0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVAE1, bit [43]

Trap execution of TLBI VAE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAE1NXS.

TLBIVAE1	Meaning
0b0	Execution of TLBI VAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVMALLE1, bit [42]

Trap execution of TLBI VMALLE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VMALLE1NXS.

TLBIVMALLE1	Meaning
0b0	Execution of TLBI VMALLE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VMALLE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIRVAALE1, bit [41]

When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAALE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAALE1NXS.

TLBIRVAALE1	Meaning
0b0	Execution of TLBI RVAALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVALE1, bit [40]

When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVALE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVALE1NXS.

TLBIRVALE1	Meaning
0b0	Execution of TLBI RVALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAAE1, bit [39]

When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAAE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAAE1NXS.

TLBIRVAAE1	Meaning
0b0	Execution of TLBI RVAAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAE1, bit [38]

When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1NXS.

TLBIRVAE1	Meaning
0b0	Execution of TLBI RVAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAALE1IS, bit [37]

When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAALE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAALE1ISNXS.

TLBIRVAALE1IS	Meaning
0b0	Execution of TLBI RVAALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVALE1IS, bit [36]

When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVALE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVALE1ISNXS.

TLBIRVALE1IS	Meaning
0b0	Execution of TLBI RVALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAAE1IS, bit [35]

When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAAE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAAE1ISNXS.

TLBIRVAAE1IS	Meaning
0b0	Execution of TLBI RVAAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAE1IS, bit [34]

When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1ISNXS.

TLBIRVAE1IS	Meaning
0b0	Execution of TLBI RVAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVAALE1IS, bit [33]

Trap execution of TLBI VAALE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAALE1ISNXS.

TLBIVAALE1IS	Meaning
0b0	Execution of TLBI VAALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVALE1IS, bit [32]

Trap execution of TLBI VALE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VALE1ISNXS.

TLBIVALE1IS	Meaning
0b0	Execution of TLBI VALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVAAE1IS, bit [31]

Trap execution of TLBI VAAE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAAE1ISNXS.

TLBIVAAE1IS	Meaning
0b0	Execution of TLBI VAAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIASIDE1IS, bit [30]

Trap execution of TLBI ASIDE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI ASIDE1ISNXS.

TLBIASIDE1IS	Meaning
0b0	Execution of TLBI ASIDE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVAE1IS, bit [29]

Trap execution of TLBI VAE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAE1ISNXS.

TLBIVAE1IS	Meaning
0b0	Execution of TLBI VAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVMALLE1IS, bit [28]

Trap execution of TLBI VMALLE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VMALLE1ISNXS.

TLBIVMALLE1IS	Meaning
0b0	Execution of TLBI VMALLE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VMALLE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIRVAALE1OS, bit [27]

When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVAALE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAALE1OSNXS.

TLBIRVAALE1OS	Meaning
0b0	Execution of TLBI RVAALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVALE1OS, bit [26]

When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVALE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVALE1OSNXS.

TLBIRVALE1OS	Meaning
0b0	Execution of TLBI RVALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAAE1OS, bit [25]
When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVAAE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAAE1OSNXS.

TLBIRVAAE1OS	Meaning
0b0	Execution of TLBI RVAAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAE1OS, bit [24]
When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVAE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1OSNXS.

TLBIRVAE1OS	Meaning
0b0	Execution of TLBI RVAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVAALE1OS, bit [23]
When FEAT_TLBIOS is implemented:

Trap execution of TLBI VAALE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAALE1OSNXS.

TLBIVAALE1OS	Meaning
0b0	Execution of TLBI VAALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVALE1OS, bit [22]

When FEAT_TLBIOS is implemented:

Trap execution of TLBI VALE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VALE1OSNXS.

TLBIVALE1OS	Meaning
0b0	Execution of TLBI VALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVAAE1OS, bit [21]

When FEAT_TLBIOS is implemented:

Trap execution of TLBI VAAE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAAE1OSNXS.

TLBIVAAE1OS	Meaning
0b0	Execution of TLBI VAAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIASIDE1OS, bit [20]

When FEAT_TLBIOS is implemented:

Trap execution of TLBI ASIDE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI ASIDE1OSNXS.

TLBIASIDE1OS	Meaning
0b0	Execution of TLBI ASIDE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVAE1OS, bit [19]

When FEAT_TLBIOS is implemented:

Trap execution of TLBI VAE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAE1OSNXS.

TLBIVAE1OS	Meaning
0b0	Execution of TLBI VAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVMALLE1OS, bit [18]

When FEAT_TLBIOS is implemented:

Trap execution of TLBI VMALLE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VMALLE1OSNXS.

TLBIVMALLE1OS	Meaning
0b0	Execution of TLBI VMALLE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VMALLE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATS1E1WP, bit [17]

When FEAT_PAN2 is implemented:

Trap execution of AT S1E1WP at EL1 using AArch64 to EL2.

ATS1E1WP	Meaning
0b0	Execution of AT S1E1WP is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1WP at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATS1E1RP, bit [16]

When FEAT_PAN2 is implemented:

Trap execution of AT S1E1RP at EL1 using AArch64 to EL2.

ATS1E1RP	Meaning
0b0	Execution of AT S1E1RP is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1RP at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATS1E0W, bit [15]

Trap execution of AT S1E0W at EL1 using AArch64 to EL2.

ATS1E0W	Meaning
0b0	Execution of AT S1E0W is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E0W at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ATS1E0R, bit [14]

Trap execution of AT S1E0R at EL1 using AArch64 to EL2.

ATS1E0R	Meaning
0b0	Execution of AT S1E0R is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E0R at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ATS1E1W, bit [13]

Trap execution of AT S1E1W at EL1 using AArch64 to EL2.

ATS1E1W	Meaning
0b0	Execution of AT S1E1W is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1W at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ATS1E1R, bit [12]

Trap execution of AT S1E1R at EL1 using AArch64 to EL2.

ATS1E1R	Meaning
0b0	Execution of AT S1E1R is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1R at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCZVA, bit [11]

Trap execution of any of the following AArch64 instructions at EL1 and EL0 to EL2:

- DC ZVA.
- DC GVA, if FEAT_MTE is implemented.
- DC GZVA, if FEAT_MTE is implemented.

Note

Unlike HCR_EL2.TDZ, this field has no effect on DCZID_EL0.DZP.

DCZVA	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCCIVAC, bit [10]

Trap execution of any of the following AArch64 instructions at EL1 and EL0 to EL2:

- DC CIVAC.
- DC CIGVAC, if FEAT_MTE is implemented.
- DC CIGDVAC, if FEAT_MTE is implemented.
- DC CIVAOC, if FEAT_OCCMO is implemented.
- DC CIGDVAOC, if FEAT_OCCMO is implemented.

DCCIVAC	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution at EL1 and EL0 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL2, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

DCCVADP, bit [9]

When FEAT_DPB2 is implemented:

Trap execution of any of the following AArch64 instructions at EL1 and EL0 to EL2:

- DC CVADP.
- DC CGVADP, if FEAT_MTE is implemented.
- DC CGDVADP, if FEAT_MTE is implemented.

DCCVADP	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution at EL1 and EL0 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DCCVAP, bit [8]

Trap execution of any of the following AArch64 instructions at EL1 and EL0 to EL2:

- DC CVAP.
- DC CGVAP, if FEAT_MTE is implemented.
- DC CGDVAP, if FEAT_MTE is implemented.

DCCVAP	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution at EL1 and EL0 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCCVAU, bit [7]

Trap execution of DC CVAU at EL1 and EL0 using AArch64 to EL2.

DCCVAU	Meaning
0b0	Execution of DC CVAU is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution of DC CVAU at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCCISW, bit [6]

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- DC CISW.
- DC CIGSW, if FEAT_MTE2 is implemented.
- DC CIGDSW, if FEAT_MTE2 is implemented.

DCCISW	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCCSW, bit [5]

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- DC CSW.
- DC CGSW, if FEAT_MTE2 is implemented.
- DC CGDSW, if FEAT_MTE2 is implemented.

DCCSW	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCISW, bit [4]

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- DC ISW.
- DC IGSW, if FEAT_MTE2 is implemented.
- DC IGDSW, if FEAT_MTE2 is implemented.

DCISW	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCIVAC, bit [3]

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- DC IVAC.
- DC IGVAC, if FEAT_MTE2 is implemented.
- DC IGDVAC, if FEAT_MTE2 is implemented.

DCIVAC	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ICIVAU, bit [2]

Trap execution of IC IVAU at EL1 and EL0 using AArch64 to EL2.

ICIVAU	Meaning
0b0	Execution of IC IVAU is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution of IC IVAU at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ICIALLU, bit [1]

Trap execution of IC IALLU at EL1 using AArch64 to EL2.

ICIALLU	Meaning
0b0	Execution of IC IALLU is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution of IC IALLU at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ICIALLUIS, bit [0]

Trap execution of IC IALLUIS at EL1 using AArch64 to EL2.

ICIALLUIS	Meaning
0b0	Execution of IC IALLUIS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution of IC IALLUIS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HFGITR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HFGITR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b110

```
if !(IsFeatureImplemented(FEAT_FGT) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'1x1'} then

HFGRTR2_EL2, Hypervisor Fine-Grained Read Trap Register 2

The HFGRTR2_EL2 characteristics are:

Purpose

Provides controls for traps of `MRRS`, `MRS` and `MRC` reads of System registers.

Configuration

This register is present only when FEAT_FGT2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HFGRTR2_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HFGRTR2_EL2 is a 64-bit register.

Field descriptions

RES0																					

Bits [63:15]

Reserved, RES0.

nACTLRALIAS_EL1, bit [14]

When FEAT_SRMASK is implemented:

Trap `MRS` reads of ACTLRALIAS_EL1 at EL1 using AArch64 to EL2.

nACTLRALIAS_EL1	Meaning
`0b0`	If EL2 is implemented and enabled in the current Security state, then `MRS` reads of ACTLRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`, unless the read generates a higher priority exception.
`0b1`	`MRS` reads of ACTLRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nACTLRMASK_EL1, bit [13]
When FEAT_SRMASK is implemented:

Trap MRS reads of ACTLRMASK_EL1 at EL1 using AArch64 to EL2.

nACTLRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of ACTLRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of ACTLRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCR2ALIAS_EL1, bit [12]
When FEAT_SRMASK is implemented:

Trap MRS reads of TCR2ALIAS_EL1 at EL1 using AArch64 to EL2.

nTCR2ALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TCR2ALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TCR2ALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCRALIAS_EL1, bit [11]

When FEAT_SRMASK is implemented:

Trap MRS reads of TCRALIAS_EL1 at EL1 using AArch64 to EL2.

nTCRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TCRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TCRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLRALIAS2_EL1, bit [10]

When FEAT_SRMASK is implemented:

Trap MRS reads of SCTLRALIAS2_EL1 at EL1 using AArch64 to EL2.

nSCTLRALIAS2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SCTLRALIAS2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SCTLRALIAS2_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLRALIAS_EL1, bit [9]

When FEAT_SRMASK is implemented:

Trap MRS reads of SCTLRALIAS_EL1 at EL1 using AArch64 to EL2.

nSCTLRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SCTLRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SCTLRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nCPACRALIAS_EL1, bit [8]

When FEAT_SRMASK is implemented:

Trap MRS reads of CPACRALIAS_EL1 at EL1 using AArch64 to EL2.

nCPACRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of CPACRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of CPACRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCR2MASK_EL1, bit [7]

When FEAT_SRMASK is implemented:

Trap MRS reads of TCR2MASK_EL1 at EL1 using AArch64 to EL2.

nTCR2MASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TCR2MASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TCR2MASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCRMASK_EL1, bit [6]

When FEAT_SRMASK is implemented:

Trap MRS reads of TCRMASK_EL1 at EL1 using AArch64 to EL2.

nTCRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TCRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TCRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLR2MASK_EL1, bit [5]

When FEAT_SRMASK is implemented:

Trap MRS reads of SCTLR2MASK_EL1 at EL1 using AArch64 to EL2.

nSCTLR2MASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SCTLR2MASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SCTLR2MASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLRMASK_EL1, bit [4]

When FEAT_SRMASK is implemented:

Trap MRS reads of SCTLRMASK_EL1 at EL1 using AArch64 to EL2.

nSCTLRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SCTLRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SCTLRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nCPACRMASK_EL1, bit [3]

When FEAT_SRMASK is implemented:

Trap MRS reads of CPACRMASK_EL1 at EL1 using AArch64 to EL2.

nCPACRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of CPACRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of CPACRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nRCWSMASK_EL1, bit [2]
When FEAT_THE is implemented:

Trap MRS or MRRS reads of RCWSMASK_EL1 at EL1 using AArch64 to EL2.

nRCWSMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then unless the read generates a higher priority exception: • MRS reads of RCWSMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRRS reads of RCWSMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.
0b1	MRS and MRRS reads of RCWSMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nERXGSR_EL1, bit [1]
When FEAT_RASv2 is implemented:

Trap MRS reads of ERXGSR_EL1 at EL1 using AArch64 to EL2.

nERXGSR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of ERXGSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of ERXGSR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPFAR_EL1, bit [0]
When FEAT_PFAR is implemented:

Trap MRS reads of PFAR_EL1 at EL1 using AArch64 to EL2.

nPFAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of PFAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PFAR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HFGRTR2_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HFGRTR2_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b010

```
if !(IsFeatureImplemented(FEAT_FGT2) && IsFeatureImplemented(FEAT_AA64)) then

HFGRTR_EL2, Hypervisor Fine-Grained Read Trap Register

The HFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRRS, MRS and MRC reads of System registers.

Configuration

This register is present only when FEAT_FGT is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HFGRTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HFGRTR_EL2 is a 64-bit register.

Field descriptions

nAMAIR2_EL1, bit [63]

When FEAT_AIE is implemented:

Trap MRS reads of AMAIR2_EL1 at EL1 using AArch64 to EL2.

nAMAIR2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AMAIR2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of AMAIR2_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nMAIR2_EL1, bit [62]

When FEAT_AIE is implemented:

Trap MRS reads of MAIR2_EL1 at EL1 using AArch64 to EL2.

nMAIR2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MAIR2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of MAIR2_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nS2POR_EL1, bit [61]

When FEAT_S2POE is implemented:

Trap MRS reads of S2POR_EL1 at EL1 using AArch64 to EL2.

nS2POR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of S2POR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of S2POR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPOR_EL1, bit [60]

When FEAT_S1POE is implemented:

Trap MRS reads of POR_EL1 at EL1 using AArch64 to EL2.

nPOR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of POR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of POR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPOR_EL0, bit [59]
When FEAT_S1POE is implemented:

Trap MRS reads of POR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPOR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of POR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of POR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPIR_EL1, bit [58]
When FEAT_S1PIE is implemented:

Trap MRS reads of PIR_EL1 at EL1 using AArch64 to EL2.

nPIR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PIR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPIRE0_EL1, bit [57]
When FEAT_S1PIE is implemented:

Trap MRS reads of PIRE0_EL1 at EL1 using AArch64 to EL2.

nPIRE0_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PIRE0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PIRE0_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nRCWMASK_EL1, bit [56]

When FEAT_THE is implemented:

Trap MRS or MRRS reads of RCWMASK_EL1 at EL1 using AArch64 to EL2.

nRCWMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of RCWMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRRS reads of RCWMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.
0b1	MRS and MRRS reads of RCWMASK_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTPIDR2_EL0, bit [55]

When FEAT_SME is implemented:

Trap MRS reads of TPIDR2_EL0 at EL1 and EL0 using AArch64 to EL2.

nTPIDR2_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TPIDR2_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TPIDR2_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSMPRI_EL1, bit [54]
When FEAT_SME is implemented:

Trap MRS reads of SMPRI_EL1 at EL1 using AArch64 to EL2.

nSMPRI_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SMPRI_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SMPRI_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCS_EL1, bit [53]
When FEAT_GCS is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- GCSCR_EL1.
- GCSPR_EL1.

nGCS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCS_EL0, bit [52]

When FEAT_GCS is implemented:

Trap MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- GCSCRE0_EL1, at EL1 only.
- GCSPR_EL0.

nGCS_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [51]

Reserved, RES0.

nACCDATA_EL1, bit [50]

When FEAT_LS64_ACCDATA is implemented:

Trap MRS reads of ACCDATA_EL1 at EL1 using AArch64 to EL2.

nACCDATA_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of ACCDATA_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXADDR_EL1, bit [49]

When FEAT_RAS is implemented:

Trap MRS reads of ERXADDR_EL1 at EL1 using AArch64 to EL2.

ERXADDR_EL1	Meaning
0b0	MRS reads of ERXADDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXPFGCDN_EL1, bit [48]

When FEAT_RASv1p1 is implemented:

Trap MRS reads of ERXPFGCDN_EL1 at EL1 using AArch64 to EL2.

ERXPFGCDN_EL1	Meaning
0b0	MRS reads of ERXPFGCDN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXPFGCTL_EL1, bit [47]

When FEAT_RASv1p1 is implemented:

Trap MRS reads of ERXPFGCTL_EL1 at EL1 using AArch64 to EL2.

ERXPFGCTL_EL1	Meaning
0b0	MRS reads of ERXPFGCTL_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXPFGF_EL1, bit [46]
When FEAT_RASv1p1 is implemented:

Trap MRS reads of ERXPFGF_EL1 at EL1 using AArch64 to EL2.

ERXPFGF_EL1	Meaning
0b0	MRS reads of ERXPFGF_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGF_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXMISCn_EL1, bit [45]
When FEAT_RAS is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- ERXMISC0_EL1.
- ERXMISC1_EL1.
- ERXMISC2_EL1.
- ERXMISC3_EL1.

ERXMISCn_EL1	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXSTATUS_EL1, bit [44]

When FEAT_RAS is implemented:

Trap MRS reads of ERXSTATUS_EL1 at EL1 using AArch64 to EL2.

ERXSTATUS_EL1	Meaning
0b0	MRS reads of ERXSTATUS_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXCTLR_EL1, bit [43]

When FEAT_RAS is implemented:

Trap MRS reads of ERXCTLR_EL1 at EL1 using AArch64 to EL2.

ERXCTLR_EL1	Meaning
0b0	MRS reads of ERXCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXFR_EL1, bit [42]

When FEAT_RAS is implemented:

Trap MRS reads of ERXFR_EL1 at EL1 using AArch64 to EL2.

ERXFR_EL1	Meaning
0b0	MRS reads of ERXFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERRSELR_EL1, bit [41]

When FEAT_RAS is implemented:

Trap MRS reads of ERRSELR_EL1 at EL1 using AArch64 to EL2.

ERRSELR_EL1	Meaning
0b0	MRS reads of ERRSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERRSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERRIDR_EL1, bit [40]

When FEAT_RAS is implemented:

Trap MRS reads of ERRIDR_EL1 at EL1 using AArch64 to EL2.

ERRIDR_EL1	Meaning
0b0	MRS reads of ERRIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERRIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ICC_IGRPENn_EL1, bit [39]

When GICv3 is implemented:

Trap MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 to EL2.

ICC_IGRPENn_EL1	Meaning
0b0	MRS reads of ICC_IGRPEN<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VBAR_EL1, bit [38]

Trap MRS reads of VBAR_EL1 at EL1 using AArch64 to EL2.

VBAR_EL1	Meaning
0b0	MRS reads of VBAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of VBAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TTBR1_EL1, bit [37]

Trap MRS or MRRS reads of TTBR1_EL1 at EL1 using AArch64 to EL2.

TTBR1_EL1	Meaning
0b0	MRS and MRRS reads of TTBR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRRS reads of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TTBR0_EL1, bit [36]

Trap MRS or MRRS reads of TTBR0_EL1 at EL1 using AArch64 to EL2.

TTBR0_EL1	Meaning
0b0	MRS and MRRS reads of TTBR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRRS reads of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPIDR_EL0, bit [35]

Trap MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURW at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDR_EL0	Meaning
0b0	MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURW at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of TPIDRURW at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPIDRRO_EL0, bit [34]

Trap MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURO at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDRRO_EL0	Meaning
0b0	MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURO at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of TPIDRURO at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPIDR_EL1, bit [33]

Trap MRS reads of TPIDR_EL1 at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MRS reads of TPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TCR_EL1, bit [32]

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TCR_EL1.
- TCR2_EL1, if FEAT_TCR2 is implemented.

TCR_EL1	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SCXTNUM_EL0, bit [31]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MRS reads of SCXTNUM_EL0 at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_EL0	Meaning
0b0	MRS reads of SCXTNUM_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCXTNUM_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCXTNUM_EL1, bit [30]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MRS reads of SCXTNUM_EL1 at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MRS reads of SCXTNUM_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCXTNUM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCTLR_EL1, bit [29]

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- SCTLR_EL1.
- SCTLR2_EL1, if FEAT_SCTLR2 is implemented.

SCTLR_EL1	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

REVIDR_EL1, bit [28]

Trap MRS reads of REVIDR_EL1 at EL1 using AArch64 to EL2.

REVIDR_EL1	Meaning
0b0	MRS reads of REVIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of REVIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

PAR_EL1, bit [27]

Trap MRS or MRRS reads of PAR_EL1 at EL1 using AArch64 to EL2.

PAR_EL1	Meaning
0b0	MRS and MRRS reads of PAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRRS reads of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

MPIDR_EL1, bit [26]

Trap MRS reads of MPIDR_EL1 at EL1 using AArch64 to EL2.

MPIDR_EL1	Meaning
0b0	MRS reads of MPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

MIDR_EL1, bit [25]

Trap MRS reads of MIDR_EL1 at EL1 using AArch64 to EL2.

MIDR_EL1	Meaning
0b0	MRS reads of MIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

MAIR_EL1, bit [24]

Trap MRS reads of MAIR_EL1 at EL1 using AArch64 to EL2.

MAIR_EL1	Meaning
0b0	MRS reads of MAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

LORSA_EL1, bit [23]
When FEAT_LOR is implemented:

Trap MRS reads of LORSA_EL1 at EL1 using AArch64 to EL2.

LORSA_EL1	Meaning
0b0	MRS reads of LORSA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORSA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LORN_EL1, bit [22]
When FEAT_LOR is implemented:

Trap MRS reads of LORN_EL1 at EL1 using AArch64 to EL2.

LORN_EL1	Meaning
0b0	MRS reads of LORN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LORID_EL1, bit [21]

When FEAT_LOR is implemented:

Trap MRS reads of LORID_EL1 at EL1 using AArch64 to EL2.

LORID_EL1	Meaning
0b0	MRS reads of LORID_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORID_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LOREA_EL1, bit [20]

When FEAT_LOR is implemented:

Trap MRS reads of LOREA_EL1 at EL1 using AArch64 to EL2.

LOREA_EL1	Meaning
0b0	MRS reads of LOREA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LOREA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LORC_EL1, bit [19]

When FEAT_LOR is implemented:

Trap MRS reads of LORC_EL1 at EL1 using AArch64 to EL2.

LORC_EL1	Meaning
0b0	MRS reads of LORC_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORC_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISR_EL1, bit [18]

Trap MRS reads of ISR_EL1 at EL1 using AArch64 to EL2.

ISR_EL1	Meaning
0b0	MRS reads of ISR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ISR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

FAR_EL1, bit [17]

Trap MRS reads of FAR_EL1 at EL1 using AArch64 to EL2.

FAR_EL1	Meaning
0b0	MRS reads of FAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of FAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ESR_EL1, bit [16]

Trap MRS reads of ESR_EL1 at EL1 using AArch64 to EL2.

ESR_EL1	Meaning
0b0	MRS reads of ESR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ESR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCZID_EL0, bit [15]

Trap MRS reads of DCZID_EL0 at EL1 and EL0 using AArch64 to EL2.

DCZID_EL0	Meaning
0b0	MRS reads of DCZID_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DCZID_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CTR_EL0, bit [14]

Trap MRS reads of CTR_EL0 at EL1 and EL0 using AArch64 to EL2.

CTR_EL0	Meaning
0b0	MRS reads of CTR_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CSSELR_EL1, bit [13]

Trap MRS reads of CSSELR_EL1 at EL1 using AArch64 to EL2.

CSSELR_EL1	Meaning
0b0	MRS reads of CSSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CSSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CPACR_EL1, bit [12]

Trap MRS reads of CPACR_EL1 at EL1 using AArch64 to EL2.

CPACR_EL1	Meaning
0b0	MRS reads of CPACR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CPACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CONTEXTIDR_EL1, bit [11]

Trap MRS reads of CONTEXTIDR_EL1 at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MRS reads of CONTEXTIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CONTEXTIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CLIDR_EL1, bit [10]

Trap MRS reads of CLIDR_EL1 at EL1 using AArch64 to EL2.

CLIDR_EL1	Meaning
0b0	MRS reads of CLIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CLIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CCSIDR_EL1, bit [9]

Trap MRS reads of CCSIDR_EL1 at EL1 using AArch64 to EL2.

CCSIDR_EL1	Meaning
0b0	MRS reads of CCSIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CCSIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL2, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

APIBKey, bit [8]

When FEAT_PAuth is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIBKeyHi_EL1.
- APIBKeyLo_EL1.

APIBKey	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APIAKey, bit [7]

When FEAT_PAuth is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIAKeyHi_EL1.
- APIAKeyLo_EL1.

APIAKey	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APGAKey, bit [6]

When FEAT_PAuth is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APGAKeyHi_EL1.
- APGAKeyLo_EL1.

APGAKey	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APDBKey, bit [5]
When FEAT_PAuth is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDBKeyHi_EL1.
- APDBKeyLo_EL1.

APDBKey	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APDAKey, bit [4]
When FEAT_PAuth is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDAKeyHi_EL1.
- APDAKeyLo_EL1.

APDAKey	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMAIR_EL1, bit [3]

Trap MRS reads of AMAIR_EL1 at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MRS reads of AMAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AMAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AIDR_EL1, bit [2]

Trap MRS reads of AIDR_EL1 at EL1 using AArch64 to EL2.

AIDR_EL1	Meaning
0b0	MRS reads of AIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AFSR1_EL1, bit [1]

Trap MRS reads of AFSR1_EL1 at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MRS reads of AFSR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AFSR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AFSR0_EL1, bit [0]

Trap MRS reads of AFSR0_EL1 at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MRS reads of AFSR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AFSR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HFGRTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HFGRTR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b100

```
if !(IsFeatureImplemented(FEAT_FGT) && IsFeatureImplemented(FEAT_AA64)) then

HFGWTR2_EL2, Hypervisor Fine-Grained Write Trap Register 2

The HFGWTR2_EL2 characteristics are:

Purpose

Provides controls for traps of `MSRR`, `MSR` and `MCR` writes of System registers.

Configuration

This register is present only when FEAT_FGT2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HFGWTR2_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HFGWTR2_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42

RES0																					

Bits [63:15]

Reserved, RES0.

nACTLRALIAS_EL1, bit [14]

When FEAT_SRMASK is implemented:

Trap `MSR` writes of ACTLRALIAS_EL1 at EL1 using AArch64 to EL2.

nACTLRALIAS_EL1	Meaning
`0b0`	If EL2 is implemented and enabled in the current Security state, then `MSR` writes of ACTLRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`, unless the write generates a higher priority exception.
`0b1`	`MSR` writes of ACTLRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nACTLRMASK_EL1, bit [13]
When FEAT_SRMASK is implemented:

Trap MSR writes of ACTLRMASK_EL1 at EL1 using AArch64 to EL2.

nACTLRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of ACTLRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of ACTLRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCR2ALIAS_EL1, bit [12]
When FEAT_SRMASK is implemented:

Trap MSR writes of TCR2ALIAS_EL1 at EL1 using AArch64 to EL2.

nTCR2ALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TCR2ALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TCR2ALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCRALIAS_EL1, bit [11]

When FEAT_SRMASK is implemented:

Trap MSR writes of TCRALIAS_EL1 at EL1 using AArch64 to EL2.

nTCRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TCRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TCRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLRALIAS2_EL1, bit [10]

When FEAT_SRMASK is implemented:

Trap MSR writes of SCTLRALIAS2_EL1 at EL1 using AArch64 to EL2.

nSCTLRALIAS2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of SCTLRALIAS2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SCTLRALIAS2_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLRALIAS_EL1, bit [9]

When FEAT_SRMASK is implemented:

Trap MSR writes of SCTLRALIAS_EL1 at EL1 using AArch64 to EL2.

nSCTLRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of SCTLRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SCTLRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nCPACRALIAS_EL1, bit [8]

When FEAT_SRMASK is implemented:

Trap MSR writes of CPACRALIAS_EL1 at EL1 using AArch64 to EL2.

nCPACRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of CPACRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of CPACRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCR2MASK_EL1, bit [7]

When FEAT_SRMASK is implemented:

Trap MSR writes of TCR2MASK_EL1 at EL1 using AArch64 to EL2.

nTCR2MASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TCR2MASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TCR2MASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCRMASK_EL1, bit [6]

When FEAT_SRMASK is implemented:

Trap MSR writes of TCRMASK_EL1 at EL1 using AArch64 to EL2.

nTCRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TCRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TCRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLR2MASK_EL1, bit [5]

When FEAT_SRMASK is implemented:

Trap MSR writes of SCTLR2MASK_EL1 at EL1 using AArch64 to EL2.

nSCTLR2MASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of SCTLR2MASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SCTLR2MASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLRMASK_EL1, bit [4]

When FEAT_SRMASK is implemented:

Trap MSR writes of SCTLRMASK_EL1 at EL1 using AArch64 to EL2.

nSCTLRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of SCTLRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SCTLRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nCPACRMASK_EL1, bit [3]

When FEAT_SRMASK is implemented:

Trap MSR writes of CPACRMASK_EL1 at EL1 using AArch64 to EL2.

nCPACRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of CPACRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of CPACRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nRCWSMASK_EL1, bit [2]

When FEAT_THE is implemented:

Trap MSR or MSRR writes of RCWSMASK_EL1 at EL1 using AArch64 to EL2.

nRCWSMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then unless the write generates a higher priority exception: • MSR writes of RCWSMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MSRR writes of RCWSMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.
0b1	MSR and MSRR writes of RCWSMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [1]

Reserved, RES0.

nPFAR_EL1, bit [0]

When FEAT_PFAR is implemented:

Trap MSR writes of PFAR_EL1 at EL1 using AArch64 to EL2.

nPFAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PFAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PFAR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HFGWTR2_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HFGWTR2_EL2
```

nAMAIR2_EL1, bit [63]

When FEAT_AIE is implemented:

Trap MSR writes of AMAIR2_EL1 at EL1 using AArch64 to EL2.

nAMAIR2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AMAIR2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of AMAIR2_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nMAIR2_EL1, bit [62]

When FEAT_AIE is implemented:

Trap MSR writes of MAIR2_EL1 at EL1 using AArch64 to EL2.

nMAIR2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MAIR2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of MAIR2_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nS2POR_EL1, bit [61]

When FEAT_S2POE is implemented:

Trap MSR writes of S2POR_EL1 at EL1 using AArch64 to EL2.

nS2POR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of S2POR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of S2POR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPOR_EL1, bit [60]

When FEAT_S1POE is implemented:

Trap MSR writes of POR_EL1 at EL1 using AArch64 to EL2.

nPOR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of POR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of POR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPOR_EL0, bit [59]
When FEAT_S1POE is implemented:

Trap MSR writes of POR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPOR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of POR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of POR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPIR_EL1, bit [58]
When FEAT_S1PIE is implemented:

Trap MSR writes of PIR_EL1 at EL1 using AArch64 to EL2.

nPIR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PIR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPIRE0_EL1, bit [57]
When FEAT_S1PIE is implemented:

Trap MSR writes of PIRE0_EL1 at EL1 using AArch64 to EL2.

nPIRE0_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PIRE0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PIRE0_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nRCWMASK_EL1, bit [56]

When FEAT_THE is implemented:

Trap MSR or MSRR writes of RCWMASK_EL1 at EL1 using AArch64 to EL2.

nRCWMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of RCWMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MSRR writes of RCWMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.
0b1	MSR and MSRR writes of RCWMASK_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTPIDR2_EL0, bit [55]

When FEAT_SME is implemented:

Trap MSR writes of TPIDR2_EL0 at EL1 and EL0 using AArch64 to EL2.

nTPIDR2_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDR2_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TPIDR2_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSMPRI_EL1, bit [54]
When FEAT_SME is implemented:

Trap MSR writes of SMPRI_EL1 at EL1 using AArch64 to EL2.

nSMPRI_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SMPRI_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SMPRI_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCS_EL1, bit [53]
When FEAT_GCS is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- GCSCR_EL1.
- GCSPR_EL1.

nGCS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCS_EL0, bit [52]

When FEAT_GCS is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- GCSCRE0_EL1.
- GCSPR_EL0.

nGCS_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [51]

Reserved, RES0.

nACCDATA_EL1, bit [50]

When FEAT_LS64_ACCDATA is implemented:

Trap MSR writes of ACCDATA_EL1 at EL1 using AArch64 to EL2.

nACCDATA_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of ACCDATA_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXADDR_EL1, bit [49]

When FEAT_RAS is implemented:

Trap MSR writes of ERXADDR_EL1 at EL1 using AArch64 to EL2.

ERXADDR_EL1	Meaning
0b0	MSR writes of ERXADDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXPFGCDN_EL1, bit [48]

When FEAT_RASv1p1 is implemented:

Trap MSR writes of ERXPFGCDN_EL1 at EL1 using AArch64 to EL2.

ERXPFGCDN_EL1	Meaning
0b0	MSR writes of ERXPFGCDN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXPFGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXPFGCTL_EL1, bit [47]

When FEAT_RASv1p1 is implemented:

Trap MSR writes of ERXPFGCTL_EL1 at EL1 using AArch64 to EL2.

ERXPFGCTL_EL1	Meaning
0b0	MSR writes of ERXPFGCTL_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXPFGCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [46]

Reserved, RES0.

ERXMISCn_EL1, bit [45]

When FEAT_RAS is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- ERXMISC0_EL1.
- ERXMISC1_EL1.
- ERXMISC2_EL1.
- ERXMISC3_EL1.

ERXMISCn_EL1	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXSTATUS_EL1, bit [44]

When FEAT_RAS is implemented:

Trap MSR writes of ERXSTATUS_EL1 at EL1 using AArch64 to EL2.

ERXSTATUS_EL1	Meaning
0b0	MSR writes of ERXSTATUS_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXCTLR_EL1, bit [43]

When FEAT_RAS is implemented:

Trap MSR writes of ERXCTLR_EL1 at EL1 using AArch64 to EL2.

ERXCTLR_EL1	Meaning
0b0	MSR writes of ERXCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

ERRSELR_EL1, bit [41]

When FEAT_RAS is implemented:

Trap MSR writes of ERRSELR_EL1 at EL1 using AArch64 to EL2.

ERRSELR_EL1	Meaning
0b0	MSR writes of ERRSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERRSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [40]

Reserved, RES0.

ICC_IGRPENn_EL1, bit [39]

When GICv3 is implemented:

Trap MSR writes of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 to EL2.

ICC_IGRPENn_EL1	Meaning
0b0	MSR writes of ICC_IGRPEN<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VBAR_EL1, bit [38]

Trap MSR writes of VBAR_EL1 at EL1 using AArch64 to EL2.

VBAR_EL1	Meaning
0b0	MSR writes of VBAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of VBAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TTBR1_EL1, bit [37]

Trap MSR or MSRR writes of TTBR1_EL1 at EL1 using AArch64 to EL2.

TTBR1_EL1	Meaning
0b0	MSR and MSRR writes of TTBR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MSRR writes of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TTBR0_EL1, bit [36]

Trap MSR or MSRR writes of TTBR0_EL1 at EL1 using AArch64 to EL2.

TTBR0_EL1	Meaning
0b0	MSR and MSRR writes of TTBR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MSRR writes of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPIDR_EL0, bit [35]

Trap MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 and MCR writes of TPIDRURW at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDR_EL0	Meaning
0b0	MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 and MCR writes of TPIDRURW at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of TPIDRURW at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPIDRRO_EL0, bit [34]

Trap MSR writes of TPIDRRO_EL0 at EL1 using AArch64 to EL2.

TPIDRRO_EL0	Meaning
0b0	MSR writes of TPIDRRO_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDRRO_EL0 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPIDR_EL1, bit [33]

Trap MSR writes of TPIDR_EL1 at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MSR writes of TPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TCR_EL1, bit [32]

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TCR_EL1.
- TCR2_EL1, if FEAT_TCR2 is implemented.

TCR_EL1	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SCXTNUM_EL0, bit [31]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MSR writes of SCXTNUM_EL0 at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_EL0	Meaning
0b0	MSR writes of SCXTNUM_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCXTNUM_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCXTNUM_EL1, bit [30]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MSR writes of SCXTNUM_EL1 at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MSR writes of SCXTNUM_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCXTNUM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCTLR_EL1, bit [29]

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- SCTLR_EL1.
- SCTLR2_EL1, if FEAT_SCTLR2 is implemented.

SCTLR_EL1	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [28]

Reserved, RES0.

PAR_EL1, bit [27]

Trap MSR or MSRR writes of PAR_EL1 at EL1 using AArch64 to EL2.

PAR_EL1	Meaning
0b0	MSR and MSRR writes of PAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MSRR writes of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [26:25]

Reserved, RES0.

MAIR_EL1, bit [24]

Trap MSR writes of MAIR_EL1 at EL1 using AArch64 to EL2.

MAIR_EL1	Meaning
0b0	MSR writes of MAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL2, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

LORSA_EL1, bit [23]

When FEAT_LOR is implemented:

Trap MSR writes of LORSA_EL1 at EL1 using AArch64 to EL2.

LORSA_EL1	Meaning
0b0	MSR writes of LORSA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORSA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LORN_EL1, bit [22]

When FEAT_LOR is implemented:

Trap MSR writes of LORN_EL1 at EL1 using AArch64 to EL2.

LORN_EL1	Meaning
0b0	MSR writes of LORN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

LOREA_EL1, bit [20]

When FEAT_LOR is implemented:

Trap MSR writes of LOREA_EL1 at EL1 using AArch64 to EL2.

LOREA_EL1	Meaning
0b0	MSR writes of LOREA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LOREA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LORC_EL1, bit [19]

When FEAT_LOR is implemented:

Trap MSR writes of LORC_EL1 at EL1 using AArch64 to EL2.

LORC_EL1	Meaning
0b0	MSR writes of LORC_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORC_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

FAR_EL1, bit [17]

Trap MSR writes of FAR_EL1 at EL1 using AArch64 to EL2.

FAR_EL1	Meaning
0b0	MSR writes of FAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of FAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

- Otherwise, this field resets to an architecturally UNKNOWN value.

ESR_EL1, bit [16]

Trap MSR writes of ESR_EL1 at EL1 using AArch64 to EL2.

ESR_EL1	Meaning
0b0	MSR writes of ESR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ESR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [15:14]

Reserved, RES0.

CSSELR_EL1, bit [13]

Trap MSR writes of CSSELR_EL1 at EL1 using AArch64 to EL2.

CSSELR_EL1	Meaning
0b0	MSR writes of CSSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CSSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CPACR_EL1, bit [12]

Trap MSR writes of CPACR_EL1 at EL1 using AArch64 to EL2.

CPACR_EL1	Meaning
0b0	MSR writes of CPACR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CPACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CONTEXTIDR_EL1, bit [11]

Trap MSR writes of CONTEXTIDR_EL1 at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MSR writes of CONTEXTIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CONTEXTIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [10:9]

Reserved, RES0.

APIBKey, bit [8]

When FEAT_PAuth is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIBKeyHi_EL1.
- APIBKeyLo_EL1.

APIBKey	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APIAKey, bit [7]

When FEAT_PAuth is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIAKeyHi_EL1.
- APIAKeyLo_EL1.

APIAKey	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APGAKey, bit [6]

When FEAT_PAuth is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APGAKeyHi_EL1.
- APGAKeyLo_EL1.

APGAKey	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APDBKey, bit [5]

When FEAT_PAuth is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDBKeyHi_EL1.
- APDBKeyLo_EL1.

APDBKey	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APDAKey, bit [4]

When FEAT_PAuth is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDAKeyHi_EL1.
- APDAKeyLo_EL1.

APDAKey	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMAIR_EL1, bit [3]

Trap MSR writes of AMAIR_EL1 at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MSR writes of AMAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AMAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

AFSR1_EL1, bit [1]

Trap MSR writes of AFSR1_EL1 at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MSR writes of AFSR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AFSR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AFSR0_EL1, bit [0]

Trap MSR writes of AFSR0_EL1 at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MSR writes of AFSR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AFSR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HFGWTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HFGWTR_EL2

HPFAR_EL2, Hypervisor IPA Fault Address Register

The HPFAR_EL2 characteristics are:

Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to EL2 and GPC exceptions due to a fault on an access for a stage 2 translation.

Configuration

AArch64 System register HPFAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HPFAR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to HPFAR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

The HPFAR_EL2 is written for:

- A Translation fault, Access Flag fault, or Address Size fault on a stage 2 translation not on a stage 1 translation table walk.
- A Translation fault, Access Flag fault, Address Size fault, or Permission fault on stage 2 translation of an address accessed in a stage 1 translation table walk.
- If FEAT_RME is implemented, a Granule Protection Check fault in the second stage of translation.

For all other exceptions taken to EL2, this register is UNKNOWN.

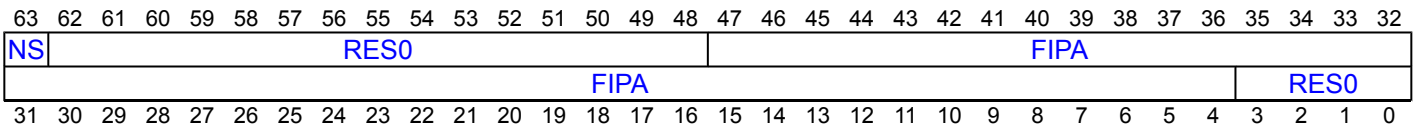
Note

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the Instruction Abort exception or Data Abort exception. It is the lower address that gave rise to the fault that is reported. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize which fault is reported.

Attributes

HPFAR_EL2 is a 64-bit register.

Field descriptions



Execution at EL1 or EL0 makes HPFAR_EL2 become UNKNOWN.

NS, bit [63]

When FEAT_SEL2 is implemented:

Faulting IPA address space.

NS	Meaning
0b0	Faulting IPA is from the Secure IPA space.
0b1	Faulting IPA is from the Non-secure IPA space.

For Data Abort exceptions or Instruction Abort exceptions taken to Non-secure EL2:

- This field is RES0.
- The address is from the Non-secure IPA space.

If FEAT_RME is implemented, for Data Abort exceptions or Instruction Abort exceptions taken to Realm EL2:

- This field is RES0.
- The address is from the Realm IPA space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

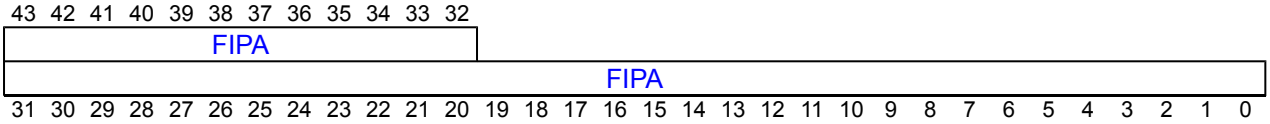
Reserved, RES0.

Bits [62:48]

Reserved, RES0.

FIPA, bits [47:4]

FIPA encoding when FEAT_D128 is implemented



FIPA, bits [43:0]

Bits [55:12] of the Faulting Intermediate Physical Address.

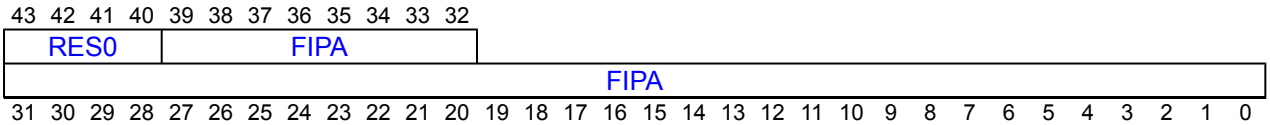
For implementations with fewer than 55 physical address bits, the corresponding upper bits in this field are RES0.

When FEAT_MOPS is implemented, the value presented in FIPA on a synchronous exception that set the HPFAR_EL2 from any of the Memory Copy and Memory Set instructions is within the address range of the current stage 2 translation granule, aligned to the size of the current stage 2 translation granule, of the address that generated the Data abort. In this case, bits[(n-1):0] of the value are UNKNOWN, where 2^n is the current stage 2 translation granule size in bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIPA encoding when FEAT_LPA is implemented and FEAT_D128 is not implemented



Bits [43:40]

Reserved, RES0.

FIPA, bits [39:0]

Bits [51:12] of the Faulting Intermediate Physical Address.

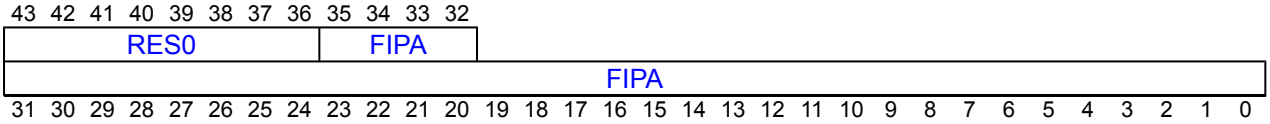
For implementations with fewer than 52 physical address bits, the corresponding upper bits in this field are RES0.

When FEAT_MOPS is implemented, the value presented in FIPA on a synchronous exception that set the HPFAR_EL2 from any of the Memory Copy and Memory Set instructions is within the address range of the current stage 2 translation granule, aligned to the size of the current stage 2 translation granule, of the address that generated the Data abort. In this case, bits[(n-1):0] of the value are UNKNOWN, where 2^n is the current stage 2 translation granule size in bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIPA encoding when FEAT_LPA is not implemented



Bits [43:36]

Reserved, RES0.

FIPA, bits [35:0]

Bits[47:12] Faulting Intermediate Physical Address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

When FEAT_MOPS is implemented, the value presented in FIPA on a synchronous exception that set the HPFAR_EL2 from any of the Memory Copy and Memory Set instructions is within the address range of the current stage 2 translation granule, aligned to the size of the current stage 2 translation granule, of the address that generated the Data abort. In this case, bits[(n-1):0] of the value are UNKNOWN, where 2^n is the current stage 2 translation granule size in bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

Reserved, RES0.

Accessing HPFAR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HPFAR_EL2
```

op0	op1	CRn	CRm	op2

HSTR_EL2, Hypervisor System Trap Register

The HSTR_EL2 characteristics are:

Purpose

Controls trapping to EL2 of EL1 or lower AArch32 accesses to the System register in the coproc == `0b1111` encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

Configuration

AArch64 System register HSTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSTR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to HSTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

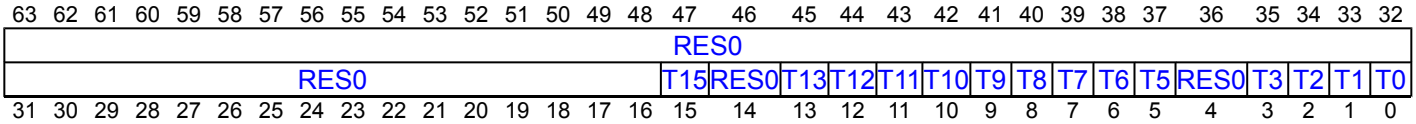
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

HSTR_EL2 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:16, 14, 4]

Reserved, RES0.

T<n>, bit [n], for n = 15, 13 to 5, 3 to 0

The remaining fields control whether EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == `0b1111` encoding space, are trapped to EL2 as follows:

- MCR or MRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value `0x03`, unless the access is UNDEFINED.
- MCRR or MRRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value `0x04`, unless the access is UNDEFINED.

T<n>	Meaning
0b0	This control has no effect on EL0 or EL1 accesses to System registers.
0b1	System registers in the coproc == 0b1111 encoding space and CRn == <n> or CRm == <n> where T<n> is the name of this field, are trapped as follows: • An EL1 MCR or MRC access is trapped to EL2. • An EL0 MCR or MRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0. • An EL1 MCRR or MRRC access is trapped to EL2. • An EL0 MCRR or MRRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0. It is IMPLEMENTATION DEFINED whether an EL0 access using AArch32 is trapped to EL2, or is UNDEFINED. If the access is UNDEFINED, and generates an exception that is taken to EL1 or EL2 using AArch64, this is reported with EC syndrome value 0x00. **Note** Arm expects that trapping to EL2 of EL0 accesses to these registers is unusual and used only when the hypervisor must virtualize EL0 operation. Arm recommends that, whenever possible, EL0 accesses to these registers behave as they would if the implementation did not include EL2. This means that, if the architecture does not support the EL0 access, then the register access instruction is treated as UNDEFINED and generates an exception that is taken to EL1.

For example, when HSTR_EL2.T7 is 1, for instructions executed at EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to EL2.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to EL2.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

IC IALLU, Instruction Cache Invalidate All to PoU

The IC IALLU characteristics are:

Purpose

Invalidate all instruction caches of the PE executing the instruction to the Point of Unification.

Configuration

AArch64 System instruction IC IALLU performs the same function as AArch32 System instruction ICIALLU.

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to IC IALLU are UNDEFINED.

Attributes

IC IALLU is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing IC IALLU

The Rt field should be set to `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
IC IALLU{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0101	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then

IC IALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The IC IALLUIS characteristics are:

Purpose

Invalidate all instruction caches in the Inner Shareable domain of the PE executing the instruction to the Point of Unification.

Configuration

AArch64 System instruction IC IALLUIS performs the same function as AArch32 System instruction ICIALLUIS.

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to IC IALLUIS are UNDEFINED.

Attributes

IC IALLUIS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing IC IALLUIS

The Rt field should be set to `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
IC IALLUIS{, <Xt>}
```

op0	op1	CRn	CRm	op2

IC IVAU, Instruction Cache line Invalidate by VA to PoU

The IC IVAU characteristics are:

Purpose

Invalidate instruction cache by address to Point of Unification.

Configuration

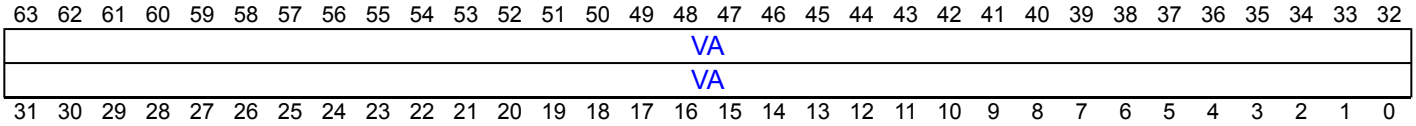
AArch64 System instruction IC IVAU performs the same function as AArch32 System instruction ICIMVAU.

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to IC IVAU are UNDEFINED.

Attributes

IC IVAU is a 64-bit System instruction.

Field descriptions



VA, bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing IC IVAU

If EL0 access is enabled, when executed at EL0, the instruction may generate a Permission fault, subject to the constraints described in 'MMU faults generated by cache maintenance operations'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
IC IVAU{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0101	0b001

ICC_AP0R<n>_EL1, Interrupt Controller Active Priorities Group 0 Registers, n = 0 - 3

The ICC_AP0R<n>_EL1 characteristics are:

Purpose

Provides information about Group 0 active priorities.

Configuration

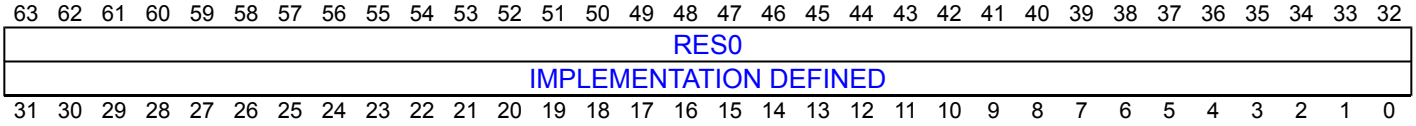
AArch64 System register ICC_AP0R<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_AP0R<n>[31:0].

This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_AP0R<n>_EL1 are UNDEFINED.

Attributes

ICC_AP0R<n>_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'00000000000000000000000000000000'`.

Additional information

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value `0x00000000` is consistent with no interrupts being active.

Accessing ICC_AP0R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or `0x00000000` when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP0R1_EL1 is implemented only in implementations that support 6 or more bits of priority. ICC_AP0R2_EL1 and ICC_AP0R3_EL1 are implemented only in implementations that support 7 or more bits of priority. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICC_AP0R<n>_EL1.
- Secure ICC_AP1R<n>_EL1.
- Non-secure ICC_AP1R<n>_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_AP0R<m>_EL1 ; Where m = 0-3
```

ICC_AP1R<n>_EL1, Interrupt Controller Active Priorities Group 1 Registers, n = 0 - 3

The ICC_AP1R<n>_EL1 characteristics are:

Purpose

Provides information about Group 1 active priorities.

Configuration

This register is banked between ICC_AP1R<n>_EL1 and ICC_AP1R<n>_EL1_S and ICC_AP1R<n>_EL1_NS.

AArch64 System register ICC_AP1R<n>_EL1 bits [31:0] (ICC_AP1R<n>_EL1_S) are architecturally mapped to AArch32 System register ICC_AP1R<n>[31:0] (ICC_AP1R<n>_S).

AArch64 System register ICC_AP1R<n>_EL1 bits [31:0] (ICC_AP1R<n>_EL1_NS) are architecturally mapped to AArch32 System register ICC_AP1R<n>[31:0] (ICC_AP1R<n>_NS).

This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_AP1R<n>_EL1 are UNDEFINED.

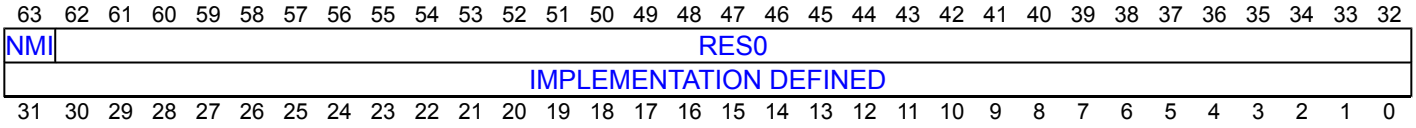
Attributes

ICC_AP1R<n>_EL1 is a 64-bit register.

This register has the following instances:

- ICC_AP1R<n>_EL1, when EL3 is not implemented.
- ICC_AP1R<n>_EL1_S, when EL3 is implemented.
- ICC_AP1R<n>_EL1_NS, when EL3 is implemented.

Field descriptions



NMI, bit [63]

When FEAT_GICv3_NMI is implemented and n == 0:

Indicates whether there is an active NMI priority.

NMI	Meaning
0b0	There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority drop.
0b1	There is an active Group 1 NMI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [62:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00000000000000000000000000000000'.

Additional information

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICC_AP1R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP1R1_EL1 is implemented only in implementations that support 6 or more bits of priority. ICC_AP1R2_EL1 and ICC_AP1R3_EL1 are implemented only in implementations that support 7 or more bits of priority. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICC_AP0R<n>_EL1.
- Secure ICC_AP1R<n>_EL1.
- Non-secure ICC_AP1R<n>_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_AP1R<m>_EL1 ; Where m = 0-3

ICC_ASGI1R_EL1, Interrupt Controller Alias Software Generated Interrupt Group 1 Register

The ICC_ASGI1R_EL1 characteristics are:

Purpose

Generates Group 1 SGIs for the Security state that is not the current Security state.

Configuration

AArch64 System register ICC_ASGI1R_EL1 performs the same function as AArch32 System register ICC_ASGI1R.

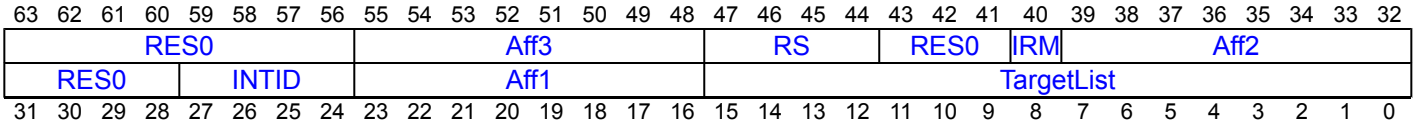
This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_ASGI1R_EL1 are UNDEFINED.

Under certain conditions a write to ICC_ASGI1R_EL1 can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_ASGI1R_EL1 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

Note

If SRE is set only for EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Accessing ICC_ASGI1R_EL1

This register allows software executing in a Secure state to generate Non-secure Group 1 SGIs. It will also allow software executing in a Non-secure state to generate Secure Group 1 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding'.

Note

Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_ASGI1R_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b110

ICC_BPR0_EL1, Interrupt Controller Binary Point Register 0

The ICC_BPR0_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

Configuration

AArch64 System register ICC_BPR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_BPR0[31:0].

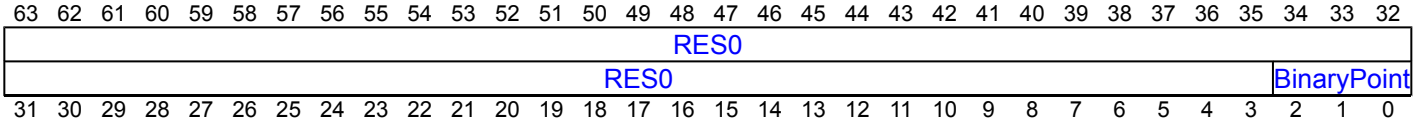
This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_BPR0_EL1 are UNDEFINED.

Virtual accesses to this register update ICH_VMCR_EL2.VBPR0.

Attributes

ICC_BPR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	gggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.ssssssss

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_BPR0_EL1

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by:

- ICC_CTLR_EL1.PRIbits
- ICC_CTLR_EL3.PRIbits An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_BPR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b011

ICC_BPR1_EL1, Interrupt Controller Binary Point Register 1

The ICC_BPR1_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

Configuration

This register is banked between ICC_BPR1_EL1 and ICC_BPR1_EL1_S and ICC_BPR1_EL1_NS.

AArch64 System register ICC_BPR1_EL1 bits [31:0] (ICC_BPR1_EL1_S) are architecturally mapped to AArch32 System register ICC_BPR1[31:0] (ICC_BPR1_S).

AArch64 System register ICC_BPR1_EL1 bits [31:0] (ICC_BPR1_EL1_NS) are architecturally mapped to AArch32 System register ICC_BPR1[31:0] (ICC_BPR1_NS).

This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_BPR1_EL1 are UNDEFINED.

Virtual accesses to this register update ICH_VMCR_EL2.VBPR1.

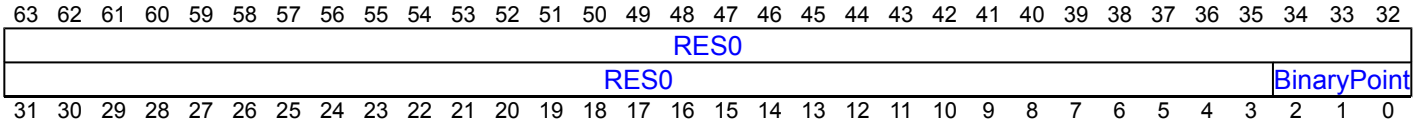
Attributes

ICC_BPR1_EL1 is a 64-bit register.

This register has the following instances:

- ICC_BPR1_EL1, when EL3 is not implemented.
- ICC_BPR1_EL1_S, when EL3 is implemented.
- ICC_BPR1_EL1_NS, when EL3 is implemented.

Field descriptions



Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The minimum value of the Non-secure copy of this register is the minimum value of ICC_BPR0_EL1 + 1. The minimum value of the Secure copy of this register is the minimum value of ICC_BPR0_EL1.

If EL3 is implemented and ICC_CTLR_EL3.CBPR_EL1S is 1:

- Accesses to this register from Secure EL2 access the state of ICC_BPR0_EL1.

- Accesses to this register from Secure EL1:
  - When SCR_EL3.EEL2 is 1 and HCR_EL2.IMO is 1, access the state of ICV_BPR1_EL1.
  - Otherwise, access the state of ICC_BPR0_EL1.

If EL3 is implemented and ICC_CTLR_EL3.CBPR_EL1NS is 1, Non-secure accesses to this register at EL1 and EL2 behave as follows, depending on the values of HCR_EL2.IMO and SCR_EL3.IRQ:

HCR_EL2.IMO	SCR_EL3.IRQ	Behavior
0b0	0b0	Non-secure EL1 and EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b0	0b1	Non-secure EL1 and EL2 accesses trap to EL3.
0b1	0b0	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.
0b1	0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3.

If EL3 is not implemented and ICC_CTLR_EL1.CBPR is 1, Non-secure accesses to this register at EL1 and EL2 behave as follows, depending on the values of HCR_EL2.IMO:

HCR_EL2.IMO	Behavior
0b0	Non-secure EL1 and EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_BPR1_EL1

On a reset, the binary point field is UNKNOWN.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_BPR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b011

ICC_CTLR_EL1, Interrupt Controller Control Register (EL1)

The ICC_CTLR_EL1 characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

This register is banked between ICC_CTLR_EL1 and ICC_CTLR_EL1_S and ICC_CTLR_EL1_NS.

AArch64 System register ICC_CTLR_EL1 bits [31:0] (ICC_CTLR_EL1_S) are architecturally mapped to AArch32 System register ICC_CTLR[31:0] (ICC_CTLR_S).

AArch64 System register ICC_CTLR_EL1 bits [31:0] (ICC_CTLR_EL1_NS) are architecturally mapped to AArch32 System register ICC_CTLR[31:0] (ICC_CTLR_NS).

This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_CTLR_EL1 are UNDEFINED.

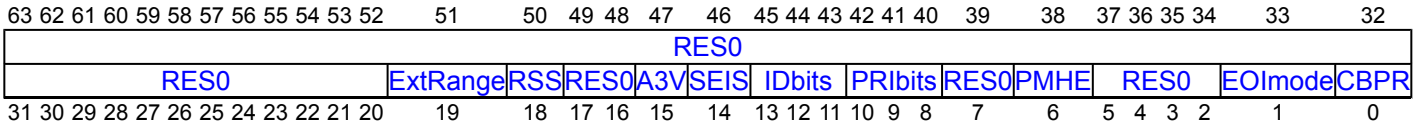
Attributes

ICC_CTLR_EL1 is a 64-bit register.

This register has the following instances:

- ICC_CTLR_EL1, when EL3 is not implemented.
- ICC_CTLR_EL1_S, when EL3 is implemented.
- ICC_CTLR_EL1_NS, when EL3 is implemented.

Field descriptions



Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. • Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL3.ExtRange.

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

A3V	Meaning
0b0	The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The CPU interface logic supports nonzero values of Affinity 3 in SGI generation System registers.

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.A3V.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

SEIS	Meaning
0b0	The CPU interface logic does not support local generation of SEIs.
0b1	The CPU interface logic supports local generation of SEIs.

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.SEIS.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is implemented, this field is an alias of ICC_CTLR_EL3.IDbits.

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of GICD_CTLR.DS.

For physical accesses, this field determines the minimum value of ICC_BPR0_EL1.

If EL3 is implemented, physical accesses return the value from ICC_CTLR_EL3.PRIbits.

If EL3 is not implemented, physical accesses return the value from this field.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

PMHE	Meaning
0b0	Disables use of ICC_PMR_EL1 as a hint for interrupt distribution.
0b1	Enables use of ICC_PMR_EL1 as a hint for interrupt distribution.

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.PMHE. Whether this bit can be written as part of an access to this register depends on the value of GICD_CTLR.DS:

- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read/write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

Bits [5:2]

Reserved, RES0.

EOImode, bit [1]

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

EOImode	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

The Secure ICC_CTLR_EL1.EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1S.

The Non-secure ICC_CTLR_EL1.EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1NS

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for both Group 0 and Group 1 interrupts.

If EL3 is implemented:

- This bit is an alias of ICC_CTLR_EL3.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, this bit is read/write.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_CTLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_CTLR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b100

```

ICC_CTLR_EL3, Interrupt Controller Control Register (EL3)

The ICC_CTLR_EL3 characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

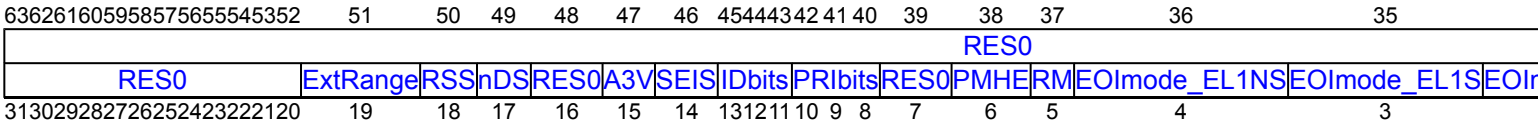
Configuration

This register is present only when GICv3 is implemented, EL3 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_CTLR_EL3 are UNDEFINED.

Attributes

ICC_CTLR_EL3 is a 64-bit register.

Field descriptions



Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. • Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.

RSS, bit [18]

Range Selector Support.

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0-15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0-255 are supported.

This bit is read-only.

nDS, bit [17]

Disable Security not supported. Read-only and writes are ignored.

nDS	Meaning
0b0	The CPU interface logic supports disabling of security.
0b1	The CPU interface logic does not support disabling of security, and requires that security is not disabled.

When a PE implements FEAT_RME and FEAT_SEL2, this field is RAO/WI.

Bit [16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored.

A3V	Meaning
0b0	The CPU interface logic does not support nonzero values of the Aff3 field in SGI generation System registers.
0b1	The CPU interface logic supports nonzero values of the Aff3 field in SGI generation System registers.

If EL3 is present, ICC_CTLR_EL1.A3V is an alias of ICC_CTLR_EL3.A3V

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The CPU interface logic does not support generation of SEIs.
0b1	The CPU interface logic supports generation of SEIs.

If EL3 is present, ICC_CTLR_EL1.SEIS is an alias of ICC_CTLR_EL3.SEIS

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported.

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is present, ICC_CTLR_EL1.IDbits is an alias of ICC_CTLR_EL3.IDbits

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the value of SCR_EL3.NS or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0_EL1 and ICC_BPR1_EL1.

This field determines the minimum value of ICC_BPR0_EL1.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable.

PMHE	Meaning
0b0	Disables use of the priority mask register as a hint for interrupt distribution.
0b1	Enables use of the priority mask register as a hint for interrupt distribution.

Software must write ICC_PMR_EL1 to 0xFF before clearing this field to 0.

- An implementation might choose to make this field RAO/WI if priority-based routing is always used
- An implementation might choose to make this field RAZ/WI if priority-based routing is never used

If EL3 is present, ICC_CTLR_EL1.PMHE is an alias of ICC_CTLR_EL3.PMHE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

RM, bit [5]

Routing Modifier. This bit controls whether EL3 can acknowledge, or observe as the Highest Priority Pending Interrupt, Secure Group 0 and Non-secure Group 1 interrupts.

RM	Meaning
0b0	Secure Group 0 and Non-secure Group 1 interrupts can be acknowledged and observed as the highest priority interrupt at EL3.
0b1	Secure Group 0 and Non-secure Group 1 interrupts cannot be acknowledged and observed as the highest priority interrupt at EL3. Secure Group 0 interrupts return a special INTID value of 1020. This affects accesses to ICC_IAR0_EL1 and ICC_HPPIR0_EL1. Non-secure Group 1 interrupts return a special INTID value of 1021. This affects accesses to ICC_IAR1_EL1 and ICC_HPPIR1_EL1.

Note

The Routing Modifier bit is supported in AArch64 only. In systems without EL3 the behavior is as if the value is 0. Software must ensure this bit is 0 when the Secure copy of ICC_SRE_EL1.SRE is 1, otherwise system behavior is UNPREDICTABLE. In systems without EL3 or where the Secure copy of ICC_SRE_EL1.SRE is RAO/WI, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1NS, bit [4]

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1NS	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR_EL1(NS).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1S, bit [3]

EOI mode for interrupts handled at Secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1S	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR_EL1(S).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL3	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

CBPR_EL1NS	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Non-secure Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1_EL1 access the state of ICC_BPR0_EL1.

If EL3 is present, ICC_CTLR_EL1(NS).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts at EL1 and EL2.

CBPR_EL1S	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Secure Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 and Secure EL2 accesses to ICC_BPR1_EL1 access the state of ICC_BPR0_EL1.

If EL3 is present, ICC_CTLR_EL1(S).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_CTLR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_CTLR_EL3

ICC_DIR_EL1, Interrupt Controller Deactivate Interrupt Register

The ICC_DIR_EL1 characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

Configuration

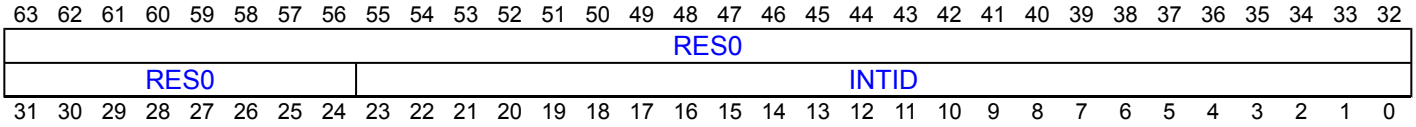
AArch64 System register ICC_DIR_EL1 bits [31:0] performs the same function as AArch32 System register ICC_DIR[31:0].

This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_DIR_EL1 are UNDEFINED.

Attributes

ICC_DIR_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_DIR_EL1

There are two cases when writing to ICC_DIR_EL1 that were UNPREDICTABLE for a corresponding GICv2 write to GICC_DIR:

- When EOImode == 0. GICv3 implementations must ignore such writes. In systems supporting system error generation, an implementation might generate an SEI.
- When EOImode == 1 but no EOI has been issued. The interrupt will be deactivated by the Distributor, however the active priority in the CPU interface for the interrupt will remain set (because no EOI was issued).

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_DIR_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b001

```

ICC_EOIR0_EL1, Interrupt Controller End Of Interrupt Register 0

The ICC_EOIR0_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

Configuration

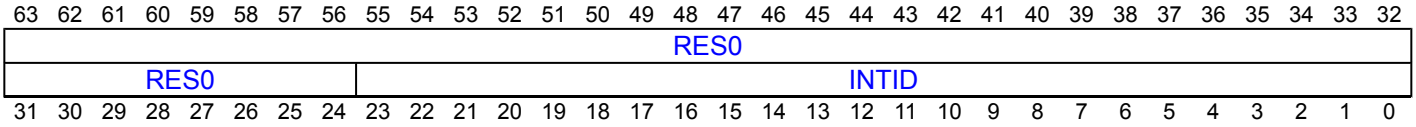
AArch64 System register ICC_EOIR0_EL1 bits [31:0] performs the same function as AArch32 System register ICC_EOIR0[31:0].

This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_EOIR0_EL1 are UNDEFINED.

Attributes

ICC_EOIR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICC_IAR0_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR_EL1 to deactivate the interrupt.

The EOImode bit for the current Exception level and Security state is determined as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR_EL1.EOIMode.
- If EL3 is implemented and the software is executing at EL3, the appropriate bit is ICC_CTLR_EL3.EOImode_EL3.
- If EL3 is implemented and the software is not executing at EL3, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTLR_EL3.EOImode_EL1S.
  - If the software is executing in Non-secure state, the bit is ICC_CTLR_EL3.EOImode_EL1NS.

Accessing ICC_EOIR0_EL1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR0_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_EOIR0_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b001

```

ICC_HPPIR0_EL1, Interrupt Controller Highest Priority Pending Interrupt Register 0

The ICC_HPPIR0_EL1 characteristics are:

Purpose

Indicates the highest priority pending Group 0 interrupt on the CPU interface.

Configuration

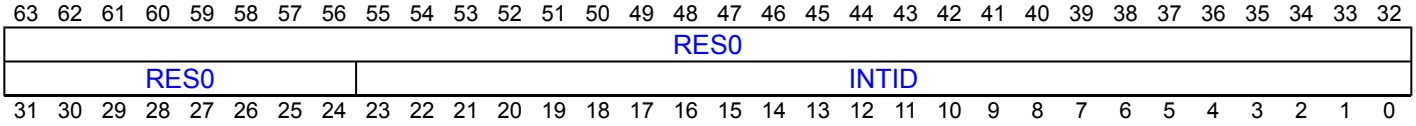
AArch64 System register ICC_HPPIR0_EL1 bits [31:0] performs the same function as AArch32 System register ICC_HPPIR0[31:0].

This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_HPPIR0_EL1 are UNDEFINED.

Attributes

ICC_HPPIR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the highest priority pending interrupt, if that interrupt is observable at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. These special INTIDs can be one of: 1020, 1021, or 1023. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_HPPIR0_EL1

ICC_IAR0_EL1, Interrupt Controller Interrupt Acknowledge Register 0

The ICC_IAR0_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 0 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch64 System register ICC_IAR0_EL1 bits [31:0] performs the same function as AArch32 System register ICC_IAR0[31:0].

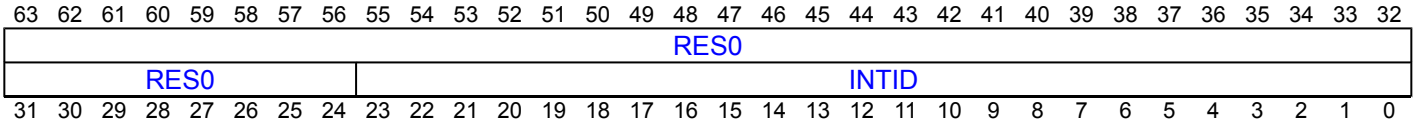
This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_IAR0_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers'.

Attributes

ICC_IAR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_IAR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

ICC_IAR1_EL1, Interrupt Controller Interrupt Acknowledge Register 1

The ICC_IAR1_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 1 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch64 System register ICC_IAR1_EL1 bits [31:0] performs the same function as AArch32 System register ICC_IAR1[31:0].

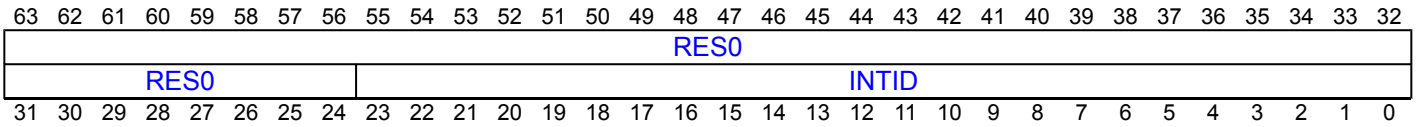
This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_IAR1_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_IAR1_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_IAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

ICC_IGRPEN0_EL1, Interrupt Controller Interrupt Group 0 Enable Register

The ICC_IGRPEN0_EL1 characteristics are:

Purpose

Controls whether Group 0 interrupts are enabled or not.

Configuration

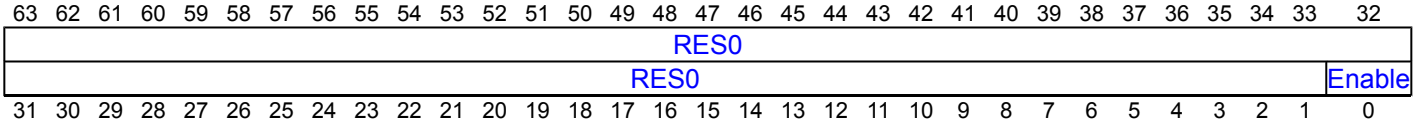
AArch64 System register ICC_IGRPEN0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_IGRPEN0[31:0].

This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_IGRPEN0_EL1 are UNDEFINED.

Attributes

ICC_IGRPEN0_EL1 is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 0 interrupts.

Enable	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

Virtual accesses to this register update ICH_VMCR_EL2.VENG0.

If the highest priority pending interrupt for that PE is a Group 0 interrupt using 1 of N model, then the interrupt will be targeted to another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_IGRPEN0_EL1

Accesses to this register use the following encodings in the System register encoding space:

ICC_IGRPEN1_EL1, Interrupt Controller Interrupt Group 1 Enable Register

The ICC_IGRPEN1_EL1 characteristics are:

Purpose

Controls whether Group 1 interrupts are enabled for the current Security state.

Configuration

This register is banked between ICC_IGRPEN1_EL1 and ICC_IGRPEN1_EL1_S and ICC_IGRPEN1_EL1_NS.

AArch64 System register ICC_IGRPEN1_EL1 bits [31:0] (ICC_IGRPEN1_EL1_S) are architecturally mapped to AArch32 System register ICC_IGRPEN1[31:0] (ICC_IGRPEN1_S).

AArch64 System register ICC_IGRPEN1_EL1 bits [31:0] (ICC_IGRPEN1_EL1_NS) are architecturally mapped to AArch32 System register ICC_IGRPEN1[31:0] (ICC_IGRPEN1_NS).

This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_IGRPEN1_EL1 are UNDEFINED.

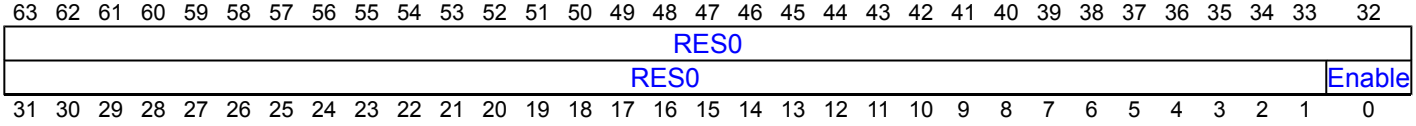
Attributes

ICC_IGRPEN1_EL1 is a 64-bit register.

This register has the following instances:

- ICC_IGRPEN1_EL1, when EL3 is not implemented.
- ICC_IGRPEN1_EL1_S, when EL3 is implemented.
- ICC_IGRPEN1_EL1_NS, when EL3 is implemented.

Field descriptions



Bits [63:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 1 interrupts for the current Security state.

Enable	Meaning
0b0	Group 1 interrupts are disabled for the current Security state.
0b1	Group 1 interrupts are enabled for the current Security state.

Virtual accesses to this register update ICH_VMCR_EL2.VENG1.

If EL3 is present:

- The Secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1S bit.
- The Non-secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

ICC_IGRPEN1_EL3, Interrupt Controller Interrupt Group 1 Enable Register (EL3)

The ICC_IGRPEN1_EL3 characteristics are:

Purpose

Controls whether Group 1 interrupts are enabled or not.

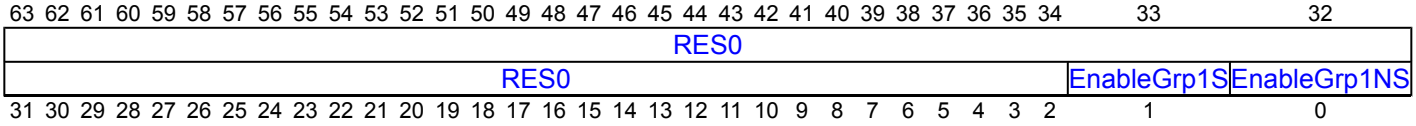
Configuration

This register is present only when GICv3 is implemented, EL3 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_IGRPEN1_EL3 are UNDEFINED.

Attributes

ICC_IGRPEN1_EL3 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

EnableGrp1S, bit [1]

Enables Group 1 interrupts for the Secure state.

EnableGrp1S	Meaning
0b0	Secure Group 1 interrupts are disabled.
0b1	Secure Group 1 interrupts are enabled.

The Secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

EnableGrp1NS, bit [0]

Enables Group 1 interrupts for the Non-secure state.

EnableGrp1NS	Meaning
0b0	Non-secure Group 1 interrupts are disabled.
0b1	Non-secure Group 1 interrupts are enabled.

The Non-secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Accessing ICC_IGRPEN1_EL3

Accesses to this register use the following encodings in the System register encoding space:

ICC_NMIAR1_EL1, Interrupt Controller Non-maskable Interrupt Acknowledge Register 1

The ICC_NMIAR1_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 1 non-maskable interrupt. This read acts as an acknowledge for the interrupt.

Configuration

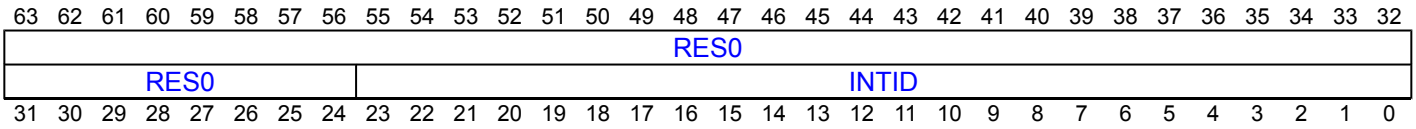
This register is present only when FEAT_GICv3_NMI is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_NMIAR1_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_NMIAR1_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt has the Non-maskable property and is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_NMIAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_NMIAR1_EL1

ICC_PMR_EL1, Interrupt Controller Interrupt Priority Mask Register

The ICC_PMR_EL1 characteristics are:

Purpose

Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Writes to this register must be high performance and must ensure that no interrupt of lower priority than the written value occurs after the write, without requiring an ISB or an exception boundary.

Configuration

AArch64 System register ICC_PMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_PMR[31:0].

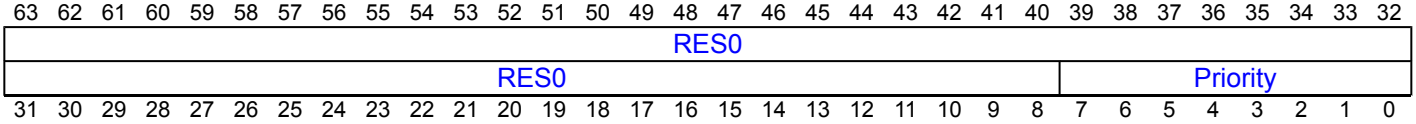
This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_PMR_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_PMR_EL1 is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	0x00-0xFF (0-255), all values	256
[7:1]	0x00-0xFE (0-254), even values only	128
[7:2]	0x00-0xFC (0-252), in steps of 4	64
[7:3]	0x00-0xF8 (0-248), in steps of 8	32
[7:4]	0x00-0xF0 (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00000000'.

Accessing ICC_PMR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_PMR_EL1

ICC_RPR_EL1, Interrupt Controller Running Priority Register

The ICC_RPR_EL1 characteristics are:

Purpose

Indicates the Running priority of the CPU interface.

Configuration

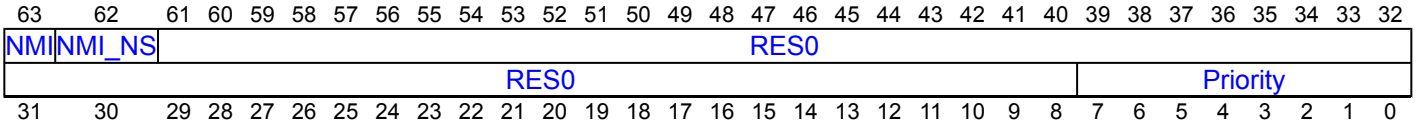
AArch64 System register ICC_RPR_EL1 bits [31:0] performs the same function as AArch32 System register ICC_RPR[31:0].

This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_RPR_EL1 are UNDEFINED.

Attributes

ICC_RPR_EL1 is a 64-bit register.

Field descriptions



NMI, bit [63]

When FEAT_GICv3_NMI is implemented:

Indicates whether the running priority is from a NMI.

NMI	Meaning
0b0	When GICD_CTLR.DS==1, there are no Active NMIs, or all Active NMIs have undergone priority drop. When GICD_CTLR.DS==0: • For Non-secure and Realm reads, there are no Active Non-secure Group 1 NMIs, or all Active Non-secure Group 1 NMIs have undergone priority drop. • For Secure and Root reads, there are no Active Secure Group 1 NMIs, or all Active Secure Group 1 NMIs have undergone priority drop.
0b1	When GICD_CTLR.DS==1, there is an Active NMI. When GICD_CTLR.DS==0: • For Non-secure and Realm reads, there is an Active Non-secure Group 1 NMI. • For Secure and Root reads, there is an Active Secure Group 1 NMI.

Otherwise:

Reserved, RES0.

NMI_NS, bit [62]

When FEAT_GICv3_NMI is implemented and EL3 is implemented:

Indicates whether the running priority is from a Non-secure Group 1 NMI.

NMI_NS	Meaning
0b0	There are no Active Non-secure Group 1 NMIs, or all Active Non-secure Group 1 NMIs have undergone priority drop.
0b1	There is an Active Non-secure Group 1 NMI which has not undergone priority drop.

For Non-secure and Realm accesses, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [61:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

The group priority of a Secure NMI, or NMI when GICD_CTLR.DS is 1, is 0x00. The group priority of a Non-secure NMI is 0x80, saturated to 0x00 for Non-secure reads.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

Accessing ICC_RPR_EL1

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_RPR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b011

```

ICC_SGI0R_EL1, Interrupt Controller Software Generated Interrupt Group 0 Register

The ICC_SGI0R_EL1 characteristics are:

Purpose

Generates Secure Group 0 SGIs.

Configuration

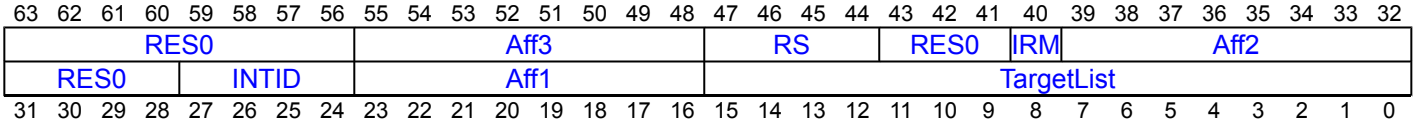
AArch64 System register ICC_SGI0R_EL1 performs the same function as AArch32 System register ICC_SGI0R.

This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_SGI0R_EL1 are UNDEFINED.

Attributes

ICC_SGI0R_EL1 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

Note

If SRE is set only for EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Accessing ICC_SGI0R_EL1

This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_SGI0R_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b111

ICC_SGI1R_EL1, Interrupt Controller Software Generated Interrupt Group 1 Register

The ICC_SGI1R_EL1 characteristics are:

Purpose

Generates Group 1 SGIs for the current Security state.

Configuration

AArch64 System register ICC_SGI1R_EL1 performs the same function as AArch32 System register ICC_SGI1R.

This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_SGI1R_EL1 are UNDEFINED.

Under certain conditions a write to ICC_SGI1R_EL1 can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_SGI1R_EL1 is a 64-bit register.

Field descriptions

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

Note

If SRE is set only for EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Accessing ICC_SGI1R_EL1

Note

Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_SGI1R_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b101

```

ICC_SRE_EL1, Interrupt Controller System Register Enable Register (EL1)

The ICC_SRE_EL1 characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL1.

Configuration

This register is banked between ICC_SRE_EL1 and ICC_SRE_EL1_S and ICC_SRE_EL1_NS.

AArch64 System register ICC_SRE_EL1 bits [31:0] (ICC_SRE_EL1_S) are architecturally mapped to AArch32 System register ICC_SRE[31:0] (ICC_SRE_S).

AArch64 System register ICC_SRE_EL1 bits [31:0] (ICC_SRE_EL1_NS) are architecturally mapped to AArch32 System register ICC_SRE[31:0] (ICC_SRE_NS).

AArch64 System register ICC_SRE_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_SRE.

This register is present only when GICv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_SRE_EL1 are UNDEFINED.

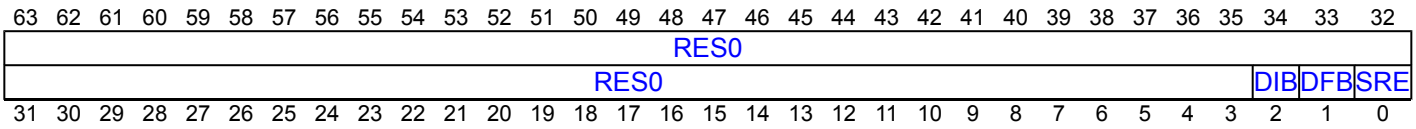
Attributes

ICC_SRE_EL1 is a 64-bit register.

This register has the following instances:

- ICC_SRE_EL1, when EL3 is not implemented.
- ICC_SRE_EL1_S, when EL3 is implemented.
- ICC_SRE_EL1_NS, when EL3 is implemented.

Field descriptions



Bits [63:3]

Reserved, RES0.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_SRE_EL3.DIB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read/write alias of ICC_SRE_EL3.DIB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DIB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_SRE_EL3.DFB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read/write alias of ICC_SRE_EL3.DFB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DFB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DFB.

In systems that do not support FIQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL1 to any ICC_* System register other than ICC_SRE_EL1 is trapped to EL1.
0b1	The System register interface for the current Security state is enabled.

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and ICC_SRE_EL3.SRE==0 the Secure copy of this bit is RAZ/WI. If ICC_SRE_EL3.SRE is changed from zero to one, the Secure copy of this bit becomes UNKNOWN.

If EL2 is implemented and ICC_SRE_EL2.SRE==0 the Non-secure copy of this bit is RAZ/WI. If ICC_SRE_EL2.SRE is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

If EL3 is implemented and ICC_SRE_EL3.SRE==0 the Non-secure copy of this bit is RAZ/WI. If ICC_SRE_EL3.SRE is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

If Realm Management Extension is implemented, this field is RAO/WI.

GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI. The following options are supported:

- The Non-secure copy of ICC_SRE_EL1.SRE can be RAO/WI if ICC_SRE_EL2.SRE is also RAO/WI. This means all Non-secure software, including VMs using only virtual interrupts, must access the GIC using System registers.
- The Secure copy of ICC_SRE_EL1.SRE can be RAO/WI if ICC_SRE_EL3.SRE and ICC_SRE_EL2.SRE are also RAO/WI. This means that all Secure software must access the GIC using System registers and all Non-secure accesses to registers for physical interrupts must use System registers.

Note

A VM using only virtual interrupts might still use memory-mapped access if the Non-secure copy of ICC_SRE_EL1.SRE is not RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_SRE_EL1

Execution with ICC_SRE_EL1.SRE set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_SRE_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b101

```

ICC_SRE_EL2, Interrupt Controller System Register Enable Register (EL2)

The ICC_SRE_EL2 characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

Configuration

AArch64 System register ICC_SRE_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICC_HSRE[31:0].

This register is present only when GICv3 is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_SRE_EL2 are UNDEFINED.

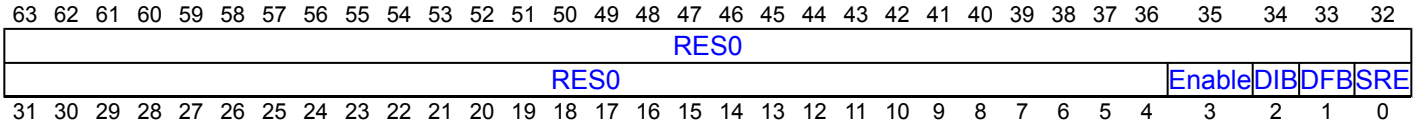
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICC_SRE_EL2 is a 64-bit register.

Field descriptions



Bits [63:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to ICC_SRE_EL1.

Enable	Meaning
0b0	When EL2 is implemented and enabled in the current Security state, EL1 accesses to ICC_SRE_EL1 trap to EL2.
0b1	EL1 accesses to ICC_SRE_EL1 do not trap to EL2.

If ICC_SRE_EL2.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_SRE_EL2.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_SRE_EL3.DIB.

If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read/write alias of ICC_SRE_EL3.DIB.

In systems that do not support IRQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_SRE_EL3.DFB.

If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read/write alias of ICC_SRE_EL3.DFB.

In systems that do not support FIQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL2 to any ICH_* or ICC_* register other than ICC_SRE_EL1 or ICC_SRE_EL2, is trapped to EL2.
0b1	The System register interface to the ICH_* registers and the EL1 and EL2 ICC_* registers is enabled for EL2.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and ICC_SRE_EL3.SRE==0 this bit is RAZ/WI. If ICC_SRE_EL3.SRE is changed from zero to one, this bit becomes UNKNOWN.

If Realm Management Extension is implemented, this field is RAO/WI.

FEAT_GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI, but this is only allowed if ICC_SRE_EL3.SRE is also RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_SRE_EL2

Execution with ICC_SRE_EL2.SRE set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_SRE_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1001	0b101

ICC_SRE_EL3, Interrupt Controller System Register Enable Register (EL3)

The ICC_SRE_EL3 characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

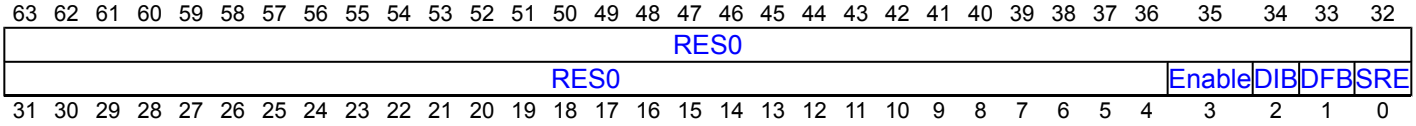
Configuration

This register is present only when GICv3 is implemented, EL3 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_SRE_EL3 are UNDEFINED.

Attributes

ICC_SRE_EL3 is a 64-bit register.

Field descriptions



Bits [63:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to ICC_SRE_EL1 and ICC_SRE_EL2.

Enable	Meaning
0b0	EL1 accesses to ICC_SRE_EL1 trap to EL3, unless these accesses are trapped to EL2 as a result of ICC_SRE_EL2.Enable == 0. EL2 accesses to ICC_SRE_EL1 and ICC_SRE_EL2 trap to EL3.
0b1	EL1 accesses to ICC_SRE_EL1 do not trap to EL3. EL2 accesses to ICC_SRE_EL1 and ICC_SRE_EL2 do not trap to EL3.

If ICC_SRE_EL3.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_SRE_EL3.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

In systems that do not support IRQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

In systems that do not support FIQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL3 to any ICH_* or ICC_* register other than ICC_SRE_EL1, ICC_SRE_EL2, or ICC_SRE_EL3 is trapped to EL3
0b1	The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_* registers is enabled for EL3.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If Realm Management Extension is implemented, this field is RAO/WI.

FEAT_GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_SRE_EL3

This register is always System register accessible.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_SRE_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b101

```

ICH_AP0R<n>_EL2, Interrupt Controller Hyp Active Priorities Group 0 Registers, n = 0 - 3

The ICH_AP0R<n>_EL2 characteristics are:

Purpose

Provides information about Group 0 virtual active priorities for EL2.

Configuration

AArch64 System register ICH_AP0R<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_AP0R<n>[31:0].

This register is present only when GICv3 is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_AP0R<n>_EL2 are UNDEFINED.

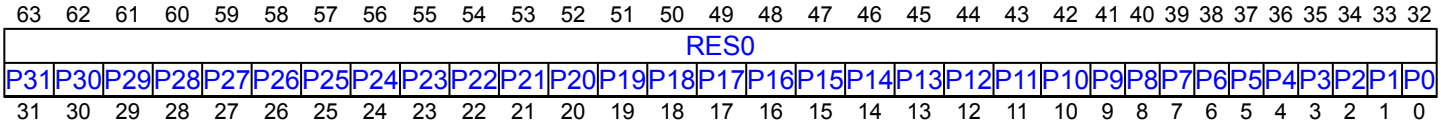
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_AP0R<n>_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

P<x>, bit [x], for x = 31 to 0

Provides the access to the virtual active priorities for Group 0 interrupts. Possible values of each bit are:

P<x>	Meaning
0b0	There is no Group 0 interrupt active with this priority level, or all active Group 0 interrupts with this priority level have undergone priority-drop.
0b1	There is a Group 0 interrupt active with this priority level which has not undergone priority drop.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP0R0_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP0R0_EL2 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP0R1_EL2 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP0R0_EL2 in the bits corresponding to 00:Priority[5:1].

- The active state of preemption levels 64 - 126 are held in ICH_AP0R1_EL2 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP0R2_EL2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH_AP0R3_EL2 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Additional information

Software must ensure that ICH_AP0R<n>_EL2 is 0 for legacy VMs otherwise behavior is UNPREDICTABLE. For more information about support for legacy VMs, see 'Support for legacy operation of VMs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The active priorities for Group 0 and Group 1 interrupts for legacy VMs are held in ICH_AP1R<n>_EL2 and reads and writes to GICV_APR access ICH_AP1R<n>_EL2. This means that ICH_AP0R<n>_EL2 is inaccessible to legacy VMs.

Accessing ICH_AP0R<n>_EL2

ICH_AP0R1_EL2 is implemented only in implementations that support 6 or more bits of preemption. ICH_AP0R2_EL2 and ICH_AP0R3_EL2 are implemented only in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits

Writing to these registers with any value other than the last read value of the register (or `0x00000000` for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

- Virtual interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution at EL1 or EL0.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICH_AP0R<n>_EL2.
- ICH_AP1R<n>_EL2.

Having the bit corresponding to a priority set in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 can result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_AP0R<m>_EL2 ; Where m = 0-3
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1000	0b0:m[1:0]

```

ICH_AP1R<n>_EL2, Interrupt Controller Hyp Active Priorities Group 1 Registers, n = 0 - 3

The ICH_AP1R<n>_EL2 characteristics are:

Purpose

Provides information about Group 1 virtual active priorities for EL2.

Configuration

AArch64 System register ICH_AP1R<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_AP1R<n>[31:0].

This register is present only when GICv3 is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_AP1R<n>_EL2 are UNDEFINED.

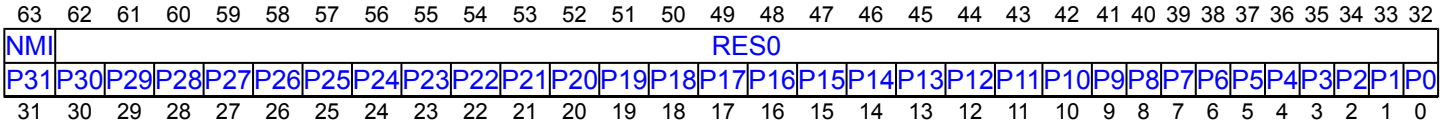
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_AP1R<n>_EL2 is a 64-bit register.

Field descriptions



NMI, bit [63]

When FEAT_GICv3_NMI is implemented and n == 0:

Indicates whether the running virtual priority is from a NMI.

NMI	Meaning
0b0	There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority drop.
0b1	There is an active Group 1 NMI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [62:32]

Reserved, RES0.

P<x>, bit [x], for x = 31 to 0

Group 1 interrupt active priorities. Possible values of each bit are:

P<x>	Meaning
0b0	There is no Group 1 interrupt active with this priority level, or all active Group 1 interrupts with this priority level have undergone priority-drop.
0b1	There is a Group 1 interrupt active with this priority level which has not undergone priority drop.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP1R0_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP1R0_EL2 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP1R1_EL2 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP1R0_EL2 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP1R1_EL2 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP1R2_EL2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH_AP1R3_EL2 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Additional information

This register is always used for legacy VMs, regardless of the group of the virtual interrupt. Reads and writes to GICV_APR<n> access ICH_AP1R<n>_EL2. For more information about support for legacy VMs, see 'Support for legacy operation of VMs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accessing ICH_AP1R<n>_EL2

ICH_AP1R1_EL2 is implemented only in implementations that support 6 or more bits of preemption. ICH_AP1R2_EL2 and ICH_AP1R3_EL2 are implemented only in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits

Writing to these registers with any value other than the last read value of the register (or 0x00000000 for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

ICH_EISR_EL2, Interrupt Controller End of Interrupt Status Register

The ICH_EISR_EL2 characteristics are:

Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

Configuration

AArch64 System register ICH_EISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_EISR[31:0].

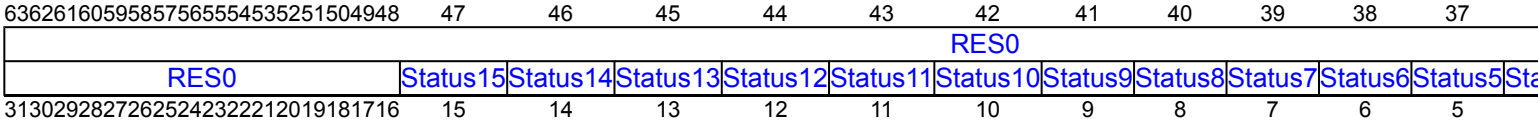
This register is present only when GICv3 is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_EISR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_EISR_EL2 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status bit for List register <n>:

Status<n>	Meaning
0b0	List register <n>, ICH_LR<n>_EL2, does not have an EOI maintenance interrupt.
0b1	List register <n>, ICH_LR<n>_EL2, has an EOI maintenance interrupt that has not been handled.

For any ICH_LR<n>_EL2, the corresponding status bit is set to 1 if all of the following are true:

- ICH_LR<n>_EL2.State is 0b00.
- ICH_LR<n>_EL2.HW is 0.
- ICH_LR<n>_EL2.EOI (bit [41]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

Otherwise the status bit takes the value 0.

Accessing ICH_EISR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_EISR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b011

```
if !(IsFeatureImplemented(FEAT_GICv3) && (HaveEL(EL2) || HaveEL(EL3)) &&
IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;

ICH_ELRSR_EL2, Interrupt Controller Empty List Register Status Register

The ICH_ELRSR_EL2 characteristics are:

Purpose

These registers can be used to locate a usable List register when the hypervisor is delivering an interrupt to a VM.

Configuration

AArch64 System register ICH_ELRSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_ELRSR[31:0].

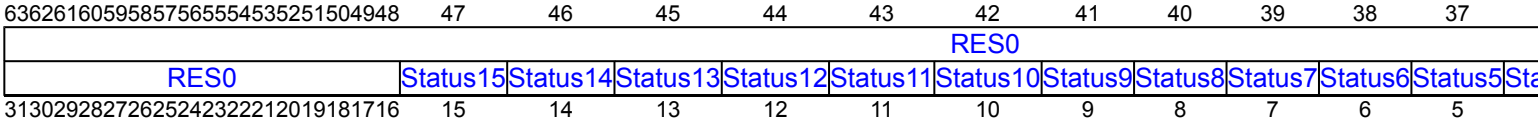
This register is present only when GICv3 is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_ELRSR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_ELRSR_EL2 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>, ICH_LR<n>_EL2:

Status<n>	Meaning
0b0	List register ICH_LR<n>_EL2, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.
0b1	List register ICH_LR<n>_EL2 does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.

For any List register <n>, the corresponding status bit is set to 1 if ICH_LR<n>_EL2.State is 0b00 and either ICH_LR<n>_EL2.HW is 1 or ICH_LR<n>_EL2.EOI (bit [41]) is 0.

Otherwise the status bit takes the value 0.

Accessing ICH_ELRSR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_ELRSR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b101

```
if !(IsFeatureImplemented(FEAT_GICv3) && (HaveEL(EL2) || HaveEL(EL3)) &&
IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = ICH_ELRSR_EL2;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        X[t, 64] = ICH_ELRSR_EL2;
```

ICH_HCR_EL2, Interrupt Controller Hyp Control Register

The ICH_HCR_EL2 characteristics are:

Purpose

Controls the environment for VMs.

Configuration

AArch64 System register ICH_HCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_HCR[31:0].

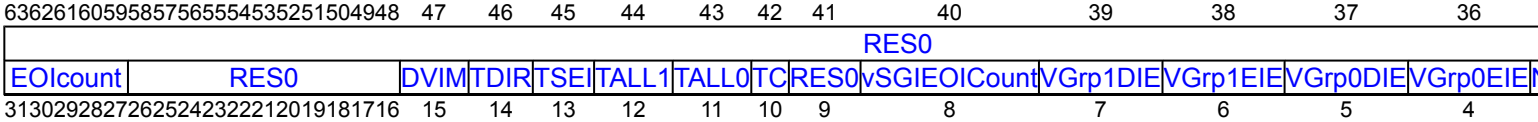
This register is present only when GICv3 is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_HCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_HCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

EOIcount, bits [31:27]

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It is CONSTRAINED UNPREDICTABLE whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers (ICH_AP0R<n>_EL2/ICH_AP1R<n>_EL2) increments EOIcount. Permitted behaviors are:

- Increment EOIcount.
- Leave EOIcount unchanged.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'00000'`.

Bits [26:16]

Reserved, RES0.

DVIM, bit [15]

When ICH_VTR_EL2.DVIM == 1:

Directly-injected Virtual Interrupt Mask.

DVIM	Meaning
0b0	This control has no effect on the signaling of virtual interrupts.
0b1	Virtual interrupts received via direct-injection are not presented to the virtual CPU interface and not considered when determining the highest priority pending virtual interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

TDIR, bit [14]

When FEAT_GICv3_TDIR is implemented:

Trap EL1 writes to ICC_DIR_EL1 and ICV_DIR_EL1.

TDIR	Meaning
0b0	EL1 writes of ICC_DIR_EL1 and ICV_DIR_EL1 are not trapped to EL2, unless trapped by other mechanisms.
0b1	EL1 writes of ICV_DIR_EL1 are trapped to EL2. It is IMPLEMENTATION DEFINED whether writes of ICC_DIR_EL1 are trapped. Not trapping ICC_DIR_EL1 writes is DEPRECATED.

Arm deprecates not including this trap bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

TSEI, bit [13]

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at EL1.

TSEI	Meaning
0b0	Locally generated SEIs do not cause a trap to EL2.
0b1	Locally generated SEIs trap to EL2.

If ICH_VTR_EL2.SEIS is 0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TALL1, bit [12]

Trap all EL1 accesses to ICC_* and ICV_* System registers for Group 1 interrupts to EL2.

TALL1	Meaning
0b0	EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.
0b1	EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TALL0, bit [11]

Trap all EL1 accesses to ICC_* and ICV_* System registers for Group 0 interrupts to EL2.

TALL0	Meaning
0b0	EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.
0b1	EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TC, bit [10]

Trap all EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

TC	Meaning
0b0	EL1 accesses to common registers proceed as normal.
0b1	EL1 accesses to common registers trap to EL2.

This affects accesses to ICC_SGI0R_EL1, ICC_SGI1R_EL1, ICC_ASGI1R_EL1, ICC_CTLR_EL1, ICC_DIR_EL1, ICC_PMR_EL1, ICC_RPR_EL1, ICV_CTLR_EL1, ICV_DIR_EL1, ICV_PMR_EL1, and ICV_RPR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [9]

Reserved, RES0.

vSGIEOICount, bit [8]

When GICv4.1 is implemented:

Controls whether deactivation of virtual SGIs can increment ICH_HCR_EL2.EOIcount

vSGIEOICount	Meaning
0b0	Deactivation of virtual SGIs can increment ICH_HCR_EL2.EOIcount.
0b1	Deactivation of virtual SGIs does not increment ICH_HCR_EL2.EOIcount.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp1DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp1EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG1 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp0DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp0EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

NPIE, bit [3]

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

NPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

LRENPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted while the EOIcount field is not 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

UIE, bit [1]

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

UIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

En, bit [0]

Enable. Global enable bit for the virtual CPU interface:

En	Meaning
0b0	Virtual CPU interface operation disabled.
0b1	Virtual CPU interface operation enabled.

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of ICV_IAR0_EL1, ICV_IAR1_EL1, ICV_NMIAR1_EL1, GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

Note

This field is RES0 when SCR_EL3.{NS,EEL2}=={0,0}

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICH_HCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_HCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b000

ICH_LR<n>_EL2, Interrupt Controller List Registers, n = 0 - 15

The ICH_LR<n>_EL2 characteristics are:

Purpose

Provides interrupt context information for the virtual CPU interface.

Configuration

AArch64 System register ICH_LR<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_LR<n>[31:0].

AArch64 System register ICH_LR<n>_EL2 bits [63:32] are architecturally mapped to AArch32 System register ICH_LRC<n>[31:0].

This register is present only when GICv3 is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_LR<n>_EL2 are UNDEFINED.

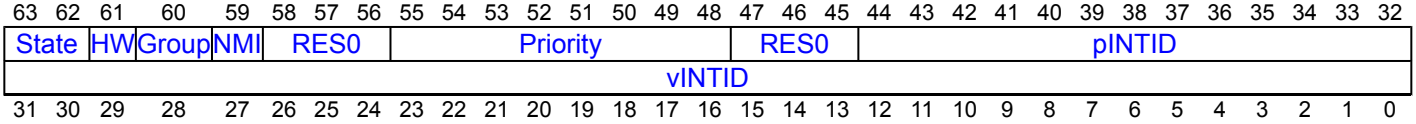
If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

Attributes

ICH_LR<n>_EL2 is a 64-bit register.

Field descriptions



State, bits [63:62]

The state of the interrupt:

State	Meaning
0b00	Invalid (Inactive).
0b01	Pending.
0b10	Active.
0b11	Pending and active.

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. When a virtual interrupt from a List register is acknowledged, the state is updated to the active state regardless of the interrupt type.

Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HW, bit [61]

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the ID that the pINTID field indicates.

HW	Meaning
0b0	The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
0b1	The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical interrupt ID. If ICH_VMCR_EL2.VEOIM is 0, this request corresponds to a write to ICC_EOIR0_EL1 or ICC_EOIR1_EL1. Otherwise, it corresponds to a write to ICC_DIR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Group, bit [60]

Indicates the group for this virtual interrupt.

Group	Meaning
0b0	This is a Group 0 virtual interrupt. ICH_VMCR_EL2.VFIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and ICH_VMCR_EL2.VENG0 enables signaling of this interrupt to the virtual machine.
0b1	This is a Group 1 virtual interrupt, signaled as a virtual IRQ. ICH_VMCR_EL2.VENG1 enables the signaling of this interrupt to the virtual machine. If ICH_VMCR_EL2.VCBPR is 0, then ICC_BPR1_EL1 determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, ICH_LR<n>_EL2 determines preemption.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NMI, bit [59]

When FEAT_GICv3_NMI is implemented:

Indicates whether the virtual priority has the non-maskable property.

NMI	Meaning
0b0	vINTID does not have the non-maskable interrupt property.
0b1	vINTID has the non-maskable interrupt property.

Setting ICH_LR<n>_EL2.NMI to 1 when ICH_LR<n>_EL2.State is not Invalid is CONSTRAINTED UNPREDICTABLE if either ICH_LR<n>_EL2.vINTID indicates an LPI or ICH_LR<n>_EL2.Group is 0.

The permitted behaviors are:

- ICH_LR<n>_EL2.NMI is treated as 0 for all purposes other than a direct read of the register.
- The virtual interrupt is presented with superpriority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [58:56]

Reserved, RES0.

Priority, bits [55:48]

The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[48] up to bit[50]. The number of implemented bits can be discovered from ICH_VTR_EL2.PRIbits.

When ICH_LR<n>_EL2.NMI is set to 1, this field is RES0 and the virtual interrupt's priority is treated as `0x00`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:45]

Reserved, RES0.

pINTID, bits [44:32]

Physical INTID, for hardware interrupts.

When ICH_LR<n>_EL2.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[44:42]: RES0.
- Bit[41]: EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, a maintenance interrupt is asserted.
- Bits[40:32]: RES0.

When ICH_LR<n>_EL2.HW is 1 (there is a corresponding physical interrupt):

- This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.
- When ICC_CTLR_EL1.ExtRange is 0, then bits[44:42] of this field are RES0.
- If the value of pINTID is not a valid INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by ICC_CTLR_EL1.IDbits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

vINTID, bits [31:0]

Virtual INTID of the interrupt.

If the value of vINTID is 1020-1023 and ICH_LR<n>_EL2.State!=`0b00` (Inactive), behavior is UNPREDICTABLE.

Behavior is UNPREDICTABLE if two or more List Registers specify the same vINTID when:

- ICH_LR<n>_EL2.State == `0b01`.
- ICH_LR<n>_EL2.State == `0b10`.
- ICH_LR<n>_EL2.State == `0b11`.

It is IMPLEMENTATION DEFINED how many bits are implemented, though at least 16 bits must be implemented. Unimplemented bits are RES0. The number of implemented bits can be discovered from ICH_VTR_EL2.IDbits.

When ICC_SRE_EL1.SRE == 0, specifying a vINTID in the LPI range is UNPREDICTABLE

Note

When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICH_LR<n>_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_LR<m>_EL2 ; Where m = 0-15
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b110:m[3]	m[2:0]

```
integer m = UInt(CRm<0>:op2<2:0>);

if !(IsFeatureImplemented(FEAT_GICv3) && (HaveEL(EL2) || HaveEL(EL3)) &&
IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif m >= NUM_GIC_LIST_REGS then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'1x1'} then
        X[t, 64] = NVMem[0x400 + (8 * m)];
    elsif EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = ICH_LR_EL2[m];
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        X[t, 64] = ICH_LR_EL2[m];
```

```
MSR ICH_LR<m>_EL2, <Xt> ; Where m = 0-15
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b110:m[3]	m[2:0]

```
integer m = UInt(CRm<0>:op2<2:0>);

if !(IsFeatureImplemented(FEAT_GICv3) && (HaveEL(EL2) || HaveEL(EL3)) &&
IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif m >= NUM_GIC_LIST_REGS then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'1x1'} then
        NVMem[0x400 + (8 * m)] = X[t, 64];
    elsif EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        ICH_LR_EL2[m] = X[t, 64];
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        ICH_LR_EL2[m] = X[t, 64];
```

ICH_MISR_EL2, Interrupt Controller Maintenance Interrupt State Register

The ICH_MISR_EL2 characteristics are:

Purpose

Indicates which maintenance interrupts are asserted.

Configuration

AArch64 System register ICH_MISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_MISR[31:0].

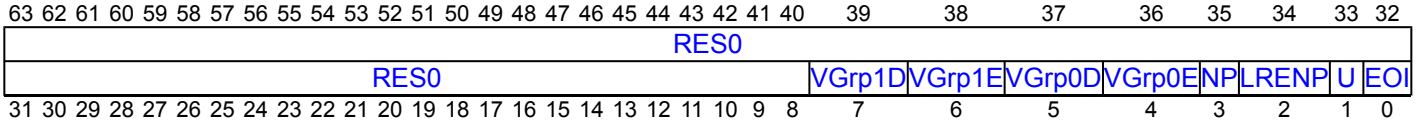
This register is present only when GICv3 is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_MISR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_MISR_EL2 is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

VGrp1D, bit [7]

vPE Group 1 Disabled.

VGrp1D	Meaning
0b0	vPE Group 1 Disabled maintenance interrupt not asserted.
0b1	vPE Group 1 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp1DIE==1 and ICH_VMCR_EL2.VENG1==is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp1E, bit [6]

vPE Group 1 Enabled.

VGrp1E	Meaning
0b0	vPE Group 1 Enabled maintenance interrupt not asserted.
0b1	vPE Group 1 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp1EIE==1 and ICH_VMCR_EL2.VENG1==is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0D, bit [5]

vPE Group 0 Disabled.

VGrp0D	Meaning
0b0	vPE Group 0 Disabled maintenance interrupt not asserted.
0b1	vPE Group 0 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp0DIE==1 and ICH_VMCR_EL2.VENG0==0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0E, bit [4]

vPE Group 0 Enabled.

VGrp0E	Meaning
0b0	vPE Group 0 Enabled maintenance interrupt not asserted.
0b1	vPE Group 0 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp0EIE==1 and ICH_VMCR_EL2.VENG0==1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

NP, bit [3]

No Pending.

NP	Meaning
0b0	No Pending maintenance interrupt not asserted.
0b1	No Pending maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.NPIE==1 and no List register is in pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

LRENP, bit [2]

List Register Entry Not Present.

LRENP	Meaning
0b0	List Register Entry Not Present maintenance interrupt not asserted.
0b1	List Register Entry Not Present maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.LRENPIE==1 and ICH_HCR_EL2.EOIcount is nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

U, bit [1]

Underflow.

U	Meaning
0b0	Underflow maintenance interrupt not asserted.
0b1	Underflow maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.UIE==1 and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding ICH_LR<n>_EL2.State bits do not equal 0x0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

EOI, bit [0]

End Of Interrupt.

EOI	Meaning
0b0	End Of Interrupt maintenance interrupt not asserted.
0b1	End Of Interrupt maintenance interrupt asserted.

This maintenance interrupt is asserted when at least one bit in ICH_EISR_EL2 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Additional information

The U and NP bits do not include the status of any pending/active 'VSet (IRI)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069) packets because these bits control generation of interrupts that allow software management of the contents of the List Registers (which are not affected by 'VSet (IRI)' packets).

Accessing ICH_MISR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_MISR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b010

```
if !(IsFeatureImplemented(FEAT_GICv3) && (HaveEL(EL2) || HaveEL(EL3)) &&
IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = ICH_MISR_EL2;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        X[t, 64] = ICH_MISR_EL2;
```

ICH_VMCR_EL2, Interrupt Controller Virtual Machine Control Register

The ICH_VMCR_EL2 characteristics are:

Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

Configuration

AArch64 System register ICH_VMCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_VMCR[31:0].

This register is present only when GICv3 is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_VMCR_EL2 are UNDEFINED.

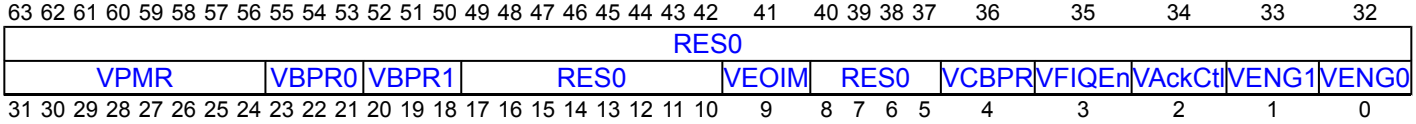
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_VMCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

VPMR, bits [31:24]

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

This field is an alias of ICV_PMR_EL1.Priority.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH_VMCR_EL2.VCBPR == 1.

This field is an alias of ICV_BPR0_EL1.BinaryPoint.

The minimum value of this field is determined by ICH_VTR_EL2.PREbits. An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if ICH_VMCR_EL2.VCBPR == 0.

This field is an alias of ICV_BPR1_EL1.BinaryPoint.

This field is always accessible to EL2 accesses, regardless of the setting of the ICH_VMCR_EL2.VCBPR field.

For Non-secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0 plus one.

For Secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

Bits [17:10]

Reserved, RES0.

VEOIM, bit [9]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

VEOIM	Meaning
0b0	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR_EL1 are UNPREDICTABLE.
0b1	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide priority drop functionality only. ICV_DIR_EL1 provides interrupt deactivation functionality.

This bit is an alias of ICV_CTLR_EL1.EOImode.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

VCBPR	Meaning
0b0	ICV_BPR1_EL1 determines the preemption group for virtual Group 1 interrupts.
0b1	Reads of ICV_BPR1_EL1 return ICV_BPR0_EL1 plus one, saturated to 0b111. Writes to ICV_BPR1_EL1 are ignored.

This field is an alias of ICV_CTLR_EL1.CBPR.

VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

VFIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

This bit is an alias of GICV_CTLR.FIQEn.

In implementations where the Non-secure copy of ICC_SRE_EL1.SRE is always 1, this bit is RES1.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

VAckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.

This bit is an alias of GICV_CTLR.AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

In implementations where the Non-secure copy of ICC_SRE_EL1.SRE is always 1, this bit is RES0.

VENG1, bit [1]

Virtual Group 1 interrupt enable. Possible values of this bit are:

VENG1	Meaning
0b0	Virtual Group 1 interrupts are disabled.
0b1	Virtual Group 1 interrupts are enabled.

This bit is an alias of ICV_IGRPEN1_EL1.Enable.

VENG0, bit [0]

Virtual Group 0 interrupt enable. Possible values of this bit are:

VENG0	Meaning
0b0	Virtual Group 0 interrupts are disabled.
0b1	Virtual Group 0 interrupts are enabled.

This bit is an alias of ICV_IGRPEN0_EL1.Enable.

Accessing ICH_VMCR_EL2

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_VMCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b111

```

ICH_VTR_EL2, Interrupt Controller VGIC Type Register

The ICH_VTR_EL2 characteristics are:

Purpose

Reports supported GIC virtualization features.

Configuration

AArch64 System register ICH_VTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_VTR[31:0].

This register is present only when GICv3 is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_VTR_EL2 are UNDEFINED.

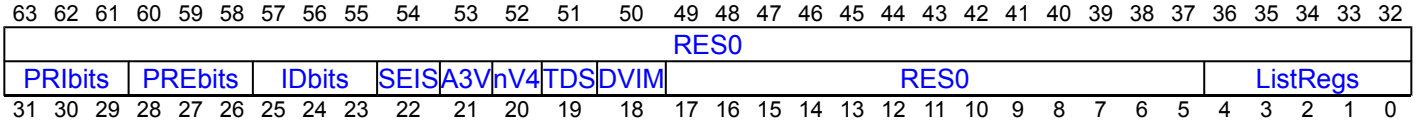
If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_VTR_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

PRIbits, bits [31:29]

Priority bits. Indicates the number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of ICV_CTLR_EL1.PRIbits.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PRIbits	Meaning
0b100..0b110	The number of virtual priority bits implemented, minus one.

Access to this field is **RO**.

PREbits, bits [28:26]

Preemption bits. Indicates the number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH_VTR_EL2.PRIbits.

This field determines the minimum value of ICH_VMCR_EL2.VBPR0.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PREbits	Meaning
0b000..0b110	The number of virtual preemption bits implemented, minus one.

Access to this field is **RO**.

IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

The value of this field is an IMPLEMENTATION DEFINED choice of:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

This field is an alias of ICV_CTLR_EL1.IDbits.

Access to this field is **RO**.

SEIS, bit [22]

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support generation of SEIs.
0b1	The virtual CPU interface logic supports generation of SEIs.

This bit is an alias of ICV_CTLR_EL1.SEIS.

Access to this field is **RO**.

A3V, bit [21]

Affinity 3 Valid.

The value of this field is an IMPLEMENTATION DEFINED choice of:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports nonzero values of Affinity 3 in SGI generation System registers.

This bit is an alias of ICV_CTLR_EL1.A3V.

Access to this field is **RO**.

nV4, bit [20]

Direct injection of virtual interrupts not supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

nV4	Meaning
0b0	The CPU interface logic supports direct injection of virtual interrupts.
0b1	The CPU interface logic does not support direct injection of virtual interrupts.

In GICv3, the only permitted value is 0b1.

Access to this field is **RO**.

TDS, bit [19]

Separate trapping of EL1 writes to ICV_DIR_EL1 supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TDS	Meaning
0b0	Implementation does not support ICH_HCR_EL2.TDIR.
0b1	Implementation supports ICH_HCR_EL2.TDIR.

FEAT_GICv3_TDIR implements the functionality added by the value 0b1.

Access to this field is **RO**.

DVIM, bit [18]

Masking of directly-injected virtual interrupts.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DVIM	Meaning
0b0	Masking of Directly-injected Virtual Interrupts not supported.
0b1	Masking of Directly-injected Virtual Interrupts is supported.

When a PE implements the Realm Management Extension, this field is RAO/WI.

Access to this field is **RO**.

Bits [17:5]

Reserved, RES0.

ListRegs, bits [4:0]

List Registers. Indicates the number of List registers implemented, minus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ListRegs	Meaning
0b00000..0b01111	The number of List registers implemented, minus one.

Access to this field is **RO**.

Accessing ICH_VTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_VTR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b001

```
if !(IsFeatureImplemented(FEAT_GICv3) && (HaveEL(EL2) || HaveEL(EL3)) &&
IsFeatureImplemented(FEAT_AA64)) then

ICV_AP0R<n>_EL1, Interrupt Controller Virtual Active Priorities Group 0 Registers, n = 0 - 3

The ICV_AP0R<n>_EL1 characteristics are:

Purpose

Provides information about virtual Group 0 active priorities.

Configuration

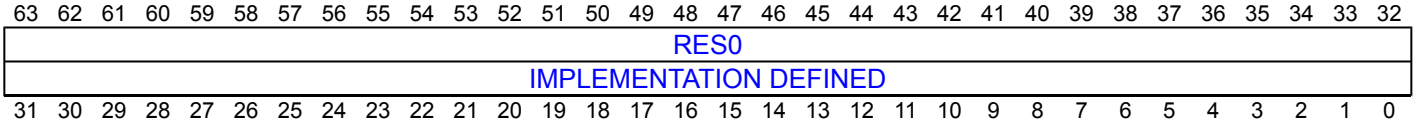
AArch64 System register ICV_AP0R<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_AP0R<n>[31:0].

This register is present only when GICv3 is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_AP0R<n>_EL1 are UNDEFINED.

Attributes

ICV_AP0R<n>_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value `0x00000000` is consistent with no interrupts being active.

Accessing ICV_AP0R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or `0x00000000` when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP0R1_EL1 is implemented only in implementations that support 6 or more bits of priority. ICV_AP0R2_EL1 and ICV_AP0R3_EL1 are implemented only in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>_EL1.
- ICV_AP1R<n>_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_AP0R<m>_EL1 ; Where m = 0-3
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b1:m[1:0]

```
integer m = UInt(op2<1:0>);

ICV_AP1R<n>_EL1, Interrupt Controller Virtual Active Priorities Group 1 Registers, n = 0 - 3

The ICV_AP1R<n>_EL1 characteristics are:

Purpose

Provides information about virtual Group 1 active priorities.

Configuration

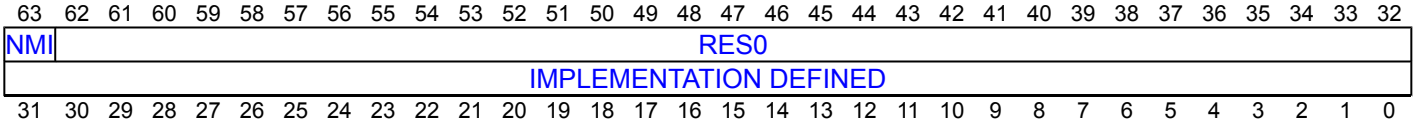
AArch64 System register ICV_AP1R<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_AP1R<n>[31:0].

This register is present only when GICv3 is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_AP1R<n>_EL1 are UNDEFINED.

Attributes

ICV_AP1R<n>_EL1 is a 64-bit register.

Field descriptions



NMI, bit [63]

When FEAT_GICv3_NMI is implemented and n == 0:

Indicates whether the running priority is from a NMI.

NMI	Meaning
0b0	There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority-drop.
0b1	There is an active Group 1 NMI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [62:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value `0x00000000` is consistent with no interrupts being active.

Accessing ICV_AP1R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or `0x00000000` when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

ICV_BPR0_EL1, Interrupt Controller Virtual Binary Point Register 0

The ICV_BPR0_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 0 interrupt preemption.

Configuration

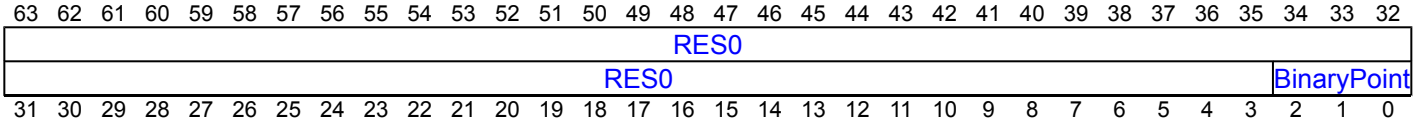
AArch64 System register ICV_BPR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_BPR0[31:0].

This register is present only when GICv3 is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_BPR0_EL1 are UNDEFINED.

Attributes

ICV_BPR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	gggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.sssssssss

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR0_EL1

The minimum binary point value is derived from the number of implemented preemption bits, as shown in the following table:

Number of implemented preemption bits	Minimum value of BPR0
7	0
6	1
5	2

The number of implemented preemption bits is indicated by ICH_VTR_EL2.PREbits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_BPR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b011

ICV_BPR1_EL1, Interrupt Controller Virtual Binary Point Register 1

The ICV_BPR1_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 1 interrupt preemption.

Configuration

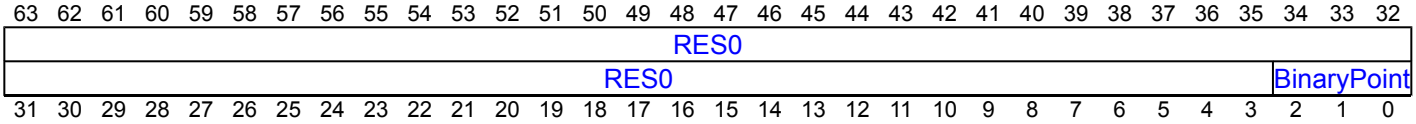
AArch64 System register ICV_BPR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_BPR1[31:0].

This register is present only when GICv3 is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_BPR1_EL1 are UNDEFINED.

Attributes

ICV_BPR1_EL1 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

An attempt to program this field to a value less than the minimum value sets the field to the minimum value.

If ICV_CTLR_EL1.CBPR is set to 1, Non-secure EL1 reads return ICV_BPR0_EL1 + 1 saturated to `0b111`. Non-secure EL1 writes are ignored.

If ICV_CTLR_EL1.CBPR is set to 1, Secure EL1 reads return ICV_BPR0_EL1. Secure EL1 writes modify ICV_BPR0_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR1_EL1

For Non-secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0 plus one.

For Secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_BPR1_EL1
```

ICV_CTLR_EL1, Interrupt Controller Virtual Control Register

The ICV_CTLR_EL1 characteristics are:

Purpose

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

Configuration

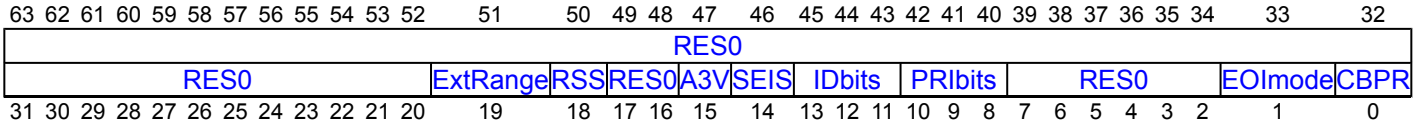
AArch64 System register ICV_CTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_CTLR[31:0].

This register is present only when GICv3 is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_CTLR_EL1 are UNDEFINED.

Attributes

ICV_CTLR_EL1 is a 64-bit register.

Field descriptions



Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

The value of this field is an IMPLEMENTATION DEFINED choice of:

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. • Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.

ICV_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL1.ExtRange.

Access to this field is **RO**.

RSS, bit [18]

Range Selector Support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Access to this field is **RO**.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored.

The value of this field is an IMPLEMENTATION DEFINED choice of:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports nonzero values of Affinity 3 in SGI generation System registers.

Access to this field is **RO**.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support local generation of SEIs.
0b1	The virtual CPU interface logic supports local generation of SEIs.

Access to this field is **RO**.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. Indicates the number of virtual interrupt identifier bits supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

Access to this field is **RO**.

PRIbits, bits [10:8]

Indicates the number of virtual priority bits implemented.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

The division between group priority and subpriority is defined in the binary point registers ICV_BPR0_EL1 and ICV_BPR1_EL1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PRIbits	Meaning
0b100..0b110	The number of virtual priority bits implemented, minus one.

Access to this field is **RO**.

Bits [7:2]

Reserved, RES0.

EOImode, bit [1]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

EOImode	Meaning
0b0	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR_EL1 are UNPREDICTABLE.
0b1	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide priority drop functionality only. ICV_DIR_EL1 provides interrupt deactivation functionality.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

CBPR	Meaning
0b0	ICV_BPR1_EL1 determines the preemption group for virtual Group 1 interrupts.
0b1	Non-secure reads of ICV_BPR1_EL1 return ICV_BPR0_EL1 plus one, saturated to 0b111. Non-secure writes to ICV_BPR1_EL1 are ignored. Secure reads of ICV_BPR1_EL1 return ICV_BPR0_EL1. Secure writes of ICV_BPR1_EL1 modify ICV_BPR0_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_CTLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_CTLR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b100

ICV_DIR_EL1, Interrupt Controller Deactivate Virtual Interrupt Register

The ICV_DIR_EL1 characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified virtual interrupt.

Configuration

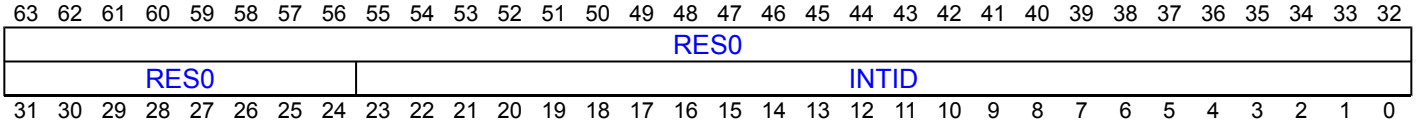
AArch64 System register ICV_DIR_EL1 bits [31:0] performs the same function as AArch32 System register ICV_DIR[31:0].

This register is present only when GICv3 is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_DIR_EL1 are UNDEFINED.

Attributes

ICV_DIR_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the virtual interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_DIR_EL1

When EOImode == 0, writes are ignored. In systems supporting system error generation, an implementation might generate an SEI.

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_DIR_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b001

```

ICV_EOIR0_EL1, Interrupt Controller Virtual End Of Interrupt Register 0

The ICV_EOIR0_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 0 interrupt.

Configuration

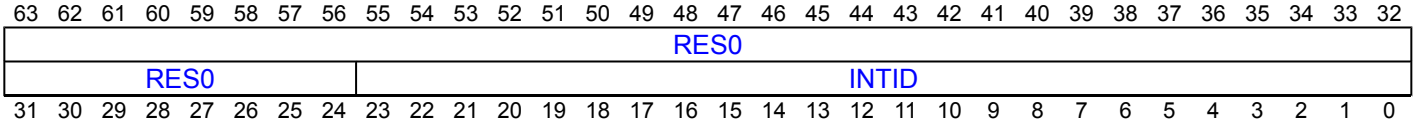
AArch64 System register ICV_EOIR0_EL1 bits [31:0] performs the same function as AArch32 System register ICV_EOIR0[31:0].

This register is present only when GICv3 is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_EOIR0_EL1 are UNDEFINED.

Attributes

ICV_EOIR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICV_IAR0_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR_EL1.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR_EL1.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR_EL1 to deactivate the virtual interrupt.

Accessing ICV_EOIR0_EL1

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR0_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_EOIR0_EL1, <Xt>
```

op0	op1	CRn	CRm	op2

0b11	0b000	0b1100	0b1000	0b001

ICV_HPPIR0_EL1, Interrupt Controller Virtual Highest Priority Pending Interrupt Register 0

The ICV_HPPIR0_EL1 characteristics are:

Purpose

Indicates the highest priority pending virtual Group 0 interrupt on the virtual CPU interface.

Configuration

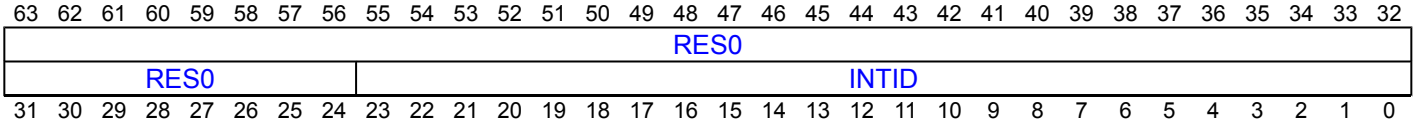
AArch64 System register ICV_HPPIR0_EL1 bits [31:0] performs the same function as AArch32 System register ICV_HPPIR0[31:0].

This register is present only when GICv3 is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_HPPIR0_EL1 are UNDEFINED.

Attributes

ICV_HPPIR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the highest priority pending virtual interrupt.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

ICV_IAR0_EL1, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV_IAR0_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch64 System register ICV_IAR0_EL1 bits [31:0] performs the same function as AArch32 System register ICV_IAR0[31:0].

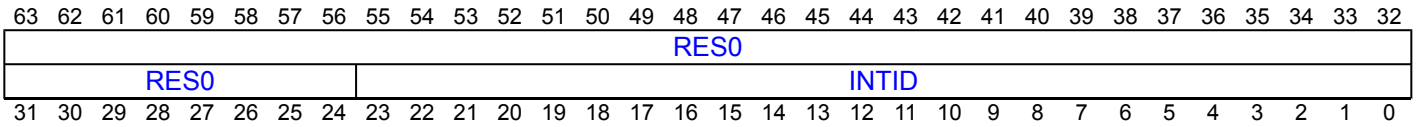
This register is present only when GICv3 is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_IAR0_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_IAR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_IAR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_IAR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b000

ICV_NMIAR1_EL1, Interrupt Controller Virtual Non-maskable Interrupt Acknowledge Register 1

The ICV_NMIAR1_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 1 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

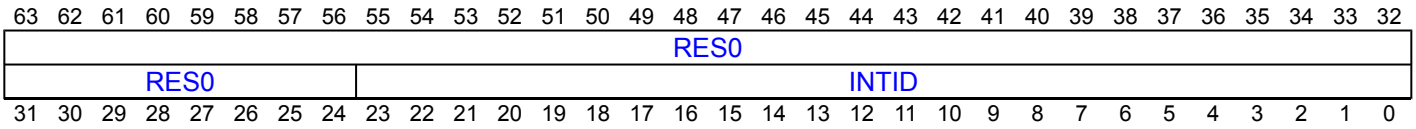
This register is present only when FEAT_GICv3_NMI is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_NMIAR1_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_NMIAR1_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that virtual interrupt has the Non-maskable property and is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_NMIAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

ICV_PMR_EL1, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV_PMR_EL1 characteristics are:

Purpose

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

Configuration

AArch64 System register ICV_PMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_PMR[31:0].

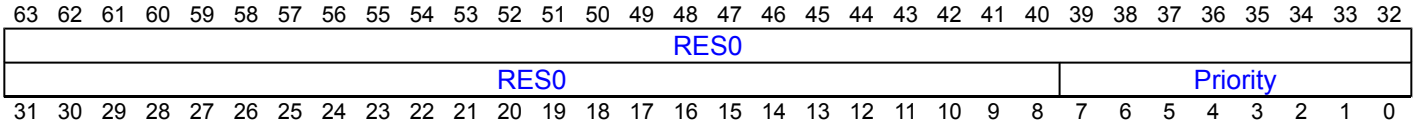
This register is present only when GICv3 is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_PMR_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronizing. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_PMR_EL1 is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	0x00-0xFF (0-255), all values	256
[7:1]	0x00-0xFE (0-254), even values only	128
[7:2]	0x00-0xFC (0-252), in steps of 4	64
[7:3]	0x00-0xF8 (0-248), in steps of 8	32
[7:4]	0x00-0xF0 (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_PMR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

ICV_RPR_EL1, Interrupt Controller Virtual Running Priority Register

The ICV_RPR_EL1 characteristics are:

Purpose

Indicates the Running priority of the virtual CPU interface.

Configuration

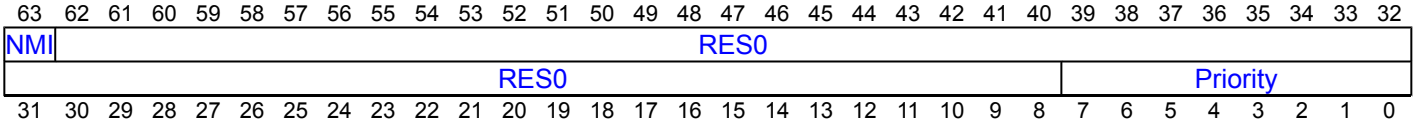
AArch64 System register ICV_RPR_EL1 bits [31:0] performs the same function as AArch32 System register ICV_RPR[31:0].

This register is present only when GICv3 is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_RPR_EL1 are UNDEFINED.

Attributes

ICV_RPR_EL1 is a 64-bit register.

Field descriptions



NMI, bit [63]

When FEAT_GICv3_NMI is implemented:

Indicates whether the running priority is from a NMI.

NMI	Meaning
0b0	There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority drop.
0b1	There is an active Group 1 NMI.

Otherwise:

Reserved, RES0.

Bits [62:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

Accessing ICV_RPR_EL1

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_RPR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b011

```

Zero PMU event counters for a Guest operating system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HPMN0	Meaning
0b0000	Setting MDCR_EL2.HPMN to zero has CONSTRAINED UNPREDICTABLE behavior.
0b0001	Setting MDCR_EL2.HPMN to zero has defined behavior.

All other values are reserved.

FEAT_HPMN0 implements the functionality identified by the value 0b0001.

From Armv8.8, in an implementation that includes FEAT_PMUv3, FEAT_FGT, and EL2, the value 0b0000 is not permitted.

Access to this field is **RO**.

ExtTrcBuff, bits [59:56]

Trace Buffer External Mode Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ExtTrcBuff	Meaning
0b0000	Trace Buffer External Mode not implemented.
0b0001	Trace Buffer External Mode implemented.

All other values are reserved.

FEAT_TRBE_EXT implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

BRBE, bits [55:52]

Branch Record Buffer Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BRBE	Meaning
0b0000	Branch Record Buffer Extension not implemented.
0b0001	Branch Record Buffer Extension implemented.
0b0010	As 0b0001, and adds support for branch recording at EL3.

All other values are reserved.

FEAT_BRBE implements the functionality identified by the value 0b0001.

FEAT_BRBEv1p1 implements the functionality identified by the value 0b0010.

From Armv9.3, if FEAT_BRBE is implemented, the value 0b0001 is not permitted.

Access to this field is **RO**.

MTPMU, bits [51:48]

Multi-threaded PMU extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are read/write or RES0.
0b0001	FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are RES0.

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

Access to this field is **RO**.

TraceBuffer, bits [47:44]

Trace Buffer Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceBuffer	Meaning
0b0000	Trace Buffer Extension not implemented.
0b0001	Trace Buffer Extension implemented.
0b0010	As 0b0001, and adds: • If EL2 and FEAT_FGT are implemented, a fine-grained trap on the TSB CSYNC instruction. • If EL2 is implemented, an EL2 control to override TRBLIMITR_EL1.nVM. • The TRBE Profiling exception extension, FEAT_TRBE_EXC.

All other values are reserved.

FEAT_TRBE implements the functionality identified by the value 0b0001.

FEAT_TRBEv1p1 implements the functionality identified by the value 0b0010.

In any Armv9 implementation, if FEAT_ETE is implemented, the value 0b0000 is not permitted.

From Armv9.6, if FEAT_TRBE is implemented, the value 0b0001 is not permitted.

Access to this field is **RO**.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if FEAT_ETMv4 is implemented, the value 0b0000 is not permitted.

If FEAT_ETE is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

DoubleLock, bits [39:36]

OS Double Lock implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DoubleLock	Meaning
0b0000	OS Double Lock implemented. OSDLR_EL1 is RW.
0b1111	OS Double Lock not implemented. OSDLR_EL1 is RAZ/WI.

All other values are reserved.

FEAT_DoubleLock implements the functionality identified by the value 0b0000.

In Armv8.0, the only permitted value is 0b0000.

If FEAT_Debugv8p2 is implemented and FEAT_DoPD is not implemented, the permitted values are 0b0000 and 0b1111.

If FEAT_DoPD is implemented, the only permitted value is 0b1111.

Access to this field is **RO**.

PMSVer, bits [35:32]

Statistical Profiling Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMSVer	Meaning
0b0000	Statistical Profiling Extension not implemented.
0b0001	Statistical Profiling Extension implemented.
0b0010	As 0b0001, and adds: • Support for the Events packet Alignment flag. • If FEAT_SVE is implemented, support for the Scalable Vector extensions to Statistical Profiling.
0b0011	As 0b0010, and adds: • Discard mode. • Extended event filtering, including the PMSNEVFR_EL1 System register. • Support for the OPTIONAL previous branch target Address packet. • If FEAT_PMUv3 is implemented, controls to freeze the PMU event counters after an SPE buffer management event occurs. • If FEAT_PMUv3 is implemented, the SAMPLE_FEED_BR, SAMPLE_FEED_EVENT, SAMPLE_FEED_LAT, SAMPLE_FEED_LD, SAMPLE_FEED_OP, and SAMPLE_FEED_ST PMU events.
0b0100	As 0b0011, and adds: • If FEAT_MOPS is implemented, Operation Type packet encodings for Memory Copy and Set operations. • If FEAT_MTE is implemented, Operation Type packet encodings for loads and stores of Allocation Tags.
0b0101	As 0b0100, and adds: • Support for the Events packet Level 2 Data cache access, Level 2 Data cache miss, Cached data modified, Recently fetched cache line, and Cache snoop flags. • Support for Data Source filtering.
0b0110	As 0b0101, and adds: • If EL2 and FEAT_FGT are implemented, a fine-grained trap on the PSB CSYNC instruction. • The SPE Profiling exception extension, FEAT_SPE_EXC. • The Statistical Profiling physical addressing mode extension, FEAT_SPE_nVM.

All other values are reserved.

FEAT_SPE implements the functionality identified by the value 0b0001.

FEAT_SPEv1p1 implements the functionality identified by the value 0b0010.

FEAT_SPEv1p2 implements the functionality identified by the value 0b0011.

FEAT_SPEv1p3 implements the functionality identified by the value 0b0100.

FEAT_SPEv1p4 implements the functionality identified by the value 0b0101.

FEAT_SPEv1p5 implements the functionality identified by the value 0b0110.

From Armv8.5, if FEAT_SPE is implemented, the value 0b0001 is not permitted.

From Armv8.7, if FEAT_SPE is implemented, the value 0b0010 is not permitted.

From Armv8.8, if FEAT_SPE is implemented, the value 0b0011 is not permitted.

From Armv8.9, if FEAT_SPE is implemented, the value 0b0100 is not permitted.

From Armv9.6, if FEAT_SPE is implemented, the value 0b0101 is not permitted.

Access to this field is **RO**.

CTX_CMPs, bits [31:28]

Number of context-aware breakpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CTX_CMPs	Meaning
0b0000..0b1111	The number of context-aware breakpoints, minus 1.

The value of this field is never greater than ID_AA64DFR0_EL1.BRPs.

If FEAT_Debugv8p9 is implemented and 16 or more context-aware breakpoints are implemented, then this field reads as 0b1111 and ID_AA64DFR1_EL1.CTX_CMPs indicates the number of context-aware breakpoints.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 breakpoints.

Access to this field is **RO**.

SEBEP, bits [27:24]

Synchronous-exception-based event profiling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEBEP	Meaning
0b0000	Synchronous-exception-based event profiling not implemented.
0b0001	Synchronous-exception-based event profiling implemented.

All other values are reserved.

FEAT_SEBEP implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

WRPs, bits [23:20]

Number of watchpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WRPs	Meaning
0b0001..0b1111	The number of watchpoints, minus 1.

If FEAT_Debugv8p9 is implemented and 16 or more watchpoints are implemented, then this field reads as 0b1111 and ID_AA64DFR1_EL1.WRPs indicates the number of watchpoints.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 watchpoints.

The value 0b0000 is reserved.

Access to this field is **RO**.

PMSS, bits [19:16]

PMU Snapshot extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMSS	Meaning
0b0000	PMU snapshot extension not implemented.
0b0001	PMU snapshot extension implemented.

All other values are reserved.

FEAT_PMUv3_SS implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

BRPs, bits [15:12]

Number of breakpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BRPs	Meaning
0b0001..0b1111	The number of breakpoints, minus 1.

If FEAT_Debugv8p9 is implemented and 16 or more breakpoints are implemented, then this field reads as 0b1111 and ID_AA64DFR1_EL1.BRPs indicates the number of breakpoints.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 breakpoints.

The value 0b0000 is reserved.

Access to this field is **RO**.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and adds support for: • Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. • If EL2 is implemented, the MDCR_EL2.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR_EL1 register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: • 64-bit event counters. • If EL2 is implemented, the MDCR_EL2.HCCD control. • If EL3 is implemented, the MDCR_EL3.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: • The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO controls. • If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: • Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. • Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1001	PMUv3 for Armv8.9. As 0b1000, and: • Updates the definitions of existing PMU events. • Adds support for the PMUSERENR_EL0.UEN control and the PMUACR_EL1 register. • Adds support for the EDECR.PME control.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

FEAT_PMUv3p9 implements the functionality identified by the value 0b1001.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

From Armv8.9, if FEAT_PMUv3 is implemented, the value 0b1000 is not permitted.

Access to this field is **RO**.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a trace unit is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceVer	Meaning
0b0000	Trace unit System registers not implemented.
0b0001	Trace unit System registers implemented.

All other values are reserved.

When trace unit System registers are implemented, see TRCIDR1 for tracing capabilities of the trace unit.

Access to this field is **RO**.

DebugVer, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DebugVer	Meaning
0b0110	Armv8.0 debug architecture.
0b0111	Armv8.1 debug architecture, FEAT_Debugv8p1.
0b1000	Armv8.2 debug architecture, FEAT_Debugv8p2.
0b1001	Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010	Armv8.8 debug architecture, FEAT_Debugv8p8.
0b1011	Armv8.9 debug architecture, FEAT_Debugv8p9.

All other values are reserved.

FEAT_Debugv8p1 implements the functionality identified by the value 0b0111.

FEAT_Debugv8p2 implements the functionality identified by the value 0b1000.

FEAT_Debugv8p4 implements the functionality identified by the value 0b1001.

FEAT_Debugv8p8 implements the functionality identified by the value 0b1010.

FEAT_Debugv8p9 implements the functionality identified by the value 0b1011.

From Armv8.1, when FEAT_Debugv8p1 is implemented the value 0b0110 is not permitted.

From Armv8.2, the values `0b0110` and `0b0111` are not permitted.

From Armv8.4, the value `0b1000` is not permitted.

From Armv8.8, the value `0b1001` is not permitted.

From Armv8.9, the value `0b1010` is not permitted.

Access to this field is **RO**.

Accessing ID_AA64DFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64DFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0101	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then

ID_AA64DFR1_EL1, AArch64 Debug Feature Register 1

The ID_AA64DFR1_EL1 characteristics are:

Purpose

Provides top-level information about the debug system in AArch64.

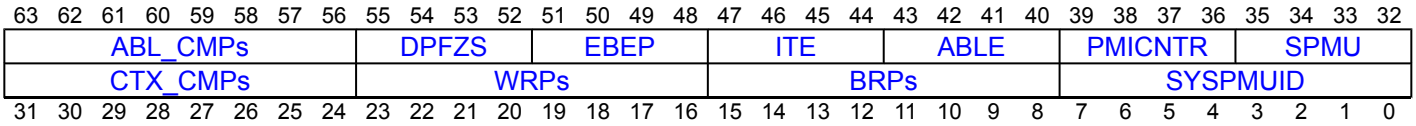
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64DFR1_EL1 are UNDEFINED.

Attributes

ID_AA64DFR1_EL1 is a 64-bit register.

Field descriptions



ABL_CMPs, bits [63:56]

When FEAT_ABLE is implemented:

Number of breakpoints that support address linking, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ABL_CMPs	Meaning
0x00..0x3F	Number of breakpoints that support address linking minus 1.

All other values are reserved.

The number of breakpoints that support address linking is never more than either the number of breakpoints or the number of watchpoints.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

DPFZS, bits [55:52]

Behavior of the cycle counter when event counting is frozen by a Statistical Profiling management event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DPFZS	Meaning
0b0000	The cycle counter PMCCNTR_EL0 is never affected by PMCR_EL0.FZS.
0b0001	The cycle counter PMCCNTR_EL0 does not count when PMCR_EL0.DP is 1 and counting by event counters accessible to EL1 is frozen by the PMCR_EL0.FZS mechanism.

FEAT_SPE_DPFZS implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

EBEP, bits [51:48]

Exception-based event profiling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EBEP	Meaning
0b0000	Exception-based event profiling not implemented.
0b0001	Exception-based event profiling implemented.

All other values are reserved.

FEAT_EBEP implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

ITE, bits [47:44]

Instrumentation Trace Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ITE	Meaning
0b0000	Instrumentation Trace Extension not implemented.
0b0001	Instrumentation Trace Extension implemented.

All other values are reserved.

FEAT_ITE implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

ABLE, bits [43:40]

Address Breakpoint Linking Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ABLE	Meaning
0b0000	Address Breakpoint Linking Extension not implemented.
0b0001	Address Breakpoint Linking Extension implemented.

All other values are reserved.

FEAT_BWE implements the address range breakpoints and mismatch breakpoints part of the functionality identified by the value 0b0001.

FEAT_ABLE implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

PMICNTR, bits [39:36]

PMU fixed-function instruction counter.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMICNTR	Meaning
0b0000	PMU fixed-function instruction counter not implemented.
0b0001	PMU fixed-function instruction counter implemented.

All other values are reserved.

FEAT_PMUv3_ICNTR implements the functionality identified by the value 0b0001.

If FEAT_PMUv3 is not implemented, then the only permitted value is 0b0000.

Access to this field is **RO**.

SPMU, bits [35:32]

System PMU extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SPMU	Meaning
0b0000	System PMU extension not implemented.
0b0001	System PMU extension implemented.
0b0010	As 0b0001, and adds support for SPMZR_EL0.

All other values are reserved.

FEAT_SPMU implements the functionality identified by the value 0b0001.

FEAT_SPMU2 implements the functionality identified by the value 0b0010.

From Armv9.5, the value 0b0001 is not permitted.

Access to this field is **RO**.

CTX_CMPs, bits [31:24]

Context-aware breakpoints.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CTX_CMPs	Meaning
0x00	ID_AA64DFR0_EL1.CTX_CMPs is the number of context-aware breakpoints, minus 1.
0x01..0x3F	Number of context-aware breakpoints minus 1.

All other values are reserved.

The value of this field is never greater than ID_AA64DFR1_EL1.BRPs.

Access to this field is **RO**.

WRPs, bits [23:16]

Watchpoints.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WRPs	Meaning
0x00	ID_AA64DFR0_EL1.WRPs is the number of watchpoints, minus 1.
0x01..0x3F	Number of watchpoints minus 1.

All other values are reserved.

Access to this field is **RO**.

BRPs, bits [15:8]

Breakpoints.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BRPs	Meaning
0x00	ID_AA64DFR0_EL1.BRPs is the number of breakpoints, minus 1.
0x01..0x3F	Number of breakpoints minus 1.

All other values are reserved.

Access to this field is **RO**.

SYSPMUID, bits [7:0]

When FEAT_SPMU is implemented:

System PMU ID. Indicates the largest value that can be written to SPMSELR_EL0.SYSPMUSEL.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYSPMUID	Meaning
0x00..0x1F	The largest supported value that can be written to SPMSELR_EL0.SYSPMUSEL.

All other values are reserved.

Since System PMUs might not be contiguously accessible, this field does not necessarily indicate the total number of accessible System PMUs.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Accessing ID_AA64DFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64DFR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0101	0b001

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if HaveEL(EL3) && EL3SDDUndefPriority() && IsFeatureImplemented(FEAT_IDTE3) && SCR_EL3.TID3 ==
'1' then
        UNDEFINED;
    elsif EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && IsFeatureImplemented(FEAT_IDTE3) && SCR_EL3.TID3 == '1' then
        if EL3SDDUndef() then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
    else
        X[t, 64] = ID_AA64DFR1_EL1;
elsif PSTATE.EL == EL2 then

ID_AA64DFR2_EL1, AArch64 Debug Feature Register 2

The ID_AA64DFR2_EL1 characteristics are:

Purpose

Provides top-level information about the debug system in AArch64.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64DFR2_EL1 are UNDEFINED.

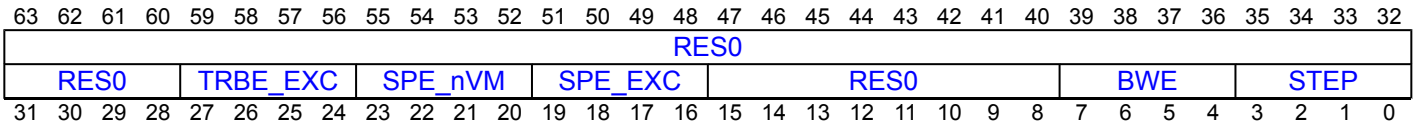
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64DFR2_EL1 is a 64-bit register.

Field descriptions



Bits [63:28]

Reserved, RES0.

TRBE_EXC, bits [27:24]

TRBE Profiling exception extension. Describes support for reporting trace buffer management events as TRBE Profiling exceptions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRBE_EXC	Meaning
0b0000	TRBE Profiling exception not implemented.
0b0001	TRBE Profiling exception implemented.

All other values are reserved.

FEAT_TRBE_EXC implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

SPE_nVM, bits [23:20]

Profiling Buffer physical address mode supported. Describes support for defining the Profiling Buffer using physical addresses or intermediate physical addresses.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SPE_nVM	Meaning
0b0000	Profiling Buffer physical address mode not implemented.
0b0001	Profiling Buffer physical address mode implemented.

All other values are reserved.

FEAT_SPE_nVM implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

SPE_EXC, bits [19:16]

SPE Profiling exception extension. Describes support for reporting Profiling Buffer management events as SPE Profiling exceptions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SPE_EXC	Meaning
0b0000	SPE Profiling exception not implemented.
0b0001	SPE Profiling exception implemented.

All other values are reserved.

FEAT_SPE_EXC implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

Bits [15:8]

Reserved, RES0.

BWE, bits [7:4]

Breakpoints and watchpoint enhancements.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BWE	Meaning
0b0000	This field does not indicate whether DBGBCR<n>_EL1.MASK and address mismatch breakpoints are implemented.
0b0001	DBGBCR<n>_EL1.MASK and address mismatch breakpoints are implemented.
0b0010	As 0b0001, and address mismatch watchpoints are implemented.

All other values are reserved.

FEAT_BWE implements the functionality identified by the value 0b0001.

FEAT_BWE2 implements the functionality identified by the value 0b0010.

When this field is 0b0000, ID_AA64DFR1_EL1.ABLE might indicate the presence of support for DBGBCR<n>_EL1.MASK and address mismatch breakpoints.

From Armv9.5, the value 0b0001 is not permitted.

Access to this field is **RO**.

STEP, bits [3:0]

Enhanced Software Step Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

STEP	Meaning
0b0000	Execution from MDSTEPOP_EL1 is not supported for Software Step.
0b0001	Execution from MDSTEPOP_EL1 is supported for Software Step.

All other values are reserved.

FEAT_STEP2 implements the functionality identified by the value `0b0001`.

Access to this field is **RO**.

Accessing ID_AA64DFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

`MRS <Xt>, ID_AA64DFR2_EL1`

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0101	0b010

```

ID_AA64FPFR0_EL1, AArch64 Floating-point Feature Register 0

The ID_AA64FPFR0_EL1 characteristics are:

Purpose

Provides information about floating-point formats and instructions implemented in AArch64 state.

The fields in this register do not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64SMFR0_EL1 and ID_AA64FPFR0_EL1.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64FPFR0_EL1 are UNDEFINED.

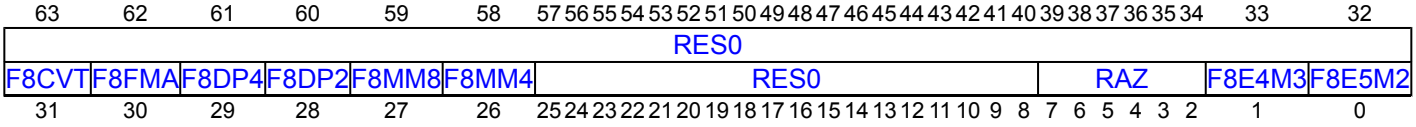
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64FPFR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

F8CVT, bit [31]

Indicates support for the following instructions:

- The Advanced SIMD floating-point scaling instruction `FSCALE`.
- The Advanced SIMD FP8 convert instructions `BF1CVTL`, `BF1CVTL2`, `BF2CVTL`, `BF2CVTL2`, `F1CVTL`, `F1CVTL2`, `F2CVTL`, `F2CVTL2`, `FCVTN`, and `FCVTN2`.
- When FEAT_SVE2 or FEAT_SME2 is implemented, the SVE2 FP8 convert instructions `BF1CVT`, `BF1CVTLT`, `BF2CVT`, `BF2CVTLT`, `F1CVT`, `F1CVTLT`, `F2CVT`, `F2CVTLT`, `BFCVTN`, `FCVTN`, `FCVTNB`, and `FCVTNT`.
- When FEAT_SME2 is implemented, the SME2 multi-vector floating-point scaling instruction `FSCALE` and the SME2 FP8 convert instructions `BF1CVT`, `BF1CVTL`, `BF2CVT`, `BF2CVTL`, `F1CVT`, `F1CVTL`, `F2CVT`, `F2CVTL`, `BFCVT`, `FCVT`, and `FCVTN`.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8CVT	Meaning
`0b0`	The specified instructions are not implemented.
`0b1`	The specified instructions are implemented.

FEAT_FP8 implements the functionality identified by the value 1.

Access to this field is **RO**.

F8FMA, bit [30]

Indicates support for the following instructions:

- The Advanced SIMD FP8 to single-precision and half-precision multiply-accumulate instructions `FMLALB`, `FMLALT`, `FMLALLBB`, `FMLALLBT`, `FMLALLTB`, and `FMLALLTT`.
- When FEAT_SVE2 is implemented and the PE is not in Streaming SVE mode, the SVE2 FP8 to single-precision and half-precision multiply-accumulate instructions `FMLALB`, `FMLALT`, `FMLALLBB`, `FMLALLBT`, `FMLALLTB`, and `FMLALLTT`.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8FMA	Meaning
`0b0`	The specified instructions are not implemented.
`0b1`	The specified instructions are implemented.

FEAT_FP8FMA implements the functionality identified by the value 1.

Access to this field is **RO**.

F8DP4, bit [29]

Indicates support for the following instructions:

- Advanced SIMD FP8 to single-precision 4-way dot product `FDOT` (4-way) instructions.
- When FEAT_SVE2 is implemented and the PE is not in Streaming SVE mode, SVE FP8 to single-precision 4-way dot product `FDOT` (4-way) instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8DP4	Meaning
`0b0`	The specified instructions are not implemented by this feature.
`0b1`	The specified instructions are implemented.

Note

Other features may implement some of the specified instructions.

All other values are reserved.

FEAT_FP8DOT4 implements the functionality identified by the value 1.

Access to this field is **RO**.

F8DP2, bit [28]

Indicates support for the following instructions:

- Advanced SIMD FP8 to half-precision 2-way dot product `FDOT` (2-way) instructions.
- When FEAT_SVE2 is implemented and the PE is not in Streaming SVE mode, SVE FP8 to half-precision 2-way dot product `FDOT` (2-way) instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8DP2	Meaning
`0b0`	The specified instructions are not implemented by this feature.
`0b1`	The specified instructions are implemented.

Note

Other features may implement some of the specified instructions.

FEAT_FP8DOT2 implements the functionality identified by the value 1.

Access to this field is **RO**.

F8MM8, bit [27]

Indicates support for the following instructions:

- Advanced SIMD FP8 to single-precision matrix multiply `FMMLA` (8-way, FP8 to FP32) instruction.
- If FEAT_SVE2 is implemented, SVE FP8 to single-precision matrix multiply `FMMLA` (widening, FP8 to FP32) instruction is implemented when the PE is not in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8MM8	Meaning
`0b0`	Advanced SIMD and SVE FP8 to single-precision matrix multiply instructions are not implemented by this feature.
`0b1`	The specified Advanced SIMD and SVE FP8 to single-precision matrix multiply instructions are implemented.

FEAT_F8F32MM implements the functionality identified by the value `0b0001`

Access to this field is **RO**.

F8MM4, bit [26]

Indicates support for the following instructions:

- Advanced SIMD FP8 to half-precision matrix multiply `FMMLA` (4-way, FP8 to FP16) instruction.
- If FEAT_SVE2 is implemented, SVE FP8 to half-precision matrix multiply `FMMLA` (widening, FP8 to FP16) instruction is implemented when the PE is not in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8MM4	Meaning
`0b0`	Advanced SIMD and SVE FP8 to half-precision matrix multiply instructions are not implemented by this feature.
`0b1`	The specified Advanced SIMD and SVE FP8 to half-precision matrix multiply instructions are implemented.

FEAT_F8F16MM implements the functionality identified by the value `0b0001`

Access to this field is **RO**.

Bits [25:8]

Reserved, RES0.

Bits [7:2]

Reserved for data formats 2 to 7.

Reserved, RAZ.

F8E4M3, bit [1]

Indicates support for OFP8 E4M3 format and behavior for FP8 instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8E4M3	Meaning
`0b0`	OFP8 E4M3 format is not supported.
`0b1`	OFP8 E4M3 format is supported.

If FEAT_FP8 is implemented, the only permitted value is 1.

Otherwise, the only permitted value is 0.

For more information on OFP8 formats, see the Open Compute Project, OCP 8-bit Floating Point Specification (OFP8).

Access to this field is **RO**.

F8E5M2, bit [0]

Indicates support for OFP8 E5M2 format and behavior for FP8 instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8E5M2	Meaning
0b0	OFP8 E5M2 format is not supported.
0b1	OFP8 E5M2 format is supported.

If FEAT_FP8 is implemented, the only permitted value is 1.

Otherwise, the only permitted value is 0.

For more information on OFP8 formats, see the Open Compute Project, OCP 8-bit Floating Point Specification (OFP8).

Access to this field is **RO**.

Accessing ID_AA64FPFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64FPFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b111

```
if !IsFeatureImplemented(FEAT_AA64) then

ID_AA64ISAR0_EL1, AArch64 Instruction Set Attribute Register 0

The ID_AA64ISAR0_EL1 characteristics are:

Purpose

Provides information about the instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64ISAR0_EL1 are UNDEFINED.

Attributes

ID_AA64ISAR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RNDR, bits [63:60]

Indicates support for Random Number instructions in AArch64 state.

When FEAT_RNG_TRAP is implemented, the value returned by a direct read of ID_AA64ISAR0_EL1.RNDR is further controlled by the value of SCR_EL3.TRNDR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RNDR	Meaning
0b0000	No Random Number instructions are implemented.
0b0001	RNDR and RNDRRS registers are implemented.

All other values are reserved.

FEAT_RNG implements the functionality identified by the value 0b0001.

From Armv8.5, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

TLB, bits [59:56]

Indicates support for Outer Shareable and TLB range maintenance instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TLB	Meaning
0b0000	Outer Shareable and TLB range maintenance instructions are not implemented.
0b0001	Outer Shareable TLB maintenance instructions are implemented.
0b0010	Outer Shareable and TLB range maintenance instructions are implemented.

All other values are reserved.

FEAT_TLBIOS implements the functionality identified by the values 0b0001 and 0b0010.

FEAT_TLBIRANGE implements the functionality identified by the value 0b0010.

From Armv8.4, the values 0b0000 and 0b0001 are not permitted.

Access to this field is **RO**.

TS, bits [55:52]

Indicates support for flag manipulation instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TS	Meaning
0b0000	No flag manipulation instructions are implemented.
0b0001	CFINV, RMIF, SETF16, and SETF8 instructions are implemented.
0b0010	CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.

All other values are reserved.

FEAT_FlagM implements the functionality identified by the value 0b0001.

FEAT_FlagM2 implements the functionality identified by the value 0b0010.

In Armv8.4, the value 0b0000 is not permitted.

From Armv8.5, the value 0b0001 is not permitted.

Access to this field is **RO**.

FHM, bits [51:48]

Indicates support for the Advanced SIMD half-precision to single-precision multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FHM	Meaning
0b0000	The Advanced SIMD half-precision to single-precision multiply instructions are not implemented.
0b0001	FMLAL and FMLSL instructions are implemented.

All other values are reserved.

FEAT_FHM implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

DP, bits [47:44]

Indicates support for Dot Product instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DP	Meaning
0b0000	No Dot Product instructions implemented.
0b0001	UDOT and SDOT instructions implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

SM4, bits [43:40]

Indicates support for SM4 instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SM4	Meaning
0b0000	No SM4 instructions implemented.
0b0001	SM4E and SM4EKEY instructions implemented.

All other values are reserved.

If FEAT_SM4 is not implemented, the value 0b0001 is reserved.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM3.

Access to this field is **RO**.

SM3, bits [39:36]

Indicates support for the following SM3 instructions SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SM3	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

If FEAT_SM3 is not implemented, the value 0b0001 is reserved.

FEAT_SM3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM4.

Access to this field is **RO**.

SHA3, bits [35:32]

Indicates support for the following SHA3 instructions EOR3, RAX1, XAR, and BCAX in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA3	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

If FEAT_SHA3 is not implemented, the value 0b0001 is reserved.

FEAT_SHA3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0001, ID_AA64ISAR0_EL1.SHA2 must have the value 0b0010.

Access to this field is **RO**.

RDM, bits [31:28]

Indicates support for SQRDMLAH and SQRDMLSH instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RDM	Meaning
0b0000	No RDMA instructions implemented.
0b0001	SQRDMLAH and SQRDMLSH instructions implemented.

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is **RO**.

TME, bits [27:24]

Indicates support for the following TME instructions TCANCEL, TCOMMIT, TSTART, and TTEST.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TME	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_TME is implemented.
  - PSTATE.EL IN {EL2, EL1}.
  - SCR_EL3.TME == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_TME is implemented.
  - PSTATE.EL == EL1.
  - EL2Enabled().
  - HCR_EL2.TME == 0.
- Otherwise, access to this field is **RO**.

Atomic, bits [23:20]

Indicates support for Atomic instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Atomic	Meaning
0b0000	No Atomic instructions implemented.
0b0010	LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.
0b0011	As for 0b0010, plus 128-bit instructions LDCLRP, LDSETP, and SWPP.

All other values are reserved.

FEAT_LSE implements the functionality identified by the value 0b0010.

FEAT_LSE128 implements the functionality identified by the value 0b0011.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is **RO**.

CRC32, bits [19:16]

Indicates support for the following CRC32 instructions `CRC32B`, `CRC32H`, `CRC32W`, `CRC32X`, `CRC32CB`, `CRC32CH`, `CRC32CW`, and `CRC32CX` in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CRC32	Meaning
`0b0000`	The specified instructions are not implemented.
`0b0001`	The specified instructions are implemented.

All other values are reserved.

FEAT_CRC32 implements the functionality identified by the value `0b0001`.

From Armv8.1, the value `0b0000` is not permitted.

Access to this field is **RO**.

SHA2, bits [15:12]

Indicates support for SHA2 instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA2	Meaning
`0b0000`	No SHA2 instructions implemented.
`0b0001`	Implements instructions: `SHA256H`, `SHA256H2`, `SHA256SU0`, and `SHA256SU1`.
`0b0010`	Implements instructions: • `SHA256H`, `SHA256H2`, `SHA256SU0`, and `SHA256SU1`. • `SHA512H`, `SHA512H2`, `SHA512SU0`, and `SHA512SU1`.

All other values are reserved.

FEAT_SHA256 implements the functionality identified by the value `0b0001`.

FEAT_SHA512 implements the functionality identified by the value `0b0010`.

If the value of ID_AA64ISAR0_EL1.SHA1 is `0b0000`, this field must have the value `0b0000`.

If the value of this field is `0b0010`, ID_AA64ISAR0_EL1.SHA3 must have the value `0b0001`.

Access to this field is **RO**.

SHA1, bits [11:8]

Indicates support for the following SHA1 instructions `SHA1C`, `SHA1P`, `SHA1M`, `SHA1H`, `SHA1SU0`, and `SHA1SU1` in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA1	Meaning
`0b0000`	The specified instructions are not implemented.
`0b0001`	The specified instructions are implemented.

All other values are reserved.

FEAT_SHA1 implements the functionality identified by the value `0b0001`.

If the value of ID_AA64ISAR0_EL1.SHA2 is `0b0000`, this field must have the value `0b0000`.

Access to this field is **RO**.

AES, bits [7:4]

Indicates support for AES instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC instructions implemented.
0b0010	As for 0b0001, plus PMULL and PMULL2 instructions operating on 64-bit source elements.

FEAT_AES implements the functionality identified by the value 0b0001.

FEAT_PMULL implements the functionality identified by the value 0b0010.

All other values are reserved.

Access to this field is **RO**.

Bits [3:0]

Reserved, RES0.

Accessing ID_AA64ISAR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64ISAR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b000

```

ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1

The ID_AA64ISAR1_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

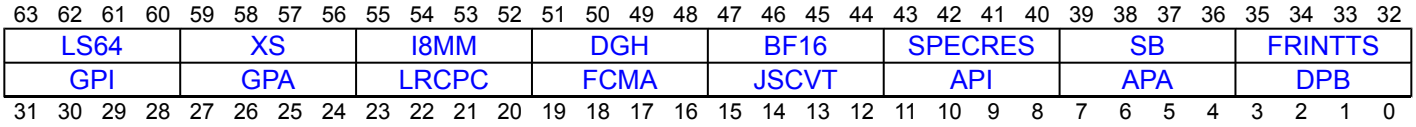
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64ISAR1_EL1 are UNDEFINED.

Attributes

ID_AA64ISAR1_EL1 is a 64-bit register.

Field descriptions



LS64, bits [63:60]

Indicates support for `LD64B` and `ST64B*` instructions, and the ACCDATA_EL1 register.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LS64	Meaning
`0b0000`	No `LD64B` or `ST64B` instructions are supported.
`0b0001`	The `LD64B` and `ST64B` instructions are supported.
`0b0010`	As `0b0001`, and adds the `ST64BV` instruction and traps.
`0b0011`	As `0b0010`, and adds the `ST64BV0` instruction, ACCDATA_EL1 register, and traps.
`0b0100`	As `0b0011`, and adds support for atomic accesses to Write-back Cacheable, Shareable memory using one of the following: • `LD64B` and `ST64B` instructions. • SIMD&FP instructions that load or store a pair of 128-bit registers by generating 32-byte single-copy atomic accesses.

All other values are reserved.

FEAT_LS64 implements the functionality identified by `0b0001`.

FEAT_LS64_V implements the functionality identified by `0b0010`.

FEAT_LS64_ACCDATA implements the functionality identified by `0b0011`.

FEAT_LS64WB implements the functionality identified by `0b0100`.

Access to this field is **RO**.

XS, bits [59:56]

Indicates support for the XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

XS	Meaning
0b0000	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields are not supported.
0b0001	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields are supported.

All other values are reserved.

FEAT_XS implements the functionality identified by 0b0001.

From Armv8.7, the value 0b0000 is not permitted.

Access to this field is **RO**.

I8MM, bits [55:52]

Indicates support for the following Advanced SIMD Int8 matrix multiplication instructions SMMLA, SUDOT, UMMLA, USMMLA, and USDOT in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

I8MM	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.I8MM.

From Armv8.6, the value 0b0000 is not permitted.

Access to this field is **RO**.

DGH, bits [51:48]

Indicates support for the Data Gathering Hint instruction.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DGH	Meaning
0b0000	Data Gathering Hint is not implemented.
0b0001	Data Gathering Hint is implemented.

All other values are reserved.

FEAT_DGH implements the functionality identified by 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0b0000.

Access to this field is **RO**.

BF16, bits [47:44]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	BFCVT, BFCVTN, BFCVTN2, BFDOT, BFMLALB, BFMLALT, and BFMMLA instructions are implemented.
0b0010	As 0b0001, but the FPCR.EBF field is also supported.

All other values are reserved.

FEAT_BF16 implements the functionality identified by 0b0001.

FEAT_EBF16 implements the functionality identified by 0b0010.

When FEAT_SVE or FEAT_SME is implemented, this field must return the same value as ID_AA64ZFR0_EL1.BF16.

From Armv8.6 and Armv9.1, the value 0b0000 is not permitted.

Access to this field is **RO**.

SPECRES, bits [43:40]

Indicates support for prediction invalidation instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SPECRES	Meaning
0b0000	Prediction invalidation instructions are not implemented.
0b0001	CFP RCTX, DVP RCTX and CPP RCTX instructions are implemented.
0b0010	As 0b0001, and COSP RCTX instruction is implemented.

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

FEAT_SPECRES2 implements the functionality identified by 0b0010.

From Armv8.5, the value 0b0000 is not permitted.

From Armv8.9, the value 0b0001 is not permitted.

Access to this field is **RO**.

SB, bits [39:36]

Indicates support for SB instruction in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

From Armv8.5, the value 0b0000 is not permitted.

Access to this field is **RO**.

FRINTTS, bits [35:32]

Indicates support for FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FRINTTS	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_FRINTTS implements the functionality identified by 0b0001.

From Armv8.5, the value 0b0000 is not permitted.

Access to this field is **RO**.

GPI, bits [31:28]

Indicates support for an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GPI	Meaning
0b0000	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

When this field is nonzero, FEAT_PACIMP is implemented.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPA is nonzero, or the value of ID_AA64ISAR2_EL1.GPA3 is nonzero, this field must have the value 0b0000.

Access to this field is **RO**.

GPA, bits [27:24]

Indicates whether the QARMA5 algorithm is implemented in the PE for generic code authentication in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GPA	Meaning
0b0000	Generic Authentication using the QARMA5 algorithm is not implemented.
0b0001	Generic Authentication using the QARMA5 algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

FEAT_PACQARMA5 implements the functionality identified by 0b0001.

When this field is nonzero, FEAT_PACQARMA5 is implemented.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPI is nonzero, or the value of ID_AA64ISAR2_EL1.GPA3 is nonzero, this field must have the value 0b0000.

Access to this field is **RO**.

LRCPC, bits [23:20]

Indicates support for weaker release consistency, RCpc, based model.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LRCPC	Meaning
0b0000	RCpc instructions are not implemented.
0b0001	The no offset LDAPR, LDAPRB, and LDAPRH instructions are implemented.
0b0010	As 0b0001, and the LDAPR (unscaled immediate) and STLR (unscaled immediate) instructions are implemented.
0b0011	As 0b0010, and the post-index LDAPR, LDIAPP, STILP, and pre-index STLR instructions are implemented. If Advanced SIMD and floating-point is implemented, then the LDAPUR (SIMD&FP), LDAP1 (SIMD&FP), STLUR (SIMD&FP), and STL1 (SIMD&FP) instructions are implemented in Advanced SIMD and floating-point.

All other values are reserved.

FEAT_LRCPC implements the functionality identified by the value 0b0001.

FEAT_LRCPC2 implements the functionality identified by the value 0b0010.

FEAT_LRCPC3 implements the functionality identified by the value 0b0011.

From Armv8.3, the value 0b0000 is not permitted.

From Armv8.4, the value 0b0001 is not permitted.

Access to this field is **RO**.

FCMA, bits [19:16]

Indicates support for complex number addition and multiplication, where numbers are stored in vectors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FCMA	Meaning
0b0000	The FCMLA and FCADD instructions are not implemented.
0b0001	The FCMLA and FCADD instructions are implemented.

All other values are reserved.

FEAT_FCMA implements the functionality identified by the value 0b0001.

From Armv8.3, if Advanced SIMD or floating-point is implemented, the value 0b0000 is not permitted.

From Armv8.3, if Advanced SIMD or floating-point is not implemented, the only permitted value is 0b0000.

Access to this field is **RO**.

JSCVT, bits [15:12]

Indicates support for JavaScript conversion from double-precision floating-point values to integers in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

JSCVT	Meaning
0b0000	The FJCVTZS instruction is not implemented.
0b0001	The FJCVTZS instruction is implemented.

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

From Armv8.3, if Advanced SIMD or floating-point is implemented, the value 0b0000 is not permitted.

From Armv8.3, if Advanced SIMD or floating-point is not implemented, the only permitted value is 0b0000.

Access to this field is **RO**.

API, bits [11:8]

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the `PACGA` instruction.

The value of this field is an IMPLEMENTATION DEFINED choice of:

API	Meaning
`0b0000`	Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
`0b0001`	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, FEAT_EPAC and FEAT_PAuth2 are not implemented.
`0b0010`	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, FEAT_EPAC is implemented, and FEAT_PAuth2 is not implemented.
`0b0011`	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, FEAT_EPAC is not implemented, and FEAT_PAuth2 is implemented.
`0b0100`	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, FEAT_EPAC is not implemented, FEAT_PAuth2 and FEAT_FPAC are implemented.
`0b0101`	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, FEAT_EPAC is not implemented, FEAT_PAuth2, FEAT_FPAC, and FEAT_FPACCOMBINE are implemented.
`0b0110`	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, including instructions that allow signing of LR using SP and PC as diversifiers, FEAT_EPAC is not implemented, FEAT_PAuth2, FEAT_FPAC, FEAT_FPACCOMBINE, and FEAT_PAuth_LR are implemented.

All other values are reserved.

FEAT_PAuth implements the functionality identified by `0b0001`.

FEAT_EPAC implements the functionality identified by `0b0010`.

FEAT_PAuth2 implements the functionality identified by `0b0011`.

FEAT_FPAC implements the functionality identified by `0b0100`.

FEAT_FPACCOMBINE implements the functionality identified by `0b0101`.

FEAT_PAuth_LR implements the functionality identified by `0b0110`.

When this field is nonzero, FEAT_PACIMP is implemented.

In Armv8.3, the permitted values are `0b0000`, `0b0001`, `0b0010`, `0b0011`, `0b0100`, and `0b0101`.

From Armv8.6, the permitted values are `0b0000`, `0b0011`, `0b0100`, and `0b0101`.

From Armv9.5, the permitted values are `0b0000`, `0b0011`, `0b0100`, `0b0101`, and `0b0110`.

If the value of ID_AA64ISAR1_EL1.APA is nonzero, or the value of ID_AA64ISAR2_EL1.APA3 is nonzero, this field must have the value `0b0000`.

Access to this field is **RO**.

APA, bits [7:4]

Indicates whether the QARMA5 algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the `PACGA` instruction.

The value of this field is an IMPLEMENTATION DEFINED choice of:

APA	Meaning
0b0000	Address Authentication using the QARMA5 algorithm is not implemented.
0b0001	Address Authentication using the QARMA5 algorithm is implemented, FEAT_EPAC and FEAT_PAuth2 are not implemented.
0b0010	Address Authentication using the QARMA5 algorithm is implemented, FEAT_EPAC is implemented, and FEAT_PAuth2 is not implemented.
0b0011	Address Authentication using the QARMA5 algorithm is implemented, FEAT_EPAC is not implemented, and FEAT_PAuth2 is implemented.
0b0100	Address Authentication using the QARMA5 algorithm is implemented, FEAT_EPAC is not implemented, FEAT_PAuth2 and FEAT_FPAC are implemented.
0b0101	Address Authentication using the QARMA5 algorithm is implemented, FEAT_EPAC is not implemented, FEAT_PAuth2, FEAT_FPAC, and FEAT_FPACCOMBINE are implemented.
0b0110	Address Authentication using the QARMA5 algorithm is implemented, including instructions that allow signing of LR using SP and PC as diversifiers, FEAT_EPAC is not implemented, FEAT_PAuth2, FEAT_FPAC, FEAT_FPACCOMBINE, and FEAT_PAuth_LR are implemented.

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.

FEAT_EPAC implements the functionality identified by 0b0010.

FEAT_PAuth2 implements the functionality identified by 0b0011.

FEAT_FPAC implements the functionality identified by 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

FEAT_PAuth_LR implements the functionality identified by 0b0110.

When this field is nonzero, FEAT_PACQARMA5 is implemented.

In Armv8.3, the permitted values are 0b0000, 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.

From Armv8.6, the permitted values are 0b0000, 0b0011, 0b0100, and 0b0101.

From Armv9.5, the permitted values are 0b0000, 0b0011, 0b0100, 0b0101, and 0b0110.

If the value of ID_AA64ISAR1_EL1.API is nonzero, or the value of ID_AA64ISAR2_EL1.APA3 is nonzero, this field must have the value 0b0000.

Access to this field is **RO**.

DPB, bits [3:0]

Data Persistence writeback. Indicates support for the DC CVAP and DC CVADP instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DPB	Meaning
0b0000	DC CVAP not supported.
0b0001	DC CVAP supported.
0b0010	DC CVAP and DC CVADP supported.

All other values are reserved.

FEAT_DPB implements the functionality identified by the value 0b0001.

FEAT_DPB2 implements the functionality identified by the value 0b0010.

From Armv8.2, the value 0b0000 is not permitted.

From Armv8.5, the value 0b0001 is not permitted.

Access to this field is **RO**.

Accessing ID_AA64ISAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64ISAR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b001

```

ID_AA64ISAR2_EL1, AArch64 Instruction Set Attribute Register 2

The ID_AA64ISAR2_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64ISAR2_EL1 are UNDEFINED.

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64ISAR2_EL1 is a 64-bit register.

Field descriptions

ATS1A, bits [63:60]

Indicates support for address translation instructions, which perform stage 1 address translation for the given virtual address without checking for stage 1 permissions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ATS1A	Meaning
0b0000	Address Translate Stage 1 instructions without Permissions Checks are not implemented
0b0001	Address Translate Stage 1 instructions without Permissions Checks are implemented.

All other values are reserved.

Access to this field is **RO**.

LUT, bits [59:56]

Indicates support for:

- Advanced SIMD lookup table instructions with 2-bit and 4-bit indices.
- If FEAT_SVE2 or FEAT_SME2 is implemented, SVE lookup table instructions with 2-bit and 4-bit indices.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LUT	Meaning
0b0000	The specified instructions are not implemented.
0b0001	Lookup table instructions with 2-bit indices LUTI2 and 4-bit indices LUTI4 are implemented.

All other values are reserved.

FEAT_LUT implements the functionality identified by the value 0b0001.

From Armv9.5, if FEAT_AdvSIMD is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

CSSC, bits [55:52]

Indicates support for common short sequence compression instructions.

If FEAT_CMPBR is implemented, indicates support for compare and branch instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSSC	Meaning
0b0000	Common short sequence compression instructions are not implemented.
0b0001	The following common short sequence compression instructions are implemented: • 32-bit and 64-bit ABS, CNT, CTZ • 32-bit SMAX, UMAX, SMIN, UMIN (immediate). • 64-bit SMAX, UMAX, SMIN, UMIN (immediate). • 32-bit SMAX, UMAX, SMIN, UMIN (register). • 64-bit SMAX, UMAX, SMIN, UMIN (register).
0b0010	As 0b0001, and adds compare and branch instructions: • CBB<cc>. • CB<cc> (immediate), CB<cc> (register). • CBH<cc>.

All other values are reserved.

FEAT_CSSC implements the functionality identified by the value 0b0001.

FEAT_CMPBR implements the functionality identified by the value 0b0010.

From Armv9.4, the value 0b0000 is not permitted.

From Armv9.6, the value 0b0001 is not permitted.

Access to this field is **RO**.

RPRFM, bits [51:48]

RPRFM hint instruction.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RPRFM	Meaning
0b0000	RPRFM hint instruction is not implemented and is treated as a NOP.
0b0001	RPRFM hint instruction is implemented.

All other values are reserved.

FEAT_RPRFM implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

PCDPHINT, bits [47:44]

Indicates support for producer-consumer data placement hints.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCDPHINT	Meaning
0b0000	The STSHH and PRFM IR hint instructions are not implemented.
0b0001	The STSHH and PRFM IR hint instructions are implemented.

FEAT_PCDPHINT implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

PRFMSLC, bits [43:40]

Indicates whether the PRFM and PRFUM instructions support a system level cache option.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PRFMSLC	Meaning
0b0000	The PRFM and PRFUM instructions do not support the SLC target.
0b0001	The PRFM and PRFUM instructions support the SLC target.

All other values are reserved.

FEAT_PRFMSLC implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

SYSINSTR_128, bits [39:36]

SYSINSTR_128. Indicates support for System instructions that can take 128-bit inputs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYSINSTR_128	Meaning
0b0000	System instructions that can take 128-bit inputs are not supported.
0b0001	System instructions that can take 128-bit inputs are supported.

All other values are reserved.

FEAT_SYSINSTR128 implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

SYSREG_128, bits [35:32]

SYSREG_128. Indicates support for instructions to access 128-bit System Registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYSREG_128	Meaning
0b0000	Instructions to access 128-bit System Registers are not supported.
0b0001	Instructions to access 128-bit System Registers are supported.

All other values are reserved.

FEAT_SYSREG128 implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

CLRBHB, bits [31:28]

Indicates support for the CLRBHB instruction in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CLRBHB	Meaning
0b0000	CLRBHB instruction is not implemented.
0b0001	CLRBHB instruction is implemented.

All other values are reserved.

FEAT_CLRBHB implements the functionality identified by the value 0b0001.

From Armv8.9, the value 0b0000 is not permitted.

Access to this field is **RO**.

PAC_frac, bits [27:24]

Indicates which address bit is used to determine the size of the PAC field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PAC_frac	Meaning
0b0000	The address bit which is used to define the size of the PAC field is dependent on whether address tagging is used.
0b0001	The address bit which is used to define the size of the PAC field is fixed.

All other values are reserved.

FEAT_CONSTPACFIELD implements the functionality identified by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

BC, bits [23:20]

Indicates support for the BC instruction in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BC	Meaning
0b0000	BC instruction is not implemented.
0b0001	BC instruction is implemented.

All other values are reserved.

FEAT_HBC implements the functionality identified by the value 0b0001.

From Armv8.8, the value 0b0000 is not permitted.

Access to this field is **RO**.

MOPS, bits [19:16]

Indicates support for the Memory Copy and Memory Set instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MOPS	Meaning
0b0000	The Memory Copy and Memory Set instructions are not implemented in AArch64 state.
0b0001	The Memory Copy and Memory Set instructions are implemented in AArch64 state with the following exception. If FEAT_MTE is implemented, then SETGP*, SETGM* and SETGE* instructions are also supported.

All other values are reserved.

FEAT_MOPS implements the functionality identified by the value 0b0001.

From Armv8.8, the value 0b0000 is not permitted.

Access to this field is **RO**.

APA3, bits [15:12]

Indicates whether the QARMA3 algorithm is implemented in the PE for address authentication in AArch64 state. This applies to all Pointer Authentication instructions other than the `PACGA` instruction.

The value of this field is an IMPLEMENTATION DEFINED choice of:

APA3	Meaning
`0b0000`	Address Authentication using the QARMA3 algorithm is not implemented.
`0b0001`	Address Authentication using the QARMA3 algorithm is implemented, FEAT_EPAC and FEAT_PAuth2 are not implemented.
`0b0010`	Address Authentication using the QARMA3 algorithm is implemented, FEAT_EPAC is implemented, and FEAT_PAuth2 is not implemented.
`0b0011`	Address Authentication using the QARMA3 algorithm is implemented, FEAT_EPAC is not implemented, and FEAT_PAuth2 is implemented.
`0b0100`	Address Authentication using the QARMA3 algorithm is implemented, FEAT_EPAC is not implemented, FEAT_PAuth2 and FEAT_FPAC are implemented.
`0b0101`	Address Authentication using the QARMA3 algorithm is implemented, FEAT_EPAC is not implemented, FEAT_PAuth2, FEAT_FPAC, and FEAT_FPACCOMBINE are implemented.
`0b0110`	Address Authentication using the QARMA3 algorithm is implemented, including instructions that allow signing of LR using SP and PC as diversifiers, FEAT_EPAC is not implemented, FEAT_PAuth2, FEAT_FPAC, FEAT_FPACCOMBINE, and FEAT_PAuth_LR are implemented.

All other values are reserved.

FEAT_PAuth implements the functionality identified by the value `0b0001`.

FEAT_EPAC implements the functionality identified by the value `0b0010`.

FEAT_PAuth2 implements the functionality identified by the value `0b0011`.

FEAT_FPAC implements the functionality identified by the value `0b0100`.

FEAT_FPACCOMBINE implements the functionality identified by the value `0b0101`.

FEAT_PAuth_LR implements the functionality identified by the value `0b0110`.

When this field is nonzero, FEAT_PACQARMA3 is implemented.

In Armv8.3, the permitted values are `0b0000`, `0b0001`, `0b0010`, `0b0011`, `0b0100`, and `0b0101`.

From Armv8.6, the permitted values are `0b0000`, `0b0011`, `0b0100`, and `0b0101`.

From Armv9.5, the permitted values are `0b0000`, `0b0011`, `0b0100`, `0b0101`, and `0b0110`.

If the value of ID_AA64ISAR1_EL1.API is nonzero, or the value of ID_AA64ISAR1_EL1.APA is nonzero, this field must have the value `0b0000`.

Access to this field is **RO**.

GPA3, bits [11:8]

Indicates whether the QARMA3 algorithm is implemented in the PE for generic code authentication in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GPA3	Meaning
`0b0000`	Generic Authentication using the QARMA3 algorithm is not implemented.
`0b0001`	Generic Authentication using the QARMA3 algorithm is implemented. This includes the `PACGA` instruction.

All other values are reserved.

FEAT_PACQARMA3 implements the functionality identified by the value 0b0001.

When this field is nonzero, FEAT_PACQARMA3 is implemented.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPI is nonzero, or the value of ID_AA64ISAR1_EL1.GPA is nonzero, this field must have the value 0b0000.

Access to this field is **RO**.

RPRES, bits [7:4]

Indicates support for 12 bits of mantissa in single-precision reciprocal and reciprocal square root instructions in AArch64 state, when FPCR.AH is 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RPRES	Meaning
0b0000	Single-precision reciprocal and reciprocal square root estimates give 8 bits of mantissa, when FPCR.AH is 1.
0b0001	Single-precision reciprocal and reciprocal square root estimates give 12 bits of mantissa, when FPCR.AH is 1.

All other values are reserved.

FEAT_RPRES implements the functionality identified by the value 0b0001.

When FPCR.AH is 0, the floating-point reciprocal estimate and reciprocal square root estimate instructions give 8 bits of mantissa.

Access to this field is **RO**.

WFxT, bits [3:0]

Indicates support for the WFET and WFIT instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WFxT	Meaning
0b0000	WFET and WFIT are not supported.
0b0010	WFET and WFIT are supported, and the register number is reported in the ESR_ELx on exceptions.

All other values are reserved.

FEAT_WFxT implements the functionality identified by the value 0b0010.

From Armv8.7, the only permitted value is 0b0010.

Access to this field is **RO**.

Accessing ID_AA64ISAR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64ISAR2_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b010

```
if PSTATE.EL == EL0 then

ID_AA64ISAR3_EL1, AArch64 Instruction Set Attribute Register 3

The ID_AA64ISAR3_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64ISAR3_EL1 are UNDEFINED.

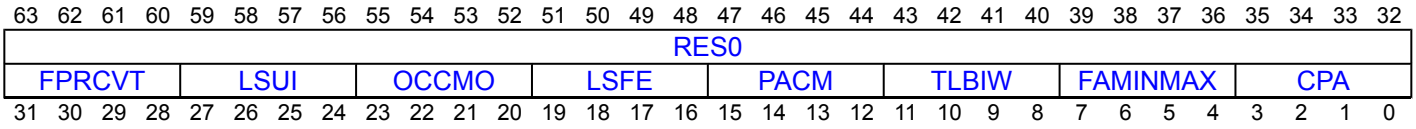
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64ISAR3_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

FPRCVT, bits [31:28]

Indicates support for the following conversions between floating-point and integer instructions with only scalar SIMD&FP register operands and results, and with different input and output register sizes:

- FCVTAS (scalar SIMD&FP), FCVTAU (scalar SIMD&FP).
- FCVTMS (scalar SIMD&FP), FCVTMU (scalar SIMD&FP).
- FCVTNS (scalar SIMD&FP), FCVTNU (scalar SIMD&FP).
- FCVTPS (scalar SIMD&FP), FCVTPU (scalar SIMD&FP).
- FCVTZS (scalar SIMD&FP), FCVTZU (scalar SIMD&FP).
- SCVTF (scalar SIMD&FP), UCVTF (scalar SIMD&FP).

If FEAT_SME2p1 is implemented, FEAT_FPRCVT indicates support for the following conversions between floating-point and integer instructions with only scalar SIMD&FP register operands and results, and with the same input and output register sizes when the PE is in Streaming SVE mode:

- FCVTAS (vector), FCVTAU (vector).
- FCVTMS (vector), FCVTMU (vector).
- FCVTNS (vector), FCVTNU (vector).
- FCVTPS (vector), FCVTPU (vector).
- FCVTZS (vector), FCVTZU (vector).

- SCVTF (vector), UCVTF (vector).

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPRCVT	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

FEAT_FPRCVT implements the functionality identified by the value 0b0001.

From Armv9.6, the value 0b0000 is not permitted.

Access to this field is **RO**.

LSUI, bits [27:24]

Support for the following load and store unprivileged instructions:

- LDTXR, STTXR.
- CAST, CASAT, CASALT, CASLT.
- CASP, CASPA, CASPAL, CASPL.
- LDTP, STTP.
- LDTP (SIMD&FP), STTP (SIMD&FP).
- LDTNP, STTNP.
- LDTNP (SIMD&FP), STTNP (SIMD&FP).

The value of this field is an IMPLEMENTATION DEFINED choice of:

LSUI	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

FEAT_LSUI implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

OCCMO, bits [23:20]

Indicates support for the following cache maintenance operation to the Outer cache level instructions:

- DC CIVAOC.
- DC CVAOC.

If FEAT_MTE is implemented:

- DC CIGDVAOC.
- DC CGDVAOC.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OCCMO	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

FEAT_OCCMO implements the functionality identified by the value 0b0001.

From Armv9.6, the value 0b0000 is not permitted.

Access to this field is **RO**.

LSFE, bits [19:16]

Indicates support for the following A64 Base atomic floating-point in-memory instructions:

- Floating-point atomic add in memory: LDFADD, LDFADDA, LDFADDAL, and LDFADDL.
- BFloat16 atomic add in memory: LDBFADD, LDBFADDA, LDBFADDAL, and LDBFADDL.

- Floating-point atomic maximum in memory: LDFMAX, LDFMAXA, LDFMAXAL, and LDFMAXL.
- BFloat16 atomic maximum in memory: LDBFMAX, LDBFMAXA, LDBFMAXAL, and LDBFMAXL.
- Floating-point atomic maximum number in memory: LDFMAXNM, LDFMAXNMA, LDFMAXNMAL, and LDFMAXNML.
- BFloat16 atomic maximum number in memory: LDBFMAXNM, LDBFMAXNMA, LDBFMAXNMAL, and LDBFMAXNML.
- Floating-point atomic minimum in memory: LDFMIN, LDFMINA, LDFMINAL, and LDFMINL.
- BFloat16 atomic minimum in memory: LDBFMIN, LDBFMINA, LDBFMINAL, and LDBFMINL.
- Floating-point atomic minimum number in memory: LDFMINNM, LDFMINNMA, LDFMINNMAL, and LDFMINNML.
- BFloat16 atomic minimum number in memory: LDBFMINNM, LDBFMINNMA, LDBFMINNMAL, and LDBFMINNML.
- Floating-point atomic add in memory, without return: STFADD and STFADDL.
- BFloat16 atomic add in memory, without return: STBFADD and STBFADDL.
- Floating-point atomic maximum in memory, without return: STFMAX and STFMAXL.
- BFloat16 atomic maximum in memory, without return: STBFMAX and STBFMAXL.
- Floating-point atomic maximum number in memory, without return: STFMAXNM and STFMAXNML.
- BFloat16 atomic maximum number in memory, without return: STBFMAXNM and STBFMAXNML.
- Floating-point atomic minimum in memory, without return: STFMIN and STFMINL.
- BFloat16 atomic minimum in memory, without return: STBFMIN and STBFMINL.
- Floating-point atomic minimum number in memory, without return: STFMINNM and STFMINNML.
- BFloat16 atomic minimum number in memory, without return: STBFMINNM and STBFMINNML.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LSFE	Meaning
0b0000	Atomic floating-point in-memory instructions are not implemented.
0b0001	The specified Atomic floating-point in-memory instructions are implemented.

FEAT_LSFE implements the functionality identified by the value 0b0001

Access to this field is **RO**.

PACM, bits [15:12]

Indicates the implementation of PSTATE.PACM.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PACM	Meaning
0b0000	PSTATE.PACM is not implemented.
0b0001	Trivial implementation of PSTATE.PACM.
0b0010	Full implementation of PSTATE.PACM.

All other values are reserved.

FEAT_PAuth_LR implements the functionality identified by the values 0b0001 and 0b0010.

If FEAT_PAuth_LR is implemented, the value 0b0000 is not permitted.

If ID_AA64ISAR1_EL1.API is 0b0000, the value 0b0001 is not permitted.

If one of FEAT_PACQARMA3 or FEAT_PACQARMA5 are implemented, the value 0b0001 is not permitted.

Access to this field is **RO**.

TLBIW, bits [11:8]

Support for TLBI VMALL for Dirty state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TLBIW	Meaning
0b0000	TLBI VMALL for Dirty state is not supported.
0b0001	TLBI VMALL for Dirty state is supported.

All other values are reserved.

FEAT_TLBIW implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

FAMINMAX, bits [7:4]

Indicates support for the following Advanced SIMD, SVE2, and SME2 instructions that compute maximum and minimum absolute value:

- When Advanced SIMD is implemented, the Advanced SIMD instructions `FAMAX` and `FAMIN`.
- When FEAT_SVE2 or FEAT_SME2 is implemented, the SVE2 instructions `FAMAX` and `FAMIN`.
- When FEAT_SME2 is implemented, the SME2 instructions `FAMAX` (multiple and single vectors), `FAMIN` (multiple and single vectors), `FAMAX` (multiple vectors), and `FAMIN` (multiple vectors).

The value of this field is an IMPLEMENTATION DEFINED choice of:

FAMINMAX	Meaning
`0b0000`	The specified instructions are not implemented.
`0b0001`	The specified instructions are implemented.

All other values are reserved.

FEAT_FAMINMAX implements the functionality identified by the value `0b0001`.

Access to this field is **RO**.

CPA, bits [3:0]

Indicates support for Checked Pointer Arithmetic instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CPA	Meaning
`0b0000`	Checked Pointer Arithmetic instructions are not implemented.
`0b0001`	Checked Pointer Arithmetic instructions are implemented.
`0b0010`	Checked Pointer Arithmetic instructions are implemented, and Checked Pointer Arithmetic can be enabled.

All other values are reserved.

FEAT_CPA implements the functionality identified by the value `0b0001`.

FEAT_CPA2 implements the functionality identified by the value `0b0010`.

From Armv9.5, the value `0b0000` is not permitted.

Access to this field is **RO**.

Accessing ID_AA64ISAR3_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64ISAR3_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b011

```
if !IsFeatureImplemented(FEAT_AA64) then
    UnimplementedIDRegister();
elsif PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if HaveEL(EL3) && EL3SDDUndefPriority() && IsFeatureImplemented(FEAT_IDTE3) && SCR_EL3.TID3 ==
'1' then
        UNDEFINED;
    elsif EL2Enabled() && (IsFeatureImplemented(FEAT_FGT) || !IsZero(ID_AA64ISAR3_EL1) || boolean
IMPLEMENTATION_DEFINED "ID_AA64ISAR3_EL1 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && IsFeatureImplemented(FEAT_IDTE3) && SCR_EL3.TID3 == '1' then
        if EL3SDDUndef() then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
    else
        X[t, 64] = ID_AA64ISAR3_EL1;
elsif PSTATE.EL == EL2 then
    if HaveEL(EL3) && EL3SDDUndefPriority() && IsFeatureImplemented(FEAT_IDTE3) && SCR_EL3.TID3 ==
'1' then

ID_AA64MMFR0_EL1, AArch64 Memory Model Feature Register 0

The ID_AA64MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

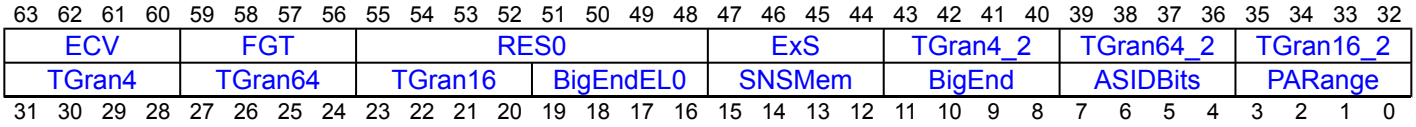
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64MMFR0_EL1 are UNDEFINED.

Attributes

ID_AA64MMFR0_EL1 is a 64-bit register.

Field descriptions



ECV, bits [63:60]

Indicates presence of Enhanced Counter Virtualization.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ECV	Meaning
0b0000	Enhanced Counter Virtualization is not implemented.
0b0001	Enhanced Counter Virtualization is implemented. Supports CNTHCTL_EL2.{EL1TVT, EL1TVCT, EL1NVPCT, EL1NVVCT, EVNTIS}, CNTKCTL_EL1.EVNTIS, CNTPCTSS_EL0 counter views, and CNTVCTSS_EL0 counter views. Extends the PMSCR_EL1.PCT, PMSCR_EL2.PCT, TRFCR_EL1.TS, and TRFCR_EL2.TS fields.
0b0010	As 0b0001, and the CNTPOFF_EL2 register and the CNTHCTL_EL2.ECV and SCR_EL3.ECVEn fields are implemented.

All other values are reserved.

FEAT_ECV implements the functionality identified by the value 0b0001.

FEAT_ECV_POFF implements the functionality identified by the value 0b0010.

From Armv8.6, the value 0b0000 is not permitted.

Access to this field is **RO**.

FGT, bits [59:56]

Indicates presence of the Fine-Grained Trap controls.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FGT	Meaning
0b0000	Fine-grained trap controls are not implemented.
0b0001	Fine-grained trap controls are implemented. Supports: • If EL2 is implemented, the HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers, and their associated traps. • If EL2 is implemented, MDCR_EL2.TDCC. • If EL3 is implemented, MDCR_EL3.TDCC. • If both EL2 and EL3 are implemented, SCR_EL3.FGTEn.
0b0010	As 0b0001, and also includes support for: • If EL2 is implemented, the HDFGRTR2_EL2, HDFGWTR2_EL2, HFGITR2_EL2, HFGRTR2_EL2, and HFGWTR2_EL2 registers, and their associated traps. • If both EL2 and EL3 are implemented, SCR_EL3.FGTEn2.

All other values are reserved.

FEAT_FGT implements the functionality identified by the value 0b0001.

FEAT_FGT2 implements the functionality identified by the value 0b0010.

From Armv8.6, the value 0b0000 is not permitted.

From Armv8.9, the value 0b0001 is not permitted.

Access to this field is **RO**.

Bits [55:48]

Reserved, RES0.

ExS, bits [47:44]

Indicates support for disabling context synchronizing exception entry and exit.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ExS	Meaning
0b0000	All exception entries and exits are context synchronization events.
0b0001	Non-context synchronizing exception entry and exit are supported.

All other values are reserved.

FEAT_ExS implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

TGran4_2, bits [43:40]

Indicates support for 4KB memory granule size at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TGran4_2	Meaning	Applies when
0b0000	Support for 4KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran4 field.	
0b0001	4KB granule not supported at stage 2.	
0b0010	4KB granule supported at stage 2.	
0b0011	4KB granule at stage 2 supports 52-bit input addresses and can describe 52-bit output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

If EL2 is not implemented, this field is 0b0000. Otherwise, the value 0b0000 is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

Access to this field is **RO**.

TGran64_2, bits [39:36]

Indicates support for 64KB memory granule size at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TGran64_2	Meaning
0b0000	Support for 64KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran64 field.
0b0001	64KB granule not supported at stage 2.
0b0010	64KB granule supported at stage 2.

All other values are reserved.

If EL2 is not implemented, this field is 0b0000. Otherwise, the value 0b0000 is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

Access to this field is **RO**.

TGran16_2, bits [35:32]

Indicates support for 16KB memory granule size at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TGran16_2	Meaning	Applies when
0b0000	Support for 16KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran16 field.	
0b0001	16KB granule not supported at stage 2.	
0b0010	16KB granule supported at stage 2.	
0b0011	16KB granule at stage 2 supports 52-bit input addresses and can describe 52-bit output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

If EL2 is not implemented, this field is 0b0000. Otherwise, the value 0b0000 is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

Access to this field is **RO**.

TGran4, bits [31:28]

Indicates support for 4KB memory translation granule size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TGran4	Meaning	Applies when
0b0000	4KB granule supported.	
0b0001	4KB granule supports 52-bit input addresses and can describe 52-bit output addresses.	When FEAT_LPA2 is implemented
0b1111	4KB granule not supported.	

All other values are reserved.

Access to this field is **RO**.

TGran64, bits [27:24]

Indicates support for 64KB memory translation granule size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TGran64	Meaning
0b0000	64KB granule supported.
0b1111	64KB granule not supported.

All other values are reserved.

Access to this field is **RO**.

TGran16, bits [23:20]

Indicates support for 16KB memory translation granule size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TGran16	Meaning	Applies when
0b0000	16KB granule not supported.	
0b0001	16KB granule supported.	
0b0010	16KB granule supports 52-bit input addresses and can describe 52-bit output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

Access to this field is **RO**.

BigEndEL0, bits [19:16]

Indicates support for mixed-endian at EL0 only.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BigEndEL0	Meaning
0b0000	No mixed-endian support at EL0. The SCTLR_EL1.E0E bit has a fixed value.
0b0001	Mixed-endian support at EL0. The SCTLR_EL1.E0E bit can be configured.

FEAT_MixedEndEL0 implements the functionality identified by the value 0b0001.

All other values are reserved.

This field is invalid and is RES0 if ID_AA64MMFR0_EL1.BigEnd is not 0b0000.

Access to this field is **RO**.

SNSMem, bits [15:12]

Indicates support for a distinction between Secure and Non-secure Memory.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SNSMem	Meaning
0b0000	Does not support a distinction between Secure and Non-secure Memory.
0b0001	Does support a distinction between Secure and Non-secure Memory.

Note

If EL3 is implemented, the value 0b0000 is not permitted.

All other values are reserved.

Access to this field is **RO**.

BigEnd, bits [11:8]

Indicates support for mixed-endian configuration.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BigEnd	Meaning
0b0000	No mixed-endian support. The SCTLR_ELx.EE bits have a fixed value. See the BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian.
0b0001	Mixed-endian support. The SCTLR_ELx.EE and SCTLR_EL1.E0E bits can be configured.

FEAT_MixedEnd implements the functionality identified by the value 0b0001.

If this field is 0b0001, FEAT_MixedEndEL0 is also implemented.

All other values are reserved.

Access to this field is **RO**.

ASIDBits, bits [7:4]

Number of ASID bits.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ASIDBits	Meaning
0b0000	8 bits.
0b0010	16 bits.

All other values are reserved.

Access to this field is **RO**.

PARange, bits [3:0]

Physical Address range supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PARange	Meaning	Applies when
0b0000	32 bits, 4GB.	
0b0001	36 bits, 64GB.	
0b0010	40 bits, 1TB.	
0b0011	42 bits, 4TB.	
0b0100	44 bits, 16TB.	
0b0101	48 bits, 256TB.	
0b0110	52 bits, 4PB.	When FEAT_LPA is implemented
0b0111	56 bits, 64PB.	When FEAT_D128 is implemented

All other values are reserved.

Access to this field is **RO**.

Accessing ID_AA64MMFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64MMFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b000

ID_AA64MMFR1_EL1, AArch64 Memory Model Feature Register 1

The ID_AA64MMFR1_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

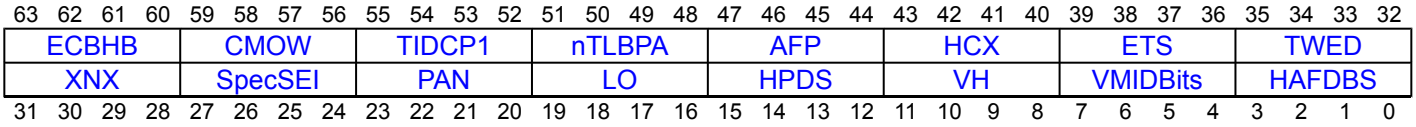
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64MMFR1_EL1 are UNDEFINED.

Attributes

ID_AA64MMFR1_EL1 is a 64-bit register.

Field descriptions



ECBHB, bits [63:60]

Indicates support for restrictions on branch history speculation around exceptions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ECBHB	Meaning
0b0000	The implementation does not disclose whether restrictions are imposed on branch history speculation around exceptions.
0b0001	The implementation imposes restrictions on branch history speculation around exceptions.

All other values are reserved.

FEAT_ECBHB implements the functionality identified by the value 0b0001.

From Armv8.9, the value 0b0000 is not permitted.

Access to this field is **RO**.

CMOW, bits [59:56]

Indicates support for cache maintenance instruction permission.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMOW	Meaning
0b0000	SCTLR_EL1.CMOW, SCTLR_EL2.CMOW, and HCRX_EL2.CMOW bits are not implemented.
0b0001	SCTLR_EL1.CMOW is implemented. If EL2 is implemented, SCTLR_EL2.CMOW and HCRX_EL2.CMOW bits are implemented.

All other values are reserved.

FEAT_CMOW implements the functionality identified by the value 0b0001.

From Armv8.8, the value 0b0000 is not permitted.

Access to this field is **RO**.

TIDCP1, bits [55:52]

Indicates whether SCTLR_EL1.TIDCP and SCTLR_EL2.TIDCP are implemented in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TIDCP1	Meaning
0b0000	SCTLR_EL1.TIDCP and SCTLR_EL2.TIDCP bits are not implemented and are RES0.
0b0001	SCTLR_EL1.TIDCP bit is implemented. If EL2 is implemented, SCTLR_EL2.TIDCP bit is implemented.

All other values are reserved.

FEAT_TIDCP1 implements the functionality identified by the value 0b0001.

From Armv8.8, the value 0b0000 is not permitted.

Access to this field is **RO**.

nTLBPA, bits [51:48]

Indicates support for intermediate caching of translation table walks.

The value of this field is an IMPLEMENTATION DEFINED choice of:

nTLBPA	Meaning
0b0000	The intermediate caching of translation table walks might include non-coherent physical translation caches.
0b0001	The intermediate caching of translation table walks does not include non-coherent physical translation caches.

Non-coherent physical translation caches are non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE, where either:

- The caching is indexed by the physical address of the location holding the translation table entry.
- The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

AFP, bits [47:44]

Indicates support for FPCR.{AH, FIZ, NEP}.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AFP	Meaning
0b0000	The FPCR.{AH, FIZ, NEP} fields are not supported.
0b0001	The FPCR.{AH, FIZ, NEP} fields are supported.

All other values are reserved.

FEAT_AFP implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

HCX, bits [43:40]

Indicates support for HCRX_EL2 and its associated EL3 trap.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HCX	Meaning
0b0000	HCRX_EL2 and its associated EL3 trap are not supported.
0b0001	HCRX_EL2 and its associated EL3 trap are supported.

All other values are reserved.

FEAT_HCX implements the functionality identified by the value 0b0001.

From Armv8.7, if EL2 is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

ETS, bits [39:36]

Indicates support for Enhanced Translation Synchronization.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is not supported.
0b0010	FEAT_ETS2 is implemented.
0b0011	FEAT_ETS3 is implemented.

All other values are reserved.

FEAT_ETS2 implements the functionality identified by the value 0b0010.

FEAT_ETS3 implements the functionality identified by the value 0b0011.

From Armv8.8, the values 0b0000 and 0b0001 are not permitted.

From Armv9.5, the value 0b0010 is not permitted.

Access to this field is **RO**.

TWED, bits [35:32]

Indicates support for the configurable delayed trapping of WFE.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TWED	Meaning
0b0000	Configurable delayed trapping of WFE is not supported.
0b0001	Configurable delayed trapping of WFE is supported.

All other values are reserved.

FEAT_TWED implements the functionality identified by the value 0b0001.

From Armv8.6, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

XNX, bits [31:28]

Indicates support for execute-never control distinction by Exception level at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

From Armv8.2, the value 0b0000 is not permitted.

Access to this field is **RO**.

SpecSEI, bits [27:24]

When FEAT_RAS is implemented:

Describes whether the PE can generate SError exceptions from speculative reads of memory, including speculative instruction fetches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SpecSEI	Meaning
0b0000	The PE never generates an SError exception due to an External abort on a speculative read.
0b0001	The PE might generate an SError exception due to an External abort on a speculative read.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

PAN, bits [23:20]

Privileged Access Never. Indicates support for the PAN bit in PSTATE, SPSR_EL1, SPSR_EL2, SPSR_EL3, and DSPSR_EL0.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PAN	Meaning
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and AT S1E1RP and AT S1E1WP instructions supported.
0b0011	PAN supported, AT S1E1RP and AT S1E1WP instructions supported, and SCTLR_EL1.EPAN and SCTLR_EL2.EPAN bits supported.

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

FEAT_PAN3 implements the functionality added by the value 0b0011.

From Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the value 0b0001 is not permitted.

From Armv8.7, the value 0b0010 is not permitted.

Access to this field is **RO**.

LO, bits [19:16]

LORegions. Indicates support for LORegions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LO	Meaning
0b0000	LORegions not supported.
0b0001	LORegions supported.

All other values are reserved.

FEAT_LOR implements the functionality identified by the value 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is **RO**.

HPDS, bits [15:12]

Hierarchical Permission Disables. Indicates support for disabling hierarchical controls in translation tables.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Disabling of hierarchical controls supported with the TCR_EL1.{HPD1, HPD0}, TCR_EL2.HPD or TCR_EL2.{HPD1, HPD0}, and TCR_EL3.HPD bits.
0b0010	As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the Translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT_HPDS implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality identified by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is **RO**.

VH, bits [11:8]

Virtualization Host Extensions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VH	Meaning
0b0000	Virtualization Host Extensions not supported.
0b0001	Virtualization Host Extensions supported.

All other values are reserved.

FEAT_VHE implements the functionality identified by the value 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is **RO**.

VMIDBits, bits [7:4]

Number of VMID bits.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMIDBits	Meaning
0b0000	8 bits
0b0010	16 bits

All other values are reserved.

FEAT_VMID16 implements the functionality identified by the value 0b0010.

From Armv8.1, the permitted values are 0b0000 and 0b0010.

Access to this field is **RO**.

HAFDBS, bits [3:0]

Hardware updates to Access flag and Dirty state in translation tables.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAFDBS	Meaning
0b0000	Hardware update of the Access flag and dirty state are not supported.
0b0001	Support for hardware update of the Access flag for Block and Page descriptors.
0b0010	As 0b0001, and adds support for hardware update of dirty state.
0b0011	As 0b0010, and adds support for hardware update of the Access flag for Table descriptors.
0b0100	As 0b0011, and adds support for hardware tracking of Dirty state Structure.

All other values are reserved.

FEAT_HAFDBS implements the functionality identified by the values 0b0001 and 0b0010.

FEAT_HAFT implements the functionality identified by the value 0b0011.

FEAT_HDBSS implements the functionality identified by the value 0b0100.

Access to this field is **RO**.

ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2

The ID_AA64MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64MMFR2_EL1 are UNDEFINED.

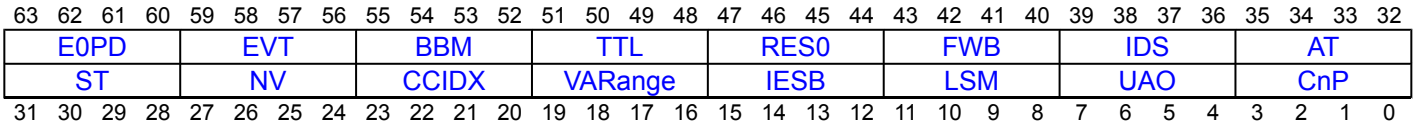
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64MMFR2_EL1 is a 64-bit register.

Field descriptions



E0PD, bits [63:60]

Indicates support for the E0PD mechanism.

The value of this field is an IMPLEMENTATION DEFINED choice of:

E0PD	Meaning
0b0000	E0PDx mechanism is not implemented.
0b0001	E0PDx mechanism is implemented.

All other values are reserved.

FEAT_E0PD implements the functionality identified by the value 0b0001.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

Access to this field is **RO**.

EVT, bits [59:56]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EVT	Meaning
0b0000	HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	HCR_EL2.{TOCU, TICAB, TID4} traps are supported. HCR_EL2.{TTLBOS, TTLBIS} traps are not supported.
0b0010	HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented, the only permitted value is 0b0000.

From Armv8.5, if EL2 is implemented, the value 0b0001 is not permitted.

Access to this field is **RO**.

BBM, bits [55:52]

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block or table size for a translation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BBM	Meaning
0b0000	Break-before-make sequence must be used.
0b0001	Level 1 support for changing block size is supported.
0b0010	Level 2 support for changing block size is supported.

All other values are reserved.

FEAT_BBML1 implements the functionality identified by the value 0b0001.

FEAT_BBML2 implements the functionality identified by the value 0b0010.

Access to this field is **RO**.

TTL, bits [51:48]

Indicates support for TTL field in address operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TTL	Meaning
0b0000	TLB maintenance instructions by address have bits[47:44] as RES0.
0b0001	TLB maintenance instructions by address have bits[47:44] holding the TTL field.

All other values are reserved.

FEAT_TTL implements the functionality identified by the value 0b0001.

This field affects TLBI IPAS2E1, TLBI IPAS2E1IS, TLBI IPAS2E1OS, TLBI IPAS2LE1, TLBI IPAS2LE1IS, TLBI IPAS2LE1OS, TLBI VAAE1, TLBI VAAE1IS, TLBI VAAE1OS, TLBI VAALE1, TLBI VAALE1IS, TLBI VAALE1OS, TLBI VAE1, TLBI VAE1IS, TLBI VAE1OS, TLBI VAE2, TLBI VAE2IS, TLBI VAE2OS, TLBI VAE3, TLBI VAE3IS, TLBI VAE3OS,TLBI VALE1, TLBI VALE1IS, TLBI VALE1OS, TLBI VALE2, TLBI VALE2IS, TLBI VALE2OS, TLBI VALE3, TLBI VALE3IS, TLBI VALE3OS.

From Armv8.4, the value 0b0000 is not permitted.

Access to this field is **RO**.

Bits [47:44]

Reserved, RES0.

FWB, bits [43:40]

Indicates support for HCR_EL2.FWB.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FWB	Meaning
0b0000	HCR_EL2.FWB bit is not supported.
0b0001	HCR_EL2.FWB is supported.

All other values reserved.

FEAT_S2FWB implements the functionality identified by the value 0b0001.

From Armv8.4, the value 0b0000 is not permitted.

Access to this field is **RO**.

IDS, bits [39:36]

Indicates the EC syndrome value in ESR_ELx.EC that is reported if an exception is generated by a read access to the feature ID space.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IDS	Meaning
0b0000	An exception which is generated by a read access to the feature ID space, other than a trap caused by HCR_EL2.TIDx, SCTLR_EL1.UCT, or SCTLR_EL2.UCT is reported by ESR_ELx.EC == 0x0.
0b0001	All exceptions generated by an AArch64 read access to the feature ID space are reported by ESR_ELx.EC == 0x18.
0b0010	As 0b0001 and introduces support for trapping ID register accesses to EL3.

All other values are reserved.

The Feature ID space is defined as the System register space in AArch64 with op0==3, op1=={0, 1, 3}, CRn==0, CRm=={0-7}, op2=={0-7}.

FEAT_IDST implements the functionality identified by the value 0b0001.

FEAT_IDTE3 implements the functionality identified by 0b0010.

From Armv8.4, the value 0b0000 is not permitted.

From Armv9.6, if EL3 is implemented, the value 0b0001 is not permitted.

Access to this field is **RO**.

AT, bits [35:32]

Identifies support for unaligned single-copy atomicity and atomic functions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AT	Meaning
0b0000	Unaligned single-copy atomicity and atomic functions are not supported.
0b0001	Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.

All other values are reserved.

FEAT_LSE2 implements the functionality identified by the value 0b0001.

From Armv8.4, the value 0b0000 is not permitted.

Access to this field is **RO**.

ST, bits [31:28]

Identifies support for small translation tables.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ST	Meaning
0b0000	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 39.
0b0001	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.

All other values are reserved.

FEAT_TTST implements the functionality identified by the value 0b0001.

When FEAT_SEL2 is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

NV, bits [27:24]

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NV	Meaning
0b0000	If ID_AA64MMFR4_EL1.NV_frac != 0b0000, support for nested virtualization is described in ID_AA64MMFR4_EL1.NV_frac. Otherwise, nested virtualization is not supported.
0b0001	The HCR_EL2.{AT, NV1, NV} bits are implemented.
0b0010	The VNCR_EL2 register and the HCR_EL2.{NV2, AT, NV1, NV} bits are implemented.

All other values are reserved.

If EL2 is not implemented, the only permitted value is 0b0000.

FEAT_NV implements the functionality identified by the value 0b0001.

FEAT_NV2 implements the functionality identified by the value 0b0010.

In Armv8.3, if EL2 is implemented, the permitted values are 0b0000 and 0b0001.

From Armv8.4, if EL2 is implemented, the permitted values are 0b0000, 0b0001, and 0b0010.

Access to this field is **RO**.

CCIDX, bits [23:20]

Support for the use of revised CCSIDR_EL1 register format.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR_EL1.
0b0001	64-bit format implemented for all levels of the CCSIDR_EL1.

All other values are reserved.

FEAT_CCIDX implements the functionality identified by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

VARange, bits [19:16]

Indicates support for a larger virtual address.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VARange	Meaning	Applies when
0b0000	VMSAv8-64 supports 48-bit VAs.	
0b0001	VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The size for other translation granules is not defined by this field.	
0b0010	VMSAv9-128 supports 56-bit VAs.	When FEAT_D128 is implemented

All other values are reserved.

FEAT_LVA implements the functionality identified by the value 0b0001.

FEAT_LVA3 implements the functionality identified by the value 0b0010.

Access to this field is **RO**.

IESB, bits [15:12]

Indicates support for the IESB bit in the SCTLR_ELx registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IESB	Meaning
0b0000	IESB bit in the SCTLR_ELx registers is not supported.
0b0001	IESB bit in the SCTLR_ELx registers is supported.

All other values are reserved.

FEAT_IESB implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

LSM, bits [11:8]

Indicates support for LSMAOE and nTLSMD bits in SCTLR_EL1 and SCTLR_EL2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

UAO, bits [7:4]

User Access Override.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UAO	Meaning
0b0000	UAO not supported.
0b0001	UAO supported.

All other values are reserved.

FEAT_UAO implements the functionality identified by the value `0b0001`.

From Armv8.2, the value `0b0000` is not permitted.

Access to this field is **RO**.

CnP, bits [3:0]

Indicates support for Common not Private translations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CnP	Meaning
`0b0000`	Common not Private translations not supported.
`0b0001`	Common not Private translations supported.

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value `0b0001`.

From Armv8.2, the value `0b0000` is not permitted.

Access to this field is **RO**.

Accessing ID_AA64MMFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64MMFR2_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b010

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;

ID_AA64MMFR3_EL1, AArch64 Memory Model Feature Register 3

The ID_AA64MMFR3_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64MMFR3_EL1 are UNDEFINED.

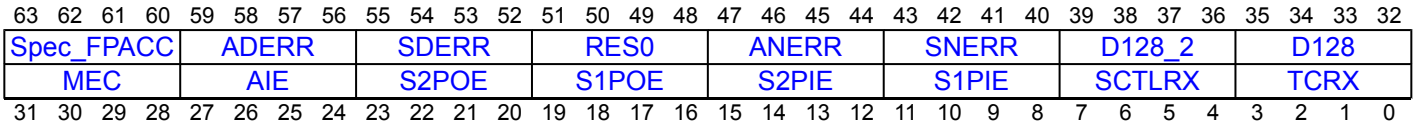
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64MMFR3_EL1 is a 64-bit register.

Field descriptions



Spec_FPACC, bits [63:60]

When FEAT_FPACCOMBINE is implemented:

Speculative behavior in the event of a PAC authentication failure in an implementation that includes FEAT_FPACCOMBINE.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Spec_FPACC	Meaning
0b0000	The implementation does not disclose whether the speculative use of pointers processed by a PAC Authentication is materially different in terms of the impact on cached microarchitectural state between passing and failing of the PAC Authentication.
0b0001	The speculative use of pointers processed by a PAC Authentication is not materially different in terms of the impact on cached microarchitectural state between passing and failing of the PAC Authentication.

All other values are reserved.

For the purpose of this definition, cached microarchitecture state is the state of caching agents such as instruction caches, data caches and TLBs which can be altered as a result of speculation caused by a mispredicted execution, but is not restored to the state prior to the speculation when the misprediction is corrected.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

ADERR, bits [59:56]

Asynchronous Device error exceptions. With ID_AA64MMFR3_EL1.SDERR, describes the PE behavior for External aborts signaled on Device memory loads.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ADERR	Meaning
0b0000	If FEAT_RASv2 is not implemented and ID_AA64MMFR3_EL1.SDERR is 0b0000, then the behavior is not described. Otherwise, the behavior is described by ID_AA64MMFR3_EL1.SDERR.
0b0001	All External aborts on Device memory loads are handled asynchronously.
0b0010	FEAT_ADERR is implemented. SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR are implemented. If FEAT_ANERR is also implemented, then software should ensure that all the following apply: • SCTLR2_ELx.EnADERR is set to the value of SCTLR2_ELx.EnANERR. • HCRX_EL2.EnSDERR is set to the value of HCRX_EL2.EnSNERR.
0b0011	FEAT_ADERR is implemented. SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR are implemented. If FEAT_ANERR is also implemented, then SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR operate independently of SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR.

All other values are reserved.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

When FEAT_RASv2 is implemented and ID_AA64MMFR3_EL1.SDERR is 0b0000, the value of this field is 0b0001.

When ID_AA64MMFR3_EL1.SDERR is 0b0001, the value of this field is 0b0000.

When ID_AA64MMFR3_EL1.SDERR is 0b0010, the value of this field is 0b0010.

When ID_AA64MMFR3_EL1.SDERR is 0b0011, the value of this field is 0b0011.

FEAT_ADERR implements the functionality described by the value 0b0010.

Access to this field is **RO**.

SDERR, bits [55:52]

Synchronous Device error exceptions. With ID_AA64MMFR3_EL1.ADERR, describes the PE behavior for External aborts signaled on Device memory loads.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SDERR	Meaning
0b0000	If FEAT_RASv2 is not implemented and ID_AA64MMFR3_EL1.ADERR is 0b0000, then the behavior is not described. Otherwise, the behavior is described by ID_AA64MMFR3_EL1.ADERR.
0b0001	All External aborts on Device memory loads are handled synchronously.
0b0010	FEAT_ADERR is implemented. SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR are implemented. If FEAT_ANERR is also implemented, then software should ensure that all the following apply: • SCTLR2_ELx.EnADERR is set to the value of SCTLR2_ELx.EnANERR. • HCRX_EL2.EnSDERR is set to the value of HCRX_EL2.EnSNERR.
0b0011	FEAT_ADERR is implemented. SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR are implemented. If FEAT_ANERR is also implemented, then SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR operate independently of SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR.

All other values are reserved.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

When FEAT_RASv2 is implemented and ID_AA64MMFR3_EL1.ADERR is 0b0000, the value of this field is 0b0001.

When ID_AA64MMFR3_EL1.ADERR is 0b0001, the value of this field is 0b0000.

When ID_AA64MMFR3_EL1.ADERR is 0b0010, the value of this field is 0b0010.

When ID_AA64MMFR3_EL1.ADERR is 0b0011, the value of this field is 0b0011.

FEAT_ADERR implements the functionality described by the value 0b0010.

Access to this field is **RO**.

Bits [51:48]

Reserved, RES0.

ANERR, bits [47:44]

Asynchronous Normal error exceptions. With ID_AA64MMFR3_EL1.SNERR, describes the PE behavior for External aborts signaled on Normal memory loads.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ANERR	Meaning
0b0000	If FEAT_RASv2 is not implemented and ID_AA64MMFR3_EL1.SNERR is 0b0000, then the behavior is not described. Otherwise, the behavior is described by ID_AA64MMFR3_EL1.SNERR.
0b0001	All External aborts on Normal memory loads are handled asynchronously.
0b0010	FEAT_ANERR is implemented. SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR are implemented. If FEAT_ADERR is also implemented, then software should ensure that all the following apply: • SCTLR2_ELx.EnANERR is set to the value of SCTLR2_ELx.EnADERR. • HCRX_EL2.EnSNERR is set to the value of HCRX_EL2.EnSDERR.
0b0011	FEAT_ANERR is implemented. SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR are implemented. If FEAT_ADERR is also implemented, then SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR operate independently of SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR.

All other values are reserved.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

When FEAT_RASv2 is implemented and ID_AA64MMFR3_EL1.SNERR is 0b0000, the value of this field is 0b0001.

When ID_AA64MMFR3_EL1.SNERR is 0b0001, the value of this field is 0b0000.

When ID_AA64MMFR3_EL1.SNERR is 0b0010, the value of this field is 0b0010.

When ID_AA64MMFR3_EL1.SNERR is 0b0011, the value of this field is 0b0011.

FEAT_ANERR implements the functionality described by the value 0b0010.

Access to this field is **RO**.

SNERR, bits [43:40]

Synchronous Normal error exceptions. With ID_AA64MMFR3_EL1.ANERR, describes the PE behavior for External aborts signaled on Normal memory loads.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SNERR	Meaning
0b0000	If FEAT_RASv2 is not implemented and ID_AA64MMFR3_EL1.ANERR is 0b0000, then the behavior is not described. Otherwise, the behavior is described by ID_AA64MMFR3_EL1.ANERR.
0b0001	All External aborts on Normal memory loads are handled synchronously.
0b0010	FEAT_ANERR is implemented. SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR are implemented. If FEAT_ADERR is also implemented, then software should ensure that all the following apply: • SCTLR2_ELx.EnANERR is set to the value of SCTLR2_ELx.EnADERR. • HCRX_EL2.EnSNERR is set to the value of HCRX_EL2.EnSDERR.
0b0011	FEAT_ANERR is implemented. SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR are implemented. If FEAT_ADERR is also implemented, then SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR operate independently of SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR.

All other values are reserved.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

When FEAT_RASv2 is implemented and ID_AA64MMFR3_EL1.ANERR is 0b0000, the value of this field is 0b0001.

When ID_AA64MMFR3_EL1.ANERR is 0b0001, the value of this field is 0b0000.

When ID_AA64MMFR3_EL1.ANERR is 0b0010, the value of this field is 0b0010.

When ID_AA64MMFR3_EL1.ANERR is 0b0011, the value of this field is 0b0011.

FEAT_ANERR implements the functionality described by the value 0b0010.

Access to this field is **RO**.

D128_2, bits [39:36]

128-bit translation table descriptor at stage 2. Indicates support for 128-bit translation table descriptor at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

D128_2	Meaning
0b0000	128-bit translation table descriptor Extension at stage 2 is not supported.
0b0001	128-bit translation table descriptor Extension at stage 2 is supported.

All other values are reserved.

Access to this field is **RO**.

D128, bits [35:32]

128-bit translation table descriptor. Indicates support for 128-bit translation table descriptor.

The value of this field is an IMPLEMENTATION DEFINED choice of:

D128	Meaning
0b0000	128-bit translation table descriptor Extension is not supported.
0b0001	128-bit translation table descriptor Extension is supported.

All other values are reserved.

Access to this field is **RO**.

MEC, bits [31:28]

Indicates support for Memory Encryption Contexts.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MEC	Meaning
0b0000	Memory Encryption Contexts is not supported.
0b0001	Memory Encryption Contexts is supported, with multiple contexts in the Realm physical address space.

All other values are reserved.

FEAT_MEC implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

AIE, bits [27:24]

Attribute Indexing. Indicates support for the Attribute Index Enhancement.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AIE	Meaning
0b0000	The Attribute Index Enhancement is not supported.
0b0001	The Attribute Index Enhancement at stage 1 is supported.

All other values are reserved.

FEAT_AIE implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

S2POE, bits [23:20]

Stage 2 Permission Overlay. Indicates support for Permission Overlay at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

S2POE	Meaning
0b0000	Permission Overlay at stage 2 is not supported.
0b0001	Permission Overlay at stage 2 is supported.

All other values are reserved.

FEAT_S2POE implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

S1POE, bits [19:16]

Stage 1 Permission Overlay. Indicates support for Permission Overlay at stage 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

S1POE	Meaning
0b0000	Permission Overlay at stage 1 is not supported.
0b0001	Permission Overlay at stage 1 is supported.

All other values are reserved.

FEAT_S1POE implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

S2PIE, bits [15:12]

Stage 2 Permission Indirection. Indicates support for Permission Indirection at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

S2PIE	Meaning
0b0000	Permission Indirection at stage 2 is not supported.
0b0001	Permission Indirection at stage 2 is supported.

All other values are reserved.

FEAT_S2PIE implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

S1PIE, bits [11:8]

Stage 1 Permission Indirection. Indicates support for Permission Indirection at stage 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

S1PIE	Meaning
0b0000	Permission Indirection at stage 1 is not supported.
0b0001	Permission Indirection at stage 1 is supported.

All other values are reserved.

FEAT_S1PIE implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

SCTLRX, bits [7:4]

SCTLR Extension. Indicates support for extension of SCTLR_ELx.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SCTLRX	Meaning
0b0000	SCTLR2_EL1, SCTLR2_EL2, SCTLR2_EL3 registers, and their associated trap controls are not implemented.
0b0001	SCTLR2_EL1, SCTLR2_EL2, SCTLR2_EL3 resisters, and their associated trap controls are implemented.

All other values are reserved.

From Armv8.9, the value 0b0000 is not permitted.

FEAT_SCTLR2 implements the functionality described by the value 0b0001.

Access to this field is **RO**.

TCRX, bits [3:0]

TCR Extension. Indicates support for extension of TCR_ELx.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TCRX	Meaning
0b0000	TCR2_EL1, TCR2_EL2, and their associated trap controls are not implemented.
0b0001	TCR2_EL1, TCR2_EL2, and their associated trap controls are implemented.

All other values are reserved.

From Armv8.9, the value 0b0000 is not permitted.

FEAT_TCR2 implements the functionality described by the value 0b0001.

Access to this field is **RO**.

Accessing ID_AA64MMFR3_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64MMFR3_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b011

```

ID_AA64MMFR4_EL1, AArch64 Memory Model Feature Register 4

The ID_AA64MMFR4_EL1 characteristics are:

Purpose

Provides additional information about implemented memory model and memory management support in AArch64.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64MMFR4_EL1 are UNDEFINED.

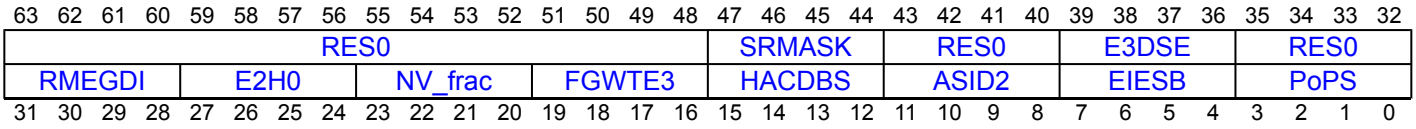
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64MMFR4_EL1 is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

SRMASK, bits [47:44]

Indicates support for bitwise write masks for the following registers:

- ACTLR_EL1.
- CPACR_EL1.
- SCTLR_EL1.
- SCTLR2_EL1.
- TCR_EL1.
- TCR2_EL1.
- ACTLR_EL2.
- CPTR_EL2.
- SCTLR_EL2.
- SCTLR2_EL2.
- TCR_EL2.
- TCR2_EL2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SRMASK	Meaning
0b0000	Bitwise write masks for the specified registers are not supported.
0b0001	Bitwise write masks for the specified registers are supported.

FEAT_SRMASK implements the functionality identified by the value 0b0001.

From Armv9.6, the value 0b0000 is not permitted.

Access to this field is **RO**.

Bits [43:40]

Reserved, RES0.

E3DSE, bits [39:36]

Delegated SError exceptions from EL3. Describes support for delegated SError injection from EL3.

The value of this field is an IMPLEMENTATION DEFINED choice of:

E3DSE	Meaning
0b0000	FEAT_E3DSE is not implemented.
0b0001	FEAT_E3DSE is implemented. The following are implemented: • Register fields SCR_EL3.DSE and SCR_EL3.EnDSE. • Registers VSESR_EL3 and VDISR_EL3.

All other values are reserved.

FEAT_E3DSE implements the functionality described by the value 0b0001.

Access to this field is **RO**.

Bits [35:32]

Reserved, RES0.

RMEGDI, bits [31:28]

RME Granular Data Isolation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RMEGDI	Meaning
0b0000	The Granular Data isolation GPI encodings are reserved.
0b0001	The Granular Data Isolation GPI encodings can be configured to be either reserved or No Access from this PE.

All other values are reserved.

FEAT_RME_GDI implements the functionality described by the value 0b0001.

Access to this field is **RO**.

E2H0, bits [27:24]

Indicates support for programming HCR_EL2.E2H.

The value of this field is an IMPLEMENTATION DEFINED choice of:

E2H0	Meaning
0b0000	FEAT_E2H0 is implemented.
0b1110	FEAT_E2H0 is not implemented. HCR_EL2.NV1 is RES0.
0b1111	FEAT_E2H0 is not implemented.

All other values are reserved.

If FEAT_NV is not implemented, then the value 0b1110 is not permitted.

If FEAT_E2H0 is implemented and FEAT_VHE is not implemented, then HCR_EL2.E2H is RES0.

If FEAT_E2H0 is implemented and FEAT_VHE is implemented, then HCR_EL2.E2H can be programmed to 0 or 1.

If FEAT_E2H0 is not implemented then:

- FEAT_VHE is implemented.
- HCR_EL2.E2H is RES1 and behaves as though it is 1.

Access to this field is **RO**.

NV_frac, bits [23:20]

Indicates support for a subset of FEAT_NV and FEAT_NV2 behaviors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NV_frac	Meaning
0b0000	Support for FEAT_NV and FEAT_NV2 is described in ID_AA64MMFR2_EL1.NV.
0b0001	FEAT_NV and FEAT_NV2 are implemented, but all of the following apply: • ID_AA64MMFR2_EL1.NV is 0b0000. • Programming HCR_EL2.{NV, NV2} to {1, 0} behaves as {1, 1}.
0b0010	As 0b0001 and adds stateful bits in specified _EL1 registers for software usage under nested virtualization.

FEAT_NV2p1 implements the functionality indicated by the value 0b0010.

Access to this field is **RO**.

FGWTE3, bits [19:16]

Indicates support for Fine Grained Write Trap EL3 feature.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FGWTE3	Meaning
0b0000	Fine Grained Write Trap EL3 is not supported.
0b0001	Fine Grained Write Trap EL3 is supported.

All other values are reserved.

FEAT_FGWTE3 implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

HACDBS, bits [15:12]

Support for Hardware accelerator for cleaning Dirty state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HACDBS	Meaning
0b0000	Hardware accelerator for cleaning Dirty state is not supported.
0b0001	Hardware accelerator for cleaning Dirty state is supported.

All other values are reserved.

FEAT_HACDBS implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

ASID2, bits [11:8]

Indicates support for concurrent use of two ASIDs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ASID2	Meaning
0b0000	FEAT_ASID2 is not implemented.
0b0001	FEAT_ASID2 is implemented.

All other values are reserved.

From Armv9.5, the value 0b0000 is not permitted.

Access to this field is **RO**.

EIESB, bits [7:4]

When FEAT_IESB is implemented:

Early Implicit Error Synchronization event. Indicates whether the implicit Error synchronization event inserted on taking an exception to ELx when SCTLR_ELx.IESB is 1 is inserted before or after the exception is taken.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EIESB	Meaning
0b1111	FEAT_IESB is implemented. When SError exceptions are routed to EL3, and either FEAT_DoubleFault is not implemented or the Effective value of SCR_EL3.NMEA is 1, an implicit Error synchronization event might be inserted after an exception is taken to EL3.
0b0000	FEAT_IESB is not implemented, or behavior is not described.
0b0001	FEAT_IESB is implemented. When SError exceptions are routed to EL3, and either FEAT_DoubleFault is not implemented or the Effective value of SCR_EL3.NMEA is 1, an implicit Error synchronization event is inserted before an exception taken to EL3.
0b0010	As 0b0001, and also: • When SError exceptions are routed to EL1, and either FEAT_DoubleFault2 is not implemented or the Effective value of SCTLR2_EL1.NMEA is 1, an implicit Error synchronization event is inserted before an exception taken to EL1. • When SError exceptions are routed to EL2, and either FEAT_DoubleFault2 is not implemented or the Effective value of SCTLR2_EL2.NMEA is 1, an implicit Error synchronization event is inserted before an exception taken to EL2.

All other values are reserved.

This field describes the PE behavior on taking an exception to ELx when SCTLR_ELx.IESB is 1. This field does not describe the behavior when SCTLR_ELx.IESB is 0.

The behavior described by this field only applies for the conditions described above. For example, if ID_AA64MMFR4_EL1.EIESB reads as 0b0001, then it does not describe the behavior when SError exceptions are not routed to EL3, or when FEAT_DoubleFault is implemented and the Effective value of SCR_EL3.NMEA is 0.

Inserting the event before the exception is taken means that if the Error synchronization event causes an SError exception to become pending, and SError exceptions are not masked and not disabled, then the SError exception is taken in place of the original exception.

When FEAT_IESB is not implemented, the only permitted value of this field is 0b0000.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

PoPS, bits [3:0]

Support for the clean and invalidate to the Point of Physical Storage instructions:

- DC CIVAPS.
- If FEAT_MTE2 is implemented, DC CIGDVAPS.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PoPS	Meaning
0b0000	The System instructions to clean and invalidate to the Point of Physical Storage are not implemented.
0b0001	The specified System instructions to clean and invalidate to the Point of Physical Storage are implemented.

FEAT_PoPS implements the functionality described by the value 0b0001.

All other values are reserved.

Access to this field is **RO**.

Accessing ID_AA64MMFR4_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64MMFR4_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b100

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);

ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0

The ID_AA64PFR0_EL1 characteristics are:

Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

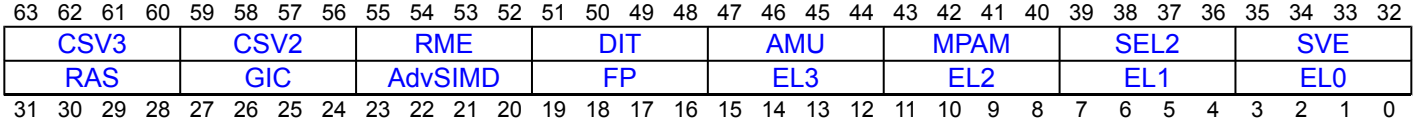
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64PFR0_EL1 are UNDEFINED.

The external register EDPFR gives information from this register.

Attributes

ID_AA64PFR0_EL1 is a 64-bit register.

Field descriptions



CSV3, bits [63:60]

Speculative use of faulting data.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSV3	Meaning
0b0000	This PE does not disclose whether data loaded or read from a register under speculation where the data load or register read would not be permitted architecturally, can be used by instructions newer than the load or register read in a manner that allows the value of the inaccessible data to be recovered by code architecturally executed.
0b0001	Data loaded or read from a register under speculation where the data load or register read would not be permitted architecturally, cannot be used by instructions newer than the load or register read in a manner that allows the value of the inaccessible data to be recovered by code architecturally executed.

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

From Armv8.5, the value 0b0000 is not permitted.

Access to this field is **RO**.

CSV2, bits [59:56]

Speculative use of out of context prediction resources.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSV2	Meaning
0b0000	The implementation does not disclose whether FEAT_CSV2 is implemented.
0b0001	FEAT_CSV2 is implemented, but FEAT_CSV2_2 and FEAT_CSV2_3 are not implemented. ID_AA64PFR1_EL1.CSV2_frac determines whether either or both of FEAT_CSV2_1p1 or FEAT_CSV2_1p2 are implemented.
0b0010	FEAT_CSV2_2 is implemented, but FEAT_CSV2_3 is not implemented.
0b0011	FEAT_CSV2_3 is implemented.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the value 0b0001.

FEAT_CSV2_2 implements the functionality identified by the value 0b0010.

FEAT_CSV2_3 implements the functionality identified by the feature 0b0011.

From Armv8.5, the value 0b0000 is not permitted.

Access to this field is **RO**.

RME, bits [55:52]

Realm Management Extension (RME).

The value of this field is an IMPLEMENTATION DEFINED choice of:

RME	Meaning
0b0000	Realm Management Extension not implemented.
0b0001	RMEv1 is implemented.
0b0010	As 0b0001, and adds support for the GPC2 Extension.
0b0011	As 0b0010, and adds support for the GPC3 Extension.

All other values are reserved.

FEAT_RME implements the functionality identified by the value 0b0001.

FEAT_RME_GPC2 implements the functionality identified by the value 0b0010.

FEAT_RME_GPC3 implements the functionality identified by the value 0b0011.

Access to this field is **RO**.

DIT, bits [51:48]

Data Independent Timing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DIT	Meaning
0b0000	AArch64 does not guarantee constant execution time of any instructions.
0b0001	AArch64 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the value 0b0000 is not permitted.

Access to this field is **RO**.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

Access to this field is **RO**.

MPAM, bits [43:40]

Indicates the major version number of support for the MPAM Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MPAM	Meaning
0b0000	The major version number of the MPAM extension is 0.
0b0001	The major version number of the MPAM extension is 1.

All other values are reserved.

When combined with the minor version number from ID_AA64PFR1_EL1.MPAM_frac, the "major.minor" version is:

MPAM Extension version	MPAM	MPAM_frac
Not implemented.	0b0000	0b0000
v0.1 is implemented.	0b0000	0b0001
v1.0 is implemented.	0b0001	0b0000
v1.1 is implemented.	0b0001	0b0001

For more information, see 'The Memory Partitioning and Monitoring (MPAM) Extension'.

Access to this field is **RO**.

SEL2, bits [39:36]

Secure EL2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

All other values are reserved.

FEAT_SEL2 implements the functionality identified by the value 0b0001.

From Armv8.4, if Secure state and EL2 are implemented, the value 0b0000 is not permitted.

From Armv8.4, if Secure state is not implemented, or if EL2 is not implemented, the only permitted value is 0b0000.

Access to this field is **RO**.

SVE, bits [35:32]

Scalable Vector Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SVE	Meaning
0b0000	SVE architectural state and programmers' model are not implemented.
0b0001	SVE architectural state and programmers' model are implemented.

All other values are reserved.

FEAT_SVE implements the functionality identified by the value 0b0001.

If implemented, refer to ID_AA64ZFR0_EL1 for information about which SVE instructions are available.

Access to this field is **RO**.

RAS, bits [31:28]

RAS Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	Support for the Reliability, Availability, and Serviceability Extension is implemented. The ESB instruction and the Error synchronization event are supported.
0b0010	As 0b0001, and adds support for: • If EL3 is implemented, FEAT_DoubleFault. • Additional ERXMISC<m>_EL1 System registers. • Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.
0b0011	As 0b0010 and adds support for: • ERXGSR_EL1, to support System RAS agents. • Additional fine-grained EL2 traps for additional error record System registers. • The SCR_EL3.TWERR write control for error record System registers. Error records accessed through System registers conform to RAS System Architecture v2.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 and FEAT_DoubleFault implement the functionality identified by the value 0b0010.

FEAT_RASv2 implements the functionality identified by the value 0b0011.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the value 0b0000 is not permitted.

From Armv8.4, if FEAT_DoubleFault is implemented or ERRIDR_EL1.NUM is nonzero, the value 0b0001 is not permitted.

Note

When the value of this field is 0b0001, ID_AA64PFR1_EL1.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

From Armv8.9, if FEAT_DoubleFault is implemented or ERRIDR_EL1.NUM is nonzero, the value 0b0010 is not permitted.

Access to this field is **RO**.

GIC, bits [27:24]

System register GIC CPU interface.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

Access to this field is **RO**.

AdvSIMD, bits [23:20]

Advanced SIMD.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following SISD and SIMD operations: • Integer byte, halfword, word and doubleword element operations. • Single-precision and double-precision floating-point arithmetic. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

Access to this field is **RO**.

FP, bits [19:16]

Floating-point.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: • Single-precision and double-precision floating-point types. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- `0b0000` in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- `0b0001` in an implementation with floating-point support that includes the FEAT_FP16 extension.
- `0b1111` in an implementation without floating-point support.

Access to this field is **RO**.

EL3, bits [15:12]

EL3 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL3	Meaning
`0b0000`	EL3 is not implemented.
`0b0001`	EL3 can be executed in AArch64 state only.
`0b0010`	EL3 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

The value `0b0010` is not permitted in Armv9-A implementations.

Access to this field is **RO**.

EL2, bits [11:8]

EL2 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL2	Meaning
`0b0000`	EL2 is not implemented.
`0b0001`	EL2 can be executed in AArch64 state only.
`0b0010`	EL2 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

The value `0b0010` is not permitted in Armv9-A implementations.

Access to this field is **RO**.

EL1, bits [7:4]

EL1 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL1	Meaning
`0b0001`	EL1 can be executed in AArch64 state only.
`0b0010`	EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

The value `0b0010` is not permitted in Armv9-A implementations.

Access to this field is **RO**.

EL0, bits [3:0]

EL0 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL0	Meaning
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

Access to this field is **RO**.

Accessing ID_AA64PFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64PFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b000

```

ID_AA64PFR1_EL1, AArch64 Processor Feature Register 1

The ID_AA64PFR1_EL1 characteristics are:

Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

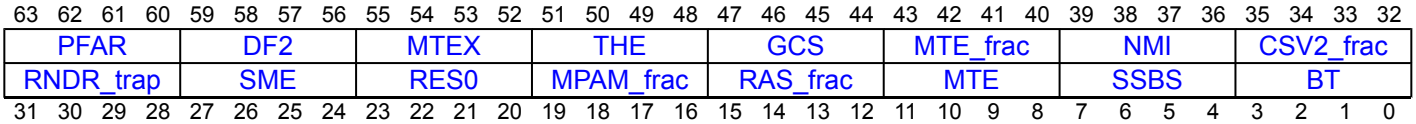
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64PFR1_EL1 are UNDEFINED.

Attributes

ID_AA64PFR1_EL1 is a 64-bit register.

Field descriptions



PFAR, bits [63:60]

Support for physical fault address registers, FEAT_PFAR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PFAR	Meaning
0b0000	FEAT_PFAR is not implemented.
0b0001	FEAT_PFAR is implemented. Includes support for the PFAR_ELx and, if EL3 is implemented, MFAR_EL3 registers.

All other values are reserved.

FEAT_PFAR implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

DF2, bits [59:56]

Support for error exception routing extensions, FEAT_DoubleFault2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DF2	Meaning
0b0000	FEAT_DoubleFault2 is not implemented. **Note** This does not mean that FEAT_DoubleFault, as identified by ID_AA64PFR0_EL1.RAS >= 0b0010, is not implemented.
0b0001	FEAT_DoubleFault2 is implemented. As ID_AA64PFR0_EL1.RAS == 0b0010, and also includes support for routing error exceptions: • Traps for masked error exceptions, HCRX_EL2.TMEA and SCR_EL3.TMEA. • Additional controls for masking SError exceptions, SCTLR2_EL1.NMEA, and SCTLR2_EL2.NMEA. • Additional controls for taking external aborts to the SError exception vector, SCTLR2_EL1.EASE and SCTLR2_EL2.EASE.

All other values are reserved.

FEAT_DoubleFault2 implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

MTEX, bits [55:52]

Support for additional MTE tag checking modes.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTEX	Meaning
0b0000	Canonical Tag checking and Memory tagging with Address tagging disabled are not supported.
0b0001	The following additional tag checking modes for MTE are supported: • Canonical Tag checking. • Memory tagging with Address tagging disabled.

All other values are reserved.

This field is valid only if ID_AA64PFR1_EL1.MTE >= 0b0010.

FEAT_MTE_NO_ADDRESS_TAGS and FEAT_MTE_CANONICAL_TAGS implement the functionality identified by the value 0b0001.

If FEAT_MTE2 is not implemented, the value 0b0001 is not permitted.

From Armv8.9, if FEAT_MTE2 is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

THE, bits [51:48]

Support for Translation Hardening Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

THE	Meaning
0b0000	Translation Hardening Extension is not implemented.
0b0001	The RCW and RCWS instructions, their associated registers and traps are supported. If EL2 is implemented, the AssuredOnly check, TopLevel check, and their associated controls are implemented. If EL2 and FEAT_GCS are implemented, VTCR_EL2.GCSH is implemented.

All other values are reserved.

FEAT_THE implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

GCS, bits [47:44]

Support for Guarded Control Stack.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GCS	Meaning
0b0000	Guarded Control Stack is not implemented.
0b0001	Guarded Control Stack is implemented.

All other values are reserved.

FEAT_GCS implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

MTE_frac, bits [43:40]

Support for Asynchronous reporting of a Tag Check Fault.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTE_frac	Meaning
0b0000	Asynchronous reporting of a Tag Check Fault is supported.
0b1111	Asynchronous reporting of a Tag Check Fault is not supported.

All other values are reserved.

This field is valid only if ID_AA64PFR1_EL1.MTE >= 0b0010.

FEAT_MTE_ASYNC implements the functionality identified by the value 0b0000.

If FEAT_MTE_ASYM_FAULT is implemented this field must be 0b0000.

Access to this field is **RO**.

NMI, bits [39:36]

Non-maskable Interrupt. Indicates support for Non-maskable interrupts.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NMI	Meaning
0b0000	SCTLR_ELx.{SPINTMASK, NMI} and PSTATE.ALLINT with its associated instructions are not supported.
0b0001	SCTLR_ELx.{SPINTMASK, NMI} and PSTATE.ALLINT with its associated instructions are supported.

All other values are reserved.

FEAT_NMI implements the functionality identified by the value 0b0001.

From Armv8.8, the value 0b0000 is not permitted.

Access to this field is **RO**.

CSV2_frac, bits [35:32]

CSV2 fractional field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSV2_frac	Meaning
0b0000	Either ID_AA64PFR0_EL1.CSV2 is not 0b0001, or the implementation does not disclose whether FEAT_CSV2_1p1 is implemented. FEAT_CSV2_1p2 is not implemented.
0b0001	FEAT_CSV2_1p1 is implemented, but FEAT_CSV2_1p2 is not implemented.
0b0010	FEAT_CSV2_1p2 is implemented.

All other values are reserved.

FEAT_CSV2_1p1 implements the functionality identified by the value 0b0001.

FEAT_CSV2_1p2 implements the functionality identified by the value 0b0010.

From Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

The values 0b0001 and 0b0010 are permitted only when ID_AA64PFR0_EL1.CSV2 is 0b0001.

Access to this field is **RO**.

RNDR_trap, bits [31:28]

Random Number trap to EL3 field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RNDR_trap	Meaning
0b0000	Trapping of RNDR and RNDRRS to EL3 is not supported.
0b0001	Trapping of RNDR and RNDRRS to EL3 is supported. SCR_EL3.TRNDR is present.

All other values are reserved.

FEAT_RNG_TRAP implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

SME, bits [27:24]

Scalable Matrix Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SME	Meaning
0b0000	SME architectural state and programmers' model are not implemented.
0b0001	SME architectural state and programmers' model are implemented.
0b0010	As 0b0001, plus the SME2 ZT0 register.

All other values are reserved.

FEAT_SME implements the functionality identified by the value 0b0001.

FEAT_SME2 implements the functionality identified by the value 0b0010.

From Armv9.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If implemented, refer to ID_AA64SMFR0_EL1 and ID_AA64ZFR0_EL1 for information about which SME and SVE instructions are available.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

MPAM_frac, bits [19:16]

Indicates the minor version number of support for the MPAM Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MPAM_frac	Meaning
0b0000	The minor version number of the MPAM extension is 0.
0b0001	The minor version number of the MPAM extension is 1.

All other values are reserved.

When combined with the major version number from ID_AA64PFR0_EL1.MPAM, The combined "major.minor" version is:

MPAM Extension version	MPAM	MPAM_frac
Not implemented.	0b0000	0b0000
v0.1 is implemented.	0b0000	0b0001
v1.0 is implemented.	0b0001	0b0000
v1.1 is implemented.	0b0001	0b0001

For more information, see 'The Memory Partitioning and Monitoring (MPAM) Extension'.

Access to this field is **RO**.

RAS_frac, bits [15:12]

RAS Extension fractional field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RAS_frac	Meaning
0b0000	If ID_AA64PFR0_EL1.RAS == 0b0001, support for the Reliability, Availability, and Serviceability Extension is implemented.
0b0001	If ID_AA64PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for: • Additional ERXMISC<m>_EL1 System registers. • Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS, and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0000.

FEAT_RASv1p1 implements the functionality identified by the value 0b0001.

This field is valid only if ID_AA64PFR0_EL1.RAS == 0b0001.

Access to this field is **RO**.

MTE, bits [11:8]

Support for the Memory Tagging Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTE	Meaning
0b0000	Memory Tagging Extension is not implemented.
0b0001	Instruction-only Memory Tagging Extension is implemented.
0b0010	As 0b0001, and adds: • Support for in-memory Allocation tags. • Support for synchronous tag checking. • Optional support for Asynchronous reporting of a Tag Check Fault, identified as FEAT_MTE_ASYNC. Support for FEAT_MTE_ASYNC is indicated by ID_AA64PFR1_EL1.MTE_frac.
0b0011	As 0b0010, except that support for FEAT_MTE_ASYNC is mandatory, and adds support for Asymmetric Tag Check Fault handling, identified as FEAT_MTE_ASYM_FAULT.

All other values are reserved.

FEAT_MTE implements the functionality identified by the value 0b0001.

FEAT_MTE2 implements the functionality identified by the value 0b0010.

FEAT_MTE3 implements the functionality identified by the value 0b0011.

From Armv8.7, when the value of this field is >= 0b0010, ID_AA64PFR2_EL1.MTEPERM indicates support for FEAT_MTE_PERM.

From Armv8.7, when the value of this field is >= 0b0010, the following fields indicate support for FEAT_MTE4:

- ID_AA64PFR1_EL1.MTEX
- ID_AA64PFR2_EL1.MTEFAR
- ID_AA64PFR2_EL1.MTESTOREONLY

Access to this field is **RO**.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SSBS	Meaning
0b0000	AArch64 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.
0b0010	As 0b0001, and adds the MSR and MRS instructions to directly read and write the PSTATE.SSBS field.

All other values are reserved.

FEAT_SSBS implements the functionality identified by the value 0b0001.

FEAT_SSBS2 implements the functionality identified by the value 0b0010.

Access to this field is **RO**.

BT, bits [3:0]

Branch Target Identification mechanism support in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BT	Meaning
0b0000	The Branch Target Identification mechanism is not implemented.
0b0001	The Branch Target Identification mechanism is implemented.

All other values are reserved.

FEAT_BTI implements the functionality identified by the value 0b0001.

From Armv8.5, the value `0b0000` is not permitted.

Access to this field is **RO**.

Accessing ID_AA64PFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64PFR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then

ID_AA64PFR2_EL1, AArch64 Processor Feature Register 2

The ID_AA64PFR2_EL1 characteristics are:

Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64PFR2_EL1 are UNDEFINED.

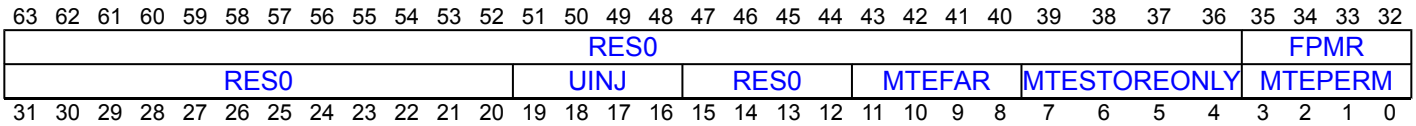
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64PFR2_EL1 is a 64-bit register.

Field descriptions



Bits [63:36]

Reserved, RES0.

FPMR, bits [35:32]

Indicates support for FPMR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPMR	Meaning
0b0000	FPMR is not implemented.
0b0001	FPMR is implemented.

All other values are reserved.

FEAT_FPMR implements the functionality identified by the value 0b0001.

Access to this field is **RO**.

Bits [31:20]

Reserved, RES0.

UINJ, bits [19:16]

Support for software injection of Undefined Instruction exceptions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UINJ	Meaning
0b0000	Software injection of Undefined Instruction exceptions is not implemented.
0b0001	Software injection of Undefined Instruction exceptions is implemented.

FEAT_UINJ implements the functionality identified by the value 0b0001.

From Armv9.6, the value 0b0000 is not permitted.

Access to this field is **RO**.

Bits [15:12]

Reserved, RES0.

MTEFAR, bits [11:8]

Indicates whether FAR_ELx[63:60] are UNKNOWN on a synchronous exception due to a Tag Check Fault.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTEFAR	Meaning
0b0000	On a synchronous exception due to a Tag Check Fault, FAR_ELx[63:60] are UNKNOWN.
0b0001	On a synchronous exception due to a Tag Check Fault, FAR_ELx[63:60] are not UNKNOWN.

All other values are reserved.

FEAT_MTE_TAGGED_FAR implements the functionality identified by the value 0b0001.

If FEAT_MTE2 is not implemented, the value 0b0001 is not permitted.

From Armv8.9, if FEAT_MTE2 is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

MTESTOREONLY, bits [7:4]

Support for Store-only Tag checking.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTESTOREONLY	Meaning
0b0000	Store-only Tag checking is not supported.
0b0001	Store-only Tag checking is supported.

All other values are reserved.

FEAT_MTE_STORE_ONLY implements the functionality identified by the value 0b0001.

If FEAT_MTE2 is not implemented, the value 0b0001 is not permitted.

From Armv8.9, if FEAT_MTE2 is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

MTEPERM, bits [3:0]

Support for Allocation tag access permissions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTEPERM	Meaning
0b0000	Allocation tag access permissions are not supported.
0b0001	Allocation tag access permissions are supported. **Note** NoTagAccess is supported at stage 2 of translation only.

All other values are reserved.

FEAT_MTE_PERM implements the functionality identified by the value 0b0001

If FEAT_MTE2 is not implemented, the value 0b0001 is not permitted.

From Armv8.9, if FEAT_MTE2 is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

Accessing ID_AA64PFR2_EL1

ID_AA64SMFR0_EL1, SME Feature ID Register 0

The ID_AA64SMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented features of the AArch64 Scalable Matrix Extension.

The fields in this register do not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64SMFR0_EL1 and ID_AA64FPFR0_EL1.

Configuration

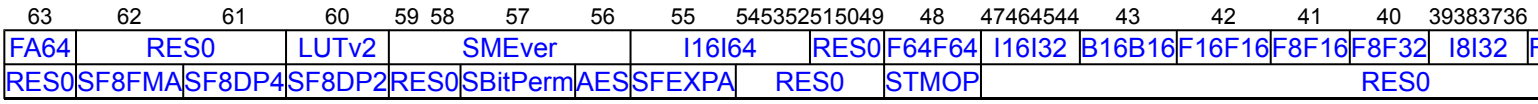
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64SMFR0_EL1 is a 64-bit register.

Field descriptions



FA64, bit [63]

Indicates support at each Exception Level for execution of the full AArch64 Advanced SIMD and SVE instruction sets when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FA64	Meaning
0b0	Only those AArch64 instructions defined as being legal can be executed in streaming SVE mode.
0b1	All implemented AArch64 instructions are legal for execution in Streaming SVE mode, when enabled by SMCR_EL1.FA64, SMCR_EL2.FA64, and SMCR_EL3.FA64.

FEAT_SME_FA64 implements the functionality identified by the value 0b1.

Access to this field is **RO**.

Bits [62:61]

Reserved, RES0.

LUTv2, bit [60]

Indicates support for the following additional variants of SME2 lookup table LUTI4 and MOVT instructions:

- A LUTI4 instruction with 8-bit result elements, two consecutively numbered source vectors, and four consecutively numbered destination vectors.
- If FEAT_SME2p1 is implemented, a LUTI4 instruction with 8-bit result elements, two consecutively numbered source vectors, and four destination vectors with strided register numbering.
- A MOVT instruction that copies a single Z source vector to ZT0.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LUTv2	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

All other values are reserved.

FEAT_SME_LUTv2 implements the functionality identified by the value 0b1.

Access to this field is **RO**.

SMEver, bits [59:56]

Indicates support for SME instructions when FEAT_SME is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SMEver	Meaning
0b0000	The mandatory SME instructions are implemented.
0b0001	As 0b0000, and adds the mandatory SME2 instructions.
0b0010	As 0b0001, and adds the mandatory SME2.1 instructions.
0b0011	As 0b0010, and adds the mandatory SME2.2 instructions.

All other values are reserved.

FEAT_SME implements the functionality identified by the value 0b0000.

FEAT_SME2 implements the functionality identified by the value 0b0001.

FEAT_SME2p1 implements the functionality identified by the value 0b0010.

From Armv9.4, the value 0b0001 is not permitted.

FEAT_SME2p2 implements the functionality identified by 0b0011.

From Armv9.6, the values 0b0000 and 0b0010 are not permitted.

Access to this field is **RO**.

I16I64, bits [55:52]

Indicates support for the following SME instructions that accumulate into 64-bit integer elements in the ZA array:

- The variants of the ADDHA, ADDVA, SMOPA, SMOPS, SUMOPA, SUMOPS, UMOPA, UMOPS, USMOPA, and USMOPS instructions that accumulate into 64-bit integer tiles.
- When FEAT_SME2 is implemented, the variants of the ADD, ADDA, SDOT, SMLALL, SMLSLL, SUB, SUBA, SVDOT, UDOT, UMLALL, UMLSLL, and UVDOT instructions that accumulate into 64-bit integer elements in ZA array vectors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

I16I64	Meaning
0b0000	The specified instructions are not implemented by this control.
0b1111	The specified instructions are implemented.

All other values are reserved.

FEAT_SME_I16I64 implements the functionality identified by the value 0b1111.

Access to this field is **RO**.

Bits [51:49]

Reserved, RES0.

F64F64, bit [48]

Indicates support for the following SME instructions that accumulate into double-precision floating-point elements in the ZA array:

- The variants of the FMOPA and FMOPS instructions that accumulate into double-precision tiles.
- When FEAT_SME2 is implemented, the variants of the FADD, FMLA, FMLS, and FSUB instructions that accumulate into double-precision elements in ZA array vectors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F64F64	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented .

FEAT_SME_F64F64 implements the functionality identified by the value 0b1.

Access to this field is **RO**.

I16I32, bits [47:44]

When FEAT_SME2 is implemented:

Indicates support for SME2 SMOPA (2-way), SMOPS (2-way), UMOPA (2-way), and UMOPS (2-way) instructions that accumulate 16-bit outer products into 32-bit integer tiles.

The value of this field is an IMPLEMENTATION DEFINED choice of:

I16I32	Meaning
0b0000	The specified instructions are not implemented by this control.
0b0101	The specified instructions are implemented.

All other values are reserved.

If FEAT_SME2 is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

B16B16, bit [43]

Indicates support for the SME ZA-targeting non-widening BFloat16 BFADD, BFMLA, BFMLS, BFMOPA, BFMOPS, and BFSUB instructions with BFloat16 operands and results.

The value of this field is an IMPLEMENTATION DEFINED choice of:

B16B16	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

FEAT_SME_B16B16 implements the functionality identified by the value 0b1.

Access to this field is **RO**.

F16F16, bit [42]

Indicates support for the following SME2 half-precision floating-point instructions:

- FMOPA and FMOPS instructions that accumulate half-precision outer-products into half-precision tiles.
- Multi-vector FADD, FMLA, FMLS, and FSUB instructions with half-precision operands and results.
- Multi-vector FCVT and FCVTL instructions that convert half-precision inputs to single-precision results.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F16F16	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

FEAT_SME_F16F16 implements the functionality identified by the value 0b1.

Access to this field is **RO**.

F8F16, bit [41]

Indicates support for the following SME2 instructions:

- The ZA-targeting FP8 instructions FDOT (2-way), FMLAL, FMOPA (2-way), and FVDOT that accumulate into half-precision floating-point elements.
- ZA-targeting non-widening half-precision FADD and FSUB instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8F16	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

FEAT_SME_F8F16 implements the functionality identified by the value 0b1.

Access to this field is **RO**.

F8F32, bit [40]

Indicates support for the SME2 ZA-targeting FP8 FDOT (4-way), FMLALL, FMOPA (4-way), FVDOTB, and FVDOTT instructions that accumulate into single-precision floating-point elements.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8F32	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

FEAT_SME_F8F32 implements the functionality identified by the value 0b1.

Access to this field is **RO**.

I8I32, bits [39:36]

When FEAT_SME is implemented:

Indicates support for SME SMOPA, SMOPS, SUMOPA, SUMOPS, UMOPA, UMOPS, USMOPA, and USMOPS instructions that accumulate 8-bit outer products into 32-bit tiles

The value of this field is an IMPLEMENTATION DEFINED choice of:

I8I32	Meaning
0b0000	The specified instructions are not implemented by this control.
0b1111	The specified instructions are implemented.

All other values are reserved.

If FEAT_SME is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

F16F32, bit [35]
When FEAT_SME is implemented:

Indicates support for SME FMOPA and FMOPS instructions that accumulate half-precision floating-point outer products into single-precision floating-point tiles.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F16F32	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

If FEAT_SME is implemented, the value 0b0 is not permitted.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

B16F32, bit [34]
When FEAT_SME is implemented:

Indicates support for SME BFMOPA and BFMOPS instructions that accumulate BFloat16 outer products into single-precision floating-point tiles.

The value of this field is an IMPLEMENTATION DEFINED choice of:

B16F32	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

If FEAT_SME is implemented, the value 0b0 is not permitted.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

BI32I32, bit [33]
When FEAT_SME2 is implemented:

Indicates support for SME BMOPA and BMOPS instructions that accumulate thirty-two 1-bit binary outer products into 32-bit integer tiles.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BI32I32	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

If FEAT_SME2 is implemented, the value 0b0 is not permitted.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

F32F32, bit [32]

When FEAT_SME is implemented:

Indicates support for SME FMOPA and FMOPS instructions that accumulate single-precision floating-point outer products into single-precision floating-point tiles.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F32F32	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

If FEAT_SME is implemented, the value 0b0 is not permitted.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES0.

SF8FMA, bit [30]

Indicates support for the SVE2 FP8 to single-precision and half-precision multiply-accumulate FMLALB, FMLALT, FMLALLBB, FMLALLBT, FMLALLTB, and FMLALLTT instructions when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SF8FMA	Meaning
0b0	This control has no effect on Streaming SVE mode behavior.
0b1	The specified instructions are supported in Streaming SVE mode.

Note

Other features may support some of the specified instructions in Non-streaming SVE mode.

If FEAT_SME2 and FEAT_FP8FMA are implemented, the value 0b0 is not permitted.

FEAT_SSVE_FP8FMA implements the functionality identified by the value 0b1.

Access to this field is **RO**.

SF8DP4, bit [29]

Indicates support for the SVE2 FP8 to single-precision 4-way dot product FDOT (4-way) instructions when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SF8DP4	Meaning
0b0	This control has no effect on Streaming SVE mode behavior.
0b1	The specified instructions are supported in Streaming SVE mode.

Note

Other features may support some of the specified instructions in Non-streaming SVE mode.

If FEAT_SME2 and FEAT_FP8DOT4 are implemented, the value `0b0` is not permitted.

FEAT_SSVE_FP8DOT4 implements the functionality identified by the value `0b1`.

Access to this field is **RO**.

SF8DP2, bit [28]

Indicates support for the SVE2 FP8 to half-precision 2-way dot product `FDOT` (2-way) instructions when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SF8DP2	Meaning
`0b0`	This control has no effect on Streaming SVE mode behavior.
`0b1`	The specified instructions are supported in Streaming SVE mode.

Note

Other features may support some of the specified instructions in Non-streaming SVE mode.

If FEAT_SME2 and FEAT_FP8DOT2 are implemented, the value `0b0` is not permitted.

FEAT_SSVE_FP8DOT2 implements the functionality identified by the value `0b1`.

Access to this field is **RO**.

Bits [27:26]

Reserved, RES0.

SBitPerm, bit [25]

Indicates support for the SVE bit permute instructions identified as implemented by ID_AA64ZFR0_EL1.BitPerm, when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SBitPerm	Meaning
`0b0`	This control has no effect on Streaming SVE mode behavior.
`0b1`	The specified instructions are implemented when the PE is in Streaming SVE mode.

Note

Other features may support some of the specified instructions in Non-streaming SVE mode.

FEAT_SSVE_BitPerm implements the functionality identified by the value `0b1`.

Access to this field is **RO**.

AES, bit [24]

Indicates support for the SVE AES and 128-bit polynomial multiply long instructions identified as implemented by ID_AA64ZFR0_EL1.AES, when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AES	Meaning
`0b0`	This control has no effect on Streaming SVE mode behavior.
`0b1`	The specified instructions are supported when the PE is in Streaming SVE mode.

Note

Other features may support some of the specified instructions in Non-streaming SVE mode.

FEAT_SSVE_AES implements the functionality identified by the value `0b1`.

Access to this field is **RO**.

SFEXPA, bit [23]

Indicates support for the SVE `FEXPA` instruction when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SFEXPA	Meaning
`0b0`	This control has no effect on Streaming SVE mode behavior.
`0b1`	The specified instruction is supported when the PE is in Streaming SVE mode.

Note

Other features may support some of the specified instructions in Non-streaming SVE mode.

FEAT_SSVE_FEXPA implements the functionality identified by the value `0b1`.

Access to this field is **RO**.

Bits [22:17]

Reserved, RES0.

STMOP, bit [16]

Indicates support for the following SME Structured sparsity outer product instructions:

- `BFTMOPA` (non-widening), if FEAT_SME_B16B16 is implemented.
- `BFTMOPA` (widening, BF16 to FP32).
- `FTMOPA` (non-widening, FP16), if FEAT_SME_F16F16 is implemented.
- `FTMOPA` (non-widening, FP32).
- `FTMOPA` (widening, 2-way, FP16 to FP32).
- `FTMOPA` (widening, 2-way, FP8 to FP16), if FEAT_SME_F8F16 is implemented.
- `FTMOPA` (widening, 4-way, FP8 to FP32) if FEAT_SME_F8F32 is implemented.
- `STMOPA`, `SUTMOPA`, `USTMOPA`, `UTMOPA` (4-way, Int8 to Int32). `STMOPA`, `UTMOPA` (2-way, Int16 to Int32).

The value of this field is an IMPLEMENTATION DEFINED choice of:

STMOP	Meaning
`0b0`	The specified instructions are not implemented by this control.
`0b1`	The specified instructions are implemented.

FEAT_SME_TMOP implements the functionality identified by the value `0b1`.

Access to this field is **RO**.

Bits [15:1]

Reserved, RES0.

SMOP4, bit [0]

Indicates support for the following SME Quarter-tile outer product instructions:

- BFMOP4A, BFMOP4S (non-widening, BF16), if FEAT_SME_B16B16 is implemented.
- BFMOP4A, BFMOP4S (widening, 2-way, BF16 to FP32).
- FMOP4A, FMOP4S (non-widening, FP16), if FEAT_SME_F16F16 is implemented.
- FMOP4A, FMOP4S (non-widening, FP32).
- FMOP4A, FMOP4S (non-widening, FP64), if FEAT_SME_F64F64 is implemented.
- FMOP4A, FMOP4S (widening, 2-way, FP16 to FP32).
- FMOP4A(widening, 2-way, FP8 to FP16), if FEAT_SME_F8F16 is implemented.
- FMOP4A(widening, 4-way, FP8 to FP32) instruction, if FEAT_SME_F8F32 is implemented.
- SMOP4A, SMOP4S, SUMOP4A, SUMOP4S, UMOP4A, UMOP4S, USMOP4A, USMOP4S (4-way, Int8 to Int32).
- SMOP4A, SMOP4S, SUMOP4A, SUMOP4S, UMOP4A, UMOP4S, USMOP4A, USMOP4S (4-way, Int16 to Int64), if FEAT_SME_I16I64 is implemented.
- SMOP4A, SMOP4S, UMOP4A, UMOP4S (2-way, Int16 to Int32).

The value of this field is an IMPLEMENTATION DEFINED choice of:

SMOP4	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

FEAT_SME_MOP4 implements the functionality identified by the value 0b1.

Access to this field is **RO**.

Accessing ID_AA64SMFR0_EL1

This register is read-only and can be accessed from EL1 and higher.

This register is only accessible from the AArch64 state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64SMFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b101

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

ID_AA64ZFR0_EL1, SVE Feature ID Register 0

The ID_AA64ZFR0_EL1 characteristics are:

Purpose

Provides additional information about the implemented features of the AArch64 Scalable Vector Extension instruction set, when FEAT_SVE or FEAT_SME is implemented.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

If FEAT_SME is implemented and FEAT_SVE is not implemented, then SVE instructions can only be executed when the PE is in Streaming SVE mode and the instructions are legal for execution in Streaming SVE mode.

Attributes

ID_AA64ZFR0_EL1 is a 64-bit register.

Bits [63:60]

Reserved, RES0.

F64MM, bits [59:56]

Indicates support for the SVE double-precision floating-point matrix multiply-accumulate instruction `FMMLA`, the `LD1RO*` instructions, the 128-bit element variants of the SVE `TRN1`, `TRN2`, `UZP1`, `UZP2`, `ZIP1`, and `ZIP2` instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F64MM	Meaning
`0b0000`	This field does not indicate support for the specified instructions.
`0b0001`	The specified instructions are implemented.

All other values are reserved.

FEAT_F64MM implements the functionality identified by `0b0001`.

The instructions described by nonzero values of this field might not be legal when the PE is in Streaming SVE mode.

Access to this field is **RO**.

F32MM, bits [55:52]

Indicates support for the SVE single-precision floating-point matrix multiply-accumulate instruction FMMLA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F32MM	Meaning
0b0000	This field does not indicate support for the specified instruction.
0b0001	The specified instruction is implemented.

All other values are reserved.

FEAT_F32MM implements the functionality identified by 0b0001.

The instructions described by nonzero values of this field might not be legal when the PE is in Streaming SVE mode.

Access to this field is **RO**.

F16MM, bits [51:48]

Indicates support for the SVE half-precision floating-point matrix multiply-accumulate to single-precision instruction FMMLA (widening, FP16 to FP32).

The value of this field is an IMPLEMENTATION DEFINED choice of:

F16MM	Meaning
0b0000	This field does not indicate support for the specified instruction.
0b0001	The specified instruction is implemented.

FEAT_SVE_F16F32MM implements the functionality identified by 0b0001.

The instructions described by nonzero values of this field might not be legal when the PE is in Streaming SVE mode.

Access to this field is **RO**.

I8MM, bits [47:44]

Indicates support for the following SVE 8-bit integer sum-of-products and accumulate to 32-bit integer instructions SMMLA, SUDOT, UMMLA, USMMLA, and USDOT.

The value of this field is an IMPLEMENTATION DEFINED choice of:

I8MM	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ISAR1_EL1.I8MM.

From Armv8.6, if SVE is implemented, the value 0b0000 is not permitted.

The SVE SMMLA, UMMLA, and USMMLA instructions might not be legal when the PE is in Streaming SVE mode.

Access to this field is **RO**.

SM4, bits [43:40]

Indicates support for SVE SM4 instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SM4	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	SVE SM4E and SM4EKEY instructions are implemented.

All other values are reserved.

FEAT_SVE_SM4 implements the functionality identified by 0b0001.

The instructions described by nonzero values of this field might not be legal when the PE is in Streaming SVE mode.

Access to this field is **RO**.

Bits [39:36]

Reserved, RES0.

SHA3, bits [35:32]

Indicates support for the SVE SHA3 instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA3	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	SVE RAX1 instruction is implemented.

All other values are reserved.

FEAT_SVE_SHA3 implements the functionality identified by 0b0001.

If FEAT_SME2p1 is not implemented, then instructions described by nonzero values of this field might not be legal when the PE is in Streaming SVE mode.

Access to this field is **RO**.

Bits [31:28]

Reserved, RES0.

B16B16, bits [27:24]

Indicates support for SVE non-widening BFloat16 instructions and SME multi-vector Z-targeting non-widening BFloat16 instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

B16B16	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	The following non-widening BFloat16 instructions are implemented: • SVE instructions: BFADD, BFCLAMP, BFMAX, BFMAXNM, BFMIN, BFMINNM, BFMLA, BFMLS, BFMUL, and BFSUB. • If FEAT_SME2 is implemented, SME multi-vector Z-targeting instructions: BFCLAMP, BFMAX, BFMAXNM, BFMIN, and BFMINNM.
0b0010	As 0b0001, and adds the following non-widening BFloat16 instructions: • SVE instruction BFSCALE. • If FEAT_SME2 is implemented, SME multi-vector Z-targeting instructions BFMUL and BFSCALE.

FEAT_SVE_B16B16 implements the functionality identified by 0b0001.

FEAT_SVE_BFSCALE implements the functionality identified by 0b0010.

Access to this field is **RO**.

BF16, bits [23:20]

Indicates support for SVE BFloat16 instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BF16	Meaning
0b0000	SVE BFloat16 instructions are not implemented.
0b0001	SVE BFCVT, BFCVTNT, BFDOT, BFMLALB, BFMLALT, and BFMMLA instructions are implemented.
0b0010	As 0b0001, but the FPCR.EBF field is also supported.

All other values are reserved.

FEAT_BF16 implements the functionality identified by 0b0001.

FEAT_EBF16 implements the functionality identified by 0b0010.

This field must return the same value as ID_AA64ISAR1_EL1.BF16.

The SVE BFMMLA instructions might not be legal when the PE is in Streaming SVE mode.

From Armv8.6 and Armv9.1, the value 0b0000 is not permitted.

Access to this field is **RO**.

BitPerm, bits [19:16]

Indicates support for the SVE bit permute instructions BDEP, BEXT, and BGRP.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BitPerm	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_SVE_BitPerm implements the functionality identified by 0b0001.

If FEAT_SSVE_BitPerm is not implemented, then instructions described by nonzero values of this field might not be legal when the PE is in Streaming SVE mode.

Access to this field is **RO**.

EltPerm, bits [15:12]

When FEAT_SVE2p2 is implemented or FEAT_SME2p2 is implemented:

If FEAT_SVE2p2 is implemented, the following SVE instructions are implemented when the PE is not in Streaming SVE mode:

- 8-bit and 16-bit element COMPACT.
- 8-bit, 16-bit, 32-bit, and 64-bit element EXPAND.

If FEAT_SME2p2 is implemented, the following SVE instructions are implemented when the PE is in Streaming SVE mode:

- 8-bit, 16-bit, 32-bit, and 64-bit element COMPACT and EXPAND.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EltPerm	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	The specified instructions are implemented.

If FEAT_SVE2p2 or FEAT_SME2p2 is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [11:8]

Reserved, RES0.

AES, bits [7:4]

Indicates support for SVE Advanced Encryption Standard instructions and 128-bit polynomial multiply long instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AES	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	The following instructions are implemented: • SVE single-vector AESD, AESE, AESIMC, and AESMC instructions. • The 128-bit destination element variant of the SVE single-vector PMULLB and PMULLT instructions.
0b0010	As 0b0001.
0b0011	As 0b0010, and adds the following SVE instructions: • Multi-vector AESD, AESDIMC, AESE and AESEMC instructions. • Multi-vector 128-bit destination element PMULL and PMLAL instructions.

All other values are reserved.

FEAT_SVE_AES implements the functionality identified by the value 0b0001.

FEAT_SVE_PMULL128 implements the functionality identified by the value 0b0010.

FEAT_SVE_AES2 implements the functionality identified by 0b0011.

If FEAT_SSVE_AES is not implemented, then instructions described by nonzero values of this field might not be legal when the PE is in Streaming SVE mode.

Access to this field is **RO**.

SVEver, bits [3:0]

Indicates support for SVE instructions when FEAT_SME or FEAT_SVE is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SVEver	Meaning
0b0000	The SVE instructions are implemented.
0b0001	As 0b0000, and adds the mandatory SVE2 instructions.
0b0010	As 0b0001, and adds the mandatory SVE2.1 instructions.
0b0011	As 0b0010, and adds the mandatory SVE2.2 instructions.

All other values are reserved.

FEAT_SVE2 implements the functionality identified by 0b0001 when the PE is not in Streaming SVE mode.

FEAT_SME implements the functionality identified by 0b0001 when the PE is in Streaming SVE mode.

FEAT_SME2p1 implements the functionality identified by 0b0010 when the PE is in Streaming SVE mode.

FEAT_SVE2p1 implements the functionality identified by 0b0010 when the PE is not in Streaming SVE mode.

FEAT_SVE2p2 implements the functionality identified by 0b0011 when the PE is not in Streaming SVE mode.

FEAT_SME2p2 implements the functionality identified by 0b0011 when the PE is in Streaming SVE mode.

From Armv9, if this register is present, the value `0b0000` is not permitted.

From Armv9.4, the value `0b0001` is not permitted.

From Armv9.6, the value `0b0010` is not permitted.

Access to this field is **RO**.

Accessing ID_AA64ZFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64ZFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b100

ID_AFR0_EL1, AArch32 Auxiliary Feature Register 0

The ID_AFR0_EL1 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_AFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_AFR0[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AFR0_EL1 are UNDEFINED.

Attributes

ID_AFR0_EL1 is a 64-bit register.

Field descriptions

ID_DFR0_EL1, AArch32 Debug Feature Register 0

The ID_DFR0_EL1 characteristics are:

Purpose

Provides top-level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_DFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR0[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_DFR0_EL1 are UNDEFINED.

Attributes

ID_DFR0_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0

Bits [63:32]

Reserved, RES0.

TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if FEAT_ETMv4 is implemented, the value 0b0000 is not permitted.

If FEAT_ETE is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

The value of this field is an IMPLEMENTATION DEFINED choice of:

PerfMon	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv1 implemented.
0b0010	Performance Monitors Extension, PMUv2 implemented.
0b0011	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0011, and adds support for: • Extended 16-bit PMEVTYPER<n>.evtCount field. • If EL2 is implemented, the HDCR.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: • 64-bit event counters. • If EL2 is implemented, the HDCR.HCCD control. • If EL3 is implemented, the MDCR_EL3.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: • The PMCR.FZO and, if EL2 is implemented, HDCR.HPMFZO controls. • If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: • Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. • Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1001	PMUv3 for Armv8.9. As 0b1000, and: • Updates the definitions of existing PMU events. • Adds support for the EDECR.PME control.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

FEAT_PMUv3p9 implements the functionality identified by the value 0b1001.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

From Armv8.9, if FEAT_PMUv3 is implemented, the value 0b1000 is not permitted.

Access to this field is **RO**.

MProfDbg, bits [23:20]

M-profile Debug. Support for memory-mapped debug model for M-profile processors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MProfDbg	Meaning
0b0000	Not supported.
0b0001	Support for M-profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

MMapTrc, bits [19:16]

Memory-mapped Trace. Support for memory-mapped trace model.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MMapTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the Arm® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

Access to this field is **RO**.

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CopTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the Arm® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

Access to this field is **RO**.

MMapDbg, bits [11:8]

Memory-mapped Debug. Support for Armv7 memory-mapped debug model for A and R-profile processors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MMapDbg	Meaning
0b0000	Not supported.
0b0100	Support for Armv7, v7 Debug architecture, with memory-mapped access.
0b0101	Support for Armv7, v7.1 Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

The optional memory map defined by Armv8 is not compatible with Armv7.

Access to this field is **RO**.

CopSDbg, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A-profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CopDbg, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CopDbg	Meaning
0b0000	Not supported.
0b0010	Armv6, v6 Debug architecture, with System registers access.
0b0011	Armv6, v6.1 Debug architecture, with System registers access.
0b0100	Armv7, v7 Debug architecture, with System registers access.
0b0101	Armv7, v7.1 Debug architecture, with System registers access.
0b0110	Armv8 debug architecture.
0b0111	Armv8.1 debug architecture, FEAT_Debugv8p1.
0b1000	Armv8.2 debug architecture, FEAT_Debugv8p2.
0b1001	Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010	Armv8.8 debug architecture, FEAT_Debugv8p8.
0b1011	Armv8.9 debug architecture, FEAT_Debugv8p9.

All other values are reserved.

The values 0b0000, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted in Armv8.

FEAT_Debugv8p1 implements the functionality identified by the value 0b0111.

FEAT_Debugv8p2 implements the functionality identified by the value 0b1000.

FEAT_Debugv8p4 implements the functionality identified by the value 0b1001.

FEAT_Debugv8p8 implements the functionality identified by the value 0b1010.

FEAT_Debugv8p9 implements the functionality identified by the value 0b1011.

From Armv8.1, when FEAT_Debugv8p1 is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

From Armv8.9, the value 0b1010 is not permitted.

Access to this field is **RO**.

Otherwise:

ID_DFR1_EL1, AArch32 Debug Feature Register 1

The ID_DFR1_EL1 characteristics are:

Purpose

Provides top-level information about the debug system in AArch32.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_DFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR1[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_DFR1_EL1 are UNDEFINED.

Note

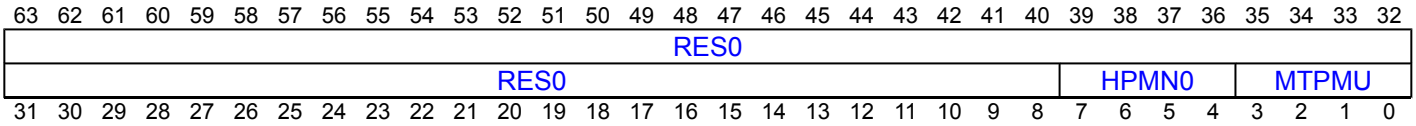
Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_DFR1_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:8]

Reserved, RES0.

HPMN0, bits [7:4]

Zero PMU event counters for a Guest operating system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HPMN0	Meaning
0b0000	Setting HDCR.HPMN to zero has CONSTRAINED UNPREDICTABLE behavior.
0b0001	Setting HDCR.HPMN to zero has defined behavior.

All other values are reserved.

If FEAT_PMUv3 is not implemented, FEAT_FGT is not implemented, or EL2 is not implemented, the only permitted value is 0b0000.

FEAT_HPMN0 implements the functionality identified by the value 0b0001.

From Armv8.8, in an implementation that includes FEAT_PMUv3, FEAT_FGT, and EL2, the value 0b0000 is not permitted.

Access to this field is **RO**.

MTPMU, bits [3:0]

Multi-threaded PMU extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>.MT are read/write or RES0.
0b0001	FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER<n>.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<n>.MT are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER<n>.MT are RES0.

All other values are reserved.

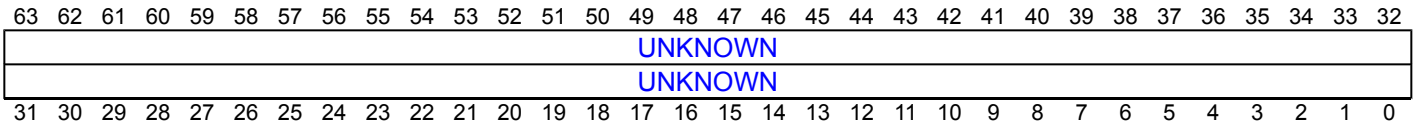
FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_DFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_DFR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b101

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then

ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0

The ID_ISAR0_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR0[31:0].

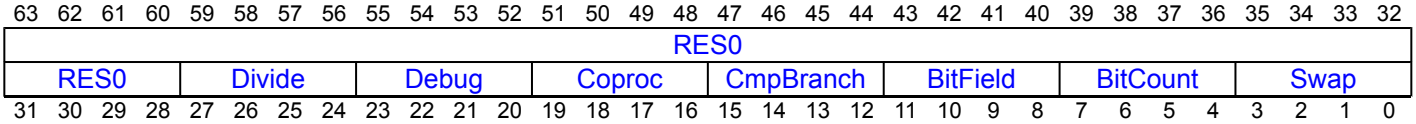
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR0_EL1 are UNDEFINED.

Attributes

ID_ISAR0_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:28]

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Divide	Meaning
0b0000	None implemented.
0b0001	Adds SDIV and UDIV in the T32 instruction set.
0b0010	As for 0b0001, and adds SDIV and UDIVin the A32 instruction set.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

Debug, bits [23:20]

Indicates the implemented Debug instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Debug	Meaning
0b0000	None implemented.
0b0001	Adds BKPT.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Coproc, bits [19:16]

Indicates the implemented System register access instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Coproc	Meaning
0b0000	None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.
0b0001	Adds generic CDP, LDC, MCR, MRC, and STC.
0b0010	As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.
0b0011	As for 0b0010, and adds generic MCRR and MRRC.
0b0100	As for 0b0011, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CmpBranch	Meaning
0b0000	None implemented.
0b0001	Adds CBNZ and CBZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

BitField, bits [11:8]

Indicates support for the following BitField instructions BFC, BFI, SBFX, and UBFX.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BitField	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BitCount	Meaning
0b0000	None implemented.
0b0001	Adds CLZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

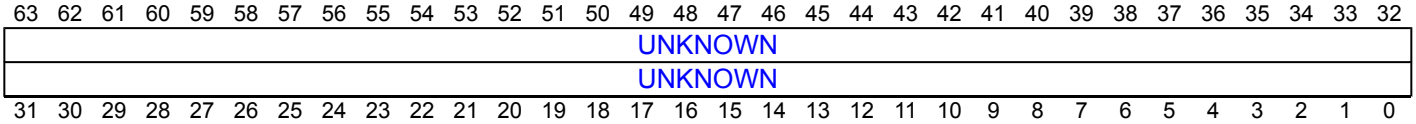
Swap	Meaning
0b0000	None implemented.
0b0001	Adds SWP and SWPB.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_ISAR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b000

```

ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1

The ID_ISAR1_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR1[31:0].

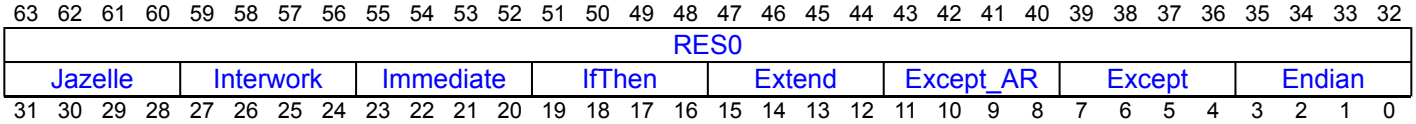
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR1_EL1 are UNDEFINED.

Attributes

ID_ISAR1_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Jazelle	Meaning
0b0000	No support for Jazelle.
0b0001	Adds the BXJ instruction and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Interwork, bits [27:24]

Indicates the implemented Interworking instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Interwork	Meaning
0b0000	None implemented.
0b0001	Adds the BX instruction, and the T bit in the PSR.
0b0010	As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.
0b0011	As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Access to this field is **RO**.

Immediate, bits [23:20]

Indicates support for the following data-processing instructions with long immediates:

- The MOVT instruction.
- The MOV instruction encodings with zero-extended 16-bit immediates.
- The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Immediate	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IfThen	Meaning
0b0000	None implemented.
0b0001	Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Extend, bits [15:12]

Indicates the implemented Extend instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Extend	Meaning
0b0000	No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.
0b0001	Adds the SXTB, SXTH, UXTB, and UXTH instructions.
0b0010	As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

Except_AR, bits [11:8]

Indicates the implemented A and R-profile exception-handling instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Except_AR	Meaning
0b0000	None implemented.
0b0001	Adds the SRS and RFE instructions, and the A and R-profile forms of the CPS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Except	Meaning
0b0000	Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
0b0001	Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Endian, bits [3:0]

Indicates the implemented Endian instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

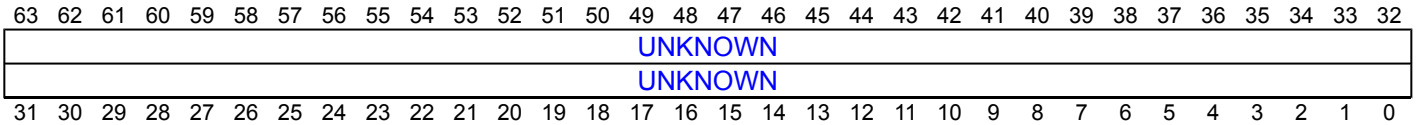
Endian	Meaning
0b0000	None implemented.
0b0001	Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_ISAR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b001

ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2

The ID_ISAR2_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR2[31:0].

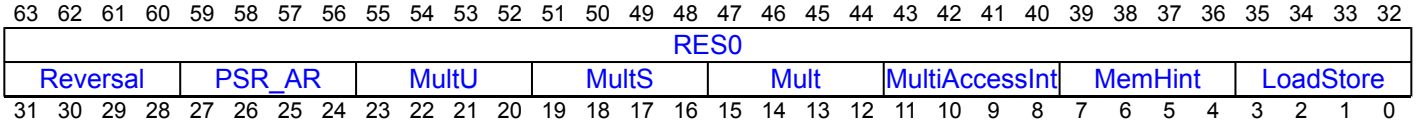
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR2_EL1 are UNDEFINED.

Attributes

ID_ISAR2_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

Reversal, bits [31:28]

Indicates the implemented Reversal instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Reversal	Meaning
0b0000	None implemented.
0b0001	Adds the REV, REV16, and REVSH instructions.
0b0010	As for 0b0001, and adds the RBIT instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

PSR_AR, bits [27:24]

Indicates the implemented A and R-profile instructions to manipulate the PSR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PSR_AR	Meaning
0b0000	None implemented.
0b0001	Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

Access to this field is **RO**.

MultU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MultU	Meaning
0b0000	None implemented.
0b0001	Adds the UMULL and UMLAL instructions.
0b0010	As for 0b0001, and adds the UMAAL instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

MultS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MultS	Meaning
0b0000	None implemented.
0b0001	Adds the SMULL and SMLAL instructions.
0b0010	As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
0b0011	As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Access to this field is **RO**.

Mult, bits [15:12]

Indicates the implemented additional Multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Mult	Meaning
0b0000	No additional instructions implemented. This means only MUL is implemented.
0b0001	Adds the MLA instruction.
0b0010	As for 0b0001, and adds the MLS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MultiAccessInt	Meaning
0b0000	No support. This means the LDM and STM instructions are not interruptible.
0b0001	LDM and STM instructions are restartable.
0b0010	LDM and STM instructions are continuable.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MemHint	Meaning
0b0000	None implemented.
0b0001	Adds the PLD instruction.
0b0010	Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)
0b0011	As for 0b0001 (or 0b0010), and adds the PLI instruction.
0b0100	As for 0b0011, and adds the PLDW instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

Access to this field is **RO**.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

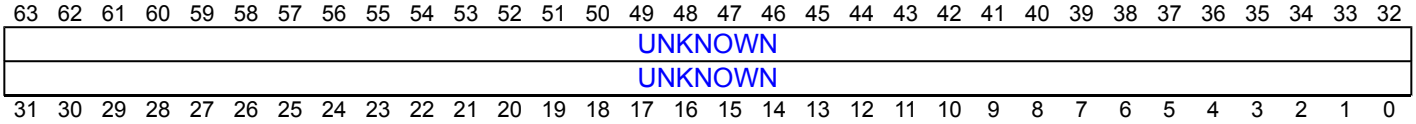
LoadStore	Meaning
0b0000	No additional load/store instructions implemented.
0b0001	Adds the LDRD and STRD instructions.
0b0010	As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3

The ID_ISAR3_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR3[31:0].

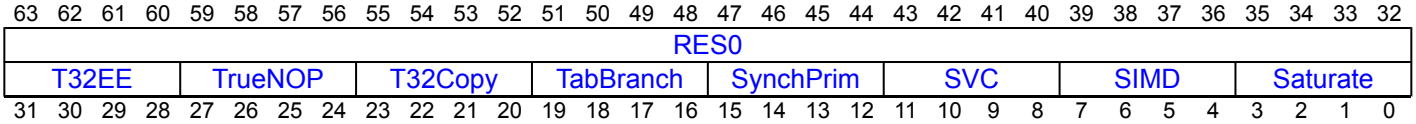
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR3_EL1 are UNDEFINED.

Attributes

ID_ISAR3_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

T32EE, bits [31:28]

Indicates the implemented T32EE instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

T32EE	Meaning
0b0000	None implemented.
0b0001	Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TrueNOP	Meaning
0b0000	None implemented. This means there are no NOP instructions that do not have any register dependencies.
0b0001	Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

T32Copy	Meaning
0b0000	Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.
0b0001	Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TabBranch	Meaning
0b0000	None implemented.
0b0001	Adds the TBB and TBH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SynchPrim	Meaning
0b0000	If SynchPrim_frac == 0b0000, no Synchronization Primitives implemented.
0b0001	If SynchPrim_frac == 0b0000, adds the LDREX and STREX instructions. If SynchPrim_frac == 0b0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
0b0010	If SynchPrim_frac == 0b0000, as for [0b0001, 0b0011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

SVC, bits [11:8]

Indicates the implemented SVC instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SVC	Meaning
0b0000	Not implemented.
0b0001	Adds the SVC instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMD	Meaning
0b0000	None implemented.
0b0001	Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
0b0011	As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports Advanced SIMD and floating-point instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

Access to this field is **RO**.

Saturate, bits [3:0]

Indicates the implemented Saturate instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

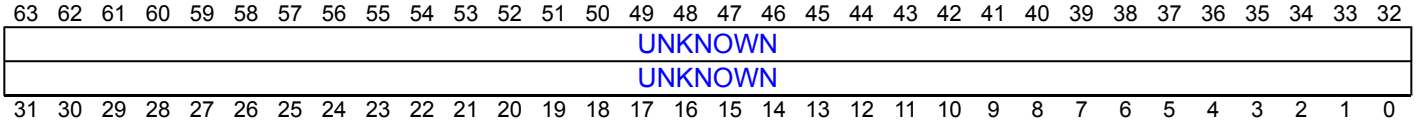
Saturate	Meaning
0b0000	None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
0b0001	Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR3_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_ISAR3_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b011

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if HaveEL(EL3) && EL3SDDUndefPriority() && IsFeatureImplemented(FEAT_IDTE3) && SCR_EL3.TID3 ==
'1' then
        UNDEFINED;
    elsif EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && IsFeatureImplemented(FEAT_IDTE3) && SCR_EL3.TID3 == '1' then
        if EL3SDDUndef() then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
    else
        X[t, 64] = ID_ISAR3_EL1;
elsif PSTATE.EL == EL2 then

ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4

The ID_ISAR4_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR4[31:0].

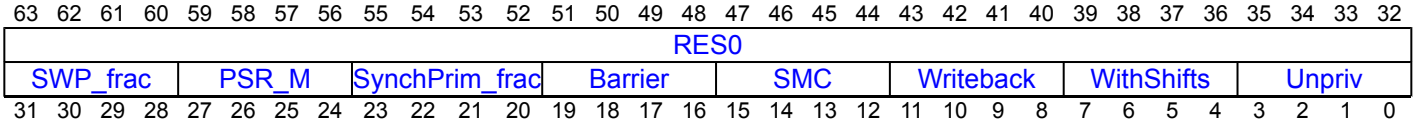
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR4_EL1 are UNDEFINED.

Attributes

ID_ISAR4_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SWP_frac	Meaning
0b0000	SWP or SWPB instructions not implemented.
0b0001	SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if ID_ISAR0.Swap is 0b0000.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

PSR_M, bits [27:24]

Indicates the implemented M-profile instructions to modify the PSRs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PSR_M	Meaning
0b0000	None implemented.
0b0001	Adds the M-profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

SynchPrim_frac, bits [23:20]

Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SynchPrim_frac	Meaning
0b0000	If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.
0b0011	If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the T32 and A32 instruction sets.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Barrier	Meaning
0b0000	None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.
0b0001	Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

SMC, bits [15:12]

Indicates the implemented SMC instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SMC	Meaning
0b0000	None implemented.
0b0001	Adds the SMC instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- If EL3 is implemented and EL1 can use AArch32, the only permitted value is 0b0001.
- If neither EL3 nor EL2 is implemented, the only permitted value is 0b0000.

If EL1 cannot use AArch32, this field has the value 0b0000.

Access to this field is **RO**.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Writeback	Meaning
0b0000	Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
0b0001	Adds support for all of the writeback addressing modes.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WithShifts	Meaning
0b0000	Nonzero shifts supported only in MOV and shift instructions.
0b0001	Adds support for shifts of loads and stores over the range LSL 0-3.
0b0011	As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.
0b0100	As for 0b0011, and adds support for register-controlled shift options.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

Access to this field is **RO**.

Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

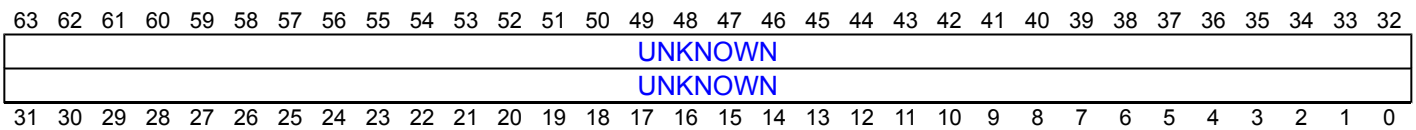
Unpriv	Meaning
0b0000	None implemented. No T variant instructions are implemented.
0b0001	Adds the LDRBT, LDRT, STRBT, and STRT instructions.
0b0010	As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR4_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_ISAR4_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b100

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;

ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5

The ID_ISAR5_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR5[31:0].

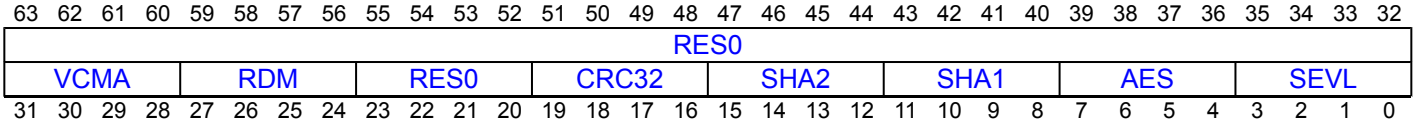
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR5_EL1 are UNDEFINED.

Attributes

ID_ISAR5_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

VCMA, bits [31:28]

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VCMA	Meaning
0b0000	The VCMLA and VCADD instructions are not implemented in AArch32.
0b0001	The VCMLA and VCADD instructions are implemented in AArch32.

All other values are reserved.

FEAT_FCMA implements the functionality identified by 0b0001.

From Armv8.3, the value 0b0000 is not permitted.

Access to this field is **RO**.

RDM, bits [27:24]

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RDM	Meaning
0b0000	No VQRDMLAH and VQRDMLSH instructions implemented.
0b0001	VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates whether the CRC32 instructions CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW are implemented in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CRC32	Meaning
0b0000	CRC32 instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_CRC32 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is **RO**.

SHA2, bits [15:12]

Indicates whether the SHA2 instructions SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 are implemented in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

SHA1, bits [11:8]

Indicates whether the SHA1 instructions SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 are implemented in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

Access to this field is **RO**.

AES, bits [7:4]

Indicates whether the AES instructions are implemented in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AES	Meaning
`0b0000`	No AES instructions implemented.
`0b0001`	`AESE`, `AESD`, `AESMC`, and `AESIMC` implemented.
`0b0010`	As for `0b0001`, plus `VMULL` (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0010`.

Access to this field is **RO**.

SEVL, bits [3:0]

Indicates whether the `SEVL` instruction is implemented in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

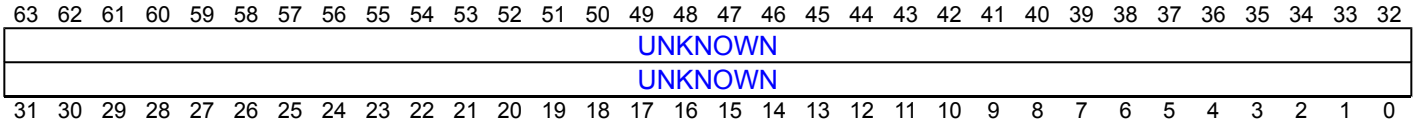
SEVL	Meaning
`0b0000`	`SEVL` is implemented as a NOP.
`0b0001`	`SEVL` is implemented as Send Event Local.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR5_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_ISAR5_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b101

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);

ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6

The ID_ISAR6_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1 and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR6_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR6[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR6_EL1 are UNDEFINED.

Note

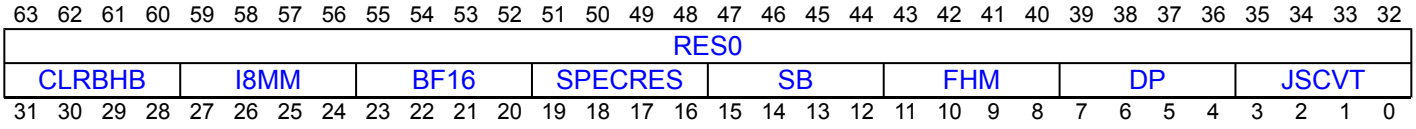
Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_ISAR6_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

CLRBHB, bits [31:28]

Indicates support for the CLRBHB instruction in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CLRBHB	Meaning
0b0000	CLRBHB instruction is not implemented.
0b0001	CLRBHB instruction is implemented.

All other values are reserved.

FEAT_CLRBHB implements the functionality identified by 0b0001.

From Armv8.9, the value 0b0000 is not permitted.

Access to this field is **RO**.

I8MM, bits [27:24]

Indicates support for the following Advanced SIMD Int8 matrix multiplication instructions VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_AA32I8MM implements the functionality identified by 0b0001.

Access to this field is **RO**.

BF16, bits [23:20]

Indicates support for the following Advanced SIMD and floating-point BFloat16 instructions VCVT, VCVTB, VCVTT, VDOT, VFMAB, VFMAT, and VMMLA instructions with BF16 operand or result types in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

Access to this field is **RO**.

SPECRES, bits [19:16]

Indicates support for prediction invalidation instructions in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SPECRES	Meaning
0b0000	Prediction invalidation instructions are not implemented.
0b0001	CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.
0b0010	As 0b0001, and COSPRCTX instruction is implemented.

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

FEAT_SPECRES2 implements the functionality identified by 0b0010.

From Armv8.5, the value 0b0000 is not permitted.

From Armv8.9, the value 0b0001 is not permitted.

Access to this field is **RO**.

SB, bits [15:12]

Indicates support for the SB instruction in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

From Armv8.5, value 0b0000 is not permitted.

Access to this field is **RO**.

FHM, bits [11:8]

Indicates support for the following Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FHM	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_FHM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

DP, bits [7:4]

Indicates support for dot product instructions in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DP	Meaning
0b0000	Dot product instructions are not implemented.
0b0001	VUDOT and VSDOT instructions are implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

Access to this field is **RO**.

JSCVT, bits [3:0]

Indicates support for the VJCVT instruction in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

JSCVT	Meaning
0b0000	The VJCVT instruction is not implemented.
0b0001	The VJCVT instruction is implemented.

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

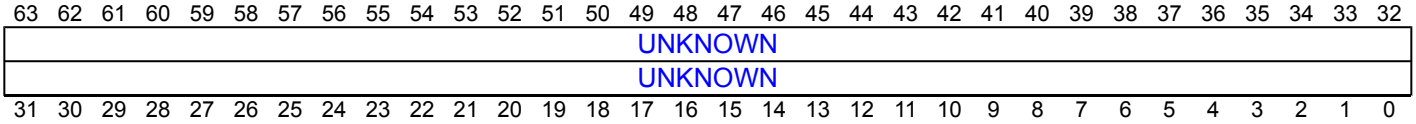
In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the value 0b0000 is not implemented.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR6_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_ISAR6_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b111

```

ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0

The ID_MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR0[31:0].

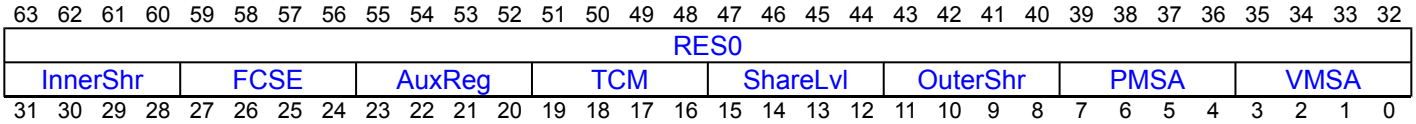
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_MMFR0_EL1 are UNDEFINED.

Attributes

ID_MMFR0_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

InnerShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0_EL1.ShareLvl having the value 0b0001.

When ID_MMFR0_EL1.ShareLvl is zero, this field is UNKNOWN.

Access to this field is **RO**.

FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FCSE	Meaning
0b0000	Not supported.
0b0001	Support for FCSE.

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

Access to this field is **RO**.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AuxReg	Meaning
0b0000	None supported.
0b0001	Support for Auxiliary Control Register only.
0b0010	Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

Access to this field is **RO**.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TCM	Meaning
0b0000	Not supported.
0b0001	Support is IMPLEMENTATION DEFINED.
0b0010	Support for TCM only, Armv6 implementation.
0b0011	Support for TCM and DMA, Armv6 implementation.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Access to this field is **RO**.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ShareLvl	Meaning
0b0000	One level of shareability implemented.
0b0001	Two levels of shareability implemented.

All other values are reserved.

From Armv8 the only permitted value is 0b0001.

Access to this field is **RO**.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OuterShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

Access to this field is **RO**.

PMSA, bits [7:4]

Indicates support for a PMSA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED PMSA.
0b0010	Support for PMSAv6, with a Cache Type Register implemented.
0b0011	Support for PMSAv7, with support for memory subsections. Armv7-R profile.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Access to this field is **RO**.

VMSA, bits [3:0]

Indicates support for a VMSA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

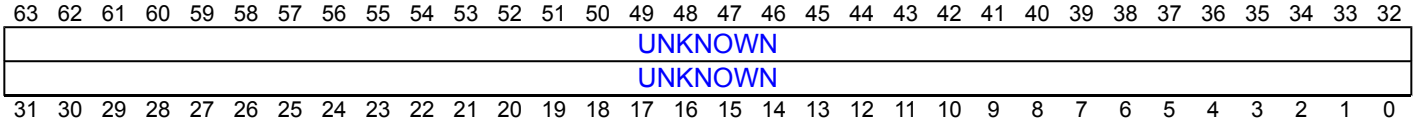
VMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED VMSA.
0b0010	Support for VMSAv6, with Cache and TLB Type Registers implemented.
0b0011	Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile.
0b0100	As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
0b0101	As for 0b0100, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In Armv8-A the only permitted value is 0b0101.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_MMFR0_EL1

ID_MMFR1_EL1, AArch32 Memory Model Feature Register 1

The ID_MMFR1_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR1[31:0].

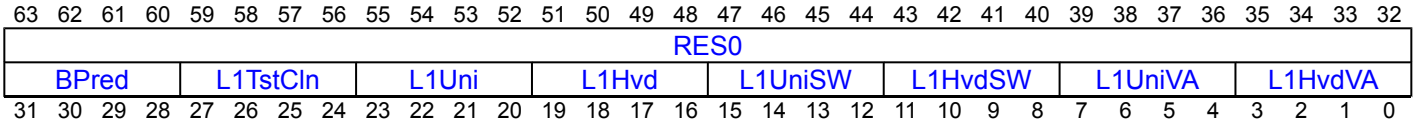
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_MMFR1_EL1 are UNDEFINED.

Attributes

ID_MMFR1_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BPred	Meaning
0b0000	No branch predictor, or no MMU present. Implies a fixed MPU configuration.
0b0001	Branch predictor requires flushing on: • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Changes to the TTBR0, TTBR1, or TTBCR registers. • Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.
0b0010	Branch predictor requires flushing on: • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.
0b0011	Branch predictor requires flushing only on writing new data to instruction locations.
0b0100	For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In Armv8-A, the permitted values are 0b0010, 0b0011, and 0b0100. For values other than 0b0000 and 0b0100 the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

Access to this field is **RO**.

L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1TstCln	Meaning
0b0000	None supported.
0b0001	Supported Level 1 data cache test and clean operations are: • Test and clean data cache.
0b0010	As for 0b0001, and adds: • Test, clean, and invalidate data cache.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1Uni	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: • Invalidate cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for 0b0001, and adds: • Clean cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1Hvd	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: • Invalidate instruction cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for 0b0001, and adds: • Invalidate data cache. • Invalidate data cache and instruction cache, including branch predictor if appropriate.
0b0011	As for 0b0010, and adds: • Clean data cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1UniSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by set/way are: • Clean cache line by set/way.
0b0010	As for 0b0001, and adds: • Clean and invalidate cache line by set/way.
0b0011	As for 0b0010, and adds: • Invalidate cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by set/way are: • Clean data cache line by set/way. • Clean and invalidate data cache line by set/way.
0b0010	As for 0b0001, and adds: • Invalidate data cache line by set/way.
0b0011	As for 0b0010, and adds: • Invalidate instruction cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1UniVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by VA are: • Clean cache line by VA. • Invalidate cache line by VA. • Clean and invalidate cache line by VA.
0b0010	As for 0b0001, and adds: • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by VA are: • Clean data cache line by VA. • Invalidate data cache line by VA. • Clean and invalidate data cache line by VA. • Clean instruction cache line by VA.
0b0010	As for 0b0001, and adds: • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

Otherwise:

ID_MMFR2_EL1, AArch32 Memory Model Feature Register 2

The ID_MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR2[31:0].

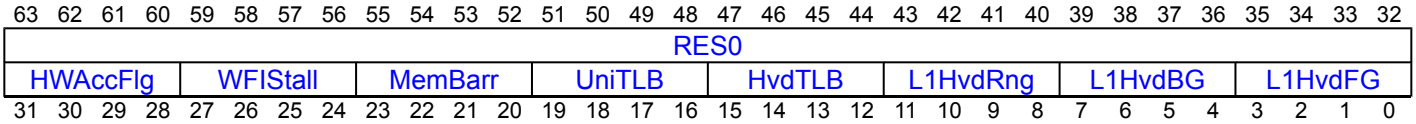
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_MMFR2_EL1 are UNDEFINED.

Attributes

ID_MMFR2_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

HWAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HWAccFlg	Meaning
0b0000	Not supported.
0b0001	Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

From Armv8.0, 0b0001 is not permitted.

Access to this field is **RO**.

WFIStall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WFIStall	Meaning
0b0000	Not supported.
0b0001	Support for WFI stalling.

All other values are reserved.

Access to this field is **RO**.

MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==0b1111) encoding space:

The value of this field is an IMPLEMENTATION DEFINED choice of:

MemBarr	Meaning
0b0000	None supported.
0b0001	Supported memory barrier System instructions are: • Data Synchronization Barrier (DSB).
0b0010	As for 0b0001, and adds: • Instruction Synchronization Barrier (ISB). • Data Memory Barrier (DMB).

All other values are reserved.

From Armv8.0, the values 0b000 and 0b0001 are not permitted.

Arm deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

Access to this field is **RO**.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UniTLB	Meaning
0b0000	Not supported.
0b0001	Supported unified TLB maintenance operations are: • Invalidate all entries in the TLB. • Invalidate TLB entry by VA.
0b0010	As for 0b0001, and adds: • Invalidate TLB entries by ASID match.
0b0011	As for 0b0010, and adds: • Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.
0b0100	As for 0b0011, and adds: • Invalidate Hyp mode unified TLB entry by VA. • Invalidate entire Non-secure PL1&0 unified TLB. • Invalidate entire Hyp mode unified TLB.
0b0101	As for 0b0100, and adds the following operations: TLBIMVALIS, TLBIMVAALIS, TLBIMVALHIS, TLBIMVAL, TLBIMVAAL, TLBIMVALH.
0b0110	As for 0b0101, and adds the following operations: TLBIIPAS2IS, TLBIIPAS2LIS, TLBIIPAS2, TLBIIPAS2L.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

Access to this field is **RO**.

HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdRng	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache maintenance range operations are: • Invalidate data cache range by VA. • Invalidate instruction cache range by VA. • Clean data cache range by VA. • Clean and invalidate data cache range by VA.

All other values are reserved.

From Armv8.0, the value 0b0001 is not permitted.

Access to this field is **RO**.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdBG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache background fetch operations are: • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

From Armv8.0, the value 0b0001 is not permitted.

Access to this field is **RO**.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

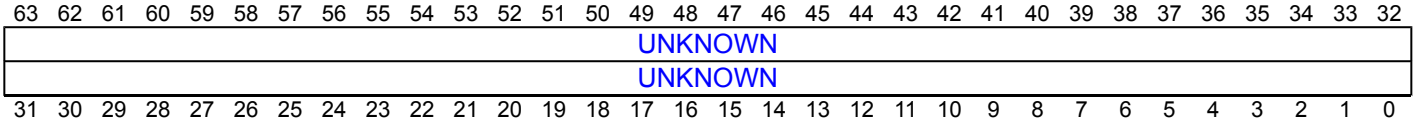
L1HvdFG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache foreground fetch operations are: • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

From Armv8.0, the value 0b0001 is not permitted.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_MMFR2_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b110

```
if PSTATE.EL == EL0 then

ID_MMFR3_EL1, AArch32 Memory Model Feature Register 3

The ID_MMFR3_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR3[31:0].

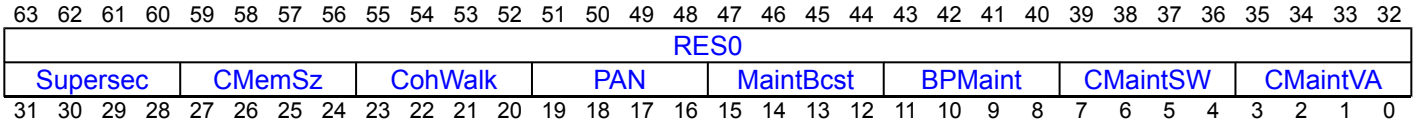
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_MMFR3_EL1 are UNDEFINED.

Attributes

ID_MMFR3_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Supersec	Meaning
0b0000	Supersections supported.
0b1111	Supersections not supported.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b1111.

Access to this field is **RO**.

CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMemSz	Meaning
0b0000	4GB, corresponding to a 32-bit physical address range.
0b0001	64GB, corresponding to a 36-bit physical address range.
0b0010	1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b0010.

Access to this field is **RO**.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification.:

The value of this field is an IMPLEMENTATION DEFINED choice of:

CohWalk	Meaning
0b0000	Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.
0b0001	Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

PAN, bits [19:16]

Privileged Access Never. Indicates support for the PAN bit in CPSR, SPSR, and DSPSR in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PAN	Meaning
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and ATS1CPRP and ATS1CPWP instructions supported.

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the value 0b0001 is not permitted.

Access to this field is **RO**.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MaintBcst	Meaning
0b0000	Cache, TLB, and branch predictor operations only affect local structures.
0b0001	Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
0b0010	Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BPMaint	Meaning
0b0000	None supported.
0b0001	Supported branch predictor maintenance operations are: • Invalidate all branch predictors.
0b0010	As for 0b0001, and adds: • Invalidate branch predictors by VA.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMaintSW	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance instructions by set/way are: • Invalidate data cache by set/way. • Clean data cache by set/way. • Clean and invalidate data cache by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

Access to this field is **RO**.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMaintVA	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance operations by VA are: • Invalidate data cache by VA. • Clean data cache by VA. • Clean and invalidate data cache by VA. • Invalidate instruction cache by VA. • Invalidate all instruction cache entries.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Access to this field is **RO**.

ID_MMFR4_EL1, AArch32 Memory Model Feature Register 4

The ID_MMFR4_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR4[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_MMFR4_EL1 are UNDEFINED.

Note

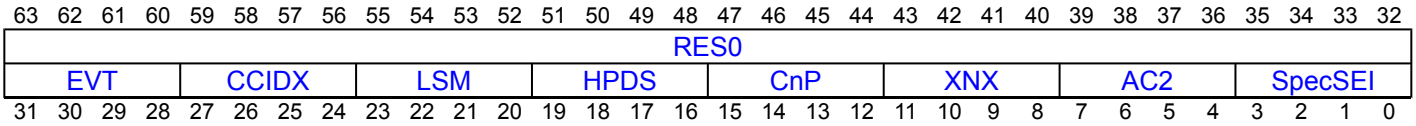
Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_MMFR4_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

EVT, bits [31:28]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR2.{TTLBIS, TOCU, TICAB, TID4} traps.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EVT	Meaning
0b0000	HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	HCR2.{TOCU, TICAB, TID4} traps are supported. HCR2.TTLBIS trap is not supported.
0b0010	HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented or does not support AArch32, the only permitted value is 0b0000.

From Armv8.5, if EL2 is supported and supports AArch32, the value 0b0001 is not permitted.

Access to this field is **RO**.

CCIDX, bits [27:24]

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.
0b0001	64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.

All other values are reserved.

FEAT_CCIDX implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

LSM, bits [23:20]

Indicates support for LSMAOE and nTLSMD bits in HSCTLR and SCTLR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

HPDS, bits [19:16]

Hierarchical permission disables bits in translation tables.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Supports disabling of hierarchical controls using the TTBCR2.HPD0, TTBCR2.HPD1, and HTCR.HPD bits.
0b0010	As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the Translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT_AA32HPD implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality added by the value 0b0010.

Note

The value 0b0000 implies that the encoding for TTBCR2 is UNDEFINED.

Access to this field is **RO**.

CnP, bits [15:12]

Common not Private translations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the value 0b0000 is not permitted.

Access to this field is **RO**.

XNX, bits [11:8]

Support for execute-never control distinction by Exception level at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

When FEAT_XNX is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4_EL1.XNX is 0b0000 or 0b0001:
  - ID_AA64MMFR1_EL1.XNX ==1.
  - EL2 cannot use AArch32.
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the value 0b0000 is not permitted.

Access to this field is **RO**.

AC2, bits [7:4]

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AC2	Meaning
0b0000	ACTLR2 and HACTLR2 are not implemented.
0b0001	ACTLR2 and HACTLR2 are implemented.

All other values are reserved.

In Armv8.0 and Armv8.1 the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Access to this field is **RO**.

SpecSEI, bits [3:0]

When FEAT_RAS is implemented:

Describes whether the PE can generate SError exceptions from speculative reads of memory, including speculative instruction fetches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SpecSEI	Meaning
0b0000	The PE never generates an SError exception due to an External abort on a speculative read.
0b0001	The PE might generate an SError exception due to an External abort on a speculative read.

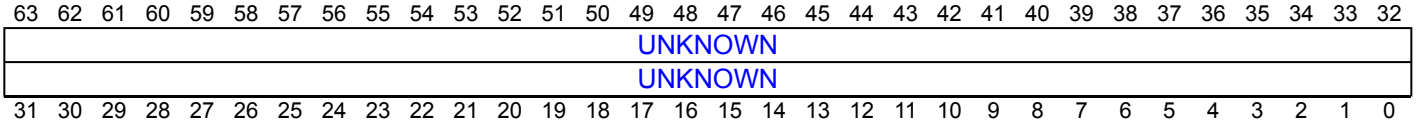
All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR4_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_MMFR4_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b110

```
if PSTATE.EL == EL0 then

ID_MMFR5_EL1, AArch32 Memory Model Feature Register 5

The ID_MMFR5_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR5[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_MMFR5_EL1 are UNDEFINED.

Note

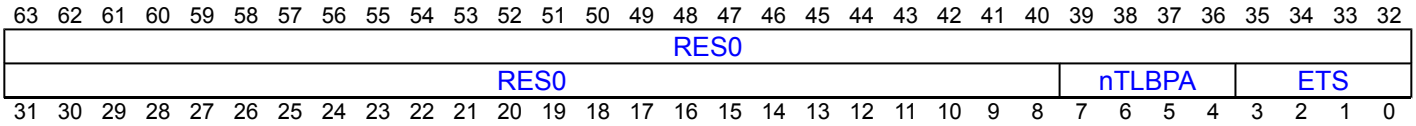
Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_MMFR5_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:8]

Reserved, RES0.

nTLBPA, bits [7:4]

Indicates support for intermediate caching of translation table walks.

The value of this field is an IMPLEMENTATION DEFINED choice of:

nTLBPA	Meaning
0b0000	The intermediate caching of translation table walks might include non-coherent physical translation caches.
0b0001	The intermediate caching of translation table walks does not include non-coherent physical translation caches.

Non-coherent physical translation caches are non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE, where either:

- The caching is indexed by the physical address of the location holding the translation table entry.
- The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

ETS, bits [3:0]

Indicates support for Enhanced Translation Synchronization.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is not supported.
0b0010	FEAT_ETS2 is implemented.
0b0011	FEAT_ETS3 is implemented.

All other values are reserved.

FEAT_ETS2 implements the functionality identified by the value 0b0010.

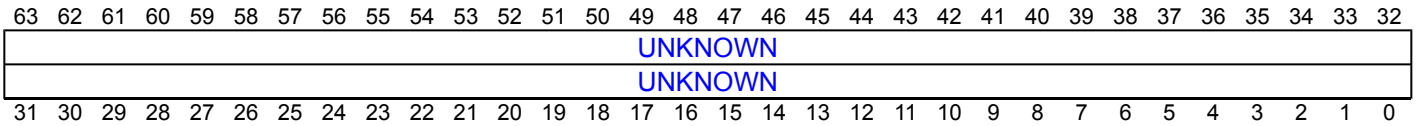
FEAT_ETS3 implements the functionality identified by the value 0b0011.

From Armv8.8, the values 0b0000 and 0b0001 are not permitted.

From Armv9.5, the value 0b0010 is not permitted.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR5_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_MMFR5_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b110

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then

ID_PFR0_EL1, AArch32 Processor Feature Register 0

The ID_PFR0_EL1 characteristics are:

Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR0[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_PFR0_EL1 are UNDEFINED.

Attributes

ID_PFR0_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RAS				DIT				AMU				CSV2				State3				State2				State1				State0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

RAS, bits [31:28]

RAS Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	Support for the Reliability, Availability, and Serviceability Extension is implemented. The ESB instruction and the Error synchronization event are supported.
0b0010	As 0b0001, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.
0b0011	As 0b0010, and requires that error records accessed through System registers conform to RAS System Architecture v2.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 implements the functionality identified by the value 0b0010.

FEAT_RASv2 implements the functionality identified by the value 0b0011.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the value 0b0000 is not permitted.

From Armv8.4, if FEAT_DoubleFault is implemented or ERRIDR_EL1.NUM is nonzero, the value 0b0001 is not permitted.

Note

When the value of this field is 0b0001, ID_PFR2_EL1.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

From Armv8.9, if FEAT_DoubleFault is implemented or ERRIDR_EL1.NUM is nonzero, the value 0b0010 is not permitted.

Access to this field is **RO**.

DIT, bits [27:24]

Data Independent Timing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DIT	Meaning
0b0000	AArch32 does not guarantee constant execution time of any instructions.
0b0001	AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

Access to this field is **RO**.

AMU, bits [23:20]

Indicates support for Activity Monitors Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

Access to this field is **RO**.

CSV2, bits [19:16]

Speculative use of out of context branch targets.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSV2	Meaning
0b0000	The implementation does not disclose whether FEAT_CSV2 is implemented.
0b0001	FEAT_CSV2 is implemented, but FEAT_CSV2_1p1 is not implemented.
0b0010	FEAT_CSV2_1p1 is implemented.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the value 0b0001.

FEAT_CSV2_1p1 implements the functionality identified by the value 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

Access to this field is **RO**.

State3, bits [15:12]

T32EE instruction set support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State3	Meaning
0b0000	Not implemented.
0b0001	T32EE instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

State2, bits [11:8]

Jazelle extension support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State2	Meaning
0b0000	Not implemented.
0b0001	Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.
0b0010	Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

State1, bits [7:4]

T32 instruction set support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State1	Meaning
0b0000	T32 instruction set not implemented.
0b0001	T32 encodings before the introduction of Thumb-2 technology implemented: • All instructions are 16-bit. • A BL or BLX is a pair of 16-bit instructions. • 32-bit instructions other than BL and BLX cannot be encoded.
0b0011	T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Access to this field is **RO**.

State0, bits [3:0]

A32 instruction set support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State0	Meaning
0b0000	A32 instruction set not implemented.
0b0001	A32 instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ID_PFR1_EL1, AArch32 Processor Feature Register 1

The ID_PFR1_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR1[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_PFR1_EL1 are UNDEFINED.

Attributes

ID_PFR1_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
GIC				Virt_frac				Sec_frac				GenTimer				Virtualization				MProgMod				Security				ProgMod			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

GIC, bits [31:28]

System register GIC CPU interface.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

Access to this field is **RO**.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for Virtualization Extensions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Virt_frac	Meaning
0b0000	No Virtualization Extensions are implemented.
0b0001	The following Virtualization Extensions are implemented: • The SCR.SIF bit, if EL3 is implemented. • The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented. • The MSR (banked register) and MRS (banked register) instructions. • The ERET instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is valid only when the value of ID_PFR1_EL1.Virtualization is 0, otherwise it holds the value 0b0000.

Note

The ID_ISAR registers do not identify whether the instructions added by the Virtualization Extensions are implemented.

Access to this field is **RO**.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for Security Extensions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Sec_frac	Meaning
0b0000	No Security Extensions are implemented.
0b0001	The following Security Extensions are implemented: • The VBAR register. • The TTBCR.PD0 and TTBCR.PD1 bits.
0b0010	As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is valid only when the value of ID_PFR1_EL1.Security is 0, otherwise it holds the value 0b0000.

Access to this field is **RO**.

GenTimer, bits [19:16]

Generic Timer support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GenTimer	Meaning
0b0000	Generic Timer is not implemented.
0b0001	Generic Timer is implemented.
0b0010	Generic Timer is implemented, and also includes support for CNTHCTL.EVNTIS and CNTKCTL.EVNTIS fields, and CNTPCTSS and CNTVCTSS counter views.

All other values are reserved.

FEAT_ECV implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0001.

From Armv8.6, the only permitted value is 0b0010.

Access to this field is **RO**.

Virtualization, bits [15:12]

Virtualization support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Virtualization	Meaning
0b0000	EL2, Hyp mode, and the HVC instruction not implemented.
0b0001	EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Note

The ID_ISARs do not identify whether the HVC instruction is implemented.

Access to this field is **RO**.

MProgMod, bits [11:8]

M-profile programmers' model support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MProgMod	Meaning
0b0000	Not supported.
0b0010	Support for two-stack programmers' model.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Access to this field is **RO**.

Security, bits [7:4]

Security support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Security	Meaning
0b0000	EL3, Monitor mode, and the SMC instruction not implemented.
0b0001	EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.
0b0010	As for 0b0001, and adds the ability to set the NSACR.RFR bit. Not permitted in Armv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In Armv8-A, the permitted values are:

- `0b0000` when EL3 is not implemented.
- `0b0001` when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value `0b0001`.

If EL1 cannot use AArch32 then this field has the value `0b0000`.

Access to this field is **RO**.

ProgMod, bits [3:0]

Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ProgMod	Meaning
`0b0000`	Not supported.
`0b0001`	Supported.

All other values are reserved.

In Armv8-A, the permitted values are `0b0001` and `0b0000`.

If EL1 cannot use AArch32 then this field has the value `0b0000`.

Access to this field is **RO**.

Otherwise:

ID_PFR2_EL1, AArch32 Processor Feature Register 2

The ID_PFR2_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1 and ID_PFR1_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR2[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_PFR2_EL1 are UNDEFINED.

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_PFR2_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0

Bits [63:12]

Reserved, RES0.

RAS_frac, bits [11:8]

RAS Extension fractional field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RAS_frac	Meaning
0b0000	If ID_PFR0_EL1.RAS == 0b0001, Support for the Reliability, Availability, and Serviceability Extension is implemented.
0b0001	If ID_PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0000.

FEAT_RASv1p1 implements the functionality identified by the value 0b0001.

This field is valid only if ID_PFR0_EL1.RAS == 0b0001.

Access to this field is **RO**.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SSBS	Meaning
0b0000	AArch32 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

Access to this field is **RO**.

CSV3, bits [3:0]

Speculative use of faulting data.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSV3	Meaning
0b0000	This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence.
0b0001	Data loaded under speculation with a permission or domain fault cannot be used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence. The execution timing of any other instructions in the speculative sequence is not a function of the data loaded under speculation.

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

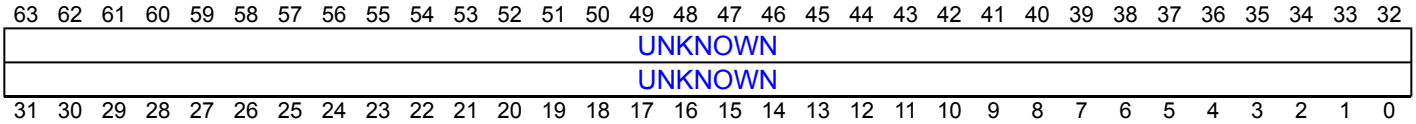
In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

IFSR32_EL2, Instruction Fault Status Register (EL2)

The IFSR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 IFSR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register IFSR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register IFSR[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to IFSR32_EL2 are UNDEFINED.

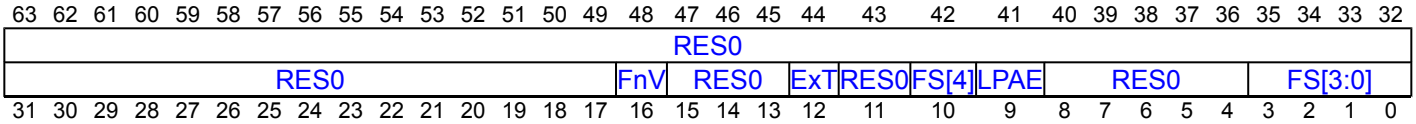
If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Attributes

IFSR32_EL2 is a 64-bit register.

Field descriptions

When TTBCR.EAE == 0:



Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	IFAR is valid.
0b1	IFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault Status bits. Bits [10] and [3:0] are interpreted together.

FS	Meaning	Applies when
0b00001	PC alignment fault.	
0b00010	Debug exception.	
0b00011	Access flag fault, level 1.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01000	Synchronous External abort, not on translation table walk.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault).	
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When FEAT_RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When FEAT_RAS is not implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is IFSR32_EL2[10].
- FS[3:0] is IFSR32_EL2[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

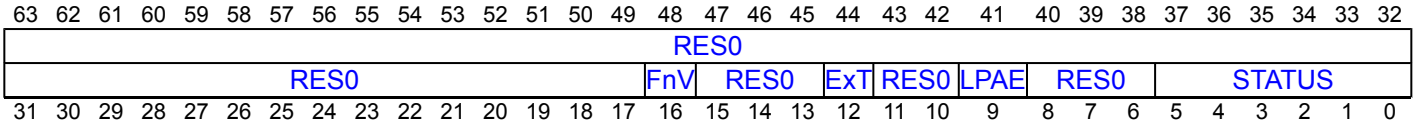
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:



Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	IFAR is valid.
0b1	IFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

STATUS	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100001	PC alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	

All other values are reserved.

When FEAT_RAS is implemented, 0b011000, 0b011101, 0b011110, and 0b011111 are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing IFSR32_EL2

Accesses to this register use the following encodings in the System register encoding space:

ISR_EL1, Interrupt Status Register

The ISR_EL1 characteristics are:

Purpose

Shows the pending status of IRQ and FIQ interrupts and SError exceptions.

When FEAT_NMI is implemented, also shows whether a pending IRQ or FIQ interrupt has Superpriority.

Configuration

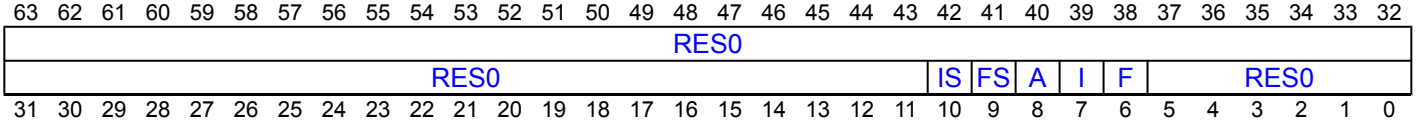
AArch64 System register ISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ISR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ISR_EL1 are UNDEFINED.

Attributes

ISR_EL1 is a 64-bit register.

Field descriptions



Bits [63:11]

Reserved, RES0.

IS, bit [10]

When FEAT_NMI is implemented:

IRQ with Superpriority pending bit. Indicates whether an IRQ interrupt with Superpriority is pending.

IS	Meaning
0b0	No pending IRQ with Superpriority.
0b1	An IRQ interrupt with Superpriority is pending.

If all of the following apply then this field shows the pending status of virtual IRQ interrupts with Superpriority:

- EL2 is implemented and enabled in the current Security state.
- HCR_EL2.IMO is 1.
- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical IRQ interrupts with Superpriority.

Otherwise:

Reserved, RES0.

FS, bit [9]

When FEAT_NMI is implemented:

FIQ with Superpriority pending bit. Indicates whether an FIQ interrupt with Superpriority is pending.

FS	Meaning
0b0	No pending FIQ with Superpriority.
0b1	An FIQ interrupt with Superpriority is pending.

If all of the following apply then this field shows the pending status of virtual FIQ interrupts with Superpriority:

- EL2 is implemented and enabled in the current Security state.
- HCR_EL2.FMO is 1.
- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical FIQ interrupts with Superpriority.

Otherwise:

Reserved, RES0.

A, bit [8]

SError exception pending bit. Indicates whether an SError exception is pending.

A	Meaning
0b0	No pending SError.
0b1	An SError exception is pending.

If all of the following apply then this field shows the pending status of virtual SError exceptions:

- EL2 is implemented and enabled in the current Security state.
- Any of the following apply:
  - HCR_EL2.AMO is 1.
  - FEAT_DoubleFault2 is implemented and the Effective value of HCRX_EL2.TMEA is 1.
- The PE is executing at EL1.

Otherwise, if all of the following apply then this field shows the pending status of delegated SError exceptions:

- FEAT_E3DSE is implemented.
- SCR_EL3.EnDSE is 1.
- The PE is executing at EL2 or EL1.

Otherwise, this field shows the pending status of physical SError exceptions.

If the physical SError exception is edge-triggered, this field is cleared to zero when the physical SError exception is taken.

I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending.

I	Meaning
0b0	No pending IRQ.
0b1	An IRQ interrupt is pending.

If all of the following apply then this field shows the pending status of virtual IRQ interrupts:

- EL2 is implemented and enabled in the current Security state.
- HCR_EL2.IMO is 1.
- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical IRQ interrupts.

Note

This bit indicates the presence of a pending IRQ interrupt regardless of whether the interrupt has Superpriority.

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

F	Meaning
0b0	No pending FIQ.
0b1	An FIQ interrupt is pending.

If all of the following apply then this field shows the pending status of virtual FIQ interrupts:

- EL2 is implemented and enabled in the current Security state.
- HCR_EL2.FMO is 1.
- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical FIQ interrupts.

Note

This bit indicates the presence of a pending FIQ interrupt regardless of whether the interrupt has Superpriority.

Bits [5:0]

Reserved, RES0.

Accessing ISR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ISR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then

LORC_EL1, LORegion Control (EL1)

The LORC_EL1 characteristics are:

Purpose

Enables and disables LORegions, and selects the current LORegion descriptor.

Configuration

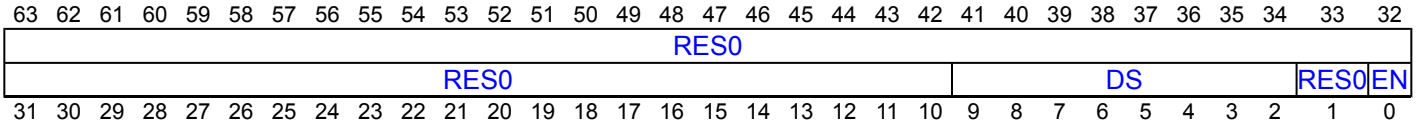
This register is present only when FEAT_LOR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to LORC_EL1 are UNDEFINED.

If no LORegion descriptors are supported by the PE, then this register is RES0.

Attributes

LORC_EL1 is a 64-bit register.

Field descriptions



Bits [63:10]

Reserved, RES0.

DS, bits [9:2]

Descriptor Select. Selects the current LORegion descriptor accessed by LORSA_EL1, LOREA_EL1, and LORN_EL1.

If this field points to an LORegion descriptor that is not supported by an implementation, then the registers LORN_EL1, LOREA_EL1, and LORSA_EL1 are RES0.

The number of LORegion descriptors in IMPLEMENTATION DEFINED. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is Log_2(Number of LORegion descriptors supported by the implementation).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [1]

Reserved, RES0.

EN, bit [0]

Enable. Indicates whether LORegions are enabled.

EN	Meaning
0b0	Disabled. Memory accesses do not match any LORegions.
0b1	Enabled. Memory accesses may match a LORegion.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing LORC_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORC_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b011

LOREA_EL1, LORegion End Address (EL1)

The LOREA_EL1 characteristics are:

Purpose

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Configuration

This register is present only when FEAT_LOR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to LOREA_EL1 are UNDEFINED.

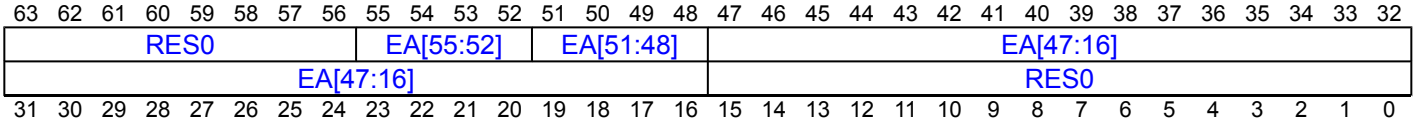
This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

Attributes

LOREA_EL1 is a 64-bit register.

Field descriptions



Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:56]

Reserved, RES0.

EA[55:52], bits [55:52]

When FEAT_D128 is implemented:

Extension to EA[47:16]. For more information, see EA[47:16].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA[51:48], bits [51:48]

When FEAT_LPA is implemented:

Extension to EA[47:16]. For more information, see EA[47:16].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA[47:16], bits [47:16]

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by LORC_EL1.DS. Bits[15:0] of this address are `0xFFFF`. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented and 52-bit addresses are in use, EA[51:48] form bits [51:48] of the end physical address of the LORegion. Otherwise, when 52-bit addresses are not in use, EA[51:48] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:0]

Reserved, RES0.

LORID_EL1, LORegionID (EL1)

The LORID_EL1 characteristics are:

Purpose

Indicates the number of LORegions and LORegion descriptors supported by the PE.

Configuration

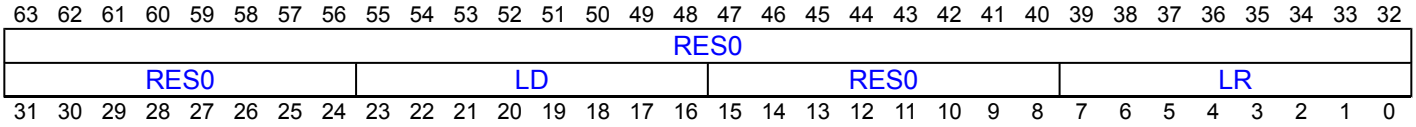
This register is present only when FEAT_LOR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to LORID_EL1 are UNDEFINED.

If no LORegion descriptors are implemented, then the registers LORC_EL1, LORN_EL1, LOREA_EL1, and LORSA_EL1 are RES0.

Attributes

LORID_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

LD, bits [23:16]

Number of LORegion descriptors supported by the PE. This is an 8-bit binary number.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LD	Meaning
0x00..0xFF	The number of LORegions descriptors supported.

Access to this field is **RO**.

Bits [15:8]

Reserved, RES0.

LR, bits [7:0]

Number of LORegions supported by the PE. This is an 8-bit binary number.

Note

If LORID_EL1 indicates that no LORegions are implemented, then LoadLOAcquire and StoreLORelease will behave as LoadAcquire and StoreRelease.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LR	Meaning
0x00..0xFF	The number of LORegions supported.

Access to this field is **RO**.

Accessing LORID_EL1

LORN_EL1, LORegion Number (EL1)

The LORN_EL1 characteristics are:

Purpose

Holds the number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Configuration

This register is present only when FEAT_LOR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to LORN_EL1 are UNDEFINED.

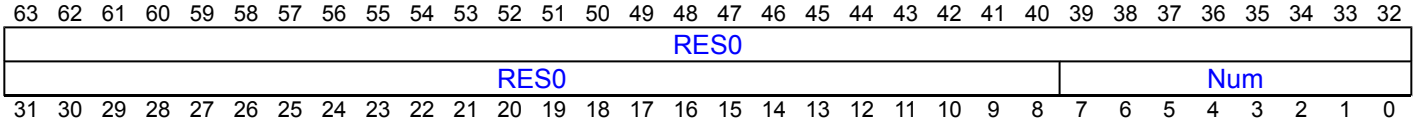
This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

Attributes

LORN_EL1 is a 64-bit register.

Field descriptions



Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:8]

Reserved, RES0.

Num, bits [7:0]

Number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is (Log_2(Number of LORegions supported by the PE)).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing LORN_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, LORN_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b010

LORSA_EL1, LORegion Start Address (EL1)

The LORSA_EL1 characteristics are:

Purpose

Indicates whether the current LORegion descriptor selected by LORC_EL1.DS is enabled, and holds the physical address of the start of the LORegion.

Configuration

This register is present only when FEAT_LOR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to LORSA_EL1 are UNDEFINED.

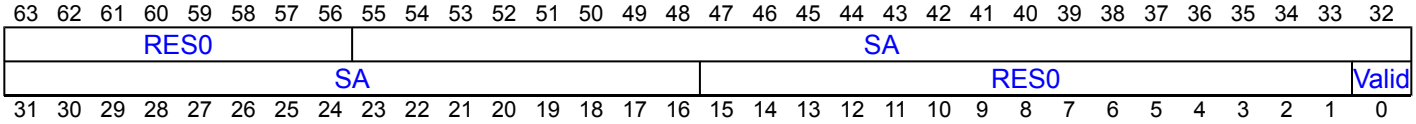
This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

Attributes

LORSA_EL1 is a 64-bit register.

Field descriptions



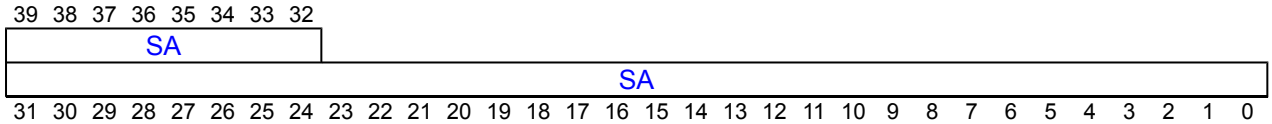
Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:56]

Reserved, RES0.

SA, bits [55:16]

SA encoding when FEAT_D128 is implemented



SA, bits [39:0]

Bits [55:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

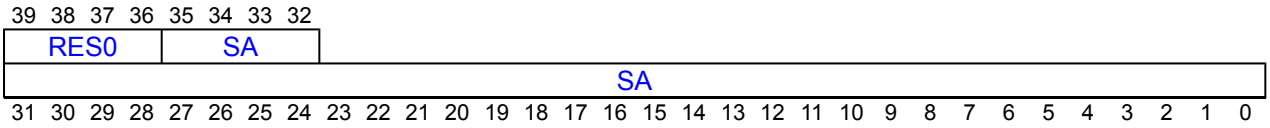
Bits[15:0] of this address are `0x0000`.

For implementations with fewer than 56 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SA encoding when FEAT_LPA is implemented and FEAT_D128 is not implemented



Bits [39:36]

Reserved, RES0.

SA, bits [35:0]

Bits [51:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

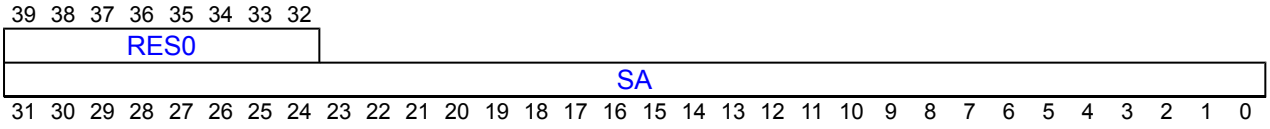
Bits[15:0] of this address are `0x0000`.

For implementations with fewer than 52 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SA encoding when FEAT_LPA is not implemented



Bits [39:32]

Reserved, RES0.

SA, bits [31:0]

Bits [47:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Bits[15:0] of this address are `0x0000`.

For implementations with fewer than 48 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:1]

Reserved, RES0.

Valid, bit [0]

Indicates whether the current LORegion descriptor is enabled.

Valid	Meaning
`0b0`	LORegion descriptor is disabled.
`0b1`	LORegion descriptor is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Accessing LORSA_EL1

MAIR2_EL1, Extended Memory Attribute Indirection Register (EL1)

The MAIR2_EL1 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a VMSAv8-64 or VMSAv9-128 translation table entry for stage 1 translations at EL1.

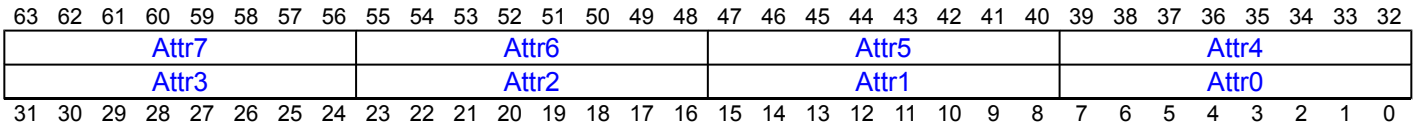
Configuration

This register is present only when FEAT_AIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MAIR2_EL1 are UNDEFINED.

Attributes

MAIR2_EL1 is a 64-bit register.

Field descriptions



Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 1, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 0, see MAIR_EL1.Attr

Attr is encoded as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000		If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR2_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name MAIR2_EL1 or MAIR2_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MAIR2_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0010	0b001

```

MAIR2_EL2, Extended Memory Attribute Indirection Register (EL2)

The MAIR2_EL2 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a VMSAv8-64 or VMSAv9-128 translation table entry for stage 1 translations at EL1.

Configuration

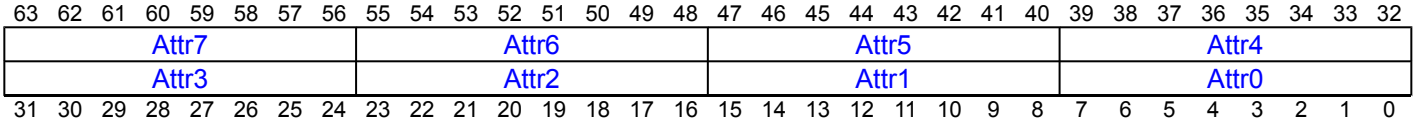
This register is present only when FEAT_AIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MAIR2_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

MAIR2_EL2 is a 64-bit register.

Field descriptions



Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 1, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 0, see MAIR_EL2.Attr

Attr is encoded as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000		If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR2_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name MAIR2_EL2 or MAIR2_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

MAIR2_EL3, Extended Memory Attribute Indirection Register (EL3)

The MAIR2_EL3 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a VMSAv8-64 or VMSAv9-128 translation table entry for stage 1 translations at EL1.

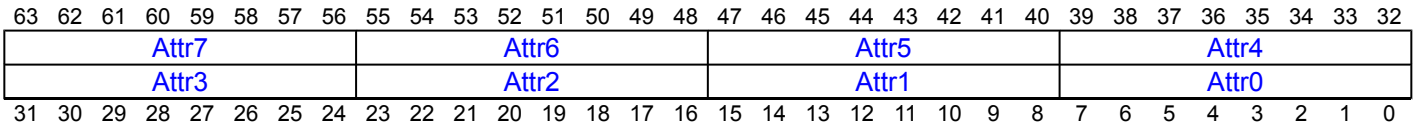
Configuration

This register is present only when FEAT_AIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MAIR2_EL3 are UNDEFINED.

Attributes

MAIR2_EL3 is a 64-bit register.

Field descriptions



Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 1, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 0, see MAIR_EL3.Attr

Attr is encoded as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000		If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR2_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MAIR2_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0001	0b001

```

MAIR_EL1, Memory Attribute Indirection Register (EL1)

The MAIR_EL1 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

Configuration

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PRRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MAIR0[31:0] when TTBCR.EAE == 1.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register NMRR[31:0] when TTBCR.EAE == 0.

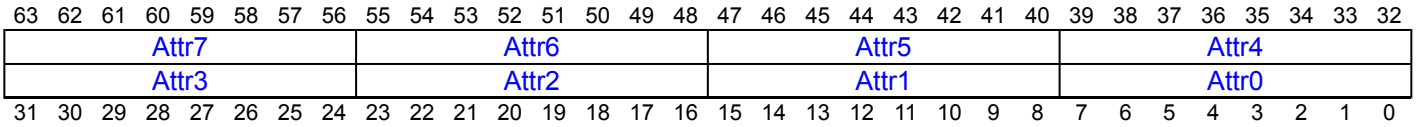
AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register MAIR1[31:0] when TTBCR.EAE == 1.

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MAIR_EL1 are UNDEFINED.

Attributes

MAIR_EL1 is a 64-bit register.

Field descriptions



MAIR_EL1 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 0, or when FEAT_AIE is not implemented, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 1, see MAIR2_EL1.Attr

Attr is encoded as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000		If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name MAIR_EL1 or MAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MAIR_EL1
```

MAIR_EL2, Memory Attribute Indirection Register (EL2)

The MAIR_EL2 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

Configuration

AArch64 System register MAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HMAIR0[31:0].

AArch64 System register MAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HMAIR1[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MAIR_EL2 are UNDEFINED.

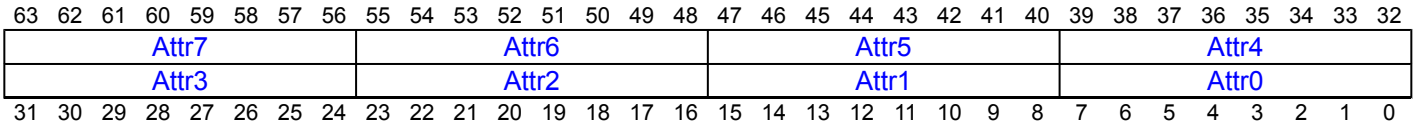
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MAIR_EL2 is a 64-bit register.

Field descriptions



MAIR_EL2 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 0, or when FEAT_AIE is not implemented, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 1, see MAIR2_EL2.Attr

Attr is encoded as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000		If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name MAIR_EL2 or MAIR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MAIR_EL3, Memory Attribute Indirection Register (EL3)

The MAIR_EL3 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL3.

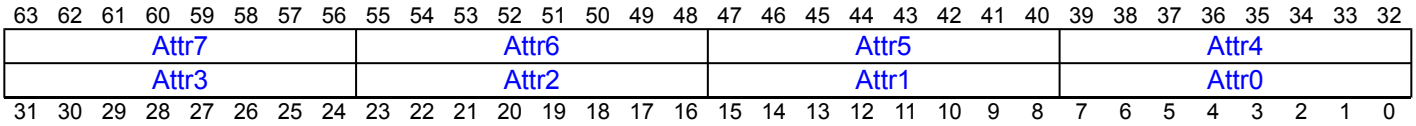
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MAIR_EL3 are UNDEFINED.

Attributes

MAIR_EL3 is a 64-bit register.

Field descriptions



MAIR_EL3 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 0, or when FEAT_AIE is not implemented, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 1, see MAIR2_EL3.Attr

Attr is encoded as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000		If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MAIR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b000

MDCCINT_EL1, Monitor DCC Interrupt Enable Register

The MDCCINT_EL1 characteristics are:

Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

Configuration

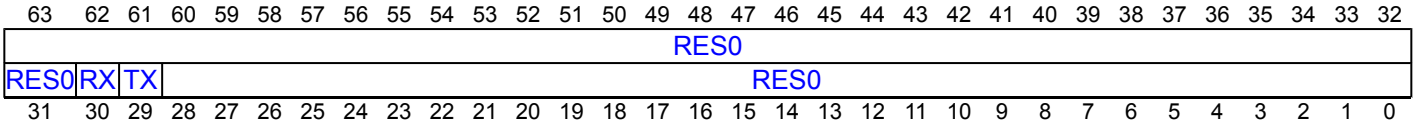
AArch64 System register MDCCINT_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDCCINT[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MDCCINT_EL1 are UNDEFINED.

Attributes

MDCCINT_EL1 is a 64-bit register.

Field descriptions



Bits [63:31]

Reserved, RES0.

RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

RX	Meaning
0b0	No interrupt request generated by DTRRX.
0b1	Interrupt request will be generated on RXfull == 1.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

TX	Meaning
0b0	No interrupt request generated by DTRTX.
0b1	Interrupt request will be generated on TXfull == 0.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [28:0]

Reserved, RES0.

Accessing MDCCINT_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MDCCINT_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0010	0b000

```

MDCCSR_EL0, Monitor DCC Status Register

The MDCCSR_EL0 characteristics are:

Purpose

Read-only register containing control status flags for the DCC.

Configuration

AArch64 System register MDCCSR_EL0 bits [30:29] are architecturally mapped to External register EDSCR[30:29].

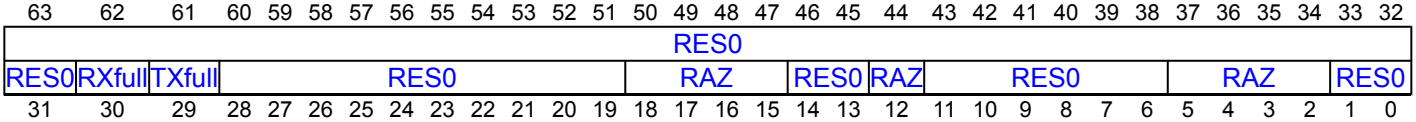
AArch64 System register MDCCSR_EL0 bits [30:29] are architecturally mapped to AArch32 System register DBGDSCRint[30:29].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MDCCSR_EL0 are UNDEFINED.

Attributes

MDCCSR_EL0 is a 64-bit register.

Field descriptions



Bits [63:31]

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Read-only view of the equivalent bit in the EDSCR.

TXfull, bit [29]

MDCR_EL2, Monitor Debug Configuration Register (EL2)

The MDCR_EL2 characteristics are:

Purpose

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

Configuration

AArch64 System register MDCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDCR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MDCR_EL2 are UNDEFINED.

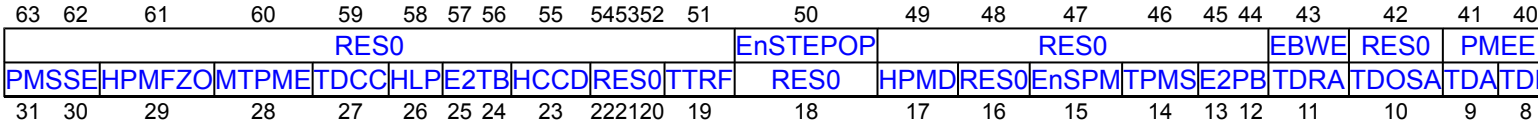
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MDCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:51]

Reserved, RES0.

EnSTEPOP, bit [50]

When FEAT_STEP2 is implemented:

EnSTEPOP	Meaning
0b0	Execution from MDSTEPOP_EL1 is disabled.
0b1	Execution from MDSTEPOP_EL1 is not disabled by this control.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 0b1, other than for a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [49:44]

Reserved, RES0.

EBWE, bit [43]

When FEAT_Debugv8p9 is implemented:

Extended Breakpoint and Watchpoint Enable. Enables use of additional breakpoints or watchpoints.

EBWE	Meaning
0b0	The Effective value of MDSCR_EL1.EMBWE is 0. The Effective value of MDSELR_EL1.BANK is zero at EL2.
0b1	The Effective values of MDSCR_EL1.EMBWE and MDSELR_EL1.BANK are not affected by this field.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 1, other than for a direct read of the register.

This field is ignored by the PE and treated as 0 when EL3 is implemented and MDCR_EL3.EBWE is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

PMEE, bits [41:40]

When FEAT_EBEP is implemented:

Performance Monitors Exception Enable. Controls the generation of the **PMUIRQ** signal and the PMU Profiling exception at EL0, EL1, and EL2.

PMEE	Meaning
0b00	The **PMUIRQ** signal is asserted on a PMU overflow, and the PMU Profiling exception is disabled.
0b01	The **PMUIRQ** signal and the PMU Profiling exception are both controlled by PMECR_EL1.PMEE.
0b10	The **PMUIRQ** signal is deasserted, and the PMU Profiling exception is disabled.
0b11	The **PMUIRQ** signal is deasserted, and the PMU Profiling exception is enabled.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 0b01, other than for a direct read of the register.

This field is ignored by the PE when all of the following are true:

- EL3 is implemented.
- MDCR_EL3.PMEE != 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:37]

Reserved, RES0.

HPMFZS, bit [36]
When FEAT_SPEv1p2 is implemented:

Hyp Performance Monitors Freeze-on-SPE event. Stop counters when PMBLIMITR_EL1.{PMFZ,E} is {1,1} and profiling is stopped.

HPMFZS	Meaning
0b0	Do not freeze on a Statistical Profiling Buffer Management event.
0b1	Affected counters do not count following a Statistical Profiling Buffer Management event.

The pseudocode function `SPEProfilingStopped` describes when profiling is stopped.

The counters affected by this field are the event counters in the second range. This applies even when EL2 is disabled in the current Security state.

Other event counters and PMCCNTR_EL0 are not affected by this field.

When FEAT_PMUv3_ICNTR is implemented, PMICNTR_EL0 is not affected by this field.

If MDCR_EL2.HPMN is equal to `GetNumEventCountersSelfHosted()`, then this field has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:32]

Reserved, RES0.

PMSSE, bits [31:30]
When FEAT_PMUv3_SS is implemented:

Performance Monitors Snapshot Enable. Controls the generation of Capture events.

PMSSE	Meaning
0b00	Capture events are disabled.
0b01	Capture events are controlled by PMECR_EL1.SSE.
0b10	Capture events are enabled and prohibited.
0b11	Capture events are enabled and allowed.

If EL2 is not implemented, then the Effective value of this field is `0b01`.

The reset behavior of this field is:

- On a Cold reset:
  - When the highest implemented Exception level is EL2, this field resets to `'00'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPMFZO, bit [29]
When FEAT_PMUv3p7 is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

HPMFZO	Meaning
0b0	Do not freeze on overflow.
0b1	Affected counters do not count when all of the following are true for any event counter PMEVCNTR<m>_EL0 in the second range: • PMOVSCLR_EL0[m] is 1. • Either FEAT_SEBEP is not implemented or PMEVTYPER<m>_EL0.SYNC is 0.

The counters affected by this field are the event counters in the second range. This applies even when EL2 is disabled in the current Security state.

Other event counters and PMCCNTR_EL0 are not affected by this field.

When FEAT_PMUv3_ICNTR is implemented, PMICNTR_EL0 is not affected by this field.

If MDCR_EL2.HPMN is equal to `GetNumEventCountersSelfHosted()`, then this field has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTPME, bit [28]
When FEAT_MTPMU is implemented and EL3 is not implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>_EL0.MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>_EL0.MT is 0.
0b1	PMEVTYPER<n>_EL0.MT bits not affected by this field.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'1'`.

Otherwise:

Reserved, RES0.

TDCC, bit [27]
When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Trap exception to EL2, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: OSDTRRX_EL1, OSDTRTX_EL1, MDCCSR_EL0, MDCCINT_EL1, and, when the PE is in Non-debug state, DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to DBGDTRTXint and STC from DBGDTRRXint.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL2.TDCC does not trap any accesses to:

AArch64: DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXint and DBGDTRTXint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HLP, bit [26]

When FEAT_PMUv3p5 is implemented:

Hypervisor Long Event Counter Enable. Determines which event counter bit generates an overflow recorded by PMOVSR[n].

HLP	Meaning
0b0	Affected counters overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[31:0].
0b1	Affected counters overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[63:0].

When FEAT_EBEP is implemented and the PMU Profiling exception is enabled, the Effective value of this field is 1.

The counters affected by this field are the event counters in the second range. This applies even when EL2 is disabled in the current Security state.

The following are not affected by this field:

- Other event counters.
- PMCCNTR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, PMICNTR_EL0.

If MDCR_EL2.HPMN is equal to GetNumEventCountersSelfHosted(), then this field has no effect.

For more information see the description of MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2TB, bits [25:24]
When FEAT_TRBE is implemented:

EL2 Trace Buffer.

If EL2 is implemented and enabled in the trace buffer owning Security state, then this field controls the trace buffer owning translation regime.

If EL2 is implemented and enabled in the current Security state, then this field controls access to trace buffer System registers from EL1.

E2TB	Meaning
0b00	If EL2 is implemented and enabled in the trace buffer owning Security state, then the trace buffer owning Exception level is EL2. Otherwise, the trace buffer owning Exception level is EL1 and, if TraceBufferEnabled() == TRUE, tracing is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, then accesses to trace buffer System registers at EL1 are trapped to EL2, unless the access generates a higher priority exception.
0b10	Trace buffer owning Exception level is EL1. If TraceBufferEnabled() == TRUE, then tracing is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, then accesses to trace buffer System registers at EL1 are trapped to EL2, unless the access generates a higher priority exception.
0b11	Trace buffer owning Exception level is EL1. If TraceBufferEnabled() == TRUE, then tracing is prohibited at EL2. Accesses to trace buffer System registers at EL1 are not trapped by this mechanism.

All other values are reserved.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to TRBBASER_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.
- If FEAT_TRBE_MPAM is implemented, MRS and MSR accesses to TRBMPAM_EL1.
- If FEAT_TRBE_EXC is implemented, MRS and MSR accesses to TRBSR_EL2 and TRBSR_EL12.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL2, reported using EC syndrome value 0x18.

When TraceBufferEnabled()==FALSE, this field has no effect on whether tracing is prohibited.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HCCD, bit [23]
When FEAT_PMUv3p5 is implemented:

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting at EL2.

HCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited at EL2.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]

When FEAT_TRF is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:

- Access to TRFCR_EL1 is trapped to EL2, reported using EC syndrome value `0x18`.
- Access to TRFCR is trapped to EL2, reported using EC syndrome value `0x03`.

TTRF	Meaning
`0b0`	Accesses to the specified registers at EL1 are not affected by this control.
`0b1`	Accesses to the specified registers at EL1 generate a trap exception to EL2 when EL2 is enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

When FEAT_PMUv3p1 is implemented and FEAT_Debugv8p2 is implemented:

Guest Performance Monitors Disable. Controls PMU operation at EL2.

HPMD	Meaning
`0b0`	Counters are not affected by this mechanism.
`0b1`	Affected counters are prohibited from counting at EL2. If PMCR_EL0.DP is 1, then PMCCNTR_EL0 is disabled at EL2. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.

The counters affected by this field are:

- Event counters in the first range.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.
- If PMCR_EL0.DP is 1, the cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_PMUv3p1 is implemented:

Guest Performance Monitors Disable. Controls PMU operation at EL2 when ExternalSecureNoninvasiveDebugEnabled() is FALSE.

HPMD	Meaning
0b0	Counters are not affected by this mechanism.
0b1	If ExternalSecureNoninvasiveDebugEnabled() is FALSE then all the following apply: • Affected event counters are prohibited from counting at EL2. • If PMCR_EL0.DP is 1, then PMCCNTR_EL0 is disabled at EL2. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.

If ExternalSecureNoninvasiveDebugEnabled() is TRUE then the event counters and PMCCNTR_EL0 are not affected by this field.

Otherwise, the counters affected by this field are:

- Event counters in the first range.
- If PMCR_EL0.DP is 1, the cycle counter, PMCCNTR_EL0.

Other event counters are not affected by this field. When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [16]

Reserved, RES0.

EnSPM, bit [15]

When FEAT_SPMU is implemented:

Enable access to System PMU registers. When disabled, accesses to System PMU registers generate a trap to EL2.

EnSPM	Meaning
0b0	Accesses of the specified System PMU registers at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified System PMU registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to SPMACCESSR_EL1, SPMCFGR_EL1, SPMCGCR<n>_EL1, SPMCNTENCLR_EL0, SPMCNTENSET_EL0, SPMCR_EL0, SPMDEVAFF_EL1, SPMDEVARCH_EL1, SPMEVCNTR<n>_EL0, SPMEVFILT2R<n>_EL0, SPMEVFILTR<n>_EL0, SPMEVTYPER<n>_EL0, SPMIIDR_EL1, SPMINTENCLR_EL1, SPMINTENSET_EL1, SPMOVSCLR_EL0, SPMOVSSET_EL0, SPMSCR_EL1, and SPMSELR_EL0.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPMS, bit [14]

When FEAT_SPE is implemented:

Trap Performance Monitor Sampling. Enables a trap to EL2 on accesses of SPE registers.

TPMS	Meaning
0b0	Accesses of the specified SPE registers are not trapped by this mechanism.
0b1	Accesses of the specified SPE registers at EL1 are trapped to EL2, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMSCR_EL1, PMSEVFR_EL1, PMSFCR_EL1, PMSICR_EL1, PMSIRR_EL1, and PMSLATFR_EL1.
- MRS accesses to PMSIDR_EL1.
- If FEAT_SPE_FnE is implemented, MRS and MSR accesses to PMSNEVFR_EL1.
- If FEAT_SPE_FDS is implemented, MRS and MSR accesses to PMSDSFR_EL1.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2PB, bits [13:12]

When FEAT_SPE is implemented:

EL2 Profiling Buffer.

If EL2 is implemented and enabled in the Profiling Buffer owning Security state, then this field controls the Profiling Buffer owning translation regime.

If EL2 is implemented and enabled in the current Security state, then this field controls access to Profiling Buffer System registers from EL1.

E2PB	Meaning
0b00	If EL2 is implemented and enabled in the Profiling Buffer owning Security state, then the Profiling Buffer owning Exception level is EL2. Otherwise, the Profiling Buffer owning Exception level is EL1 and, Profiling is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, then accesses to Profiling Buffer System registers at EL1 are trapped to EL2, unless the access generates a higher priority exception.
0b10	Profiling Buffer owning Exception level is EL1. Profiling is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, then accesses to Profiling Buffer System registers at EL1 are trapped to EL2, unless the access generates a higher priority exception.
0b11	Profiling Buffer owning Exception level is EL1. Profiling is prohibited at EL2. Accesses to Profiling Buffer System registers at EL1 are not trapped by this mechanism.

All other values are reserved.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMBLIMITR_EL1, PMBPTR_EL1, and PMBSR_EL1.
- If FEAT_SPE_nVM is implemented, MRS and MSR accesses to PMBMAR_EL1.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL2, reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64, accesses to MDRAR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05 and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value 0x0C:
  - DBGDRAR, DBGDSAR.

TDRA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by the following: • DBGDSCRext.UDCCdis. • MDSCR_EL1.TDCC.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDOSA, bit [10]

When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, and DBGPRCR_EL1.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
  - DBGOSLSR, DBGOSLAR, DBGOSDLR, and DBGPRCR.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x18`:
  - OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x05`:
  - DBGOSLSR, DBGOSLAR, and DBGPRCR.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 are trapped.

It is IMPLEMENTATION DEFINED whether accesses to DBGOSDLR are trapped.

TDOSA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap accesses of debug System registers. Enables a trap to EL2 on accesses of debug System registers.

TDA	Meaning
`0b0`	Accesses of the specified debug System registers are not trapped by this mechanism.
`0b1`	Accesses of the specified debug System registers at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to DBGAUTHSTATUS_EL1, DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGCLAIMCLR_EL1, DBGCLAIMSET_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1, MDCCINT_EL1, MDCCSR_EL0, MDSCR_EL1, OSDTRRX_EL1, OSDTRTX_EL1, and OSECCR_EL1.
- If FEAT_Debugv8p9 is implemented, MRS and MSR accesses to MDSELR_EL1.
- If FEAT_STEP2 is implemented, MRS and MSR accesses to MDSTEPOP_EL1.
- In Non-debug state, MRS accesses to DBGDTRRX_EL0 and DBGDTR_EL0 and MSR accesses to DBGDTRTX_EL0 and DBGDTR_EL0.

In AArch32 state, the instructions affected by this control are:

- MRC and MCR accesses to DBGAUTHSTATUS, DBGBCR<n>, DBGBVR<n>, DBGBXVR<n>, DBGCLAIMCLR, DBGCLAIMSET, DBGDCCINT, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGDIDR, DBGDSCRext, DBGDSCRint, DBGDTRRXext, DBGDTRTXext, DBGOSECCR, DBGVCR, DBGWCR<n>, DBGWFAR, and DBGWVR<n>.
- STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint.
- In Non-debug state, MRC accesses to DBGDTRRXint and MCR accesses to DBGDTRTXint.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x05 for MRC and MCR accesses, and 0x06 for LDC and STC accesses.

The following instructions are not trapped in Debug state:

- AArch64 MRS accesses to DBGDTRRX_EL0 and DBGDTR_EL0 and MSR accesses to DBGDTRTX_EL0 and DBGDTR_EL0.
- AArch32 MRC accesses to DBGDTRRXint and MCR accesses to DBGDTRTXint.

If 16 or fewer breakpoints and 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI, then it is IMPLEMENTATION DEFINED whether AArch64 accesses to MDSELR_EL1 are trapped to EL2 when MDCR_EL2.TDA is 1.

This field is ignored by the PE and treated as one when any of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDE, bit [8]

Trap Debug Exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D.

TDE	Meaning
0b0	The debug target Exception level is EL1.
0b1	If EL2 is enabled for the current Effective value of SCR_EL3.NS, the debug target Exception level is EL2, otherwise the debug target Exception level is EL1. The MDCR_EL2.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see 'Routing debug exceptions'.

This field is treated as being 1 for all purposes other than a direct read when HCR_EL2.TGE == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPME, bit [7]

When FEAT_PMUv3 is implemented:

Hyp Enable.

HPME	Meaning
0b0	Affected counters are disabled and do not count.
0b1	Affected counters are enabled by PMCNTENSET_EL0.

The counters affected by this field are the event counters in the second range. This applies even when EL2 is disabled in the current Security state.

The following counters are not affected by this field:

- Other event counters.
- PMCCNTR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, PMICNTR_EL0.

If MDCR_EL2.HPMN is equal to `GetNumEventCountersSelfHosted()`, then this field has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

Trap accesses of PMU registers. Enables a trap to EL2 on accesses of PMU registers.

TPM	Meaning
0b0	Accesses of the specified PMU registers are not trapped by this mechanism.
0b1	Accesses of the specified PMU registers at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMCCFILTR_EL0, PMCCNTR_EL0, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMCR_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMINTENCLR_EL1, PMINTENSET_EL1, PMOVSCLR_EL0, PMOVSSET_EL0, PMSELR_EL0, PMSWINC_EL0, PMUSERENR_EL0, PMXEVCNTR_EL0, and PMXEVTYPER_EL0.
- MRS accesses to PMCEID0_EL0 and PMCEID1_EL0.
- If FEAT_PMUv3p4 is implemented, MRS accesses to PMMIR_EL1.
- If FEAT_PMUv3p9 is implemented, MSR accesses to PMZR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, MRS accesses to PMICFILTR_EL0 and PMICNTR_EL0.
- If FEAT_EBEP is implemented or FEAT_PMUv3_SS is implemented, MRS and MSR accesses to PMECR_EL1.
- If FEAT_SEBEP is implemented, MRS and MSR accesses to PMIAR_EL1.

In AArch32 state, the instructions affected by this control are:

- MRC and MCR accesses to PMCCFILTR, PMCCNTR, PMCNTENCLR, PMCNTENSET, PMCR, PMEVCNTR<n>, PMEVTYPER<n>, PMINTENCLR, PMINTENSET, PMOVSR, PMOVSSET, PMSELR, PMSWINC, PMUSERENR, PMXEVCNTR, and PMXEVTYPER.
- MRC accesses to PMCEID0 and PMCEID1.
- MRRC and MCRR accesses to PMCCNTR.
- If FEAT_PMUv3p1 is implemented, MRC accesses to PMCEID2 and PMCEID3.
- If FEAT_PMUv3p4 is implemented, MRC accesses to PMMIR.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x03 for MRC and MCR accesses, and 0x04 for MRRC and MCRR accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]

When FEAT_PMUv3 is implemented:

Trap PMCR_EL0 or PMCR accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to PMCR_EL0 are trapped to EL2, reported using EC syndrome value `0x18`.
- In AArch32 state, accesses to PMCR are trapped to EL2, reported using EC syndrome value `0x03`.

TPMCR	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL0 and EL1 accesses to the specified registers are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by the following: • PMUSERENR.EN. • PMUSERENR_EL0.EN.

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]

When FEAT_PMUv3 is implemented:

Defines the number of event counters PMEVCNTR<n>_EL0 and, if FEAT_PMUv3_SS is implemented, event counter snapshot registers PMEVCNTSVR<n>_EL1, that are accessible from EL1 and, if permitted, from EL0.

MDCR_EL2.HPMN divides the event counters accessible from self-hosted software into a first range and a second range.

When FEAT_PMUv3_EXTPMN is implemented, all of the following apply:

- PMCCR.EPMN divides the NUM_PMU_COUNTERS event counters implemented by the PE into the event counters that MDCR_EL2.HPMN divides into the first and second ranges, and a third range that is inaccessible from self-hosted software.
- If MDCR_EL2.HPMN is not 0 and is less than the Effective value of PMCCR.EPMN, then event counters [0..(MDCR_EL2.HPMN-1)] are in the first range, and the remaining event counters [MDCR_EL2.HPMN..(PMCCR.EPMN-1)] are in the second range.
- The pseudcode function `GetNumEventCountersSelfHosted()` returns the Effective value of PMCCR.EPMN.

When FEAT_PMUv3_EXTPMN is not implemented, all of the following apply:

- All of the NUM_PMU_COUNTERS event counters are accessible to self-hosted software and no counters are in the third range.
- If MDCR_EL2.HPMN is not 0 and is less than NUM_PMU_COUNTERS, then event counters [0..(MDCR_EL2.HPMN-1)] are in the first range, and the remaining event counters [MDCR_EL2.HPMN..(NUM_PMU_COUNTERS-1)] are in the second range.
- The pseudocode function `GetNumEventCountersSelfHosted()` returns NUM_PMU_COUNTERS.

If FEAT_HPMN0 is implemented and MDCR_EL2.HPMN is 0, then all of the following apply:

- No event counters are in the first range.
- If FEAT_PMUv3_EXTPMN is implemented, then event counters [0..(PMCCR.EPMN-1)] are in the second range.
- If FEAT_PMUv3_EXTPMN is not implemented, then all event counters are in the second range.

If MDCR_EL2.HPMN is equal to `GetNumEventCountersSelfHosted()`, or EL2 is not implemented, then all of the following apply:

- If FEAT_PMUv3_EXTPMN is implemented, then event counters [0..(PMCCR.EPMN-1)] are in the first range.
- If FEAT_PMUv3_EXTPMN is not implemented, then all event counters are in the first range.
- No event counters are in the second range.

All of the following apply for an event counter PMEVCNTR<n>_EL0 in the first range:

- The counter is accessible from EL1, EL2, and EL3.
- The counter is accessible from EL0 if permitted by PMUSERENR_EL0 and PMUACR_EL1, or by PMUSERENR.
- If FEAT_PMUv3p5 is implemented, then PMCR_EL0.LP or PMCR.LP determines whether the counter overflow flag PMOVSSET_EL0[n] is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- PMCR_EL0.E and PMCNTENSET_EL0[n] enable the operation of the event counter.

All of the following apply for an event counter PMEVCNTR<n>_EL0 in the second range:

- The counter is accessible from EL2 and EL3.
- If EL2 is disabled in the current Security state, then the event counter is accessible from EL1, and from EL0 if permitted by PMUSERENR_EL0 and PMUACR_EL1, or by PMUSERENR.
- If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP determines whether the counter overflow flag PMOVSSET_EL0[n] is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- MDCR_EL2.HPME and PMCNTENSET_EL0[n] enable the operation of the event counter.

If FEAT_PMUv3_SS is implemented, then all of the following apply:

- For an event counter snapshot register PMEVCNTSVR<n>_EL1 in the first range, the register is accessible from EL1, EL2, and EL3.
- For an event counter snapshot register PMEVCNTSVR<n>_EL1 in the second range, the register is accessible from EL2 and EL3. If EL2 is disabled in the current Security state, the event counter is also accessible from EL1.

For information about counters in the third range, see the description of PMCCR.EPMN.

Values greater than `GetNumEventCountersSelfHosted()` are reserved. If FEAT_HPMN0 is not implemented then the value 0 is reserved.

When FEAT_PMUv3_EXTPMN is not implemented and this field is set to a reserved value, the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of MDCR_EL2.HPMN is UNKNOWN.
- The number of event counters in each of the first and second ranges is UNKNOWN. That is, either:
  - The PE behaves as if MDCR_EL2.HPMN is set to an UNKNOWN nonzero value less than or equal to NUM_PMU_COUNTERS.
  - All counters are in the second range and none are in the first range.

When FEAT_PMUv3_EXTPMN is implemented and this field is set to a reserved value, the following behaviors apply:

- The value returned by a direct read of MDCR_EL2.HPMN is the Effective value of PMCCR.EPMN.
- No event counters are in the second range.
- The value returned by an indirect read of MDCR_EL2.HPMN as a result of direct reads of PMCR_EL0.N or PMCR.N is the Effective value of PMCCR.EPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `NUM_PMU_COUNTERS`.

Otherwise:

Reserved, RES0.

Accessing MDCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MDCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);

MDCR_EL3, Monitor Debug Configuration Register (EL3)

The MDCR_EL3 characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

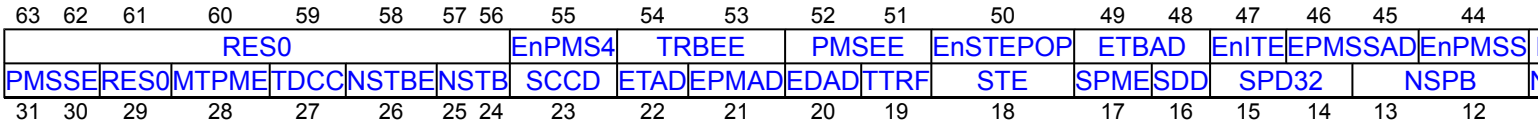
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MDCR_EL3 are UNDEFINED.

Attributes

MDCR_EL3 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

EnPMS4, bit [55]

When FEAT_SPE_nVM is implemented:

Enable access to SPE registers. When disabled, accesses to SPE registers generate a trap to EL3.

EnPMS4	Meaning
0b0	Accesses of the specified SPE registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified SPE registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to PMBMAR_EL1.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBEE, bits [54:53]

When FEAT_TRBE_EXC is implemented:

Trace buffer management event Exception Enable.

TRBEE	Meaning
0b00	Disabled. TRBE Profiling exceptions for all Exception levels are disabled. All of the following apply: • No trace buffer management events are recorded in TRBSR_EL3. • TRBE Profiling exceptions are not generated. • TRBSR_EL1.IRQ drives the interrupt request signal **TRBIRQ**. • Accesses to TRBSR_EL2 at EL2 are trapped to EL3. • Accesses to TRBSR_EL1 at EL1 ignore the value of HCR_EL2.NV1 and accesses to TRBSR_EL1 at EL2 ignore the value of HCR_EL2.E2H.
0b01	Delegated. TRBE Profiling exceptions for EL3 are disabled, but might be enabled for EL2 or EL1 by TRFCR_EL2.EE or TRFCR_EL1.EE. All of the following apply: • No trace buffer management events are recorded in TRBSR_EL3. • TRBSR_EL3.IRQ is ignored and TRBE Profiling exceptions are not taken to EL3.
0b10	Enabled. TRBE Profiling exceptions for EL3 are enabled for trace buffer management events targeting EL3, as follows: • Trace buffer management events due to a fault on a write to the trace buffer that would generate a Data Abort exception taken to EL3 if generated by a store instruction executed at the owning Exception level are recorded in TRBSR_EL3. That is, any of the following faults: ◦ Granule Protection Check faults other than Granule Protection Faults (GPFs). ◦ If SCR_EL3.GPF is 1, GPFs. ◦ If SCR_EL3.EA is 1, External aborts. • TRBE Profiling exceptions are generated and taken to EL3 when unmasked and TRBSR_EL3.IRQ is 1.
0b11	Trap all. TRBE Profiling exceptions for EL3 are enabled for all trace buffer management events, as follows: • All trace buffer management events are recorded in TRBSR_EL3. • TRBE Profiling exceptions are generated and taken to EL3 when unmasked and TRBSR_EL3.IRQ is 1.

If EL3 is not implemented, then the Effective value of MDCR_EL3.TRBEE is 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSEE, bits [52:51]

When FEAT_SPE_EXC is implemented:

Profiling Buffer management event Exception Enable.

PMSEE	Meaning
0b00	Disabled. SPE Profiling exceptions for all Exception levels are disabled. All of the following apply: • No Profiling Buffer management events are recorded in PMBSR_EL3. • SPE Profiling exceptions are not generated. • PMBSR_EL1.S drives the interrupt request signal **PMBIRQ**. • Accesses to PMBSR_EL2 at EL2 are trapped to EL3. • Accesses to PMBSR_EL1 at EL1 ignore the value of HCR_EL2.NV1 and accesses to PMBSR_EL1 at EL2 ignore the value of HCR_EL2.E2H.
0b01	Delegated. SPE Profiling exceptions for EL3 are disabled, but might be enabled for EL2 or EL1 by PMSCR_EL2.EE or PMSCR_EL1.EE. All of the following apply: • No Profiling Buffer management events are recorded in PMBSR_EL3. • PMBSR_EL3.S is ignored and SPE Profiling exceptions are not taken to EL3.
0b10	Enabled. SPE Profiling exceptions for EL3 are enabled for Profiling Buffer management events targeting EL3, as follows: • Profiling Buffer management events due to a fault on a write to the Profiling Buffer that would generate a Data Abort exception taken to EL3 if generated by a store instruction executed at the owning Exception level are recorded in PMBSR_EL3. That is, any of the following faults: ◦ Granule Protection Check faults other than Granule Protection Faults (GPFs). ◦ If SCR_EL3.GPF is 1, GPFs. ◦ If SCR_EL3.EA is 1, External aborts. • SPE Profiling exceptions are generated and taken to EL3 when unmasked and PMBSR_EL3.S is 1.
0b11	Trap all. SPE Profiling exceptions for EL3 are enabled for all Profiling Buffer management events, as follows: • All Profiling Buffer management events are recorded in PMBSR_EL3. • SPE Profiling exceptions are generated and taken to EL3 when unmasked and PMBSR_EL3.S is 1.

If EL3 is not implemented, then the Effective value of MDCR_EL3.PMSEE is 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSTEPOP, bit [50]

When FEAT_STEP2 is implemented:

EnSTEPOP	Meaning
0b0	Execution from MDSTEPOP_EL1 is disabled. EL2, EL1 and EL0 System register accesses to MDSTEPOP_EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b1	Execution from MDSTEPOP_EL1 is not disabled by this control. System register accesses to MDSTEPOP_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ETBAD, bits [49:48]

When FEAT_TRBE_EXT is implemented:

External Trace Buffer Access Disable. Controls access to the Trace Buffer registers from an external debugger.

ETBAD	Meaning	Applies when
0b00	Non-secure accesses from an external debugger to Trace Buffer registers are prohibited. If FEAT_RME is implemented, Secure and Realm accesses from an external debugger to Trace Buffer registers are prohibited and Root accesses to Trace Buffer registers are allowed. If FEAT_RME is not implemented, Secure accesses to Trace Buffer registers are allowed.	
0b01	Secure and Non-secure accesses from an external debugger to Trace Buffer registers are prohibited. Root and Realm accesses to Trace Buffer registers are allowed.	When FEAT_RME is implemented
0b10	Realm and Non-secure accesses from an external debugger to Trace Buffer registers are prohibited. Root and Secure accesses to Trace Buffer registers are allowed.	When FEAT_RME is implemented
0b11	All accesses from an external debugger to Trace Buffer registers are allowed.	

If EL3 is not implemented, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

Otherwise:

Reserved, RES0.

EnITE, bit [47]

When FEAT_ITE is implemented:

Enable access to Instrumentation trace registers. When disabled, accesses to Instrumentation trace registers generate a trap to EL3.

EnITE	Meaning
0b0	Accesses of the specified Instrumentation trace registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified Instrumentation trace registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to TRCITECR_EL1, TRCITECR_EL2, and TRCITECR_EL12.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EPMSSAD, bits [46:45]

When FEAT_PMUv3_SS is implemented:

External PMU Snapshot Access Disable. Controls access to the PMU Snapshot registers from an external debugger.

External accesses of the following registers are affected by this control:

- PMCCNTSVR_EL1, PMEVCNTSVR<n>_EL1, and PMSSCR_EL1.
- If FEAT_PMUv3_ICNTR is implemented, PMICNTSVR_EL1.

EPMSSAD	Meaning	Applies when
0b00	Non-secure accesses from an external debugger to the affected PMU Snapshot registers are prohibited. If FEAT_RME is implemented, Secure and Realm accesses from an external debugger to the affected PMU Snapshot registers are prohibited. Other accesses from an external debugger to the specified registers are not affected by this control.	
0b01	Secure and Non-secure accesses from an external debugger to the affected PMU Snapshot registers are prohibited. Other accesses from an external debugger to the specified registers are not affected by this control.	When FEAT_RME is implemented
0b10	Realm and Non-secure accesses from an external debugger to the affected PMU Snapshot registers are prohibited. Other accesses from an external debugger to the specified registers are not affected by this control.	When FEAT_RME is implemented
0b11	No accesses from an external debugger to the affected PMU Snapshot registers are prohibited by this control.	

If EL3 is not implemented, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

Otherwise:

Reserved, RES0.

EnPMSS, bit [44]

When FEAT_PMUv3_SS is implemented:

Enable access to PMU Snapshot registers. When disabled, accesses to PMU Snapshot registers generate a trap to EL3.

EnPMSS	Meaning
0b0	Accesses of the specified PMU Snapshot registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified PMU Snapshot registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMCCNTSVR_EL1, PMEVCNTSVR<n>_EL1, and PMSSCR_EL1.
- If FEAT_PMUv3_ICNTR is implemented, MRS and MSR accesses to PMICNTSVR_EL1.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EBWE, bit [43]
When FEAT_Debugv8p9 is implemented:

Extended Breakpoint and Watchpoint Enable. Enables use of additional breakpoints or watchpoints, and enables a trap to EL3 on accesses to debug registers.

EBWE	Meaning
0b0	The Effective values of MDSCR_EL1.EMBWE and MDCR_EL2.EBWE are 0. The Effective value of MDSELR_EL1.BANK is zero at EL3. Accesses of MDSELR_EL1 at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	The Effective values of MDSCR_EL1.EMBWE, MDCR_EL2.EBWE, and MDSELR_EL1.BANK are not affected by this field. Accesses of MDSELR_EL1 are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to MDSELR_EL1.

Trapped instructions are reported using EC syndrome value 0x18.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

If EL3 is not implemented, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

EnPMS3, bit [42]
When FEAT_SPE_FDS is implemented:

Enable access to SPE registers. When disabled, accesses to SPE registers generate a trap to EL3.

EnPMS3	Meaning
0b0	Accesses of the specified SPE registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified SPE registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to PMSDSFR_EL1.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEE, bits [41:40]

When FEAT_EBEP is implemented:

Performance Monitors Exception Enable. Controls the generation of the **PMUIRQ** signal and the PMU Profiling exception at all Exception levels.

PMEE	Meaning
0b00	The **PMUIRQ** signal is asserted on a PMU overflow, and the PMU Profiling exception is disabled.
0b01	The **PMUIRQ** signal and the PMU Profiling exception are both controlled by MDCR_EL2.PMEE.
0b10	The **PMUIRQ** signal is deasserted, and the PMU Profiling exception is disabled.
0b11	The **PMUIRQ** signal is deasserted, and the PMU Profiling exception is enabled.

If EL3 is not implemented, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnTB2, bit [39]

When FEAT_TRBE_MPAM is implemented:

Enable access to Trace Buffer registers. When disabled, accesses to Trace Buffer registers generate a trap to EL3.

EnTB2	Meaning
0b0	Accesses of the specified Trace Buffer registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified Trace Buffer registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to TRBMPAM_EL1.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3BREC, bit [38]

When FEAT_BRBEv1p1 is implemented:

Branch Record Buffer EL3 Cold Reset Enable. With MDCR_EL3.E3BREW, controls branch recording at EL3.

E3BREC	Meaning
0b0	When MDCR_EL3.E3BREW == 0: Branch recording at EL3 is disabled. When MDCR_EL3.E3BREW == 1: Branch recording at EL3 is enabled.
0b1	When MDCR_EL3.E3BREW == 0: Branch recording at EL3 is enabled. When MDCR_EL3.E3BREW == 1: Branch recording at EL3 is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Otherwise:

Reserved, RES0.

E3BREW, bit [37]
When FEAT_BRBEv1p1 is implemented:

Branch Record Buffer EL3 Warm Reset Enable. With MDCR_EL3.E3BREC, controls branch recording at EL3.

For a description of the values derived by evaluating MDCR_EL3.E3BREC and MDCR_EL3.E3BREW together, see MDCR_EL3.E3BREC.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Otherwise:

Reserved, RES0.

EnPMSN, bit [36]
When FEAT_SPE_FnE is implemented:

Trap accesses to PMSNEVFR_EL1. Controls access to Statistical Profiling PMSNEVFR_EL1 System register from EL2 and EL1.

EnPMSN	Meaning
`0b0`	Accesses to PMSNEVFR_EL1 at EL2 and EL1 generate a Trap exception to EL3.
`0b1`	Do not trap PMSNEVFR_EL1 to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MPMX, bit [35]
When FEAT_PMUv3p7 is implemented:

Monitor Performance Monitors Extended control. With MDCR_EL3.SPME, controls PMU operation at EL3.

MPMX	Meaning
`0b0`	Counters are not affected by this mechanism.
`0b1`	Affected counters are prohibited from counting at EL3. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled at EL3. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.

The counters affected by this field are:

- If EL2 is implemented and MDCR_EL3.SPME is 1, event counters PMEVCNTR<n>_EL0 in the first range.
- If EL2 is not implemented or MDCR_EL3.SPME is 0, event counters in the first and second ranges.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter, PMICNTR_EL0.
- If PMCR_EL0.DP is 1, the cycle counter, PMCCNTR_EL0.

Other event counters are not affected by this field. When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

MCCD, bit [34]
When FEAT_PMUv3p7 is implemented:

Monitor Cycle Counter Disable. Prohibits the Cycle Counter, PMCCNTR_EL0, from counting at EL3.

MCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited at EL3.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SBRBE, bits [33:32]
When FEAT_BRBE is implemented:

Secure Branch Record Buffer Enable. Controls branch recording by the BRBE, and access to BRBE registers and instructions at EL2 and EL1.

SBRBE	Meaning
0b00	Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. EL0, EL1, and EL2 are prohibited regions.
0b01	Direct accesses to BRBE registers and instructions in Secure state, except when in EL3, generate a Trap exception to EL3. EL0, EL1, and EL2 in Secure state are prohibited regions. This control does not cause any direct accesses to BRBE registers when not in Secure state to be trapped, and does not cause any Exception levels when not in Secure state to be a prohibited region.
0b10	Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. This control does not cause any Exception levels to be prohibited regions.
0b11	This control does not cause any direct accesses to BRBE registers or instruction to be trapped, and does not cause any Exception levels to be a prohibited region.

The Branch Record Buffer registers trapped by this control are: BRBCR_EL1, BRBCR_EL2, BRBCR_EL12, BRBFCR_EL1, BRBIDR0_EL1, BRBINF<n>_EL1, BRBINFINJ_EL1, BRBSRC<n>_EL1, BRBSRCINJ_EL1, BRBTGT<n>_EL1, BRBTGTINJ_EL1, and BRBTS_EL1.

The Branch Record Buffer instructions trapped by this control are:

- BRB IALL.
- BRB INJ.

Note

If FEAT_BRBEv1p1 is not implemented, EL3 is a prohibited region.

If EL3 is not implemented then the Effective value of this field is `0b11`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSSE, bits [31:30]
When FEAT_PMUv3_SS is implemented:

Performance Monitors Snapshot Enable. Controls the generation of Capture events.

PMSSE	Meaning
`0b00`	Capture events are disabled.
`0b01`	Capture events are controlled by MDCR_EL2.PMSSE.
`0b10`	Capture events are enabled and prohibited.
`0b11`	Capture events are enabled and allowed.

If EL3 is not implemented, then the Effective value of this field is `0b01`.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'00'`.

Otherwise:

Reserved, RES0.

Bit [29]

Reserved, RES0.

MTPME, bit [28]
When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>_EL0.MT bits.

MTPME	Meaning
`0b0`	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>_EL0.MT is 0.
`0b1`	PMEVTYPER<n>_EL0.MT bits not affected by this field.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'1'`.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: OSDTRRX_EL1, OSDTRTX_EL1, MDCCSR_EL0, MDCCINT_EL1, and, when the PE is in Non-debug state, DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to DBGDTRTXint and STC from DBGDTRRXint.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL3.TDCC does not trap any accesses to:

AArch64: DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXint and DBGDTRTXint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSTBE, bit [26]

When FEAT_TRBE is implemented and FEAT_RME is implemented:

Non-secure Trace Buffer Extended. Together with MDCR_EL3.NSTB, controls the trace buffer owning Security state and accesses to trace buffer System registers from EL2 and EL1.

For a description of the values derived by evaluating NSTB and NSTBE together, see MDCR_EL3.NSTB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSTB, bits [25:24]

When FEAT_TRBE is implemented and FEAT_RME is implemented:

Non-secure Trace Buffer. Together with MDCR_EL3.NSTBE, controls the trace buffer owning Security state and accesses to trace buffer System registers from EL2 and EL1.

NSTBE	NSTB	Meaning
0b0	0b00	Trace buffer owning Security state is Secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Realm and Non-secure states. Accesses to trace buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception. When Secure state is not implemented, this encoding is reserved.
0b0	0b01	Trace buffer owning Security state is Secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Realm and Non-secure states. Accesses to trace buffer System registers at Realm and Non-secure EL2, and Realm and Non-secure EL1, are trapped to EL3, unless the access generates a higher priority exception. When Secure state is not implemented, this encoding is reserved.
0b0	0b10	Trace buffer owning Security state is Non-secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure and Realm states. Accesses to trace buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b0	0b11	Trace buffer owning Security state is Non-secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure and Realm states. Accesses to trace buffer System registers at Secure and Realm EL2, and Secure and Realm EL1, are trapped to EL3, unless the access generates a higher priority exception.
0b1	0b10	Trace buffer owning Security state is Realm state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure and Non-secure states. Accesses to trace buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a highe priority exception.
0b1	0b11	Trace buffer owning Security state is Realm state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure and Non-secure states. Accesses to trace buffer System registers at Secure and Non-secure EL2, and Secure and Non-secure EL1, are trapped to EL3, unless the access generates a higher priority exception.

All other combinations of MDCR_EL3.NSTBE and MDCR_EL3.NSTB are reserved.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to TRBBASER_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.
- If FEAT_TRBE_MPAM is implemented, MRS and MSR accesses to TRBMPAM_EL1.
- If FEAT_TRBE_EXC is implemented, MRS and MSR accesses to TRBSR_EL2 and TRBSR_EL12.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3, reported using EC syndrome value 0x18.

When TraceBufferEnabled()==FALSE, these controls have no effect on whether tracing is prohibited.

If the Trace Buffer Unit is enabled and using Self-hosted mode, and MDCR_EL3.{NSTB, NSTBE} selects a reserved value, then the behavior is CONSTRAINED UNPREDICTABLE, and the Trace Buffer Unit does one of:

- Behaves as if the Trace Buffer Unit is disabled.
- Selects an implemented Security state as the owning Security state.
- When trace data is received from the trace unit, it is not written to memory and the Trace Buffer Unit generates a trace buffer management event, as follows:
    - TRBSR_ELx.IRQ is set to 1.
    - If TRBSR_ELx.S is 0, then all of the following occur:
        - TRBSR_ELx.S is set to 1, Collection is stopped.
        - TRBSR_ELx.EC is set to 0x00, Other buffer management event.
        - TRBSR_ELx.BSC is set to 0b000000, Access not allowed.
    - The other fields in TRBSR_ELx are unchanged.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_TRBE is implemented:

Non-secure Trace Buffer. Controls the trace buffer owning Security state and accesses to trace buffer System registers from EL2 and EL1.

NSTB	Meaning
0b00	Trace buffer owning Security state is Secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Non-secure state. Accesses to trace buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b01	Trace buffer owning Security state is Secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Non-secure state. Accesses to trace buffer System registers at EL2 and EL1 in Non-secure state are trapped to EL3, unless the access generates a higher priority exception.
0b10	Trace buffer owning Security state is Non-secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure state. Accesses to trace buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b11	Trace buffer owning Security state is Non-secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure state. Accesses to trace buffer System registers at EL2 and EL1 in Secure state are trapped to EL3, unless the access generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to TRBBASER_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.
- If FEAT_TRBE_MPAM is implemented, MRS and MSR accesses to TRBMPAM_EL1.
- If FEAT_TRBE_EXC is implemented, MRS and MSR accesses to TRBSR_EL2 and TRBSR_EL12.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3, reported using EC syndrome value 0x18.

When TraceBufferEnabled()==FALSE, this control has no effect on whether tracing is prohibited.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCCD, bit [23]
When FEAT_PMUv3p5 is implemented:

Secure Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting in Secure state and EL3.

SCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited in Secure state and EL3.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

ETAD, bit [22]

When FEAT_RME is implemented, FEAT_TRC_EXT is implemented, and FEAT_TRBE is implemented:

External Trace Access Disable. Together with MDCR_EL3.ETADE, controls access to trace unit registers by an external debugger.

ETADE	ETAD	Meaning
0b0	0b0	No accesses from an external debugger to trace unit registers are prohibited by this control.
0b0	0b1	Realm and Non-secure accesses from an external debugger to trace unit registers are prohibited. Other accesses from an external debugger to trace unit registers are not affected by this control.
0b1	0b0	Secure and Non-secure accesses from an external debugger to trace unit registers are prohibited. Other accesses from an external debugger to trace unit registers are not affected by this control.
0b1	0b1	Secure, Non-secure, and Realm accesses from an external debugger to trace unit registers are prohibited. Other accesses from an external debugger to trace unit registers are not affected by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_TRC_EXT is implemented and FEAT_TRBE is implemented:

External Trace Access Disable. Controls Non-secure access to trace unit registers by an external debugger.

ETAD	Meaning
0b0	No accesses from an external debugger to the trace unit registers are prohibited by this control.
0b1	Non-secure accesses from an external debugger to some trace unit registers are prohibited. See individual registers for the effect of this field.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

EPMAD, bit [21]

When FEAT_RME is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable. Together with MDCR_EL3.EPMADE, controls access to Performance Monitor registers by an external debugger.

External accesses of the following Performance Monitor registers are affected by this control:

- PMCCFILTR_EL0, PMCCNTR_EL0, PMCFGR, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMCR_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMINTENCLR_EL1, PMINTENSET_EL1, PMOVSCLR_EL0, and PMOVSSET_EL0.
- If PMEVFILT2R<n> is implemented, PMEVFILT2R<n>.
- If implemented, PMIIDR.
- If PMSWINC_EL0 is implemented in the external view, PMSWINC_EL0.
- If FEAT_PMUv3p4 is implemented, PMMIR.
- If FEAT_PMUv3_EXT64 is implemented, PMCNTEN, PMINTEN, and PMOVS.

- If FEAT_PMUv3p9 is implemented, PMZR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, PMCGCR0, PMICFILTR_EL0, and PMICNTR_EL0.
- If FEAT_PCSRv8p9 is implemented, PMPCSCTL.

EPMADE	EPMAD	Meaning
0b0	0b0	No accesses from an external debugger to affected Performance Monitor registers are prohibited by this control.
0b0	0b1	Realm and Non-secure accesses from an external debugger to affected Performance Monitor registers are prohibited. Other accesses from an external debugger to affected Performance Monitor registers are not affected by this control.
0b1	0b0	Secure and Non-secure accesses from an external debugger to affected Performance Monitor registers are prohibited. Other accesses from an external debugger to affected Performance Monitor registers are not affected by this control.
0b1	0b1	Secure, Non-secure, and Realm accesses from an external debugger to affected Performance Monitor registers are prohibited. Other accesses from an external debugger to affected Performance Monitor registers are not affected by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

External accesses of the following Performance Monitor registers are affected by this control:

- PMCCFILTR_EL0, PMCCNTR_EL0, PMCFGR, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMCR_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMINTENCLR_EL1, PMINTENSET_EL1, PMOVSCLR_EL0, and PMOVSSET_EL0.
- If PMEVFILT2R<n> is implemented, PMEVFILT2R<n>.
- If implemented, PMIIDR.
- If PMSWINC_EL0 is implemented in the external view, PMSWINC_EL0.
- If FEAT_PMUv3p4 is implemented, PMMIR.
- If FEAT_PMUv3_EXT64 is implemented, PMCNTEN, PMINTEN, and PMOVS.
- If FEAT_PMUv3p9 is implemented, PMZR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, PMCGCR0, PMICFILTR_EL0, and PMICNTR_EL0.
- If FEAT_PCSRv8p9 is implemented, PMPCSCTL.

EPMAD	Meaning
0b0	No accesses from an external debugger to the Performance Monitor registers are prohibited by this control.
0b1	Non-secure accesses from an external debugger to the affected Performance Monitor registers are prohibited.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

External accesses of the following Performance Monitor registers are affected by this control:

- PMCCFILTR_EL0, PMCCNTR_EL0, PMCFGR, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMCR_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMINTENCLR_EL1, PMINTENSET_EL1, PMOVSCLR_EL0, and PMOVSSET_EL0.
- If PMEVFILT2R<n> is implemented, PMEVFILT2R<n>.
- If implemented, PMIIDR.
- If PMSWINC_EL0 is implemented in the external view, PMSWINC_EL0.
- If FEAT_PMUv3p4 is implemented, PMMIR.

EPMAD	Meaning
0b0	No accesses from an external debugger to the Performance Monitor registers are prohibited by this control.
0b1	If the IMPLEMENTATION DEFINED authentication interface function `ExternalSecureInvasiveDebugEnabled()` returns FALSE, then accesses from an external debugger to the affected Performance Monitor registers are prohibited.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Otherwise:

Reserved, RES0.

EDAD, bit [20]
When FEAT_RME is implemented:

External Debug Access Disable. Together with MDCR_EL3.EDADE, controls access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger.

External accesses of the following debug registers are affected by this control:

- DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1, and OSLAR_EL1.

EDADE	EDAD	Meaning
0b0	0b0	No accesses from an external debugger to affected debug registers are prohibited by this control.
0b0	0b1	Realm and Non-secure accesses from an external debugger to affected debug registers are prohibited. Other accesses from an external debugger to affected debug registers are not affected by this control.
0b1	0b0	Secure and Non-secure accesses from an external debugger to affected debug registers are prohibited. Other accesses from an external debugger to affected debug registers are not affected by this control.
0b1	0b1	Secure, Non-secure, and Realm accesses from an external debugger to affected debug registers are prohibited. Other accesses from an external debugger to affected debug registers are not affected by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

When FEAT_Debugv8p4 is implemented:

External Debug Access Disable. Controls Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger.

External accesses of the following debug registers are affected by this control:

- DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1, and OSLAR_EL1.

EDAD	Meaning
0b0	No accesses from an external debugger to the debug registers are prohibited by this control.
0b1	Non-secure accesses from an external debugger to the affected debug registers are prohibited.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable. Controls access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger.

External accesses of the following debug registers are affected by this control:

- DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1, and OSLAR_EL1.

EDAD	Meaning
0b0	No accesses from an external debugger to the debug registers are prohibited by this control.
0b1	If the IMPLEMENTATION DEFINED authentication interface function ExternalSecureInvasiveDebugEnabled() returns FALSE, then accesses from an external debugger to the affected debug registers are prohibited.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

External Debug Access Disable. Controls access to breakpoint registers, watchpoint registers, and optionally OSLAR_EL1 by an external debugger.

External accesses of the following debug registers are affected by this control:

- DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, and DBGWVR<n>_EL1.
- It is IMPLEMENTATION DEFINED whether this control affects OSLAR_EL1.

EDAD	Meaning
0b0	No accesses from an external debugger to the debug registers are prohibited by this control.
0b1	If the IMPLEMENTATION DEFINED authentication interface function ExternalSecureInvasiveDebugEnabled() returns FALSE, then accesses from an external debugger to the affected debug registers are prohibited.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TTRF, bit [19]

When FEAT_TRF is implemented:

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- TRFCR_EL2, TRFCR_EL12, TRFCR_EL1, reported using EC syndrome value 0x18.
- HTRFCR and TRFCR, reported using EC syndrome value 0x03.

TTRF	Meaning
0b0	Accesses to Trace Filter registers at EL2 and EL1 are not affected by this field.
0b1	Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

STE, bit [18]
When FEAT_TRF is implemented and Secure state is implemented:

Secure Trace enable. Enables tracing in Secure state.

STE	Meaning
0b0	Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Secure state is not affected by this field.

This field also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SPME, bit [17]
When FEAT_PMUv3 is implemented and FEAT_PMUv3p7 is implemented:

Secure Performance Monitors Enable. Controls PMU operation in Secure state and at EL3 when MDCR_EL3.MPMX is 0.

SPME	Meaning
0b0	Affected counters are prohibited from counting in Secure state and at EL3. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state and at EL3. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
0b1	Counters are not affected by this mechanism.

When MDCR_EL3.MPMX is 0, the counters affected by this field are:

- Event counters in the first and second ranges. For more information about event counter ranges, see MDCR_EL2.HPMN.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter, PMICNTR_EL0.
- If PMCR_EL0.DP is 1, the cycle counter, PMCCNTR_EL0.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

When MDCR_EL3.MPMX is 1, this field controls which event counters are affected by MDCR_EL3.MPMX at EL3. See MDCR_EL3.MPMX for more information.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

Secure Performance Monitors Enable. Controls PMU operation in Secure state.

SPME	Meaning
0b0	Event counting is prohibited in Secure state. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
0b1	Event counting and PMCCNTR_EL0 are not affected by this mechanism.

The counters affected by this field are:

- All event counters.
- If PMCR_EL0.DP is 1, the cycle counter, PMCCNTR_EL0.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_PMUv3 is implemented:

Secure Performance Monitors Enable. Controls PMU operation in Secure state.

SPME	Meaning
0b0	If ExternalSecureNoninvasiveDebugEnabled() is FALSE, then all the following apply: • Event counting is prohibited in Secure state. • If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
0b1	Event counting and PMCCNTR_EL0 are not affected by this mechanism.

If ExternalSecureNoninvasiveDebugEnabled() is TRUE then the event counters and PMCCNTR_EL0 are not affected by this field.

Otherwise, the counters affected by this field are:

- All event counters.
- If PMCR_EL0.DP is 1, the cycle counter, PMCCNTR_EL0.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SDD, bit [16]

When Secure state is implemented:

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

SDD	Meaning
0b0	Debug exceptions in Secure state are not affected by this field.
0b1	Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of SCR_EL3.RW is 0.

If Secure EL2 is implemented and enabled, and Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER32_EL3.SUIDEN is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPD32, bits [15:14]
When FEAT_AA32EL1 is implemented:

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

SPD32	Meaning
0b00	Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.
0b10	Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
0b11	Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of SCR_EL3.RW is 0.

If Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER32_EL3.SUIDEN is 1.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPB, bits [13:12]

When FEAT_SPE is implemented and FEAT_RME is implemented:

Non-secure Profiling Buffer. Together with MDCR_EL3.NSPBE, controls the Profiling Buffer owning Security state and accesses to Statistical Profiling and Profiling Buffer System registers from EL2 and EL1.

NSPBE	NSPB	Meaning
0b0	0b00	Profiling Buffer owning Security state is Secure state. Profiling is disabled in Realm and Non-secure states. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception. When Secure state is not implemented, this encoding is reserved.
0b0	0b01	Profiling Buffer owning Security state is Secure state. Profiling is disabled in Realm and Non-secure states. Accesses to Statistical Profiling and Profiling Buffer System registers at Realm and Non-secure EL2, and Realm and Non-secure EL1, are trapped to EL3, unless the access generates a higher priority exception. When Secure state is not implemented, this encoding is reserved.
0b0	0b10	Profiling Buffer owning Security state is Non-secure state. Profiling is disabled in Secure and Realm states. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b0	0b11	Profiling Buffer owning Security state is Non-secure state. Profiling is disabled in Secure and Realm states. Accesses to Statistical Profiling and Profiling Buffer System registers at Secure and Realm EL2, and Secure and Realm EL1, are trapped to EL3, unless the access generates a higher priority exception.
0b1	0b10	Profiling Buffer owning Security state is Realm state. Profiling is disabled in Secure and Non-secure states. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a highe priority exception.
0b1	0b11	Profiling Buffer owning Security state is Realm state. Profiling is disabled in Secure and Non-secure states. Accesses to Statistical Profiling and Profiling Buffer System registers at Secure and Non-secure EL2, and Secure and Non-secure EL1, are trapped to EL3, unless the access generates a higher priority exception.

All other combinations of MDCR_EL3.NSPBE and MDCR_EL3.NSPB are reserved.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMBLIMITR_EL1, PMBPTR_EL1, PMBSR_EL1, PMSCR_EL1, PMSCR_EL2, PMSCR_EL12, PMSEVFR_EL1, PMSFCR_EL1, PMSICR_EL1, PMSIRR_EL1, and PMSLATFR_EL1.
- MRS accesses to PMSIDR_EL1.
- If FEAT_SPE_FnE is implemented, MRS and MSR accesses to PMSNEVFR_EL1.
- If FEAT_SPE_FDS is implemented, MRS and MSR accesses to PMSDSFR_EL1.
- If FEAT_SPE_EXC is implemented, MRS and MSR accesses to PMBSR_EL2 and PMBSR_EL12.
- If FEAT_SPE_nVM is implemented, MRS and MSR accesses to PMBMAR_EL1.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3, reported using EC syndrome value 0x18.

If profiling is enabled and MDCR_EL3.{NSPB, NSPBE} selects a reserved value, then the behavior is CONSTRAINED UNPREDICTABLE, and the Statistical Profiling Unit does one of:

- Behaves as if profiling is disabled.
- Selects an implemented Security state as the owning Security state.
- When profiling data is generated, it is not written to memory and the Statistical Profiling Unit generates a Profiling Buffer management event, as follows:
  - If PMBSR_ELx.S is 0, then all of the following occur:
    - PMBSR_ELx.S is set to 1.
    - PMBSR_ELx.DL is set to 1.
    - PMBSR_ELx.EC is set to 0b000000, Other buffer management event.
    - PMBSR_ELx.BSC is set to 0b000000, Access not allowed.
  - The other fields in PMBSR_ELx are unchanged.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPE is implemented:

Non-secure Profiling Buffer. Controls the Profiling Buffer owning Security state and accesses to Statistical Profiling and Profiling Buffer System registers from EL2 and EL1.

NSPB	Meaning
0b00	Profiling Buffer owning Security state is Secure state. Profiling is disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b01	Profiling Buffer owning Security state is Secure state. Profiling is disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 in Non-secure state are trapped to EL3, unless the access generates a higher priority exception.
0b10	Profiling Buffer owning Security state is Non-secure state. Profiling is disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b11	Profiling Buffer owning Security state is Non-secure state. Profiling is disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 in Secure state are trapped to EL3, unless the access generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMBLIMITR_EL1, PMBPTR_EL1, PMBSR_EL1, PMSCR_EL1, PMSCR_EL2, PMSCR_EL12, PMSEVFR_EL1, PMSFCR_EL1, PMSICR_EL1, PMSIRR_EL1, and PMSLATFR_EL1.
- MRS accesses to PMSIDR_EL1.
- If FEAT_SPE_FnE is implemented, MRS and MSR accesses to PMSNEVFR_EL1.
- If FEAT_SPE_FDS is implemented, MRS and MSR accesses to PMSDSFR_EL1.
- If FEAT_SPE_EXC is implemented, MRS and MSR accesses to PMBSR_EL2 and PMBSR_EL12.
- If FEAT_SPE_nVM is implemented, MRS and MSR accesses to PMBMAR_EL1.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3, reported using EC syndrome value 0x18.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPBE, bit [11]
When FEAT_SPE is implemented and FEAT_RME is implemented:

Non-secure Profiling Buffer Extended. Together with MDCR_EL3.NSPB, controls the Profiling Buffer owning Security state and accesses to Statistical Profiling and Profiling Buffer System registers from EL2 and EL1.

For a description of the values derived by evaluating NSPB and NSPBE together, see MDCR_EL3.NSPB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDOSA, bit [10]

When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, DBGPRCR_EL1, and any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this field, are trapped to EL3 and reported using EC syndrome value `0x18`.
- Accesses using MCR or MRC to DBGOSLAR, DBGOSLSR, DBGOSDLR, and DBGPRCR, are trapped to EL3 and reported using EC syndrome value `0x05`.
- Accesses to any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this field.

TDOSA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.

Note

The powerdown debug registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- AArch64: OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
- AArch32: DBGOSLAR, DBGOSLSR, and DBGPRCR.
- AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this field.
- It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 and DBGOSDLR are trapped.

TDOSA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.

Note

The powerdown debug registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap accesses of debug System registers. Enables a trap to EL3 on accesses of debug System registers.

TDA	Meaning
0b0	Accesses of the specified debug System registers are not trapped by this mechanism.
0b1	Accesses of the specified debug System registers at EL2, EL1, and EL0 are trapped to EL3, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to DBGAUTHSTATUS_EL1, DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGCLAIMCLR_EL1, DBGCLAIMSET_EL1, DBGVCR32_EL2, DBGWCR<n>_EL1, DBGWVR<n>_EL1, MDCCINT_EL1, MDCCSR_EL0, MDCR_EL2, MDRAR_EL1, MDSCR_EL1, OSDTRRX_EL1, OSDTRTX_EL1, and OSECCR_EL1.
- If FEAT_Debugv8p9 is implemented, MRS and MSR accesses to MDSELR_EL1.
- If FEAT_STEP2 is implemented, MRS and MSR accesses to MDSTEPOP_EL1.
- In Non-debug state, MRS accesses to DBGDTRRX_EL0 and DBGDTR_EL0 and MSR accesses to DBGDTRTX_EL0 and DBGDTR_EL0.

In AArch32 state, the instructions affected by this control are:

- MRC and MCR accesses to DBGAUTHSTATUS, DBGBCR<n>, DBGBVR<n>, DBGBXVR<n>, DBGCLAIMCLR, DBGCLAIMSET, DBGDCCINT, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGDIDR, DBGDRAR, DBGDSAR, DBGDSCRext, DBGDSCRint, DBGDTRRXext, DBGDTRTXext, DBGOSECCR, DBGVCR, DBGWCR<n>, DBGWFAR, DBGWVR<n>, HDCR, and SDER.
- MRRC accesses to DBGDRAR and DBGDSAR.
- STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint.
- In Non-debug state, MRC accesses to DBGDTRRXint and MCR accesses to DBGDTRTXint.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x03 for MRC and MCR accesses with coproc == 0b1111, 0x05 for MCR and MCR accesses with coproc == 0b1110, 0x06 for LDC and STC accesses, and 0x0C for MRRC accesses.

The following instructions are not trapped in Debug state:

- AArch64 MRS accesses to DBGDTRRX_EL0 and DBGDTR_EL0 and MSR accesses to DBGDTRTX_EL0 and DBGDTR_EL0.
- AArch32 MRC accesses to DBGDTRRXint and MCR accesses to DBGDTRTXint.

If 16 or fewer breakpoints and 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI, then it is IMPLEMENTATION DEFINED whether AArch64 accesses to MDSELR_EL1 are trapped to EL3 when MDCR_EL3.TDA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

EnPM2, bit [7]

When FEAT_PMUv3p9 is implemented, or FEAT_SPMU is implemented, or FEAT_EBEP is implemented, or FEAT_PMUv3_SS is implemented, or FEAT_SPMU2 is implemented:

Enable access to PMU registers. When disabled, accesses to PMU registers generate a trap to EL3.

EnPM2	Meaning
0b0	Accesses of the specified PMU registers at EL2, EL1, and EL0 are trapped to EL3, unless the instruction generates a higher priority exception. If FEAT_PMUv3_ICNTR is implemented, then: • PMCNTENCLR_EL0.F0, PMCNTENSET_EL0.F0, PMOVSCLR_EL0.F0, PMOVSSET_EL0.F0, and PMZR_EL0.F0 read-as-zero and ignore writes at EL2, EL1, and EL0. • PMINTENCLR_EL1.F0 and PMINTENSET_EL1.F0 read-as-zero and ignore writes at EL2 and EL1.
0b1	Accesses of the specified PMU registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are:

- If FEAT_EBEP is implemented or FEAT_PMUv3_SS is implemented, MRS and MSR accesses to PMECR_EL1.
- If FEAT_PMUv3_ICNTR is implemented, MRS and MSR accesses to PMICFILTR_EL0 and PMICNTR_EL0.
- If FEAT_PMUv3p9 is implemented, MRS and MSR accesses to PMUACR_EL1.
- If FEAT_SEBEP is implemented, MRS and MSR accesses to PMIAR_EL1.
- If FEAT_SPMU is implemented, MRS and MSR accesses to SPMACCESSR_EL1, SPMACCESSR_EL2, SPMACCESSR_EL12, SPMCFGR_EL1, SPMCGCR<n>_EL1, SPMCNTENCLR_EL0, SPMCNTENSET_EL0, SPMCR_EL0, SPMDEVAFF_EL1, SPMDEVARCH_EL1, SPMEVCNTR<n>_EL0, SPMEVFILT2R<n>_EL0, SPMEVFILTR<n>_EL0, SPMEVTYPER<n>_EL0, SPMIIDR_EL1, SPMINTENCLR_EL1, SPMINTENSET_EL1, SPMOVSCLR_EL0, SPMOVSSET_EL0, SPMSCR_EL1, and SPMSELR_EL0.
- If FEAT_SPMU2 is implemented, MSR writes to SPMZR_EL0.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

Trap accesses of PMU registers. Enables a trap to EL3 on accesses of PMU registers.

TPM	Meaning
0b0	Accesses of the specified PMU registers are not trapped by this mechanism.
0b1	Accesses of the specified PMU registers at EL2, EL1, and EL0 are trapped to EL3, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMCCFILTR_EL0, PMCCNTR_EL0, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMCR_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMINTENCLR_EL1, PMINTENSET_EL1, PMOVSCLR_EL0, PMOVSSET_EL0, PMSELR_EL0, PMSWINC_EL0, PMUSERENR_EL0, PMXEVCNTR_EL0, and PMXEVTYPER_EL0.
- MRS accesses to PMCEID0_EL0 and PMCEID1_EL0.
- If FEAT_PMUv3p4 is implemented, MRS accesses to PMMIR_EL1.
- If FEAT_PMUv3p9 is implemented, MSR accesses to PMZR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, MRS and MSR accesses to PMICFILTR_EL0 and PMICNTR_EL0.
- If FEAT_EBEP is implemented or FEAT_PMUv3_SS is implemented, MRS and MSR accesses to PMECR_EL1.
- If FEAT_SEBEP is implemented, MRS and MSR accesses to PMIAR_EL1.

In AArch32 state, the instructions affected by this control are:

- MRC and MCR accesses to PMCCFILTR, PMCCNTR, PMCEID0, PMCEID1, PMCNTENCLR, PMCNTENSET, PMCR, PMEVCNTR<n>, PMEVTYPER<n>, PMINTENCLR, PMINTENSET, PMOVSR, PMOVSSET, PMSELR, PMSWINC, PMUSERENR, PMXEVCNTR, and PMXEVTYPER.
- MRRC and MCRR accesses to PMCCNTR.
- If FEAT_PMUv3p1 is implemented, MRC accesses to PMCEID2 and PMCEID3.
- If FEAT_PMUv3p4 is implemented, MRC accesses to PMMIR.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x03 for MRC and MCR accesses, and 0x04 for MRRC and MCRR accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

EDADE, bit [4]

When FEAT_RME is implemented:

External Debug Access Disable Extended. Together with MDCR_EL3.EDAD, controls access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger.

For a description of the values derived by evaluating MDCR_EL3.EDAD and MDCR_EL3.EDADE together, see MDCR_EL3.EDAD.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Otherwise:

Reserved, RES0.

ETADE, bit [3]

When FEAT_RME is implemented, FEAT_TRC_EXT is implemented, and FEAT_TRBE is implemented:

External Trace Access Disable Extended. Together with MDCR_EL3.ETAD, controls access to trace unit registers by an external debugger.

For a description of the values derived by evaluating MDCR_EL3.ETAD and MDCR_EL3.ETADE together, see MDCR_EL3.ETAD.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Otherwise:

Reserved, RES0.

EPMADE, bit [2]

When FEAT_RME is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable Extended. Together with MDCR_EL3.EPMAD, controls access to Performance Monitor registers by an external debugger.

For a description of the values derived by evaluating MDCR_EL3.EPMAD and MDCR_EL3.EPMADE together, see MDCR_EL3.EPMAD.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Otherwise:

Reserved, RES0.

Bit [1]

Reserved, RES0.

RLTE, bit [0]

When FEAT_RME is implemented and FEAT_TRF is implemented:

Realm Trace enable. Enables tracing in Realm state.

RLTE	Meaning
0b0	Trace prohibited in Realm state, unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Realm state is not affected by this field.

This field also controls the level of authentication that is required by an external debugger to enable external tracing.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Accessing MDCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MDCR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0011	0b001

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = MDCR_EL3;
```

```
MSR MDCR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0011	0b001

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    if IsFeatureImplemented(FEAT_FGWTE3) && FGWTE3_EL3.MDCR_EL3 == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        MDCR_EL3 = X[t, 64];
```

MDRAR_EL1, Monitor Debug ROM Address Register

The MDRAR_EL1 characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Use of this register is deprecated.

Configuration

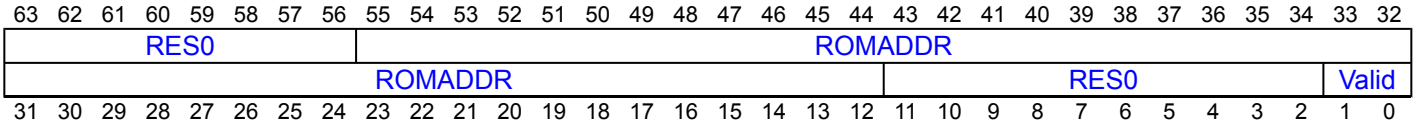
AArch64 System register MDRAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register DBGDRAR[63:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MDRAR_EL1 are UNDEFINED.

Attributes

MDRAR_EL1 is a 64-bit register.

Field descriptions

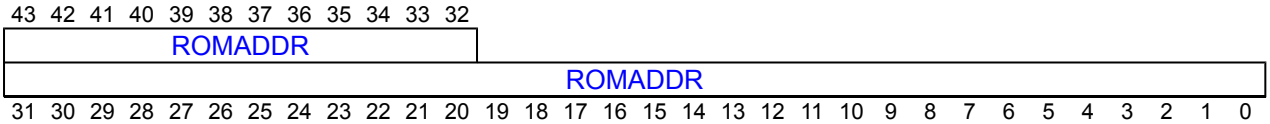


Bits [63:56]

Reserved, RES0.

ROMADDR, bits [55:12]

ROMADDR encoding when FEAT_D128 is implemented and MDRAR_EL1.Valid != 0b00



ROMADDR, bits [43:0]

Bits [55:12] of the ROM table physical address.

Bits [11:0] of the ROM table physical address are zero.

For implementations with fewer than 56 physical address bits, the corresponding upper bits of this field are RES0

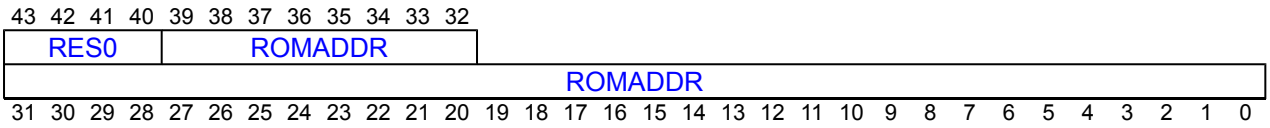
In an implementation that includes EL3, ROMADDR is an address in Non-secure PA space. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure PA space. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether the ROM table is also accessible in the Root or Realm PA spaces.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system where the implementation only supports execution in AArch32 state.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

ROMADDR encoding when FEAT_D128 is not implemented, FEAT_LPA is implemented, and MDRAR_EL1.Valid != 0b00



Bits [43:40]

Reserved, RES0.

ROMADDR, bits [39:0]

Bits [51:12] of the ROM table physical address.

Bits [11:0] of the ROM table physical address are zero.

For implementations with fewer than 52 physical address bits, the corresponding upper bits of this field are RES0

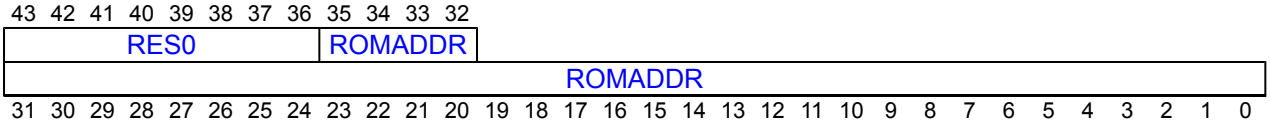
In an implementation that includes EL3, ROMADDR is an address in Non-secure PA space. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure PA space. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether the ROM table is also accessible in the Root or Realm PA spaces.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system where the implementation only supports execution in AArch32 state.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

ROMADDR encoding when FEAT_D128 is not implemented, FEAT_LPA is not implemented, and MDRAR_EL1.Valid != 0b00



Bits [43:36]

Reserved, RES0.

ROMADDR, bits [35:0]

Bits [39:12] of the ROM table physical address.

Bits [11:0] of the ROM table physical address are zero.

For implementations with fewer than 48 physical address bits, the corresponding upper bits of this field are RES0

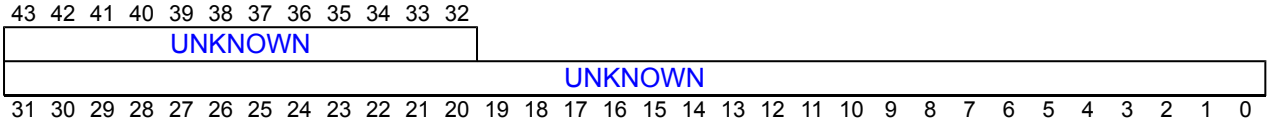
In an implementation that includes EL3, ROMADDR is an address in Non-secure PA space. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure PA space. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Root or Realm PA spaces.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system where the implementation only supports execution in AArch32 state.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

ROMADDR encoding when MDRAR_EL1.Valid == 0b00



Bits [43:0]

Reserved, UNKNOWN.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Valid	Meaning
0b00	ROM Table address is not valid. Software must ignore ROMADDR.
0b11	ROM Table address is valid.

Other values are reserved.

Arm recommends implementations set this field to zero.

Access to this field is **RO**.

Accessing MDRAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MDRAR_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if HaveEL(EL3) && EL3SDDUndefPriority() && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elsif EL2Enabled() && MDCR_EL2.<TDE,TDRA> != '00' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && MDCR_EL3.TDA == '1' then
        if EL3SDDUndef() then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
    else
        X[t, 64] = MDRAR_EL1;
elsif PSTATE.EL == EL2 then
    if HaveEL(EL3) && EL3SDDUndefPriority() && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elsif HaveEL(EL3) && MDCR_EL3.TDA == '1' then
        if EL3SDDUndef() then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
    else
        X[t, 64] = MDRAR_EL1;
elsif PSTATE.EL == EL3 then
    X[t, 64] = MDRAR_EL1;
```

MDSCR_EL1, Monitor Debug System Control Register

The MDSCR_EL1 characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

AArch64 System register MDSCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDSCRext[31:0].

AArch64 System register MDSCR_EL1 bit [15] is architecturally mapped to AArch32 System register DBGDSCRint[15].

AArch64 System register MDSCR_EL1 bit [12] is architecturally mapped to AArch32 System register DBGDSCRint[12].

AArch64 System register MDSCR_EL1 bits [5:2] are architecturally mapped to AArch32 System register DBGDSCRint[5:2].

AArch64 System register MDSCR_EL1 bits [31:29, 27:26, 23:21, 19, 14, 6] are architecturally mapped to External register EDSCR[31:29, 27:26, 23:21, 19, 14, 6].

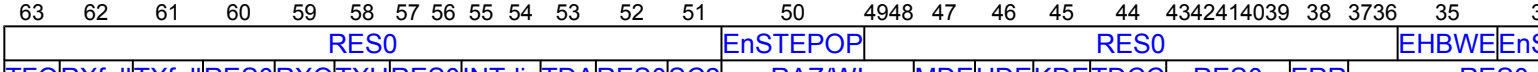
AArch64 System register MDSCR_EL1 bits [35, 33] are architecturally mapped to External register EDSCR2[3, 1].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MDSCR_EL1 are UNDEFINED.

Attributes

MDSCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:51]

Reserved, RES0.

EnSTEPOP, bit [50]

When FEAT_STEP2 is implemented:

Software step control bit. Enable execution from MDSTEPOP_EL1. Permitted values are:

EnSTEPOP	Meaning
0b0	Execution from MDSTEPOP_EL1 is disabled.
0b1	Execution from MDSTEPOP_EL1 is not disabled by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [49:36]

Reserved, RES0.

EHBWE, bit [35]

When FEAT_Debugv8p9 is implemented:

Extended Halting Breakpoint and Watchpoint Enable. Used for save/restore of EDSCR2.EHBWE.

When OSLSR_EL1.OSLK is 0, software must treat this field as UNK/SBZP.

When OSLSR_EL1.OSLK is 1, this field holds the value of EDSCR2.EHBWE. Reads and writes of this field are indirect accesses to EDSCR2.EHBWE.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

EnSPM, bit [34]

When FEAT_SPMU is implemented:

Enable access to System PMU registers. When disabled, accesses to System PMU registers generate a trap to EL1.

EnSPM	Meaning
`0b0`	Accesses of the specified System PMU registers at EL0 are trapped to EL1, unless the instruction generates a higher priority exception.
`0b1`	Accesses of the specified System PMU registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: `MRS` and `MSR` accesses to SPMCNTENCLR_EL0, SPMCNTENSET_EL0, SPMCR_EL0, SPMEVCNTR<n>_EL0, SPMEVFILT2R<n>_EL0, SPMEVFILTR<n>_EL0, SPMEVTYPER<n>_EL0, SPMOVSCLR_EL0, SPMOVSSET_EL0, and SPMSELR_EL0.

Unless the instruction generates a higher priority exception:

- If EL2 is implemented and enabled in the current Security state, and HCR_EL2.TGE is 1, then trapped instructions generate an exception to EL2.
- Otherwise, trapped instructions generate an exception to EL1.

Trapped instructions are reported using EC syndrome value `0x18`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTA, bit [33]

When FEAT_TRBE_EXT is implemented or FEAT_ETEv1p3 is implemented:

Trap Trace Accesses. Used for save/restore of EDSCR2.TTA.

When OSLSR_EL1.OSLK is 0, software must treat this field as UNK/SBZP.

When OSLSR_EL1.OSLK is 1, this field holds the value of EDSCR2.TTA. Reads and writes of this field are indirect accesses to EDSCR2.TTA.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

EMBWE, bit [32]

When FEAT_Debugv8p9 is implemented:

Extended Monitor Breakpoint and Watchpoint Enable. Enables use of additional breakpoints or watchpoints.

EMBWE	Meaning
`0b0`	Breakpoint and Watchpoint exceptions are disabled for each breakpoint <n> and watchpoint <n>, where n is greater than or equal to 16. The Effective value of MDSELR_EL1.BANK is zero at EL1.
`0b1`	Breakpoint and Watchpoint exceptions are not affected by this mechanism. The Effective value of MDSELR_EL1.BANK is not affected by this field.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and MDCR_EL3.EBWE is 0.
- EL2 is implemented and enabled in the current Security state, and MDCR_EL2.EBWE is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TFO, bit [31]

When FEAT_TRF is implemented:

Trace Filter override. Used for save/restore of EDSCR.TFO.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

Used for save/restore of EDSCR.RXfull.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.RXfull. Reads and writes of this bit are indirect accesses to EDSCR.RXfull.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

TXfull, bit [29]

Used for save/restore of EDSCR.TXfull.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TXfull. Reads and writes of this bit are indirect accesses to EDSCR.TXfull.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of EDSCR.RXO.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.RXO. Reads and writes of this bit are indirect accesses to EDSCR.RXO.

When OSLSR_EL1.OSLK == 1, if bits [27,6] of the value written to MDSCR_EL1 are {1,0}, that is, the RXO bit is 1 and the ERR bit is 0, the PE sets EDSCR.{RXO,ERR} to UNKNOWN values.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

TXU, bit [26]

Used for save/restore of EDSCR.TXU.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TXU. Reads and writes of this bit are indirect accesses to EDSCR.TXU.

When OSLSR_EL1.OSLK == 1, if bits [26,6] of the value written to MDSCR_EL1 are {1,0}, that is, the TXU bit is 1 and the ERR bit is 0, the PE sets EDSCR.{TXU,ERR} to UNKNOWN values.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bits [25:24]

Reserved, RES0.

INTdis, bits [23:22]

Used for save/restore of EDSCR.INTdis.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this field holds the value of EDSCR.INTdis. Reads and writes of this field are indirect accesses to EDSCR.INTdis.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'00'`.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

TDA, bit [21]

Used for save/restore of EDSCR.TDA.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TDA. Reads and writes of this bit are indirect accesses to EDSCR.TDA.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bit [20]

Reserved, RES0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented, and FEAT_PCSRv8p2 is not implemented:

Used for save/restore of EDSCR.SC2.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.SC2. Reads and writes of this bit are indirect accesses to EDSCR.SC2.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [18:16]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

MDE, bit [15]

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

MDE	Meaning
`0b0`	Breakpoint, Watchpoint, and Vector Catch exceptions disabled.
`0b1`	Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HDE, bit [14]

Used for save/restore of EDSCR.HDE.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.HDE. Reads and writes of this bit are indirect accesses to EDSCR.HDE.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

KDE, bit [13]

Local (kernel) debug enable. If EL_D is using AArch64, enable debug exceptions within EL_D. Permitted values are:

KDE	Meaning
0b0	Debug exceptions, other than Breakpoint Instruction exceptions, disabled within EL_D.
0b1	All debug exceptions enabled within EL_D.

RES0 if EL_D is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDCC, bit [12]

Traps EL0 accesses to the Debug Communication Channel (DCC) registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, as follows:

- In AArch64 state, MRS or MSR accesses to the following DCC registers are trapped, reported using EC syndrome value 0x18:
  - MDCCSR_EL0.
  - If not in Debug state, DBGDTR_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped, reported using EC syndrome value 0x05.
  - DBGDSCRint, DBGDIDR, DBGDSAR, DBGDRAR.
  - If not in Debug state, DBGDTRRXint, and DBGDTRTXint.
- In AArch32 state, LDC access to DBGDTRRXint and STC access to DBGDTRTXint are trapped, reported using EC syndrome value 0x06.
- In AArch32 state, MRRC accesses to DBGDSAR and DBGDRAR are trapped, reported using EC syndrome value 0x0C.

TDCC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 using AArch64: EL0 accesses to the AArch64 DCC registers are trapped. EL0 using AArch32: EL0 accesses to the AArch32 DCC registers are trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of EDSCR.ERR.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.ERR. Reads and writes of this bit are indirect accesses to EDSCR.ERR.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bits [5:1]

Reserved, RES0.

SS, bit [0]

Software step control bit. If EL_D is using AArch64, enable Software step. Permitted values are:

SS	Meaning
0b0	Software step disabled
0b1	Software step enabled.

RES0 if EL_D is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MDSCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MDSCR_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0010	0b010

MDSELR_EL1, Breakpoint and Watchpoint Selection Register

The MDSELR_EL1 characteristics are:

Purpose

Selects the current breakpoints or watchpoints accessed by System register instructions.

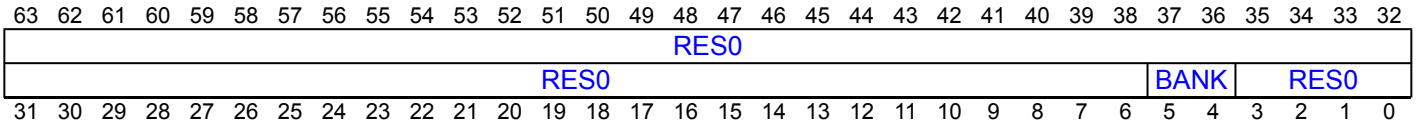
Configuration

This register is present only when FEAT_Debugv8p9 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MDSELR_EL1 are UNDEFINED.

Attributes

MDSELR_EL1 is a 64-bit register.

Field descriptions



Bits [63:6]

Reserved, RES0.

BANK, bits [5:4]

Breakpoint and watchpoint bank select.

BANK	Meaning	Applies when
0b00	Select 0 to 15.	
0b01	Select 16 to 31.	When NUM_BREAKPOINTS > 16 or NUM_WATCHPOINTS > 16
0b10	Select 32 to 47.	When NUM_BREAKPOINTS > 32 or NUM_WATCHPOINTS > 32
0b11	Select 48 to 63.	When NUM_BREAKPOINTS > 48 or NUM_WATCHPOINTS > 48

Each of the following register names accesses a register for breakpoint or watchpoint <n>, where n = UInt(MDSELR_EL1.BANK:m[3:0]):

- DBGBCR<m>_EL1.
- DBGBVR<m>_EL1.
- DBGWCR<m>_EL1.
- DBGWVR<m>_EL1.

This field is ignored by the PE and treated as zeros when any of the following are true:

- Executing at EL3 and MDCR_EL3.EBWE is 0.
- Executing at EL2 and the Effective value of MDCR_EL2.EBWE is 0.
- Executing at EL1 and the Effective value of MDSCR_EL1.EMBWE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES0** if all the following are true:
  - NUM_BREAKPOINTS <= 16.
  - NUM_WATCHPOINTS <= 16.
- Otherwise, access to this field is **RW**.

Bits [3:0]

Reserved, RES0.

Accessing MDSELR_EL1

When 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI, it is IMPLEMENTATION DEFINED whether these trap controls have any effect on accesses to MDSELR_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MDSELR_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0100	0b010

MDSTEPOP_EL1, Monitor Debug Step Opcode Register

The MDSTEPOP_EL1 characteristics are:

Purpose

Used to execute instructions while Software Step is in active-not-pending state.

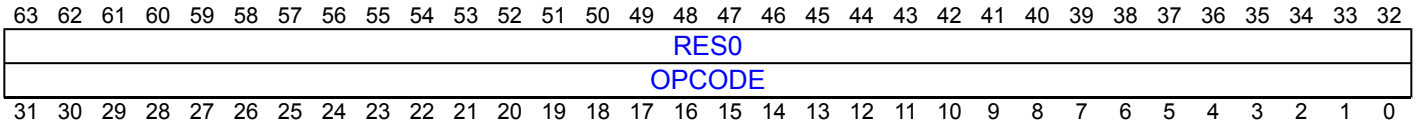
Configuration

This register is present only when FEAT_STEP2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MDSTEPOP_EL1 are UNDEFINED.

Attributes

MDSTEPOP_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

OPCODE, bits [31:0]

A64 instruction to be executed on the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MDSTEPOP_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

MECID_A0_EL2, Alternate MECID for EL2 and EL2&0 translation regimes

The MECID_A0_EL2 characteristics are:

Purpose

Alternate MECID for EL2 and EL2&0 accesses translated by TTBR0_EL2.

Configuration

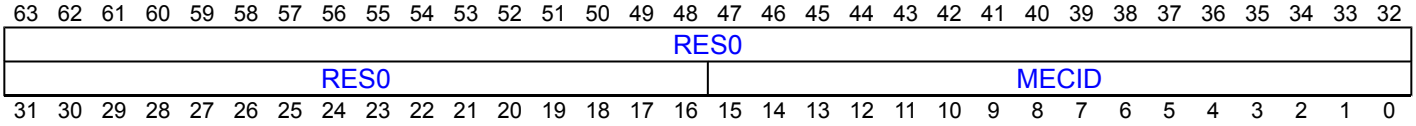
This register is present only when FEAT_MEC is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MECID_A0_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

MECID_A0_EL2 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

MECID, bits [15:0]

If MECIDWidth is less than 16 bits, bits[15:MECIDWidth] are RES0.

Note

MECIDWidth is defined in MECIDR_EL2.MECIDWidthm1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MECID_A0_EL2

MECID_A1_EL2, Alternate MECID for EL2&0 translation regimes.

The MECID_A1_EL2 characteristics are:

Purpose

Alternate MECID for EL2&0 accesses translated by TTBR1_EL2.

Configuration

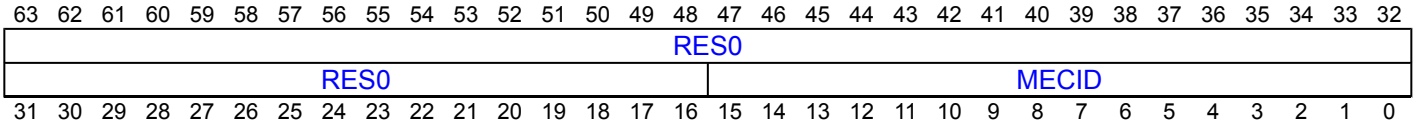
This register is present only when FEAT_MEC is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MECID_A1_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

MECID_A1_EL2 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

MECID, bits [15:0]

If MECIDWidth is less than 16 bits, bits[15:MECIDWidth] are RES0.

Note

MECIDWidth is defined in MECIDR_EL2.MECIDWidthm1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MECID_A1_EL2

Accesses to this register use the following encodings in the System register encoding space:

```

MECID_RL_A_EL3, Realm PA space Alternate MECID for EL3 stage 1 translation regime

The MECID_RL_A_EL3 characteristics are:

Purpose

Alternate MECID for EL3 accesses to the Realm physical address space, translated by TTBR0_EL3.

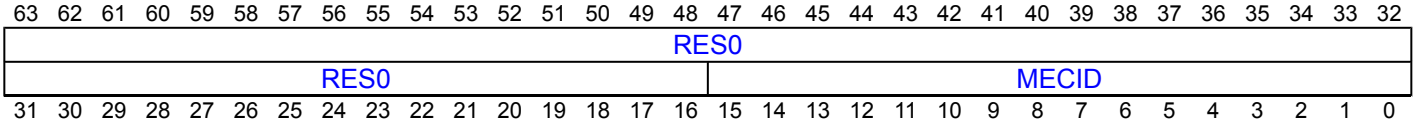
Configuration

This register is present only when FEAT_MEC is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MECID_RL_A_EL3 are UNDEFINED.

Attributes

MECID_RL_A_EL3 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

MECID, bits [15:0]

If MECIDWidth is less than 16 bits, bits[15:MECIDWidth] are RES0.

Note

MECIDWidth is defined in MECIDR_EL2.MECIDWidthm1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MECID_RL_A_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MECID_RL_A_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b1010	0b001

MECIDR_EL2, MEC Identification Register

The MECIDR_EL2 characteristics are:

Purpose

MEC identification register.

Configuration

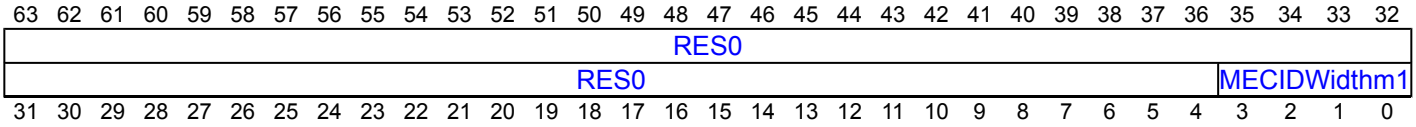
This register is present only when FEAT_MEC is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MECIDR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

MECIDR_EL2 is a 64-bit register.

Field descriptions



Bits [63:4]

Reserved, RES0.

MECIDWidthm1, bits [3:0]

MECID width minus 1.

The value of this field plus 1 is the MECID width in bits, that this PE supports.

For example, the value `0b1111` indicates that this PE supports a MECID width of 16 bits, and provides 2^{16} possible MECID values.

MECIDWidth is defined as MECIDR_EL2.MECIDWidthm1 + 1.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing MECIDR_EL2

For accesses from EL2 and EL3, this register is RO.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MECIDR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b1000	0b111

MFAR_EL3, Physical Fault Address Register (EL3)

The MFAR_EL3 characteristics are:

Purpose

Records the faulting physical address for a Granule Protection Check, synchronous External abort, or SError exception taken to EL3.

Configuration

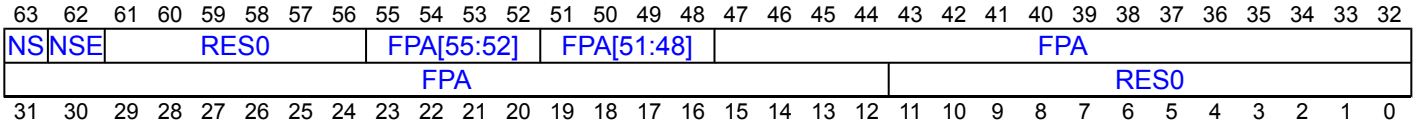
This register is present only when (FEAT_PFAR is implemented or FEAT_RME is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to MFAR_EL3 are UNDEFINED.

Attributes

MFAR_EL3 is a 64-bit register.

Field descriptions

When FEAT_RME is implemented and the exception is a GPC exception:



NS, bit [63]

Together with MFAR_EL3.NSE, reports the physical address space of the access that triggered the exception.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [62]

Together with MFAR_EL3.NS, reports the physical address space of the access that triggered the exception.

For a description of the values derived by evaluating NS and NSE together, see MFAR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [61:56]

Reserved, RES0.

FPA[55:52], bits [55:52]

When FEAT_D128 is implemented:

When FEAT_D128 is implemented, extension to MFAR_EL3.FPA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FPA[51:48], bits [51:48]

When FEAT_LPA is implemented:

When FEAT_LPA is implemented, extension to MFAR_EL3.FPA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FPA, bits [47:12]

Bits [47:12] of the Faulting Physical Address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

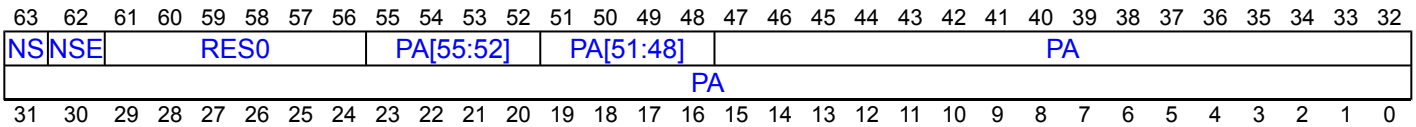
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

When FEAT_PFAR is implemented and the exception is a synchronous External abort or SError exception:



NS, bit [63]

When FEAT_RME is implemented:

Together with MFAR_EL3.NSE, reports the physical address space of the access that triggered the exception.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure. Reports the physical address space of the access that triggered the exception.

NS	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [62]

When FEAT_RME is implemented:

Together with MFAR_EL3.NS, reports the physical address space of the access that triggered the exception.

For a description of the values derived by evaluating NS and NSE together, see MFAR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [61:56]

Reserved, RES0.

PA[55:52], bits [55:52]

When FEAT_D128 is implemented:

When FEAT_D128 is implemented, extension to MFAR_EL3.PA[47:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[51:48], bits [51:48]

When FEAT_LPA is implemented:

When FEAT_LPA is implemented, extension to MFAR_EL3.PA[47:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA, bits [47:0]

Physical Address. Bits [47:0] of the aborting physical address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The recorded address can be any address within the same naturally-aligned fault granule as the faulting physical address, where the size of the fault granule is IMPLEMENTATION DEFINED and no larger than the larger than:

- The size of the range of values permitted to be recorded in FAR_EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MFAR_EL3

MFAR_EL3 is not valid and reads UNKNOWN if ESR_EL3.EC is recorded indicating an Abort or SError exception and ESR_EL3.PFV is recorded as 0.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MFAR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0110	0b0000	0b101

MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MIDR[31:0].

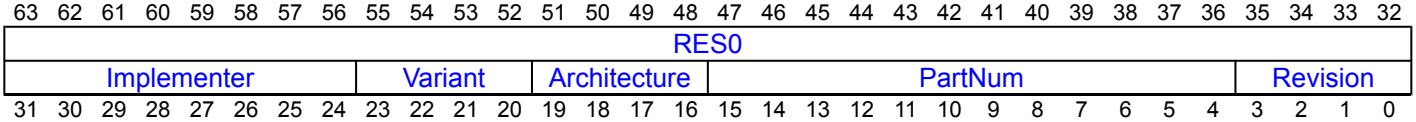
AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to External register MIDR_EL1[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MIDR_EL1 are UNDEFINED.

Attributes

MIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Implementer	Meaning
0x00	Reserved for software use.

0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is **RO**.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture, bits [19:16]

Architecture version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

Access to this field is **RO**.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing MIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UnimplementedIDRegister();
elsif PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&

MPAM0_EL1, MPAM0 Register (EL1)

The MPAM0_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL0. When EL2 is implemented and enabled in the current Security state, the MPAM virtualization option is present, MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM information to label memory requests.

If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the MPAM virtualization option is present and MPAMHCR_EL2.EL0_VPMEN == 1, then MPAM PARTIDs in MPAM0_EL1 are virtual and mapped into physical PARTIDs for the current Security state.

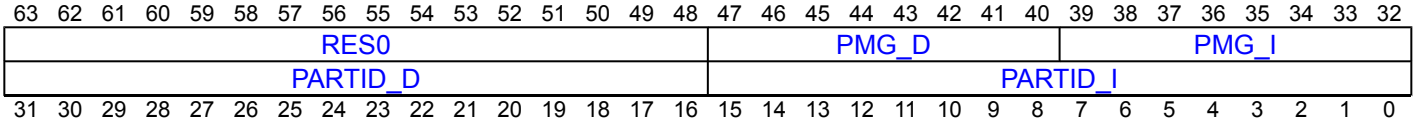
Configuration

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM0_EL1 are UNDEFINED.

Attributes

MPAM0_EL1 is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group property for PARTID_I.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM0_EL1

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAM0_EL1
```

op0	op1	CRn	CRm	op2

MPAM1_EL1, MPAM1 Register (EL1)

The MPAM1_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL1.

When EL2 is implemented and enabled in the current Security state, the MPAM virtualization option is present, MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests when executing at EL0.

If EL2 is implemented and enabled in the current Security state, the MPAM virtualization option is present and MPAMHCR_EL2.EL1_VPMEN == 1, MPAM PARTIDs in MPAM1_EL1 are virtual and mapped into physical PARTIDs for the current Security state. This mapping of MPAM1_EL1 virtual PARTIDs to physical PARTIDs when EL1_VPMEN is 1 also applies when MPAM1_EL1 is used at EL0 due to MPAMHCR_EL2.GSTAPP_PLK.

Configuration

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when EL3 is implemented.

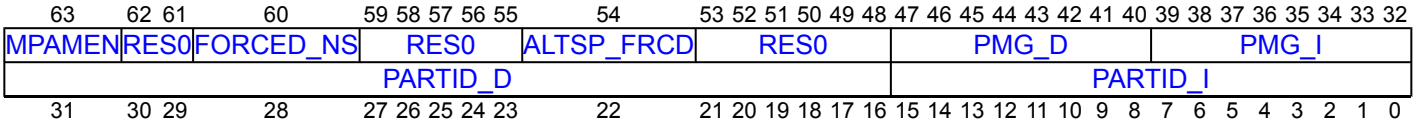
AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when EL3 is not implemented and EL2 is implemented.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM1_EL1 are UNDEFINED.

Attributes

MPAM1_EL1 is a 64-bit register.

Field descriptions



MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

If EL3 is implemented, this field is read-only and reads the current value of the read/write bit MPAM3_EL3.MPAMEN.

If EL3 is not implemented and EL2 is implemented, this field is read-only and reads the current value of the read/write bit MPAM2_EL2.MPAMEN.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is **RW** if all the following are true:
  - EL3 is not implemented.
  - EL2 is not implemented.

- Access to this field is **RAZ/WI** if all the following are true:
  - EL3 is implemented.
  - MPAM3_EL3.MPAMEN == 0.
- Access to this field is **RAO/WI** if all the following are true:
  - EL3 is implemented.
  - MPAM3_EL3.MPAMEN == 1.
- Access to this field is **RAZ/WI** if all the following are true:
  - EL3 is not implemented.
  - EL2 is implemented.
  - MPAM2_EL2.MPAMEN == 0.
- Access to this field is **RAO/WI** if all the following are true:
  - EL3 is not implemented.
  - EL2 is implemented.
  - MPAM2_EL2.MPAMEN == 1.

Bits [62:61]

Reserved, RES0.

FORCED_NS, bit [60]

When FEAT_MPAMv0p1 is implemented:

In the Secure state, FORCED_NS indicates the state of MPAM3_EL3.FORCE_NS.

FORCED_NS	Meaning
0b0	In the Non-secure state, always reads as 0. In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 0.
0b1	In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 1.

Always reads as 0 in the Non-secure state.

Writes are ignored.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [59:55]

Reserved, RES0.

ALTSP_FRCD, bit [54]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Alternative PARTID forced for PARTIDs in this register.

ALTSP_FRCD	Meaning
0b0	The PARTIDs in MPAM1_EL1 and MPAM0_EL1 are using the primary PARTID space.
0b1	The PARTIDs in MPAM1_EL1 and MPAM0_EL1 are using the alternative PARTID space.

This bit indicates that a higher Exception level has forced the PARTIDs in this register to use the alternative PARTID space defined for the current Security state.

In MPAM1_EL1, it also indicates that MPAM0_EL1 is forced to use alternative PARTID space.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

Accessing this field has the following behavior:

- When !UsePrimarySpaceEL10(), access to this field is **RAO/WI**.
- Otherwise, access to this field is **RAZ/WI**.

Otherwise:

Reserved, RES0.

Bits [53:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group property for PARTID_I.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM1_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name MPAM1_EL1 or MPAM1_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAM1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0101	0b000

MPAM2_EL2, MPAM2 Register (EL2)

The MPAM2_EL2 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL2.

Configuration

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when EL3 is implemented.

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63].

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAM2_EL2 is a 64-bit register.

Field descriptions

MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information from all Exception levels.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according to the MPAM configuration.

If EL3 is implemented, this field is read-only and reads the current value of the read/write MPAM3_EL3.MPAMEN bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - EL3 is implemented.
  - MPAM3_EL3.MPAMEN == 0.
- Access to this field is **RAO/WI** if all the following are true:
  - EL3 is implemented.
  - MPAM3_EL3.MPAMEN == 1.
- When EL3 is not implemented, access to this field is **RW**.

Bits [62:59]

Reserved, RES0.

TIDR, bit [58]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_TIDR == 1:

TIDR traps accesses to MPAMIDR_EL1 from EL1 to EL2.

TIDR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Trap accesses to MPAMIDR_EL1 from EL1 to EL2.

MPAMHCR_EL2.TRAP_MPAMIDR_EL1 == 1 also traps MPAMIDR_EL1 accesses from EL1 to EL2. If either TIDR or TRAP_MPAMIDR_EL1 are 1, accesses are trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [57]

Reserved, RES0.

ALTSP_HFC, bit [56]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Hierarchical force of alternative PARTID space controls. When MPAM3_EL3.ALTSP_HEN is 0, ALTSP controls in MPAM2_EL2 have no effect. When MPAM3_EL3.ALTSP_HEN is 1, this bit selects whether the PARTIDs in MPAM1_EL1 and MPAM0_EL1 are in the primary (0) or alternative (1) PARTID space for the security state.

ALTSP_HFC	Meaning
0b0	When MPAM3_EL3.ALTSP_HEN is 1, the PARTID space of MPAM1_EL1.PARTID_I, MPAM1_EL1.PARTID_D, MPAM0_EL1.PARTID_I, and MPAM0_EL1.PARTID_D are in the primary PARTID space for the Security state.
0b1	When MPAM3_EL3.ALTSP_HEN is 1, the PARTID space of MPAM1_EL1.PARTID_I, MPAM1_EL1.PARTID_D, MPAM0_EL1.PARTID_I, and MPAM0_EL1.PARTID_D are in the alternative PARTID space for the Security state.

This control has no effect when MPAM3_EL3.ALTSP_HEN is 0.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_EL2, bit [55]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Select alternative PARTID space for PARTIDs in MPAM2_EL2 when MPAM3_EL3.ALTSP_HEN is 1.

ALTSP_EL2	Meaning
0b0	When MPAM3_EL3.ALTSP_HEN is 1, selects the primary PARTID space for MPAM2_EL2.PARTID_I and MPAM2_EL2.PARTID_D.
0b1	When MPAM3_EL3.ALTSP_HEN is 1, selects the alternative PARTID space for MPAM2_EL2.PARTID_I and MPAM2_EL2.PARTID_D.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_FRCD, bit [54]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Alternative PARTID forced for PARTIDs in this register.

ALTSP_FRCD	Meaning
0b0	The PARTIDs in this register are using the primary PARTID space.
0b1	The PARTIDs in this register are using the alternative PARTID space.

This bit indicates that a higher Exception level has forced the PARTIDs in this register to use the alternative PARTID space defined for the current Security state. In EL2, it is also 1 when MPAM2_EL2.ALTSP_EL2 is 1.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When !UsePrimarySpaceEL2(), access to this field is **RAO/WI**.
- Otherwise, access to this field is **RAZ/WI**.

Otherwise:

Reserved, RES0.

Bits [53:51]

Reserved, RES0.

EnMPAMSM, bit [50]

When FEAT_SME is implemented:

Traps execution at EL1 of instructions that directly access the MPAMSM_EL1 register to EL2. The exception is reported using ESR_ELx.EC syndrome value 0x18.

EnMPAMSM	Meaning
0b0	This control causes execution of these instructions at EL1 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

This field has no effect on accesses to MPAMSM_EL1 from EL2 or EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRAPMPAM0EL1, bit [49]

Trap accesses from EL1 to the MPAM0_EL1 register trap to EL2.

TRAPMPAM0EL1	Meaning
0b0	Accesses to MPAM0_EL1 from EL1 are not trapped.
0b1	Accesses to MPAM0_EL1 from EL1 are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When EL3 is not implemented, this field resets to '1'.
  - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

TRAPMPAM1EL1, bit [48]

Trap accesses from EL1 to the MPAM1_EL1 register trap to EL2.

TRAPMPAM1EL1	Meaning
0b0	Accesses to MPAM1_EL1 from EL1 are not trapped.
0b1	Accesses to MPAM1_EL1 from EL1 are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When EL3 is not implemented, this field resets to '1'.
  - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

PMG_D, bits [47:40]

Performance monitoring group for data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group for instruction accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM2_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name MPAM2_EL2 or MPAM1_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAM2_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0101	0b000

MPAM3_EL3, MPAM3 Register (EL3)

The MPAM3_EL3 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL3.

Configuration

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when EL2 is implemented.

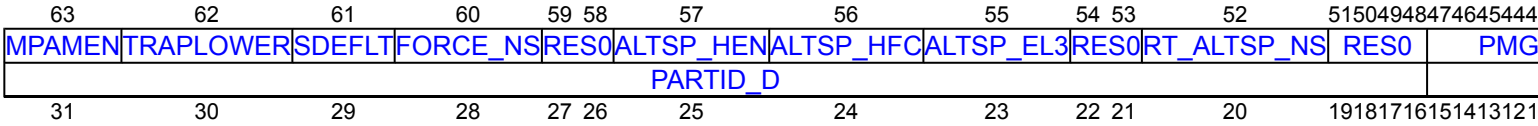
AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63].

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM3_EL3 are UNDEFINED.

Attributes

MPAM3_EL3 is a 64-bit register.

Field descriptions



MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

Values of this field are:

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information when executing at any ELn.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **RW**.

TRAPLOWER, bit [62]

Trap direct accesses to MPAM System registers that are not UNDEFINED from all ELn lower than EL3.

TRAPLOWER	Meaning
0b0	Do not force trapping of direct accesses of MPAM System registers to EL3.
0b1	Force direct accesses of MPAM System registers to trap to EL3.

Note

This trap is higher priority than any of the traps controlled by MPAM _EL2 registers.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'1'`.

SDEFLT, bit [61]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_SDEFLT == 1:

SDEFLT overrides the PARTID and PMG with the default PARTID and default PMG when executing in the Secure state.

SDEFLT	Meaning
`0b0`	The PARTID and PMG are determined normally in the Secure state.
`0b1`	When executing in the Secure state, the PARTID is always PARTID 0, and the PMG is always PMG 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FORCE_NS, bit [60]

When FEAT_MPAMv0p1 is implemented and MPAMIDR_EL1.HAS_FORCE_NS == 1:

FORCE_NS forces MPAM_NS to always be 1 in the Secure state.

FORCE_NS	Meaning
`0b0`	MPAM_NS is 0 when executing in the Secure state.
`0b1`	MPAM_NS is 1 when executing in the Secure state.

An implementation is permitted to have this field as RAO if the implementation does not support generating MPAM_NS as 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [59:58]

Reserved, RES0.

ALTSP_HEN, bit [57]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Hierarchical enable for alternative PARTID space controls. Alternative PARTID space controls in MPAM2_EL2 have no effect when this field is zero.

ALTSP_HEN	Meaning
`0b0`	Disable alternative PARTID space controls in MPAM2_EL2. The PARTID space for PARTIDs in MPAM2_EL2, MPAM1_EL1, and MPAM0_EL1 is selected by MPAM3_EL3.ALTSP_HFC.
`0b1`	Enable alternative PARTID space controls in MPAM2_EL2 to control the PARTID space used for PARTIDs in MPAM2_EL2, MPAM1_EL1, and MPAM0_EL1.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_HFC, bit [56]
When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Hierarchical force of alternative PARTID space controls. When MPAM3_EL3.ALTSP_HEN is 0, the PARTID space for PARTIDs in MPAM2_EL2, MPAM1_EL1, and MPAM0_EL1 is selected by the value of this bit.

ALTSP_HFC	Meaning
0b0	When MPAM3_EL3.ALTSP_HEN is 0, the PARTID space of MPAM2_EL2.PARTID, MPAM1_EL1.PARTID and MPAM0_EL1.PARTID are the primary PARTID space for the security state.
0b1	When MPAM3_EL3.ALTSP_HEN is 0, the PARTID space of MPAM2_EL2.PARTID and MPAM1_EL1.PARTID and MPAM0_EL1.PARTID are the alternative PARTID space for the security state.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_EL3, bit [55]
When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Select alternative PARTID space for PARTIDs in MPAM3_EL3.

ALTSP_EL3	Meaning
0b0	Selects the primary PARTID space of MPAM3_EL3.PARTID_I and MPAM3_EL3.PARTID_D.
0b1	Selects the alternative PARTID space of MPAM3_EL3.PARTID_I and MPAM3_EL3.PARTID_D.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

Bits [54:53]

Reserved, RES0.

RT_ALTSP_NS, bit [52]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Selects whether the alternative PARTID space for the Root security state is the Secure PARTID space or the Non-secure PARTID space. MPAM3_EL3.RT_ALTSP_NS selects the alternative PARTID space for the Root Security state when MPAM3_EL3.ALTSP_EL3 == 1.

RT_ALTSP_NS	Meaning
0b0	The alternative PARTID space in the Root security state is the Secure PARTID space.
0b1	The alternative PARTID space in the Root security state is the Non-secure PARTID space.

This field has no effect except in the Root security state (EL3).

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

Bits [51:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group for data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group for instruction accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM3_EL3

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAM3_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b000

MPAMBW0_EL1, MPAM PE-side Maximum-bandwidth Control Register (EL0)

The MPAMBW0_EL1 characteristics are:

Purpose

Enables software to configure a maximum fraction of memory bandwidth that the PE is permitted to use when executing at EL0 with its current PARTID.

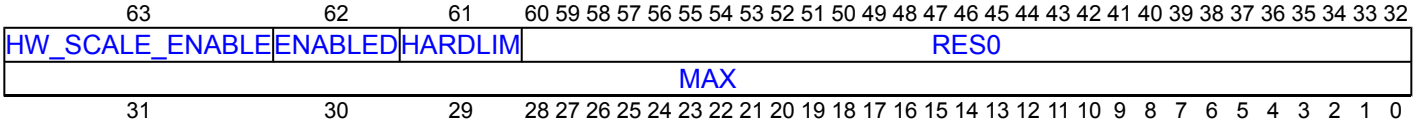
Configuration

This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented. Otherwise, direct accesses to MPAMBW0_EL1 are UNDEFINED.

Attributes

MPAMBW0_EL1 is a 64-bit register.

Field descriptions



HW_SCALE_ENABLE, bit [63]

When MPAMBWIDR_EL1.HAS_HW_SCALE == 1:

Enables hardware bandwidth scaling of the MPAMBW0_EL1.MAX value.

HW_SCALE_ENABLE	Meaning
0b0	PE-side memory bandwidth control hardware scaling in EL0 is disabled.
0b1	PE-side memory bandwidth control hardware scaling in EL0 is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLED, bit [62]

Enables the PE-side memory bandwidth control when in EL0.

ENABLED	Meaning
0b0	The PE-side memory bandwidth control in EL0 is disabled.
0b1	The PE-side memory bandwidth control in EL0 is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HARDLIM, bit [61]

PE-side Maximum Bandwidth Limit Behavior Selection.

HARDLIM	Meaning
0b0	Soft limit: when MPAMBW0_EL1.MAX bandwidth is exceeded, the PE is unregulated unless the downstream memory path is saturated. It is IMPLEMENTATION DEFINED how hardware determines when the downstream memory path is saturated.
0b1	Hard limit: when MPAMBW0_EL1.MAX bandwidth is exceeded, the PE does not use any more bandwidth until the memory bandwidth for the PE falls below MPAMBW0_EL1.MAX.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

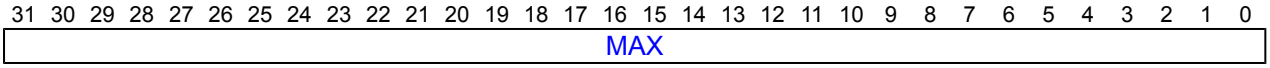
- When MPAMBWIDR_EL1.MAX_LIM == 0b00, access to this field is **RW**.
- When MPAMBWIDR_EL1.MAX_LIM == 0b01, access to this field is **RAZ/WI**.
- When MPAMBWIDR_EL1.MAX_LIM == 0b10, access to this field is **RAO/WI**.

Bits [60:32]

Reserved, RES0.

MAX, bits [31:0]

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == 1 and MPAMBW0_EL1.HW_SCALE_ENABLE == 1



MAX, bits [31:0]

Maximum memory bandwidth allocated to the PE when executing at EL0 with its current PARTID.

The value is represented as a multiplier of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

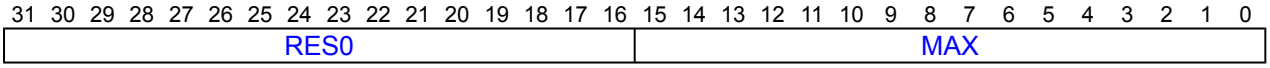
Bits [31:16] represent the integer part of the value.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == 0 or MPAMBW0_EL1.HW_SCALE_ENABLE == 0



Bits [31:16]

Reserved, RES0.

MAX, bits [15:0]

Maximum memory bandwidth allocated to the PE when executing at EL0 with its current PARTID.

The value is represented as a fraction of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMBW0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAMBW0_EL1
```

MPAMBW1_EL1, MPAM PE-side Maximum-bandwidth Control Register (EL1)

The MPAMBW1_EL1 characteristics are:

Purpose

Enables software to configure a maximum fraction of memory bandwidth that the PE is permitted to use when executing at EL1 with its current PARTID.

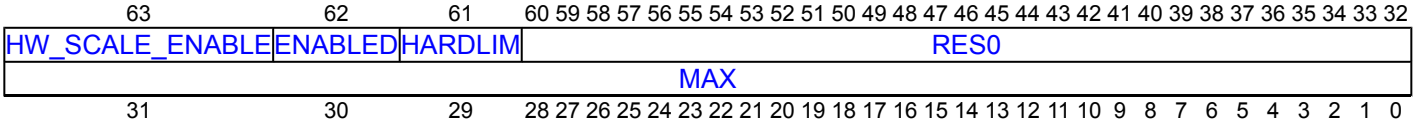
Configuration

This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented. Otherwise, direct accesses to MPAMBW1_EL1 are UNDEFINED.

Attributes

MPAMBW1_EL1 is a 64-bit register.

Field descriptions



HW_SCALE_ENABLE, bit [63]

When MPAMBWIDR_EL1.HAS_HW_SCALE == 1:

Enables hardware bandwidth scaling of the MPAMBW1_EL1.MAX value.

HW_SCALE_ENABLE	Meaning
0b0	PE-side memory bandwidth control hardware scaling in EL1 is disabled.
0b1	PE-side memory bandwidth control hardware scaling in EL1 is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLED, bit [62]

Enables the PE-side memory bandwidth control when in EL1.

ENABLED	Meaning
0b0	The PE-side memory bandwidth control in EL1 is disabled.
0b1	The PE-side memory bandwidth control in EL1 is enabled.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL1, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

HARDLIM, bit [61]

PE-side Maximum Bandwidth Limit Behavior Selection.

HARDLIM	Meaning
0b0	Soft limit: when MPAMBW1_EL1.MAX bandwidth is exceeded, the PE is unregulated unless the downstream memory path is saturated. It is IMPLEMENTATION DEFINED how hardware determines when the downstream memory path is saturated.
0b1	Hard limit: when MPAMBW1_EL1.MAX bandwidth is exceeded, the PE does not use any more bandwidth until the memory bandwidth for the PE falls below MPAMBW1_EL1.MAX.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

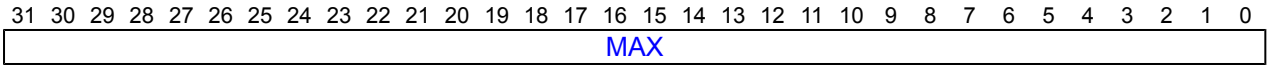
- When MPAMBWIDR_EL1.MAX_LIM == 0b00, access to this field is **RW**.
- When MPAMBWIDR_EL1.MAX_LIM == 0b01, access to this field is **RAZ/WI**.
- When MPAMBWIDR_EL1.MAX_LIM == 0b10, access to this field is **RAO/WI**.

Bits [60:32]

Reserved, RES0.

MAX, bits [31:0]

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == 1 and MPAMBW1_EL1.HW_SCALE_ENABLE == 1



MAX, bits [31:0]

Maximum memory bandwidth allocated to the PE when executing at EL1 with its current PARTID.

The value is represented as a multiplier of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

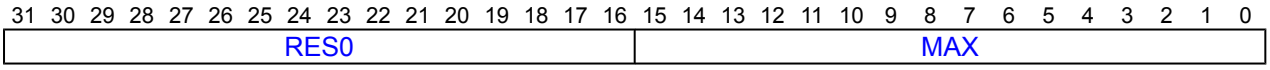
Bits [31:16] represent the integer part of the value.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == 0 or MPAMBW1_EL1.HW_SCALE_ENABLE == 0



Bits [31:16]

Reserved, RES0.

MAX, bits [15:0]

Maximum memory bandwidth allocated to the PE when executing at EL1 with its current PARTID.

The value is represented as a fraction of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMBW1_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name MPAMBW1_EL1 or MPAMBW1_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAMBW1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0101	0b100

MPAMBW2_EL2, MPAM PE-side Maximum-bandwidth Control Register (EL2)

The MPAMBW2_EL2 characteristics are:

Purpose

Enables software to configure a maximum fraction of memory bandwidth that the PE is permitted to use when executing at EL2 with its current PARTID.

Configuration

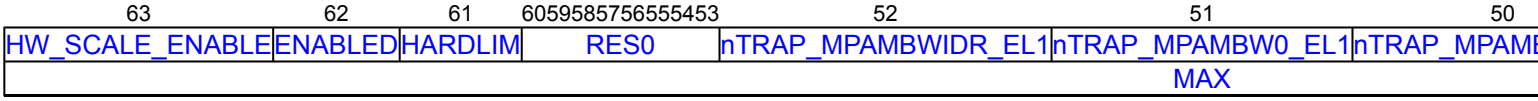
This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented. Otherwise, direct accesses to MPAMBW2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMBW2_EL2 is a 64-bit register.

Field descriptions



HW_SCALE_ENABLE, bit [63]

When MPAMBWIDR_EL1.HAS_HW_SCALE == 1:

Enables hardware bandwidth scaling of the MPAMBW2_EL2.MAX value.

HW_SCALE_ENABLE	Meaning
0b0	PE-side memory bandwidth control hardware scaling in EL2 is disabled.
0b1	PE-side memory bandwidth control hardware scaling in EL2 is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLED, bit [62]

Enables the PE-side memory bandwidth control when in EL2.

ENABLED	Meaning
0b0	The PE-side memory bandwidth control in EL2 is disabled.
0b1	The PE-side memory bandwidth control in EL2 is enabled.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

HARDLIM, bit [61]

PE-side Maximum Bandwidth Limit Behavior Selection.

HARDLIM	Meaning
0b0	Soft limit: when MPAMBW2_EL2.MAX bandwidth is exceeded, the PE is unregulated unless the downstream memory path is saturated. It is IMPLEMENTATION DEFINED how hardware determines when the downstream memory path is saturated.
0b1	Hard limit: when MPAMBW2_EL2.MAX bandwidth is exceeded, the PE does not use any more bandwidth until the memory bandwidth for the PE falls below MPAMBW2_EL2.MAX.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When MPAMBWIDR_EL1.MAX_LIM == 0b00, access to this field is **RW**.
- When MPAMBWIDR_EL1.MAX_LIM == 0b01, access to this field is **RAZ/WI**.
- When MPAMBWIDR_EL1.MAX_LIM == 0b10, access to this field is **RAO/WI**.

Bits [60:53]

Reserved, RES0.

nTRAP_MPAMBWIDR_EL1, bit [52]

Traps accesses to MPAMBWIDR_EL1 from EL1 to EL2.

nTRAP_MPAMBWIDR_EL1	Meaning
0b0	Accesses to MPAMBWIDR_EL1 from EL1 are trapped to EL2 with EC syndrome value 0x18.
0b1	Accesses to MPAMBWIDR_EL1 from EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

nTRAP_MPAMBW0_EL1, bit [51]

Traps accesses to MPAMBW0_EL1 from EL1 to EL2.

nTRAP_MPAMBW0_EL1	Meaning
0b0	Accesses to MPAMBW0_EL1 from EL1 are trapped to EL2 with EC syndrome value 0x18.
0b1	Accesses to MPAMBW0_EL1 from EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

nTRAP_MPAMBW1_EL1, bit [50]

Traps accesses to MPAMBW1_EL1 from EL1 to EL2.

nTRAP_MPAMBW1_EL1	Meaning
0b0	Accesses to MPAMBW1_EL1 from EL1 are trapped to EL2 with EC syndrome value 0x18.
0b1	Accesses to MPAMBW1_EL1 from EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

nTRAP_MPAMBWSM_EL1, bit [49]

When FEAT_SME is implemented:

Traps accesses to MPAMBWSM_EL1 from EL1 to EL2.

nTRAP_MPAMBWSM_EL1	Meaning
0b0	Accesses to MPAMBWSM_EL1 from EL1 are trapped to EL2 with EC syndrome value 0x18.
0b1	Accesses to MPAMBWSM_EL1 from EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

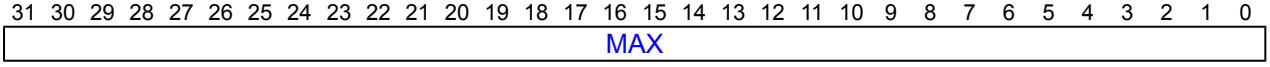
Reserved, RES0.

Bits [48:32]

Reserved, RES0.

MAX, bits [31:0]

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == 1 and MPAMBW2_EL2.HW_SCALE_ENABLE == 1



MAX, bits [31:0]

Maximum memory bandwidth allocated to the PE when executing at EL2 with its current PARTID.

The value is represented as a multiplier of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

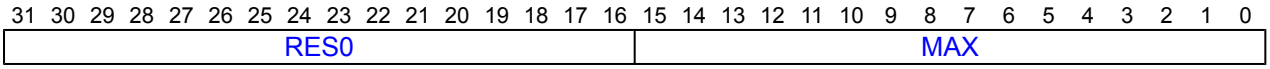
Bits [31:16] represent the integer part of the value.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == 0 or MPAMBW2_EL2.HW_SCALE_ENABLE == 0



Bits [31:16]

Reserved, RES0.

MAX, bits [15:0]

Maximum memory bandwidth allocated to the PE when executing at EL2 with its current PARTID.

The value is represented as a fraction of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMBW2_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name MPAMBW2_EL2 or MPAMBW1_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAMBW2_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0101	0b100

```

MPAMBW3_EL3, MPAM PE-side Maximum-bandwidth Control Register (EL3)

The MPAMBW3_EL3 characteristics are:

Purpose

Enables software to configure a maximum fraction of memory bandwidth that the PE is permitted to use when executing at EL3 with its current PARTID.

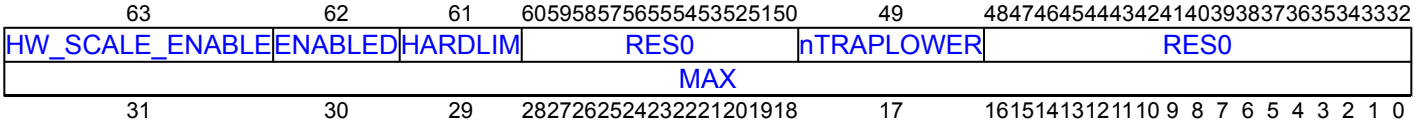
Configuration

This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented. Otherwise, direct accesses to MPAMBW3_EL3 are UNDEFINED.

Attributes

MPAMBW3_EL3 is a 64-bit register.

Field descriptions



HW_SCALE_ENABLE, bit [63]

When MPAMBWIDR_EL1.HAS_HW_SCALE == 1:

Enables hardware bandwidth scaling of the MPAMBW3_EL3.MAX value.

HW_SCALE_ENABLE	Meaning
0b0	PE-side memory bandwidth control hardware scaling in EL3 is disabled.
0b1	PE-side memory bandwidth control hardware scaling in EL3 is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLED, bit [62]

Enables the PE-side memory bandwidth control when in EL3.

ENABLED	Meaning
0b0	The PE-side memory bandwidth control in EL3 is disabled.
0b1	The PE-side memory bandwidth control in EL3 is enabled.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

HARDLIM, bit [61]

PE-side Maximum Bandwidth Limit Behavior Selection.

HARDLIM	Meaning
0b0	Soft limit: when MPAMBW3_EL3.MAX bandwidth is exceeded, the PE is unregulated unless the downstream memory path is saturated. It is IMPLEMENTATION DEFINED how hardware determines when the downstream memory path is saturated.
0b1	Hard limit: when MPAMBW3_EL3.MAX bandwidth is exceeded, the PE does not use any more bandwidth until the memory bandwidth for the PE falls below MPAMBW3_EL3.MAX.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When MPAMBWIDR_EL1.MAX_LIM == 0b00, access to this field is **RW**.
- When MPAMBWIDR_EL1.MAX_LIM == 0b01, access to this field is **RAZ/WI**.
- When MPAMBWIDR_EL1.MAX_LIM == 0b10, access to this field is **RAO/WI**.

Bits [60:50]

Reserved, RES0.

nTRAPLOWER, bit [49]

Traps accesses to MPAMBW2_EL2, MPAMBWCAP_EL2, MPAMBW1_EL1, MPAMBW0_EL1, MPAMBWSM_EL1, MPAMBWIDR_EL1 from any lower EL to EL3.

nTRAPLOWER	Meaning
0b0	Accesses to MPAMBW2_EL2, MPAMBWCAP_EL2, MPAMBW1_EL1, MPAMBW0_EL1, MPAMBWSM_EL1, MPAMBWIDR_EL1 from EL1 are trapped to EL3 with EC syndrome value 0x18.
0b1	Accesses to MPAMBW2_EL2, MPAMBWCAP_EL2, MPAMBW1_EL1, MPAMBW0_EL1, MPAMBWSM_EL1, MPAMBWIDR_EL1 from EL1 are not trapped by this mechanism.

Note

This trap is higher priority than any of the traps controlled by MPAM _EL2 registers.

The reset behavior of this field is:

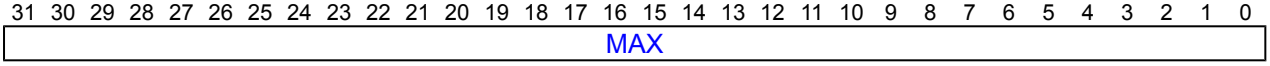
- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Bits [48:32]

Reserved, RES0.

MAX, bits [31:0]

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == 1 and MPAMBW3_EL3.HW_SCALE_ENABLE == 1



MAX, bits [31:0]

Maximum memory bandwidth allocated to the PE when executing at EL3 with its current PARTID.

The value is represented as a multiplier of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

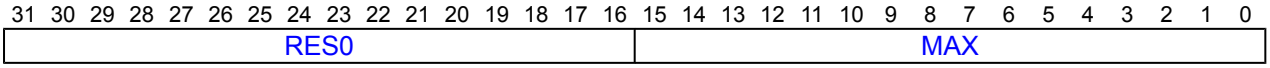
Bits [31:16] represent the integer part of the value.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == 0 or MPAMBW3_EL3.HW_SCALE_ENABLE == 0



Bits [31:16]

Reserved, RES0.

MAX, bits [15:0]

Maximum memory bandwidth allocated to the PE when executing at EL3 with its current PARTID.

The value is represented as a fraction of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMBW3_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAMBW3_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b100

```

MPAMBWCAP_EL2, MPAM PE-side Maximum-bandwidth Limit Virtualization Register

The MPAMBWCAP_EL2 characteristics are:

Purpose

Allows software executing at EL2 to provide MPAMBWCAP_EL2.CAP as an upper bound to MPAMBW1_EL1.MAX.

If FEAT_SME is implemented, the upper bound also applies to MPAMBWSM_EL1.MAX when executing at EL1: the maximum bandwidth allowed for the PE is MIN(MPAMBWSM_EL1.MAX, MPAMBWCAP_EL2.CAP).

If the Effective value of HCR_EL2.{E2H,TGE} is not {1,1}:

- The upper bound also applies to MPAMBW0_EL1.MAX: the maximum bandwidth allowed for the PE is MIN(MPAMBW0_EL1.MAX, MPAMBWCAP_EL2.CAP).
- If FEAT_SME is implemented, the upper bound also applies to MPAMBWSM_EL1.MAX when executing at EL0: the maximum bandwidth allowed for the PE is MIN(MPAMBWSM_EL1.MAX, MPAMBWCAP_EL2.CAP).

If MPAMBWCAP_EL2.ENABLED is 1, a PARTID that has used more than min(CAP,MAX) is given no access to additional bandwidth.

Configuration

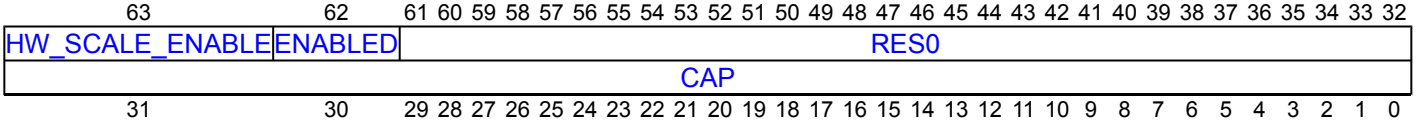
This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMBWCAP_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMBWCAP_EL2 is a 64-bit register.

Field descriptions



HW_SCALE_ENABLE, bit [63]

When MPAMBWIDR_EL1.HAS_HW_SCALE == 1:

Enables hardware bandwidth scaling of the MPAMBWCAP_EL2.CAP value.

HW_SCALE_ENABLE	Meaning
0b0	PE-side memory bandwidth control hardware scaling for EL2 capping is disabled.
0b1	PE-side memory bandwidth control hardware scaling for EL2 capping is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLED, bit [62]

Enables the PE-side memory bandwidth control capping by EL2.

ENABLED	Meaning
0b0	The PE-side memory bandwidth control capping by EL2 is disabled.
0b1	The PE-side memory bandwidth control capping by EL2 is enabled.

The reset behavior of this field is:

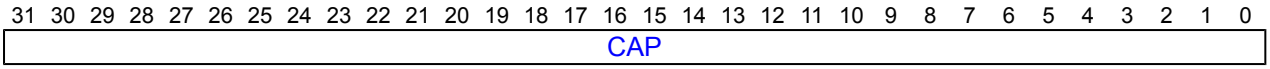
- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [61:32]

Reserved, RES0.

CAP, bits [31:0]

CAP encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == 1 and MPAMBWCAP_EL2.HW_SCALE_ENABLE == 1



CAP, bits [31:0]

Upper bound to the maximum memory bandwidth allocated to the current PARTID in MPAMBW1_EL1.MAX, MPAMBW0_EL1.MAX and MPAMBWSM_EL1.MAX.

The value is represented as a multiplier of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [31:16] represent the integer part of the value.

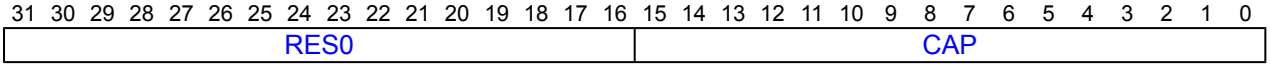
Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The value set in the MAX field must be less than or equal to this upper bound.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CAP encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == 0 or MPAMBWCAP_EL2.HW_SCALE_ENABLE == 0



Bits [31:16]

Reserved, RES0.

CAP, bits [15:0]

Upper bound to the maximum memory bandwidth allocated to the current PARTID in MPAMBW1_EL1.MAX, MPAMBW0_EL1.MAX and MPAMBWSM_EL1.MAX.

The value is represented as a fraction of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The value set in the MAX field must be less than or equal to this upper bound.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMBWCAP_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAMBWCAP_EL2
```

MPAMBWIDR_EL1, MPAM PE-side Bandwidth Controls ID Register

The MPAMBWIDR_EL1 characteristics are:

Purpose

Indicates the supported PE-side memory bandwidth parameter values.

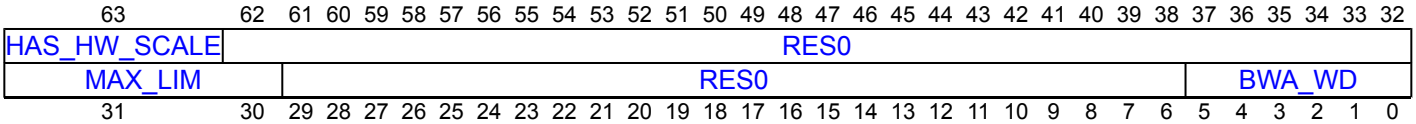
Configuration

This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented. Otherwise, direct accesses to MPAMBWIDR_EL1 are UNDEFINED.

Attributes

MPAMBWIDR_EL1 is a 64-bit register.

Field descriptions



HAS_HW_SCALE, bit [63]

Indicates whether hardware support for auto-scaling of MPAMBWn_ELx.MAX, MPAMBWSM_EL1.MAX and MPAMBWCAP_EL2.CAP limits is available.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_HW_SCALE	Meaning
0b0	Hardware support for auto-scaling is not implemented.
0b1	Hardware support for auto-scaling is implemented.

Access to this field is **RO**.

Bits [62:32]

Reserved, RES0.

MAX_LIM, bits [31:30]

Indicates the implemented maximum-bandwidth limit partitioning behaviors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MAX_LIM	Meaning
0b00	Both soft limit and hard limit behaviors are implemented.
0b01	Soft limit behavior is implemented.
0b10	Hard limit behavior is implemented.
0b11	Reserved.

Access to this field is **RO**.

Bits [29:6]

Reserved, RES0.

BWA_WD, bits [5:0]

Indicates the number of implemented bits in the bandwidth allocation fields MPAMBWn_ELx.MAX, MPAMBWSM_EL1.MAX and MPAMBWCAP_EL2.CAP.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BWA_WD	Meaning
0b000001..0b010000	Number of implemented bits in the bandwidth allocation fields.

Access to this field is **RO**.

Accessing MPAMBWIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAMBWIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b101

MPAMBWSM_EL1, MPAM Streaming Mode Bandwidth Control Register (EL1)

The MPAMBWSM_EL1 characteristics are:

Purpose

Enables software to configure a maximum fraction of memory bandwidth that the PE is permitted for SME memory accesses labelled with values from MPAMSM_EL1.

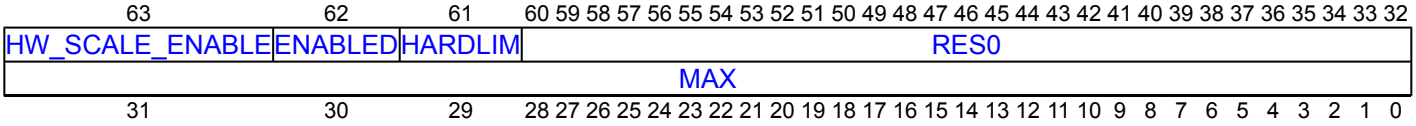
Configuration

This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented and FEAT_SME is implemented. Otherwise, direct accesses to MPAMBWSM_EL1 are UNDEFINED.

Attributes

MPAMBWSM_EL1 is a 64-bit register.

Field descriptions



HW_SCALE_ENABLE, bit [63]

When MPAMBWIDR_EL1.HAS_HW_SCALE == 1:

Enables hardware bandwidth scaling of the MPAMBWSM_EL1.MAX value.

HW_SCALE_ENABLE	Meaning
0b0	PE-side memory bandwidth control hardware scaling for streaming PARTIDs is disabled.
0b1	PE-side memory bandwidth control hardware scaling for streaming PARTIDs is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLED, bit [62]

Enables the PE-side memory bandwidth control for streaming PARTIDs.

ENABLED	Meaning
0b0	PE-side memory bandwidth control for streaming PARTIDs is disabled.
0b1	PE-side memory bandwidth control for streaming PARTIDs is enabled.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

HARDLIM, bit [61]

PE-side Maximum-bandwidth Limit Behavior Selection.

HARDLIM	Meaning
0b0	Soft limit: when MPAMBWSM_EL1.MAX bandwidth is exceeded, the PE is unregulated unless the downstream memory path is saturated. It is IMPLEMENTATION DEFINED how hardware determines when the downstream memory path is saturated.
0b1	Hard limit: when MPAMBWSM_EL1.MAX bandwidth is exceeded, the PE does not use any more bandwidth until the memory bandwidth for the PE falls below MPAMBWSM_EL1.MAX.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

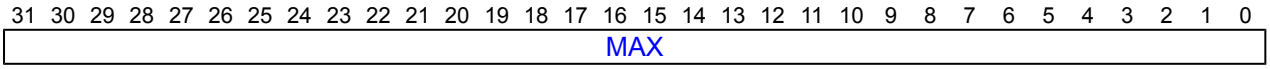
- When MPAMBWIDR_EL1.MAX_LIM == 0b00, access to this field is **RW**.
- When MPAMBWIDR_EL1.MAX_LIM == 0b01, access to this field is **RAZ/WI**.
- When MPAMBWIDR_EL1.MAX_LIM == 0b10, access to this field is **RAO/WI**.

Bits [60:32]

Reserved, RES0.

MAX, bits [31:0]

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == 1 and MPAMBWSM_EL1.HW_SCALE_ENABLE == 1



MAX, bits [31:0]

Maximum memory bandwidth allocated to the partition selected by MPAMSM_EL1.PARTID_D.

The value is represented as a multiplier of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

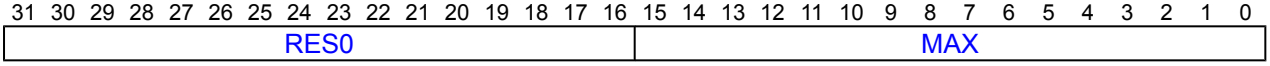
Bits [31:16] represent the integer part of the value.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == 0 or MPAMBWSM_EL1.HW_SCALE_ENABLE == 0



Bits [31:16]

Reserved, RES0.

MAX, bits [15:0]

Maximum memory bandwidth allocated to the partition selected by MPAMSM_EL1.PARTID_D.

The value is represented as a fraction of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMBWSM_EL1

MPAMHCR_EL2, MPAM Hypervisor Control Register (EL2)

The MPAMHCR_EL2 characteristics are:

Purpose

Controls the PARTID virtualization features of MPAM. It controls the mapping of virtual PARTIDs into physical PARTIDs in MPAM0_EL1 when EL0_VPMEN == 1 and in MPAM1_EL1 when EL1_VPMEN == 1.

Configuration

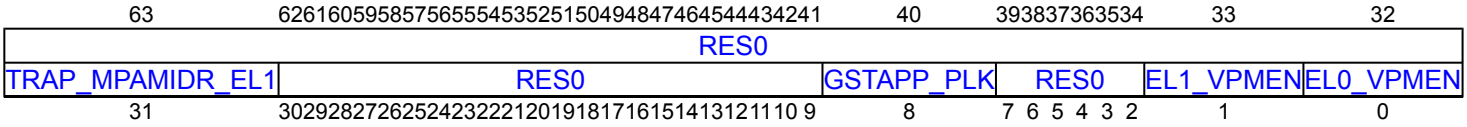
This register is present only when FEAT_MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMHCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMHCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

TRAP_MPAMIDR_EL1, bit [31]

Trap accesses from EL1 to MPAMIDR_EL1 to EL2.

TRAP_MPAMIDR_EL1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Direct accesses to MPAMIDR_EL1 from EL1 are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When EL3 is not implemented, this field resets to '1'.
  - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

Bits [30:9]

Reserved, RES0.

GSTAPP_PLK, bit [8]

Make the PARTIDs at EL0 the same as the PARTIDs at EL1. When executing at EL0, EL2 is enabled, HCR_EL2.TGE == 0 and GSTAPP_PLK = 1, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests.

GSTAPP_PLK	Meaning
0b0	MPAM0_EL1 is used to generate MPAM labels when executing at EL0.
0b1	MPAM1_EL1 is used to generate MPAM labels when executing at EL0 with EL2 enabled and HCR_EL2.TGE == 0. Otherwise MPAM0_EL1 is used.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL1_VPMEN, bit [1]

Enable the virtual PARTID mapping of the PARTID fields in MPAM1_EL1 when executing at EL1. This bit also enables virtual PARTID mapping when MPAM1_EL1 is used to generate MPAM labels for memory requests at EL0 due to GSTAPP_PLK == 1.

EL1_VPMEN	Meaning
0b0	MPAM1_EL1.PARTID_I and MPAM1_EL1.PARTID_D are physical PARTIDs that are used to label memory system requests.
0b1	MPAM1_EL1.PARTID_I and MPAM1_EL1.PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of MPAMVPM0_EL2 to MPAMVPM7_EL2 registers to map the virtual PARTID into a physical PARTID to label memory system requests.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0_VPMEN, bit [0]

Enable the virtual PARTID mapping of the PARTID fields of MPAM0_EL1 unless the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL0_VPMEN is ignored and MPAM0_EL1 PARTID fields are not mapped.

When MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used as the source of PARTIDs and the virtual PARTID mapping of MPAM1_EL1 PARTIDs is controlled by MPAMHCR_EL2.EL1_VPMEN.

EL0_VPMEN	Meaning
0b0	MPAM0_EL1.PARTID_I and MPAM0_EL1.PARTID_D are physical PARTIDs that are used to label memory system requests.
0b1	MPAM0_EL1.PARTID_I and MPAM0_EL1.PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of MPAMVPM0_EL2 to MPAMVPM7_EL2 registers to map the virtual PARTID into a physical PARTID to label memory system requests.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMIDR_EL1, MPAM ID Register (EL1)

The MPAMIDR_EL1 characteristics are:

Purpose

Indicates the presence and maximum PARTID and PMG values supported in the implementation. It also indicates whether the implementation supports MPAM virtualization.

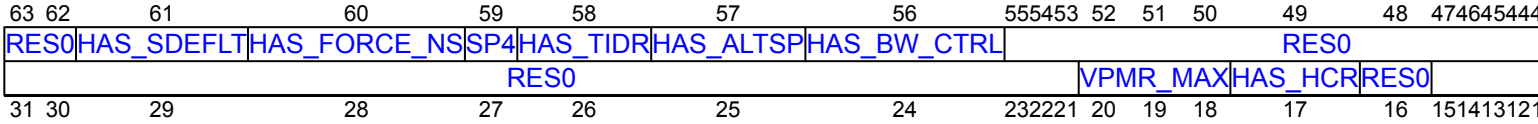
Configuration

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMIDR_EL1 are UNDEFINED.

Attributes

MPAMIDR_EL1 is a 64-bit register.

Field descriptions



MPAMIDR_EL1 indicates the MPAM implementation parameters of the PE.

Bits [63:62]

Reserved, RES0.

HAS_SDEFLT, bit [61]

HAS_SDEFLT indicates support for MPAM3_EL3.SDEFLT bit.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_SDEFLT	Meaning
0b0	The SDEFLT bit is not implemented in MPAM3_EL3.
0b1	The SDEFLT bit is implemented in MPAM3_EL3.

When MPAM3_EL3.SDEFLT == 1, accesses from the Secure Execution state use the default PARTID, PARTID == 0.

Access to this field is **RO**.

HAS_FORCE_NS, bit [60]

HAS_FORCE_NS indicates support for MPAM3_EL3.FORCE_NS bit.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_FORCE_NS	Meaning
0b0	The FORCE_NS bit is not implemented in MPAM3_EL3.
0b1	The FORCE_NS bit is implemented in MPAM3_EL3.

When MPAM3_EL3.FORCE_NS == 1, accesses from the Secure Execution state have MPAM_NS == 1.

Access to this field is **RO**.

SP4, bit [59]

Supports 4 MPAM PARTID spaces.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SP4	Meaning
0b0	MPAM supports 2 PARTID spaces.
0b1	MPAM supports 4 PARTID spaces.

Access to this field is **RO**.

HAS_TIDR, bit [58]

HAS_TIDR indicates support for MPAM2_EL2.TIDR bit.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_TIDR	Meaning
0b0	The TIDR bit is not implemented in MPAM2_EL2.
0b1	The TIDR bit is implemented in MPAM2_EL2.

Note

Arm recommends that when the MPAM version is MPAM v0.1 or MPAM v1.1, MPAMIDR_EL1.HAS_TIDR is 1 and that the MPAM2_EL2.TIDR field is implemented.

Access to this field is **RO**.

HAS_ALTSP, bit [57]

HAS_ALTSP indicates support for alternative PARTID spaces.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_ALTSP	Meaning
0b0	Alternative PARTID spaces are not implemented.
0b1	Alternative PARTID spaces are implemented with control bits in MPAM3_EL3 and MPAM2_EL2.

Access to this field is **RO**.

HAS_BW_CTRL, bit [56]

HAS_BW_CTRL indicates support for PE-side bandwidth controls.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_BW_CTRL	Meaning
0b0	PE-side bandwidth controls are not implemented.
0b1	PE-side bandwidth controls are implemented.

FEAT_MPAM_PE_BW_CTRL implements the functionality identified by the value 0b1.

Access to this field is **RO**.

Bits [55:40]

Reserved, RES0.

PMG_MAX, bits [39:32]

The largest value of PMG that the implementation can generate. The PMG_I and PMG_D fields of every MPAMn_ELx must implement at least enough bits to represent PMG_MAX.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [31:21]

Reserved, RES0.

VPMR_MAX, bits [20:18]

When MPAMIDR_EL1.HAS_HCR == 1:

Indicates the maximum register index n for the MPAMVPM<n>_EL2 registers.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

HAS_HCR, bit [17]

HAS_HCR indicates that the PE implementation supports MPAM virtualization, including MPAMHCR_EL2, MPAMVPMV_EL2, and MPAMVPM<n>_EL2 with n in the range 0 to VPMR_MAX. Must be 0 if EL2 is not implemented in either Security state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_HCR	Meaning
0b0	MPAM virtualization is not supported.
0b1	MPAM virtualization is supported.

Access to this field is **RO**.

Bit [16]

Reserved, RES0.

PARTID_MAX, bits [15:0]

The largest value of PARTID that the implementation can generate. The PARTID_I and PARTID_D fields of every MPAMn_ELx must implement at least enough bits to represent PARTID_MAX.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

MPAMSM_EL1, MPAM Streaming Mode Register

The MPAMSM_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests that are:

- Issued due to the execution of SME load and store instructions.
- Issued when the PE is in Streaming SVE mode due to the execution of SVE and SIMD&FP load and store instructions and SVE prefetch instructions.

If an implementation uses a shared SMCU, then the MPAM labels in this register have precedence over the labels in MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, and MPAM3_EL3.

If an implementation includes an SMCU that is not shared with other PEs, then it is IMPLEMENTATION DEFINED whether the MPAM labels in this register have precedence over the labels in MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, and MPAM3_EL3.

The MPAM labels in this register are only used if MPAM1_EL1.MPAMEN is 1.

For memory requests issued from EL0, the MPAM PARTID in this register is virtual and mapped into a physical PARTID when all of the following are true:

- EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The MPAM virtualization option is implemented and MPAMHCR_EL2.EL0_VPMEN is 1.

For memory requests issued from EL1, the MPAM PARTID in this register is virtual and mapped into a physical PARTID when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The MPAM virtualization option is implemented and MPAMHCR_EL2.EL1_VPMEN is 1.

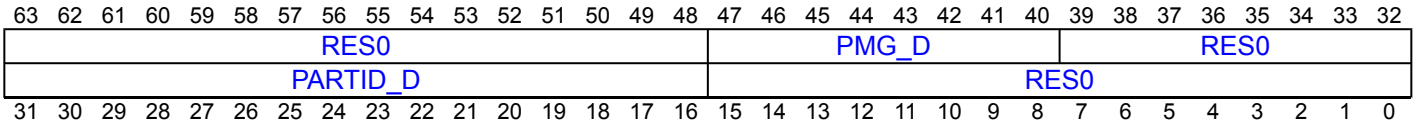
Configuration

This register is present only when FEAT_MPAM is implemented and FEAT_SME is implemented. Otherwise, direct accesses to MPAMSM_EL1 are UNDEFINED.

Attributes

MPAMSM_EL1 is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [39:32]

Reserved, RES0.

PARTID_D, bits [31:16]

Partition ID for requests issued due to the execution at any Exception level of SME load and store instructions and, when the PE is in Streaming SVE mode, SVE and SIMD&FP load and store instructions and SVE prefetch instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:0]

Reserved, RES0.

Accessing MPAMSM_EL1

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAMSM_EL1

MPAMVPM0_EL2, MPAM Virtual PARTID Mapping Register 0

The MPAMVPM0_EL2 characteristics are:

Purpose

MPAMVPM0_EL2 provides mappings from virtual PARTIDs 0 - 3 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 register. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

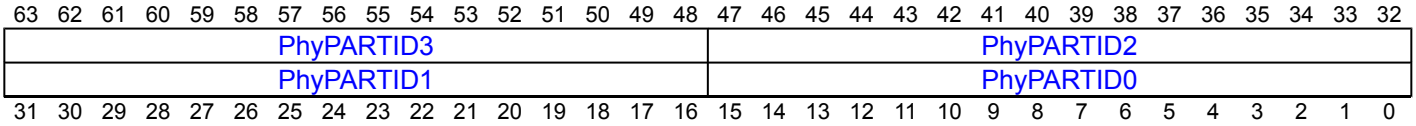
This register is present only when FEAT_MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMVPM0_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM0_EL2 is a 64-bit register.

Field descriptions



PhyPARTID3, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 3. PhyPARTID3 gives the mapping of virtual PARTID 3 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID2, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 2. PhyPARTID2 gives the mapping of virtual PARTID 2 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID1, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 1. PhyPARTID1 gives the mapping of virtual PARTID 1 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID0, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 0. PhyPARTID0 gives the mapping of virtual PARTID 0 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMVPM0_EL2

MPAMVPM1_EL2, MPAM Virtual PARTID Mapping Register 1

The MPAMVPM1_EL2 characteristics are:

Purpose

MPAMVPM1_EL2 provides mappings from virtual PARTIDs 4 - 7 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM0_EL2 to MPAMVPM7_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

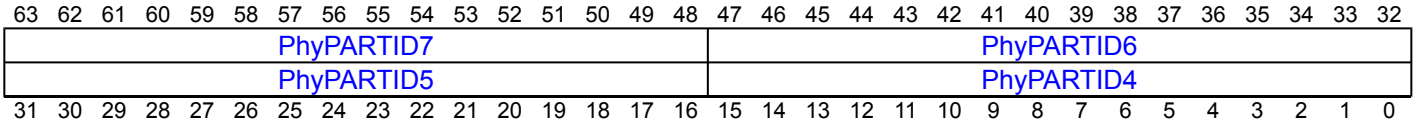
This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1, and UInt(MPAMIDR_EL1.VPMR_MAX) > 0. Otherwise, direct accesses to MPAMVPM1_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM1_EL2 is a 64-bit register.

Field descriptions



PhyPARTID7, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 7. PhyPARTID7 gives the mapping of virtual PARTID 7 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID6, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 6. PhyPARTID6 gives the mapping of virtual PARTID 6 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID5, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 5. PhyPARTID5 gives the mapping of virtual PARTID 5 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID4, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 4. PhyPARTID4 gives the mapping of virtual PARTID 4 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM2_EL2, MPAM Virtual PARTID Mapping Register 2

The MPAMVPM2_EL2 characteristics are:

Purpose

MPAMVPM2_EL2 provides mappings from virtual PARTIDs 8 - 11 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM0_EL2 to MPAMVPM7_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

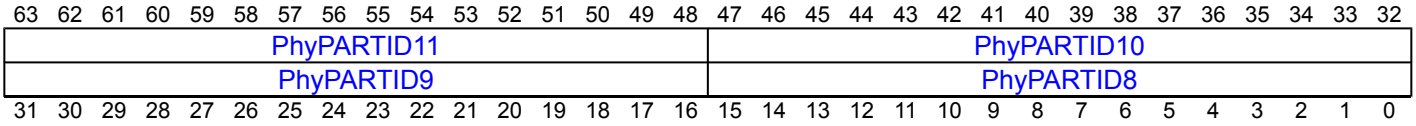
This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1, and UInt(MPAMIDR_EL1.VPMR_MAX) > 1. Otherwise, direct accesses to MPAMVPM2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM2_EL2 is a 64-bit register.

Field descriptions



PhyPARTID11, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 11. PhyPARTID11 gives the mapping of virtual PARTID 11 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID10, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 10. PhyPARTID10 gives the mapping of virtual PARTID 10 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID9, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 9. PhyPARTID9 gives the mapping of virtual PARTID 9 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID8, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 8. PhyPARTID8 gives the mapping of virtual PARTID 8 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM3_EL2, MPAM Virtual PARTID Mapping Register 3

The MPAMVPM3_EL2 characteristics are:

Purpose

MPAMVPM3_EL2 provides mappings from virtual PARTIDs 12 - 15 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

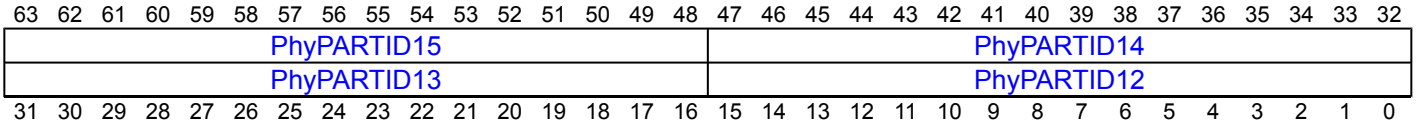
This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1, and UInt(MPAMIDR_EL1.VPMR_MAX) > 2. Otherwise, direct accesses to MPAMVPM3_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM3_EL2 is a 64-bit register.

Field descriptions



PhyPARTID15, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 15. PhyPARTID15 gives the mapping of virtual PARTID 15 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID14, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 14. PhyPARTID14 gives the mapping of virtual PARTID 14 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID13, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 13. PhyPARTID13 gives the mapping of virtual PARTID 13 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID12, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 12. PhyPARTID12 gives the mapping of virtual PARTID 12 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM5_EL2, MPAM Virtual PARTID Mapping Register 5

The MPAMVPM5_EL2 characteristics are:

Purpose

MPAMVPM5_EL2 provides mappings from virtual PARTIDs 20 - 23 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

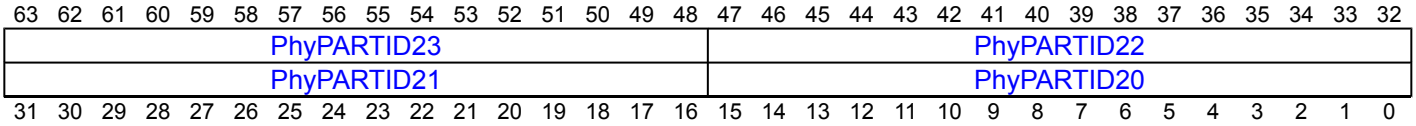
This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1, and UInt(MPAMIDR_EL1.VPMR_MAX) > 4. Otherwise, direct accesses to MPAMVPM5_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM5_EL2 is a 64-bit register.

Field descriptions



PhyPARTID23, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 23. PhyPARTID23 gives the mapping of virtual PARTID 23 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID22, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 22. PhyPARTID22 gives the mapping of virtual PARTID 22 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID21, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 21. PhyPARTID21 gives the mapping of virtual PARTID 21 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID20, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 20. PhyPARTID20 gives the mapping of virtual PARTID 20 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM6_EL2, MPAM Virtual PARTID Mapping Register 6

The MPAMVPM6_EL2 characteristics are:

Purpose

MPAMVPM6_EL2 provides mappings from virtual PARTIDs 24 - 27 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

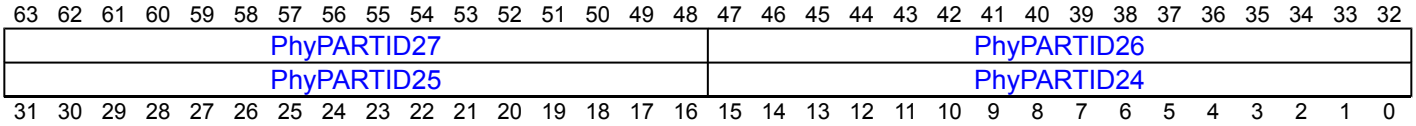
This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1, and UInt(MPAMIDR_EL1.VPMR_MAX) > 5. Otherwise, direct accesses to MPAMVPM6_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM6_EL2 is a 64-bit register.

Field descriptions



PhyPARTID27, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 27. PhyPARTID27 gives the mapping of virtual PARTID 27 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID26, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 26. PhyPARTID26 gives the mapping of virtual PARTID 26 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID25, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 25. PhyPARTID25 gives the mapping of virtual PARTID 25 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID24, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 24. PhyPARTID24 gives the mapping of virtual PARTID 24 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM7_EL2, MPAM Virtual PARTID Mapping Register 7

The MPAMVPM7_EL2 characteristics are:

Purpose

MPAMVPM7_EL2 provides mappings from virtual PARTIDs 28 - 31 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

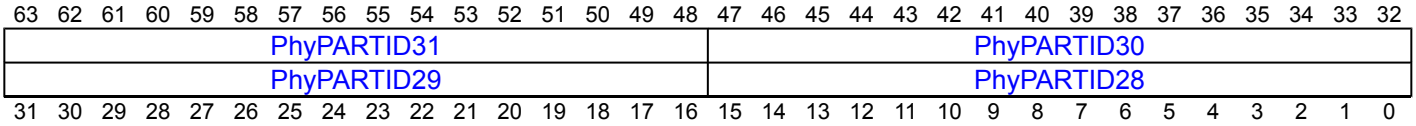
This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1, and UInt(MPAMIDR_EL1.VPMR_MAX) == 7. Otherwise, direct accesses to MPAMVPM7_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM7_EL2 is a 64-bit register.

Field descriptions



PhyPARTID31, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 31. PhyPARTID31 gives the mapping of virtual PARTID 31 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID30, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 30. PhyPARTID30 gives the mapping of virtual PARTID 30 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID29, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 29. PhyPARTID29 gives the mapping of virtual PARTID 29 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID28, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 28. PhyPARTID28 gives the mapping of virtual PARTID 28 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPMV_EL2, MPAM Virtual Partition Mapping Valid Register

The MPAMVPMV_EL2 characteristics are:

Purpose

Valid bits for virtual PARTID mapping entries. Each bit m corresponds to virtual PARTID mapping entry m in the MPAMVPM<n>_EL2 registers where n = m >> 2.

Configuration

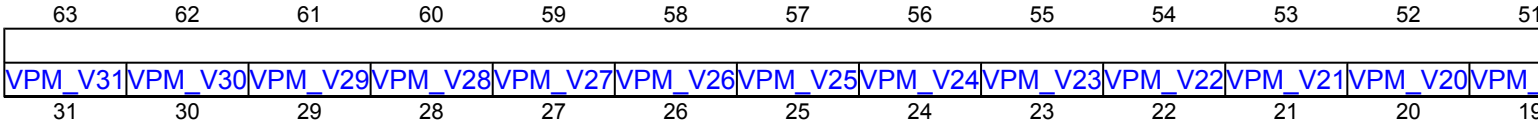
This register is present only when FEAT_MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMVPMV_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPMV_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

VPM_V<m>, bit [m], for m = 31 to 0

Contains valid bit for virtual PARTID mapping entry corresponding to virtual PARTID<m>.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPIDR_EL1, Multiprocessor Affinity Register

The MPIDR_EL1 characteristics are:

Purpose

In a multiprocessor system, provides an additional PE identification mechanism.

Configuration

AArch64 System register MPIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MPIDR[31:0].

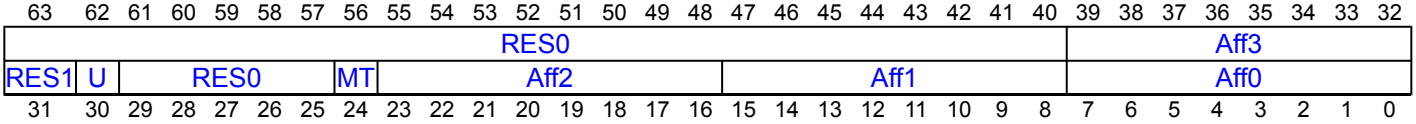
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MPIDR_EL1 are UNDEFINED.

In a uniprocessor system, Arm recommends that each Aff<n> field of this register returns a value of 0.

Attributes

MPIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of Aff0 for more information.

Aff3 is not supported in AArch32 state.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [31]

Reserved, RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is **RO**.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is **RO**.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing MPIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b101

MVFR0_EL1, AArch32 Media and VFP Feature Register 0

The MVFR0_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and floating-point implementation.

Must be interpreted with MVFR1_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register MVFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR0[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MVFR0_EL1 are UNDEFINED.

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR0_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
FPRound				FPShVec				FPSqrt				FPDivide				FPTrap				FPDP				FPSP				SIMDReg			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPRound	Meaning
0b0000	Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.
0b0001	All rounding modes supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

FPShVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPShVec	Meaning
0b0000	Short vectors not supported.
0b0001	Short vector operation supported.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Access to this field is **RO**.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPSqrt	Meaning
0b0000	Not supported in hardware.
0b0001	Supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

Access to this field is **RO**.

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPDivide	Meaning
0b0000	Not supported in hardware.
0b0001	Supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

Access to this field is **RO**.

FPTrap, bits [15:12]

Floating-Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPTrap	Meaning
0b0000	Not supported.
0b0001	Supported.

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

Access to this field is **RO**.

FPDP, bits [11:8]

Floating-Point Double-Precision. Indicates whether the floating-point implementation provides support for double-precision operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPDP	Meaning
0b0000	Not supported in hardware.
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

Access to this field is **RO**.

FPSP, bits [7:4]

Floating-Point Single-Precision. Indicates whether the floating-point implementation provides support for single-precision operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPSP	Meaning
0b0000	Not supported in hardware.
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

Access to this field is **RO**.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank.

The value of this field is an IMPLEMENTATION DEFINED choice of:

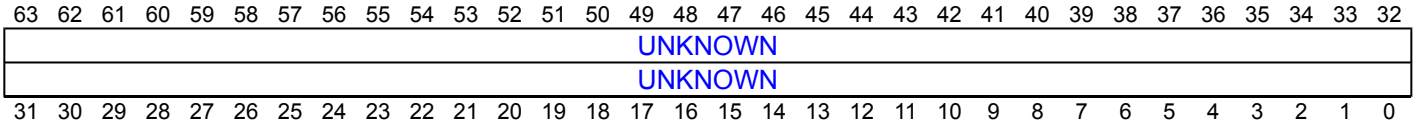
SIMDReg	Meaning
0b0000	The implementation has no Advanced SIMD and floating-point support.
0b0001	The implementation includes floating-point support with 16 x 64-bit registers.
0b0010	The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In Armv8-A the permitted values are `0b0000` and `0b0010`.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing MVFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

`MRS <Xt>, MVFR0_EL1`

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b000

MVFR1_EL1, AArch32 Media and VFP Feature Register 1

The MVFR1_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and floating-point implementation.

Must be interpreted with MVFR0_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register MVFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR1[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MVFR1_EL1 are UNDEFINED.

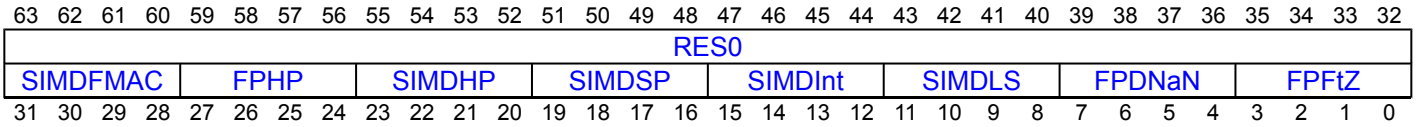
In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR1_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDFMAC	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

Access to this field is **RO**.

FPHP, bits [27:24]

Floating-Point Half-Precision. Indicates the level of half-precision floating-point support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPHP	Meaning
0b0000	Not supported.
0b0001	Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds instructions for conversion between double-precision and half-precision.
0b0011	As for 0b0010, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0011 in an implementation with floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

Half-Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

Access to this field is **RO**.

SIMDHP, bits [23:20]

Advanced SIMD Half-Precision. Indicates the level of half-precision floating-point support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDHP	Meaning
0b0000	Not supported.
0b0001	SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0001 in an implementation with SIMD floating-point support that does not include the FEAT_FP16 extension.
- 0b0010 in an implementation with SIMD floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

Half-Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

Access to this field is **RO**.

SIMDSP, bits [19:16]

Advanced SIMD Single-Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDSP	Meaning
0b0000	Not implemented.
0b0001	Implemented. This value is permitted only if the SIMDInt field is 0b0001.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

SIMDInt, bits [15:12]

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDInt	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

SIMDLS, bits [11:8]

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDLS	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

FPDNaN, bits [7:4]

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPDNaN	Meaning
0b0000	Not implemented, or hardware supports only the Default NaN mode.
0b0001	Hardware supports propagation of NaN values.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

FPFtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPFtZ	Meaning
0b0000	Not implemented, or hardware supports only the Flush-to-Zero mode of operation.
0b0001	Hardware supports full denormalized number arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

MVFR2_EL1, AArch32 Media and VFP Feature Register 2

The MVFR2_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and floating-point implementation.

Must be interpreted with MVFR0_EL1 and MVFR1_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register MVFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR2[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MVFR2_EL1 are UNDEFINED.

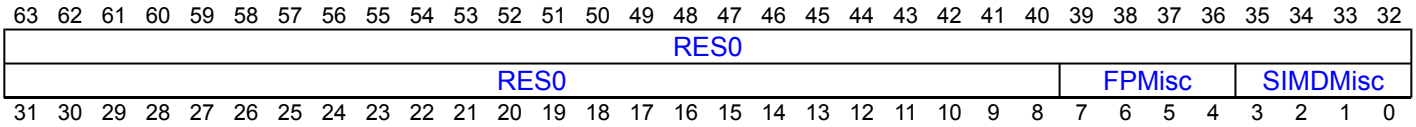
In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR2_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:8]

Reserved, RES0.

FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPMisc	Meaning
0b0000	Not implemented, or no support for miscellaneous features.
0b0001	Support for Floating-point selection.
0b0010	As 0b0001, and Floating-point Conversion to Integer with Directed Rounding modes.
0b0011	As 0b0010, and Floating-point Round to Integer Floating-point.
0b0100	As 0b0011, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0100.

Access to this field is **RO**.

SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

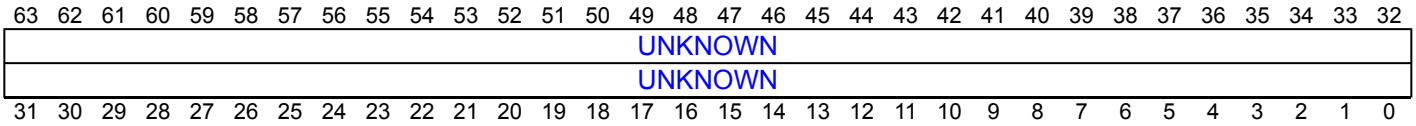
SIMDMisc	Meaning
0b0000	Not implemented, or no support for miscellaneous features.
0b0001	Floating-point Conversion to Integer with Directed Rounding modes.
0b0010	As 0b0001, and Floating-point Round to Integer Floating-point.
0b0011	As 0b0010, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0011.

Access to this field is **RO**.

Otherwise:



Bits [63:0]

NZCV, Condition Flags

The NZCV characteristics are:

Purpose

Allows access to the condition flags.

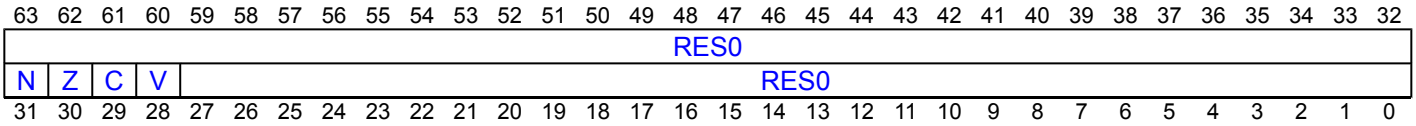
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to NZCV are UNDEFINED.

Attributes

NZCV is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative condition flag. Set to 1 if the result of the last flag-setting instruction was negative.

Z, bit [30]

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

C, bit [29]

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

V, bit [28]

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

Bits [27:0]

Reserved, RES0.

Accessing NZCV

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, NZCV

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b000

```

OSDLR_EL1, OS Double Lock Register

The OSDLR_EL1 characteristics are:

Purpose

Used to control the OS Double Lock.

Configuration

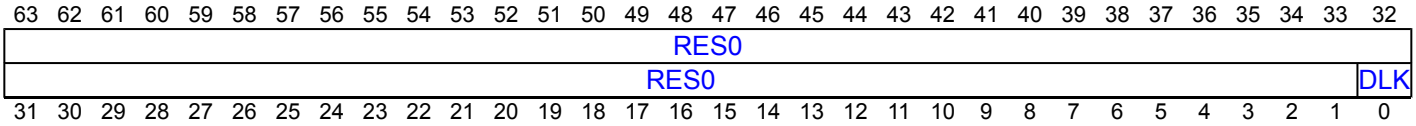
AArch64 System register OSDLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSDLR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to OSDLR_EL1 are UNDEFINED.

Attributes

OSDLR_EL1 is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

DLK, bit [0]

When FEAT_DoubleLock is implemented:

OS Double Lock control bit.

DLK	Meaning
0b0	OS Double Lock unlocked.
0b1	OS Double Lock locked, if DBGPRCR_EL1.CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RAZ/WI.

Accessing OSDLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSDLR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0011	0b100

OSDTRRX_EL1, OS Lock Data Transfer Register, Receive

The OSDTRRX_EL1 characteristics are:

Purpose

Used for save and restore of DBGDTRRX_EL0. It is a component of the Debug Communications Channel.

Configuration

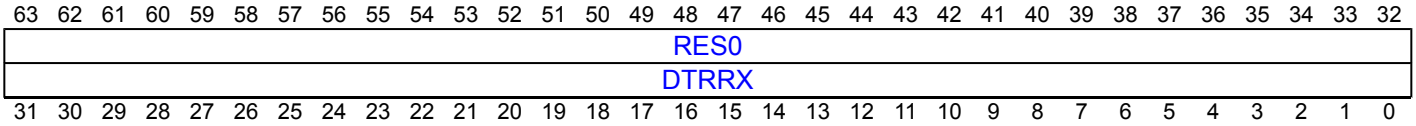
AArch64 System register OSDTRRX_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXext[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to OSDTRRX_EL1 are UNDEFINED.

Attributes

OSDTRRX_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

DTRRX, bits [31:0]

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

Accessing OSDTRRX_EL1

Arm deprecates reads and writes of OSDTRRX_EL1 when the OS Lock is unlocked.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, OSDTRRX_EL1
```

op0	op1	CRn	CRm	op2

OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

Configuration

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSECCR[31:0].

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to External register EDECCR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to OSECCR_EL1 are UNDEFINED.

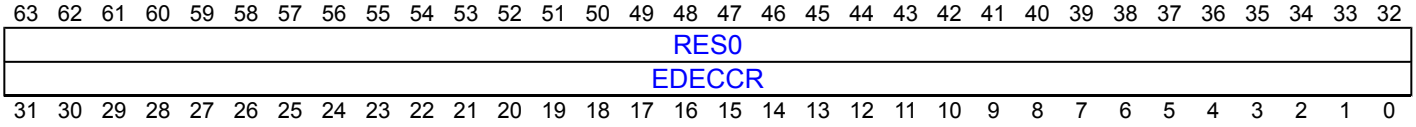
If OSLSR_EL1.OSLK == 0, then OSECCR_EL1 returns an UNKNOWN value on reads and ignores writes.

Attributes

OSECCR_EL1 is a 64-bit register.

Field descriptions

When OSLSR_EL1.OSLK == 1:



Bits [63:32]

Reserved, RES0.

EDECCR, bits [31:0]

Used for save/restore to EDECCR over powerdown.

Reads or writes to this field are indirect accesses to EDECCR.

The reset behavior of this field is:

- On a Cold reset, this field resets to '00000000000000000000000000000000'.

Accessing OSECCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, OSECCR_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0110	0b010

```

OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configuration

AArch64 System register OSLAR_EL1 bits [31:0] are architecturally mapped to External register OSLAR_EL1[31:0].

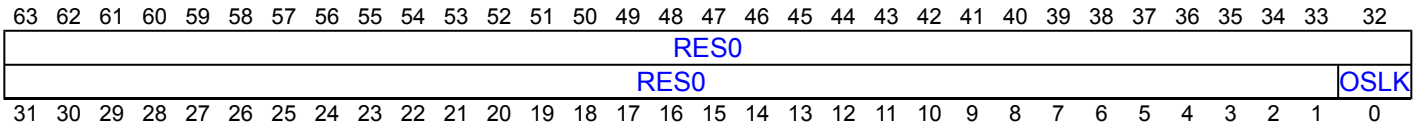
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to OSLAR_EL1 are UNDEFINED.

The OS Lock can also be locked or unlocked using DBGOSLAR.

Attributes

OSLAR_EL1 is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use OSLSR_EL1.OSLK to check the current status of the lock.

Accessing OSLAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MSR OSLAR_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0000	0b100

```

OSLSR_EL1, OS Lock Status Register

The OSLSR_EL1 characteristics are:

Purpose

Provides the status of the OS Lock.

Configuration

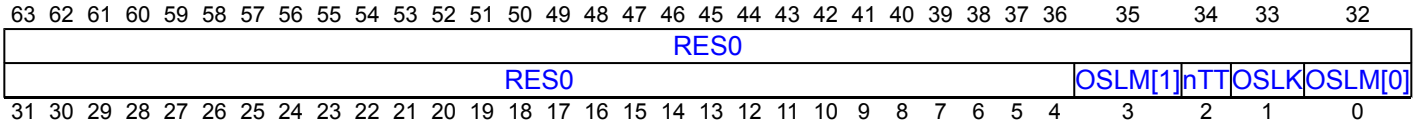
AArch64 System register OSLSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSLSR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to OSLSR_EL1 are UNDEFINED.

Attributes

OSLSR_EL1 is a 64-bit register.

Field descriptions



Bits [63:4]

Reserved, RES0.

OSLM, bits [3, 0]

OS Lock model implemented. Identifies the form of OS save and restore mechanism implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OSLM	Meaning
0b00	OS Lock not implemented.
0b10	OS Lock implemented.

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is OSLSR_EL1[3].
- OSLM[0] is OSLSR_EL1[0].

Access to this field is **RO**.

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

OSLK, bit [1]

OS Lock Status.

OSLK	Meaning
0b0	OS Lock unlocked.
0b1	OS Lock locked.

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The reset behavior of this field is:

- On a Cold reset, this field resets to '1'.

Accessing OSLSR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSLSR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0001	0b100

```

PAN, Privileged Access Never

The PAN characteristics are:

Purpose

Allows access to the Privileged Access Never bit.

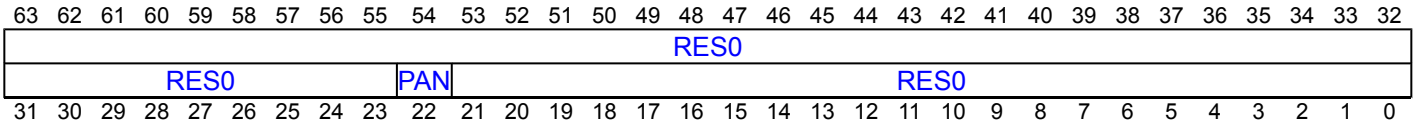
Configuration

This register is present only when FEAT_PAN is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PAN are UNDEFINED.

Attributes

PAN is a 64-bit register.

Field descriptions



Bits [63:23]

Reserved, RES0.

PAN, bit [22]

Privileged Access Never.

PAN	Meaning
0b0	Privileged reads and write are not disabled by this mechanism.
0b1	Disables privileged read and write accesses to addresses accessible at EL0 for an enabled stage 1 translation regime that defines the EL0 permissions.

The value of this bit is usually preserved on taking an exception, except in the following situations:

- When the target of the exception is EL1, and the value of the SCTLR_EL1.SPAN bit is 0, this bit is set to 1.
- When the target of the exception is EL2, the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, and the value of the SCTLR_EL2.SPAN bit is 0, this bit is set to 1.

Bits [21:0]

Reserved, RES0.

Accessing PAN

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PAN
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0010	0b011

```

PAR_EL1, Physical Address Register

The PAR_EL1 characteristics are:

Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

Configuration

AArch64 System register PAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register PAR[63:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to PAR_EL1 are UNDEFINED.

AArch64 System register PAR_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

Single stage AT Instructions (ATS1*) report their result using the 128-bit format of PAR_EL1 if the translation system that they target uses VMSAv9-128.

ATS12* Instructions report their result using the 128-bit format PAR_EL1 if either of the following is true:

- if stage 2 translations are enabled and the stage 2 translation system uses VMSAv9-128.
- if stage 2 translations are disabled and the stage 1 translation system uses VMSAv9-128.

Otherwise, 64-bit format of PAR_EL1 is used.

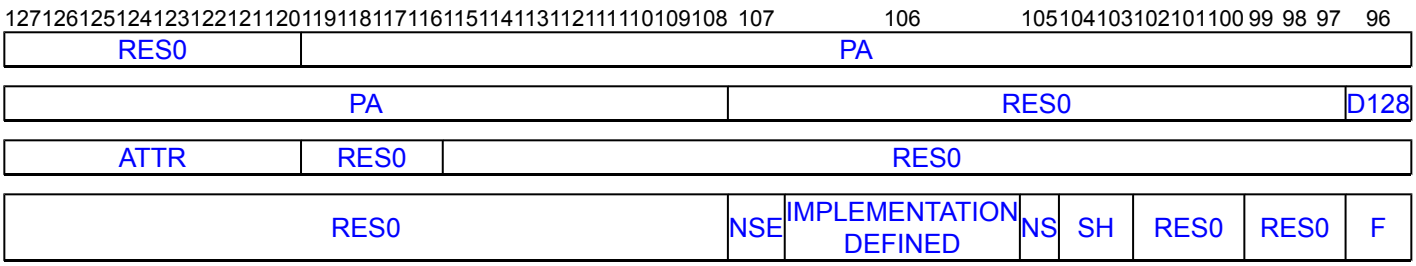
Attributes

PAR_EL1 is a:

- 128-bit register when FEAT_D128 is implemented, GetPAR_EL1_D128() == 1, and GetPAR_EL1_F() == 0
- 128-bit register when FEAT_D128 is implemented, GetPAR_EL1_D128() == 1, and GetPAR_EL1_F() == 1
- 128-bit register when FEAT_D128 is implemented, GetPAR_EL1_D128() == 0, and GetPAR_EL1_F() == 0
- 128-bit register when FEAT_D128 is implemented, GetPAR_EL1_D128() == 0, and GetPAR_EL1_F() == 1
- 64-bit register when FEAT_D128 is not implemented and GetPAR_EL1_F() == 0
- 64-bit register when FEAT_D128 is not implemented and GetPAR_EL1_F() == 1

Field descriptions

When FEAT_D128 is implemented, GetPAR_EL1_D128() == 1, and GetPAR_EL1_F() == 0:



This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the Translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the Translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

Bits [127:120]

Reserved, RES0.

PA, bits [119:76]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[55:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [75:65]

Reserved, RES0.

D128, bit [64]

Indicates if the PAR_EL1 uses the 128-bit format.

D128	Meaning
0b1	PAR_EL1 uses the 128-bit format. PAR_EL1[127:0] holds valid data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

If FEAT_MTE_PERM is implemented and the instruction performed a stage 2 translation, the following additional encoding is defined:

ATTR	Meaning
0b11100000	Tagged NoTagAccess Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory.

Note

This encoding in MAIR_ELx is Reserved.

The value returned in this field can be the resulting attribute that is actually implemented by the implementation, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

Note

The attributes presented are consistent with the stages of translation applied in the address translation instruction. If the instruction performed a stage 1 translation only, the attributes are from the stage 1 translation. If the instruction performed a stage 1 and stage 2 translation, the attributes are from the combined stage 1 and stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52, 6:4]

Reserved, RES0.

Bits [51:12]

Reserved, RES0.

NSE, bit [11]

When FEAT_RME is implemented:

Reports the NSE attribute for a translation table descriptor from the EL3 translation regime.

For a description of the values derived by evaluating NS and NSE together, see PAR_EL1.NS.

For a result from a Secure, Non-secure, or Realm translation regime, this bit is unknown.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

When FEAT_RME is implemented:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime, a Realm translation regime, and the EL3 translation regime.

For a result from an EL3 translation regime, NS and NSE are evaluated together to report the physical address space:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

For a result from an S1E1 or S1E0 operation on the Realm EL1&0 translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:1]

Reserved, RES0.

F, bit [0]

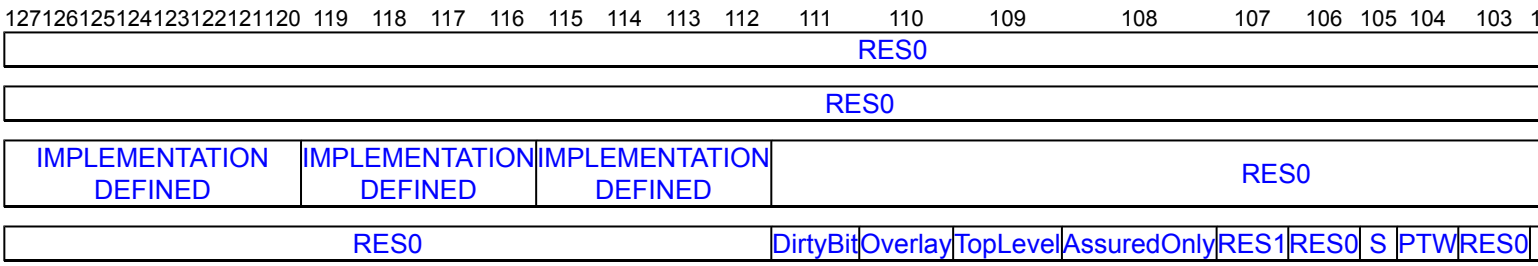
Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is implemented, GetPAR_EL1_D128() == 1, and GetPAR_EL1_F() == 1:



This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

Bits [127:65]

Reserved, RES0.

D128, bit [64]

Indicates if the PAR_EL1 uses the 128-bit format.

D128	Meaning
0b1	PAR_EL1 uses the 128-bit format. PAR_EL1[127:0] holds valid data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:16]

Reserved, RES0.

DirtyBit, bit [15]

When FEAT_S1PIE is implemented or FEAT_S2PIE is implemented:

DirtyBit flag.

If PAR_EL1.FST indicates a Permission fault for a stage of translation that is using Indirect Permissions, and dirty state is managed by software, then this field holds information about the fault.

DirtyBit	Meaning
0b0	The Permission Fault is not due to dirty state.
0b1	The Permission Fault is due to dirty state.

For any other fault or Access, this field is RES0.

Note

At stage 1, dirty state is indicated by the nDirty bit in Block and Page descriptors. At stage 2, dirty state is indicated by the Dirty bit in Block and Page descriptors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [14]

When FEAT_S1POE is implemented or FEAT_S2POE is implemented:

Overlay flag.

If PAR_EL1.FST indicates a Permission fault for a stage of translation, then this field holds information about the fault.

Overlay	Meaning
0b0	The Data Abort is not due to Overlay Permissions.
0b1	The Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TopLevel, bit [13]

When FEAT_THE is implemented:

Fault due to TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [12]

When FEAT_THE is implemented:

AssuredOnly flag.

If PAR_EL1.S indicates a stage 2 fault, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	The Data Abort is not due to AssuredOnly.
0b1	The Data Abort is due to AssuredOnly.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

S	Meaning
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort ESR encoding.

FST	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented

0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b111101	Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When FEAT_AA32EL1 is implemented
0b111110	Page Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When FEAT_AA32EL1 is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

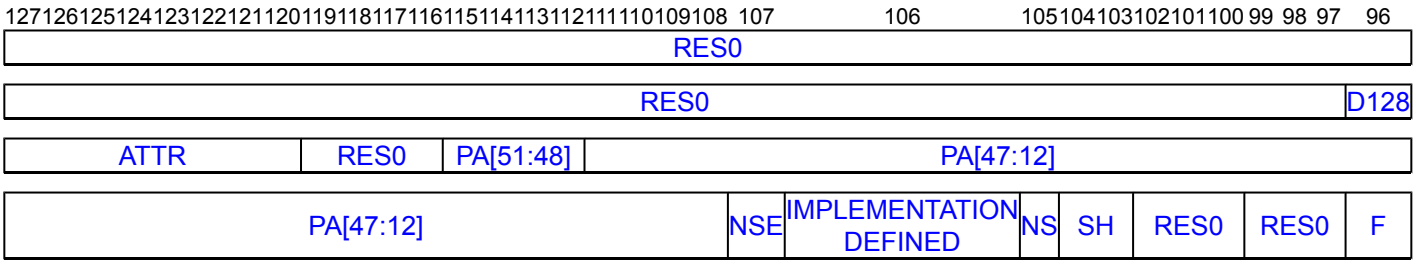
Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is implemented, GetPAR_EL1_D128() == 0, and GetPAR_EL1_F() == 0:



This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the Translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the Translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

Bits [127:65]

Reserved, RES0.

D128, bit [64]

Indicates if the PAR_EL1 uses the 128-bit format.

D128	Meaning
0b0	PAR_EL1 uses the 64-bit format. PAR_EL1[63:0] holds valid data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

If FEAT_MTE_PERM is implemented and the instruction performed a stage 2 translation, the following additional encoding is defined:

ATTR	Meaning
0b11100000	Tagged NoTagAccess Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory.

Note

This encoding in MAIR_ELx is Reserved.

The value returned in this field can be the resulting attribute that is actually implemented by the implementation, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

Note

The attributes presented are consistent with the stages of translation applied in the address translation instruction. If the instruction performed a stage 1 translation only, the attributes are from the stage 1 translation. If the instruction performed a stage 1 and stage 2 translation, the attributes are from the combined stage 1 and stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52, 6:4]

Reserved, RES0.

PA[51:48], bits [51:48]

When FEAT_LPA is implemented:

Extension to PA[47:12]. For more information, see PA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[47:12], bits [47:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When FEAT_LPA is implemented and 52-bit addresses are in use, PA[51:48] forms the upper part of the address value. Otherwise, when 52-bit addresses are not in use, PA[51:48] is RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [11]

When FEAT_RME is implemented:

Reports the NSE attribute for a translation table entry from the EL3 translation regime.

For a description of the values derived by evaluating NS and NSE together, see PAR_EL1.NS.

For a result from a Secure, Non-secure, or Realm translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

When FEAT_RME is implemented:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime, a Realm translation regime, and the EL3 translation regime.

For a result from an EL3 translation regime, NS and NSE are evaluated together to report the physical address space:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

For a result from an S1E1 or S1E0 operation on the Realm EL1&0 translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:1]

Reserved, RES0.

F, bit [0]

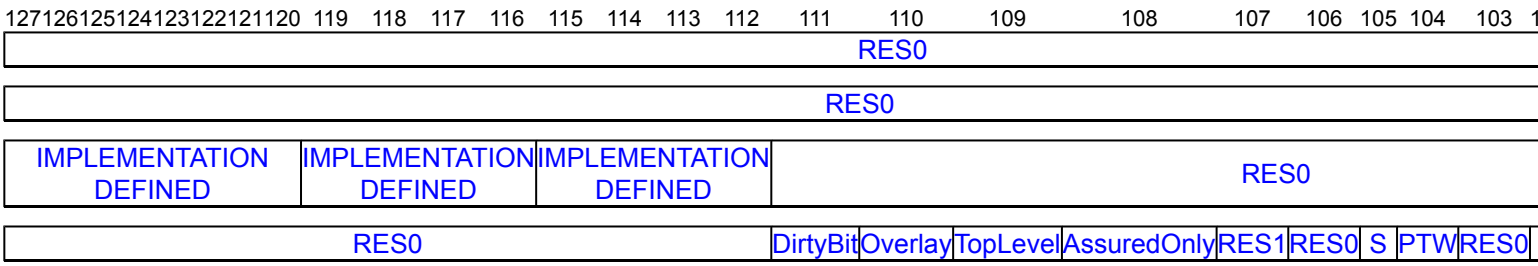
Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is implemented, GetPAR_EL1_D128() == 0, and GetPAR_EL1_F() == 1:



This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

Bits [127:65]

Reserved, RES0.

D128, bit [64]

Indicates if the PAR_EL1 uses the 128-bit format.

D128	Meaning
0b0	PAR_EL1 uses the 64-bit format. PAR_EL1[63:0] holds valid data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:16]

Reserved, RES0.

DirtyBit, bit [15]

When FEAT_S1PIE is implemented or FEAT_S2PIE is implemented:

DirtyBit flag.

If PAR_EL1.FST indicates a Permission fault for a stage of translation that is using Indirect Permissions, and dirty state is managed by software, then this field holds information about the fault.

DirtyBit	Meaning
0b0	The Permission Fault is not due to nDirty State or Dirty State.
0b1	The Permission Fault is due to nDirty State or Dirty State.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [14]

When FEAT_S1POE is implemented or FEAT_S2POE is implemented:

Overlay flag.

If PAR_EL1.FST indicates a Permission fault for a stage of translation, then this field holds information about the fault.

Overlay	Meaning
0b0	The Data Abort is not due to Overlay Permissions.
0b1	The Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TopLevel, bit [13]

When FEAT_THE is implemented:

Fault due to TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [12]

When FEAT_THE is implemented:

AssuredOnly flag.

If PAR_EL1.S indicates a stage 2 fault, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	The Data Abort is not due to AssuredOnly.
0b1	The Data Abort is due to AssuredOnly.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

S	Meaning
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort exception ESR encoding.

FST	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented

0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b111101	Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When FEAT_AA32EL1 is implemented
0b111110	Page Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When FEAT_AA32EL1 is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

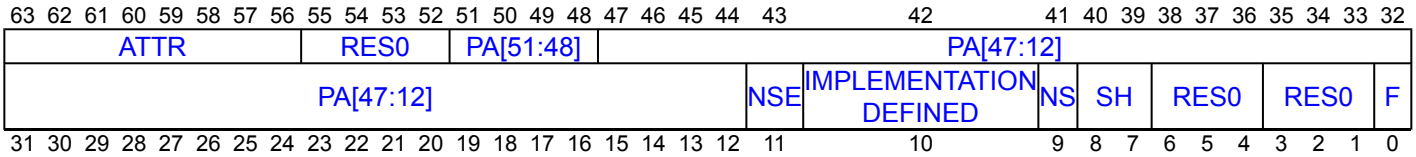
Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is not implemented and GetPAR_EL1_F() == 0:



This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the Translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the Translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

If FEAT_MTE_PERM is implemented and the instruction performed a stage 2 translation, the following additional encoding is defined:

ATTR	Meaning
0b11100000	Tagged NoTagAccess Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory.

Note

This encoding in MAIR_ELx is Reserved.

The value returned in this field can be the resulting attribute that is actually implemented by the implementation, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

Note

The attributes presented are consistent with the stages of translation applied in the address translation instruction. If the instruction performed a stage 1 translation only, the attributes are from the stage 1 translation. If the instruction performed a stage 1 and stage 2 translation, the attributes are from the combined stage 1 and stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52, 6:4]

Reserved, RES0.

PA[51:48], bits [51:48]

When FEAT_LPA is implemented:

Extension to PA[47:12]. For more information, see PA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[47:12], bits [47:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When FEAT_LPA is implemented and 52-bit addresses are in use, PA[51:48] forms the upper part of the address value. Otherwise, when 52-bit addresses are not in use, PA[51:48] is RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [11]

When FEAT_RME is implemented:

Reports the NSE attribute for a translation table entry from the EL3 translation regime.

For a description of the values derived by evaluating NS and NSE together, see PAR_EL1.NS.

For a result from a Secure, Non-secure, or Realm translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

When FEAT_RME is implemented:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime, a Realm translation regime, and the EL3 translation regime.

For a result from an EL3 translation regime, NS and NSE are evaluated together to report the physical address space:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

For a result from an S1E1 or S1E0 operation on the Realm EL1&0 translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:1]

Reserved, RES0.

F, bit [0]

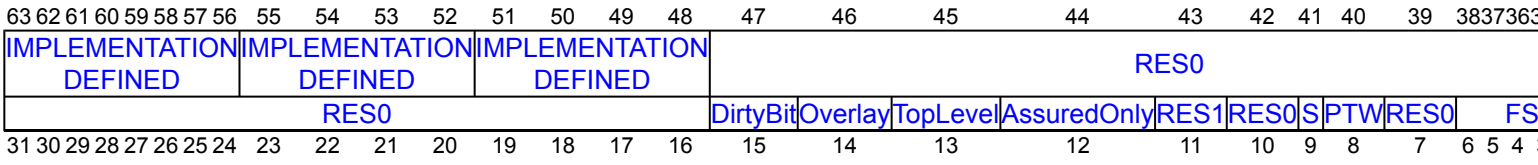
Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is not implemented and GetPAR_EL1_F() == 1:



This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:16]

Reserved, RES0.

DirtyBit, bit [15]

When FEAT_S1PIE is implemented or FEAT_S2PIE is implemented:

DirtyBit flag.

If PAR_EL1.FST indicates a Permission fault for a stage of translation that is using Indirect Permissions, and dirty state is managed by software, then this field holds information about the fault.

DirtyBit	Meaning
0b0	The Permission Fault is not due to nDirty State or Dirty State.
0b1	The Permission Fault is due to nDirty State or Dirty State.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [14]

When FEAT_S1POE is implemented or FEAT_S2POE is implemented:

Overlay flag.

If PAR_EL1.FST indicates a Permission fault for a stage of translation, then this field holds information about the fault.

Overlay	Meaning
0b0	The Data Abort is not due to Overlay Permissions.
0b1	The Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TopLevel, bit [13]

When FEAT_THE is implemented:

Fault due to TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [12]

When FEAT_THE is implemented:

AssuredOnly flag.

If PAR_EL1.S indicates a stage 2 fault, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	The Data Abort is not due to AssuredOnly.
0b1	The Data Abort is due to AssuredOnly.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

S	Meaning
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort exception ESR encoding.

FST	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented

0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b111101	Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When FEAT_AA32EL1 is implemented
0b111110	Page Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When FEAT_AA32EL1 is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PAR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0111	0b0100	0b000

PFAR_EL1, Physical Fault Address Register (EL1)

The PFAR_EL1 characteristics are:

Purpose

Records the faulting physical address for a synchronous External abort, or SError exception taken to EL1.

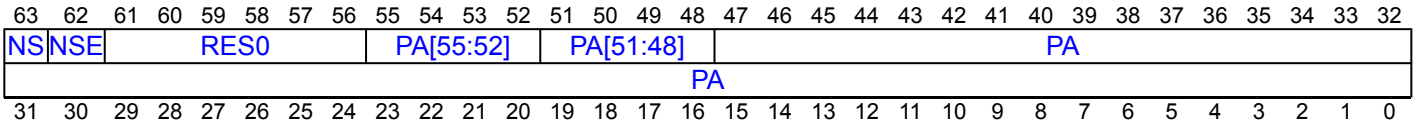
Configuration

This register is present only when FEAT_PFAR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PFAR_EL1 are UNDEFINED.

Attributes

PFAR_EL1 is a 64-bit register.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

Together with PFAR_EL1.NSE, reports the physical address space of the access that triggered the exception.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Reserved.
0b1	0b1	Realm.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When EL3 is implemented or FEAT_Secure is implemented:

Non-secure. Reports the physical address space of the access that triggered the exception.

NS	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSE, bit [62]

When FEAT_RME is implemented:

Together with PFAR_EL1.NS, reports the physical address space of the access that triggered the exception.

For a description of the values derived by evaluating NS and NSE together, see MFAR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [61:56]

Reserved, RES0.

PA[55:52], bits [55:52]

When FEAT_D128 is implemented:

When FEAT_D128 is implemented, extension to PFAR_EL1.PA[47:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[51:48], bits [51:48]

When FEAT_LPA is implemented:

When FEAT_LPA is implemented, extension to PFAR_EL1.PA[47:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA, bits [47:0]

Physical Address. Bits [47:0] of the aborting physical address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The recorded address can be any address within the same naturally-aligned fault granule as the faulting physical address, where the size of the fault granule is IMPLEMENTATION DEFINED and no larger than the larger than:

- The size of the range of values permitted to be recorded in FAR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PFAR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name PFAR_EL1 or PFAR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

PFAR_EL1 is not valid and reads UNKNOWN if ESR_EL1.PFV is recorded as 0.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PFAR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0110	0b0000	0b101

PFAR_EL2, Physical Fault Address Register (EL2)

The PFAR_EL2 characteristics are:

Purpose

Records the faulting physical address for a synchronous External abort, or SError exception taken to EL2.

Configuration

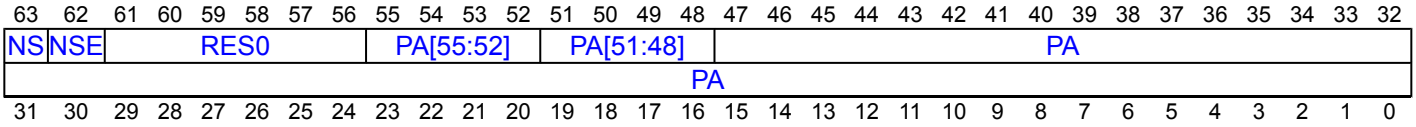
This register is present only when FEAT_PFAR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PFAR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

PFAR_EL2 is a 64-bit register.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

Together with PFAR_EL2.NSE, reports the physical address space of the access that triggered the exception.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Reserved.
0b1	0b1	Realm.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When EL3 is implemented or FEAT_Secure is implemented:

Non-secure. Reports the physical address space of the access that triggered the exception.

NS	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSE, bit [62]

When FEAT_RME is implemented:

Together with PFAR_EL2.NS, reports the physical address space of the access that triggered the exception.

For a description of the values derived by evaluating NS and NSE together, see MFAR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [61:56]

Reserved, RES0.

PA[55:52], bits [55:52]

When FEAT_D128 is implemented:

When FEAT_D128 is implemented, extension to PFAR_EL2.PA[47:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[51:48], bits [51:48]

When FEAT_LPA is implemented:

When FEAT_LPA is implemented, extension to PFAR_EL2.PA[47:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA, bits [47:0]

Physical Address. Bits [47:0] of the aborting physical address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The recorded address can be any address within the same naturally-aligned fault granule as the faulting physical address, where the size of the fault granule is IMPLEMENTATION DEFINED and no larger than the larger than:

- The size of the range of values permitted to be recorded in FAR_EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PFAR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name PFAR_EL2 or PFAR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

PFAR_EL2 is not valid and reads UNKNOWN if ESR_EL2.PFV is recorded as 0.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PFAR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b101

PIR_EL1, Permission Indirection Register 1 (EL1)

The PIR_EL1 characteristics are:

Purpose

Stage 1 Permission Indirection Register for privileged access of the EL1&0 translation regime.

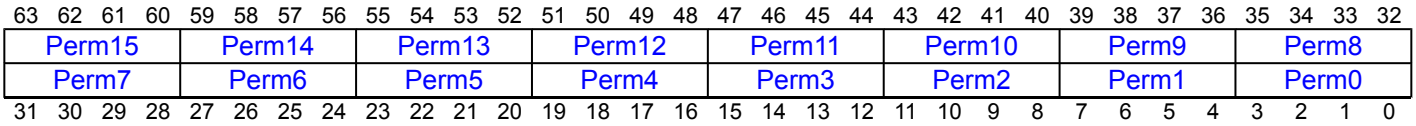
Configuration

This register is present only when FEAT_S1PIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PIR_EL1 are UNDEFINED.

Attributes

PIR_EL1 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Represents stage 1 Base Permissions.

Perm<m>	Meaning
0b0000	No access. Overlay applied.
0b0001	Read. Overlay applied.
0b0010	Execute. Overlay applied.
0b0011	Read and Execute. Overlay applied.
0b0100	Reserved - treated as No access. Overlay applied.
0b0101	Read and Write. Overlay applied.
0b0110	Read, Write, and Execute. Overlay applied. WXN control applied.
0b0111	Read, Write, and Execute. Overlay applied.
0b1000	Read. Overlay not applied.
0b1001	Read, GCS Read, and GCS Write. Overlay not applied.
0b1010	Read and Execute. Overlay not applied.
0b1011	Reserved - treated as No access. Overlay not applied.
0b1100	Read and Write. Overlay not applied.
0b1101	Reserved - treated as No access. Overlay not applied.
0b1110	Read, Write, and Execute. Overlay not applied.
0b1111	Reserved - treated as No access. Overlay not applied.

This field is permitted to be cached in a TLB.

When stage 1 Indirect Permission mechanism is disabled, this register is ignored.

Unless otherwise specified, the WXN control is not applied.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PIR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name PIR_EL1 or PIR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

PIR_EL3, Permission Indirection Register 3 (EL3)

The PIR_EL3 characteristics are:

Purpose

Stage 1 Permission Indirection Register for privileged access of the EL3 translation regime.

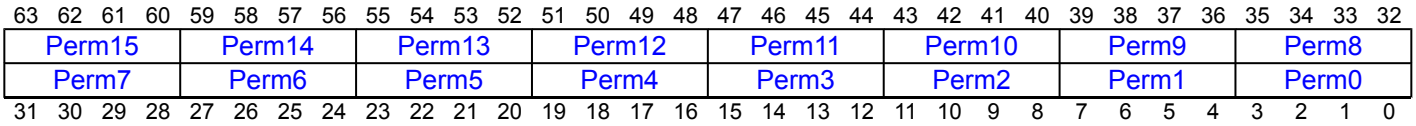
Configuration

This register is present only when FEAT_S1PIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PIR_EL3 are UNDEFINED.

Attributes

PIR_EL3 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Represents stage 1 Base Permissions.

Perm<m>	Meaning
0b0000	No access. Overlay applied.
0b0001	Read. Overlay applied.
0b0010	Execute. Overlay applied.
0b0011	Read and Execute. Overlay applied.
0b0100	Reserved - treated as No access. Overlay applied.
0b0101	Read and Write. Overlay applied.
0b0110	Read, Write, and Execute. Overlay applied. WXN control applied.
0b0111	Read, Write, and Execute. Overlay applied.
0b1000	Read. Overlay not applied.
0b1001	Read, GCS Read, and GCS Write. Overlay not applied.
0b1010	Read and Execute. Overlay not applied.
0b1011	Reserved - treated as No access. Overlay not applied.
0b1100	Read and Write. Overlay not applied.
0b1101	Reserved - treated as No access. Overlay not applied.
0b1110	Read, Write, and Execute. Overlay not applied.
0b1111	Reserved - treated as No access. Overlay not applied.

This field is permitted to be cached in a TLB.

When stage 1 Indirect Permission mechanism is disabled, this register is ignored.

Unless otherwise specified, the WXN control is not applied.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PIR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PIR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b011

PIRE0_EL1, Permission Indirection Register 0 (EL1)

The PIRE0_EL1 characteristics are:

Purpose

Stage 1 Permission Indirection Register for unprivileged access of the EL1&0 translation regime.

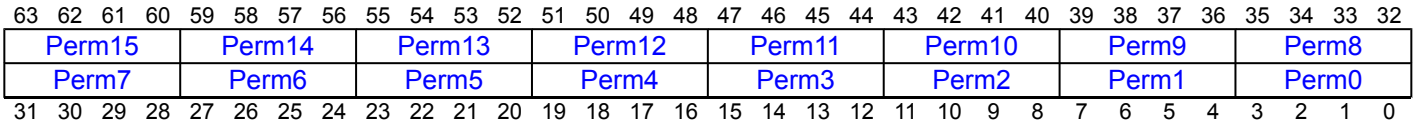
Configuration

This register is present only when FEAT_S1PIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PIRE0_EL1 are UNDEFINED.

Attributes

PIRE0_EL1 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Represents stage 1 Base Permissions.

Perm<m>	Meaning
0b0000	No access. Overlay applied.
0b0001	Read. Overlay applied.
0b0010	Execute. Overlay applied.
0b0011	Read and Execute. Overlay applied.
0b0100	Reserved - treated as No access. Overlay applied.
0b0101	Read and Write. Overlay applied.
0b0110	Read, Write, and Execute. Overlay applied. WXN control applied.
0b0111	Read, Write, and Execute. Overlay applied.
0b1000	Read. Overlay not applied.
0b1001	Read, GCS Read, and GCS Write. Overlay not applied.
0b1010	Read and Execute. Overlay not applied.
0b1011	Reserved - treated as No access. Overlay not applied.
0b1100	Read and Write. Overlay not applied.
0b1101	Reserved - treated as No access. Overlay not applied.
0b1110	Read, Write, and Execute. Overlay not applied.
0b1111	Reserved - treated as No access. Overlay not applied.

This field is permitted to be cached in a TLB.

When stage 1 Indirect Permission mechanism is disabled, this register is ignored.

Unless otherwise specified, the WXN control is not applied.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PIRE0_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name PIRE0_EL1 or PIRE0_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```

PM, Profiling Exception Mask

The PM characteristics are:

Purpose

Allows access to the Profiling exception Mask bit.

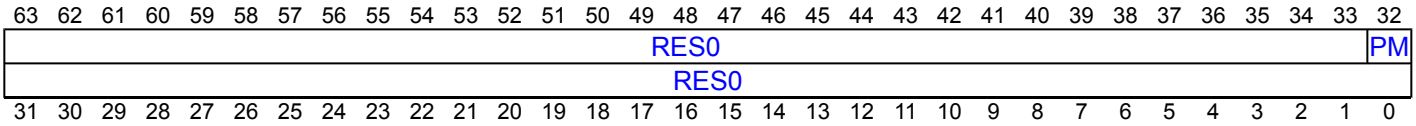
Configuration

This register is present only when FEAT_EBEP is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PM are UNDEFINED.

Attributes

PM is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

PM, bit [32]

PMU Exception Mask.

PM	Meaning
0b0	Does not cause the Profiling exception to be masked.
0b1	Causes the Profiling exception to be masked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

Accessing PM

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PM
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0011	0b001

```
if !(IsFeatureImplemented(FEAT_EBEP) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    X[t, 64] = Zeros(31):PSTATE.PM:Zeros(32);
elsif PSTATE.EL == EL2 then
    X[t, 64] = Zeros(31):PSTATE.PM:Zeros(32);
elsif PSTATE.EL == EL3 then
    X[t, 64] = Zeros(31):PSTATE.PM:Zeros(32);
```

MSR PM, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0011	0b001

```
if !(IsFeatureImplemented(FEAT_EBEP) && IsFeatureImplemented(FEAT_AA64)) then

PMBIDR_EL1, Profiling Buffer ID Register

The PMBIDR_EL1 characteristics are:

Purpose

Provides information to software as to whether the buffer can be programmed at the current Exception level.

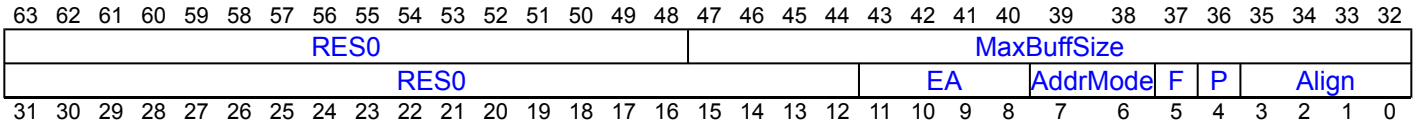
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBIDR_EL1 are UNDEFINED.

Attributes

PMBIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

MaxBuffSize, bits [47:32]

Maximum supported Profiling Buffer size. Reserved for software use.

The only permitted value is `0x0000`, indicating there is no limit to the maximum buffer size.

Note

Permitted values relate to the values an implementation is permitted to set this field to. A hypervisor might trap accesses to this register and use other values to describe limitations of its virtualization support to a guest operating system, as follows:

- MaxBuffSize bits[8:0] encodes a mantissa value, M.
- MaxBuffSize bits[13:9] encodes an exponent value, E.
- MaxBuffSize bits[15:14] are reserved.

The maximum buffer size, in bytes, is expressed using the following function:

if IsZero(E) then UInt(M:Zeros(12)) else UInt('1':M:Zeros(UInt(E)+11))

For example:

- A value of `0x0001` means a maximum buffer size of 4KB.
- A value of `0x3FFF` means a maximum buffer size of 4092TB.

Reads as `0x0000`.

Access to this field is **RO**.

Bits [31:12]

Reserved, RES0.

EA, bits [11:8]

External Abort handling. Describes how the PE manages External aborts on writes made by the Statistical Profiling Unit to the Profiling Buffer.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EA	Meaning
0b0000	Not described.
0b0001	The PE ignores External aborts on writes made by the Statistical Profiling Unit.
0b0010	An External abort on a write made by the Statistical Profiling Unit generates an asynchronous SError exception at the PE.

All other values are reserved.

From Armv8.8, the value 0b0000 is not permitted.

PMBIDR_EL1.EA describes only External aborts generated by the write to memory. External aborts on a translation table walk made by the Statistical Profiling Unit generate Profiling Buffer management events reported as MMU faults using PMBSR_ELx.

Access to this field is **RO**.

AddrMode, bits [7:6]

When FEAT_SPE_nVM is implemented:

Address Modes. Describes the addressing modes available for the Profiling Buffer.

AddrMode	Meaning
0b00	Only virtual address mode is supported.
0b01	Virtual and physical address modes are supported.
0b11	Reserved for software use under virtualization, to show that only physical address mode is supported.

Other values are reserved.

If the Effective value of PMSCR_EL2.EnVM is 1 and the value returned for PMBIDR_EL1.P is 0, then this field reads as 0b01. Otherwise, this field reads as 0b00.

Note

A hypervisor might trap accesses to this register to describe limitations of its virtualization support to a guest operating system.

Otherwise:

Reserved, RES0.

F, bit [5]

Flag updates. Describes how address translations performed by the Statistical Profiling Unit manage the Access flag and dirty state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F	Meaning
0b0	Hardware management of the Access flag and dirty state for accesses made by the Statistical Profiling Unit is always disabled for all translation stages.
0b1	Hardware management of the Access flag and dirty state for accesses made by the Statistical Profiling Unit is controlled in the same way as explicit memory accesses in the Profiling Buffer owning translation regime.

Note

If hardware management of the Access flag is disabled for a stage of translation, an access to a Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor and might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

From Armv8.8, the value 0 is not permitted.

Access to this field is **RO**.

P, bit [4]

Programming not allowed. When read at EL3, this field reads as zero. Otherwise, indicates that the Profiling Buffer owning Exception level is a higher Exception level or the Profiling Buffer owning Security state is not the current Security state.

P	Meaning
0b0	Programming is allowed.
0b1	Programming not allowed.

The value read from this field depends on the current Exception level and the Effective values of MDCR_EL3.NSPB, MDCR_EL3.NSPBE, and MDCR_EL2.E2PB:

- If EL3 is implemented, MDCR_EL3.NSPB is 0b0x, and either FEAT_RME is not implemented, or Secure state is implemented and MDCR_EL3.NSPBE is 0, then this field reads as one from:
  - Non-secure EL1 and Non-secure EL2.
  - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
  - If Secure EL2 is implemented and enabled, and MDCR_EL2.E2PB is 0b00, Secure EL1.
- If EL3 is implemented, MDCR_EL3.NSPB is 0b1x and either FEAT_RME is not implemented or MDCR_EL3.NSPBE is 0, then this field reads as one from:
  - If Secure state is implemented, Secure EL1.
  - If Secure EL2 is implemented, Secure EL2.
  - If EL2 is implemented and MDCR_EL2.E2PB is 0b00, Non-secure EL1.
  - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
- If FEAT_RME is implemented, and MDCR_EL3.{NSPB, NSPBE} is {0b1x, 1}, then this field reads as one from:
  - Non-secure EL1 and Non-secure EL2.
  - If Secure state is implemented, Secure EL1 and Secure EL2.
  - If MDCR_EL2.E2PB is 0b00, Realm EL1.
- If EL3 is not implemented, EL2 is implemented, and MDCR_EL2.E2PB is 0b00, then this field reads as one from EL1.

Otherwise, this field reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for writes to PMBPTR_EL1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Align	Meaning
0b0000	Byte.
0b0001	Halfword.
0b0010	Word.
0b0011	Doubleword.
0b0100	16 bytes.
0b0101	32 bytes.
0b0110	64 bytes.
0b0111	128 bytes.
0b1000	256 bytes.
0b1001	512 bytes.
0b1010	1KB.
0b1011	2KB.

All other values are reserved.

For more information, see 'Restrictions on the current write pointer'.

If this field is nonzero, then every record is a multiple of this size.

Access to this field is **RO**.

Accessing PMBIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMBIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1010	0b111

```
if !IsFeatureImplemented(FEAT_SPE) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HDFGRTR_EL2.PMBIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        X[t, 64] = PMBIDR_EL1;
elsif PSTATE.EL == EL2 then
    X[t, 64] = PMBIDR_EL1;
elsif PSTATE.EL == EL3 then
    X[t, 64] = PMBIDR_EL1;
```

PMBLIMITR_EL1, Profiling Buffer Limit Address Register

The PMBLIMITR_EL1 characteristics are:

Purpose

Defines the upper limit for the profiling buffer, and enables the profiling buffer

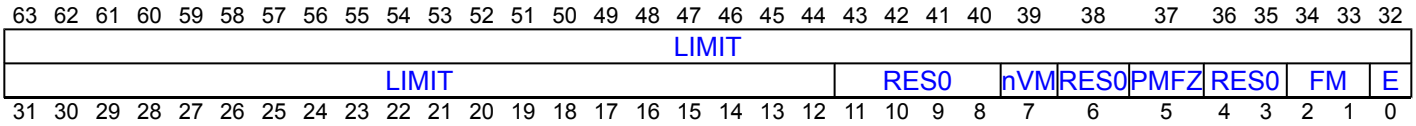
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBLIMITR_EL1 are UNDEFINED.

Attributes

PMBLIMITR_EL1 is a 64-bit register.

Field descriptions



LIMIT, bits [63:12]

Limit address. PMBLIMITR_EL1.LIMIT:Zeros(12) is the address of the first byte in memory after the last byte in the profiling buffer. If the smallest implemented translation granule is not 4KB, then bits[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value, Log_2(smallest implemented translation granule).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:8]

Reserved, RES0.

nVM, bit [7]

When FEAT_SPE_nVM is implemented:

Address mode.

nVM	Meaning
0b0	The Profiling Buffer pointers are virtual addresses.
0b1	The Profiling Buffer pointers are: • Physical address in the owning security state if the owning translation regime has no stage 2 translation. • Intermediate physical addresses in the owning security state if the owning translation regime has stage 2 translations.

If the Effective value of PMSCR_EL2.EnVM is 0, then the PE ignores the value of this field, and the Profiling Buffer pointers are always virtual addresses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RW**.

Otherwise:

Reserved, RES0.

Bit [6]

Reserved, RES0.

PMFZ, bit [5]

When FEAT_SPEv1p2 is implemented:

Freeze PMU on SPE event. Stop PMU event counters when PMBSR_EL1.S == 1.

PMFZ	Meaning
0b0	Do not freeze PMU event counters on Statistical Profiling Buffer Management event.
0b1	Freeze PMU event counters on Statistical Profiling Buffer Management event.

The PMU event counters affected by this control is controlled by PMCR_EL0.FZS and, if EL2 is implemented, MDCR_EL2.HPMFZS. See the descriptions of these control bits for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

FM, bits [2:1]

Fill mode.

FM	Meaning	Applies when
0b00	Fill mode. Stop collection and raise maintenance interrupt on buffer fill.	
0b10	Discard mode. All output is discarded.	When FEAT_SPEv1p2 is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Profiling Buffer enable

E	Meaning
0b0	All output is discarded.
0b1	Profiling buffer enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Accessing PMBLIMITR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMBLIMITR_EL1
```

PMBMAR_EL1, Profiling Buffer Memory Attribute Register

The PMBMAR_EL1 characteristics are:

Purpose

Controls Statistical Profiling Unit accesses to memory.

If the Profiling Buffer pointers specify virtual addresses, the address properties are defined by the translation tables and this register is ignored.

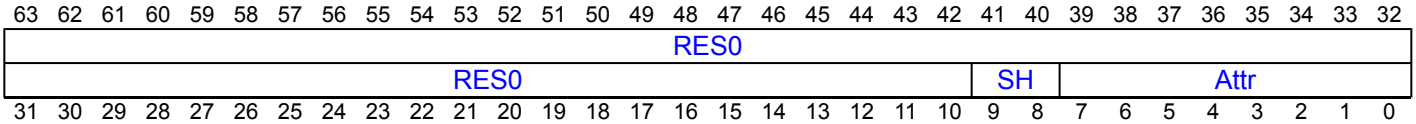
Configuration

This register is present only when FEAT_SPE_nVM is implemented. Otherwise, direct accesses to PMBMAR_EL1 are UNDEFINED.

Attributes

PMBMAR_EL1 is a 64-bit register.

Field descriptions



Bits [63:10]

Reserved, RES0.

SH, bits [9:8]

Profiling Buffer shareability domain. Defines the shareability domain for Normal memory used by the Profiling Buffer.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when PMBMAR_EL1.Attr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Attr, bits [7:0]

Profiling Buffer memory type and attributes. Defines the memory type and, for Normal memory, the cacheability attributes, for memory addressed by the Profiling Buffer.

The encoding of this field is the same as that of a MAIR_ELx.Attr<n> field, as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000		If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMBPTR_EL1, Profiling Buffer Write Pointer Register

The PMBPTR_EL1 characteristics are:

Purpose

Defines the current write pointer for the profiling buffer.

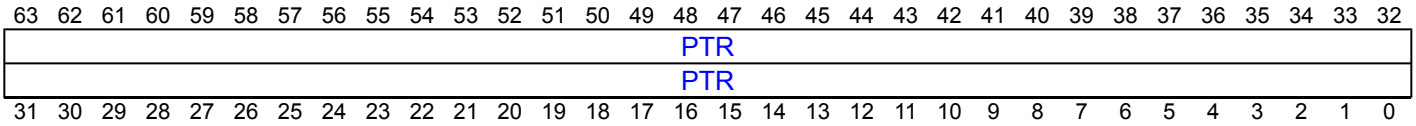
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBPTR_EL1 are UNDEFINED.

Attributes

PMBPTR_EL1 is a 64-bit register.

Field descriptions



PTR, bits [63:0]

Current write address. Defines the virtual address of the next entry to be written to the buffer.

If PMBIDR_EL1.Align is not zero, then it is IMPLEMENTATION DEFINED whether bits [M-1:0] are RES0 or read/write, where M is an integer between 1 and PMBIDR_EL1.Align inclusive.

The architecture places restrictions on the values software can write to the pointer when the SPU is not in Discard mode. For more information see 'Restrictions on the current write pointer'.

On a management interrupt, PMBPTR_EL1 is frozen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMBPTR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMBPTR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1010	0b001

```

PMBSR_EL1, Profiling Buffer Status/syndrome Register (EL1)

The PMBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software for a Profiling Buffer management event.

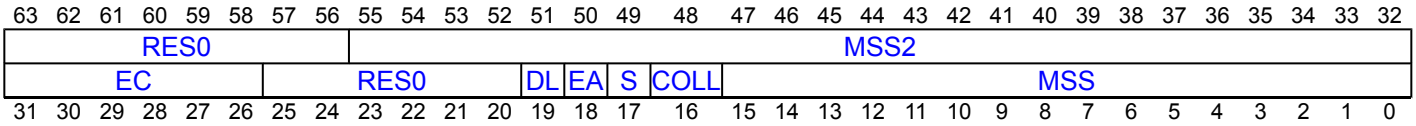
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBSR_EL1 are UNDEFINED.

Attributes

PMBSR_EL1 is a 64-bit register.

Field descriptions



Bits [63:56]

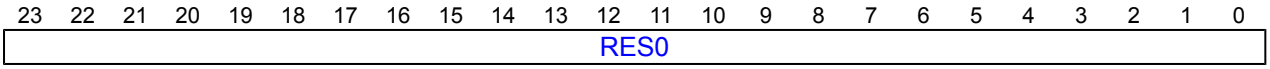
Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

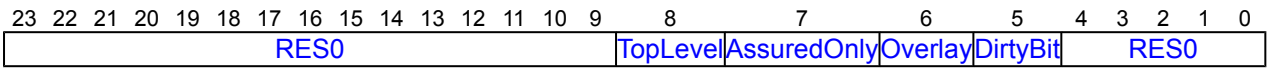
MSS2 encoding for other Profiling Buffer management events



Bits [23:0]

Reserved, RES0.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer



Bits [23:9]

Reserved, RES0.

TopLevel, bit [8]

When FEAT_THE is implemented:

TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]

When FEAT_THE is implemented, PMBSR_EL1.EC == 0b100101, and GetPMBSR_EL1_FSC() IN {0b0011xx}:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]

When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetPMBSR_EL1_FSC() IN {0b0011xx}:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]

When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetPMBSR_EL1_FSC() IN {0b0011xx}:

DirtyBit flag. If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

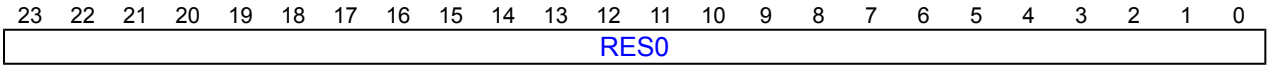
Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

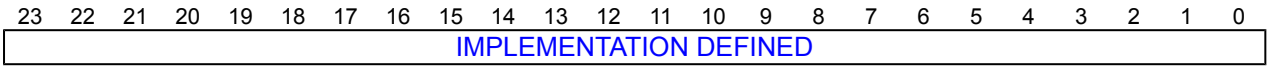
MSS2 encoding for Granule Protection Check faults on write to Profiling Buffer



Bits [23:0]

Reserved, RES0.

MSS2 encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason



IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

EC, bits [31:26]

Event class. Top-level description of the cause of the Profiling Buffer management event.

EC	Meaning	MSS	MSS2	Applies when
0b000000	Other Profiling Buffer management event. All Profiling Buffer management events other than those described by the other defined Event class codes.	MSS encoding for other Profiling Buffer management events	MSS2 encoding for other Profiling Buffer management events	
0b011110	Granule Protection Check fault on write to Profiling Buffer, other than Granule Protection Fault (GPF). That is, any of the following: • Granule Protection Table (GPT) address size fault. • GPT walk fault. • Synchronous External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for Granule Protection Check faults on write to Profiling Buffer	MSS2 encoding for Granule Protection Check faults on write to Profiling Buffer	When FEAT_RME is implemented
0b011111	Profiling Buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason	MSS2 encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	
0b100101	Stage 2 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:20]

Reserved, RES0.

DL, bit [19]

Partial record lost. Following a buffer management event other than an asynchronous External abort, indicates whether the last record written to the Profiling Buffer is complete.

DL	Meaning
0b0	PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer.
0b1	Part of a record was lost because of a buffer management event or synchronous External abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse.

When the buffer management event was because of an asynchronous External abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if the PE never sets this bit as a result of a buffer management event caused by an asynchronous External abort.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [18]

External abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Statistical Profiling Unit.

This bit is RES0 if the PE never sets this bit as the result of an External abort.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [17]

Service. Indicates that a Profiling Buffer management event has been recorded.

S	Meaning
0b0	No Profiling Buffer management event for EL1 has been recorded.
0b1	A Profiling Buffer management event for EL1 has been recorded.

When FEAT_SPE_EXC is implemented, this field indicates a management event for EL1.

If FEAT_SPE_EXC is implemented and the SPE Profiling exception for EL1 is enabled, then when this field is 1, an SPE Profiling exception for EL1 is pending

If FEAT_SPE_EXC is not implemented or the SPE Profiling exception for EL1 is disabled, then this field drives the **PMBIRQ** Profiling Buffer interrupt request signal.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COLL, bit [16]

Collision detected.

COLL	Meaning
0b0	No collision events detected.
0b1	At least one collision event was recorded.

The reset behavior of this field is:

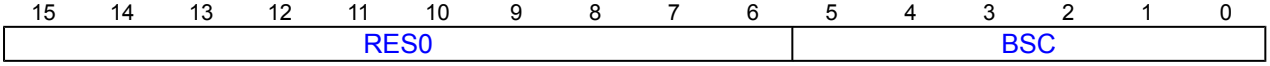
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the Profiling Buffer management event.

The syndrome contents for each Profiling Buffer management event are described in the following sections.

MSS encoding for other Profiling Buffer management events



Bits [15:6]

Reserved, RES0.

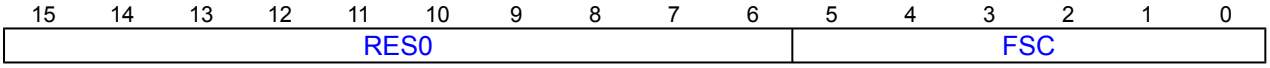
BSC, bits [5:0]

Profiling Buffer status code

BSC	Meaning
0b000000	Collection not stopped, or access not allowed.
0b000001	Profiling Buffer filled.
0b000100	Buffer size. The requested Profiling Buffer size was too large.

All other values are reserved.

MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer



Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented

0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

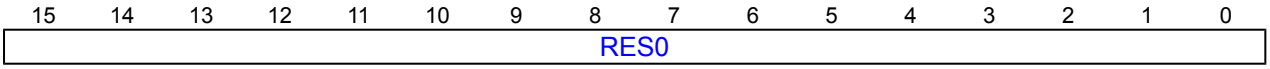
All other values are reserved.

It is IMPLEMENTATION DEFINED whether each of the Access Flag fault, asynchronous External abort and synchronous External abort, Alignment fault, and TLB Conflict abort values can be generated by the PE. For more information see 'Faults and Watchpoints'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check faults on write to Profiling Buffer



Bits [15:0]

Reserved, RES0.

MSS encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

Accessing PMBSR_EL1

When the Effective value of HCR_EL2.E2H is 1 and FEAT_SPE_EXC is implemented, without explicit synchronization, accesses from EL3 using the accessor name PMBSR_EL1 or PMBSR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMBSR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1010	0b011

```

PMBSR_EL2, Profiling Buffer Syndrome Register (EL2)

The PMBSR_EL2 characteristics are:

Purpose

Provides syndrome information to software for a Profiling Buffer management event.

Configuration

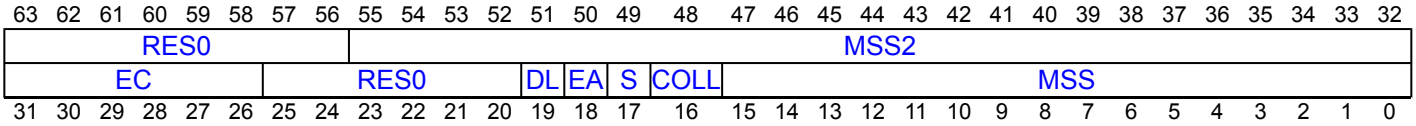
This register is present only when FEAT_SPE_EXC is implemented. Otherwise, direct accesses to PMBSR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

PMBSR_EL2 is a 64-bit register.

Field descriptions



Bits [63:56]

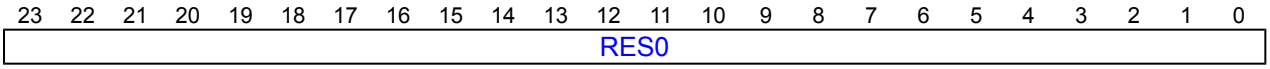
Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

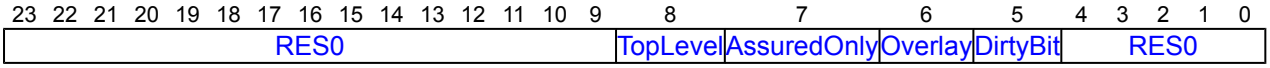
MSS2 encoding for other Profiling Buffer management events



Bits [23:0]

Reserved, RES0.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer



Bits [23:9]

Reserved, RES0.

TopLevel, bit [8]

When FEAT_THE is implemented:

TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]

When FEAT_THE is implemented, PMBSR_EL2.EC == 0b100101, and GetPMBSR_EL2_FSC() IN {0b0011xx}:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]

When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetPMBSR_EL2_FSC() IN {0b0011xx}:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]

When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetPMBSR_EL2_FSC() IN {0b0011xx}:

DirtyBit flag. If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

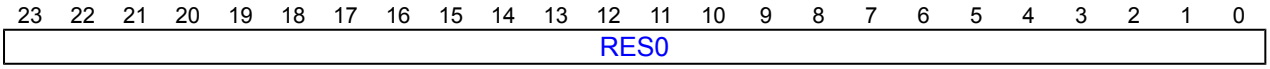
Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

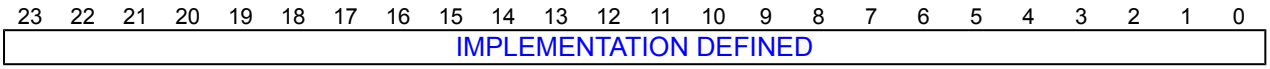
MSS2 encoding for Granule Protection Check faults on write to Profiling Buffer



Bits [23:0]

Reserved, RES0.

MSS2 encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason



IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

EC, bits [31:26]

Event class. Top-level description of the cause of the Profiling Buffer management event.

EC	Meaning	MSS	MSS2	Applies when
0b000000	Other Profiling Buffer management event. All Profiling Buffer management events other than those described by the other defined Event class codes.	MSS encoding for other Profiling Buffer management events	MSS2 encoding for other Profiling Buffer management events	
0b011110	Granule Protection Check fault on write to Profiling Buffer, other than Granule Protection Fault (GPF). That is, any of the following: • Granule Protection Table (GPT) address size fault. • GPT walk fault. • Synchronous External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for Granule Protection Check faults on write to Profiling Buffer	MSS2 encoding for Granule Protection Check faults on write to Profiling Buffer	When FEAT_RME is implemented
0b011111	Profiling Buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason	MSS2 encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	
0b100101	Stage 2 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:20]

Reserved, RES0.

DL, bit [19]

Partial record lost. Following a buffer management event other than an asynchronous External abort, indicates whether the last record written to the Profiling Buffer is complete.

DL	Meaning
0b0	PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer.
0b1	Part of a record was lost because of a buffer management event or synchronous External abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse.

When the buffer management event was because of an asynchronous External abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if the PE never sets this bit as a result of a buffer management event caused by an asynchronous External abort.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [18]

External abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Statistical Profiling Unit.

This bit is RES0 if the PE never sets this bit as the result of an External abort.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [17]

Service. Indicates that a Profiling Buffer management event has been recorded.

S	Meaning
0b0	No Profiling Buffer management event for EL2 has been recorded.
0b1	A Profiling Buffer management event for EL2 has been recorded.

When FEAT_SPE_EXC is implemented, this field indicates a management event for EL2.

If the SPE Profiling exception for EL2 is enabled, then when this field is 1, an SPE Profiling exception for EL2 is pending

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COLL, bit [16]

Collision detected.

COLL	Meaning
0b0	No collision events detected.
0b1	At least one collision event was recorded.

The reset behavior of this field is:

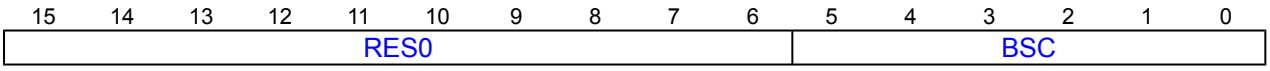
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the Profiling Buffer management event.

The syndrome contents for each Profiling Buffer management event are described in the following sections.

MSS encoding for other Profiling Buffer management events



Bits [15:6]

Reserved, RES0.

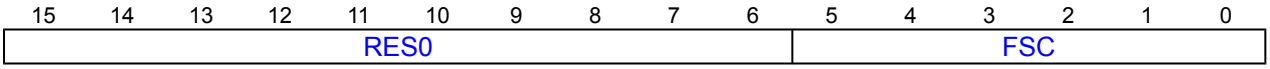
BSC, bits [5:0]

Profiling Buffer status code

BSC	Meaning
0b000000	Collection not stopped, or access not allowed.
0b000001	Profiling Buffer filled.
0b000100	Buffer size. The requested Profiling Buffer size was too large.

All other values are reserved.

MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer



Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented

0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

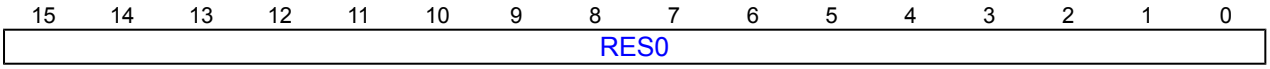
All other values are reserved.

It is IMPLEMENTATION DEFINED whether each of the Access Flag fault, asynchronous External abort and synchronous External abort, Alignment fault, and TLB Conflict abort values can be generated by the PE. For more information see 'Faults and Watchpoints'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check faults on write to Profiling Buffer



Bits [15:0]

Reserved, RES0.

MSS encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

Accessing PMBSR_EL2

When the Effective value of HCR_EL2.E2H is 1 and FEAT_SPE_EXC is implemented, without explicit synchronization, accesses from EL2 using the accessor name PMBSR_EL2 or PMBSR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMBSR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1001	0b1010	0b011

```
if !IsFeatureImplemented(FEAT_SPE_EXC) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then

PMBSR_EL3, Profiling Buffer Syndrome Register (EL3)

The PMBSR_EL3 characteristics are:

Purpose

Provides syndrome information to software for a Profiling Buffer management event.

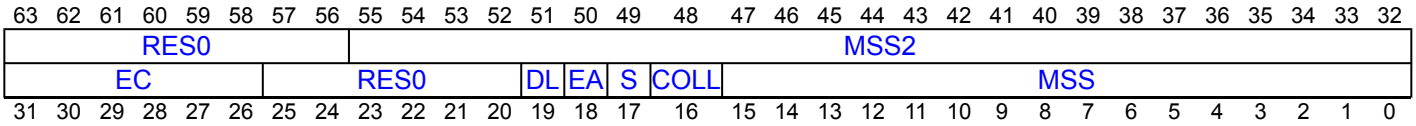
Configuration

This register is present only when FEAT_SPE_EXC is implemented and EL3 is implemented. Otherwise, direct accesses to PMBSR_EL3 are UNDEFINED.

Attributes

PMBSR_EL3 is a 64-bit register.

Field descriptions



Bits [63:56]

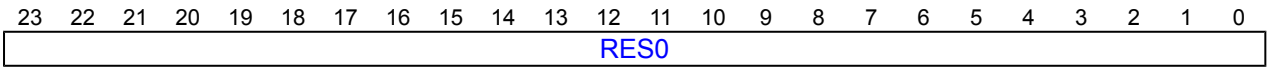
Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

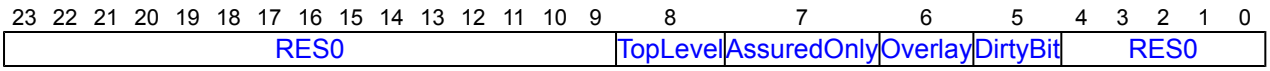
MSS2 encoding for other Profiling Buffer management events



Bits [23:0]

Reserved, RES0.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer



Bits [23:9]

Reserved, RES0.

TopLevel, bit [8]

When FEAT_THE is implemented:

TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]

When FEAT_THE is implemented, PMBSR_EL3.EC == 0b100101, and GetPMBSR_EL3_FSC() IN {0b0011xx}:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]

When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetPMBSR_EL3_FSC() IN {0b0011xx}:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]

When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetPMBSR_EL3_FSC() IN {0b0011xx}:

DirtyBit flag. If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

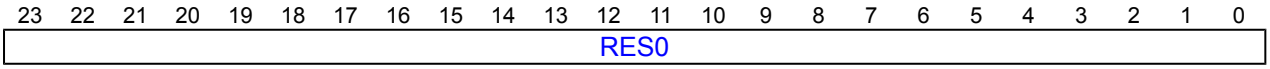
Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

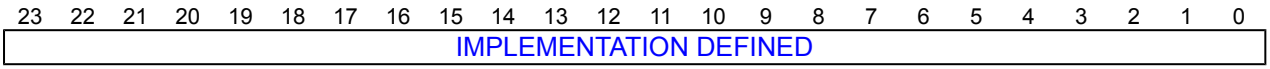
MSS2 encoding for Granule Protection Check faults on write to Profiling Buffer



Bits [23:0]

Reserved, RES0.

MSS2 encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason



IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

EC, bits [31:26]

Event class. Top-level description of the cause of the Profiling Buffer management event.

EC	Meaning	MSS	MSS2	Applies when
0b000000	Other Profiling Buffer management event. All Profiling Buffer management events other than those described by the other defined Event class codes.	MSS encoding for other Profiling Buffer management events	MSS2 encoding for other Profiling Buffer management events	
0b011110	Granule Protection Check fault on write to Profiling Buffer, other than Granule Protection Fault (GPF). That is, any of the following: • Granule Protection Table (GPT) address size fault. • GPT walk fault. • Synchronous External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for Granule Protection Check faults on write to Profiling Buffer	MSS2 encoding for Granule Protection Check faults on write to Profiling Buffer	When FEAT_RME is implemented
0b011111	Profiling Buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason	MSS2 encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	
0b100101	Stage 2 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:20]

Reserved, RES0.

DL, bit [19]

Partial record lost. Following a buffer management event other than an asynchronous External abort, indicates whether the last record written to the Profiling Buffer is complete.

DL	Meaning
0b0	PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer.
0b1	Part of a record was lost because of a buffer management event or synchronous External abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse.

When the buffer management event was because of an asynchronous External abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if the PE never sets this bit as a result of a buffer management event caused by an asynchronous External abort.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [18]

External abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Statistical Profiling Unit.

This bit is RES0 if the PE never sets this bit as the result of an External abort.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [17]

Service. Indicates that a Profiling Buffer management event has been recorded.

S	Meaning
0b0	No Profiling Buffer management event for EL3 has been recorded.
0b1	A Profiling Buffer management event for EL3 has been recorded.

When FEAT_SPE_EXC is implemented, this field indicates a management event for EL3.

If the SPE Profiling exception for EL3 is enabled, then when this field is 1, an SPE Profiling exception for EL3 is pending

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COLL, bit [16]

Collision detected.

COLL	Meaning
0b0	No collision events detected.
0b1	At least one collision event was recorded.

The reset behavior of this field is:

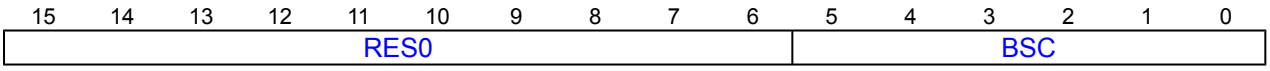
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the Profiling Buffer management event.

The syndrome contents for each Profiling Buffer management event are described in the following sections.

MSS encoding for other Profiling Buffer management events



Bits [15:6]

Reserved, RES0.

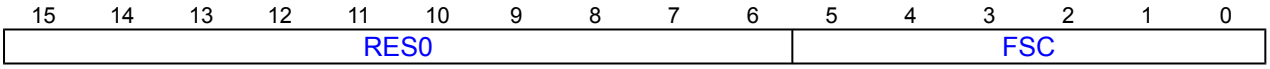
BSC, bits [5:0]

Profiling Buffer status code

BSC	Meaning
0b000000	Collection not stopped, or access not allowed.
0b000001	Profiling Buffer filled.
0b000100	Buffer size. The requested Profiling Buffer size was too large.

All other values are reserved.

MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer



Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented

0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

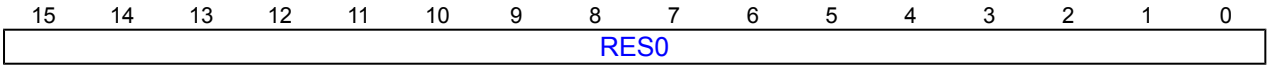
All other values are reserved.

It is IMPLEMENTATION DEFINED whether each of the Access Flag fault, asynchronous External abort and synchronous External abort, Alignment fault, and TLB Conflict abort values can be generated by the PE. For more information see 'Faults and Watchpoints'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check faults on write to Profiling Buffer



Bits [15:0]

Reserved, RES0.

MSS encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

Accessing PMBSR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMBSR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1001	0b1010	0b011

```
if !(IsFeatureImplemented(FEAT_SPE_EXC) && HaveEL(EL3)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = PMBSR_EL3;
```

```
MSR PMBSR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1001	0b1010	0b011

```
if !(IsFeatureImplemented(FEAT_SPE_EXC) && HaveEL(EL3)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    PMBSR_EL3 = X[t, 64];
```

PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

Configuration

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0].

AArch64 System register PMCCFILTR_EL0 bits [63:32] are architecturally mapped to External register PMCCFILTR_EL0[63:32] when FEAT_PMUv3_TH is implemented, or FEAT_PMUv3p8 is implemented, or FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3_SME is implemented.

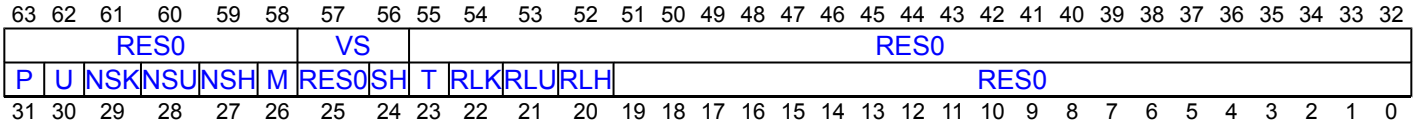
AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to External register PMCCFILTR_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are UNDEFINED.

Attributes

PMCCFILTR_EL0 is a 64-bit register.

Field descriptions



Bits [63:58]

Reserved, RES0.

VS, bits [57:56]

When FEAT_PMUv3_SME is implemented:

SVE mode filtering. Controls counting cycles in Streaming and Non-streaming SVE modes.

VS	Meaning
0b00	This mechanism has no effect on the filtering of cycles.
0b01	The PE does not count cycles in Streaming SVE mode.
0b10	The PE does not count cycles in Non-streaming SVE mode.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [55:32]

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting cycles in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL1.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL1 is further controlled by PMCCFILTR_EL0.NSK.

If FEAT_RME is implemented, then counting cycles in Realm EL1 is further controlled by PMCCFILTR_EL0.RLK.

If EL3 is implemented, then counting cycles in EL3 is further controlled by PMCCFILTR_EL0.M.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting cycles in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL0.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL0 is further controlled by PMCCFILTR_EL0.NSU.

If FEAT_RME is implemented, then counting cycles in Realm EL0 is further controlled by PMCCFILTR_EL0.RLU.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 filtering. Controls counting cycles in Non-secure EL1. If PMCCFILTR_EL0.NSK is not equal to PMCCFILTR_EL0.P, then the PE does not count cycles in Non-secure EL1. Otherwise, this mechanism has no effect on filtering of cycles in Non-secure EL1.

NSK	Meaning
0b0	When PMCCFILTR_EL0.P == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.P == 1, the PE does not count cycles in Non-secure EL1.
0b1	When PMCCFILTR_EL0.P == 0, the PE does not count cycles in Non-secure EL1. When PMCCFILTR_EL0.P == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]
When EL3 is implemented:

Non-secure EL0 filtering. Controls counting cycles in Non-secure EL0. If PMCCFILTR_EL0.NSU is not equal to PMCCFILTR_EL0.U, then the PE does not count cycles in Non-secure EL0. Otherwise, this mechanism has no effect on filtering of cycles in Non-secure EL0.

NSU	Meaning
0b0	When PMCCFILTR_EL0.U == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.U == 1, the PE does not count cycles in Non-secure EL0.
0b1	When PMCCFILTR_EL0.U == 0, the PE does not count cycles in Non-secure EL0. When PMCCFILTR_EL0.U == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]
When EL2 is implemented:

EL2 filtering. Controls counting cycles in EL2.

NSH	Meaning
0b0	The PE does not count cycles in EL2.
0b1	This mechanism has no effect on filtering of cycles.

If EL3 is implemented and FEAT_SEL2 is implemented, then counting cycles in Secure EL2 is further controlled by PMCCFILTR_EL0.SH.

If FEAT_RME is implemented, then counting cycles in Realm EL2 is further controlled by PMCCFILTR_EL0.RLH.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]
When EL3 is implemented:

EL3 filtering. Controls counting cycles in EL3. If PMCCFILTR_EL0.M is not equal to PMCCFILTR_EL0.P, then the PE does not count cycles in EL3. Otherwise, this mechanism has no effect on filtering of cycles in EL3.

M	Meaning
0b0	When PMCCFILTR_EL0.P == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.P == 1, the PE does not count cycles in EL3.
0b1	When PMCCFILTR_EL0.P == 0, the PE does not count cycles in EL3. When PMCCFILTR_EL0.P == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

When EL3 is implemented and FEAT_SEL2 is implemented:

Secure EL2 filtering. Controls counting cycles in Secure EL2. If PMCCFILTR_EL0.SH is equal to PMCCFILTR_EL0.NSH, then the PE does not count cycles in Secure EL2. Otherwise, this mechanism has no effect on filtering of cycles in Secure EL2.

SH	Meaning
0b0	When PMCCFILTR_EL0.NSH == 0, the PE does not count cycles in Secure EL2. When PMCCFILTR_EL0.NSH == 1, this mechanism has no effect on filtering of cycles.
0b1	When PMCCFILTR_EL0.NSH == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.NSH == 1, the PE does not count cycles in Secure EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When Secure EL2 is not implemented, access to this field is **RES0**.

Otherwise:

Reserved, RES0.

T, bit [23]

When FEAT_TME is implemented:

Non-Transactional state filtering field. Controls counting of cycles in Non-transactional state.

T	Meaning
0b0	This field has no effect on the filtering of cycles.
0b1	Do not count Attributable cycles in Non-transactional state.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]

When FEAT_RME is implemented:

Realm EL1 filtering. Controls counting cycles in Realm EL1. If PMCCFILTR_EL0.RLK is not equal to PMCCFILTR_EL0.P, then the PE does not count cycles in Realm EL1. Otherwise, this mechanism has no effect on filtering of cycles in Realm EL1.

RLK	Meaning
0b0	When PMCCFILTR_EL0.P == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.P == 1, the PE does not count cycles in Realm EL1.
0b1	When PMCCFILTR_EL0.P == 0, the PE does not count cycles in Realm EL1. When PMCCFILTR_EL0.P == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 filtering. Controls counting cycles in Realm EL0. If PMCCFILTR_EL0.RLU is not equal to PMCCFILTR_EL0.U, then the PE does not count cycles in Realm EL0. Otherwise, this mechanism has no effect on filtering of cycles in Realm EL0.

RLU	Meaning
0b0	When PMCCFILTR_EL0.U == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.U == 1, the PE does not count cycles in Realm EL0.
0b1	When PMCCFILTR_EL0.U == 0, the PE does not count cycles in Realm EL0. When PMCCFILTR_EL0.U == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]

When FEAT_RME is implemented:

Realm EL2 filtering. Controls counting cycles in Realm EL2. If PMCCFILTR_EL0.RLH is equal to PMCCFILTR_EL0.NSH, then the PE does not count cycles in Realm EL2. Otherwise, this mechanism has no effect on filtering of cycles in Realm EL2.

RLH	Meaning
0b0	When PMCCFILTR_EL0.NSH == 0, the PE does not count cycles in Realm EL2. When PMCCFILTR_EL0.NSH == 1, this mechanism has no effect on filtering of cycles.
0b1	When PMCCFILTR_EL0.NSH == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.NSH == 1, the PE does not count cycles in Realm EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

PMCCFILTR_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to 0b11111.

Permitted reads and writes of PMCCFILTR_EL0 are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.C == 0.

Permitted writes of PMCCFILTR_EL0 are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.{UEN,CR} == {1,1}.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMCCFILTR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b1111	0b111

```

PMCCNTR_EL0, Performance Monitors Cycle Count Register

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' for more information.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

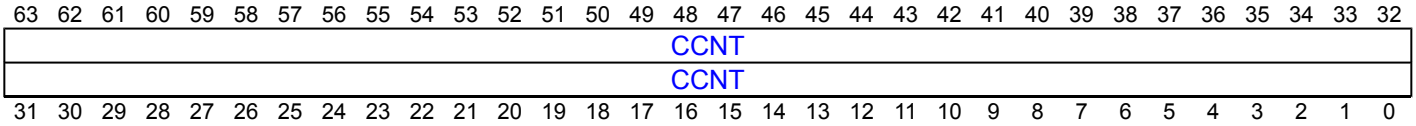
This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are UNDEFINED.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions



CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR_EL0

Permitted reads and writes of PMCCNTR_EL0 are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.C == 0.

Permitted writes of PMCCNTR_EL0 are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.{UEN,CR} == {1,1}.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMCCNTR_EL0

PMCCNTSVR_EL1, Performance Monitors Cycle Count Saved Value Register

The PMCCNTSVR_EL1 characteristics are:

Purpose

Captures the PMU Cycle counter, PMCCNTR_EL0.

Configuration

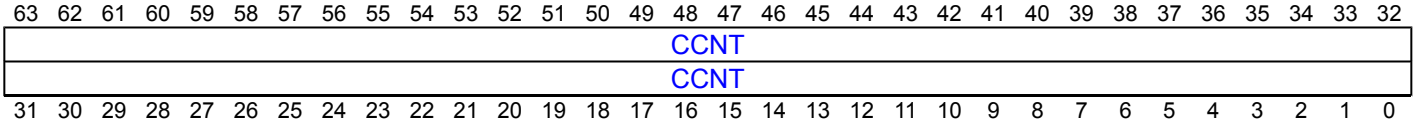
AArch64 System register PMCCNTSVR_EL1 bits [63:0] are architecturally mapped to External register PMCCNTSVR_EL1[63:0].

This register is present only when FEAT_PMUv3_SS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCCNTSVR_EL1 are UNDEFINED.

Attributes

PMCCNTSVR_EL1 is a 64-bit register.

Field descriptions



CCNT, bits [63:0]

Sampled Cycle Count. The value of PMCCNTR_EL0 at the last successful Capture event.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTSVR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMCCNTSVR_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b1110	0b1011	0b111

PMCEID0_EL0, Performance Monitors Common Event Identification Register 0

The PMCEID0_EL0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the ranges `0x0000` to `0x001F` and `0x4000` to `0x401F`.

For more information about the Common events and the use of the PMCEID<n>_EL0 registers see 'The PMU event number space and common events'.

Configuration

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to AArch32 System register PMCEID2[31:0].

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to External register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to External register PMCEID2[31:0].

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCEID0_EL0 are UNDEFINED.

Attributes

PMCEID0_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	
IDhi31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16	IDhi15	IDhi14	IDhi13	IDh
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	

IDhi<n>, bit [n+32], for n = 31 to 0

When FEAT_PMUv3p1 is implemented:

IDhi[n] corresponds to Common event (`0x4000` + n).

For each bit:

IDhi<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Accessing PMCEID0_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMCEID0_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b110

PMCEID1_EL0, Performance Monitors Common Event Identification Register 1

The PMCEID1_EL0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the ranges `0x0020` to `0x003F` and `0x4020` to `0x403F`.

For more information about the Common events and the use of the PMCEID<n>_EL0 registers see 'The PMU event number space and common events'.

Configuration

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID1[31:0].

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to AArch32 System register PMCEID3[31:0].

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to External register PMCEID1[31:0].

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to External register PMCEID3[31:0].

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCEID1_EL0 are UNDEFINED.

Attributes

PMCEID1_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45

PMCNTENCLR_EL0, Performance Monitors Count Enable Clear Register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Allows software to disable the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows which counters are enabled.

Configuration

AArch64 System register PMCNTENCLR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[63:0].

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to External register PMCNTENCLR_EL0[31:0].

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to External register PMCNTENSET_EL0[31:0].

AArch64 System register PMCNTENCLR_EL0 bits [63:32] are architecturally mapped to External register PMCNTENCLR_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

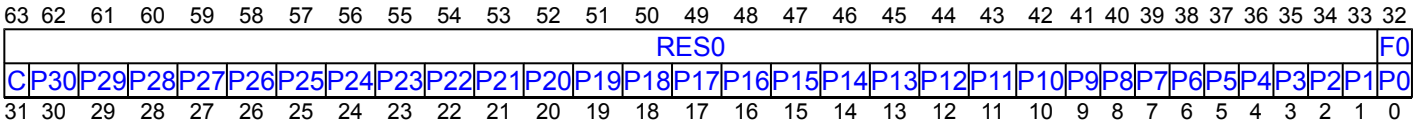
AArch64 System register PMCNTENCLR_EL0 bits [63:32] are architecturally mapped to External register PMCNTENSET_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCNTENCLR_EL0 are UNDEFINED.

Attributes

PMCNTENCLR_EL0 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]

When FEAT_PMUv3_ICNTR is implemented:

PMICNTR_EL0 disable. On writes, allows software to disable PMICNTR_EL0. On reads, returns the PMICNTR_EL0 enable status.

F0	Meaning
0b0	PMICNTR_EL0 disabled.
0b1	PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - EL3 is implemented.
  - PSTATE.EL != EL3.
  - MDCR_EL3.EnPM2 == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 0 or PMUACR_EL1.F0 == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or (HDFGRTR2_EL2.nPMICFILTR_EL0 == 0 and HDFGWTR2_EL2.nPMICFILTR_EL0 == 0).
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL0.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGRTR2_EL2.nPMICFILTR_EL0 == 0.
  - PMUSERENR_EL0.IR == 1.
- Access to this field is **WO/RAZ** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGRTR2_EL2.nPMICFILTR_EL0 == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGWTR2_EL2.nPMICFILTR_EL0 == 0.
- Access to this field is **RO** if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.IR == 1.
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

C, bit [31]

PMCCNTR_EL0 disable. On writes, allows software to disable PMCCNTR_EL0. On reads, returns the PMCCNTR_EL0 enable status.

C	Meaning
0b0	PMCCNTR_EL0 disabled.
0b1	PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 1.
  - PMUACR_EL1.C == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,CR] == 0b11.
- Otherwise, access to this field is **W1C**.

P<m>, bit [m], for m = 30 to 0

PMEVCNTR<m>_EL0 disable. On writes, allows software to disable PMEVCNTR<m>_EL0. On reads, returns the PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 disabled.
0b1	PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 1.
  - PMUACR_EL1.P<m> == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,ER] == 0b11.
- Otherwise, access to this field is **W1C**.

Accessing PMCNTENCLR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```

PMCNTENSET_EL0, Performance Monitors Count Enable Set Register

The PMCNTENSET_EL0 characteristics are:

Purpose

Allows software to enable the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows which counters are enabled.

Configuration

AArch64 System register PMCNTENSET_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[63:0].

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to External register PMCNTENSET_EL0[31:0].

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to External register PMCNTENCLR_EL0[31:0].

AArch64 System register PMCNTENSET_EL0 bits [63:32] are architecturally mapped to External register PMCNTENSET_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

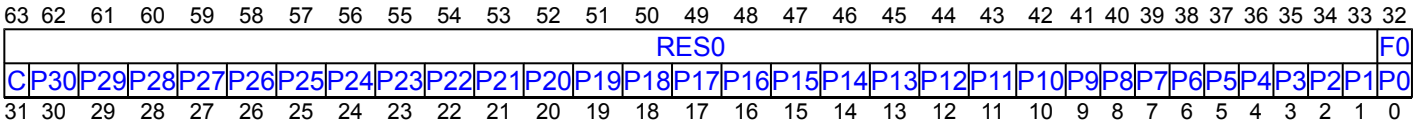
AArch64 System register PMCNTENSET_EL0 bits [63:32] are architecturally mapped to External register PMCNTENCLR_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCNTENSET_EL0 are UNDEFINED.

Attributes

PMCNTENSET_EL0 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]

When FEAT_PMUv3_ICNTR is implemented:

PMICNTR_EL0 enable. On writes, allows software to enable PMICNTR_EL0. On reads, returns the PMICNTR_EL0 enable status.

F0	Meaning
0b0	PMICNTR_EL0 disabled.
0b1	PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - EL3 is implemented.
  - PSTATE.EL != EL3.
  - MDCR_EL3.EnPM2 == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 0 or PMUACR_EL1.F0 == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or (HDFGRTR2_EL2.nPMICFILTR_EL0 == 0 and HDFGWTR2_EL2.nPMICFILTR_EL0 == 0).
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL0.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGRTR2_EL2.nPMICFILTR_EL0 == 0.
  - PMUSERENR_EL0.IR == 1.
- Access to this field is **WO/RAZ** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGRTR2_EL2.nPMICFILTR_EL0 == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGWTR2_EL2.nPMICFILTR_EL0 == 0.
- Access to this field is **RO** if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.IR == 1.
- Otherwise, access to this field is **W1S**.

Otherwise:

Reserved, RES0.

C, bit [31]

PMCCNTR_EL0 enable. On writes, allows software to enable PMCCNTR_EL0. On reads, returns the PMCCNTR_EL0 enable status.

C	Meaning
0b0	PMCCNTR_EL0 disabled.
0b1	PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 1.
  - PMUACR_EL1.C == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,CR] == 0b11.
- Otherwise, access to this field is **W1S**.

P<m>, bit [m], for m = 30 to 0

PMEVCNTR<m>_EL0 enable. On writes, allows software to enable PMEVCNTR<m>_EL0. On reads, returns the PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 disabled.
0b1	PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 1.
  - PMUACR_EL1.P<m> == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,ER] == 0b11.
- Otherwise, access to this field is **W1S**.

Accessing PMCNTENSET_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMCNTENSET_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b001

```

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCR[31:0].

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to External register PMCR_EL0[31:0].

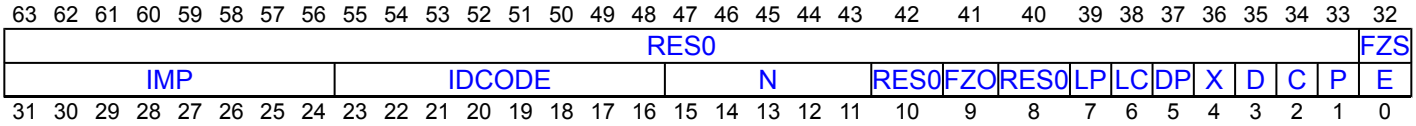
AArch64 System register PMCR_EL0 bits [63:32] are architecturally mapped to External register PMCR_EL0[63:32] when FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCR_EL0 are UNDEFINED.

Attributes

PMCR_EL0 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

FZS, bit [32]

When FEAT_SPEv1p2 is implemented:

Freeze-on-SPE event. Stop counters when PMBLIMITR_EL1.{PMFZ,E} is {1,1} and profiling is stopped.

FZS	Meaning
0b0	Do not freeze on a Statistical Profiling Buffer Management event.
0b1	Affected counters do not count following a Statistical Profiling Buffer Management event.

The pseudocode function `SPEProfilingStopped` describes when profiling is stopped.

The counters affected by this field are:

- The event counters in the first range.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.
- If FEAT_SPE_DPFZS is implemented and PMCR_EL0.DP is 1, the cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

When FEAT_SPE_DPFZS is not implemented or PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA32 is implemented, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMP, bits [31:24]
When FEAT_PMUv3p7 is not implemented:

Implementer code.

If this field is zero, then PMCR_EL0.IDCODE is RES0 and software must use MIDR_EL1 to identify the PE.

Otherwise, this field and PMCR_EL0.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A nonzero value has the same interpretation as MIDR_EL1.Implementer.

Arm deprecates use of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

IDCODE, bits [23:16]
When PMCR_EL0.IMP != 0b00000000:

Identification code. Arm deprecates use of this field.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of `0b00000-0b11111`. If the value is `0b00000`, then only PMCCNTR_EL0 is implemented. If the value is `0b11111`, then PMCCNTR_EL0 and 31 event counters are implemented.

When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the Effective value of MDCR_EL2.HPMN.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Affected counters do not count when any of the following applies: • For any event counter PMEVCNTR<m>_EL0 in the first range, PMOVSCLR_EL0[m] is 1, and either FEAT_SEBEP is not implemented or PMEVTYPER<m>_EL0.SYNC is 0. • FEAT_PMUv3_ICNTR is implemented, PMOVSCLR_EL0.F0 is 1, and either FEAT_SEBEP is not implemented or PMICFILTR_EL0.SYNC is 0.

The counters affected by this field are:

- The event counters in the first range.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.
- If PMCR_EL0.DP is 1, the cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by PMOVSCLR_EL0.P[n].

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[63:0].

When FEAT_EBEP is implemented and the PMU Profiling exception is enabled, the Effective value of this field is 1.

The counters affected by this field are the event counters in the first range. For more information about event counter ranges, see MDCR_EL2.HPMN.

Other event counters and PMCCNTR_EL0 are not affected by this field.

When FEAT_PMUv3_ICNTR is implemented, PMICNTR_EL0 is not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]
When FEAT_AA32 is implemented:

Long cycle counter enable. Determines when unsigned overflow is recorded by PMOVSCLR_EL0.C.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].

When FEAT_EBEP is implemented and the PMU Profiling exception is enabled, the Effective value of this field is 1.

Arm deprecates use of PMCR_EL0.LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]
When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is disabled in prohibited regions and when event counting is frozen: • If FEAT_PMUv3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL2. • If FEAT_SPE_DPFZS is implemented and event counting is frozen by PMCR_EL0.FZS, then cycle counting by PMCCNTR_EL0 is disabled. • If FEAT_PMUv3p7 is implemented and event counting is frozen by PMCR_EL0.FZO, then cycle counting by PMCCNTR_EL0 is disabled. • If FEAT_PMUv3p7 is implemented, EL3 is implemented, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL3. • If EL3 is implemented, MDCR_EL3.SPME is 0, and either FEAT_PMUv3p7 is not implemented or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR_EL0 is disabled at EL3 and in Secure state.

The conditions when this field disables the cycle counter are the same as when event counting by an event counter in the first range is prohibited or frozen. For more information about event counter ranges, see MDCR_EL2.HPMN.

If FEAT_PMUv3p7 and FEAT_SPEv1p2 are implemented, meaning PMCR_EL0.FZS is implemented, and FEAT_SPE_DPFZS is not implemented, then cycle counting by PMCCNTR_EL0 is not affected by PMCR_EL0.FZS.

For more information, see 'Prohibiting event and cycle counting'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

If FEAT_ETE is implemented, this field does not affect the use of PMU events as an External Input by the trace unit.

If FEAT_ETMv4 is implemented, this field does affect the use of PMU events as an External Input by the trace unit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

When FEAT_AA32 is implemented:

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR_EL0 counts every clock cycle.
0b1	When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

If the Effective value of PMCR_EL0.LC is 1, then this field is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this field are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR_EL0 to zero.

Note

Resetting PMCCNTR_EL0 does not change the cycle counter overflow field. The value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset.

P	Meaning
0b0	No action.
0b1	Reset all affected event counters PMEVCNTR<n>_EL0 to zero.

The event counters affected by this field are:

- All event counters in the first range.
- If any of the following are true, all event counters in the second range:
  - EL2 is disabled or not implemented in the current Security state.
  - The PE is executing at EL2 or EL3.

Writes to this field do not affect other event counters, the cycle counter PMCCNTR_EL0, or the instruction counter PMICNTR_EL0.

For more information about event counter ranges, see MDCR_EL2.HPMN.

Note

Resetting the event counters does not change the event counter overflow fields. If FEAT_PMUv3p5 is implemented, the values of MDCR_EL2.HLP and PMCR_EL0.LP are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

E	Meaning
0b0	Affected counters are disabled and do not count.
0b1	Affected counters are enabled by PMCNTENSET_EL0.

The counters affected by this field are:

- The event counters in the first range. For more information about event counter ranges, see MDCR_EL2.HPMN.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.
- The cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

PMECR_EL1, Performance Monitors Extended Control Register (EL1)

The PMECR_EL1 characteristics are:

Purpose

Provides EL1 configuration options for the Performance Monitors.

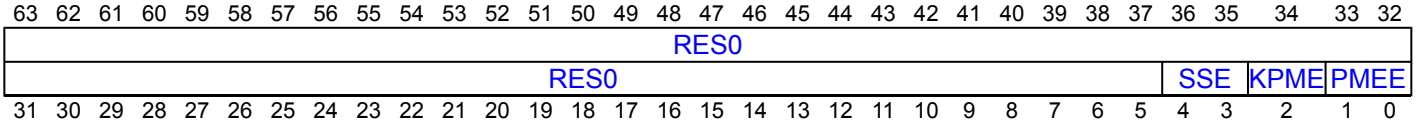
Configuration

This register is present only when (FEAT_EBEP is implemented or FEAT_PMUv3_SS is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to PMECR_EL1 are UNDEFINED.

Attributes

PMECR_EL1 is a 64-bit register.

Field descriptions



Bits [63:5]

Reserved, RES0.

SSE, bits [4:3]

When FEAT_PMUv3_SS is implemented:

Snapshot Enable. Controls the generation of Capture events.

SSE	Meaning
0b00	Capture events are disabled.
0b10	Capture events are enabled and prohibited.
0b11	Capture events are enabled and allowed.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset:
  - When the highest implemented Exception level is EL1, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

KPME, bit [2]

When FEAT_EBEP is implemented:

Local (Kernel) PMU Exception Enable. Enables PMU Profiling exceptions taken to the current Exception level.

KPME	Meaning
0b0	PMU Profiling exceptions taken to the current Exception level are disabled.
0b1	PMU Profiling exceptions taken to the current Exception level are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEE, bits [1:0]

When FEAT_EBEP is implemented:

Performance Monitors Exception Enable. Controls the generation of the **PMUIRQ** signal and the PMU Profiling exception at EL0 and EL1.

PMEE	Meaning
0b00	The **PMUIRQ** signal is asserted on a PMU overflow, and the PMU Profiling exception is disabled.
0b10	The **PMUIRQ** signal is deasserted, and the PMU Profiling exception is disabled.
0b11	The **PMUIRQ** signal is deasserted, and the PMU Profiling exception is enabled.

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- All of the following are true:
  - EL3 is implemented.
  - MDCR_EL3.PMEE != 0b01.
- All of the following are true:
  - EL2 is implemented and enabled in the current Security State.
  - MDCR_EL2.PMEE != 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR<n>[31:0].

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVCNTR<n>_EL0[31:0].

AArch64 System register PMEVCNTR<n>_EL0 bits [63:32] are architecturally mapped to External register PMEVCNTR<n>_EL0[63:32] when FEAT_PMUv3p5 is implemented.

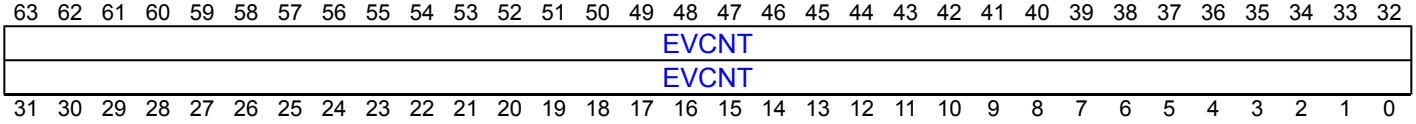
This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMEVCNTR<n>_EL0 are UNDEFINED.

Attributes

PMEVCNTR<n>_EL0 is a 64-bit register.

Field descriptions

When FEAT_PMUv3p5 is implemented:



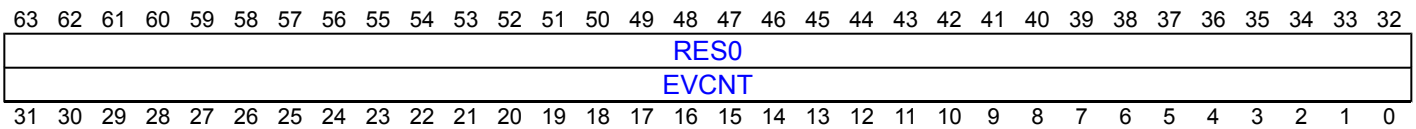
EVCNT, bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:



Bits [63:32]

Reserved, RES0.

EVCNT, bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>_EL0

PMEVCNTR<n>_EL0 can also be accessed by using PMXEVCNTR_EL0 with PMSELR_EL0.SEL set to the value of <n>.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMEVCNTR<n>_EL0 is as follows:

- If <n> is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of PMEVCNTR<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMEVCNTR<n>_EL0 are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.P<n> == 0.

Permitted writes of PMEVCNTR<n>_EL0 are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.{UEN,ER} == {1,1}.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{UEN,ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMEVCNTR<m>_EL0 ; Where m = 0-30
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b10:m[4:3]	m[2:0]

```
integer m = UInt(CRm<1:0>:op2<2:0>);

PMEVCNTSVR<n>_EL1, Performance Monitors Event Count Saved Value Registers, n = 0 - 30

The PMEVCNTSVR<n>_EL1 characteristics are:

Purpose

Captures the PMU Event counter <n>, PMEVCNTR<n>_EL0.

Configuration

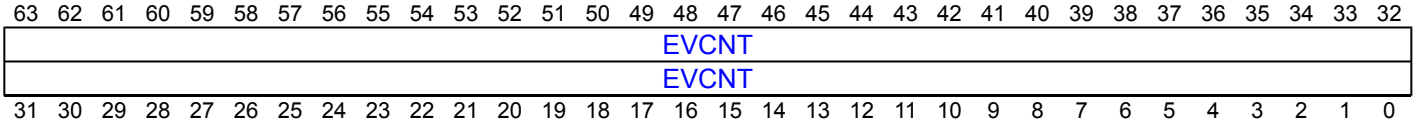
AArch64 System register PMEVCNTSVR<n>_EL1 bits [63:0] are architecturally mapped to External register PMEVCNTSVR<n>_EL1[63:0].

This register is present only when FEAT_PMUv3_SS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMEVCNTSVR<n>_EL1 are UNDEFINED.

Attributes

PMEVCNTSVR<n>_EL1 is a 64-bit register.

Field descriptions



EVCNT, bits [63:0]

Sampled Event Count. The value of PMEVCNTR<n>_EL0 at the last successful Capture event.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTSVR<n>_EL1

If <n> is greater-than-or-equal-to the Effective value of PMCCR.EPMN, then direct reads of PMEVCNTSVR<n>_EL1 are UNDEFINED.

Otherwise, direct reads of PMEVCNTSVR<n>_EL1 generate a Trap exception to EL2 when all of the following are true:

- <n> is greater-than-or-equal-to the number of snapshot registers accessible at the current Exception level.
- EL2 is implemented and enabled in the current Security state.
- The access is from EL1.

Note

If EL2 is implemented and enabled in the current Security state, MDCR_EL2.HPMN identifies the number of accessible snapshot registers at EL1. Otherwise, the number of accessible snapshot registers is the number of implemented event counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMEVCNTSVR<m>_EL1 ; Where m = 0-30
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b1110	0b10:m[4:3]	m[2:0]

```
integer m = UInt(CRm<1:0>:op2<2:0>);

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVTYPER<n>[31:0].

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVTYPER<n>_EL0[31:0].

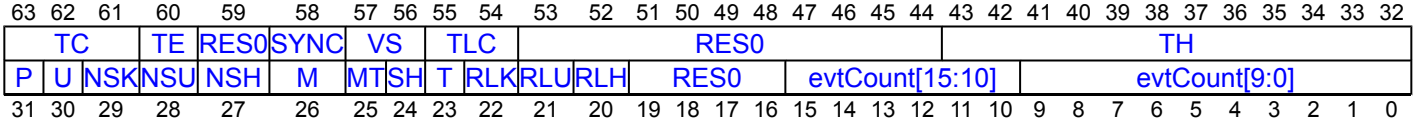
AArch64 System register PMEVTYPER<n>_EL0 bits [63:32] are architecturally mapped to External register PMEVTYPER<n>_EL0[63:32] when FEAT_PMUv3_TH is implemented, or FEAT_PMUv3p8 is implemented, or FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3_SME is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are UNDEFINED.

Attributes

PMEVTYPER<n>_EL0 is a 64-bit register.

Field descriptions



TC, bits [63:61]

When FEAT_PMUv3_TH is implemented, (FEAT_PMUv3_EDGE is not implemented or PMEVTYPER<n>_EL0.TE == 0), and (FEAT_PMUv3_TH2 is not implemented, or n is even, or PMEVTYPER<n>_EL0.TLC IN {0b0x}):

Threshold Control. Defines the threshold function. In the description of this field:

- V_B[n] is the value the event specified by PMEVTYPER<n>_EL0 would increment event counter n by on a processor cycle if the threshold function is disabled.
- For odd values of n, V[n-1] is the value that event counter n-1 increments by on the same processor cycle. V[n-1] is the result of applying the threshold and edge functions on event counter n-1. If event counter n-1 is disabled then V[n-1] is zero. V[n-1] is not defined for even values of n.
- TH[n] is the value of PMEVTYPER<n>_EL0.TH.

TC	Meaning
0b000	Not-equal. The counter increments by V_B[n] on each processor cycle when V_B[n] is not equal to TH[n].
0b001	Not-equal, count. The counter increments by 1 on each processor cycle when V_B[n] is not equal to TH[n].
0b010	Equals. The counter increments by V_B[n] on each processor cycle when V_B[n] is equal to TH[n].
0b011	Equals, count. The counter increments by 1 on each processor cycle when V_B[n] is equal to TH[n].
0b100	Greater-than-or-equal. The counter increments by V_B[n] on each processor cycle when V_B[n] is greater than or equal to TH[n].
0b101	Greater-than-or-equal, count. The counter increments by 1 on each processor cycle when V_B[n] is greater than or equal to TH[n].
0b110	Less-than. The counter increments by V_B[n] on each processor cycle when V_B[n] is less than TH[n].
0b111	Less-than, count. The counter increments by 1 on each processor cycle when V_B[n] is less than TH[n].

Comparisons treat V_B[n] and TH[n] as unsigned integer values.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC[2:1] is true:

- If PMEVTYPER<n>_EL0.TC[0] is 0, then the counter increments by V_B[n].
- If PMEVTYPER<n>_EL0.TC[0] is 1, then the counter increments by 1.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC[2:1] is false:

- If FEAT_PMUv3_TH2 is implemented, n is odd, and PMEVTYPER<n>_EL0.TLC is 0b01, then the counter increments by V[n-1].
- Otherwise, the counter does not increment.

If PMEVTYPER<n>_EL0.{TC, TLC, TH} are zero then the threshold function is disabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to '000'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When FEAT_PMUv3_TH2 is implemented, PMEVTYPER<n>_EL0.TE == 0, n is odd, and PMEVTYPER<n>_EL0.TLC == 0b10:

Threshold Control. Defines the threshold function. In the description of this field:

- V_B[n] is the value the event specified by PMEVTYPER<n>_EL0 would increment event counter n by on a processor cycle if the threshold function is disabled.
- V[n-1] is the value that event counter n-1 increments by on the same processor cycle. V[n-1] is the result of applying the threshold and edge functions on event counter n-1. If event counter n-1 is disabled then V[n-1] is zero.
- TH[n] is the value of PMEVTYPER<n>_EL0.TH.

TC	Meaning
0b000	Not-equal. The counter increments by V[n-1] on each processor cycle when V_B[n] is not equal to TH[n].
0b010	Equals. The counter increments by V[n-1] on each processor cycle when V_B[n] is equal to TH[n].
0b100	Greater-than-or-equal. The counter increments by V[n-1] on each processor cycle when V_B[n] is greater than or equal to TH[n].
0b110	Less-than. The counter increments by V[n-1] on each processor cycle when V_B[n] is less than TH[n].

All other values are reserved.

Comparisons treat V_B[n] and TH[n] as unsigned integer values.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC is true, the counter increments by V[n-1].

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC is false, the counter does not increment.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to '000'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When FEAT_PMUv3_EDGE is implemented and PMEVTYPER<n>_EL0.TE == 1:

Threshold Control. Defines the threshold function. In the description of this field:

- V_B[n] is the value the event specified by PMEVTYPER<n>_EL0 would increment event counter n by on a processor cycle if the threshold function is disabled.
- For odd values of n, V[n-1] is the value that event counter n-1 increments by on the same processor cycle. V[n-1] is the result of applying the threshold and edge functions on event counter n-1. If event counter n-1 is disabled then V[n-1] is zero. V[n-1] is not defined for even values of n.
- TH[n] is the value of PMEVTYPER<n>_EL0.TH.

TC	Meaning
0b001	Equal to not-equal. The counter increments on each processor cycle when V_B[n] is not equal to TH[n] and V_B[n] was equal to TH[n] on the previous processor cycle.
0b010	Equal to/from not-equal. The counter increments on each processor cycle when either: • V_B[n] is not equal to TH[n] and V_B[n] was equal to TH[n] on the previous processor cycle. • V_B[n] is equal to TH[n] and V_B[n] was not equal to TH[n] on the previous processor cycle.
0b011	Not-equal to equal. The counter increments on each processor cycle when V_B[n] is equal to TH[n] and V_B[n] was not equal to TH[n] on the previous processor cycle.
0b101	Less-than to greater-than-or-equal. The counter increments on each processor cycle when V_B[n] is greater than or equal to TH[n] and V_B[n] was less than TH[n] on the previous processor cycle.
0b110	Less-than to/from greater-than-or-equal. The counter increments on each processor cycle when either: • V_B[n] is greater than or equal to TH[n] and V_B[n] was less than TH[n] on the previous processor cycle. • V_B[n] is less than TH[n] and V_B[n] was greater than or equal to TH[n] on the previous processor cycle.
0b111	Greater-than-or-equal to less-than. The counter increments on each processor cycle when V_B[n] is less than TH[n] and V_B[n] was greater than or equal to TH[n] on the previous processor cycle.

All other values are reserved.

Comparisons treat V_B[n] and TH[n] as unsigned integer values.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC is true:

- If FEAT_PMUv3_TH2 is implemented, n is odd, and PMEVTYPER<n>_EL0.TLC is 0b10, then the counter increments by V[n-1].
- Otherwise, the counter increments by 1.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC is false, the counter does not increment.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to '000'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TE, bit [60]

When FEAT_PMUv3_EDGE is implemented:

Threshold Edge. Enables the edge condition. When PMEVTYPER<n>_EL0.TE is 1, the event counter increments on cycles when the result of the threshold condition changes. See PMEVTYPER<n>_EL0.TC for more information.

TE	Meaning
0b0	Threshold edge condition disabled.
0b1	Threshold edge condition enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to '0'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [59]

Reserved, RES0.

SYNC, bit [58]

When FEAT_SEBEP is implemented:

Synchronous mode. Controls whether a PMU Profiling exception generated by the counter is synchronous or asynchronous.

SYNC	Meaning
0b0	Asynchronous PMU Profiling exception is enabled.
0b1	Synchronous PMU Profiling exception is enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VS, bits [57:56]

When FEAT_PMUv3_SME is implemented:

SVE mode filtering. Controls counting events in Streaming and Non-streaming SVE modes.

VS	Meaning
0b00	This mechanism has no effect on the filtering of events.
0b01	The PE does not count events in Streaming SVE mode.
0b10	The PE does not count events in Non-streaming SVE mode.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLC, bits [55:54]
When FEAT_PMUv3_TH2 is implemented and n is odd:

Threshold Linking Control. Extends PMEVTYPER<n>_EL0.TC with additional controls for event linking. See PMEVTYPER<n>_EL0.TC.

TLC	Meaning
0b00	Threshold linking disabled.
0b01	Threshold linking enabled. If the threshold condition described by PMEVTYPER<n>_EL0.TC is false, the counter increments by V[n-1]. Otherwise, the counter increments as described by PMEVTYPER<n>_EL0.TC.
0b10	Threshold linking enabled. If the threshold condition described by PMEVTYPER<n>_EL0.TC is true, the counter increments by V[n-1]. Otherwise, the counter does not increment.

All other values are reserved.

See PMEVTYPER<n>_EL0.TC for more information

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [53:44]

Reserved, RES0.

TH, bits [43:32]
When FEAT_PMUv3_TH is implemented:

Threshold value. Provides the unsigned value for the threshold function defined by PMEVTYPER<n>_EL0.TC.

If PMEVTYPER<n>_EL0.{TC, TH} are both zero and either FEAT_PMUv3_TH2 is not implemented or PMEVTYPER<n>_EL0.TLC is also zero, then the threshold function is disabled.

If PMMIR_EL1.THWIDTH is less than 12, then bits PMEVTYPER<n>_EL0.TH[11:UInt(PMMIR_EL1.THWIDTH)] are RES0. This accounts for the behavior when writing a value greater-than-or-equal-to $2^{\text{UInt(PMMIR\_EL1.THWIDTH)}}$.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to '000000000000'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting events in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL1.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL1 is further controlled by PMEVTYPER<n>_EL0.NSK.

If FEAT_RME is implemented, then counting events in Realm EL1 is further controlled by PMEVTYPER<n>_EL0.RLK.

If EL3 is implemented, then counting events in EL3 is further controlled by PMEVTYPER<n>_EL0.M.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting events in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL0.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL0 is further controlled by PMEVTYPER<n>_EL0.NSU.

If FEAT_RME is implemented, then counting events in Realm EL0 is further controlled by PMEVTYPER<n>_EL0.RLU.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 filtering. Controls counting events in Non-secure EL1. If PMEVTYPER<n>_EL0.NSK is not equal to PMEVTYPER<n>_EL0.P, then the PE does not count events in Non-secure EL1. Otherwise, this mechanism has no effect on filtering of events in Non-secure EL1.

NSK	Meaning
0b0	When PMEVTYPER<n>_EL0.P == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.P == 1, the PE does not count events in Non-secure EL1.
0b1	When PMEVTYPER<n>_EL0.P == 0, the PE does not count events in Non-secure EL1. When PMEVTYPER<n>_EL0.P == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 filtering. Controls counting events in Non-secure EL0. If PMEVTYPER<n>_EL0.NSU is not equal to PMEVTYPER<n>_EL0.U, then the PE does not count events in Non-secure EL0. Otherwise, this mechanism has no effect on filtering of events in Non-secure EL0.

NSU	Meaning
0b0	When PMEVTYPER<n>_EL0.U == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.U == 1, the PE does not count events in Non-secure EL0.
0b1	When PMEVTYPER<n>_EL0.U == 0, the PE does not count events in Non-secure EL0. When PMEVTYPER<n>_EL0.U == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 filtering. Controls counting events in EL2.

NSH	Meaning
0b0	The PE does not count events in EL2.
0b1	This mechanism has no effect on filtering of events.

If EL3 is implemented and FEAT_SEL2 is implemented, then counting events in Secure EL2 is further controlled by PMEVTYPER<n>_EL0.SH.

If FEAT_RME is implemented, then counting events in Realm EL2 is further controlled by PMEVTYPER<n>_EL0.RLH.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

EL3 filtering. Controls counting events in EL3. If PMEVTYPER<n>_EL0.M is not equal to PMEVTYPER<n>_EL0.P, then the PE does not count events in EL3. Otherwise, this mechanism has no effect on filtering of events in EL3.

M	Meaning
0b0	When PMEVTYPER<n>_EL0.P == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.P == 1, the PE does not count events in EL3.
0b1	When PMEVTYPER<n>_EL0.P == 0, the PE does not count events in EL3. When PMEVTYPER<n>_EL0.P == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]
When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

Unless otherwise stated:

- If the event counts PE cycles when a stall condition is true, then the counter counts Processor cycles when the stall condition is true for all of these PEs.
- If the event counts PE cycles when any other condition is true, then the counter counts Processor cycles when the condition is true for any of these PEs.
- Otherwise, the event counts by the sum of the count across all of these PEs. See 'Multithreaded implementations' and 'Cycle event counting in multithreaded implementations'.

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this field is RES0. See ID_AA64DFR0_EL1.MTPMU.

This field is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and disabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]
When EL3 is implemented and FEAT_SEL2 is implemented:

Secure EL2 filtering. Controls counting events in Secure EL2. If PMEVTYPER<n>_EL0.SH is equal to PMEVTYPER<n>_EL0.NSH, then the PE does not count events in Secure EL2. Otherwise, this mechanism has no effect on filtering of events in Secure EL2.

SH	Meaning
0b0	When PMEVTYPER<n>_EL0.NSH == 0, the PE does not count events in Secure EL2. When PMEVTYPER<n>_EL0.NSH == 1, this mechanism has no effect on filtering of events.
0b1	When PMEVTYPER<n>_EL0.NSH == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.NSH == 1, the PE does not count events in Secure EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When Secure EL2 is not implemented, access to this field is **RES0**.

Otherwise:

Reserved, RES0.

T, bit [23]
When FEAT_TME is implemented:

Non-Transactional state filtering field. Controls counting of events in Non-transactional state.

T	Meaning
0b0	This field has no effect on the filtering of events.
0b1	Do not count Attributable events in Non-transactional state.

For each Unattributable event, it is IMPLEMENTATION DEFINED whether the filtering applies.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]
When FEAT_RME is implemented:

Realm EL1 filtering. Controls counting events in Realm EL1. If PMEVTYPER<n>_EL0.RLK is not equal to PMEVTYPER<n>_EL0.P, then the PE does not count events in Realm EL1. Otherwise, this mechanism has no effect on filtering of events in Realm EL1.

RLK	Meaning
0b0	When PMEVTYPER<n>_EL0.P == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.P == 1, the PE does not count events in Realm EL1.
0b1	When PMEVTYPER<n>_EL0.P == 0, the PE does not count events in Realm EL1. When PMEVTYPER<n>_EL0.P == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]
When FEAT_RME is implemented:

Realm EL0 filtering. Controls counting events in Realm EL0. If PMEVTYPER<n>_EL0.RLU is not equal to PMEVTYPER<n>_EL0.U, then the PE does not count events in Realm EL0. Otherwise, this mechanism has no effect on filtering of events in Realm EL0.

RLU	Meaning
0b0	When PMEVTYPER<n>_EL0.U == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.U == 1, the PE does not count events in Realm EL0.
0b1	When PMEVTYPER<n>_EL0.U == 0, the PE does not count events in Realm EL0. When PMEVTYPER<n>_EL0.U == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]

When FEAT_RME is implemented:

Realm EL2 filtering. Controls counting events in Realm EL2. If PMEVTYPER<n>_EL0.RLH is equal to PMEVTYPER<n>_EL0.NSH, then the PE does not count events in Realm EL2. Otherwise, this mechanism has no effect on filtering of events in Realm EL2.

RLH	Meaning
0b0	When PMEVTYPER<n>_EL0.NSH == 0, the PE does not count events in Realm EL2. When PMEVTYPER<n>_EL0.NSH == 1, this mechanism has no effect on filtering of events.
0b1	When PMEVTYPER<n>_EL0.NSH == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.NSH == 1, the PE does not count events in Realm EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter PMEVCNTR<n>_EL0.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.

Note

Arm recommends this behavior for all implementations of FEAT_PMUv3.

Otherwise, if PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range `0x0000` to `0x003F`, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range `0x4000` to `0x403F`, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>_EL0

PMEVTYPER<n>_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMEVTYPER<n>_EL0 is as follows:

- If <n> is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of PMEVTYPER<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a `NOP`.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMEVTYPER<n>_EL0 are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.

- PMUACR_EL1.P<n> == 0.

Permitted writes of PMEVTYPER<n>_EL0 are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.{UEN,ER} == {1,1}.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{UEN,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMEVTYPER<m>_EL0 ; Where m = 0-30
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b11:m[4:3]	m[2:0]

```
integer m = UInt(CRm<1:0>:op2<2:0>);

PMIAR_EL1, Performance Monitors Instruction Address Register

The PMIAR_EL1 characteristics are:

Purpose

Captures the address of the instruction generating a PMU Profiling exception.

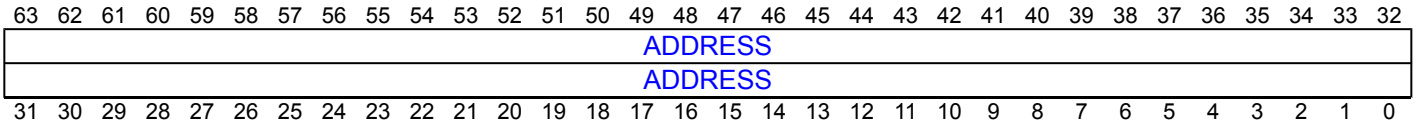
Configuration

This register is present only when FEAT_SEBEP is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMIAR_EL1 are UNDEFINED.

Attributes

PMIAR_EL1 is a 64-bit register.

Field descriptions



ADDRESS, bits [63:0]

Instruction virtual address.

For writes to PMIAR_EL1, PMIAR_EL1.ADDRESS[63:P] is RESS. P is defined as:

- 56, when FEAT_LVA3 is implemented.
- 52, when FEAT_LVA is implemented.
- 48, otherwise.

PMIAR_EL1.ADDRESS[1:0] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMIAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMIAR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1110	0b111

```
if !(IsFeatureImplemented(FEAT_SEBEP) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if HaveEL(EL3) && EL3SDDUndefPriority() && MDCR_EL3.EnPM2 == '0' then
        UNDEFINED;
    elsif HaveEL(EL3) && EL3SDDUndefPriority() && MDCR_EL3.TPM == '1' then
        UNDEFINED;

PMICFILTR_EL0, Performance Monitors Instruction Counter Filter Register

The PMICFILTR_EL0 characteristics are:

Purpose

Configures the Instruction Counter.

Configuration

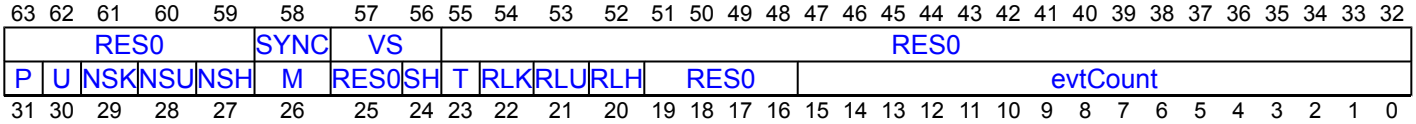
AArch64 System register PMICFILTR_EL0 bits [63:0] are architecturally mapped to External register PMICFILTR_EL0[63:0].

This register is present only when FEAT_PMUv3_ICNTR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMICFILTR_EL0 are UNDEFINED.

Attributes

PMICFILTR_EL0 is a 64-bit register.

Field descriptions



Bits [63:59]

Reserved, RES0.

SYNC, bit [58]

When FEAT_SEBEP is implemented:

Synchronous mode. Controls whether a PMU Profiling exception generated by the counter is synchronous or asynchronous.

SYNC	Meaning
0b0	Asynchronous PMU Profiling exception is enabled.
0b1	Synchronous PMU Profiling exception is enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VS, bits [57:56]

When FEAT_PMUv3_SME is implemented:

SVE mode filtering. Controls counting instructions in Streaming and Non-streaming SVE modes.

VS	Meaning
0b00	This mechanism has no effect on the filtering of instructions.
0b01	The PE does not count instructions in Streaming SVE mode.
0b10	The PE does not count instructions in Non-streaming SVE mode.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [55:32]

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting instructions in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of instructions.
0b1	The PE does not count instructions in EL1.

If Secure and Non-secure states are implemented, then counting instructions in Non-secure EL1 is further controlled by PMICFILTR_EL0.NSK.

If FEAT_RME is implemented, then counting instructions in Realm EL1 is further controlled by PMICFILTR_EL0.RLK.

If EL3 is implemented, then counting instructions in EL3 is further controlled by PMICFILTR_EL0.M.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting instructions in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of instructions.
0b1	The PE does not count instructions in EL0.

If Secure and Non-secure states are implemented, then counting instructions in Non-secure EL0 is further controlled by PMICFILTR_EL0.NSU.

If FEAT_RME is implemented, then counting instructions in Realm EL0 is further controlled by PMICFILTR_EL0.RLU.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 filtering. Controls counting instructions in Non-secure EL1. If PMICFILTR_EL0.NSK is not equal to PMICFILTR_EL0.P, then the PE does not count instructions in Non-secure EL1. Otherwise, this mechanism has no effect on filtering of instructions in Non-secure EL1.

NSK	Meaning
0b0	When PMICFILTR_EL0.P == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.P == 1, the PE does not count instructions in Non-secure EL1.
0b1	When PMICFILTR_EL0.P == 0, the PE does not count instructions in Non-secure EL1. When PMICFILTR_EL0.P == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 filtering. Controls counting instructions in Non-secure EL0. If PMICFILTR_EL0.NSU is not equal to PMICFILTR_EL0.U, then the PE does not count instructions in Non-secure EL0. Otherwise, this mechanism has no effect on filtering of instructions in Non-secure EL0.

NSU	Meaning
0b0	When PMICFILTR_EL0.U == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.U == 1, the PE does not count instructions in Non-secure EL0.
0b1	When PMICFILTR_EL0.U == 0, the PE does not count instructions in Non-secure EL0. When PMICFILTR_EL0.U == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 filtering. Controls counting instructions in EL2.

NSH	Meaning
0b0	The PE does not count instructions in EL2.
0b1	This mechanism has no effect on filtering of instructions.

If EL3 is implemented and FEAT_SEL2 is implemented, then counting instructions in Secure EL2 is further controlled by PMICFILTR_EL0.SH.

If FEAT_RME is implemented, then counting instructions in Realm EL2 is further controlled by PMICFILTR_EL0.RLH.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

EL3 filtering. Controls counting instructions in EL3. If PMICFILTR_EL0.M is not equal to PMICFILTR_EL0.P, then the PE does not count instructions in EL3. Otherwise, this mechanism has no effect on filtering of instructions in EL3.

M	Meaning
0b0	When PMICFILTR_EL0.P == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.P == 1, the PE does not count instructions in EL3.
0b1	When PMICFILTR_EL0.P == 0, the PE does not count instructions in EL3. When PMICFILTR_EL0.P == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

When EL3 is implemented and FEAT_SEL2 is implemented:

Secure EL2 filtering. Controls counting instructions in Secure EL2. If PMICFILTR_EL0.SH is equal to PMICFILTR_EL0.NSH, then the PE does not count instructions in Secure EL2. Otherwise, this mechanism has no effect on filtering of instructions in Secure EL2.

SH	Meaning
0b0	When PMICFILTR_EL0.NSH == 0, the PE does not count instructions in Secure EL2. When PMICFILTR_EL0.NSH == 1, this mechanism has no effect on filtering of instructions.
0b1	When PMICFILTR_EL0.NSH == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.NSH == 1, the PE does not count instructions in Secure EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When Secure EL2 is not implemented, access to this field is **RES0**.

Otherwise:

Reserved, RES0.

T, bit [23]

When FEAT_TME is implemented:

Non-Transactional state filtering field. Controls counting of instructions in Non-transactional state.

T	Meaning
0b0	This field has no effect on the filtering of instructions.
0b1	Do not count Attributable instructions in Non-transactional state.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]

When FEAT_RME is implemented:

Realm EL1 filtering. Controls counting instructions in Realm EL1. If PMICFILTR_EL0.RLK is not equal to PMICFILTR_EL0.P, then the PE does not count instructions in Realm EL1. Otherwise, this mechanism has no effect on filtering of instructions in Realm EL1.

RLK	Meaning
0b0	When PMICFILTR_EL0.P == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.P == 1, the PE does not count instructions in Realm EL1.
0b1	When PMICFILTR_EL0.P == 0, the PE does not count instructions in Realm EL1. When PMICFILTR_EL0.P == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 filtering. Controls counting instructions in Realm EL0. If PMICFILTR_EL0.RLU is not equal to PMICFILTR_EL0.U, then the PE does not count instructions in Realm EL0. Otherwise, this mechanism has no effect on filtering of instructions in Realm EL0.

RLU	Meaning
0b0	When PMICFILTR_EL0.U == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.U == 1, the PE does not count instructions in Realm EL0.
0b1	When PMICFILTR_EL0.U == 0, the PE does not count instructions in Realm EL0. When PMICFILTR_EL0.U == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.

- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]

When FEAT_RME is implemented:

Realm EL2 filtering. Controls counting instructions in Realm EL2. If PMICFILTR_EL0.RLH is equal to PMICFILTR_EL0.NSH, then the PE does not count instructions in Realm EL2. Otherwise, this mechanism has no effect on filtering of instructions in Realm EL2.

RLH	Meaning
0b0	When PMICFILTR_EL0.NSH == 0, the PE does not count instructions in Realm EL2. When PMICFILTR_EL0.NSH == 1, this mechanism has no effect on filtering of instructions.
0b1	When PMICFILTR_EL0.NSH == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.NSH == 1, the PE does not count instructions in Realm EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count.

Reads as 0x0008.

Access to this field is **RO**.

Accessing PMICFILTR_EL0

Permitted reads and writes of PMICFILTR_EL0 are RAZ/WI if all of the following are true:

- PSTATE.EL == EL0.
- PMUACR_EL1.F0 == 0.

Permitted writes of PMICFILTR_EL0 are ignored if all of the following are true:

- PSTATE.EL == EL0.
- PMUSERENR_EL0.IR == 1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMICFILTR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b0110	0b000

PMICNTR_EL0, Performance Monitors Instruction Counter Register

The PMICNTR_EL0 characteristics are:

Purpose

If event counting is not prohibited and the instruction counter is enabled, the counter increments for each architecturally-executed instruction, according to the configuration specified by PMICFILTR_EL0.

Configuration

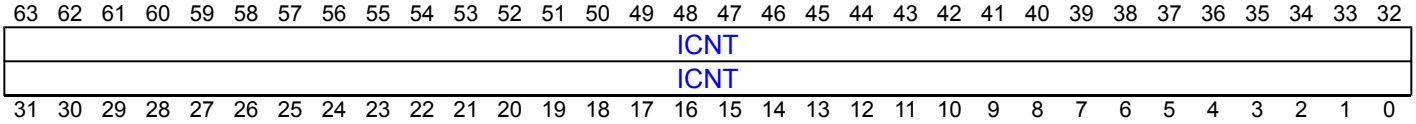
AArch64 System register PMICNTR_EL0 bits [63:0] are architecturally mapped to External register PMICNTR_EL0[63:0].

This register is present only when FEAT_PMUv3_ICNTR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMICNTR_EL0 are UNDEFINED.

Attributes

PMICNTR_EL0 is a 64-bit register.

Field descriptions



ICNT, bits [63:0]

Instruction Counter.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMICNTR_EL0

PMICNTR_EL0 treats permitted reads-as-zero and ignores permitted writes if all of the following are true:

- PSTATE.EL == EL0.
- PMUACR_EL1.F0 == 0.

PMICNTR_EL0 ignores permitted writes if all of the following are true:

- PSTATE.EL == EL0.
- PMUSERENR_EL0.IR == 1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMICNTR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b0100	0b000

```

PMICNTSVR_EL1, Performance Monitors Instruction Count Saved Value Register

The PMICNTSVR_EL1 characteristics are:

Purpose

Captures the PMU Instruction counter, PMICNTR_EL0.

Configuration

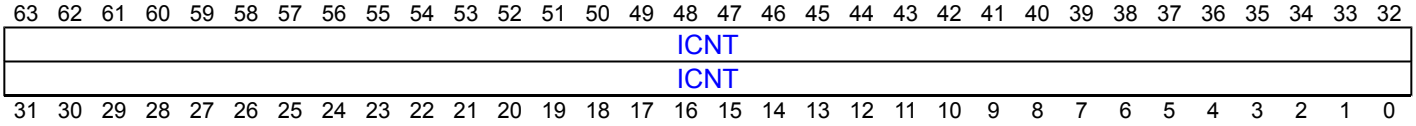
AArch64 System register PMICNTSVR_EL1 bits [63:0] are architecturally mapped to External register PMICNTSVR_EL1[63:0].

This register is present only when FEAT_PMUv3_ICNTR is implemented, FEAT_PMUv3_SS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to PMICNTSVR_EL1 are UNDEFINED.

Attributes

PMICNTSVR_EL1 is a 64-bit register.

Field descriptions



ICNT, bits [63:0]

Sampled Instruction Count. The value of PMICNTR_EL0 at the last successful Capture event.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMICNTSVR_EL1

Accesses to this register use the following encodings in the System register encoding space:

PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear Register

The PMINTENCLR_EL1 characteristics are:

Purpose

Allows software to disable the generation of interrupt requests or, when FEAT_EBEP is implemented, PMU Profiling exceptions on overflows from the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows which overflow interrupt requests or PMU Profiling exceptions are enabled.

Configuration

AArch64 System register PMINTENCLR_EL1 bits [63:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[63:0].

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0].

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to External register PMINTENSET_EL1[31:0].

AArch64 System register PMINTENCLR_EL1 bits [63:32] are architecturally mapped to External register PMINTENCLR_EL1[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

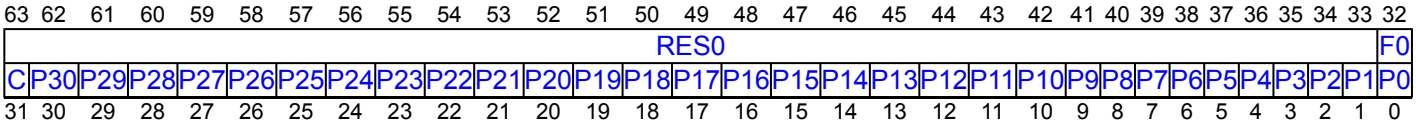
AArch64 System register PMINTENCLR_EL1 bits [63:32] are architecturally mapped to External register PMINTENSET_EL1[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMINTENCLR_EL1 are UNDEFINED.

Attributes

PMINTENCLR_EL1 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]

When FEAT_PMUv3_ICNTR is implemented:

Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 enable status.

F0	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - EL3 is implemented.
  - PSTATE.EL != EL3.
  - MDCR_EL3.EnPM2 == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL1.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or (HDFGRTR2_EL2.nPMICFILTR_EL0 == 0 and HDFGWTR2_EL2.nPMICFILTR_EL0 == 0).
- Access to this field is **WO/RAZ** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL1.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGRTR2_EL2.nPMICFILTR_EL0 == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL1.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGWTR2_EL2.nPMICFILTR_EL0 == 0.
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

C, bit [31]

Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enable status.

C	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.

P<m>, bit [m], for m = 30 to 0

Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1C**.

PMINTENSET_EL1, Performance Monitors Interrupt Enable Set Register

The PMINTENSET_EL1 characteristics are:

Purpose

Allows software to enable the generation of interrupt requests or, when FEAT_EBEP is implemented, PMU Profiling exceptions on overflows from the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows which overflow interrupt requests or PMU Profiling exceptions are enabled.

Configuration

AArch64 System register PMINTENSET_EL1 bits [63:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[63:0].

AArch64 System register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0].

AArch64 System register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

AArch64 System register PMINTENSET_EL1 bits [31:0] are architecturally mapped to External register PMINTENSET_EL1[31:0].

AArch64 System register PMINTENSET_EL1 bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

AArch64 System register PMINTENSET_EL1 bits [63:32] are architecturally mapped to External register PMINTENSET_EL1[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

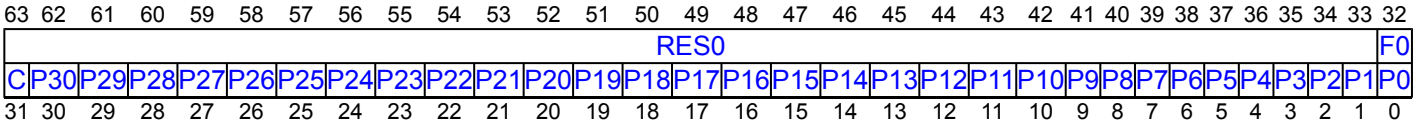
AArch64 System register PMINTENSET_EL1 bits [63:32] are architecturally mapped to External register PMINTENCLR_EL1[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMINTENSET_EL1 are UNDEFINED.

Attributes

PMINTENSET_EL1 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]

When FEAT_PMUv3_ICNTR is implemented:

Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 enable. On writes, allows software to enable the interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 enable status.

F0	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - EL3 is implemented.
  - PSTATE.EL != EL3.
  - MDCR_EL3.EnPM2 == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL1.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or (HDFGRTR2_EL2.nPMICFILTR_EL0 == 0 and HDFGWTR2_EL2.nPMICFILTR_EL0 == 0).
- Access to this field is **WO/RAZ** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL1.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGRTR2_EL2.nPMICFILTR_EL0 == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL1.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGWTR2_EL2.nPMICFILTR_EL0 == 0.
- Otherwise, access to this field is **W1S**.

Otherwise:

Reserved, RES0.

C, bit [31]

Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enable. On writes, allows software to enable the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enable status.

C	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1S**.

P<m>, bit [m], for m = 30 to 0

Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enable. On writes, allows software to enable the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1S**.

Accessing PMINTENSET_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMINTENSET_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1110	0b001

PMMIR_EL1, Performance Monitors Machine Identification Register

The PMMIR_EL1 characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation to software.

Configuration

AArch64 System register PMMIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMMIR[31:0].

AArch64 System register PMMIR_EL1 bits [31:0] are architecturally mapped to External register PMMIR[31:0] when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3p4 is implemented.

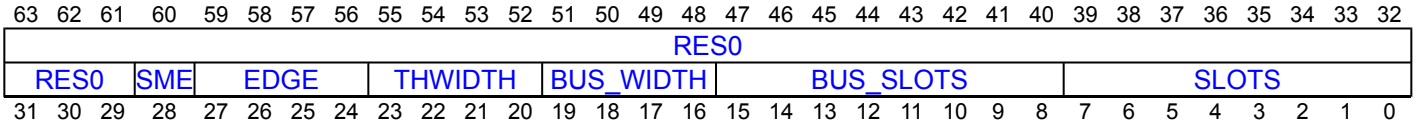
AArch64 System register PMMIR_EL1 bits [63:32] are architecturally mapped to External register PMMIR[63:32] when FEAT_PMUv3_EXT is implemented, FEAT_PMUv3p4 is implemented, and (FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented).

This register is present only when FEAT_PMUv3p4 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMMIR_EL1 are UNDEFINED.

Attributes

PMMIR_EL1 is a 64-bit register.

Field descriptions



Bits [63:29]

Reserved, RES0.

SME, bit [28]

PMUv3 for SME. Adds support for the Streaming SVE mode filter.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SME	Meaning
0b0	Streaming SVE mode filter not implemented.
0b1	Adds support for the Streaming SVE mode filter.

All other values are reserved.

FEAT_PMUv3_SME implements the functionality identified by the value 1.

Access to this field is **RO**.

EDGE, bits [27:24]

PMU event edge detection. With PMMIR_EL1.THWIDTH, indicates implementation of event counter thresholding features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EDGE	Meaning
0b0000	FEAT_PMUv3_EDGE is not implemented.
0b0001	FEAT_PMUv3_EDGE is implemented.
0b0010	As 0b0001, and adds support for threshold value linking between a pair of counters.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, the only permitted value is 0b0000.

FEAT_PMUv3_EDGE implements the functionality identified by the value 0b0001.

FEAT_PMUv3_TH2 implements the functionality identified by the value 0b0010.

Access to this field is **RO**.

THWIDTH, bits [23:20]

PMEVTYPER<n>_EL0.TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the PMEVTYPER<n>_EL0.TH field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

THWIDTH	Meaning
0b0000	FEAT_PMUv3_TH is not implemented.
0b0001	1 bit. PMEVTYPER<n>_EL0.TH[11:1] are RES0.
0b0010	2 bits. PMEVTYPER<n>_EL0.TH[11:2] are RES0.
0b0011	3 bits. PMEVTYPER<n>_EL0.TH[11:3] are RES0.
0b0100	4 bits. PMEVTYPER<n>_EL0.TH[11:4] are RES0.
0b0101	5 bits. PMEVTYPER<n>_EL0.TH[11:5] are RES0.
0b0110	6 bits. PMEVTYPER<n>_EL0.TH[11:6] are RES0.
0b0111	7 bits. PMEVTYPER<n>_EL0.TH[11:7] are RES0.
0b1000	8 bits. PMEVTYPER<n>_EL0.TH[11:8] are RES0.
0b1001	9 bits. PMEVTYPER<n>_EL0.TH[11:9] are RES0.
0b1010	10 bits. PMEVTYPER<n>_EL0.TH[11:10] are RES0.
0b1011	11 bits. PMEVTYPER<n>_EL0.TH[11] is RES0.
0b1100	12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to PMEVTYPER<n>_EL0.TH is $2^{(\text{PMMIR\_EL1.THWIDTH})}$ minus one.

Access to this field is **RO**.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as Log_2(number of bytes), plus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

Access to this field is **RO**.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

If the bus count information is not available, this field will read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMMIR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMMIR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1110	0b110

```

PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear Register

The PMOVSCLR_EL0 characteristics are:

Purpose

Allows software to clear the unsigned overflow flags for the following counters to 0:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows the current unsigned overflow flag values.

Configuration

AArch64 System register PMOVSCLR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[63:0].

AArch64 System register PMOVSCLR_EL0 bits [63:0] are architecturally mapped to External register PMOVS[63:0].

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to External register PMOVSCLR_EL0[31:0].

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

AArch64 System register PMOVSCLR_EL0 bits [63:32] are architecturally mapped to External register PMOVSCLR_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

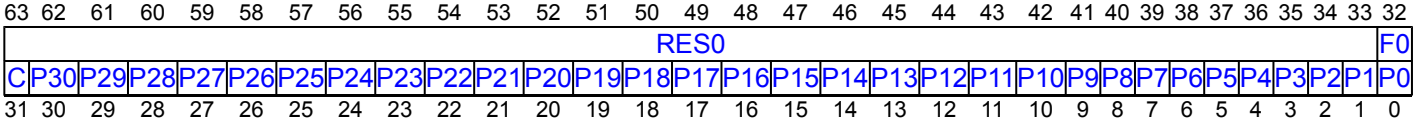
AArch64 System register PMOVSCLR_EL0 bits [63:32] are architecturally mapped to External register PMOVSSET_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMOVSCLR_EL0 are UNDEFINED.

Attributes

PMOVSCLR_EL0 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]

When FEAT_PMUv3_ICNTR is implemented:

Unsigned overflow flag for PMICNTR_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMICNTR_EL0 to 0. On reads, returns the unsigned overflow flag for PMICNTR_EL0 overflow status.

F0	Meaning
0b0	PMICNTR_EL0 has not overflowed.
0b1	PMICNTR_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - EL3 is implemented.
  - PSTATE.EL != EL3.
  - MDCR_EL3.EnPM2 == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 0 or PMUACR_EL1.F0 == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or (HDFGRTR2_EL2.nPMICFILTR_EL0 == 0 and HDFGWTR2_EL2.nPMICFILTR_EL0 == 0).
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL0.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGRTR2_EL2.nPMICFILTR_EL0 == 0.
  - PMUSERENR_EL0.IR == 1.
- Access to this field is **WO/RAZ** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGRTR2_EL2.nPMICFILTR_EL0 == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGWTR2_EL2.nPMICFILTR_EL0 == 0.
- Access to this field is **RO** if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.IR == 1.
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

C, bit [31]

Unsigned overflow flag for PMCCNTR_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMCCNTR_EL0 to 0. On reads, returns the unsigned overflow flag for PMCCNTR_EL0 overflow status.

C	Meaning
0b0	PMCCNTR_EL0 has not overflowed.
0b1	PMCCNTR_EL0 has overflowed.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.

- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 1.
  - PMUACR_EL1.C == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,CR] == 0b11.
- Otherwise, access to this field is **W1C**.

P<m>, bit [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m>_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMEVCNTR<m>_EL0 to 0. On reads, returns the unsigned overflow flag for PMEVCNTR<m>_EL0 overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 has not overflowed.
0b1	PMEVCNTR<m>_EL0 has overflowed.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<m>_EL0[31:0] or unsigned overflow of PMEVCNTR<m>_EL0[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 1.
  - PMUACR_EL1.P<m> == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,ER] == 0b11.
- Otherwise, access to this field is **W1C**.

Accessing PMOVSCLR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMOVSCLR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b011

```
if !(IsFeatureImplemented(FEAT_PMUv3) && IsFeatureImplemented(FEAT_AA64)) then

PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set Register

The PMOVSSET_EL0 characteristics are:

Purpose

Allows software to set the unsigned overflow flags for the following counters to 1:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows the current unsigned overflow flag values.

Configuration

AArch64 System register PMOVSSET_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[63:0].

AArch64 System register PMOVSSET_EL0 bits [63:0] are architecturally mapped to External register PMOVS[63:0].

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to External register PMOVSCLR_EL0[31:0].

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

AArch64 System register PMOVSSET_EL0 bits [63:32] are architecturally mapped to External register PMOVSCLR_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

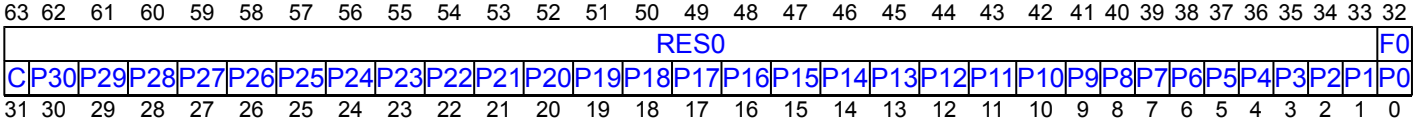
AArch64 System register PMOVSSET_EL0 bits [63:32] are architecturally mapped to External register PMOVSSET_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMOVSSET_EL0 are UNDEFINED.

Attributes

PMOVSSET_EL0 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]

When FEAT_PMUv3_ICNTR is implemented:

Unsigned overflow flag for PMICNTR_EL0 set. On writes, allows software to set the unsigned overflow flag for PMICNTR_EL0 to 1. On reads, returns the unsigned overflow flag for PMICNTR_EL0 overflow status.

F0	Meaning
0b0	PMICNTR_EL0 has not overflowed.
0b1	PMICNTR_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - EL3 is implemented.
  - PSTATE.EL != EL3.
  - MDCR_EL3.EnPM2 == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 0 or PMUACR_EL1.F0 == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or (HDFGRTR2_EL2.nPMICFILTR_EL0 == 0 and HDFGWTR2_EL2.nPMICFILTR_EL0 == 0).
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL0.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGRTR2_EL2.nPMICFILTR_EL0 == 0.
  - PMUSERENR_EL0.IR == 1.
- Access to this field is **WO/RAZ** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGRTR2_EL2.nPMICFILTR_EL0 == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGWTR2_EL2.nPMICFILTR_EL0 == 0.
- Access to this field is **RO** if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.IR == 1.
- Otherwise, access to this field is **W1S**.

Otherwise:

Reserved, RES0.

C, bit [31]

Unsigned overflow flag for PMCCNTR_EL0 set. On writes, allows software to set the unsigned overflow flag for PMCCNTR_EL0 to 1. On reads, returns the unsigned overflow flag for PMCCNTR_EL0 overflow status.

C	Meaning
0b0	PMCCNTR_EL0 has not overflowed.
0b1	PMCCNTR_EL0 has overflowed.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.

- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 1.
  - PMUACR_EL1.C == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,CR] == 0b11.
- Otherwise, access to this field is **W1S**.

P<m>, bit [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m>_EL0 set. On writes, allows software to set the unsigned overflow flag for PMEVCNTR<m>_EL0 to 1. On reads, returns the unsigned overflow flag for PMEVCNTR<m>_EL0 overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 has not overflowed.
0b1	PMEVCNTR<m>_EL0 has overflowed.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<m>_EL0[31:0] or unsigned overflow of PMEVCNTR<m>_EL0[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 1.
  - PMUACR_EL1.P<m> == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,ER] == 0b11.
- Otherwise, access to this field is **W1S**.

PMSCR_EL1, Statistical Profiling Control Register (EL1)

The PMSCR_EL1 characteristics are:

Purpose

Provides EL1 controls for Statistical Profiling.

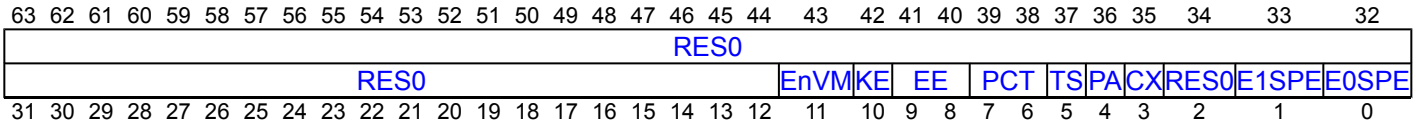
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSCR_EL1 are UNDEFINED.

Attributes

PMSCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

EnVM, bit [11]

When FEAT_SPE_nVM is implemented and FEAT_NV is implemented:

Reserved for software use in nested virtualization. See also PMSCR_EL2.EnVM.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

KE, bit [10]

When FEAT_SPE_EXC is implemented:

Kernel exception enable for SPE Profiling exceptions taken to EL1.

KE	Meaning
0b0	SPE Profiling exceptions taken to EL1 are always masked at EL1.
0b1	Enabled SPE Profiling exceptions taken to EL1 are masked at EL1 when PSTATE.PM is 1 and unmasked when PSTATE.PM is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EE, bits [9:8]
When FEAT_SPE_EXC is implemented:

Exception Enable.

EE	Meaning	Applies when
0b00	Disabled. SPE Profiling exceptions for EL1 are disabled. All of the following apply: • Unless enabled by a higher Exception level, SPE Profiling exceptions are not generated. • PMBSR_EL1.S drives the interrupt request signal **PMBIRQ**. • Accesses to PMBSR_EL1 at EL1 ignore the value of HCR_EL2.NV1.	
0b01	Reserved for software use in nested virtualization. Behaves as 0b00 for the purpose of controlling the SPE Profiling exception and interrupt request signal **PMBIRQ**, and as 0b11 for the purpose of accesses to PMBSR_EL1.	When FEAT_NV is implemented
0b10	Reserved for software use in nested virtualization. Behaves as 0b11 for the purposes of controlling the SPE Profiling exception and interrupt request signal **PMBIRQ**, and accesses to PMBSR_EL1.	When FEAT_NV is implemented
0b11	Enabled. SPE Profiling exceptions for EL1 are enabled, as follows: • All Profiling Buffer management events are recorded in PMBSR_EL1, unless they are configured to be recorded in PMBSR_EL3 by MDCR_EL3.PMSEE or PMBSR_EL2 by PMSCR_EL2.EE. • SPE Profiling exceptions are generated and taken to EL1 when unmasked and PMBSR_EL1.S is 1, unless the Effective value of HCR_EL2.TGE is 1, in which case the exception is taken to EL2. • The interrupt request signal **PMBIRQ** is not asserted.	

For more information on the values reserved for software use in nested virtualization, see PMSCR_EL2.EE.

If the Effective value of PMSCR_EL2.EE is 0b00, then the Effective value of PMSCR_EL1.EE is 0b00.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PCT, bits [7:6]
When EL2 is implemented:

Physical Timestamp. If timestamp sampling is enabled and the Profiling Buffer owning Exception level is EL1, requests which timestamp counter value is collected.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.

PCT	Meaning	Applies when
0b00	Virtual timestamp. The collected timestamp is the physical counter minus the value of CNTVOFF_EL2.	
0b01	Physical timestamp. The collected timestamp is the physical counter.	
0b11	Guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2: • SCR_EL3.ECVEn == 0. • CNTHCTL_EL2.ECV == 0. • FEAT_ECV_POFF is not implemented.	When FEAT_ECV is implemented

When EL2 is implemented, all of the following apply:

- If the Profiling Buffer owning Exception level is EL1 and EL2 is enabled in the owning Security state, then the value of PMSCR_EL2.PCT might override or modify the meaning of this field.
- If the Profiling Buffer owning Exception level is EL2, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Physical Timestamp. Reserved. This field reads as 0b01 and ignores writes. Software should treat this field as UNK/SBZP.

When EL2 is not implemented, the Effective values of CNTVOFF_EL2 and CNTPOFF_EL2 are zero, meaning the virtual counter and physical counter have the same value.

TS, bit [5]

Timestamp sample enable. Enables recording of a Timestamp packet when the owning Exception level is EL1.

TS	Meaning
0b0	Timestamp packet recording disabled.
0b1	Timestamp packet recording enabled.

If the Profiling Buffer owning Exception level is EL2, then this field is ignored by the PE. For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address sample enable.

PA	Meaning
0b0	Physical addresses are not collected.
0b1	Physical addresses are collected.

When EL2 is implemented, all of the following apply:

- If the Profiling Buffer owning Exception level is EL1, then this field is combined with the Effective value PMSCR_EL2.PA to determine whether Physical addresses are collected.
- If the Profiling Buffer owning Exception level is EL2, then this field is ignored by the PE.

For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CX, bit [3]

CONTEXTIDR_EL1 sample enable. Enables recording of a Context packet containing the value of CONTEXTIDR_EL1.

CX	Meaning
0b0	CONTEXTIDR_EL1 recording disabled.
0b1	CONTEXTIDR_EL1 recording enabled.

The PE ignores the value of this field and CONTEXTIDR_EL1 is not recorded when any of the following apply:

- The sampled operation executes at EL2.
- The sampled operation executes at EL0 and the Effective value of HCR_EL2.TGE is 1.

For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E1SPE, bit [1]

EL1 Statistical Profiling Enable.

E1SPE	Meaning
0b0	Sampling disabled at EL1.
0b1	Sampling enabled at EL1.

If the Effective value of HCR_EL2.TGE is 1, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E0SPE, bit [0]

EL0 Statistical Profiling Enable. Controls sampling at EL0 when HCR_EL2.TGE == 0 or if EL2 is disabled or not implemented.

E0SPE	Meaning
0b0	Sampling disabled at EL0.
0b1	Sampling enabled at EL0.

If the Effective value of HCR_EL2.TGE is 1, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMSCR_EL1

PMSCR_EL2, Statistical Profiling Control Register (EL2)

The PMSCR_EL2 characteristics are:

Purpose

Provides EL2 controls for Statistical Profiling.

Configuration

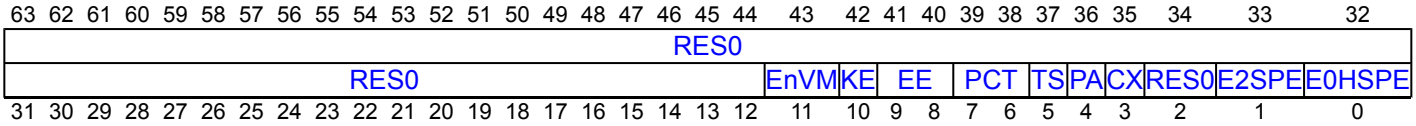
This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

PMSCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

EnVM, bit [11]

When FEAT_SPE_nVM is implemented:

Enable use of physical address Profiling Buffer pointers.

EnVM	Meaning
0b0	Use of physical address Profiling Buffer pointers is disabled. The PE behaves as if PMBLIMITR_EL1.nVM is 0.
0b1	Use of physical address Profiling Buffer pointers is permitted.

If EL2 is disabled in the owning Security state, or the Profiling Buffer owning Exception level is EL2, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

KE, bit [10]

When FEAT_SPE_EXC is implemented:

Kernel exception enable for SPE Profiling exceptions taken to EL2.

KE	Meaning
0b0	SPE Profiling exceptions taken to EL2 are always masked at EL2.
0b1	Enabled SPE Profiling exceptions taken to EL2 are masked at EL2 when PSTATE.PM is 1 and unmasked when PSTATE.PM is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EE, bits [9:8]
When FEAT_SPE_EXC is implemented:

Exception Enable.

EE	Meaning
0b00	Disabled. SPE Profiling exceptions for EL2 and EL1 are disabled. All of the following apply: • No Profiling Buffer management events are recorded in PMBSR_EL2. • Unless enabled by a higher Exception level, SPE Profiling exceptions are not generated. • PMBSR_EL1.S drives the interrupt request signal **PMBIRQ**. • Accesses to PMBSR_EL1 at EL1 ignore the value of HCR_EL2.NV1 and accesses to PMBSR_EL1 at EL2 ignore the value of HCR_EL2.E2H.
0b01	Delegated. SPE Profiling exceptions for EL2 are disabled, but might be enabled for EL1 by PMSCR_EL1.EE. All of the following apply: • No Profiling Buffer management events are recorded in PMBSR_EL2. • PMBSR_EL2.S is ignored and SPE Profiling exceptions are not taken to EL2, other than for the case when the Effective value of HCR_EL2.TGE is 1.
0b10	Enabled. SPE Profiling exceptions for EL2 are enabled for Profiling Buffer management events targeting EL2, as follows: • Profiling Buffer management events due to a fault on a write to the Profiling Buffer that would generate a Data Abort exception taken to EL2 if generated by a store instruction executed at the owning Exception level are recorded in PMBSR_EL2, unless they are configured to be recorded in PMBSR_EL3 by MDCR_EL3.PMSEE. If the Profiling Buffer owning Exception level is EL2, then this means any fault on a write to the Profiling Buffer. If the Profiling Buffer owning Exception level is EL1, then this means any of the following faults on a write to the Profiling Buffer: ◦ Stage 2 faults. ◦ If HCR_EL2.TEA is 1, synchronous External aborts. ◦ If HCR_EL2.GPF is 1, Granule Protection Faults (GPFs). • Profiling Buffer management events due to Granule Protection Check faults other than GPFs on a write to the Profiling Buffer are recorded in PMBSR_EL2, unless they are configured to be recorded in PMBSR_EL3 by MDCR_EL3.PMSEE. • SPE Profiling exceptions are generated and taken to EL2 when unmasked and PMBSR_EL2.S is 1.
0b11	Trap all. SPE Profiling exceptions for EL2 are enabled for all Profiling Buffer management events, as follows: • All Profiling Buffer management events are recorded in PMBSR_EL2, unless they are configured to be recorded in PMBSR_EL3 by MDCR_EL3.PMSEE. • SPE Profiling exceptions are generated and taken to EL2 when unmasked and PMBSR_EL2.S is 1.

If the Effective value of MDCR_EL3.PMSEE is 0b00, then the Effective value of PMSCR_EL2.EE is 0b00. Otherwise, if EL2 is not implemented or the Effective value of SCR_EL3.{NS, EEL2} is {0, 0}, then the Effective value of PMSCR_EL2.EE is 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PCT, bits [7:6]

Physical Timestamp. If timestamp sampling is enabled, determines which counter is collected. The behavior depends on the Profiling Buffer owning Exception level.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.

PCT	Meaning	Applies when
0b00	Virtual timestamp. The collected timestamp is the physical counter minus a virtual offset. If the Profiling Buffer owning Exception level is EL2 and any of the following are true, then the virtual offset is zero: • The sampled operation executed at EL2 and the Effective value of HCR_EL2.E2H is 1. • The sampled operation executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}. Otherwise, the virtual offset is the value of CNTVOFF_EL2.	
0b01	If the Profiling Buffer owning Exception level is EL1, then the timestamp value is selected by PMSCR_EL1.PCT. Otherwise, physical timestamp. The collected timestamp is the physical counter.	
0b11	If the Profiling Buffer owning Exception level is EL1 and PMSCR_EL1.PCT is 0b00, then guest virtual timestamp. The collected timestamp is the physical counter minus the value of CNTVOFF_EL2. Otherwise, guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, then the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2: • SCR_EL3.ECVEn is 0. • CNTHCTL_EL2.ECV is 0. • FEAT_ECV_POFF is not implemented.	When FEAT_ECV is implemented

All other values are reserved.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 0b01, other than for a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TS, bit [5]

Timestamp sample enable. Enables recording of a Timestamp packet when the owning Exception level is EL2.

TS	Meaning
0b0	Timestamp packet recording disabled.
0b1	Timestamp packet recording enabled.

If the Profiling Buffer owning Exception level is EL1, then this field is ignored by the PE. For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address Sample Enable.

PA	Meaning
0b0	Physical addresses are not collected.
0b1	Physical addresses are collected.

If the Profiling Buffer owning Exception level is EL1, and EL2 is enabled in the owning Security state, then this field is combined with PMSCR_EL1.PA to determine whether physical addresses are collected.

If EL2 is not implemented or EL2 is disabled in the owning Security state, then the Effective value of PMSCR_EL1.PA is 1.

For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CX, bit [3]

CONTEXTIDR_EL2 sample enable. Enables recording of a Context packet containing the value of CONTEXTIDR_EL2.

CX	Meaning
0b0	CONTEXTIDR_EL2 recording disabled.
0b1	CONTEXTIDR_EL2 recording enabled.

The PE ignores the value of this field and CONTEXTIDR_EL2 is not recorded when EL2 is not implemented or EL2 is disabled in the current Security state.

For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E2SPE, bit [1]

EL2 Statistical Profiling Enable.

E2SPE	Meaning
0b0	Sampling disabled at EL2.
0b1	Sampling enabled at EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When MDCR_EL2.E2PB != 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

E0HSPE, bit [0]

EL0 Statistical Profiling Enable.

E0HSPE	Meaning
0b0	Sampling disabled at EL0.
0b1	Sampling enabled at EL0.

If the Effective value of HCR_EL2.TGE is 0, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When MDCR_EL2.E2PB != 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Accessing PMSCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMSCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1001	0b1001	0b000

```

PMSDSFR_EL1, Sampling Data Source Filter Register

The PMSDSFR_EL1 characteristics are:

Purpose

Controls sample filtering by Data Source.

Configuration

This register is present only when FEAT_SPE_FDS is implemented. Otherwise, direct accesses to PMSDSFR_EL1 are UNDEFINED.

Attributes

PMSDSFR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33

S<m>, bit [m], for m = 63 to 0

When filtering on Data Source <m> is supported:

S[<m>] is the Data Source filter for IMPLEMENTATION DEFINED Data Source <m>.

S<m>	Meaning
0b0	If PMSFCR_EL1.FDS is 1, do not record load operations that have bits [5:0] of the Data Source packet set to <m>.
0b1	Load operations with Data Source <m> are unaffected by PMSFCR_EL1.FDS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

PMSELR_EL0, Performance Monitors Event Counter Selection Register

The PMSELR_EL0 characteristics are:

Purpose

Selects the current event counter PMEVCNTR<n>_EL0 or the cycle counter PMCCNTR_EL0.

Used in conjunction with PMXEVTYPER_EL0 to determine the event that increments a selected counter, and the modes and states in which the selected counter increments.

Used in conjunction with PMXEVCNTR_EL0 to determine the value of a selected counter.

Configuration

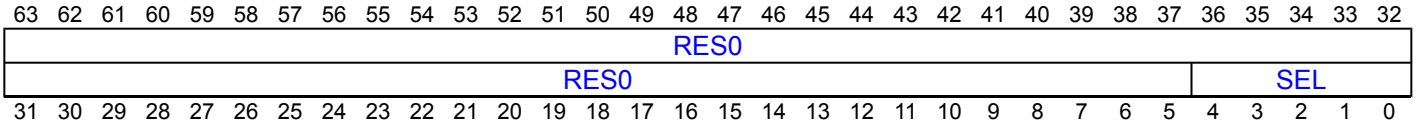
AArch64 System register PMSELR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSELR[31:0].

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMSELR_EL0 are UNDEFINED.

Attributes

PMSELR_EL0 is a 64-bit register.

Field descriptions



Bits [63:5]

Reserved, RES0.

SEL, bits [4:0]

Event counter select. Selects the counter accessed by subsequent accesses to PMXEVTYPER_EL0 and PMXEVCNTR_EL0.

SEL	Meaning
0b00000..0b11110	Select event counter PMEVCNTR<n>_EL0, where n is the value of this field: • MRS and MSR of PMXEVTYPER_EL0 access PMEVTYPER<n>_EL0. • MRS and MSR of PMXEVCNTR_EL0 access PMEVCNTR<n>_EL0.
0b11111	Select the cycle counter, PMCCNTR_EL0: • MRS and MSR of PMXEVTYPER_EL0 access PMCCFILTR_EL0. • MRS and MSR of PMXEVCNTR_EL0 are CONSTRAINED UNPREDICTABLE. For more information, see PMXEVCNTR_EL0.

If FEAT_FGT is not implemented and this field is set to a value greater than or equal to the number of implemented counters, but not equal to 31, then direct reads of this field return an UNKNOWN value.

For more information about the results of accesses to the event counters, including when PMSELR_EL0.SEL is set to the index of an unimplemented or inaccessible event counter, see PMXEVTYPER_EL0 and PMXEVCNTR_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMSEVFR_EL1, Sampling Event Filter Register

The PMSEVFR_EL1 characteristics are:

Purpose

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if PMSEVFR_EL1.E[3] and PMSEVFR_EL1.E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 (TLB walk) set to 1 are recorded.

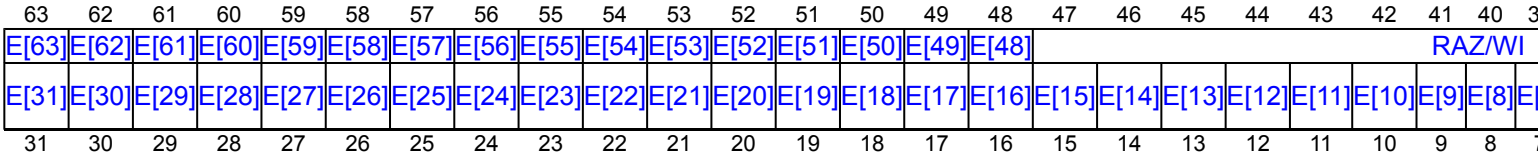
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSEVFR_EL1 are UNDEFINED.

Attributes

PMSEVFR_EL1 is a 64-bit register.

Field descriptions



E[63], bit [63]

When event 63 is implemented and filtering on event 63 is supported:

Filter on IMPLEMENTATION DEFINED event 63.

E[63]	Meaning
0b0	Event 63 is ignored.
0b1	Do not record samples that have event 63 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[62], bit [62]

When event 62 is implemented and filtering on event 62 is supported:

Filter on IMPLEMENTATION DEFINED event 62.

E[62]	Meaning
0b0	Event 62 is ignored.
0b1	Do not record samples that have event 62 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[61], bit [61]

When event 61 is implemented and filtering on event 61 is supported:

Filter on IMPLEMENTATION DEFINED event 61.

E[61]	Meaning
0b0	Event 61 is ignored.
0b1	Do not record samples that have event 61 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[60], bit [60]

When event 60 is implemented and filtering on event 60 is supported:

Filter on IMPLEMENTATION DEFINED event 60.

E[60]	Meaning
0b0	Event 60 is ignored.
0b1	Do not record samples that have event 60 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[59], bit [59]

When event 59 is implemented and filtering on event 59 is supported:

Filter on IMPLEMENTATION DEFINED event 59.

E[59]	Meaning
0b0	Event 59 is ignored.
0b1	Do not record samples that have event 59 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[58], bit [58]

When event 58 is implemented and filtering on event 58 is supported:

Filter on IMPLEMENTATION DEFINED event 58.

E[58]	Meaning
0b0	Event 58 is ignored.
0b1	Do not record samples that have event 58 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[57], bit [57]

When event 57 is implemented and filtering on event 57 is supported:

Filter on IMPLEMENTATION DEFINED event 57.

E[57]	Meaning
0b0	Event 57 is ignored.
0b1	Do not record samples that have event 57 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[56], bit [56]

When event 56 is implemented and filtering on event 56 is supported:

Filter on IMPLEMENTATION DEFINED event 56.

E[56]	Meaning
0b0	Event 56 is ignored.
0b1	Do not record samples that have event 56 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[55], bit [55]

When event 55 is implemented and filtering on event 55 is supported:

Filter on IMPLEMENTATION DEFINED event 55.

E[55]	Meaning
0b0	Event 55 is ignored.
0b1	Do not record samples that have event 55 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[54], bit [54]

When event 54 is implemented and filtering on event 54 is supported:

Filter on IMPLEMENTATION DEFINED event 54.

E[54]	Meaning
0b0	Event 54 is ignored.
0b1	Do not record samples that have event 54 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[53], bit [53]
When event 53 is implemented and filtering on event 53 is supported:

Filter on IMPLEMENTATION DEFINED event 53.

E[53]	Meaning
0b0	Event 53 is ignored.
0b1	Do not record samples that have event 53 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[52], bit [52]
When event 52 is implemented and filtering on event 52 is supported:

Filter on IMPLEMENTATION DEFINED event 52.

E[52]	Meaning
0b0	Event 52 is ignored.
0b1	Do not record samples that have event 52 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[51], bit [51]
When event 51 is implemented and filtering on event 51 is supported:

Filter on IMPLEMENTATION DEFINED event 51.

E[51]	Meaning
0b0	Event 51 is ignored.
0b1	Do not record samples that have event 51 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[50], bit [50]

When event 50 is implemented and filtering on event 50 is supported:

Filter on IMPLEMENTATION DEFINED event 50.

E[50]	Meaning
0b0	Event 50 is ignored.
0b1	Do not record samples that have event 50 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[49], bit [49]

When event 49 is implemented and filtering on event 49 is supported:

Filter on IMPLEMENTATION DEFINED event 49.

E[49]	Meaning
0b0	Event 49 is ignored.
0b1	Do not record samples that have event 49 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[48], bit [48]

When event 48 is implemented and filtering on event 48 is supported:

Filter on IMPLEMENTATION DEFINED event 48.

E[48]	Meaning
0b0	Event 48 is ignored.
0b1	Do not record samples that have event 48 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [47:32]

Reserved, RAZ/WI.

E[31], bit [31]

When FEAT_SPEv1p4 is not implemented, event 31 is implemented, and filtering on event 31 is supported:

Filter on IMPLEMENTATION DEFINED event 31.

E[31]	Meaning
0b0	Event 31 is ignored.
0b1	Do not record samples that have event 31 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[30], bit [30]

When FEAT_SPEv1p4 is not implemented, event 30 is implemented, and filtering on event 30 is supported:

Filter on IMPLEMENTATION DEFINED event 30.

E[30]	Meaning
0b0	Event 30 is ignored.
0b1	Do not record samples that have event 30 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[29], bit [29]
When FEAT_SPEv1p4 is not implemented, event 29 is implemented, and filtering on event 29 is supported:

Filter on IMPLEMENTATION DEFINED event 29.

E[29]	Meaning
0b0	Event 29 is ignored.
0b1	Do not record samples that have event 29 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[28], bit [28]
When FEAT_SPEv1p4 is not implemented, event 28 is implemented, and filtering on event 28 is supported:

Filter on IMPLEMENTATION DEFINED event 28.

E[28]	Meaning
0b0	Event 28 is ignored.
0b1	Do not record samples that have event 28 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[27], bit [27]
When FEAT_SPEv1p4 is not implemented, event 27 is implemented, and filtering on event 27 is supported:

Filter on IMPLEMENTATION DEFINED event 27.

E[27]	Meaning
0b0	Event 27 is ignored.
0b1	Do not record samples that have event 27 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[26], bit [26]

When FEAT_SPEv1p4 is not implemented, event 26 is implemented, and filtering on event 26 is supported:

Filter on IMPLEMENTATION DEFINED event 26.

E[26]	Meaning
0b0	Event 26 is ignored.
0b1	Do not record samples that have event 26 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[25], bit [25]

When (FEAT_SPE_SME is implemented or FEAT_SPEv1p5 is implemented) and event 25 is implemented:

Filter on SMCU or other shared resource operation event.

E[25]	Meaning
0b0	SMCU or other shared resource operation event is ignored.
0b1	Do not record samples that have the SMCU or other shared resource operation event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPEv1p4 is not implemented, event 25 is implemented, and filtering on event 25 is supported:

Filter on IMPLEMENTATION DEFINED event 25.

E[25]	Meaning
0b0	Event 25 is ignored.
0b1	Do not record samples that have event 25 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[24], bit [24]
When FEAT_SPE_SME is implemented:

Filter on Streaming SVE mode event.

E[24]	Meaning
0b0	Streaming SVE mode event is ignored.
0b1	Do not record samples that have the Streaming SVE mode event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPEv1p4 is not implemented, event 24 is implemented, and filtering on event 24 is supported:

Filter on IMPLEMENTATION DEFINED event 24.

E[24]	Meaning
0b0	Event 24 is ignored.
0b1	Do not record samples that have event 24 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[23], bit [23]
When FEAT_SPEv1p4 is implemented and event 23 is implemented:

Filter on Data snooped event.

E[23]	Meaning
0b0	Data snooped event is ignored.
0b1	Do not record samples that have the Data snooped event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[22], bit [22]
When FEAT_SPEv1p4 is implemented and event 22 is implemented:

Filter on Recently fetched event.

E[22]	Meaning
0b0	Recently fetched event is ignored.
0b1	Do not record samples that have the Recently fetched event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[21], bit [21]
When FEAT_SPEv1p4 is implemented and event 21 is implemented:

Filter on Cache data modified event.

E[21]	Meaning
0b0	Cache data modified event is ignored.
0b1	Do not record samples that have the Cache data modified event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[20], bit [20]
When FEAT_SPEv1p4 is implemented and event 20 is implemented:

Filter on Level 2 data cache miss event.

E[20]	Meaning
0b0	Level 2 data cache miss event is ignored.
0b1	Do not record samples that have the Level 2 data cache miss event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[19], bit [19]
When FEAT_SPEv1p4 is implemented and event 19 is implemented:

Filter on Level 2 data cache access event.

E[19]	Meaning
0b0	Level 2 data cache access event is ignored.
0b1	Do not record samples that have the Level 2 data cache access event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[18], bit [18]
When FEAT_SPEv1p1 is implemented and (FEAT_SVE is implemented or FEAT_SME is implemented):

Filter on Empty predicate event.

E[18]	Meaning
0b0	Empty predicate event is ignored.
0b1	Do not record samples that have the Empty predicate event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]
When FEAT_SPEv1p1 is implemented and (FEAT_SVE is implemented or FEAT_SME is implemented):

Filter on Partial or empty predicate event.

E[17]	Meaning
0b0	Partial or empty predicate event is ignored.
0b1	Do not record samples that have the Partial or empty predicate event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[16], bit [16]
When FEAT_TME is implemented:

Filter on Transactional event.

E[16]	Meaning
0b0	Transactional event is ignored.
0b1	Do not record samples that have the Transactional event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[15], bit [15]
When event 15 is implemented and filtering on event 15 is supported:

Filter on IMPLEMENTATION DEFINED event 15.

E[15]	Meaning
0b0	Event 15 is ignored.
0b1	Do not record samples that have event 15 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[14], bit [14]
When event 14 is implemented and filtering on event 14 is supported:

Filter on IMPLEMENTATION DEFINED event 14.

E[14]	Meaning
0b0	Event 14 is ignored.
0b1	Do not record samples that have event 14 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[13], bit [13]

When event 13 is implemented and filtering on event 13 is supported:

Filter on IMPLEMENTATION DEFINED event 13.

E[13]	Meaning
0b0	Event 13 is ignored.
0b1	Do not record samples that have event 13 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[12], bit [12]

When event 12 is implemented and filtering on event 12 is supported:

Filter on IMPLEMENTATION DEFINED event 12.

E[12]	Meaning
0b0	Event 12 is ignored.
0b1	Do not record samples that have event 12 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[11], bit [11]

When FEAT_SPEv1p1 is implemented:

Filter on Misalignment event.

E[11]	Meaning
0b0	Misalignment event is ignored.
0b1	Do not record samples that have the Misalignment event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[10], bit [10]

When (FEAT_SPEv1p4 is implemented or filtering on event 10 is optionally supported) and event 10 is implemented:

Filter on Remote access event.

E[10]	Meaning
0b0	Remote access event is ignored.
0b1	Do not record samples that have the Remote access event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[9], bit [9]

When (FEAT_SPEv1p4 is implemented or filtering on event 9 is optionally supported) and event 9 is implemented:

Filter on Last Level cache miss event.

E[9]	Meaning
0b0	Last Level cache miss event is ignored.
0b1	Do not record samples that have the Last Level cache miss event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[8], bit [8]

When (FEAT_SPEv1p4 is implemented or filtering on event 8 is optionally supported) and event 8 is implemented:

Filter on Last Level cache access event.

E[8]	Meaning
0b0	Last Level cache access event is ignored.
0b1	Do not record samples that have the Last Level cache access event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[7], bit [7]

Filter on Mispredicted event.

E[7]	Meaning
0b0	Mispredicted event is ignored.
0b1	Do not record samples that have the Mispredicted event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[6], bit [6]

When FEAT_SPEv1p2 is implemented:

Filter on Not taken event.

E[6]	Meaning
0b0	Not taken event is ignored.
0b1	Do not record samples that have the Not taken event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[5], bit [5]

Filter on TLB walk event.

E[5]	Meaning
0b0	TLB walk event is ignored.
0b1	Do not record samples that have the TLB walk event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[4], bit [4]

When FEAT_SPEv1p4 is implemented or filtering on event 4 is optionally supported:

Filter on TLB access event.

E[4]	Meaning
0b0	TLB access event is ignored.
0b1	Do not record samples that have the TLB access event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[3], bit [3]

Filter on Level 1 data cache refill or miss event.

E[3]	Meaning
0b0	Level 1 data cache refill or miss event is ignored.
0b1	Do not record samples that have the Level 1 data cache refill or miss event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[2], bit [2]

When FEAT_SPEv1p4 is implemented or filtering on event 2 is optionally supported:

Filter on Level 1 data cache access event.

E[2]	Meaning
0b0	Level 1 data cache access event is ignored.
0b1	Do not record samples that have the Level 1 data cache access event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[1], bit [1]

When the PE supports sampling of speculative instructions:

Filter on Architecturally retired event.

E[1]	Meaning
0b0	Architecturally retired event is ignored.
0b1	Do not record samples that have the Architecturally retired event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, UNKNOWN.

Bit [0]

Reserved, RAZ/WI.

Accessing PMSEVFR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMSEVFR_EL1

PMSFCR_EL1, Sampling Filter Control Register

The PMSFCR_EL1 characteristics are:

Purpose

Controls sample filtering. The filter is the logical AND of the filters controlled by FDS, FnE, FL, FT, and FE bits. For example, if PMSFCR_EL1.FE is 1 and PMSFCR_EL1.FT is 1, then only samples including the selected types and the selected events will be recorded.

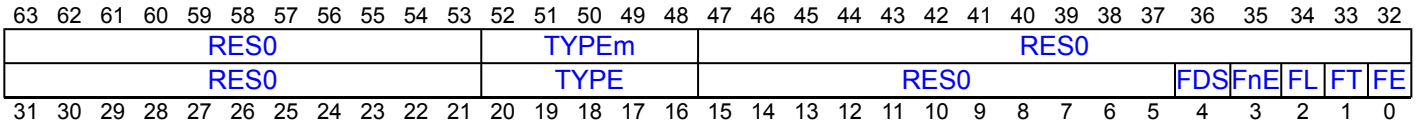
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSFCR_EL1 are UNDEFINED.

Attributes

PMSFCR_EL1 is a 64-bit register.

Field descriptions

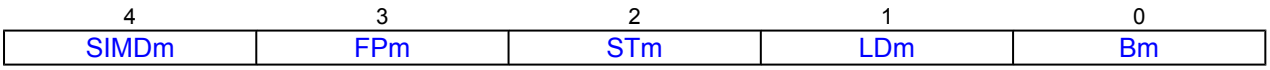


Bits [63:53]

Reserved, RES0.

TYPEm, bits [52:48]

TYPEm encoding when FEAT_SPE_EFT is implemented



SIMDm, bit [4]

SIMD filter mask.

SIMDm	Meaning
0b0	PMSFCR_EL1.SIMD controls whether SIMD operations are recorded as part of a Boolean-OR filter with other masked operation type filter controls.
0b1	PMSFCR_EL1.SIMD controls whether SIMD operations are recorded as part of a Boolean-AND filter with other unmasked operation type filter controls.

This field is ignored by the PE when PMSFCR_EL1.FT is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FPm, bit [3]

Floating-point filter mask.

FPm	Meaning
0b0	PMSFCR_EL1.FP controls whether floating-point operations are recorded as part of a Boolean-OR filter with other masked operation type filter controls.
0b1	PMSFCR_EL1.FP controls whether floating-point operations are recorded as part of a Boolean-AND filter with other unmasked operation type filter controls.

This field is ignored by the PE when PMSFCR_EL1.FT is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

STm, bit [2]

Store filter mask.

STm	Meaning
0b0	PMSFCR_EL1.ST controls whether store operations are recorded as part of a Boolean-OR filter with other masked operation type filter controls.
0b1	PMSFCR_EL1.ST controls whether store operations are recorded as part of a Boolean-AND filter with other unmasked operation type filter controls.

This field is ignored by the PE when PMSFCR_EL1.FT is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LDm, bit [1]

Load filter mask.

LDm	Meaning
0b0	PMSFCR_EL1.LD controls whether load operations are recorded as part of a Boolean-OR filter with other masked operation type filter controls.
0b1	PMSFCR_EL1.LD controls whether load operations are recorded as part of a Boolean-AND filter with other unmasked operation type filter controls.

This field is ignored by the PE when PMSFCR_EL1.FT is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bm, bit [0]

Branch filter mask.

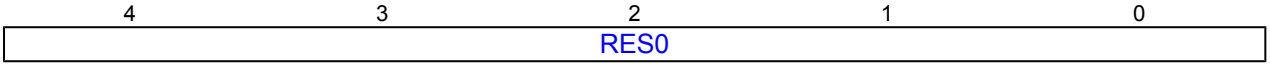
Bm	Meaning
0b0	PMSFCR_EL1.B controls whether branch operations are recorded as part of a Boolean-OR filter with other masked operation type filter controls.
0b1	PMSFCR_EL1.B controls whether branch operations are recorded as part of a Boolean-AND filter with other unmasked operation type filter controls.

This field is ignored by the PE when PMSFCR_EL1.FT is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TYPEm encoding when FEAT_SPE_EFT is not implemented



Bits [4:0]

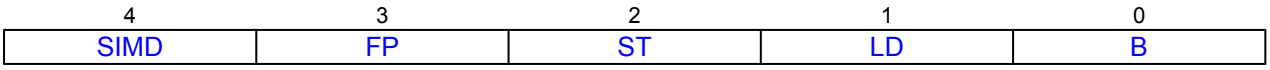
Reserved, RES0.

Bits [47:21]

Reserved, RES0.

TYPE, bits [20:16]

TYPE encoding



SIMD, bit [4]

When FEAT_SPE_EFT is implemented:

SIMD filter enable.

SIMD	Meaning
0b0	If PMSFCR_EL1.SIMDm is 1, then record only operations that are not SIMD operations. Otherwise, do not record SIMD operations, unless allowed by another operation type filter.
0b1	If PMSFCR_EL1.SIMDm is 1, then record only operations that are SIMD operations. Otherwise, record all SIMD operations.

This field is ignored by the PE and no records are removed by this filter when any of the following apply:

- PMSFCR_EL1.FT is 0.
- PMSFCR_EL1.SIMDm is 0 and the values of the PMSCR_EL1.{SIMD, FP, ST, LD, B} bits for which the corresponding PMSCR_EL1.{SIMDm, FPm, STm, LDm, Bm} bit is zero are all zero.

For filtering purposes, SIMD operations means all Advanced SIMD, SVE, and SME SIMD operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FP, bit [3]

When FEAT_SPE_EFT is implemented:

Floating-point filter enable.

FP	Meaning
0b0	If PMSFCR_EL1.FPm is 1, then record only operations that are not floating-point operations. Otherwise, do not record floating-point operations, unless allowed by another operation type filter.
0b1	If PMSFCR_EL1.FPm is 1, then record only operations that are floating-point operations. Otherwise, record all floating-point operations.

This field is ignored by the PE and no records are removed by this filter when any of the following apply:

- PMSFCR_EL1.FT is 0.
- PMSFCR_EL1.FPm is 0 and the values of the PMSCR_EL1.{SIMD, FP, ST, LD, B} bits for which the corresponding PMSCR_EL1.{SIMDm, FPm, STm, LDm, Bm} bit is zero are all zero.

For filtering purposes, floating-point operations means all scalar, Advanced SIMD, SVE, and SME floating-point operations, as defined by the FP_SPEC event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ST, bit [2]

Store filter enable.

ST	Meaning
0b0	If FEAT_SPE_EFT is implemented and PMSFCR_EL1.STm is 1, then record only operations that are not store operations. Otherwise, do not record store operations, unless allowed by another operation type filter.
0b1	If FEAT_SPE_EFT is implemented and PMSFCR_EL1.STm is 1, then record only operations that are store operations. Otherwise, record all store operations.

This field is ignored by the PE and no records are removed by this filter when any of the following apply:

- PMSFCR_EL1.FT is 0.
- FEAT_SPE_EFT is implemented, PMSFCR_EL1.STm is 0, and the values of the PMSCR_EL1.{SIMD, FP, ST, LD, B} bits for which the corresponding PMSCR_EL1.{SIMDm, FPm, STm, LDm, Bm} bit is zero are all zero.

For filtering purposes, store operations includes vector stores and all atomic operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LD, bit [1]

Load filter enable.

LD	Meaning
0b0	If FEAT_SPE_EFT is implemented and PMSFCR_EL1.LDm is 1, then record only operations that are not load operations. Otherwise, do not record load operations, unless allowed by another operation type filter.
0b1	If FEAT_SPE_EFT is implemented and PMSFCR_EL1.LDm is 1, then record only operations that are load operations. Otherwise, record all load operations.

This field is ignored by the PE and no records are removed by this filter when any of the following apply:

- PMSFCR_EL1.FT is 0.
- FEAT_SPE_EFT is implemented, PMSFCR_EL1.LDm is 0, and the values of the PMSCR_EL1.{SIMD, FP, ST, LD, B} bits for which the corresponding PMSCR_EL1.{SIMDm, FPm, STm, LDm, Bm} bit is zero are all zero.

For filtering purposes, load operations includes vector loads and atomic operations that return a value to the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

B, bit [0]

Branch filter enable.

B	Meaning
0b0	If FEAT_SPE_EFT is implemented and PMSFCR_EL1.Bm is 1, then record only operations that are not branch operations. Otherwise, do not record branch operations.
0b1	If FEAT_SPE_EFT is implemented and PMSFCR_EL1.Bm is 1, then record only operations that are branch operations. Otherwise, record all branch operations.

This field is ignored by the PE and no records are removed by this filter when any of the following apply:

- PMSFCR_EL1.FT is 0.
- FEAT_SPE_EFT is implemented, PMSFCR_EL1.Bm is 0, and the values of the PMSCR_EL1.{SIMD, FP, ST, LD, B} bits for which the corresponding PMSCR_EL1.{SIMDm, FPm, STm, LDm, Bm} bit is zero are all zero.

For filtering purposes, branch operations includes exception returns.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:5]

Reserved, RES0.

FDS, bit [4]

When FEAT_SPE_FDS is implemented:

Filter by Data Source.

FDS	Meaning
0b0	Data Source filtering disabled.
0b1	Data Source filtering enabled. Samples of load instructions reporting a Data Source not selected by PMSDSFR_EL1 will not be recorded.

If PMSFCR_EL1.FDS is 1 and PMSDSFR_EL1 is zero, then no load operations with a Data Source will be recorded.

Load operations without a Data Source and other sampled operations are unaffected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnE, bit [3]

When FEAT_SPE_FnE is implemented:

Filter by event, inverted.

FnE	Meaning
0b0	Inverted event filtering disabled.
0b1	Inverted event filtering enabled. Samples including the events selected by PMSNEVFR_EL1 will not be recorded.

If any of the following are true, then it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FnE is 0:

- PMSFCR_EL1.FnE is 1 and PMSNEVFR_EL1 is zero.
- PMSFCR_EL1.FnE is 1, PMSFCR_EL1.FE is 1, and there exists a value x such that PMSEVFR_EL1.E[x] is 1 and PMSNEVFR_EL1.E[x] is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FL, bit [2]

Filter by latency.

FL	Meaning
0b0	Latency filtering disabled.
0b1	Latency filtering enabled. Samples with a total latency less than PMSLATFR_EL1.MINLAT will not be recorded.

If this field is 1 and PMSLATFR_EL1.MINLAT is zero, then it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FL is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FT, bit [1]

Filter by type. The filter is controlled by the TYPE and, if FEAT_SPE_EFT is implemented, TYPEm fields.

FT	Meaning
0b0	Type filtering disabled
0b1	Type filtering enabled. Samples not one of the selected types will not be recorded.

Type filtering filters according to the type of the sampled operation.

If FEAT_SPE_EFT is not implemented, this field is 1, and the PMSFCR_EL1.{ST, LD, B} bits are all zero, then it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FT is 0.

For more information, see Filtering by operation type.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FE, bit [0]

Filter by event.

FE	Meaning
0b0	Event filtering disabled.
0b1	Event filtering enabled. Samples not including the events selected by PMSEVFR_EL1 will not be recorded.

If any of the following are true, then it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FE is 0:

- PMSFCR_EL1.FE is 1 and PMSEVFR_EL1 is zero.
- FEAT_SPE_FnE is implemented, PMSFCR_EL1.FnE is 1, PMSFCR_EL1.FE is 1, and there exists a value x such that PMSEVFR_EL1.E[x] is 1 and PMSNEVFR_EL1.E[x] is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSFCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMSFCR_EL1

PMSICR_EL1, Sampling Interval Counter Register

The PMSICR_EL1 characteristics are:

Purpose

Software must write zero to PMSICR_EL1 before enabling sample profiling for a sampling session. Software must then treat PMSICR_EL1 as an opaque, 64-bit, read/write register used for context switches only.

Configuration

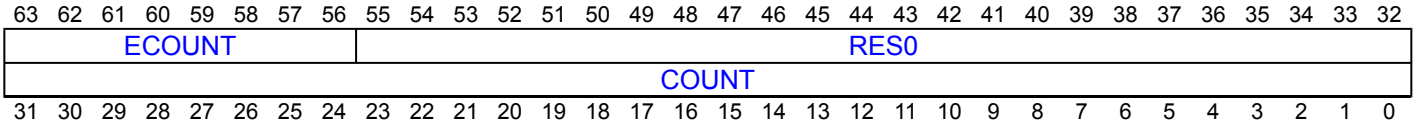
This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSICR_EL1 are UNDEFINED.

The value of PMSICR_EL1 does not change whilst profiling is disabled.

Attributes

PMSICR_EL1 is a 64-bit register.

Field descriptions



ECOUNT, bits [63:56]

When PMSIDR_EL1.ERnd == 1:

Secondary sample interval counter. Provides the secondary counter used after the primary counter reaches zero.

While the secondary counter is nonzero and profiling is enabled, the secondary counter decrements by 1 for each member of the sample population. The primary counter also continues to decrement since it is also nonzero. When the secondary counter reaches zero, a member of the sampling population is selected for sampling.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [55:32]

Reserved, RES0.

COUNT, bits [31:0]

Primary sample interval counter. Provides the primary counter used for sampling.

When the PE moves from a state or Exception level where profiling is disabled to a state or Exception level where profiling is enabled, if the value of this register is zero, then the primary counter is loaded from PMSIRR_EL1.

While the primary counter is nonzero and sampling is enabled, the primary counter decrements by 1 for each member of the sample population.

The sample interval counter counts either a number of operations or a number of instructions, depending on the IMPLEMENTATION DEFINED value of PMSIDR_EL1.ArchInst.

When the counter reaches zero, the behavior depends on the values of PMSIDR_EL1.ERnd and PMSIRR_EL1.RND:

- If PMSIRR_EL1.RND is 1 and PMSIDR_EL1.ERnd is 1, then the secondary counter is set to a random or pseudorandom value in the range `0x00` to `0xFF`.
- Otherwise, a member of the sampling population is selected for sampling.
- The primary counter is loaded from PMSIRR_EL1.

The primary counter is loaded from PMSIRR_EL1 means:

- PMSICR_EL1.COUNT[31:8] is set to the value of PMSIRR_EL1.INTERVAL.
- If PMSIRR_EL1.RND is 1 and PMSIDR_EL1.ERnd is 0, then PMSICR_EL1.COUNT[7:0] is set to a random or pseudorandom value in the range `0x00` to `0xFF`.
- Otherwise, PMSICR_EL1.COUNT[7:0] is set to `0x00`.

For more information, see Initializing the sample interval counters and Behavior of the sample interval counter while profiling is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSICR_EL1

PMSIDR_EL1, Sampling Profiling ID Register

The PMSIDR_EL1 characteristics are:

Purpose

Describes the Statistical Profiling implementation to software.

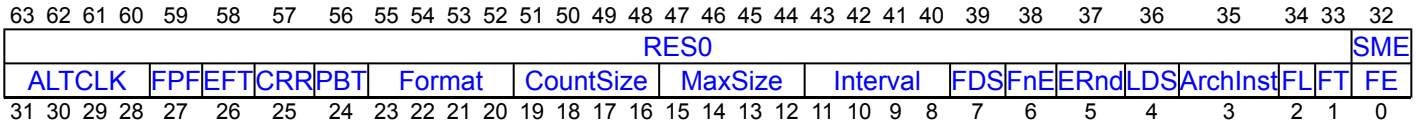
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSIDR_EL1 are UNDEFINED.

Attributes

PMSIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

SME, bit [32]

SPE for SME. Adds support for the Scalable Matrix Extensions to Statistical Profiling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SME	Meaning
0b0	The SME extensions to the Statistical Profiling Extension are not implemented.
0b1	Adds support for Statistical Profiling of the Scalable Matrix Extensions.

FEAT_SPE_SME implements the functionality identified by the value 1.

Access to this field is **RO**.

ALTCLK, bits [31:28]

Alternate clock domain.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ALTCLK	Meaning
0b0000	Alternate clock domain not implemented, or CPU clock domain.
0b0001	The external Streaming Mode Compute Unit provides the alternate clock domain.
0b1111	IMPLEMENTATION DEFINED clock domain.

All other values are reserved.

FEAT_SPE_ALTCLK implements the functionality identified by a nonzero value.

Access to this field is **RO**.

FPF, bit [27]

Floating-point flag.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPF	Meaning
0b0	Operation Type packets for scalar and Advanced SIMD operations do not contain floating-point or Advanced SIMD information.
0b1	Operation Type packets for scalar and Advanced SIMD operations contain floating-point or Advanced SIMD information.

FEAT_SPE_FPF implements the functionality identified by the value 1.

Access to this field is **RO**.

EFT, bit [26]

Extended filtering by operation type.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EFT	Meaning
0b0	PMSFCR_EL1.{SIMDm, FPm, STm, Bm, LDm, SIMD, FP} are RES0.
0b1	PMSFCR_EL1.{SIMDm, FPm, STm, Bm, LDm, SIMD, FP} are implemented.

FEAT_SPE_EFT implements the functionality identified by the value 1.

Access to this field is **RO**.

CRR, bit [25]

Call Return branch records.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CRR	Meaning
0b0	Operation Type packets for branches do not contain Call Return information.
0b1	Operation Type packets for branches contain Call Return information.

FEAT_SPE_CRR implements the functionality identified by the value 1.

Access to this field is **RO**.

PBT, bit [24]

Previous branch target Address packet.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PBT	Meaning
0b0	Previous branch target Address packet not supported.
0b1	Previous branch target Address packet support implemented.

FEAT_SPE_PBT implements the OPTIONAL functionality identified by the value 1.

Access to this field is **RO**.

Format, bits [23:20]

Defines the format of the sample records.

Format	Meaning
0b0000	Format 0.

All other values are reserved.

Access to this field is **RO**.

CountSize, bits [19:16]

Defines the size of the counters.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CountSize	Meaning
0b0010	12-bit saturating counters.
0b0011	16-bit saturating counters.

All other values are reserved.

Access to this field is **RO**.

MaxSize, bits [15:12]

Defines the largest size for a single record, rounded up to a power-of-two. If this is the same as the minimum alignment (PMBIDR_EL1.Align), then each record is exactly this size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MaxSize	Meaning
0b0100	16 bytes.
0b0101	32 bytes.
0b0110	64 bytes.
0b0111	128 bytes.
0b1000	256 bytes.
0b1001	512 bytes.
0b1010	1KB.
0b1011	2KB.

All other values are reserved.

The values 0b0100 and 0b0101 are not permitted for an implementation.

Access to this field is **RO**.

Interval, bits [11:8]

Minimum sampling interval. This provides guidance from the implementer to the smallest sampling interval.

The interval is defined as a number of either operations or instructions, depending on the IMPLEMENTATION DEFINED value of PMSIDR_EL1.ArchInst.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Interval	Meaning
0b0000	256 operations or instructions, or no minimum specified.
0b0010	512 operations or instructions.
0b0011	768 operations or instructions.
0b0100	1,024 operations or instructions.
0b0101	1,536 operations or instructions.
0b0110	2,048 operations or instructions.
0b0111	3,072 operations or instructions.
0b1000	4,096 operations or instructions.

All other values are reserved.

If this field reads as a nonzero value, then setting the sample interval to a value less than the indicated value is likely to cause a statistically significant number of sample collisions. For example, the smallest interval might indicate the typical size of the speculation window for the implementation. That is, the number of operations or instructions that will be executing in parallel, when the processor implementation is not heavily loaded.

Setting the sample interval to a value greater than or equal to the indicated value does not guarantee a statistically insignificant number of sample collisions, as this is typically dependent on the program being profiled. For example, if the program has a large number of long latency loads due to cache misses, then this might cause more collisions when these operations or instructions are sampled.

For more information, see 'Sample collisions'.

Access to this field is **RO**.

FDS, bit [7]

When FEAT_SPEv1p4 is implemented:

Filtering by data source.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FDS	Meaning
0b0	PMSDSFR_EL1 is not implemented and PMSFCR_EL1.FDS is RES0.
0b1	PMSDSFR_EL1 and PMSFCR_EL1.FDS are implemented.

FEAT_SPE_FDS implements the functionality identified by the value 1.

From Armv8.9, if FEAT_SPE_LDS is implemented, the value 0 is not permitted.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

FnE, bit [6]

When FEAT_SPEv1p2 is implemented:

Filtering by events, inverted.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FnE	Meaning
0b0	PMSNEVFR_EL1 is not implemented and PMSFCR_EL1.FnE is RES0.
0b1	PMSNEVFR_EL1 and PMSFCR_EL1.FnE are implemented.

FEAT_SPE_FnE implements the functionality identified by the value 1.

From Armv8.7, if FEAT_SPE is implemented, the value 0 is not permitted.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

ERnd, bit [5]

Defines how the random number generator is used in determining the interval between samples, when enabled by PMSIRR_EL1.RND.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ERnd	Meaning
0b0	The random number is added at the start of the interval, and the sample is taken and a new interval started when the combined interval expires.
0b1	The random number is added and the new interval started after the interval programmed in PMSIRR_EL1.INTERVAL expires, and the sample is taken when the random interval expires.

Access to this field is **RO**.

LDS, bit [4]

Data source indicator for sampled load instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LDS	Meaning
0b0	Loaded data source not implemented.
0b1	Loaded data source implemented.

FEAT_SPE_LDS implements the functionality identified by the value 1.

Access to this field is **RO**.

ArchInst, bit [3]

Architectural instruction profiling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ArchInst	Meaning
0b0	Micro-op sampling implemented.
0b1	Architecture instruction sampling implemented.

Access to this field is **RO**.

FL, bit [2]

Filtering by latency.

Reads as 0b1.

Access to this field is **RO**.

FT, bit [1]

Filtering by operation type.

Reads as 0b1.

Access to this field is **RO**.

FE, bit [0]

Filtering by events.

Reads as 0b1.

Access to this field is **RO**.

Accessing PMSIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

PMSIRR_EL1, Sampling Interval Reload Register

The PMSIRR_EL1 characteristics are:

Purpose

Defines the interval between samples.

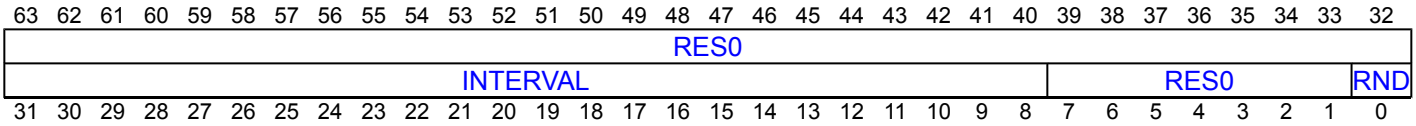
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSIRR_EL1 are UNDEFINED.

Attributes

PMSIRR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

INTERVAL, bits [31:8]

Bits [31:8] of the PMSICR_EL1 interval counter reload value. Software must set this to a nonzero value.

If this field is zero, then an UNKNOWN sampling interval is used.

If PMSIDR_EL1.Interval is nonzero, then it provides guidance from the implementer to the smallest sampling interval that should be used.

Setting this field to a nonzero value smaller than the indicated value is likely to cause a statistically significant number of sample collisions. See Sample collisions. Setting the sample interval to a value greater than or equal to the indicated value does not guarantee a statistically insignificant number of sample collisions, as this is typically dependent on the program being profiled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:1]

Reserved, RES0.

RND, bit [0]

Controls randomization of the sampling interval.

RND	Meaning
0b0	Disable randomization of sampling interval.
0b1	Add (pseudo-)random jitter to sampling interval.

The random number generator is not architected.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSIRR_EL1

Accesses to this register use the following encodings in the System register encoding space:

PMSLATFR_EL1, Sampling Latency Filter Register

The PMSLATFR_EL1 characteristics are:

Purpose

Controls sample filtering by latency

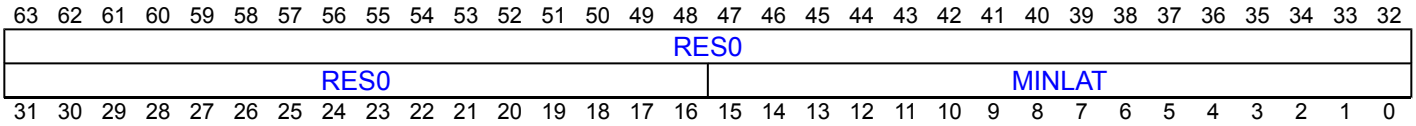
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSLATFR_EL1 are UNDEFINED.

Attributes

PMSLATFR_EL1 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

MINLAT, bits [15:0]

Minimum latency.

When PMSFCR_EL1.FL is 1, defines the value used for filtering by latency. Samples with a Total latency less than PMSLATFR_EL1.MINLAT are not recorded.

If PMSIDR_EL1.CountSize is `0b0010`, PMSLATFR_EL1.MINLAT[15:12] is RES0.

This field is ignored by the PE when PMSFCR_EL1.FL is 0.

For more information, see Filtering by latency.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSLATFR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMSLATFR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1001	0b110

```

PMSNEVFR_EL1, Sampling Inverted Event Filter Register

The PMSNEVFR_EL1 characteristics are:

Purpose

Controls sample filtering by events. The overall inverted filter is the logical OR of these filters. For example, if PMSNEVFR_EL1.E[3] and PMSNEVFR_EL1.E[5] are both set to 1, samples that have either event 3 (Level 1 unified or data cache refill) or event 5 (TLB walk) set to 1 are not recorded.

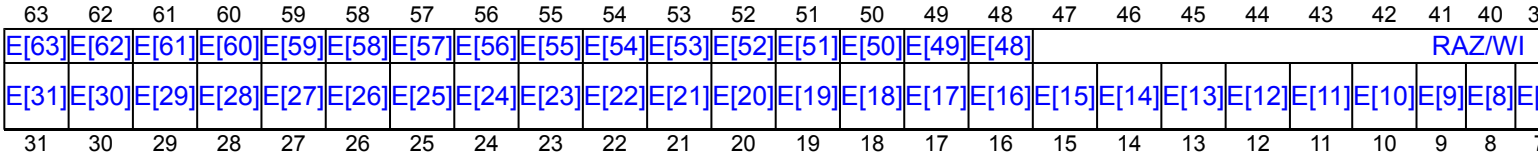
Configuration

This register is present only when FEAT_SPE_FnE is implemented. Otherwise, direct accesses to PMSNEVFR_EL1 are UNDEFINED.

Attributes

PMSNEVFR_EL1 is a 64-bit register.

Field descriptions



E[63], bit [63]

When event 63 is implemented and filtering on event 63 is supported:

Filter on IMPLEMENTATION DEFINED event 63.

E[63]	Meaning
0b0	Event 63 is ignored.
0b1	Do not record samples that have event 63 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[62], bit [62]

When event 62 is implemented and filtering on event 62 is supported:

Filter on IMPLEMENTATION DEFINED event 62.

E[62]	Meaning
0b0	Event 62 is ignored.
0b1	Do not record samples that have event 62 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[61], bit [61]

When event 61 is implemented and filtering on event 61 is supported:

Filter on IMPLEMENTATION DEFINED event 61.

E[61]	Meaning
0b0	Event 61 is ignored.
0b1	Do not record samples that have event 61 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[60], bit [60]

When event 60 is implemented and filtering on event 60 is supported:

Filter on IMPLEMENTATION DEFINED event 60.

E[60]	Meaning
0b0	Event 60 is ignored.
0b1	Do not record samples that have event 60 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[59], bit [59]

When event 59 is implemented and filtering on event 59 is supported:

Filter on IMPLEMENTATION DEFINED event 59.

E[59]	Meaning
0b0	Event 59 is ignored.
0b1	Do not record samples that have event 59 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[58], bit [58]

When event 58 is implemented and filtering on event 58 is supported:

Filter on IMPLEMENTATION DEFINED event 58.

E[58]	Meaning
0b0	Event 58 is ignored.
0b1	Do not record samples that have event 58 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[57], bit [57]

When event 57 is implemented and filtering on event 57 is supported:

Filter on IMPLEMENTATION DEFINED event 57.

E[57]	Meaning
0b0	Event 57 is ignored.
0b1	Do not record samples that have event 57 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[56], bit [56]

When event 56 is implemented and filtering on event 56 is supported:

Filter on IMPLEMENTATION DEFINED event 56.

E[56]	Meaning
0b0	Event 56 is ignored.
0b1	Do not record samples that have event 56 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[55], bit [55]

When event 55 is implemented and filtering on event 55 is supported:

Filter on IMPLEMENTATION DEFINED event 55.

E[55]	Meaning
0b0	Event 55 is ignored.
0b1	Do not record samples that have event 55 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[54], bit [54]

When event 54 is implemented and filtering on event 54 is supported:

Filter on IMPLEMENTATION DEFINED event 54.

E[54]	Meaning
0b0	Event 54 is ignored.
0b1	Do not record samples that have event 54 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[53], bit [53]
When event 53 is implemented and filtering on event 53 is supported:

Filter on IMPLEMENTATION DEFINED event 53.

E[53]	Meaning
0b0	Event 53 is ignored.
0b1	Do not record samples that have event 53 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[52], bit [52]
When event 52 is implemented and filtering on event 52 is supported:

Filter on IMPLEMENTATION DEFINED event 52.

E[52]	Meaning
0b0	Event 52 is ignored.
0b1	Do not record samples that have event 52 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[51], bit [51]
When event 51 is implemented and filtering on event 51 is supported:

Filter on IMPLEMENTATION DEFINED event 51.

E[51]	Meaning
0b0	Event 51 is ignored.
0b1	Do not record samples that have event 51 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[50], bit [50]
When event 50 is implemented and filtering on event 50 is supported:

Filter on IMPLEMENTATION DEFINED event 50.

E[50]	Meaning
0b0	Event 50 is ignored.
0b1	Do not record samples that have event 50 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[49], bit [49]
When event 49 is implemented and filtering on event 49 is supported:

Filter on IMPLEMENTATION DEFINED event 49.

E[49]	Meaning
0b0	Event 49 is ignored.
0b1	Do not record samples that have event 49 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[48], bit [48]

When event 48 is implemented and filtering on event 48 is supported:

Filter on IMPLEMENTATION DEFINED event 48.

E[48]	Meaning
0b0	Event 48 is ignored.
0b1	Do not record samples that have event 48 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [47:32]

Reserved, RAZ/WI.

E[31], bit [31]

When FEAT_SPEv1p4 is not implemented, event 31 is implemented, and filtering on event 31 is supported:

Filter on IMPLEMENTATION DEFINED event 31.

E[31]	Meaning
0b0	Event 31 is ignored.
0b1	Do not record samples that have event 31 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[30], bit [30]

When FEAT_SPEv1p4 is not implemented, event 30 is implemented, and filtering on event 30 is supported:

Filter on IMPLEMENTATION DEFINED event 30.

E[30]	Meaning
0b0	Event 30 is ignored.
0b1	Do not record samples that have event 30 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[29], bit [29]
When FEAT_SPEv1p4 is not implemented, event 29 is implemented, and filtering on event 29 is supported:

Filter on IMPLEMENTATION DEFINED event 29.

E[29]	Meaning
0b0	Event 29 is ignored.
0b1	Do not record samples that have event 29 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[28], bit [28]
When FEAT_SPEv1p4 is not implemented, event 28 is implemented, and filtering on event 28 is supported:

Filter on IMPLEMENTATION DEFINED event 28.

E[28]	Meaning
0b0	Event 28 is ignored.
0b1	Do not record samples that have event 28 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[27], bit [27]
When FEAT_SPEv1p4 is not implemented, event 27 is implemented, and filtering on event 27 is supported:

Filter on IMPLEMENTATION DEFINED event 27.

E[27]	Meaning
0b0	Event 27 is ignored.
0b1	Do not record samples that have event 27 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[26], bit [26]

When FEAT_SPEv1p4 is not implemented, event 26 is implemented, and filtering on event 26 is supported:

Filter on IMPLEMENTATION DEFINED event 26.

E[26]	Meaning
0b0	Event 26 is ignored.
0b1	Do not record samples that have event 26 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[25], bit [25]

When (FEAT_SPE_SME is implemented or FEAT_SPEv1p5 is implemented) and event 25 is implemented:

Filter on Not SMCU or other shared resource operation event.

E[25]	Meaning
0b0	SMCU or other shared resource operation event is ignored.
0b1	Do not record samples that have the SMCU or other shared resource operation event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPEv1p4 is not implemented, event 25 is implemented, and filtering on event 25 is supported:

Filter on IMPLEMENTATION DEFINED event 25.

E[25]	Meaning
0b0	Event 25 is ignored.
0b1	Do not record samples that have event 25 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[24], bit [24]
When FEAT_SPE_SME is implemented:

Filter on Non-streaming SVE mode event.

E[24]	Meaning
0b0	Streaming SVE mode event is ignored.
0b1	Do not record samples that have the Streaming SVE mode event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPEv1p4 is not implemented, event 24 is implemented, and filtering on event 24 is supported:

Filter on IMPLEMENTATION DEFINED event 24.

E[24]	Meaning
0b0	Event 24 is ignored.
0b1	Do not record samples that have event 24 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[23], bit [23]
When FEAT_SPEv1p4 is implemented and event 23 is implemented:

Filter on Data not snooped event.

E[23]	Meaning
0b0	Data snooped event is ignored.
0b1	Do not record samples that have the Data snooped event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[22], bit [22]
When FEAT_SPEv1p4 is implemented and event 22 is implemented:

Filter on Not recently fetched event.

E[22]	Meaning
0b0	Recently fetched event is ignored.
0b1	Do not record samples that have the Recently fetched event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[21], bit [21]
When FEAT_SPEv1p4 is implemented and event 21 is implemented:

Filter on Cache data not modified event.

E[21]	Meaning
0b0	Cache data modified event is ignored.
0b1	Do not record samples that have the Cache data modified event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[20], bit [20]
When FEAT_SPEv1p4 is implemented and event 20 is implemented:

Filter on Level 2 data cache hit event.

E[20]	Meaning
0b0	Level 2 data cache miss event is ignored.
0b1	Do not record samples that have the Level 2 data cache miss event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[19], bit [19]
When FEAT_SPEv1p4 is implemented and event 19 is implemented:

Filter on No level 2 data cache access event.

E[19]	Meaning
0b0	Level 2 data cache access event is ignored.
0b1	Do not record samples that have the Level 2 data cache access event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[18], bit [18]
When FEAT_SPEv1p1 is implemented and (FEAT_SVE is implemented or FEAT_SME is implemented):

Filter on Not empty predicate event.

E[18]	Meaning
0b0	Empty predicate event is ignored.
0b1	Do not record samples that have the Empty predicate event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]
When FEAT_SPEv1p1 is implemented and (FEAT_SVE is implemented or FEAT_SME is implemented):

Filter on Not partial predicate event.

E[17]	Meaning
0b0	Partial or empty predicate event is ignored.
0b1	Do not record samples that have the Partial or empty predicate event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[16], bit [16]
When FEAT_TME is implemented:

Filter on Not transactional event.

E[16]	Meaning
0b0	Transactional event is ignored.
0b1	Do not record samples that have the Transactional event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[15], bit [15]
When event 15 is implemented and filtering on event 15 is supported:

Filter on IMPLEMENTATION DEFINED event 15.

E[15]	Meaning
0b0	Event 15 is ignored.
0b1	Do not record samples that have event 15 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[14], bit [14]
When event 14 is implemented and filtering on event 14 is supported:

Filter on IMPLEMENTATION DEFINED event 14.

E[14]	Meaning
0b0	Event 14 is ignored.
0b1	Do not record samples that have event 14 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[13], bit [13]
When event 13 is implemented and filtering on event 13 is supported:

Filter on IMPLEMENTATION DEFINED event 13.

E[13]	Meaning
0b0	Event 13 is ignored.
0b1	Do not record samples that have event 13 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[12], bit [12]
When event 12 is implemented and filtering on event 12 is supported:

Filter on IMPLEMENTATION DEFINED event 12.

E[12]	Meaning
0b0	Event 12 is ignored.
0b1	Do not record samples that have event 12 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[11], bit [11]

When FEAT_SPEv1p1 is implemented:

Filter on Aligned event.

E[11]	Meaning
0b0	Misalignment event is ignored.
0b1	Do not record samples that have the Misalignment event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[10], bit [10]

When (FEAT_SPEv1p4 is implemented or filtering on event 10 is optionally supported) and event 10 is implemented:

Filter on No remote access event.

E[10]	Meaning
0b0	Remote access event is ignored.
0b1	Do not record samples that have the Remote access event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[9], bit [9]

When (FEAT_SPEv1p4 is implemented or filtering on event 9 is optionally supported) and event 9 is implemented:

Filter on Last Level cache hit event.

E[9]	Meaning
0b0	Last Level cache miss event is ignored.
0b1	Do not record samples that have the Last Level cache miss event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[8], bit [8]

When (FEAT_SPEv1p4 is implemented or filtering on event 8 is optionally supported) and event 8 is implemented:

Filter on No Last Level cache access event.

E[8]	Meaning
0b0	Last Level cache access event is ignored.
0b1	Do not record samples that have the Last Level cache access event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[7], bit [7]

Filter on Correctly predicted event.

E[7]	Meaning
0b0	Mispredicted event is ignored.
0b1	Do not record samples that have the Mispredicted event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[6], bit [6]

When FEAT_SPEv1p2 is implemented:

Filter on Taken event.

E[6]	Meaning
0b0	Not taken event is ignored.
0b1	Do not record samples that have the Not taken event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[5], bit [5]

Filter on TLB hit event.

E[5]	Meaning
0b0	TLB walk event is ignored.
0b1	Do not record samples that have the TLB walk event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[4], bit [4]

When FEAT_SPEv1p4 is implemented or filtering on event 4 is optionally supported:

Filter on No TLB access event.

E[4]	Meaning
0b0	TLB access event is ignored.
0b1	Do not record samples that have the TLB access event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[3], bit [3]

Filter on Level 1 data cache hit event.

E[3]	Meaning
0b0	Level 1 data cache refill or miss event is ignored.
0b1	Do not record samples that have the Level 1 data cache refill or miss event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[2], bit [2]

When FEAT_SPEv1p4 is implemented or filtering on event 2 is optionally supported:

Filter on No Level 1 data cache access event.

E[2]	Meaning
0b0	Level 1 data cache access event is ignored.
0b1	Do not record samples that have the Level 1 data cache access event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[1], bit [1]

When the PE supports sampling of speculative instructions:

Filter on Speculative event.

E[1]	Meaning
0b0	Architecturally retired event is ignored.
0b1	Do not record samples that have the Architecturally retired event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bit [0]

Reserved, RAZ/WI.

PMSSCR_EL1, Performance Monitors Snapshot Status and Capture Register

The PMSSCR_EL1 characteristics are:

Purpose

Holds status information about the captured counters and provides a mechanism for software to initiate a sample.

Configuration

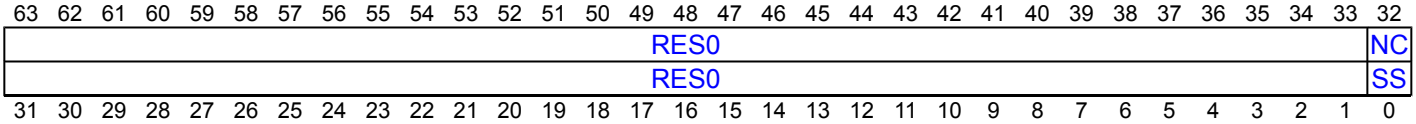
AArch64 System register PMSSCR_EL1 bits [63:0] are architecturally mapped to External register PMSSCR_EL1[63:0].

This register is present only when FEAT_PMUv3_SS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMSSCR_EL1 are UNDEFINED.

Attributes

PMSSCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

NC, bit [32]

No Capture. Indicates whether the PMU counters have been captured.

NC	Meaning
0b0	PMU counters captured.
0b1	PMU counters not captured.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Bits [31:1]

Reserved, RES0.

SS, bit [0]

Snapshot Capture and Status.

SS	Meaning
0b0	On a read, the Capture event has completed. On a write, request a Capture event.
0b1	On a read, the Capture event has not completed. On a write, request a Capture event.

A write of 0 to this field is ignored.

It is CONSTRAINED UNPREDICTABLE whether a Capture event has completed if this field is modified when the Capture event is ongoing.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- When PMU capture events are disabled, access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Accessing PMSSCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMSSCR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1101	0b011

```

PMSWINC_EL0, Performance Monitors Software Increment Register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event `0x00`. For more information, see 'SW_INCR'.

Configuration

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSWINC[31:0].

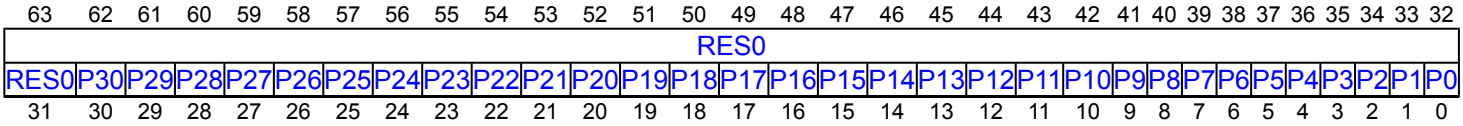
AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to External register PMSWINC_EL0[31:0] when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is not implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMSWINC_EL0 are UNDEFINED.

Attributes

PMSWINC_EL0 is a 64-bit register.

Field descriptions



Bits [63:31]

Reserved, RES0.

P<m>, bit [m], for m = 30 to 0

Software increment.

P<m>	Meaning
`0b0`	Write is ignored.
`0b1`	Increment PMEVCNTR<m>_EL0, if PMEVCNTR<m>_EL0 is configured to count software increment events.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,SW] == 0b10.
  - PMUACR_EL1.P<m> == 0.
- Otherwise, access to this field is **WO/RAZ**.

Accessing PMSWINC_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MSR PMSWINC_EL0, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b100

```
if !(IsFeatureImplemented(FEAT_PMUv3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;

PMUACR_EL1, Performance Monitors User Access Control Register

The PMUACR_EL1 characteristics are:

Purpose

Enables or disables EL0 access to specfic Performance Monitors.

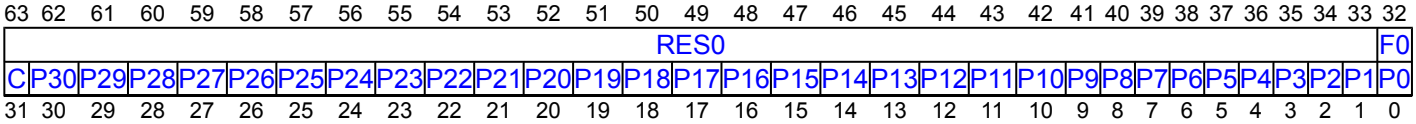
Configuration

This register is present only when FEAT_PMUv3p9 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMUACR_EL1 are UNDEFINED.

Attributes

PMUACR_EL1 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]

When FEAT_PMUv3_ICNTR is implemented:

EL0 accesses to PMICNTR_EL0 enable. With PMUSERENR_EL0.UEN and PMUSERENR_EL0.IR, controls EL0 accesses to PMICNTR_EL0.

F0	Meaning
0b0	If the Effective value of PMUSERENR_EL0.UEN is 1, then EL0 accesses to PMICNTR_EL0 and associated controls are RAZ/WI, and permitted EL0 writes to PMZR_EL0.F0 are ignored.
0b1	If the Effective value of PMUSERENR_EL0.UEN is 1, then EL0 accesses to PMICNTR_EL0 and associated controls are either read-only or read/write, depending on the value of PMUSERENR_EL0.IR.

The controls associated with PMICNTR_EL0 that are accessible at EL0 are PMCNTENSET_EL0.F0, PMCNTENCLR_EL0.F0, PMOVSSET_EL0.F0, and PMOVSCLR_EL0.F0.

This field is ignored by the PE when any of the following are true:

- EL1 is using AArch32.
- PMUSERENR_EL0.UEN is 0.
- The access generates an exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [31]

EL0 accesses to PMCCNTR_EL0 enable. With PMUSERENR_EL0.EN, PMUSERENR_EL0.UEN, and PMUSERENR_EL0.CR, controls EL0 accesses to PMCCNTR_EL0.

C	Meaning
0b0	If the Effective value of PMUSERENR_EL0.UEN is 1, then EL0 accesses to PMCCNTR_EL0 and associated controls are RAZ/WI, and permitted EL0 writes to PMZR_EL0.C are ignored.
0b1	If the Effective value of PMUSERENR_EL0.UEN is 1, then EL0 accesses to PMCCNTR_EL0 and associated controls are either read-only or read/write, depending on the value of PMUSERENR_EL0.CR.

The controls associated with PMCCNTR_EL0 that are accessible at EL0 are PMCNTENSET_EL0.C, PMCNTENCLR_EL0.C, PMOVSSET_EL0.C, and PMOVSCLR_EL0.C.

This field is ignored by the PE when any of the following are true:

- EL1 is using AArch32.
- PMUSERENR_EL0.UEN is 0.
- The access generates an exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<m>, bit [m], for m = 30 to 0

EL0 accesses to PMEVCNTR<m>_EL0 enable. With PMUSERENR_EL0.EN, PMUSERENR_EL0.UEN, and PMUSERENR_EL0.ER, controls EL0 accesses to PMEVCNTR<m>_EL0.

P<m>	Meaning
0b0	If the Effective value of PMUSERENR_EL0.UEN is 1, then EL0 accesses to PMEVCNTR<m>_EL0 and associated controls are RAZ/WI, and permitted EL0 writes to PMZR_EL0.P<m> are ignored.
0b1	If the Effective value of PMUSERENR_EL0.UEN is 1, then EL0 accesses to PMEVCNTR<m>_EL0 and associated controls are either read-only or read/write, depending on the value of PMUSERENR_EL0.ER.

The controls associated with PMEVCNTR<m>_EL0 that are accessible at EL0 are PMCNTENSET_EL0.P<m>, PMCNTENCLR_EL0.P<m>, PMOVSSET_EL0.P<m>, and PMOVSCLR_EL0.P<m>.

This field is ignored by the PE when any of the following are true:

- EL1 is using AArch32.
- PMUSERENR_EL0.UEN is 0.
- The access generates an exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RW**.

Accessing PMUACR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMUACR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1110	0b100

PMUSERENR_EL0, Performance Monitors User Enable Register

The PMUSERENR_EL0 characteristics are:

Purpose

Enables or disables EL0 access to the Performance Monitors.

Configuration

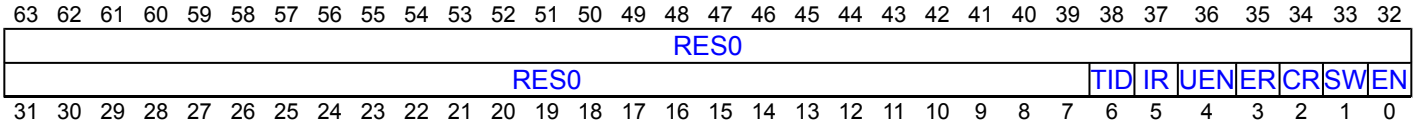
AArch64 System register PMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMUSERENR[31:0].

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMUSERENR_EL0 are UNDEFINED.

Attributes

PMUSERENR_EL0 is a 64-bit register.

Field descriptions



Bits [63:7]

Reserved, RES0.

TID, bit [6]

When FEAT_PMUv3p9 is implemented:

Trap ID registers. Traps EL0 read access to common event identification registers.

TID	Meaning
0b0	Accesses to PMCEID<n>_EL0 and PMCEID<n> are not trapped by this mechanism.
0b1	EL0 read accesses to PMCEID<n>_EL0 and PMCEID<n> are trapped.

In AArch64 state, the register accesses affected by this control are:

- MRS reads of PMCEID0_EL0 and PMCEID1_EL0.

In AArch32 state, the register accesses affected by this control are:

- MRC reads of PMCEID0, PMCEID1, PMCEID2, and PMCEID3.

When trapped, reads generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MRS reads are reported using EC syndrome value 0x18.
- AArch32 MRC reads are reported using EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IR, bit [5]
When FEAT_PMUv3_ICNTR is implemented:

Instruction counter Read-only. When PMUSERENR_EL0.UEN is 1, controls whether EL0 writes to instruction counter are ignored.

IR	Meaning
0b0	EL0 accesses are not affected by this mechanism.
0b1	If the Effective value of PMUSERENR_EL0.UEN is 1, then all of the following apply at EL0: • Writes to PMICNTR_EL0 are ignored. • The controls associated with instruction counter are RAZ/WI. • Writes to PMZR_EL0.F0 are ignored.

The controls associated with PMICNTR_EL0 that are accessible at EL0 are PMCNTENSET_EL0.F0, PMCNTENCLR_EL0.F0, PMOVSSET_EL0.F0, and PMOVSCLR_EL0.F0.

Ignored writes are not trapped and do not generate an exception.

This field is ignored by the PE when any of the following are true:

- PMUSERENR_EL0.UEN is 0.
- The access generates an exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEN, bit [4]
When FEAT_PMUv3p9 is implemented:

User Enable, with access controlled by PMUACR_EL1. Enables EL0 read/write access to PMU registers, other than PMCR_EL0.

UEN	Meaning
0b0	If FEAT_PMUv3_ICNTR is implemented, then EL0 accesses to PMICFILTR_EL0 and PMICNTR_EL0 are trapped. EL0 accesses to the other specified PMU registers, PMCR_EL0, and PMCR are trapped, unless enabled by PMUSERENR_EL0.{ER,CR,SW,EN}.
0b1	EL0 accesses to the specified PMU registers are enabled, unless trapped by another control. The behavior of permitted accesses is controlled by PMUSERENR_EL0.{ IR, ER,CR,SW} and PMUACR_EL1. EL0 accesses to PMCR_EL0 and PMCR are trapped.

In AArch64 state, the register accesses affected by this control are:

- MRS or MSR accesses to the following registers:
  - PMCCFILTR_EL0, PMCCNTR_EL0, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMOVSCLR_EL0, PMOVSSET_EL0, PMSELR_EL0, PMXEVCNTR_EL0, and PMXEVTYPER_EL0.
  - If FEAT_PMUv3_ICNTR is implemented, PMICFILTR_EL0 and PMICNTR_EL0.
- MRS reads of PMCEID0_EL0 and PMCEID1_EL0.
- MSR writes to PMSWINC_EL0 and PMZR_EL0.

In AArch32 state, the register accesses affected by this control are:

- MRC or MCR accesses to PMCCFILTR, PMCCNTR, PMCNTENCLR, PMCNTENSET, PMEVCNTR<n>, PMEVTYPER<n>, PMOVSR, PMOVSSET, PMSELR, PMXEVCNTR, and PMXEVTYPER.
- MRC reads of PMCEID0, PMCEID1, PMCEID2, and PMCEID3.
- MCR writes to PMSWINC.
- MRRC or MCRR accesses to PMCCNTR.

When trapped, reads and writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MRS and MSR accesses are reported using EC syndrome value 0x18.
- AArch32 MRC and MCR accesses are reported using EC syndrome value 0x03.
- AArch32 MRRC and MCRR accesses are reported using EC syndrome value 0x04.

This field is ignored by the PE and treated as zero when EL1 is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ER, bit [3]
When FEAT_PMUv3p9 is implemented:

Event counters Read enable or Read-only.

When PMUSERENR_EL0.{UEN,EN} is {0,0}, PMUSERENR_EL0.ER enables EL0 reads of the event counters and EL0 reads and writes of the select register.

When PMUSERENR_EL0.UEN is 1, EL0 reads of the event counters and EL0 writes to PMZR_EL0 are enabled by PMUSERENR_EL0.UEN, unless trapped by another control, and PMUSERENR_EL0.ER controls the behavior of EL0 writes to the event counters and PMZR_EL0.

ER	Meaning
0b0	When PMUSERENR_EL0.UEN == 0, EL0 reads of the event counters and EL0 reads and writes of the select register are disabled, unless enabled by PMUSERENR_EL0.EN. When PMUSERENR_EL0.UEN == 1, permitted EL0 writes are not affected by this mechanism.
0b1	When PMUSERENR_EL0.UEN == 0, EL0 reads of the event counters and EL0 reads and writes of the select register are enabled, unless trapped by another control. When PMUSERENR_EL0.UEN == 1, permitted EL0 writes to the event counters and PMZR_EL0.P[30:0] are ignored.

In AArch64 state, the register accesses affected by this control are:

- When PMUSERENR_EL0.{UEN,EN} is {0,0}:
  - MRS reads of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0.
  - MRS and MSR accesses to PMSELR_EL0.
- When PMUSERENR_EL0.UEN is 1, MSR writes to PMZR_EL0.P<n>, PMEVCNTR<n>_EL0, and PMXEVCNTR_EL0.

In AArch32 state, the register accesses affected by this control are:

- When PMUSERENR_EL0.{UEN,EN} is {0,0}:
  - MRC reads of PMEVCNTR<n> and PMXEVCNTR.
  - MRC and MCR accesses to PMSELR.
- When PMUSERENR_EL0.UEN is 1, MCR writes to PMEVCNTR<n> and PMXEVCNTR.

When disabled, reads and writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 `MRS` and `MSR` accesses are reported using EC syndrome value `0x18`.
- AArch32 `MRC` and `MCR` accesses are reported using EC syndrome value `0x03`.

Ignored writes are not trapped and do not generate an exception.

This field is ignored by the PE when PMUSERENR_EL0.{UEN,EN} == {0,1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Event counters Read enable.

When PMUSERENR_EL0.EN is 0, PMUSERENR_EL0.ER enables EL0 reads of the event counters and EL0 reads and writes of the select register.

ER	Meaning
`0b0`	EL0 reads of the event counters and EL0 reads and writes of the select register are disabled, unless enabled by PMUSERENR_EL0.EN.
`0b1`	EL0 reads of the event counters and EL0 reads and writes of the select register are enabled, unless trapped by another control.

In AArch64 state, the register accesses affected by this control are:

- `MRS` reads of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0.
- `MRS` and `MSR` accesses to PMSELR_EL0.

In AArch32 state, the register accesses affected by this control are:

- `MRC` reads of PMEVCNTR<n> and PMXEVCNTR.
- `MRC` and `MCR` accesses to PMSELR.

When disabled, reads and writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 `MRS` and `MSR` accesses are reported using EC syndrome value `0x18`.
- AArch32 `MRC` and `MCR` accesses are reported using EC syndrome value `0x03`.

This field is ignored by the PE when PMUSERENR_EL0.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CR, bit [2]

When FEAT_PMUv3p9 is implemented:

Cycle counter Read enable or Read-only.

When PMUSERENR_EL0.{UEN,EN} is {0,0}, PMUSERENR_EL0.CR enables EL0 reads of the cycle counter.

When PMUSERENR_EL0.UEN is 1, EL0 reads of the cycle counter and EL0 writes to PMZR_EL0 are enabled by PMUSERENR_EL0.UEN, unless trapped by another control, and PMUSERENR_EL0.CR controls the behavior of EL0 writes to the cycle counter and PMZR_EL0.

CR	Meaning
0b0	When PMUSERENR_EL0.UEN == 0, EL0 reads of the cycle counter are disabled, unless enabled by PMUSERENR_EL0.EN. When PMUSERENR_EL0.UEN == 1, permitted EL0 writes are not affected by this mechanism.
0b1	When PMUSERENR_EL0.UEN == 0, EL0 reads of the cycle counter are enabled, unless trapped by another control. When PMUSERENR_EL0.UEN == 1, permitted EL0 writes to the cycle counter and PMZR_EL0.C are ignored.

In AArch64 state, the register accesses affected by this control are:

- When PMUSERENR_EL0.{UEN,EN} is {0,0}, MRS reads of PMCCNTR_EL0.
- When PMUSERENR_EL0.UEN is 1, MSR writes to PMZR_EL0.C and PMCCNTR_EL0.

In AArch32 state, the register accesses affected by this control are:

- When PMUSERENR_EL0.{UEN,EN} is {0,0}:
  - MRC reads of PMCCNTR.
  - MRRC reads of PMCCNTR.
- When PMUSERENR_EL0.UEN is 1:
  - MCR writes to PMCCNTR.
  - MCRR writes to PMCCNTR.

When disabled, reads generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MRS reads are reported using EC syndrome value 0x18.
- AArch32 MRC reads are reported using EC syndrome value 0x03.
- AArch32 MRRC reads are reported using EC syndrome value 0x04.

Ignored writes are not trapped and do not generate an exception.

This field is ignored by the PE when PMUSERENR_EL0.{UEN,EN} == {0,1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Cycle counter Read enable.

When PMUSERENR_EL0.EN is 0, PMUSERENR_EL0.CR enables EL0 reads of the cycle counter.

CR	Meaning
0b0	EL0 reads of the cycle counter are disabled, unless enabled by PMUSERENR_EL0.EN.
0b1	EL0 reads of the cycle counter are enabled, unless trapped by another control.

In AArch64 state, the register accesses affected by this control are:

- MRS reads of PMCCNTR_EL0.

In AArch32 state, the register accesses affected by this control are:

- MRC reads of PMCCNTR.
- MRRC reads of PMCCNTR.

When disabled, reads generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 `MRS` reads are reported using EC syndrome value `0x18`.
- AArch32 `MRC` reads are reported using EC syndrome value `0x03`.
- AArch32 `MRRC` reads are reported using EC syndrome value `0x04`.

This field is ignored by the PE when PMUSERENR_EL0.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SW, bit [1]

When FEAT_PMUv3p9 is implemented:

Software increment register Write enable.

When PMUSERENR_EL0.UEN is 0, PMUSERENR_EL0.SW enables EL0 writes to the Software increment register.

When PMUSERENR_EL0.UEN is 1, EL0 writes to the Software increment register are enabled by PMUSERENR_EL0.UEN, unless trapped by another control, and PMUSERENR_EL0.SW controls the behavior of EL0 writes to the Software increment register.

SW	Meaning
`0b0`	When PMUSERENR_EL0.UEN == 0, EL0 writes to the Software increment register are disabled, unless enabled by PMUSERENR_EL0.EN. When PMUSERENR_EL0.UEN == 1, permitted EL0 writes are not affected by this mechanism.
`0b1`	When PMUSERENR_EL0.UEN == 0, EL0 writes to the Software increment register are enabled, unless trapped by another control. When PMUSERENR_EL0.UEN == 1, permitted EL0 writes to the Software increment register ignore the value of PMUACR_EL1.

In AArch64 state, the register accesses affected by this control are:

- `MSR` writes to PMSWINC_EL0.

In AArch32 state, the register accesses affected by this control are:

- `MCR` writes to PMSWINC.

When disabled, writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 `MSR` writes are reported using EC syndrome value `0x18`.
- AArch32 `MCR` writes are reported using EC syndrome value `0x03`.

This field is ignored by the PE when PMUSERENR_EL0.{UEN,EN} == {0,1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Software increment register Write enable.

When PMUSERENR_EL0.EN is 0, PMUSERENR_EL0.SW enables EL0 writes to the Software increment register.

SW	Meaning
`0b0`	EL0 writes to the Software increment register are disabled, unless enabled by PMUSERENR_EL0.EN.
`0b1`	EL0 writes to the Software increment register are enabled, unless trapped by another control.

In AArch64 state, the register accesses affected by this control are:

- `MSR` writes to PMSWINC_EL0.

In AArch32 state, the register accesses affected by this control are:

- MCR writes to PMSWINC.

When disabled, writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MSR writes are reported using EC syndrome value 0x18.
- AArch32 MCR writes are reported using EC syndrome value 0x03.

This field is ignored by the PE when PMUSERENR_EL0.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enable.

Enables EL0 read/write access to PMU registers, other than the instruction counter.

EN	Meaning
0b0	EL0 accesses to the specified PMU System registers are trapped, unless enabled by PMUSERENR_EL0.{UEN,ER,CR,SW}.
0b1	EL0 accesses to the specified PMU System registers are enabled, unless trapped by another control.

In AArch64 state, the register accesses affected by this control are:

- MRS or MSR accesses to PMCCFILTR_EL0, PMCCNTR_EL0, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMCR_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMOVSCLR_EL0, PMOVSSET_EL0, PMSELR_EL0, PMXEVCNTR_EL0, and PMXEVTYPER_EL0.
- MRS reads of PMCEID0_EL0 and PMCEID1_EL0.
- MSR writes to the following registers:
  - PMSWINC_EL0.
  - If FEAT_PMUv3p9 is implemented, PMZR_EL0.

Note

When FEAT_PMUv3_ICNTR is implemented, this field does not affect MRS and MSR accesses to PMICNTR_EL0 and PMICFILTR_EL0.

In AArch32 state, the register accesses affected by this control are:

- MRC or MCR accesses to PMCCFILTR, PMCCNTR, PMCNTENCLR, PMCNTENSET, PMCR, PMEVCNTR<n>, PMEVTYPER<n>, PMOVSR, PMOVSSET, PMSELR, PMXEVCNTR, and PMXEVTYPER.
- MRC reads of the following registers:
  - PMCEID0 and PMCEID1.
  - If FEAT_PMUv3p1 is implemented, PMCEID2 and PMCEID3.
- MCR writes to PMSWINC.
- MRRC or MCRR accesses to PMCCNTR.

When trapped, reads and writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MRS and MSR accesses are reported using EC syndrome value 0x18.
- AArch32 MRC and MCR accesses are reported using EC syndrome value 0x03.
- AArch32 MRRC and MCRR accesses are reported using EC syndrome value 0x04.

This field is ignored by the PE when FEAT_PMUv3p9 is implemented and PMUSERENR_EL0.UEN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMXEVCNTR_EL0, Performance Monitors Selected Event Count Register

The PMXEVCNTR_EL0 characteristics are:

Purpose

Reads or writes the value of the selected event counter, PMEVCNTR<n>_EL0. PMSELR_EL0.SEL determines which event counter is selected.

Configuration

AArch64 System register PMXEVCNTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMXEVCNTR[31:0].

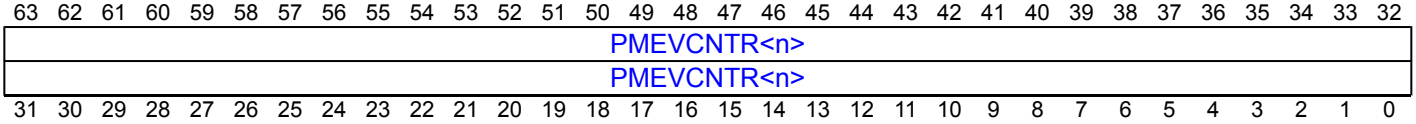
This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMXEVCNTR_EL0 are UNDEFINED.

Attributes

PMXEVCNTR_EL0 is a 64-bit register.

Field descriptions

When FEAT_PMUv3p5 is implemented:



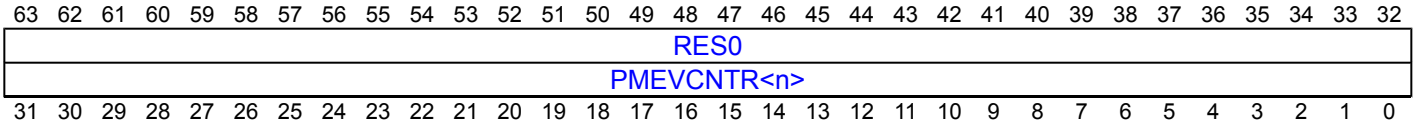
PMEVCNTR<n>, bits [63:0]

Value of the selected event counter, PMEVCNTR<n>_EL0, where n is the value stored in PMSELR_EL0.SEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



Bits [63:32]

Reserved, RES0.

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, PMEVCNTR<n>_EL0, where n is the value stored in PMSELR_EL0.SEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVCNTR_EL0

If FEAT_FGT is implemented and PMSELR_EL0.SEL is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMXEVCNTR_EL0 is as follows:

- If PMSELR_EL0.SEL is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and PMSELR_EL0.SEL is greater than or equal to the number of accessible event counters, then reads and writes of PMXEVCNTR_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and PMSELR_EL0.SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMXEVCNTR_EL0 are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.P<UInt(PMSELR_EL0.SEL)> == 0.

Permitted writes of PMXEVCNTR_EL0 are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.{UEN,ER} == {1,1}.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{UEN,ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is determined by the Effective value of PMCCR.EPMN. For more information, see MDCR_EL2.HPMN and PMCCR.EPMN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMXEVCNTR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1101	0b010

```

PMXEVTYPER_EL0, Performance Monitors Selected Event Type Register

The PMXEVTYPER_EL0 characteristics are:

Purpose

When PMSELR_EL0.SEL selects an event counter, this accesses a PMEVTYPER<n>_EL0 register. When PMSELR_EL0.SEL selects the cycle counter, this accesses PMCCFILTR_EL0.

Configuration

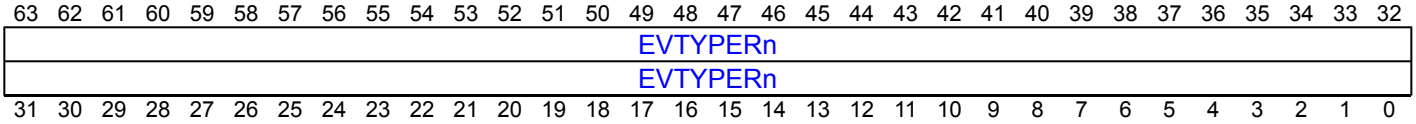
AArch64 System register PMXEVTYPER_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMXEVTYPER[31:0].

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMXEVTYPER_EL0 are UNDEFINED.

Attributes

PMXEVTYPER_EL0 is a 64-bit register.

Field descriptions



EVTYPERn, bits [63:0]

When PMSELR_EL0.SEL == 31, this register accesses PMCCFILTR_EL0.

Otherwise, this register accesses PMEVTYPER<n>_EL0 where n is the value in PMSELR_EL0.SEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVTYPER_EL0

If FEAT_FGT is implemented, and PMSELR_EL0.SEL is not 31 and is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMXEVTYPER_EL0 is as follows:

- If PMSELR_EL0.SEL is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented, and PMSELR_EL0.SEL is not 31 and is greater than or equal to the number of accessible event counters, then reads and writes of PMXEVTYPER_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR_EL0.SEL is 31.
- If EL2 is implemented and enabled in the current Security state, PMSELR_EL0 is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMXEVTYPER_EL0 are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.
- Any of the following are true:
  - PMSELR_EL0.SEL != 31 and PMUACR_EL1.P<UInt(PMSELR_EL0.SEL)> == 0.
  - PMSELR_EL0.SEL == 31 and PMUACR_EL1.C == 0.

Permitted writes of PMXEVTYPER_EL0 are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.
- Any of the following are true:
  - PMSELR_EL0.SEL != 31 and PMUSERENR_EL0.ER == 1.
  - PMSELR_EL0.SEL == 31 and PMUSERENR_EL0.CR == 1.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{UEN,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is determined by the Effective value of PMCCR.EPMN. For more information, see MDCR_EL2.HPMN and PMCCR.EPMN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, PMXEVTYPER_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1101	0b001

PMZR_EL0, Performance Monitors Zero with Mask

The PMZR_EL0 characteristics are:

Purpose

Zero the set of counters specified by the mask written to PMZR_EL0.

Configuration

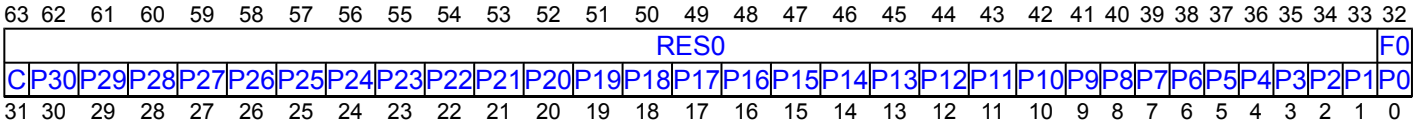
AArch64 System register PMZR_EL0 bits [63:0] are architecturally mapped to External register PMZR_EL0[63:0] when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3p9 is implemented.

This register is present only when FEAT_PMUv3p9 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMZR_EL0 are UNDEFINED.

Attributes

PMZR_EL0 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]

When FEAT_PMUv3_ICNTR is implemented:

Zero PMICNTR_EL0.

F0	Meaning
0b0	Write is ignored.
0b1	Set PMICNTR_EL0 to zero.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - EL3 is implemented.
  - PSTATE.EL != EL3.
  - MDCR_EL3.EnPM2 == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 0 or PMUACR_EL1.F0 == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != 0b11.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == 0) or HDFGWTR2_EL2.nPMICNTR_EL0 == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.IR == 1.

- Otherwise, access to this field is **WO/RAZ**.

Otherwise:

Reserved, RES0.

C, bit [31]

Zero PMCCNTR_EL0.

C	Meaning
0b0	Write is ignored.
0b1	Set PMCCNTR_EL0 to zero.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 1.
  - PMUACR_EL1.C == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,CR] == 0b11.
- Otherwise, access to this field is **WO/RAZ**.

P<m>, bit [m], for m = 30 to 0

Zero PMEVCNTR<m>_EL0.

P<m>	Meaning
0b0	Write is ignored.
0b1	Set PMEVCNTR<m>_EL0 to zero.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == 1.
  - PMUACR_EL1.P<m> == 0.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,ER] == 0b11.
- Otherwise, access to this field is **WO/RAZ**.

Accessing PMZR_EL0

Accesses to this register use the following encodings in the System register encoding space:

POR_EL0, Permission Overlay Register 0 (EL0)

The POR_EL0 characteristics are:

Purpose

Stage 1 Permission Overlay Register for unprivileged access of EL1&0 or EL2&0 translation regime.

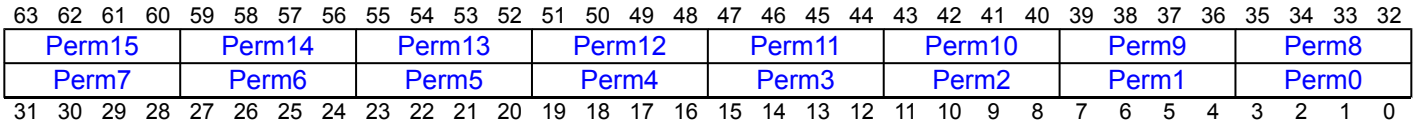
Configuration

This register is present only when FEAT_S1POE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to POR_EL0 are UNDEFINED.

Attributes

POR_EL0 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Perm Represents stage 1 Overlay Permissions.

Perm<m>	Meaning
0b0000	No access.
0b0001	Read.
0b0010	Execute.
0b0011	Read, Execute.
0b0100	Write.
0b0101	Write, Read.
0b0110	Write, Execute.
0b0111	Read, Write, Execute.
0b1xxx	Reserved - treated as No access

If FEAT_D128 is implemented and VMSAv9-128 is in use, then fields Perm[8] to Perm[15] are used for POIndex values 8 to 15.

Otherwise, the fields Perm[8] to Perm[15] are RES0.

This field is not permitted to be cached in a TLB.

When the stage 1 Overlay mechanism is disabled, this field is IGNORED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing POR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, POR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1010	0b0010	0b100

```

POR_EL1, Permission Overlay Register 1 (EL1)

The POR_EL1 characteristics are:

Purpose

Stage 1 Permission Overlay Register for privileged access of the EL1&0 translation regime.

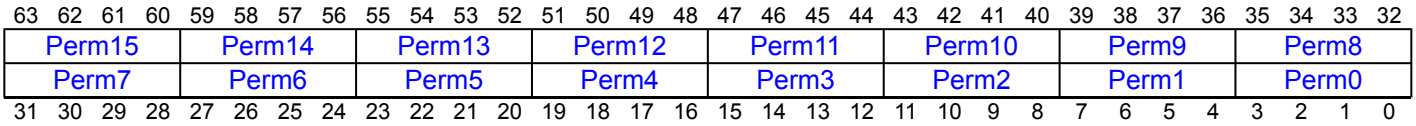
Configuration

This register is present only when FEAT_S1POE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to POR_EL1 are UNDEFINED.

Attributes

POR_EL1 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Perm Represents stage 1 Overlay Permissions.

Perm<m>	Meaning
0b0000	No access.
0b0001	Read.
0b0010	Execute.
0b0011	Read, Execute.
0b0100	Write.
0b0101	Write, Read.
0b0110	Write, Execute.
0b0111	Read, Write, Execute.
0b1xxx	Reserved - treated as No access

If FEAT_D128 is implemented and VMSAv9-128 is in use, then fields Perm[8] to Perm[15] are used for POIndex values 8 to 15.

Otherwise, the fields Perm[8] to Perm[15] are RES0.

This field is not permitted to be cached in a TLB.

When the stage 1 Overlay mechanism is disabled, this field is IGNORED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing POR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name POR_EL1 or POR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, POR_EL1

If FEAT_D128 is implemented and VMSAv9-128 is in use, then fields Perm[8] to Perm[15] are used for POIndex values 8 to 15.

Otherwise, the fields Perm[8] to Perm[15] are RES0.

This field is not permitted to be cached in a TLB.

When stage 1 Overlay mechanism is disabled, this register is ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing POR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, POR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b100

```

RCWMASK_EL1, Read Check Write Instruction Mask (EL1)

The RCWMASK_EL1 characteristics are:

Purpose

Contains the mask used by RCW instructions.

Configuration

This register is present only when FEAT_THE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to RCWMASK_EL1 are UNDEFINED.

RCWMASK_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

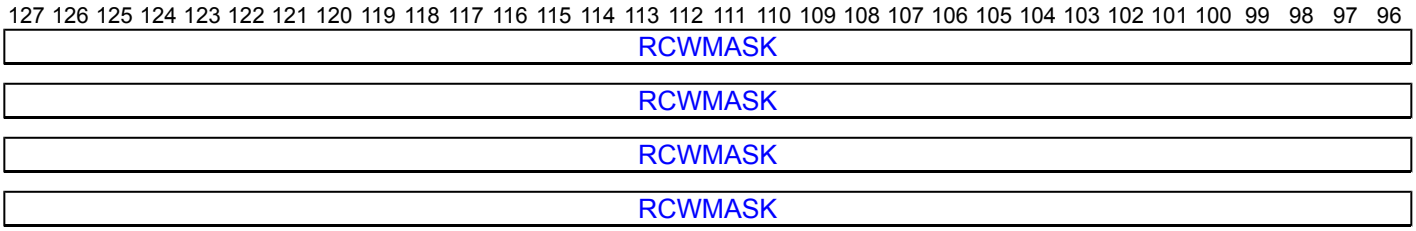
Attributes

RCWMASK_EL1 is a:

- 128-bit register when FEAT_D128 is implemented
- 64-bit register otherwise

Field descriptions

When FEAT_D128 is implemented:



RCWMASK, bits [127:0]

Mask used to decide which bit-fields are writable to the 128-bit Descriptor by RCW or RCWS instructions.

If RCWMASK_EL1 is indirectly read by 128-bit variants of RCW or RCWS instructions:

- The Effective value of RCWMASK[n] is the same as RCWMASK_EL1[n], except as follows:
  - If n >= 17, and n <= 55, the Effective value of RCWMASK[n] is the same as RCWMASK_EL1[16].
  - If n is in {126:125, 120:119, 114, 107:101, 90:56, 1:0}, the Effective value of RCWMASK[n] is 0.
  - If n >= 121, n <= 124, and FEAT_S1POE is not implemented, the Effective value of RCWMASK[n] is 0.
  - If FEAT_MEC is not implemented, the Effective value of RCWMASK[108] is 0.

If RCWMASK_EL1 is indirectly read by 64-bit variants of RCW or RCWS instructions:

- The Effective value of RCWMASK[n] is the same as RCWMASK_EL1[n], except as follows:
  - If n >= 18, and n <= 49, the Effective value of RCWMASK[n] is the same as RCWMASK_EL1[17].

RCWMASK_EL1 register bits {126:125, 120:119, 114, 107:101, 90:64, 52, 49:18, 0} are RES0.

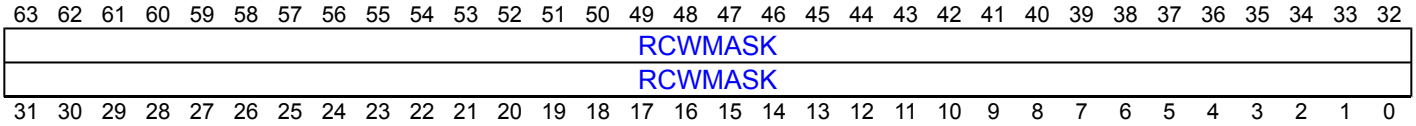
If FEAT_S1POE is not implemented, RCWMASK_EL1 register bits {124:121} are RES0.

If FEAT_MEC is not implemented, RCWMASK_EL1[108] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



RCWMASK, bits [63:0]

Mask used to decide which bit-fields are writable to the 64-bit Descriptor by RCW or RCWS Instructions.

The Effective value of RCWMASK[n] is the same as RCWMASK_EL1[n], except as follows:

- If n >= 18, and n <= 49, the Effective value of RCWMASK[n] is the same as RCWMASK_EL1[17].

RCWMASK_EL1 register bits {52, 49:18, 0} are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RCWSMASK_EL1, Software Read Check Write Instruction Mask (EL1)

The RCWSMASK_EL1 characteristics are:

Purpose

Contains the software mask used by RCWS instructions.

Configuration

This register is present only when FEAT_THE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to RCWSMASK_EL1 are UNDEFINED.

RCWSMASK_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

Attributes

RCWSMASK_EL1 is a:

- 128-bit register when FEAT_D128 is implemented
- 64-bit register otherwise

Field descriptions

When FEAT_D128 is implemented:

127	126	125	124	123	122	121	120	119	118	117	116	115	114	113	112	111	110	109	108	107	106	105	104	103	102	101	100	99	98	97	96
RCWSMASK																															
RCWSMASK																															
RCWSMASK																															
RCWSMASK																															

RCWSMASK, bits [127:0]

Software Mask used to decide which bit-fields are writable to the 128-bit Descriptor by RCWS instructions.

If RCWSMASK_EL1 is indirectly read by 128-bit variants of RCWS instructions:

- The Effective value of RCWSMASK[n] is the same as RCWSMASK_EL1[n], except as follows:
  - If n >= 17, and n <= 55, the Effective value of RCWSMASK[n] is the same as RCWSMASK_EL1[16].
  - If n is in {126:125, 120:119, 114, 107:101, 90:56, 1:0}, the Effective value of RCWSMASK[n] is 0.
  - If n >= 121, n <= 124, and FEAT_S1POE is not implemented, the Effective value of RCWSMASK[n] is 0.
  - If FEAT_MEC is not implemented, the Effective value of RCWSMASK bit RCWSMASK_EL1[108] is 0.

If RCWSMASK_EL1 is indirectly read by 64-bit variants of RCWS instructions:

- The Effective value of RCWSMASK[n] is the same as RCWSMASK_EL1[n], except as follows:
  - If n >= 18, and n <= 49, the Effective value of RCWSMASK[n] is the same as RCWSMASK_EL1[17].

- If n == 52 and Protection is enabled, the Effective value of RCWSMASK[52] is 0.

RCWSMASK_EL1 register bits {126:125, 120:119, 114, 107:101, 90:64, 49:18, 0} are RES0.

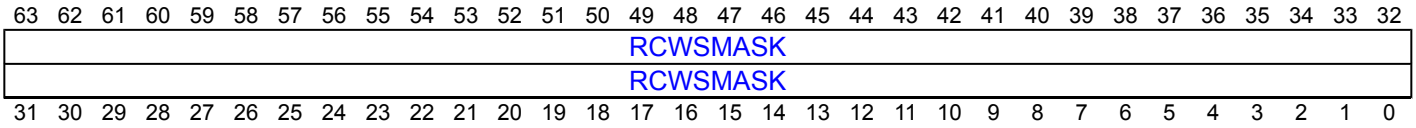
If FEAT_S1POE is not implemented, RCWSMASK_EL1 register bits {124:121} are RES0.

If FEAT_MEC is not implemented, RCWSMASK_EL1[108] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



RCWSMASK, bits [63:0]

Software Mask used to decide which bit-fields are writable to the 64-bit Descriptor by RCWS Instruction.

The Effective value of RCWSMASK[n] is the same as RCWSMASK_EL1[n], except as follows

- If n >= 18, and n <= 49, the Effective value of RCWSMASK[n] is the same as RCWSMASK_EL1[17].
- If n == 52 and Protection is enabled, the Effective value of RCWSMASK[52] is 0.

RCWSMASK_EL1 register bits {49:18, 0} are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

REVIDR_EL1, Revision ID Register

The REVIDR_EL1 characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configuration

AArch64 System register REVIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register REVIDR[31:0].

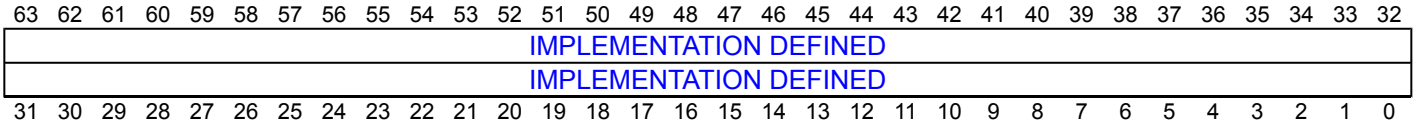
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to REVIDR_EL1 are UNDEFINED.

If REVIDR_EL1 has the same value as MIDR_EL1, then its contents have no significance.

Attributes

REVIDR_EL1 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing REVIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, REVIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b110

```

RGSR_EL1, Random Allocation Tag Seed Register.

The RGSR_EL1 characteristics are:

Purpose

Random Allocation Tag Seed Register.

Configuration

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to RGSR_EL1 are UNDEFINED.

When GCR_EL1.RRND==0b1, updates to RGSR_EL1 are implementation-specific.

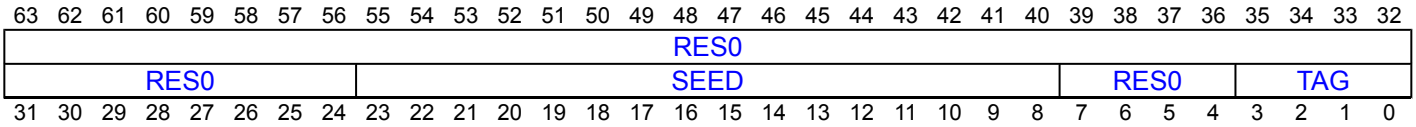
Direct and indirect reads and writes to the register appear to occur in program order relative to other instructions, without the need for any explicit synchronization.

Attributes

RGSR_EL1 is a 64-bit register.

Field descriptions

When GCR_EL1.RRND == 0:



Bits [63:24]

Reserved, RES0.

SEED, bits [23:8]

Seed register used for generating values returned by RandomTag().

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

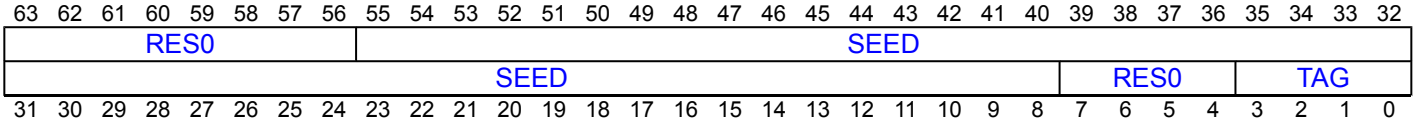
TAG, bits [3:0]

Tag generated by the most recent IRG instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



Bits [63:56]

Reserved, RES0.

SEED, bits [55:8]

IMPLEMENTATION DEFINED.

Note

Software is recommended to avoid writing SEED[15:0] with a value of zero, unless this has been generated by the PE in response to an earlier value with SEED being nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

TAG, bits [3:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RGSR_EL1

RMR_EL1, Reset Management Register (EL1)

The RMR_EL1 characteristics are:

Purpose

When this register is implemented:

- A write to the register at EL1 can request a Warm reset.
- If EL1 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch64 System register RMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register RMR[31:0] when the highest implemented Exception level is EL1.

This register is present only when the highest implemented Exception level is EL1 and FEAT_AA64 is implemented. Otherwise, direct accesses to RMR_EL1 are UNDEFINED.

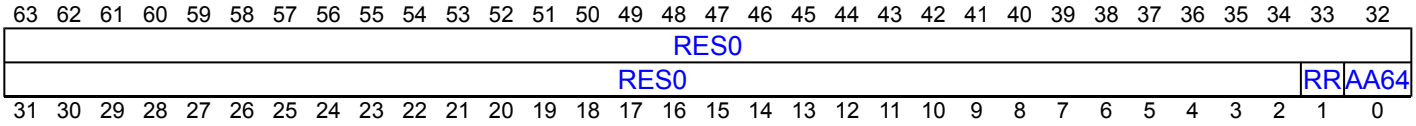
When EL1 is the highest implemented Exception level:

- If EL1 can use all Execution states then this register must be implemented.
- If EL1 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Attributes

RMR_EL1 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

AA64, bit [0]

When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
0b0	AArch32.
0b1	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL1 can only use AArch64 state, this bit is RAO/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'1'`.

Accessing RMR_EL1

Accesses to this register use the following encodings in the System register encoding space:

`MRS <Xt>, RMR_EL1`

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0000	0b010

```
if !(IsHighestEL(EL1) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL1 && IsHighestEL(EL1) then
    X[t, 64] = RMR_EL1;
else
    UNDEFINED;
```

`MSR RMR_EL1, <Xt>`

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0000	0b010

```
if !(IsHighestEL(EL1) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL1 && IsHighestEL(EL1) then
    RMR_EL1 = X[t, 64];
else
    UNDEFINED;
```

RMR_EL2, Reset Management Register (EL2)

The RMR_EL2 characteristics are:

Purpose

When this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch64 System register RMR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HRMR[31:0] when the highest implemented Exception level is EL2.

This register is present only when the highest implemented Exception level is EL2 and FEAT_AA64 is implemented. Otherwise, direct accesses to RMR_EL2 are UNDEFINED.

When EL2 is the highest implemented Exception level:

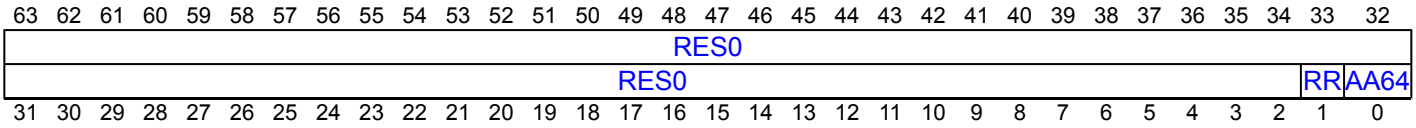
- If EL2 can use all Execution states then this register must be implemented.
- If EL2 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

RMR_EL2 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

AA64, bit [0]

When EL2 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
`0b0`	AArch32.
`0b1`	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 can only use AArch64 state, this bit is RAO/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'1'`.

Accessing RMR_EL2

Accesses to this register use the following encodings in the System register encoding space:

`MRS <Xt>, RMR_EL2`

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b0000	0b010

RMR_EL3, Reset Management Register (EL3)

The RMR_EL3 characteristics are:

Purpose

If EL3 is implemented and this register is implemented:

- A write to the register at EL3 can request a Warm reset.
- If EL3 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch64 System register RMR_EL3 bits [31:0] are architecturally mapped to AArch32 System register RMR[31:0] when EL3 is implemented.

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to RMR_EL3 are UNDEFINED.

When EL3 is implemented:

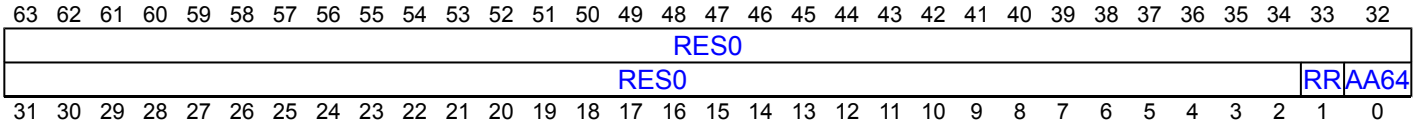
- If EL3 can use all Execution states then this register must be implemented.
- If EL3 cannot use AArch32, then it is IMPLEMENTATION DEFINED whether the register is implemented.

Otherwise, direct accesses to RMR_EL3 are UNDEFINED.

Attributes

RMR_EL3 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

AA64, bit [0]

When EL3 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
0b0	AArch32.
0b1	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL3 can only use AArch64 state, this bit is RAO/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'1'`.

Accessing RMR_EL3

Accesses to this register use the following encodings in the System register encoding space:

`MRS <Xt>, RMR_EL3`

RNDR, Random Number

The RNDR characteristics are:

Purpose

Random Number. Returns a 64-bit random number from an approved Random Bit Generator, where the Deterministic Random Bit Generator within the Random Bit Generator is reseeded from an approved entropy source at an IMPLEMENTATION DEFINED rate. See 'Properties of the generated random number'.

If the hardware returns a genuine random number, PSTATE.NZCV is set to `0b0000`.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to `0b0100` and the data value returned is 0.

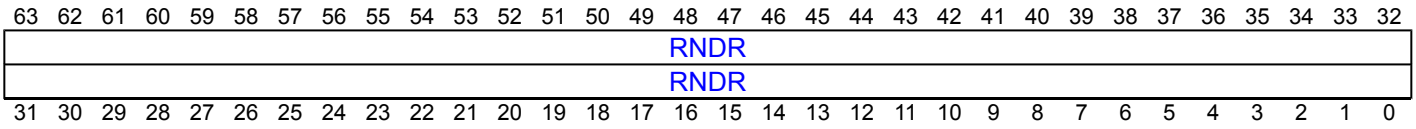
Configuration

This register is present only when (FEAT_RNG is implemented or FEAT_RNG_TRAP is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to RNDR are UNDEFINED.

Attributes

RNDR is a 64-bit register.

Field descriptions



RNDR, bits [63:0]

Random Number. Returns a 64-bit Random Number from an approved Random Bit Generator, where the Deterministic Random Bit Generator within the Random Bit Generator is reseeded from an approved entropy source at an IMPLEMENTATION DEFINED rate. See 'Properties of the generated random number'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RNDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, RNDR
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0010	0b0100	0b000

```
if !((IsFeatureImplemented(FEAT_RNG) || IsFeatureImplemented(FEAT_RNG_TRAP)) &&

RNDRRS, Random Number Full Entropy

The RNDRRS characteristics are:

Purpose

Random Number with fresh full entropy. Returns a 64-bit random number from an approved Random Bit Generator, using either a Non-deterministic Random Bit Generator or one where the Deterministic Random Bit Generator is reseeded, where possible, from an approved entropy source before the return of the random number. See 'Properties of the generated random number'.

If the hardware returns a genuine random number, PSTATE.NZCV is set to `0b0000`.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to `0b0100` and the data value returned is 0.

When FEAT_RNG_TRAP is implemented and SCR_EL3.TRNDR is 1, reads of this register are trapped to EL3.

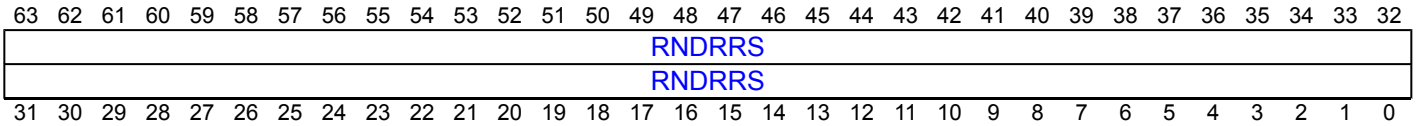
Configuration

This register is present only when (FEAT_RNG is implemented or FEAT_RNG_TRAP is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to RNDRRS are UNDEFINED.

Attributes

RNDRRS is a 64-bit register.

Field descriptions



RNDRRS, bits [63:0]

Random Number with fresh full entropy. Returns a 64-bit random number from an approved Random Bit Generator, using either a Non-deterministic Random Bit Generator or one where the Deterministic Random Bit Generator is reseeded, where possible, from an approved entropy source before the return of the random number. See 'Properties of the generated random number'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RNDRRS

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, RNDRRS
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0010	0b0100	0b001

```
if !((IsFeatureImplemented(FEAT_RNG) || IsFeatureImplemented(FEAT_RNG_TRAP)) &&

RVBAR_EL1, Reset Vector Base Address Register (if EL2 and EL3 not implemented)

The RVBAR_EL1 characteristics are:

Purpose

If EL1 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

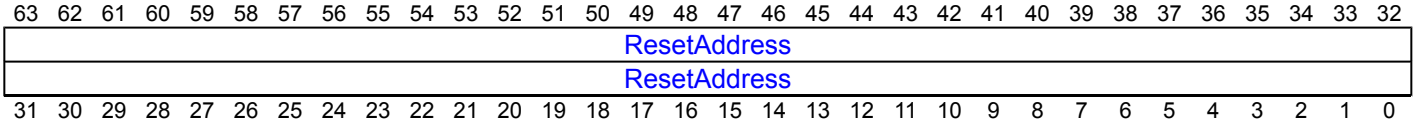
Configuration

This register is present only when the highest implemented Exception level is EL1 and FEAT_AA64 is implemented. Otherwise, direct accesses to RVBAR_EL1 are UNDEFINED.

Attributes

RVBAR_EL1 is a 64-bit register.

Field descriptions



ResetAddress, bits [63:0]

The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing RVBAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, RVBAR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0000	0b001

```
if !(IsHighestEL(EL1) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL1 && IsHighestEL(EL1) then
    X[t, 64] = RVBAR_EL1;
else
    UNDEFINED;
```

RVBAR_EL2, Reset Vector Base Address Register (if EL3 not implemented)

The RVBAR_EL2 characteristics are:

Purpose

If EL2 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

Configuration

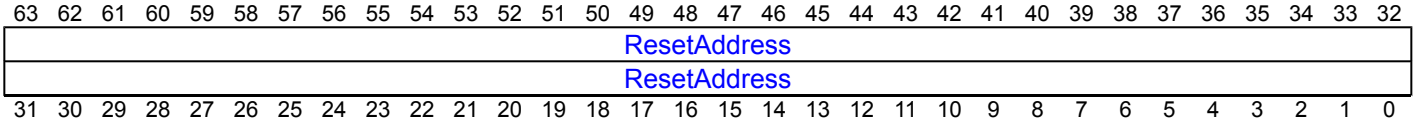
This register is present only when the highest implemented Exception level is EL2 and FEAT_AA64 is implemented. Otherwise, direct accesses to RVBAR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

RVBAR_EL2 is a 64-bit register.

Field descriptions



ResetAddress, bits [63:0]

The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing RVBAR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```

RVBAR_EL3, Reset Vector Base Address Register (if EL3 implemented)

The RVBAR_EL3 characteristics are:

Purpose

If EL3 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

Configuration

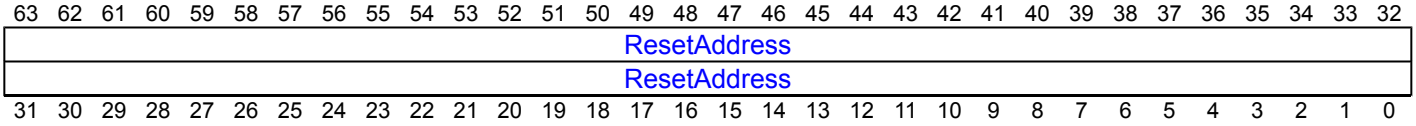
This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to RVBAR_EL3 are UNDEFINED.

Only implemented if the highest Exception level implemented is EL3.

Attributes

RVBAR_EL3 is a 64-bit register.

Field descriptions



ResetAddress, bits [63:0]

The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing RVBAR_EL3

S3_<op1>_<Cn>_<Cm>_<op2>, IMPLEMENTATION DEFINED Registers

The S3_<op1>_<Cn>_<Cm>_<op2> characteristics are:

Purpose

This area of the instruction set space is reserved for IMPLEMENTATION DEFINED registers.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to S3_<op1>_<Cn>_<Cm>_<op2> are UNDEFINED.

When FEAT_SYSREG128 is implemented, each register in this space is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

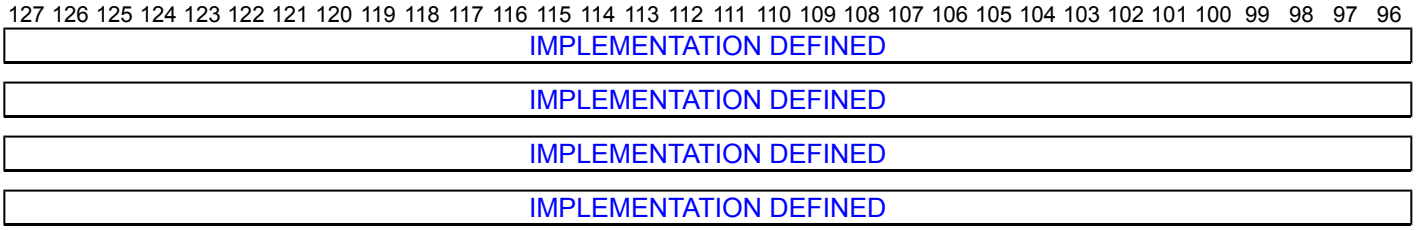
Attributes

S3_<op1>_<Cn>_<Cm>_<op2> is a:

- 128-bit register when FEAT_SYSREG128 is implemented
- 64-bit register otherwise

Field descriptions

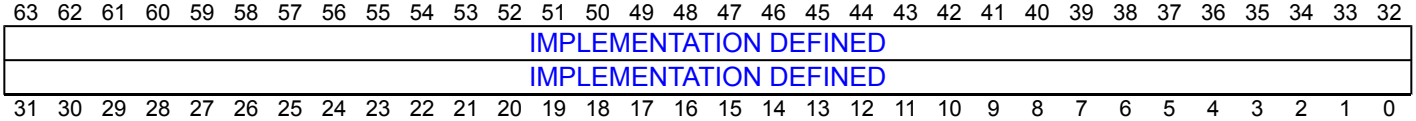
When FEAT_SYSREG128 is implemented:



IMPLEMENTATION DEFINED, bits [127:0]

IMPLEMENTATION DEFINED.

Otherwise:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing S3_<op1>_<Cn>_<Cm>_<op2>

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, S3_<op1>_C<Cn>_C<Cm>_<op2>
```

op0	op1	CRn	CRm	op2
0b11	op1[2:0]	0b1x11	Cm[3:0]	op2[2:0]

```

SCR_EL3, Secure Configuration Register

The SCR_EL3 characteristics are:

Purpose

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is Secure, Non-secure, or Realm.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, SError exceptions, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCR_EL3 are UNDEFINED.

Attributes

SCR_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49

TWEDEL		TWEDEn	ECVEn	FGTEn	ATA	EnSCXT	RES0	TID5	TID3	FIEN	NMEA	EASE	EEL2	API
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17

Bit [63]

Reserved, RES0.

NSE, bit [62]

When FEAT_RME is implemented:

This field, evaluated with SCR_EL3.NS, selects the Security state of EL2 and lower Exception levels.

For a description of the values derived by evaluating NS and NSE together, see SCR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

The Effective value of this bit is `0b0`.

Access to this field is **RES0**.

HACDBSEn, bit [61]

When FEAT_HACDBS is implemented:

Enables access to the HACDBSBR_EL2 and HACDBSCONS_EL2 registers at EL2.

HACDBSEn	Meaning
0b0	EL2 accesses to the specified registers are trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

Traps are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HDBSSEn, bit [60]
When FEAT_HDBSS is implemented:

Enables access to HDBSSBR_EL2 and HDBSSPROD_EL2 registers at EL2.

HDBSSEn	Meaning
0b0	EL2 accesses to the specified registers are trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

Traps are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTEn2, bit [59]
When FEAT_FGT2 is implemented:

Fine-Grained Traps Enable 2.

When EL2 is implemented, enables the traps to EL2 controlled by HDFGRTR2_EL2, HDFGWTR2_EL2, HFGITR2_EL2, HFGRTR2_EL2, and HFGWTR2_EL2, and controls access to those registers.

FGTEn2	Meaning
0b0	EL2 accesses to the specified registers are trapped to EL3. The values in these registers are treated as 0.
0b1	EL2 accesses to the specified registers are not trapped to EL3 by this mechanism.

Traps caused by accesses to the fine-grained trap registers are reported using EC syndrome value 0x18 and its associated ISS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDSE, bit [58]

When FEAT_E3DSE is implemented:

Enable for delegated SError exceptions pended by SCR_EL3.DSE.

EnDSE	Meaning
0b0	Delegated SError exceptions pended by SCR_EL3.DSE are disabled.
0b1	Delegated SError exceptions pended by SCR_EL3.DSE are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSE, bit [57]

When FEAT_E3DSE is implemented:

Delegated SError exception for EL2, EL1, and EL0.

DSE	Meaning
0b0	This mechanism is not making a delegated SError exception pending.
0b1	A delegated SError exception for EL2, EL1, and EL0 is pending because of this mechanism.

When EL2 is implemented and enabled in the current Security state, delegated SError exceptions pended by this field are affected by HCR_EL2.AMO and HCRX_EL2.TMEA.

Virtual SError exceptions pended by HCR_EL2.VSE have priority over delegated SError exceptions pended by this field.

This field is ignored by the PE and treated as zero when SCR_EL3.EnDSE == 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [56]

Reserved, RES0.

EnIDCP128, bit [55]

When FEAT_SYSREG128 is implemented:

Enables access to IMPLEMENTATION DEFINED 128-bit System registers.

EnIDCP128	Meaning
0b0	Accesses at EL2, EL1, EL0 to IMPLEMENTATION DEFINED 128-bit System registers are trapped to EL3 using EC syndrome value 0x14, unless the access generates a higher priority exception. Disables the functionality of the 128-bit IMPLEMENTATION DEFINED System registers that are accessible at EL3.
0b1	No accesses are trapped by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SRMASKEn, bit [54]

Enables access to the following MASK registers:

- CPACRMASK_EL1, and CPACRMASK_EL12.
- SCTLRMASK_EL1, and SCTLRMASK_EL12.
- SCTLR2MASK_EL1, and SCTLR2MASK_EL12.
- TCRMASK_EL1, and TCRMASK_EL12.
- TCR2MASK_EL1, and TCR2MASK_EL12.
- ACTLRMASK_EL1 and ACTLRMASK_EL12, if they are implemented.
- CPTRMASK_EL2.
- SCTLRMASK_EL2.
- SCTLR2MASK_EL2.
- TCRMASK_EL2.
- TCR2MASK_EL2.
- ACTLRMASK_EL2, if it is implemented.

SRMASKEn	Meaning
0b0	EL2 accesses to the specified registers are trapped to EL3. EL1 accesses to the specified EL1 registers are trapped to EL3. The values in the registers are treated as 0.
0b1	No accesses are trapped by this control.

Traps are reported using EC syndrome value 0x18.

Traps generated by this control have a lower priority than traps generated by the HCRX_EL2.SRMASKEn, HFGRTR2_EL2 and HFGWTR2_EL2 controls.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PFAREn, bit [53]

When FEAT_PFAR is implemented:

Enable access to Physical Fault Address Registers. When disabled, accesses to Physical Fault Address Registers generate a trap to EL3.

PFAREn	Meaning
0b0	Accesses of the specified Physical Fault Address Registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	This control does not cause any instructions to be trapped.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to PFAR_EL1, PFAR_EL2, and PFAR_EL12.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWERR, bit [52]

When FEAT_RASv2 is implemented:

Trap writes of Error Record registers. Enables a trap to EL3 on writes of Error Record registers.

TWERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Writes of the specified Error Record registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are: MSR accesses to ERRSELR_EL1, ERXADDR_EL1, ERXCTLR_EL1, ERXMISC0_EL1, ERXMISC1_EL1, ERXMISC2_EL1, ERXMISC3_EL1, and ERXSTATUS_EL1.

In AArch32 state, the instructions affected by this control are: MCR accesses to ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, ERXMISC4, ERXMISC5, ERXMISC6, ERXMISC7, and ERXSTATUS.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x03.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMEA, bit [51]

When FEAT_DoubleFault2 is implemented:

Trap Masked External Aborts. Controls whether a masked error exception at a lower Exception level is taken to EL3.

TMEA	Meaning
0b0	Synchronous External abort exceptions and SError exceptions at EL2, EL1, and EL0 are unaffected by this mechanism. That is, these exceptions are not taken to EL3 unless routed to EL3 by another control.
0b1	When executing at Exception levels below EL3, all of the following apply: • When PSTATE.A is 1, synchronous External abort exceptions are taken to EL3, unless they are taken from EL1 or EL0 and routed to EL2 by another control. • Masked physical SError exceptions are taken to EL3, unless they are taken from EL1 or EL0 and routed to EL2 by another control.

This field has no effect on the routing of virtual or delegated SError exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnFPM, bit [50]

When FEAT_FPMR is implemented:

Enables direct and indirect accesses to FPMR from EL2, EL1, and EL0.

When accesses to FPMR are disabled by this control:

- Direct accesses to FPMR from EL2, EL1, and EL0 are trapped to EL3 and reported with EC syndrome value `0x18`.
- Execution of FP8 data-processing instructions that indirectly access FPMR is UNDEFINED at EL2, EL1 and EL0.

EnFPM	Meaning
`0b0`	Direct and indirect accesses to FPMR are disabled at EL2, EL1 and EL0.
`0b1`	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

If EL3 is not implemented, the Effective value of this field is `0b1`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MECEn, bit [49]

When FEAT_MEC is implemented:

Enables access to the following EL2 MECID registers, from EL2:

- MECID_P0_EL2.
- MECID_A0_EL2
- MECID_P1_EL2
- MECID_A1_EL2
- VMECID_P_EL2
- VMECID_A_EL2

Accesses to these registers are trapped and reported using EC syndrome value `0x18`.

MECEn	Meaning
`0b0`	EL2 accesses to any of the specified registers are trapped to EL3. The values of the specified registers are treated as 0 for all purposes other than direct reads or writes to the register from EL3.
`0b1`	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GPF, bit [48]

When FEAT_RME is implemented:

Controls the reporting of Granule protection faults at EL0, EL1 and EL2.

GPF	Meaning
0b0	This control does not cause exceptions to be routed from EL0, EL1 or EL2 to EL3.
0b1	GPFs at EL0, EL1 and EL2 are routed to EL3 and reported as Granule Protection Check exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D128En, bit [47]
When FEAT_D128 is implemented:

128-bit System Register trap control. Enables access to 128-bit System Registers via MRRS, MSRR instructions.

- MRRS and MSRR accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x14:
  - TTBR0_EL1.
  - TTBR1_EL1.
  - RCWMASK_EL1, RCWSMASK_EL1.
  - PAR_EL1.
- MRRS and MSRR accesses from EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x14:
  - TTBR1_EL2 and accesses using the register name TTBR1_EL12.
  - TTBR0_EL2 and accesses using the register name TTBR0_EL12.
  - VTTBR_EL2.

D128En	Meaning
0b0	EL1 and EL2 accesses to the specified registers are disabled, and trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIEn, bit [46]
When FEAT_AIE is implemented:

MAIR2_ELx, AMAIR2_ELx Register access trap control.

- Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x18:
  - AMAIR2_EL1.
  - MAIR2_EL1.
- Accesses from EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x18:
  - AMAIR2_EL2 and accesses using the register name AMAIR2_EL12.
  - MAIR2_EL2 and accesses using the register name MAIR2_EL12.

AIEn	Meaning
0b0	EL1 and EL2 accesses to the specified registers are disabled, and trapped to EL3. The values in these registers are treated as 0.
0b1	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIEn, bit [45]

When FEAT_S1PIE is implemented, or FEAT_S2PIE is implemented, or FEAT_S1POE is implemented, or FEAT_S2POE is implemented:

Permission Indirection, Overlay Register access trap control. Enables access to Permission Indirection and Overlay registers.

- Accesses from EL0, EL1 and EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x18:
  - POR_EL0.
- Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x18:
  - PIRE0_EL1.
  - PIR_EL1.
  - POR_EL1.
  - S2POR_EL1.
- Accesses from EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x18:
  - PIRE0_EL2 and accesses using the register name PIRE0_EL12.
  - PIR_EL2 and accesses using the register name PIR_EL12.
  - POR_EL2 and accesses using the register name POR_EL12.
  - S2PIR_EL2.

PIEn	Meaning
0b0	EL0, EL1 and EL2 accesses to the specified registers are disabled, and trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

If this field is 0, it is IMPLEMENTATION SPECIFIC whether the values of the named registers are treated as zero.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCTLR2En, bit [44]

When FEAT_SCTLR2 is implemented:

SCTLR2_ELx register trap control. Enables access to SCTLR2_EL1 and SCTLR2_EL2 registers.

SCTLR2En	Meaning
0b0	EL1 and EL2 accesses to SCTLR2_EL1 and SCTLR2_EL2 registers are disabled, and trapped to EL3. The values in these registers are treated as 0.
0b1	This control does not cause any instructions to be trapped.

Traps are reported using EC syndrome value 0x18.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCR2En, bit [43]

When FEAT_TCR2 is implemented:

TCR2_ELx register trap control. Enables access to TCR2_EL1 and TCR2_EL2 registers.

TCR2En	Meaning
0b0	EL1 and EL2 accesses to TCR2_EL1 and TCR2_EL2 registers are disabled, and trapped to EL3. The values in these registers are treated as 0.
0b1	This control does not cause any instructions to be trapped.

Traps are reported using EC syndrome value 0x18.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RCWMASKEn, bit [42]

When FEAT_THE is implemented:

RCW and RCWS Mask register trap control. Enables access to RCWMASK_EL1, RCWSMASK_EL1.

RCWMASKEn	Meaning
0b0	EL1 and EL2 accesses to RCWMASK_EL1 and RCWSMASK_EL1 registers are disabled, and trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

Traps for MRS, MSR access are reported using EC syndrome value 0x18.

Traps for MRRS, MSRR acceess are reported using EC syndrome value 0x14.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnTP2, bit [41]
When FEAT_SME is implemented:

Traps instructions executed at EL2, EL1, and EL0 that access TPIDR2_EL0 to EL3. The exception is reported using EC syndrome value 0x18.

EnTP2	Meaning
0b0	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRNDR, bit [40]
When FEAT_RNG_TRAP is implemented:

Controls trapping of reads of RNDR and RNDRRS. The exception is reported using EC syndrome value 0x18.

TRNDR	Meaning
0b0	This control does not cause RNDR and RNDRRS to be trapped. When FEAT_RNG is implemented: • ID_AA64ISAR0_EL1.RNDR returns the value 0b0001. When FEAT_RNG is not implemented: • ID_AA64ISAR0_EL1.RNDR returns the value 0b0000. • MRS reads of RNDR and RNDRRS are UNDEFINED.
0b1	ID_AA64ISAR0_EL1.RNDR returns the value 0b0001. Any attempt to read RNDR or RNDRRS is trapped to EL3.

When FEAT_RNG is not implemented, Arm recommends that SCR_EL3.TRNDR is initialized before entering Exception levels below EL3 and not subsequently changed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

GCSEn, bit [39]
When FEAT_GCS is implemented:

Guarded Control Stack enable. Controls access to the Guarded Control Stack registers from EL2, EL1, and EL0, and controls whether the Guarded Control Stack is enabled.

The Guarded Control Stack registers trapped by this mechanism are:

- GCSCRE0_EL1.
- GCSCR_EL1.
- GCSCR_EL2.
- GCSCR_EL12.

- GCSPR_EL0.
- GCSPR_EL1.
- GCSPR_EL2.
- GCSPR_EL12.

GCSEn	Meaning
0b0	Trap read and write accesses to all Guarded Control Stack registers to EL3. All Guarded Control Stack behavior is disabled at EL2, EL1, and EL0.
0b1	This control does not cause any instructions to be trapped, and does not disable Guarded Control Stack behavior at EL2, EL1, or EL0.

Traps are reported using EC syndrome value 0x18.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HXEn, bit [38]
When FEAT_HCX is implemented:

Enables access to the HCRX_EL2 register at EL2 from EL3.

HXEn	Meaning
0b0	Accesses at EL2 to HCRX_EL2 are trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

When EL3 is not implemented, the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ADEn, bit [37]
When FEAT_LS64_ACCDATA is implemented:

Enables access to the ACCDATA_EL1 register at EL1 and EL2.

ADEn	Meaning
0b0	Accesses to ACCDATA_EL1 at EL1 and EL2 are trapped to EL3, unless the accesses are trapped to EL2 by the EL2 fine-grained trap.
0b1	This control does not cause accesses to ACCDATA_EL1 to be trapped.

If the HFGWTR_EL2.nACCDATA_EL1 or HFGRTR_EL2.nACCDATA_EL1 traps are enabled, they take priority over this trap.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [36]

When FEAT_LS64_ACCDATA is implemented:

Traps execution of an ST64BV0 instruction at EL0, EL1, or EL2 to EL3.

EnAS0	Meaning
0b0	EL0 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL1 by SCTLR_EL1.EnAS0, or to EL2 by either HCRX_EL2.EnAS0 or SCTLR_EL2.EnAS0. EL1 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL2 by HCRX_EL2.EnAS0. EL2 execution of an ST64BV0 instruction is trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [35]

When FEAT_AMUv1p1 is implemented:

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Accesses to AMEVCNTVOFF0<n>_EL2 and AMEVCNTVOFF1<n>_EL2 at EL2 are trapped to EL3. Indirect reads of the virtual offset registers are zero.
0b1	Accesses to AMEVCNTVOFF0<n>_EL2 and AMEVCNTVOFF1<n>_EL2 are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [34]

When FEAT_TME is implemented:

Enables access to the TSTART, TCOMMIT, TTEST and TCANCEL instructions at EL0, EL1 and EL2.

TME	Meaning
0b0	EL0, EL1 and EL2 accesses to TSTART, TCOMMIT, TTEST and TCANCEL instructions are UNDEFINED.
0b1	This control does not cause any instruction to be UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [33:30]
When FEAT_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCR_EL3.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCR_EL3.TWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [29]
When FEAT_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCR_EL3.TWE.

Traps are reported using EC syndrome value `0x01`.

TWEDEn	Meaning
`0b0`	The delay for taking the trap is IMPLEMENTATION DEFINED.
`0b1`	The delay for taking the trap is at least the number of cycles defined in SCR_EL3.TWEDEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECVEn, bit [28]
When FEAT_ECV_POFF is implemented:

ECV Enable. Enables access to the CNTPOFF_EL2 register.

ECVEn	Meaning
`0b0`	EL2 accesses to CNTPOFF_EL2 are trapped to EL3, and the value of CNTPOFF_EL2 is treated as 0 for all purposes other than direct reads or writes to the register from EL3.
`0b1`	EL2 accesses to CNTPOFF_EL2 are not trapped to EL3 by this mechanism.

When FEAT_ECV_POFF is not implemented, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTEn, bit [27]
When FEAT_FGT is implemented:

Fine-Grained Traps Enable. When EL2 is implemented, enables the traps to EL2 controlled by HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2, and HFGWTR_EL2, and controls access to those registers.

Note

If EL2 is not implemented but EL3 is implemented, FEAT_FGT implements the MDCR_EL3.TDCC traps.

FGTEn	Meaning
0b0	EL2 accesses to HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers are trapped to EL3, and the traps to EL2 controlled by those registers are disabled.
0b1	EL2 accesses to HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers are not trapped to EL3 by this mechanism.

Traps caused by accesses to the fine-grained trap registers are reported using EC syndrome value 0x18 and its associated ISS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [26]
When FEAT_MTE2 is implemented:

Allocation Tag Access. Controls access to Allocation Tags, System registers for Memory tagging, and prevention of Tag checking, at EL2, EL1 and EL0.

ATA	Meaning
0b0	Access to Allocation Tags is prevented at EL2, EL1, and EL0. Accesses at EL1 and EL2 to GCR_EL1, RGSR_EL1, TFSR_EL1, TFSR_EL2 or TFSRE0_EL1 that are not UNDEFINED or trapped to a lower Exception level are trapped to EL3. Accesses at EL2 using MRS or MSR with the register name TFSR_EL12 that are not UNDEFINED are trapped to EL3. Memory accesses at EL2, EL1, and EL0 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL2, EL1, and EL0. This control does not prevent Tag checking at EL2, EL1, and EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [25]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Enables access to the SCXTNUM_EL2, SCXTNUM_EL1, and SCXTNUM_EL0 registers.

EnSCXT	Meaning
0b0	Accesses at EL0, EL1 and EL2 to SCXTNUM_EL0, SCXTNUM_EL1, or SCXTNUM_EL2 registers are trapped to EL3 if they are not trapped by a higher priority exception, and the values of these registers are treated as 0.
0b1	This control does not cause any accesses to be trapped, or register values to be treated as 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [24]

Reserved, RES0.

TID5, bit [23]

When FEAT_IDTE3 is implemented and FEAT_MTE2 is implemented:

Trap ID group 5. EL2 and EL1 reads of the group 5 ID register GMID_EL1 are trapped to EL3, reported using EC syndrome value 0x18, unless the instruction generates a higher priority exception.

TID5	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL2 accesses to ID group 5 registers are trapped to EL3. When EL2 is not enabled in the current Security state, or when HCR_EL2.TID3 is 0, EL1 read accesses to the specified registers are trapped to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID3, bit [22]

When FEAT_IDTE3 is implemented:

Trap ID group 3. EL2 and EL1 reads of the following group 3 registers are trapped to EL3, reported using EC syndrome value 0x18, unless the instruction generates a higher priority exception:

- ID_PFR0_EL1, ID_PFR1_EL1, ID_DFR0_EL1, ID_AFR0_EL1, ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, ID_ISAR5_EL1, MVFR0_EL1, MVFR1_EL1, and MVFR2_EL1.
- ID_AA64PFR0_EL1, ID_AA64PFR1_EL1, ID_AA64DFR0_EL1, ID_AA64DFR1_EL1, ID_AA64ISAR0_EL1, ID_AA64ISAR1_EL1, ID_AA64MMFR0_EL1, ID_AA64MMFR1_EL1, ID_AA64AFR0_EL1, and ID_AA64AFR1_EL1.
- ID_PFR2_EL1, ID_MMFR4_EL1 and ID_MMFR5_EL1.
- ID_AA64MMFR3_EL1.
- ID_AA64MMFR4_EL1.
- ID_AA64PFR2_EL1.
- ID_AA64MMFR2_EL1 and ID_ISAR6_EL1.
- ID_DFR1_EL1.

- ID_AA64ZFR0_EL1.
- ID_AA64SMFR0_EL1.
- ID_AA64ISAR2_EL1.
- This field traps all MRS accesses to registers in the following range that are not already mentioned in this field description: op0 == 3, op1 == 0, CRn == 0, CRm == {2-7}, op2 == {0-7}.

TID3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL2 read accesses to ID group 3 registers are trapped to EL3. When EL2 is not enabled in the current Security state, or when HCR_EL2.TID3 is 0, EL1 read accesses to the specified registers are trapped to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FIEN, bit [21]
When FEAT_RASv1p1 is implemented:

Fault Injection enable. Trap accesses to the registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 from EL1 and EL2 to EL3, reported using EC syndrome value 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.
0b1	This control does not cause any instructions to be trapped.

If EL3 is not implemented, the Effective value of SCR_EL3.FIEN is 0b1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [20]
When FEAT_DoubleFault is implemented:

Non-maskable External Aborts. Controls whether PSTATE.A masks SError exceptions at EL3.

NMEA	Meaning
0b0	SError exceptions are not taken at EL3 if PSTATE.A == 1.
0b1	SError exceptions are taken at EL3 regardless of the value of PSTATE.A.

This field is ignored by the PE and treated as zero when all of the following are true:

- FEAT_DoubleFault2 is not implemented.
- SCR_EL3.EA is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

EASE, bit [19]
When FEAT_DoubleFault is implemented:

External aborts to SError exception vector.

EASE	Meaning
0b0	Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from VBAR_EL3.
0b1	Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError exception vector offset from VBAR_EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

EEL2, bit [18]
When FEAT_SEL2 is implemented:

Secure EL2 Enable.

EEL2	Meaning
0b0	All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by FEAT_SEL2 are UNDEFINED, and those timers are disabled.
0b1	All behaviors associated with Secure EL2 are enabled.

When the value of this bit is 1, then:

- When SCR_EL3.NS == 0, the SCR_EL3.RW bit is treated as 1 for all purposes other than reading or writing the register.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2, using EC syndrome value 0x03 :
  - A read or write of the SCR.
  - A read or write of the NSACR.
  - A read or write of the MVBAR.
  - A read or write of the SDCR.
  - Execution of an ATS12NSO** instruction.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using EC syndrome value 0x00 :
  - Execution of an SRS instruction that uses R13_mon.
  - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access SPSR_mon, R13_mon, or R14_mon.

Note

If the Effective value of SCR_EL3.EEL2 is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.

A Secure only implementation that does not implement EL3 but implements EL2, behaves as if SCR_EL3.EEL2 == 1.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [17]

When FEAT_PAuth is implemented:

Controls the use of the following instructions related to Pointer Authentication.

- PACGA.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAB, when any of the following are true:
  - In EL0, when the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and the associated SCTLR_EL1.En<N><M> == 1.
  - In EL0, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, and the associated SCTLR_EL2.En<N><M> == 1.
  - In EL1, when the associated SCTLR_EL1.En<N><M> == 1.
  - In EL2, when the associated SCTLR_EL2.En<N><M> == 1.
- When FEAT_PAuth_LR is implemented, AUTIASPPC, AUTIASPPCR, AUTIA171615, AUTIBSPPC, AUTIBSPPCR, AUTIB171615, PACIASPPC, PACNBIASPPC, PACIA171615, PACIBSPPC, PACNBIBSPPC, PACIB171615, RETAASPPC, RETAASPPCR, RETABSPPC, RETABSPPCR, when any of the following are true:
  - In EL0, when the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and the associated SCTLR_EL1.En<N><M> == 1.
  - In EL0, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, and the associated SCTLR_EL2.En<N><M> == 1.
  - In EL1, when the associated SCTLR_EL1.En<N><M> == 1.
  - In EL2, when the associated SCTLR_EL2.En<N><M> == 1.

API	Meaning
0b0	The specified instructions are trapped to EL3, when the instructions are enabled, unless they are trapped to EL2 as a result of the higher priority HCR_EL2.API trap.
0b1	This control does not cause any instructions to be trapped.

Traps are reported using EC syndrome value 0x09.

An instruction is trapped only if Pointer Authentication is enabled for that instruction, for more information, see 'PAC generation and verification keys'.

Note

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [16]

When FEAT_PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers, using EC syndrome value 0x18, from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps:

- APIAKeyLo_EL1, APIAKeyHi_EL1, APIBKeyLo_EL1, APIBKeyHi_EL1.
- APDAKeyLo_EL1, APDAKeyHi_EL1, APDBKeyLo_EL1, APDBKeyHi_EL1.
- APGAKeyLo_EL1, and APGAKeyHi_EL1.

APK	Meaning
0b0	Access to the registers holding "key" values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps.
0b1	This control does not cause any instructions to be trapped.

For more information, see 'PAC generation and verification keys'.

Note

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [15]

When FEAT_RAS is implemented:

Trap accesses of Error Record registers. Enables a trap to EL3 on accesses of Error Record registers.

TERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses of the specified Error Record registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to ERRSELR_EL1, ERXADDR_EL1, ERXCTLR_EL1, ERXMISC0_EL1, ERXMISC1_EL1, and ERXSTATUS_EL1.
- MRS accesses to ERRIDR_EL1 and ERXFR_EL1.
- If FEAT_RASv1p1 is implemented, MRS and MSR accesses to ERXMISC2_EL1 and ERXMISC3_EL1.
- If FEAT_RASv2 is implemented, MRS accesses to ERXGSR_EL1.

In AArch32 state, the instructions affected by this control are:

- MRC and MCR accesses to ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.
- MRC accesses to ERRIDR, ERXFR, and ERXFR2.
- If FEAT_RASv1p1 is implemented, MRC and MCR accesses to ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x03.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [14]

When FEAT_LOR is implemented:

Trap LOR registers. Traps Non-secure and Realm accesses to the LORSA_EL1, LOREA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

TLOR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure and Realm EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped by HCR_EL2.TLOR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [13]

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from any Security state and both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE, HCR.TWE, SCTLR_EL1.nTWE, SCTLR_EL2.nTWE, or HCR_EL2.TWE.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TWI, bit [12]

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from any Security state and both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI, HCR.TWI, SCTLR_EL1.nTWI, SCTLR_EL2.nTWI, or HCR_EL2.TWI.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ST, bit [11]

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only, reported using EC syndrome value 0x18.

ST	Meaning
0b0	Secure EL1 using AArch64 accesses to the CNTPS_TVAL_EL1, CNTPS_CTL_EL1, and CNTPS_CVAL_EL1 are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was 0b1.
0b1	This control does not cause any instructions to be trapped.

Note

Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3. These registers are not accessible at EL0.

When FEAT_RME is implemented and Secure state is not implemented, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RW, bit [10]

When FEAT_AA32EL1 is implemented:

Execution state control for lower Exception levels.

RW	Meaning
0b0	All lower Exception levels are using AArch32.
0b1	The next lower Exception level is using AArch64: • If EL2 is implemented and enabled in the Security state determined by SCR_EL3.{NSE,NS}, then EL2 is using AArch64 and EL2 controls the Execution state for EL1. • If EL2 is not implemented or EL2 is disabled in the Security state determined by SCR_EL3.{NSE,NS}, then EL1 is using AArch64. When executing at EL0, if the next higher Exception level is using AArch64, then the Execution state is determined by PSTATE.nRW. Otherwise, EL0 uses AArch32.

If any of the following apply, then the Effective value of this bit is 1:

- EL2 is implemented and does not support AArch32, and SCR_EL3.NS is 1.

- The Effective value of SCR_EL3.{EEL2,NS} is {1,0}.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

SIF, bit [9]

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction execution from memory marked in the first stage of translation as being Non-secure.

SIF	Meaning
0b0	Secure state instruction execution from memory marked in the first stage of translation as being Non-secure is permitted.
0b1	Secure state instruction execution from memory marked in the first stage of translation as being Non-secure is not permitted.

When FEAT_RME is implemented and Secure state is not implemented, this bit is RES0.

When FEAT_PAN3 is implemented, it is IMPLEMENTATION DEFINED whether SCR_EL3.SIF is also used to determine instruction access permission for the purpose of PAN.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states, reported using EC syndrome value 0x00.

HCE	Meaning
0b0	HVC instructions are UNDEFINED.
0b1	HVC instructions are enabled at EL3, EL2, and EL1.

Note

HVC instructions are always UNDEFINED at EL0 and, if Secure EL2 is disabled, at Secure EL1. Any resulting exception is taken from the current Exception level to the current Exception level.

If EL2 is not implemented, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SMD, bit [7]

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from any Security state and both Execution states, reported using EC syndrome value 0x00.

SMD	Meaning
0b0	SMC instructions are enabled at EL3, EL2 and EL1.
0b1	SMC instructions are UNDEFINED.

Note

SMC instructions are always UNDEFINED at EL0. Any resulting exception is taken from the current Exception level to the current Exception level.

If HCR_EL2.TSC or HCR.TSC traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

EA, bit [3]

External Abort and SError exception routing.

EA	Meaning
0b0	When executing at Exception levels below EL3, External aborts and SError exceptions are not taken to EL3. In addition, when executing at EL3: • SError exceptions are not taken. • External aborts are taken to EL3.
0b1	When executing at any Exception level, External aborts and SError exceptions are taken to EL3.

This field has no effect on the routing of virtual or delegated SError exceptions.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIQ, bit [2]

Physical FIQ Routing.

FIQ	Meaning
0b0	When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3. When executing at EL3, physical FIQ interrupts are not taken.
0b1	When executing at any Exception level, physical FIQ interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRQ, bit [1]

Physical IRQ Routing.

IRQ	Meaning
0b0	When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3. When executing at EL3, physical IRQ interrupts are not taken.
0b1	When executing at any Exception level, physical IRQ interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [0]

When FEAT_RME is implemented:

Non-secure bit. This field is used in combination with SCR_EL3.NSE to select the Security state of EL2 and lower Exception levels.

NSE	NS	Meaning
0b0	0b0	Secure.
0b0	0b1	Non-secure.
0b1	0b0	Reserved.
0b1	0b1	Realm.

When Secure state is not implemented, SCR_EL3.NS is RES1 and its effective value is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure bit.

NS	Meaning
0b0	Indicates that EL0 and EL1 are in Secure state. When FEAT_SEL2 is implemented and SCR_EL3.EEL2 == 1, then EL2 is using AArch64 and in Secure state.
0b1	Indicates that Exception levels lower than EL3 are in Non-secure state, so memory accesses from those Exception levels cannot access Secure memory.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SCR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = SCR_EL3;
```

```
MSR SCR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SCR_EL3 = X[t, 64];
```

SCTLR2_EL1, System Control Register (EL1)

The SCTLR2_EL1 characteristics are:

Purpose

Provides top-level control of the system, including its memory system, at EL1 and EL0.

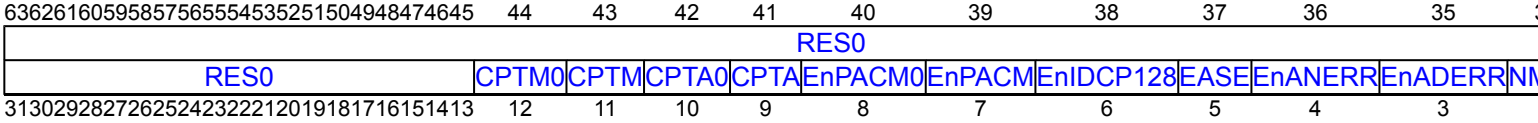
Configuration

This register is present only when FEAT_SCTLR2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR2_EL1 are UNDEFINED.

Attributes

SCTLR2_EL1 is a 64-bit register.

Field descriptions



Bits [63:13]

Reserved, RES0.

CPTM0, bit [12]

When FEAT_CPA2 is implemented:

This field controls unprivileged Checked Pointer Arithmetic for Multiplication.

CPTM0	Meaning
0b0	Pointer Arithmetic for Multiplication is not checked.
0b1	Pointer Arithmetic for Multiplication is checked.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

If the Effective value of SCTLR2_EL1.CPTA0 is 0, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTM, bit [11]

When FEAT_CPA2 is implemented:

This field controls Checked Pointer Arithmetic for Multiplication at EL1.

CPTM	Meaning
0b0	Pointer Arithmetic for Multiplication is not checked.
0b1	Pointer Arithmetic for Multiplication is checked.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

If the Effective value of SCTLR2_EL1.CPTA is 0, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTA0, bit [10]

When FEAT_CPA2 is implemented:

This field controls unprivileged Checked Pointer Arithmetic for Addition.

CPTA0	Meaning
0b0	Pointer Arithmetic for Addition is not checked.
0b1	Pointer Arithmetic for Addition is checked.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTA, bit [9]

When FEAT_CPA2 is implemented:

This field controls Checked Pointer Arithmetic for Addition at EL1.

CPTA	Meaning
0b0	Pointer Arithmetic for Addition is not checked.
0b1	Pointer Arithmetic for Addition is checked.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnPACM0, bit [8]
When FEAT_PAuth_LR is implemented:

PACM Enable at EL0. Controls the effect of a PACM instruction at EL0.

EnPACM0	Meaning
0b0	The effects of PACM are disabled at EL0.
0b1	A PACM instruction at EL0 causes PSTATE.PACM to be set to 0b1.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.PACMEn == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnPACM, bit [7]
When FEAT_PAuth_LR is implemented:

PACM Enable at EL1. Controls the effect of a PACM instruction at EL1.

EnPACM	Meaning
0b0	The effects of PACM are disabled at EL1.
0b1	A PACM instruction at EL1 causes PSTATE.PACM to be set to 0b1.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.PACMEn == 0.

The reset behavior of this field is:
