EL2.TTRF, for accesses to the trace filter control register, TRFCR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.AT, for execution of AT S1E* instructions, using AArch64 state, execution is trapped to EL2.
- HCR_EL2.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- SCR_EL3.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TCPAC, for accesses to CPTR_EL2 and CPACR_EL1 using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TTRF, for accesses to the trace filter control registers, TRFCR_EL1 and TRFCR_EL2, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- If FEAT_SPE is implemented:
  - MDCR_EL3.NSPB for accesses to Statistical Profiling and Profiling Buffer control registers, using AArch64 state, MSR or MRS access at EL1 and EL2 trapped to EL3.
  - MDCR_EL2.TPMS for accesses to SPE registers, using AArch64 state, MSR or MRS access at EL1 trapped to EL2.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - HCR2.{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT_FGT is implemented:
  - SCR_EL3.FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - HFGRTR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - HFGITR_EL2 for execution of system instructions, MSR or MRS access trapped to EL2.
  - HDFGRTR_EL2 for reads and HDFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - HAFGRTR_EL2 for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.
- If FEAT_RNG_TRAP is implemented, SCR_EL3.TRNDR for reads of RNDR and RNDRRS using AArch64 state, MRS access trapped to EL3.
- If FEAT_SME is implemented:
  - CPTR_EL3.ESM, for MSR or MRS accesses to SMPRI_EL1 at EL1, EL2, and EL3, trapped to EL3.
  - CPTR_EL3.ESM, for MSR or MRS accesses to SMPRIMAP_EL2 at EL2 and EL3, trapped to EL3.
  - SCTLR_EL1.EnTP2, for MSR or MRS accesses to TPIDR2_EL0 at EL0, trapped to EL1 or EL2.
  - SCTLR_EL2.EnTP2, for MSR or MRS accesses to TPIDR2_EL0 at EL0, trapped to EL2.
  - SCR_EL3.EnTP2, for MSR or MRS accesses to TPIDR2_EL0 at EL0, EL1, and EL2, trapped to EL3.
- If FEAT_FPMR is implemented:
  - SCTLR_EL1.EnFPM, for accesses to FPMR at EL0, trapped to EL1 or EL2.
  - SCTLR_EL2.EnFPM, for accesses to FPMR at EL0, trapped to EL2.
  - HCRX_EL2.EnFPM, for accesses to FPMR at EL0 and EL1, trapped to EL2.
  - SCR_EL3.EnFPM, for accesses to FPMR at EL0, EL1, and EL2, trapped to EL3.
- If FEAT_NMI is implemented, HCRX_EL2.TALLINT, for MSR writes of ALLINT at EL1, trapped to EL2.
- If FEAT_FGT2 is implemented:
  - SCR_EL3.FGTEn2, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - HFGRTR2_EL2 for reads and HFGWTR2_EL2 for writes of registers, using AArch64 state, using MSR or MRS access at EL1 trapped to EL2.
  - HDFGRTR2_EL2 for reads and HDFGWTR2_EL2 for writes of registers, using AArch64 state, using MSR or MRS access at EL0 and EL1 trapped to EL2.
  - HFGITR2_EL2 for execution of system instructions, MSR or MRS access trapped to EL2.
- If FEAT_ITE is implemented, MDCR_EL3.EnITE, for accesses to Instrumentation trace registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_MEC is implemented, SCR_EL3.MECEn, for accesses to MECID registers at EL2, trapped to EL3.
- If FEAT_SPE_FDS is implemented, MDCR_EL3.EnPMS3 for accesses to SPE registers, using AArch64 state, MSR or MRS access at EL1 and EL2 trapped to EL3.
- If FEAT_SPE_nVM is implemented, MDCR_EL3.EnPMS4 for accesses to SPE registers, using AArch64 state, MSR or MRS access at EL1 and EL2 trapped to EL3.

- If FEAT_RASv2 is implemented, SCR_EL3.TWERR, for accesses to Error Record registers, MSR access at EL1 and EL2 trapped to EL3.
- If FEAT_Debugv8p9 is implemented, MDCR_EL3.EBWE for accesses of MDSELR_EL1, using AArch64 state, MRS or MSR access at EL2 and EL1 trapped to EL3.
- If FEAT_PMUv3p9, FEAT_SPMU, FEAT_EBEP, or FEAT_PMUv3_SS is implemented, MDCR_EL3.EnPM2, for accesses to PMU registers, using AArch64 state, MSR or MRS access at EL2, EL1, and EL0, trapped to EL3.
- If FEAT_PMUv3_SS is implemented, MDCR_EL3.EnPMSS, for accesses to PMU Snapshot registers, using AArch64 state, MSR or MRS access at EL2 and EL1 trapped to EL3.
- If FEAT_THE is implemented, SCR_EL3.RCWMASKEn for accesses to RCWMASK_EL1 and RCWSMASK_EL1, using AArch64 state, MSR or MRS access at EL2 and EL1 trapped to EL3.
- If FEAT_AIE is implemented, SCR_EL3.AIEn for accesses to Extended Memory Attribute registers, MSR or MRS access at EL2 and EL1 trapped to EL3.
- If FEAT_S1PIE, FEAT_S2PIE, FEAT_S1POE, or FEAT_S2POE is implemented, SCR_EL3.PIEn for accesses to Permission Indirection, Overlay registers, MSR or MRS access at EL2, EL1 and EL0 trapped to EL3.
- If FEAT_MPAM_PE_BW_CTRL is implemented, MPAMBW2_EL2.{nTRAP_MPAMBWIDR_EL1, nTRAP_MPAMBW0_EL1, nTRAP_MPAMBW1_EL1} for accesses to MPAMBW*_EL1 registers, using AArch64 state, MRS or MSR access at EL1, trapped to EL2.
- If FEAT_MPAM_PE_BW_CTRL and FEAT_SME are implemented, MPAMBW2_EL2.nTRAP_MPAMBWSM_EL1, for accesses to MPAMBWSM_EL1, using AArch64 state, MRS or MSR access at EL1, trapped to EL2.
- If FEAT_MPAM_PE_BW_CTRL is implemented, MPAMBW3_EL3.nTRAPLOWER, for accesses to MPAMBW_EL2 registers and MPAMBW_EL1 registers, using AArch64 state, MRS or MSR access at EL1, trapped to EL3.
- If FEAT_HACDBS is implemented, SCR_EL3.HACDBSEn, for accesses to HACDBSBR_EL2 and HACDBSCONS_EL2, using AArch64 state, MRS or MSR access at EL2, trapped to EL3.
- If FEAT_HDBSS is implemented, SCR_EL3.HDBSSEn, for accesses to HDBSSBR_EL2 and HDBSSPROD_EL2, using AArch64 state, MRS or MSR access at EL2, trapped to EL3.
- If FEAT_SRMASK is implemented, SCR_EL3.SRMASKEn, for MSR or MRS accesses at EL1 or EL2 to the MASK registers using AArch64 state, trapped to EL3.

ISS encoding for an exception from MSRR, MRRS, or 128-bit System instruction execution in AArch64 state



Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:6]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

Note

This value represents register pair of X[Rt:0], X[Rt:1].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, MSRR instructions.
0b1	Read access, MRRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from MSRR, MRRS, or 128-bit System instruction execution in AArch64 state

The following fields describe configuration settings for generating exceptions from an MSRR or MRRS access that are reported using EC value 0b010100:

- If FEAT_FGT is implemented:
  - HFGRTR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, accesses at EL1 trapped to EL2.
- If FEAT_FGT2 is implemented:
  - HFGRTR2_EL2.nRCWSMASK_EL1 for reads and HFGWTR2_EL2.nRCWSMASK_EL1 for writes of RCWSMASK_EL1, using AArch64 state, accesses at EL1 trapped to EL2.
- If FEAT_SYSREG128 is implemented:
  - SCTLR2_EL1.EnIDCP128 for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL0 trapped to EL1.
  - SCTLR2_EL2.EnIDCP128 for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL0 trapped to EL2.
  - HCRX_EL2.EnIDCP128 for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL1 and EL0 trapped to EL2.

    - SCR_EL3.EnIDCP128 for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL2, EL1, and EL0 trapped to EL3.
- If FEAT_D128 is implemented:
    - HCR_EL2.{TRVM, TVM} for accesses to TTBR0_EL1 and TTBR1_EL1, accesses at EL1 and EL0 trapped to EL2.
    - HCRX_EL2.D128En for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL1 trapped to EL2.
    - SCR_EL3.D128En for accesses to 128-bit IMPLEMENTATION DEFINED System registers, accesses at EL2 and EL1 trapped to EL3.
- If FEAT_THE is implemented, SCR_EL3.RCWMASKEn for accesses to RCWMASK_EL1 and RCWSMASK_EL1, using AArch64 state, accesses at EL2 and EL1 trapped to EL3.

ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																								

IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										PFV	RES0		SET		FnV	EA	RES0		S1PTW	RES0			IFSC						

When FEAT_S1POE is implemented, if a memory access generates a Instruction Abort due to a Permission fault, the ISS2 encoding for an exception from an Instruction Abort includes further information about the exception.

Bits [24:15]

Reserved, RES0.

PFV, bit [14]

When FEAT_PFAR is implemented and (IFSC == 0b010000, or IFSC IN {0b01001x}, or IFSC IN {0b0101xx}):

PFAR Valid. Describes whether the MFAR_EL3 register is valid.

PFV	Meaning
0b0	MFAR_EL3 is UNKNOWN.
0b1	MFAR_EL3 is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [13]

Reserved, RES0.

SET, bits [12:11]

When FEAT_RAS is implemented and (IFSC == 0b010000, or IFSC IN {0b01001x}, or IFSC IN {0b0101xx}):

Synchronous Error Type. Describes the PE error state after taking the Instruction Abort exception.

SET	Meaning	Applies when
0b00	Recoverable state (UER).	
0b10	Uncontainable (UC).	When FEAT_RASv2 is not implemented
0b11	Restartable state (UEO).	

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External abort exception might result in a PE state that is not recoverable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented

0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

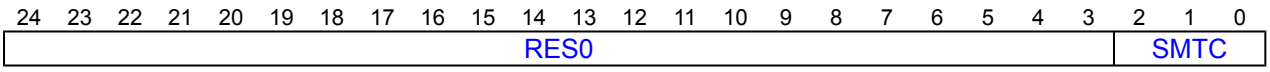
For more information about the lookup level associated with a fault, see 'The lookup level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception due to SME functionality



The accesses covered by this trap include:

- Execution of SME instructions.
- Execution of SVE and Advanced SIMD instructions, when the PE is in Streaming SVE mode.
- Direct accesses of SVCR, SMCR_EL1, SMCR_EL2, SMCR_EL3.

Bits [24:3]

Reserved, RES0.

SMTC, bits [2:0]

SME Trap Code. Identifies the reason for instruction trapping.

SMTC	Meaning	Applies when
0b000	Access to SME functionality trapped as a result of CPACR_EL1.SMEN, CPTR_EL2.SMEN, CPTR_EL2.TSM, or CPTR_EL3.ESM, that is not reported using EC value 0b000000.	
0b001	Advanced SIMD, SVE, or SVE2 instruction trapped because PSTATE.SM is 1.	
0b010	SME instruction trapped because PSTATE.SM is 0.	
0b011	SME instruction trapped because PSTATE.ZA is 0.	
0b100	Access to the SME2 ZT0 register trapped as a result of SMCR_EL1.EZT0, SMCR_EL2.EZT0, or SMCR_EL3.EZT0.	When FEAT_SME2 is implemented

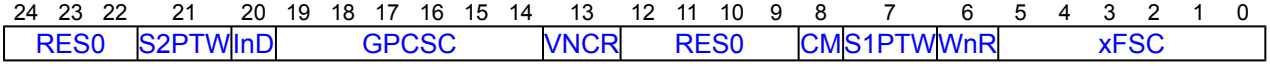
All other values are reserved.

Additional information for the ISS encoding for an exception due to SME functionality

The following fields describe the configuration settings for the traps that are reported using the EC value 0b011101:

- CPACR_EL1.SMEN, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access SVCR and SMCR_EL1 System registers at EL1 and EL0, trapped to EL1 or EL2.
- CPTR_EL2.SMEN and CPTR_EL2.TSM, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access SVCR, SMCR_EL1, SMCR_EL2 at EL2, EL1, and EL0, trapped to EL2.
- CPTR_EL3.ESM, for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access SVCR, SMCR_EL1, SMCR_EL2, SMCR_EL3 from all Exception levels and any Security state, trapped to EL3.
- If FEAT_SME2 is implemented:
  - SMCR_EL1.EZT0, for accesses to ZT0 at EL1 and EL0, trapped to EL1 or EL2.
  - SMCR_EL2.EZT0, for accesses to ZT0 at EL2, EL1, and EL0, trapped to EL2.
  - SMCR_EL3.EZT0, for accesses to ZT0 at any Exception level, trapped to EL3.

ISS encoding for a Granule Protection Check exception



Bits [24:22]

Reserved, RES0.

S2PTW, bit [21]

Indicates whether the Granule Protection Check exception was on an access made for a stage 2 translation table walk.

S2PTW	Meaning
0b0	Fault not on a stage 2 translation table walk.
0b1	Fault on a stage 2 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [20]

Indicates whether the Granule Protection Check exception was on an instruction or data access.

InD	Meaning
0b0	Data access.
0b1	Instruction access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GPCSC, bits [19:14]

Granule Protection Check Status Code.

GPCSC	Meaning
0b000000	GPT address size fault at level 0.
0b000100	GPT walk fault at level 0.
0b000101	GPT walk fault at level 1.
0b001100	Granule protection fault at level 0.
0b001101	Granule protection fault at level 1.
0b010100	Synchronous External abort on GPT fetch at level 0.
0b010101	Synchronous External abort on GPT fetch at level 1.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VNCR, bit [13]

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning	Applies when
0b0	The fault was not generated by the use of VNCR_EL2 by EL1 code.	
0b1	The fault was generated by the use of VNCR_EL2 by EL1 code.	When FEAT_NV2 is implemented

When InD is 1, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

Indicates whether the Granule Protection Check exception was on an access for stage 2 translation for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

When InD is 1, this field is RES0.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

xFSC, bits [5:0]

Instruction or Data Fault Status Code.

xFSC	Meaning	Applies when
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented

All other values are reserved.

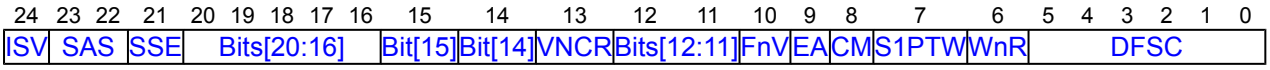
For more information about the lookup level associated with a fault, see 'The lookup level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort



The ISS2 encoding for an exception from a Data Abort includes further information about the exception when any of the following features are implemented:

- FEAT_LS64_V.
- FEAT_LS64_ACCDATA.
- FEAT_S1POE.
- FEAT_S1PIE.
- FEAT_GCS.
- FEAT_MTE_CANONICAL_TAGS.

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL3, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

In ESR_EL3, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL3, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_V is implemented and a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64_ACCDATA is implemented and a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_MTE2 is implemented, for a synchronous Tag Check Fault abort taken to EL3, ESR_EL3.FnV is 0 and FAR_EL3 is valid.

When FEAT_MOPS is implemented, for a synchronous Data Abort on a Memory Copy and Memory Set instruction, ISV is 0.

When FEAT_MTE is implemented, for a synchronous Data Abort on an instruction that directly accesses Allocation Tags, ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]
When ISV == 1:

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSE, bit [21]
When ISV == 1:

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits[20:16]
When ISV == 1:

SRT, bits [4:0] of bits [20:16]

Syndrome Register Transfer. The register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ISV == 0, FEAT_RASv2 is implemented, and (DFSC == 0b010000, or DFSC IN {0b01001x}, or DFSC IN {0b0101xx}):

Bits [4:2] of bits [20:16]

Reserved, RES0.

WU, bits [1:0] of bits [20:16]

Write Update. Describes whether a store instruction that generated an External abort updated the location.

WU	Meaning
0b00	Not a store instruction or translation table update, or the location might have been updated.
0b10	Store instruction or translation table update that did not update the location.
0b11	Store instruction or translation table update that updated the location.

In the description of this field, a store instruction is any memory-writing instruction that explicitly performs a store. This includes instructions that both read and write memory.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[15]
When ISV == 1:

SF, bit [15]

Sixty Four bit general-purpose register transfer. Width of the register accessed by the instruction is 64-bit.

SF	Meaning
0b0	Instruction loads/stores a 32-bit general-purpose register.
0b1	Instruction loads/stores a 64-bit general-purpose register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ISV == 0:

FnP, bit [15]

FAR not Precise.

FnP	Meaning	Applies when
0b0	The FAR holds the faulting virtual address that generated the Data Abort.	
0b1	The FAR holds any virtual address within the naturally-aligned granule that contains the faulting virtual address that generated a Data Abort due to an SVE contiguous vector load/store instruction, or an SME load/store instruction. For more information about the naturally-aligned fault granule, see FAR_ELx (for example, FAR_EL1).	When FEAT_SME is implemented or FEAT_SVE is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[14]
When ISV == 1:

AR, bit [14]

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an LD64B or ST64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_V is implemented, if a memory access generated by an ST64BV instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

When FEAT_LS64_ACCDATA is implemented, if a memory access generated by an ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_PFAR is implemented and (DFSC == 0b010000, or DFSC IN {0b01001x}, or DFSC IN {0b0101xx}):

PFV, bit [14]

PFAR Valid. Describes whether the MFAR_EL3 register is valid.

PFV	Meaning
0b0	MFAR_EL3 is UNKNOWN.
0b1	MFAR_EL3 is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VNCR, bit [13]

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning	Applies when
0b0	The fault was not generated by the use of VNCR_EL2 by EL1 code.	
0b1	The fault was generated by the use of VNCR_EL2 by EL1 code.	When FEAT_NV2 is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits[12:11]

When (DFSC IN {0b00xxxx} || DFSC IN {0b10101x}) && !(DFSC IN {0b0000xx}):

LST, bits [1:0] of bits [12:11]

Load/Store Type. Used when a Translation fault, Access flag fault, or Permission fault generates a Data Abort.

LST	Meaning	Applies when
0b00	The instruction that generated the Data Abort is not specified by this field.	
0b01	An ST64BV instruction generated the Data Abort.	When FEAT_LS64_V is implemented
0b10	An LD64B or ST64B instruction generated the Data Abort.	When FEAT_LS64 is implemented
0b11	An ST64BV0 instruction generated the Data Abort.	When FEAT_LS64_ACCDATA is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RAS is implemented and (DFSC == 0b010000, or DFSC IN {0b01001x}, or DFSC IN {0b0101xx}):

SET, bits [1:0] of bits [12:11]

Synchronous Error Type. Used when a synchronous External abort, not on a Translation table walk or hardware update of the Translation table, generated the Data Abort. Describes the PE error state after taking the Data Abort exception.

SET	Meaning	Applies when
0b00	Recoverable state (UER).	
0b10	Uncontainable (UC).	When FEAT_RASv2 is not implemented
0b11	Restartable state (UEO).	

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External abort exception might result in a PE state that is not recoverable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- If FEAT_RASv2 is implemented, an External abort on an Atomic access, reported with ESR_EL3.WU set to `0b00`.
- A fault reported using a DFSC value of `0b110101` or `0b110001`, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	

0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The lookup level associated with MMU faults'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV	RES0												VECITR			IDF	RES0		IXF	UFF	OFF	DZF	IOF

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from an instruction that is performing floating-point operations on more than one lane of a vector.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from an instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

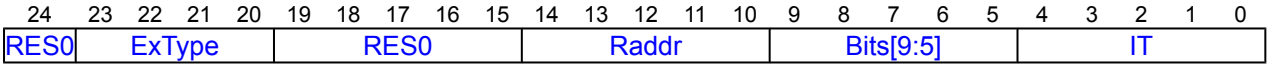
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from a trapped floating-point exception

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the FPCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for a GCS exception



Bit [24]

Reserved, RES0.

ExType, bits [23:20]

The first level classification of GCS exceptions.

ExType	Meaning
0b0000	The exception reported is a Guarded Control Stack Data Check Exception.
0b0001	The exception reported is an EXLOCK Exception.
0b0010	The exception reported is a trap exception on GCSSTR or GCSSTTR instruction execution.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:15]

Reserved, RES0.

Raddr, bits [14:10]

When ExType == 0b0010 :

Indicates the data address register number supplied in the instruction that has been trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits[9:5]

When ExType == 0b0000 :

Rn, bits [4:0] of bits [9:5]

Indicates a register number used by the instruction that caused the Guarded Control Stack Data Check Exception.

For a procedure return instruction reported with ESR_EL3.ISS.IT as 0b00000, contains the register number for the register which contains the target address of the branch.

For a GCSPOPM instruction reported with ESR_EL3.ISS.IT as 0b00001, contains the register number for the register which is the destination register of the instruction.

For a procedure return instruction reported with ESR_EL3.ISS.IT as `0b00010` or `0b00011`, contains the value `0b11110`, indicating X30.

For a GCSSS1 instruction reported with ESR_EL3.ISS.IT as `0b00100`, contains the register number for the register which is the input register of the instruction.

If ESR_EL3.ISS.IT is reported as `0b00101` or `0b01000`, this field is UNKNOWN

If ESR_EL3.ISS.IT is reported as `0b01001`, this field is `0b11111`

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ExType == 0b0010 :

Rvalue, bits [4:0] of bits [9:5]

Indicates the data value register number supplied in the instruction that has been trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IT, bits [4:0]

When ExType == 0b0000 :

Type of the instruction that caused the Guarded Control Stack Data Check Exception.

IT	Meaning
`0b00000`	Guarded Control Stack Data Check Exception is from a procedure return instruction without Pointer authentication.
`0b00001`	Guarded Control Stack Data Check Exception is from a GCSPOPM instruction.
`0b00010`	Guarded Control Stack Data Check Exception is from a procedure return instruction with Pointer authentication that uses key A.
`0b00011`	Guarded Control Stack Data Check Exception is from a procedure return instruction with Pointer authentication that uses key B.
`0b00100`	Guarded Control Stack Data Check Exception is from a GCSSS1 instruction.
`0b00101`	Guarded Control Stack Data Check Exception is from a GCSSS2 instruction.
`0b01000`	Guarded Control Stack Data Check Exception is from a GCSPOPCX instruction.
`0b01001`	Guarded Control Stack Data Check Exception is from a GCSPOPX instruction.

All other values are reserved

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

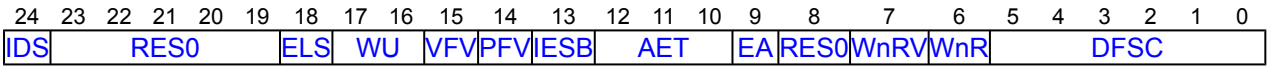
Reserved, RES0.

Additional information for the ISS encoding for a GCS exception

The following fields describe the configuration settings for the traps that are reported using EC value `0b101101` and ExType value `0b0010`:

- GCSCRE0_EL1.STREn
- GCSCR_EL1.STREn.
- GCSCR_EL2.STREn.
- GCSCR_EL3.STREn.
- HFGITR_EL2.nGCSSTR_EL1.

ISS encoding for an SError exception



Note

In earlier versions of the architecture, an SError exception is referred to as an SError interrupt or an asynchronous External abort exception.

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
`0b0`	Bits [23:0] of the ISS field holds the fields described in this encoding. **Note** If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.
`0b1`	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError exception.

Note

This field was previously called ISV.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:19]

Reserved, RES0.

ELS, bit [18]

When FEAT_RASv2 is implemented and DFSC == 0b010001:

Meaning of ELR_ELx.

ELS	Meaning
`0b0`	Asynchronous. Does not indicate the trigger for the exception.
`0b1`	Synchronous. The exception was triggered by the instruction at ELR_ELx.

SError exceptions that report this field is 1 are not required to be precise.

The ESR_EL3.AET field describes whether the exception is precise or imprecise.

Corrected, Recoverable or Restartable exceptions are precise. Unrecoverable or Uncontainable exceptions are imprecise.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WU, bits [17:16]
When FEAT_RASv2 is implemented and DFSC == 0b010001:

Write Update. Describes whether a store instruction that generated an External abort updated the location.

WU	Meaning
0b00	Not a store instruction or translation table update, or the location might have been updated.
0b10	Store instruction or translation table update that did not update the location.
0b11	Store instruction or translation table update that updated the location.

In the description of this field, a store instruction is any memory-writing instruction that explicitly performs a store. This includes instructions that both read and write memory.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VFV, bit [15]
When FEAT_RASv2 is implemented and DFSC == 0b010001:

FAR Valid. Indicates the FAR_EL3 register contains a valid virtual address.

VFV	Meaning
0b0	FAR_EL3 is not valid, and holds an UNKNOWN value.
0b1	FAR_EL3 contains a valid virtual address associated with the error.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PFV, bit [14]
When FEAT_PFAR is implemented and DFSC == 0b010001:

PFAR Valid. Describes whether the MFAR_EL3 register is valid.

PFV	Meaning
0b0	MFAR_EL3 is UNKNOWN.
0b1	MFAR_EL3 is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IESB, bit [13]
When FEAT_IESB is implemented and DFSC == 0b010001:

Implicit error synchronization event.

IESB	Meaning
0b0	The SError exception was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError exception was synchronized by the implicit error synchronization event and taken immediately.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]
When FEAT_RAS is implemented and DFSC == 0b010001:

Asynchronous Error Type.

Describes the PE error state after taking the SError exception.

AET	Meaning
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]
When FEAT_RAS is implemented and DFSC == 0b010001:

External abort type. Provides an IMPLEMENTATION DEFINED classification of External aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

WnRV, bit [7]
When FEAT_RASv2 is implemented and DFSC == 0b010001:

ESR_EL3.WnR valid.

WnRV	Meaning
0b0	ESR_EL3.WnR is not valid and has been set to 0b0.
0b1	ESR_EL3.WnR is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WnR, bit [6]
When FEAT_RASv2 is implemented and DFSC == 0b010001:

Write-not-Read. When the WnRV field is 0b1, indicates whether an exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Exception was caused by an instruction reading from a memory location.
0b1	Exception was caused by an instruction writing to a memory location.

Accessing this bit has the following behavior:

- This bit is RES0 if ESR_EL3.WnRV==0b0.
- This bit is not valid and reads UNKNOWN if an External abort on a Atomic access, reported with ESR_EL3.WU == 0b00.
- Otherwise RW.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DFSC, bits [5:0]

When FEAT_RAS is implemented:

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError exception.

All other values are reserved.

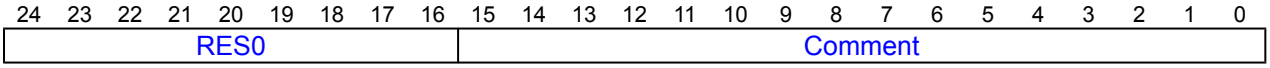
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from execution of a Breakpoint instruction



Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

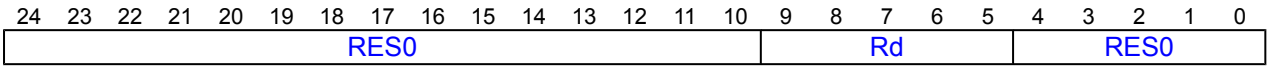
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for an exception from execution of a Breakpoint instruction

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

ISS encoding for an exception from a TSTART instruction



Bits [24:10]

Reserved, RES0.

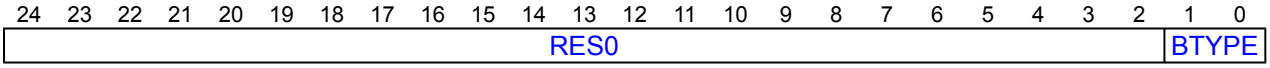
Rd, bits [9:5]

The Rd value from the issued instruction, the general purpose register used for the destination.

Bits [4:0]

Reserved, RES0.

ISS encoding for an exception from Branch Target Identification instruction



Bits [24:2]

Reserved, RES0.

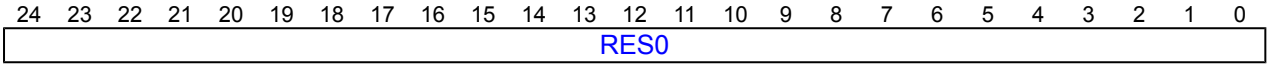
BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

Additional information for the ISS encoding for an exception from Branch Target Identification instruction

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ISS encoding for an exception from a trapped Pointer Authentication instruction



Bits [24:0]

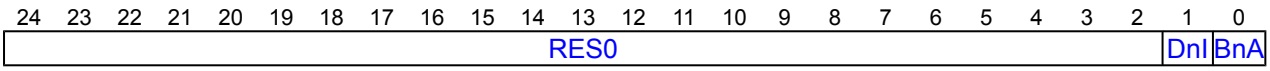
Reserved, RES0.

Additional information for the ISS encoding for an exception from a trapped Pointer Authentication instruction

For more information about generating these exceptions, see:

- HCR_EL2.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- SCR_EL3.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for a PAC Fail exception



Bits [24:2]

Reserved, RES0.

DnI, bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

DnI	Meaning
0b0	Instruction Key.
0b1	Data Key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BnA, bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

BnA	Meaning
0b0	A key.
0b1	B key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for a PAC Fail exception

The following instructions generate a PAC Fail exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTDA, AUTDZA.
- AUTDB, AUTDZB.
- AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIZA.
- AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZB.
- AUTIASPPC, AUTIASPPCR, AUTIA171615.
- AUTIBSPPC, AUTIBSPPCR, AUTIB171615.

If FEAT_FPACCOMBINE is implemented, the following instructions generate a PAC Fail exception when the Pointer Authentication Code (PAC) is incorrect:

- RETAA, RETAB.
- RETAASPPC, RETABSPPC.
- RETAASPPCR, RETABSPPCR.
- BLRAA, BLRAAZ, BLRAB, BLRABZ.
- BRAA, BRAB, BRAAZ, BRABZ.
- ERETAA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing ESR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ESR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0101	0b0010	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = ESR_EL3;
```

```
MSR ESR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0101	0b0010	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    ESR_EL3 = X[t, 64];
```

FAR_EL1, Fault Address Register (EL1)

The FAR_EL1 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction Abort exceptions, Data Abort exceptions, PC alignment fault exceptions and Watchpoint exceptions that are taken to EL1.

Configuration

AArch64 System register FAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DFAR[31:0].

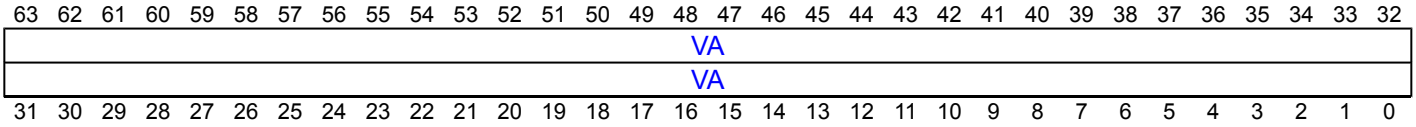
AArch64 System register FAR_EL1 bits [63:32] are architecturally mapped to AArch32 System register IFAR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to FAR_EL1 are UNDEFINED.

Attributes

FAR_EL1 is a 64-bit register.

Field descriptions



VA, bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL1. Exceptions that set the FAR_EL1 are Instruction Aborts (EC `0x20` or `0x21`), Data Aborts (EC `0x24` or `0x25`), PC alignment faults (EC `0x22`), and Watchpoints (EC `0x34` or `0x35`). ESR_EL1.EC holds the EC syndrome value for the exception.

For a synchronous External abort:

- If the VA that generated the abort was from an address range for which Address tagging is enabled for the translation regime in use when the abort was generated, then bits[63:56] of FAR_EL1 are UNKNOWN.
- If the VA that generated the abort was from an address range for which Address tagging is disabled and Logical Address Tagging is enabled for the translation regime in use when the abort was generated, then bits[59:56] of FAR_EL1 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL1.FnV is 0, and FAR_EL1 is UNKNOWN if ESR_EL1.FnV is 1.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL1 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by DC ZVA.

If a memory fault that sets FAR_EL1 is generated from an STZGM instruction, the address held in FAR_EL1 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument.

If a memory fault that sets FAR_EL1, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL1 is taken from an Exception level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are `0x00000001`:

- The faulting address was generated by a load or store instruction that sequentially incremented from address `0xFFFFFFFF`. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

When the PE sets ESR_EL1.{ISV,FnP} to {0,1} on taking a Data Abort exception, the PE sets FAR_EL1 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Data Abort exception.

When the PE sets ESR_EL1.{FnV,FnP} to {0,1} on taking a Watchpoint exception, the PE sets FAR_EL1 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Watchpoint exception.

The naturally-aligned fault granule is one of:

- When ESR_EL1.DFSC is `0b010001`, indicating a Synchronous Tag Check fault, it is a 16-byte tag granule.
- When ESR_EL1.DFSC is `0b11010x`, indicating an IMPLEMENTATION DEFINED fault, it is an IMPLEMENTATION DEFINED granule.
- Otherwise, it is the smallest implemented translation granule.

When FEAT_MOPS is implemented, the value in FAR_EL1 on a synchronous exception from any of the Memory Copy and Memory Set instructions represents the first element that has not been copied or set, and is determined as follows:

- For a Data Abort generated by the MMU, the value is within the address range of the relevant translation granule, aligned to the size of the relevant translation granule of the address that generated the Data Abort. Bits[(n-1):0] of the value are UNKNOWN, where 2^n is the relevant translation granule size in bytes. For the purpose of calculating the relevant translation granule, if the MMU is disabled for a stage of translation, then the current translation granule size is equal to 2^{64} for stage 1, and the PARange for stage 2. The relevant translation granule is:
  - For MMU faults generated at stage 1, the current stage 1 translation granule.
  - For MMU faults generated at stage 2, the smaller of the current stage 1 translation granule and the current stage 2 translation granule.
  - If FEAT_RME is implemented, for a synchronous Data Abort generated as the result of a GPF, the smallest of the current stage 1 translation granule, the current stage 2 translation granule and the configured granule size in GPCCR_EL3.PGS.
- For a Data Abort generated by a Tag Check Fault, the value is any address that caused a Tag Check Fault within the block size of the load or store.
- For a Watchpoint exception, the value is an address range of the size defined by the DCZID_EL0.BS field. This address does not need to be the element with a watchpoint, but can be some earlier element.
- Otherwise, the value is the lowest address in the block size of the load or store.

For a Data Abort exception or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging'.

For a synchronous Tag Check Fault:

- If FEAT_MTE_TAGGED_FAR is implemented or Address tagging is disabled for the translation regime in use when the abort was generated, all bits of FAR_EL1 are not UNKNOWN.
- If FEAT_MTE_TAGGED_FAR is not implemented and Address tagging is enabled for the translation regime in use when the abort was generated, bits[63:60] of FAR_EL1 are UNKNOWN.

Execution at EL0 makes FAR_EL1 become UNKNOWN.

Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or Data Abort. It is the lower address that gave rise to the fault that is reported. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize which fault is reported.

For all other exceptions taken to EL1, FAR_EL1 is UNKNOWN.

FAR_EL1 is made UNKNOWN on an exception return from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FAR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name FAR_EL1 or FAR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, FAR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0110	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then

FAR_EL2, Fault Address Register (EL2)

The FAR_EL2 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction Abort exceptions, Data Abort exceptions, PC alignment fault exceptions and Watchpoint exceptions that are taken to EL2.

Configuration

AArch64 System register FAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDFAR[31:0].

AArch64 System register FAR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HIFAR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to FAR_EL2 are UNDEFINED.

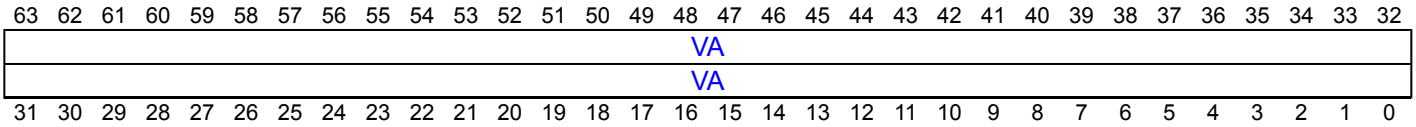
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

FAR_EL2 is a 64-bit register.

Field descriptions



VA, bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL2. Exceptions that set the FAR_EL2 are Instruction Aborts (EC `0x20` or `0x21`), Data Aborts (EC `0x24` or `0x25`), PC alignment faults (EC `0x22`), and Watchpoints (EC `0x34` or `0x35`). ESR_EL2.EC holds the EC syndrome value for the exception.

For a synchronous External abort:

- If the VA that generated the abort was from an address range for which Address tagging is enabled for the translation regime in use when the abort was generated, then bits[63:56] of FAR_EL2 are UNKNOWN.
- If the VA that generated the abort was from an address range for which Address tagging is disabled and Logical Address Tagging is enabled for the translation regime in use when the abort was generated, then bits[59:56] of FAR_EL2 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL2.FnV is 0, and FAR_EL2 is UNKNOWN if ESR_EL2.FnV is 1.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL2 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by DC ZVA.

If a memory fault that sets FAR_EL2 is generated from an STZGM instruction, the address held in FAR_EL2 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument.

If a memory fault that sets FAR_EL2, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL2 is taken from an Exception level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are `0x00000001`:

- The faulting address was generated by a load or store instruction that sequentially incremented from address `0xFFFFFFFF`. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

When the PE sets ESR_EL2.{ISV,FnP} to {0,1} on taking a Data Abort exception, the PE sets FAR_EL2 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Data Abort exception.

When the PE sets ESR_EL2.{FnV,FnP} to {0,1} on taking a Watchpoint exception, the PE sets FAR_EL2 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Watchpoint exception.

The naturally-aligned fault granule is one of:

- When ESR_EL2.DFSC is `0b010001`, indicating a Synchronous Tag Check fault, it is a 16-byte tag granule.
- When ESR_EL2.DFSC is `0b11010x`, indicating an IMPLEMENTATION DEFINED fault, it is an IMPLEMENTATION DEFINED granule.
- Otherwise, it is the smallest implemented translation granule.

When FEAT_MOPS is implemented, the value in FAR_EL2 on a synchronous exception from any of the Memory Copy and Memory Set instructions represents the first element that has not been copied or set, and is determined as follows:

- For a Data Abort generated by the MMU, the value is within the address range of the relevant translation granule, aligned to the size of the relevant translation granule of the address that generated the Data Abort. Bits[(n-1):0] of the value are UNKNOWN, where 2^n is the relevant translation granule size in bytes. For the purpose of calculating the relevant translation granule, if the MMU is disabled for a stage of translation, then the current translation granule size is equal to 2^{64} for stage 1, and the PARange for stage 2. The relevant translation granule is:
  - For MMU faults generated at stage 1, the current stage 1 translation granule.
  - For MMU faults generated at stage 2, the smaller of the current stage 1 translation granule and the current stage 2 translation granule.
  - If FEAT_RME is implemented, for a synchronous Data Abort generated as the result of a GPF, the smallest of the current stage 1 translation granule, the current stage 2 translation granule and the configured granule size in GPCCR_EL3.PGS.
- For a Data Abort generated by a Tag Check Fault, the value is any address that caused a Tag Check Fault within the block size of the load or store.
- For a Watchpoint exception, the value is an address range of the size defined by the DCZID_EL0.BS field. This address does not need to be the element with a watchpoint, but can be some earlier element.
- Otherwise, the value is the lowest address in the block size of the load or store.

For a Data Abort exception or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging'.

For a synchronous Tag Check Fault:

- If FEAT_MTE_TAGGED_FAR is implemented or Address tagging is disabled for the translation regime in use when the abort was generated, all bits of FAR_EL2 are not UNKNOWN.
- If FEAT_MTE_TAGGED_FAR is not implemented and Address tagging is enabled for the translation regime in use when the abort was generated, bits[63:60] of FAR_EL2 are UNKNOWN.

Execution at EL1 or EL0 makes FAR_EL2 become UNKNOWN.

Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or Data Abort. It is the lower address that gave rise to the fault that is reported. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize which fault is reported.

For all other exceptions taken to EL2, FAR_EL2 is UNKNOWN.

FAR_EL2 is made UNKNOWN on an exception return from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FAR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name FAR_EL2 or FAR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, FAR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'1x1'} then
        X[t, 64] = FAR_EL1;
    elsif EffectiveHCR_EL2_NVx() IN {'xx1'} then

FAR_EL3, Fault Address Register (EL3)

The FAR_EL3 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction Abort exceptions, Data Abort exceptions and PC alignment fault exceptions that are taken to EL3.

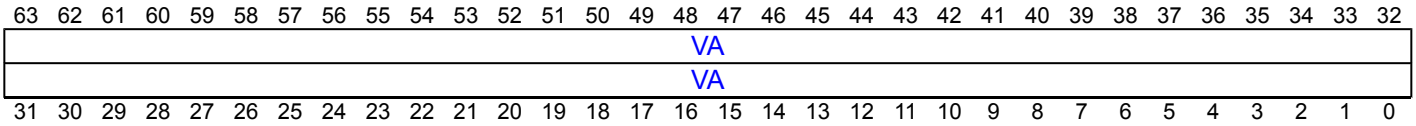
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to FAR_EL3 are UNDEFINED.

Attributes

FAR_EL3 is a 64-bit register.

Field descriptions



VA, bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL3. Exceptions that set the FAR_EL3 are Instruction Aborts (EC `0x20` or `0x21`), Data Aborts (EC `0x24` or `0x25`), and PC alignment faults (EC `0x22`). ESR_EL3.EC holds the EC syndrome value for the exception.

For a synchronous External abort:

- If the VA that generated the abort was from an address range for which Address tagging is enabled for the translation regime in use when the abort was generated, then bits[63:56] of FAR_EL3 are UNKNOWN.
- If the VA that generated the abort was from an address range for which Address tagging is disabled and Logical Address Tagging is enabled for the translation regime in use when the abort was generated, then bits[59:56] of FAR_EL3 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL3.FnV is 0, and FAR_EL3 is UNKNOWN if ESR_EL3.FnV is 1.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL3 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by DC ZVA.

If a memory fault that sets FAR_EL3 is generated from an STZGM instruction, the address held in FAR_EL3 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument.

If a memory fault that sets FAR_EL3, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL3 is taken from an Exception level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are `0x00000001`:

- The faulting address was generated by a load or store instruction that sequentially incremented from address `0xFFFFFFFF`. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

When the PE sets ESR_EL3.{ISV,FnP} to {0,1} on taking a Data Abort exception, the PE sets FAR_EL3 to any address within the naturally-aligned fault granule that contains the virtual address of the memory access that generated the Data Abort exception.

The naturally-aligned fault granule is one of:

- When ESR_EL3.DFSC is `0b010001`, indicating a Synchronous Tag Check fault, it is a 16-byte tag granule.
- When ESR_EL3.DFSC is `0b11010x`, indicating an IMPLEMENTATION DEFINED fault, it is an IMPLEMENTATION DEFINED granule.
- Otherwise, it is the smallest implemented translation granule.

When FEAT_MOPS is implemented, the value in FAR_EL3 on a synchronous exception from any of the Memory Copy and Memory Set instructions represents the first element that has not been copied or set, and is determined as follows:

- For a Data Abort generated by the MMU, the value is within the address range of the relevant translation granule, aligned to the size of the relevant translation granule of the address that generated the Data Abort. Bits[(n-1):0] of the value are UNKNOWN, where 2^n is the relevant translation granule size in bytes. For the purpose of calculating the relevant translation granule, if the MMU is disabled for a stage of translation, then the current translation granule size is equal to 2^{64} for stage 1, and the PARange for stage 2. The relevant translation granule is:
  - For MMU faults generated at stage 1, the current stage 1 translation granule.
  - For MMU faults generated at stage 2, the smaller of the current stage 1 translation granule and the current stage 2 translation granule.
  - If FEAT_RME is implemented, for a synchronous Data Abort generated as the result of a GPF, the smallest of the current stage 1 translation granule, the current stage 2 translation granule and the configured granule size in GPCCR_EL3.PGS.
- For a Data Abort generated by a Tag Check Fault, the value is any address that caused a Tag Check Fault within the block size of the load or store.
- Otherwise, the value is the lowest address in the block size of the load or store.

For a Data Abort exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging'.

For a synchronous Tag Check Fault:

- If FEAT_MTE_TAGGED_FAR is implemented or Address tagging is disabled for the translation regime in use when the abort was generated, all bits of FAR_EL3 are not UNKNOWN.
- If FEAT_MTE_TAGGED_FAR is not implemented and Address tagging is enabled for the translation regime in use when the abort was generated, bits[63:60] of FAR_EL3 are UNKNOWN.

Execution at EL2, EL1, and EL0 makes FAR_EL3 become UNKNOWN.

Note

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or Data Abort. It is the lowest address that gave rise to the fault that is reported. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize which fault is reported.

For all other exceptions taken to EL3, FAR_EL3 is UNKNOWN.

FAR_EL3 is made UNKNOWN on an exception return from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FAR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, FAR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0110	0b0000	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;

FGWTE3_EL3, Fine-Grained Write Traps EL3

The FGWTE3_EL3 characteristics are:

Purpose

Provides controls for traps of MSR and MSRR writes to specified EL3 system registers.

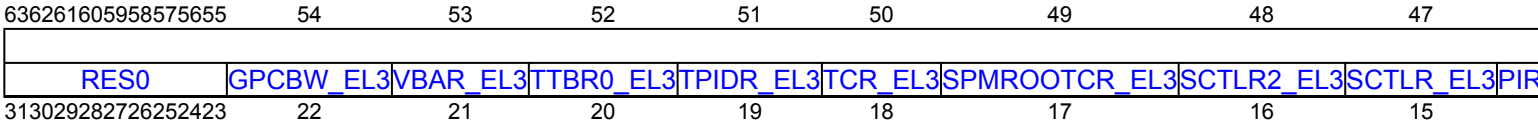
Configuration

This register is present only when EL3 is implemented, FEAT_FGWTE3 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to FGWTE3_EL3 are UNDEFINED.

Attributes

FGWTE3_EL3 is a 64-bit register.

Field descriptions



MSR accesses are trapped to EL3 and reported with EC syndrome value 0x18.

MSRR accesses are trapped to EL3 and reported with EC syndrome value 0x14.

The bits in this register are sticky. Writes to these bits have the following properties:

- A write of 0b0 is ignored.
- A write of 0b1 updates the bit to 0b1.

Bits [63:23]

Reserved, RES0.

GPCBW_EL3, bit [22]

When FEAT_RME_GPC3 is implemented:

Traps accesses of GPCBW_EL3 to EL3.

GPCBW_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

Otherwise:

Reserved, RES0.

VBAR_EL3, bit [21]

Traps accesses of VBAR_EL3 to EL3.

VBAR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

TTBR0_EL3, bit [20]

Traps accesses of TTBR0_EL3 to EL3.

TTBR0_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

TPIDR_EL3, bit [19]

Traps accesses of TPIDR_EL3 to EL3.

TPIDR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

TCR_EL3, bit [18]

Traps accesses of TCR_EL3 to EL3.

TCR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

SPMROOTCR_EL3, bit [17]

When FEAT_RME is implemented and FEAT_SPMU is implemented:

Traps accesses of SPMROOTCR_EL3 to EL3.

SPMROOTCR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

Otherwise:

Reserved, RES0.

SCTLR2_EL3, bit [16]

When FEAT_SCTLR2 is implemented:

Traps accesses of SCTLR2_EL3 to EL3.

SCTLR2_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

Otherwise:

Reserved, RES0.

SCTLR_EL3, bit [15]

Traps accesses of SCTLR_EL3 to EL3.

SCTLR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

PIR_EL3, bit [14]

When FEAT_S1PIE is implemented:

Traps accesses of PIR_EL3 to EL3.

PIR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

Otherwise:

Reserved, RES0.

MPAM3_EL3, bit [13]

When FEAT_MPAM is implemented:

Traps accesses of MPAM3_EL3 to EL3.

MPAM3_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

Otherwise:

Reserved, RES0.

MECID_RL_A_EL3, bit [12]

When FEAT_MEC is implemented:

Traps accesses of MECID_RL_A_EL3 to EL3.

MECID_RL_A_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

Otherwise:

Reserved, RES0.

MDCR_EL3, bit [11]

Traps accesses of MDCR_EL3 to EL3.

MDCR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

MAIR2_EL3, bit [10]

When FEAT_AIE is implemented:

Traps accesses of MAIR2_EL3 to EL3.

MAIR2_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

Otherwise:

Reserved, RES0.

MAIR_EL3, bit [9]

Traps accesses of MAIR_EL3 to EL3.

MAIR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

GPTBR_EL3, bit [8]

When FEAT_RME is implemented:

Traps accesses of GPTBR_EL3 to EL3.

GPTBR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

Otherwise:

Reserved, RES0.

GPCCR_EL3, bit [7]

When FEAT_RME is implemented:

Traps accesses of GPCCR_EL3 to EL3.

GPCCR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

Otherwise:

Reserved, RES0.

GCSPR_EL3, bit [6]

When FEAT_GCS is implemented:

Traps accesses of GCSPR_EL3 to EL3.

GCSPR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

Otherwise:

Reserved, RES0.

GCSCR_EL3, bit [5]

When FEAT_GCS is implemented:

Traps accesses of GCSCR_EL3 to EL3.

GCSCR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

Otherwise:

Reserved, RES0.

AMAIR2_EL3, bit [4]

When FEAT_AIE is implemented:

Traps accesses of AMAIR2_EL3 to EL3.

AMAIR2_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

Otherwise:

Reserved, RES0.

AMAIR_EL3, bit [3]

Traps accesses of AMAIR_EL3 to EL3.

AMAIR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

AFSR1_EL3, bit [2]

Traps accesses of AFSR1_EL3 to EL3.

AFSR1_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

AFSR0_EL3, bit [1]

Traps accesses of AFSR0_EL3 to EL3.

AFSR0_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

ACTLR_EL3, bit [0]

Traps accesses of ACTLR_EL3 to EL3.

ACTLR_EL3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	MSR write accesses to the specified register are trapped to EL3 with EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1S**.

Accessing FGWTE3_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, FGWTE3_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b101

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_FGWTE3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = FGWTE3_EL3;
```

MSR FGWTE3_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b101

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_FGWTE3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;

FPCR, Floating-point Control Register

The FPCR characteristics are:

Purpose

Controls floating-point behavior.

Configuration

AArch64 System register FPCR bits [26:15] are architecturally mapped to AArch32 System register FPSCR[26:15].

AArch64 System register FPCR bits [12:8] are architecturally mapped to AArch32 System register FPSCR[12:8].

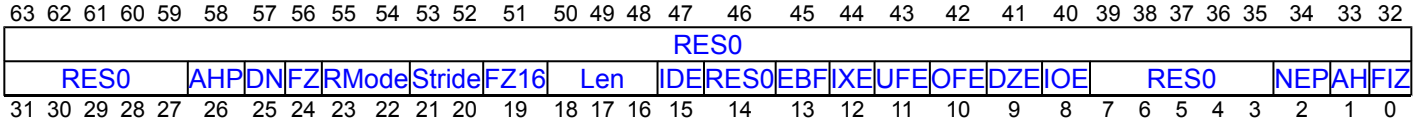
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to FPCR are UNDEFINED.

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to nonzero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

Attributes

FPCR is a 64-bit register.

Field descriptions



Bits [63:27]

Reserved, RES0.

AHP, bit [26]

Alternative half-precision control bit.

AHP	Meaning
0b0	IEEE half-precision format selected.
0b1	Alternative half-precision format selected.

This bit is used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DN, bit [25]

Default NaN use for NaN propagation.

DN	Meaning
0b0	NaN operands propagate through to the output of a floating-point operation.
0b1	Any operation involving one or more NaNs returns the Default NaN. This bit has no effect on the output of the FABS and FNEG instructions. This bit has no effect on the output of the FMAX, FMAXP, FMAXV, FMIN, FMINP, and FMINV instructions when FPCR.AH is 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ, bit [24]

Flushing denormalized numbers to zero control bit.

FZ	Meaning
0b0	If FPCR.AH is 0, the flushing to zero of single-precision and double-precision denormalized inputs to, and outputs of, floating-point instructions not enabled by this control, but other factors might cause the input denormalized numbers to be flushed to zero. If FPCR.AH is 1, the flushing to zero of single-precision and double-precision denormalized outputs of floating-point instructions not enabled by this control, but other factors might cause the input denormalized numbers to be flushed to zero.
0b1	If FPCR.AH is 0, denormalized single-precision and double-precision inputs to, and outputs from, floating-point instructions are flushed to zero. If FPCR.AH is 1, denormalized single-precision and double-precision outputs from floating-point instructions are flushed to zero.

For more information, see 'Flushing denormalized numbers to zero' and the pseudocode of the floating-point instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RMode, bits [23:22]

Rounding Mode control field.

RMode	Meaning
0b00	Round to Nearest (RN) mode.
0b01	Round towards Plus Infinity (RP) mode.
0b10	Round towards Minus Infinity (RM) mode.
0b11	Round towards Zero (RZ) mode.

The specified rounding mode is used by both scalar and Advanced SIMD floating-point instructions.

If FPCR.AH is 1, then the following instructions use Round to Nearest mode regardless of the value of this bit:

- The FRECPE, FRECPS, FRECPX, FRSQRTE, and FRSQRTS instructions.
- The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Stride, bits [21:20]

This field has no function in AArch64 state, and nonzero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 FPSCR.Stride field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation implements FPSCR.LEN,STRIDE as RAZ, access to this field is **RAZ/WI**.

FZ16, bit [19]

When FEAT_FP16 is implemented:

Flushing denormalized numbers to zero control bit on half-precision data-processing instructions.

FZ16	Meaning
0b0	For some instructions, this bit disables flushing to zero of inputs and outputs that are half-precision denormalized numbers.
0b1	Flushing denormalized numbers to zero enabled. For some instructions that do not convert a half-precision input to a higher precision output, this bit enables flushing to zero of inputs and outputs that are half-precision denormalized numbers.

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations.

For more information, see 'Flushing denormalized numbers to zero' and the pseudocode of the floating-point instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Len, bits [18:16]

This field has no function in AArch64 state, and nonzero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 FPSCR.Len field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation implements FPSCR.LEN,STRIDE as RAZ, access to this field is **RAZ/WI**.

IDE, bit [15]

Input Denormal floating-point exception trap enable.

IDE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.IDC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IDC bit.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled, the value of FPCR.IDE is treated as 0 for all purposes other than a direct read or write of the FPCR.

The Effective value of this bit controls both scalar and vector floating-point arithmetic.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Input Denormal floating-point exceptions, access to this field is **RAZ/WI**.

Bit [14]

Reserved, RES0.

EBF, bit [13]

When FEAT_EBF16 is implemented:

The value of this bit controls the numeric behaviors of BFloat16 dot product calculations performed by the BFDOT, BFMMLA, BFMOPA, and BFMOPS instructions. If FEAT_SME2 is implemented, this also controls BFVDOT instruction.

When ID_AA64ISAR1_EL1.BF16 and ID_AA64ZFR0_EL1.BF16 are `0b0010`, the PE supports the FPCR.EBF field. Otherwise, FPCR.EBF is RES0.

EBF	Meaning
`0b0`	These instructions use the standard BFloat16 behaviors: • Ignoring the FPCR.RMode control and using the rounding mode defined for BFloat16. For more information, see 'Round to Odd mode'. • Flushing denormalized inputs and outputs to zero, as if the FPCR.FZ and FPCR.FIZ controls had the value '1'. • Performing unfused multiplies and additions with intermediate rounding of all products and sums.
`0b1`	These instructions use the extended BFloat16 behaviors: • Supporting all four IEEE 754 rounding modes selected by the FPCR.RMode control. • Optionally, flushing denormalized inputs and outputs to zero, as governed by the FPCR.FZ and FPCR.FIZ controls. • Performing a fused two-way sum-of-products for each pair of adjacent BFloat16 elements, without intermediate rounding of the products, but rounding the single-precision sum before addition to the accumulator. • Generating the default NaN as intermediate sum-of-products when any multiplier input is a NaN, or any product is infinity × 0.0, or there are infinite products with differing signs. • Generating an intermediate sum-of-products of the same infinity when there are infinite products all with the same sign.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IXE, bit [12]

Inexact floating-point exception trap enable.

IXE	Meaning
`0b0`	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.IXC bit is set to 1.
`0b1`	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IXC bit.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled, the value of FPCR.IXE is treated as 0 for all purposes other than a direct read or write of the FPCR.

The Effective value of this bit controls both scalar and vector floating-point arithmetic.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Inexact floating-point exceptions, access to this field is **RAZ/WI**.

UFE, bit [11]

Underflow floating-point exception trap enable.

UFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.UFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs and Flush-to-zero is not enabled, the PE does not update the FPSR.UFC bit.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled, the value of FPCR.UFE is treated as 0 for all purposes other than a direct read or write of the FPCR.

The Effective value of this bit controls both scalar and vector floating-point arithmetic.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Underflow floating-point exceptions, access to this field is **RAZ/WI**.

OFE, bit [10]

Overflow floating-point exception trap enable.

OFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.OFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.OFC bit.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled, the value of FPCR.OFE is treated as 0 for all purposes other than a direct read or write of the FPCR.

The Effective value of this bit controls both scalar and vector floating-point arithmetic.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Overflow floating-point exceptions, access to this field is **RAZ/WI**.

DZE, bit [9]

Divide by Zero floating-point exception trap enable.

DZE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.DZC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.DZC bit.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled, the value of FPCR.DZE is treated as 0 for all purposes other than a direct read or write of the FPCR.

The Effective value of this bit controls both scalar and vector floating-point arithmetic.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Divide by Zero floating-point exceptions, access to this field is **RAZ/WI**.

IOE, bit [8]

Invalid Operation floating-point exception trap enable.

IOE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.IOC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IOC bit.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled, the value of FPCR.IOE is treated as 0 for all purposes other than a direct read or write of the FPCR.

The Effective value of this bit controls both scalar and vector floating-point arithmetic.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Invalid Operation floating-point exceptions, access to this field is **RAZ/WI**.

Bits [7:3]

Reserved, RES0.

NEP, bit [2]

When FEAT_AFP is implemented:

Controls how the output elements other than the lowest element of the vector are determined for Advanced SIMD scalar instructions.

NEP	Meaning
0b0	Does not affect how the output elements other than the lowest are determined for Advanced SIMD scalar instructions.
0b1	The output elements other than the lowest are taken from the following registers: • For 3-input scalar versions of the FMLA (by element) and FMLS (by element) instructions, the <Hd>, <Sd>, or <Dd> register. • For 3-input versions of the FMADD, FMSUB, FNMADD, and FNMSUB instructions, the <Ha>, <Sa>, or <Da> register. • For 2-input scalar versions of the FACGE, FACGT, FCMEQ (register), FCMGE (register), and FCMGT (register) instructions, the <Hm>, <Sm>, or <Dm> register. • For 2-input scalar versions of the FABD, FADD (scalar), FDIV (scalar), FMAX (scalar), FMAXNM (scalar), FMIN (scalar), FMINNM (scalar), FMUL (by element), FMUL (scalar), FMULX (by element), FMULX, FNMUL (scalar), FRECPS, FRSQRTS, and FSUB (scalar) instructions, the <Hn>, <Sn>, or <Dn> register. • For 1-input scalar versions of the following instructions, the <Hd>, <Sd>, or <Dd> register: ◦ The (vector) versions of the FCVTAS, FCVTAU, FCVTMS, FCVTMU, FCVTNS, FCVTNU, FCVTPS, and FCVTPU instructions. ◦ The (vector, fixed-point) and (vector, integer) versions of the FCVTZS, FCVTZU, SCVTF, and UCVTF instructions. ◦ The (scalar) versions of the FABS, FNEG, FRINT32X, FRINT32Z, FRINT64X, FRINT64Z, FRINTA, FRINTI, FRINTM, FRINTN, FRINTP, FRINTX, FRINTZ, and FSQRT instructions. ◦ The (scalar, fixed-point) and (scalar, integer) versions of the SCVTF and UCVTF instructions. ◦ The BFCVT, FCVT, FCVTXN, FRECPE, FRECPX, and FRSQRTE instructions.

When the PE is in Streaming SVE mode, and FEAT_SME_FA64 is not implemented or not enabled, the value of FPCR.NEP is treated as 0 for all purposes other than a direct read or write of the FPCR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AH, bit [1]
When FEAT_AFP is implemented:

Alternate Handling. Controls alternate handling of floating-point numbers.

The Arm architecture supports two models for handling some of the corner cases of the floating-point behaviors, such as the nature of flushing of denormalized numbers, the detection of tininess and other exceptions and a range of other behaviors. The value of the FPCR.AH bit selects between these models.

For more information on the FPCR.AH bit, see 'Flushing denormalized numbers to zero', 'Floating-point exceptions and exception traps' and the pseudocode of the floating-point instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FIZ, bit [0]
When FEAT_AFP is implemented:

Flush Inputs to Zero. Controls whether single-precision, double-precision and BFloat16 input operands that are denormalized numbers are flushed to zero.

FIZ	Meaning
0b0	The flushing to zero of single-precision and double-precision denormalized inputs to floating-point instructions not enabled by this control, but other factors might cause the input denormalized numbers to be flushed to zero.
0b1	Denormalized single-precision and double-precision inputs to most floating-point instructions flushed to zero.

For more information, see 'Flushing denormalized numbers to zero' and the pseudocode of the floating-point instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing FPCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, FPCR
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0100	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then

FPEXC32_EL2, Floating-Point Exception Control Register

The FPEXC32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register FPEXC from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register FPEXC32_EL2 bits [31:0] are architecturally mapped to AArch32 System register FPEXC[31:0].

This register is present only when FEAT_AA32EL1 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to FPEXC32_EL2 are UNDEFINED.

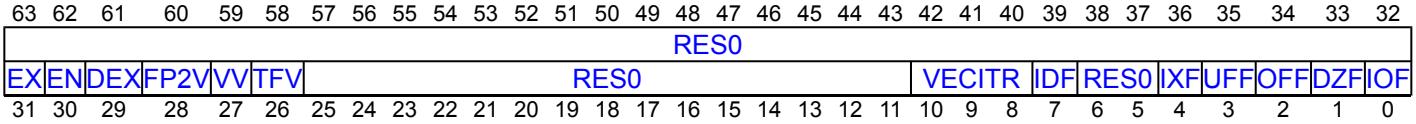
If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPEXC32_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

EX, bit [31]

Exception bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RAZ/WI**.

EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.

EN	Meaning
0b0	Accesses to the FPSCR, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.
0b1	This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of Advanced SIMD and floating-point instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - HCPTR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
  - NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
  - CPACR.ASEDIS.
  - If executing in Non-secure state, HCPTR.TASE and NSACR.NSASEDIS.

See the descriptions of the controls for more information.

Note

When executing at EL0 using AArch32:

- If EL1 is using AArch64, then the Effective value of FPEXC.EN is 1.
- If EL2 is using AArch64 and is enabled in the current Security state, HCR_EL2.TGE is 1, and the Effective value of HCR_EL2.RW is 1, then the Effective value of FPEXC.EN is 1. However, Arm deprecates using the value of FPEXC32_EL2.EN to determine behavior.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DEX, bit [29]

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC32_EL2.TFV field is valid.

The meaning of this bit is:

DEX	Meaning
0b0	The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC32_EL2.TFV is RW then it is invalid and UNKNOWN. If FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
0b1	The exception was generated during the execution of an allocated encoding. FPEXC32_EL2.TFV is valid and indicates the cause of the exception.

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the AArch32 FPSCR.{Stride, Len} fields as RAZ, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FP2V, bit [28]

FPINST2 instruction Valid bit. From Armv8.0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RES0**.

VV, bit [27]

VECITR valid bit. From Armv8, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RES0**.

TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC32_EL2.DEX is 1. When valid, it indicates the cause of the exception and therefore whether FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} are valid.

TFV	Meaning
0b0	The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of FPSCR.{Stride, Len} was nonzero. If FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
0b1	FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of FPEXC32_EL2.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When an implementation does not implement trapping of floating-point exceptions, access to this field is **RAZ/WI**.
- When an implementation implements FPSCR.LEN,STRIDE as RAZ, access to this field is **RAO/WI**.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector iteration count. From Armv8, this field is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RES1**.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while FPSCR.IDE was 1:

IDF	Meaning
0b0	Input Denormal exception has not occurred.
0b1	Input Denormal exception has occurred.

Input Denormal exceptions can occur only when FPSCR.FZ is 1.

Note

A half-precision floating-point value that is flushed to zero because the value of FPSCR.FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Input Denormal floating-point exceptions, access to this field is **RAZ/WI**.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while FPSCR.IXE was 1:

IXF	Meaning
0b0	Inexact exception has not occurred.
0b1	Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Inexact floating-point exceptions, access to this field is **RAZ/WI**.

UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while FPSCR.UFE was 1:

UFF	Meaning
0b0	Underflow exception has not occurred.
0b1	Underflow exception has occurred.

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when FPSCR.FZ16 is 0.
- Otherwise only when FPSCR.FZ is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Underflow floating-point exceptions, access to this field is **RAZ/WI**.

OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while FPSCR.OFE was 1:

OFF	Meaning
0b0	Overflow exception has not occurred.
0b1	Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Overflow floating-point exceptions, access to this field is **RAZ/WI**.

DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while FPSCR.DZE was 1:

DZF	Meaning
0b0	Divide by Zero exception has not occurred.
0b1	Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Divide by Zero floating-point exceptions, access to this field is **RAZ/WI**.

IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while FPSCR.IOE was 1:

IOF	Meaning
0b0	Invalid Operation exception has not occurred.
0b1	Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Invalid Operation floating-point exceptions, access to this field is **RAZ/WI**.

Accessing FPEXC32_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, FPEXC32_EL2

FPMR, Floating-point Mode Register

The FPMR characteristics are:

Purpose

Controls behaviors of the FP8 instructions.

Configuration

This register is present only when FEAT_FPMR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to FPMR are UNDEFINED.

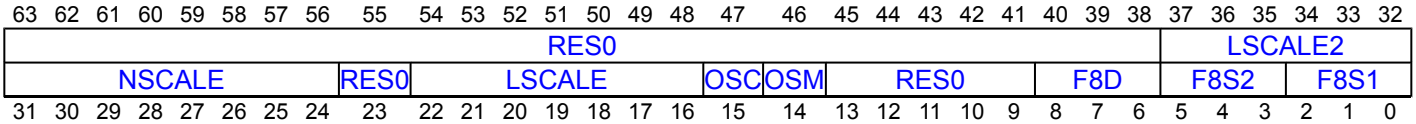
A direct or indirect read of this register occurs in program order relative to a direct write of this register without explicit synchronization.

On entry to or exit from Streaming SVE mode, FPMR is set to 0.

Attributes

FPMR is a 64-bit register.

Field descriptions



Bits [63:38]

Reserved, RES0.

LSCALE2, bits [37:32]

Downscaling value for instructions that convert the second FP8 input data stream to other floating-point formats.

This value is an unsigned integer that is subtracted from the result exponent.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSCALE, bits [31:24]

Scaling value for instructions that convert other floating-point formats to an FP8 format.

This value is a signed integer that is added to the operand exponent.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [23]

Reserved, RES0.

LSCALE, bits [22:16]

Downscaling value.

This value is an unsigned integer that is subtracted from:

- The product or the sum-of-products exponent, for multiplication instructions with FP8 operands.
- The result exponent, for instructions that convert the first FP8 input data stream to other floating-point formats.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OSC, bit [15]

Overflow saturation for FP8 convert instructions. Specifies the result when a floating-point Overflow exception is detected.

OSC	Meaning
0b0	Infinity or NaN is generated.
0b1	Maximum normal number is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OSM, bit [14]

Overflow saturation for FP8 multiplication instructions. Specifies the result when a floating-point Overflow exception is detected.

OSM	Meaning
0b0	Infinity is generated.
0b1	Maximum normal number is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [13:9]

Reserved, RES0.

F8D, bits [8:6]

Destination result format for instructions that convert other floating-point values to an FP8 format.

F8D	Meaning
0b000	OFP8 E5M2 format.
0b001	OFP8 E4M3 format.

All other values are reserved.

Reserved values identify an unsupported format, causing convert instructions that generate an FP8 result to perform a CONSTRAINED UNPREDICTABLE choice of one of the following behaviors:

- Setting the result to 0xFF and signaling an Invalid Operation floating-point exception.
- Generating the expected result of any of the supported FP8 formats.

It is software's responsibility to check that a format value is supported in ID_AA64FPFR0_EL1[7:0], before writing it to this field.

For more information about the FP8 formats, see the OCP 8-bit Floating Point Specification (OFP8).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F8S2, bits [5:3]

Second FP8 input data stream format for multiplication instructions with FP8 operands, and the corresponding instructions that convert an FP8 format to other floating-point formats.

F8S2	Meaning
0b000	OFP8 E5M2 format.
0b001	OFP8 E4M3 format.

All other values are reserved.

Reserved values identify an unsupported format, and FP8 instructions treat the corresponding input as a CONSTRAINED UNPREDICTABLE choice of one of the following:

- A signaling NaN.
- Any of the supported FP8 formats.

It is software's responsibility to check that a format value is supported in ID_AA64FPFR0_EL1[7:0], before writing it to this field.

For more information about the FP8 formats, see the OCP 8-bit Floating Point Specification (OFP8).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F8S1, bits [2:0]

First FP8 input data stream format for multiplication instructions with FP8 operands, and the corresponding instructions that convert an FP8 format to other floating-point formats.

F8S1	Meaning
0b000	OFP8 E5M2 format.
0b001	OFP8 E4M3 format.

All other values are reserved.

Reserved values identify an unsupported format, and FP8 instructions treat the corresponding input as a CONSTRAINED UNPREDICTABLE choice of one of the following:

- A signaling NaN.
- Any of the supported FP8 formats.

It is software's responsibility to check that a format value is supported in ID_AA64FPFR0_EL1[7:0], before writing it to this field.

For more information about the FP8 formats, see the OCP 8-bit Floating Point Specification (OFP8).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FPSR, Floating-point Status Register

The FPSR characteristics are:

Purpose

Provides floating-point system status information.

Configuration

AArch64 System register FPSR bits [31:27] are architecturally mapped to AArch32 System register FPSCR[31:27].

AArch64 System register FPSR bit [7] is architecturally mapped to AArch32 System register FPSCR[7].

AArch64 System register FPSR bits [4:0] are architecturally mapped to AArch32 System register FPSCR[4:0].

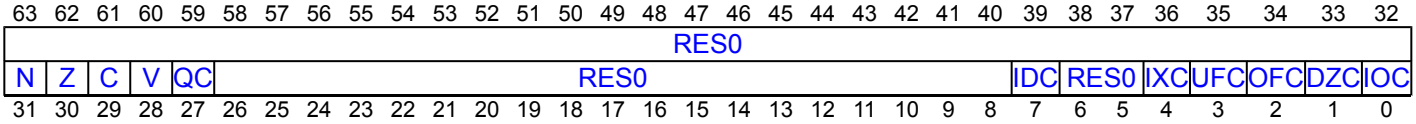
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to FPSR are UNDEFINED.

On entry to or exit from Streaming SVE mode, FPSR.{IOC, DZC, OFC, UFC, IXC, IDC, QC} are set to 1 and the remaining bits are set to 0.

Attributes

FPSR is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

N, bit [31]

When FEAT_AA32 is implemented and FEAT_FP is implemented:

Negative condition flag for AArch32 floating-point comparison operations.

Note

AArch64 floating-point comparisons set the PSTATE.N flag instead.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Z, bit [30]

When FEAT_AA32 is implemented and FEAT_FP is implemented:

Zero condition flag for AArch32 floating-point comparison operations.

Note

AArch64 floating-point comparisons set the PSTATE.Z flag instead.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [29]

When FEAT_AA32 is implemented and FEAT_FP is implemented:

Carry condition flag for AArch32 floating-point comparison operations.

Note

AArch64 floating-point comparisons set the PSTATE.C flag instead.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

V, bit [28]

When FEAT_AA32 is implemented and FEAT_FP is implemented:

Overflow condition flag for AArch32 floating-point comparison operations.

Note

AArch64 floating-point comparisons set the PSTATE.V flag instead.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

QC, bit [27]

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [26:8]

Reserved, RES0.

IDC, bit [7]

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IDE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.IDE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXC, bit [4]

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IXE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.IXE is 0.

The criteria for the Inexact floating-point exception to occur are affected by whether denormalized numbers are flushed to zero and by the value of the FPCR.AH bit. For more information, see 'Floating-point exceptions and exception traps'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFC, bit [3]

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.UFE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.UFE is 0 or if flushing denormalized numbers to zero is enabled.

The criteria for the Underflow floating-point exception to occur are affected by whether denormalized numbers are flushed to zero and by the value of the FPCR.AH bit. For more information, see 'Floating-point exceptions and exception traps'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFC, bit [2]

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.OFE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.OFE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZC, bit [1]

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.DZE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.DZE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOC, bit [0]

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IOE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.IOE is 0.

The criteria for the Invalid Operation floating-point exception to occur are affected by the value of the FPCR.AH bit. For more information, see 'Floating-point exceptions and exception traps'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GCR_EL1, Tag Control Register.

The GCR_EL1 characteristics are:

Purpose

Tag Control Register.

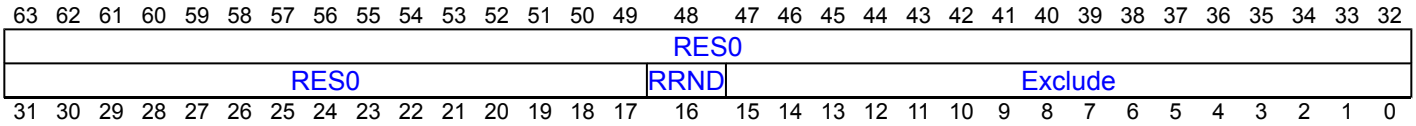
Configuration

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to GCR_EL1 are UNDEFINED.

Attributes

GCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:17]

Reserved, RES0.

RRND, bit [16]

Controls generation of tag values by the `IRG` instruction.

RRND	Meaning
`0b0`	`IRG` generates a tag value as defined by RandomTag() and ChooseNonExcludedTag(). This mode does not provide strong guarantees for randomness and should only be used for debugging purposes.
`0b1`	`IRG` generates an implementation-specific tag value with a distribution of tag values no worse than generated with GCR_EL1.RRND == 0.

Note

Arm recommends that IMPLEMENTATION DEFINED algorithms minimize the risk of a bias by selecting tags from a uniform distribution.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Exclude, bits [15:0]

Allocation Tag values excluded from selection by ChooseNonExcludedTag().

If all bits of GCR_EL1.Exclude are 1, then the Allocation Tag value 0 will be used.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GCSCR_EL1, Guarded Control Stack Control Register (EL1)

The GCSCR_EL1 characteristics are:

Purpose

Controls the Guarded Control Stack at EL1.

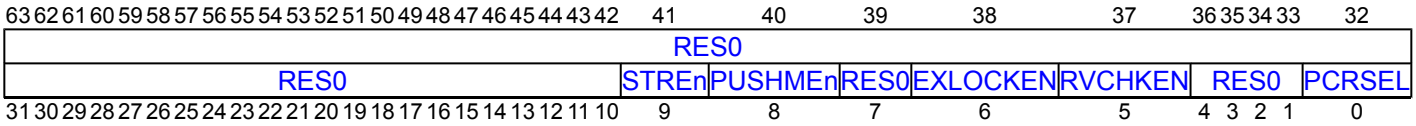
Configuration

This register is present only when FEAT_GCS is implemented. Otherwise, direct accesses to GCSCR_EL1 are UNDEFINED.

Attributes

GCSCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:10]

Reserved, RES0.

STREn, bit [9]

Execution of the following instructions are trapped:

- GCSSTR.
- GCSSTTR if any of the following are true.
  - PSTATE.UAO is 1.
  - If EL2 is implemented and enabled in the current Security state and the Effective value of HCR_EL2.{NV,NV1} is {1,1}.

STREn	Meaning
0b0	Execution of any of the specified instructions at EL1 causes a GCS exception.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

PUSHMEn, bit [8]

Trap GCSPUSHM instruction.

PUSHMEn	Meaning
0b0	Execution of a GCSPUSHM instruction at EL1 causes a Trap exception.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [7]

Reserved, RES0.

EXLOCKEN, bit [6]

Exception state lock.

Prevents MSR instructions from writing to ELR_EL1 or SPSR_EL1.

EXLOCKEN	Meaning
0b0	EL1 exception state locking disabled.
0b1	EL1 exception state locking enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

RVCHKEN, bit [5]

Return value check enable.

RVCHKEN	Meaning
0b0	Return value checking disabled at EL1.
0b1	Return value checking enabled at EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:1]

Reserved, RES0.

PCRSEL, bit [0]

Guarded Control Stack procedure call return enable selection.

PCRSEL	Meaning
0b0	Guarded Control Stack at EL1 is not PCR Selected.
0b1	Guarded Control Stack at EL1 is PCR Selected.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing GCSCR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name GCSCR_EL1 or GCSCR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, GCSCR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0101	0b000

GCSCR_EL2, Guarded Control Stack Control Register (EL2)

The GCSCR_EL2 characteristics are:

Purpose

Controls the Guarded Control Stack at EL2.

Configuration

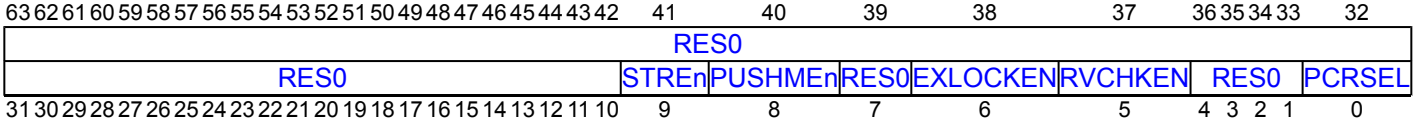
This register is present only when FEAT_GCS is implemented. Otherwise, direct accesses to GCSCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

GCSCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:10]

Reserved, RES0.

STREn, bit [9]

Execution of the following instructions are trapped:

- GCSSTR.
- GCSSTTR if any of the following are true.
  - The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
  - The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, and PSTATE.UAO is 1.

STREn	Meaning
0b0	Execution of any of the specified instructions at EL2 cause a GCS exception.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

PUSHMEn, bit [8]

Trap GCSPUSHM instruction.

PUSHMEn	Meaning
0b0	Execution of a GCSPUSHM instruction at EL2 causes a Trap exception.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [7]

Reserved, RES0.

EXLOCKEN, bit [6]

Exception state lock.

Prevents MSR instructions from writing to ELR_EL2 or SPSR_EL2.

EXLOCKEN	Meaning
0b0	EL2 exception state locking disabled.
0b1	EL2 exception state locking enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

RVCHKEN, bit [5]

Return value check enable.

RVCHKEN	Meaning
0b0	Return value checking disabled at EL2.
0b1	Return value checking enabled at EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:1]

Reserved, RES0.

PCRSEL, bit [0]

Guarded Control Stack procedure call return enable selection.

PCRSEL	Meaning
0b0	Guarded Control Stack at EL2 is not PCR Selected.
0b1	Guarded Control Stack at EL2 is PCR Selected.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing GCSCR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name GCSCR_EL2 or GCSCR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, GCSCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0101	0b000

GCSCR_EL3, Guarded Control Stack Control Register (EL3)

The GCSCR_EL3 characteristics are:

Purpose

Controls the Guarded Control Stack at EL3.

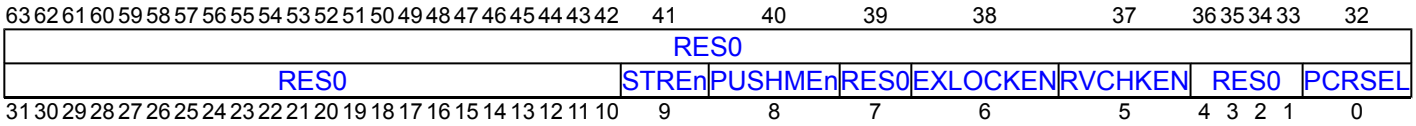
Configuration

This register is present only when FEAT_GCS is implemented and EL3 is implemented. Otherwise, direct accesses to GCSCR_EL3 are UNDEFINED.

Attributes

GCSCR_EL3 is a 64-bit register.

Field descriptions



Bits [63:10]

Reserved, RES0.

STREn, bit [9]

Execution of the following instructions are trapped:

- GCSSTR.
- GCSSTTR.

STREn	Meaning
0b0	Execution of any of the specified instructions at EL3 cause a GCS exception.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

PUSHMEn, bit [8]

Trap GCSPUSHM instruction.

PUSHMEn	Meaning
0b0	Execution of a GCSPUSHM instruction at EL3 causes a Trap exception.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [7]

Reserved, RES0.

EXLOCKEN, bit [6]

Exception state lock.

Prevents MSR instructions from writing to ELR_EL3 or SPSR_EL3.

EXLOCKEN	Meaning
0b0	EL3 exception state locking disabled.
0b1	EL3 exception state locking enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

RVCHKEN, bit [5]

Return value check enable.

RVCHKEN	Meaning
0b0	Return value checking disabled at EL3.
0b1	Return value checking enabled at EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:1]

Reserved, RES0.

PCRSEL, bit [0]

Guarded Control Stack procedure call return enable selection.

PCRSEL	Meaning
0b0	Guarded Control Stack at EL3 is not PCR Selected.
0b1	Guarded Control Stack at EL3 is PCR Selected.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing GCSCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, GCSCR_EL3

GCSCRE0_EL1, Guarded Control Stack Control Register (EL0)

The GCSCRE0_EL1 characteristics are:

Purpose

Controls the Guarded Control Stack at EL0.

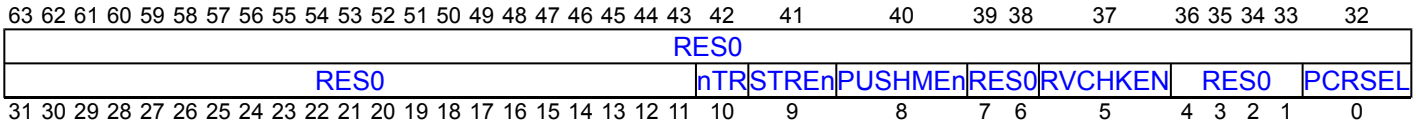
Configuration

This register is present only when FEAT_GCS is implemented. Otherwise, direct accesses to GCSCRE0_EL1 are UNDEFINED.

Attributes

GCSCRE0_EL1 is a 64-bit register.

Field descriptions



Bits [63:11]

Reserved, RES0.

nTR, bit [10]

Trap GCS register accesses from EL0.

nTR	Meaning
0b0	Read accesses to GCSPR_EL0 at EL0 cause a Trap exception.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

STREn, bit [9]

Execution of the following instructions are trapped:

- GCSSTR.
- GCSSTTR.

STREn	Meaning
0b0	Execution of any of the specified instructions at EL0 cause a GCS exception.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

PUSHMEn, bit [8]

Trap GCSPUSHM instruction.

PUSHMEn	Meaning
0b0	Execution of a GCSPUSHM instruction at EL0 causes a Trap exception.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [7:6]

Reserved, RES0.

RVCHKEN, bit [5]

Return value check enable.

RVCHKEN	Meaning
0b0	Return value checking disabled at EL0.
0b1	Return value checking enabled at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:1]

Reserved, RES0.

PCRSEL, bit [0]

Guarded Control Stack procedure call return enable selection.

PCRSEL	Meaning
0b0	Guarded Control Stack at EL0 is not PCR Selected.
0b1	Guarded Control Stack at EL0 is PCR Selected.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

GCSPOPCX, Guarded Control Stack Pop and Compare exception return record

The GCSPOPCX characteristics are:

Purpose

Loads an exception return record from the location indicated by the current Guarded Control Stack Pointer register, compares the values loaded with the current ELR_ELx, SPSR_ELx, and LR, and increments the current Guarded Control Stack Pointer register by the size of a Guarded Control Stack exception return record.

Configuration

This instruction is present only when FEAT_GCS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to GCSPOPCX are UNDEFINED.

Attributes

GCSPOPCX is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing GCSPOPCX

Rt should be encoded as `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

`GCSPOPCX`

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0111	0b101

```
if !(IsFeatureImplemented(FEAT_GCS) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if IsFeatureImplemented(FEAT_GCS) && GetCurrentEXLOCKEN() && !Halted() && PSTATE.EXLOCK == '1'
then
        EXLOCKException();
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1')
&& HFGITR_EL2.nGCSEPP == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif GCSEnabled(EL1) then
        GCSPOPCX();
elsif PSTATE.EL == EL2 then
    if IsFeatureImplemented(FEAT_GCS) && GetCurrentEXLOCKEN() && !Halted() && PSTATE.EXLOCK == '1'
then
        EXLOCKException();
    elsif GCSEnabled(EL2) then
        GCSPOPCX();
elsif PSTATE.EL == EL3 then
    if IsFeatureImplemented(FEAT_GCS) && GetCurrentEXLOCKEN() && !Halted() && PSTATE.EXLOCK == '1'
then
        EXLOCKException();
    elsif GCSEnabled(EL3) then
        GCSPOPCX();
```

GCSPOPM, Guarded Control Stack Pop

The GCSPOPM characteristics are:

Purpose

Loads the 64-bit doubleword that is pointed to by the current Guarded Control Stack Pointer, writes it to the destination register, and increments the current Guarded Control Stack Pointer register by the size of a Guarded Control Stack procedure return record.

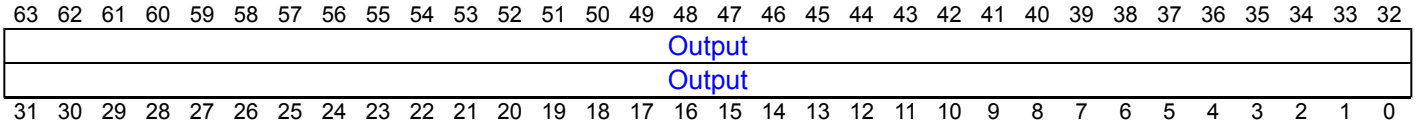
Configuration

This instruction is present only when FEAT_GCS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to GCSPOPM are UNDEFINED.

Attributes

GCSPOPM is a 64-bit System instruction.

Field descriptions



Output, bits [63:0]

Output value for Guarded Control Stack procedure return record.

Executing GCSPOPM

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
GCSPOPM {<Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0111	0b001

```
if !(IsFeatureImplemented(FEAT_GCS) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif GCSEnabled(PSTATE.EL) then
    X[t, 64] = GCSPOPM();
```

GCSPOPX, Guarded Control Stack Pop exception return record

The GCSPOPX characteristics are:

Purpose

Loads an exception return record from the location indicated by the current Guarded Control Stack Pointer register, checks that the record is a Guarded Control Stack exception return record, and increments the current Guarded Control Stack Pointer register by the size of a Guarded Control Stack exception return record.

Configuration

This instruction is present only when FEAT_GCS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to GCSPOPX are UNDEFINED.

Attributes

GCSPOPX is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing GCSPOPX

Rt should be encoded as `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

`GCSPOPX`

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0111	0b110

```
if !(IsFeatureImplemented(FEAT_GCS) && IsFeatureImplemented(FEAT_AA64)) then

GCSPR_EL0, Guarded Control Stack Pointer Register (EL0)

The GCSPR_EL0 characteristics are:

Purpose

Contains the Guarded Control Stack Pointer at EL0.

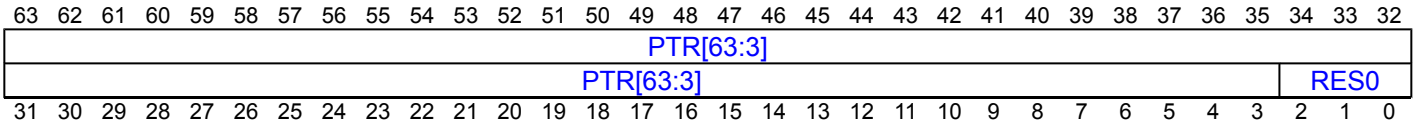
Configuration

This register is present only when FEAT_GCS is implemented. Otherwise, direct accesses to GCSPR_EL0 are UNDEFINED.

Attributes

GCSPR_EL0 is a 64-bit register.

Field descriptions



PTR[63:3], bits [63:3]

EL0 Guarded Control Stack Pointer bits [63:3].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [2:0]

Reserved, RES0.

Accessing GCSPR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, GCSPR_EL0
```

GCSPR_EL1, Guarded Control Stack Pointer Register (EL1)

The GCSPR_EL1 characteristics are:

Purpose

Contains the Guarded Control Stack Pointer at EL1.

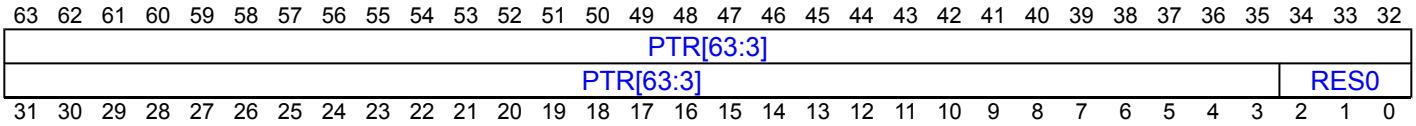
Configuration

This register is present only when FEAT_GCS is implemented. Otherwise, direct accesses to GCSPR_EL1 are UNDEFINED.

Attributes

GCSPR_EL1 is a 64-bit register.

Field descriptions



PTR[63:3], bits [63:3]

EL1 Guarded Control Stack Pointer bits [63:3].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [2:0]

Reserved, RES0.

Accessing GCSPR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name GCSPR_EL1 or GCSPR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```

GCSPR_EL3, Guarded Control Stack Pointer Register (EL3)

The GCSPR_EL3 characteristics are:

Purpose

Contains the Guarded Control Stack Pointer at EL3.

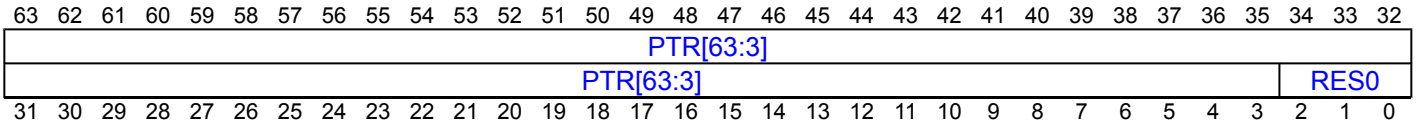
Configuration

This register is present only when FEAT_GCS is implemented and EL3 is implemented. Otherwise, direct accesses to GCSPR_EL3 are UNDEFINED.

Attributes

GCSPR_EL3 is a 64-bit register.

Field descriptions



PTR[63:3], bits [63:3]

EL3 Guarded Control Stack Pointer bits [63:3].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [2:0]

Reserved, RES0.

Accessing GCSPR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, GCSPR_EL3
```

op0	op1	CRn	CRm	op2

GCSPUSHM, Guarded Control Stack Push

The GCSPUSHM characteristics are:

Purpose

Decrements the current Guarded Control Stack Pointer register by the size of a Guarded Control Stack procedure return record and stores an entry to the Guarded Control Stack.

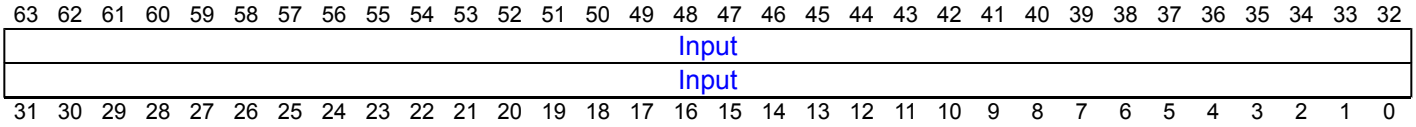
Configuration

This instruction is present only when FEAT_GCS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to GCSPUSHM are UNDEFINED.

Attributes

GCSPUSHM is a 64-bit System instruction.

Field descriptions



Input, bits [63:0]

Input value for Guarded Control Stack procedure return record.

Executing GCSPUSHM

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
GCSPUSHM <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0111	0b000

```

GCSPUSHX, Guarded Control Stack Push exception return record

The GCSPUSHX characteristics are:

Purpose

Decrements the current Guarded Control Stack Pointer register by the size of a Guarded Control Stack exception return record and stores a Guarded Control Stack exception return record to the Guarded Control Stack.

Configuration

This instruction is present only when FEAT_GCS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to GCSPUSHX are UNDEFINED.

Attributes

GCSPUSHX is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing GCSPUSHX

Rt should be encoded as `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

`GCSPUSHX`

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0111	0b100

GCSSS1, Guarded Control Stack Switch Stack 1

The GCSSS1 characteristics are:

Purpose

Validates that the stack being switched to contains a Valid cap entry, stores an In-progress cap entry on to the stack that is getting switched to and sets the current Guarded Control Stack Pointer to the stack that is getting switched to.

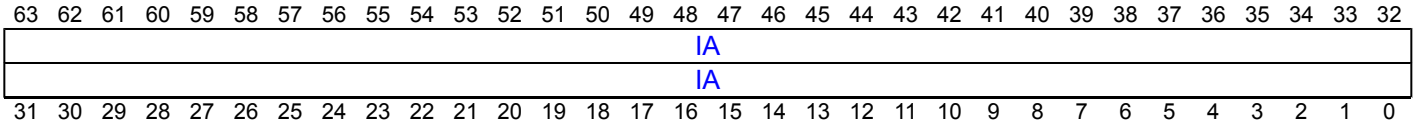
Configuration

This instruction is present only when FEAT_GCS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to GCSSS1 are UNDEFINED.

Attributes

GCSSS1 is a 64-bit System instruction.

Field descriptions



IA, bits [63:0]

Incoming address, for the incoming Guarded Control Stack.

Executing GCSSS1

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
GCSSS1 <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0111	0b010

```
if !(IsFeatureImplemented(FEAT_GCS) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif GCSEnabled(PSTATE.EL) then
    GCSSS1(X[t, 64]);
```

GCSSS2, Guarded Control Stack Switch Stack 2

The GCSSS2 characteristics are:

Purpose

Validates that the most recent entry of the Guarded Control Stack that is getting switched to contains an In-progress cap entry, stores a Valid cap entry to the Guarded Control Stack that is getting switched from, and sets Xt to the address of that Valid cap entry.

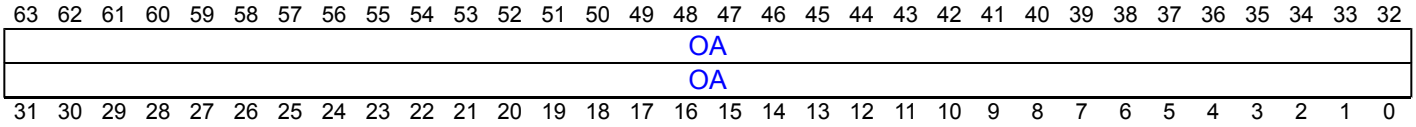
Configuration

This instruction is present only when FEAT_GCS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to GCSSS2 are UNDEFINED.

Attributes

GCSSS2 is a 64-bit System instruction.

Field descriptions



OA, bits [63:0]

Outgoing address, for the outgoing Guarded Control Stack.

Executing GCSSS2

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
GCSSS2 <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0111	0b011

```
if !(IsFeatureImplemented(FEAT_GCS) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif GCSEnabled(PSTATE.EL) then
    X[t, 64] = GCSSS2();
```

GMID_EL1, Multiple tag transfer ID Register

The GMID_EL1 characteristics are:

Purpose

Indicates the block size that is accessed by the LDGM and STGM System instructions.

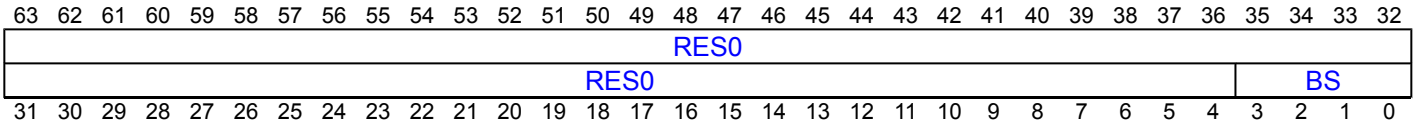
Configuration

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to GMID_EL1 are UNDEFINED.

Attributes

GMID_EL1 is a 64-bit register.

Field descriptions



Bits [63:4]

Reserved, RES0.

BS, bits [3:0]

Log_2 of the block size in words. The minimum supported size is 16B (value == 2) and the maximum is 256B (value == 6).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing GMID_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, GMID_EL1
```

op0	op1	CRn	CRm	op2

GPCBW_EL3, Granule Protection Check Bypass Window Register (EL3)

The GPCBW_EL3 characteristics are:

Purpose

The control register for Granule Protection Check bypass window.

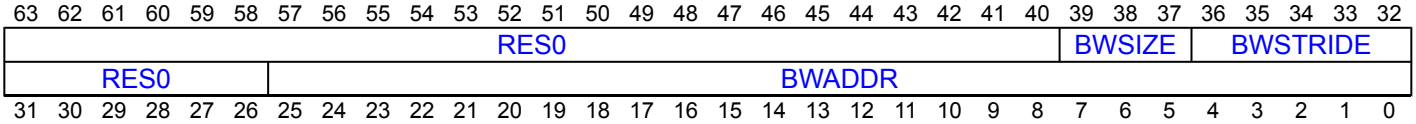
Configuration

This register is present only when FEAT_RME_GPC3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to GPCBW_EL3 are UNDEFINED.

Attributes

GPCBW_EL3 is a 64-bit register.

Field descriptions



Bits [63:40]

Reserved, RES0.

BWSIZE, bits [39:37]

GPC Bypass Window Size.

BWSIZE defines the size of the GPC bypass memory region.

BWSIZE	Meaning
0b000	30 bits, 1GB GPC bypass window.
0b001	31 bits, 2GB GPC bypass window.
0b010	32 bits, 4GB GPC bypass window.
0b100	34 bits, 16GB GPC bypass window.
0b110	36 bits, 64GB GPC bypass window.

All other values are reserved.

This field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BWSTRIDE, bits [36:32]

GPC Bypass Window Stride.

BWSTRIDE allows creating multiple GPC bypass memory regions in the memory map across a specific stride.

BWSTRIDE	Meaning
0b00000	1TB stride.
0b00010	4TB stride.
0b00100	16TB stride.
0b00110	64TB stride.
0b00111	128TB stride.
0b01000	256TB stride.
0b01001	512TB stride.
0b01010	1PB stride.
0b10000	64PB (No stride).

All other values are reserved.

This field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [31:26]

Reserved, RES0.

BWADDR, bits [25:0]

GPC Bypass window address.

This field represents bits [55:30] of the GPC bypass window base address.

The GPC bypass window is:

- Aligned in memory to the size of the window as specified by GPCBW_EL3.BWSIZE.
- Duplicated in PA space across a stride specified using GPCBW_EL3.BWSTRIDE.

This means that only bits [gpcbwu:gpcbwl] of a PA are compared against bits [gpcbwu:gpcbwl] of the window base address derived from BWADDR when checking if a PA falls within the range of a window, where:

- gpcbwl is derived from GPCBW_EL3.BWSIZE as follows:

BWSIZE	gpcbwl
0b000	30
0b001	31
0b010	32
0b100	34
0b110	36

- gpcbwu is derived from GPCBW_EL3.BWSTRIDE as follows:

BWSTRIDE	gpcbwu
0b00000	39
0b00010	41
0b00100	43
0b00110	45
0b00111	46
0b01000	47
0b01001	48
0b01010	49
0b10000	55

If the base address derived from BWADDR is not aligned to the size programmed in BWSIZE the configuration is invalid.

If this field is configured to a value that produces a GPC bypass window base address that is greater than or equal to the stride value configured by BWSTRIDE, the configuration is invalid.

An access to a PA falls within a GPC bypass window if the pseudocode function `PAWithinGPCBypassWindow()` returns TRUE.

This field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GPCBW_EL3

Accesses to this register use the following encodings in the System register encoding space:

GPCCR_EL3, Granule Protection Check Control Register (EL3)

The GPCCR_EL3 characteristics are:

Purpose

The control register for Granule Protection Checks.

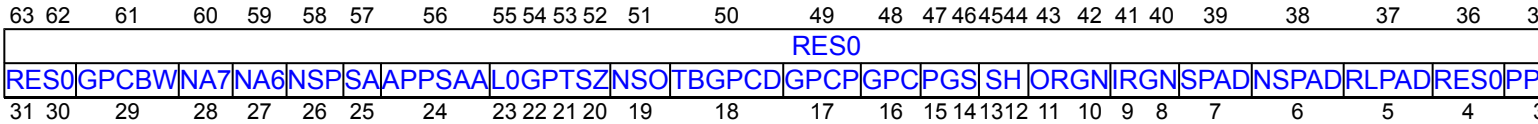
Configuration

This register is present only when FEAT_RME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to GPCCR_EL3 are UNDEFINED.

Attributes

GPCCR_EL3 is a 64-bit register.

Field descriptions



Bits [63:30]

Reserved, RES0.

GPCBW, bit [29]

When FEAT_RME_GPC3 is implemented:

GPC Bypass Window Enable.

This field governs the behavior of the GPC bypass windows.

GPCBW	Meaning
0b0	GPC bypass windows are disabled.
0b1	GPC bypass windows are enabled.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NA7, bit [28]

When FEAT_RME_GDI is implemented:

No access 7.

This field governs the behavior of the GPI encoding for NA7.

NA7	Meaning
0b0	GPI encoding value of 0b0111 is reserved.
0b1	GPI encoding value of 0b0111 is No access permitted from this PE.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NA6, bit [27]
When FEAT_RME_GDI is implemented:

No access 6.

This field governs the behavior of the GPI encoding for NA6.

NA6	Meaning
0b0	GPI encoding value of 0b0110 is reserved.
0b1	GPI encoding value of 0b0110 is No access permitted from this PE.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSP, bit [26]
When FEAT_RME_GDI is implemented:

Non-secure Protected.

This field governs the behavior of the GPI encoding for NSP.

NSP	Meaning
0b0	GPI encoding value of 0b0101 is reserved.
0b1	GPI encoding value of 0b0101 is No access permitted from this PE.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SA, bit [25]

When FEAT_RME_GDI is implemented:

System Agent.

This field governs the behavior of the GPI encoding for SA.

SA	Meaning
0b0	GPI encoding value of 0b0100 is reserved.
0b1	GPI encoding value of 0b0100 is No access permitted from this PE.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APPSAA, bit [24]

When FEAT_RME_GPC2 is implemented:

Above PPS All Access. This field governs the behavior of memory accesses to Secure, Realm and Root PA space, for physical addresses above the range configured by GPCCR_EL3.PPS.

APPSAA	Meaning
0b0	Accesses to addresses above the configured PPS must be to Non-secure PA space, otherwise they generate a GPF at level 0.
0b1	Accesses to addresses above the configured PPS, to any PA space, do not generate a GPF because of this control.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

L0GPTSZ, bits [23:20]

Level 0 GPT entry size.

This field advertises the number of least-significant address bits protected by each entry in the level 0 GPT.

L0GPTSZ	Meaning
0b0000	30-bits. Each entry covers 1GB of address space.
0b0100	34-bits. Each entry covers 16GB of address space.
0b0110	36-bits. Each entry covers 64GB of address space.
0b1001	39-bits. Each entry covers 512GB of address space.

All other values are reserved.

Access to this field is **RO**.

NSO, bit [19]

When FEAT_RME_GPC2 is implemented:

Non-secure Only. This field governs the behavior of the GPI encoding for NSO.

NSO	Meaning
0b0	GPI encoding value of 0b1101 is reserved.
0b1	GPI encoding value of 0b1101 is NSO.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBGPCD, bit [18]

When FEAT_TRBE_EXT is implemented:

Trace Buffer Granule Protection Check Disabled. Controls whether the Trace Buffer Unit accepts or rejects trace when Granule Protection Checks are disabled.

TBGPCD	Meaning
0b0	The Trace Buffer Unit rejects trace when GPCCR_EL3.GPC is 0.
0b1	The Trace Buffer Unit accepts trace when GPCCR_EL3.GPC is 0.

When the Trace Buffer Unit rejects trace, the trace might remain buffered by the trace unit until the Trace Buffer Unit is able to accept trace. When the Trace Buffer Unit accepts trace, the Trace Buffer Unit writes the trace to memory.

Note

Setting GPCCR_EL3.{TBGPCD, GPC} to {1, 0} means that the Trace Buffer Unit might write to memory without any Granule Protection Checks. The addresses that the Trace Buffer Unit writes to can be programmed by an external agent. The physical address spaces the Trace Buffer Unit can address are restricted by an IMPLEMENTATION DEFINED debug authentication interface.

Setting GPCCR_EL3.{TBGPCD, GPC} to {1, 1} means that GPCCR_EL3.{TBGPCD, GPC} will become {1, 0} on a Warm reset.

This field is ignored by the PE and treated as one when any of the following are true:

- GPCCR_EL3.GPC == 1.
- `ExternalRootInvasiveDebugEnabled()` == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Otherwise:

Reserved, RES0.

GPCP, bit [17]

Granule Protection Check Priority.

This control governs behavior of granule protection checks on fetches of stage 2 Table descriptors.

GPCP	Meaning
0b0	GPC faults are all reported with a priority that is consistent with the GPC being performed on any access to physical address space.
0b1	A GPC fault for the fetch of a Table descriptor for a stage 2 translation table walk might not be generated or reported. All other GPC faults are reported with a priority consistent with the GPC being performed on all accesses to physical address spaces.

This bit is permitted to be cached in a TLB.

An implementation is permitted to treat this field as RES0, with an Effective value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GPC, bit [16]

Granule Protection Check Enable.

GPC	Meaning
0b0	Granule protection checks are disabled. Accesses are not prevented by this mechanism.
0b1	All accesses to physical address spaces are subject to granule protection checks, except for fetches of GPT information and accesses governed by the GPCCR_EL3.GPCP control.

If any stage of translation is enabled, this bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

PGS, bits [15:14]

Physical Granule size.

PGS	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

All other values are reserved.

The value of this field is permitted to be cached in a TLB.

Granule sizes not supported for stage 1 and not supported for stage 2, as defined in ID_AA64MMFR0_EL1, are reserved. For example, if ID_AA64MMFR0_EL1.TGran16 == 0b0000 and ID_AA64MMFR0_EL1.TGran16_2 == 0b0001, then the PGS encoding 0b10 is reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [13:12]

GPT fetch Shareability attribute

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

Fetches of GPT information are made with the Shareability attribute that is configured in this field.

If both ORGN and IRGN are configured with Non-cacheable attributes, it is invalid to configure this field to any value other than 0b10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN, bits [11:10]

GPT fetch Outer cacheability attribute.

ORGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

Fetches of GPT information are made with the Outer cacheability attributes configured in this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [9:8]

GPT fetch Inner cacheability attribute.

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

Fetches of GPT information are made with the Inner cacheability attributes configured in this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SPAD, bit [7]

When FEAT_RME_GPC2 is implemented:

Secure PA space Disable. This field controls access to the Secure PA space.

SPAD	Meaning
0b0	This control has no effect on accesses.
0b1	When granule protection checks are enabled, access to the Secure Physical Address space generates a Granule Protection fault.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPAD, bit [6]

When FEAT_RME_GPC2 is implemented:

Non-secure PA space Disable. This field controls access to the Non-secure PA space.

NSPAD	Meaning
0b0	This control has no effect on accesses.
0b1	When granule protection checks are enabled, access to the Non-secure Physical Address space generates a Granule Protection fault.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLPAD, bit [5]

When FEAT_RME_GPC2 is implemented:

Realm PA space Disable. This field controls access to the Realm PA space.

RLPAD	Meaning
0b0	This control has no effect on accesses.
0b1	When granule protection checks are enabled, access to the Realm Physical Address space generates a Granule Protection fault.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [4]

Reserved, RES0.

PPS3, bit [3]

When FEAT_RME_GPC3 is implemented:

This field extends GPCCR_EL3.PPS[2:0], creating a GPCCR_EL3.PPS[3:0] field.

For a description of the values derived by evaluating PPS, see GPCCR_EL3.PPS[2:0].

The value of this field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PPS, bits [2:0]
When FEAT_RME_GPC3 is implemented:

Protected Physical Address Size.

The size of the memory region protected by GPTBR_EL3, in terms of the number of least-significant address bits.

This field is evaluated with PPS3, as {PPS3, PPS} to give PPS[3:0], interpreted as:

PPS[3:0]	Meaning
0b0000	32 bits, 4GB protected address space.
0b0001	36 bits, 64GB protected address space.
0b0010	40 bits, 1TB protected address space.
0b0011	42 bits, 4TB protected address space.
0b0100	44 bits, 16TB protected address space.
0b1000	46 bits, 64TB protected address space.
0b1001	47 bits, 128TB protected address space.
0b0101	48 bits, 256TB protected address space.
0b0110	52 bits, 4PB protected address space.
0b0111	56 bits, 64PB protected address space.

All other values are reserved.

Configuration of this field to a value exceeding the implemented physical address size is invalid.

The value of this field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Protected Physical Address Size.

The size of the memory region protected by GPTBR_EL3, in terms of the number of least-significant address bits.

PPS	Meaning
0b000	32 bits, 4GB protected address space.
0b001	36 bits, 64GB protected address space.
0b010	40 bits, 1TB protected address space.
0b011	42 bits, 4TB protected address space.
0b100	44 bits, 16TB protected address space.
0b101	48 bits, 256TB protected address space.
0b110	52 bits, 4PB protected address space.

All other values are reserved.

Configuration of this field to a value exceeding the implemented physical address size is invalid.

The value of this field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GPCCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, GPCCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0001	0b110

```
if !(IsFeatureImplemented(FEAT_RME) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = GPCCR_EL3;
```

MSR GPCCR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0001	0b110

```
if !(IsFeatureImplemented(FEAT_RME) && IsFeatureImplemented(FEAT_AA64)) then

GPTBR_EL3, Granule Protection Table Base Register

The GPTBR_EL3 characteristics are:

Purpose

The control register for Granule Protection Table base address.

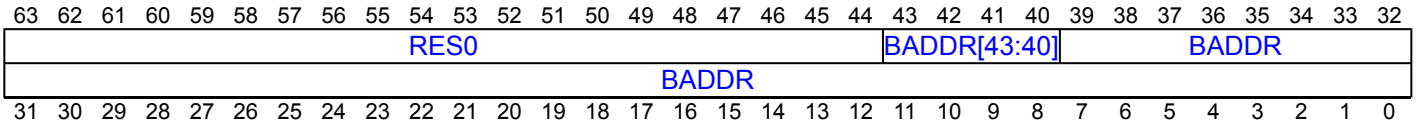
Configuration

This register is present only when FEAT_RME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to GPTBR_EL3 are UNDEFINED.

Attributes

GPTBR_EL3 is a 64-bit register.

Field descriptions



Bits [63:44]

Reserved, RES0.

BADDR[43:40], bits [43:40]

When FEAT_RME_GPC3 is implemented:

Extension to BADDR[39:0]. This field represents bit [55:52] of the level 0 GPT base address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BADDR, bits [39:0]

Base address for the level 0 GPT.

This field represents bits [51:12] of the level 0 GPT base address.

The level 0 GPT is aligned in memory to the greater of:

- The size of the level 0 GPT in bytes.
- 4KB.

Bits [x:0] of the base address are treated as zero, where:

- x = Max(pps - l0gptsz + 2, 11)
- pps is derived from GPCCR_EL3.PPS as follows:

GPCCR_EL3.PPS	pps
0b000	32
0b001	36
0b010	40
0b011	42
0b100	44
0b101	48
0b110	52

- l0gptsz is derived from GPCCR_EL3.L0GPTSZ as follows:

GPCCR_EL3.L0GPTSZ	l0gptsz
0b0000	30
0b0100	34
0b0110	36
0b1001	39

If x is greater than 11, then BADDR[x - 12:0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GPTBR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, GPTBR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0001	0b100

HACDBSBR_EL2, Hardware Accelerator for Cleaning Dirty State Base Register

The HACDBSBR_EL2 characteristics are:

Purpose

Control register for HACDBS structure.

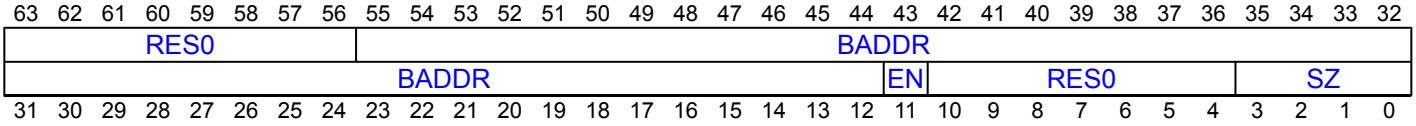
Configuration

This register is present only when FEAT_HACDBS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HACDBSBR_EL2 are UNDEFINED.

Attributes

HACDBSBR_EL2 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

BADDR, bits [55:12]

HACDBS base address, bits [55:12].

- Bits [55:12] of the base address are the value of this field.
- Bits [11:0] of the base address are 0.

Bits of this field above the implemented physical address size, indicated in ID_AA64MMFR0_EL1.PARange, are RES0.

Based on the value of the SZ field of this register, for encodings of the SZ field greater than 4KB, bits [(SZ+12-1):12] of this field are RES0 such that the base address of the HACDBS is aligned to its size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [11]

Enable use of HACDBS.

EN	Meaning
0b0	Hardware accelerator for cleaning Dirty state is disabled.
0b1	Hardware accelerator for cleaning Dirty state is enabled.

If SCR_EL3.HACDBSEn is set to 0, then this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:4]

Reserved, RES0.

SZ, bits [3:0]

Size of the HACDBS.

SZ	Meaning
0b0000	4KB
0b0001	8KB
0b0010	16KB
0b0011	32KB
0b0100	64KB
0b0101	128KB
0b0110	256KB
0b0111	512KB
0b1000	1MB
0b1001	2MB

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HACDBSBR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HACDBSBR_EL2
```

op0	op1	CRn	CRm	op2

HACDBSCONS_EL2, Hardware Accelerator for Cleaning Dirty State Consumer Register

The HACDBSCONS_EL2 characteristics are:

Purpose

Read index for HACDBS structure.

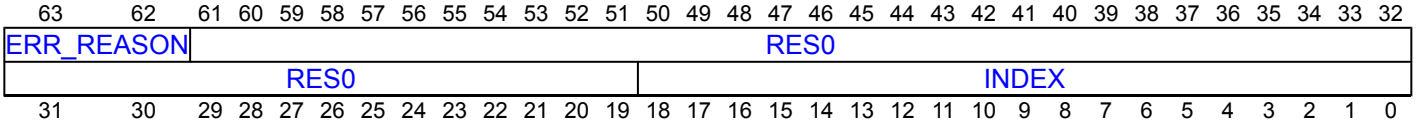
Configuration

This register is present only when FEAT_HACDBS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HACDBSCONS_EL2 are UNDEFINED.

Attributes

HACDBSCONS_EL2 is a 64-bit register.

Field descriptions



ERR_REASON, bits [63:62]

Reason for HACDBS error.

ERR_REASON	Meaning
0b00	The PE has not experienced an error while processing the HACDBS.
0b01	STRUCTF - A read of an entry from the HACDBS has experienced a fault.
0b10	IPAF - A stage 2 walk of an IPA from a HACDBS entry has experienced an MMU fault.
0b11	IPAHACF - An entry from the HACDBS experienced an error that is not an MMU fault.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [61:19]

Reserved, RES0.

INDEX, bits [18:0]

This field indicates the index of the HACDBS entry that will be read from next.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HACDBSCONS_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HACDBSCONS_EL2

HACR_EL2, Hypervisor Auxiliary Control Register

The HACR_EL2 characteristics are:

Purpose

Controls trapping to EL2 of IMPLEMENTATION DEFINED aspects of EL1 or EL0 operation.

Note

Arm recommends that the values in this register do not cause unnecessary traps to EL2 when the Effective value of HCR_EL2.{E2H, TGE} == {1, 1}.

Configuration

AArch64 System register HACR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HACR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to HACR_EL2 are UNDEFINED.

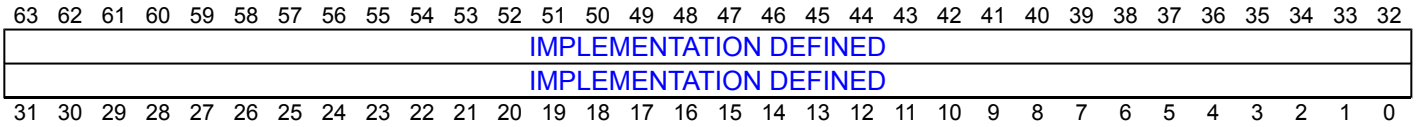
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

HACR_EL2 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HACR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HACR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b111

```

HAFGRTR_EL2, Hypervisor Activity Monitors Fine-Grained Read Trap Register

The HAFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRS reads of Activity Monitors System registers.

Configuration

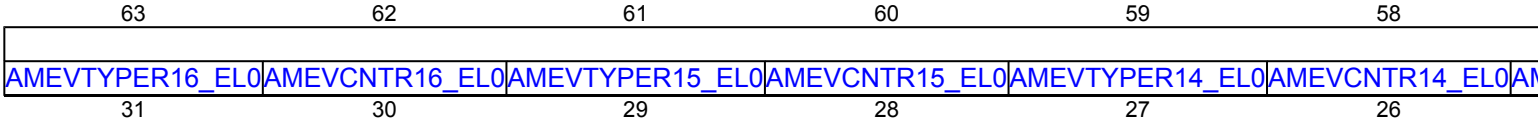
This register is present only when FEAT_AMUv1 is implemented, FEAT_FGT is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to HAFGRTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HAFGRTR_EL2 is a 64-bit register.

Field descriptions



Bits [63:50]

Reserved, RES0.

AMEVTYPER1<x>_EL0, bit [19+2x], for x = 15 to 0

Trap MRS reads of AMEVTYPER1<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER1<x> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER1<x>_EL0	Meaning
0b0	MRS reads of AMEVTYPER1<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER1<x> at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER1<x>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER1<x> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(AMCGCR_EL0.CG1NC), access to this field is **RES0**.
- When !IsG1ActivityMonitorImplemented(x), access to this field is **RES0**.

AMEVCNTR1<x>_EL0, bit [18+2x], for x = 15 to 0

Trap `MRS` reads of AMEVCNTR1<x>_EL0 at EL1 and EL0 using AArch64 and `MRC` reads of AMEVCNTR1<x> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR1<x>_EL0	Meaning
`0b0`	`MRS` reads of AMEVCNTR1<x>_EL0 at EL1 and EL0 using AArch64 and `MRC` reads of AMEVCNTR1<x> at EL0 using AArch32 are not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • `MRS` reads of AMEVCNTR1<x>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`. • `MRC` reads of AMEVCNTR1<x> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value `0x03`.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(AMCGCR_EL0.CG1NC), access to this field is **RES0**.
- When !IsG1ActivityMonitorImplemented(x), access to this field is **RES0**.

AMCNTEN<x>, bit [17x], for x = 1 to 0

Trap `MRS` reads and `MRC` reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: `MRS` reads of AMCNTENCLR<x>_EL0 and AMCNTENSET<x>_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: `MRC` reads of AMCNTENCLR<x> and AMCNTENSET<x>.

AMCNTEN<x>	Meaning
`0b0`	The operations listed above are not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • `MRS` reads at EL1 and EL0 using AArch64 of AMCNTENCLR<x>_EL0 and AMCNTENSET<x>_EL0 are trapped to EL2 and reported with EC syndrome value `0x18`. • `MRC` reads at EL0 using AArch32 of AMCNTENCLR<x> and AMCNTENSET<x> are trapped to EL2 and reported with EC syndrome value `0x03`.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [16:5]

Reserved, RES0.

AMEVCNTR0<x>_EL0, bit [x+1], for x = 3 to 0

Trap MRS reads of AMEVCNTR0<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR0<x> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR0<x>_EL0	Meaning
0b0	MRS reads of AMEVCNTR0<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR0<x> at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR0<x>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR0<x> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

When x >= 4, access to this field is **RES0**.

Accessing HAFGRTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HAFGRTR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b110

```
if !(IsFeatureImplemented(FEAT_AMUv1) && IsFeatureImplemented(FEAT_FGT) &&

HCR_EL2, Hypervisor Configuration Register

The HCR_EL2 characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

Configuration

AArch64 System register HCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HCR[31:0].

AArch64 System register HCR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HCR2[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to HCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Unless otherwise stated, the bits in this register behave as if they are 0 for all purposes other than direct reads of the register if EL2 is not enabled in the current Security state.

Attributes

HCR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43

TWEDEL, bits [63:60]

When FEAT_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when HCR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by HCR_EL2.TWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [59]

When FEAT_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by HCR_EL2.TWE.

TWEDEn	Meaning
0b0	The delay for taking the trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking the trap is at least the number of cycles defined in HCR_EL2.TWEDEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID5, bit [58]

When FEAT_MTE2 is implemented:

Trap ID group 5. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- GMID_EL1.

TID5	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 accesses to ID group 5 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DCT, bit [57]

When FEAT_MTE2 is implemented:

Default Cacheability Tagging. When HCR_EL2.DC is in effect, controls whether EL1&0 stage 1 translations have the Tagged attribute.

DCT	Meaning
0b0	Stage 1 translations do not have the Tagged attribute.
0b1	Stage 1 translations have the Tagged attribute.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [56]

When FEAT_MTE2 is implemented:

Allocation Tag Access. Controls access to Allocation Tags, System registers for Memory tagging, and prevention of Tag checking, at EL1 and EL0

ATA	Meaning
0b0	Access to Allocation Tags is prevented at EL1 and EL0. Accesses at EL1 to GCR_EL1, RGSR_EL1, TFSR_EL1, or TFSRE0_EL1 that are not UNDEFINED are trapped to EL2. Accesses at EL1 using MRS or MSR with the register name TFSR_EL2 that are not UNDEFINED are trapped to EL2. Memory accesses at EL1 and EL0 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL1 and EL0. This control does not prevent Tag checking at EL1 and EL0.

If EL2 is not enabled in the current Security state, the Effective value of this field is 1.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBOS, bit [55]
When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Outer Shareable domain. Traps execution of those TLB maintenance instructions at EL1 using AArch64 to EL2, when EL2 is enabled in the current Security state. The following instructions are trapped and reported with EC syndrome value 0x18:

- TLBI VMALLE1OS, TLBI VAE1OS, TLBI ASIDE1OS,TLBI VAAE1OS, TLBI VALE1OS, and TLBI VAALE1OS.
- If FEAT_TLBIRANGE is implemented, TLBI RVAE1OS, TLBI RVAAE1OS,TLBI RVALE1OS, and TLBI RVAALE1OS.
- If FEAT_XS is implemented then the *OSNXS variants are also trapped.

TTLBOS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBIS, bit [54]
When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, then the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS, TLBI VAAE1IS, TLBI VALE1IS, TLBI VAALE1IS, TLBI RVAE1IS, TLBI RVAAE1IS, TLBI RVALE1IS, and TLBI RVAALE1IS.
- If EL1 is using AArch32, then the following instructions are trapped to EL2 and reported with EC syndrome value 0x03:
  - TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, and TLBIMVAALIS.
- If FEAT_XS is implemented then the *ISNXS variants are also trapped.

TTLBIS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [53]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Enable Access to the SCXTNUM_EL1 and SCXTNUM_EL0 registers. The defined values are:

EnSCXT	Meaning
0b0	When EL2 is enabled in the current Security state, EL1 accesses to SCXTNUM_EL0 and SCXTNUM_EL1 are disabled, causing an exception to EL2, and the value of the registers to be treated as 0. When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1} and EL2 is enabled in the current Security state, EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL2, and the value of the register to be treated as 0.
0b1	This control does not cause accesses to SCXTNUM_EL0 or SCXTNUM_EL1 to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1} and the value of this field is 0, accesses at EL0 are not trapped by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TOCU, bit [52]
When FEAT_EVT is implemented:

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at EL0 and EL1 to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL0 is using AArch64, the value of SCTLR_EL1.UCI is 1, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then the following instructions at EL0 are trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IVAU, and DC CVAU.
- If EL1 is using AArch64, then the following instructions at EL1 are trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IVAU, IC IALLU, and DC CVAU.
- If EL1 is using AArch32, then the following instructions are trapped at EL1 to EL2 and reported with EC syndrome value 0x03:
  - ICIMVAU, ICIALLU, and DCCMVAU.

Note

When SCTLR_EL1.UCI is 0, the trap on execution of instructions at EL0 is higher priority than this control.

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- IC IALLUIS and IC IALLU are always UNDEFINED at EL0 using AArch64.
- ICIMVAU, ICIALLU, ICIALLUIS, and DCCMVAU are always UNDEFINED at EL0 using AArch32.

TOCU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	For each of the specified instructions, if the execution of the instruction can be trapped, accesses are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [51]
When FEAT_AMUv1p1 is implemented:

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Virtualization of the Activity Monitors is disabled. Indirect reads of the virtual offset registers are zero.
0b1	Virtualization of the Activity Monitors is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TICAB, bit [50]
When FEAT_EVT is implemented:

Trap ICIALLUIS and IC IALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, then the following instruction is trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IALLUIS.
- If EL1 is using AArch32, then the following instruction is trapped to EL2 and reported with EC syndrome value 0x03:
  - ICIALLUIS.

TICAB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	For each of the specified instructions, if the execution of the instruction can be trapped, EL1 access is trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID4, bit [49]
When FEAT_EVT is implemented:

Trap ID group 4. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- EL1 reads of CCSIDR_EL1, CCSIDR2_EL1, CLIDR_EL1, and CSSELR_EL1.
- EL1 writes to CSSELR_EL1.

AArch32:

- EL1 reads of CCSIDR, CCSIDR2, CLIDR, and CSSELR.
- EL1 writes to CSSELR.

TID4	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 accesses to ID group 4 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GPF, bit [48]

When FEAT_RME is implemented:

Controls the reporting of Granule protection faults at EL0 and EL1.

GPF	Meaning
0b0	This control does not cause exceptions to be routed from EL0 and EL1 to EL2.
0b1	Instruction Abort exceptions and Data Abort exceptions due to GPFs from EL0 and EL1 are routed to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FIEN, bit [47]

When FEAT_RASv1p1 is implemented:

Fault Injection Enable. Unless this bit is set to 1, accesses to the ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

If EL2 is disabled in the current Security state, the Effective value of HCR_EL2.FIEN is 1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FWB, bit [46]

When FEAT_S2FWB is implemented:

Forced Write-Back. Defines the combined cacheability attributes in a 2 stage translation regime.

FWB	Meaning
0b0	When this bit is 0, then the combination of stage 1 and stage 2 translations on memory type and cacheability attributes are as described in the Armv8.0 architecture. For more information, see 'Combining stage 1 and stage 2 memory type attributes'.
0b1	When this bit is 1, then the encoding of the stage 2 memory type and cacheability attributes in bits[5:2] of the stage 2 Page or Block descriptors are as described in 'Stage 2 memory type and Cacheability attributes when FEAT_S2FWB is enabled'.

In Secure state, this bit applies to both the Secure stage 2 translation and the Non-secure stage 2 translation.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV2, bit [45]

When FEAT_NV2 is implemented:

Nested Virtualization. Changes the behaviors of HCR_EL2.{NV1, NV} to provide a mechanism for hardware to transform reads and writes from System registers into reads and writes from memory.

NV2	Meaning
0b0	This bit has no effect on the behavior of HCR_EL2.{NV1, NV}. The behavior of HCR_EL2.{NV1, NV} is as defined for FEAT_NV.
0b1	Redefines behavior of HCR_EL2{NV1, NV} to enable: • Transformation of read/writes to registers into read/writes to memory. • Redirection of EL2 registers to EL1 registers. Any exception taken from EL1 and taken to EL1 causes SPSR_EL1.M[3:2] to be set to 0b10 and not 0b01.

When the Effective value of HCR_EL2.NV is 0, the Effective value of this field is 0 and this field is treated as 0 for all purposes other than direct reads and writes of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AT, bit [44]

When FEAT_NV is implemented:

Address Translation. EL1 execution of the following address translation instructions is trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- AT S1E0R, AT S1E0W, AT S1E1R, AT S1E1W, AT S1E1RP, and AT S1E1WP.
- If FEAT_ATS1A is implemented, AT S1E1A.

AT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified instructions is trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV1, bit [43]
When FEAT_NV2 is implemented:

Nested Virtualization.

NV1	Meaning
0b0	If the Effective value of HCR_EL2.{NV2, NV} is {1, 1}, accesses executed from EL1 to implemented EL12, EL02, or EL2 registers are transformed to loads and stores. If the Effective value of HCR_EL2.{NV2, NV} is not {1, 1}, this control does not cause any instructions to be trapped.
0b1	If the Effective value of HCR_EL2.NV2 is 1, accesses executed from EL1 to implemented EL2 registers are transformed to loads and stores. If the Effective value of HCR_EL2.NV2 is 0, EL1 accesses to VBAR_EL1, ELR_EL1, SPSR_EL1, and, when FEAT_CSV2_2 or FEAT_CSV2_1p2 is implemented, SCXTNUM_EL1, are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If the Effective value of HCR_EL2.NV2 is 1, the Effective value of HCR_EL2.NV1 defines which EL1 register accesses are transformed to loads and stores.

The trapping of EL1 registers caused by other control bits has priority over the transformation of these accesses.

If a register is specified that is not implemented by an implementation, then access to that register are UNDEFINED.

For the list of registers affected, see 'Enhanced support for nested virtualization'.

If the Effective value of HCR_EL2.{NV1, NV} is {0, 1}, any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to 0b10, and not 0b01.

If the Effective value of HCR_EL2.{NV1, NV} is {1, 1}, then:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - The Effective value of UXN is 0.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If the Effective value of HCR_EL2.{NV1, NV} are {1, 0}, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if the Effective value of HCR_EL2.{NV1, NV} is {1, 1} for all purposes other than reading back the value of the HCR_EL2.NV bit.
- Behaving as if the Effective value of HCR_EL2.{NV1, NV} is {0, 0} for all purposes other than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the Effective value of HCR_EL2.{NV1, NV} behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_NV is implemented:

Nested Virtualization. EL1 accesses to certain registers are trapped to EL2, when EL2 is enabled in the current Security state.

NV1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to VBAR_EL1, ELR_EL1, SPSR_EL1, and, when FEAT_CSV2_2 or FEAT_CSV2_1p2 is implemented, SCXTNUM_EL1, are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If the Effective value of HCR_EL2.{NV1, NV} is {0, 1}, then the following effects also apply:

- Any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to 0b10, and not 0b01.

If the Effective value of HCR_EL2.{NV1, NV} is {1, 1}, then the following effects also apply:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - The Effective value of UXN is 0.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If the Effective value of HCR_EL2.{NV1, NV} is {1, 0}, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if the Effective value of HCR_EL2.{NV1, NV} is {1, 1} for all purposes other than reading back the value of the HCR_EL2.NV bit.
- Behaving as if the Effective value of HCR_EL2.{NV1, NV} is {0, 0} for all purposes other than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the Effective value of HCR_EL2.{NV1, NV} behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV, bit [42]
When FEAT_NV2 is implemented:

Nested Virtualization.

When the Effective value of HCR_EL2.NV2 is 1, redefines register accesses so that:

- Instructions accessing the Special purpose registers SPSR_EL2 and ELR_EL2 instead access SPSR_EL1 and ELR_EL1 respectively.
- Instructions accessing the System registers ESR_EL2 and FAR_EL2 instead access ESR_EL1 and FAR_EL1.

When the Effective value of HCR_EL2.NV2 is 0, traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

NV	Meaning
0b0	When this bit is set to 0, then the PE behaves as if the Effective value of HCR_EL2.NV2 is 0 for all purposes other than reading this register. This control does not cause any instructions to be trapped. When the Effective value of HCR_EL2.NV2 is 1, no FEAT_NV2 functionality is implemented.
0b1	When the Effective value of HCR_EL2.NV2 is 0, EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of 0x2. When the Effective value of HCR_EL2.NV2 is 1, this control redefines EL1 register accesses so that instructions accessing SPSR_EL2, ELR_EL2, ESR_EL2, and FAR_EL2 instead access SPSR_EL1, ELR_EL1, ESR_EL1, and FAR_EL1 respectively.

When the Effective value of HCR_EL2.NV2 is 0, then:

- The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:
  - Registers accessed using MRS or MSR with a name ending in _EL2, except the following:
    - SP_EL2.
    - If FEAT_MEC is implemented, MECID_A0_EL2, MECID_A1_EL2, MECID_P0_EL2, MECID_P1_EL2, MECIDR_EL2, VMECID_A_EL2, and VMECID_P_EL2.
  - Registers accessed using MRS or MSR with a name ending in _EL12.
  - Registers accessed using MRS or MSR with a name ending in _EL02.
  - Special-purpose registers SPSR_irq, SPSR_abt, SPSR_und, and SPSR_fiq, accessed using MRS or MSR.
  - Special-purpose register SP_EL1 accessed using the dedicated MRS or MSR instruction.
- The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:
  - EL2 translation regime Address Translation instructions and TLB maintenance instructions.
  - EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.
- The instructions for which the execution is trapped as follows:
  - SMC in an implementation that does not include EL3 and when HCR_EL2.TSC is 1. HCR_EL2.TSC bit is not RES0 in this case. This is reported using EC syndrome value 0x17.
  - The ERET, ERETAA, and ERETAB instructions, reported using EC syndrome value 0x1A.

Note

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_NV is implemented:

Nested Virtualization. Traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

NV	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of 0x2.

The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:

- Registers accessed using MRS or MSR with a name ending in _EL2, except the following:
  - SP_EL2.

        - If FEAT_MEC is implemented, MECID_A0_EL2, MECID_A1_EL2, MECID_P0_EL2, MECID_P1_EL2, MECIDR_EL2, VMECID_A_EL2, and VMECID_P_EL2.
    - Registers accessed using MRS or MSR with a name ending in _EL12.
    - Registers accessed using MRS or MSR with a name ending in _EL02.
    - Special-purpose registers SPSR_irq, SPSR_abt, SPSR_und, and SPSR_fiq, accessed using MRS or MSR.
    - Special-purpose register SP_EL1 accessed using the dedicated MRS or MSR instruction.

The instructions for which the execution is trapped and reported using EC syndrome value `0x18` are as follows:

- EL2 translation regime Address Translation instructions and TLB maintenance instructions.
- EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.

The execution of the ERET, ERETAA, and ERETAB instructions are trapped and reported using EC syndrome value `0x1A`.

Note

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is `0x1A`.

The execution of the SMC instructions in an implementation that does not include EL3 and when HCR_EL2.TSC is 1 are trapped and reported using EC syndrome value `0x17`. HCR_EL2.TSC bit is not RES0 in this case.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [41]
When FEAT_PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- PACGA.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB.
- PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB.
- RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB, LDRAA, and LDRAB.
- When FEAT_PAuth_LR is implemented, AUTIASPPC, AUTIASPPCR, AUTIA171615, AUTIBSPPC, AUTIBSPPCR, AUTIB171615, PACIASPPC, PACNBIASPPC, PACIA171615, PACIBSPPC, PACNBIBSPPC, PACIB171615, RETAASPPC, RETAASPPCR, RETABSPPC, RETABSPPCR.

This field is ignored if the instruction is disabled as a result of the SCTLR_ELx.{EnIB, EnIA, EnDA, EnDB} fields.

API	Meaning
0b0	The instructions related to Pointer Authentication are trapped to EL2 and reported using EC syndrome value 0x09, when EL2 is enabled in the current Security state and the instructions are enabled for the EL1&0 translation regime, from: • When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, EL0. • EL1. If the Effective value of HCR_EL2.NV is 1, the HCR_EL2.NV trap takes precedence over the HCR_EL2.API trap for the ERETAA and ERETAB instructions. If EL2 is implemented and enabled in the current Security state and the Effective value of HFGITR_EL2.ERET is 1, execution at EL1 using AArch64 of ERETAA or ERETAB instructions is reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the trap enabled by HCR_EL2.API == 0.
0b1	This control does not cause any instructions to be trapped.

If FEAT_PAuth is implemented but EL2 is not implemented or is disabled in the current Security state, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [40]

When FEAT_PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers from EL1 to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- APIAKeyLo_EL1, APIAKeyHi_EL1, APIBKeyLo_EL1, APIBKeyHi_EL1, APDAKeyLo_EL1, APDAKeyHi_EL1, APDBKeyLo_EL1, APDBKeyHi_EL1, APGAKeyLo_EL1, and APGAKeyHi_EL1.

APK	Meaning
0b0	Access to the registers holding "key" values for pointer authentication from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

Note

If FEAT_PAuth is implemented but EL2 is not implemented or is disabled in the current Security state, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [39]

When FEAT_TME is implemented:

Enables access to the TSTART, TCOMMIT, TTEST, and TCANCEL instructions at EL0 and EL1.

TME	Meaning
0b0	EL0 and EL1 accesses to TSTART, TCOMMIT, TTEST, and TCANCEL instructions are UNDEFINED.
0b1	This control does not cause any instruction to be UNDEFINED.

If EL2 is not implemented or is disabled in the current Security state, the Effective value of this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [38]

Note

This bit was previously the MIOCNCE control.

Reserved, RES0.

TEA, bit [37]
When FEAT_RAS is implemented:

Route synchronous External abort exceptions to EL2.

TEA	Meaning
0b0	Synchronous External abort exceptions are unaffected by this mechanism. That is, synchronous External abort exceptions are not taken to EL2 unless routed to EL2 by another control.
0b1	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state, synchronous External abort exceptions are taken to EL2, unless they are routed to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [36]
When FEAT_RAS is implemented:

Trap accesses of Error Record registers. Enables a trap to EL2 on accesses of Error Record registers.

TERR	Meaning
0b0	Accesses of the specified Error Record registers are not trapped by this mechanism.
0b1	Accesses of the specified Error Record registers at EL1 are trapped to EL2, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to ERRSELR_EL1, ERXADDR_EL1, ERXCTLR_EL1, ERXMISC0_EL1, ERXMISC1_EL1, and ERXSTATUS_EL1.
- MRS accesses to ERRIDR_EL1 and ERXFR_EL1.
- If FEAT_RASv1p1 is implemented, MRS and MSR accesses to ERXMISC2_EL1 and ERXMISC3_EL1.
- If FEAT_RASv2 is implemented, MRS accesses to ERXGSR_EL1.

In AArch32 state, the instructions affected by this control are:

- MRC and MCR accesses to ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.
- MRC accesses to ERRIDR, ERXFR, and ERXFR2.
- If FEAT_RASv1p1 is implemented, MRC and MCR accesses to ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL2.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x03.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [35]
When FEAT_LOR is implemented:

Trap LOR registers. Traps Non-secure and Realm EL1 accesses to LORSA_EL1, LOREA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers to EL2.

TLOR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure and Realm EL1 accesses to the LOR registers are trapped to EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2H, bit [34]
When FEAT_VHE is implemented:

EL2 Host. Enables a configuration where a Host Operating System is running in EL2, and the Host Operating System's applications are running in EL0.

E2H	Meaning
0b0	The facilities to support a Host Operating System at EL2 are disabled.
0b1	The facilities to support a Host Operating System at EL2 are enabled.

For information on the behavior of this bit see 'Behavior of HCR_EL2.E2H'.

When FEAT_E2H0 is not implemented, this field is RES1 and behaves as if it is 1 for all purposes other than a direct read.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ID, bit [33]

Stage 2 Instruction access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

ID	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime.
0b1	Forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CD, bit [32]

Stage 2 Data access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

CD	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime for data accesses and translation table walks.
0b1	Forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RW, bit [31]

When FEAT_AA32EL1 is implemented:

Execution state control for lower Exception levels:

RW	Meaning
0b0	Lower levels are all AArch32.
0b1	The Execution state for EL1 is AArch64. The Execution state for EL0 is determined by the current value of PSTATE.nRW when executing at EL0.

In an implementation that includes EL3, when EL2 is not enabled in Secure state, the PE behaves as if this bit has the same value as the SCR_EL3.RW bit for all purposes other than a direct read or write access of HCR_EL2.

The RW bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, EL1 accesses to the following registers are trapped to EL2 and reported using EC syndrome value `0x18` for `MRS` and `0x14` for `MRRS`:
  - SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, and CONTEXTIDR_EL1.
  - If FEAT_AIE is implemented, MAIR2_EL1 and AMAIR2_EL1.
  - If FEAT_S1PIE is implemented, PIRE0_EL1 and PIR_EL1.
  - If FEAT_S1POE is implemented, POR_EL0 and POR_EL1.
  - If FEAT_S2POE is implemented, S2POR_EL1.
  - If FEAT_TCR2 is implemented, TCR2_EL1.
  - If FEAT_SCTLR2 is implemented, SCTLR2_EL1.
- If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and EL0 is using AArch64, EL0 accesses to the following registers are trapped to EL2 and reported using EC syndrome value `0x18` for `MRS`:
  - If FEAT_S1POE is implemented, POR_EL0.
- If EL1 is using AArch32, EL1 accesses using MRC to the following registers are trapped to EL2 and reported using EC syndrome value `0x03`, accesses using MRRC are trapped to EL2 and reported using EC syndrome value `0x04`:
  - SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, and CONTEXTIDR.

TRVM	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Read accesses to the specified Virtual Memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

EL2 provides a second stage of address translation, that a hypervisor can use to remap the address map defined by a Guest OS. In addition, a hypervisor can trap attempts by a Guest OS to write to the registers that control the memory system. A hypervisor might use this trap as part of its virtualization of memory management.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HCD, bit [29]

When EL3 is not implemented:

HVC instruction disable. Disables EL1 and EL2 execution of HVC instructions, from both Execution states, when EL2 is enabled in the current Security state, reported using EC syndrome value `0x00`.

HCD	Meaning
`0b0`	HVC instruction execution is enabled at EL2 and EL1.
`0b1`	HVC instructions are UNDEFINED at EL2 and EL1. Any resulting exception is taken to the Exception level at which the HVC instruction is executed.

Note

HVC instructions are always UNDEFINED at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDZ, bit [28]

Trap DC ZVA instructions. Traps EL0 and EL1 execution of DC ZVA instructions to EL2, when EL2 is enabled in the current Security state, from AArch64 state only, reported using EC syndrome value `0x18`.

If FEAT_MTE is implemented, this trap also applies to DC GVA and DC GZVA.

TDZ	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	In AArch64 state, any attempt to execute an instruction this trap applies to at EL1, or at EL0 when the instruction is not UNDEFINED at EL0, is trapped to EL2 when EL2 is enabled in the current Security state. Reading the DCZID_EL0 returns a value that indicates that the instructions this trap applies to are not supported.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TGE, bit [27]

Trap General Exceptions, from EL0.

TGE	Meaning
`0b0`	This control has no effect on execution at EL0.
`0b1`	When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0. When EL2 is enabled in the current Security state, in all cases: • All exceptions that would be routed to EL1 are routed to EL2. • If EL1 is using AArch64, the SCTLR_EL1.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR_EL1. • If EL1 is using AArch32, the SCTLR.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR. • All virtual interrupts and virtual exceptions are disabled. • Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled. • An exception return to EL1 is treated as an illegal exception return. • The MDCR_EL2.{TDRA, TDOSA, TDA, TDE} fields are treated as being 1 for all purposes other than returning the result of a direct read of MDCR_EL2. In addition, when EL2 is enabled in the current Security state, if: • The Effective value of HCR_EL2.E2H is not 1, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 1. • The Effective value of HCR_EL2.E2H is 1, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 0. For further information on the behavior of this bit when the Effective value of E2H is 1, see 'Behavior of HCR_EL2.E2H'.

HCR_EL2.TGE must not be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TVM, bit [26]

Trap Virtual Memory controls. Traps writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, the following registers are trapped to EL2 and reported using EC syndrome value `0x18` for `MSR` and `0x14` for `MSRR`:
  - SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, and CONTEXTIDR_EL1.
  - If FEAT_AIE is implemented, MAIR2_EL1 and AMAIR2_EL1.
  - If FEAT_S1PIE is implemented, PIRE0_EL1 and PIR_EL1.
  - If FEAT_S1POE is implemented, POR_EL0 and POR_EL1.
  - If FEAT_S2POE is implemented, S2POR_EL1.
  - If FEAT_TCR2 is implemented, TCR2_EL1.
  - If FEAT_SCTLR2 is implemented, SCTLR2_EL1.
- If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and EL0 is using AArch64, EL0 accesses to the following registers are trapped to EL2 and reported using EC syndrome value `0x18` for `MSR`:
  - If FEAT_S1POE is implemented, POR_EL0.
- If EL1 is using AArch32, EL1 accesses using MCR to the following registers are trapped to EL2 and reported using EC syndrome value `0x03`, accesses using MCRR are trapped to EL2 and reported using EC syndrome value `0x04`:
  - SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, and CONTEXTIDR.

TVM	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Write accesses to the specified Virtual Memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TTLB, bit [25]

Trap TLB maintenance instructions. Traps execution of TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, then the following instructions are trapped to EL2 and reported using EC syndrome value `0x18`:
  - TLBI VMALLE1, TLBI VAE1, TLBI ASIDE1, TLBI VAAE1, TLBI VALE1, and TLBI VAALE1.
  - TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS, TLBI VAAE1IS, TLBI VALE1IS, and TLBI VAALE1IS.
  - If FEAT_TLBIOS is implemented, TLBI VMALLE1OS, TLBI VAE1OS, TLBI ASIDE1OS, TLBI VAAE1OS, TLBI VALE1OS, and TLBI VAALE1OS.
  - If FEAT_TLBIRANGE is implemented, TLBI RVAE1, TLBI RVAAE1, TLBI RVALE1, TLBI RVAALE1, TLBI RVAE1IS, TLBI RVAAE1IS, TLBI RVALE1IS, and TLBI RVAALE1IS.
  - If FEAT_TLBIOS and FEAT_TLBIRANGE are implemented, TLBI RVAE1OS, TLBI RVAAE1OS, TLBI RVALE1OS, and TLBI RVAALE1OS.
- If EL1 is using AArch32, then the following instructions are trapped to EL2 and reported using EC syndrome value `0x03`:
  - TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, and TLBIMVAALIS.
  - TLBIALL, TLBIMVA, TLBIASID, TLBIMVAA, TLBIMVAL, and TLBIMVAAL
  - ITLBIALL, ITLBIMVA, and ITLBIASID.
  - DTLBIALL, DTLBIMVA, and DTLBIASID.

TTLB	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

The TLB maintenance instructions are UNDEFINED at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at EL0 and EL1 to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL0 is using AArch64 and the value of SCTLR_EL1.UCI is 1, then the following instructions at EL0 are trapped to EL2 and reported with EC syndrome value `0x18`:
  - IC IVAU and DC CVAU.
- If EL1 is using AArch64, then the following instructions at EL1 are trapped to EL2 and reported with EC syndrome value `0x18`:
  - IC IVAU, IC IALLU, IC IALLUIS, and DC CVAU.
- If EL1 is using AArch32, then the following instructions are trapped to EL2 and reported with EC syndrome value `0x03`:
  - ICIMVAU, ICIALLU, ICIALLUIS, and DCCMVAU.

Note

When SCTLR_EL1.UCI is 0, the trap on execution of instructions at EL0 is higher priority than this control.

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- IC IALLUIS and IC IALLU are always UNDEFINED at EL0 using AArch64.
- ICIMVAU, ICIALLU, ICIALLUIS, and DCCMVAU are always UNDEFINED at EL0 using AArch32.

TPU	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	For each of the specified instructions, if the execution of the instruction can be trapped, access is trapped to EL2, when EL2 is enabled in the current Security state.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPCP, bit [23]

Trap data or unified cache maintenance instructions that operate to the Point of Coherency, Persistence, or Physical Storage. When EL2 is enabled in the current Security state, traps execution of cache maintenance instructions at EL0 and EL1 to EL2 as follows:

- If EL0 is using AArch64 and the value of SCTLR_EL1.UCI is 1, then the following instructions at EL0 are trapped to EL2 and reported using EC syndrome value `0x18`:
  - DC CIVAC and DC CVAC.
  - If FEAT_MTE is implemented, DC CIGVAC, DC CIGDVAC, DC CGVAC, and DC CGDVAC.
  - If FEAT_DPB is implemented, DC CVAP.
  - If FEAT_DPB and FEAT_MTE are implemented, DC CGVAP and DC CGDVAP.
  - If FEAT_DPB2 is implemented, DC CVADP.
  - If FEAT_DPB2 and FEAT_MTE are implemented, DC CGVADP and DC CGDVADP.
- If FEAT_OCCMO is implemented, DC CIVAOC, DC CIGDVAOC, DC CVAOC and DC CGDVAOC.
- If EL1 is using AArch64, then the following instructions at EL1 are trapped to EL2 and reported using EC syndrome value `0x18`:
  - DC IVAC, DC CIVAC and DC CVAC.
  - If FEAT_MTE is implemented, DC CIGVAC, DC CIGDVAC, DC IGVAC, DC IGDVAC, DC CGVAC, and DC CGDVAC.
  - If FEAT_DPB is implemented, DC CVAP.
  - If FEAT_DPB and FEAT_MTE are implemented, DC CGVAP and DC CGDVAP.
  - If FEAT_DPB2 is implemented, DC CVADP.
  - If FEAT_DPB2 and FEAT_MTE are implemented, DC CGVADP and DC CGDVADP.
  - If FEAT_PoPS is implemented, DC CIVAPS.
  - If FEAT_PoPS and FEAT_MTE2 are implemented, DC CIGDVAPS.

- If FEAT_OCCMO is implemented, DC CIVAOC, DC CIGDVAOC, DC CVAOC and DC CGDVAOC.
- If EL1 is using AArch32, then the following instructions at EL1 are trapped to EL2 and reported using EC syndrome value 0x03:
  - DCIMVAC, DCCIMVAC, and DCCMVAC.

Note

This field was previously named TPC.

When SCTLR_EL1.UCI is 0, the trap on execution of instructions at EL0 is higher priority than this control.

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- AArch64 instructions which invalidate by VA to the Point of Coherency or Physical Storage are always UNDEFINED at EL0 using AArch64.
- DCIMVAC, DCCIMVAC, and DCCMVAC are always UNDEFINED at EL0 using AArch32.

TPCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	For each of the specified instructions, if the execution of the instruction can be trapped, it is trapped to EL2, when EL2 is enabled in the current Security state.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, then the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - DC ISW, DC CSW, and DC CISW.
  - If FEAT_MTE2 is implemented, DC IGSW, DC IGDSW, DC CGSW, DC CGDW, DC CIGSW, and DC CIGDSW.
- If EL1 is using AArch32, then the following instructions are trapped to EL2 and reported with EC syndrome value 0x03:
  - DCISW, DCCSW, and DCCISW.

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TSW	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TACR, bit [21]

Trap Auxiliary Control Registers. Traps EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, accesses to ACTLR_EL1 to EL2, are trapped to EL2 and reported using EC syndrome value 0x18.
- If EL1 is using AArch32, accesses to ACTLR and, if implemented, ACTLR2 are trapped to EL2 and reported using EC syndrome value 0x03.

TACR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

ACTLR_EL1 is not accessible at EL0.

ACTLR and ACTLR2 are not accessible at EL0.

The Auxiliary Control Registers are IMPLEMENTATION DEFINED registers that might implement global control bits for the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps EL1 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, EL0 access to the encodings in the following reserved encoding spaces are trapped:
  - IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}, and are reported using EC syndrome value 0x18.
  - IMPLEMENTATION DEFINED System instructions, which are accessed using SYSP, with CRn == {11, 15}, and are reported using EC syndrome value 0x14.
  - IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name, and are reported using EC syndrome 0x18.
  - IMPLEMENTATION DEFINED System registers, which are accessed using MRRS and MSRR with the S3_<op1>_<Cn>_<Cm>_<op2> register name, and are reported using EC syndrome 0x14.
- In AArch32 state, MCR and MRC access to instructions with the following encodings are trapped and reported using EC syndrome value 0x03:
  - All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c10, opc1 =={0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

When this functionality is accessed from EL0:

- If FEAT_TIDCP1 is implemented and the Effective value of SCTLR_EL1.TIDCP is 1, any accesses from EL0 are trapped to EL1.
- Otherwise, if FEAT_TIDCP1 is implemented and the Effective value of SCTLR_EL2.TIDCP is 1, any accesses from EL0 are trapped to EL2.
- Otherwise:
  - If HCR_EL2.TIDCP is 1, it is IMPLEMENTATION DEFINED whether any accesses from EL0 are trapped to EL2.
  - If HCR_EL2.TIDCP is 0, any accesses from EL0 are UNDEFINED and generate an exception that is taken to EL1 or EL2.

TIDCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to or execution of the specified encodings reserved for IMPLEMENTATION DEFINED functionality are trapped to EL2, when EL2 is enabled in the current Security state.

An implementation can also include IMPLEMENTATION DEFINED registers that provide additional controls, to give finer-grained control of the trapping of IMPLEMENTATION DEFINED features.

Note

The trapping of accesses to these registers from EL1 is higher priority than an exception resulting from the register access being UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TSC, bit [19]

Trap SMC instructions. Traps EL1 execution of SMC instructions to EL2, when EL2 is enabled in the current Security state.

If execution is in AArch64 state, the trap is reported using EC syndrome value 0x17.

If execution is in AArch32 state, the trap is reported using EC syndrome value 0x13.

Note

HCR_EL2.TSC traps execution of the SMC instruction. It is not a routing control for the SMC exception. Trap exceptions and SMC exceptions have different preferred return addresses.

TSC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If EL3 is implemented, then any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state, regardless of the value of SCR_EL3.SMD. If EL3 is not implemented and the Effective value of HCR_EL2.NV is 1, then any attempt to execute an SMC instruction at EL1 using AArch64 is trapped to EL2. If EL3 is not implemented and the Effective value of HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether: • Any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state. • Any attempt to execute an SMC instruction is UNDEFINED.

In AArch32 state, the Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

SMC instructions are UNDEFINED at EL0.

If EL3 is not implemented, and the Effective value of HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether this bit is:

- RES0.
- Implemented with the functionality as described in HCR_EL2.TSC.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID3, bit [18]

Trap ID group 3. Traps EL1 reads of group 3 ID registers to EL2, when EL2 is enabled in the current Security state, as follows:

In AArch64 state:

- Reads of the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - ID_PFR0_EL1, ID_PFR1_EL1, ID_DFR0_EL1, ID_AFR0_EL1, ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, ID_ISAR5_EL1, MVFR0_EL1, MVFR1_EL1, and MVFR2_EL1.
  - ID_AA64PFR0_EL1, ID_AA64PFR1_EL1, ID_AA64DFR0_EL1, ID_AA64DFR1_EL1, ID_AA64ISAR0_EL1, ID_AA64ISAR1_EL1, ID_AA64MMFR0_EL1, ID_AA64MMFR1_EL1, ID_AA64AFR0_EL1, and ID_AA64AFR1_EL1.
  - If FEAT_FGT is implemented, reads of the following registers are trapped to EL2. If FEAT_FGT is not implemented, reads of the following registers are trapped to EL2, unless the registers are implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses are trapped to EL2.
    - ID_PFR2_EL1, ID_MMFR4_EL1 and ID_MMFR5_EL1.
    - ID_AA64MMFR3_EL1.
    - ID_AA64MMFR4_EL1.
    - ID_AA64PFR2_EL1.
    - ID_AA64MMFR2_EL1 and ID_ISAR6_EL1.

            - ID_DFR1_EL1.
            - ID_AA64ZFR0_EL1.
            - ID_AA64SMFR0_EL1.
            - ID_AA64ISAR2_EL1.
        - If FEAT_FGT is implemented, this field traps all MRS accesses to registers in the following range that are not already mentioned in this field description: op0 == 3, op1 == 0, CRn == 0, CRm == {2-7}, op2 == {0-7}. If FEAT_FGT is not implemented, it is IMPLEMENTATION DEFINED whether this field traps accesses to registers in the range.

In AArch32 state:

- VMRS access to MVFR0, MVFR1, and MVFR2, are trapped to EL2, reported using EC syndrome value `0x08`, unless access is also trapped by HCPTR which takes priority.
- MRC access to the following registers are trapped to EL2, reported using EC syndrome value `0x03`:
    - ID_PFR0, ID_PFR1, ID_PFR2, ID_DFR0, ID_AFR0, ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.
    - If FEAT_FGT is implemented:
        - ID_MMFR4 and ID_MMFR5.
        - ID_ISAR6.
        - ID_DFR1.
        - This field traps all MRC accesses to encodings in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.
    - If FEAT_FGT is not implemented:
        - ID_MMFR4 and ID_MMFR5 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4 or ID_MMFR5 are trapped.
        - ID_ISAR6 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_ISAR6 are trapped to EL2.
        - ID_DFR1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1 are trapped to EL2.
        - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps all MRC accesses to registers in the following range not already mentioned in this field description with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

TID3	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	The specified EL1 read accesses to ID group 3 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, reads of CTR_EL0, CCSIDR_EL1, CCSIDR2_EL1, CLIDR_EL1, and CSSELR_EL1 are trapped to EL2, reported using EC syndrome value `0x18`.
- If EL0 is using AArch64 and the value of SCTLR_EL1.UCT is not 0, reads of CTR_EL0 are trapped to EL2, reported using EC syndrome value `0x18`. If the value of SCTLR_EL1.UCT is 0, then EL0 reads of CTR_EL0 are trapped to EL1 and the resulting exception takes precedence over this trap.
- If EL1 is using AArch64, writes to CSSELR_EL1 are trapped to EL2, reported using EC syndrome value `0x18`.
- If EL1 is using AArch32, reads of CTR, CCSIDR, CCSIDR2, CLIDR, and CSSELR are trapped to EL2, reported using EC syndrome value `0x03`.
- If EL1 is using AArch32, writes to CSSELR are trapped to EL2, reported using EC syndrome value `0x03`.

TID2	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	The specified EL1 and EL0 accesses to ID group 2 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID1, bit [16]

Trap ID group 1. Traps EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, accesses of REVIDR_EL1, AIDR_EL1, and SMIDR_EL1, reported using EC syndrome value 0x18.
- In AArch32 state, accesses of TCMTR, TLBTR, REVIDR, and AIDR, reported using EC syndrome value 0x03.

TID1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 1 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID0, bit [15]

When FEAT_AA32 is implemented:

Trap ID group 0. Traps the following register accesses to EL2:

- EL1 reads of the JIDR, reported using EC syndrome value 0x05.
- If the JIDR is RAZ from EL0, EL0 reads of the JIDR, reported using EC syndrome value 0x05.
- EL1 accesses using VMRS of the FPSID, reported using EC syndrome value 0x08.

Note

- It is IMPLEMENTATION DEFINED whether the JIDR is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0, then any resulting exception takes precedence over this trap.
- The FPSID is not accessible at EL0 using AArch32.
- Writes to the FPSID are ignored, and not trapped by this control.

TID0	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 0 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [14]

Traps EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE or SCTLR_EL1.nTWE.

In AArch32 state, the attempted execution of a conditional WFE instruction is trapped only if the instruction passes its condition code check.

Note

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TWI, bit [13]

Traps EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value `0x01`.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

TWI	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any attempt to execute a WFI instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI or SCTLR_EL1.nTWI.

In AArch32 state, the attempted execution of a conditional WFI instruction is trapped only if the instruction passes its condition code check.

Note

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DC, bit [12]

Default Cacheability.

DC	Meaning
`0b0`	This control has no effect on the EL1&0 translation regime.
`0b1`	In any Security state: • When EL1 is using AArch64, the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of SCTLR_EL1. • When EL1 is using AArch32, the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of SCTLR. • The PE behaves as if the value of the HCR_EL2.VM field is 1 for all purposes other than returning the value of a direct read of HCR_EL2. • The memory type produced by stage 1 of the EL10 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.

This field has no effect on the EL2, EL2&0, and EL3 translation regimes.

This bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BSU, bits [11:10]

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from EL1 or EL0:

BSU	Meaning
0b00	No effect.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FB, bit [9]

Force broadcast. Causes the following Non-shareable invalidate instructions to be broadcast within the Inner Shareable domain when executed from EL1:

- In AArch32 state: BPIALL, TLBIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, ITLBIALL, ITLBIMVA, ITLBIASID, TLBIMVAA, ICIALLU, TLBIMVAL, and TLBIMVAAL.
- In AArch64 state:
  - All `TLBI` instructions that are executable at EL1 and do not specify IS or OS.
  - All `TLBIP` instructions that are executable at EL1 and do not specify IS or OS.
  - `IC IALLU`.

For more information, see 'A64 System instructions for TLB maintenance'.

FB	Meaning
0b0	The specified instructions are not affected by this control.
0b1	When one of the specified Non-shareable instructions is executed at EL1, the operation is broadcast within the Inner Shareable shareability domain.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VSE, bit [8]

Virtual SError exception.

VSE	Meaning
0b0	This mechanism is not making a virtual SError exception pending.
0b1	A virtual SError exception is pending because of this mechanism.

The virtual SError exception is enabled only when HCR_EL2.TGE is 0 and either HCR_EL2.AMO is 1 or FEAT_DoubleFault2 is implemented and the Effective value of HCRX_EL2.TMEA is 1.

When FEAT_E3DSE is implemented, virtual SError exceptions pended by this field have priority over delegated SError exceptions pended by SCR_EL3.DSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VI, bit [7]

Virtual IRQ Interrupt.

VI	Meaning
0b0	This mechanism is not making a virtual IRQ pending.
0b1	A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of HCR_EL2.{TGE, IMO} is {0, 1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VF, bit [6]

Virtual FIQ Interrupt.

VF	Meaning
0b0	This mechanism is not making a virtual FIQ pending.
0b1	A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR_EL2.{TGE, FMO} is {0, 1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AMO, bit [5]

Physical SError exception routing.

AMO	Meaning
0b0	Physical SError exceptions are unaffected by this mechanism. That is, physical SError exceptions are not taken to EL2 unless routed to EL2 by another control. Virtual SError exceptions are not enabled by this mechanism.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state, all of the following apply: • Physical SError exceptions are taken to EL2, unless they are routed to EL3. • If FEAT_E3DSE is implemented then delegated SError exceptions enabled by SCR_EL3.DSE are taken to EL2. • If HCR_EL2.TGE is 0 then virtual SError exceptions are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of HCR_EL2.AMO, physical SError exceptions target EL2 unless they are routed to EL3.
- If FEAT_E3DSE is implemented then regardless of the value of HCR_EL2.AMO, delegated SError exceptions target EL2.
- When the Effective value of HCR_EL2.E2H is not 1, the Effective value of this field is 1.
- When the Effective value of HCR_EL2.E2H is 1, the Effective value of this field is 0.

For more information, see 'Asynchronous exception routing'.

Virtual SError exceptions are disabled when the Effective value of HCR_EL2.AMO is 0 and either FEAT_DoubleFault2 is not implemented or the Effective value of HCRX_EL2.TMEA is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMO, bit [4]

Physical IRQ Routing.

IMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: • When the value of HCR_EL2.TGE is 0, Physical IRQ interrupts are not taken to EL2. • When the value of HCR_EL2.TGE is 1, Physical IRQ interrupts are taken to EL2 unless they are routed to EL3. • Virtual IRQ interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: • Physical IRQ interrupts are taken to EL2, unless they are routed to EL3. • When the value of HCR_EL2.TGE is 0, then Virtual IRQ interrupts are enabled.

If EL2 is enabled in the current Security state, and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the IMO bit, physical IRQ Interrupts target EL2 unless they are routed to EL3.
- When the Effective value of HCR_EL2.E2H is not 1, the Effective value of this field is 1.
- When the Effective value of HCR_EL2.E2H is 1, the Effective value of this field is 0.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FMO, bit [3]

Physical FIQ Routing.

FMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: • When the value of HCR_EL2.TGE is 0, Physical FIQ interrupts are not taken to EL2. • When the value of HCR_EL2.TGE is 1, Physical FIQ interrupts are taken to EL2 unless they are routed to EL3. • Virtual FIQ interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: • Physical FIQ interrupts are taken to EL2, unless they are routed to EL3. • When HCR_EL2.TGE is 0, then Virtual FIQ interrupts are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the FMO bit, physical FIQ Interrupts target EL2 unless they are routed to EL3.
- When the Effective value of HCR_EL2.E2H is not 1, the Effective value of this field is 1.
- When the Effective value of HCR_EL2.E2H is 1, the Effective value of this field is 0.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [2]

Protected Table Walk. In the EL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs, then the value of this bit determines the behavior:

PTW	Meaning
0b0	The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
0b1	The memory access generates a stage 2 Permission fault.

This bit is permitted to be cached in a TLB.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SWIO, bit [1]

Set/Way Invalidation Override. Causes EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way:

SWIO	Meaning
0b0	This control has no effect on the operation of data cache invalidate by set/way instructions.
0b1	Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When the value of this bit is 1:

AArch32: DCISW performs the same invalidation as a DCCISW instruction.

AArch64: DC ISW performs the same invalidation as a DC CISW instruction.

This bit can be implemented as RES1.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the EL1&0 translation regime, when EL2 is enabled in the current Security state.

VM	Meaning
0b0	EL1&0 stage 2 address translation disabled.
0b1	EL1&0 stage 2 address translation enabled.

When the value of this bit is 1, data cache invalidate instructions executed at EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR_EL2.SWIO bit.

This bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'1x1'} then
        X[t, 64] = NVMem[0x078];
    elsif EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    X[t, 64] = HCR_EL2;
elsif PSTATE.EL == EL3 then
    X[t, 64] = HCR_EL2;
```

```
MSR HCR_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'1x1'} then
        NVMem[0x078] = X[t, 64];
    elsif EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HCR_EL2 = X[t, 64];
elsif PSTATE.EL == EL3 then
    HCR_EL2 = X[t, 64];
```

HCRX_EL2, Extended Hypervisor Configuration Register

The HCRX_EL2 characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

Configuration

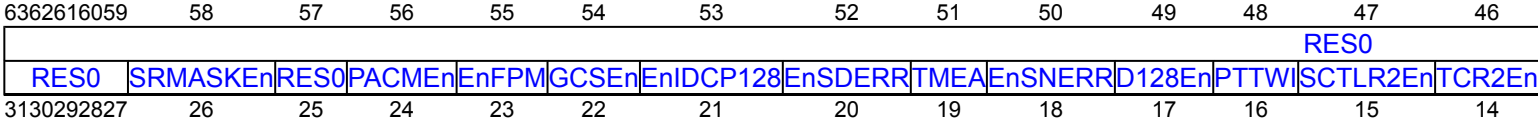
This register is present only when FEAT_HCX is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HCRX_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HCRX_EL2 is a 64-bit register.

Field descriptions



Bits [63:27]

Reserved, RES0.

SRMASKEn, bit [26]

When FEAT_SRMASK is implemented:

If EL1 is using AArch64, accesses to the following registers are trapped to EL2 and reported using EC syndrome value `0x18`:

- CPACRMASK_EL1.
- SCTLRMASK_EL1.
- SCTLR2MASK_EL1.
- TCRMASK_EL1.
- TCR2MASK_EL1.
- ACTLRMASK_EL1, if it is implemented.

SRMASKEn	Meaning
`0b0`	EL1 accesses to the specified EL1 registers are trapped to EL2. The values in the registers are treated as 0.
`0b1`	This control does not cause any instructions to be trapped.

Traps generated by this control have a lower priority than traps generated by the HFGRTR2_EL2 and HFGWTR2_EL2 controls.

When EL2 is not implemented or not enabled in the current Security state, the Effective value of this field is 1.

Otherwise, when the Effective value of SCR_EL3.HXEn is 0, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

PACMEn, bit [24]
When FEAT_PAuth_LR is implemented:

PACM Enable. Controls the effect of a PACM instruction at EL1 and EL0.

PACMEn	Meaning
0b0	The effects of PACM are disabled at EL1 and EL0, regardless of the value in any other controls.
0b1	This control does not disable the effect of PACM at EL1 and EL0.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnFPM, bit [23]
When FEAT_FPMR is implemented:

Enables direct and indirect accesses to FPMR from EL0 and EL1.

When accesses to FPMR are disabled by this control:

- Direct accesses to FPMR from EL0 and EL1 are trapped to EL2 and reported using EC syndrome value 0x18.
- Execution of FP8 data-processing instructions that indirectly access FPMR is UNDEFINED at EL0 and EL1.

EnFPM	Meaning
0b0	Direct and indirect accesses to FPMR are disabled at EL1 and EL0.
0b1	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.

- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GCSEn, bit [22]
When FEAT_GCS is implemented:

Guarded Control Stack enable. Controls Guarded Control Stack behavior at EL1 and EL0.

GCSEn	Meaning
0b0	The Guarded Control Stack is disabled at EL1 and EL0.
0b1	Guarded Control Stack behavior at EL1 and EL0 is not affected by mechanism.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [21]
When FEAT_SYSREG128 is implemented:

Enables access to IMPLEMENTATION DEFINED 128-bit System registers.

EnIDCP128	Meaning
0b0	Accesses at EL1, EL0 to IMPLEMENTATION DEFINED 128-bit System registers are trapped to EL2 using EC syndrome value 0x14, unless the access generates a higher priority exception. Disables the functionality of the 128-bit IMPLEMENTATION DEFINED System registers that are accessible at EL2.
0b1	No accesses are trapped by this control.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSDERR, bit [20]
When FEAT_ADERR is implemented:

Enable Synchronous Device Read Error. Override SCTLR2_EL1.EnADERR.

EnSDERR	Meaning
0b0	This field has no effect on External aborts on Device memory reads in the EL1&0 translation regime.
0b1	External abort on Device memory reads generate synchronous Data Abort exceptions in the EL1&0 translation regime.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 1 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Device memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, HCRX_EL2.EnSDERR is 1, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 1 might have a performance impact for Device memory reads.

This field is ignored by the PE and has an Effective value of 0 when any of the following are true:

- All of the following are true:
  - FEAT_ANERR is implemented.
  - ID_AA64MMFR3_EL1.ADERR reads as 0b0010.
  - HCRX_EL2.{EnSDERR, EnSNERR} == {1, 0}.
- The Effective value of SCR_EL3.HXEn is 0.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- EL2 is not implemented or not enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMEA, bit [19]
When FEAT_DoubleFault2 is implemented:

Trap Masked External Aborts. Controls whether a masked error exception at a lower Exception level is taken to EL2.

TMEA	Meaning
0b0	Synchronous External abort exceptions, physical SError exceptions, and delegated SError exceptions at EL1 and EL0 are unaffected by this mechanism. That is, these exceptions are not taken to EL2 unless routed to EL2 by another control. Virtual SError exceptions are not enabled by this mechanism.
0b1	When executing at Exception levels below EL2, if EL2 is enabled in the current Security state, then all of the following apply: • When PSTATE.A is 1, synchronous External abort exceptions are taken to EL2, unless they are routed to EL3. • Masked physical SError exceptions are taken to EL2, unless they are routed to EL3. • If FEAT_E3DSE is implemented, then masked delegated SError exceptions enabled by SCR_EL3.DSE are taken to EL2. • If HCR_EL2.TGE is 0, then virtual SError exceptions are enabled.

The Effective value of this field is 0 when any of the following are true:

- The Effective value of SCR_EL3.HXEn is 0.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- EL2 is not implemented or not enabled in the current Security state.

Virtual SError exceptions are disabled when the Effective value of HCR_EL2.AMO is 0 and the Effective value of HCRX_EL2.TMEA is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSNERR, bit [18]
When FEAT_ANERR is implemented:

Enable Synchronous Normal Read Error. Override SCTLR2_EL1.EnANERR.

EnSNERR	Meaning
0b0	This field has no effect on External aborts on Normal memory reads in the EL1&0 translation regime.
0b1	External abort on Normal memory reads generate synchronous Data Abort exceptions in the EL1&0 translation regime.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 1 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Normal memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, HCRX_EL2.EnSNERR is 1, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 1 might have a performance impact for Normal memory reads.

This field is ignored by the PE and has an Effective value of 0 when any of the following are true:

- All of the following are true:
  - FEAT_ADERR is implemented.
  - ID_AA64MMFR3_EL1.ANERR reads as 0b0010.
  - HCRX_EL2.{EnSDERR, EnSNERR} == {0, 1}.
- The Effective value of SCR_EL3.HXEn is 0.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- EL2 is not implemented or not enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D128En, bit [17]
When FEAT_D128 is implemented:

128-bit System Register trap control. Enable access to 128-bit System Registers that relate to VMSAv9-128 via MRRS, MSRR instructions.

If EL1 is using AArch64, accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x14:

- TTBR0_EL1.
- TTBR1_EL1.
- If FEAT_THE is implemented, RCWMASK_EL1, RCWSMASK_EL1.
- PAR_EL1.

D128En	Meaning
0b0	EL1 accesses to the specified registers are disabled, and trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

When EL2 is not implemented or not enabled in the current Security state, the Effective value of this field is 1.

Otherwise, when the Effective value of SCR_EL3.HXEn is 0, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [16]
When FEAT_THE is implemented:

Permit Translation Table Walk Incoherence.

Permits RCWS instructions to generate writes that have the Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS at EL1 and EL0 do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS at EL1 and EL0 have the Reduced Coherence property, if enabled by TCR2_EL1.PTTWI.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

This field is permitted to be cached in TLB.

This field is permitted to be implemented as a read-only field with a fixed value of 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCTLR2En, bit [15]

When FEAT_SCTLR2 is implemented:

SCTLR2_EL1 Enable. In AArch64 state, accesses to SCTLR2_EL1 are trapped to EL2 and reported using EC syndrome value 0x18.

SCTLR2En	Meaning
0b0	Accesses to SCTLR2_EL1 at EL1 are trapped to EL2, unless the access generates a higher priority exception. The value in SCTLR2_EL1 is treated as 0.
0b1	This control does not cause any instructions to be trapped.

When EL2 is not implemented or not enabled in the current Security state, the Effective value of this field is 1.

Otherwise, when the Effective value of SCR_EL3.HXEn is 0, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCR2En, bit [14]

When FEAT_TCR2 is implemented:

TCR2_EL1 Enable. In AArch64 state, accesses to TCR2_EL1 are trapped to EL2 and reported using EC syndrome value 0x18.

TCR2En	Meaning
0b0	Accesses to TCR2_EL1 at EL1 are trapped to EL2, unless the access generates a higher priority exception. The value in TCR2_EL1 is treated as 0.
0b1	This control does not cause any instructions to be trapped.

When EL2 is not implemented or not enabled in the current Security state, the Effective value of this field is 1.

Otherwise, when the Effective value of SCR_EL3.HXEn is 0, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [13:12]

Reserved, RES0.

MSCEn, bit [11]
When FEAT_MOPS is implemented:

Memory Set and Memory Copy instructions Enable. Enables execution of the CPY*, SETG*, SETP*, SETM*, and SETE* instructions at EL1 or EL0.

MSCEn	Meaning
0b0	Execution of the Memory Copy and Memory Set instructions is UNDEFINED at EL1 or EL0.
0b1	This control does not cause any instructions to be UNDEFINED.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
    - When the highest implemented Exception level is EL2, this field resets to '0'.
    - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MCE2, bit [10]
When FEAT_MOPS is implemented:

Controls Memory Copy and Memory Set exceptions generated as part of attempting to execute the Memory Copy and Memory Set instructions from EL1.

MCE2	Meaning
0b0	Memory Copy and Memory Set exceptions generated from EL1 are taken to EL1.
0b1	Memory Copy and Memory Set exceptions generated from EL1 are taken to EL2.

The Effective value of this field is 0 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
    - When the highest implemented Exception level is EL2, this field resets to '0'.
    - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [9]
When FEAT_CMOW is implemented:

Controls cache maintenance instruction permission for the following instructions executed at EL1 or EL0.

- IC IVAU and DC CIVAC.
- If FEAT_MTE is implemented, DC CIGDVAC and DC CIGVAC.
- If FEAT_PoPS is implemented, DC CIVAPS.
- If FEAT_PoPS and FEAT_MTE2 are implemented, DC CIGDVAPS.
- ICIMVAU and DCCIMVAC.

CMOW	Meaning
0b0	This control does not cause any instructions to generate a stage 2 Permission fault.
0b1	Unless the instruction generates a higher priority exception, EL1 and EL0 execution of the specified instructions without stage 2 write permission generates a stage 2 Permission fault.

For this control, stage 2 has write permission if S2AP[1] is 1 or DBM is 1 in the stage 2 descriptor. The instructions do not cause an update to the dirty state.

The Effective value of this field is 0 when any of the following are true:

- The Effective value of SCR_EL3.HXEn is 0.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- EL2 is not implemented or not enabled in the current Security state.

This field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VFNMI, bit [8]
When FEAT_NMI is implemented:

Virtual FIQ Interrupt with Superpriority. Enables signaling of virtual FIQ interrupts with Superpriority.

VFNMI	Meaning
0b0	When HCR_EL2.VF is 1, a signaled pending virtual FIQ interrupt does not have Superpriority.
0b1	When HCR_EL2.VF is 1, a signaled pending virtual FIQ interrupt has Superpriority.

When HCR_EL2.VF is 0, this field has no effect.

The Effective value of this field is 0 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL2, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VINMI, bit [7]

When FEAT_NMI is implemented:

Virtual IRQ Interrupt with Superpriority. Enables signaling of virtual IRQ interrupts with Superpriority.

VINMI	Meaning
0b0	When HCR_EL2.VI is 1, a signaled pending virtual IRQ interrupt does not have Superpriority.
0b1	When HCR_EL2.VI is 1, a signaled pending virtual IRQ interrupt has Superpriority.

When HCR_EL2.VI is 0, this field has no effect.

The Effective value of this field is 0 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TALLINT, bit [6]

When FEAT_NMI is implemented:

Traps the following writes at EL1 using AArch64 to EL2, when EL2 is implemented and enabled:

- MSR (register) writes of ALLINT.
- MSR (immediate) writes of ALLINT with a value of 1.

TALLINT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified MSR accesses at EL1 using AArch64 are trapped to EL2.

The Effective value of this field is 0 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SMPME, bit [5]

When FEAT_SME is implemented:

Streaming Mode Priority Mapping Enable.

Controls mapping of the value of SMPRI_EL1.Priority for streaming execution priority at EL0 or EL1.

SMPME	Meaning
0b0	The effective priority value is taken from SMPRI_EL1.Priority.
0b1	The effective priority value is: • When the current Exception level is EL2 or EL3, the value of SMPRI_EL1.Priority. • When the current Exception level is EL0 or EL1, the value of the SMPRIMAP_EL2 field corresponding to the value of SMPRI_EL1.Priority.

When SMIDR_EL1.SMPS is '0', this field is RES0.

The Effective value of this field is 0 when any of the following are true:

- The Effective value of SCR_EL3.HXEn is 0.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- EL2 is not implemented or not enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTnXS, bit [4]

When FEAT_XS is implemented:

Determines if the fine-grained traps in HFGITR_EL2 that apply to each of the TLBI maintenance instructions that are accessible at EL1 also apply to the corresponding TLBI maintenance instructions with the nXS qualifier.

FGTnXS	Meaning
0b0	The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 also applies to the corresponding TLBI instruction with the nXS qualifier at EL1.
0b1	The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 does not apply to the corresponding TLBI instruction with the nXS qualifier at EL1.

The Effective value of this field is 0 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnXS, bit [3]

When FEAT_XS is implemented:

Determines the behavior of TLBI instructions affected by the XS attribute.

This control field also determines whether an AArch64 DSB instruction behaves as a DSB instruction with an nXS qualifier when executed at EL0 and EL1.

FnXS	Meaning
0b0	This control does not have any effect on the behavior of the TLBI maintenance instructions.
0b1	A TLBI maintenance instruction without the nXS qualifier executed at EL1 behaves in the same way as the corresponding TLBI maintenance instruction with the nXS qualifier. An AArch64 DSB instruction that applies to both loads and stores executed at EL1 or EL0 behaves in the same way as the corresponding DSB instruction with the nXS qualifier executed at EL1 or EL0.

The Effective value of this field is 0 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of SCR_EL3.HXEn is 0.

This field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [2]

When FEAT_LS64_V is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps execution of an ST64BV instruction at EL0 or EL1 to EL2.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnASR. Execution of an ST64BV instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000000.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [1]
When FEAT_LS64 is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 or EL1 to EL2.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnALS. Execution of an LD64B or ST64B instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000002.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
    - When the highest implemented Exception level is EL2, this field resets to '0'.
    - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [0]
When FEAT_LS64_ACCDATA is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps execution of an ST64BV0 instruction at EL0 or EL1 to EL2.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnAS0. Execution of an ST64BV0 instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000001.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
    - When the highest implemented Exception level is EL2, this field resets to '0'.
    - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HCRX_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HCRX_EL2

HDBSSBR_EL2, Hardware Dirty State Tracking Structure Base Register

The HDBSSBR_EL2 characteristics are:

Purpose

Control register for HDBSS base address.

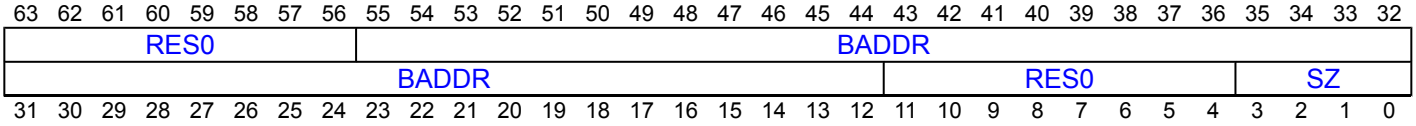
Configuration

This register is present only when FEAT_HDBSS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HDBSSBR_EL2 are UNDEFINED.

Attributes

HDBSSBR_EL2 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

BADDR, bits [55:12]

HDBSS base address, bits [55:12].

- Bits [55:12] of the base address are the value of this field.
- Bits [11:0] of the base address are 0.

Bits of this field above the implemented physical address size, indicated in ID_AA64MMFR0_EL1.PARange, are RES0.

Based on the value of the SZ field of this register, for encodings of the SZ field greater than 4KB, bits [(SZ+12-1):12] of this field are RES0 such that the base address of the HDBSS is aligned to its size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:4]

Reserved, RES0.

SZ, bits [3:0]

Size of the HDBSS.

SZ	Meaning
0b0000	4KB
0b0001	8KB
0b0010	16KB
0b0011	32KB
0b0100	64KB
0b0101	128KB
0b0110	256KB
0b0111	512KB
0b1000	1MB
0b1001	2MB

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HDBSSBR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDBSSBR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0011	0b010

HDBSSPROD_EL2, Hardware Dirty State Tracking Structure Producer Register

The HDBSSPROD_EL2 characteristics are:

Purpose

Allows producer to update write index for HDBSS.

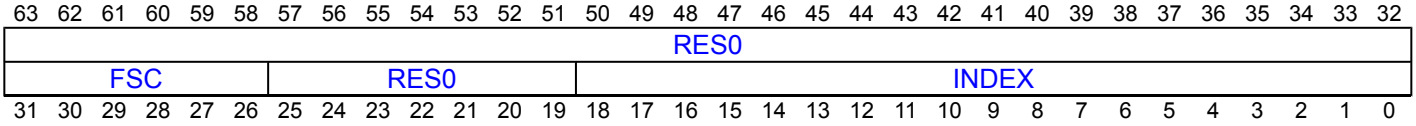
Configuration

This register is present only when FEAT_HDBSS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HDBSSPROD_EL2 are UNDEFINED.

Attributes

HDBSSPROD_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

FSC, bits [31:26]

Fault Status Code.

FSC	Meaning	Applies when
0b000000	The PE has not experienced any error on writes to the HDBSS.	
0b010000	External Abort on write to HDBSS.	
0b101000	Granule Protection Fault on write to HDBSS.	When FEAT_RME is implemented

If this field is non-zero then one or more HDBSS writes have experienced a fault since this field was last set to zero, and the associated HDBSS entries have been lost.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:19]

Reserved, RES0.

INDEX, bits [18:0]

This field indicates the index of the HDBSS entry that will be written to next.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HDBSSPROD_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HDBSSPROD_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0011	0b011

HDFGRTR2_EL2, Hypervisor Debug Fine-Grained Read Trap Register 2

The HDFGRTR2_EL2 characteristics are:

Purpose

Provides controls for traps of `MRS` and `MRC` reads of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

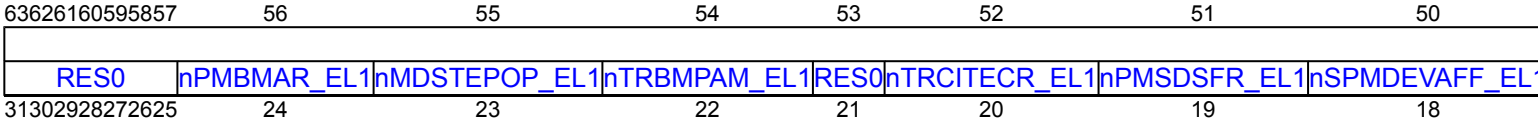
This register is present only when FEAT_FGT2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HDFGRTR2_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HDFGRTR2_EL2 is a 64-bit register.

Field descriptions



Bits [63:25]

Reserved, RES0.

nPMBMAR_EL1, bit [24]

When FEAT_SPE_nVM is implemented:

Trap `MRS` reads of PMBMAR_EL1 at EL1 using AArch64 to EL2.

nPMBMAR_EL1	Meaning
`0b0`	If EL2 is implemented and enabled in the current Security state, then `MRS` reads of PMBMAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`, unless the read generates a higher priority exception.
`0b1`	`MRS` reads of PMBMAR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nMDSTEPOP_EL1, bit [23]

When FEAT_STEP2 is implemented:

Trap MRS reads of MDSTEPOP_EL1 at EL1 using AArch64 to EL2.

nMDSTEPOP_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of MDSTEPOP_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of MDSTEPOP_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTRBMPAM_EL1, bit [22]

When FEAT_TRBE_MPAM is implemented:

Trap MRS reads of TRBMPAM_EL1 at EL1 using AArch64 to EL2.

nTRBMPAM_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TRBMPAM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TRBMPAM_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

nTRCITECR_EL1, bit [20]

When FEAT_ITE is implemented:

Trap MRS reads of TRCITECR_EL1 at EL1 using AArch64 to EL2.

nTRCITECR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TRCITECR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TRCITECR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSDSFR_EL1, bit [19]

When FEAT_SPE_FDS is implemented:

Trap MRS reads of PMSDSFR_EL1 at EL1 using AArch64 to EL2.

nPMSDSFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of PMSDSFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMSDSFR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMDEVAFF_EL1, bit [18]

When FEAT_SPMU is implemented:

Trap MRS reads of SPMDEVAFF_EL1 at EL1 using AArch64 to EL2.

nSPMDEVAFF_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SPMDEVAFF_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMDEVAFF_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMID, bit [17]

When FEAT_SPMU is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMCFGR_EL1.
- SPMCGCR<n>_EL1.
- SPMDEVARCH_EL1.
- SPMIIDR_EL1.

nSPMID	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMSCR_EL1, bit [16]

When FEAT_SPMU is implemented:

Trap MRS reads of SPMSCR_EL1 at EL1 using AArch64 to EL2.

nSPMSCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SPMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMSCR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMACCESSR_EL1, bit [15]

When FEAT_SPMU is implemented:

Trap MRS reads of SPMACCESSR_EL1 at EL1 using AArch64 to EL2.

nSPMACCESSR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SPMACCESSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMACCESSR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMCR_EL0, bit [14]

When FEAT_SPMU is implemented:

Trap MRS reads of SPMCR_EL0 at EL1 and EL0 using AArch64 to EL2.

nSPMCR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads of SPMCR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMCR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMOVS, bit [13]

When FEAT_SPMU is implemented:

Trap MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMOVSCLR_EL0.
- SPMOVSSET_EL0.

nSPMOVS	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMINTEN, bit [12]

When FEAT_SPMU is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMINTENCLR_EL1.
- SPMINTENSET_EL1.

nSPMINTEN	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMCNTEN, bit [11]

When FEAT_SPMU is implemented:

Trap MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMCNTENCLR_EL0.
- SPMCNTENSET_EL0.

nSPMCNTEN	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMSELR_EL0, bit [10]

When FEAT_SPMU is implemented:

Trap MRS reads of SPMSELR_EL0 at EL1 and EL0 using AArch64 to EL2.

nSPMSELR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads of SPMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMSELR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMEVTYPERn_EL0, bit [9]
When FEAT_SPMU is implemented:

Trap MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMEVTYPER<n>_EL0.
- SPMEVFILTR<n>_EL0.
- SPMEVFILT2R<n>_EL0.

nSPMEVTYPERn_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMEVCNTRn_EL0, bit [8]
When FEAT_SPMU is implemented:

Trap MRS reads of SPMEVCNTR<n>_EL0 at EL1 and EL0 using AArch64 to EL2.

nSPMEVCNTRn_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads of SPMEVCNTR<n>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMEVCNTR<n>_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSSCR_EL1, bit [7]
When FEAT_PMUv3_SS is implemented:

Trap MRS reads of PMSSCR_EL1 at EL1 using AArch64 to EL2.

nPMSSCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of PMSSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMSSCR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSSDATA, bit [6]
When FEAT_PMUv3_SS is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- PMCCNTSVR_EL1.
- PMEVCNTSVR<n>_EL1.
- PMICNTSVR_EL1, if FEAT_PMUv3_ICNTR is implemented.

nPMSSDATA	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nMDSELR_EL1, bit [5]

When FEAT_Debugv8p9 is implemented:

Trap MRS reads of MDSELR_EL1 at EL1 using AArch64 to EL2.

nMDSELR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of MDSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of MDSELR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMUACR_EL1, bit [4]

When FEAT_PMUv3p9 is implemented:

Trap MRS reads of PMUACR_EL1 at EL1 using AArch64 to EL2.

nPMUACR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of PMUACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMUACR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMICFILTR_EL0, bit [3]

When FEAT_PMUv3_ICNTR is implemented:

Trap MRS reads of PMICFILTR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPMICFILTR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then: • MRS reads of PMICFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception. • PMCNTENCLR_EL0.F0, PMCNTENSET_EL0.F0, PMOVSCLR_EL0.F0, and PMOVSSET_EL0.F0 read as zero at EL1 and EL0. • PMINTENCLR_EL1.F0 and PMINTENSET_EL1.F0 read as zero at EL1.
0b1	MRS reads of PMICFILTR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMICNTR_EL0, bit [2]

When FEAT_PMUv3_ICNTR is implemented:

Trap MRS reads of PMICNTR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPMICNTR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads of PMICNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMICNTR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMIAR_EL1, bit [1]

When FEAT_SEBEP is implemented:

Trap MRS reads of PMIAR_EL1 at EL1 using AArch64 to EL2.

nPMIAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of PMIAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMIAR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMECR_EL1, bit [0]

When FEAT_EBEP is implemented or FEAT_PMUv3_SS is implemented:

Trap MRS reads of PMECR_EL1 at EL1 using AArch64 to EL2.

nPMECR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of PMECR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMECR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HDFGRTR2_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDFGRTR2_EL2

HDFGRTR_EL2, Hypervisor Debug Fine-Grained Read Trap Register

The HDFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRS and MRC reads of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

This register is present only when FEAT_FGT is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HDFGRTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HDFGRTR_EL2 is a 64-bit register.

PMBIDR_EL1, bit [63]

When FEAT_SPE is implemented:

Trap MRS reads of PMBIDR_EL1 at EL1 using AArch64 to EL2.

PMBIDR_EL1	Meaning
0b0	MRS reads of PMBIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSNEVFR_EL1, bit [62]

When FEAT_SPE_FnE is implemented:

Trap MRS reads of PMSNEVFR_EL1 at EL1 using AArch64 to EL2.

nPMSNEVFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSNEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMSNEVFR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBDATA, bit [61]

When FEAT_BRBE is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- BRBINF<n>_EL1.
- BRBINFINJ_EL1.
- BRBSRC<n>_EL1.
- BRBSRCINJ_EL1.
- BRBTGT<n>_EL1.
- BRBTGTINJ_EL1.
- BRBTS_EL1.

nBRBDATA	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBCTL, bit [60]

When FEAT_BRBE is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- BRBCR_EL1.
- BRBFCR_EL1.

nBRBCTL	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBIDR, bit [59]
When FEAT_BRBE is implemented:

Trap MRS reads of BRBIDR0_EL1 at EL1 using AArch64 to EL2.

nBRBIDR	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of BRBIDR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of BRBIDR0_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCEIDn_EL0, bit [58]
When FEAT_PMUv3 is implemented:

Trap MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCEIDn_EL0	Meaning
0b0	MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMCEID<n> at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMUSERENR_EL0, bit [57]

When FEAT_PMUv3 is implemented:

Trap MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMUSERENR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMUSERENR_EL0	Meaning
0b0	MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMUSERENR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMUSERENR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBTRG_EL1, bit [56]

When FEAT_TRBE is implemented:

Trap MRS reads of TRBTRG_EL1 at EL1 using AArch64 to EL2.

TRBTRG_EL1	Meaning
0b0	MRS reads of TRBTRG_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBTRG_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBSR_EL1, bit [55]
When FEAT_TRBE is implemented:

Trap MRS reads of TRBSR_EL1 at EL1 using AArch64 to EL2.

TRBSR_EL1	Meaning
0b0	MRS reads of TRBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBPTR_EL1, bit [54]
When FEAT_TRBE is implemented:

Trap MRS reads of TRBPTR_EL1 at EL1 using AArch64 to EL2.

TRBPTR_EL1	Meaning
0b0	MRS reads of TRBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBMAR_EL1, bit [53]
When FEAT_TRBE is implemented:

Trap MRS reads of TRBMAR_EL1 at EL1 using AArch64 to EL2.

TRBMAR_EL1	Meaning
0b0	MRS reads of TRBMAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBMAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBLIMITR_EL1, bit [52]

When FEAT_TRBE is implemented:

Trap MRS reads of TRBLIMITR_EL1 at EL1 using AArch64 to EL2.

TRBLIMITR_EL1	Meaning
0b0	MRS reads of TRBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBIDR_EL1, bit [51]

When FEAT_TRBE is implemented:

Trap MRS reads of TRBIDR_EL1 at EL1 using AArch64 to EL2.

TRBIDR_EL1	Meaning
0b0	MRS reads of TRBIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBBASER_EL1, bit [50]

When FEAT_TRBE is implemented:

Trap MRS reads of TRBBASER_EL1 at EL1 using AArch64 to EL2.

TRBBASER_EL1	Meaning
0b0	MRS reads of TRBBASER_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBBASER_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [49]

Reserved, RES0.

TRCVICTLR, bit [48]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCVICTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCVICTLR at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MRS reads of TRCVICTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCVICTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCSTATR, bit [47]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCSTATR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCSTATR at EL1 using AArch64 to EL2.

TRCSTATR	Meaning
0b0	MRS reads of TRCSTATR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSTATR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCSSCSRn, bit [46]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSSCSR<n> are implemented, and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCSSCSR<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCSSCSR<n> at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MRS reads of TRCSSCSR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSSCSR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Single-shot Comparator n is not implementented, a read of TRCSSCSR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCSEQSTR, bit [45]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSEQSTR is implemented, and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCSEQSTR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCSEQSTR at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MRS reads of TRCSEQSTR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCPRGCTLR, bit [44]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCPRGCTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCPRGCTLR at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
0b0	MRS reads of TRCPRGCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCOSLSR, bit [43]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCOSLSR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCOSLSR at EL1 using AArch64 to EL2.

TRCOSLSR	Meaning
0b0	MRS reads of TRCOSLSR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCOSLSR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TRCIMSPECn, bit [41]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCIMSPEC<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCIMSPEC<n> at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MRS reads of TRCIMSPEC<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCIMSPEC<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If TRCIMSPEC<n> is not implemented, a read of TRCIMSPEC<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCID, bit [40]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- In an Armv9 implementation:
  - TRCDEVARCH.
  - TRCDEVID.
  - All of the TRCIDR<n> registers.
- In an Armv8 implementation:
  - ETM TRCDEVARCH.
  - ETM TRCDEVID.
  - All of the ETM TRCIDR<n> registers.

TRCID	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

TRCCNTVRn, bit [37]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCCNTVR<n> are implemented, and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCCNTVR<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCCNTVR<n> at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MRS reads of TRCCNTVR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCCNTVR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Counter n is not implemented, a read of TRCCNTVR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCCLAIM, bit [36]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- In an Armv9 implementation: TRCCLAIMCLR and TRCCLAIMSET.
- In an Armv8 implementation: ETM TRCCLAIMCLR and ETM TRCCLAIMSET.

TRCCLAIM	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCAUXCTLR, bit [35]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCAUXCTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCAUXCTLR at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MRS reads of TRCAUXCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCAUXCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCAUTHSTATUS, bit [34]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCAUTHSTATUS at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCAUTHSTATUS at EL1 using AArch64 to EL2.

TRCAUTHSTATUS	Meaning
0b0	MRS reads of TRCAUTHSTATUS are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCAUTHSTATUS at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRC, bit [33]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- In an Armv9 implementation:
  - TRCACATR<n>.
  - TRCACVR<n>.
  - TRCBBCTLR.
  - TRCCCCTLR.
  - TRCCIDCCTLR0.
  - TRCCIDCCTLR1.
  - TRCCIDCVR<n>.
  - TRCCNTCTLR<n>.
  - TRCCNTRLDVR<n>.
  - TRCCONFIGR.
  - TRCEVENTCTL0R.
  - TRCEVENTCTL1R.
  - TRCEXTINSELR<n>.
  - TRCQCTLR.
  - TRCRSCTLR<n>.
  - TRCRSR.
  - TRCSEQEVR<n>.
  - TRCSEQRSTEVR.
  - TRCSSCCR<n>.
  - TRCSSPCICR<n>.
  - TRCSTALLCTLR.
  - TRCSYNCPR.
  - TRCTRACEIDR.
  - TRCTSCTLR.
  - TRCVIIECTLR.
  - TRCVIPCSSCTLR.
  - TRCVISSCTLR.
  - TRCVMIDCCTLR0.
  - TRCVMIDCCTLR1.
  - TRCVMIDCVR<n>.
- In an Armv8 implementation:
  - ETM TRCACATR<n>.
  - ETM TRCACVR<n>.
  - ETM TRCBBCTLR.
  - ETM TRCCCCTLR.
  - ETM TRCCIDCCTLR0.
  - ETM TRCCIDCCTLR1.
  - ETM TRCCIDCVR<n>.
  - ETM TRCCNTCTLR<n>.
  - ETM TRCCNTRLDVR<n>.
  - ETM TRCCONFIGR.
  - ETM TRCEVENTCTL0R.
  - ETM TRCEVENTCTL1R.
  - ETM TRCEXTINSELR.
  - ETM TRCQCTLR.
  - ETM TRCRSCTLR<n>.
  - ETM TRCSEQEVR<n>.

- ETM TRCSEQRSTEVR.
- ETM TRCSSCCR<n>.
- ETM TRCSSPCICR<n>.
- ETM TRCSTALLCTLR.
- ETM TRCSYNCPR.
- ETM TRCTRACEIDR.
- ETM TRCTSCTLR.
- ETM TRCVIIECTLR.
- ETM TRCVIPCSSCTLR.
- ETM TRCVISSCTLR.
- ETM TRCVMIDCCTLR0.
- ETM TRCVMIDCCTLR1.
- ETM TRCVMIDCVR<n>.

TRC	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

A read of an unimplemented register is UNDEFINED.

TRCEXTINSELR<n> and TRCRSR are implemented only if FEAT_ETE is implemented.

TRCEXTINSELR is implemented only if FEAT_ETE is not implemented and FEAT_ETMv4 is implemented.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSLATFR_EL1, bit [32]

When FEAT_SPE is implemented:

Trap MRS reads of PMSLATFR_EL1 at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MRS reads of PMSLATFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSLATFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSIRR_EL1, bit [31]

When FEAT_SPE is implemented:

Trap MRS reads of PMSIRR_EL1 at EL1 using AArch64 to EL2.

PMSIRR_EL1	Meaning
0b0	MRS reads of PMSIRR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSIRR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSIDR_EL1, bit [30]

When FEAT_SPE is implemented:

Trap MRS reads of PMSIDR_EL1 at EL1 using AArch64 to EL2.

PMSIDR_EL1	Meaning
0b0	MRS reads of PMSIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSICR_EL1, bit [29]

When FEAT_SPE is implemented:

Trap MRS reads of PMSICR_EL1 at EL1 using AArch64 to EL2.

PMSICR_EL1	Meaning
0b0	MRS reads of PMSICR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSICR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSFCR_EL1, bit [28]
When FEAT_SPE is implemented:

Trap MRS reads of PMSFCR_EL1 at EL1 using AArch64 to EL2.

PMSFCR_EL1	Meaning
0b0	MRS reads of PMSFCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSEVFR_EL1, bit [27]
When FEAT_SPE is implemented:

Trap MRS reads of PMSEVFR_EL1 at EL1 using AArch64 to EL2.

PMSEVFR_EL1	Meaning
0b0	MRS reads of PMSEVFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSCR_EL1, bit [26]
When FEAT_SPE is implemented:

Trap MRS reads of PMSCR_EL1 at EL1 using AArch64 to EL2.

PMSCR_EL1	Meaning
0b0	MRS reads of PMSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMBSR_EL1, bit [25]

When FEAT_SPE is implemented:

Trap MRS reads of PMBSR_EL1 at EL1 using AArch64 to EL2.

PMBSR_EL1	Meaning
0b0	MRS reads of PMBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMBPTR_EL1, bit [24]

When FEAT_SPE is implemented:

Trap MRS reads of PMBPTR_EL1 at EL1 using AArch64 to EL2.

PMBPTR_EL1	Meaning
0b0	MRS reads of PMBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMBLIMITR_EL1, bit [23]
When FEAT_SPE is implemented:

Trap MRS reads of PMBLIMITR_EL1 at EL1 using AArch64 to EL2.

PMBLIMITR_EL1	Meaning
0b0	MRS reads of PMBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMMIR_EL1, bit [22]
When FEAT_PMUv3 is implemented:

Trap MRS reads of PMMIR_EL1 at EL1 using AArch64 to EL2.

PMMIR_EL1	Meaning
0b0	MRS reads of PMMIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMMIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [21:20]

Reserved, RES0.

PMSELR_EL0, bit [19]

When FEAT_PMUv3 is implemented:

Trap MRS reads of PMSELR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMSELR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSELR_EL0	Meaning
0b0	MRS reads of PMSELR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMSELR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of PMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMSELR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMOVS, bit [18]

When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMOVSCLR_EL0 and PMOVSSET_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMOVSR and PMOVSSET.

PMOVS	Meaning
0b0	MRS reads at EL1 and EL0 using AArch64 and MRC reads at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMINTEN, bit [17]

When FEAT_PMUv3 is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- PMINTENCLR_EL1.
- PMINTENSET_EL1.

PMINTEN	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCNTEN, bit [16]

When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMCNTENCLR_EL0 and PMCNTENSET_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMCNTENCLR and PMCNTENSET.

PMCNTEN	Meaning
0b0	MRS reads at EL1 and EL0 using AArch64 and MRC reads at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCCNTR_EL0, bit [15]

When FEAT_PMUv3 is implemented:

Trap MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MRC and MRRC reads of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MRC and MRRC reads of PMCCNTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03. • MRRC reads of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x04.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCCFILTR_EL0, bit [14]

When FEAT_PMUv3 is implemented:

Trap MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCFILTR_EL0	Meaning
0b0	MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCCFILTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

PMCCFILTR_EL0 can also be accessed in AArch64 state using PMXEVTYPER_EL0 when PMSELR_EL0.SEL == 31, and PMCCFILTR can also be accessed in AArch32 state using PMXEVTYPER when PMSELR.SEL == 31.

Setting this field to 1 has no effect on accesses to PMXEVTYPER_EL0 and PMXEVTYPER, regardless of the value of PMSELR_EL0.SEL or PMSELR.SEL.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEVTYPERn_EL0, bit [13]
When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMEVTYPER<n> and PMXEVTYPER.

PMEVTYPERn_EL0	Meaning
0b0	MRS reads at EL1 and EL0 using AArch64 and MRC reads at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of PMEVTYPER<n>_EL0, or, if n is not 31, a read of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n.
  - In AArch32 state, a read of PMEVTYPER<n>, or, if n is not 31, a read of PMXEVTYPER when PMSELR.SEL == n.
- If event counter n is implemented, n is greater-than-or-equal-to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a read of PMEVTYPER<n>_EL0, or a read of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value 0x18.
  - In AArch32 state, a read of PMEVTYPER<n>, or a read of PMXEVTYPER when PMSELR.SEL == n, reported with EC syndrome value 0x03.

See also HDFGRTR_EL2.PMCCFILTR_EL0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEVCNTRn_EL0, bit [12]
When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMEVCNTR<n> and PMXEVCNTR.

PMEVCNTRn_EL0	Meaning
0b0	MRS reads at EL1 and EL0 using AArch64 and MRC reads at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of PMEVCNTR<n>_EL0, or a read of PMXEVCNTR_EL0 when PMSELR_EL0.SEL is n.
  - In AArch32 state, a read of PMEVCNTR<n>, or a read of PMXEVCNTR when PMSELR.SEL is n.
- If event counter n is implemented, n is greater than or equal to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a read of PMEVCNTR<n>_EL0, or a read of PMXEVCNTR_EL0 when PMSELR_EL0.SEL is n, reported with EC syndrome value 0x18.
  - In AArch32 state, a read of PMEVCNTR<n>, or a read of PMXEVCNTR when PMSELR.SEL is n, reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OSDLR_EL1, bit [11]

When FEAT_DoubleLock is implemented:

Trap MRS reads of OSDLR_EL1 at EL1 using AArch64 to EL2.

OSDLR_EL1	Meaning
0b0	MRS reads of OSDLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSDLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OSECCR_EL1, bit [10]

Trap MRS reads of OSECCR_EL1 at EL1 using AArch64 to EL2.

OSECCR_EL1	Meaning
0b0	MRS reads of OSECCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSECCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

OSLSR_EL1, bit [9]

Trap MRS reads of OSLSR_EL1 at EL1 using AArch64 to EL2.

OSLSR_EL1	Meaning
0b0	MRS reads of OSLSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSLSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

DBGPRCR_EL1, bit [7]

Trap MRS reads of DBGPRCR_EL1 at EL1 using AArch64 to EL2.

DBGPRCR_EL1	Meaning
0b0	MRS reads of DBGPRCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGPRCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGAUTHSTATUS_EL1, bit [6]

Trap MRS reads of DBGAUTHSTATUS_EL1 at EL1 using AArch64 to EL2.

DBGAUTHSTATUS_EL1	Meaning
0b0	MRS reads of DBGAUTHSTATUS_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGAUTHSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGCLAIM, bit [5]

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- DBGCLAIMCLR_EL1.
- DBGCLAIMSET_EL1.

DBGCLAIM	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

MDSCR_EL1, bit [4]

Trap MRS reads of MDSCR_EL1 at EL1 using AArch64 to EL2.

MDSCR_EL1	Meaning
0b0	MRS reads of MDSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MDSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGWVRn_EL1, bit [3]

Trap MRS reads of DBGWVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWVRn_EL1	Meaning
0b0	MRS reads of DBGWVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGWVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of DBGWVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGWCRn_EL1, bit [2]

Trap MRS reads of DBGWCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MRS reads of DBGWCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGWCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of DBGWCR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGBVRn_EL1, bit [1]

Trap MRS reads of DBGBVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBVRn_EL1	Meaning
0b0	MRS reads of DBGBVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGBVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of DBGBVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGBCRn_EL1, bit [0]

Trap MRS reads of DBGBCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBCRn_EL1	Meaning
0b0	MRS reads of DBGBCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGBCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of DBGBCR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HDFGRTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDFGRTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b100

```
if !(IsFeatureImplemented(FEAT_FGT) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'1x1'} then
        X[t, 64] = NVMem[0x1D0];

HDFGWTR2_EL2, Hypervisor Debug Fine-Grained Write Trap Register 2

The HDFGWTR2_EL2 characteristics are:

Purpose

Provides controls for traps of MSR and MCR writes of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

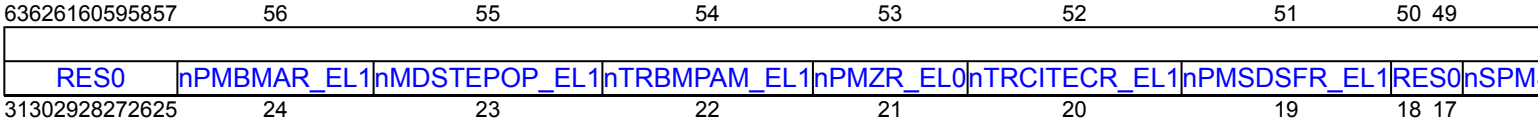
This register is present only when FEAT_FGT2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HDFGWTR2_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HDFGWTR2_EL2 is a 64-bit register.

Field descriptions



Bits [63:25]

Reserved, RES0.

nPMBMAR_EL1, bit [24]

When FEAT_SPE_nVM is implemented:

Trap MSR writes of PMBMAR_EL1 at EL1 using AArch64 to EL2.

nPMBMAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PMBMAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMBMAR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nMDSTEPOP_EL1, bit [23]
When FEAT_STEP2 is implemented:

Trap MSR writes of MDSTEPOP_EL1 at EL1 using AArch64 to EL2.

nMDSTEPOP_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of MDSTEPOP_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of MDSTEPOP_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTRBMPAM_EL1, bit [22]
When FEAT_TRBE_MPAM is implemented:

Trap MSR writes of TRBMPAM_EL1 at EL1 using AArch64 to EL2.

nTRBMPAM_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TRBMPAM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TRBMPAM_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMZR_EL0, bit [21]

When FEAT_PMUv3p9 is implemented:

Trap MSR writes of PMZR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPMZR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes of PMZR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMZR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTRCITECR_EL1, bit [20]

When FEAT_ITE is implemented:

Trap MSR writes of TRCITECR_EL1 at EL1 using AArch64 to EL2.

nTRCITECR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TRCITECR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TRCITECR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSDSFR_EL1, bit [19]

When FEAT_SPE_FDS is implemented:

Trap MSR writes of PMSDSFR_EL1 at EL1 using AArch64 to EL2.

nPMSDSFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PMSDSFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMSDSFR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [18:17]

Reserved, RES0.

nSPMSCR_EL1, bit [16]

When FEAT_SPMU is implemented:

Trap MSR writes of SPMSCR_EL1 at EL1 using AArch64 to EL2.

nSPMSCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of SPMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SPMSCR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMACCESSR_EL1, bit [15]

When FEAT_SPMU is implemented:

Trap MSR writes of SPMACCESSR_EL1 at EL1 using AArch64 to EL2.

nSPMACCESSR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of SPMACCESSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SPMACCESSR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMCR_EL0, bit [14]

When FEAT_SPMU is implemented:

Trap MSR writes of SPMCR_EL0 at EL1 and EL0 using AArch64 to EL2.

nSPMCR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes of SPMCR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SPMCR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMOVS, bit [13]

When FEAT_SPMU is implemented:

Trap MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMOVSCLR_EL0.
- SPMOVSSET_EL0.

nSPMOVS	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMINTEN, bit [12]

When FEAT_SPMU is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMINTENCLR_EL1.
- SPMINTENSET_EL1.

nSPMINTEN	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMCNTEN, bit [11]

When FEAT_SPMU is implemented:

Trap MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMCNTENCLR_EL0.
- SPMCNTENSET_EL0.

nSPMCNTEN	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMSELR_EL0, bit [10]

When FEAT_SPMU is implemented:

Trap MSR writes of SPMSELR_EL0 at EL1 and EL0 using AArch64 to EL2.

nSPMSELR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes of SPMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SPMSELR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMEVTYPERn_EL0, bit [9]

When FEAT_SPMU is implemented:

Trap MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMEVTYPER<n>_EL0.
- SPMEVFILTR<n>_EL0.
- SPMEVFILT2R<n>_EL0.

nSPMEVTYPERn_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMEVCNTRn_EL0, bit [8]
When FEAT_SPMU is implemented:

Trap MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMEVCNTR<n>_EL0.
- SPMZR_EL0.

nSPMEVCNTRn_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSSCR_EL1, bit [7]
When FEAT_PMUv3_SS is implemented:

Trap MSR writes of PMSSCR_EL1 at EL1 using AArch64 to EL2.

nPMSSCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PMSSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMSSCR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [6]

Reserved, RES0.

nMDSELR_EL1, bit [5]

When FEAT_Debugv8p9 is implemented:

Trap MSR writes of MDSELR_EL1 at EL1 using AArch64 to EL2.

nMDSELR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of MDSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of MDSELR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMUACR_EL1, bit [4]

When FEAT_PMUv3p9 is implemented:

Trap MSR writes of PMUACR_EL1 at EL1 using AArch64 to EL2.

nPMUACR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PMUACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMUACR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMICFILTR_EL0, bit [3]

When FEAT_PMUv3_ICNTR is implemented:

Trap MSR writes of PMICFILTR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPMICFILTR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then: • MSR writes of PMICFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception. • PMCNTENCLR_EL0.F0, PMCNTENSET_EL0.F0, PMOVSCLR_EL0.F0, and PMOVSSET_EL0.F0 ignore writes at EL1 and EL0. • PMINTENCLR_EL1.F0 and PMINTENSET_EL1.F0 ignore writes at EL1.
0b1	MSR writes of PMICFILTR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMICNTR_EL0, bit [2]

When FEAT_PMUv3_ICNTR is implemented:

Trap MSR writes of PMICNTR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPMICNTR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then: • MSR writes of PMICNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception. • PMZR_EL0.F0 ignores writes at EL1 and EL0.
0b1	MSR writes of PMICNTR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMIAR_EL1, bit [1]
When FEAT_SEBEP is implemented:

Trap MSR writes of PMIAR_EL1 at EL1 using AArch64 to EL2.

nPMIAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PMIAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMIAR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMECR_EL1, bit [0]
When FEAT_EBEP is implemented or FEAT_PMUv3_SS is implemented:

Trap MSR writes of PMECR_EL1 at EL1 using AArch64 to EL2.

nPMECR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PMECR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMECR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HDFGWTR2_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDFGWTR2_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b001

```
if !(IsFeatureImplemented(FEAT_FGT2) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'1x1'} then
        X[t, 64] = NVMem[0x1B0];
    elsif EffectiveHCR_EL2_NVx() IN {'xx1'} then

HDFGWTR_EL2, Hypervisor Debug Fine-Grained Write Trap Register

The HDFGWTR_EL2 characteristics are:

Purpose

Provides controls for traps of MSR and MCR writes of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

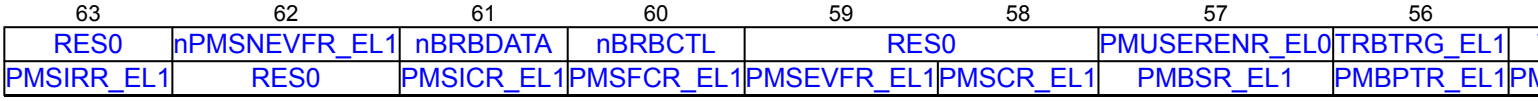
This register is present only when FEAT_FGT is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HDFGWTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HDFGWTR_EL2 is a 64-bit register.

Field descriptions



Bit [63]

Reserved, RES0.

nPMSNEVFR_EL1, bit [62]

When FEAT_SPE_FnE is implemented:

Trap MSR writes of PMSNEVFR_EL1 at EL1 using AArch64 to EL2.

nPMSNEVFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSNEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMSNEVFR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBDATA, bit [61]

When FEAT_BRBE is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- BRBINFINJ_EL1.
- BRBSRCINJ_EL1.
- BRBTGTINJ_EL1.
- BRBTS_EL1.

nBRBDATA	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBCTL, bit [60]

When FEAT_BRBE is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- BRBCR_EL1.
- BRBFCR_EL1.

nBRBCTL	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [59:58]

Reserved, RES0.

PMUSERENR_EL0, bit [57]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMUSERENR_EL0 at EL1 using AArch64 to EL2.

PMUSERENR_EL0	Meaning
0b0	MSR writes of PMUSERENR_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMUSERENR_EL0 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBTRG_EL1, bit [56]

When FEAT_TRBE is implemented:

Trap MSR writes of TRBTRG_EL1 at EL1 using AArch64 to EL2.

TRBTRG_EL1	Meaning
0b0	MSR writes of TRBTRG_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBTRG_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBSR_EL1, bit [55]

When FEAT_TRBE is implemented:

Trap MSR writes of TRBSR_EL1 at EL1 using AArch64 to EL2.

TRBSR_EL1	Meaning
0b0	MSR writes of TRBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBPTR_EL1, bit [54]
When FEAT_TRBE is implemented:

Trap MSR writes of TRBPTR_EL1 at EL1 using AArch64 to EL2.

TRBPTR_EL1	Meaning
0b0	MSR writes of TRBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBMAR_EL1, bit [53]
When FEAT_TRBE is implemented:

Trap MSR writes of TRBMAR_EL1 at EL1 using AArch64 to EL2.

TRBMAR_EL1	Meaning
0b0	MSR writes of TRBMAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBMAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBLIMITR_EL1, bit [52]
When FEAT_TRBE is implemented:

Trap MSR writes of TRBLIMITR_EL1 at EL1 using AArch64 to EL2.

TRBLIMITR_EL1	Meaning
0b0	MSR writes of TRBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [51]

Reserved, RES0.

TRBBASER_EL1, bit [50]

When FEAT_TRBE is implemented:

Trap MSR writes of TRBBASER_EL1 at EL1 using AArch64 to EL2.

TRBBASER_EL1	Meaning
0b0	MSR writes of TRBBASER_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBBASER_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRFCR_EL1, bit [49]

When FEAT_TRF is implemented:

Trap MSR writes of TRFCR_EL1 at EL1 using AArch64 to EL2.

TRFCR_EL1	Meaning
0b0	MSR writes of TRFCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCVICTLR, bit [48]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCVICTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCVICTLR at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MSR writes of TRCVICTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCVICTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [47]

Reserved, RES0.

TRCSSCSRn, bit [46]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSSCSR<n> are implemented, and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCSSCSR<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCSSCSR<n> at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MSR writes of TRCSSCSR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCSSCSR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Single-shot Comparator n is not implementented, a write of TRCSSCSR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCSEQSTR, bit [45]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSEQSTR is implemented, and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCSEQSTR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCSEQSTR at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MSR writes of TRCSEQSTR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCPRGCTLR, bit [44]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCPRGCTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCPRGCTLR at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
0b0	MSR writes of TRCPRGCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [43]

Reserved, RES0.

TRCOSLAR, bit [42]

When FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented:

In an Armv8 implementation, trap MSR writes of ETM TRCOSLAR at EL1 using AArch64 to EL2.

TRCOSLAR	Meaning
0b0	MSR writes of ETM TRCOSLAR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ETM TRCOSLAR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCIMSPECn, bit [41]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCIMSPEC<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCIMSPEC<n> at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MSR writes of TRCIMSPEC<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCIMSPEC<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If TRCIMSPEC<n> is not implemented, a write of TRCIMSPEC<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [40:38]

Reserved, RES0.

TRCCNTVRn, bit [37]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCCNTVR<n> are implemented, and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCCNTVR<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCCNTVR<n> at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MSR writes of TRCCNTVR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCCNTVR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Counter n is not implemented, a write of TRCCNTVR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCCLAIM, bit [36]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- In an Armv9 implementation: TRCCLAIMCLR and TRCCLAIMSET.
- In an Armv8 implementation: ETM TRCCLAIMCLR and ETM TRCCLAIMSET.

TRCCLAIM	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCAUXCTLR, bit [35]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCAUXCTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCAUXCTLR at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MSR writes of TRCAUXCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCAUXCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [34]

Reserved, RES0.

TRC, bit [33]

When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- In an Armv9 implementation:
  - TRCACATR<n>.
  - TRCACVR<n>.
  - TRCBBCTLR.
  - TRCCCCTLR.
  - TRCCIDCCTLR0.
  - TRCCIDCCTLR1.
  - TRCCIDCVR<n>.
  - TRCCNTCTLR<n>.
  - TRCCNTRLDVR<n>.
  - TRCCONFIGR.
  - TRCEVENTCTL0R.
  - TRCEVENTCTL1R.
  - TRCEXTINSELR<n>.
  - TRCQCTLR.
  - TRCRSCTLR<n>.
  - TRCRSR.
  - TRCSEQEVR<n>.
  - TRCSEQRSTEVR.
  - TRCSSCCR<n>.
  - TRCSSPCICR<n>.
  - TRCSTALLCTLR.
  - TRCSYNCPR.
  - TRCTRACEIDR.
  - TRCTSCTLR.
  - TRCVIIECTLR.
  - TRCVIPCSSCTLR.
  - TRCVISSCTLR.
  - TRCVMIDCCTLR0.
  - TRCVMIDCCTLR1.
  - TRCVMIDCVR<n>.
- In an Armv8 implementation:
  - ETM TRCACATR<n>.
  - ETM TRCACVR<n>.

- ETM TRCBBCTLR.
- ETM TRCCCCTLR.
- ETM TRCCIDCCTLR0.
- ETM TRCCIDCCTLR1.
- ETM TRCCIDCVR<n>.
- ETM TRCCNTCTLR<n>.
- ETM TRCCNTRLDVR<n>.
- ETM TRCCONFIGR.
- ETM TRCEVENTCTL0R.
- ETM TRCEVENTCTL1R.
- ETM TRCEXTINSELR.
- ETM TRCQCTLR.
- ETM TRCRSCTLR<n>.
- ETM TRCSEQEVR<n>.
- ETM TRCSEQRSTEVR.
- ETM TRCSSCCR<n>.
- ETM TRCSSPCICR<n>.
- ETM TRCSTALLCTLR.
- ETM TRCSYNCPR.
- ETM TRCTRACEIDR.
- ETM TRCTSCTLR.
- ETM TRCVIIECTLR.
- ETM TRCVIPCSSCTLR.
- ETM TRCVISSCTLR.
- ETM TRCVMIDCCTLR0.
- ETM TRCVMIDCCTLR1.
- ETM TRCVMIDCVR<n>.

TRC	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

A write of an unimplemented register is UNDEFINED.

TRCEXTINSELR<n> and TRCRSR are implemented only if FEAT_ETE is implemented.

TRCEXTINSELR is implemented only if FEAT_ETE is not implemented and FEAT_ETMv4 is implemented.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSLATFR_EL1, bit [32]
When FEAT_SPE is implemented:

Trap MSR writes of PMSLATFR_EL1 at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MSR writes of PMSLATFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSLATFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSIRR_EL1, bit [31]

When FEAT_SPE is implemented:

Trap `MSR` writes of PMSIRR_EL1 at EL1 using AArch64 to EL2.

PMSIRR_EL1	Meaning
`0b0`	`MSR` writes of PMSIRR_EL1 are not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then `MSR` writes of PMSIRR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [30]

Reserved, RES0.

PMSICR_EL1, bit [29]

When FEAT_SPE is implemented:

Trap `MSR` writes of PMSICR_EL1 at EL1 using AArch64 to EL2.

PMSICR_EL1	Meaning
`0b0`	`MSR` writes of PMSICR_EL1 are not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then `MSR` writes of PMSICR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSFCR_EL1, bit [28]

When FEAT_SPE is implemented:

Trap MSR writes of PMSFCR_EL1 at EL1 using AArch64 to EL2.

PMSFCR_EL1	Meaning
0b0	MSR writes of PMSFCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSEVFR_EL1, bit [27]

When FEAT_SPE is implemented:

Trap MSR writes of PMSEVFR_EL1 at EL1 using AArch64 to EL2.

PMSEVFR_EL1	Meaning
0b0	MSR writes of PMSEVFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSCR_EL1, bit [26]

When FEAT_SPE is implemented:

Trap MSR writes of PMSCR_EL1 at EL1 using AArch64 to EL2.

PMSCR_EL1	Meaning
0b0	MSR writes of PMSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMBSR_EL1, bit [25]

When FEAT_SPE is implemented:

Trap MSR writes of PMBSR_EL1 at EL1 using AArch64 to EL2.

PMBSR_EL1	Meaning
0b0	MSR writes of PMBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMBPTR_EL1, bit [24]

When FEAT_SPE is implemented:

Trap MSR writes of PMBPTR_EL1 at EL1 using AArch64 to EL2.

PMBPTR_EL1	Meaning
0b0	MSR writes of PMBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMBLIMITR_EL1, bit [23]

When FEAT_SPE is implemented:

Trap MSR writes of PMBLIMITR_EL1 at EL1 using AArch64 to EL2.

PMBLIMITR_EL1	Meaning
0b0	MSR writes of PMBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

PMCR_EL0, bit [21]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMCR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCR_EL0	Meaning
0b0	MSR writes of PMCR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of PMCR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMCR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSWINC_EL0, bit [20]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSWINC at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSWINC_EL0	Meaning
0b0	MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSWINC at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMSWINC at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSELR_EL0, bit [19]
When FEAT_PMUv3 is implemented:

Trap MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSELR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSELR_EL0	Meaning
0b0	MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSELR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMSELR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMOVS, bit [18]
When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMOVSCLR_EL0 and PMOVSSET_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMOVSR and PMOVSSET.

PMOVS	Meaning
0b0	MSR writes at EL1 and EL0 using AArch64 and MCR writes at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMINTEN, bit [17]
When FEAT_PMUv3 is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- PMINTENCLR_EL1.
- PMINTENSET_EL1.

PMINTEN	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCNTEN, bit [16]
When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMCNTENCLR_EL0 and PMCNTENSET_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMCNTENCLR and PMCNTENSET.

PMCNTEN	Meaning
0b0	MSR writes at EL1 and EL0 using AArch64 and MCR writes at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCCNTR_EL0, bit [15]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MCR and MCRR writes of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MCR and MCRR writes of PMCCNTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03. • MCRR writes of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x04.

PMCCNTR_EL0 can also be indirectly set to zero by a write of 1 to PMCR_EL0.C or PMZR_EL0.C in AArch64 state, or a write of 1 to PMCR.C in AArch32 state. Setting this field to 1 has no effect on indirect writes to PMCCNTR_EL0 using PMCR_EL0, PMZR_EL0, or PMCR.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCCFILTR_EL0, bit [14]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCFILTR_EL0	Meaning
0b0	MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCCFILTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

PMCCFILTR_EL0 can also be accessed in AArch64 state using PMXEVTYPER_EL0 when PMSELR_EL0.SEL == 31, and PMCCFILTR can also be accessed in AArch32 state using PMXEVTYPER when PMSELR.SEL == 31.

Setting this field to 1 has no effect on accesses to PMXEVTYPER_EL0 and PMXEVTYPER, regardless of the value of PMSELR_EL0.SEL or PMSELR.SEL.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEVTYPERn_EL0, bit [13]

When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMEVTYPER<n> and PMXEVTYPER.

PMEVTYPERn_EL0	Meaning
0b0	MSR writes at EL1 and EL0 using AArch64 and MCR writes at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a write of PMEVTYPER<n>_EL0, or, if n is not 31, a write of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n.

        - In AArch32 state, a write of PMEVTYPER<n>, or, if n is not 31, a write of PMXEVTYPER when PMSELR.SEL == n.
    - If event counter n is implemented, n is greater-than-or-equal-to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
        - In AArch64 state, a write of PMEVTYPER<n>_EL0, or a write of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value 0x18.
        - In AArch32 state, a write of PMEVTYPER<n>, or a write of PMXEVTYPER when PMSELR.SEL == n, reported with EC syndrome value 0x03.

See also HDFGWTR_EL2.PMCCFILTR_EL0.

The reset behavior of this field is:

- On a Warm reset:
    - When the highest implemented Exception level is EL2, this field resets to '0'.
    - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEVCNTRn_EL0, bit [12]
When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMEVCNTR<n> and PMXEVCNTR.

PMEVCNTRn_EL0	Meaning
0b0	MSR writes at EL1 and EL0 using AArch64 and MCR writes at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
    - In AArch64 state, a write of PMEVCNTR<n>_EL0, or a write of PMXEVCNTR_EL0 when PMSELR_EL0.SEL is n.
    - In AArch32 state, a write of PMEVCNTR<n>, or a write of PMXEVCNTR when PMSELR.SEL is n.
- If event counter n is implemented, n is greater than or equal to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
    - In AArch64 state, a write of PMEVCNTR<n>_EL0, or a write of PMXEVCNTR_EL0 when PMSELR_EL0.SEL is n, reported with EC syndrome value 0x18.
    - In AArch32 state, a write of PMEVCNTR<n>, or a write of PMXEVCNTR when PMSELR.SEL is n, reported with EC syndrome value 0x03.

For values of n less than MDCR_EL2.HPMN, PMEVCNTR<n>_EL0 can also be indirectly set to zero by a write of 1 to PMCR_EL0.P or PMZR_EL0.P<n> in AArch64 state, or a write of 1 to PMCR.P in AArch32 state. Setting this field to 1 has no effect on indirect writes to PMEVCNTR<n>_EL0 using PMCR_EL0, PMZR_EL0, or PMCR.

The reset behavior of this field is:

- On a Warm reset:
    - When the highest implemented Exception level is EL2, this field resets to '0'.
    - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OSDLR_EL1, bit [11]

When FEAT_DoubleLock is implemented:

Trap MSR writes of OSDLR_EL1 at EL1 using AArch64 to EL2.

OSDLR_EL1	Meaning
0b0	MSR writes of OSDLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of OSDLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OSECCR_EL1, bit [10]

Trap MSR writes of OSECCR_EL1 at EL1 using AArch64 to EL2.

OSECCR_EL1	Meaning
0b0	MSR writes of OSECCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of OSECCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

OSLAR_EL1, bit [8]

Trap MSR writes of OSLAR_EL1 at EL1 using AArch64 to EL2.

OSLAR_EL1	Meaning
0b0	MSR writes of OSLAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of OSLAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGPRCR_EL1, bit [7]

Trap MSR writes of DBGPRCR_EL1 at EL1 using AArch64 to EL2.

DBGPRCR_EL1	Meaning
0b0	MSR writes of DBGPRCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGPRCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

DBGCLAIM, bit [5]

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- DBGCLAIMCLR_EL1.
- DBGCLAIMSET_EL1.

DBGCLAIM	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

MDSCR_EL1, bit [4]

Trap MSR writes of MDSCR_EL1 at EL1 using AArch64 to EL2.

MDSCR_EL1	Meaning
0b0	MSR writes of MDSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MDSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

- Otherwise, this field resets to an architecturally UNKNOWN value.

DBGWVRn_EL1, bit [3]

Trap MSR writes of DBGWVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWVRn_EL1	Meaning
0b0	MSR writes of DBGWVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGWVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of DBGWVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGWCRn_EL1, bit [2]

Trap MSR writes of DBGWCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MSR writes of DBGWCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGWCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of DBGWCR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGBVRn_EL1, bit [1]

Trap MSR writes of DBGBVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBVRn_EL1	Meaning
0b0	MSR writes of DBGBVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGBVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of DBGBVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGBCRn_EL1, bit [0]

Trap MSR writes of DBGBCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBCRn_EL1	Meaning
0b0	MSR writes of DBGBCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGBCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of DBGBCR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HDFGWTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HDFGWTR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b101

HFGITR2_EL2, Hypervisor Fine-Grained Instruction Trap Register 2

The HFGITR2_EL2 characteristics are:

Purpose

Provides instruction trap controls.

Configuration

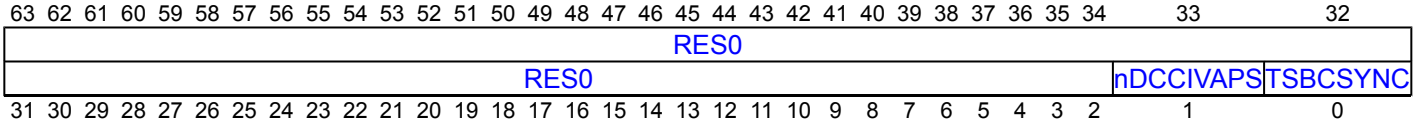
This register is present only when FEAT_FGT2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HFGITR2_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HFGITR2_EL2 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

nDCCIVAPS, bit [1]

When FEAT_PoPS is implemented:

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- DC CIVAPS.
- DC CIGDVAPS, if FEAT_MTE2 is implemented.

If the Point of Physical Storage is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

nDCCIVAPS	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of the specified instructions is not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL2, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSBCSYNC, bit [0]
When FEAT_TRBEv1p1 is implemented:

Trap execution of TSB CSYNC at EL1 and EL0 using AArch64 to EL2.

TSBCSYNC	Meaning
0b0	Execution of TSB CSYNC is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then execution of TSB CSYNC at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x0A, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HFGITR_EL2, Hypervisor Fine-Grained Instruction Trap Register

The HFGITR_EL2 characteristics are:

Purpose

Provides instruction trap controls.

Configuration

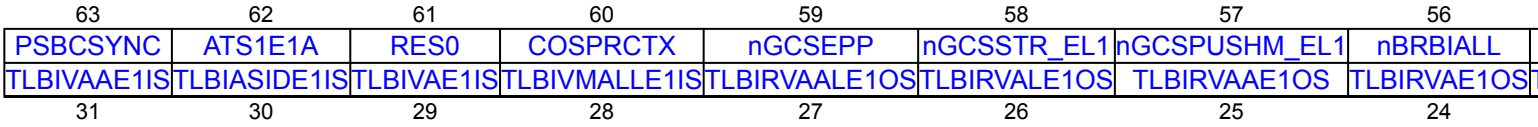
This register is present only when FEAT_FGT is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HFGITR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HFGITR_EL2 is a 64-bit register.

Field descriptions



PSBCSYNC, bit [63]

When FEAT_SPEv1p5 is implemented:

Trap execution of PSB CSYNC at EL1 and EL0 using AArch64 to EL2.

PSBCSYNC	Meaning
0b0	Execution of PSB CSYNC is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of PSB CSYNC at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x0A, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATS1E1A, bit [62]

When FEAT_ATS1A is implemented:

Trap execution of AT S1E1A at EL1 using AArch64 to EL2.

ATS1E1A	Meaning
0b0	Execution of AT S1E1A is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1A at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [61]

Reserved, RES0.

COSPRCTX, bit [60]

When FEAT_SPECRES2 is implemented:

Trap execution of COSP RCTX at EL1 and EL0 using AArch64 and execution of COSPRCTX at EL0 using AArch32 when EL1 is using AArch64 to EL2.

COSPRCTX	Meaning
0b0	Execution of COSP RCTX at EL1 and EL0 using AArch64 and execution of COSPRCTX at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the instruction generates a higher priority exception: • Execution of COSP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. • Execution of COSPRCTX at EL0 using AArch32 when EL1 is using AArch64 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCSEPP, bit [59]

When FEAT_GCS is implemented:

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- GCSPUSHX.
- GCSPOPCX.

nGCSEPP	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of the specified instructions is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCSSTR_EL1, bit [58]

When FEAT_GCS is implemented:

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- GCSSTR.
- GCSSTTR when PSTATE.UAO is 1.
- GCSSTTR when the Effective value of HCR_EL2.{NV, NV1} is {1, 1}.

nGCSSTR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the specified instructions generates a GCS exception with EC syndrome value 0x2D, unless the instruction generates a higher priority exception.
0b1	Execution of the specified instructions is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCSPUSHM_EL1, bit [57]

When FEAT_GCS is implemented:

Trap execution of GCSPUSHM at EL1 using AArch64 to EL2.

nGCSPUSHM_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of GCSPUSHM at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of GCSPUSHM is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBIALL, bit [56]

When FEAT_BRBE is implemented:

Trap execution of BRB IALL at EL1 using AArch64 to EL2.

nBRBIALL	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of BRB IALL at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of BRB IALL is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBINJ, bit [55]

When FEAT_BRBE is implemented:

Trap execution of BRB INJ at EL1 using AArch64 to EL2.

nBRBINJ	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of BRB INJ at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of BRB INJ is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DCCVAC, bit [54]

Trap execution of any of the following AArch64 instructions at EL1 and EL0 to EL2:

- DC CVAC.
- DC CGVAC, if FEAT_MTE is implemented.
- DC CGDVAC, if FEAT_MTE is implemented.

- DC CVAOC, if FEAT_OCCMO is implemented.
- DC CGDVAOC, if FEAT_OCCMO is implemented.

DCCVAC	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution at EL1 and EL0 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SVC_EL1, bit [53]

Trap execution of SVC at EL1 using AArch64 to EL2.

SVC_EL1	Meaning
0b0	Execution of SVC is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of SVC at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SVC_EL0, bit [52]

Trap execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 when EL1 is using AArch64 to EL2.

SVC_EL0	Meaning
0b0	Execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the instruction generates a higher priority exception: • Execution of SVC at EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15. • Execution of SVC at EL0 using AArch32 when EL1 is using AArch64 is trapped to EL2 and reported with EC syndrome value 0x11.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ERET, bit [51]

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- ERET.
- ERETAA, if FEAT_PAuth is implemented.
- ERETAB, if FEAT_PAuth is implemented.

ERET	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x1A, unless the instruction generates a higher priority exception.

If EL2 is implemented and enabled in the current Security state, HCR_EL2.API == 0, and this field enables a fine-grained trap on the instruction, then execution at EL1 using AArch64 of ERETAA or ERETAB instructions is trapped to EL2 and reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the trap enabled by HCR_EL2.API == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CPPRCTX, bit [50]

When FEAT_SPECRES is implemented:

Trap execution of CPP RCTX at EL1 and EL0 using AArch64 and execution of CPPRCTX at EL0 using AArch32 when EL1 is using AArch64 to EL2.

CPPRCTX	Meaning
0b0	Execution of CPP RCTX at EL1 and EL0 using AArch64 and execution of CPPRCTX at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the instruction generates a higher priority exception: • Execution of CPP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. • Execution of CPPRCTX at EL0 using AArch32 when EL1 is using AArch64 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DVPRCTX, bit [49]

When FEAT_SPECRES is implemented:

Trap execution of DVP RCTX at EL1 and EL0 using AArch64 and execution of DVPRCTX at EL0 using AArch32 when EL1 is using AArch64 to EL2.

DVPRCTX	Meaning
0b0	Execution of DVP RCTX at EL1 and EL0 using AArch64 and execution of DVPRCTX at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the instruction generates a higher priority exception: • Execution of DVP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. • Execution of DVPRCTX at EL0 using AArch32 when EL1 is using AArch64 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CFPRCTX, bit [48]

When FEAT_SPECRES is implemented:

Trap execution of CFP RCTX at EL1 and EL0 using AArch64 and execution of CFPRCTX at EL0 using AArch32 when EL1 is using AArch64 to EL2.

CFPRCTX	Meaning
0b0	Execution of CFP RCTX at EL1 and EL0 using AArch64 and execution of CFPRCTX at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the instruction generates a higher priority exception: • Execution of CFP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. • Execution of CFPRCTX at EL0 using AArch32 when EL1 is using AArch64 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVAALE1, bit [47]

Trap execution of TLBI VAALE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAALE1NXS.

TLBIVAALE1	Meaning
0b0	Execution of TLBI VAALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVALE1, bit [46]

Trap execution of TLBI VALE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VALE1NXS.

TLBIVALE1	Meaning
0b0	Execution of TLBI VALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVAAE1, bit [45]

Trap execution of TLBI VAAE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAAE1NXS.

TLBIVAAE1	Meaning
0b0	Execution of TLBI VAAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIASIDE1, bit [44]

Trap execution of TLBI ASIDE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI ASIDE1NXS.

TLBIASIDE1	Meaning
0b0	Execution of TLBI ASIDE1 is not trapped by this mechanism.
