ICC_MCTLR, Interrupt Controller Monitor Control Register

The ICC_MCTLR characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

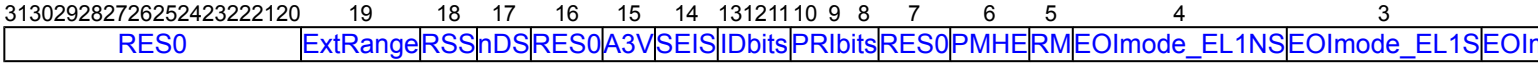
Configuration

This register is present only when FEAT_AA32EL3 is implemented, GICv3 is implemented, and EL3 is implemented. Otherwise, direct accesses to ICC_MCTLR are UNDEFINED.

Attributes

ICC_MCTLR is a 32-bit register.

Field descriptions



Bits [31:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191 All INTIDs in the range 1024..8191 are treated as requiring deactivation.

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

nDS, bit [17]

Disable Security not supported. Read-only and writes are ignored.

nDS	Meaning
0b0	The CPU interface logic supports disabling of security.
0b1	The CPU interface logic does not support disabling of security, and requires that security is not disabled.

Bit [16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored.

A3V	Meaning
0b0	The CPU interface logic does not support nonzero values of the Aff3 field in SGI generation System registers.
0b1	The CPU interface logic supports nonzero values of the Aff3 field in SGI generation System registers.

If EL3 is present, ICC_CTLR.A3V is an alias of ICC_MCTLR.A3V

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs.

SEIS	Meaning
0b0	The CPU interface logic does not support generation of SEIs.
0b1	The CPU interface logic supports generation of SEIs.

If EL3 is present, ICC_CTLR.SEIS is an alias of ICC_MCTLR.SEIS

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported.

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is present, ICC_CTLR.IDbits is an alias of ICC_MCTLR.IDbits

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the value of SCR.NS or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0 and ICC_BPR1.

This field determines the minimum value of ICC_BPR0.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable.

PMHE	Meaning
0b0	Disables use of the priority mask register as a hint for interrupt distribution.
0b1	Enables use of the priority mask register as a hint for interrupt distribution.

Software must write ICC_PMR to 0xFF before clearing this field to 0.

An implementation might choose to make this field RAO/WI.

If EL3 is present, ICC_CTLR.PMHE is an alias of ICC_MCTLR.PMHE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

RM, bit [5]

SBZ.

The equivalent bit in AArch64 is the Routing Modifier bit. This feature is not supported when EL3 is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1NS, bit [4]

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1NS	Meaning
0b0	ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
0b1	ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR(NS).EOImode is an alias of ICC_MCTLR.EOImode_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1S, bit [3]

EOI mode for interrupts handled at Secure EL1. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1S	Meaning
0b0	ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
0b1	ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR(S).EOImode is an alias of ICC_MCTLR.EOImode_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL3	Meaning
0b0	ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
0b1	ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

CBPR_EL1NS	Meaning
0b0	ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Non-secure Group 1 interrupts.
0b1	ICC_BPR0 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1 access the state of ICC_BPR0.

If EL3 is present, ICC_CTLR(NS).CBPR is an alias of ICC_MCTLR.CBPR_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts in Secure non-Monitor modes.

CBPR_EL1S	Meaning
0b0	ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Secure Group 1 interrupts.
0b1	ICC_BPR0 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 accesses, or EL3 accesses when not in Monitor mode, to ICC_BPR1 access the state of ICC_BPR0.

If EL3 is present, ICC_CTLR(S).CBPR is an alias of ICC_MCTLR.CBPR_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_MCTLR

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

ICC_MGRPEN1, Interrupt Controller Monitor Interrupt Group 1 Enable register

The ICC_MGRPEN1 characteristics are:

Purpose

Controls whether Group 1 interrupts are enabled or not.

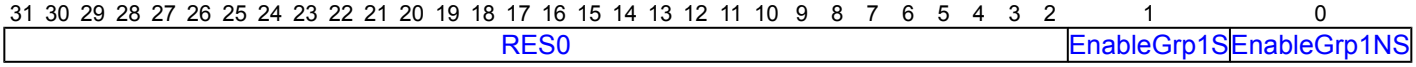
Configuration

This register is present only when FEAT_AA32EL3 is implemented, GICv3 is implemented, and EL3 is implemented. Otherwise, direct accesses to ICC_MGRPEN1 are UNDEFINED.

Attributes

ICC_MGRPEN1 is a 32-bit register.

Field descriptions



Bits [31:2]

Reserved, RES0.

EnableGrp1S, bit [1]

Enables Group 1 interrupts for the Secure state.

EnableGrp1S	Meaning
0b0	Secure Group 1 interrupts are disabled.
0b1	Secure Group 1 interrupts are enabled.

The Secure ICC_IGRPEN1.Enable bit is a read/write alias of the ICC_MGRPEN1.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

EnableGrp1NS, bit [0]

Enables Group 1 interrupts for the Non-secure state.

EnableGrp1NS	Meaning
0b0	Non-secure Group 1 interrupts are disabled.
0b1	Non-secure Group 1 interrupts are enabled.

The Non-secure ICC_IGRPEN1.Enable bit is a read/write alias of the ICC_MGRPEN1.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_MGRPEN1

If an interrupt is pending within the CPU interface when an Enable bit becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

ICC_MSRE, Interrupt Controller Monitor System Register Enable register

The ICC_MSRE characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

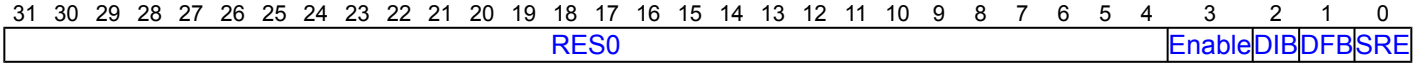
Configuration

This register is present only when FEAT_AA32EL3 is implemented, GICv3 is implemented, and EL3 is implemented. Otherwise, direct accesses to ICC_MSRE are UNDEFINED.

Attributes

ICC_MSRE is a 32-bit register.

Field descriptions



Bits [31:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to ICC_SRE and ICC_HSRE.

Enable	Meaning
0b0	Secure EL1 accesses to Secure ICC_SRE trap to EL3. EL2 accesses to Non-secure ICC_SRE and ICC_HSRE trap to EL3. Non-secure EL1 accesses to ICC_SRE trap to EL3, unless these accesses are trapped to EL2 as a result of ICC_HSRE.Enable == 0.
0b1	Secure EL1 accesses to Secure ICC_SRE do not trap to EL3. EL2 accesses to Non-secure ICC_SRE and ICC_HSRE do not trap to EL3. Non-secure EL1 accesses to ICC_SRE do not trap to EL3.

If ICC_MSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_MSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

In systems that do not support IRQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

In systems that do not support FIQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Accesses at EL3 or below to any ICH_* System register, or any EL1, EL2, or EL3 ICC_* register other than ICC_SRE, ICC_HSRE, or ICC_MSRE, are UNDEFINED.
0b1	The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_* registers is enabled for EL3.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_MSRE

This register is always System register accessible.

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_MSRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b110	0b1100	0b1100	0b101

```

ICC_PMR, Interrupt Controller Interrupt Priority Mask Register

The ICC_PMR characteristics are:

Purpose

Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Configuration

AArch32 System register ICC_PMR bits [31:0] are architecturally mapped to AArch64 System register ICC_PMR_EL1[31:0].

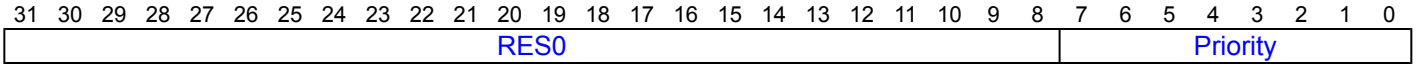
This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_PMR are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronizing. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_PMR is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	`0x00-0xFF` (0-255), all values	256
[7:1]	`0x00-0xFE` (0-254), even values only	128
[7:2]	`0x00-0xFC` (0-252), in steps of 4	64
[7:3]	`0x00-0xF8` (0-248), in steps of 8	32
[7:4]	`0x00-0xF0` (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'00000000'`.

Accessing ICC_PMR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICC_RPR, Interrupt Controller Running Priority Register

The ICC_RPR characteristics are:

Purpose

Indicates the Running priority of the CPU interface.

Configuration

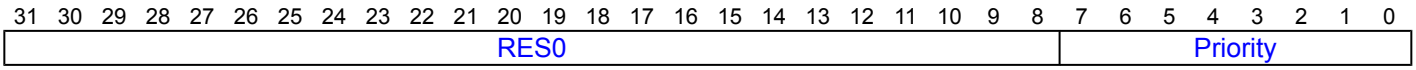
AArch32 System register ICC_RPR bits [31:0] performs the same function as AArch64 System register ICC_RPR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_RPR are UNDEFINED.

Attributes

ICC_RPR is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

Accessing ICC_RPR

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1011	0b011

```

ICC_SGI0R, Interrupt Controller Software Generated Interrupt Group 0 Register

The ICC_SGI0R characteristics are:

Purpose

Generates Secure Group 0 SGIs.

Configuration

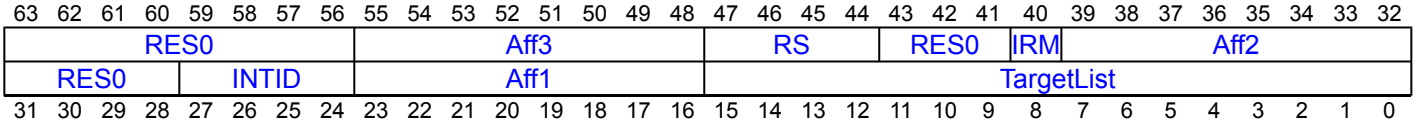
AArch32 System register ICC_SGI0R performs the same function as AArch64 System register ICC_SGI0R_EL1.

This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_SGI0R are UNDEFINED.

Attributes

ICC_SGI0R is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

Note

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Accessing ICC_SGI0R

This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

Accesses to this register use the following encodings in the System register encoding space:

```
MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1
0b1111	0b1100	0b0010

Purpose

Generates Group 1 SGIs for the current Security state.

Configuration

AArch32 System register ICC_SGI1R performs the same function as AArch64 System register ICC_SGI1R_EL1.

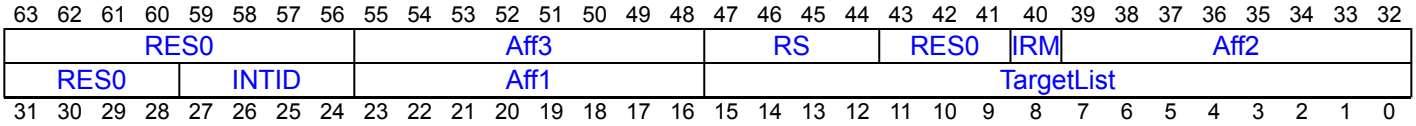
This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_SGI1R are UNDEFINED.

Under certain conditions a write to ICC_SGI1R can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_SGI1R is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

Note

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Accessing ICC_SGI1R

Note

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

Accesses to this register use the following encodings in the System register encoding space:

```
MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1
0b1111	0b1100	0b0000

```

ICC_SRE, Interrupt Controller System Register Enable register

The ICC_SRE characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL0 and EL1.

Configuration

This register is banked between ICC_SRE and ICC_SRE_S and ICC_SRE_NS.

AArch32 System register ICC_SRE bits [31:0] (ICC_SRE_S) are architecturally mapped to AArch64 System register ICC_SRE_EL1[31:0] (ICC_SRE_EL1_S).

AArch32 System register ICC_SRE bits [31:0] (ICC_SRE_NS) are architecturally mapped to AArch64 System register ICC_SRE_EL1[31:0] (ICC_SRE_EL1_NS).

AArch32 System register ICC_SRE bits [31:0] are architecturally mapped to AArch64 System register ICC_SRE_EL1.

This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_SRE are UNDEFINED.

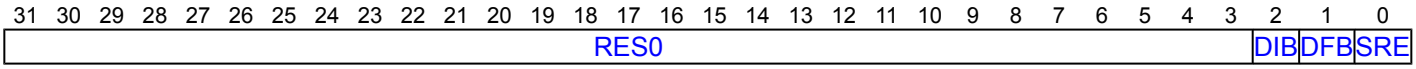
Attributes

ICC_SRE is a 32-bit register.

This register has the following instances:

- ICC_SRE, when EL3 is not implemented or FEAT_AA64 is implemented.
- ICC_SRE_S, when FEAT_AA32EL3 is implemented.
- ICC_SRE_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



Bits [31:3]

Reserved, RES0.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_MSRE.DIB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read/write alias of ICC_MSRE.DIB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DIB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_MSRE.DFB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read/write alias of ICC_MSRE.DFB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DFB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DFB.

In systems that do not support FIQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Accesses at EL1 to any ICC_* System register other than ICC_SRE are UNDEFINED.
0b1	The System register interface for the current Security state is enabled.

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When ICC_SRE_EL3.SRE==0 the Secure copy of this bit is RAZ/WI.
- When ICC_SRE_EL3.SRE==0 the Non-secure copy of this bit is RAZ/WI.

If EL3 is implemented and using AArch32:

- When ICC_MSRE.SRE==0 the Secure copy of this bit is RAZ/WI.
- When ICC_MSRE.SRE==0 the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch64:

- When ICC_SRE_EL2.SRE==0 the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch32:

- When ICC_HSRE.SRE==0 the Non-secure copy of this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_SRE

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_SRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b101

```

ICH_AP0R<n>, Interrupt Controller Hyp Active Priorities Group 0 Registers, n = 0 - 3

The ICH_AP0R<n> characteristics are:

Purpose

Provides information about Group 0 active priorities for EL2.

Configuration

AArch32 System register ICH_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_AP0R<n>_EL2[31:0].

This register is present only when FEAT_AA32EL2 is implemented, GICv3 is implemented, and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_AP0R<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_AP0R<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

P<x>, bit [x], for x = 31 to 0

Provides the access to the virtual active priorities for Group 0 interrupts. Possible values of each bit are:

P<x>	Meaning
0b0	There is no Group 0 interrupt active at the priority corresponding to that bit.
0b1	There is a Group 0 interrupt active at the priority corresponding to that bit.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP0R0 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP0R0 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP0R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP0R0 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP0R1 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP0R2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH_AP0R3 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n> and ICH_AP1R<n> might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICH_AP0R<n>

ICH_AP0R1 is implemented only in implementations that support 6 or more bits of preemption. ICH_AP0R2 and ICH_AP0R3 are implemented only in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR.PREbits

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICH_AP0R<n>
- ICH_AP1R<n>

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-3
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1000	0b0:m[1:0]

```
integer m = UInt(opc2<1:0>);

ICH_AP1R<n>, Interrupt Controller Hyp Active Priorities Group 1 Registers, n = 0 - 3

The ICH_AP1R<n> characteristics are:

Purpose

Provides information about Group 1 active priorities for EL2.

Configuration

AArch32 System register ICH_AP1R<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_AP1R<n>_EL2[31:0].

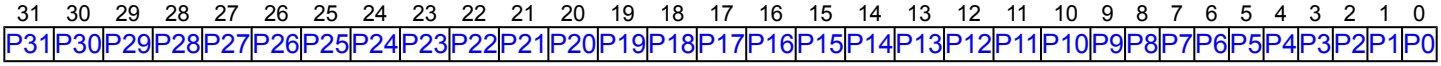
This register is present only when FEAT_AA32EL2 is implemented, GICv3 is implemented, and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_AP1R<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_AP1R<n> is a 32-bit register.

Field descriptions



P<x>, bit [x], for x = 31 to 0

Group 1 interrupt active priorities. Possible values of each bit are:

P<x>	Meaning
0b0	There is no Group 1 interrupt active at the priority corresponding to that bit.
0b1	There is a Group 1 interrupt active at the priority corresponding to that bit.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP1R0 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP1R0 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP1R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP1R0 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP1R1 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP1R2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH_AP1R3 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n> and ICH_AP1R<n> might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICH_AP1R<n>

ICH_AP1R1 is implemented only in implementations that support 6 or more bits of preemption. ICH_AP1R2 and ICH_AP1R3 are implemented only in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR.PREbits

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICH_AP0R<n>
- ICH_AP1R<n>

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-3
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1001	0b0:m[1:0]

```
integer m = UInt(opc2<1:0>);

ICH_EISR, Interrupt Controller End of Interrupt Status Register

The ICH_EISR characteristics are:

Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

Configuration

AArch32 System register ICH_EISR bits [31:0] are architecturally mapped to AArch64 System register ICH_EISR_EL2[31:0].

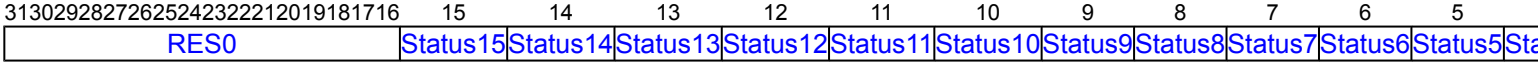
This register is present only when FEAT_AA32EL2 is implemented, GICv3 is implemented, and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_EISR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_EISR is a 32-bit register.

Field descriptions



Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status bit for List register <n>:

Status<n>	Meaning
0b0	List register <n>, ICH_LR<n>, does not have an EOI maintenance interrupt.
0b1	List register <n>, ICH_LR<n>, has an EOI maintenance interrupt that has not been handled.

For any ICH_LR<n>, the corresponding status bit is set to 1 if all of the following are true:

- ICH_LRC<n>.State is 0b00.
- ICH_LRC<n>.HW is 0.
- ICH_LRC<n>.EOI (bit [9]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICH_EISR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1011	0b011

```
if !(IsFeatureImplemented(FEAT_AA32EL2) && IsFeatureImplemented(FEAT_GICv3) && (HaveEL(EL2) ||

ICH_ELRSR, Interrupt Controller Empty List Register Status Register

The ICH_ELRSR characteristics are:

Purpose

Indicates which List registers contain valid interrupts.

Configuration

AArch32 System register ICH_ELRSR bits [31:0] are architecturally mapped to AArch64 System register ICH_ELRSR_EL2[31:0].

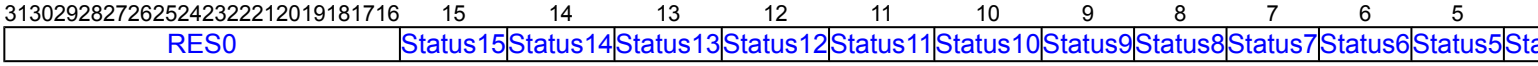
This register is present only when FEAT_AA32EL2 is implemented, GICv3 is implemented, and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_ELRSR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_ELRSR is a 32-bit register.

Field descriptions



Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>, ICH_LR<n>:

Status<n>	Meaning
0b0	List register ICH_LR<n>, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.
0b1	List register ICH_LR<n> does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.

For any List register <n>, the corresponding status bit is set to 1 if ICH_LRC<n>.State is 0b00 and either ICH_LRC<n>.HW is 1 or ICH_LRC<n>.EOI (bit [9]) is 0.

Accessing ICH_ELRSR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1011	0b101

```
if !(IsFeatureImplemented(FEAT_AA32EL2) && IsFeatureImplemented(FEAT_GICv3) && (HaveEL(EL2) ||
HaveEL(EL3))) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T12
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T12 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_HSRE.SRE == '0' then

ICH_HCR, Interrupt Controller Hyp Control Register

The ICH_HCR characteristics are:

Purpose

Controls the environment for VMs.

Configuration

AArch32 System register ICH_HCR bits [31:0] are architecturally mapped to AArch64 System register ICH_HCR_EL2[31:0].

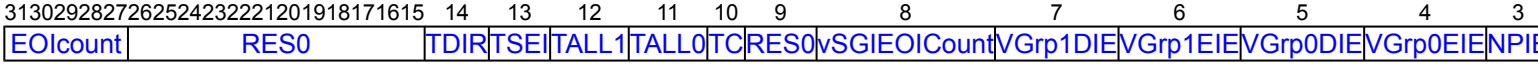
This register is present only when FEAT_AA32EL2 is implemented, GICv3 is implemented, and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_HCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_HCR is a 32-bit register.

Field descriptions



EOIcount, bits [31:27]

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It is CONSTRAINED UNPREDICTABLE whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers (ICH_AP0R<n>/ICH_AP1R<n>) increments EOIcount. Permitted behaviors are:

- Increment EOIcount.
- Leave EOIcount unchanged.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'00000'`.

Bits [26:15]

Reserved, RES0.

TDIR, bit [14]

When FEAT_GICv3_TDIR is implemented:

Trap Non-secure EL1 writes to ICC_DIR and ICV_DIR.

TDIR	Meaning
0b0	Non-secure EL1 writes of ICC_DIR and ICV_DIR are not trapped to EL2, unless trapped by other mechanisms.
0b1	Non-secure EL1 writes of ICV_DIR are trapped to EL2. It is IMPLEMENTATION DEFINED whether Non-secure writes of ICC_DIR are trapped. Not trapping ICC_DIR writes is DEPRECATED.

Arm deprecates not including this trap bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

TSEI, bit [13]

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at Non-secure EL1.

TSEI	Meaning
0b0	Locally generated SEIs do not cause a trap to EL2.
0b1	Locally generated SEIs trap to EL2.

If ICH_VTR.SEIS is 0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TALL1, bit [12]

Trap all Non-secure EL1 accesses to ICC_* and ICV_* System registers for Group 1 interrupts to EL2.

TALL1	Meaning
0b0	Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.
0b1	Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TALL0, bit [11]

Trap all Non-secure EL1 accesses to ICC_* and ICV_* System registers for Group 0 interrupts to EL2.

TALL0	Meaning
0b0	Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.
0b1	Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TC, bit [10]

Trap all Non-secure EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

TC	Meaning
0b0	Non-secure EL1 accesses to common registers proceed as normal.
0b1	Non-secure EL1 accesses to common registers trap to EL2.

This affects accesses to ICC_SGI0R, ICC_SGI1R, ICC_ASGI1R, ICC_CTLR, ICC_DIR, ICC_PMR, ICC_RPR, ICV_CTLR, ICV_DIR, ICV_PMR, and ICV_RPR.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [9]

Reserved, RES0.

vSGIEOICount, bit [8]

When GICv4.1 is implemented:

Controls whether deactivation of virtual SGIs can increment ICH_HCR_EL2.EOIcount

vSGIEOICount	Meaning
0b0	Deactivation of virtual SGIs can increment ICH_HCR.EOIcount.
0b1	Deactivation of virtual SGIs does not increment ICH_HCR.EOIcount.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp1DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR.VENG1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp1EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR.VENG1 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp0DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR.VENG0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp0EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR.VENG0 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

NPIE, bit [3]

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

NPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

LRENPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted while the EOIcount field is not 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

UIE, bit [1]

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

UIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

En, bit [0]

Enable. Global enable bit for the virtual CPU interface:

En	Meaning
0b0	Virtual CPU interface operation disabled.
0b1	Virtual CPU interface operation enabled.

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of ICV_IAR0, ICV_IAR1, GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICH_HCR

ICH_LRC<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH_LRC<n> characteristics are:

Purpose

Provides interrupt context information for the virtual CPU interface.

Configuration

AArch32 System register ICH_LRC<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_LR<n>_EL2[63:32].

This register is present only when FEAT_AA32EL2 is implemented, GICv3 is implemented, and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_LRC<n> are UNDEFINED.

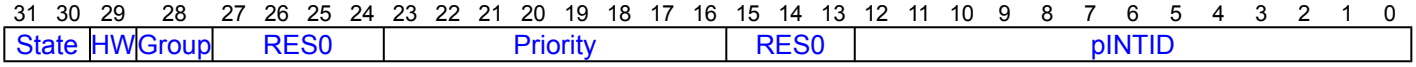
If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

Attributes

ICH_LRC<n> is a 32-bit register.

Field descriptions



State, bits [31:30]

The state of the interrupt:

State	Meaning
0b00	Invalid (Inactive).
0b01	Pending.
0b10	Active.
0b11	Pending and active.

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

HW, bit [29]

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the INTID that the pINTID field indicates.

HW	Meaning
0b0	The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
0b1	The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical INTID. If ICH_VMCR.VEOIM is 0, this request corresponds to a write to ICC_EOIR0 or ICC_EOIR1. Otherwise, it corresponds to a write to ICC_DIR.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Group, bit [28]

Indicates the group for this virtual interrupt.

Group	Meaning
0b0	This is a Group 0 virtual interrupt. ICH_VMCR.VFIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and ICH_VMCR.VENG0 enables signaling of this interrupt to the virtual machine.
0b1	This is a Group 1 virtual interrupt, signaled as a virtual IRQ. ICH_VMCR.VENG1 enables the signaling of this interrupt to the virtual machine. If ICH_VMCR.VCBPR is 0, then ICC_BPR1 determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, ICH_LR<n> determines preemption.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [27:24]

Reserved, RES0.

Priority, bits [23:16]

The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[16] up to bit[18]. The number of implemented bits can be discovered from ICH_VTR.PRIbits.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00000000'.

Bits [15:13]

Reserved, RES0.

pINTID, bits [12:0]

Physical INTID, for hardware interrupts.

When ICH_LRC<n>.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[12:10]: RES0.
- Bit[9]: EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits[8:0]: Reserved, RES0.

When ICH_LRC<n>.HW is 1 (there is a corresponding physical interrupt):

- This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.

- When ICC_CTLR_EL1.ExtRange is 0, then bits[44:42] of this field are RES0.
- If the value of pINTID is not a valid INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by ICC_CTLR.IDbits.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0000000000000'.

Accessing ICH_LRC<n>

ICH_LR<n> and ICH_LRC<n> can be updated independently.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15
```

ICH_LR<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH_LR<n> characteristics are:

Purpose

Provides interrupt context information for the virtual CPU interface.

Configuration

AArch32 System register ICH_LR<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_LR<n>_EL2[31:0].

This register is present only when FEAT_AA32EL2 is implemented, GICv3 is implemented, and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_LR<n> are UNDEFINED.

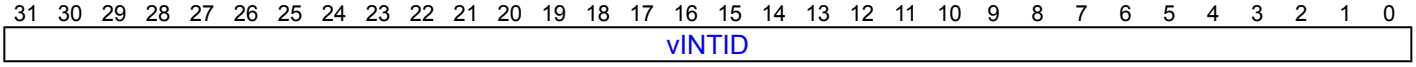
If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

Attributes

ICH_LR<n> is a 32-bit register.

Field descriptions



vINTID, bits [31:0]

Virtual INTID of the interrupt.

If the value of vINTID is 1020-1023 and ICH_LRC<n>.State!=0b00 (Inactive), behavior is UNPREDICTABLE.

Behavior is UNPREDICTABLE if two or more List Registers specify the same vINTID when:

- ICH_LRC<n>.State == 01.
- ICH_LRC<n>.State == 10.
- ICH_LRC<n>.State == 11.

It is IMPLEMENTATION DEFINED how many bits are implemented, though at least 16 bits must be implemented. Unimplemented bits are RES0. The number of implemented bits can be discovered from ICH_VTR.IDbits.

Note

When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to '00000000000000000000000000000000'.

Accessing ICH_LR<n>

ICH_LR<n> and ICH_LRC<n> can be updated independently.

ICH_MISR, Interrupt Controller Maintenance Interrupt State Register

The ICH_MISR characteristics are:

Purpose

Indicates which maintenance interrupts are asserted.

Configuration

AArch32 System register ICH_MISR bits [31:0] are architecturally mapped to AArch64 System register ICH_MISR_EL2[31:0].

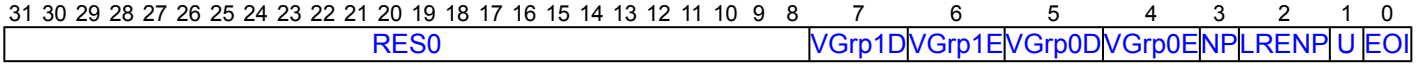
This register is present only when FEAT_AA32EL2 is implemented, GICv3 is implemented, and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_MISR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_MISR is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

VGrp1D, bit [7]

vPE Group 1 Disabled.

VGrp1D	Meaning
0b0	vPE Group 1 Disabled maintenance interrupt not asserted.
0b1	vPE Group 1 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.VGrp1DIE is 1 and ICH_VMCR.VENG0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp1E, bit [6]

vPE Group 1 Enabled.

VGrp1E	Meaning
0b0	vPE Group 1 Enabled maintenance interrupt not asserted.
0b1	vPE Group 1 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.VGrp1EIE is 1 and ICH_VMCR.VENG1 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0D, bit [5]

vPE Group 0 Disabled.

VGrp0D	Meaning
0b0	vPE Group 0 Disabled maintenance interrupt not asserted.
0b1	vPE Group 0 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.VGrp0DIE is 1 and ICH_VMCR.VENG0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0E, bit [4]

vPE Group 0 Enabled.

VGrp0E	Meaning
0b0	vPE Group 0 Enabled maintenance interrupt not asserted.
0b1	vPE Group 0 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.VGrp0EIE is 1 and ICH_VMCR.VENG0 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

NP, bit [3]

No Pending.

NP	Meaning
0b0	No Pending maintenance interrupt not asserted.
0b1	No Pending maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.NPIE is 1 and no List register is in pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

LRENP, bit [2]

List Register Entry Not Present.

LRENP	Meaning
0b0	List Register Entry Not Present maintenance interrupt not asserted.
0b1	List Register Entry Not Present maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.LRENPIE is 1 and ICH_HCR.EOIcount is nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

U, bit [1]

Underflow.

U	Meaning
0b0	Underflow maintenance interrupt not asserted.
0b1	Underflow maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.UIE is 1 and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding ICH_LRC<n>.State bits do not equal 0x0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

EOI, bit [0]

End Of Interrupt.

EOI	Meaning
0b0	End Of Interrupt maintenance interrupt not asserted.
0b1	End Of Interrupt maintenance interrupt asserted.

This maintenance interrupt is asserted when at least one bit in ICH_EISR is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICH_MISR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1011	0b010

```
if !(IsFeatureImplemented(FEAT_AA32EL2) && IsFeatureImplemented(FEAT_GICv3) && (HaveEL(EL2) ||
HaveEL(EL3))) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T12
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T12 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_HSRE.SRE == '0' then
        UNDEFINED;
    else
        R[t] = ICH_MISR;
elsif PSTATE.EL == EL3 then
    if ICC_MSRE.SRE == '0' then
        UNDEFINED;
    else
        R[t] = ICH_MISR;
```

ICH_VMCR, Interrupt Controller Virtual Machine Control Register

The ICH_VMCR characteristics are:

Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

Configuration

AArch32 System register ICH_VMCR bits [31:0] are architecturally mapped to AArch64 System register ICH_VMCR_EL2[31:0].

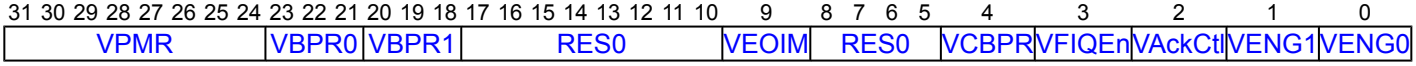
This register is present only when FEAT_AA32EL2 is implemented, GICv3 is implemented, and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_VMCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_VMCR is a 32-bit register.

Field descriptions



VPMR, bits [31:24]

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

This field is an alias of ICV_PMR.Priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH_VMCR.VCBPR == 1.

This field is an alias of ICV_BPR0.BinaryPoint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if ICH_VMCR.VCBPR == 0.

This field is an alias of ICV_BPR1.BinaryPoint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [17:10]

Reserved, RES0.

VEOIM, bit [9]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

VEOIM	Meaning
0b0	ICV_EOIR0 and ICV_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR are UNPREDICTABLE.
0b1	ICV_EOIR0 and ICV_EOIR1 provide priority drop functionality only. ICV_DIR provides interrupt deactivation functionality.

This bit is an alias of ICV_CTLR.EOImode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

VCBPR	Meaning
0b0	ICV_BPR0 determines the preemption group for virtual Group 0 interrupts only. ICV_BPR1 determines the preemption group for virtual Group 1 interrupts.
0b1	ICV_BPR0 determines the preemption group for both virtual Group 0 and virtual Group 1 interrupts. Reads of ICV_BPR1 return ICV_BPR0 plus one, saturated to 0b111. Writes to ICV_BPR1 are ignored.

This field is an alias of ICV_CTLR.CBPR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

VFIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

This bit is an alias of GICV_CTLR.FIQEn.

In implementations where the Non-secure copy of ICC_SRE.SRE is always 1, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

VAckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.

This bit is an alias of GICV_CTLR.AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

In implementations where the Non-secure copy of ICC_SRE.SRE is always 1, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG1, bit [1]

Virtual Group 1 interrupt enable. Possible values of this bit are:

VENG1	Meaning
0b0	Virtual Group 1 interrupts are disabled.
0b1	Virtual Group 1 interrupts are enabled.

This bit is an alias of ICV_IGRPEN1.Enable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG0, bit [0]

Virtual Group 0 interrupt enable. Possible values of this bit are:

VENG0	Meaning
0b0	Virtual Group 0 interrupts are disabled.
0b1	Virtual Group 0 interrupts are enabled.

This bit is an alias of ICV_IGRPEN0.Enable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICH_VMCR

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1011	0b111

```

ICH_VTR, Interrupt Controller VGIC Type Register

The ICH_VTR characteristics are:

Purpose

Reports supported GIC virtualization features.

Configuration

AArch32 System register ICH_VTR bits [31:0] are architecturally mapped to AArch64 System register ICH_VTR_EL2[31:0].

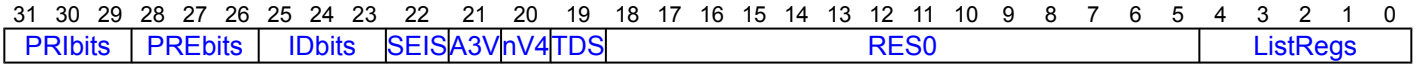
This register is present only when FEAT_AA32EL2 is implemented, GICv3 is implemented, and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_VTR are UNDEFINED.

If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3.

Attributes

ICH_VTR is a 32-bit register.

Field descriptions



PRIbits, bits [31:29]

Priority bits. The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of ICV_CTLR.PRIbits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PREbits, bits [28:26]

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH_VTR.PRIbits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

The value of this field is an IMPLEMENTATION DEFINED choice of:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

This field is an alias of ICV_CTLR.IDbits.

Access to this field is **RO**.

SEIS, bit [22]

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support generation of SEIs.
0b1	The virtual CPU interface logic supports generation of SEIs.

This bit is an alias of ICV_CTLR.SEIS.

Access to this field is **RO**.

A3V, bit [21]

Affinity 3 Valid. Possible values are:

The value of this field is an IMPLEMENTATION DEFINED choice of:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports nonzero values of Affinity 3 in SGI generation System registers.

This bit is an alias of ICV_CTLR.A3V.

Access to this field is **RO**.

nV4, bit [20]

Direct injection of virtual interrupts not supported. Possible values are:

The value of this field is an IMPLEMENTATION DEFINED choice of:

nV4	Meaning
0b0	The CPU interface logic supports direct injection of virtual interrupts.
0b1	The CPU interface logic does not support direct injection of virtual interrupts.

In GICv3, the only permitted value is 0b1.

Access to this field is **RO**.

TDS, bit [19]

Separate trapping of Non-secure EL1 writes to ICV_DIR supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TDS	Meaning
0b0	Implementation does not support ICH_HCR.TDIR.
0b1	Implementation supports ICH_HCR.TDIR.

FEAT_GICv3_TDIR implements the functionality added by the value 0b1.

Access to this field is **RO**.

Bits [18:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one. For example, a value of `0b01111` indicates that the maximum of 16 List registers are implemented.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ICH_VTR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICIALLU, Instruction Cache Invalidate All to PoU

The ICIALLU characteristics are:

Purpose

Invalidate all instruction caches of the PE executing the instruction to the Point of Unification. If branch predictors are architecturally visible, also flush branch predictors.

Configuration

AArch32 System instruction ICIALLU performs the same function as AArch64 System instruction IC IALLU.

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ICIALLU are UNDEFINED.

Attributes

ICIALLU is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing ICIALLU

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

When HCR.FB is 1, at Non-secure EL1 this instruction executes as a ICIALLUIS.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0101	0b000

ICIMVAU, Instruction Cache line Invalidate by VA to PoU

The ICIMVAU characteristics are:

Purpose

Invalidate instruction cache line by virtual address to PoU.

Configuration

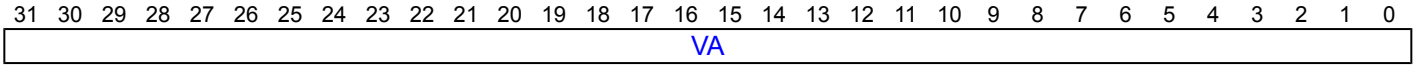
AArch32 System instruction ICIMVAU performs the same function as AArch64 System instruction IC IVAU.

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ICIMVAU are UNDEFINED.

Attributes

ICIMVAU is a 32-bit System instruction.

Field descriptions



VA, bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing ICIMVAU

Execution of this instruction might require an address translation from VA to PA, and that translation might fault.

For more information about faults, see 'Permission fault'.

For more information about data cache maintenance instructions, see 'AArch32 instruction cache maintenance instructions (IC*)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICV_AP0R<n>, Interrupt Controller Virtual Active Priorities Group 0 Registers, n = 0 - 3

The ICV_AP0R<n> characteristics are:

Purpose

Provides information about virtual Group 0 active priorities.

Configuration

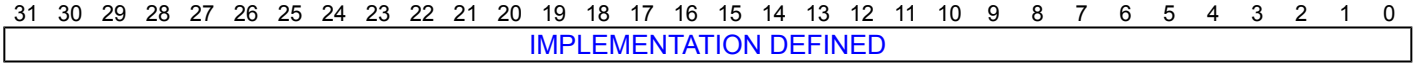
AArch32 System register ICV_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register ICV_AP0R<n>_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_AP0R<n> are UNDEFINED.

Attributes

ICV_AP0R<n> is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00000000000000000000000000000000'.

Additional information

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICV_AP0R<n>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP0R1 is implemented only in implementations that support 6 or more bits of priority. ICV_AP0R2 and ICV_AP0R3 are implemented only in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>.
- ICV_AP1R<n>.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-3
```

coproc	opc1	CRn	CRm	opc2

ICV_AP1R<n>, Interrupt Controller Virtual Active Priorities Group 1 Registers, n = 0 - 3

The ICV_AP1R<n> characteristics are:

Purpose

Provides information about virtual Group 1 active priorities.

Configuration

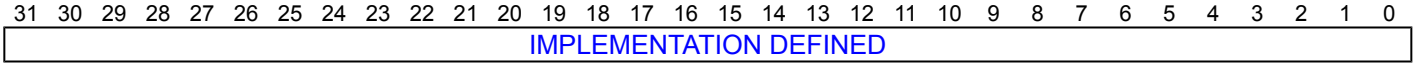
AArch32 System register ICV_AP1R<n> bits [31:0] are architecturally mapped to AArch64 System register ICV_AP1R<n>_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_AP1R<n> are UNDEFINED.

Attributes

ICV_AP1R<n> is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00000000000000000000000000000000'.

Additional information

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICV_AP1R<n>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP1R1 is implemented only in implementations that support 6 or more bits of priority. ICV_AP1R2 and ICV_AP1R3 are implemented only in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>.
- ICV_AP1R<n>.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-3
```

ICV_BPR0, Interrupt Controller Virtual Binary Point Register 0

The ICV_BPR0 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 0 interrupt preemption.

Configuration

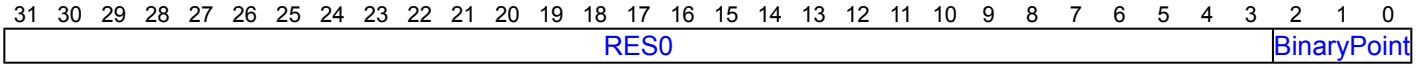
AArch32 System register ICV_BPR0 bits [31:0] are architecturally mapped to AArch64 System register ICV_BPR0_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_BPR0 are UNDEFINED.

Attributes

ICV_BPR0 is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	gggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.sssssss

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR0

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by ICV_CTLR.PRIbits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1000	0b011

```

ICV_BPR1, Interrupt Controller Virtual Binary Point Register 1

The ICV_BPR1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 1 interrupt preemption.

Configuration

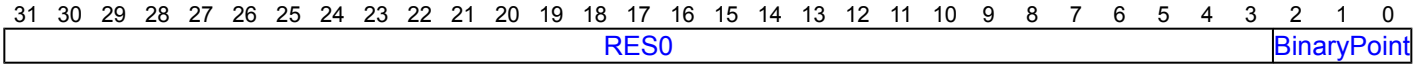
AArch32 System register ICV_BPR1 bits [31:0] are architecturally mapped to AArch64 System register ICV_BPR1_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_BPR1 are UNDEFINED.

Attributes

ICV_BPR1 is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

An attempt to program this field to a value less than the minimum value sets the field to the minimum value.

If ICV_CTLR.CBPR is set to 1, Non-secure EL1 reads return ICV_BPR0 + 1 saturated to `0b111`. Non-secure EL1 writes are ignored.

If ICV_CTLR.CBPR is set to 1, Secure EL1 reads return ICV_BPR0. Secure EL1 writes modify ICV_BPR0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR1

The minimum value of this register is equal to the minimum value of ICV_BPR0 plus one.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b011

```

ICV_CTLR, Interrupt Controller Virtual Control Register

The ICV_CTLR characteristics are:

Purpose

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

Configuration

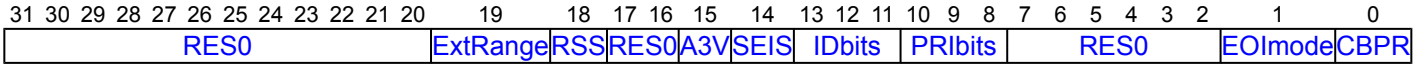
AArch32 System register ICV_CTLR bits [31:0] are architecturally mapped to AArch64 System register ICV_CTLR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_CTLR are UNDEFINED.

Attributes

ICV_CTLR is a 32-bit register.

Field descriptions



Bits [31:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.

ICV_CTLR.ExtRange is an alias of ICC_CTLR.ExtRange.

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports nonzero values of Affinity 3 in SGI generation System registers.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support local generation of SEIs.
0b1	The virtual CPU interface logic supports local generation of SEIs.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

The division between group priority and subpriority is defined in the binary point registers ICV_BPR0 and ICV_BPR1.

Bits [7:2]

Reserved, RES0.

EOImode, bit [1]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

EOImode	Meaning
0b0	ICV_EOIR0 and ICV_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR are UNPREDICTABLE.
0b1	ICV_EOIR0 and ICV_EOIR1 provide priority drop functionality only. ICV_DIR provides interrupt deactivation functionality.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

CBPR	Meaning
0b0	ICV_BPR0 determines the preemption group for virtual Group 0 interrupts only. ICV_BPR1 determines the preemption group for virtual Group 1 interrupts.
0b1	Non-secure reads of ICV_BPR1 return ICV_BPR0 plus one, saturated to 0b111. Non-secure writes to ICV_BPR1 are ignored. Secure reads of ICV_BPR1 return ICV_BPR0. Secure writes of ICV_BPR1 modify ICV_BPR0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_CTLR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b100

ICV_DIR, Interrupt Controller Deactivate Virtual Interrupt Register

The ICV_DIR characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified virtual interrupt.

Configuration

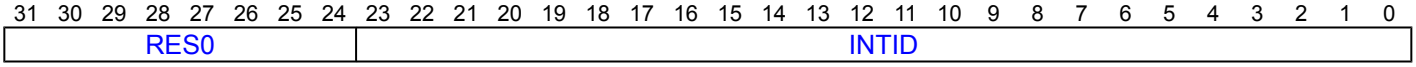
AArch32 System register ICV_DIR bits [31:0] performs the same function as AArch64 System register ICV_DIR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_DIR are UNDEFINED.

Attributes

ICV_DIR is a 32-bit register.

Field descriptions



Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the virtual interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_DIR

When EOImode == 0, writes are ignored. In systems supporting system error generation, an implementation might generate an SEI.

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1011	0b001

```

ICV_EOIR0, Interrupt Controller Virtual End Of Interrupt Register 0

The ICV_EOIR0 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 0 interrupt.

Configuration

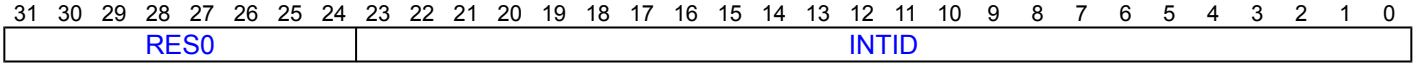
AArch32 System register ICV_EOIR0 bits [31:0] performs the same function as AArch64 System register ICV_EOIR0_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_EOIR0 are UNDEFINED.

Attributes

ICV_EOIR0 is a 32-bit register.

Field descriptions



Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICV_IAR0 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR to deactivate the virtual interrupt.

Accessing ICV_EOIR0

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR0, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

ICV_EOIR1, Interrupt Controller Virtual End Of Interrupt Register 1

The ICV_EOIR1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 1 interrupt.

Configuration

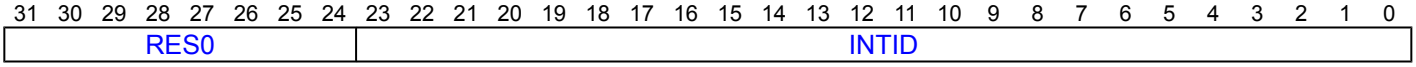
AArch32 System register ICV_EOIR1 bits [31:0] performs the same function as AArch64 System register ICV_EOIR1_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_EOIR1 are UNDEFINED.

Attributes

ICV_EOIR1 is a 32-bit register.

Field descriptions



Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICV_IAR1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR to deactivate the virtual interrupt.

Accessing ICV_EOIR1

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICV_HPPIR0, Interrupt Controller Virtual Highest Priority Pending Interrupt Register 0

The ICV_HPPIR0 characteristics are:

Purpose

Indicates the highest priority pending virtual Group 0 interrupt on the virtual CPU interface.

Configuration

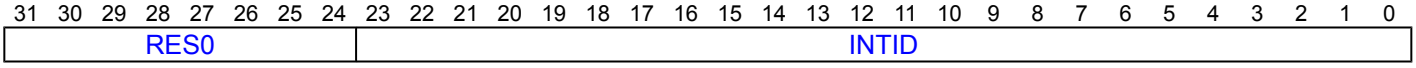
AArch32 System register ICV_HPPIR0 bits [31:0] performs the same function as AArch64 System register ICV_HPPIR0_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_HPPIR0 are UNDEFINED.

Attributes

ICV_HPPIR0 is a 32-bit register.

Field descriptions



Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the highest priority pending virtual interrupt.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_HPPIR0

Accesses to this register use the following encodings in the System register encoding space:

ICV_IAR0, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV_IAR0 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch32 System register ICV_IAR0 bits [31:0] performs the same function as AArch64 System register ICV_IAR0_EL1[31:0].

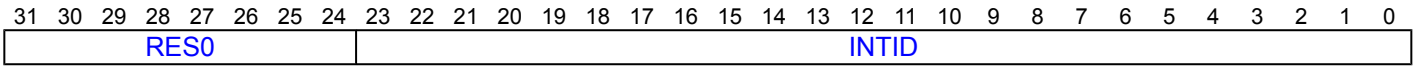
This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_IAR0 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_IAR0 is a 32-bit register.

Field descriptions



Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_IAR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICV_IAR1, Interrupt Controller Virtual Interrupt Acknowledge Register 1

The ICV_IAR1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 1 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch32 System register ICV_IAR1 bits [31:0] performs the same function as AArch64 System register ICV_IAR1_EL1[31:0].

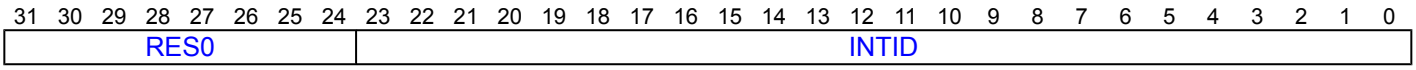
This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_IAR1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_IAR1 is a 32-bit register.

Field descriptions



Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_IAR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b000

ICV_IGRPEN0, Interrupt Controller Virtual Interrupt Group 0 Enable register

The ICV_IGRPEN0 characteristics are:

Purpose

Controls whether virtual Group 0 interrupts are enabled or not.

Configuration

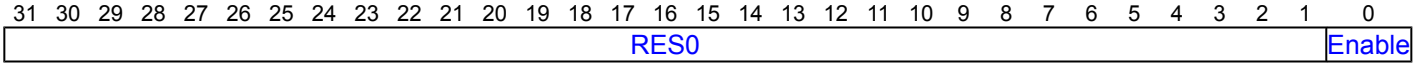
AArch32 System register ICV_IGRPEN0 bits [31:0] are architecturally mapped to AArch64 System register ICV_IGRPEN0_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_IGRPEN0 are UNDEFINED.

Attributes

ICV_IGRPEN0 is a 32-bit register.

Field descriptions



Bits [31:1]

Reserved, RES0.

Enable, bit [0]

Enables virtual Group 0 interrupts.

Enable	Meaning
0b0	Virtual Group 0 interrupts are disabled.
0b1	Virtual Group 0 interrupts are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICV_IGRPEN0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b110

ICV_PMR, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV_PMR characteristics are:

Purpose

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

Configuration

AArch32 System register ICV_PMR bits [31:0] are architecturally mapped to AArch64 System register ICV_PMR_EL1[31:0].

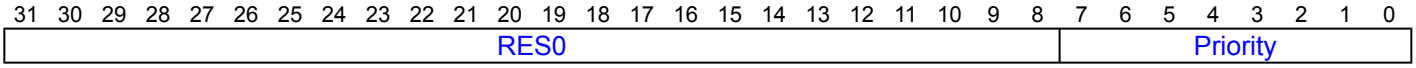
This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_PMR are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronizing. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_PMR is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	0x00-0xFF (0-255), all values	256
[7:1]	0x00-0xFE (0-254), even values only	128
[7:2]	0x00-0xFC (0-252), in steps of 4	64
[7:3]	0x00-0xF8 (0-248), in steps of 8	32
[7:4]	0x00-0xF0 (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00000000'.

Accessing ICV_PMR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0100	0b0110	0b000

```

ICV_RPR, Interrupt Controller Virtual Running Priority Register

The ICV_RPR characteristics are:

Purpose

Indicates the Running priority of the virtual CPU interface.

Configuration

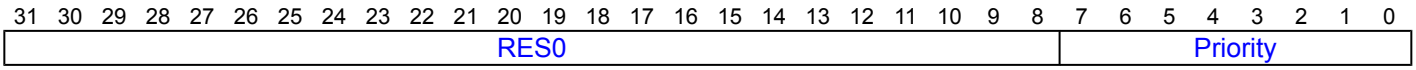
AArch32 System register ICV_RPR bits [31:0] performs the same function as AArch64 System register ICV_RPR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented, GICv3 is implemented, and EL2 is implemented. Otherwise, direct accesses to ICV_RPR are UNDEFINED.

Attributes

ICV_RPR is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

Accessing ICV_RPR

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1011	0b011

ID_AFR0, Auxiliary Feature Register 0

The ID_AFR0 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, MIDR.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_AFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_AFR0_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_AFR0 are UNDEFINED.

Attributes

ID_AFR0 is a 32-bit register.

ID_DFR0, Debug Feature Register 0

The ID_DFR0 characteristics are:

Purpose

Provides top-level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, MIDR.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

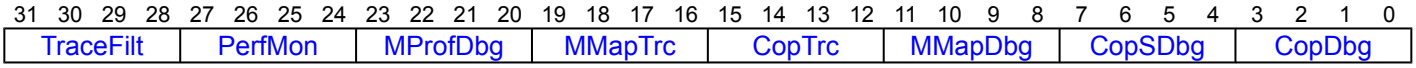
AArch32 System register ID_DFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_DFR0_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_DFR0 are UNDEFINED.

Attributes

ID_DFR0 is a 32-bit register.

Field descriptions



TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if FEAT_ETMv4 is implemented, the value 0b0000 is not permitted.

If FEAT_ETE is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PerfMon	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv1 implemented.
0b0010	Performance Monitors Extension, PMUv2 implemented.
0b0011	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0011, and adds support for: • Extended 16-bit PMEVTYPER<n>.evtCount field. • If EL2 is implemented, the HDCR.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: • 64-bit event counters. • If EL2 is implemented, the HDCR.HCCD control. • If EL3 is implemented, the SDCR.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: • The PMCR.FZO and, if EL2 is implemented, HDCR.HPMFZO controls. • If EL3 is implemented and using AArch64, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: • Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. • Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1001	PMUv3 for Armv8.9. As 0b1000, and: • Updates the definitions of existing PMU events. • Adds support for the EDECR.PME control.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

FEAT_PMUv3p9 implements the functionality identified by the value 0b1001.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

From Armv8.9, if FEAT_PMUv3 is implemented, the value 0b1000 is not permitted.

Note

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 and PMUv2 are not permitted in an Armv8 implementation.

Access to this field is **RO**.

MProfDbg, bits [23:20]

M-profile Debug. Support for memory-mapped debug model for M-profile processors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MProfDbg	Meaning
0b0000	Not supported.
0b0001	Support for M-profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

MMapTrc, bits [19:16]

Memory-mapped Trace. Support for memory-mapped trace model.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MMapTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the Arm® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

Access to this field is **RO**.

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CopTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the Arm® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

Access to this field is **RO**.

MMapDbg, bits [11:8]

Memory-mapped Debug. Support for Armv7 memory-mapped debug model for A and R-profile processors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MMapDbg	Meaning
0b0000	Not supported.
0b0100	Support for Armv7, v7 Debug architecture, with memory-mapped access.
0b0101	Support for Armv7, v7.1 Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

The optional memory map defined by Armv8 is not compatible with Armv7.

Access to this field is **RO**.

CopSDbg, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A-profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CopDbg, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CopDbg	Meaning
0b0000	Not supported.
0b0010	Armv6, v6 Debug architecture, with System registers access.
0b0011	Armv6, v6.1 Debug architecture, with System registers access.
0b0100	Armv7, v7 Debug architecture, with System registers access.
0b0101	Armv7, v7.1 Debug architecture, with System registers access.
0b0110	Armv8 debug architecture.
0b0111	Armv8.1 debug architecture, FEAT_Debugv8p1.
0b1000	Armv8.2 debug architecture, FEAT_Debugv8p2.
0b1001	Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010	Armv8.8 debug architecture, FEAT_Debugv8p8.
0b1011	Armv8.9 debug architecture, FEAT_Debugv8p9.

All other values are reserved.

The values 0b0000, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted in Armv8.

FEAT_Debugv8p1 implements the functionality identified by the value 0b0111.

FEAT_Debugv8p2 implements the functionality identified by the value 0b1000.

FEAT_Debugv8p4 implements the functionality identified by the value 0b1001.

FEAT_Debugv8p8 implements the functionality identified by the value 0b1010.

FEAT_Debugv8p9 implements the functionality identified by the value 0b1011.

From Armv8.1, when FEAT_Debugv8p1 is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

From Armv8.9, the value 0b1010 is not permitted.

Access to this field is **RO**.

Accessing ID_DFR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b010

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;

ID_DFR1, Debug Feature Register 1

The ID_DFR1 characteristics are:

Purpose

Provides top-level information about the debug system in AArch32.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_DFR1 bits [31:0] are architecturally mapped to AArch64 System register ID_DFR1_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_DFR1 are UNDEFINED.

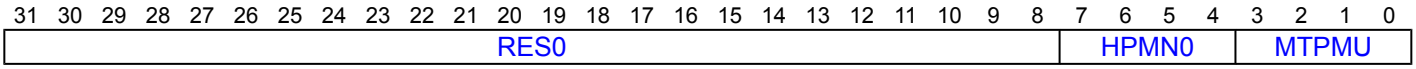
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_DFR1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

HPMN0, bits [7:4]

Zero PMU event counters for a Guest operating system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HPMN0	Meaning
0b0000	Setting HDCR.HPMN to zero has CONSTRAINED UNPREDICTABLE behavior.
0b0001	Setting HDCR.HPMN to zero has defined behavior.

All other values are reserved.

If FEAT_PMUv3 is not implemented, FEAT_FGT is not implemented, or EL2 is not implemented, the only permitted value is 0b0000.

FEAT_HPMN0 implements the functionality identified by the value 0b0001.

From Armv8.8, in an implementation that includes FEAT_PMUv3, FEAT_FGT, and EL2, the value 0b0000 is not permitted.

Access to this field is **RO**.

MTPMU, bits [3:0]

Multi-threaded PMU extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>.MT are read/write or RES0.
0b0001	FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER<n>.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<n>.MT are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER<n>.MT are RES0.

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

Access to this field is **RO**.

Accessing ID_DFR1

ID_ISAR0, Instruction Set Attribute Register 0

The ID_ISAR0 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

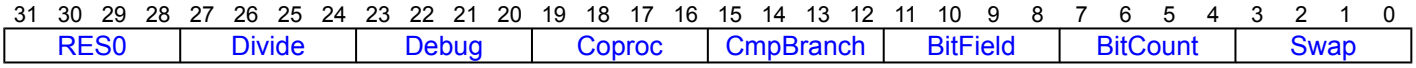
AArch32 System register ID_ISAR0 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR0_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_ISAR0 are UNDEFINED.

Attributes

ID_ISAR0 is a 32-bit register.

Field descriptions



Bits [31:28]

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Divide	Meaning
0b0000	None implemented.
0b0001	Adds SDIV and UDIV in the T32 instruction set.
0b0010	As for 0b0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

Debug, bits [23:20]

Indicates the implemented Debug instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Debug	Meaning
0b0000	None implemented.
0b0001	Adds BKPT.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Coproc, bits [19:16]

Indicates the implemented System register access instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Coproc	Meaning
0b0000	None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.
0b0001	Adds generic CDP, LDC, MCR, MRC, and STC.
0b0010	As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.
0b0011	As for 0b0010, and adds generic MCRR and MRRC.
0b0100	As for 0b0011, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CmpBranch	Meaning
0b0000	None implemented.
0b0001	Adds CBNZ and CBZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

BitField, bits [11:8]

Indicates support for BitField instructions BFC, BFI, SBFX, and UBFX.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BitField	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BitCount	Meaning
0b0000	None implemented.
0b0001	Adds CLZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Swap	Meaning
0b0000	None implemented.
0b0001	Adds SWP and SWPB.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

Accessing ID_ISAR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T0
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T0 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) &&
HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HCR.TID3 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        R[t] = ID_ISAR0;
elsif PSTATE.EL == EL2 then
    R[t] = ID_ISAR0;
elsif PSTATE.EL == EL3 then
    R[t] = ID_ISAR0;
```

ID_ISAR1, Instruction Set Attribute Register 1

The ID_ISAR1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

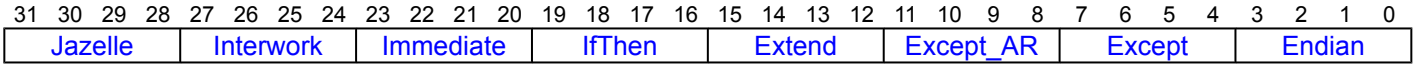
AArch32 System register ID_ISAR1 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR1_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_ISAR1 are UNDEFINED.

Attributes

ID_ISAR1 is a 32-bit register.

Field descriptions



Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Jazelle	Meaning
0b0000	No support for Jazelle.
0b0001	Adds the BXJ instruction, and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Interwork, bits [27:24]

Indicates the implemented Interworking instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Interwork	Meaning
0b0000	None implemented.
0b0001	Adds the BX instruction, and the T bit in the PSR.
0b0010	As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.
0b0011	As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Access to this field is **RO**.

Immediate, bits [23:20]

Indicates support for data-processing instructions with long immediates:

- The MOVT instruction
- The MOV instruction encodings with zero-extended 16-bit immediates.
- The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Immediate	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IfThen	Meaning
0b0000	None implemented.
0b0001	Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Extend, bits [15:12]

Indicates the implemented Extend instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Extend	Meaning
0b0000	No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.
0b0001	Adds the SXTB, SXTH, UXTB, and UXTH instructions.
0b0010	As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

Except_AR, bits [11:8]

Indicates the implemented A and R-profile exception-handling instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Except_AR	Meaning
0b0000	None implemented.
0b0001	Adds the SRS and RFE instructions, and the A and R-profile forms of the CPS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Except	Meaning
0b0000	Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
0b0001	Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Endian, bits [3:0]

Indicates the implemented Endian instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Endian	Meaning
0b0000	None implemented.
0b0001	Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

Accessing ID_ISAR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b001

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T0
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T0 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) &&

ID_ISAR2, Instruction Set Attribute Register 2

The ID_ISAR2 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

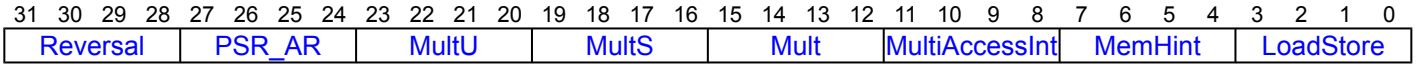
AArch32 System register ID_ISAR2 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR2_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_ISAR2 are UNDEFINED.

Attributes

ID_ISAR2 is a 32-bit register.

Field descriptions



Reversal, bits [31:28]

Indicates the implemented Reversal instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Reversal	Meaning
0b0000	None implemented.
0b0001	Adds the REV, REV16, and REVSH instructions.
0b0010	As for 0b0001, and adds the RBIT instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

PSR_AR, bits [27:24]

Indicates the implemented A and R-profile instructions to manipulate the PSR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PSR_AR	Meaning
0b0000	None implemented.
0b0001	Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the `SUBS PC, LR, #N` instruction.

Access to this field is **RO**.

MultU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MultU	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the `UMULL` and `UMLAL` instructions.
`0b0010`	As for `0b0001`, and adds the `UMAAL` instruction.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0010`.

Access to this field is **RO**.

MultS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MultS	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the `SMULL` and `SMLAL` instructions.
`0b0010`	As for `0b0001`, and adds the `SMLABB`, `SMLABT`, `SMLALBB`, `SMLALBT`, `SMLALTB`, `SMLALTT`, `SMLATB`, `SMLATT`, `SMLAWB`, `SMLAWT`, `SMULBB`, `SMULBT`, `SMULTB`, `SMULTT`, `SMULWB`, and `SMULWT` instructions. Also adds the Q bit in the PSRs.
`0b0011`	As for `0b0010`, and adds the `SMLAD`, `SMLADX`, `SMLALD`, `SMLALDX`, `SMLSD`, `SMLSDX`, `SMLSLD`, `SMLSLDX`, `SMMLA`, `SMMLAR`, `SMMLS`, `SMMLSR`, `SMMUL`, `SMMULR`, `SMUAD`, `SMUADX`, `SMUSD`, and `SMUSDX` instructions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0011`.

Access to this field is **RO**.

Mult, bits [15:12]

Indicates the implemented additional Multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Mult	Meaning
`0b0000`	No additional instructions implemented. This means only `MUL` is implemented.
`0b0001`	Adds the `MLA` instruction.
`0b0010`	As for `0b0001`, and adds the `MLS` instruction.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0010`.

Access to this field is **RO**.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MultiAccessInt	Meaning
0b0000	No support. This means the LDM and STM instructions are not interruptible.
0b0001	LDM and STM instructions are restartable.
0b0010	LDM and STM instructions are continuable.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MemHint	Meaning
0b0000	None implemented.
0b0001	Adds the PLD instruction.
0b0010	Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)
0b0011	As for 0b0001 (or 0b0010), and adds the PLI instruction.
0b0100	As for 0b0011, and adds the PLDW instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

Access to this field is **RO**.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LoadStore	Meaning
0b0000	No additional load/store instructions implemented.
0b0001	Adds the LDRD and STRD instructions.
0b0010	As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

Accessing ID_ISAR2

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b010

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T0
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T0 ==
'1' then
        AArch32.TakeHypTrapException(0x03);

ID_ISAR3, Instruction Set Attribute Register 3

The ID_ISAR3 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

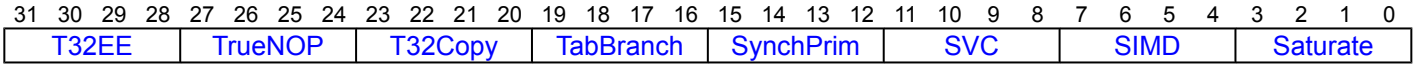
AArch32 System register ID_ISAR3 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR3_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_ISAR3 are UNDEFINED.

Attributes

ID_ISAR3 is a 32-bit register.

Field descriptions



T32EE, bits [31:28]

Indicates the implemented T32EE instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

T32EE	Meaning
0b0000	None implemented.
0b0001	Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TrueNOP	Meaning
0b0000	None implemented. This means there are no NOP instructions that do not have any register dependencies.
0b0001	Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting `MOV` instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

T32Copy	Meaning
`0b0000`	Not supported. This means that in the T32 instruction set, encoding T1 of the `MOV` (register) instruction does not support a copy from a low register to a low register.
`0b0001`	Adds support for T32 instruction set encoding T1 of the `MOV` (register) instruction, copying from a low register to a low register.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Access to this field is **RO**.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TabBranch	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the `TBB` and `TBH` instructions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Access to this field is **RO**.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SynchPrim	Meaning
`0b0000`	If SynchPrim_frac == `0b000`, no Synchronization Primitives implemented.
`0b0001`	If SynchPrim_frac == `0b000`, adds the `LDREX` and `STREX` instructions. If SynchPrim_frac == `0b011`, also adds the `CLREX`, `LDREXB`, `STREXB`, and `STREXH` instructions.
`0b0010`	If SynchPrim_frac == `0b000`, as for [`0b001`, `0b011`] and also adds the `LDREXD` and `STREXD` instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is `0b0010`.

Access to this field is **RO**.

SVC, bits [11:8]

Indicates the implemented `SVC` instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SVC	Meaning
0b0000	Not implemented.
0b0001	Adds the SVC instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMD	Meaning
0b0000	None implemented.
0b0001	Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
0b0011	As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports Advanced SIMD and floating-point instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

Access to this field is **RO**.

Saturate, bits [3:0]

Indicates support for Saturate instructions QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Saturate	Meaning
0b0000	None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Accessing ID_ISAR3

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b011

```

ID_ISAR4, Instruction Set Attribute Register 4

The ID_ISAR4 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR5.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

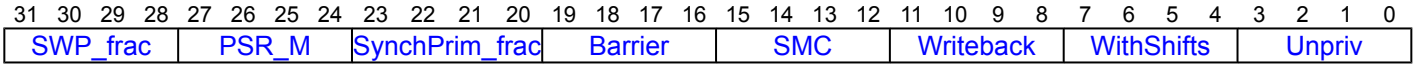
AArch32 System register ID_ISAR4 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR4_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_ISAR4 are UNDEFINED.

Attributes

ID_ISAR4 is a 32-bit register.

Field descriptions



SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for `SWP` or `SWPB` instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SWP_frac	Meaning
`0b0000`	`SWP` or `SWPB` instructions not implemented.
`0b0001`	`SWP` or `SWPB` implemented but only in a uniprocessor context. `SWP` and `SWPB` do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the `SWP` or `SWPB`.

All other values are reserved. This field is valid only if ID_ISAR0.Swap is `0b0000`.

In Armv8-A, the only permitted value is `0b0000`.

Access to this field is **RO**.

PSR_M, bits [27:24]

Indicates the implemented M-profile instructions to modify the PSRs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PSR_M	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the M-profile forms of the `CPS`, `MRS`, and `MSR` instructions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

Access to this field is **RO**.

SynchPrim_frac, bits [23:20]

Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SynchPrim_frac	Meaning
0b0000	If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.
0b0011	If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

Barrier, bits [19:16]

Indicates support for Barrier instructions DMB, DSB, and ISB in the T32 and A32 instruction sets.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Barrier	Meaning
0b0000	None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

SMC, bits [15:12]

Indicates the implemented SMC instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SMC	Meaning
0b0000	None implemented.
0b0001	Adds the SMC instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- If EL3 is implemented, the only permitted value is 0b0001.
- If neither EL3 nor EL2 is implemented, the only permitted value is 0b0000.

Access to this field is **RO**.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Writeback	Meaning
0b0000	Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
0b0001	Adds support for all of the writeback addressing modes.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WithShifts	Meaning
0b0000	Nonzero shifts supported only in MOV and shift instructions.
0b0001	Adds support for shifts of loads and stores over the range LSL 0-3.
0b0011	As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.
0b0100	As for 0b0011, and adds support for register-controlled shift options.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

Access to this field is **RO**.

Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Unpriv	Meaning
0b0000	None implemented. No T variant instructions are implemented.
0b0001	Adds the LDRBT, LDRT, STRBT, and STRT instructions.
0b0010	As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

Accessing ID_ISAR4

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b100

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T0

ID_ISAR5, Instruction Set Attribute Register 5

The ID_ISAR5 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR4.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

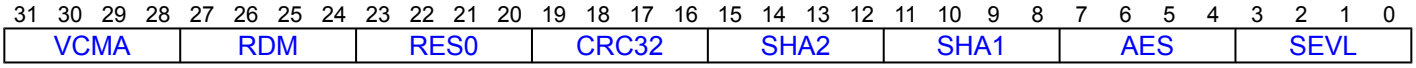
AArch32 System register ID_ISAR5 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR5_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_ISAR5 are UNDEFINED.

Attributes

ID_ISAR5 is a 32-bit register.

Field descriptions



VCMA, bits [31:28]

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VCMA	Meaning
0b0000	The VCMLA and VCADD instructions are not implemented in AArch32.
0b0001	The VCMLA and VCADD instructions are implemented in AArch32.

All other values are reserved.

FEAT_FCMA implements the functionality identified by 0b0001.

From Armv8.3, the value 0b0000 is not permitted.

Access to this field is **RO**.

RDM, bits [27:24]

Indicates support for the VQRDMLAH and VQRDMLSH instructions in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RDM	Meaning
0b0000	No VQRDMLAH and VQRDMLSH instructions implemented.
0b0001	VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates support for the CRC32 instructions CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CRC32	Meaning
0b0000	CRC32 instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_CRC32 implements the functionality identified by the value 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is **RO**.

SHA2, bits [15:12]

Indicates support for the SHA2 instructions SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

SHA1, bits [11:8]

Indicates support for the SHA1 instructions SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

AES, bits [7:4]

Indicates support for the AES instructions in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC implemented.
0b0010	As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

Access to this field is **RO**.

SEVL, bits [3:0]

Indicates support for the SEVL instruction in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEVL	Meaning
0b0000	SEVL is implemented as a NOP.
0b0001	SEVL is implemented as Send Event Local.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Accessing ID_ISAR5

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b101

```

ID_ISAR6, Instruction Set Attribute Register 6

The ID_ISAR6 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR6 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR6_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_ISAR6 are UNDEFINED.

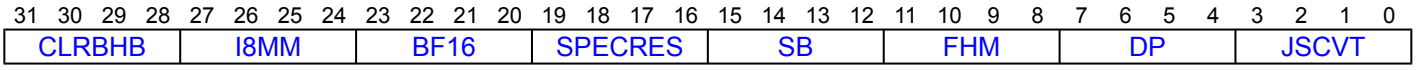
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_ISAR6 is a 32-bit register.

Field descriptions



CLRBHB, bits [31:28]

Indicates support for the CLRBHB instruction in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CLRBHB	Meaning
0b0000	CLRBHB instruction is not implemented.
0b0001	CLRBHB instruction is implemented.

All other values are reserved.

FEAT_CLRBHB implements the functionality identified by 0b0001.

From Armv8.9, the value 0b0000 is not permitted.

Access to this field is **RO**.

I8MM, bits [27:24]

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_AA32I8MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions VCVT, VCVTB, VCVTT, VDOT, VFMAB, VFMAT, and VMMLA instructions with BF16 operand or result types in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

SPECRES, bits [19:16]

Indicates support for prediction invalidation instructions in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SPECRES	Meaning
0b0000	Prediction invalidation instructions are not implemented.
0b0001	CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.
0b0010	As 0b0001, and the COSPRCTX instruction is implemented.

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

FEAT_SPECRES2 implements the functionality identified by 0b0010.

From Armv8.5, the value 0b0000 is not permitted.

From Armv8.9, the value 0b0001 is not permitted.

Access to this field is **RO**.

SB, bits [15:12]

Indicates support for SB instruction in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

From Armv8.5, the value 0b0000 is not permitted.

Access to this field is **RO**.

FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point `VFMAL` and `VMFSL` instructions in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FHM	Meaning
`0b0000`	`VFMAL` and `VMFSL` instructions not implemented.
`0b0001`	`VFMAL` and `VMFSL` instructions implemented.

FEAT_FHM implements the functionality identified by the value `0b0001`.

Access to this field is **RO**.

DP, bits [7:4]

Indicates support for dot product instructions in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DP	Meaning
`0b0000`	No dot product instructions implemented.
`0b0001`	`VUDOT` and `VSDOT` instructions implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value `0b0001`.

Access to this field is **RO**.

JSCVT, bits [3:0]

Indicates support for the Javascript conversion instruction in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

JSCVT	Meaning
`0b0000`	The `VJCVT` instruction is not implemented.
`0b0001`	The `VJCVT` instruction is implemented.

All other values are reserved.

In Armv8.0, the only permitted value is `0b0000`.

FEAT_JSCVT implements the functionality identified by `0b0001`.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the value `0b0000` is not permitted.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is `0b0000`.

Access to this field is **RO**.

Accessing ID_ISAR6

Accesses to this register use the following encodings in the System register encoding space:

```

ID_MMFR0, Memory Model Feature Register 0

The ID_MMFR0 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

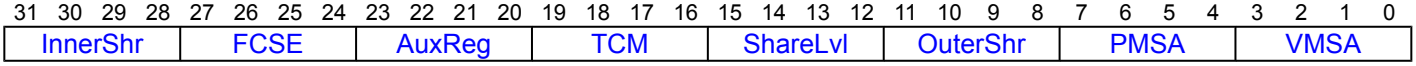
AArch32 System register ID_MMFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR0_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_MMFR0 are UNDEFINED.

Attributes

ID_MMFR0 is a 32-bit register.

Field descriptions



InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

InnerShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0.ShareLvl having the value 0b0001.

When ID_MMFR0.ShareLvl is zero, this field is UNKNOWN.

Access to this field is **RO**.

FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FCSE	Meaning
0b0000	Not supported.
0b0001	Support for FCSE.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AuxReg	Meaning
0b0000	None supported.
0b0001	Support for Auxiliary Control Register only.
0b0010	Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

Access to this field is **RO**.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TCM	Meaning
0b0000	Not supported.
0b0001	Support is IMPLEMENTATION DEFINED.
0b0010	Support for TCM only, Armv6 implementation.
0b0011	Support for TCM and DMA, Armv6 implementation.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ShareLvl	Meaning
0b0000	One level of shareability implemented.
0b0001	Two levels of shareability implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OuterShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b1111.

Access to this field is **RO**.

PMSA, bits [7:4]

Indicates support for a PMSA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED PMSA.
0b0010	Support for PMSAv6, with a Cache Type Register implemented.
0b0011	Support for PMSAv7, with support for memory subsections. Armv7-R profile.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

VMSA, bits [3:0]

Indicates support for a VMSA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED VMSA.
0b0010	Support for VMSAv6, with Cache and TLB Type Registers implemented.
0b0011	Support for VMSAv7, with support for remapping and the Access flag. ARMv7-A profile.
0b0100	As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
0b0101	As for 0b0100, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0101.

Access to this field is **RO**.

Accessing ID_MMFR0

ID_MMFR1, Memory Model Feature Register 1

The ID_MMFR1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_MMFR1 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR1_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_MMFR1 are UNDEFINED.

Attributes

ID_MMFR1 is a 32-bit register.

Field descriptions

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
BPred	L1TstCln	L1Uni	L1Hvd	L1UniSW	L1HvdSW	L1UniVA	L1HvdVA

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BPred	Meaning
0b0000	No branch predictor, or no MMU present. Implies a fixed MPU configuration.
0b0001	Branch predictor requires flushing on: • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Changes to the TTBR0, TTBR1, or TTBCR registers. • Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.
0b0010	Branch predictor requires flushing on: • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.
0b0011	Branch predictor requires flushing only on writing new data to instruction locations.
0b0100	For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In Armv8-A, the permitted values are 0b0010, 0b0011, or 0b0100. For values other than 0b0000 and 0b0100, the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

Access to this field is **RO**.

L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1TstCln	Meaning
0b0000	None supported.
0b0001	Supported Level 1 data cache test and clean operations are: • Test and clean data cache.
0b0010	As for 0b0001, and adds: • Test, clean, and invalidate data cache.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1Uni	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: • Invalidate cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for 0b0001, and adds: • Clean cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1Hvd	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: • Invalidate instruction cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for 0b0001, and adds: • Invalidate data cache. • Invalidate data cache and instruction cache, including branch predictor if appropriate.
0b0011	As for 0b0010, and adds: • Clean data cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1UniSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by set/way are: • Clean cache line by set/way.
0b0010	As for 0b0001, and adds: • Clean and invalidate cache line by set/way.
0b0011	As for 0b0010, and adds: • Invalidate cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by set/way are: • Clean data cache line by set/way. • Clean and invalidate data cache line by set/way.
0b0010	As for 0b0001, and adds: • Invalidate data cache line by set/way.
0b0011	As for 0b0010, and adds: • Invalidate instruction cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1UniVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by VA are: • Clean cache line by VA. • Invalidate cache line by VA. • Clean and invalidate cache line by VA.
0b0010	As for 0b0001, and adds: • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by VA are: • Clean data cache line by VA. • Invalidate data cache line by VA. • Clean and invalidate data cache line by VA. • Clean instruction cache line by VA.
0b0010	As for 0b0001, and adds: • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

Accessing ID_MMFR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b101

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T0
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);

ID_MMFR2, Memory Model Feature Register 2

The ID_MMFR2 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

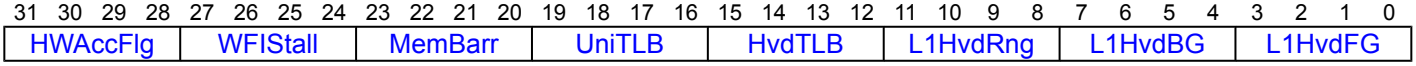
AArch32 System register ID_MMFR2 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR2_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_MMFR2 are UNDEFINED.

Attributes

ID_MMFR2 is a 32-bit register.

Field descriptions



HWAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HWAccFlg	Meaning
0b0000	Not supported.
0b0001	Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

WFIStall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WFIStall	Meaning
0b0000	Not supported.
0b0001	Support for WFI stalling.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc == 1111) encoding space.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MemBarr	Meaning
0b0000	None supported.
0b0001	Supported memory barrier System instructions are: • Data Synchronization Barrier (DSB).
0b0010	As for 0b0001, and adds: • Instruction Synchronization Barrier (ISB). • Data Memory Barrier (DMB).

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Arm deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

Access to this field is **RO**.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UniTLB	Meaning
0b0000	Not supported.
0b0001	Supported unified TLB maintenance operations are: • Invalidate all entries in the TLB. • Invalidate TLB entry by VA.
0b0010	As for 0b0001, and adds: • Invalidate TLB entries by ASID match.
0b0011	As for 0b0010, and adds: • Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation
0b0100	As for 0b0011, and adds: • Invalidate Hyp mode unified TLB entry by VA. • Invalidate entire Non-secure PL1&0 unified TLB. • Invalidate entire Hyp mode unified TLB.
0b0101	As for 0b0100, and adds the following operations: TLBIMVALIS, TLBIMVAALIS, TLBIMVALHIS, TLBIMVAL, TLBIMVAAL,TLBIMVALH.
0b0110	As for 0b0101, and adds the following operations: TLBIIPAS2IS, TLBIIPAS2LIS, TLBIIPAS2, TLBIIPAS2L.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

Access to this field is **RO**.

HvdTLB, bits [15:12]

If the value of ID_MMFR2.UniTLB is not 0b0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdRng	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache maintenance range operations are: • Invalidate data cache range by VA. • Invalidate instruction cache range by VA. • Clean data cache range by VA. • Clean and invalidate data cache range by VA.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdBG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache background fetch operations are: • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdFG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache foreground fetch operations are: • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

Accessing ID_MMFR2

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b110

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T0
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T0 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) &&
HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HCR.TID3 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        R[t] = ID_MMFR2;
elsif PSTATE.EL == EL2 then
    R[t] = ID_MMFR2;
elsif PSTATE.EL == EL3 then
    R[t] = ID_MMFR2;
```

ID_MMFR3, Memory Model Feature Register 3

The ID_MMFR3 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

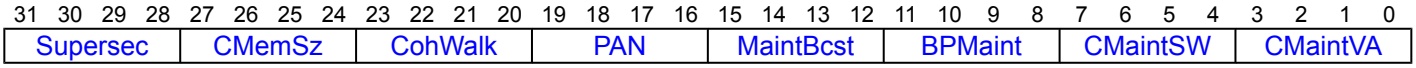
AArch32 System register ID_MMFR3 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR3_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_MMFR3 are UNDEFINED.

Attributes

ID_MMFR3 is a 32-bit register.

Field descriptions



Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Supersec	Meaning
0b0000	Supersections supported.
0b1111	Supersections not supported.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b1111.

Access to this field is **RO**.

CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMemSz	Meaning
0b0000	4GB, corresponding to a 32-bit physical address range.
0b0001	64GB, corresponding to a 36-bit physical address range.
0b0010	1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b0010.

Access to this field is **RO**.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CohWalk	Meaning
0b0000	Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.
0b0001	Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

PAN, bits [19:16]

Privileged Access Never. Indicates support for the PAN bit in CPSR, SPSR, and DSPSR in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PAN	Meaning
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and ATS1CPRP and ATS1CPWP instructions supported.

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the value 0b0001 is not permitted.

Access to this field is **RO**.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MaintBcst	Meaning
0b0000	Cache, TLB, and branch predictor operations only affect local structures.
0b0001	Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
0b0010	Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BPMaint	Meaning
0b0000	None supported.
0b0001	Supported branch predictor maintenance operations are: • Invalidate all branch predictors.
0b0010	As for 0b0001, and adds: • Invalidate branch predictors by VA.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is **RO**.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMaintSW	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance instructions by set/way are: • Invalidate data cache by set/way. • Clean data cache by set/way. • Clean and invalidate data cache by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

Access to this field is **RO**.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMaintVA	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance operations by VA are: • Invalidate data cache by VA. • Clean data cache by VA. • Clean and invalidate data cache by VA. • Invalidate instruction cache by VA. • Invalidate all instruction cache entries.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Access to this field is **RO**.

Accessing ID_MMFR3

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b111

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;

ID_MMFR4, Memory Model Feature Register 4

The ID_MMFR4 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

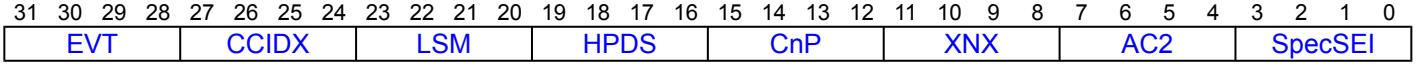
AArch32 System register ID_MMFR4 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR4_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_MMFR4 are UNDEFINED.

Attributes

ID_MMFR4 is a 32-bit register.

Field descriptions



EVT, bits [31:28]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR2.{TTLBIS, TOCU, TICAB, TID4} traps.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EVT	Meaning
0b0000	HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	HCR2.{TOCU, TICAB, TID4} traps are supported. HCR2.TTLBIS trap is not supported.
0b0010	HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented or does not support AArch32, the only permitted value is 0b0000.

From Armv8.5, if EL2 is implemented and supports AArch32, the value 0b0001 is not permitted.

Access to this field is **RO**.

CCIDX, bits [27:24]

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.
0b0001	64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.

All other values are reserved.

FEAT_CCIDX implements the functionality identified by `0b0001`.

From Armv8.3, the permitted values are `0b0000` and `0b0001`.

Access to this field is **RO**.

LSM, bits [23:20]

Indicates support for LSMAOE and nTLSMD bits in HSCTLR and SCTLR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LSM	Meaning
`0b0000`	LSMAOE and nTLSMD bits not supported.
`0b0001`	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value `0b0001`.

From Armv8.2, the permitted values are `0b0000` and `0b0001`.

Access to this field is **RO**.

HPDS, bits [19:16]

Hierarchical permission disables bits in translation tables.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HPDS	Meaning
`0b0000`	Disabling of hierarchical controls not supported.
`0b0001`	Supports disabling of hierarchical controls using the TTBCR2.HPD0, TTBCR2.HPD1, and HTCR.HPD bits.
`0b0010`	As for value `0b0001`, and adds possible hardware allocation of bits[62:59] of the Translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT_AA32HPD implements the functionality identified by the value `0b0001`.

FEAT_HPDS2 implements the functionality added by the value `0b0010`.

Note

The value `0b0000` implies that the encoding for TTBCR2 is UNDEFINED.

Access to this field is **RO**.

CnP, bits [15:12]

Common not Private translations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CnP	Meaning
`0b0000`	Common not Private translations not supported.
`0b0001`	Common not Private translations supported.

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value `0b0001`.

From Armv8.2, the value 0b0000 is not permitted.

Access to this field is **RO**.

XNX, bits [11:8]

Support for execute-never control distinction by Exception level at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

When FEAT_XNX is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4.XNX is 0b0000 or 0b0001:
  - ID_AA64MMFR1_EL1.XNX ==1.
  - EL2 cannot use AArch32.
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the value 0b0000 is not permitted.

Access to this field is **RO**.

AC2, bits [7:4]

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AC2	Meaning
0b0000	ACTLR2 and HACTLR2 are not implemented.
0b0001	ACTLR2 and HACTLR2 are implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Access to this field is **RO**.

SpecSEI, bits [3:0]

When FEAT_RAS is implemented:

Describes whether the PE can generate SError exceptions from speculative reads of memory, including speculative instruction fetches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SpecSEI	Meaning
0b0000	The PE never generates an SError exception due to an External abort on a speculative read.
0b0001	The PE might generate an SError exception due to an External abort on a speculative read.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Accessing ID_MMFR4

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ID_MMFR5, Memory Model Feature Register 5

The ID_MMFR5 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

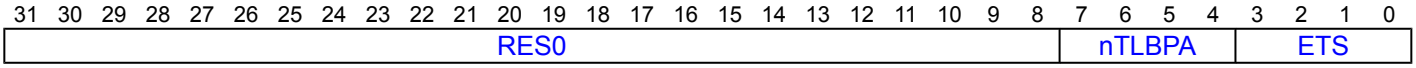
AArch32 System register ID_MMFR5 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR5_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_MMFR5 are UNDEFINED.

Attributes

ID_MMFR5 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

nTLBPA, bits [7:4]

Indicates support for intermediate caching of translation table walks.

The value of this field is an IMPLEMENTATION DEFINED choice of:

nTLBPA	Meaning
0b0000	The intermediate caching of translation table walks might include non-coherent physical translation caches.
0b0001	The intermediate caching of translation table walks does not include non-coherent physical translation caches.

Non-coherent physical translation caches are non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE, where either:

- The caching is indexed by the physical address of the location holding the translation table entry.
- The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

ETS, bits [3:0]

Indicates support for Enhanced Translation Synchronization.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is not supported.
0b0010	FEAT_ETS2 is implemented.
0b0011	FEAT_ETS3 is implemented.

All other values are reserved.

FEAT_ETS2 implements the functionality identified by the value 0b0010.

FEAT_ETS3 implements the functionality identified by the value 0b0011.

From Armv8.8, the values 0b0000 and 0b0001 are not permitted.

From Armv9.5, the value 0b0010 is not permitted.

Access to this field is **RO**.

Accessing ID_MMFR5

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0011	0b110

```

ID_PFR0, Processor Feature Register 0

The ID_PFR0 characteristics are:

Purpose

Gives top-level information about the instruction sets and other features supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

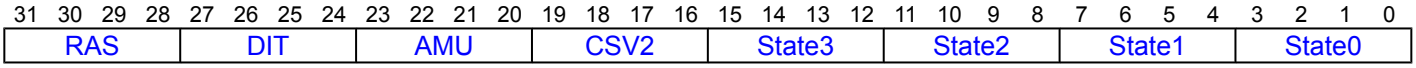
AArch32 System register ID_PFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_PFR0_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_PFR0 are UNDEFINED.

Attributes

ID_PFR0 is a 32-bit register.

Field descriptions



RAS, bits [31:28]

RAS Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RAS	Meaning
0b0000	The RAS Extension is not implemented.
0b0001	The RAS Extension is implemented, FEAT_RAS provides the ESB instruction and the Error synchronization event.
0b0010	FEAT_RASv1p1 implemented. As 0b0001, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.
0b0011	FEAT_RASv2 implemented. As 0b0010, and requires that error records accessed through System registers conform to RAS System Architecture v2.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 implements the functionality identified by the value 0b0010.

FEAT_RASv2 implements the functionality identified by the value 0b0011.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the value 0b0000 is not permitted.

From Armv8.4, if FEAT_DoubleFault is implemented or ERRIDR.NUM is nonzero, the value 0b0001 is not permitted.

Note

When the value of this field is 0b0001, ID_PFR2.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

From Armv8.9, if FEAT_DoubleFault is implemented or ERRIDR_EL1.NUM is nonzero, the value 0b0010 is not permitted.

Access to this field is **RO**.

DIT, bits [27:24]

Data Independent Timing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DIT	Meaning
0b0000	AArch32 does not guarantee constant execution time of any instructions.
0b0001	AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the value 0b0000 is not permitted.

Access to this field is **RO**.

AMU, bits [23:20]

Indicates support for Activity Monitors Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

Access to this field is **RO**.

CSV2, bits [19:16]

Speculative use of out of context branch targets.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSV2	Meaning
0b0000	The implementation does not disclose whether FEAT_CSV2 is implemented.
0b0001	FEAT_CSV2 is implemented, but FEAT_CSV2_1p1 is not implemented.
0b0010	FEAT_CSV2_1p1 is implemented.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the value 0b0001.

FEAT_CSV2_1p1 implements the functionality identified by the value 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

Access to this field is **RO**.

State3, bits [15:12]

T32EE instruction set support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State3	Meaning
0b0000	Not implemented.
0b0001	T32EE instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

State2, bits [11:8]

Jazelle extension support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State2	Meaning
0b0000	Not implemented.
0b0001	Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.
0b0010	Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

State1, bits [7:4]

T32 instruction set support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State1	Meaning
0b0000	T32 instruction set not implemented.
0b0001	T32 encodings before the introduction of Thumb-2 technology implemented: • All instructions are 16-bit. • A BL or BLX is a pair of 16-bit instructions. • 32-bit instructions other than BL and BLX cannot be encoded.
0b0011	T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Access to this field is **RO**.

State0, bits [3:0]

A32 instruction set support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State0	Meaning
0b0000	A32 instruction set not implemented.
0b0001	A32 instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Accessing ID_PFR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T0
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T0 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) &&
HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HCR.TID3 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        R[t] = ID_PFR0;
elsif PSTATE.EL == EL2 then
    R[t] = ID_PFR0;
elsif PSTATE.EL == EL3 then
    R[t] = ID_PFR0;
```

ID_PFR1, Processor Feature Register 1

The ID_PFR1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

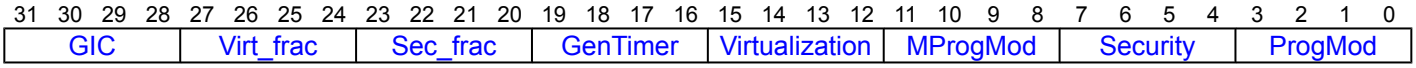
AArch32 System register ID_PFR1 bits [31:0] are architecturally mapped to AArch64 System register ID_PFR1_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_PFR1 are UNDEFINED.

Attributes

ID_PFR1 is a 32-bit register.

Field descriptions



GIC, bits [31:28]

System register GIC CPU interface.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

Access to this field is **RO**.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for Virtualization Extensions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Virt_frac	Meaning
0b0000	No Virtualization Extensions are implemented.
0b0001	The following Virtualization Extensions are implemented: • The SCR.SIF bit, if EL3 is implemented. • The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented. • The MSR (banked register) and MRS (banked register) instructions. • The ERET instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- `0b0000` when EL2 is implemented.
- `0b0001` when EL2 is not implemented.

This field is valid only when the value of ID_PFR1.Virtualization is 0, otherwise it holds the value `0b0000`.

Note

The ID_ISAR registers do not identify whether the instructions added by the Virtualization Extensions are implemented.

Access to this field is **RO**.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is `0b0000`, determines the support for Security Extensions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Sec_frac	Meaning
`0b0000`	No Security Extensions are implemented.
`0b0001`	The following Security Extensions are implemented: • The VBAR register. • The TTBCR.PD0 and TTBCR.PD1 bits.
`0b0010`	As for `0b0001`, and the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In Armv8-A, the permitted values are:

- `0b0000` when EL3 is implemented.
- `0b0001` or `0b0010` when EL3 is not implemented.

This field is valid only when the value of ID_PFR1.Security is 0, otherwise it holds the value `0b0000`.

Access to this field is **RO**.

GenTimer, bits [19:16]

Generic Timer support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GenTimer	Meaning
`0b0000`	Generic Timer is not implemented.
`0b0001`	Generic Timer is implemented.
`0b0010`	Generic Timer is implemented, and also includes support for CNTHCTL.EVNTIS and CNTKCTL.EVNTIS fields, and CNTPCTSS and CNTVCTSS counter views.

All other values are reserved.

FEAT_ECV implements the functionality identified by the value `0b0010`.

In Armv8.0, the only permitted value is `0b0001`.

From Armv8.6, the only permitted value is `0b0010`.

Access to this field is **RO**.

Virtualization, bits [15:12]

Virtualization support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Virtualization	Meaning
0b0000	EL2, Hyp mode, and the HVC instruction not implemented.
0b0001	EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

Note

The ID_ISARs do not identify whether the HVC instruction is implemented.

Access to this field is **RO**.

MProgMod, bits [11:8]

M-profile programmers' model support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MProgMod	Meaning
0b0000	Not supported.
0b0010	Support for two-stack programmers' model.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

Security, bits [7:4]

Security support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Security	Meaning
0b0000	EL3, Monitor mode, and the SMC instruction not implemented.
0b0001	EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.
0b0010	As for 0b0001, and adds the ability to set the NSACR.RFR bit. Not permitted in Armv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

Access to this field is **RO**.

ProgMod, bits [3:0]

Support for the standard programmers' model for ARMv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ProgMod	Meaning
0b0000	Not supported.
0b0001	Supported.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is **RO**.

Accessing ID_PFR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b001

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T0
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T0 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) &&
HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HCR.TID3 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        R[t] = ID_PFR1;
elsif PSTATE.EL == EL2 then
    R[t] = ID_PFR1;
elsif PSTATE.EL == EL3 then
    R[t] = ID_PFR1;
```

ID_PFR2, Processor Feature Register 2

The ID_PFR2 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0 and ID_PFR1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

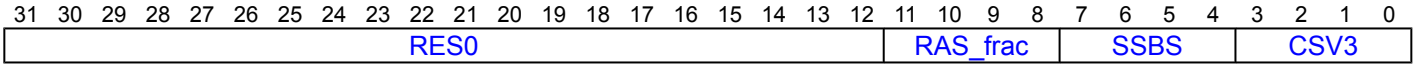
AArch32 System register ID_PFR2 bits [31:0] are architecturally mapped to AArch64 System register ID_PFR2_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ID_PFR2 are UNDEFINED.

Attributes

ID_PFR2 is a 32-bit register.

Field descriptions



Bits [31:12]

Reserved, RES0.

RAS_frac, bits [11:8]

RAS Extension fractional field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RAS_frac	Meaning
0b0000	If ID_PFR0.RAS == 0b0001, support for the Reliability, Availability, and Serviceability Extension is implemented.
0b0001	If ID_PFR0.RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0000.

FEAT_RASv1p1 implements the functionality identified by the value 0b0001.

This field is valid only if ID_PFR0.RAS == 0b0001.

Access to this field is **RO**.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SSBS	Meaning
0b0000	AArch32 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

Access to this field is **RO**.

CSV3, bits [3:0]

Speculative use of faulting data.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSV3	Meaning
0b0000	This PE does not disclose whether data loaded or read from a register under speculation where the data load or register read would not be permitted architecturally, can be used by instructions newer than the load or register read in a manner that allows the value of the inaccessible data to be recovered by code architecturally executed.
0b0001	Data loaded or read from a register under speculation where the data load or register read would not be permitted architecturally, cannot be used by instructions newer than the load or register read in a manner that allows the value of the inaccessible data to be recovered by code architecturally executed.

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

Access to this field is **RO**.

Accessing ID_PFR2

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0011	0b100

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then

IFAR, Instruction Fault Address Register

The IFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception.

Configuration

This register is banked between IFAR and IFAR_S and IFAR_NS.

AArch32 System register IFAR bits [31:0] are architecturally mapped to AArch64 System register FAR_EL1[63:32].

AArch32 System register IFAR bits [31:0] (IFAR_S) are architecturally mapped to AArch32 System register HIFAR[31:0] when EL2 is implemented and EL3 is implemented.

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to IFAR are UNDEFINED.

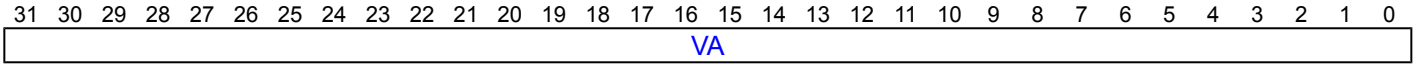
Attributes

IFAR is a 32-bit register.

This register has the following instances:

- IFAR, when EL3 is not implemented or FEAT_AA64 is implemented.
- IFAR_S, when FEAT_AA32EL3 is implemented.
- IFAR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



VA, bits [31:0]

VA of faulting address of synchronous Prefetch Abort exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing IFAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0110	0b0000	0b010

```

IFSR, Instruction Fault Status Register

The IFSR characteristics are:

Purpose

Holds status information about the last instruction fault.

Configuration

This register is banked between IFSR and IFSR_S and IFSR_NS.

AArch32 System register IFSR bits [31:0] are architecturally mapped to AArch64 System register IFSR32_EL2[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to IFSR are UNDEFINED.

The current translation table format determines which format of the register is used.

Attributes

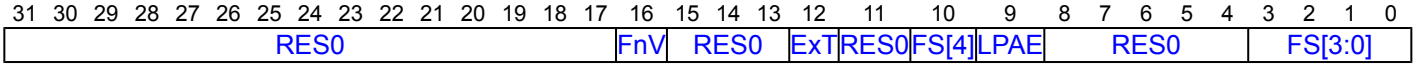
IFSR is a 32-bit register.

This register has the following instances:

- IFSR, when EL3 is not implemented or FEAT_AA64 is implemented.
- IFSR_S, when FEAT_AA32EL3 is implemented.
- IFSR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == 0:



Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	IFAR is valid.
0b1	IFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault Status bits. Bits [10] and [3:0] are interpreted together.

FS	Meaning	Applies when
0b00001	PC alignment fault.	
0b00010	Debug exception.	
0b00011	Access flag fault, level 1.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01000	Synchronous External abort, not on translation table walk.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault).	
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When FEAT_RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When FEAT_RAS is not implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is IFSR[10].
- FS[3:0] is IFSR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

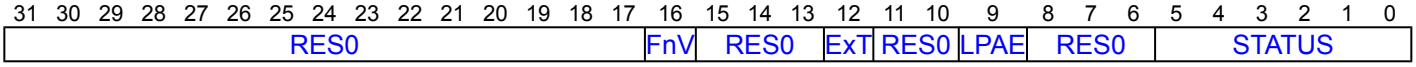
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:



Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	IFAR is valid.
0b1	IFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

STATUS	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100001	PC alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	

All other values are reserved.

When FEAT_RAS is implemented, 0b011000, 0b011101, 0b011110, and 0b011111 are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing IFSR

ISR, Interrupt Status Register

The ISR characteristics are:

Purpose

Shows the pending status of the IRQ and FIQ interrupts and the SError exceptions.

Configuration

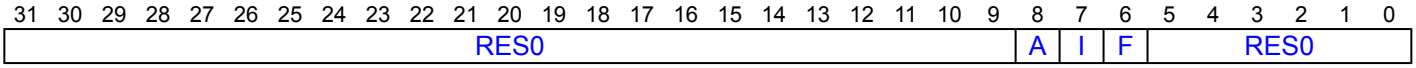
AArch32 System register ISR bits [31:0] are architecturally mapped to AArch64 System register ISR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ISR are UNDEFINED.

Attributes

ISR is a 32-bit register.

Field descriptions



Bits [31:9]

Reserved, RES0.

A, bit [8]

SError exception pending bit:

A	Meaning
0b0	No pending SError exception.
0b1	An SError exception is pending.

If all of the following apply then this field shows the pending status of virtual SError exceptions:

- EL2 is implemented and enabled in the current Security state.
- Any of the following apply:
  - EL2 is using AArch64 and HCR_EL2.AMO is 1.
  - EL2 is using AArch64, FEAT_DoubleFault2 is implemented, and the Effective value of HCRX_EL2.TMEA is 1.
  - EL2 is using AArch32 and HCR.AMO is 1.
- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical SError exceptions.

If the SError exception is edge-triggered, this field is cleared to zero when the physical SError exception is taken.

I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending:

I	Meaning
0b0	No pending IRQ.
0b1	An IRQ interrupt is pending.

If all of the following apply then this field shows the pending status of virtual IRQ interrupts:

- EL2 is implemented and enabled in the current Security state.
- Any of the following apply:
    - EL2 is using AArch64 and HCR_EL2.IMO is 1.
    - EL2 is using AArch32 and HCR.IMO is 1.
- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical IRQ interrupts.

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

F	Meaning
0b0	No pending FIQ.
0b1	An FIQ interrupt is pending.

If all of the following apply then this field shows the pending status of virtual FIQ interrupts:

- EL2 is implemented and enabled in the current Security state.
- Any of the following apply:
    - EL2 is using AArch64 and HCR_EL2.FMO is 1.
    - EL2 is using AArch32 and HCR.FMO is 1.
- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical FIQ interrupts.

Bits [5:0]

Reserved, RES0.

Accessing ISR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T12
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T12 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        R[t] = ISR;
elsif PSTATE.EL == EL2 then
    R[t] = ISR;
elsif PSTATE.EL == EL3 then
    R[t] = ISR;
```

ITLBIALL, Instruction TLB Invalidate All

The ITLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ITLBIALL are UNDEFINED.

Attributes

ITLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing ITLBIALL

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0101	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL1) then

ITLBIASID, Instruction TLB Invalidate by ASID match

The ITLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

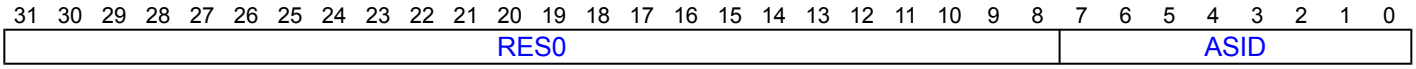
Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ITLBIASID are UNDEFINED.

Attributes

ITLBIASID is a 32-bit System instruction.

Field descriptions



Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing ITLBIASID

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0101	0b010

ITLBIMVA, Instruction TLB Invalidate by VA

The ITLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

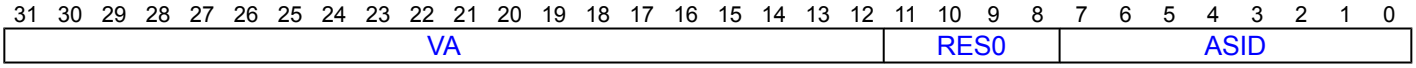
Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ITLBIMVA are UNDEFINED.

Attributes

ITLBIMVA is a 32-bit System instruction.

Field descriptions



VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

Executing ITLBIMVA

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

MAIR0, Memory Attribute Indirection Register 0

The MAIR0 characteristics are:

Purpose

Along with MAIR1, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIndx[2] indicates the MAIR register to be used:

- When AttrIndx[2] is 0, MAIR0 is used.
- When AttrIndx[2] is 1, MAIR1 is used.

Configuration

This register is banked between MAIR0 and MAIR0_S and MAIR0_NS.

AArch32 System register MAIR0 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR0 bits [31:0] are architecturally mapped to AArch32 System register PRRR[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR0 bits [31:0] (MAIR0_NS) are architecturally mapped to AArch32 System register PRRR[31:0] (PRRR_NS) when EL3 is using AArch32.

AArch32 System register MAIR0 bits [31:0] (MAIR0_S) are architecturally mapped to AArch32 System register PRRR[31:0] (PRRR_S) when EL3 is using AArch32.

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to MAIR0 are UNDEFINED.

MAIR0 and PRRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in MAIR0.

When EL3 is using AArch32, write access to MAIR0(S) is disabled when the **CP15SDISABLE** signal is asserted HIGH.

Attributes

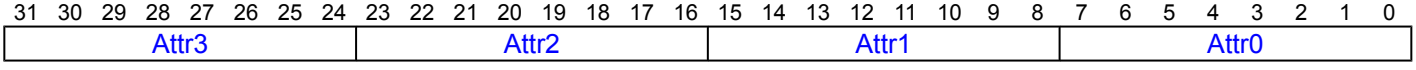
MAIR0 is a 32-bit register.

This register has the following instances:

- MAIR0, when EL3 is not implemented or FEAT_AA64 is implemented.
- MAIR0_S, when FEAT_AA32EL3 is implemented.
- MAIR0_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == 1:



Attr<n>, bits [8n+7:8n], for n = 3 to 0

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0010	0b000

MAIR1, Memory Attribute Indirection Register 1

The MAIR1 characteristics are:

Purpose

Along with MAIR0, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIndx[2] indicates the MAIR register to be used:

- When AttrIndx[2] is 0, MAIR0 is used.
- When AttrIndx[2] is 1, MAIR1 is used.

Configuration

This register is banked between MAIR1 and MAIR1_S and MAIR1_NS.

AArch32 System register MAIR1 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[63:32] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR1 bits [31:0] are architecturally mapped to AArch32 System register NMRR[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR1 bits [31:0] (MAIR1_NS) are architecturally mapped to AArch32 System register NMRR[31:0] (NMRR_NS) when EL3 is using AArch32.

AArch32 System register MAIR1 bits [31:0] (MAIR1_S) are architecturally mapped to AArch32 System register NMRR[31:0] (NMRR_S) when EL3 is using AArch32.

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to MAIR1 are UNDEFINED.

MAIR1 and NMRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in MAIR1.

When EL3 is using AArch32, write access to MAIR1(S) is disabled when the **CP15SDISABLE** signal is asserted HIGH.

Attributes

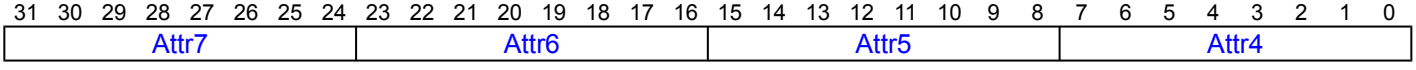
MAIR1 is a 32-bit register.

This register has the following instances:

- MAIR1, when EL3 is not implemented or FEAT_AA64 is implemented.
- MAIR1_S, when FEAT_AA32EL3 is implemented.
- MAIR1_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == 1:



Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 7 to 4

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0010	0b001

MIDR, Main ID Register

The MIDR characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

AArch32 System register MIDR bits [31:0] are architecturally mapped to AArch64 System register MIDR_EL1[31:0].

AArch32 System register MIDR bits [31:0] are architecturally mapped to External register MIDR_EL1[31:0].

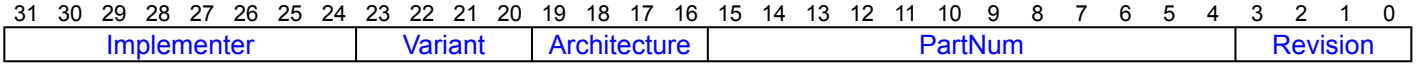
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to MIDR are UNDEFINED.

Some fields of the MIDR are IMPLEMENTATION DEFINED. For more information about the values of these fields for a particular Armv8 implementation, and any implementation-specific significance of these values, see the product documentation.

Attributes

MIDR is a 32-bit register.

Field descriptions



Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is **RO**.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture, bits [19:16]

Architecture version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

Access to this field is **RO**.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing MIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b000

```

MPIDR, Multiprocessor Affinity Register

The MPIDR characteristics are:

Purpose

In a multiprocessor system, provides an additional PE identification mechanism.

Configuration

AArch32 System register MPIDR bits [31:0] are architecturally mapped to AArch64 System register MPIDR_EL1[31:0].

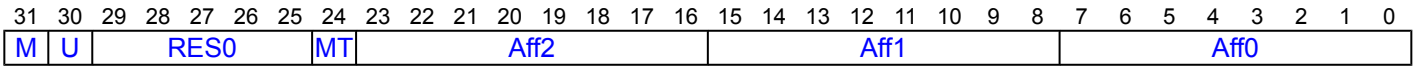
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to MPIDR are UNDEFINED.

In a uniprocessor system, Arm recommends that each Aff<n> field of this register returns a value of 0.

Attributes

MPIDR is a 32-bit register.

Field descriptions



M, bit [31]

Indicates whether this implementation includes the functionality introduced by the Armv7 Multiprocessing Extensions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

M	Meaning
0b0	This implementation does not include the Armv7 Multiprocessing Extensions functionality.
0b1	This implementation includes the Armv7 Multiprocessing Extensions functionality.

Access to this field is **RAO/WI**.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is **RO**.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is **RO**.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing MPIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b101

```
if !IsFeatureImplemented(FEAT_AA32EL1) then

MVBAR, Monitor Vector Base Address Register

The MVBAR characteristics are:

Purpose

When EL3 is implemented and can use AArch32, holds the vector base address for any exception that is taken to Monitor mode.

Secure software must program the MVBAR with the required initial value as part of the PE boot sequence.

Configuration

This register is present only when FEAT_AA32EL3 is implemented. Otherwise, direct accesses to MVBAR are UNDEFINED.

It is IMPLEMENTATION DEFINED whether MVBAR[0] has a fixed value and ignored writes, or takes the last value written to it.

On a Warm reset into EL3 using AArch32, the reset value of MVBAR is an IMPLEMENTATION DEFINED choice between the following:

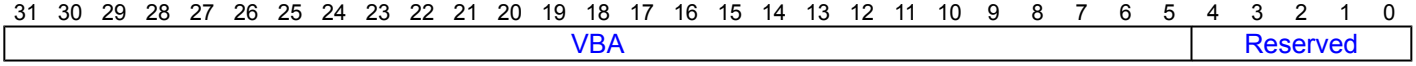
- MVBAR[31:5] = an IMPLEMENTATION DEFINED value, which might be UNKNOWN, MVBAR[4:1] = RES0, and MVBAR[0] = 0.
- MVBAR[31:1] = an IMPLEMENTATION DEFINED value that is bits[31:1] of the AArch32 reset address, and MVBAR[0] = 1.

Attributes

MVBAR is a 32-bit register.

Field descriptions

When programmed with a vector base address:



VBA, bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

Reserved, bits [4:0]

Reserved, see Configurations.

Accessing MVBAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

MVFR0, Media and VFP Feature Register 0

The MVFR0 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and floating-point implementation.

Must be interpreted with MVFR1 and MVFR2.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register MVFR0 bits [31:0] are architecturally mapped to AArch64 System register MVFR0_EL1[31:0].

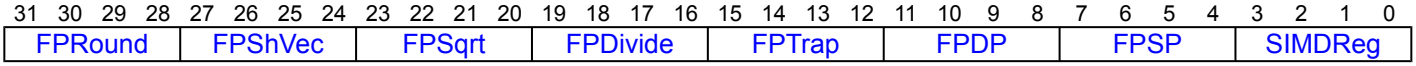
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to MVFR0 are UNDEFINED.

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

Attributes

MVFR0 is a 32-bit register.

Field descriptions



FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPRound	Meaning
0b0000	Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.
0b0001	All rounding modes supported.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is **RO**.

FPShVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPShVec	Meaning
0b0000	Short vectors not supported.
0b0001	Short vector operation supported.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

Access to this field is **RO**.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPSqrt	Meaning
`0b0000`	Not supported in hardware.
`0b0001`	Supported.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

Access to this field is **RO**.

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPDivide	Meaning
`0b0000`	Not supported in hardware.
`0b0001`	Supported.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

Access to this field is **RO**.

FPTrap, bits [15:12]

Floating-Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPTrap	Meaning
`0b0000`	Not supported.
`0b0001`	Supported.

All other values are reserved.

A value of `0b0001` indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

Access to this field is **RO**.

FPDP, bits [11:8]

Floating-Point Double-Precision. Indicates whether the floating-point implementation provides support for double-precision operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPDP	Meaning
0b0000	Not supported in hardware.
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

Access to this field is **RO**.

FPSP, bits [7:4]

Floating-Point Single-Precision. Indicates whether the floating-point implementation provides support for single-precision operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPSP	Meaning
0b0000	Not supported in hardware.
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

Access to this field is **RO**.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDReg	Meaning
0b0000	The implementation has no Advanced SIMD and floating-point support.
0b0001	The implementation includes floating-point support with 16 x 64-bit registers.
0b0010	The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

Access to this field is **RO**.

Accessing MVFR0

Accesses to this register use the following encodings in the System register encoding space:

MVFR1, Media and VFP Feature Register 1

The MVFR1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and floating-point implementation.

Must be interpreted with MVFR0 and MVFR2.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register MVFR1 bits [31:0] are architecturally mapped to AArch64 System register MVFR1_EL1[31:0].

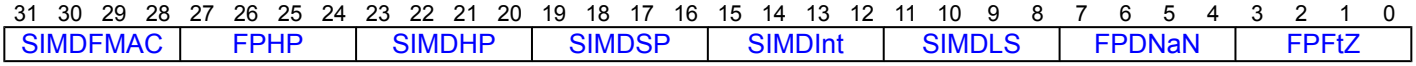
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to MVFR1 are UNDEFINED.

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

Attributes

MVFR1 is a 32-bit register.

Field descriptions



SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDFMAC	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

Access to this field is **RO**.

FPHP, bits [27:24]

Floating-Point Half-Precision. Indicates the level of half-precision floating-point support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPHP	Meaning
0b0000	Not supported.
0b0001	Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds instructions for conversion between double-precision and half-precision.
0b0011	As for 0b0010, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0011 in an implementation with floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

Half-Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

Access to this field is **RO**.

SIMDHP, bits [23:20]

Advanced SIMD Half-Precision. Indicates the level of half-precision floating-point support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDHP	Meaning
0b0000	Not supported.
0b0001	SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0001 in an implementation with SIMD floating-point support that does not include the FEAT_FP16 extension.
- 0b0010 in an implementation with SIMD floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

Half-Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

Access to this field is **RO**.

SIMDSP, bits [19:16]

Advanced SIMD Single-Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDSP	Meaning
0b0000	Not implemented.
0b0001	Implemented. This value is permitted only if the SIMDInt field is 0b0001.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

Access to this field is **RO**.

SIMDInt, bits [15:12]

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDInt	Meaning
`0b0000`	Not implemented.
`0b0001`	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

Access to this field is **RO**.

SIMDLS, bits [11:8]

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDLS	Meaning
`0b0000`	Not implemented.
`0b0001`	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

Access to this field is **RO**.

FPDNaN, bits [7:4]

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPDNaN	Meaning
`0b0000`	Not implemented, or hardware supports only the Default NaN mode.
`0b0001`	Hardware supports propagation of NaN values.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

Access to this field is **RO**.

FPFtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPFtZ	Meaning
`0b0000`	Not implemented, or hardware supports only the Flush-to-Zero mode of operation.
`0b0001`	Hardware supports full denormalized number arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

Access to this field is **RO**.

Accessing MVFR1

MVFR2, Media and VFP Feature Register 2

The MVFR2 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and floating-point implementation.

Must be interpreted with MVFR0 and MVFR1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register MVFR2 bits [31:0] are architecturally mapped to AArch64 System register MVFR2_EL1[31:0].

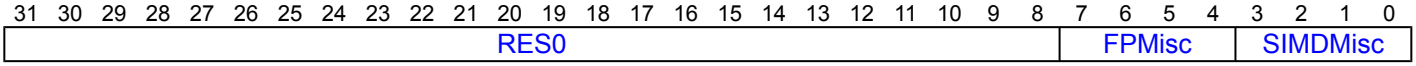
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to MVFR2 are UNDEFINED.

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

Attributes

MVFR2 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPMisc	Meaning
0b0000	Not implemented, or no support for miscellaneous features.
0b0001	Support for Floating-point selection.
0b0010	As 0b0001, and Floating-point Conversion to Integer with Directed Rounding modes.
0b0011	As 0b0010, and Floating-point Round to Integer Floating-point.
0b0100	As 0b0011, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0100.

Access to this field is **RO**.

SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDMisc	Meaning
0b0000	Not implemented, or no support for miscellaneous features.
0b0001	Floating-point Conversion to Integer with Directed Rounding modes.
0b0010	As 0b0001, and Floating-point Round to Integer Floating-point.
0b0011	As 0b0010, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0011.

Access to this field is **RO**.

Accessing MVFR2

NMRR, Normal Memory Remap Register

The NMRR characteristics are:

Purpose

Provides additional mapping controls for memory regions that are mapped as Normal memory by their entry in the PRRR.

Used in conjunction with the PRRR.

Configuration

This register is banked between NMRR and NMRR_S and NMRR_NS.

AArch32 System register NMRR bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[63:32] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register NMRR bits [31:0] are architecturally mapped to AArch32 System register MAIR1[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register NMRR bits [31:0] (NMRR_S) are architecturally mapped to AArch32 System register MAIR1[31:0] (MAIR1_S) when EL3 is using AArch32.

AArch32 System register NMRR bits [31:0] (NMRR_NS) are architecturally mapped to AArch32 System register MAIR1[31:0] (MAIR1_NS) when EL3 is using AArch32.

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to NMRR are UNDEFINED.

MAIR1 and NMRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in MAIR1.

Attributes

NMRR is a 32-bit register.

This register has the following instances:

- NMRR, when EL3 is not implemented or FEAT_AA64 is implemented.
- NMRR_S, when FEAT_AA32EL3 is implemented.
- NMRR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == 0:

31 30	29 28	27 26	25 24	23 22	21 20	19 18	17 16	15 14	13 12	11 10	9 8	7 6	5 4	3 2	1 0
OR7	OR6	OR5	OR4	OR3	OR2	OR1	OR0	IR7	IR6	IR5	IR4	IR3	IR2	IR1	IR0

OR<n>, bits [2n+17:2n+16], for n = 7 to 0

Outer Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the PRRR.TR<n> entry. n is the value of the TEX[0], C, and B bits concatenated.

OR<n>	Meaning
0b00	Region is Non-cacheable.
0b01	Region is Write-Back, Write-Allocate.
0b10	Region is Write-Through, no Write-Allocate.
0b11	Region is Write-Back, no Write-Allocate.

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

When FEAT_XS is implemented, stage 1 Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IR<n>, bits [2n+1:2n], for n = 7 to 0

Inner Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the PRRR.TR<n> entry. n is the value of the TEX[0], C, and B bits concatenated.

IR<n>	Meaning
0b00	Region is Non-cacheable.
0b01	Region is Write-Back, Write-Allocate.
0b10	Region is Write-Through, no Write-Allocate.
0b11	Region is Write-Back, no Write-Allocate.

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing NMRR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0010	0b001

NSACR, Non-Secure Access Control Register

The NSACR characteristics are:

Purpose

When EL3 is implemented and can use AArch32, defines the Non-secure access permissions to Trace, Advanced SIMD and floating-point functionality. Also includes IMPLEMENTATION DEFINED bits that can define Non-secure access permissions for IMPLEMENTATION DEFINED functionality.

Configuration

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to NSACR are UNDEFINED.

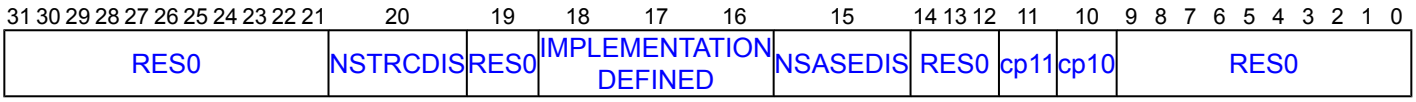
Note

In AArch64 state, the NSACR controls are replaced by controls in CPTR_EL3.

Attributes

NSACR is a 32-bit register.

Field descriptions



If EL3 is implemented and is using AArch64 then:

- Any read of the NSACR from Non-secure EL2 or Non-secure EL1 returns a value of `0x00000C00`.
- Any read or write to NSACR from Secure EL1 is trapped as an exception to EL3.

If EL3 is not implemented, then any read of the NSACR from EL2 or EL1 returns a value of `0x00000C00`.

Bits [31:21]

Reserved, RES0.

NSTRCDIS, bit [20]

Disables Non-secure System register accesses to all implemented trace registers.

NSTRCDIS	Meaning
`0b0`	This control has no effect on: • System register access to implemented trace registers. • The behavior of CPACR.TRCDIS and HCPTR.TTA.
`0b1`	Non-secure System register accesses to all implemented trace registers are disabled, meaning: • CPACR.TRCDIS behaves as RAO/WI in Non-secure state, regardless of its actual value. • HCPTR.TTA behaves as RAO/WI, regardless of its actual value.

The implementation of this field must correspond to the implementation of the CPACR.TRCDIS field:

- If CPACR.TRCDIS is RAZ/WI, this field is RAZ/WI.
- If CPACR.TRCDIS is RW, this field is RW.

Note

- The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED.
- The Arm architecture does not provide Non-secure access controls on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to `'0'`.

Bit [19]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [18:16]

IMPLEMENTATION DEFINED.

NSASEDIS, bit [15]

Disables Non-secure access to the Advanced SIMD functionality.

NSASEDIS	Meaning
`0b0`	This control has no effect on: • Non-secure access to Advanced SIMD functionality. • The behavior of CPACR.ASEDIS and HCPTR.TASE.
`0b1`	Non-secure access to the Advanced SIMD functionality is disabled, meaning: • CPACR.ASEDIS behaves as RAO/WI in Non-secure state, regardless of its actual value. • HCPTR.TASE behaves as RAO/WI, regardless of its actual value.

The implementation of this field must correspond to the implementation of the CPACR.ASEDIS field:

- If CPACR.ASEDIS is RES0, this field is RES0. If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.
- If CPACR.ASEDIS is RAZ/WI, this field is RAZ/WI.
- If CPACR.ASEDIS is RW, this field is RW.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to `'0'`.

Bits [14:12]

Reserved, RES0.

cp11, bit [11]

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the NSACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

cp10, bit [10]

Enable Non-secure access to the Advanced SIMD and floating-point features. Possible values of the fields are:

cp10	Meaning
0b0	Advanced SIMD and floating-point features can be accessed only from Secure state. Any attempt to access this functionality from Non-secure state is UNDEFINED. When the PE is in Non-secure state: • The CPACR.{cp11, cp10} fields ignore writes and read as 0b00, access denied. • The HCPTR.{TCP11, TCP10} fields behave as RAO/WI, regardless of their actual values.
0b1	Advanced SIMD and floating-point features can be accessed from both Security states.

If Non-secure access to the Advanced SIMD and floating-point functionality is enabled, the CPACR must be checked to determine the level of access that is permitted.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing NSACR

PAR, Physical Address Register

The PAR characteristics are:

Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

Configuration

This register is banked between PAR and PAR_S and PAR_NS.

AArch32 System register PAR bits [63:0] are architecturally mapped to AArch64 System register PAR_EL1[63:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to PAR are UNDEFINED.

PAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits[31:0] and do not modify bits[63:32].

The Configurations section specifies the cases where each PAR format is used.

PAR is accessed as a 32-bit value:

- When the PE is not in Hyp mode and is using the Short-descriptor translation table format.
- When the PE is in Hyp mode and executes an ATS12NSOPR, ATS12NSOPW, ATS12NSOUR, or ATS12NSOUW instruction and the value of HCR.VM is 0 and the value of TTBCR.EAE is 0.

In these cases, PAR[63:32] is RES0.

Otherwise, the PAR is accessed as a 64-bit value, if any of the following is true:

- When using the Long-descriptor translation table format.
- If the stage 1 address translation is disabled and TTBCR.EAE is set to 1.
- In an implementation that includes EL2, for the result of an ATS1Cxx instruction performed from Hyp mode.

For PL1&0 stage 1 translations, TTBCR.EAE selects the translation table format.

Attributes

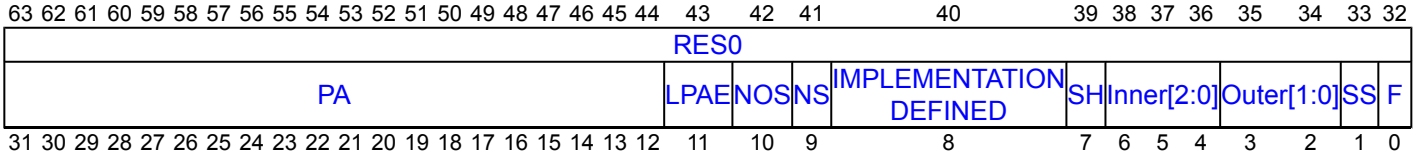
PAR is a 64-bit register.

This register has the following instances:

- PAR, when EL3 is not implemented or FEAT_AA64 is implemented.
- PAR_S, when FEAT_AA32EL3 is implemented.
- PAR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When the instruction returned a 32-bit value to the PAR, PAR.F==0:



This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the Translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the Translation table descriptors. This applies to the NOS, SH, Inner, and Outer fields.
- See the NS bit description for constraints on the value it returns.

Bits [63:32]

Reserved, RES0.

PA, bits [31:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[31:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
0b0	Short-descriptor translation table format used. This means the PAR returned a 32-bit value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [10]

Not Outer Shareable. When the returned value of PAR.SH is 1, indicates the Shareability attribute for the physical memory region:

NOS	Meaning
0b0	Memory region is Outer Shareable.
0b1	Memory region is Inner Shareable.

When the returned value of PAR.SH is 0 the value returned to this field is UNKNOWN.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bit [8]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bit [7]

Shareability. Indicates whether the physical memory region is Non-shareable:

SH	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is shareable, and PAR.NOS indicates whether the region is Outer Shareable or Inner Shareable.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Inner[2:0], bits [6:4]

Inner cacheability attribute for the region. Permitted values are:

Inner[2:0]	Meaning
0b000	Non-cacheable.
0b001	Device-nGnRnE.
0b011	Device-nGnRE.
0b101	Write-Back, Write-Allocate.
0b110	Write-Through.
0b111	Write-Back, no Write-Allocate.

The values 0b010 and 0b100 are reserved.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Outer[1:0], bits [3:2]

Outer cacheability attribute for the region. Permitted values are:

Outer[1:0]	Meaning
0b00	Non-cacheable.
0b01	Write-Back, Write-Allocate.
0b10	Write-Through, no Write-Allocate.
0b11	Write-Back, no Write-Allocate.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [1]

Supersection. Used to indicate if the result is a Supersection:

SS	Meaning
0b0	Result is not a Supersection. PAR[31:12] contains OA[31:12].
0b1	Result is a Supersection, and: • PAR[31:24] contains OA[31:24]. • PAR[23:16] contains OA[39:32]. • PAR[15:12] contains 0b0000. If an implementation supports less than 40 bits of physical address, the bits in the PAR field that correspond to physical address bits that are not implemented are UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the instruction returned a 32-bit value to the PAR, PAR.F==1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
IMPLEMENTATION DEFINED																RES0				LPAE	RES0				FS[5]	FS[4:0]					F
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:16]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
0b0	Short-descriptor translation table format used. This means the PAR returned a 32-bit value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:7]

Reserved, RES0.

FS[5], bit [6]

Fault status bits, External abort type. Provides an IMPLEMENTATION DEFINED classification of an External abort. Values are as in the DFSR.ExT field when using the Short-descriptor translation table format.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FS[4:0], bits [5:1]

Fault status bits. Values are as in the DFSR.FS field when using the Short-descriptor translation table format.

FS[4:0]	Meaning	Applies when
0b00001	Alignment fault.	
0b00011	Access flag fault, level 1.	
0b00100	Fault on instruction cache maintenance.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When FEAT_RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When FEAT_RAS is not implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

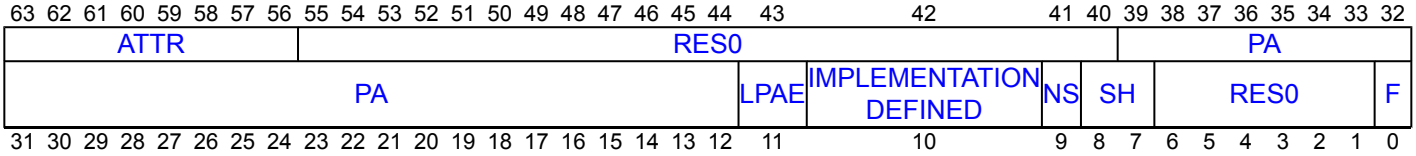
Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the instruction returned a 64-bit value to the PAR, PAR.F==0:



This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the Translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the Translation table descriptors. This applies to the ATTR and SH fields.
- See the NS bit description for constraints on the value it returns.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR0 and MAIR1.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [55:40]

Reserved, RES0.

PA, bits [39:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[39:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
0b1	Long-descriptor translation table format used. This means the PAR returned a 64-bit value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address. Permitted values are:

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

F, bit [0]

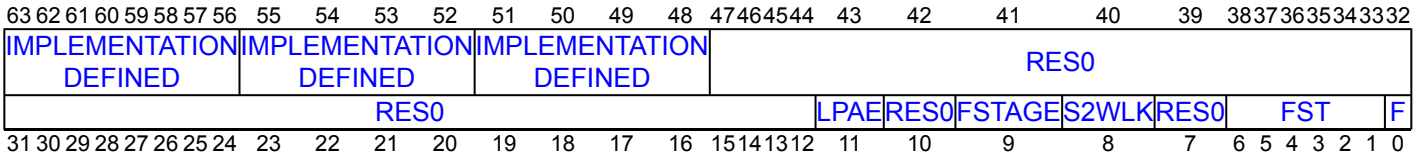
Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the instruction returned a 64-bit value to the PAR, PAR.F==1:



This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:12]

Reserved, RES0.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
0b1	Long-descriptor translation table format used. This means the PAR returned a 64-bit value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [10]

Reserved, RES0.

FSTAGE, bit [9]

Indicates the translation stage at which the translation aborted:

FSTAGE	Meaning
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S2WLK, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status field. Values are as in the DFSR.STATUS and IFSR.STATUS fields when using the Long-descriptor translation table format.

FST	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b110000	TLB conflict abort.	

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0100	0b000

```

PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

Purpose

Determines the modes in which the Cycle Counter, PMCCNTR, increments.

Configuration

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to AArch64 System register PMCCFILTR_EL0[31:0].

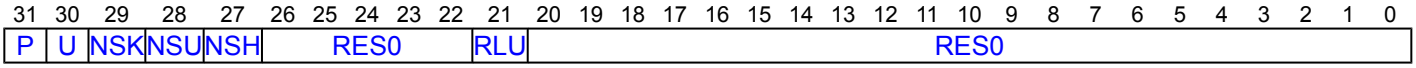
AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to External register PMCCFILTR_EL0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR are UNDEFINED.

Attributes

PMCCFILTR is a 32-bit register.

Field descriptions



P, bit [31]

Privileged filtering. Controls counting cycles in EL1 and, if EL3 is using AArch32, EL3.

P	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL1 and, if EL3 is using AArch32, EL3.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL1 is further controlled by PMCCFILTR.NSK.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering. Controls counting cycles in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL0.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL0 is further controlled by PMCCFILTR.NSU.

If FEAT_RME is implemented, then counting cycles in Realm EL0 is further controlled by PMCCFILTR.RLU.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:

- When FEAT_AA64 is not implemented, this field resets to '0'.
- When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 filtering. Controls counting cycles in Non-secure EL1. If PMCCFILTR.NSK is not equal to PMCCFILTR.P, then the PE does not count cycles in Non-secure EL1. Otherwise, this mechanism has no effect on filtering of cycles in Non-secure EL1.

NSK	Meaning
0b0	When PMCCFILTR.P == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR.P == 1, the PE does not count cycles in Non-secure EL1.
0b1	When PMCCFILTR.P == 0, the PE does not count cycles in Non-secure EL1. When PMCCFILTR.P == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 filtering. Controls counting cycles in Non-secure EL0. If PMCCFILTR.NSU is not equal to PMCCFILTR.U, then the PE does not count cycles in Non-secure EL0. Otherwise, this mechanism has no effect on filtering of cycles in Non-secure EL0.

NSU	Meaning
0b0	When PMCCFILTR.U == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR.U == 1, the PE does not count cycles in Non-secure EL0.
0b1	When PMCCFILTR.U == 0, the PE does not count cycles in Non-secure EL0. When PMCCFILTR.U == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 filtering. Controls counting cycles in EL2.

NSH	Meaning
0b0	The PE does not count cycles in EL2.
0b1	This mechanism has no effect on filtering of cycles.

If EL3 is implemented and FEAT_SEL2 is implemented, then counting cycles in Secure EL2 is further controlled by PMCCFILTR.SH.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to `'0'`.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [26:22]

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 filtering. Controls counting cycles in Realm EL0. If PMCCFILTR.RLU is not equal to PMCCFILTR.U, then the PE does not count cycles in Realm EL0. Otherwise, this mechanism has no effect on filtering of cycles in Realm EL0.

RLU	Meaning
`0b0`	When PMCCFILTR.U == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR.U == 1, the PE does not count cycles in Realm EL0.
`0b1`	When PMCCFILTR.U == 0, the PE does not count cycles in Realm EL0. When PMCCFILTR.U == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [20:0]

Reserved, RES0.

Accessing PMCCFILTR

PMCCFILTR can also be accessed by using PMXEVTYPER with PMSELR.SEL set to `0b11111`.

Permitted reads and writes of PMCCFILTR are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.C == 0.

Permitted writes of PMCCFILTR are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.{UEN,CR} == {1,1}.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b1111	0b111

```

PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' for more information.

PMCCFILTR determines the modes and states in which the PMCCNTR can increment.

Configuration

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR are UNDEFINED.

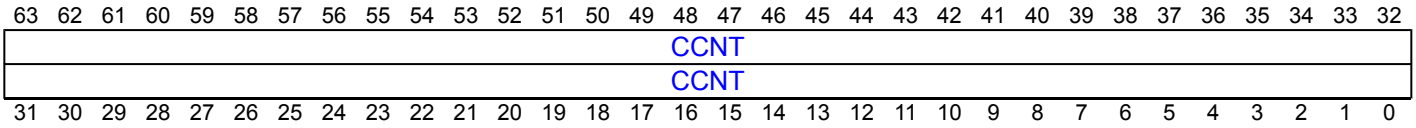
PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

Attributes

PMCCNTR is a 64-bit register.

Field descriptions



CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR.C sets this field to 0.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR

Permitted reads and writes of PMCCNTR are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.UEN == 1.

- PMUACR_EL1.C == 0.

Permitted writes of PMCCNTR are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.{UEN,CR} == {1,1}.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1101	0b000

PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x0000` to `0x001F`.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Configuration

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[31:0].

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to External register PMCEID0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0 are UNDEFINED.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID7	ID6	ID5	ID4

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

ID<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b110

```

PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x0020` to `0x003F`.

For more information about the Common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

Configuration

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[31:0].

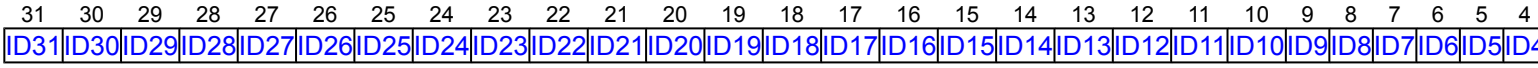
AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to External register PMCEID1[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1 are UNDEFINED.

Attributes

PMCEID1 is a 32-bit register.

Field descriptions



ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event (`0x0020` + n).

For each bit:

ID<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b111

```

PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x4000` to `0x401F`.

For more information about the Common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

Configuration

AArch32 System register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[63:32].

AArch32 System register PMCEID2 bits [31:0] are architecturally mapped to External register PMCEID2[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are UNDEFINED.

Attributes

PMCEID2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	
IDhi31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16	IDhi15	IDhi14	IDhi13	IDh

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to Common event (`0x4000` + n).

For each bit:

IDhi<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x4020` to `0x403F`.

For more information about the Common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

Configuration

AArch32 System register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[63:32].

AArch32 System register PMCEID3 bits [31:0] are architecturally mapped to External register PMCEID3[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are UNDEFINED.

Attributes

PMCEID3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	
IDhi31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16	IDhi15	IDhi14	IDhi13	IDh

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to Common event (`0x4020` + n).

For each bit:

IDhi<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID3

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b101

```

PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

Purpose

Allows software to disable the following counters:

- The cycle counter PMCCNTR.
- The event counters PMEVCNTR<n>.

Reading from this register shows which counters are enabled.

Configuration

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0].

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0].

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to External register PMCNTENCLR_EL0[31:0].

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to External register PMCNTENSET_EL0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR are UNDEFINED.

Attributes

PMCNTENCLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

PMCCNTR disable. On writes, allows software to disable PMCCNTR. On reads, returns the PMCCNTR enable status.

C	Meaning
0b0	PMCCNTR disabled.
0b1	PMCCNTR enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.UEN == 1.
  - PMUACR_EL1.C == 0.

- Access to this field is **RO** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.[UEN,CR] == 0b11.
- Otherwise, access to this field is **W1C**.

P<m>, bit [m], for m = 30 to 0

PMEVCNTR<m> disable. On writes, allows software to disable PMEVCNTR<m>. On reads, returns the PMEVCNTR<m> enable status.

P<m>	Meaning
0b0	PMEVCNTR<m> disabled.
0b1	PMEVCNTR<m> enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.UEN == 1.
  - PMUACR_EL1.P<m> == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.[UEN,ER] == 0b11.
- Otherwise, access to this field is **W1C**.

PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

Purpose

Allows software to enable the following counters:

- The cycle counter PMCCNTR.
- The event counters PMEVCNTR<n>.

Reading from this register shows which counters are enabled.

Configuration

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0].

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0].

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to External register PMCNTENSET_EL0[31:0].

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to External register PMCNTENCLR_EL0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET are UNDEFINED.

Attributes

PMCNTENSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

PMCCNTR enable. On writes, allows software to enable PMCCNTR. On reads, returns the PMCCNTR enable status.

C	Meaning
0b0	PMCCNTR disabled.
0b1	PMCCNTR enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.UEN == 1.
  - PMUACR_EL1.C == 0.
- Access to this field is **RO** if all the following are true:
  - FEAT_PMUv3p9 is implemented.

        - PSTATE.EL == EL0.
        - EL1 is using AArch64.
        - PMUSERENR_EL0.[UEN,CR] == 0b11.
    - Otherwise, access to this field is **W1S**.

P<m>, bit [m], for m = 30 to 0

PMEVCNTR<m> enable. On writes, allows software to enable PMEVCNTR<m>. On reads, returns the PMEVCNTR<m> enable status.

P<m>	Meaning
0b0	PMEVCNTR<m> disabled.
0b1	PMEVCNTR<m> enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Access to this field is **RAZ/WI** if all the following are true:
    - FEAT_PMUv3p9 is implemented.
    - PSTATE.EL == EL0.
    - EL1 is using AArch64.
    - PMUSERENR_EL0.UEN == 1.
    - PMUACR_EL1.P<m> == 0.
- Access to this field is **RO** if all the following are true:
    - FEAT_PMUv3p9 is implemented.
    - PSTATE.EL == EL0.
    - EL1 is using AArch64.
    - PMUSERENR_EL0.[UEN,ER] == 0b11.
- Otherwise, access to this field is **W1S**.

Accessing PMCNTENSET

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b001

```

PMCR, Performance Monitors Control Register

The PMCR characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

AArch32 System register PMCR bits [31:0] are architecturally mapped to AArch64 System register PMCR_EL0[31:0].

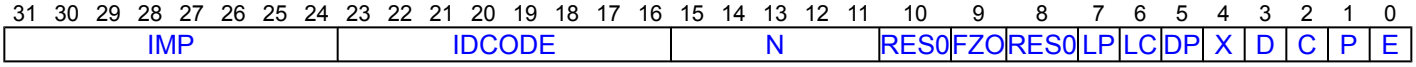
AArch32 System register PMCR bits [10:0] are architecturally mapped to External register PMCR_EL0[10:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR are UNDEFINED.

Attributes

PMCR is a 32-bit register.

Field descriptions



IMP, bits [31:24]

When FEAT_PMUv3p7 is not implemented:

Implementer code.

If this field is zero, then PMCR.IDCODE is RES0 and software must use MIDR to identify the PE.

Otherwise, this field and PMCR.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A nonzero value has the same interpretation as MIDR.Implementer.

Arm deprecates use of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

IDCODE, bits [23:16]

When PMCR.IMP != 0b00000000:

Identification code. Arm deprecates use of this field.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of `0b00000`-`0b11111`. If the value is `0b00000`, then only PMCCNTR is implemented. If the value is `0b11111`, then PMCCNTR and 31 event counters are implemented.

If EL2 is implemented, then all of the following apply:

- If EL2 is using AArch32, then reads of this field from Non-secure EL1 and Non-secure EL0 return the Effective value of HDCR.HPMN.
- If EL2 is enabled in the current Security state and using AArch64, then reads of this field from EL1 and EL0 return the Effective value of MDCR_EL2.HPMN.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

FZO	Meaning
`0b0`	Do not freeze on overflow.
`0b1`	Affected counters do not count when PMOVSR[m] is 1 for any event counter PMEVCNTR<m> in the first range.

The counters affected by this field are:

- The event counters in the first range.
- If PMCR.DP is 1, the cycle counter PMCCNTR.

Other event counters are not affected by this field.

When PMCR.DP is 0, PMCCNTR is not affected by this field.

For more information about event counter ranges, see MDCR_EL2.HPMN or HDCR.HPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by PMOVSR.P[n].

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>[31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>[63:0].

The counters affected by this field are the event counters in the first range. For more information about event counter ranges, see MDCR_EL2.HPMN or HDCR.HPMN.

Other event counters and PMCCNTR are not affected by this field.

PMEVCNTR<n>[63:32] is not accessible in AArch32 state.

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this field is read/write or RAZ/WI.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]

Long cycle counter enable. Determines when unsigned overflow is recorded by PMOVSR.C.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR[31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR[63:0].

Arm deprecates use of PMCR.LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DP, bit [5]

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by PMCCNTR is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR is disabled in prohibited regions and when event counting is frozen: • If FEAT_PMUv3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD or HDCR.HPMD is 1, then cycle counting by PMCCNTR is disabled at EL2. • If FEAT_PMUv3p7 is implemented and event counting is frozen by PMCR.FZO, then cycle counting by PMCCNTR is disabled. • If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR is disabled at EL3. • If EL3 is implemented, MDCR_EL3.SPME or SDCR.SPME is 0, and one of FEAT_PMUv3p7 is not implemented, EL3 is using AArch32, or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR is disabled at EL3 and in Secure state.

The conditions when this field disables the cycle counter are the same as when event counting by an event counter in the first range is prohibited or frozen. For more information about event counter ranges, see MDCR_EL2.HPMN or HDCR.HPMN.

For more information, see 'Prohibiting event and cycle counting'.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]
When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

If FEAT_ETE is implemented, this field does not affect the use of PMU events as an External Input by the trace unit.

If FEAT_ETMv4 is implemented, this field does affect the use of PMU events as an External Input by the trace unit.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR counts every clock cycle.
0b1	When enabled, PMCCNTR counts once every 64 clock cycles.

If the Effective value of PMCR.LC is 1, then this field is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR.D = 1.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cycle counter reset. The effects of writing to this field are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR to zero.

Note

Resetting PMCCNTR does not change the cycle counter overflow field. The value of PMCR.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset.

P	Meaning
0b0	No action.
0b1	Reset all affected event counters PMEVCNTR<n> to zero.

The event counters affected by this field are:

- All event counters in the first range.
- If any of the following are true, all event counters in the second range:
  - EL2 is disabled or not implemented in the current Security state.
  - The PE is executing at EL2 or EL3.

Writes to this field do not affect other event counters or the cycle counter PMCCNTR.

For more information about event counter ranges, see MDCR_EL2.HPMN or HDCR.HPMN.

Note

Resetting the event counters does not change the event counter overflow fields. If FEAT_PMUv3p5 is implemented, the values of MDCR_EL2.HLP or HDCR.HLP and PMCR.LP are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

E	Meaning
0b0	Affected counters are disabled and do not count.
0b1	Affected counters are enabled by PMCNTENSET.

The counters affected by this field are:

- The event counters in the first range. For more information about event counter ranges, see MDCR_EL2.HPMN or HDCR.HPMN.
- The cycle counter PMCCNTR.

Other event counters are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing PMCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b000

```

PMEVCNTR<n>, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n> characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to AArch64 System register PMEVCNTR<n>_EL0[31:0].

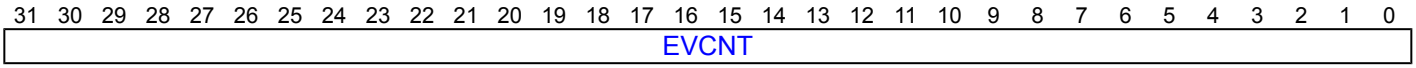
AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to External register PMEVCNTR<n>_EL0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n> are UNDEFINED.

Attributes

PMEVCNTR<n> is a 32-bit register.

Field descriptions



EVCNT, bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMEVCNTR<n> return bits [31:0] of the counter.
- Writes to PMEVCNTR<n> update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64, bits [63:32] are not required to be implemented.

If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>

PMEVCNTR<n> can also be accessed by using PMXEVCNTR with PMSELR.SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMEVCNTR<n> is as follows:

- If <n> is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of PMEVCNTR<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMEVCNTR<n> are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.P<n> == 0.

Permitted writes of PMEVCNTR<n> are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.{UEN,ER} == {1,1}.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR.{ER,EN} or PMUSERENR_EL0.{UEN,ER,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see HDCR.HPMN and MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-30
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b10:m[4:3]	m[2:0]

```
integer m = UInt(CRm<1:0>:opc2<2:0>);

PMEVTYPER<n>, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n> characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0[31:0].

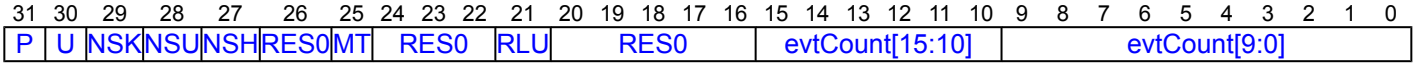
AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to External register PMEVTYPER<n>_EL0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n> are UNDEFINED.

Attributes

PMEVTYPER<n> is a 32-bit register.

Field descriptions



P, bit [31]

Privileged filtering. Controls counting events in EL1 and, if EL3 is using AArch32, EL3.

P	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL1 and, if EL3 is using AArch32, EL3.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL1 is further controlled by PMEVTYPER<n>.NSK.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering. Controls counting events in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL0.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL0 is further controlled by PMEVTYPER<n>.NSU.

If FEAT_RME is implemented, then counting events in Realm EL0 is further controlled by PMEVTYPER<n>.RLU.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 filtering. Controls counting events in Non-secure EL1. If PMEVTYPER<n>.NSK is not equal to PMEVTYPER<n>.P, then the PE does not count events in Non-secure EL1. Otherwise, this mechanism has no effect on filtering of events in Non-secure EL1.

NSK	Meaning
0b0	When PMEVTYPER<n>.P == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>.P == 1, the PE does not count events in Non-secure EL1.
0b1	When PMEVTYPER<n>.P == 0, the PE does not count events in Non-secure EL1. When PMEVTYPER<n>.P == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 filtering. Controls counting events in Non-secure EL0. If PMEVTYPER<n>.NSU is not equal to PMEVTYPER<n>.U, then the PE does not count events in Non-secure EL0. Otherwise, this mechanism has no effect on filtering of events in Non-secure EL0.

NSU	Meaning
0b0	When PMEVTYPER<n>.U == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>.U == 1, the PE does not count events in Non-secure EL0.
0b1	When PMEVTYPER<n>.U == 0, the PE does not count events in Non-secure EL0. When PMEVTYPER<n>.U == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 filtering. Controls counting events in EL2.

NSH	Meaning
0b0	The PE does not count events in EL2.
0b1	This mechanism has no effect on filtering of events.

If EL3 is implemented and FEAT_SEL2 is implemented, then counting events in Secure EL2 is further controlled by PMEVTYPER<n>.SH.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

MT, bit [25]

When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

Unless otherwise stated:

- If the event counts PE cycles when a stall condition is true, then the counter counts Processor cycles when the stall condition is true for all of these PEs.
- If the event counts PE cycles when any other condition is true, then the counter counts Processor cycles when the condition is true for any of these PEs.
- Otherwise, the event counts by the sum of the count across all of these PEs. See 'Multithreaded implementations' and 'Cycle event counting in multithreaded implementations'.

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this field is RES0. See ID_DFR1.MTPMU.

This field is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and disabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:22]

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 filtering. Controls counting events in Realm EL0. If PMEVTYPER<n>.RLU is not equal to PMEVTYPER<n>.U, then the PE does not count events in Realm EL0. Otherwise, this mechanism has no effect on filtering of events in Realm EL0.

RLU	Meaning
0b0	When PMEVTYPER<n>.U == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>.U == 1, the PE does not count events in Realm EL0.
0b1	When PMEVTYPER<n>.U == 0, the PE does not count events in Realm EL0. When PMEVTYPER<n>.U == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [20:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter PMEVCNTR<n>.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<n>.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.

Note

Arm recommends this behavior for all implementations of FEAT_PMUv3.

Otherwise, if PMEVTYPER<n>.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range `0x0000` to `0x003F`, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range `0x4000` to `0x403F`, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>

PMEVTYPER<n> can also be accessed by using PMXEVTYPER with PMSELR.SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMEVTYPER<n> is as follows:

- If <n> is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of PMEVTYPER<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMEVTYPER<n> are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.P<n> == 0.

Permitted writes of PMEVTYPER<n> are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.{UEN,ER} == {1,1}.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR.EN or PMUSERENR_EL0.{UEN,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see HDCR.HPMN and MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-30
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b11:m[4:3]	m[2:0]

```
integer m = UInt(CRm<1:0>:opc2<2:0>);

PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

Purpose

Allows software to disable the generation of interrupt requests on overflows from the following counters:

- The cycle counter PMCCNTR.
- The event counters PMEVCNTR<n>.

Reading from this register shows which overflow interrupt requests are enabled.

Configuration

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register PMINTENSET_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR are UNDEFINED.

Attributes

PMINTENCLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

C, bit [31]

Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR enable status.

C	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.

P<m>, bit [m], for m = 30 to 0

Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m> disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m> enable status.

P<m>	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m> disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m> enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1C**.

PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation to software.

Configuration

AArch32 System register PMMIR bits [31:0] are architecturally mapped to AArch64 System register PMMIR_EL1[31:0].

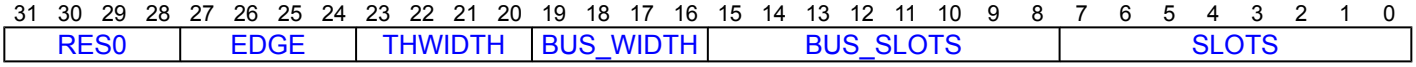
AArch32 System register PMMIR bits [31:0] are architecturally mapped to External register PMMIR[31:0] when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3p4 is implemented.

This register is present only when FEAT_AA32EL1 is implemented and FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are UNDEFINED.

Attributes

PMMIR is a 32-bit register.

Field descriptions



Bits [31:28]

Reserved, RES0.

EDGE, bits [27:24]

PMU event edge detection. With PMMIR.THWIDTH, indicates implementation of event counter thresholding features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EDGE	Meaning
0b0000	FEAT_PMUv3_EDGE is not implemented.
0b0001	FEAT_PMUv3_EDGE is implemented.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, the only permitted value is 0b0000.

FEAT_PMUv3_EDGE implements the functionality identified by the value 0b0001.

Note

PMEVTYPER<n>_EL0.TE cannot be accessed through PMEVTYPER<n>.

Access to this field is **RO**.

THWIDTH, bits [23:20]

PMEVTYPER<n>_EL0.TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the PMEVTYPER<n>_EL0.TH field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

THWIDTH	Meaning
0b0000	FEAT_PMUv3_TH is not implemented.
0b0001	1 bit. PMEVTYPER<n>_EL0.TH[11:1] are RES0.
0b0010	2 bits. PMEVTYPER<n>_EL0.TH[11:2] are RES0.
0b0011	3 bits. PMEVTYPER<n>_EL0.TH[11:3] are RES0.
0b0100	4 bits. PMEVTYPER<n>_EL0.TH[11:4] are RES0.
0b0101	5 bits. PMEVTYPER<n>_EL0.TH[11:5] are RES0.
0b0110	6 bits. PMEVTYPER<n>_EL0.TH[11:6] are RES0.
0b0111	7 bits. PMEVTYPER<n>_EL0.TH[11:7] are RES0.
0b1000	8 bits. PMEVTYPER<n>_EL0.TH[11:8] are RES0.
0b1001	9 bits. PMEVTYPER<n>_EL0.TH[11:9] are RES0.
0b1010	10 bits. PMEVTYPER<n>_EL0.TH[11:10] are RES0.
0b1011	11 bits. PMEVTYPER<n>_EL0.TH[11] is RES0.
0b1100	12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to PMEVTYPER<n>_EL0.TH is $2^{(\text{PMMIR.THWIDTH})}$ minus one.

Note

PMEVTYPER<n>_EL0.TH cannot be accessed through PMEVTYPER<n>.

Access to this field is **RO**.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as Log_2(number of bytes), plus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

Access to this field is **RO**.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

If the bus count information is not available, this field will read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMMIR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

PMOVSR, Performance Monitors Overflow Flag Status Register

The PMOVSR characteristics are:

Purpose

Allows software to clear the unsigned overflow flags for the following counters to 0:

- The cycle counter PMCCNTR.
- The event counters PMEVCNTR<n>.

Reading from this register shows the current unsigned overflow flag values.

Configuration

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0].

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0].

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to External register PMOVSCLR_EL0[31:0].

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

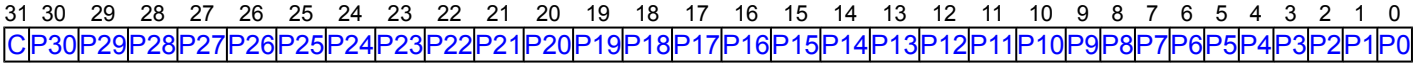
AArch32 System register PMOVSR bits [31:0] are architecturally mapped to External register PMOVS[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSR are UNDEFINED.

Attributes

PMOVSR is a 32-bit register.

Field descriptions



C, bit [31]

Unsigned overflow flag for PMCCNTR clear. On writes, allows software to clear the unsigned overflow flag for PMCCNTR to 0. On reads, returns the unsigned overflow flag for PMCCNTR overflow status.

C	Meaning
0b0	PMCCNTR has not overflowed.
0b1	PMCCNTR has overflowed.

PMCR.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR[31:0] or unsigned overflow of PMCCNTR[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.

        - EL1 is using AArch64.
        - PMUSERENR_EL0.UEN == 1.
        - PMUACR_EL1.C == 0.
    - Access to this field is **RO** if all the following are true:
        - FEAT_PMUv3p9 is implemented.
        - PSTATE.EL == EL0.
        - EL1 is using AArch64.
        - PMUSERENR_EL0.[UEN,CR] == 0b11.
    - Otherwise, access to this field is **W1C**.

P<m>, bit [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m> clear. On writes, allows software to clear the unsigned overflow flag for PMEVCNTR<m> to 0. On reads, returns the unsigned overflow flag for PMEVCNTR<m> overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m> has not overflowed.
0b1	PMEVCNTR<m> has overflowed.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP, HDCR.HLP, and PMCR.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<m>[31:0] or unsigned overflow of PMEVCNTR<m>[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Access to this field is **RAZ/WI** if all the following are true:
    - FEAT_PMUv3p9 is implemented.
    - PSTATE.EL == EL0.
    - EL1 is using AArch64.
    - PMUSERENR_EL0.UEN == 1.
    - PMUACR_EL1.P<m> == 0.
- Access to this field is **RO** if all the following are true:
    - FEAT_PMUv3p9 is implemented.
    - PSTATE.EL == EL0.
    - EL1 is using AArch64.
    - PMUSERENR_EL0.[UEN,ER] == 0b11.
- Otherwise, access to this field is **W1C**.

Accessing PMOVSR

PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

Purpose

Allows software to set the unsigned overflow flags for the following counters to 1:

- The cycle counter PMCCNTR.
- The event counters PMEVCNTR<n>.

Reading from this register shows the current unsigned overflow flag values.

Configuration

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0].

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0].

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register PMOVSCLR_EL0[31:0].

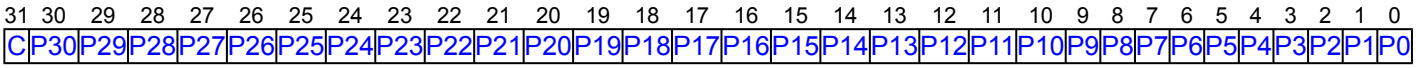
AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register PMOVS[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET are UNDEFINED.

Attributes

PMOVSSET is a 32-bit register.

Field descriptions



C, bit [31]

Unsigned overflow flag for PMCCNTR set. On writes, allows software to set the unsigned overflow flag for PMCCNTR to 1. On reads, returns the unsigned overflow flag for PMCCNTR overflow status.

C	Meaning
0b0	PMCCNTR has not overflowed.
0b1	PMCCNTR has overflowed.

PMCR.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR[31:0] or unsigned overflow of PMCCNTR[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:

        - FEAT_PMUv3p9 is implemented.
        - PSTATE.EL == EL0.
        - EL1 is using AArch64.
        - PMUSERENR_EL0.UEN == 1.
        - PMUACR_EL1.C == 0.
    - Access to this field is **RO** if all the following are true:
        - FEAT_PMUv3p9 is implemented.
        - PSTATE.EL == EL0.
        - EL1 is using AArch64.
        - PMUSERENR_EL0.[UEN,CR] == 0b11.
    - Otherwise, access to this field is **W1S**.

P<m>, bit [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m> set. On writes, allows software to set the unsigned overflow flag for PMEVCNTR<m> to 1. On reads, returns the unsigned overflow flag for PMEVCNTR<m> overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m> has not overflowed.
0b1	PMEVCNTR<m> has overflowed.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP, HDCR.HLP, and PMCR.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<m>[31:0] or unsigned overflow of PMEVCNTR<m>[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Access to this field is **RAZ/WI** if all the following are true:
    - FEAT_PMUv3p9 is implemented.
    - PSTATE.EL == EL0.
    - EL1 is using AArch64.
    - PMUSERENR_EL0.UEN == 1.
    - PMUACR_EL1.P<m> == 0.
- Access to this field is **RO** if all the following are true:
    - FEAT_PMUv3p9 is implemented.
    - PSTATE.EL == EL0.
    - EL1 is using AArch64.
    - PMUSERENR_EL0.[UEN,ER] == 0b11.
- Otherwise, access to this field is **W1S**.

Accessing PMOVSSET

PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

Purpose

Selects the current event counter PMEVCNTR<n> or the cycle counter PMCCNTR.

Used in conjunction with PMXEVTYPER to determine the event that increments a selected counter, and the modes and states in which the selected counter increments.

Used in conjunction with PMXEVCNTR to determine the value of a selected counter.

Configuration

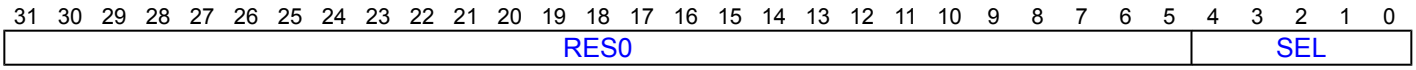
AArch32 System register PMSELR bits [31:0] are architecturally mapped to AArch64 System register PMSELR_EL0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSELR are UNDEFINED.

Attributes

PMSELR is a 32-bit register.

Field descriptions



Bits [31:5]

Reserved, RES0.

SEL, bits [4:0]

Event counter select. Selects the counter accessed by subsequent accesses to PMXEVTYPER and PMXEVCNTR.

SEL	Meaning
0b00000..0b11110	Select event counter PMEVCNTR<n>, where n is the value of this field: • MRC and MCR of PMXEVTYPER access PMEVTYPER<n>. • MRC and MCR of PMXEVCNTR access PMEVCNTR<n>.
0b11111	Select the cycle counter, PMCCNTR: • MRC and MCR of PMXEVTYPER access PMCCFILTR. • MRC and MCR of PMXEVCNTR are CONSTRAINED UNPREDICTABLE. For more information, see PMXEVCNTR.

For more information about the results of accesses to the event counters, including when PMSELR.SEL is set to the index of an unimplemented or inaccessible event counter, see PMXEVTYPER and PMXEVCNTR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSELR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b101

PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event `0x00`. For more information, see 'SW_INCR'.

Configuration

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to AArch64 System register PMSWINC_EL0[31:0].

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to External register PMSWINC_EL0[31:0] when FEAT_PMUv3p9 is not implemented.

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC are UNDEFINED.

Attributes

PMSWINC is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bit [31]

Reserved, RES0.

P<m>, bit [m], for m = 30 to 0

Software increment.

P<m>	Meaning
`0b0`	Write is ignored.
`0b1`	Increment PMEVCNTR<m>, if PMEVCNTR<m> is configured to count software increment events.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is **RAZ/WI**.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.[UEN,SW] == 0b10.
  - PMUACR_EL1.P<m> == 0.
- Otherwise, access to this field is **WO/RAZ**.

Accessing PMSWINC

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b100

```

PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

Purpose

Enables or disables EL0 access to the Performance Monitors.

Configuration

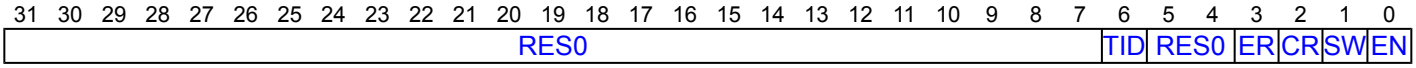
AArch32 System register PMUSERENR bits [31:0] are architecturally mapped to AArch64 System register PMUSERENR_EL0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR are UNDEFINED.

Attributes

PMUSERENR is a 32-bit register.

Field descriptions



Bits [31:7]

Reserved, RES0.

TID, bit [6]

When FEAT_PMUv3p9 is implemented:

Trap ID registers. Traps EL0 read access to common event identification registers.

TID	Meaning
0b0	Accesses to PMCEID<n> are not trapped by this mechanism.
0b1	EL0 read accesses to PMCEID<n> are trapped.

The register accesses affected by this control are:

- MRC reads of PMCEID0, PMCEID1, PMCEID2, and PMCEID3.

When trapped, reads are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES0.

ER, bit [3]

Event counters Read enable.

When PMUSERENR.EN is 0, PMUSERENR.ER enables EL0 reads of the event counters and EL0 reads and writes of the select register.

ER	Meaning
0b0	EL0 reads of the event counters and EL0 reads and writes of the select register are disabled, unless enabled by PMUSERENR.EN.
0b1	EL0 reads of the event counters and EL0 reads and writes of the select register are enabled, unless trapped by another control.

The register accesses affected by this control are:

- MRC reads of PMEVCNTR<n> and PMXEVCNTR.
- MRC and MCR accesses to PMSELR.

When disabled, reads and writes are UNDEFINED.

This field is ignored by the PE when PMUSERENR.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CR, bit [2]

Cycle counter Read enable.

When PMUSERENR.EN is 0, PMUSERENR.CR enables EL0 reads of the cycle counter.

CR	Meaning
0b0	EL0 reads of the cycle counter are disabled, unless enabled by PMUSERENR.EN.
0b1	EL0 reads of the cycle counter are enabled, unless trapped by another control.

The register accesses affected by this control are:

- MRC reads of PMCCNTR.
- MRRC reads of PMCCNTR.

When disabled, reads are UNDEFINED.

This field is ignored by the PE when PMUSERENR.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SW, bit [1]

Software increment register Write enable.

When PMUSERENR.EN is 0, PMUSERENR.SW enables EL0 writes to the Software increment register.

SW	Meaning
0b0	EL0 writes to the Software increment register are disabled, unless enabled by PMUSERENR.EN.
0b1	EL0 writes to the Software increment register are enabled, unless trapped by another control.

The register accesses affected by this control are:

- MCR writes to PMSWINC.

When disabled, writes are UNDEFINED.

This field is ignored by the PE when PMUSERENR.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enable. Enables EL0 read/write access to PMU registers.

EN	Meaning
0b0	EL0 accesses to the specified PMU System registers are trapped, unless enabled by PMUSERENR.{ER,CR,SW}.
0b1	EL0 accesses to the specified PMU System registers are enabled, unless trapped by another control.

The register accesses affected by this control are:

- MRC or MCR accesses to PMCCFILTR, PMCCNTR, PMCNTENCLR, PMCNTENSET, PMCR, PMEVCNTR<n>, PMEVTYPER<n>, PMOVSR, PMOVSSET, PMSELR, PMXEVCNTR, and PMXEVTYPER.
- MRC reads of the following registers:
  - PMCEID0 and PMCEID1.
  - If FEAT_PMUv3p1 is implemented, PMCEID2 and PMCEID3.
- MCR writes to PMSWINC.
- MRRC or MCRR accesses to PMCCNTR.

When trapped, reads and writes are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMUSERENR

When FEAT_PMUv3p9 is implemented and EL1 is using AArch64, PMUSERENR_EL0 contains additional controls that affect the behavior of this register.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b000

```

PMXEVCNTR, Performance Monitors Selected Event Count Register

The PMXEVCNTR characteristics are:

Purpose

Reads or writes the value of the selected event counter, PMEVCNTR<n>. PMSELR.SEL determines which event counter is selected.

Configuration

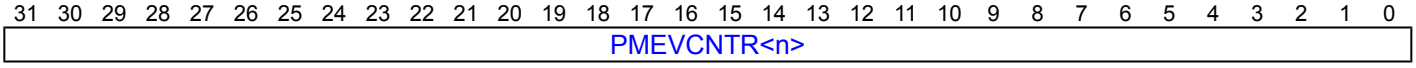
AArch32 System register PMXEVCNTR bits [31:0] are architecturally mapped to AArch64 System register PMXEVCNTR_EL0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR are UNDEFINED.

Attributes

PMXEVCNTR is a 32-bit register.

Field descriptions



PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, PMEVCNTR<n>, where n is the value stored in PMSELR.SEL.

If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMXEVCNTR return bits [31:0] of the counter.
- Writes to PMXEVCNTR update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64, bits [63:32] are not required to be implemented.

If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVCNTR

If FEAT_FGT is implemented and PMSELR.SEL is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMXEVCNTR is as follows:

- If PMSELR.SEL is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and PMSELR.SEL is greater than or equal to the number of accessible event counters, then reads and writes of PMXEVCNTR are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.

- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if PMSELR.SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and PMSELR.SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMXEVCNTR are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.P<UInt(PMSELR.SEL)> == 0.

Permitted writes of PMXEVCNTR are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.{UEN,ER} == {1,1}.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR.{ER,EN} or PMUSERENR_EL0.{UEN,ER,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is determined by the Effective value of PMCCR.EPMN. For more information, see HDCR.HPMN, MDCR_EL2.HPMN and PMCCR.EPMN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1101	0b010

PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

Purpose

When PMSELR.SEL selects an event counter, this accesses a PMEVTYPER<n> register. When PMSELR.SEL selects the cycle counter, this accesses PMCCFILTR.

Configuration

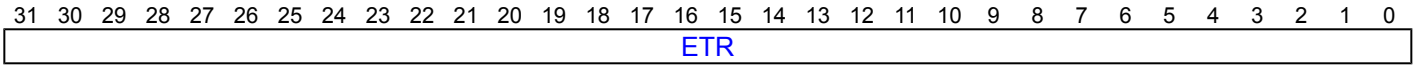
AArch32 System register PMXEVTYPER bits [31:0] are architecturally mapped to AArch64 System register PMXEVTYPER_EL0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER are UNDEFINED.

Attributes

PMXEVTYPER is a 32-bit register.

Field descriptions



ETR, bits [31:0]

Event type register or PMCCFILTR.

When PMSELR.SEL == 31, this register accesses PMCCFILTR.

Otherwise, this register accesses PMEVTYPER<n> where n is the value in PMSELR.SEL.

Accessing PMXEVTYPER

If FEAT_FGT is implemented, and PMSELR.SEL is not 31 and is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMXEVTYPER is as follows:

- If PMSELR.SEL is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented, and PMSELR.SEL is not 31 and is greater than or equal to the number of accessible event counters, then reads and writes of PMXEVTYPER are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if PMSELR.SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR.SEL is 31.
- If EL2 is implemented and enabled in the current Security state, and PMSELR.SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMXEVTYPER are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.

- EL1 is using AArch64.
- PMUSERENR_EL0.UEN == 1.
- Any of the following are true:
    - PMSELR.SEL != 31 and PMUACR_EL1.P<UInt(PMSELR.SEL)> == 0.
    - PMSELR.SEL == 31 and PMUACR_EL1.C == 0.

Permitted writes of PMXEVTYPER are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.UEN == 1.
- Any of the following are true:
    - PMSELR.SEL != 31 and PMUSERENR_EL0.ER == 1.
    - PMSELR.SEL == 31 and PMUSERENR_EL0.CR == 1.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR.EN or PMUSERENR_EL0.{UEN,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is determined by the Effective value of PMCCR.EPMN. For more information, see HDCR.HPMN, MDCR_EL2.HPMN and PMCCR.EPMN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

PRRR, Primary Region Remap Register

The PRRR characteristics are:

Purpose

Controls the top-level mapping of the TEX[0], C, and B memory region attributes.

Configuration

This register is banked between PRRR and PRRR_S and PRRR_NS.

AArch32 System register PRRR bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register PRRR bits [31:0] are architecturally mapped to AArch32 System register MAIR0[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register PRRR bits [31:0] (PRRR_S) are architecturally mapped to AArch32 System register MAIR0[31:0] (MAIR0_S) when EL3 is using AArch32.

AArch32 System register PRRR bits [31:0] (PRRR_NS) are architecturally mapped to AArch32 System register MAIR0[31:0] (MAIR0_NS) when EL3 is using AArch32.

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to PRRR are UNDEFINED.

MAIR0 and PRRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in MAIR0.

Attributes

PRRR is a 32-bit register.

This register has the following instances:

- PRRR, when EL3 is not implemented or FEAT_AA64 is implemented.
- PRRR_S, when FEAT_AA32EL3 is implemented.
- PRRR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == 0:

31	30	29	28	27	26	25	24	23 22 21 20	19	18	17	16	15 14	13 12	11 10	9 8	7 6	5 4	3 2	1 0
NOS7	NOS6	NOS5	NOS4	NOS3	NOS2	NOS1	NOS0	RES0	NS1	NS0	DS1	DS0	TR7	TR6	TR5	TR4	TR3	TR2	TR1	TR0

NOS<n>, bit [n+24], for n = 7 to 0

Not Outer Shareable. NOS<n> is the Outer Shareable property for memory attributes n, if the region is mapped as Normal memory that is not Inner Non-cacheable, Outer Non-cacheable, and the appropriate PRRR.{NS0, NS1} field identifies the region as shareable. n is the value of the concatenation of the {TEX[0], C, B} bits from the Translation table descriptor. The possible values of each NOS<n> field other than NOS6 are:

NOS<n>	Meaning
0b0	Memory region is Outer Shareable.
0b1	Memory region is Inner Shareable.

The value of this bit is ignored if the region is:

- Device memory
- Normal memory that is at least one of:
    - Inner Non-cacheable, Outer Non-cacheable.
    - Identified by the appropriate PRRR.{NS0, NS1} field as Non-shareable.

The meaning of the NOS6 field is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:20]

Reserved, RES0.

NS1, bit [19]

Mapping of S = 1 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the Translation table descriptor set to 1.

NS1	Meaning
0b0	Region is Non-shareable.
0b1	Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS0, bit [18]

Mapping of S = 0 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the Translation table descriptor set to 0.

NS0	Meaning
0b0	Region is Non-shareable.
0b1	Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DS1, bit [17]

Mapping of S = 1 attribute for Device memory. From Armv8.0, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DS0, bit [16]

Mapping of S = 0 attribute for Device memory. From Armv8.0, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TR<n>, bits [2n+1:2n], for n = 7 to 0

TR<n> is the primary TEX mapping for memory attributes n, and defines the mapped memory type for a region with attributes n. n is the value of the concatenation of the {TEX[0], C, B} bits from the Translation table descriptor. The possible values for each field other than TR6 are:

TR<n>	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Normal memory

The value 0b11 is reserved. The effect of programming a field to 0b11 is CONSTRAINED UNPREDICTABLE.

The meaning of the TR6 field is IMPLEMENTATION DEFINED.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PRRR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0010	0b000

REVIDR, Revision ID Register

The REVIDR characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configuration

AArch32 System register REVIDR bits [31:0] are architecturally mapped to AArch64 System register REVIDR_EL1[31:0].

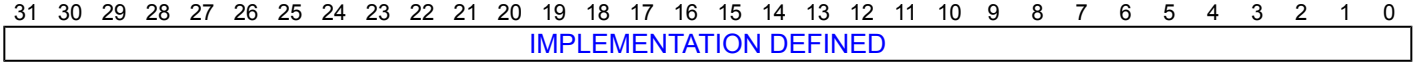
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to REVIDR are UNDEFINED.

If REVIDR has the same value as MIDR, then its contents have no significance.

Attributes

REVIDR is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing REVIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

RMR, Reset Management Register

The RMR characteristics are:

Purpose

If EL1 or EL3 is the highest implemented Exception level and this register is implemented:

- A write to the register at the highest implemented Exception level can request a Warm reset.
- If the highest implemented Exception level can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register RMR_EL1[31:0] when the highest implemented Exception level is EL1.

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register RMR_EL3[31:0] when EL3 is implemented.

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to RMR are UNDEFINED.

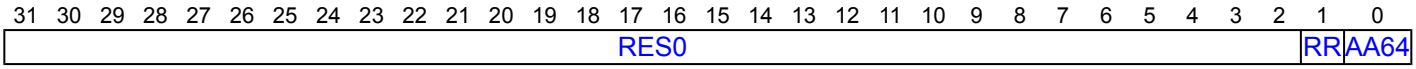
Only implemented if EL1 or EL3 is the highest implemented Exception level. In this case:

- If the highest implemented Exception level can use AArch32 and AArch64 then this register must be implemented.
- If the highest implemented Exception level cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Attributes

RMR is a 32-bit register.

Field descriptions



Bits [31:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

AA64, bit [0]

When the highest implemented Exception level can use AArch64, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
0b0	AArch32.
0b1	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If the highest implemented Exception level cannot use AArch64 this bit is RAZ/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing RMR

When EL3 is implemented, Arm deprecates accessing this register from any PE mode other than Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0000	0b010

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL IN {EL1, EL3} && IsHighestEL(PSTATE.EL) then
    R[t] = RMR;
else
    UNDEFINED;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0000	0b010

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if IsHighestEL(EL1) then
        RMR = R[t];
    else

RVBAR, Reset Vector Base Address Register

The RVBAR characteristics are:

Purpose

If EL3 is not implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch32 state.

Configuration

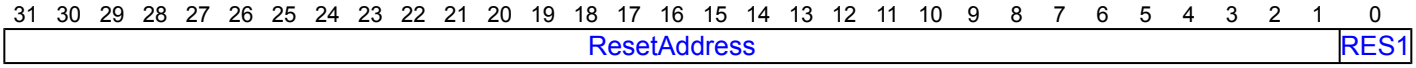
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to RVBAR are UNDEFINED.

This register is implemented only if the highest Exception level implemented is capable of using AArch32, and is not EL3.

Attributes

RVBAR is a 32-bit register.

Field descriptions



ResetAddress, bits [31:1]

Bits [31:1] of the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 32-bit state.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [0]

Reserved, RES1.

Accessing RVBAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0000	0b001

```

SCR, Secure Configuration Register

The SCR characteristics are:

Purpose

When EL3 is implemented and can use AArch32, defines the configuration of the current Security state. It specifies:

- The Security state, either Secure or Non-secure.
- What mode the PE branches to if an IRQ, FIQ, or External abort occurs.
- Whether the PSTATE.F or PSTATE.A bits can be modified when SCR.NS==1.

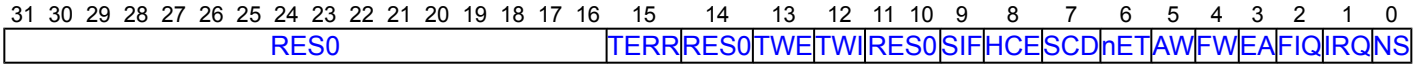
Configuration

This register is present only when FEAT_AA32EL3 is implemented. Otherwise, direct accesses to SCR are UNDEFINED.

Attributes

SCR is a 32-bit register.

Field descriptions



Bits [31:16]

Reserved, RES0.

TERR, bit [15]

When FEAT_RAS is implemented:

Trap Error record accesses. Generate a Monitor Trap exception on MRC, MCR, MRRC, or MCRR accesses to the following registers from modes other than Monitor mode, reported using EC syndrome values `0x03` and `0x04`:

ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS. When FEAT_RASv1p1 is implemented, ERXMISC4, ERXMISC5, ERXMISC6, ERXMISC7.

TERR	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Accesses to the specified registers from modes other than Monitor mode generate a Monitor Trap exception.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to `'0'`.

Otherwise:

Reserved, RES0.

Bit [14]

Reserved, RES0.

TWE, bit [13]

Traps WFE instructions to Monitor mode.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by SCTLR.nTWE or HCR.TWE. Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

TWI, bit [12]

Traps WFI instructions to Monitor mode.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by SCTLR.nTWI or HCR.TWI. Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Bits [11:10]

Reserved, RES0.

SIF, bit [9]

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction execution from Non-secure memory.

SIF	Meaning
0b0	Secure state instruction execution from Non-secure memory is permitted.
0b1	Secure state instruction execution from Non-secure memory is not permitted.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

HCE, bit [8]

Hypervisor Call instruction enable. If EL2 is implemented, enables execution of HVC instructions at Non-secure EL1 and EL2.

HCE	Meaning
0b0	HVC instructions are: • UNDEFINED at Non-secure EL1. The Undefined Instruction exception is taken from PL1 to PL1. • UNPREDICTABLE at EL2. Behavior is one of the following: ◦ The instruction is UNDEFINED. ◦ The instruction executes as a NOP.
0b1	HVC instructions are enabled at Non-secure EL1 and EL2.

Note

HVC instructions are always UNDEFINED at EL0 and in Secure state.

If EL2 is not implemented, this bit is RES0 and HVC is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

SCD, bit [7]

Secure Monitor Call disable. Disables SMC instructions.

SCD	Meaning
0b0	SMC instructions are enabled.
0b1	In Non-secure state, SMC instructions are UNDEFINED. The Undefined Instruction exception is taken from the current Exception level to the current Exception level. In Secure state, behavior is one of the following: • The instruction is UNDEFINED. • The instruction executes as a NOP.

Note

SMC instructions are always UNDEFINED at PL0.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

nET, bit [6]

Not Early Termination. This bit disables early termination.

nET	Meaning
0b0	Early termination permitted. Execution time of data operations can depend on the data values.
0b1	Disable early termination. The number of cycles required for data operations is forced to be independent of the data values.

This IMPLEMENTATION DEFINED mechanism can disable data dependent timing optimizations from multiplies and data operations. It can provide system support against information leakage that might be exploited by timing correlation types of attack.

On implementations that do not support early termination or do not support disabling early termination, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

AW, bit [5]

When the value of SCR.EA is 1 and the value of HCR.AMO is 0, this bit controls whether PSTATE.A masks an External abort taken from Non-secure state.

AW	Meaning
0b0	External aborts taken from Non-secure state are not masked by PSTATE.A, and are taken to EL3. External aborts taken from Secure state are masked by PSTATE.A.
0b1	External aborts taken from either Security state are masked by PSTATE.A. When PSTATE.A is 0, the abort is taken to EL3.

When SCR.EA is 0 or HCR.AMO is 1, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

FW, bit [4]

When the value of SCR.FIQ is 1 and the value of HCR.FMO is 0, this bit controls whether PSTATE.F masks an FIQ interrupt taken from Non-secure state.

FW	Meaning
0b0	An FIQ taken from Non-secure state is not masked by PSTATE.F, and is taken to EL3. An FIQ taken from Secure state is masked by PSTATE.F.
0b1	An FIQ taken from either Security state is masked by PSTATE.F. When PSTATE.F is 0, the FIQ is taken to EL3.

When SCR.FIQ is 0 or HCR.FMO is 1, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

EA, bit [3]

External Abort handler. This bit controls which mode takes External aborts and SError exceptions.

EA	Meaning
0b0	External aborts taken to Abort mode.
0b1	External aborts taken to Monitor mode.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

FIQ, bit [2]

FIQ handler. This bit controls which mode takes FIQ exceptions.

FIQ	Meaning
0b0	FIQs taken to FIQ mode.
0b1	FIQs taken to Monitor mode.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

IRQ, bit [1]

IRQ handler. This bit controls which mode takes IRQ exceptions.

IRQ	Meaning
0b0	IRQs taken to IRQ mode.
0b1	IRQs taken to Monitor mode.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

NS, bit [0]

Non-secure bit. Except when the PE is in Monitor mode, this bit determines the Security state of the PE:

NS	Meaning
0b0	PE is in Secure state.
0b1	PE is in Non-secure state.

If the HCR.TGE bit is set, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing the SCR.NS bit from 0 to 1 results in the SCR.NS bit remaining as 0.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Accessing SCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL3) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then

SCTLR, System Control Register

The SCTLR characteristics are:

Purpose

Provides the top-level control of the system, including its memory system.

Configuration

This register is banked between SCTLR and SCTLR_S and SCTLR_NS.

AArch32 System register SCTLR bits [31:0] are architecturally mapped to AArch64 System register SCTLR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to SCTLR are UNDEFINED.

Some bits in the register are read-only. These bits relate to non-configurable features of an implementation, and are provided for compatibility with previous versions of the architecture.

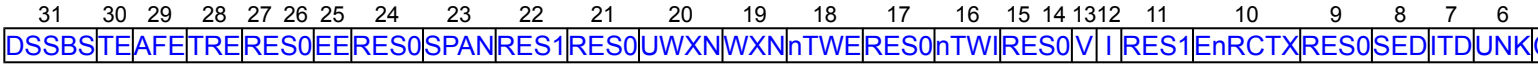
Attributes

SCTLR is a 32-bit register.

This register has the following instances:

- SCTLR, when EL3 is not implemented or FEAT_AA64 is implemented.
- SCTLR_S, when FEAT_AA32EL3 is implemented.
- SCTLR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



DSSBS, bit [31]

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to any mode in this security state except Hyp mode
0b1	PSTATE.SSBS is set to 1 on an exception to any mode in this security state except Hyp mode

Note

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to an Exception level that is executing at PL1 are taken to A32 or T32 state:

TE	Meaning
0b0	Exceptions, including reset, taken to A32 state.
0b1	Exceptions, including reset, taken to T32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

AFE, bit [29]

Access Flag Enable. When using the Short-descriptor translation table format for the PL1&0 translation regime, this bit enables use of the AP[0] bit in the translation descriptors as the Access flag, and restricts access permissions in the translation descriptors to the simplified model.

AFE	Meaning
0b0	In the Translation table descriptors, AP[0] is an access permissions bit. The full range of access permissions is supported. No Access flag is implemented.
0b1	In the Translation table descriptors, AP[0] is the Access flag. Only the simplified model for access permissions is supported.

When using the Long-descriptor translation table format, the VMSA behaves as if this bit is set to 1, regardless of the value of this bit.

The AFE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TRE, bit [28]

TEX remap enable. This bit enables remapping of the TEX[2:1] bits in the PL1&0 translation regime for use as two translation table bits that can be managed by the operating system. Enabling this remapping also changes the scheme used to describe the memory region attributes in the VMSA.

TRE	Meaning
0b0	TEX remap disabled. TEX[2:0] are used, with the C and B bits, to describe the memory region attributes.
0b1	TEX remap enabled. TEX[2:1] are reassigned for use as bits managed by the operating system. The TEX[0], C, and B bits are used to describe the memory region attributes, with the MMU remap registers.

When the value of TTBCR.EAE is 1, this bit is RES1.

The TRE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset, and the endianness of stage 1 translation table walks in the PL1&0 translation regime.

EE	Meaning
0b0	Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are little-endian.
0b1	Big-endian. PSTATE.E is set to 1 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support for data accesses at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception levels higher than EL0, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

SPAN, bit [23]

When FEAT_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1 from either Secure or Non-secure state, or to EL3 from Secure state when EL3 is using AArch32.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 in the following situations: • In Non-secure state, on taking an exception to EL1. • In Secure state, when EL3 is using AArch64, on taking an exception to EL1. • In Secure state, when EL3 is using AArch32, on taking an exception to EL3.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [22]

Reserved, RES1.

Bit [21]

Reserved, RES0.

UWXN, bit [20]

Unprivileged write permission implies PL1 XN (Execute-never). This bit can force all memory regions that are writable at PL0 to be treated as XN for accesses from software executing at PL1.

UWXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable at PL0 forced to XN for accesses from software executing at PL1.

The UWXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

WXN, bit [19]

Write permission implies XN (Execute-never). For the PL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the PL1&0 translation regime is forced to XN for accesses from software executing at PL1 or PL0.

This bit applies only when SCTLR.M bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to Undefined mode.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to Undefined mode.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no

Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'1'`.

Bits [15:14]

Reserved, RES0.

V, bit [13]

Vectors bit. This bit selects the base address of the exception vectors for exceptions taken to a PE mode other than Monitor mode or Hyp mode:

V	Meaning
`0b0`	Normal exception vectors. Base address is held in VBAR.
`0b1`	High exception vectors (Hivecs), base address `0xFFFF0000`. This base address cannot be remapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

I, bit [12]

Instruction access Cacheability control, for accesses at EL1 and EL0:

I	Meaning
`0b0`	All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
`0b1`	All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

Instruction accesses to Normal memory from EL1 and EL0 are Cacheable regardless of the value of the SCTLR.I bit if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Bit [11]

Reserved, RES1.

EnRCTX, bit [10]

When FEAT_SPECRES is implemented:

Enable EL0 access to the following System instructions:

- CFPRCTX.
- DVPRCTX.
- CPPRCTX.
- If FEAT_SPECRES2 is implemented, COSPRCTX.

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1.
0b1	EL0 access to these instructions is enabled.

Note

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

SED	Meaning
0b0	SETEND instruction execution is enabled at PL0 and PL1.
0b1	SETEND instructions are UNDEFINED at PL0 and PL1.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

ITD	Meaning
0b0	All IT instruction functionality is enabled at PL1 and PL0.
0b1	Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED: • All encodings of the IT instruction with hw1[3:0]!=1000. • All encodings of the subsequent instruction with the following values for hw1: ◦ 0b11xxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. ◦ 0b1011xxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'. ◦ 0b10100xxxxxxxxxx: ADD Rd, PC, #imm ◦ 0b01001xxxxxxxxxx: LDR Rd, [PC, #imm] ◦ 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. ◦ 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as: • A 16-bit instruction, that can only be followed by another 16-bit instruction. • The first half of a 32-bit instruction. This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1, SCTLR_EL2, and HSCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

UNK, bit [6]

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from PL1 and PL0:

CP15BEN	Meaning
0b0	PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.
0b1	PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1, SCTLR_EL2, and HSCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

When an implementation does not implement CP15BEN, access to this field is **RAO/WI**.

LSMAOE, bit [4]

When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL1 or EL0, T32 and A32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of T32 and A32 Load Multiple and Store Multiple at EL1 or EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Otherwise:

Reserved, RES1.

nTLSMD, bit [3]

When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/ Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/ Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Otherwise:

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL1 and EL0:

C	Meaning
0b0	All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, can be cached at all levels of data and unified cache.

The PE ignores SCTLR.C, and data accesses to Normal memory from EL1 and EL0 are Cacheable, if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

A	Meaning
0b0	Alignment fault checking disabled when executing at PL1 or PL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at PL1 or PL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL1 and EL0 stage 1 address translation disabled. See the SCTLR.I field for the behavior of instruction accesses to Normal memory.
0b1	EL1 and EL0 stage 1 address translation enabled.

The PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of the field if either:

- EL2 is using AArch32 and the value of HCR.{DC, TGE} is not {0, 0}.
- EL2 is using AArch64 and the value of HCR_EL2.{DC, TGE} is not {0, 0}.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing SCTLR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T1
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T1 ==
'1' then
        AArch32.TakeHypTrapException(0x03);

SDCR, Secure Debug Control Register

The SDCR characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug, trace, and the Performance Monitors Extension.

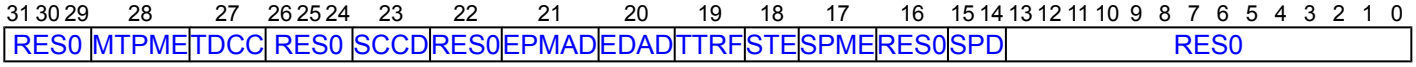
Configuration

This register is present only when FEAT_AA32EL3 is implemented. Otherwise, direct accesses to SDCR are UNDEFINED.

Attributes

SDCR is a 32-bit register.

Field descriptions



Bits [31:29]

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>.MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>.MT is 0.
0b1	PMEVTYPER<n>.MT bits not affected by this field.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, when the highest implemented Exception level is EL3, this field resets to '1'.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel in modes other than Monitor mode to Monitor mode.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	Accesses to the DCC registers in modes other than Monitor mode generate a Monitor Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

- DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

When the PE is in Debug state, SDCR.TDCC does not trap any accesses to:

- DBGDTRRXint and DBGDTRTXint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [26:24]

Reserved, RES0.

SCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

Secure Cycle Counter Disable. Prohibits PMCCNTR from counting in Secure state and EL3.

SCCD	Meaning
0b0	Cycle counting by PMCCNTR is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR is prohibited in Secure state and EL3.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

EPMAD, bit [21]

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Non-secure access disable. Controls Non-secure access to Performance Monitors registers by an external debugger.

EPMAD	Meaning
0b0	No accesses from an external debugger to the Performance Monitor registers are prohibited by this control.
0b1	Non-secure accesses from an external debugger to the affected Performance Monitor registers are prohibited.

Otherwise, if EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

When FEAT_PMUv3_EXT is implemented:

External Performance Monitors access disable. Controls access to Performance Monitors registers by an external debugger.

EPMAD	Meaning
0b0	No accesses from an external debugger to the Performance Monitor registers are prohibited by this control.
0b1	If the IMPLEMENTATION DEFINED authentication interface function ExternalSecureInvasiveDebugEnabled() returns FALSE, then accesses from an external debugger to the affected Performance Monitor registers are prohibited.

Otherwise, if EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

EDAD, bit [20]
When FEAT_Debugv8p4 is implemented:

External debug Non-secure access disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
0b0	No accesses from an external debugger to the debug registers are prohibited by this control.
0b1	Non-secure accesses from an external debugger to the affected debug registers are prohibited.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

When FEAT_Debugv8p2 is implemented:

External debug access disable. Controls access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
0b0	No accesses from an external debugger to the debug registers are prohibited by this control.
0b1	If the IMPLEMENTATION DEFINED authentication interface function `ExternalSecureInvasiveDebugEnabled()` returns FALSE, then accesses from an external debugger to the affected debug registers are prohibited.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to `'0'`.

Otherwise:

External debug access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
0b0	No accesses from an external debugger to the debug registers are prohibited by this control.
0b1	If the IMPLEMENTATION DEFINED authentication interface function `ExternalSecureInvasiveDebugEnabled()` returns FALSE, then accesses from an external debugger to the affected debug registers are prohibited.

It is IMPLEMENTATION DEFINED whether accesses to OSLAR_EL1 from an external debugger are affected by this control.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to `'0'`.

TTRF, bit [19]

When FEAT_TRF is implemented:

Trap Trace Filter controls. Controls whether accesses in modes other than Monitor mode to the trace filter control registers generate a Monitor Trap exception.

TTRF	Meaning
0b0	Accesses to HTRFCR and TRFCR are not affected by this control bit.
0b1	When not in Monitor mode, accesses to HTRFCR and TRFCR generate a Monitor Trap exception, unless the access generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to `'0'`.

Otherwise:

Reserved, RES0.

STE, bit [18]

When FEAT_TRF is implemented:

Secure Trace Enable. This field enables tracing in Secure state and controls the level of authentication required by an external debugger to enable external tracing.

STE	Meaning
0b0	Trace is prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Secure state is not affected by this field.

This field also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of SCR.NS is 0, the PE behaves as if this field is set to 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

SPME, bit [17]
When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	Event counting is prohibited in Secure state. If PMCR.DP is 1, PMCCNTR is disabled in Secure state. Otherwise, PMCCNTR is not affected by this mechanism.
0b1	Event counting and PMCCNTR are not affected by this mechanism.

This field affects the operation of all event counters in Secure state, and if PMCR.DP is 1, the operation of PMCCNTR in Secure state. When PMCR.DP is 0, PMCCNTR is not affected by this field.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

When FEAT_PMUv3 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	If ExternalSecureNoninvasiveDebugEnabled() is FALSE, event counting is prohibited in Secure state, and if PMCR.DP is 1, PMCCNTR is disabled in Secure state.
0b1	Event counting and PMCCNTR are not affected by this mechanism.

If ExternalSecureNoninvasiveDebugEnabled() is TRUE, the event counters and PMCCNTR are not affected by this field.

Otherwise, this field affects the operation of all event counters in Secure state, and if PMCR.DP is 1, the operation of PMCCNTR in Secure state. When PMCR.DP is 0, PMCCNTR is not affected by this field.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [16]

Reserved, RES0.

SPD, bits [15:14]

AArch32 Secure self-hosted Privileged Debug. Enables or disables debug exceptions from EL3, other than Breakpoint Instruction exceptions.

SPD	Meaning
0b00	Legacy mode. Debug exceptions from EL3 are enabled by the authentication interface.
0b10	Secure privileged debug disabled. Debug exceptions from EL3 are disabled.
0b11	Secure privileged debug enabled. Debug exceptions from EL3 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored in Non-secure state.

If debug exceptions from EL3 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER.SUIDEN is 1.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '00'.

Bits [13:0]

Reserved, RES0.

Accessing SDCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

SDER, Secure Debug Enable Register

The SDER characteristics are:

Purpose

Controls invasive and non-invasive debug in the Secure EL0 mode.

Configuration

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register SDER32_EL2[31:0] when EL2 is implemented and FEAT_SEL2 is implemented.

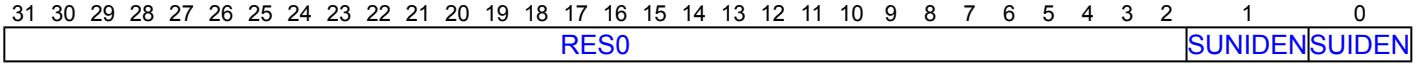
AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register SDER32_EL3[31:0] when EL3 is implemented.

This register is present only when (EL3 is implemented and FEAT_AA32EL3 is implemented) or (FEAT_AA32EL1 is implemented and Secure EL1 is implemented). Otherwise, direct accesses to SDER are UNDEFINED.

Attributes

SDER is a 32-bit register.

Field descriptions



Bits [31:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable.

SUNIDEN	Meaning
0b0	This bit has no effect on non-invasive debug.
0b1	Non-invasive debug is allowed in Secure EL0 using AArch32.

When EL3 or Secure EL1 is using AArch32, the forms of non-invasive debug affected by this control are:

- The PC Sample-based Profiling Extension. See About the PC Sample-based Profiling Extension.
- When SelfHostedTraceEnabled() == FALSE, processor trace.
- When EL3 is implemented, Performance Monitors.

When Secure EL1 is using AArch64, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

SUIDEN, bit [0]

When EL3 is implemented:

Secure User Invasive Debug Enable.

SUIDEN	Meaning
0b0	This bit does not affect the generation of debug exceptions at Secure EL0.
0b1	If EL3 or EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Accessing SDER

Accesses to this register use the following encodings in the System register encoding space:

```

SPSR, Saved Program Status Register

The SPSR characteristics are:

Purpose

Holds the saved process state for the current mode.

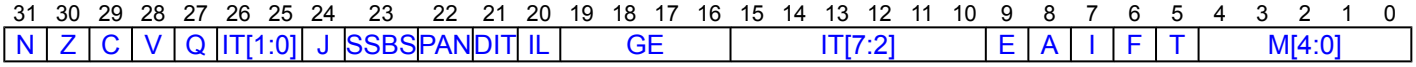
Configuration

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR are UNDEFINED.

Attributes

SPSR is a 32-bit register.

Field descriptions



N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to the current mode, and copied to PSTATE.N on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to the current mode, and copied to PSTATE.Z on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to the current mode, and copied to PSTATE.C on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to the current mode, and copied to PSTATE.V on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to the current mode, and copied to PSTATE.Q on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to the current mode, and copied to PSTATE.IT on executing an exception return operation in the current mode.

On executing an exception return operation in the current mode, SPSR.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR[26:25].
- IT[7:2] is SPSR[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to the current mode, and copied to PSTATE.SSBS on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to the current mode, and copied to PSTATE.PAN on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to the current mode, and copied to PSTATE.DIT on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to the current mode, and copied to PSTATE.IL on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to the current mode, and copied to PSTATE.GE on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to the current mode, and copied to PSTATE.E on executing an exception return operation in the current mode.

If the implementation does not support big-endian operation, SPSR.E is RES0. If the implementation does not support little-endian operation, SPSR.E is RES1. On executing an exception return operation in the current mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to the current mode, and copied to PSTATE.A on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to the current mode, and copied to PSTATE.I on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to the current mode, and copied to PSTATE.F on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to the current mode, and copied to PSTATE.T on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to the current mode, and copied to PSTATE.M[4:0] on executing an exception return operation in the current mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10110	Monitor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in the current mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR

SPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.

SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

Purpose

Holds the saved process state when an exception is taken to Abort mode.

Configuration

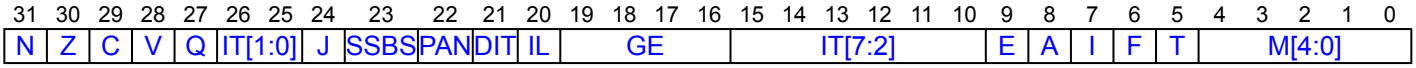
AArch32 System register SPSR_abt bits [31:0] are architecturally mapped to AArch64 System register SPSR_abt[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR_abt are UNDEFINED.

Attributes

SPSR_abt is a 32-bit register.

Field descriptions



N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Abort mode, and copied to PSTATE.IT on executing an exception return operation in Abort mode.

On executing an exception return operation in Abort mode, SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_abt[26:25].
- IT[7:2] is SPSR_abt[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_abt

SPSR_abt is accessible in all modes other than User mode and Abort mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_abt
```

R	M	M1
0b1	0b1	0b0100

```
MSR{<c>}{<q>} SPSR_abt, <Rn>
```

R	M	M1

0b1	0b1	0b0100

SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

Purpose

Holds the saved process state when an exception is taken to FIQ mode.

Configuration

AArch32 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch64 System register SPSR_fiq[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR_fiq are UNDEFINED.

Attributes

SPSR_fiq is a 32-bit register.

Field descriptions

31	30	29	28	27	26 25	24	23 22	21	20	19 18 17 16	15 14 13 12 11 10	9	8	7	6	5	4 3 2 1 0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL	GE	IT[7:2]		E	A	I	F	T	M[4:0]

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to FIQ mode, and copied to PSTATE.IT on executing an exception return operation in FIQ mode.

On executing an exception return operation in FIQ mode, SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_fiq[26:25].
- IT[7:2] is SPSR_fiq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_fiq

SPSR_fiq is accessible in all modes other than User mode and FIQ mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_fiq
```

R	M	M1
0b1	0b0	0b1110

```
MSR{<c>}{<q>} SPSR_fiq, <Rn>
```

R	M	M1

0b1	0b0	0b1110

SPSR_hyp, Saved Program Status Register (Hyp mode)

The SPSR_hyp characteristics are:

Purpose

Holds the saved process state when an exception is taken to Hyp mode.

Configuration

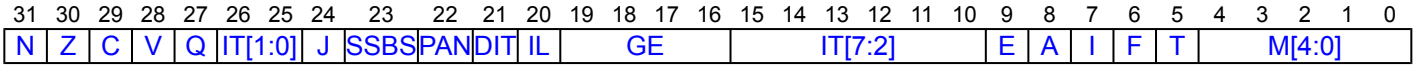
AArch32 System register SPSR_hyp bits [31:0] are architecturally mapped to AArch64 System register SPSR_EL2[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR_hyp are UNDEFINED.

Attributes

SPSR_hyp is a 32-bit register.

Field descriptions



N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Hyp mode, and copied to PSTATE.N on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Hyp mode, and copied to PSTATE.Z on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Hyp mode, and copied to PSTATE.C on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Hyp mode, and copied to PSTATE.V on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Hyp mode, and copied to PSTATE.Q on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Hyp mode, and copied to PSTATE.IT on executing an exception return operation in Hyp mode.

On executing an exception return operation in Hyp mode, SPSR_hyp.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_hyp[26:25].
- IT[7:2] is SPSR_hyp[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Hyp mode, and copied to PSTATE.SSBS on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Hyp mode, and copied to PSTATE.PAN on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Hyp mode, and copied to PSTATE.DIT on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Hyp mode, and copied to PSTATE.IL on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Hyp mode, and copied to PSTATE.GE on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Hyp mode, and copied to PSTATE.E on executing an exception return operation in Hyp mode.

If the implementation does not support big-endian operation, SPSR_hyp.E is RES0. If the implementation does not support little-endian operation, SPSR_hyp.E is RES1. On executing an exception return operation in Hyp mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_hyp.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_hyp.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Hyp mode, and copied to PSTATE.A on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Hyp mode, and copied to PSTATE.I on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Hyp mode, and copied to PSTATE.F on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Hyp mode, and copied to PSTATE.T on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Hyp mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Hyp mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_hyp.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Hyp mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_hyp

SPSR_hyp is accessible only in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_hyp
```

R	M	M1
0b1	0b1	0b1110

```
MSR{<c>}{<q>} SPSR_hyp, <Rn>
```

R	M	M1
0b1	0b1	0b1110

SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

Purpose

Holds the saved process state when an exception is taken to IRQ mode.

Configuration

AArch32 System register SPSR_irq bits [31:0] are architecturally mapped to AArch64 System register SPSR_irq[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR_irq are UNDEFINED.

Attributes

SPSR_irq is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]		J	SSBS	PAN	DIT	IL	GE				IT[7:2]						E	A	I	F	T	M[4:0]				

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to IRQ mode, and copied to PSTATE.IT on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode, SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_irq[26:25].
- IT[7:2] is SPSR_irq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_irq

SPSR_irq is accessible in all modes other than User mode and IRQ mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_irq
```

R	M	M1
0b1	0b1	0b0000

```
MSR{<c>}{<q>} SPSR_irq, <Rn>
```

R	M	M1

0b1	0b1	0b0000

SPSR_mon, Saved Program Status Register (Monitor mode)

The SPSR_mon characteristics are:

Purpose

Holds the saved process state when an exception is taken to Monitor mode.

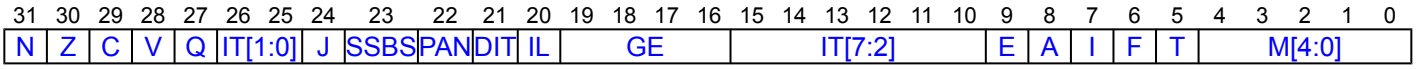
Configuration

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR_mon are UNDEFINED.

Attributes

SPSR_mon is a 32-bit register.

Field descriptions



N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Monitor mode, and copied to PSTATE.N on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Monitor mode, and copied to PSTATE.Z on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Monitor mode, and copied to PSTATE.C on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Monitor mode, and copied to PSTATE.V on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Monitor mode, and copied to PSTATE.Q on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Monitor mode, and copied to PSTATE.IT on executing an exception return operation in Monitor mode.

On executing an exception return operation in Monitor mode, SPSR_mon.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_mon[26:25].
- IT[7:2] is SPSR_mon[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Monitor mode, and copied to PSTATE.SSBS on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Monitor mode, and copied to PSTATE.PAN on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Monitor mode, and copied to PSTATE.DIT on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Monitor mode, and copied to PSTATE.IL on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Monitor mode, and copied to PSTATE.GE on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Monitor mode, and copied to PSTATE.E on executing an exception return operation in Monitor mode.

If the implementation does not support big-endian operation, SPSR_mon.E is RES0. If the implementation does not support little-endian operation, SPSR_mon.E is RES1. On executing an exception return operation in Monitor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_mon.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_mon.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Monitor mode, and copied to PSTATE.A on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Monitor mode, and copied to PSTATE.I on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Monitor mode, and copied to PSTATE.F on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Monitor mode, and copied to PSTATE.T on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Monitor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Monitor mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10110	Monitor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_mon.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Monitor mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_mon

SPSR_mon is only accessible in EL3 modes other than Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_mon
```

R	M	M1
0b1	0b1	0b1100

```
MSR{<c>}{<q>} SPSR_mon, <Rn>
```

R	M	M1
0b1	0b1	0b1100

SPSR_svc, Saved Program Status Register (Supervisor mode)

The SPSR_svc characteristics are:

Purpose

Holds the saved process state when an exception is taken to Supervisor mode.

Configuration

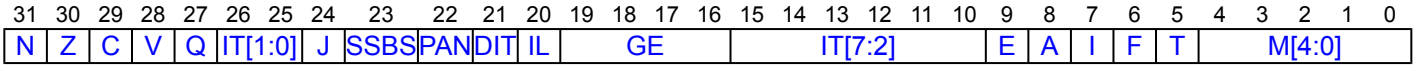
AArch32 System register SPSR_svc bits [31:0] are architecturally mapped to AArch64 System register SPSR_EL1[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR_svc are UNDEFINED.

Attributes

SPSR_svc is a 32-bit register.

Field descriptions



N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Supervisor mode, and copied to PSTATE.N on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Supervisor mode, and copied to PSTATE.Z on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Supervisor mode, and copied to PSTATE.C on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Supervisor mode, and copied to PSTATE.V on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Supervisor mode, and copied to PSTATE.Q on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Supervisor mode, and copied to PSTATE.IT on executing an exception return operation in Supervisor mode.

On executing an exception return operation in Supervisor mode, SPSR_svc.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_svc[26:25].
- IT[7:2] is SPSR_svc[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Supervisor mode, and copied to PSTATE.SSBS on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Supervisor mode, and copied to PSTATE.PAN on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Supervisor mode, and copied to PSTATE.DIT on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Supervisor mode, and copied to PSTATE.IL on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Supervisor mode, and copied to PSTATE.GE on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Supervisor mode, and copied to PSTATE.E on executing an exception return operation in Supervisor mode.

If the implementation does not support big-endian operation, SPSR_svc.E is RES0. If the implementation does not support little-endian operation, SPSR_svc.E is RES1. On executing an exception return operation in Supervisor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_svc.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_svc.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Supervisor mode, and copied to PSTATE.A on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Supervisor mode, and copied to PSTATE.I on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Supervisor mode, and copied to PSTATE.F on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Supervisor mode, and copied to PSTATE.T on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Supervisor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Supervisor mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_svc.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Supervisor mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_svc

SPSR_svc is accessible in all modes other than User mode and Supervisor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_svc
```

R	M	M1
0b1	0b1	0b0010

```
MSR{<c>}{<q>} SPSR_svc, <Rn>
```

R	M	M1

SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

Purpose

Holds the saved process state when an exception is taken to Undefined mode.

Configuration

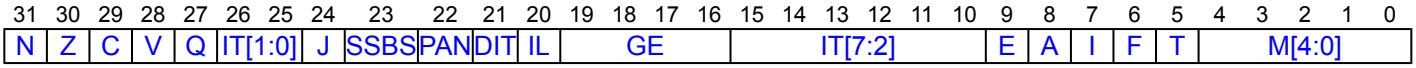
AArch32 System register SPSR_und bits [31:0] are architecturally mapped to AArch64 System register SPSR_und[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR_und are UNDEFINED.

Attributes

SPSR_und is a 32-bit register.

Field descriptions



N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Undefined mode, and copied to PSTATE.IT on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode, SPSR_und.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_und[26:25].
- IT[7:2] is SPSR_und[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_und

SPSR_und is accessible in all modes other than User mode and Undefined mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_und
```

TCMTR, TCM Type Register

The TCMTR characteristics are:

Purpose

Provides information about the implementation of the TCM.

Configuration

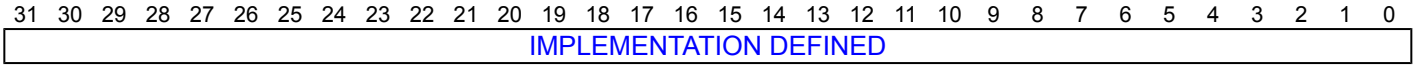
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TCMTR are UNDEFINED.

If EL1 or above can use AArch32 then this register must be implemented.

Attributes

TCMTR is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing TCMTR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b010

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T0
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T0 ==
'1' then
        AArch32.TakeHypTrapException(0x03);

TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIALL are UNDEFINED.

Attributes

TLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALL

Accesses to this instruction use the following encodings in the System instruction encoding space:

```

TLBIALLH, TLB Invalidate All, Hyp mode

The TLBIALLH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to TLBIALLH are UNDEFINED.

Attributes

TLBIALLH is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLH

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0111	0b000

```

TLBIALLHIS, TLB Invalidate All, Hyp mode, Inner Shareable

The TLBIALLHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to TLBIALLHIS are UNDEFINED.

Attributes

TLBIALLHIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLHIS

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```

TLBIALLIS, TLB Invalidate All, Inner Shareable

The TLBIALLIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIALLIS are UNDEFINED.

Attributes

TLBIALLIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

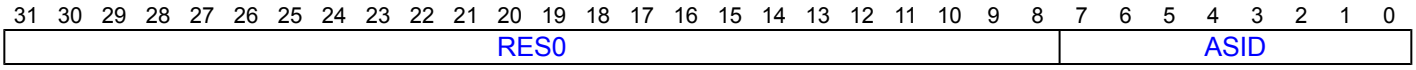
Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIASID are UNDEFINED.

Attributes

TLBIASID is a 32-bit System instruction.

Field descriptions



Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing TLBIASID

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

TLBIASIDIS, TLB Invalidate by ASID match, Inner Shareable

The TLBIASIDIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

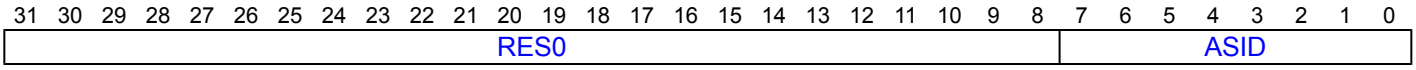
Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIASIDIS are UNDEFINED.

Attributes

TLBIASIDIS is a 32-bit System instruction.

Field descriptions



Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing TLBIASIDIS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0011	0b010

```

TLBIIPAS2, TLB Invalidate by Intermediate Physical Address, Stage 2

The TLBIIPAS2 characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to TLBIIPAS2 are UNDEFINED.

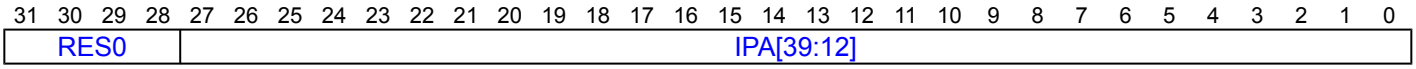
Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIIPAS2 is a 32-bit System instruction.

Field descriptions



Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing TLBIIPAS2

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

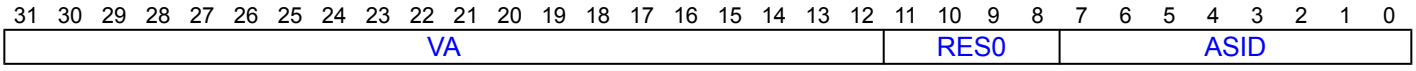
Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIMVA are UNDEFINED.

Attributes

TLBIMVA is a 32-bit System instruction.

Field descriptions



VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVA

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

TLBIMVAA, TLB Invalidate by VA, All ASID

The TLBIMVAA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

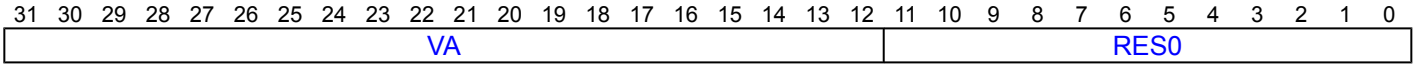
Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIMVAA are UNDEFINED.

Attributes

TLBIMVAA is a 32-bit System instruction.

Field descriptions



VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVAA

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

TLBIMVAAIS, TLB Invalidate by VA, All ASID, Inner Shareable

The TLBIMVAAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

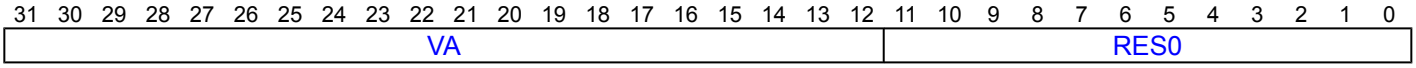
Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIMVAAIS are UNDEFINED.

Attributes

TLBIMVAAIS is a 32-bit System instruction.

Field descriptions



VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVAAIS

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIMVAH, TLB Invalidate by VA, Hyp mode

The TLBIMVAH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this System instruction.

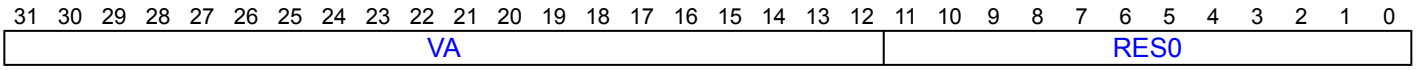
Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to TLBIMVAH are UNDEFINED.

Attributes

TLBIMVAH is a 32-bit System instruction.

Field descriptions



VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVAH

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```

TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

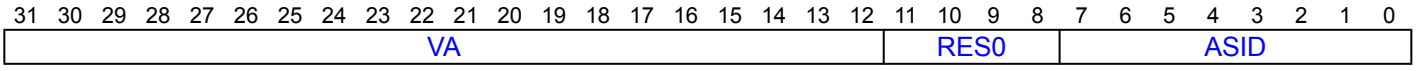
Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIMVAIS are UNDEFINED.

Attributes

TLBIMVAIS is a 32-bit System instruction.

Field descriptions



VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVAIS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0011	0b001

```

TLBIMVAL, TLB Invalidate by VA, Last level

The TLBIMVAL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

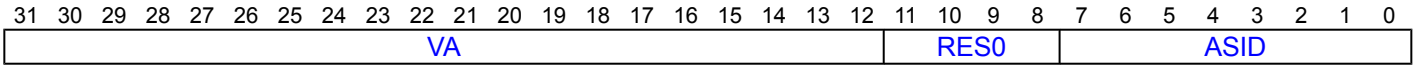
This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIMVAL are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVAL is a 32-bit System instruction.

Field descriptions



VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVAL

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b101

```

TLBIMVALH, TLB Invalidate by VA, Last level, Hyp mode

The TLBIMVALH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from the final level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this System instruction.

Configuration

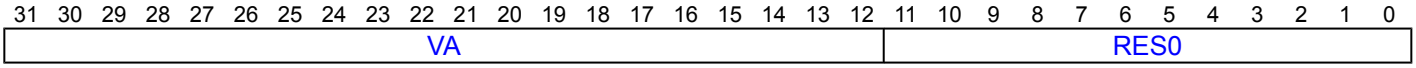
This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to TLBIMVALH are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVALH is a 32-bit System instruction.

Field descriptions



VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVALH

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

TLBIMVALIS, TLB Invalidate by VA, Last level, Inner Shareable

The TLBIMVALIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

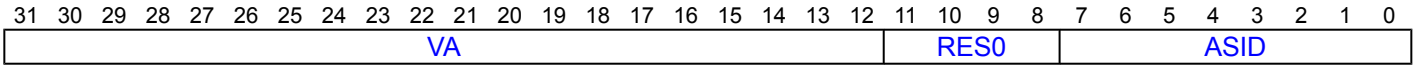
This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIMVALIS are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVALIS is a 32-bit System instruction.

Field descriptions



VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVALIS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```

TLBTR, TLB Type Register

The TLBTR characteristics are:

Purpose

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

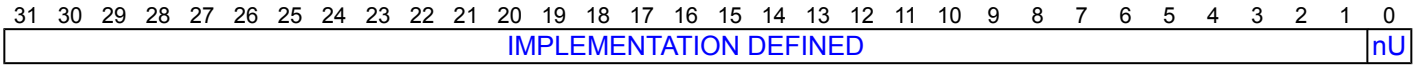
Configuration

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBTR are UNDEFINED.

Attributes

TLBTR is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:1]

IMPLEMENTATION DEFINED.

nU, bit [0]

Not Unified TLB. Indicates whether the implementation has a unified TLB.

The value of this field is an IMPLEMENTATION DEFINED choice of:

nU	Meaning
0b0	Unified TLB.
0b1	Separate Instruction and Data TLBs.

Access to this field is **RO**.

Accessing TLBTR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b011

TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configuration

This register is banked between TPIDRPRW and TPIDRPRW_S and TPIDRPRW_NS.

AArch32 System register TPIDRPRW bits [31:0] are architecturally mapped to AArch64 System register TPIDR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TPIDRPRW are UNDEFINED.

Note

The PE never updates this register.

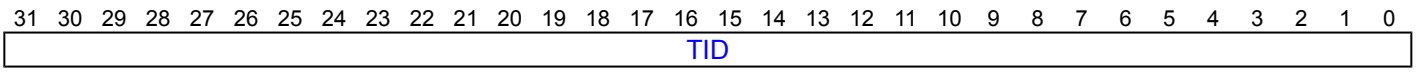
Attributes

TPIDRPRW is a 32-bit register.

This register has the following instances:

- TPIDRPRW, when EL3 is not implemented or FEAT_AA64 is implemented.
- TPIDRPRW_S, when FEAT_AA32EL3 is implemented.
- TPIDRPRW_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



TID, bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRPRW

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

TPIDRURO, PL0 Read-Only Software Thread ID Register

The TPIDRURO characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configuration

This register is banked between TPIDRURO and TPIDRURO_S and TPIDRURO_NS.

AArch32 System register TPIDRURO bits [31:0] are architecturally mapped to AArch64 System register TPIDRRO_EL0[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to TPIDRURO are UNDEFINED.

Note

The PE never updates this register.

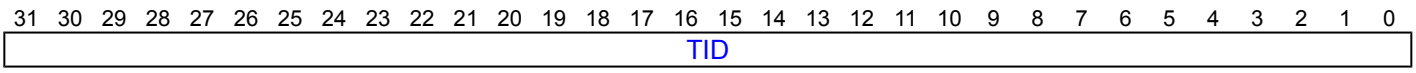
Attributes

TPIDRURO is a 32-bit register.

This register has the following instances:

- TPIDRURO, when EL3 is not implemented or FEAT_AA64 is implemented.
- TPIDRURO_S, when FEAT_AA32EL3 is implemented.
- TPIDRURO_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



TID, bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRURO

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

TRFCR, Trace Filter Control Register

The TRFCR characteristics are:

Purpose

Provides EL1 controls for Trace.

Configuration

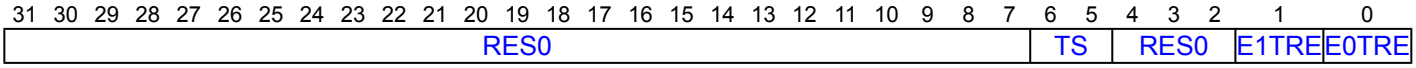
AArch32 System register TRFCR bits [31:0] are architecturally mapped to AArch64 System register TRFCR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented and FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR are UNDEFINED.

Attributes

TRFCR is a 32-bit register.

Field descriptions



Bits [31:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning	Applies when
0b01	Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF.	
0b10	Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2: • EL3 is implemented and is using AArch32. • EL3 is implemented, using AArch64, and SCR_EL3.ECVEn == 0b0. • EL2 is using AArch32. • EL2 is using AArch64 and CNTHCTL_EL2.ECV == 0b0. • FEAT_ECV_POFF is not implemented.	When FEAT_ECV is implemented
0b11	Physical timestamp. The traced timestamp is the physical counter value.	

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- EL2 is implemented and HTRFCR.TS != 0b00.
- SelfHostedTraceEnabled() == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

E1TRE	Meaning
0b0	Tracing is prohibited in PL1 modes.
0b1	Tracing is allowed in PL1 modes.

This field is ignored if SelfHostedTraceEnabled() == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

E0TRE, bit [0]

EL0 Trace Enable.

E0TRE	Meaning
0b0	Tracing is prohibited at EL0.
0b1	Tracing is allowed at EL0.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current security state and HCR.TGE == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing TRFCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

Purpose

The control register for stage 1 of the PL1&0 translation regime. Its controls include:

- Where the VA range is split between addresses translated using TTBR0 and addresses translated using TTBR1.
- The translation table format used by this stage of translation.

From Armv8.2, when the value of TTBCR.{EAE, T2E} is {1, 1}, TTBCR is used with TTBCR2.

Configuration

This register is banked between TTBCR and TTBCR_S and TTBCR_NS.

AArch32 System register TTBCR bits [31:0] are architecturally mapped to AArch64 System register TCR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TTBCR are UNDEFINED.

The current translation table format determines which format of the register is used.

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

Attributes

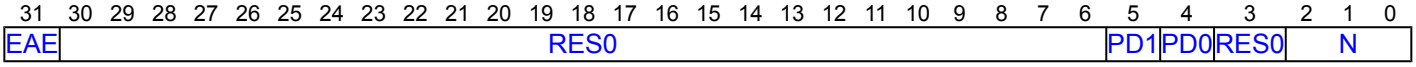
TTBCR is a 32-bit register.

This register has the following instances:

- TTBCR, when EL3 is not implemented or FEAT_AA64 is implemented.
- TTBCR_S, when FEAT_AA32EL3 is implemented.
- TTBCR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == 0:



EAE, bit [31]

Extended Address Enable.

EAE	Meaning
0b0	Use the VMSAv8-32 translation system with the Short-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [30:6]

Reserved, RES0.

PD1, bit [5]

Translation table walk disable for translations using TTBR1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1.

PD1	Meaning
0b0	Perform translation table walks using TTBR1.
0b1	A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

PD0, bit [4]

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using TTBR0.

PD0	Meaning
0b0	Perform translation table walks using TTBR0.
0b1	A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [3]

Reserved, RES0.

N, bits [2:0]

Indicate the width of the base address held in TTBR0. In TTBR0, the base address field is bits[31:14-N]. The value of N also determines:

- Whether TTBR0 or TTBR1 is used as the base address for translation table walks.
- The size of the translation table pointed to by TTBR0.

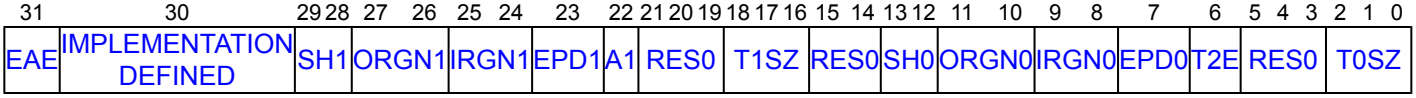
N can take any value from 0 to 7, that is, from 0b000 to 0b111.

When N has its reset value of 0, the translation table base is compatible with Armv5 and Armv6.

The reset behavior of this field is:

- On a Warm reset, this field resets to '000'.

When TTBCR.EAE == 1:



EAE, bit [31]

Extended Address Enable.

EAE	Meaning
0b1	Use the VMSAv8-32 translation system with the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1.

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using TTBR1.

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using TTBR1.

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

EPD1, bit [23]

Translation table walk disable for translations using TTBR1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1.

EPD1	Meaning
0b0	Perform translation table walks using TTBR1.
0b1	A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

A1, bit [22]

Selects whether TTBR0 or TTBR1 defines the ASID.

A1	Meaning
0b0	TTBR0.ASID defines the ASID.
0b1	TTBR1.ASID defines the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [21:19]

Reserved, RES0.

T1SZ, bits [18:16]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '000'.

Bits [15:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0.

SH0	Meaning
0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

EPD0, bit [7]

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0.

EPD0	Meaning
0b0	Perform translation table walks using TTBR0.
0b1	A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

T2E, bit [6]

When FEAT_AA32HPD is implemented:

TTBCR2 Enable.

T2E	Meaning
0b0	TTBCR2 is disabled. The contents of TTBCR2 are treated as 0 for all purposes other than reading or writing the register.
0b1	TTBCR2 is enabled.

If TTBCR.EAE==0, then the behavior is as if the bit is 0.

Otherwise:

Reserved, RES0.

Bits [5:3]

Reserved, RES0.

T0SZ, bits [2:0]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'000'`.

Accessing TTBCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

TTBCR2, Translation Table Base Control Register 2

The TTBCR2 characteristics are:

Purpose

The second control register for stage 1 of the PL1&0 translation regime.

If FEAT_AA32HPD is not implemented then this register is not implemented and its encoding is UNDEFINED. Otherwise:

- When the value of TTBCR.{EAE, T2E} is not {1, 1} the contents of TTBCR2 are treated as zero for all purposes other than reading or writing the register.
- When the value of TTBCR.{EAE, T2E} is {1, 1} TTBCR2 is used with TTBCR.

Configuration

This register is banked between TTBCR2 and TTBCR2_S and TTBCR2_NS.

AArch32 System register TTBCR2 bits [31:0] are architecturally mapped to AArch64 System register TCR_EL1[63:32].

This register is present only when FEAT_AA32EL1 is implemented and FEAT_AA32HPD is implemented. Otherwise, direct accesses to TTBCR2 are UNDEFINED.

Attributes

TTBCR2 is a 32-bit register.

This register has the following instances:

- TTBCR2, when EL3 is not implemented or FEAT_AA64 is implemented.
- TTBCR2_S, when FEAT_AA32EL3 is implemented.
- TTBCR2_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

RES0													HWU162	HWU161	HWU160	HWU159	HWU062	HWU061	HWU060	HWU059	HPD1	HPD0	RES0								

Bits [31:19]

Reserved, RES0.

HWU162, bit [18]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1.

HWU162	Meaning
0b0	For translations using TTBR1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [17]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1.

HWU161	Meaning
0b0	For translations using TTBR1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [16]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1.

HWU160	Meaning
0b0	For translations using TTBR1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [15]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1.

HWU159	Meaning
0b0	For translations using TTBR1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [14]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0.

HWU062	Meaning
0b0	For translations using TTBR0, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [13]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0.

HWU061	Meaning
0b0	For translations using TTBR0, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [12]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0.

HWU060	Meaning
0b0	For translations using TTBR0, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [11]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0.

HWU059	Meaning
0b0	For translations using TTBR0, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [10]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by TTBR1.

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled if TTBCR.T2E == 1.

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPD0, bit [9]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by TTBR0.

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled if TTBCR.T2E ==1.

When disabled, the permissions are treated is as if the bits are 0.

The Effective value of this field is 0 if the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:0]

Reserved, RES0.

TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the PL1&0 translation regime, and other information for this translation regime.

Configuration

This register is banked between TTBR0 and TTBR0_S and TTBR0_NS.

AArch32 System register TTBR0 bits [63:0] are architecturally mapped to AArch64 System register TTBR0_EL1[63:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TTBR0 are UNDEFINED.

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

TTBCR.EAE determines which TTBR0 format is used:

- TTBCR.EAE == `0b0`: 32-bit format is used. TTBR0[63:32] are ignored.
- TTBCR.EAE == `0b1`: 64-bit format is used.

When EL3 is using AArch32, write access to TTBR0(S) is disabled when the **CP15SDISABLE** signal is asserted HIGH.

Used in conjunction with the TTBCR. When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR0.

Attributes

TTBR0 is a 64-bit register.

This register has the following instances:

- TTBR0, when EL3 is not implemented or FEAT_AA64 is implemented.
- TTBR0_S, when FEAT_AA32EL3 is implemented.
- TTBR0_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TTB0																									IRGN[0]	NOS	RGN		IMP	S	IRGN[1]
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

TTB0, bits [31:7]

Translation table base address, bits[31:x], where x is 14-(TTBCR.N). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [0, 6]

Inner region bits. Bits [0,6] of this register together indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[0] is TTBR0[6].
- IRGN[1] is TTBR0[0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

NOS	Meaning
0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR0.S is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

RGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

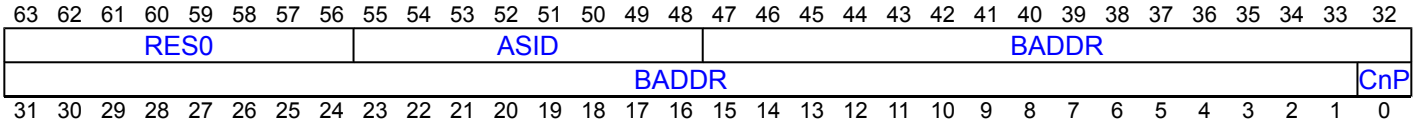
Shareable. Indicates whether the memory associated with the translation table walks is Shareable:

S	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is Shareable. The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:



Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T0SZ as follows:

- If TTBCR.T0SZ is 0 or 1, x = 5 - TTBCR.T0SZ.
- If TTBCR.T0SZ is greater than 1, x = 14 - TTBCR.T0SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. When TTBCR.EAE ==1, this bit indicates whether each entry that is pointed to by TTBR0 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by this instance of TTBR0, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR0 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR0.CnP on those other PEs. • The value of TTBCR.EAE on those other PEs. • The value of the current ASID or, for the Non-secure instance of TTBR0, the value of the current VMID.
0b1	The translation table entries pointed to by this instance of TTBR0 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1 for this instance of TTBR0 and all of the following apply: • The translation table entries are pointed to by this instance of TTBR0. • The value of the applicable TTBCR.EAE field is 1. • The ASID is the same as the current ASID. • For the Non-secure instance of TTBR0, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the PL1&0 translation regime, and other information for this translation regime.

Configuration

This register is banked between TTBR1 and TTBR1_S and TTBR1_NS.

AArch32 System register TTBR1 bits [63:0] are architecturally mapped to AArch64 System register TTBR1_EL1[63:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TTBR1 are UNDEFINED.

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

TTBCR.EAE determines which TTBR1 format is used:

- TTBCR.EAE == `0b0`: 32-bit format is used. TTBR1[63:32] are ignored.
- TTBCR.EAE == `0b1`: 64-bit format is used.

Used in conjunction with the TTBCR. When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR1.

Attributes

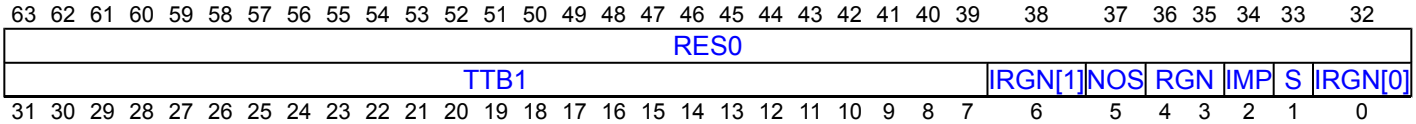
TTBR1 is a 64-bit register.

This register has the following instances:

- TTBR1, when EL3 is not implemented or FEAT_AA64 is implemented.
- TTBR1_S, when FEAT_AA32EL3 is implemented.
- TTBR1_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == 0:



Bits [63:32]

Reserved, RES0.

TTB1, bits [31:7]

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [6, 0]

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for Armv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[1] is TTBR1[6].
- IRGN[0] is TTBR1[0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

NOS	Meaning
0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR1.S is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

RGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

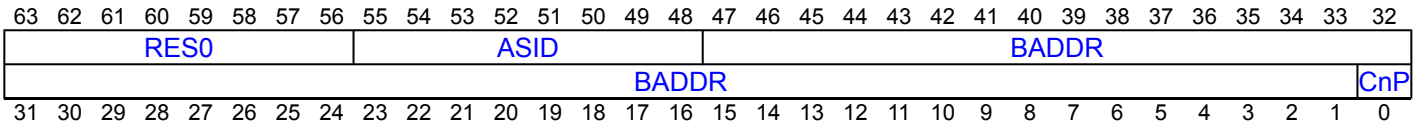
Shareable. Indicates whether the memory associated with the translation table walks is Shareable:

S	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is Shareable. The TTBR1.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:



Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T1SZ as follows:

- If TTBCR.T1SZ is 0 or 1, x = 5 - TTBCR.T1SZ.
- If TTBCR.T1SZ is greater than 1, x = 14 - TTBCR.T1SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. When TTBCR.EAE ==1, this bit indicates whether each entry that is pointed to by TTBR1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by this instance of TTBR1, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR1 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR1.CnP on those other PEs. • The value of TTBCR.EAE on those other PEs. • The value of the current ASID or, for the Non-secure instance of TTBR1, the value of the current VMID.
0b1	The translation table entries pointed to by this instance of TTBR1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1 for this instance of TTBR1 and all of the following apply: • The translation table entries are pointed to by this instance of TTBR1. • The value of the applicable TTBCR.EAE field is 1. • The ASID is the same as the current ASID. • For the Non-secure instance of TTBR1, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VBAR, Vector Base Address Register

The VBAR characteristics are:

Purpose

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

Configuration

This register is banked between VBAR and VBAR_S and VBAR_NS.

AArch32 System register VBAR bits [31:0] are architecturally mapped to AArch64 System register VBAR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to VBAR are UNDEFINED.

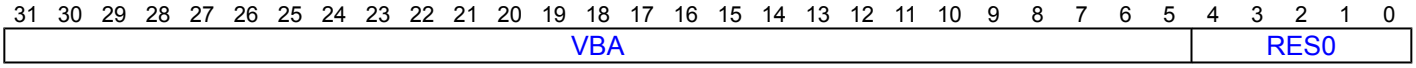
Attributes

VBAR is a 32-bit register.

This register has the following instances:

- VBAR, when EL3 is not implemented or FEAT_AA64 is implemented.
- VBAR_S, when FEAT_AA32EL3 is implemented.
- VBAR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



VBA, bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [4:0]

Reserved, RES0.

Accessing VBAR

Accesses to this register use the following encodings in the System register encoding space:

VDFSR, Virtual SError Exception Syndrome Register

The VDFSR characteristics are:

Purpose

Provides the syndrome value reported to software on taking a virtual SError exception exception to EL1, or on executing an `ESB` instruction at EL1.

When the virtual SError exception injected using HCR.VA is taken to EL1 using AArch32, then the syndrome value is reported in DFSR.{AET, ExT} and the remainder of DFSR is set as defined by VMSAv8-32. For more information, see The AArch32 Virtual Memory System Architecture.

If the virtual SError exception injected using HCR.VA is deferred by an `ESB` instruction, then the syndrome value is written to VDISR.

Configuration

AArch32 System register VDFSR bits [31:0] are architecturally mapped to AArch64 System register VSESR_EL2[31:0].

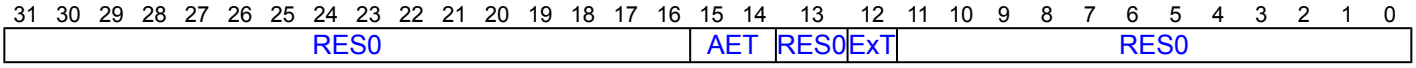
This register is present only when FEAT_RAS is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to VDFSR are UNDEFINED.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when SCR.NS == 1.

Attributes

VDFSR is a 32-bit register.

Field descriptions



Bits [31:16]

Reserved, RES0.

AET, bits [15:14]

When a virtual SError exception is taken to EL1 using AArch32, DFSR[15:14] is set to VDFSR.AET.

When a virtual SError exception is deferred by an `ESB` instruction, VDISR[15:14] is set to VDFSR.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

When a virtual SError exception is taken to EL1 using AArch32, DFSR[12] is set to VDFSR.ExT.

When a virtual SError exception is deferred by an `ESB` instruction, VDISR[12] is set to VDFSR.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing VDFSR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when SCR.NS == 1.

Accesses to this register use the following encodings in the System register encoding space:

VDISR, Virtual Deferred Interrupt Status Register

The VDISR characteristics are:

Purpose

Records that an SError exception has been consumed by an ESB instruction.

Configuration

AArch32 System register VDISR bits [31:0] are architecturally mapped to AArch64 System register VDISR_EL2[31:0].

This register is present only when FEAT_AA32EL1 is implemented and FEAT_RAS is implemented. Otherwise, direct accesses to VDISR are UNDEFINED.

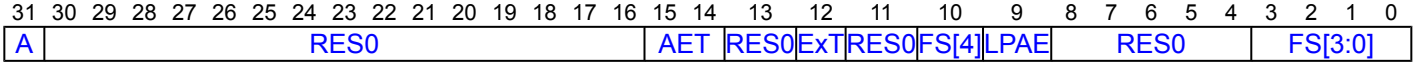
If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Attributes

VDISR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:



A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VDFSR.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VDFSR.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault status code. Set to `0b10110` when an `ESB` instruction defers a virtual SError exception.

FS	Meaning
`0b10110`	Asynchronous SError exception.

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR[10].
- FS[3:0] is VDISR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an `ESB` instruction defers a virtual SError exception.

LPAE	Meaning
`0b0`	Using the Short-descriptor translation table format.

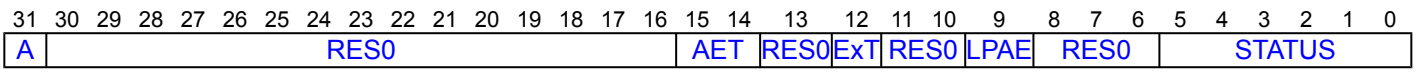
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:



A, bit [31]

Set to 1 when an `ESB` instruction defers a virtual SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VDFSR.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VDFSR.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an ESB instruction defers a virtual SError exception.

LPAE	Meaning
0b1	Using the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError exception.

STATUS	Meaning
0b010001	Asynchronous SError exception.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VDISR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

An indirect write to VDISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0001	0b001

```
if !(IsFeatureImplemented(FEAT_AA32EL1) && IsFeatureImplemented(FEAT_RAS)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then

VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of MPIDR, which in a multiprocessor system, provides an additional PE identification system.

Configuration

AArch32 System register VMPIDR bits [31:0] are architecturally mapped to AArch64 System register VMPIDR_EL2[31:0].

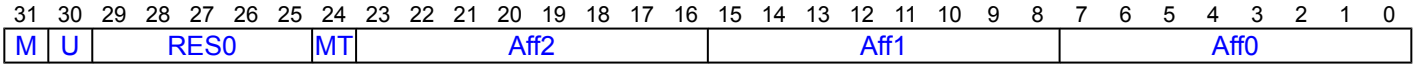
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to VMPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MPIDR.

Attributes

VMPIDR is a 32-bit register.

Field descriptions



M, bit [31]

Indicates whether this implementation includes the functionality introduced by the Armv7 Multiprocessing Extensions.

M	Meaning
0b0	This implementation does not include the Armv7 Multiprocessing Extensions functionality.
0b1	This implementation includes the Armv7 Multiprocessing Extensions functionality.

Access to this field is **RES1**.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MPIDR.U.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels.

MT	Meaning
0b0	Performance of PEs at the lowest affinity level is largely independent.
0b1	Performance of PEs at the lowest affinity level is very interdependent.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MPIDR.MT.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MPIDR.Aff2.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MPIDR.Aff1.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MPIDR.Aff0.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing VMPIDR

VPIDR, Virtualization Processor ID Register

The VPIDR characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of MIDR.

Configuration

AArch32 System register VPIDR bits [31:0] are architecturally mapped to AArch64 System register VPIDR_EL2[31:0].

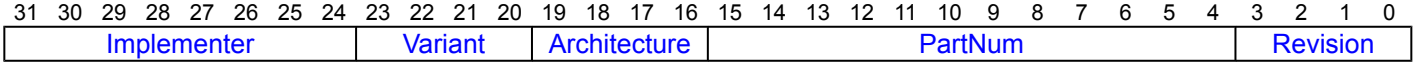
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to VPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MIDR.

Attributes

VPIDR is a 32-bit register.

Field descriptions



Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm.

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MIDR.Implementer.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MIDR.Variant.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Architecture, bits [19:16]

Architecture version.

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MIDR.Architecture.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MIDR.PartNum.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MIDR.Revision.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing VPIDR

VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

Purpose

The control register for stage 2 of the Non-secure PL1&0 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configuration

AArch32 System register VTCR bits [31:0] are architecturally mapped to AArch64 System register VTCR_EL2[31:0].

This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to VTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTCR is a 32-bit register.

Field descriptions

31	30 29	28	27	26	25	24 23 22 21 20 19 18 17 16 15 14	13 12	11 10	9 8	7 6	5	4	3 2 1 0
RES1	RES0	HWU62	HWU61	HWU60	HWU59	RES0	SH0	ORGN0	IRGN0	SL0	RES0	S	T0SZ

Bit [31]

Reserved, RES1.

Bits [30:29]

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using VTTBR.

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using VTTBR.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using VTTBR.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

Starting level for translation table walks using VTTBR.

SL0	Meaning
0b00	Start at level 2
0b01	Start at level 1

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 1 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

S, bit [4]

Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the stage 2 T0SZ value is treated as an UNKNOWN value

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [3:0]

The size offset of the memory region addressed by VTTBR. The region size is $2^{(32-T0SZ)}$ bytes.

This field holds a four-bit signed integer value, meaning it supports values from -8 to 7.

Note

This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 1 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VTCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0010	0b0001	0b010

```
if !IsFeatureImplemented(FEAT_AA32EL2) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T2
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T2 ==
'1' then
        AArch32.TakeHypTrapException(0x03);

VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register VTTBR bits [63:0] are architecturally mapped to AArch64 System register VTTBR_EL2[63:0].

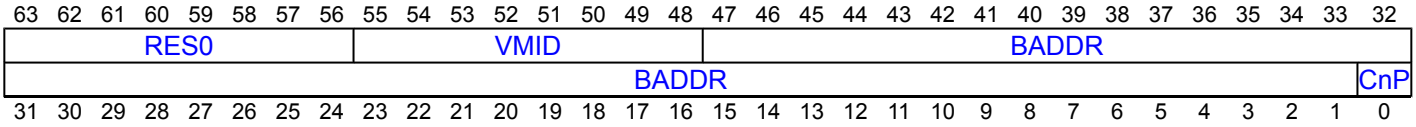
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to VTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTTBR is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

VMID, bits [55:48]

The VMID for the translation table.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'00000000'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of VTCR.SL0 and VTCR.T0SZ as follows:

- If VTCR.SL0 is `0b00`, meaning that lookup starts at level 2, then x is 14 - VTCR.T0SZ.
- If VTCR.SL0 is `0b01`, meaning that lookup starts at level 1, then x is 5 - VTCR.T0SZ.
- If VTCR.SL0 is either `0b10` or `0b11` then a stage 2 level 1 Translation fault is generated.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VTTBR are permitted to differ from the entries for VTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VTTBR are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1 and the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the VTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBRs do not point to the same translation table entries when the VMID value is the same as the current VMID, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing VTTBR

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1

Index by functional group

Below are indexes for registers with the following main functional groups:

In the IMP DEF functional group:

Exec state	Name	Description
AArch32	ACTLR	Auxiliary Control Register
AArch32	ACTLR2	Auxiliary Control Register 2
AArch64	ACTLR_EL1	Auxiliary Control Register (EL1)
AArch64	ACTLR_EL2	Auxiliary Control Register (EL2)
AArch64	ACTLR_EL3	Auxiliary Control Register (EL3)
AArch32	ADFSR	Auxiliary Data Fault Status Register
AArch64	AFSR0_EL1	Auxiliary Fault Status Register 0 (EL1)
AArch64	AFSR0_EL2	Auxiliary Fault Status Register 0 (EL2)
AArch64	AFSR0_EL3	Auxiliary Fault Status Register 0 (EL3)

Exec state	Name	Description
AArch64	AFSR1_EL1	Auxiliary Fault Status Register 1 (EL1)
AArch64	AFSR1_EL2	Auxiliary Fault Status Register 1 (EL2)
AArch64	AFSR1_EL3	Auxiliary Fault Status Register 1 (EL3)
AArch32	AIDR	Auxiliary ID Register
AArch64	AIDR_EL1	Auxiliary ID Register
AArch32	AIFSR	Auxiliary Instruction Fault Status Register
AArch32	AMAIR0	Auxiliary Memory Attribute Indirection Register 0
AArch32	AMAIR1	Auxiliary Memory Attribute Indirection Register 1
AArch64	AMAIR_EL1	Auxiliary Memory Attribute Indirection Register (EL1)
AArch64	AMAIR_EL2	Auxiliary Memory Attribute Indirection Register (EL2)
AArch64	AMAIR_EL3	Auxiliary Memory Attribute Indirection Register (EL3)
AArch64	HACR_EL2	Hypervisor Auxiliary Control Register
AArch32	HACTLR	Hyp Auxiliary Control Register
AArch32	HACTLR2	Hyp Auxiliary Control Register 2
AArch32	HADFSR	Hyp Auxiliary Data Fault Status Register
AArch32	HAIFSR	Hyp Auxiliary Instruction Fault Status Register
AArch32	HAMAIR0	Hyp Auxiliary Memory Attribute Indirection Register 0
AArch32	HAMAIR1	Hyp Auxiliary Memory Attribute Indirection Register 1
AArch64	S1_<op1>_<Cn>_<Cm>_<op2>	IMPLEMENTATION DEFINED System instructions
AArch64	S3_<op1>_<Cn>_<Cm>_<op2>	IMPLEMENTATION DEFINED Registers

In the Exception functional group:

Exec state	Name	Description
AArch32	ADFSR	Auxiliary Data Fault Status Register
AArch64	AFSR0_EL1	Auxiliary Fault Status Register 0 (EL1)
AArch64	AFSR0_EL2	Auxiliary Fault Status Register 0 (EL2)
AArch64	AFSR0_EL3	Auxiliary Fault Status Register 0 (EL3)
AArch64	AFSR1_EL1	Auxiliary Fault Status Register 1 (EL1)
AArch64	AFSR1_EL2	Auxiliary Fault Status Register 1 (EL2)
AArch64	AFSR1_EL3	Auxiliary Fault Status Register 1 (EL3)
AArch32	AIFSR	Auxiliary Instruction Fault Status Register
AArch32	DFAR	Data Fault Address Register
AArch32	DFSR	Data Fault Status Register
AArch64	ESR_EL1	Exception Syndrome Register (EL1)
AArch64	ESR_EL2	Exception Syndrome Register (EL2)
AArch64	ESR_EL3	Exception Syndrome Register (EL3)
AArch64	FAR_EL1	Fault Address Register (EL1)
AArch64	FAR_EL2	Fault Address Register (EL2)
AArch64	FAR_EL3	Fault Address Register (EL3)
AArch32	HADFSR	Hyp Auxiliary Data Fault Status Register
AArch32	HAIFSR	Hyp Auxiliary Instruction Fault Status Register
AArch32	HDFAR	Hyp Data Fault Address Register
AArch32	HIFAR	Hyp Instruction Fault Address Register
AArch32	HPFAR	Hyp IPA Fault Address Register
AArch64	HPFAR_EL2	Hypervisor IPA Fault Address Register
AArch32	HSR	Hyp Syndrome Register
AArch32	HVBAR	Hyp Vector Base Address Register
AArch32	IFAR	Instruction Fault Address Register
AArch32	IFSR	Instruction Fault Status Register
AArch64	IFSR32_EL2	Instruction Fault Status Register (EL2)
AArch32	ISR	Interrupt Status Register
AArch64	ISR_EL1	Interrupt Status Register
AArch32	MVBAR	Monitor Vector Base Address Register
AArch32	VBAR	Vector Base Address Register
AArch64	VBAR_EL1	Vector Base Address Register (EL1)
AArch64	VBAR_EL2	Vector Base Address Register (EL2)
AArch64	VBAR_EL3	Vector Base Address Register (EL3)

In the Memory functional group:

Exec state	Name	Description
AArch32	AMAIR0	Auxiliary Memory Attribute Indirection Register 0
AArch32	AMAIR1	Auxiliary Memory Attribute Indirection Register 1
AArch64	AMAIR2_EL1	Extended Auxiliary Memory Attribute Indirection Register (EL1)
AArch64	AMAIR2_EL2	Extended Auxiliary Memory Attribute Indirection Register (EL2)
AArch64	AMAIR2_EL3	Extended Auxiliary Memory Attribute Indirection Register (EL3)
AArch64	AMAIR_EL1	Auxiliary Memory Attribute Indirection Register (EL1)
AArch64	AMAIR_EL2	Auxiliary Memory Attribute Indirection Register (EL2)
AArch64	AMAIR_EL3	Auxiliary Memory Attribute Indirection Register (EL3)
AArch32	CONTEXTIDR	Context ID Register
AArch64	CONTEXTIDR_EL1	Context ID Register (EL1)
AArch64	CONTEXTIDR_EL2	Context ID Register (EL2)
AArch32	DACR	Domain Access Control Register
AArch64	DACR32_EL2	Domain Access Control Register
AArch64	GPCBW_EL3	Granule Protection Check Bypass Window Register (EL3)
AArch64	GPCCR_EL3	Granule Protection Check Control Register (EL3)
AArch64	GPTBR_EL3	Granule Protection Table Base Register
AArch64	HACDBSBR_EL2	Hardware Accelerator for Cleaning Dirty State Base Register
AArch64	HACDBSCONS_EL2	Hardware Accelerator for Cleaning Dirty State Consumer Register
AArch32	HAMAIR0	Hyp Auxiliary Memory Attribute Indirection Register 0
AArch32	HAMAIR1	Hyp Auxiliary Memory Attribute Indirection Register 1
AArch64	HDBSSBR_EL2	Hardware Dirty State Tracking Structure Base Register
AArch64	HDBSSPROD_EL2	Hardware Dirty State Tracking Structure Producer Register
AArch32	HMAIR0	Hyp Memory Attribute Indirection Register 0
AArch32	HMAIR1	Hyp Memory Attribute Indirection Register 1
AArch32	HTCR	Hyp Translation Control Register
AArch32	HTTBR	Hyp Translation Table Base Register
AArch64	LORC_EL1	LORegion Control (EL1)
AArch64	LOREA_EL1	LORegion End Address (EL1)
AArch64	LORID_EL1	LORegionID (EL1)
AArch64	LORN_EL1	LORegion Number (EL1)
AArch64	LORSA_EL1	LORegion Start Address (EL1)
AArch32	MAIR0	Memory Attribute Indirection Register 0
AArch32	MAIR1	Memory Attribute Indirection Register 1
AArch64	MAIR2_EL1	Extended Memory Attribute Indirection Register (EL1)
AArch64	MAIR2_EL2	Extended Memory Attribute Indirection Register (EL2)

AArch64	SP_EL0	Stack Pointer (EL0)
AArch64	SP_EL1	Stack Pointer (EL1)
AArch64	SP_EL2	Stack Pointer (EL2)
AArch64	SP_EL3	Stack Pointer (EL3)

In the Unknown functional group:

Exec state	Name	Description
AArch64	ACCDATA_EL1	Accelerator Data
AArch32	DSPSR2	Debug Saved Process State Register 2
AArch64	FGWTE3_EL3	Fine-Grained Write Traps EL3
AArch64	HAFGRTR_EL2	Hypervisor Activity Monitors Fine-Grained Read Trap Register
AArch64	HDFGRTR2_EL2	Hypervisor Debug Fine-Grained Read Trap Register 2
AArch64	HDFGRTR_EL2	Hypervisor Debug Fine-Grained Read Trap Register
AArch64	HDFGWTR2_EL2	Hypervisor Debug Fine-Grained Write Trap Register 2
AArch64	HDFGWTR_EL2	Hypervisor Debug Fine-Grained Write Trap Register
AArch64	HFGITR_EL2	Hypervisor Fine-Grained Instruction Trap Register
AArch64	HFGRTR2_EL2	Hypervisor Fine-Grained Read Trap Register 2
AArch64	HFGRTR_EL2	Hypervisor Fine-Grained Read Trap Register
AArch64	HFGWTR2_EL2	Hypervisor Fine-Grained Write Trap Register 2
AArch64	HFGWTR_EL2	Hypervisor Fine-Grained Write Trap Register
AArch64	MDSELR_EL1	Breakpoint and Watchpoint Selection Register
AArch64	MDSTEPOP_EL1	Monitor Debug Step Opcode Register
AArch64	PFAR_EL1	Physical Fault Address Register (EL1)
AArch64	PFAR_EL2	Physical Fault Address Register (EL2)
AArch64	PMICNTSVR_EL1	Performance Monitors Instruction Count Saved Value Register
AArch64	PMSSCR_EL1	Performance Monitors Snapshot Status and Capture Register
AArch64	SPMACCESSR_EL1	System Performance Monitors Access Register (EL1)
AArch64	SPMACCESSR_EL2	System Performance Monitors Access Register (EL2)
AArch64	SPMACCESSR_EL3	System Performance Monitors Access Register (EL3)
AArch64	SPMCFGR_EL1	System Performance Monitors Configuration Register
AArch64	SPMCGCR<n>_EL1	System PMU Counter Group Configuration Registers
AArch64	SPMCNTENCLR_EL0	System Performance Monitors Count Enable Clear Register
AArch64	SPMCNTENSET_EL0	System Performance Monitors Count Enable Set Register
AArch64	SPMCR_EL0	System Performance Monitor Control Register
AArch64	SPMDEVAFF_EL1	System Performance Monitors Device Affinity Register
AArch64	SPMDEVARCH_EL1	System Performance Monitors Device Architecture Register
AArch64	SPMEVCNTR<n>_EL0	System Performance Monitors Event Count Register
AArch64	SPMEVFILT2R<n>_EL0	System Performance Monitors Event Filter Control Register 2
AArch64	SPMEVFILTR<n>_EL0	System Performance Monitors Event Filter Control Register
AArch64	SPMEVTYPER<n>_EL0	System Performance Monitors Event Type Register
AArch64	SPMIIDR_EL1	System PMU Implementation Identification Register
AArch64	SPMINTENCLR_EL1	System Performance Monitors Interrupt Enable Clear Register
AArch64	SPMINTENSET_EL1	System Performance Monitors Interrupt Enable Set Register
AArch64	SPMOVSCLR_EL0	System Performance Monitors Overflow Flag Status Clear Register
AArch64	SPMOVSSET_EL0	System Performance Monitors Overflow Flag Status Set Register
AArch64	SPMROOTCR_EL3	System Performance Monitors Root and Realm Control Register
AArch64	SPMSCR_EL1	System Performance Monitors Secure Control Register
AArch64	SPMSELR_EL0	System Performance Monitors Select Register
AArch64	SPMZR_EL0	System Performance Monitors Zero with Mask

In the Float functional group:

Exec state	Name	Description
AArch64	FPCR	Floating-point Control Register
AArch32	FPEXC	Floating-Point Exception Control register
AArch64	FPEXC32_EL2	Floating-Point Exception Control Register
AArch64	FPMR	Floating-point Mode Register
AArch32	FPSCR	Floating-Point Status and Control Register
AArch32	FPSID	Floating-Point System ID register
AArch64	FPSR	Floating-point Status Register
AArch32	MVFR0	Media and VFP Feature Register 0
AArch64	MVFR0_EL1	AArch32 Media and VFP Feature Register 0
AArch32	MVFR1	Media and VFP Feature Register 1
AArch64	MVFR1_EL1	AArch32 Media and VFP Feature Register 1
AArch32	MVFR2	Media and VFP Feature Register 2
AArch64	MVFR2_EL1	AArch32 Media and VFP Feature Register 2

In the Reset Management functional group:

Exec state	Name	Description
AArch32	HRMR	Hyp Reset Management Register
AArch32	RMR	Reset Management Register
AArch64	RMR_EL1	Reset Management Register (EL1)
AArch64	RMR_EL2	Reset Management Register (EL2)
AArch64	RMR_EL3	Reset Management Register (EL3)
AArch32	RVBAR	Reset Vector Base Address Register
AArch64	RVBAR_EL1	Reset Vector Base Address Register (if EL2 and EL3 not implemented)
AArch64	RVBAR_EL2	Reset Vector Base Address Register (if EL3 not implemented)
AArch64	RVBAR_EL3	Reset Vector Base Address Register (if EL3 implemented)

In the Thread functional group:

Exec state	Name	Description
AArch32	HTPIDR	Hyp Software Thread ID Register
AArch64	SCXTNUM_EL0	EL0 Read/Write Software Context Number
AArch64	SCXTNUM_EL1	EL1 Read/Write Software Context Number
AArch64	SCXTNUM_EL2	EL2 Read/Write Software Context Number
AArch64	SCXTNUM_EL3	EL3 Read/Write Software Context Number
AArch64	TPIDR2_EL0	EL0 Read/Write Software Thread ID Register 2
AArch32	TPIDRPRW	PL1 Software Thread ID Register
AArch64	TPIDRRO_EL0	EL0 Read-Only Software Thread ID Register
AArch32	TPIDRURO	PL0 Read-Only Software Thread ID Register
AArch32	TPIDRURW	PL0 Read/Write Software Thread ID Register
AArch64	TPIDR_EL0	EL0 Read/Write Software Thread ID Register
AArch64	TPIDR_EL1	EL1 Software Thread ID Register
AArch64	TPIDR_EL2	EL2 Software Thread ID Register
AArch64	TPIDR_EL3	EL3 Software Thread ID Register

In the GIC control registers functional group:

Exec state	Name	Description
AArch32	ICC_AP0R<n>	Interrupt Controller Active Priorities Group 0 Registers

AArch64	PMXEVTYPER_EL0	Performance Monitors Selected Event Type Register
AArch64	PMZR_EL0	Performance Monitors Zero with Mask
External	PMZR_EL0	Performance Monitors Zero with Mask

In the Root functional group:

Exec state	Name	Description
AArch64	APAS	Associate PA space
AArch64	GPCBW_EL3	Granule Protection Check Bypass Window Register (EL3)
AArch64	GPCCR_EL3	Granule Protection Check Control Register (EL3)
AArch64	GPTBR_EL3	Granule Protection Table Base Register

In the Pointer authentication functional group:

Exec state	Name	Description
AArch64	APDAKeyHi_EL1	Pointer Authentication Key A for Data (bits[127:64])
AArch64	APDAKeyLo_EL1	Pointer Authentication Key A for Data (bits[63:0])
AArch64	APDBKeyHi_EL1	Pointer Authentication Key B for Data (bits[127:64])
AArch64	APDBKeyLo_EL1	Pointer Authentication Key B for Data (bits[63:0])
AArch64	APGAKeyHi_EL1	Pointer Authentication Key A for Code (bits[127:64])
AArch64	APGAKeyLo_EL1	Pointer Authentication Key A for Code (bits[63:0])

Exec state	Name	Description
AArch64	APIAKeyHi_EL1	Pointer Authentication Key A for Instruction (bits[127:64])
AArch64	APIAKeyLo_EL1	Pointer Authentication Key A for Instruction (bits[63:0])
AArch64	APIBKeyHi_EL1	Pointer Authentication Key B for Instruction (bits[127:64])
AArch64	APIBKeyLo_EL1	Pointer Authentication Key B for Instruction (bits[63:0])

In the BRBE Instructions functional group:

Exec state	Name	Description
AArch64	BRB IALL	Invalidate the Branch Record Buffer
AArch64	BRB INJ	Branch Record Injection into the Branch Record Buffer

In the Debug Secondary functional group:

Exec state	Name	Description
AArch64	DLR_EL0	Debug Link Register
AArch64	DSPSR_EL0	Debug Saved Program Status Register

In the GCSE Instructions functional group:

Exec state	Name	Description
AArch64	GCSPOPCX	Guarded Control Stack Pop and Compare exception return record
AArch64	GCSPOPM	Guarded Control Stack Pop
AArch64	GCSPOPX	Guarded Control Stack Pop exception return record
AArch64	GCSPUSHM	Guarded Control Stack Push
AArch64	GCSPUSHX	Guarded Control Stack Push exception return record
AArch64	GCSSS1	Guarded Control Stack Switch Stack 1
AArch64	GCSSS2	Guarded Control Stack Switch Stack 2

In the RAS functional group:

Exec state	Name	Description

External	GICD_NSACR<n>	Non-secure Access Control Registers
External	GICD_NSACR<n>E	Non-secure Access Control Registers
External	GICD_SETSPI_NSR	Set Non-secure SPI Pending Register
External	GICD_SETSPI_SR	Set Secure SPI Pending Register
External	GICD_SGIR	Software Generated Interrupt Register
External	GICD_SPENDSGIR<n>	SGI Set-Pending Registers
External	GICD_STATUSR	Error Reporting Status Register
External	GICD_TYPER	Interrupt Controller Type Register
External	GICD_TYPER2	Interrupt Controller Type Register 2
External	GICM_CLRSPI_NSR	Clear Non-secure SPI Pending Register
External	GICM_CLRSPI_SR	Clear Secure SPI Pending Register
External	GICM_IIDR	Distributor Implementer Identification Register
External	GICM_SETSPI_NSR	Set Non-secure SPI Pending Register
External	GICM_SETSPI_SR	Set Secure SPI Pending Register
External	GICM_TYPER	Distributor MSI Type Register

In the GICH functional group:

Exec state	Name	Description
External	GICH_APR<n>	Active Priorities Registers
External	GICH_EISR	End Interrupt Status Register
External	GICH_ELRSR	Empty List Register Status Register
External	GICH_HCR	Hypervisor Control Register
External	GICH_LR<n>	List Registers
External	GICH_MISR	Maintenance Interrupt Status Register
External	GICH_VMCR	Virtual Machine Control Register
External	GICH_VTR	Virtual Type Register

In the GICR functional group:

Exec state	Name	Description
External	GICR_CLRLPIR	Clear LPI Pending Register
External	GICR_CTLR	Redistributor Control Register
External	GICR_ICACTIVER0	Interrupt Clear-Active Register 0
External	GICR_ICACTIVER<n>E	Interrupt Clear-Active Registers
External	GICR_ICENABLER0	Interrupt Clear-Enable Register 0
External	GICR_ICENABLER<n>E	Interrupt Clear-Enable Registers
External	GICR_ICFGR0	Interrupt Configuration Register 0
External	GICR_ICFGR1	Interrupt Configuration Register 1
External	GICR_ICFGR<n>E	Interrupt configuration registers
External	GICR_ICPENDR0	Interrupt Clear-Pending Register 0
External	GICR_ICPENDR<n>E	Interrupt Clear-Pending Registers
External	GICR_IGROUPR0	Interrupt Group Register 0
External	GICR_IGROUPR<n>E	Interrupt Group Registers
External	GICR_IGRPMODR0	Interrupt Group Modifier Register 0
External	GICR_IGRPMODR<n>E	Interrupt Group Modifier Registers
External	GICR_IIDR	Redistributor Implementer Identification Register

Exec state	Name	Description
External	GICR_INMIR0	Non-maskable Interrupt Register 0
External	GICR_INMIR<n>E	Non-maskable Interrupt Registers for Extended PPIs, x = 1 to 2.
External	GICR_INVALLR	Redistributor Invalidate All Register
External	GICR_INVLPIR	Redistributor Invalidate LPI Register
External	GICR_IPRIORITYR<n>	Interrupt Priority Registers
External	GICR_IPRIORITYR<n>E	Interrupt Priority Registers (extended PPI range)
External	GICR_ISACTIVER0	Interrupt Set-Active Register 0
External	GICR_ISACTIVER<n>E	Interrupt Set-Active Registers
External	GICR_ISENABLER0	Interrupt Set-Enable Register 0
External	GICR_ISENABLER<n>E	Interrupt Set-Enable Registers
External	GICR_ISPENDR0	Interrupt Set-Pending Register 0
External	GICR_ISPENDR<n>E	Interrupt Set-Pending Registers
External	GICR_MPAMIDR	Report maximum PARTID and PMG Register
External	GICR_NSACR	Non-secure Access Control Register
External	GICR_PARTIDR	Set PARTID and PMG Register
External	GICR_PENDBASER	Redistributor LPI Pending Table Base Address Register
External	GICR_PROPBASER	Redistributor Properties Base Address Register
External	GICR_SETLPIR	Set LPI Pending Register
External	GICR_STATUSR	Error Reporting Status Register
External	GICR_SYNCR	Redistributor Synchronize Register
External	GICR_TYPER	Redistributor Type Register
External	GICR_VPENDBASER	Virtual Redistributor LPI Pending Table Base Address Register
External	GICR_VPROPBASER	Virtual Redistributor Properties Base Address Register
External	GICR_VSGIPENDR	Redistributor virtual SGI pending state register
External	GICR_VSGIR	Redistributor virtual SGI pending state request register
External	GICR_WAKER	Redistributor Wake Register

In the GICV functional group:

Exec state	Name	Description
External	GICV_ABPR	Virtual Machine Aliased Binary Point Register
External	GICV_AEOIR	Virtual Machine Aliased End Of Interrupt Register
External	GICV_AHPPIR	Virtual Machine Aliased Highest Priority Pending Interrupt Register
External	GICV_AIAR	Virtual Machine Aliased Interrupt Acknowledge Register
External	GICV_APR<n>	Virtual Machine Active Priorities Registers
External	GICV_BPR	Virtual Machine Binary Point Register
External	GICV_CTLR	Virtual Machine Control Register
External	GICV_DIR	Virtual Machine Deactivate Interrupt Register
External	GICV_EOIR	Virtual Machine End Of Interrupt Register
External	GICV_HPPIR	Virtual Machine Highest Priority Pending Interrupt Register
External	GICV_IAR	Virtual Machine Interrupt Acknowledge Register
External	GICV_IIDR	Virtual Machine CPU Interface Identification Register
External	GICV_PMR	Virtual Machine Priority Mask Register
External	GICV_RPR	Virtual Machine Running Priority Register
External	GICV_STATUSR	Virtual Machine Error Reporting Status Register

In the GITS functional group:

Exec state	Name	Description
External	GITS_BASER<n>	ITS Table Descriptors
External	GITS_CBASER	ITS Command Queue Descriptor
External	GITS_CREADR	ITS Read Register
External	GITS_CTLR	ITS Control Register
External	GITS_CWRITER	ITS Write Register
External	GITS_IIDR	ITS Identification Register
External	GITS_MPAMIDR	Report maximum PARTID and PMG Register
External	GITS_MPIDR	Report ITS's affinity.
External	GITS_PARTIDR	Set PARTID and PMG Register
External	GITS_SGIR	ITS SGI Register
External	GITS_STATUSR	ITS Error Reporting Status Register
External	GITS_TRANSLATER	ITS Translation Register
External	GITS_TYPER	ITS Type Register

Exec state	Name	Description
External	GITS_UMSIR	ITS Unmapped MSI register

In the AMU functional group:

Exec state	Name	Description
AArch32	AMCFGR	Activity Monitors Configuration Register
External	AMCFGR	Activity Monitors Configuration Register
AArch64	AMCFGR_EL0	Activity Monitors Configuration Register
AArch64	AMCG1IDR_EL0	Activity Monitors Counter Group 1 Identification Register
AArch32	AMCGCR	Activity Monitors Counter Group Configuration Register
External	AMCGCR	Activity Monitors Counter Group Configuration Register

External	AMEVTYPER1<n>	Activity Monitors Event Type Registers 1
AArch64	AMEVTYPER1<n>_EL0	Activity Monitors Event Type Registers 1
External	AMIIDR	Activity Monitors Implementation Identification Register
External	AMPIDR0	Activity Monitors Peripheral Identification Register 0
External	AMPIDR1	Activity Monitors Peripheral Identification Register 1
External	AMPIDR2	Activity Monitors Peripheral Identification Register 2
External	AMPIDR3	Activity Monitors Peripheral Identification Register 3
External	AMPIDR4	Activity Monitors Peripheral Identification Register 4
External	AMROOTCR	Activity Monitors Root Control Register
External	AMSCR	Activity Monitors Secure Control Register
AArch32	AMUSERENR	Activity Monitors User Enable Register
AArch64	AMUSERENR_EL0	Activity Monitors User Enable Register

In the BRBE functional group:

Exec state	Name	Description
AArch64	BRBCR_EL1	Branch Record Buffer Control Register (EL1)
AArch64	BRBCR_EL2	Branch Record Buffer Control Register (EL2)
AArch64	BRBFCR_EL1	Branch Record Buffer Function Control Register
AArch64	BRBIDR0_EL1	Branch Record Buffer ID0 Register
AArch64	BRBINF<n>_EL1	Branch Record Buffer Information Register <n>
AArch64	BRBINFINJ_EL1	Branch Record Buffer Information Injection Register
AArch64	BRBSRC<n>_EL1	Branch Record Buffer Source Address Register <n>
AArch64	BRBSRCINJ_EL1	Branch Record Buffer Source Address Injection Register
AArch64	BRBTGT<n>_EL1	Branch Record Buffer Target Address Register <n>
AArch64	BRBTGTINJ_EL1	Branch Record Buffer Target Address Injection Register
AArch64	BRBTS_EL1	Branch Record Buffer Timestamp Register

In the Trace Management functional group:

Exec state	Name	Description
AArch64	TRCAUTHSTATUS	Trace Authentication Status Register
External	TRCAUTHSTATUS	Trace Authentication Status Register
External	TRCCIDR0	Trace Component Identification Register 0
External	TRCCIDR1	Trace Component Identification Register 1
External	TRCCIDR2	Trace Component Identification Register 2
External	TRCCIDR3	Trace Component Identification Register 3
External	TRCDEVAFF	Trace Device Affinity Register
AArch64	TRCDEVARCH	Trace Device Architecture Register
External	TRCDEVARCH	Trace Device Architecture Register
AArch64	TRCDEVID	Trace Device Configuration Register
External	TRCDEVID	Trace Device Configuration Register
External	TRCDEVID1	Trace Device Configuration Register 1
External	TRCDEVID2	Trace Device Configuration Register 2
External	TRCDEVTYPE	Trace Device Type Register
External	TRCITCTRL	Trace Integration Mode Control Register
External	TRCLAR	Trace Lock Access Register
External	TRCLSR	Trace Lock Status Register
AArch64	TRCOSLSR	Trace OS Lock Status Register
External	TRCOSLSR	Trace OS Lock Status Register
External	TRCPDCR	Trace PowerDown Control Register
External	TRCPDSR	Trace PowerDown Status Register
External	TRCPIDR0	Trace Peripheral Identification Register 0
External	TRCPIDR1	Trace Peripheral Identification Register 1
External	TRCPIDR2	Trace Peripheral Identification Register 2
External	TRCPIDR3	Trace Peripheral Identification Register 3
External	TRCPIDR4	Trace Peripheral Identification Register 4
External	TRCPIDR5	Trace Peripheral Identification Register 5
External	TRCPIDR6	Trace Peripheral Identification Register 6
External	TRCPIDR7	Trace Peripheral Identification Register 7

In the Guarded Control Stack registers functional group:

Exec state	Name	Description
AArch64	GCSCRE0_EL1	Guarded Control Stack Control Register (EL0)
AArch64	GCSCR_EL1	Guarded Control Stack Control Register (EL1)
AArch64	GCSCR_EL2	Guarded Control Stack Control Register (EL2)
AArch64	GCSCR_EL3	Guarded Control Stack Control Register (EL3)
AArch64	GCSPR_EL0	Guarded Control Stack Pointer Register (EL0)
AArch64	GCSPR_EL1	Guarded Control Stack Pointer Register (EL1)
AArch64	GCSPR_EL2	Guarded Control Stack Pointer Register (EL2)
AArch64	GCSPR_EL3	Guarded Control Stack Pointer Register (EL3)

In the MPAM functional group:

Exec state	Name	Description
AArch64	MPAM0_EL1	MPAM0 Register (EL1)
AArch64	MPAM1_EL1	MPAM1 Register (EL1)
AArch64	MPAM2_EL2	MPAM2 Register (EL2)
AArch64	MPAM3_EL3	MPAM3 Register (EL3)
AArch64	MPAMBW0_EL1	MPAM PE-side Maximum-bandwidth Control Register (EL0)
AArch64	MPAMBW1_EL1	MPAM PE-side Maximum-bandwidth Control Register (EL1)
AArch64	MPAMBW2_EL2	MPAM PE-side Maximum-bandwidth Control Register (EL2)
AArch64	MPAMBW3_EL3	MPAM PE-side Maximum-bandwidth Control Register (EL3)
AArch64	MPAMBWCAP_EL2	MPAM PE-side Maximum-bandwidth Limit Virtualization Register
AArch64	MPAMBWIDR_EL1	MPAM PE-side Bandwidth Controls ID Register
AArch64	MPAMBWSM_EL1	MPAM Streaming Mode Bandwidth Control Register (EL1)
External	MPAMCFG_CASSOC	MPAM Cache Maximum Associativity Partition Configuration Register
External	MPAMCFG_CMAX	MPAM Cache Maximum Capacity Partition Configuration Register
External	MPAMCFG_CMIN	MPAM Cache Minimum Capacity Partition Configuration Register
External	MPAMCFG_CPBM<n>	MPAM Cache Portion Bitmap Partition Configuration Register
External	MPAMCFG_DIS	MPAM Partition Configuration Disable Register
External	MPAMCFG_EN	MPAM Partition Configuration Enable Register
External	MPAMCFG_EN_FLAGS	MPAM Partition Configuration Enable Flags Register
External	MPAMCFG_INTPARTID	MPAM Internal PARTID Narrowing Configuration Register
External	MPAMCFG_IN_TL	MPAM Ingress PARTID Translation Configuration Register
External	MPAMCFG_IN_TL_BASE	MPAM Ingress PARTID Translation Base Configuration Register
External	MPAMCFG_IN_TL_MASK	MPAM Ingress PARTID Translation Mask Configuration Register
External	MPAMCFG_MBW_MAX	MPAM Memory Bandwidth Maximum Partition Configuration Register
External	MPAMCFG_MBW_MIN	MPAM Memory Bandwidth Minimum Partition Configuration Register
External	MPAMCFG_MBW_PBM<n>	MPAM Bandwidth Portion Bitmap Partition Configuration Register
External	MPAMCFG_MBW_PROP	MPAM Memory Bandwidth Proportional Stride Partition Configuration Register
External	MPAMCFG_MBW_WINWD	MPAM Memory Bandwidth Partitioning Window Width Configuration Register
External	MPAMCFG_OUT_TL	MPAM Egress PARTID Translation Configuration Register
External	MPAMCFG_OUT_TL_BASE	MPAM Egress PARTID Translation Base Configuration Register
External	MPAMCFG_OUT_TL_MASK	MPAM Egress PARTID Translation Mask Configuration Register
External	MPAMCFG_PART_SEL	MPAM Partition Configuration Selection Register
External	MPAMCFG_PRI	MPAM Priority Partition Configuration Register

ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

Purpose

Can be used to provide IMPLEMENTATION DEFINED controls for the CTI. For example, the register might be used to control multiplexors for additional IMPLEMENTATION DEFINED triggers. The IMPLEMENTATION DEFINED controls provided by this register might modify the architecturally defined behavior of the CTI.

Note

The architecturally-defined triggers must not be multiplexed.

Configuration

It is IMPLEMENTATION DEFINED whether ASICCTL is implemented in the Core power domain or in the Debug power domain.

If it is implemented in the Core power domain then it is IMPLEMENTATION DEFINED whether it is in the Cold reset domain or the Warm reset domain.

This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes IMPLEMENTATION DEFINED behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are IMPLEMENTATION DEFINED.

Attributes

ASICCTL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ASICCTL

ASICCTL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x144	ASICCTL

Accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess(addrdesc), and SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **IMPDEF**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

Purpose

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- CNTNSAR controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

Configuration

It is IMPLEMENTATION DEFINED whether CNTACR<n> is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Implemented only if the value of CNTTIDR.Frame<n> is 1.

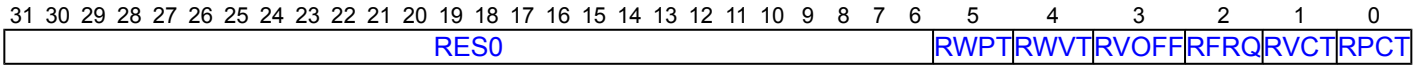
An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

Attributes

CNTACR<n> is a 32-bit register.

Field descriptions



Bits [31:6]

Reserved, RES0.

RWPT, bit [5]

Read/write access to the EL1 Physical Timer registers CNTP_CVAL, CNTP_TVAL, and CNTP_CTL, in frame <n>.

RWPT	Meaning
0b0	No access to the EL1 Physical Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the EL1 Physical Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RWVT, bit [4]

Read/write access to the Virtual Timer register CNTV_CVAL, CNTV_TVAL, and CNTV_CTL, in frame <n>.

RWVT	Meaning
0b0	No access to the Virtual Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the Virtual Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVOFF, bit [3]

Read-only access to CNTVOFF, in frame <n>.

RVOFF	Meaning
0b0	No access to CNTVOFF in frame <n>. The register is RES0.
0b1	Read-only access to CNTVOFF in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RFRQ, bit [2]

Read-only access to CNTFRQ, in frame <n>.

RFRQ	Meaning
0b0	No access to CNTFRQ in frame <n>. The register is RES0.
0b1	Read-only access to CNTFRQ in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVCT, bit [1]

Read-only access to CNTVCT, in frame <n>.

RVCT	Meaning
0b0	No access to CNTVCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTVCT in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RPCT, bit [0]

Read-only access to CNTPCT, in frame <n>.

RPCT	Meaning
0b0	No access to CNTPCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTPCT in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTACR<n>

In a system that supports the Realm Management Extension, CNTNSAR.NS<n> describes how these registers can be accessed by Root or Realm accesses.

In a system that recognizes two Security states:

- CNTACR<n> is always accessible by Secure accesses.

- CNTNSAR.NS<n> determines whether CNTACR<n> is accessible by Non-secure accesses.

CNTACR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	`0x040` + (4 * n)	CNTACR<n>

Accesses to this register are **RW**.

CNTCR, Counter Control Register

The CNTCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Configuration

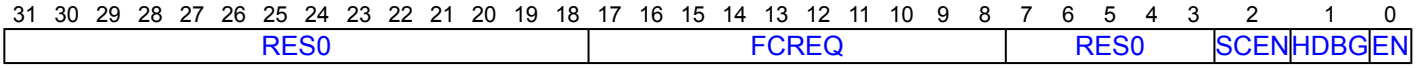
It is IMPLEMENTATION DEFINED whether CNTCR is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTCR is a 32-bit register.

Field descriptions



Bits [31:18]

Reserved, RES0.

FCREQ, bits [17:8]

Frequency change request. Indicates the number of the entry in the Frequency modes table to select.

Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see 'The Frequency modes table'. An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

The reset behavior of this field is:

- On a Timer reset, this field resets to `'0000000000'`.

Bits [7:3]

Reserved, RES0.

SCEN, bit [2]

When FEAT_CNTSC is implemented:

Scale Enable.

SCEN	Meaning
`0b0`	Scaling is not enabled. The counter value is incremented by `0x1`.0000000 for each counter tick.
`0b1`	Scaling is enabled. The counter is incremented by CNTSCR.ScaleVal for each counter tick.

The SCEN bit can only be changed when the counter is disabled, when CNTCR.EN == 0.

If the value of CNTCR.SCEN changes when CNTCR.EN == 1 then:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

When the CNTCV register in the CNTControlBase frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HDBG, bit [1]

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

HDBG	Meaning
0b0	System counter ignores Halt-on-debug.
0b1	Asserted Halt-on-debug signal halts system counter update.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enables the counter:

EN	Meaning
0b0	System counter disabled.
0b1	System counter enabled.

The reset behavior of this field is:

- On a Timer reset, this field resets to '0'.

Accessing CNTCR

In a system that supports the Realm Management Extension, the CNTControlBase frame, which includes this register, is implemented only in the Root physical address space.

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x000	CNTCR

Accesses to this register are **RW**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTCV, Counter Count Value register

The CNTCV characteristics are:

Purpose

Indicates the current count value.

Configuration

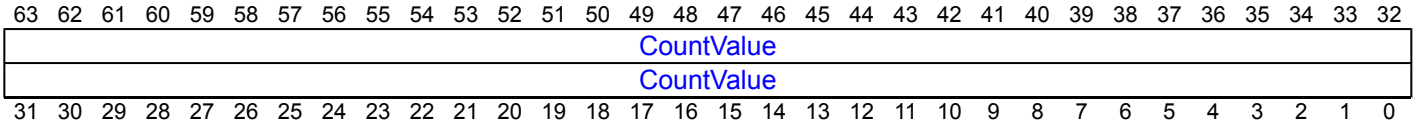
It is IMPLEMENTATION DEFINED whether CNTCV is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTCV is a 64-bit register.

Field descriptions



CountValue, bits [63:0]

Indicates the counter value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTCV

Frame	Accessibility
CNTControlBase	RW
CNTReadBase	RO

A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports the Realm Management Extension, this register is implemented only in the Root physical address space.
- In a system that supports Secure and Non-secure physical address spaces, this register is implemented only in the Secure physical address space.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

For the instance of the register in the CNTReadBase frame, this register is accessible in all physical address spaces.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

CNTCV can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTControlBase	0x008	CNTCV	63:0

Accesses to this register are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTReadBase	0x000	CNTCV	63:0

Accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTEL0ACR, Counter-timer EL0 Access Control Register

The CNTEL0ACR characteristics are:

Purpose

An implementation of CNTEL0ACR in the frame at CNTBaseN controls whether the CNTPCT, CNTVCT, CNTFRQ, EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTEL0BaseN.

Configuration

It is IMPLEMENTATION DEFINED whether CNTEL0ACR is implemented in the Core power domain or in the Debug power domain.

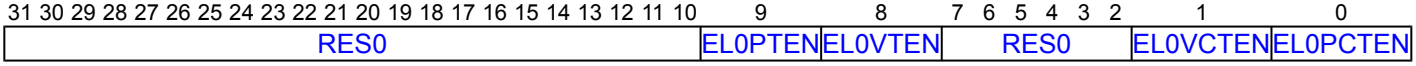
Implementation of this register is OPTIONAL.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTEL0ACR is a 32-bit register.

Field descriptions



Bits [31:10]

Reserved, RES0.

EL0PTEN, bit [9]

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the CNTP_CVAL, CNTP_TVAL, and CNTP_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame.

EL0PTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

Second view read/write access control for the Virtual Timer registers. This bit controls whether the CNTV_CVAL, CNTV_TVAL, and CNTV_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame.

EL0VTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL0VCTEN, bit [1]

Second view read access control for CNTVCT and CNTFRQ.

EL0VCTEN	Meaning
0b0	CNTVCT is not visible in the second view. If EL0PCTEN is set to 0, CNTFRQ is not visible in the second view.
0b1	Access permitted. If CNTVCT and CNTFRQ are visible in the current frame then they are visible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Second view read access control for CNTPCT and CNTFRQ.

EL0PCTEN	Meaning
0b0	CNTPCT is not visible in the second view. If EL0VCTEN is set to 0, CNTFRQ is not visible in the second view.
0b1	Access permitted. If CNTPCT and CNTFRQ are visible in the current frame then they are visible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTEL0ACR

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

- The register location in that frame is RAZ/WI.
- If the corresponding CNTEL0BaseN frame is implemented, the registers CNTFRQ, CNTP_CTL, CNTP_CVAL, CNTP_TVAL, CNTPCT, CNTV_CTL, CNTV_CVAL, CNTV_TVAL, and CNTVCT are not visible and accesses are RAZ/WI in that frame.

CNTEL0ACR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x014	CNTEL0ACR

Accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

Purpose

Indicates the base frequency of the system counter.

Configuration

It is IMPLEMENTATION DEFINED whether CNTFID0 is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information, see 'The Frequency modes table'.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

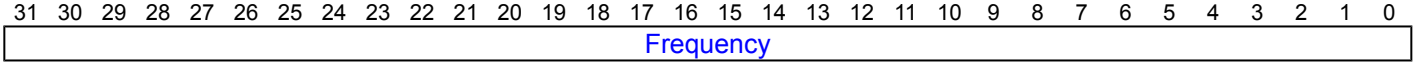
Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID0 is a 32-bit register.

Field descriptions



Frequency, bits [31:0]

The base frequency of the system counter, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID0

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports the Realm Management Extension, the CNTControlBase frame, which includes this register, is implemented only in the Root physical address space.

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTFID0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020	CNTFID0

Accesses to this register are **RO or RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTFID<n>, Counter Frequency IDs, n > 0, n = 1 - 1003

The CNTFID<n> characteristics are:

Purpose

Indicates alternative system counter update frequencies.

Configuration

It is IMPLEMENTATION DEFINED whether CNTFID<n> is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0, see 'The Frequency modes table'.

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is CNTFID0.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED up to this limit. For an implementation that includes registers in the IMPLEMENTATION DEFINED register space `0x0C0-0x0FC`, the maximum number of entries in the Frequency modes table is 40, including the zero-word end marker.

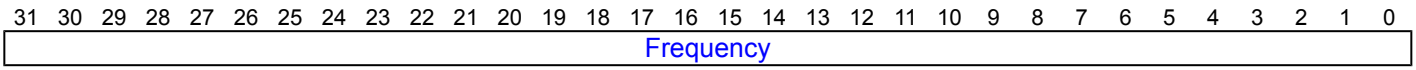
Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID<n> is a 32-bit register.

Field descriptions



Frequency, bits [31:0]

A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

increment = (base frequency) / (selected frequency)

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID<n>

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports the Realm Management Extension, the CNTControlBase frame, which includes these registers, is implemented only in the Root physical address space.

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes these registers, is implemented only in the Secure physical address space.

CNTFID<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	`0x020` + (4 * n)	CNTFID<n>

Accesses to this register are **RO or RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. The instance of the register in the CNTCTLBase frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configuration

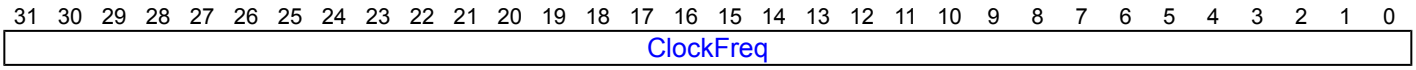
It is IMPLEMENTATION DEFINED whether CNTFRQ is implemented in the Core power domain or in the Debug power domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions



ClockFreq, bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ

CNTFRQ must be implemented as an RW register in the CNTCTLBase frame.

In a system that supports the Realm Management Extension, the instance of the register in the CNTCTLBase frame is accessible as follows:

- For Root accesses, it is IMPLEMENTATION DEFINED whether accesses to the register are permitted or behave as RES0.
- For Realm accesses, this register behaves as RES0.

In a system that recognizes two Security states, the instance of the register in the CNTCTLBase frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of CNTACR<n>.RFRQ is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:
  - CNTFRQ is accessible in the corresponding CNTBaseN frame.
  - Either the value of CNTEL0ACR.EL0VCTEN is 1 or the value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

CNTFRQ can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x010	CNTFRQ

Accesses to this register are **RO**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x010	CNTFRQ

Accesses to this register are **RO**.

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x000	CNTFRQ

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTID, Counter Identification Register

The CNTID characteristics are:

Purpose

Indicates whether counter scaling is implemented.

Configuration

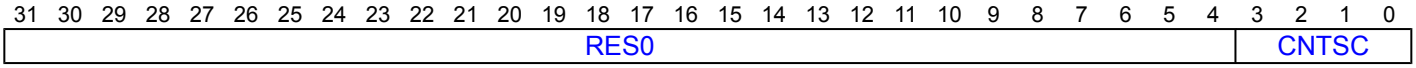
It is IMPLEMENTATION DEFINED whether CNTID is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTID are RES0.

Attributes

CNTID is a 32-bit register.

Field descriptions



Bits [31:4]

Reserved, RES0.

CNTSC, bits [3:0]

Indicates whether Counter Scaling is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CNTSC	Meaning
0b0000	Counter scaling is not implemented.
0b0001	Counter scaling is implemented.

All other values are reserved.

Access to this field is **RO**.

Accessing CNTID

In a system that supports the Realm Management Extension, the CNTControlBase frame, which includes this register, is implemented only in the Root physical address space.

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTID can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x1C	CNTID

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

Purpose

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

Configuration

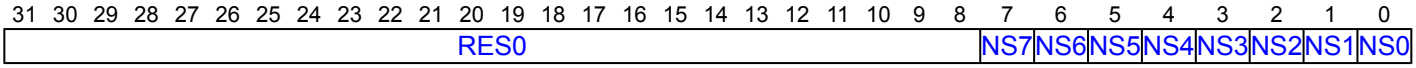
It is IMPLEMENTATION DEFINED whether CNTNSAR is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTNSAR is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

NS<n>, bit [n], for n = 7 to 0

Non-secure access to frame n.

NS<n>	Meaning
0b0	Secure access only. Behaves as RES0 to Non-secure accesses. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether Root accesses to the specified registers are permitted or behave as RES0. For Realm accesses, the specified registers behave as RES0.
0b1	Secure and Non-secure accesses permitted. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether Root and Realm accesses to the specified registers are permitted. If not permitted, the specified registers behave as RES0 for Root and Realm accesses.

This bit also determines whether, in the CNTCTLBase frame, CNTACR<n> and CNTVOFF<n> are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTNSAR

In a system that supports the Realm Management Extension, this register is accessible as follows:

- For Root accesses, it is IMPLEMENTATION DEFINED whether accesses to the register are permitted or behave as RES0.

- For Realm accesses, this register behaves as RES0.

In a system that recognizes two Security states, this register is only accessible by Secure accesses.

CNTNSAR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x004	CNTNSAR

Accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

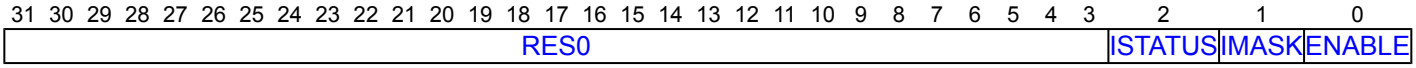
It is IMPLEMENTATION DEFINED whether CNTP_CTL is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_CTL is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CTL

CNTP_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CTL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CTL is accessible in that frame if both:
  - CNTP_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

CNTP_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x02C	CNTP_CTL

Accesses to this register are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x02C	CNTP_CTL

Accesses to this register are **RW**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the EL1 physical timer.

Configuration

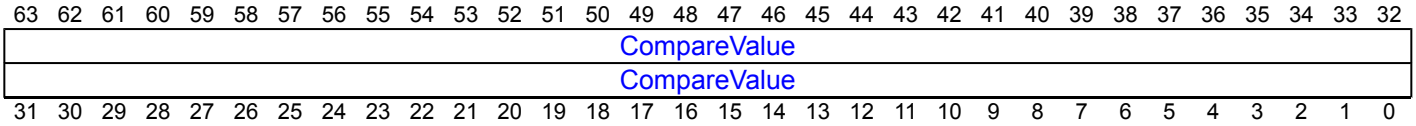
It is IMPLEMENTATION DEFINED whether CNTP_CVAL is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_CVAL is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTP_CTL.IMASK is 0.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL

CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CVAL is accessible in that frame if both:
  - CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

CNTP_CVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x020	CNTP_CVAL	31:0

Accesses to this register are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x024	CNTP_CVAL	63:32

Accesses to this register are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x020	CNTP_CVAL	31:0

Accesses to this register are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x024	CNTP_CVAL	63:32

Accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configuration

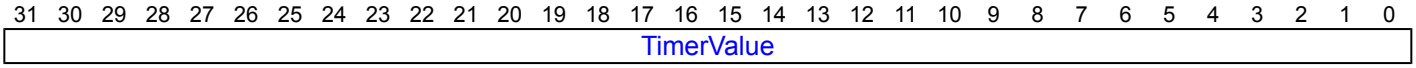
It is IMPLEMENTATION DEFINED whether CNTP_TVAL is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions



TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL.ENABLE is 1, the value returned is (CompareValue - CNTPCT).

On a write of this register, CompareValue is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_TVAL

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.

- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTP_TVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_TVAL is accessible in that frame if both:
  - CNTP_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

CNTP_TVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x028	CNTP_TVAL

Accesses to this register are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x028	CNTP_TVAL

Accesses to this register are **RW**.

CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

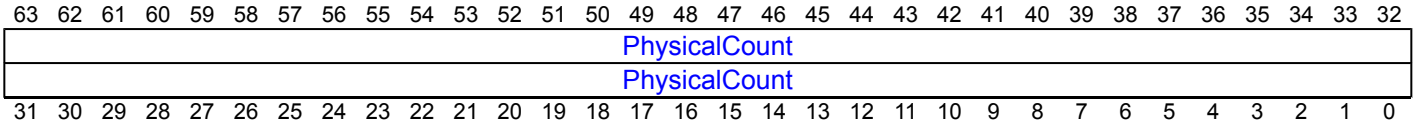
It is IMPLEMENTATION DEFINED whether CNTPCT is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTPCT is a 64-bit register.

Field descriptions



PhysicalCount, bits [63:0]

Physical count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCT

CNTPCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTPCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RPCT is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTPCT is accessible in that frame if both:
  - CNTPCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

CNTPCT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x000	CNTPCT	31:0

Accesses to this register are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x004	CNTPCT	63:32

Accesses to this register are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x000	CNTPCT	31:0

Accesses to this register are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x004	CNTPCT	63:32

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

CNTSCR, Counter Scale Register

The CNTSCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Configuration

It is IMPLEMENTATION DEFINED whether CNTSCR is implemented in the Core power domain or in the Debug power domain.

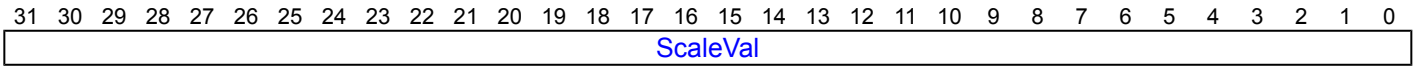
This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTSCR is a 32-bit register.

Field descriptions



ScaleVal, bits [31:0]

Scale Value

When counter scaling is enabled, ScaleVal is the average amount added to the counter value for one period of the frequency of the Generic counter as described in the CNTFRQ register.

The actual rate of update of the counter value is determined by the counter update frequency.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when CNTCR.EN == 0. If the value of this field is changed when CNTCR.EN == 1:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTSCR

In a system that supports the Realm Management Extension, the CNTControlBase frame, which includes this register, is implemented only in the Root physical address space.

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTSCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x10	CNTSCR

Accesses to this register are **RW**.

CNTSR, Counter Status Register

The CNTSR characteristics are:

Purpose

Provides counter frequency status information.

Configuration

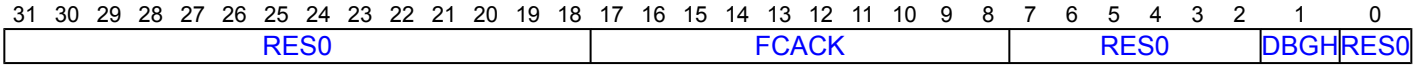
It is IMPLEMENTATION DEFINED whether CNTSR is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTSR is a 32-bit register.

Field descriptions



Bits [31:18]

Reserved, RES0.

FCACK, bits [17:8]

Frequency Change Acknowledge. Indicates the currently selected entry in the Frequency modes table, see 'The Frequency modes table'.

The reset behavior of this field is:

- On a Timer reset, this field resets to `'0000000000'`.

Bits [7:2]

Reserved, RES0.

DBGH, bit [1]

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

DBGH	Meaning
`0b0`	Counter is not halted.
`0b1`	Counter is halted.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing CNTSR

In a system that supports the Realm Management Extension, the CNTControlBase frame, which includes this register, is implemented only in the Root physical address space.

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x004	CNTSR

Accesses to this register are **RO**.

CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

Purpose

Indicates the implemented timers in the physical address space, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

Configuration

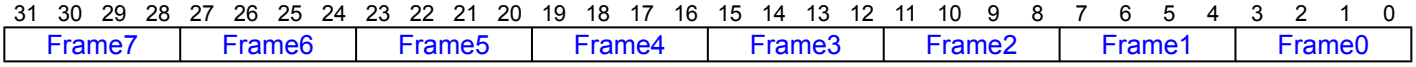
It is IMPLEMENTATION DEFINED whether CNTTIDR is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTTIDR is a 32-bit register.

Field descriptions



Frame<n>, bits [4n+3:4n], for n = 7 to 0

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTEL0Base<n>. The possible values of this bit are:

Bit[2]	Meaning
0b0	Frame<n> does not have a second view. The CNTEL0ACR register in the first view of the frame is RES0.
0b1	Frame<n> has a second view, CNTEL0Base<n>.

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers CNTV_CVAL, CNTV_TVAL, and CNTV_CTL.
- This CNTCTLBase frame implements the virtual timer offset register CNTVOFF<n>.

The possible values of bit[1] are:

Bit[1]	Meaning
0b0	Frame<n> does not have virtual capability. The virtual time and offset registers are RES0.
0b1	Frame<n> has virtual capability. The virtual time and offset registers are implemented.

If bit[0] is 0, bit[1] is RES0.

Bit[0], the FI subfield, indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

Bit[0]	Meaning
0b0	Frame<n> is not implemented. All registers associated with the frame are RES0.
0b1	Frame<n> is implemented.

Accessing CNTTIDR

In a system that supports the Realm Management Extension, it is IMPLEMENTATION DEFINED whether Root and Realm accesses to this register are permitted. If not permitted, this register behaves as RES0 for Root and Realm accesses.

In a system that recognizes two Security states, this register is accessible by both Secure and Non-secure accesses.

CNTTIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x008	CNTTIDR

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configuration

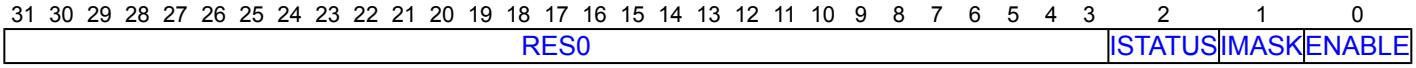
It is IMPLEMENTATION DEFINED whether CNTV_CTL is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CTL

CNTV_CTL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CTL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CTL is accessible in that frame if both:
  - CNTV_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

CNTV_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x03C	CNTV_CTL

Accesses to this register are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x03C	CNTV_CTL

Accesses to this register are **RW**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the virtual timer.

Configuration

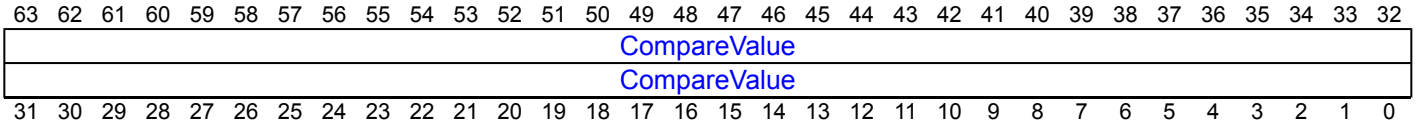
It is IMPLEMENTATION DEFINED whether CNTV_CVAL is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the virtual timer CompareValue.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTV_CTL.IMASK is 0.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL

CNTV_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.

- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CVAL is accessible in that frame if both:
  - CNTV_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

CNTV_CVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x030	CNTV_CVAL	31:0

Accesses to this register are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x034	CNTV_CVAL	63:32

Accesses to this register are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x030	CNTV_CVAL	31:0

Accesses to this register are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x034	CNTV_CVAL	63:32

Accesses to this register are **RW**.

CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configuration

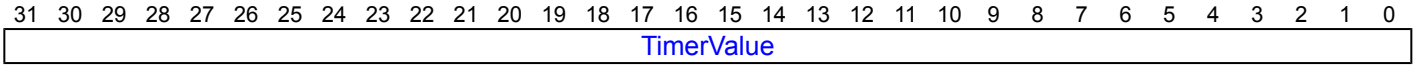
It is IMPLEMENTATION DEFINED whether CNTV_TVAL is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions



TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CompareValue - CNTVCT).

On a write of this register, CompareValue is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.

- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_TVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_TVAL is accessible in that frame if both:
  - CNTV_TVAL is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

CNTV_TVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x038	CNTV_TVAL

Accesses to this register are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x038	CNTV_TVAL

Accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value.

Configuration

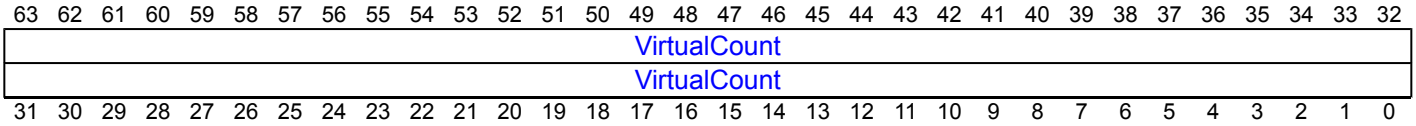
It is IMPLEMENTATION DEFINED whether CNTVCT is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVCT is a 64-bit register.

Field descriptions



VirtualCount, bits [63:0]

Virtual count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCT

CNTVCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTVCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVCT is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTVCT is accessible in that frame if both:
  - CNTVCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0VCTEN is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.

CNTVCT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x008	CNTVCT	31:0

Accesses to this register are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x00C	CNTVCT	63:32

Accesses to this register are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x008	CNTVCT	31:0

Accesses to this register are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x00C	CNTVCT	63:32

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset for a CNTBaseN frame that has virtual timer capability. This is the offset between real time and virtual time.

Configuration

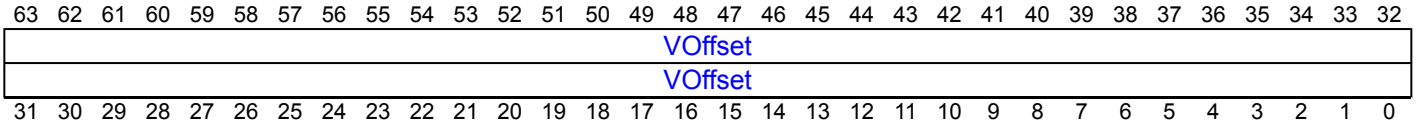
It is IMPLEMENTATION DEFINED whether CNTVOFF is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions



VOffset, bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF

CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVOFF is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

Note

CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF register must be accessible as an atomic 64-bit value.

CNTVOFF can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Range
Timer	CNTBaseN	0x018	31:0

Accesses to this register are **RO**.

Component	Frame	Offset	Range
Timer	CNTBaseN	0x01C	63:32

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTVOFF<n>, Counter-timer Virtual Offsets, n = 0 - 7

The CNTVOFF<n> characteristics are:

Purpose

Holds the 64-bit virtual offset for frame CNTBase<n>. This is the offset between real time and virtual time.

Configuration

It is IMPLEMENTATION DEFINED whether CNTVOFF<n> is implemented in the Core power domain or in the Debug power domain.

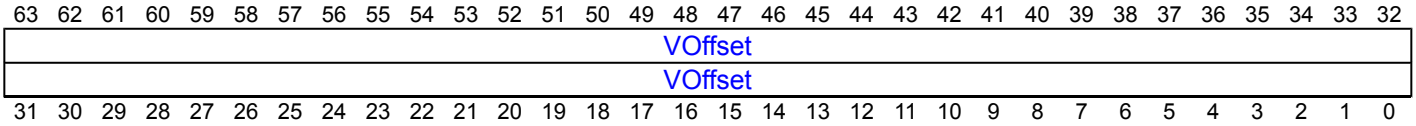
Implementation of this register is OPTIONAL.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVOFF<n> is a 64-bit register.

Field descriptions



VOffset, bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF<n>

In the CNTCTLBase frame a CNTVOFF<n> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability. For more information, see 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames'.

Note

The value of <n> in an instance of CNTVOFF<n> specifies the value of N for the associated CNTBaseN frame.

In a system that supports the Realm Management Extension, CNTNSAR.NS<n> describes how these registers can be accessed by Root or Realm accesses.

In a system that recognizes two Security states, for any CNTVOFF<n> register in the CNTCTLBase frame:

- CNTVOFF<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTVOFF<n> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<n> register in the CNTCTLBase frame is RAZ/WI.

The CNTVOFF<n> register is accessible in the CNTBaseN frame using CNTVOFF.

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF<n> registers must be accessible as atomic 64-bit values.

CNTVOFF<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Range
Timer	CNTCTLBase	`0x080` + (8 * n)	31:0

Accesses to this register are **RW**.

Component	Frame	Offset	Range
Timer	CNTCTLBase	`0x084` + (8 * n)	63:32

Accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

Configuration

It is IMPLEMENTATION DEFINED whether CounterID<n> is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

These registers are implemented independently in each of the implemented Generic Timer memory-mapped frames.

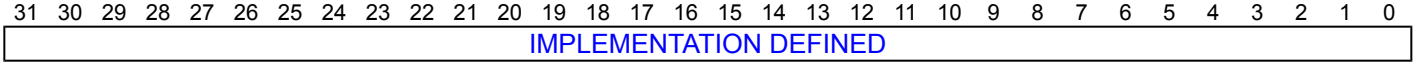
If the implementation of the Counter ID registers requires an architecture version, the value for this version of the Arm Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of `0xF`.

Attributes

CounterID<n> is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing CounterID<n>

These registers must be implemented, as RO registers, in every implemented Generic Timer memory-mapped frame.

For the CNTCTLBase frame, in a system that supports the Realm Management Extension, it is IMPLEMENTATION DEFINED whether Root and Realm accesses to these registers are permitted. If not permitted, these registers behave as RES0 for Root and Realm accesses.

For the CNTCTLBase frame, in a system that recognizes two Security states these registers are accessible by both Secure and Non-secure accesses.

For the CNTControlBase frame, in a system that supports the Realm Management Extension, the frame is implemented only in the Root physical address space, meaning these registers are implemented only in the Root physical address space.

For the CNTControlBase frame, in a system that supports Secure and Non-secure physical address spaces, the frame is implemented only in the Secure physical address space, meaning these registers are implemented only in the Secure physical address space.

For the CNTReadBase frame, these registers are accessible in all physical address spaces.

For the CNTBaseN frames, 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.

- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

CounterID<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	`0xFD0` + (4 * n)	CounterID<n>

Accesses to this register are **RO**.

Component	Frame	Offset	Instance
Timer	CNTReadBase	`0xFD0` + (4 * n)	CounterID<n>

Accesses to this register are **RO**.

Component	Frame	Offset	Instance
Timer	CNTBaseN	`0xFD0` + (4 * n)	CounterID<n>

Accesses to this register are **RO**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	`0xFD0` + (4 * n)	CounterID<n>

Accesses to this register are **RO**.

Component	Frame	Offset	Instance
Timer	CNTCTLBase	`0xFD0` + (4 * n)	CounterID<n>

Accesses to this register are **RO**.

CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

Purpose

Clears the application triggers.

Configuration

External register CTIAPPCLEAR bits [31:0] are architecturally mapped to External register CTIAPPSET[31:0].

CTIAPPCLEAR is in the Debug power domain.

Attributes

CTIAPPCLEAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23
APPCLEAR31	APPCLEAR30	APPCLEAR29	APPCLEAR28	APPCLEAR27	APPCLEAR26	APPCLEAR25	APPCLEAR24	APPCLEAR

APPCLEAR<x>, bit [x], for x = 31 to 0

Application trigger <x> disable.

Writing to this bit has the following effect:

APPCLEAR<x>	Meaning
0b0	No effect.
0b1	Clear corresponding application trigger to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use CTIAPPPULSE.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RAZ/W1C**.

Accessing CTIAPPCLEAR

CTIAPPCLEAR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x018	CTIAPPCLEAR

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are **WI**.
- Otherwise, accesses to this register are **WO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

Purpose

Causes event pulses to be generated on ECT channels.

Configuration

CTIAPPPULSE is in the Debug power domain.

Attributes

CTIAPPPULSE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23
APPPULSE31	APPPULSE30	APPPULSE29	APPPULSE28	APPPULSE27	APPPULSE26	APPPULSE25	APPPULSE24	APPPULSE2

APPPULSE<x>, bit [x], for x = 31 to 0

Generate event pulse on ECT channel <x>.

APPPULSE<x>	Meaning
0b0	No effect.
0b1	Channel <x> event pulse generated.

Note

- The CTIAPPPULSE operation does not affect the state of the application trigger. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **WO/UNKNOWN**.

Accessing CTIAPPPULSE

It is CONSTRAINED UNPREDICTABLE whether a write to CTIAPPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.

CTIAPPPULSE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x01C	CTIAPPPULSE

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are **WI**.
- Otherwise, accesses to this register are **WO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

Purpose

Sets the application triggers.

Configuration

External register CTIAPPSET bits [31:0] are architecturally mapped to External register CTIAPPCLEAR[31:0].

CTIAPPSET is in the Debug power domain.

Attributes

CTIAPPSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	
APPSET31	APPSET30	APPSET29	APPSET28	APPSET27	APPSET26	APPSET25	APPSET24	APPSET23	APPSET22	APPSET21	AP

APPSET<x>, bit [x], for x = 31 to 0

Application trigger <x> enable.

APPSET<x>	Meaning
0b0	Reading this means the application trigger is inactive. Writing this has no effect.
0b1	Reading this means the application trigger is active. Writing this sets the corresponding application trigger to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use CTIAPPPULSE.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1S**.

Accessing CTIAPPSET

CTIAPPSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x014	CTIAPPSET

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

Configuration

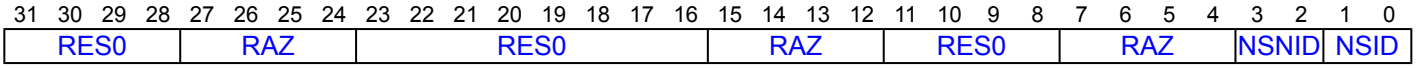
CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance.

Attributes

CTIAUTHSTATUS is a 32-bit register.

Field descriptions



Bits [31:28]

Reserved, RES0.

Bits [27:24]

Reserved, RAZ.

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RAZ.

Bits [11:8]

Reserved, RES0.

Bits [7:4]

Reserved, RAZ.

NSNID, bits [3:2]

If EL3 is implemented, this field holds the same value as DBGAUTHSTATUS_EL1.NSNID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SNID.

NSID, bits [1:0]

If EL3 is implemented, this field holds the same value as DBGAUTHSTATUS_EL1.NSID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SID.

Accessing CTIAUTHSTATUS

CTIAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFB8	CTIAUTHSTATUS

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

Purpose

Provides the raw status of the ECT channel inputs to the CTI.

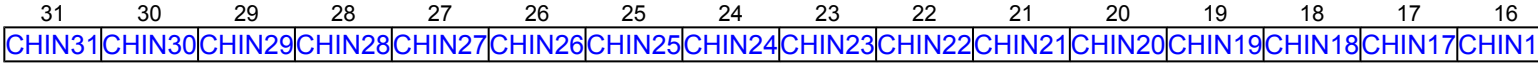
Configuration

CTICHINSTATUS is in the Debug power domain.

Attributes

CTICHINSTATUS is a 32-bit register.

Field descriptions



CHIN<n>, bit [n], for n = 31 to 0

Input channel <n> status.

CHIN<n>	Meaning
0b0	Input channel <n> is inactive.
0b1	Input channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMCHAN), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

Accessing CTICHINSTATUS

CTICHINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x138	CTICHINSTATUS

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

Purpose

Provides the status of the ECT channel outputs from the CTI.

Configuration

CTICHOUTSTATUS is in the Debug power domain.

Attributes

CTICHOUTSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
CHOUT31	CHOUT30	CHOUT29	CHOUT28	CHOUT27	CHOUT26	CHOUT25	CHOUT24	CHOUT23	CHOUT22	CHOUT21	CHOUT20	C

CHOUT<n>, bit [n], for n = 31 to 0

Output channel <n> status.

CHOUT<n>	Meaning
0b0	Output channel <n> is inactive.
0b1	Output channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

Note

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see CTIGATE.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMCHAN), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

Accessing CTICHOUTSTATUS

CTICHOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x13C	CTICHOUTSTATUS

Accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR0 is in the Debug power domain.

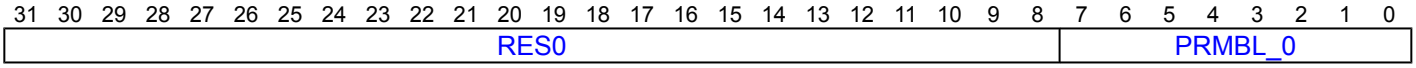
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR0 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as `0x0D`.

Access to this field is **RO**.

Accessing CTICIDR0

CTICIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFF0`	CTICIDR0

Accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR1 is in the Debug power domain.

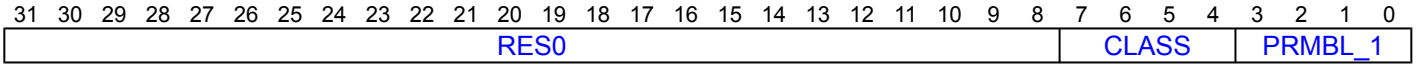
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

Access to this field is **RO**.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000.

Access to this field is **RO**.

Accessing CTICIDR1

CTICIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF4	CTICIDR1

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR2 is in the Debug power domain.

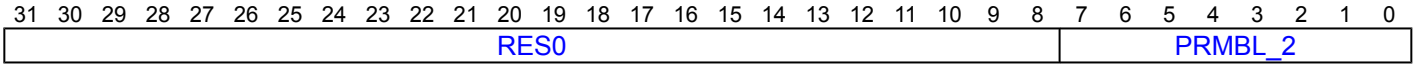
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR2 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as `0x05`.

Access to this field is **RO**.

Accessing CTICIDR2

CTICIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFF8`	CTICIDR2

Accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR3 is in the Debug power domain.

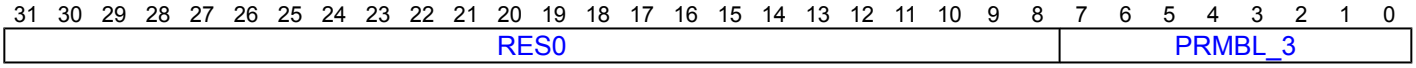
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR3 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as `0xB1`.

Access to this field is **RO**.

Accessing CTICIDR3

CTICIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFFC`	CTICIDR3

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICLAIMCLR, CTI CLAIM Tag Clear register

The CTICLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

Configuration

External register CTICLAIMCLR bits [31:0] are architecturally mapped to External register CTICLAIMSET[31:0].

CTICLAIMCLR is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMCLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18
CLAIM31	CLAIM30	CLAIM29	CLAIM28	CLAIM27	CLAIM26	CLAIM25	CLAIM24	CLAIM23	CLAIM22	CLAIM21	CLAIM20	CLAIM19	CLAI

CLAIM<m>, bit [m], for m = 31 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The number of Claim Tag bits implemented is indicated in CTICLAIMSET.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing this field has the following behavior:

- When m >= NUM_CTI_CLAIM_TAGS, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1C**.

Accessing CTICLAIMCLR

CTICLAIMCLR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA4	CTICLAIMCLR

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICLAIMSET, CTI CLAIM Tag Set register

The CTICLAIMSET characteristics are:

Purpose

Used by software to set CLAIM bits to 1.

Configuration

External register CTICLAIMSET bits [31:0] are architecturally mapped to External register CTICLAIMCLR[31:0].

CTICLAIMSET is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18
CLAIM31	CLAIM30	CLAIM29	CLAIM28	CLAIM27	CLAIM26	CLAIM25	CLAIM24	CLAIM23	CLAIM22	CLAIM21	CLAIM20	CLAIM19	CLAI

CLAIM<m>, bit [m], for m = 31 to 0

Claim Tag Set. Indicates whether Claim Tag bit <m> is implemented, and is used to set Claim Tag bit <m> to 1.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not implemented. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is implemented. On a write: Set Claim Tag bit <m> to 1.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing this field has the following behavior:

- When m >= NUM_CTI_CLAIM_TAGS, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RAO/W1S**.

Accessing CTICLAIMSET

CTICLAIMSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA0	CTICLAIMSET

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

Purpose

Controls whether the CTI is enabled.

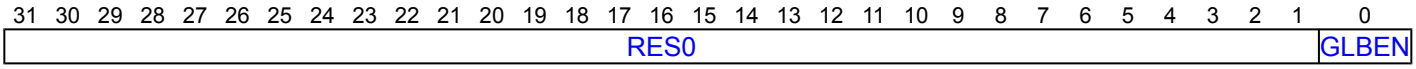
Configuration

CTICONTROL is in the Debug power domain.

Attributes

CTICONTROL is a 32-bit register.

Field descriptions



Bits [31:1]

Reserved, RES0.

GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

GLBEN	Meaning
0b0	CTI mapping functions and application trigger disabled.
0b1	CTI mapping functions and application trigger enabled.

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it is CONSTRAINED UNPREDICTABLE which of the following occurs:

- The output trigger remains asserted after the mapping functions are disabled.
- The output trigger is deasserted after the mapping functions are disabled.

All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On an External debug reset, this field resets to '0'.

Accessing CTICONTROL

CTICONTROL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x000	CTICONTROL

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF0 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

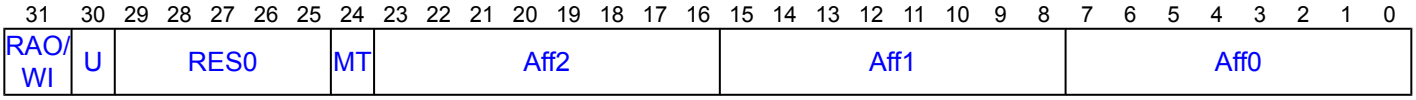
In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF1 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF0 is a 32-bit register.

Field descriptions



Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is **RO**.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is **RO**.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVAFF0

CTIDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA8	CTIDEVAFF0

Accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF1 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

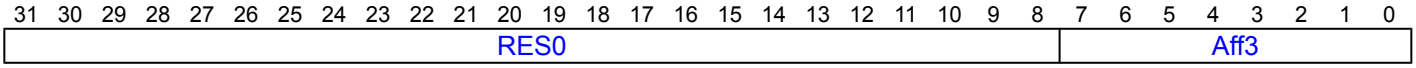
In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF0 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

Aff3, bits [7:0]

Affinity level 3. See the description of CTIDEVAFF0.Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVAFF1

CTIDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFAC	CTIDEVAFF1

Accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the CTI component.

Configuration

CTIDEVARCH is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

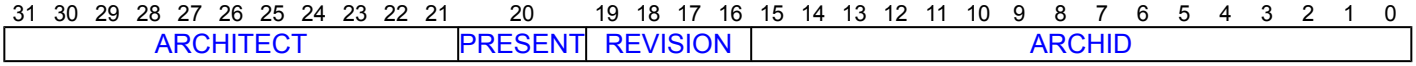
In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is not implemented, CTIDEVAFF0 and CTIDEVAFF1 are also not implemented.

Attributes

CTIDEVARCH is a 32-bit register.

Field descriptions



ARCHITECT, bits [31:21]

Defines the architect of the component. For CTI, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, `0b0100`.

Bits [27:21] are the JEP106 identification code, `0b0111011`.

Reads as `0b01000111011`.

Access to this field is **RO**.

PRESENT, bit [20]

DEVARCH present. Indicates that the CTIDEVARCH register is present.

Reads as `0b1`.

Access to this field is **RO**.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

REVISION	Meaning
`0b0000`	First revision.
`0b0001`	As `0b0000`, and also adds support for CTIDEVCTL.

All other values are reserved.

When FEAT_DoPD is implemented, the value `0b0000` is not permitted.

Access to this field is **RO**.

ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, `0x1`.
- Bits [11:0] are the architecture part number, `0xA14`.

This corresponds to CTI architecture version CTIv2.

Reads as `0x1A14`.

Access to this field is **RO**.

Accessing CTIDEVARCH

CTIDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFBC`	CTIDEVARCH

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVCTL, CTI Device Control register

The CTIDEVCTL characteristics are:

Purpose

Provides target-specific device controls

Configuration

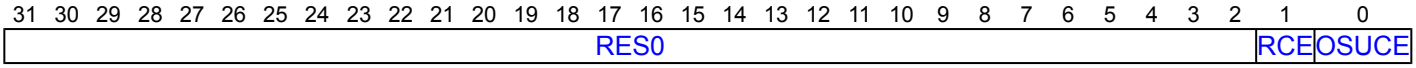
CTIDEVCTL is in the Debug power domain.

This register is present only when FEAT_DoPD is implemented. Otherwise, direct accesses to CTIDEVCTL are RES0.

Attributes

CTIDEVCTL is a 32-bit register.

Field descriptions



Bits [31:2]

Reserved, RES0.

RCE, bit [1]

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to '0'.

OSUCE, bit [0]

OS Unlock Catch Enable

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to '0'.

Accessing CTIDEVCTL

CTIDEVCTL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x150	CTIDEVCTL

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

Purpose

Describes the CTI component to the debugger.

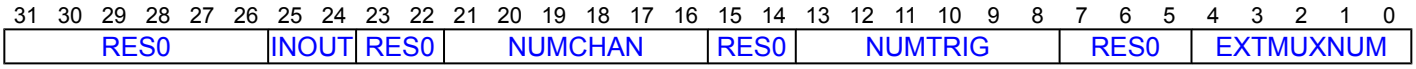
Configuration

CTIDEVID is in the Debug power domain.

Attributes

CTIDEVID is a 32-bit register.

Field descriptions



Bits [31:26]

Reserved, RES0.

INOUT, bits [25:24]

Input/output options. Indicates presence of the input gate. If the CTM is not implemented or CTIv2 is not implemented, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

INOUT	Meaning
0b00	CTIGATE does not mask propagation of input events from external channels.
0b01	CTIGATE masks propagation of input events from external channels.

All other values are reserved.

Access to this field is **RO**.

Bits [23:22]

Reserved, RES0.

NUMCHAN, bits [21:16]

Number of ECT channels implemented. For Armv8, valid values are:

- 0b000011 3 channels (0..2) implemented.
- 0b000100 4 channels (0..3) implemented.
- 0b000101 5 channels (0..4) implemented.
- 0b000110 6 channels (0..5) implemented.

and so on up to 0b100000, 32 channels (0..31) implemented.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [15:14]

Reserved, RES0.

NUMTRIG, bits [13:8]

Upper bound for number of triggers. The indices of all implemented input and output triggers are less than this value.

There is no guarantee that all of the input and output triggers, including the highest numbered, are connected to any components, or that the implementation of input and output triggers is symmetrical.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [7:5]

Reserved, RES0.

EXTMUXNUM, bits [4:0]

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, ASICCTL.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVID

CTIDEVID can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC8	CTIDEVID

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

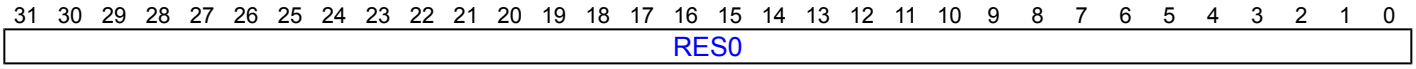
Configuration

CTIDEVID1 is in the Debug power domain.

Attributes

CTIDEVID1 is a 32-bit register.

Field descriptions



Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID1

CTIDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC4	CTIDEVID1

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

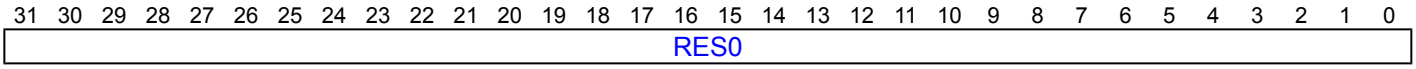
Configuration

CTIDEVID2 is in the Debug power domain.

Attributes

CTIDEVID2 is a 32-bit register.

Field descriptions



Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID2

CTIDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC0	CTIDEVID2

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's cross-trigger interface.

Configuration

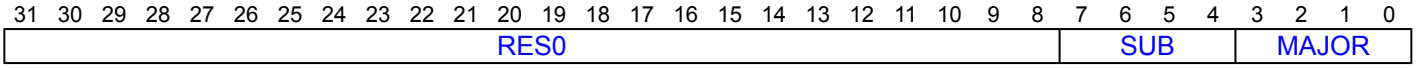
CTIDEVTYPE is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIDEVTYPE is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as `0b0001`.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type. Indicates this is a cross-trigger component.

Reads as `0b0100`.

Access to this field is **RO**.

Accessing CTIDEVTYPE

CTIDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFCC`	CTIDEVTYPE

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

Purpose

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

Configuration

CTIGATE is in the Debug power domain.

Attributes

CTIGATE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17
GATE31	GATE30	GATE29	GATE28	GATE27	GATE26	GATE25	GATE24	GATE23	GATE22	GATE21	GATE20	GATE19	GATE18	GATE17

GATE<x>, bit [x], for x = 31 to 0

Channel <x> gate enable.

GATE<x>	Meaning
0b0	Disable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.
0b1	Enable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.

If GATE<x> is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RW**.

Accessing CTIGATE

CTIGATE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x140	CTIGATE

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

Purpose

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

Configuration

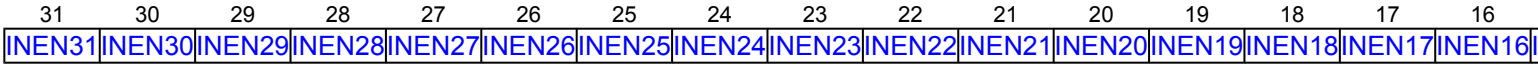
CTIINEN<n> is in the Debug power domain.

If input trigger n is not implemented or not connected, CTIINEN<n> is RES0.

Attributes

CTIINEN<n> is a 32-bit register.

Field descriptions



INEN<x>, bit [x], for x = 31 to 0

Input trigger <n> to output channel <x> enable.

INEN<x>	Meaning
0b0	Input trigger <n> will not generate an event on output channel <x>.
0b1	Input trigger <n> will generate an event on output channel <x>.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RW**.

Accessing CTIINEN<n>

CTIINEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x020 + (4 * n)	CTIINEN<n>

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

Purpose

Can be used to deactivate the output triggers.

Configuration

CTIINTACK is in the Debug power domain.

Attributes

CTIINTACK is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
ACK31	ACK30	ACK29	ACK28	ACK27	ACK26	ACK25	ACK24	ACK23	ACK22	ACK21	ACK20	ACK19	ACK18	ACK17	ACK16	ACK15	ACK1

ACK<n>, bit [n], for n = 31 to 0

Acknowledge for output trigger <n>.

If any of the following is true, writes to ACK<n> are ignored:

- n >= CTIDEVID.NUMTRIG, the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by CTIOUTEN<n>, is still active.

Otherwise, if any of the following are true, ACK<n> is RES0:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

ACK<n>	Meaning
0b0	No effect
0b1	Deactivate the trigger.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMTRIG), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **WO/UNKNOWN**.

Accessing CTIINTACK

A debugger must read CTITRIGOUTSTATUS to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPPULSE to activate another trigger.

CTIINTACK can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x010	CTIINTACK

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are **WI**.
- Otherwise, accesses to this register are **WO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

Purpose

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

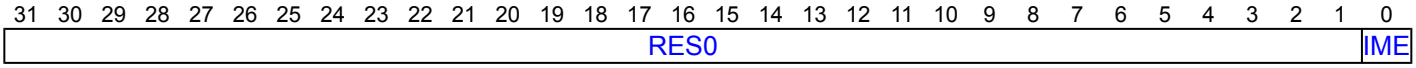
The power domain of CTIITCTRL is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

Attributes

CTIITCTRL is a 32-bit register.

Field descriptions



Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The integration mode behavior is IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to 0.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to 0.
  - On a Warm reset, the value of this field is unchanged.

Accessing CTIITCTRL

CTIITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xF00	CTIITCTRL

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register are **IMPDEF**.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

Purpose

Allows or disallows access to the CTI registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILAR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

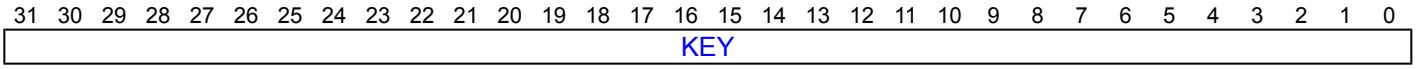
Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILAR is a 32-bit register.

Field descriptions

When CTI Software Lock is implemented:

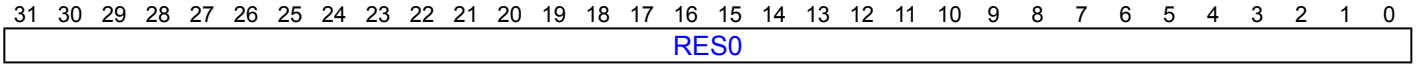


KEY, bits [31:0]

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:



Otherwise

Bits [31:0]

Reserved, RES0.

Accessing CTILAR

CTILAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance

CTI	0xFB0	CTILAR

Accesses to this register are **WO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

Purpose

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILSR is in the Debug power domain.

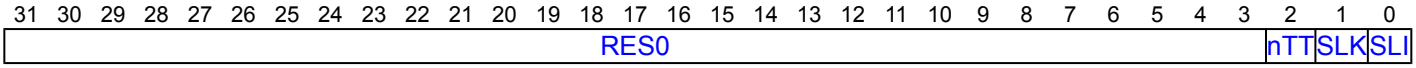
If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILSR is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SLK, bit [1]

When CTI Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On an External debug reset, this field resets to '1'.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Access to this field is **RO**.

Accessing CTILSR

CTILSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
CTI	0xFB4	CTILSR

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

Purpose

Defines which input channels generate output trigger n.

Configuration

CTIOUTEN<n> is in the Debug power domain.

If output trigger n is not implemented or not connected, CTIOUTEN<n> is RES0.

Attributes

CTIOUTEN<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	
OUTEN31	OUTEN30	OUTEN29	OUTEN28	OUTEN27	OUTEN26	OUTEN25	OUTEN24	OUTEN23	OUTEN22	OUTEN21	OUTEN20	OU

OUTEN<x>, bit [x], for x = 31 to 0

Input channel <x> to output trigger <n> enable.

OUTEN<x>	Meaning
0b0	An event on input channel <x> will not cause output trigger <n> to be asserted.
0b1	An event on input channel <x> will cause output trigger <n> to be asserted.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RW**.

Accessing CTIOUTEN<n>

CTIOUTEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x0A0 + (4 * n)	CTIOUTEN<n>

Accessible as follows:

- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR0 is in the Debug power domain.

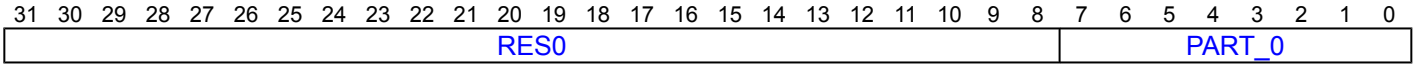
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR0 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR0

CTIPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE0	CTIPIDR0

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR1 is in the Debug power domain.

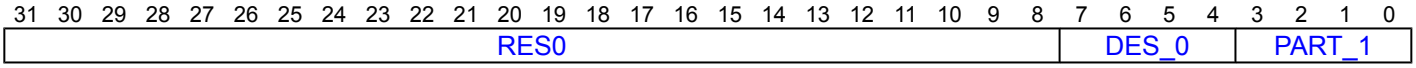
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is `0b1011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR1

CTIPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFE4`	CTIPIDR1

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR2 is in the Debug power domain.

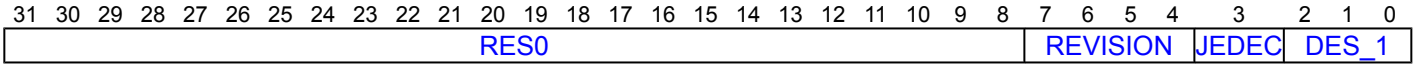
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR2 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as `0b1`.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is `0b011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR2

CTIPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE8	CTIPIDR2

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR3 is in the Debug power domain.

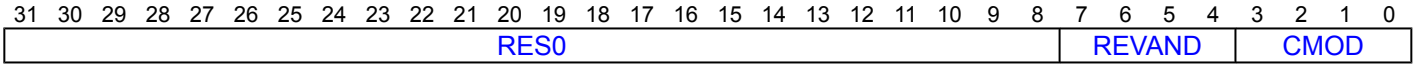
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR3 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using CTIPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR3

CTIPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFEC	CTIPIDR3

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR4 is in the Debug power domain.

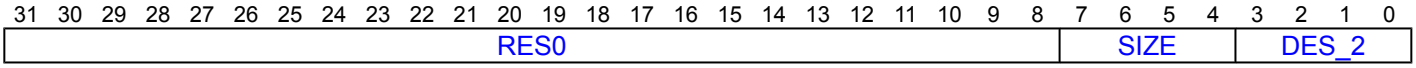
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR4 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as `0b0000`.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is `0b0100`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR4

CTIPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFD0`	CTIPIDR4

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

Purpose

Provides the status of the trigger inputs.

Configuration

CTITRIGINSTATUS is in the Debug power domain.

Attributes

CTITRIGINSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
TRIN31	TRIN30	TRIN29	TRIN28	TRIN27	TRIN26	TRIN25	TRIN24	TRIN23	TRIN22	TRIN21	TRIN20	TRIN19	TRIN18	TRIN17	TRIN16	TR

TRIN<n>, bit [n], for n = 31 to 0

Trigger input <n> status.

TRIN<n>	Meaning
0b0	Input trigger n is inactive.
0b1	Input trigger n is active.

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicycle events can be observed as active.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMTRIG), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

Accessing CTITRIGINSTATUS

CTITRIGINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x130	CTITRIGINSTATUS

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

Purpose

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

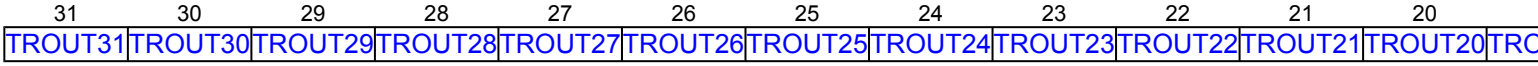
Configuration

CTITRIGOUTSTATUS is in the Debug power domain.

Attributes

CTITRIGOUTSTATUS is a 32-bit register.

Field descriptions



TROUT<n>, bit [n], for n = 31 to 0

Trigger output <n> status.

If n is less than CTIDEVID.NUMTRIG, and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT<n> are:

TROUT<n>	Meaning
0b0	Output trigger n is inactive.
0b1	Output trigger n is active.

Otherwise when n is less than CTIDEVID.NUMTRIG, it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMTRIG), access to this field is **RAZ/WI**.
- Access to this field is **RAZ/WI** if all the following are true:
  - Output trigger <n> is not implemented or not connected or (Output trigger <n> is self-acknowledging and CTI does not implement multicycle channel events).
  - an implementation implements TROUT<n>.
- Otherwise, access to this field is **RO**.

Accessing CTITRIGOUTSTATUS

CTITRIGOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x134	CTITRIGOUTSTATUS

Accesses to this register are **RO**.

DBGAUTHSTATUS_EL1, Debug Authentication Status Register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1[31:0].

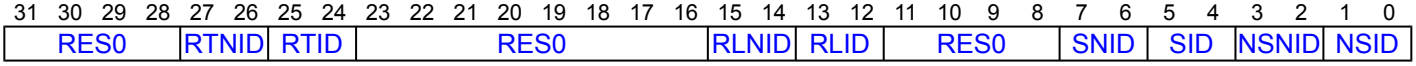
External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGAUTHSTATUS[31:0].

When FEAT_DoPD is implemented, DBGAUTHSTATUS_EL1 is in the Core power domain. Otherwise, DBGAUTHSTATUS_EL1 is in the Debug power domain.

Attributes

DBGAUTHSTATUS_EL1 is a 32-bit register.

Field descriptions



Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.
0b10	Implemented and disabled. ExternalRootInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalRootInvasiveDebugEnabled() == TRUE.

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 0b00.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.
0b10	Implemented and disabled. ExternalRealmInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalRealmInvasiveDebugEnabled() == TRUE.

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 0b00.

Bits [11:8]

Reserved, RES0.

SNID, bits [7:6]

When FEAT_Debugv8p4 is implemented:

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

Secure non-invasive debug.

SNID	Meaning
0b00	Secure state is not implemented.
0b10	Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

SID	Meaning
0b00	Secure state is not implemented.
0b10	Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSNID, bits [3:2]

When FEAT_Debugv8p4 is implemented:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Non-secure state is not implemented.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

If the Effective value of SCR_EL3.NS is 1, or if EL3 is implemented and EL2 is not implemented, this field reads as 0b11.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Non-secure state is not implemented.
0b10	Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

NSID	Meaning
0b00	Non-secure state is not implemented.
0b10	Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

Accessing DBGAUTHSTATUS_EL1

DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFB8	DBGAUTHSTATUS_EL1

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 63

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>_EL1.

Configuration

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGBCR<n>_EL1[31:0].

External register DBGBCR<n>_EL1 bits [63:32] are architecturally mapped to AArch64 System register DBGBCR<n>_EL1[63:32] when FEAT_Debugv8p9 is implemented.

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBCR<n>[31:0].

DBGBCR<n>_EL1 is in the Core power domain.

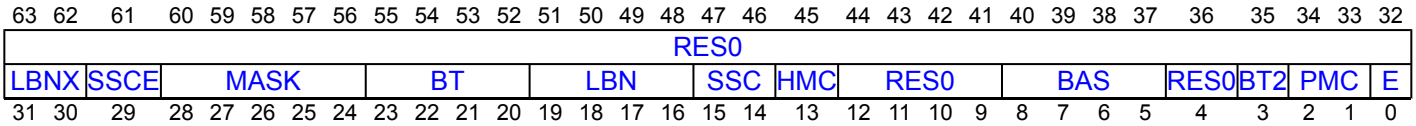
If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBCR<n>_EL1 is a 64-bit register.

Field descriptions



When the E field is zero, all the other fields in the register are ignored.

Bits [63:32]

Reserved, RES0.

LBNX, bits [31:30]

When FEAT_Debugv8p9 is implemented:

Linked Breakpoint Number.

For Linked address matching breakpoints, with DBGBCR<n>_EL1.LBN, specifies the index of the breakpoint linked to.

For all other breakpoint types, this field is ignored and reads of the register return an UNKNOWN value.

This field extends DBGBCR<n>_EL1.LBN to support up to 64 implemented breakpoints.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSCE, bit [29]
When FEAT_RME is implemented:

Security State Control Extended.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MASK, bits [28:24]
When FEAT_BWE is implemented:

Address Mask. Only address ranges up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00011..0b11111	Number of address bits masked.

All other values are reserved.

Indicates the number of masked address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

If any of the following apply then the behavior of the breakpoint is CONSTRAINED UNPREDICTABLE:

- DBGBCR<n>_EL1.MASK is a reserved value.
- DBGBCR<n>_EL1.MASK is zero, DBGBCR<n>_EL1.{BT2, BT} is {0, 0b010x} (address mismatch breakpoint without linking enabled), and AArch32 is not supported at EL1.
- DBGBCR<n>_EL1.MASK is a valid nonzero value and any of the following apply:
  - DBGBCR<n>_EL1.BAS is not 0b1111, and AArch32 is supported at EL0.
  - DBGBVR<n>_EL1[(MASK-1):0] is nonzero.
  - DBGBCR<n>_EL1.{BT2, BT} is {0, 0b0x1x} or {0, 0b1xxx} (Context matching breakpoint).

When any of these conditions apply, the breakpoint behaves as if one of the following:

- DBGBCR<n>_EL1.MASK has been programmed with a defined value, which might be 0b00000 (no mask), other than for a direct read of DBGBCR<n>_EL1.
- The breakpoint is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type.

With DBGBCR<n>_EL1.BT2 when implemented, specifies breakpoint type.

BT	Meaning	Applies when
0b0000	Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.	
0b0001	Linked instruction address match. As 0b0000, but linked to a breakpoint that has linking enabled.	
0b0010	Unlinked Context ID match. If the Effective value of HCR_EL2.E2H is 1 and either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL2. Otherwise, DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1.	When breakpoint n is context-aware
0b0011	As 0b0010, with linking enabled.	When breakpoint n is context-aware
0b0100	Unlinked instruction address mismatch. DBGBVR<n>_EL1 is the address of an instruction.	When FEAT_BWE is implemented or EL1 is using AArch32
0b0101	Linked instruction address mismatch. As 0b0100, but linked to a breakpoint that has linking enabled.	When FEAT_BWE is implemented or EL1 is using AArch32
0b0110	Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b0111	As 0b0110, with linking enabled.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b1000	Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.	When EL2 is implemented and breakpoint n is context-aware
0b1001	As 0b1000, with linking enabled.	When EL2 is implemented and breakpoint n is context-aware
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.	When EL2 is implemented and breakpoint n is context-aware
0b1011	As 0b1010, with linking enabled.	When EL2 is implemented and breakpoint n is context-aware
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBVR<n>_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b1101	As 0b1100, with linking enabled.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b1110	Unlinked Full Context ID match. DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1, and	When EL2 is implemented, FEAT_Debugv8p1 is implemented,

	DBGBVR<n>_EL1.ContextID2 is compared against CONTEXTIDR_EL2.	and breakpoint n is context-aware
0b1111	As 0b1110, with linking enabled.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number.

For Linked address matching breakpoints, with DBGBCR<n>_EL1.LBNX when implemented, specifies the index of the breakpoint linked to.

For all other breakpoint types, this field is ignored and reads of the register return an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see DBGBCR<n>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When FEAT_AA32 is implemented:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions.
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions.
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions.

All other values are reserved.

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint.
0b0011	DBGBVR<n>_EL1	Use for stepping T32 instructions.
0b1100	DBGBVR<n>_EL1 + 2	Use for stepping T32 instructions.
0b1111	DBGBVR<n>_EL1	Use for stepping A64 and A32 instructions.

All other values are reserved.

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [4]

Reserved, RES0.

BT2, bit [3]

When FEAT_ABLE is implemented and breakpoint n supports address breakpoint linking:

Breakpoint Type 2. With DBGBCR<n>_EL1.BT, specifies breakpoint type.

BT2	Meaning
0b0	As DBGBCR<n>_EL1.BT.
0b1	As DBGBCR<n>_EL1.BT, but with linking enabled. This value is only defined for the following DBGBCR<n>_EL1.BT values: 0b0000, 0b0001, 0b0100, and 0b0101. All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint n.

E	Meaning
0b0	Breakpoint n disabled.
0b1	Breakpoint n enabled.

This field is ignored by the PE and treated as zero when all of the following are true:

- Any of the following are true:
  - `HaltOnBreakpointOrWatchpoint()` is FALSE and the Effective value of MDSCR_EL1.EMBWE is 0.
  - `HaltOnBreakpointOrWatchpoint()` is TRUE and the Effective value of EDSCR2.EHBWE is 0.
- FEAT_Debugv8p9 is implemented.
- n >= 16.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

When FEAT_Debugv8p9 is not implemented, this register is 32-bits wide and offset `0x40C` + (16 * n) is reserved.

DBGBCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x408` + (16 * n)	DBGBCR<n>_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalDebugAccess(addrdesc), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 63

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1.

Configuration

External register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGBVR<n>_EL1[63:0].

External register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBVR<n>[31:0].

External register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register DBGBXVR<n>[31:0].

DBGBVR<n>_EL1 is in the Core power domain.

How this register is interpreted depends on the value of DBGBCR<n>_EL1.BT.

- When DBGBCR<n>_EL1.BT is `0b0x0x`, this register holds a virtual address.
- When DBGBCR<n>_EL1.BT is `0b001x`, `0b011x`, or `0b110x`, this register holds a Context ID.
- When DBGBCR<n>_EL1.BT is `0b100x`, this register holds a VMID.
- When DBGBCR<n>_EL1.BT is `0b101x`, this register holds a VMID and a Context ID.
- When DBGBCR<n>_EL1.BT is `0b111x`, this register holds two Context ID values.

For other values of DBGBCR<n>_EL1.BT, this register is RES0.

If breakpoint n is not implemented then accesses to this register are:

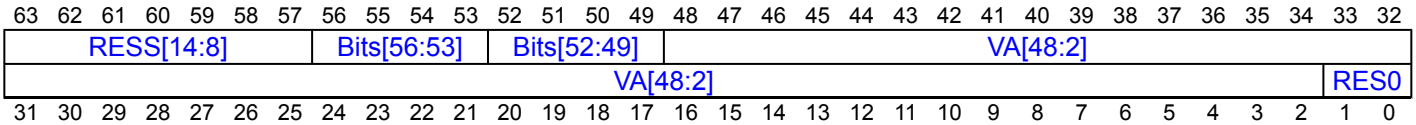
- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBVR<n>_EL1 is a 64-bit register.

Field descriptions

When DBGBCR<n>_EL1.BT IN {0b0x0x}:



RESS[14:8], bits [63:57]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

Bits[56:53]

When FEAT_LVA3 is implemented:

VA[56:53], bits [3:0] of bits [56:53]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[7:4], bits [3:0] of bits [56:53]

Extension to RESS[14:8]. For more information, see RESS[14:8].

Bits[52:49]

When FEAT_LVA is implemented:

VA[52:49], bits [3:0] of bits [52:49]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0], bits [3:0] of bits [52:49]

Extension to RESS[14:8]. For more information, see RESS[14:8].

VA[48:2], bits [48:2]

If the address is being matched in an AArch64 stage 1 translation regime:

- This field contains bits[48:2] of the address for comparison.
- When FEAT_LVA3 is implemented, (VA[56:53]:VA[52:49]) forms the upper part of the address value. If FEAT_LVA3 is not implemented, bits VA[56:53] are part of the RESS field.
- When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. If FEAT_LVA is not implemented, bits [52:49] are part of the RESS field.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

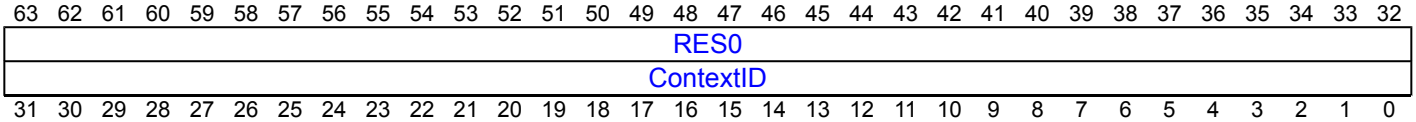
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT IN {0b001x}:



Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when the Effective value of HCR_EL2.E2H is 1, and either:

- The PE is executing at EL2.
- HCR_EL2.TGE is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

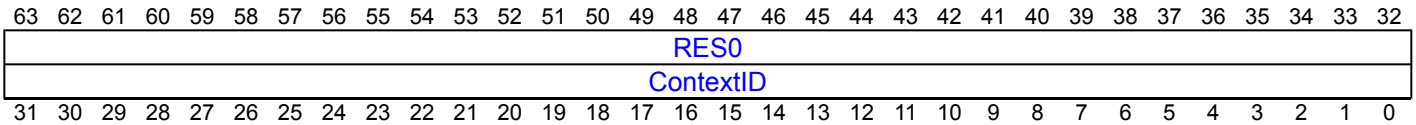
Otherwise, the value is compared against the following:

- CONTEXTIDR when the PE is executing at AArch32.
- CONTEXTIDR_EL1 when the PE is executing at AArch64.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT IN {0b011x}, EL2 is implemented, and FEAT_Debugv8p1 is implemented:



Bits [63:32]

Reserved, RES0.

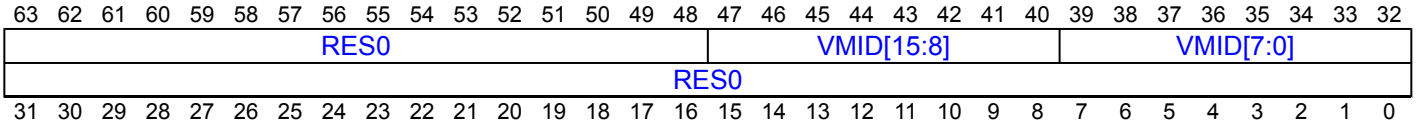
ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT IN {0b100x} and EL2 is implemented:



Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. For more information, see DBGBVR<n>_EL1.VMID[7:0].

If EL2 is using AArch32, this field is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

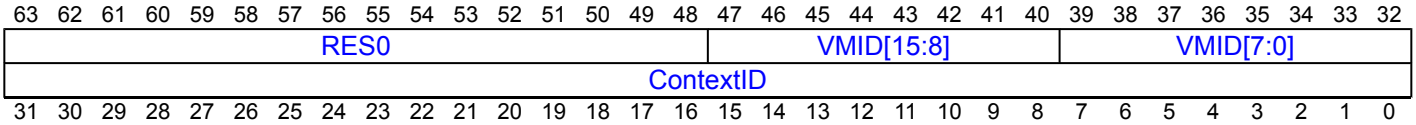
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT IN {0b101x} and EL2 is implemented:



Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. For more information, see DBGBVR<n>_EL1.VMID[7:0].

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

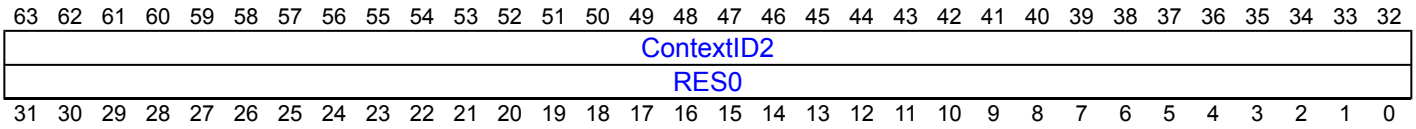
ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT IN {0b110x}, EL2 is implemented, and FEAT_Debugv8p1 is implemented:



ContextID2, bits [63:32]

Context ID value for comparison against CONTEXTIDR_EL2.

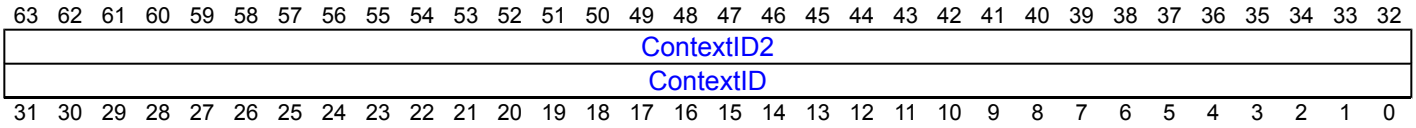
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT IN {0b111x}, EL2 is implemented, and FEAT_Debugv8p1 is implemented:



ContextID2, bits [63:32]

Context ID value for comparison against CONTEXTIDR_EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBVR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBVR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x400 + (16 * n)	DBGBVR<n>_EL1	63:0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalDebugAccess(addrdesc), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear Register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMSET_EL1 register.

Configuration

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMSET_EL1[31:0].

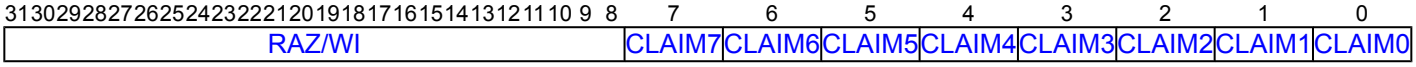
DBGCLAIMCLR_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR_EL1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RAZ/WI.

CLAIM<m>, bit [m], for m = 7 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is **W1C**.

Accessing DBGCLAIMCLR_EL1

DBGCLAIMCLR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA4	DBGCLAIMCLR_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGCLAIMSET_EL1, Debug CLAIM Tag Set Register

The DBGCLAIMSET_EL1 characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMCLR_EL1 register.

Configuration

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

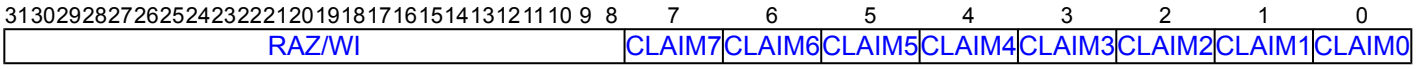
DBGCLAIMSET_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMSET_EL1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RAZ/WI.

CLAIM<m>, bit [m], for m = 7 to 0

Claim Tag Set. Used to set Claim Tag bit <m> to 1.

CLAIM<m>	Meaning
0b0	On a write: Ignored.
0b1	On a write: Set Claim Tag bit <m> to 1.

Access to this field is **RAO/W1S**.

Accessing DBGCLAIMSET_EL1

DBGCLAIMSET_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA0	DBGCLAIMSET_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

Configuration

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0].

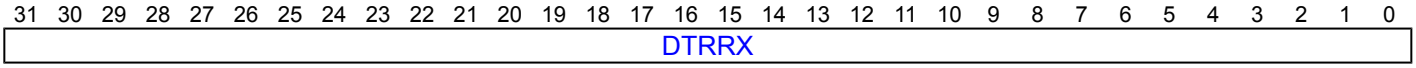
External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0].

DBGDTRRX_EL0 is in the Core power domain.

Attributes

DBGDTRRX_EL0 is a 32-bit register.

Field descriptions



DTRRX, bits [31:0]

Update DTRRX.

Writes to this register:

- If RXfull is 0, update the value in DTRRX and set RXfull to 1.
- If RXfull is 1, the written value is ignored and RXO is set to 1.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRX_EL0

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRRX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance

Debug	0x080	DBGDTRRX_EL0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

Configuration

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0].

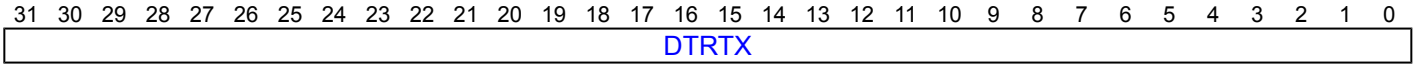
External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0].

DBGDTRTX_EL0 is in the Core power domain.

Attributes

DBGDTRTX_EL0 is a 32-bit register.

Field descriptions



DTRTX, bits [31:0]

Return DTRTX.

Reads of this register:

- If TXfull is 1, return the value in DTRTX and clear TXfull to 0.
- If TXfull is 0, return an UNKNOWN value and set TXU to 1.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTX_EL0

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRTX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance

Debug	0x08C	DBGDTRTX_EL0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalDebugAccess(addrdesc), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 63

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

Configuration

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGWCR<n>_EL1[31:0].

External register DBGWCR<n>_EL1 bits [63:32] are architecturally mapped to AArch64 System register DBGWCR<n>_EL1[63:32] when FEAT_Debugv8p9 is implemented.

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWCR<n>[31:0].

DBGWCR<n>_EL1 is in the Core power domain.

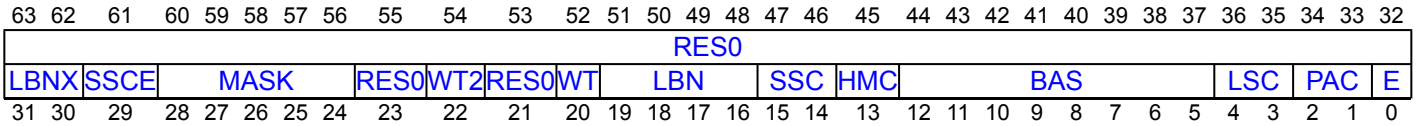
If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

Attributes

DBGWCR<n>_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

LBNX, bits [31:30]

When FEAT_Debugv8p9 is implemented:

Linked Breakpoint Number.

For Linked data address watchpoints, with DBGWCR<n>_EL1.LBN, specifies the index of the breakpoint linked to.

For all other watchpoint types, this field is ignored and reads of the register return an UNKNOWN value.

This field extends DBGWCR<n>_EL1.LBN to support up to 64 implemented breakpoints.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSCE, bit [29]

When FEAT_RME is implemented:

Security State Control Extended.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MASK, bits [28:24]

Address Mask. Only address ranges up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00011..0b11111	Number of address bits masked.

All other values are reserved.

Indicates the number of masked address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

If programmed with a reserved value, the watchpoint behaves as if one of the following:

- DBGWCR<n>_EL1.MASK has been programmed with a defined value, which might be 0b00000 (no mask), other than for a direct read of DBGWCR<n>_EL1.
- The watchpoint is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [23]

Reserved, RES0.

WT2, bit [22]

When FEAT_BWE2 is implemented:

Watchpoint Type 2. With DBGWCR<n>_EL1.WT, specifies watchpoint type.

WT2	Meaning
0b0	Watchpoint n is an address match watchpoint.
0b1	Watchpoint n is an address mismatch watchpoint.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number.

For Linked data address watchpoints, with DBGWCR<n>_EL1.LBNX when implemented, specifies the index of the breakpoint linked to.

For all other watchpoint types, this field is ignored and reads of the register return an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

BAS	Description
xxxxxxx1	Match byte at DBGWVR<n>_EL1
xxxxxx1x	Match byte at DBGWVR<n>_EL1 + 1
xxxxx1xx	Match byte at DBGWVR<n>_EL1 + 2
xxxx1xxx	Match byte at DBGWVR<n>_EL1 + 3

In cases where DBGWVR<n>_EL1 addresses a double-word:

BAS	Description, if DBGWVR<n>_EL1[2] == 0
xxx1xxxx	Match byte at DBGWVR<n>_EL1 + 4
xx1xxxxx	Match byte at DBGWVR<n>_EL1 + 5
x1xxxxxx	Match byte at DBGWVR<n>_EL1 + 6
1xxxxxxx	Match byte at DBGWVR<n>_EL1 + 7

If DBGWVR<n>_EL1[2] == 1, only BAS[3:0] is used. Arm deprecates setting DBGWVR<n>_EL1[2] == 1.

The valid values for BAS are nonzero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n.

E	Meaning
0b0	Watchpoint n disabled.
0b1	Watchpoint n enabled.

This field is ignored by the PE and treated as zero when all of the following are true:

- Any of the following are true:
  - `HaltOnBreakpointOrWatchpoint()` is FALSE and the Effective value of MDSCR_EL1.EMBWE is 0.
  - `HaltOnBreakpointOrWatchpoint()` is TRUE and the Effective value of EDSCR2.EHBWE is 0.
- FEAT_Debugv8p9 is implemented.
- n >= 16.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGWCR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

When FEAT_Debugv8p9 is not implemented, this register is 32-bits wide and offset `0x80C` + (16 * n) is reserved.

DBGWCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x808` + (16 * n)	DBGWCR<n>_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalDebugAccess(addrdesc), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 63

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

Configuration

External register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGWVR<n>_EL1[63:0].

External register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWVR<n>[31:0].

DBGWVR<n>_EL1 is in the Core power domain.

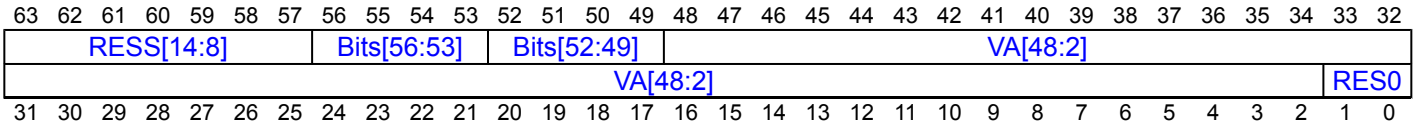
If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions



RESS[14:8], bits [63:57]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

Bits[56:53]

When FEAT_LVA3 is implemented:

VA[56:53], bits [3:0] of bits [56:53]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[7:4], bits [3:0] of bits [56:53]

Extension to RESS[14:8]. For more information, see RESS[14:8].

Bits[52:49]

When FEAT_LVA is implemented:

VA[52:49], bits [3:0] of bits [52:49]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0], bits [3:0] of bits [52:49]

Extension to RESS[14:8]. For more information, see RESS[14:8].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA3 is implemented, (VA[56:53]:VA[52:49]) forms the upper part of the address value. If FEAT_LVA3 is not implemented, bits VA[56:53] are part of the RESS field.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. If FEAT_LVA is not implemented, bits [52:49] are part of the RESS field.

Arm deprecates setting DBGWVR<n>_EL1[2] == 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGWVR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWVR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x800 + (16 * n)	DBGWVR<n>_EL1	63:0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalDebugAccess(addrdesc), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

EDAA32PFR, External Debug Auxiliary Processor Feature Register

The EDAA32PFR characteristics are:

Purpose

Provides information about implemented PE features.

Note

The register mnemonic, EDAA32PFR, is derived from previous definitions of this register that defined this register only when AArch64 was not supported.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

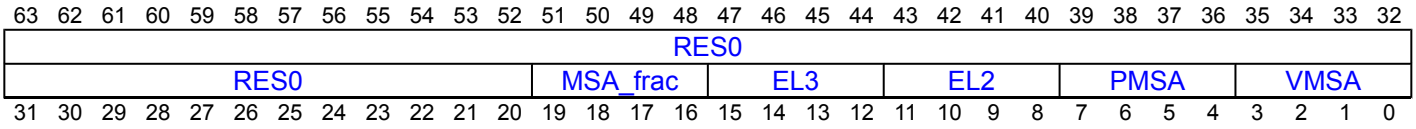
Configuration

There are no configuration notes.

Attributes

EDAA32PFR is a 64-bit register.

Field descriptions



Bits [63:20]

Reserved, RES0.

MSA_frac, bits [19:16]

When EDAA32PFR.PMSA == 0b0000 and EDAA32PFR.VMSA == 0b1111:

Memory System Architecture fractional field. This holds the information on additional Memory System Architectures supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MSA_frac	Meaning
0b0001	PMSAv8-64 supported in all translation regimes. VMSAv8-64 not supported.
0b0010	PMSAv8-64 supported in all translation regimes. In addition to PMSAv8-64, stage 1 EL1&0 translation regime also supports VMSAv8-64.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

EL3, bits [15:12]

When EDPFR.EL3 == 0b0000:

AArch32 EL3 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL3	Meaning
0b0000	EL3 is not implemented or can be executed in AArch64 state.
0b0001	EL3 can be executed in AArch32 state only.

All other values are reserved.

Note

EDPFR.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

EL2, bits [11:8]

When EDPFR.EL2 == 0b0000:

AArch32 EL2 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL2	Meaning
0b0000	EL2 is not implemented or can be executed in AArch64 state.
0b0001	EL2 can be executed in AArch32 state only.

All other values are reserved.

Note

EDPFR.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

PMSA, bits [7:4]

Indicates support for a 32-bit PMSA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMSA	Meaning
0b0000	PMSA-32 not supported.
0b0100	PMSAv8-32 supported.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

VMSA, bits [3:0]

When EDAA32PFR.PMSA != 0b0000:

Indicates support for a VMSA in addition to a 32-bit PMSA.

VMSA	Meaning
0b0000	VMSA not supported.

All other values are reserved.

Access to this field is **RO**.

When EDAA32PFR.PMSA == 0b0000:

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMSA	Meaning
0b0000	VMSAv8-64 supported.
0b1111	Memory system architecture described by EDAA32PFR.MSA_frac.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

Accessing EDAA32PFR

EDAA32PFR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD60	EDAA32PFR

Accessible as follows:

- When IsCorePowered() and !DoubleLockStatus(), accesses to this register are **RO**.
- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **IMPDEF**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

Purpose

Allows implementations to support IMPLEMENTATION DEFINED controls.

Configuration

When FEAT_DoPD is implemented, EDACR is in the Core power domain. Otherwise, it is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

If this register is implemented, EDDEVID.AuxRegs == `0b0001`.

If FEAT_DoPD is implemented, any mechanism to preserve control bits in EDACR over power down is optional and IMPLEMENTATION DEFINED.

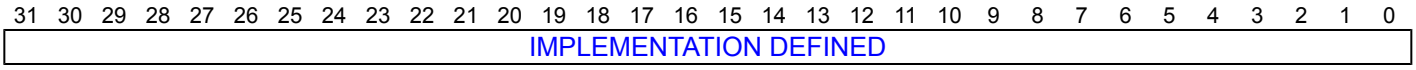
If FEAT_DoPD is not implemented and EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when the OS Lock is locked, OSLSR_EL1.OSLK == 1, and when the Core is powered off.

Changing this register from its reset value causes IMPLEMENTATION DEFINED behavior, including possible deviation from the architecturally-defined behavior.

Attributes

EDACR is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to an architecturally UNKNOWN value.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to an architecturally UNKNOWN value.
  - On a Warm reset, the value of this field is unchanged.

Accessing EDACR

EDACR can be accessed through the external debug interface:

Component	Offset	Instance

Debug	0x094	EDACR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register are **IMPDEF**.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDCIDR0 is in the Core power domain. Otherwise, EDCIDR0 is in the Debug power domain.

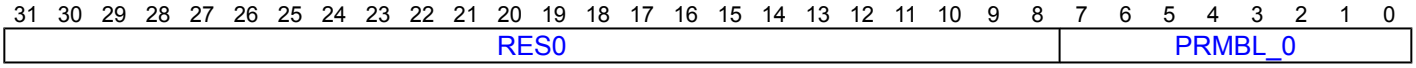
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDCIDR0 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as `0x0D`.

Access to this field is **RO**.

Accessing EDCIDR0

EDCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFF0`	EDCIDR0

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDCIDR1 is in the Core power domain. Otherwise, EDCIDR1 is in the Debug power domain.

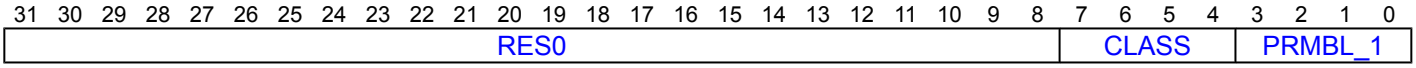
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDCIDR1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

Access to this field is **RO**.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000.

Access to this field is **RO**.

Accessing EDCIDR1

EDCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF4	EDCIDR1

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDCIDR2 is in the Core power domain. Otherwise, EDCIDR2 is in the Debug power domain.

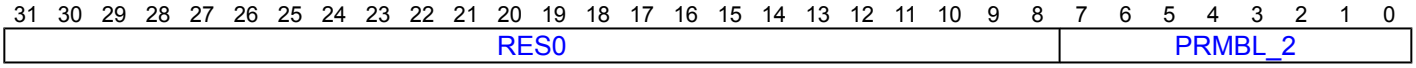
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDCIDR2 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as `0x05`.

Access to this field is **RO**.

Accessing EDCIDR2

EDCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFF8`	EDCIDR2

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDCIDR3 is in the Core power domain. Otherwise, EDCIDR3 is in the Debug power domain.

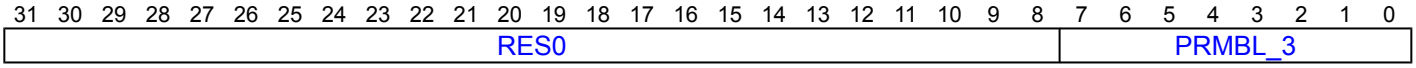
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDCIDR3 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as `0xB1`.

Access to this field is **RO**.

Accessing EDCIDR3

EDCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFFC`	EDCIDR3

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDCIDSR, External Debug Context ID Sample Register

The EDCIDSR characteristics are:

Purpose

Contains the sampled value of the Context ID, captured on reading EDPCSR[31:0].

Configuration

EDCIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDCIDSR are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

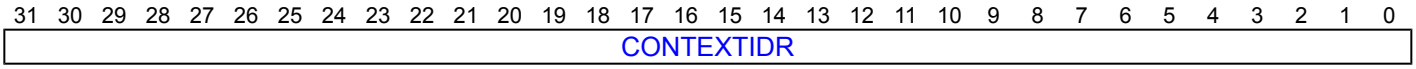
Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDCIDSR is a 32-bit register.

Field descriptions



CONTEXTIDR, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample is generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR.
- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register, and EDCIDSR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent EDPCSR sample.

Because the value written to EDCIDSR is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether EDCIDSR is set to the original or new value if EDPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDCIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

EDCIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A4	EDCIDSR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

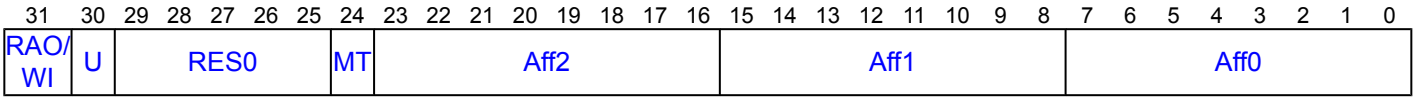
Configuration

When FEAT_DoPD is implemented, EDDEVAFF0 is in the Core power domain. Otherwise, EDDEVAFF0 is in the Debug power domain.

Attributes

EDDEVAFF0 is a 32-bit register.

Field descriptions



Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is **RO**.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is **RO**.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDDEVAFF0

EDDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA8	EDDEVAFF0

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

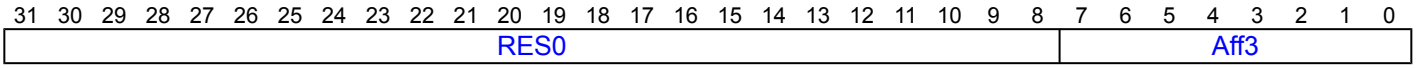
Configuration

When FEAT_DoPD is implemented, EDDEVAFF1 is in the Core power domain. Otherwise, EDDEVAFF1 is in the Debug power domain.

Attributes

EDDEVAFF1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

Aff3, bits [7:0]

Affinity level 3. See the description of EDDEVAFF0.Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDDEVAFF1

EDDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFAC	EDDEVAFF1

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVARCH, External Debug Device Architecture Register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the external debug component.

Configuration

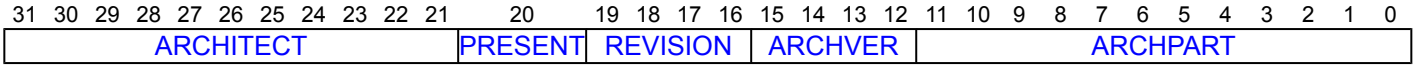
When FEAT_DoPD is implemented, EDDEVARCH is in the Core power domain. Otherwise, EDDEVARCH is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions



ARCHITECT, bits [31:21]

Defines the architect of the component. For External Debug, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, `0b0100`.

Bits [27:21] are the JEP106 identification code, `0b0111011`.

Reads as `0b01000111011`.

Access to this field is **RO**.

PRESENT, bit [20]

DEVARCH present. Indicates that the EDDEVARCH register is present.

Reads as `0b1`.

Access to this field is **RO**.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For debug, the revision defined by Armv8 is `0x0`.

All other values are reserved.

Reads as `0b0000`.

Access to this field is **RO**.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ARCHVER	Meaning
0b0110	Armv8 debug architecture.
0b0111	Armv8.1 debug architecture, FEAT_Debugv8p1.
0b1000	Armv8.2 debug architecture, FEAT_Debugv8p2.
0b1001	Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010	Armv8.8 debug architecture, FEAT_Debugv8p8.
0b1011	Armv8.9 debug architecture, FEAT_Debugv8p9.

EDDEVARCH.ARCHVER and EDDEVARCH.ARCHPART are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHVER is EDDEVARCH.ARCHID[15:12].

FEAT_Debugv8p1 implements the functionality identified by the value 0b0111.

FEAT_Debugv8p2 implements the functionality identified by the value 0b1000.

FEAT_Debugv8p4 implements the functionality identified by the value 0b1001.

FEAT_Debugv8p8 implements the functionality identified by the value 0b1010.

FEAT_Debugv8p9 implements the functionality identified by the value 0b1011.

From Armv8.1, when FEAT_Debugv8p1 is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

From Armv8.9, the value 0b1010 is not permitted.

Access to this field is **RO**.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA15	Armv8-A debug architecture.

EDDEVARCH.ARCHVER and EDDEVARCH.ARCHPART are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHPART is EDDEVARCH.ARCHID[11:0].

Armv8-A debug architecture.

Access to this field is **RO**.

Accessing EDDEVARCH

EDDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFBC	EDDEVARCH

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

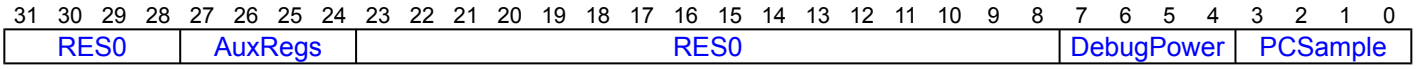
Configuration

When FEAT_DoPD is implemented, EDDEVID is in the Core power domain. Otherwise, EDDEVID is in the Debug power domain.

Attributes

EDDEVID is a 32-bit register.

Field descriptions



Bits [31:28]

Reserved, RES0.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AuxRegs	Meaning
0b0000	None supported.
0b0001	Support for External Debug Auxiliary Control Register, EDACR.

All other values are reserved.

Access to this field is **RO**.

Bits [23:8]

Reserved, RES0.

DebugPower, bits [7:4]

Indicates support for the FEAT_DoPD feature.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DebugPower	Meaning
0b0000	FEAT_DoPD not implemented. Registers in the external debug interface register map are implemented in a mix of the Debug and Core power domains.
0b0001	FEAT_DoPD implemented. All registers in the external debug interface register map are implemented in the Core power domain.

FEAT_DoPD implements the functionality added by the value 0b0001.

All other values are reserved.

Access to this field is **RO**.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the external debug registers space.
0b0010	Only EDPCSR and EDCIDSR are implemented. This option is only permitted if EL3 and EL2 are not implemented.
0b0011	EDPCSR, EDCIDSR, and EDVIDSR are implemented.

All other values are reserved.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

Access to this field is **RO**.

Accessing EDDEVID

EDDEVID can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC8	EDDEVID

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVID1, External Debug Device ID Register 1

The EDDEVID1 characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

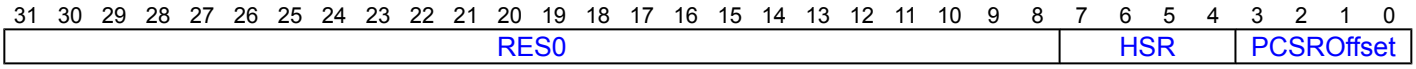
Configuration

When FEAT_DoPD is implemented, EDDEVID1 is in the Core power domain. Otherwise, EDDEVID1 is in the Debug power domain.

Attributes

EDDEVID1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

HSR, bits [7:4]

Indicates support for the External Debug Halt Status Register, EDHSR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HSR	Meaning
0b0000	EDHSR not implemented, and the PE follows behaviors consistent with all of the EDHSR fields having a zero value.
0b0001	EDHSR implemented.
0b0010	As 0b0001, but extends EDHSR to include the VNCR, CM, and WnR fields.

All other values are reserved.

FEAT_EDHSR implements the functionality identified by the value 0b0001.

FEAT_Debugv8p9 implements the functionality identified by the value 0b0010.

When FEAT_Debugv8p2 is not implemented, the only permitted value is 0b0000.

From Armv8.9, the values 0b0000 and 0b0001 are not permitted.

Access to this field is **RO**.

PCSROffset, bits [3:0]

Indicates the offset applied to PC samples returned by reads of EDPCSR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCSROffset	Meaning
0b0000	EDPCSR not implemented.
0b0010	EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

Access to this field is **RO**.

Accessing EDDEVID1

EDDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC4	EDDEVID1

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

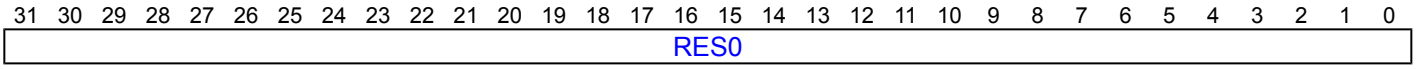
Configuration

When FEAT_DoPD is implemented, EDDEVID2 is in the Core power domain. Otherwise, EDDEVID2 is in the Debug power domain.

Attributes

EDDEVID2 is a 32-bit register.

Field descriptions



Bits [31:0]

Reserved, RES0.

Accessing EDDEVID2

EDDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC0	EDDEVID2

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's debug logic.

Configuration

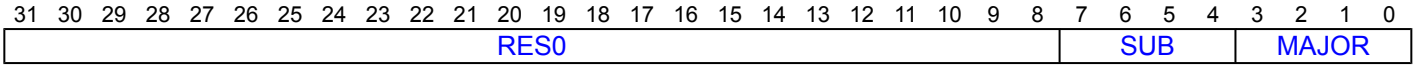
When FEAT_DoPD is implemented, EDDEVTYPE is in the Core power domain. Otherwise, EDDEVTYPE is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

EDDEVTYPE is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as `0b0001`.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type. Indicates this is a debug logic component.

Reads as `0b0101`.

Access to this field is **RO**.

Accessing EDDEVTYPE

EDDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFCC`	EDDEVTYPE

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDFR, External Debug Feature Register

The EDDFR characteristics are:

Purpose

Provides top-level information about the debug system.

Note

Debuggers must use EDDEVARCH to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

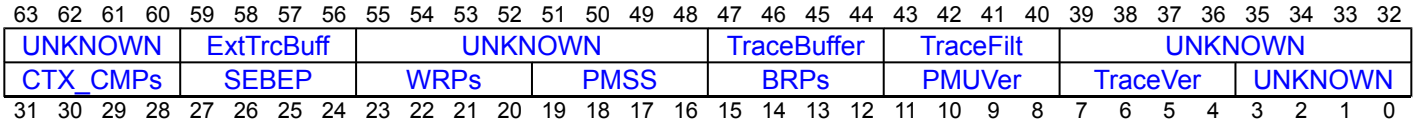
Configuration

There are no configuration notes.

Attributes

EDDFR is a 64-bit register.

Field descriptions



Bits [63:60]

Reserved, UNKNOWN.

ExtTrcBuff, bits [59:56]

Trace Buffer External Mode Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ExtTrcBuff	Meaning
0b0000	Trace Buffer Extension not implemented or Trace Buffer External Mode not implemented.
0b0001	Trace Buffer Extension implemented and Trace Buffer External Mode implemented.

All other values are reserved.

If FEAT_TRBE is not implemented, the only permitted value is 0b0000.

FEAT_TRBE_EXT implements the functionality identified by the value 0b0001.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR0_EL1.ExtTrcBuff.

Access to this field is **RO**.

Bits [55:48]

Reserved, UNKNOWN.

TraceBuffer, bits [47:44]

When FEAT_TRBE_EXT is implemented:

Trace Buffer Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceBuffer	Meaning
0b0000	Trace Buffer Extension not implemented.
0b0001	Trace Buffer Extension implemented.
0b0010	As 0b0001, and adds: • If EL2 and FEAT_FGT are implemented, a fine-grained trap on the TSB CSYNC instruction. • If EL2 is implemented, an EL2 control to override TRBLIMITR_EL1.nVM. • The TRBE Profiling exception extension, FEAT_TRBE_EXC.

All other values are reserved.

FEAT_TRBE implements the functionality identified by the value 0b0001.

FEAT_TRBEv1p1 implements the functionality identified by the value 0b0010.

In any Armv9 implementation, if FEAT_ETE is implemented, the value 0b0000 is not permitted.

From Armv9.6, if FEAT_TRBE is implemented, the value 0b0001 is not permitted.

Access to this field is **RO**.

Otherwise:

Reserved, UNKNOWN.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if FEAT_ETMv4 is implemented, the value 0b0000 is not permitted.

If FEAT_ETE is implemented, the value 0b0000 is not permitted.

Access to this field is **RO**.

Bits [39:32]

Reserved, UNKNOWN.

CTX_CMPs, bits [31:28]

Number of context-aware breakpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CTX_CMPs	Meaning
0b0000..0b1111	The number of context-aware breakpoints, minus 1.

The value of this field is never greater than EDDFR.BRPs.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR0_EL1.CTX_CMPs.

If FEAT_Debugv8p9 is implemented and 16 or more context-aware breakpoints are implemented, then this field reads as 0b1111 and EDDFR1.CTX_CMPs indicates the number of context-aware breakpoints.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 breakpoints.

Access to this field is **RO**.

SEBEP, bits [27:24]

This field either has the same value as ID_AA64DFR0_EL1.SEBEP or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

WRPs, bits [23:20]

Number of watchpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WRPs	Meaning
0b0001..0b1111	The number of watchpoints, minus 1.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR0_EL1.WRPs.

If FEAT_Debugv8p9 is implemented and 16 or more watchpoints are implemented, then this field reads as 0b1111 and EDDFR1.WRPs indicates the number of watchpoints.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 watchpoints.

The value 0b0000 is reserved.

Access to this field is **RO**.

PMSS, bits [19:16]

This field either has the same value as ID_AA64DFR0_EL1.PMSS or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

BRPs, bits [15:12]

Number of breakpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BRPs	Meaning
0b0001..0b1111	The number of breakpoints, minus 1.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR0_EL1.BRPs.

If FEAT_Debugv8p9 is implemented and 16 or more breakpoints are implemented, then this field reads as 0b1111 and EDDFR1.BRPs indicates the number of breakpoints.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 breakpoints.

The value 0b0000 is reserved.

Access to this field is **RO**.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and adds support for: • Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. • If EL2 is implemented, the MDCR_EL2.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR_EL1 register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: • 64-bit event counters. • If EL2 is implemented, the MDCR_EL2.HCCD control. • If EL3 is implemented, the MDCR_EL3.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: • The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO controls. • If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: • Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. • Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1001	PMUv3 for Armv8.9. As 0b1000, and: • Updates the definitions of existing PMU events. • Adds support for the PMUSERENR_EL0.UEN control and the PMUACR_EL1 register. • Adds support for the EDECR.PME control.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

FEAT_PMUv3p9 implements the functionality identified by the value 0b1001.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

From Armv8.9, if FEAT_PMUv3 is implemented, the value 0b1000 is not permitted.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR0_EL1.PMUVer.

Access to this field is **RO**.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a trace unit is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceVer	Meaning
0b0000	Trace unit System registers not implemented.
0b0001	Trace unit System registers implemented.

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a trace unit is implemented. A trace unit might nevertheless be implemented without a System register interface.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64DFR0_EL1.TraceVer.

Access to this field is **RO**.

Bits [3:0]

Reserved, UNKNOWN.

Accessing EDDFR

EDDFR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD28	EDDFR

Accessible as follows:

- When IsCorePowered() and !DoubleLockStatus(), accesses to this register are **RO**.
- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **IMPDEF**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDFR1, External Debug Feature Register 1

The EDDFR1 characteristics are:

Purpose

Provides top-level information about the debug system in AArch64.

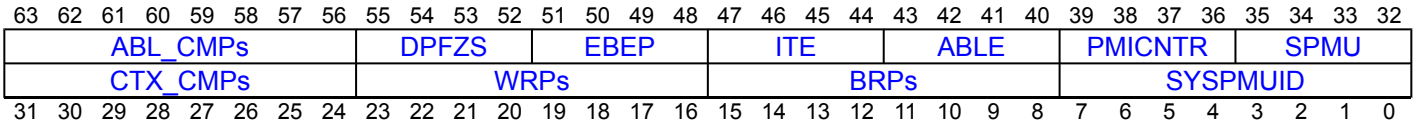
Configuration

There are no configuration notes.

Attributes

EDDFR1 is a 64-bit register.

Field descriptions



ABL_CMPs, bits [63:56]

When FEAT_ABLE is implemented:

Number of breakpoints that support address linking, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ABL_CMPs	Meaning
0x00..0x3F	Number of breakpoints that support address linking minus 1.

All other values are reserved.

The number of breakpoints that support address linking is never more than either the number of breakpoints or the number of watchpoints.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR1_EL1.ABL_CMPs.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

DPFZS, bits [55:52]

This field either has the same value as ID_AA64DFR1_EL1.DPFZS or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

EBEP, bits [51:48]

This field either has the same value as ID_AA64DFR1_EL1.EBEP or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

ITE, bits [47:44]

This field either has the same value as ID_AA64DFR1_EL1.ITE or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

ABLE, bits [43:40]

Address Breakpoint Linking Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ABLE	Meaning
0b0000	Address Breakpoint Linking Extension not implemented.
0b0001	Address Breakpoint Linking Extension implemented.

All other values are reserved.

FEAT_BWE implements the address range breakpoints and mismatch breakpoints part of the functionality identified by the value 0b0001.

FEAT_ABLE implements the functionality identified by the value 0b0001.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR1_EL1.ABLE.

Access to this field is **RO**.

PMICNTR, bits [39:36]

This field either has the same value as ID_AA64DFR1_EL1.PMICNTR or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SPMU, bits [35:32]

This field either has the same value as ID_AA64DFR1_EL1.SPMU or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CTX_CMPs, bits [31:24]

Context-aware breakpoints.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CTX_CMPs	Meaning
0x00	EDDFR.CTX_CMPs is the number of context-aware breakpoints, minus 1.
0x01..0x3F	Number of context-aware breakpoints minus 1.

All other values are reserved.

The value of this field is never greater than EDDFR1.BRPs.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR1_EL1.CTX_CMPs.

Access to this field is **RO**.

WRPs, bits [23:16]

Watchpoints.

WRPs	Meaning
0x00	EDDFR.WRPs is the number of watchpoints, minus 1.
0x01..0x3F	Number of watchpoints minus 1.

All other values are reserved.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR1_EL1.WRPs.

BRPs, bits [15:8]

Breakpoints.

BRPs	Meaning
0x00	EDDFR.BRPs is the number of breakpoints, minus 1.
0x01..0x3F	Number of breakpoints minus 1.

All other values are reserved.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR1_EL1.BRPs.

SYSPMUID, bits [7:0]

This field either has the same value as ID_AA64DFR1_EL1.SYSPMUID or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDDFR1

EDDFR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD48	EDDFR1

Accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), and (!IsZero(EDDFR1) or !OSLockStatus()), accesses to this register are **RO**.
- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **IMPDEF**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDFR2, External Debug Feature Register 2

The EDDFR2 characteristics are:

Purpose

Provides top-level information about the debug system in AArch64.

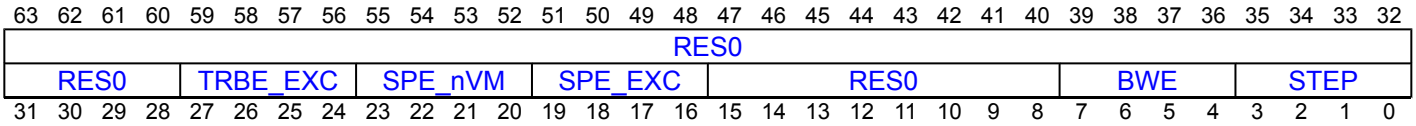
Configuration

There are no configuration notes.

Attributes

EDDFR2 is a 64-bit register.

Field descriptions



Bits [63:28]

Reserved, RES0.

TRBE_EXC, bits [27:24]

This field either has the same value as ID_AA64DFR2_EL1.TRBE_EXC or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SPE_nVM, bits [23:20]

This field either has the same value as ID_AA64DFR2_EL1.SPE_nVM or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SPE_EXC, bits [19:16]

This field either has the same value as ID_AA64DFR2_EL1.SPE_EXC or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [15:8]

Reserved, RES0.

BWE, bits [7:4]

Breakpoints and watchpoint enhancements.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BWE	Meaning
0b0000	This field does not indicate whether DBGBCR<n>_EL1.MASK and address mismatch breakpoints are implemented.
0b0001	DBGBCR<n>_EL1.MASK and address mismatch breakpoints are implemented.
0b0010	As 0b0001, and address mismatch watchpoints are implemented.

All other values are reserved.

FEAT_BWE implements the functionality identified by the value 0b0001.

FEAT_BWE2 implements the functionality identified by the value 0b0010.

When this field is 0b0000, ID_AA64DFR1_EL1.ABLE might indicate the presence of support for DBGBCR<n>_EL1.MASK and address mismatch breakpoints.

From Armv9.5, the value 0b0001 is not permitted.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR2_EL1.BWE.

Access to this field is **RO**.

STEP, bits [3:0]

This field either has the same value as ID_AA64DFR2_EL1.STEP or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDDFR2

EDDFR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD50	EDDFR2

Accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), and (!IsZero(EDDFR2) or !OSLockStatus()), accesses to this register are **RO**.
- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **IMPDEF**.

EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

Purpose

Controls Exception Catch debug events. For more information, see 'Exception Catch debug event'.

Configuration

External register EDECCR bits [31:0] are architecturally mapped to AArch64 System register OSECCR_EL1[31:0].

External register EDECCR bits [31:0] are architecturally mapped to AArch32 System register DBGOSECCR[31:0].

EDECCR is in the Core power domain.

Attributes

EDECCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3
RES0									RLR2	RLR1	RLR0	RES0	RLE2	RLE1	RLE0	NSR3	NSR2	NSR1	NSR0	SR3	SR2	SR1	SR0	NSE3	NSE2	NSE1	NSE0	SE

Bits [31:23]

Reserved, RES0.

RLR2, bit [22]

When FEAT_RME is implemented:

Controls exception catch on exception return to Realm EL2 in conjunction with EDECCR.RLE2.

RLR2	Meaning
0b0	If EDECCR.RLE2 is 0, then Exception Catch debug events are disabled for Realm EL2. If EDECCR.RLE2 is 1, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL2.
0b1	If EDECCR.RLE2 is 0, then Exception Catch debug events are enabled for exception returns to Realm EL2. If EDECCR.RLE2 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

RLR1, bit [21]

When FEAT_RME is implemented:

Controls exception catch on exception return to Realm EL1 in conjunction with EDECCR.RLE1.

RLR1	Meaning
0b0	If EDECCR.RLE1 is 0, then Exception Catch debug events are disabled for Realm EL1. If EDECCR.RLE1 is 1, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL1.
0b1	If EDECCR.RLE1 is 0, then Exception Catch debug events are enabled for exception returns to Realm EL1. If EDECCR.RLE1 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

RLR0, bit [20]

When FEAT_RME is implemented:

Controls exception catch on exception return to Realm EL0.

RLR0	Meaning
0b0	Exception Catch debug events are disabled for Realm EL0.
0b1	Exception Catch debug events are enabled for exception returns to Realm EL0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [19]

Reserved, RES0.

RLE2, bit [18]

When FEAT_RME is implemented:

Controls exception catch on exception entry to Realm EL2. Also controls exception catch on exception return to Realm EL2 in conjunction with EDECCR.RLR2.

RLE2	Meaning
0b0	If EDECCR.RLR2 is 0, then Exception Catch debug events are disabled for Realm EL2. If EDECCR.RLR2 is 1, then Exception Catch debug events are enabled for exception returns to Realm EL2.
0b1	If EDECCR.RLR2 is 0, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL2. If EDECCR.RLR2 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

RLE1, bit [17]

When FEAT_RME is implemented:

Controls exception catch on exception entry to Realm EL1. Also controls exception catch on exception return to Realm EL1 in conjunction with EDECCR.RLR1.

RLE1	Meaning
0b0	If EDECCR.RLR1 is 0, then Exception Catch debug events are disabled for Realm EL1. If EDECCR.RLR1 is 1, then Exception Catch debug events are enabled for exception returns to Realm EL1.
0b1	If EDECCR.RLR1 is 0, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL1. If EDECCR.RLR1 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

RLE0, bit [16]

Access to this field is **RES0**.

NSR3, bit [15]

Access to this field is **RES0**.

NSR2, bit [14]

When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:

Controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSE2.

NSR2	Meaning
0b0	If EDECCR.NSE2 is 0, then Exception Catch debug events are disabled for Non-secure EL2. If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2.
0b1	If EDECCR.NSE2 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL2. If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NSR1, bit [13]

When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

Controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSE1.

NSR1	Meaning
0b0	If EDECCR.NSE1 is 0, then Exception Catch debug events are disabled for Non-secure EL1. If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1.
0b1	If EDECCR.NSE1 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL1. If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NSR0, bit [12]

When FEAT_Debugv8p2 is implemented and Non-secure EL0 is implemented:

Controls exception catch on exception return to Non-secure EL0.

NSR0	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL0.
0b1	Exception Catch debug events are enabled for exception returns to Non-secure EL0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SR3, bit [11]

When FEAT_Debugv8p2 is implemented and EL3 is implemented:

Controls exception catch on exception return to EL3 in conjunction with EDECCR.SE3.

SR3	Meaning
0b0	If EDECCR.SE3 is 0, then Exception Catch debug events are disabled for EL3. If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3.
0b1	If EDECCR.SE3 is 0, then Exception Catch debug events are enabled for exception returns to EL3. If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SR2, bit [10]

When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

Controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SE2.

SR2	Meaning
0b0	If EDECCR.SE2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2.
0b1	If EDECCR.SE2 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL2. If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SR1, bit [9]

When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

Controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SE1.

SR1	Meaning
0b0	If EDECCR.SE1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1.
0b1	If EDECCR.SE1 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL1. If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SR0, bit [8]

When FEAT_Debugv8p2 is implemented and Secure EL0 is implemented:

Controls exception catch on exception return to Secure EL0.

SR0	Meaning
0b0	Exception Catch debug events are disabled for Secure EL0.
0b1	Exception Catch debug events are enabled for exception returns to Secure EL0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NSE3, bit [7]

Access to this field is **RES0**.

NSE2, bit [6]

When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:

Controls exception catch on exception entry to Non-secure EL2. Also controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSR2.

NSE2	Meaning
0b0	If EDECCR.NSR2 is 0, then Exception Catch debug events are disabled for Non-secure EL2. If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL2.
0b1	If EDECCR.NSR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2. If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

When Non-secure EL2 is implemented:

Coarse-grained exception catch for Non-secure EL2. Controls Exception Catch debug events for Non-secure EL2.

NSE2	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL2.
0b1	Exception Catch debug events are enabled for Non-secure EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NSE1, bit [5]

When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

Controls exception catch on exception entry to Non-secure EL1. Also controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSR1.

NSE1	Meaning
0b0	If EDECCR.NSR1 is 0, then Exception Catch debug events are disabled for Non-secure EL1. If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL1.
0b1	If EDECCR.NSR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1. If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

When Non-secure EL1 is implemented:

Coarse-grained exception catch for Non-secure EL1. Controls Exception Catch debug events for Non-secure EL1.

NSE1	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL1.
0b1	Exception Catch debug events are enabled for Non-secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NSE0, bit [4]

Access to this field is **RES0**.

SE3, bit [3]

When FEAT_Debugv8p2 is implemented and EL3 is implemented:

Controls exception catch on exception entry to EL3. Also controls exception catch on exception return to EL3 in conjunction with EDECCR.SR3.

SE3	Meaning
0b0	If EDECCR.SR3 is 0, then Exception Catch debug events are disabled for EL3. If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception returns to EL3.
0b1	If EDECCR.SR3 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3. If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

When FEAT_Debugv8p2 is not implemented and EL3 is implemented:

Coarse-grained exception catch for EL3. Controls Exception Catch debug events for EL3.

SE3	Meaning
0b0	Exception Catch debug events are disabled for EL3.
0b1	Exception Catch debug events are enabled for EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SE2, bit [2]

When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

Controls exception catch on exception entry to Secure EL2. Also controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SR2.

SE2	Meaning
0b0	If EDECCR.SR2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL2.
0b1	If EDECCR.SR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SE1, bit [1]

When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

Controls exception catch on exception entry to Secure EL1. Also controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SR1.

SE1	Meaning
0b0	If EDECCR.SR1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL1.
0b1	If EDECCR.SR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

When Secure EL1 is implemented:

Coarse-grained exception catch for Secure EL1. Controls Exception Catch debug events for Secure EL1.

SE1	Meaning
0b0	Exception Catch debug events are disabled for Secure EL1.
0b1	Exception Catch debug events are enabled for Secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SE0, bit [0]

Access to this field is **RES0**.

Accessing EDECCR

EDECCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x098	EDECCR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDECR, External Debug Execution Control Register

The EDECR characteristics are:

Purpose

Controls Halting debug events.

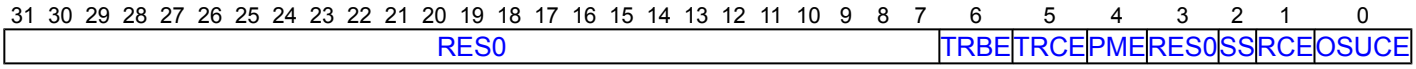
Configuration

When FEAT_DoPD is implemented, EDECR is in the Core power domain. Otherwise, EDECR is in the Debug power domain.

Attributes

EDECR is a 32-bit register.

Field descriptions



Bits [31:7]

Reserved, RES0.

TRBE, bit [6]

When FEAT_Debugv8p9 is implemented and FEAT_TRBE_EXT is implemented:

Trace Buffer External Debug Request Enable.

TRBE	Meaning
0b0	Trace Buffer External Debug Request disabled.
0b1	Trace Buffer External Debug Request enabled.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

TRCE, bit [5]

When FEAT_ETEv1p3 is implemented and FEAT_Debugv8p9 is implemented:

ETE External Debug Request Enable.

TRCE	Meaning
0b0	ETE External Debug Request disabled.
0b1	ETE External Debug Request enabled.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

PME, bit [4]

When FEAT_Debugv8p9 is implemented and FEAT_PMUv3p9 is implemented:

PMU Overflow External Debug Request Enable.

PME	Meaning
0b0	PMU Overflow External Debug Request disabled.
0b1	PMU Overflow External Debug Request enabled.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [3]

Reserved, RES0.

SS, bit [2]

Halting step enable. Possible values of this field are:

SS	Meaning
0b0	Halting step debug event disabled.
0b1	Halting step debug event enabled.

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is CONSTRAINED UNPREDICTABLE as described in 'Changing the value of EDECR.SS when not in Debug state'.

The reset behavior of this field is:

- On a Cold reset, when FEAT_DoPD is implemented, this field resets to '0'.
- On an External debug reset, when FEAT_DoPD is not implemented, this field resets to '0'.

RCE, bit [1]

When FEAT_DoPD is not implemented:

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

OSUCE, bit [0]
When FEAT_DoPD is not implemented:

OS Unlock Catch Enable.

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Accessing EDECR

EDECR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x024	EDECR

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

EDESR, External Debug Event Status Register

The EDESR characteristics are:

Purpose

Indicates the status of internally pending Halting debug events.

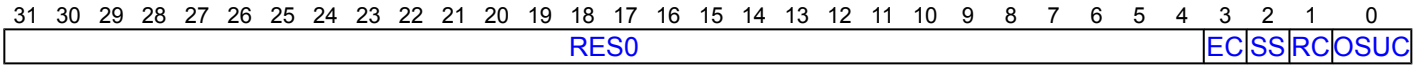
Configuration

EDESR is in the Core power domain.

Attributes

EDESR is a 32-bit register.

Field descriptions



Bits [31:4]

Reserved, RES0.

EC, bit [3]

When FEAT_Debugv8p8 is implemented:

Exception Catch debug event pending.

EC	Meaning
0b0	Exception Catch debug event is not pending.
0b1	Exception Catch debug event is pending.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

SS, bit [2]

When FEAT_DoPD is implemented:

Halting step debug event pending. Possible values of this field are:

SS	Meaning
0b0	Reading this means that a Halting step debug event is not pending. Writing this means no action.
0b1	Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Halting step debug event pending. Possible values of this field are:

SS	Meaning
0b0	Reading this means that a Halting step debug event is not pending. Writing this means no action.
0b1	Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in EDECR.SS.

RC, bit [1]

Reset Catch debug event pending. Possible values of this field are:

RC	Meaning
0b0	Reading this means that a Reset Catch debug event is not pending. Writing this means no action.
0b1	Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_DoPD is implemented, this field resets to the value in CTIDEVCTL.RCE.
  - When FEAT_DoPD is not implemented, this field resets to the value in EDECR.RCE.

OSUC, bit [0]

OS Unlock Catch debug event pending. Possible values of this field are:

OSUC	Meaning
0b0	Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action.
0b1	Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing EDESR

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is CONSTRAINED UNPREDICTABLE whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

EDESR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x020	EDESR

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

EDHSR, External Debug Halting Syndrome Register

The EDHSR characteristics are:

Purpose

Holds syndrome information for a debug event.

Configuration

EDHSR is in the Core power domain.

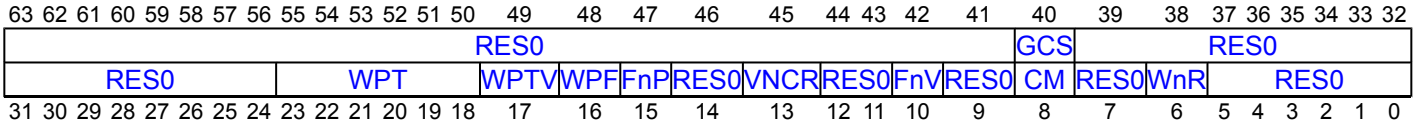
This register is present only when FEAT_EDHSR is implemented. Otherwise, direct accesses to EDHSR are RES0.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if EDSCR.STATUS is not `0b101011`.

Attributes

EDHSR is a 64-bit register.

Field descriptions



Bits [63:41]

Reserved, RES0.

GCS, bit [40]

When FEAT_GCS is implemented and FEAT_Debugv8p9 is implemented:

Guarded control stack data access.

Indicates that the Watchpoint debug event is due to a Guarded control stack data access.

GCS	Meaning
`0b0`	The Watchpoint debug event is not due to a Guarded control stack data access.
`0b1`	The Watchpoint debug event is due to a Guarded control stack data access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:24]

Reserved, RES0.

WPT, bits [23:18]

Watchpoint number. When EDHSR.WPTV is 1, holds the index of a watchpoint that triggered the Watchpoint debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WPTV, bit [17]

Watchpoint number valid.

WPTV	Meaning	Applies when
0b0	EDHSR.WPT field is not valid, and holds an UNKNOWN value.	When FEAT_Debugv8p9 is not implemented
0b1	EDHSR.WPT field is valid, and holds the number of a watchpoint that triggered the Watchpoint debug event.	

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WPF, bit [16]

Watchpoint might be false-positive.

WPF	Meaning	Applies when
0b0	The watchpoint matched an address or address range that was accessed by the instruction.	
0b1	The watchpoint matched an address or address range that might not have been accessed by the instruction.	When FEAT_SVE is implemented or FEAT_SME is implemented

Arm strongly recommends that this bit is set to 0, other than when one of the following instructions might generate a watchpoint match for an address or address range that the instruction does not access:

- An SVE contiguous vector load/store instruction, when the PE is in Streaming SVE mode.
- An SME load/store instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FnP, bit [15]

EDWAR not Precise.

FnP	Meaning	Applies when
0b0	If the EDWAR is valid, it holds the virtual address of an access or sequence of contiguous accesses that triggered the Watchpoint debug event.	
0b1	If the EDWAR is valid, it holds any virtual address within the smallest implemented translation granule that contains the virtual address of an access or set of contiguous accesses that triggered the Watchpoint debug event.	When FEAT_SME is implemented or FEAT_SVE is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [14]

Reserved, RES0.

VNCR, bit [13]

When FEAT_Debugv8p9 is implemented:

VNCR_EL2 access. Indicates that the Watchpoint debug event came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning	Applies when
0b0	The Watchpoint debug event was not generated by the use of VNCR_EL2 by EL1 code.	
0b1	The Watchpoint debug event was generated by the use of VNCR_EL2 by EL1 code.	When FEAT_NV2 is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:11]

Reserved, RES0.

FnV, bit [10]

EDWAR not Valid.

FnV	Meaning	Applies when
0b0	EDWAR is valid.	
0b1	EDWAR is not valid, and holds an UNKNOWN value.	When FEAT_SME is implemented or FEAT_SVE is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

CM, bit [8]

When FEAT_Debugv8p9 is implemented:

Cache maintenance. Indicates whether the Watchpoint debug event came from a cache maintenance instruction.

CM	Meaning
0b0	The Watchpoint debug event was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint debug event was generated by the execution of a cache maintenance instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not cache maintenance instructions, and therefore do not cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

WnR, bit [6]

When FEAT_Debugv8p9 is implemented:

Write not Read. Indicates whether the Watchpoint debug event was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint debug event caused by an instruction reading from a memory location.
0b1	Watchpoint debug event caused by an instruction writing to a memory location.

For Watchpoint debug events on cache maintenance instructions, this field is set to 1.

For Watchpoint debug events from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint debug event, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:0]

Reserved, RES0.

Accessing EDHSR

EDHSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x038	EDHSR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

Purpose

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

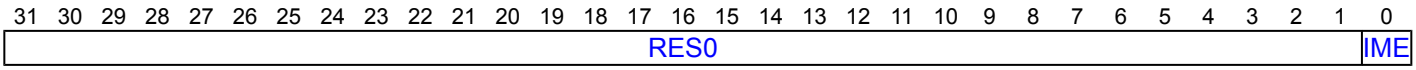
The power domain of EDITCTRL is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

Attributes

EDITCTRL is a 32-bit register.

Field descriptions



Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The integration mode behavior is IMPLEMENTATION DEFINED.

The following resets apply:

- Whichever power domain the register is implemented in, this field resets to 0.
- Otherwise, the value of this field is unchanged.

Accessing EDITCTRL

EDITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xF00	EDITCTRL

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register are **IMPDEF**.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

Purpose

Used in Debug state for passing instructions to the PE for execution.

Configuration

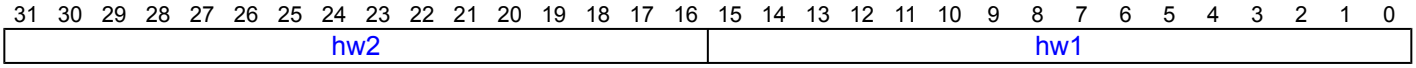
EDITR is in the Core power domain.

Attributes

EDITR is a 32-bit register.

Field descriptions

When FEAT_AA32 is implemented and in AArch32 state:



hw2, bits [31:16]

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information, see 'Behavior in Debug state'.

Note

The hw2 field is displayed on the left. This is not the usual convention for display of T32 instruction halfwords.

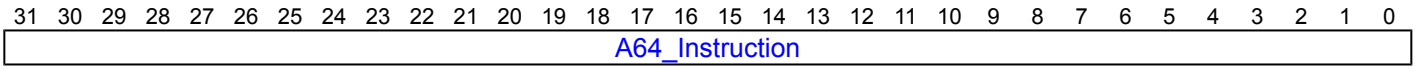
hw1, bits [15:0]

First halfword of the T32 instruction to be executed on the PE.

Note

The hw1 field is displayed on the right. This is not the usual convention for display of T32 instruction halfwords.

When FEAT_AA64 is implemented and in AArch64 state:



A64_Instruction, bits [31:0]

A64 instruction to be executed on the PE.

Accessing EDITR

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

EDITR ignores writes if the PE is in Non-debug state.

EDITR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x084	EDITR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **WI**.
- Otherwise, accesses to this register are **WO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

Purpose

Allows or disallows access to the external debug registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

When FEAT_DoPD is implemented, EDLAR is in the Core power domain. Otherwise, EDLAR is in the Debug power domain.

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLAR is a 32-bit register.

Field descriptions

When Debug Software Lock is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
KEY																															

KEY, bits [31:0]

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing EDLAR

EDLAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
Debug	`0xFB0`	EDLAR

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **WO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

Purpose

Indicates the current status of the software lock for external debug registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

When FEAT_DoPD is implemented, EDLSR is in the Core power domain. Otherwise, EDLSR is in the Debug power domain.

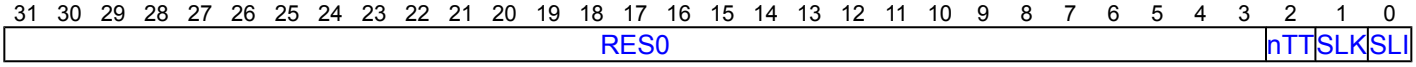
If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLSR is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SLK, bit [1]

When Debug Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On a Cold reset, when FEAT_DoPD is implemented, this field resets to '1'.
- On an External debug reset, when FEAT_DoPD is not implemented, this field resets to '1'.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Access to this field is **RO**.

Accessing EDLSR

EDLSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
Debug	0xFB4	EDLSR

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

EDPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDPCSR are RES0.

EDPCSR[63:32] and EDPCSR[31:0] are accessed at 32-bit memory mapped addresses that are not contiguous.

If FEAT_Debugv8p1 is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDPCSR is a 64-bit register.

Field descriptions

When FEAT_Debugv8p1 is not implemented or EDSCR.SC2 == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
EDPCSRhi																															
EDPCSRlo																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EDPCSRhi, bits [63:32]

PC Sample high word, EDPCSRhi. If EDVIDSR.HV == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EDPCSRlo, bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as `0xFFFFFFFF` when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of EDPCSR[31:0] is permitted but not required to return `0xFFFFFFFF`.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns `0xFFFFFFFF` or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

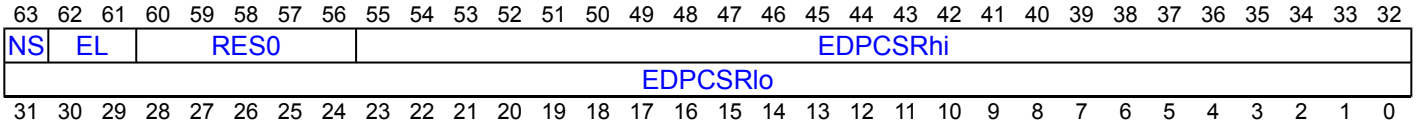
Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_Debugv8p1 is implemented and EDSCR.SC2 == 1:



NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
`0b0`	Sample is from Secure state.
`0b1`	Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

EL	Meaning
`0b00`	Sample is from EL0.
`0b01`	Sample is from EL1.
`0b10`	Sample is from EL2.
`0b11`	Sample is from EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [60:56]

Reserved, RES0.

EDPCSRhi, bits [55:32]

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EDPCSRlo, bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as `0xFFFFFFFF` when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of EDPCSR[31:0] is permitted but not required to return `0xFFFFFFFF`.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns `0xFFFFFFFF` or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'

EDPCSR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x0A0	EDPCSR	31:0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

Component	Offset	Instance	Range
Debug	0x0AC	EDPCSR	63:32

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

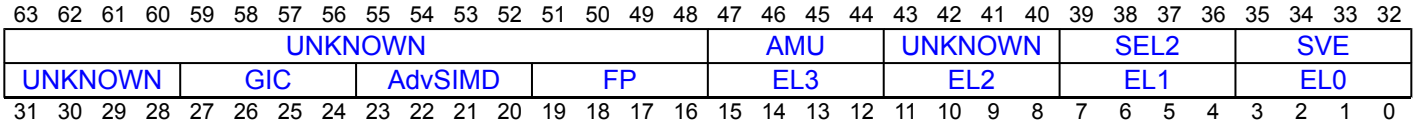
Configuration

There are no configuration notes.

Attributes

EDPFR is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, UNKNOWN.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

Access to this field is **RO**.

Bits [43:40]

Reserved, UNKNOWN.

SEL2, bits [39:36]

Secure EL2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

FEAT_SEL2 implements the functionality identified by the value 0b0001

All other values are reserved.

Access to this field is **RO**.

SVE, bits [35:32]

Scalable Vector Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SVE	Meaning
0b0000	SVE is not implemented.
0b0001	SVE is implemented.

FEAT_SVE implements the functionality identified by the value 0b0001.

All other values are reserved.

Access to this field is **RO**.

Bits [31:28]

Reserved, UNKNOWN.

GIC, bits [27:24]

System register GIC interface support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.GIC.

Access to this field is **RO**.

AdvSIMD, bits [23:20]

Advanced SIMD.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following SISD and SIMD operations: • Integer byte, halfword, word and doubleword element operations. • Single-precision and double-precision floating-point arithmetic. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support, that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support, that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.AdvSIMD.

Access to this field is **RO**.

FP, bits [19:16]

Floating-point.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: • Single-precision and double-precision floating-point types. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support, that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with floating-point support, that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without floating-point support.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.FP.

Access to this field is **RO**.

EL3, bits [15:12]

AArch64 EL3 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL3	Meaning
0b0000	EL3 is not implemented or cannot be executed in AArch64 state.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in both Execution states.

When the value of EDAA32PFR.EL3 is nonzero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL3.

Access to this field is **RO**.

EL2, bits [11:8]

AArch64 EL2 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL2	Meaning
0b0000	EL2 is not implemented or cannot be executed in AArch64 state.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in both Execution states.

When the value of EDAA32PFR.EL2 is nonzero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL2.

Access to this field is **RO**.

EL1, bits [7:4]

AArch64 EL1 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL1	Meaning
0b0000	EL1 cannot be executed in AArch64 state. EL1 can be executed in AArch32 state only.
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL1.

Access to this field is **RO**.

EL0, bits [3:0]

AArch64 EL0 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL0	Meaning
0b0000	EL0 cannot be executed in AArch64 state. EL0 can be executed in AArch32 state only.
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL0.

Access to this field is **RO**.

Accessing EDPFR

EDPFR can be accessed through the external debug interface:

Component	Offset	Instance

Debug	0xD20	EDPFR

Accessible as follows:

- When IsCorePowered() and !DoubleLockStatus(), accesses to this register are **RO**.
- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **IMPDEF**.

2025-06-23 17:47:32, 2025-06_rel

EDPIDR0, External Debug Peripheral Identification Register 0

The EDPIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDPIDR0 is in the Core power domain. Otherwise, EDPIDR0 is in the Debug power domain.

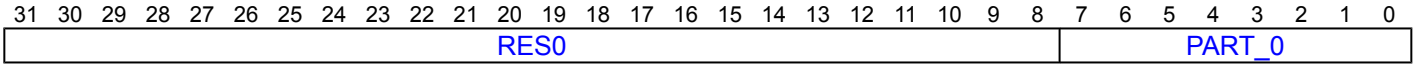
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR0 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR0

EDPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE0	EDPIDR0

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDPIDR1 is in the Core power domain. Otherwise, EDPIDR1 is in the Debug power domain.

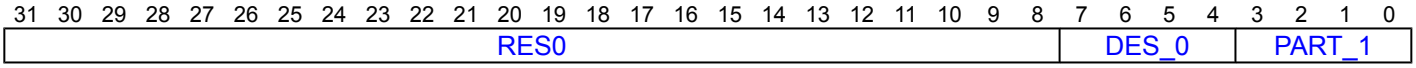
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is `0b1011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR1

EDPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFE4`	EDPIDR1

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDPIDR2 is in the Core power domain. Otherwise, EDPIDR2 is in the Debug power domain.

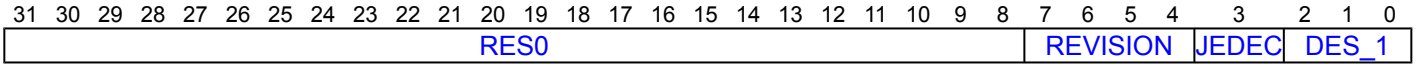
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR2 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as `0b1`.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is `0b011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR2

EDPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE8	EDPIDR2

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDPIDR3 is in the Core power domain. Otherwise, EDPIDR3 is in the Debug power domain.

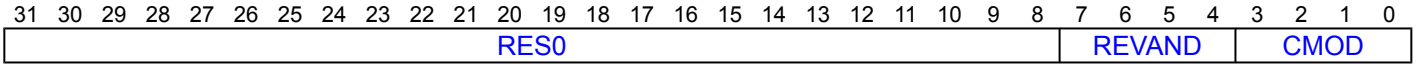
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR3 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using EDPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR3

EDPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFEC	EDPIDR3

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDPIDR4 is in the Core power domain. Otherwise, EDPIDR4 is in the Debug power domain.

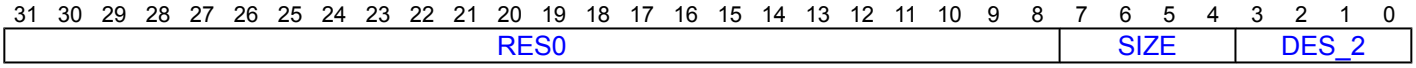
Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR4 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as `0b0000`.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is `0b0100`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR4

EDPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFD0`	EDPIDR4

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

Purpose

Controls the PE functionality related to powerup, reset, and powerdown.

Configuration

External register EDPRCR bit [0] is architecturally mapped to AArch64 System register DBGPRCR_EL1[0].

External register EDPRCR bit [0] is architecturally mapped to AArch32 System register DBGPRCR[0].

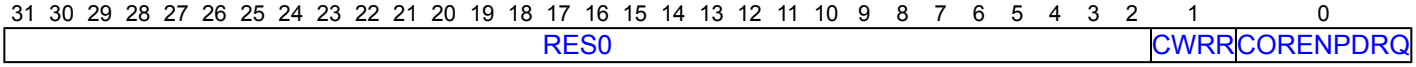
When FEAT_DoPD is implemented, EDPRCR is in the Core power domain. Otherwise, EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

Attributes

EDPRCR is a 32-bit register.

Field descriptions

When FEAT_DoPD is implemented:



Bits [31:2]

Reserved, RES0.

CWRR, bit [1]

When FEAT_RME is implemented:

The PE ignores all writes to this bit.

Otherwise:

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

CWRR	Meaning
0b0	No action.
0b1	Request Warm reset.

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the **DBGRSTREQ** signal.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if any the following are true:
  - OSLockStatus().
  - SoftwareLockStatus().
- Otherwise, access to this field is **WO/RAZ**.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
`0b0`	If the system responds to a powerdown request, it powers down Core power domain.
`0b1`	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the DBGPRCR.CORENPDRQ and DBGPRCR_EL1.CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the **DBGNOPWRDWN** signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

Note

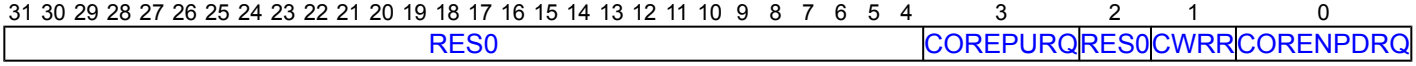
Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Accessing this field has the following behavior:

- When OSLockStatus(), access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:



Bits [31:4]

Reserved, RES0.

COREPURQ, bit [3]

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

COREPURQ	Meaning
0b0	Do not request power up of the Core power domain.
0b1	Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the **DBGPWRUPREQ** signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On an External debug reset, this field resets to '0'.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Bit [2]

Reserved, RES0.

CWRR, bit [1]

When FEAT_RME is implemented:

The PE ignores all writes to this bit.

Otherwise:

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

CWRR	Meaning
0b0	No action.
0b1	Request Warm reset.

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the **DBGRSTREQ** signal.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if any the following are true:
  - !IsCorePowered().
  - DoubleLockStatus().
  - OSLockStatus().
  - SoftwareLockStatus().
- Otherwise, access to this field is **WO/RAZ**.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
`0b0`	If the system responds to a powerdown request, it powers down Core power domain.
`0b1`	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the DBGPRCR.CORENPDRQ and DBGPRCR_EL1.CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the **DBGNOPWRDWN** signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in EDPRCR.COREPURQ.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - !IsCorePowered().
  - DoubleLockStatus().
  - OSLockStatus().
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Accessing EDPRCR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

EDPRCR can be accessed through the external debug interface:

Component	Offset	Instance

Debug	0x310	EDPRCR

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

Purpose

Holds information about the reset and powerdown state of the PE.

Configuration

When FEAT_DoPD is implemented, EDPRSR is in the Core power domain. Otherwise, EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.

Attributes

EDPRSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0															EPMADE	ETADE	EDADE	STAD	ETAD	SDR	SPMAD	EPMAD	SDAD	EDAD	DLK	OSLK	HALTED	SR	R	SP	

Bits [31:17]

Reserved, RES0.

EPMADE, bit [16]

When FEAT_RME is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable Extended status. Together with EDPRSR.EPMAD, reports whether access to Performance Monitor registers by an external debugger is prohibited by the MDCR_EL3.{EPMAD, EPMADE} controls.

For a description of the values derived by evaluating EDPRSR.EPMAD and EDPRSR.EPMADE together, see EDPRSR.EPMAD.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == 1.
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

ETADE, bit [15]

When FEAT_RME is implemented, FEAT_TRC_EXT is implemented, and FEAT_TRBE is implemented:

External Trace Access Disable Extended status. Together with EDPRSR.ETAD, reports whether access to trace unit registers by an external debugger is prohibited by the MDCR_EL3.{ETAD, ETADE} controls.

For a description of the values derived by evaluating EDPRSR.ETAD and EDPRSR.ETADE together, see EDPRSR.ETAD.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == 1.
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

EDADE, bit [14]

When FEAT_RME is implemented:

External Debug Access Disable Extended status. Together with EDPRSR.EDAD, reports whether access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger is prohibited by the MDCR_EL3.{EDAD, EDADE} controls.

For a description of the values derived by evaluating EDPRSR.EDAD and EDPRSR.EDADE together, see EDPRSR.EDAD.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == 1.
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

STAD, bit [13]

When FEAT_TRC_EXT is implemented and FEAT_TRBE is implemented:

Sticky ETAD error. Set to 1 when a Non-secure external debug interface access to an external trace register returns an error because `AllowExternalTraceAccess()` == FALSE for the access.

STAD	Meaning
`0b0`	Since EDPRSR was last read, no external accesses to the trace unit registers have failed because `AllowExternalTraceAccess()` was FALSE for the access.
`0b1`	Since EDPRSR was last read, at least one external access to the trace unit registers has failed because `AllowExternalTraceAccess()` was FALSE for the access.

If `IsCorePowered()` == TRUE, the Core power domain is powered up, then, following a read of EDPRSR, then this bit clears to 0.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().

- Otherwise, access to this field is **RC/WI**.

Otherwise:

Reserved, RES0.

ETAD, bit [12]

When FEAT_RME is implemented, FEAT_TRC_EXT is implemented, and FEAT_TRBE is implemented:

External Trace Access Disable status. Together with EDPRSR.ETADE, reports whether access to trace unit registers by an external debugger is prohibited by the MDCR_EL3.{ETAD, ETADE} controls.

ETADE	ETAD	Meaning
0b0	0b0	No accesses from an external debugger to trace unit registers are prohibited.
0b0	0b1	Realm and Non-secure accesses from an external debugger to trace unit registers are prohibited. Other accesses from an external debugger to trace unit registers are not affected.
0b1	0b0	Secure and Non-secure accesses from an external debugger to trace unit registers are prohibited. Other accesses from an external debugger to trace unit registers are not affected.
0b1	0b1	Secure, Non-secure, and Realm accesses from an external debugger to trace unit registers are prohibited. Other accesses from an external debugger to trace unit registers are not affected.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == 1.
- Otherwise, access to this field is **RO**.

When FEAT_TRC_EXT is implemented and FEAT_TRBE is implemented:

External Trace Access Disable status. Reports whether Non-secure access to trace unit registers by an external debugger is prohibited by the MDCR_EL3.ETAD control.

ETAD	Meaning
0b0	External Non-secure trace unit accesses not affected. `AllowExternalTraceAccess()` == TRUE for a Non-secure access.
0b1	External Non-secure trace unit accesses are prohibited. `AllowExternalTraceAccess()` == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == 1.
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

SDR, bit [11]

Sticky Debug Restart. Set to 1 when the PE exits Debug state.

SDR	Meaning
0b0	The PE has not restarted since EDPRSR was last read.
0b1	The PE has restarted since EDPRSR was last read.

Note

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If the Core power domain is powered up, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().
- When DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

SPMAD, bit [10]

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3_EXT is implemented:

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because `AllowExternalPMUAccess()` == FALSE.

SPMAD	Meaning
0b0	No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because `AllowExternalPMUAccess()` == FALSE for the access since EDPRSR was last read.
0b1	At least one Non-secure external debug interface access to the external Performance Monitors register has failed and returned an error because `AllowExternalPMUAccess()` == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().
- When DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

When FEAT_PMUv3_EXT is implemented:

Sticky EPMAD error.

SPMAD	Meaning
0b0	No external debug interface accesses to the Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.
0b1	At least one external debug interface access to the Performance Monitors registers has failed and returned an error because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().
- When DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- When OSLockStatus(), access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

Otherwise:

Reserved, RES0.

EPMAD, bit [9]
When FEAT_RME is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable status. Together with EDPRSR.EPMADE, reports whether access to Performance Monitor registers by an external debugger is prohibited by the MDCR_EL3.{EPMAD, EPMADE} controls.

See MDCR_EL3.EPMAD for the list of affected external Performance Monitor registers.

EPMADE	EPMAD	Meaning
0b0	0b0	No accesses from an external debugger to affected Performance Monitor registers are prohibited.
0b0	0b1	Realm and Non-secure accesses from an external debugger to affected Performance Monitor registers are prohibited. Other accesses from an external debugger to affected Performance Monitor registers are not affected.
0b1	0b0	Secure and Non-secure accesses from an external debugger to affected Performance Monitor registers are prohibited. Other accesses from an external debugger to affected Performance Monitor registers are not affected.
0b1	0b1	Secure, Non-secure, and Realm accesses from an external debugger to affected Performance Monitor registers are prohibited. Other accesses from an external debugger to affected Performance Monitor registers are not affected.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
    - FEAT_DoPD is not implemented and !IsCorePowered().
    - EDPRSR.R == 1.
- Otherwise, access to this field is **RO**.

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable status. Reports whether Non-secure access to Performance Monitor registers by an external debugger is prohibited by the MDCR_EL3.EPMAD control.

See MDCR_EL3.EPMAD for the list of affected external Performance Monitor registers.

EPMAD	Meaning
0b0	External Non-secure access to Performance Monitor registers not affected. `AllowExternalPMUAccess()` == TRUE for a Non-secure access.
0b1	External Non-secure access to affected Performance Monitor registers is prohibited. `AllowExternalPMUAccess()` == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
    - FEAT_DoPD is not implemented and !IsCorePowered().
    - EDPRSR.R == 1.
- When DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

When FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable status. Reports whether access to Performance Monitor registers by an external debugger is prohibited by the MDCR_EL3.EPMAD control.

See MDCR_EL3.EPMAD for the list of affected external Performance Monitor registers.

EPMAD	Meaning
0b0	External access to Performance Monitor registers not affected. `AllowExternalPMUAccess()` == TRUE.
0b1	External access to affected Performance Monitor registers is prohibited. `AllowExternalPMUAccess()` == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
    - FEAT_DoPD is not implemented and !IsCorePowered().
    - EDPRSR.R == 1.
- When DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- When OSLockStatus(), access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

When FEAT_PMUv3 is implemented:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

SDAD, bit [8]

When FEAT_Debugv8p4 is implemented:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because `AllowExternalDebugAccess()` == FALSE.

SDAD	Meaning
`0b0`	No Non-secure external debug interface accesses to the debug registers have failed because `AllowExternalDebugAccess()` == FALSE for the access since EDPRSR was last read.
`0b1`	At least one Non-secure external debug interface access to the debug registers has failed and returned an error because `AllowExternalDebugAccess()` == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == 1.
- When DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

Otherwise:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because `AllowExternalDebugAccess()` == FALSE.

SDAD	Meaning
`0b0`	No external debug interface accesses to the debug registers have failed because `AllowExternalDebugAccess()` == FALSE since EDPRSR was last read.
`0b1`	At least one external debug interface access to the debug registers has failed and returned an error because `AllowExternalDebugAccess()` == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == 1.
- When DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- Access to this field is **UNKNOWN/WI** if all the following are true:
  - OSLockStatus().

    - external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess(addrdesc) == FALSE.
- Otherwise, access to this field is **RO**.

EDAD, bit [7]

When FEAT_RME is implemented:

External Debug Access Disable status. Together with EDPRSR.EDADE, reports whether access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger is prohibited by the MDCR_EL3.{EDAD, EDADE} controls.

See MDCR_EL3.EDAD for the list of affected external debug registers.

EDADE	EDAD	Meaning
0b0	0b0	No accesses from an external debugger to affected debug registers are prohibited.
0b0	0b1	Realm and Non-secure accesses from an external debugger to affected debug registers are prohibited. Other accesses from an external debugger to affected debug registers are not affected.
0b1	0b0	Secure and Non-secure accesses from an external debugger to affected debug registers are prohibited. Other accesses from an external debugger to affected debug registers are not affected.
0b1	0b1	Secure, Non-secure, and Realm accesses from an external debugger to affected debug registers are prohibited. Other accesses from an external debugger to affected debug registers are not affected.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
    - FEAT_DoPD is not implemented and !IsCorePowered().
    - EDPRSR.R == 1.
- Otherwise, access to this field is **RO**.

When FEAT_Debugv8p4 is implemented:

External Debug Access Disable status. Reports whether Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger is prohibited by the MDCR_EL3.EDAD control.

See MDCR_EL3.EDAD for the list of affected external debug registers.

EDAD	Meaning
0b0	External Non-secure access to debug registers not affected. `AllowExternalDebugAccess()` == TRUE for a Non-secure access.
0b1	External Non-secure access to affected debug registers is prohibited. `AllowExternalDebugAccess()` == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
    - FEAT_DoPD is not implemented and !IsCorePowered().
    - EDPRSR.R == 1.
- When DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable status. Reports whether access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger is prohibited by the MDCR_EL3.EDAD control.

See MDCR_EL3.EDAD for the list of affected external debug registers.

EDAD	Meaning
0b0	External access to debug registers not affected. AllowExternalDebugAccess() == TRUE.
0b1	External access to affected debug registers is prohibited. AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == 1.
- When DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- Access to this field is **UNKNOWN/WI** if all the following are true:
  - OSLockStatus().
  - external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess(addrdesc) == FALSE.
- Otherwise, access to this field is **RO**.

Otherwise:

External Debug Access Disable status. Reports whether access to breakpoint registers, watchpoint registers, and optionally OSLAR_EL1 by an external debugger is prohibited by the MDCR_EL3.EDAD control.

See MDCR_EL3.EDAD for the list of affected external debug registers.

EDAD	Meaning
0b0	External access to debug registers not affected. AllowExternalDebugAccess() == TRUE.
0b1	External access to affected debug registers is prohibited. AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == 1.
- When DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

DLK, bit [6]

When FEAT_Debugv8p4 is implemented:

This field is RES0.

When FEAT_Debugv8p2 is implemented and FEAT_DoubleLock is implemented:

Double Lock. From Armv8.2, use of this field is deprecated.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - !IsCorePowered().
  - DoubleLockStatus().
- Otherwise, access to this field is **RAZ/WI**.

When FEAT_DoubleLock is implemented:

Double Lock.

This field returns the result of the pseudocode function `DoubleLockStatus()`.

If the Core power domain is powered up and `DoubleLockStatus()` == TRUE, it is IMPLEMENTATION DEFINED whether:

- EDPRSR.PU reads as 1, EDPRSR.DLK reads as 1, and EDPRSR.SPD is UNKNOWN.
- EDPRSR.PU reads as 0, EDPRSR.DLK is UNKNOWN, and EDPRSR.SPD reads as 0.

This field is in the Core power domain.

DLK	Meaning
0b0	`DoubleLockStatus()` returns FALSE.
0b1	`DoubleLockStatus()` returns TRUE and the Core power domain is powered up.

Accessing this field has the following behavior:

- When !IsCorePowered(), access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

OSLK, bit [5]

OS Lock status bit.

A read of this bit returns the value of OSLSR_EL1.OSLK.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == 1.
- When DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

HALTED, bit [4]

Halted status bit.

HALTED	Meaning
0b0	PE is in Non-debug state.
0b1	PE is in Debug state.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().
- Otherwise, access to this field is **RO**.

SR, bit [3]

Sticky core Reset status bit.

SR	Meaning
0b0	The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.
0b1	The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.

If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'1'`.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().
- When DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

R, bit [2]

PE Reset status bit.

R	Meaning
0b0	The non-debug logic of the PE is not in reset state.
0b1	The non-debug logic of the PE is in reset state.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - DoubleLockStatus().
- Otherwise, access to this field is **RO**.

SPD, bit [1]

Sticky core Powerdown status bit.

If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, then:

- If FEAT_Debugv8p2 is implemented, this bit reads as 0.
- If FEAT_Debugv8p2 is not implemented, this bit might read as 0 or 1.

For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

SPD	Meaning
0b0	If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core power domain is lost. If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not been lost.
0b1	The state of the debug registers in the Core power domain has been lost.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

When FEAT_DoPD is not implemented and the Core power domain is in either retention or powerdown state, the value of EDPRSR.SPD is IMPLEMENTATION DEFINED. For more information, see 'EDPRSR.SPD when the Core domain is in either retention or powerdown state'.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'1'`.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().
- Access to this field is **UNKNOWN/WI** if all the following are true:
  - IsCorePowered().
  - DoubleLockStatus().
- Otherwise, access to this field is **RC/WI**.

PU, bit [0]

When FEAT_DoPD is implemented:

Core powerup status bit.

Access to this field is **RAO/WI**.

When FEAT_Debugv8p2 is implemented:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

PU	Meaning
`0b0`	Either the Core power domain is in a low-power or powerdown state, or FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, meaning the debug registers in the Core power domain cannot be accessed.
`0b1`	The Core power domain is in a powerup state, and either FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE, meaning the debug registers in the Core power domain can be accessed.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'

Access to this field is **RO**.

Otherwise:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

PU	Meaning
`0b0`	Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed.
`0b1`	Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

When the Core power domain is powered-up and `DoubleLockStatus() == TRUE`, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

If FEAT_DoubleLock is implemented, the Core power domain is powered up, and `DoubleLockStatus() == TRUE`, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

Access to this field is **RO**.

Accessing EDPRSR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus() == FALSE`, then:
  - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
  - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- If FEAT_DoubleLock is implemented and `DoubleLockStatus() == TRUE`, it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If FEAT_DoPD is not implemented and the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

EDPRSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x314`	EDPRSR

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

EDRCR, External Debug Reserve Control Register

The EDRCR characteristics are:

Purpose

This register is used to allow imprecise entry to Debug state and clear sticky bits in EDSCR.

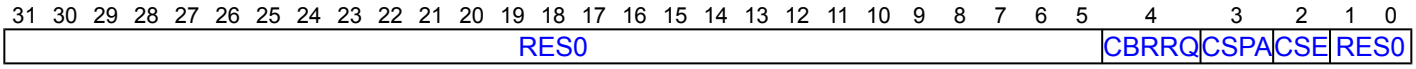
Configuration

EDRCR is in the Core power domain.

Attributes

EDRCR is a 32-bit register.

Field descriptions



Bits [31:5]

Reserved, RES0.

CBRRQ, bit [4]

Allow imprecise entry to Debug state. The actions on writing to this bit are:

CBRRQ	Meaning
0b0	No action.
0b1	Allow imprecise entry to Debug state, for example by canceling pending bus accesses.

Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.

This feature is optional. If this feature is not implemented, writes to this bit are ignored.

CSPA, bit [3]

Clear Sticky Pipeline Advance. This bit is used to clear the EDSCR.PipeAdv bit to 0. The actions on writing to this bit are:

CSPA	Meaning
0b0	No action.
0b1	Clear the EDSCR.PipeAdv bit to 0.

CSE, bit [2]

Clear Sticky Error. Used to clear the EDSCR cumulative error bits to 0. The actions on writing to this bit are:

CSE	Meaning
0b0	No action.
0b1	Clear the EDSCR.{TXU, RXO, ERR} bits, and, if the PE is in Debug state, the EDSCR.ITO bit, to 0.

Bits [1:0]

Reserved, RES0.

Accessing EDRCR

EDRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x090	EDRCR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **WI**.
- Otherwise, accesses to this register are **WO**.

2025-06-23 17:47:32, 2025-06_rel

EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

External register EDSCR bits [31:29, 27:26, 23:21, 19, 14, 6] are architecturally mapped to AArch64 System register MDSCR_EL1[31:29, 27:26, 23:21, 19, 14, 6].

External register EDSCR bits [31:29, 27:26, 23:21, 19, 14, 6] are architecturally mapped to AArch32 System register DBGDSCRext[31:29, 27:26, 23:21, 19, 14, 6].

External register EDSCR bits [30:29] are architecturally mapped to AArch64 System register MDCCSR_EL0[30:29].

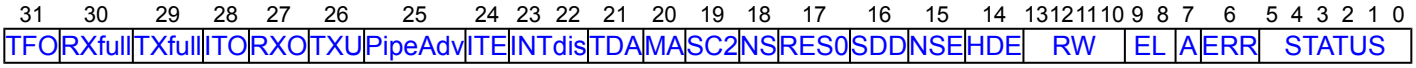
External register EDSCR bits [30:29] are architecturally mapped to AArch32 System register DBGDSCRint[30:29].

EDSCR is in the Core power domain.

Attributes

EDSCR is a 32-bit register.

Field descriptions



TFO, bit [31]

When FEAT_TRF is implemented:

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

TFO	Meaning
0b0	Trace Filter controls are not affected.
0b1	Trace Filter controls in TRFCR_EL1 and TRFCR_EL2 are ignored. Trace Filter controls TRFCR and HTRFCR are ignored.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

This bit is ignored by the PE when any of the following is true:

- ExternalSecureNoninvasiveDebugEnabled() is FALSE and the Effective value of MDCR_EL3.STE is 1.
- FEAT_RME is implemented, ExternalRealmNoninvasiveDebugEnabled() is FALSE, and the Effective value of MDCR_EL3.RLTE is 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Access to this field is **RO**.

TXfull, bit [29]

DTRTX full.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Access to this field is **RO**.

ITO, bit [28]

ITR overrun. Set to 0 on entry to Debug state.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

RXO, bit [27]

DTRRX overrun.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Access to this field is **RO**.

TXU, bit [26]

DTRTX underrun.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Access to this field is **RO**.

PipeAdv, bit [25]

Pipeline Advance. Indicates that software execution is progressing.

PipeAdv	Meaning
`0b0`	No progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA.
`0b1`	Progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA.

The architecture does not define precisely when this field is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing. For example, a PE might set this field to 1 each time the PE retires one or more instructions, or at periodic intervals during the progression of an instruction.

When FEAT_MOPS is implemented, `CPY`, `CPYF`, `SET`, and `SETG` are examples of instructions that periodically make forward progress.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

ITE, bit [24]

ITR empty.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

INTdis, bits [23:22]

When FEAT_RME is implemented:

Interrupt and SError exception disable. Disables taking interrupts and SError exceptions in Non-debug state.

INTdis	Meaning
`0b00`	This bit has no effect on the masking of interrupts and SError exceptions.
`0b01`	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Secure state are masked. If ExternalRootInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Root state are masked. If ExternalRealmInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Realm state are masked.

Note

This control affects both physical and virtual interrupts and SError exceptions.

When OSLSR_EL1.OSLK is 1, this field can be indirectly read and written through the following System registers:

- MDSCR_EL1.
- DBGDSCRext.

The Effective value of this field is `0b00` when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_RME is implemented, bit[23] of this register is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'00'`.

When FEAT_Debugv8p4 is implemented:

Interrupt and SError exception disable. Disables taking interrupts and SError exceptions in Non-debug state.

INTdis	Meaning
`0b00`	Masking of interrupts and SError exceptions is controlled by PSTATE and interrupt routing controls.
`0b01`	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Secure state are masked.

Note

This control affects both physical and virtual interrupts and SError exceptions.

When OSLSR_EL1.OSLK is 1, this field can be indirectly read and written through the following System registers:

- MDSCR_EL1.
- DBGDSCRext.

The Effective value of this field is `0b00` when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_Debugv8p4 is implemented, bit[23] of this register is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'00'`.

Otherwise:

Interrupt and SError exception disable. Disables taking interrupts and SError exceptions in Non-debug state.

INTdis	Meaning
`0b00`	Masking of interrupts and SError exceptions is controlled by PSTATE and interrupt routing controls.
`0b01`	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Non-secure EL1 are masked.
`0b10`	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Secure EL1 are masked.
`0b11`	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Secure state are masked.

Note

This control affects both physical and virtual interrupts and SError exceptions.

When OSLSR_EL1.OSLK is 1, this field can be indirectly read and written through the following System registers:

- MDSCR_EL1.
- DBGDSCRext.

The Effective value of this field is `0b00` when ExternalInvasiveDebugEnabled() is FALSE.

Support for the values `0b01` and `0b10` is IMPLEMENTATION DEFINED. If these values are not supported, they are reserved. If programmed with a reserved value, the PE behaves as if EDSCR.INTdis has been programmed with a defined value, other than for a direct read of EDSCR, and the value returned by a read of EDSCR.INTdis is UNKNOWN.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'00'`.

TDA, bit [21]

Traps accesses to the following debug System registers:

- AArch64: DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1.
- AArch32: DBGBCR<n>, DBGBVR<n>, DBGBXVR<n>, DBGWCR<n>, DBGWVR<n>.

TDA	Meaning
0b0	Accesses to debug System registers do not generate a Software Access Debug event.
0b1	Accesses to debug System registers generate a Software Access Debug event, if OSLSR_EL1.OSLK is 0 and if halting is allowed.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

MA, bit [20]

Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

MA	Meaning
0b0	Normal access mode.
0b1	Memory access mode.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, EL2 is implemented, FEAT_Debugv8p1 is implemented, and FEAT_PCSRv8p2 is not implemented:

Sample CONTEXTIDR_EL2. Controls whether the PC Sample-based Profiling Extension samples CONTEXTIDR_EL2 or VTTBR_EL2.VMID.

SC2	Meaning
0b0	Sample VTTBR_EL2.VMID.
0b1	Sample CONTEXTIDR_EL2.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NS, bit [18]

When FEAT_RME is implemented:

Non-secure status. Together with the NSE field, gives the current Security state:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

Otherwise:

Non-secure status. In Debug state, gives the current Security state:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

Bit [17]

Reserved, RES0.

SDD, bit [16]

When FEAT_RME is implemented:

EL3 debug disabled.

On entry to Debug state:

- If entering from EL3, SDD is set to 0.
- Otherwise, SDD is set to the inverse of `ExternalRootInvasiveDebugEnabled()`.

In Debug state, the value of SDD does not change, even if `ExternalRootInvasiveDebugEnabled()` changes.

In Non-debug state, SDD returns the inverse of `ExternalRootInvasiveDebugEnabled()`.

Access to this field is **RO**.

Otherwise:

Secure debug disabled.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of `ExternalSecureInvasiveDebugEnabled()`.

In Debug state, the value of the SDD bit does not change, even if `ExternalSecureInvasiveDebugEnabled()` changes.

In Non-debug state:

- SDD returns the inverse of `ExternalSecureInvasiveDebugEnabled()`. If the authentication signals that control `ExternalSecureInvasiveDebugEnabled()` change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

Access to this field is **RO**.

NSE, bit [15]

When FEAT_RME is implemented:

Together with the NS field, this field gives the current Security state.

For a description of the values derived by evaluating NS and NSE together, see EDSCR.NS.

In Non-debug state, this bit is UNKNOWN.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

HDE, bit [14]

Halting debug enable.

HDE	Meaning
0b0	Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
0b1	Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

RW, bits [13:10]

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.

RW	Meaning	Applies when
0b1111	Any of the following: • The PE is in Non-debug state. • The PE is at EL0 using AArch64. • The PE is not at EL0. EL1 is using AArch64. If implemented and enabled in the current Security state, EL2 is using AArch64. If implemented, EL3 is using AArch64.	
0b1110	The PE is in Debug state at EL0. EL0 is using AArch32. EL1 is using AArch64. If implemented and enabled in the current Security state, EL2 is using AArch64. If implemented, EL3 is using AArch64.	When FEAT_AA32 is implemented
0b110x	The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is enabled in the current Security state and is using AArch64. If implemented, EL3 is using AArch64.	When FEAT_AA32 is implemented and EL2 is implemented
0b10xx	The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is not implemented, disabled in the current Security state, or using AArch32. EL3 is using AArch64.	When FEAT_AA32 is implemented and EL3 is implemented
0b0xxx	The PE is in Debug state. All Exception levels are using AArch32.	When FEAT_AA32 is implemented

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **RAO/WI**.
- Otherwise, access to this field is **RO**.

EL, bits [9:8]

Exception level. In Debug state, gives the current Exception level of the PE.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

A, bit [7]

SError exception pending. In Debug state, indicates whether an SError exception is pending:

- If EL2 is enabled in the current Security state, the PE is executing at EL0 or EL1, HCR_EL2.TGE is 0 and either HCR_EL2.AMO is 1 or FEAT_DoubleFault2 is implemented and the Effective value of HCRX_EL2.TMEA is 1, a virtual SError exception.
- Otherwise, a physical SError exception.

A	Meaning
0b0	No SError exception pending.
0b1	SError exception pending.

A debugger can read EDSCR to check whether an SError exception is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is **RO**.

STATUS, bits [5:0]

On entering Debug state, the PE sets this field to indicate the reason for halting.

STATUS	Meaning
0b000001	PE is restarting, exiting Debug state.
0b000010	PE is in Non-debug state.
0b000111	Breakpoint.
0b010011	External debug request.
0b011011	Halting step, normal.
0b011111	Halting step, exclusive.
0b100011	OS Unlock Catch.
0b100111	Reset Catch.
0b101011	Watchpoint.
0b101111	HLT instruction.
0b110011	Software access to debug register.
0b110111	Exception Catch.
0b111011	Halting step, no syndrome.

All other values are reserved.

The PE resets into Non-debug state. However, if the PE enters Debug state immediately after reset, then the reset value is overwritten with the reason for halting.

The reset behavior of this field is:

- On a Cold reset, this field resets to '000010'.

Access to this field is **RO**.

Accessing EDSCR

EDSCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x088	EDSCR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(), accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

EDSCR2, External Debug Status and Control Register 2

The EDSCR2 characteristics are:

Purpose

Main control register 2 for the debug implementation.

Configuration

External register EDSCR2 bits [3, 1] are architecturally mapped to AArch64 System register MDSCR_EL1[35, 33].

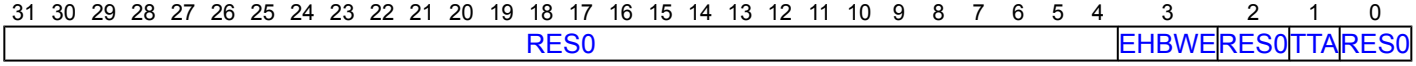
EDSCR2 is in the Core power domain.

This register is present only when FEAT_Debugv8p9 is implemented or FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to EDSCR2 are RES0.

Attributes

EDSCR2 is a 32-bit register.

Field descriptions



Bits [31:4]

Reserved, RES0.

EHBWE, bit [3]

When FEAT_Debugv8p9 is implemented:

Extended Halting Breakpoint and Watchpoint Enable. Enables use of additional breakpoints or watchpoints.

EHBWE	Meaning
0b0	Halting disabled for Breakpoint and Watchpoint debug events generated by each breakpoint <n> and Watchpoint <n>, where n is greater than or equal to 16.
0b1	Breakpoints and Watchpoint debug events are not affected by this mechanism.

When OSLSR_EL1.OSLK is 1, this field can be read and written through the MDSCR_EL1 System register.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

TTA, bit [1]

When FEAT_TRBE_EXT is implemented or FEAT_ETEv1p3 is implemented:

Trap Trace Accesses.

Traps access to the following System registers:

AArch64: TRBBASER_EL1, TRBIDR_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBMPAM_EL1, TRBPTR_EL1, TRBSR_EL1, TRBTRG_EL1, TRCACATR<n>, TRCACVR<n>, TRCAUTHSTATUS, TRCAUXCTLR, TRCBBCTLR, TRCCCCTLR, TRCCIDCCTLR0, TRCCIDCCTLR1, TRCCIDCVR<n>, TRCCLAIMCLR, TRCCLAIMSET, TRCCNTCTLR<n>, TRCCNTRLDVR<n>, TRCCNTVR<n>, TRCCONFIGR, TRCDEVARCH, TRCDEVID, TRCEVENTCTL0R, TRCEVENTCTL1R, TRCEXTINSELR<n>, TRCIDR0, TRCIDR1, TRCIDR2, TRCIDR3, TRCIDR4, TRCIDR5, TRCIDR6, TRCIDR7, TRCIDR8, TRCIDR9, TRCIDR10, TRCIDR11, TRCIDR12, TRCIDR13, TRCIMSPEC0, TRCIMSPEC<n>, TRCITEEDCR, TRCOSLSR, TRCPRGCTLR, TRCQCTLR, TRCRSCTLR<n>, TRCRSR, TRCSEQEVR<n>, TRCSEQRSTEVR, TRCSEQSTR, TRCSSCCR<n>, TRCSSCSR<n>, TRCSSPCICR<n>, TRCSTALLCTLR, TRCSTATR, TRCSYNCPR, TRCTRACEIDR, TRCTSCTLR, TRCVICTLR, TRCVIIECTLR, TRCVIPCSSCTLR, TRCVISSCTLR, TRCVMIDCCTLR0, TRCVMIDCCTLR1, and TRCVMIDCVR<n>.

TTA	Meaning
0b0	Accesses to trace System registers do not generate a Software Access debug event.
0b1	Accesses to trace System registers generate a Software Access debug event, if OSLSR_EL1.OSLK is 0 and if halting is allowed.

When OSLSR_EL1.OSLK is 1, this field can be read and written through the MDSCR_EL1 System register.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [0]

Reserved, RES0.

Accessing EDSCR2

EDSCR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x028	EDSCR2

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RW**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

Purpose

Contains sampled values captured on reading EDPCSR[31:0].

Configuration

EDVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDVIDSR are RES0.

If FEAT_Debugv8p1 is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

When the PC Sample-based Profiling Extension is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

Note

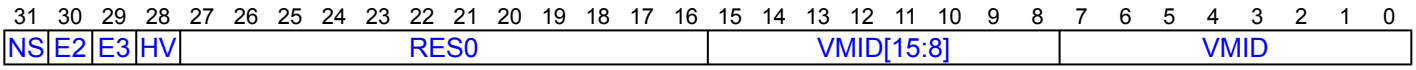
FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDVIDSR is a 32-bit register.

Field descriptions

When FEAT_Debugv8p1 is not implemented or EDSCR.SC2 == 0:



This format applies in all Armv8.0 implementations.

NS, bit [31]

Non-secure state sample. Indicates the Security state associated with the most recent EDPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E2, bit [30]

When EL2 is implemented:

Exception level 2 status sample. Indicates whether the most recent EDPCSR sample was associated with EL2.

E2	Meaning
0b0	Sample is not from EL2.
0b1	Sample is from EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [29]

When EL3 is implemented and FEAT_AA64 is implemented:

Exception level 3 status sample. Indicates whether the most recent EDPCSR sample was associated with EL3 using AArch64.

E3	Meaning
0b0	Sample is not from EL3 using AArch64.
0b1	Sample is from EL3 using AArch64.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HV, bit [28]

EDPCSRhi (EDPCSR[63:32]) valid. Indicates whether bits [63:32] of the most recent EDPCSR sample might be nonzero:

HV	Meaning
0b0	Bits[63:32] of the most recent EDPCSR sample are zero.
0b1	Bits[63:32] of the most recent EDPCSR sample might be nonzero.

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi (EDPCSR[63:32]) does not need to be read.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [27:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented and EL2 is implemented:

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]

When EL2 is implemented:

VMID sample. The VMID associated with the most recent EDPCSRlo (EDPCSR[31:0]) sample. When the most recent EDPCSR sample was generated:

- This field is RES0 if any of the following apply:
  - The PE is executing in Secure state.
  - The PE is executing at EL2.
- Otherwise:
  - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
  - If EL2 is using AArch64, FEAT_VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
  - If EL2 is using AArch32, this field is set to VTTBR.VMID.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When EL2 is implemented, FEAT_Debugv8p1 is implemented, and EDSCR.SC2 == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CONTEXTIDR_EL2																															

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample is generated:

- If the PE is not executing at EL3, EL2 is using AArch64, and EL2 is enabled in the current Security state, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- Otherwise, this field is set to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

EDVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A8	EDVIDSR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Configuration

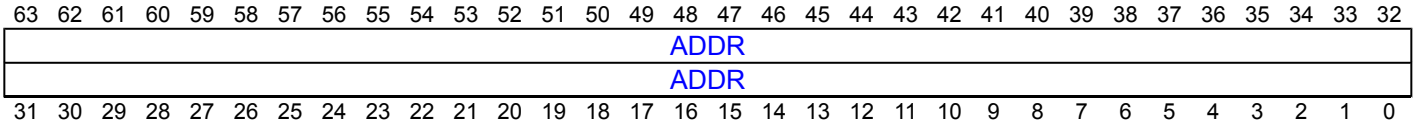
EDWAR is in the Core power domain.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if EDSCR.STATUS is not `0b101011`.

Attributes

EDWAR is a 64-bit register.

Field descriptions



ADDR, bits [63:0]

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the DC ZVA block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of EDWAR[63:32] is UNKNOWN if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See 'Exception syndrome information and preferred return address'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDWAR

EDWAR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x030`	EDWAR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are **RO**.

ERRACR, Access Configuration Register

The ERRACR characteristics are:

Purpose

Controls visibility of error records.

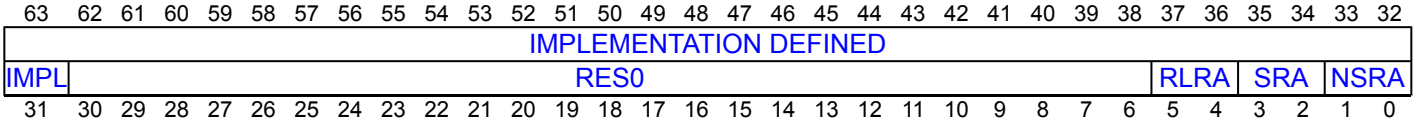
Configuration

This register is present only when (Root state is implemented or Secure state is implemented) and an implementation implements ERRACR. Otherwise, direct accesses to ERRACR are RES0.

Attributes

ERRACR is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:32]

IMPLEMENTATION DEFINED observation controls. Additional IMPLEMENTATION DEFINED access control bits.

IMPL, bit [31]

IMPL	Meaning
0b1	Indicates ERRACR is present.

Access to this field is **RAO/WI**.

Bits [30:6]

Reserved, RES0.

RLRA, bits [5:4]

When FEAT_RME is implemented and the error record group allows configuration of Secure and Realm register accesses:

Realm Restricted Access. Controls Realm access to error records and interrupt configuration registers in the error record group.

RLRA	Meaning
0b00	Realm access is disabled. All error record, ERR<irq>CR<m>, and ERRIRQSR registers are RAZ/WI to Realm accesses.
0b01	Realm read access is enabled. Realm writes are ignored.
0b11	Realm read/write access is allowed. If the error record group supports MSIs, generated MSIs are always Non-secure.

All other values are reserved.

This control applies to all error record registers (ERR<n>*, including fault injection registers ERR<n>PFG* if implemented), and interrupt configuration registers (ERR<irq>CR<m> and ERRIRQSR, if implemented) in the error record group. The effect on any IMPLEMENTATION DEFINED registers is IMPLEMENTATION DEFINED.

When Realm access to error records is disabled, a Realm read of ERRGSR will return the error record status for the error records that cannot be accessed.

When Realm access is fully or partially disabled, the effect on Realm accesses to IMPLEMENTATION DEFINED registers is IMPLEMENTATION DEFINED.

Note

Realm access to error records is enabled from reset.

The reset domain and value of this field is IMPLEMENTATION DEFINED, and depends on the security policy of the component implementing this register.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.
- On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RAZ/WI.

SRA, bits [3:2]

When Secure state is implemented, FEAT_RME is implemented, and the error record group allows configuration of Secure and Realm register accesses:

Secure Restricted Access. Controls Secure access to error records and interrupt configuration registers in the error record group.

SRA	Meaning
0b00	Secure access is disabled. All error record, ERR<irq>CR<m>, and ERRIRQSR registers are RAZ/WI to Secure accesses.
0b01	Secure read access is enabled. Secure writes are ignored.
0b11	Secure read/write access is allowed.

All other values are reserved.

This control applies to all error record registers (ERR<n>*, including fault injection registers ERR<n>PFG* if implemented), and interrupt configuration registers (ERR<irq>CR<m> and ERRIRQSR, if implemented) in the error record group. The effect on any IMPLEMENTATION DEFINED registers is IMPLEMENTATION DEFINED.

When Secure access to error records is disabled, a Secure read of ERRGSR will return the error record status for the error records that cannot be accessed.

When Secure access is fully or partially disabled, the effect on Secure accesses to IMPLEMENTATION DEFINED registers is IMPLEMENTATION DEFINED.

Note

Secure access to error records is enabled from reset.

The reset domain and value of this field is IMPLEMENTATION DEFINED, and depends on the security policy of the component implementing this register.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.
- On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RAZ/WI.

NSRA, bits [1:0]

Non-secure Restricted Access. Controls Non-secure access to error records and interrupt configuration registers in the error record group.

NSRA	Meaning
0b00	Non-secure access is disabled. All error record, ERR<irq>CR<m>, and ERRIRQSR registers are RAZ/WI to Non-secure accesses.
0b01	Non-secure read access is enabled. Non-secure writes are ignored.
0b11	Non-secure read/write access is allowed. If the error record group supports MSIs, generated MSIs are always Non-secure.

All other values are reserved.

This control applies to all error record registers (ERR<n>*, including fault injection registers ERR<n>PFG* if implemented), and interrupt configuration registers (ERR<irq>CR<m> and ERRIRQSR, if implemented) in the error record group. The effect on any IMPLEMENTATION DEFINED registers is IMPLEMENTATION DEFINED.

When Non-secure access to error records is disabled, a Non-secure read of ERRGSR will return the error record status for the error records that cannot be accessed.

When Non-secure access is fully or partially disabled, the effect on Non-secure accesses to IMPLEMENTATION DEFINED registers is IMPLEMENTATION DEFINED.

Note

Non-secure access to error records is enabled from reset.

If FEAT_RME is implemented and ERRACR.{RLRA, SRA} are not implemented, then ERRACR.NSRA applies to all Security states other than Root.

The reset domain and value of this field is IMPLEMENTATION DEFINED, and depends on the security policy of the component implementing this register.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.
- On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing ERRACR

This section shows the offset of ERRACR when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRACR.

ERRACR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE40	ERRACR

Accessible as follows:

- When (FEAT_RME is implemented and an access is not Root) or an access is Non-secure, accesses to this register are **RAZ/WI**.
- Otherwise, accesses to this register are **RW**.

ERRCIDR0, Component Identification Register 0

The ERRCIDR0 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

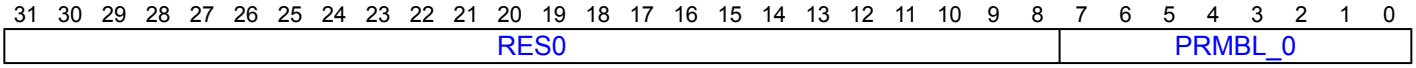
Implementation of this register is OPTIONAL.

ERRCIDR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR0 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Component identification preamble, segment 0.

Reads as `0x0D`.

Access to this field is **RO**.

Accessing ERRCIDR0

This section shows the offset of ERRCIDR0 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCIDR0.

ERRCIDR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFF0`	ERRCIDR0

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRCIDR1, Component Identification Register 1

The ERRCIDR1 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

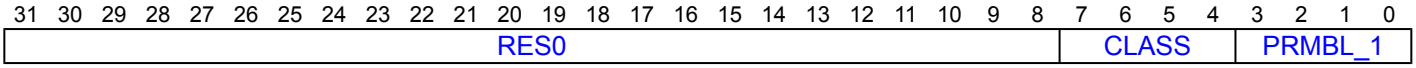
Implementation of this register is OPTIONAL.

ERRCIDR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR1 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1111	Generic peripheral with IMPLEMENTATION DEFINED register layout.

Other values are defined by the CoreSight Architecture.

This field reads as 0xF.

Access to this field is **RO**.

PRMBL_1, bits [3:0]

Component identification preamble, segment 1.

Reads as 0b0000.

Access to this field is **RO**.

Accessing ERRCIDR1

This section shows the offset of ERRCIDR1 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCIDR1.

ERRCIDR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFF4	ERRCIDR1

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRCIDR2, Component Identification Register 2

The ERRCIDR2 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

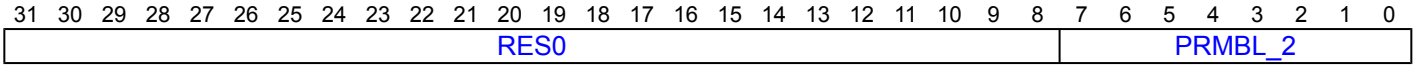
Implementation of this register is OPTIONAL.

ERRCIDR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR2 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Component identification preamble, segment 2.

Reads as `0x05`.

Access to this field is **RO**.

Accessing ERRCIDR2

This section shows the offset of ERRCIDR2 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCIDR2.

ERRCIDR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFF8`	ERRCIDR2

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRCIDR3, Component Identification Register 3

The ERRCIDR3 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

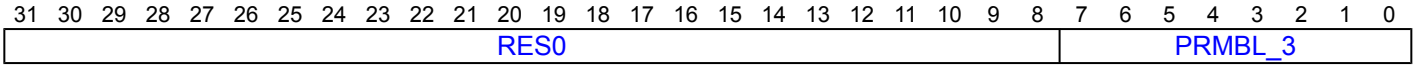
Implementation of this register is OPTIONAL.

ERRCIDR3 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR3 is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Component identification preamble, segment 3.

Reads as `0xB1`.

Access to this field is **RO**.

Accessing ERRCIDR3

This section shows the offset of ERRCIDR3 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCIDR3.

ERRCIDR3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFFC`	ERRCIDR3

Accesses to this register are **RO**.

2025-06-23 17:47:32, 2025-06_rel

ERRCRICR0, Critical Error Interrupt Configuration Register 0

The ERRCRICR0 characteristics are:

Purpose

Critical Error Interrupt configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR0 are RES0.

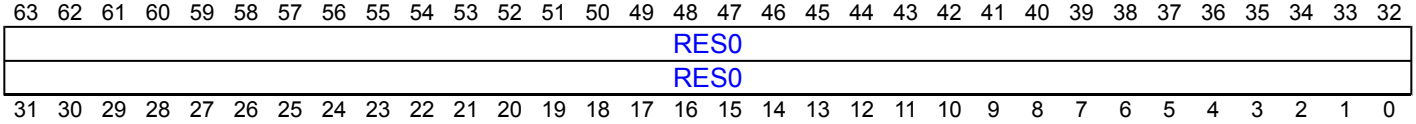
ERRCRICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR0 is a 64-bit register.

Field descriptions

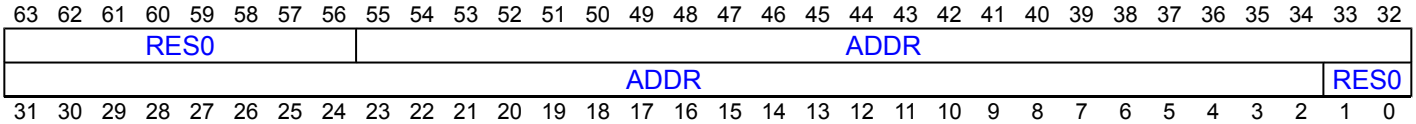
When the Critical Error Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:



Bits [63:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Critical Error Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRCRICR0.ADDR << 2) is the address that the component writes to when signaling the Critical Error Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

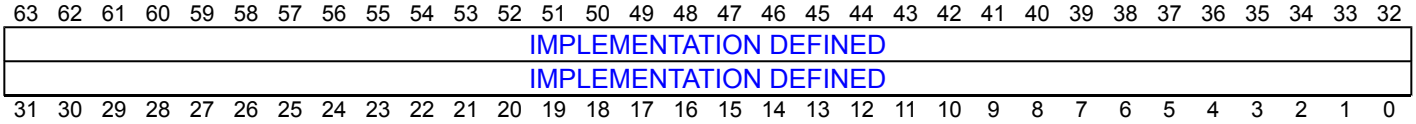
The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR registers:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR0

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRCRICR0 are IMPLEMENTATION DEFINED .

This section shows the offset of ERRCRICR0 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCRICR0.

ERRCRICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEA0	ERRCRICR0

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRCRICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRCRICR1, Critical Error Interrupt Configuration Register 1

The ERRCRICR1 characteristics are:

Purpose

Critical Error Interrupt configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR1 are RES0.

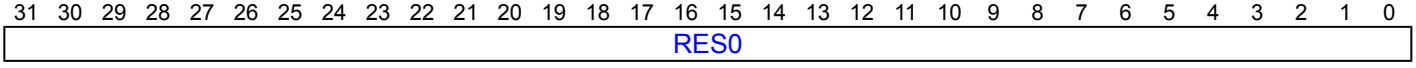
ERRCRICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR1 is a 32-bit register.

Field descriptions

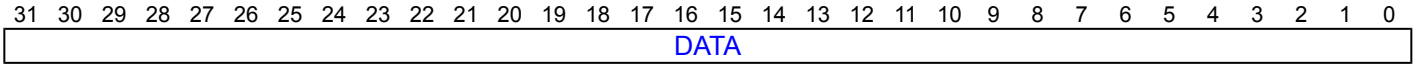
When the Critical Error Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:



Bits [31:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Critical Error Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:



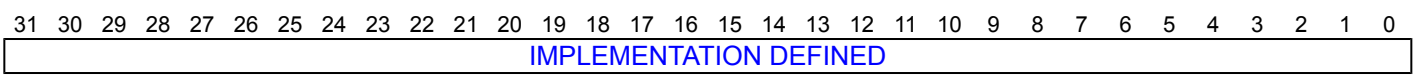
DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR registers:



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR1

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRCRICR1 are IMPLEMENTATION DEFINED .

This section shows the offset of ERRCRICR1 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCRICR1.

ERRCRICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEA8	ERRCRICR1

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRCRICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

ERRCRICR2, Critical Error Interrupt Configuration Register 2

The ERRCRICR2 characteristics are:

Purpose

Critical Error Interrupt control and configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR2 are RES0.

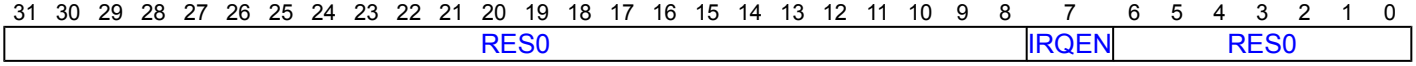
ERRCRICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR2 is a 32-bit register.

Field descriptions

When the Critical Error Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:



Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

Interrupts enable. Enables generation of interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

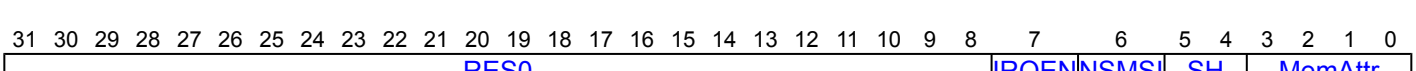
The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [6:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Critical Error Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:



Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the physical address space for message signaled interrupts:

Non-secure message signaled interrupt. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When an access is Non-secure, access to this field is **RO**.
- When an access is Realm, access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

Non-secure message signaled interrupt.

The physical address space for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Not shared.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when ERRCRICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

MemAttr	Meaning
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR2

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRCRICR2 are IMPLEMENTATION DEFINED .

This section shows the offset of ERRCRICR2 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCRICR2.

ERRCRICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEAC	ERRCRICR2

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRCRICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

ERRDEVAFF, Device Affinity Register

The ERRDEVAFF characteristics are:

Purpose

For a group of error records that has affinity with a single PE or a group of PEs, ERRDEVAFF is a copy of MPIDR_EL1 or part of MPIDR_EL1:

- If the group of error records has affinity with a single PE, the affinity level is 0, then ERRDEVAFF reads the same value as MPIDR_EL1, and ERRDEVAFF.F0V reads-as-one to indicate affinity level 0.
- If the group of error records has affinity with a group of PEs, the affinity level is 1, 2, or 3, then parts of ERRDEVAFF reads the same value as parts of MPIDR_EL1, and the rest of ERRDEVAFF indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1 then all of the following are true:

- All the PEs in the group have the same values in MPIDR_EL1.{Aff3,Aff2}, and these values are equal to ERRDEVAFF.{Aff3,Aff2}.
- ERRDEVAFF.Aff1 is nonzero and not `0x80`, and ERRDEVAFF.{Aff0,F0V} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the group of error records has affinity with is indicated by the least-significant set bit in ERRDEVAFF.Aff1. In this example, if ERRDEVAFF.Aff1[2:0] is `0b100`, then the group of error records has affinity with the up-to 8 PEs that have MPIDR_EL1.Aff1[7:3] == ERRDEVAFF.Aff1[7:3].

Depending on the IMPLEMENTATION DEFINED nature of the system, it might be possible that ERRDEVAFF is read before system firmware has configured the group of error records or the PE or group of PEs that the group of error records has affinity with. When this is the case, ERRDEVAFF reads as zero.

If RAS System Architecture v1.1 is not implemented then ERRDEVAFF can only describe a group of error records that is affine with a single PE or all the PEs at an affinity level.

Configuration

This register is present only when the group of error records has affinity with a PE or cluster of PEs and an implementation implements ERRDEVAFF. Otherwise, direct accesses to ERRDEVAFF are RES0.

ERRDEVAFF is implemented only as part of a memory-mapped group of error records.

Arm deprecates use of this register by software

Attributes

ERRDEVAFF is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

PE affinity level 3. The MPIDR_EL1.Aff3 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

F0V, bit [31]

Indicates that the ERRDEVAFF.Aff0 field is valid.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F0V	Meaning
0b0	ERRDEVAFF.Aff0 is not valid, and the PE affinity is above level 0 or a subset of level 0.
0b1	ERRDEVAFF.Aff0 is valid, and the PE affinity is at level 0.

Access to this field is **RO**.

U, bit [30]

When ERRDEVAFF.F0V == 1:

Uniprocessor. The MPIDR_EL1.U field, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

When ERRDEVAFF.F0V == 1:

Multithreaded. The MPIDR_EL1.MT field, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Aff2, bits [23:16]

When !IsZero(ERRDEVAFF.[Aff1,Aff0,F0V]):

PE affinity level 2. The MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

PE affinity level 2. Defines part of the MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff2	Meaning
0bxxxxxxx1	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7:1] is the value of MPIDR_EL1.Aff2[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7:2] is the value of MPIDR_EL1.Aff2[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7:3] is the value of MPIDR_EL1.Aff2[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7:4] is the value of MPIDR_EL1.Aff2[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7:5] is the value of MPIDR_EL1.Aff2[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7:6] is the value of MPIDR_EL1.Aff2[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7] is the value of MPIDR_EL1.Aff2[7], viewed from the highest Exception level of the associated PEs.
0x80	PE affinity is at level 3.

Access to this field is **RO**.

Aff1, bits [15:8]

When !IsZero(ERRDEVAFF.[Aff0,F0V]):

PE affinity level 1. The MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

PE affinity level 1. Defines part of the MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff1	Meaning
0x00	PE affinity is above level 2 or a subset of level 2.
0bxxxxxxx1	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7:1] is the value of MPIDR_EL1.Aff1[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7:2] is the value of MPIDR_EL1.Aff1[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7:3] is the value of MPIDR_EL1.Aff1[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7:4] is the value of MPIDR_EL1.Aff1[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7:5] is the value of MPIDR_EL1.Aff1[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7:6] is the value of MPIDR_EL1.Aff1[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7] is the value of MPIDR_EL1.Aff1[7], viewed from the highest Exception level of the associated PEs.
0x80	PE affinity is at level 2.

Access to this field is **RO**.

Aff0, bits [7:0]

When ERRDEVAFF.F0V == 1:

PE affinity level 0. The MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

PE affinity level 0. Defines part of the MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff0	Meaning
0x00	PE affinity is above level 1 or a subset of level 1.
0bxxxxxxx1	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7:1] is the value of MPIDR_EL1.Aff0[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7:2] is the value of MPIDR_EL1.Aff0[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7:3] is the value of MPIDR_EL1.Aff0[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7:4] is the value of MPIDR_EL1.Aff0[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7:5] is the value of MPIDR_EL1.Aff0[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7:6] is the value of MPIDR_EL1.Aff0[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7] is the value of MPIDR_EL1.Aff0[7], viewed from the highest Exception level of the associated PEs.
0x80	PE affinity is at level 1.

Access to this field is **RO**.

Accessing ERRDEVAFF

This section shows the offset of ERRDEVAFF when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRDEVAFF.

ERRDEVAFF can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFA8	ERRDEVAFF

Accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRDEVARCH, Device Architecture Register

The ERRDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

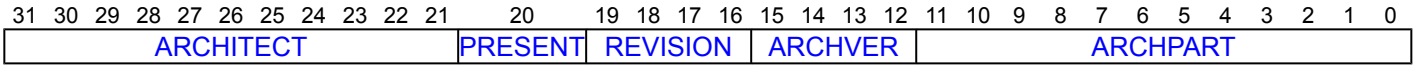
Configuration

ERRDEVARCH is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVARCH is a 32-bit register.

Field descriptions



ARCHITECT, bits [31:21]

Defines the architect of the component. For RAS, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, `0b0100`.

Bits [27:21] are the JEP106 identification code, `0b0111011`.

Reads as `0b01000111011`.

Access to this field is **RO**.

PRESENT, bit [20]

DEVARCH present. Indicates that the ERRDEVARCH register is present.

Reads as `0b1`.

Access to this field is **RO**.

REVISION, bits [19:16]

When UInt(ERRDEVARCH.ARCHPART) == 0xA00 and ERRDEVARCH.ARCHVER == 0b0000:

Revision. Defines the architecture revision of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

REVISION	Meaning
`0b0000`	RAS System Architecture, error record group v1.0.
`0b0001`	RAS System Architecture, error record group v1.1. As `0b0000` and also: • Simplifies ERR<n>STATUS. • Adds support for additional ERR<n>MISC<m> registers. • Adds support for the optional RAS Timestamp Extension. • Adds support for the optional Common Fault Injection Model Extension.

All other values are reserved.

Access to this field is **RO**.

When UInt(ERRDEVARCH.ARCHPART) == 0xA00 and ERRDEVARCH.ARCHVER == 0b0001:

Revision. Defines the architecture revision of the component.

REVISION	Meaning
0b0000	RAS System Architecture, error record group v2.0.

All other values are reserved.

Access to this field is **RO**.

When UInt(ERRDEVARCH.ARCHPART) == 0xA08 and ERRDEVARCH.ARCHVER == 0b0000:

Revision. Defines the architecture revision of the component.

REVISION	Meaning
0b0000	RAS System Architecture, fault injection group v1.0.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

ARCHVER, bits [15:12]

When UInt(ERRDEVARCH.ARCHPART) == 0xA00:

Architecture Version. Defines the architecture version of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ARCHVER	Meaning
0b0000	RAS System Architecture, error record group v1.
0b0001	RAS System Architecture, error record group v2. As 0b0000 and also: • Adds an optional access control register, ERRACR. • Adds an optional control for disabling error counters. • Adds optional fault handling interrupt controls for Deferred errors. • Adds support for continuation and proxy error records. • Adds support for implementing Common Fault Injection Mechanism registers in a separate page from the error record registers. • Adds support for simple interrupt control registers. • Defines fields in ERRDEVID that describe these properties.

All other values are reserved.

ERRDEVARCH.ARCHVER and ERRDEVARCH.ARCHPART are also defined as a single field, ERRDEVARCH.ARCHID, so that ERRDEVARCH.ARCHVER is ERRDEVARCH.ARCHID[15:12].

Access to this field is **RO**.

When UInt(ERRDEVARCH.ARCHPART) == 0xA08:

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0000	RAS System Architecture, fault injection group v1.

All other values are reserved.

ERRDEVARCH.ARCHVER and ERRDEVARCH.ARCHPART are also defined as a single field, ERRDEVARCH.ARCHID, so that ERRDEVARCH.ARCHVER is ERRDEVARCH.ARCHID[15:12].

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ARCHPART	Meaning
0xA00	RAS System Architecture, error record group.
0xA08	RAS System Architecture, fault injection group.

ERRDEVARCH.ARCHVER and ERRDEVARCH.ARCHPART are also defined as a single field, ERRDEVARCH.ARCHID, so that ERRDEVARCH.ARCHPART is ERRDEVARCH.ARCHID[11:0].

Access to this field is **RO**.

Accessing ERRDEVARCH

This section shows the offset of ERRDEVARCH when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRDEVARCH.

ERRDEVARCH can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFBC	ERRDEVARCH

Accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRDEVID, Device Configuration Register

The ERRDEVID characteristics are:

Purpose

Provides discovery information for the component.

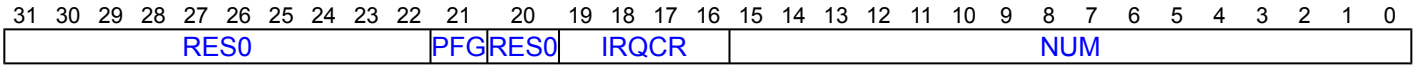
Configuration

ERRDEVID is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVID is a 32-bit register.

Field descriptions



Bits [31:22]

Reserved, RES0.

PFG, bit [21]

When RAS System Architecture v2 is implemented:

Common Fault Injection Mechanism. Describes whether any Common Fault Injection Mechanism registers are implemented in the same page as this register.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PFG	Meaning
0b0	Any Common Fault Injection Mechanism registers are implemented in the same page as this register.
0b1	Any Common Fault Injection Mechanism registers are implemented in a separate fault injection group page.

Note

The value of this field does not indicate that any Common Fault Injection Mechanism registers are implemented by the nodes in this error record group. Software must use ERR<n>FR to discover whether each node implements Common Fault Injection Mechanism registers.

Accessing this field has the following behavior:

- When ERRDEVID is part of a fault injection group, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RAZ.

Bit [20]

Reserved, RES0.

IRQCR, bits [19:16]

Interrupt Control registers. Describes whether the interrupt control registers are implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IRQCR	Meaning
0b0000	It is IMPLEMENTATION DEFINED whether any interrupt control registers are implemented.
0b0001	An IMPLEMENTATION DEFINED form of interrupt control registers are implemented.
0b0010	The recommended layout form of interrupt control registers are implemented, for simple interrupts.
0b0011	The recommended layout form of interrupt control registers are implemented, for message-signaled interrupts.
0b1111	Interrupt control registers are not implemented.

All other values are reserved.

Accessing this field has the following behavior:

- When ERRDEVID is part of a fault injection group, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

NUM, bits [15:0]

Highest numbered index of the error records in this group, plus one. Each implemented record is owned by a node. A node might own multiple records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRDEVID

This section shows the offset of ERRDEVID when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRDEVID.

ERRDEVID can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFC8	ERRDEVID

Accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRERICR0, Error Recovery Interrupt Configuration Register 0

The ERRERICR0 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR0 are RES0.

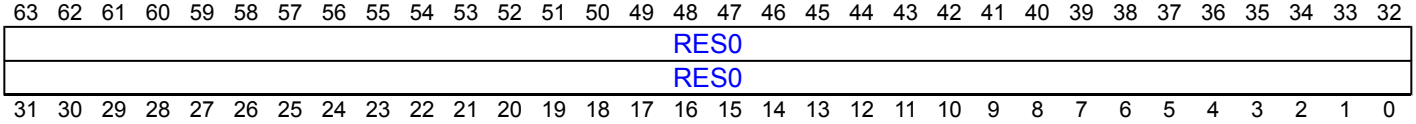
ERRERICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR0 is a 64-bit register.

Field descriptions

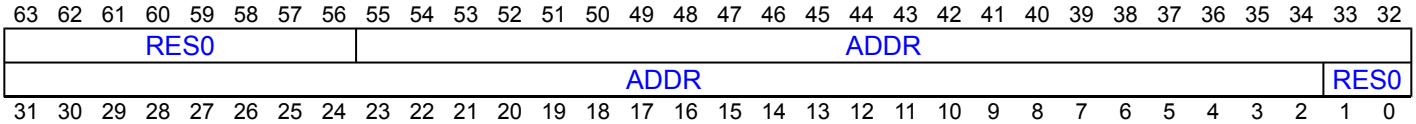
When the Error Recovery Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:



Bits [63:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Error Recovery Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRERICR0.ADDR << 2) is the address that the component writes to when signaling the Error Recovery Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

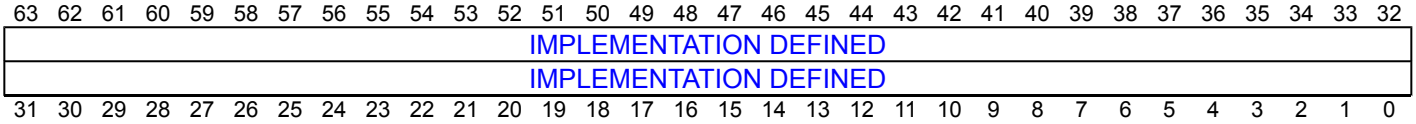
The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR registers:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR0

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRERICR0 are IMPLEMENTATION DEFINED .

This section shows the offset of ERRERICR0 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRERICR0.

ERRERICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE90	ERRERICR0

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRERICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRERICR1, Error Recovery Interrupt Configuration Register 1

The ERRERICR1 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR1 are RES0.

ERRERICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR1 is a 32-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															

Bits [31:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Error Recovery Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATA																															

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR1

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRERICR1 are IMPLEMENTATION DEFINED .

This section shows the offset of ERRERICR1 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRERICR1.

ERRERICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE98	ERRERICR1

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRERICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRERICR2, Error Recovery Interrupt Configuration Register 2

The ERRERICR2 characteristics are:

Purpose

Error Recovery Interrupt control and configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR2 are RES0.

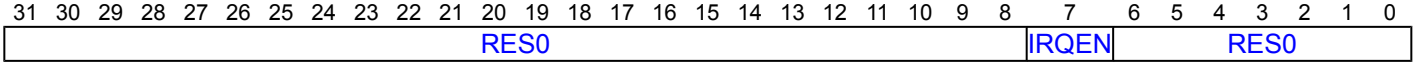
ERRERICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR2 is a 32-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:



Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

Interrupts enable. Enables generation of interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

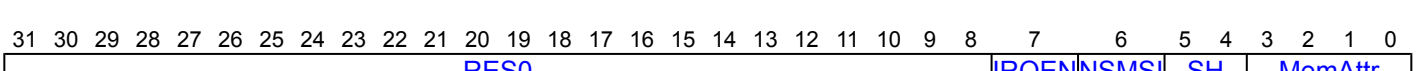
The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [6:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Error Recovery Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:



Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the physical address space for message signaled interrupts:

Non-secure message signaled interrupt. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When an access is Non-secure, access to this field is **RO**.
- When an access is Realm, access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

Non-secure message signaled interrupt.

The physical address space for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Not shared.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when ERRERICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

MemAttr	Meaning
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR2

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRERICR2 are IMPLEMENTATION DEFINED .

This section shows the offset of ERRERICR2 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRERICR2.

ERRERICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE9C	ERRERICR2

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRERICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

ERRFHICR0, Fault Handling Interrupt Configuration Register 0

The ERRFHICR0 characteristics are:

Purpose

Fault Handling Interrupt configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR0 are RES0.

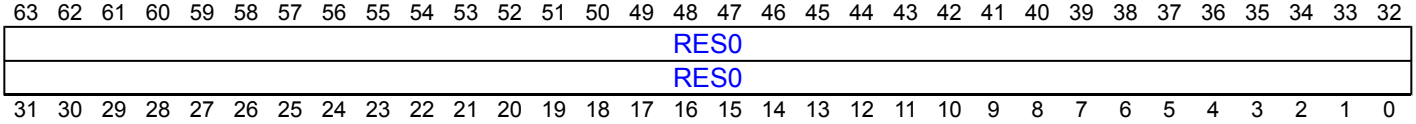
ERRFHICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR0 is a 64-bit register.

Field descriptions

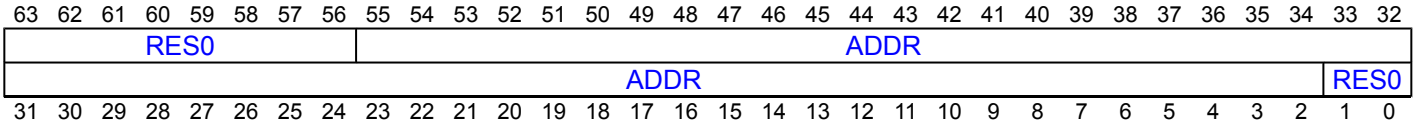
When the Fault Handling Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:



Bits [63:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Fault Handling Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRFHICR0.ADDR << 2) is the address that the component writes to when signaling the Fault Handling Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

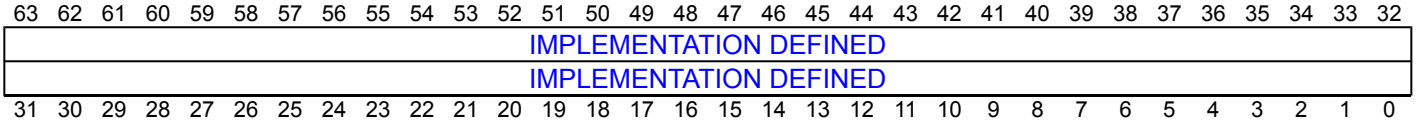
The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR registers:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR0

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRFHICR0 are IMPLEMENTATION DEFINED .

This section shows the offset of ERRFHICR0 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRFHICR0.

ERRFHICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE80	ERRFHICR0

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRFHICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRFHICR1, Fault Handling Interrupt Configuration Register 1

The ERRFHICR1 characteristics are:

Purpose

Fault Handling Interrupt configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR1 are RES0.

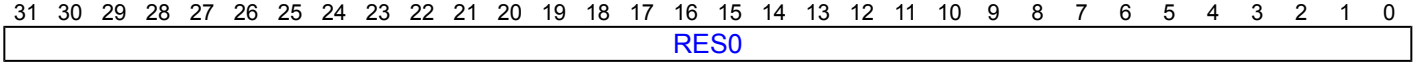
ERRFHICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR1 is a 32-bit register.

Field descriptions

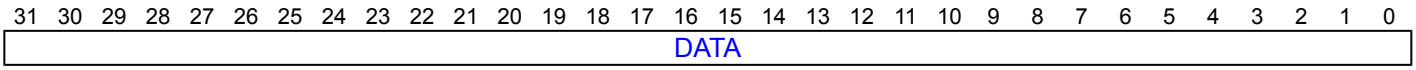
When the Fault Handling Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:



Bits [31:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Fault Handling Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:



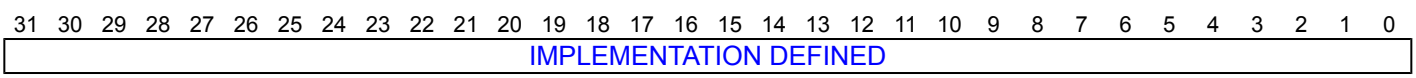
DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR registers:



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR1

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRFHICR1 are IMPLEMENTATION DEFINED .

This section shows the offset of ERRFHICR1 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRFHICR1.

ERRFHICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE88	ERRFHICR1

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRFHICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

ERRFHICR2, Fault Handling Interrupt Configuration Register 2

The ERRFHICR2 characteristics are:

Purpose

Fault Handling Interrupt control and configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR2 are RES0.

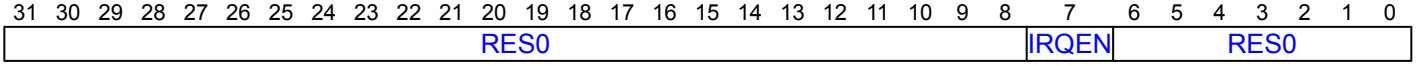
ERRFHICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR2 is a 32-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:



Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

Interrupts enable. Enables generation of interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

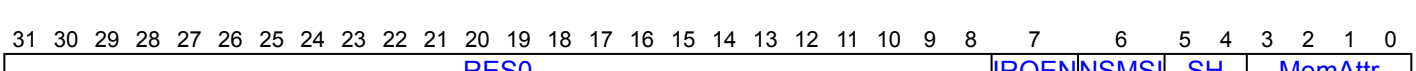
The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [6:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Fault Handling Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:



Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the physical address space for message signaled interrupts:

Non-secure message signaled interrupt. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When an access is Non-secure, access to this field is **RO**.
- When an access is Realm, access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

Non-secure message signaled interrupt.

The physical address space for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Not shared.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when ERRFHICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

MemAttr	Meaning
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR2

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRFHICR2 are IMPLEMENTATION DEFINED .

This section shows the offset of ERRFHICR2 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRFHICR2.

ERRFHICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE8C	ERRFHICR2

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRFHICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

ERRGSR<m>, Error Group <n> Status Register, n = 0 - 13

The ERRGSR<m> characteristics are:

Purpose

Shows the status for the records in the group.

Configuration

ERRGSR is implemented only as part of a memory-mapped group of error records.

If FEAT_RASSA_4KB_GRP is implemented, then a single ERRGSR register is implemented.

Attributes

ERRGSR<m> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33
S63	S62	S61	S60	S59	S58	S57	S56	S55	S54	S53	S52	S51	S50	S49	S48	S47	S46	S45	S44	S43	S42	S41	S40	S39	S38	S37	S36	S35	S34	S33
S31	S30	S29	S28	S27	S26	S25	S24	S23	S22	S21	S20	S19	S18	S17	S16	S15	S14	S13	S12	S11	S10	S9	S8	S7	S6	S5	S4	S3	S2	S1
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1

S<n>, bit [n], for n = 63 to 0

If FEAT_RASSA_4KB_GRP is implemented, the status for error record <n>. A read-only copy of ERR<n>STATUS.V.

If FEAT_RASSA_16KB_GRP is implemented or FEAT_RASSA_64KB_GRP is implemented, the status for error record <m×64+n>. A read-only copy of ERR<m×64+n>STATUS.V.

S<n>	Meaning
0b0	No error.
0b1	One or more errors.

Accessing this field has the following behavior:

- Access to this field is **RES0** if all the following are true:
  - FEAT_RASSA_4KB_GRP is implemented.
  - n >= 56.
- Access to this field is **RES0** if all the following are true:
  - FEAT_RASSA_4KB_GRP is implemented.
  - the Common Fault Injection Model is implemented by any error record in the group.
  - n >= 24.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_RASSA_4KB_GRP is implemented.
  - error record n is not implemented.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_RASSA_16KB_GRP is implemented or FEAT_RASSA_64KB_GRP is implemented.
  - error record (m * 64) + n is not implemented.
- Access to this field is **RAZ/WI** if all the following are true:
  - FEAT_RASSAv2 is not implemented.
  - error record n does not support this type of reporting.
- Otherwise, access to this field is **RO**.

Accessing ERRGSR<m>

This section shows the offset of ERRGSR when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRGSR<n>.

ERRGSR<m> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xE00` + (64 * m)	ERRGSR<m>

Accesses to this register are **RO**.

ERRIIDR, Implementation Identification Register

The ERRIIDR characteristics are:

Purpose

Defines the implementer of the component.

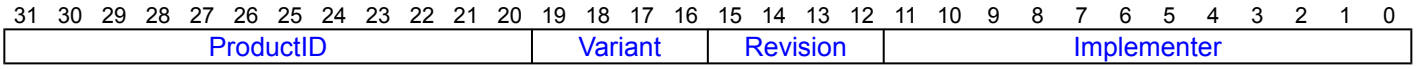
Configuration

This register is present only when RAS System Architecture v1p1 is implemented. Otherwise, direct accesses to ERRIIDR are RES0.

Attributes

ERRIIDR is a 32-bit register.

Field descriptions



ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

If ERRPIDR0 and ERRPIDR1 are implemented, ERRPIDR0.PART_0 matches bits [7:0] of ERRIIDR.ProductID and ERRPIDR1.PART_1 matches bits [11:8] of ERRIIDR.ProductID.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [19:16]

Component major revision.

This field distinguishes product variants or major revisions of the product.

If ERRPIDR2 is implemented, ERRPIDR2.REVISION matches ERRIIDR.Variant.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Component minor revision.

This field distinguishes minor revisions of the product.

If ERRPIDR3 is implemented, ERRPIDR3.REVAND matches ERRIIDR.Revision.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the RAS component.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for ERRIIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as `0x43B`.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

If ERRPIDR4 is implemented, ERRPIDR4.DES_2 matches bits [11:8] of this field.

If ERRPIDR2 is implemented, ERRPIDR2.DES_1 matches bits [6:4] of this field.

If ERRPIDR1 is implemented, ERRPIDR1.DES_0 matches bits [3:0] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRIIDR

This section shows the offset of ERRIIDR when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRIIDR.

ERRIIDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xE10`	ERRIIDR

Accesses to this register are **RO**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRIMPDEF<n>, IMPLEMENTATION DEFINED Register <n>, n = 0 - 191

The ERRIMPDEF<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED RAS extensions.

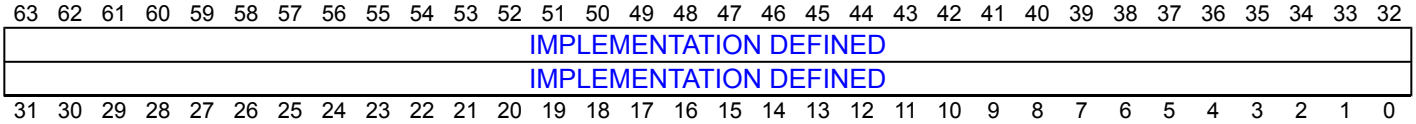
Configuration

This register is present only when the Common Fault Injection Model Extension is not implemented, UInt(ERRDEVID.NUM) <= 32, and an implementation implements ERRIMPDEF<n>. Otherwise, direct accesses to ERRIMPDEF<n> are RES0.

Attributes

ERRIMPDEF<n> is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRIMPDEF<n>

This section shows the offset of ERRIMPDEF<n> when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRIMPDEF<n>.

ERRIMPDEF<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x800` + (8 * n)	ERRIMPDEF<n>

Accesses to this register are **RW**.

ERRIRQCR<n>, Generic Error Interrupt Configuration Register <n>, n = 0 - 15

The ERRIRQCR<n> characteristics are:

Purpose

The ERRIRQCR<n> registers are reserved for IMPLEMENTATION DEFINED interrupt configuration registers.

The architecture provides a recommended layout for the ERRIRQCR<n> registers. These registers are named:

- ERRFHICR0, ERRFHICR1, and ERRFHICR2 for the fault handling interrupt controls.
- ERRERICR0, ERRERICR1, and ERRERICR2 for the error recovery interrupt controls.
- ERRCRICR0, ERRCRICR1, and ERRCRICR2 for the critical error interrupt controls.
- ERRIRQSR for the status register.

This section describes the generic, IMPLEMENTATION DEFINED, format.

Configuration

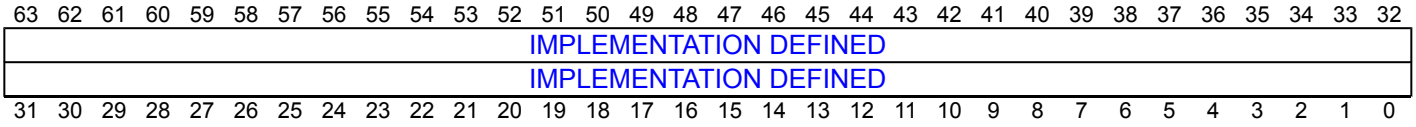
This register is present only when the interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQCR<n> are RES0.

ERRIRQCR<n> is implemented only as part of a memory-mapped group of error records.

Attributes

ERRIRQCR<n> is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED controls. The content of these registers is IMPLEMENTATION DEFINED.

Accessing ERRIRQCR<n>

This section shows the offset of ERRIRQCR<n> when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRIRQCR<n>.

ERRIRQCR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xE80` + (8 * n)	ERRIRQCR<n>

Accesses to this register are **RW**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRIRQSR, Error Interrupt Status Register

The ERRIRQSR characteristics are:

Purpose

Interrupt status register.

Configuration

This register is present only when interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQSR are RES0.

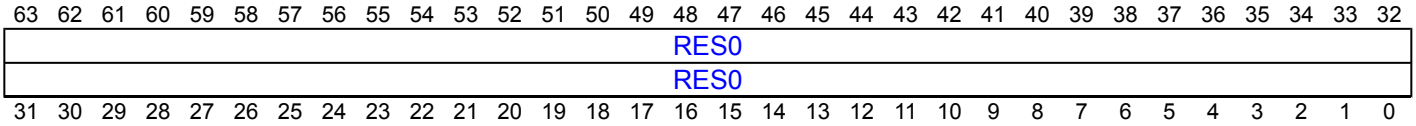
ERRIRQSR is implemented only as part of a memory-mapped group of error records.

Attributes

ERRIRQSR is a 64-bit register.

Field descriptions

When the implementation uses the recommended layout for the ERRIRQCR registers and the implementation uses simple interrupts:

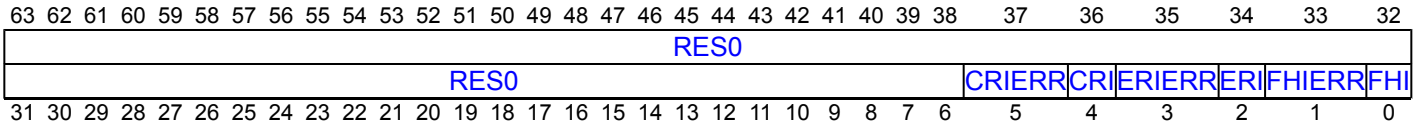


Bits [63:0]

Reserved, RES0.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

When the implementation uses message-signaled interrupts and the implementation uses the recommended layout for the ERRIRQCR registers:



Bits [63:6]

Reserved, RES0.

CRIERR, bit [5]

When the Critical Error Interrupt is implemented:

Critical Error Interrupt Error.

CRIERR	Meaning
0b0	Critical Error Interrupt write has not returned an error since this field was last cleared to zero.
0b1	Critical Error Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CRI, bit [4]
When the Critical Error Interrupt is implemented:

Critical Error Interrupt write in progress.

CRI	Meaning
0b0	Critical Error Interrupt write not in progress.
0b1	Critical Error Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

ERIERR, bit [3]
When the Error Recovery Interrupt is implemented:

Error Recovery Interrupt Error.

ERIERR	Meaning
0b0	Error Recovery Interrupt write has not returned an error since this field was last cleared to zero.
0b1	Error Recovery Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

ERI, bit [2]

When the Error Recovery Interrupt is implemented:

Error Recovery Interrupt write in progress.

ERI	Meaning
0b0	Error Recovery Interrupt write not in progress.
0b1	Error Recovery Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

FHIERR, bit [1]

When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt Error.

FHIERR	Meaning
0b0	Fault Handling Interrupt write has not returned an error since this field was last cleared to zero.
0b1	Fault Handling Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

FHI, bit [0]

When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt write in progress.

FHI	Meaning
0b0	Fault Handling Interrupt write not in progress.
0b1	Fault Handling Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

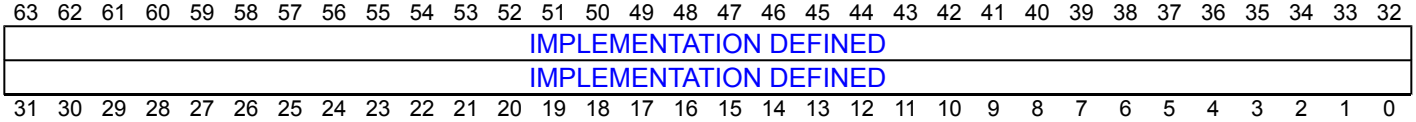
To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR registers:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRIRQSR

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRIRQSR are IMPLEMENTATION DEFINED.

This section shows the offset of ERRIRQSR when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRIRQSR.

ERRIRQSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEF8	ERRIRQSR

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRIRQSR.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>ADDR, Error Record <n> Address Register, n = 0 - 65534

The ERR<n>ADDR characteristics are:

Purpose

If an address is associated with a detected error, then it is written to ERR<n>ADDR when the error is recorded. It is IMPLEMENTATION DEFINED how the recorded address maps to the software-visible physical address. Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

Configuration

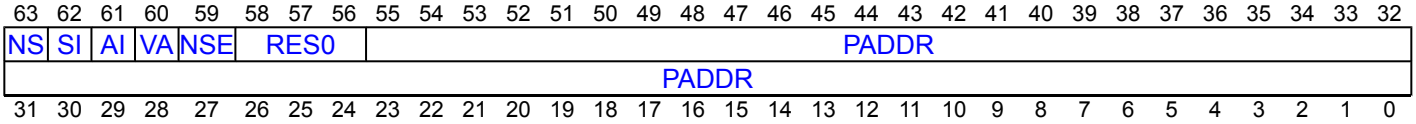
This register is present only when FEAT_RAS is implemented, error record n is implemented, and error record n includes an address associated with an error. Otherwise, direct accesses to ERR<n>ADDR are RES0.

ERRFR[FirstRecordOfNode(n)] describes the features implemented by the node that owns error record <n>. FirstRecordOfNode(n) is the index of the first error record owned by the same node as error record <n>. If the node owns a single record then FirstRecordOfNode(n) = n.

Attributes

ERR<n>ADDR is a 64-bit register.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

Non-secure attribute. With ERR<n>ADDR.NSE, indicates the physical address space of the recorded location.

NS	Meaning
0b0	When ERR<n>ADDR.NSE == 0: ERR<n>ADDR.PADDR is a Secure address. When ERR<n>ADDR.NSE == 1: ERR<n>ADDR.PADDR is a Root address.
0b1	When ERR<n>ADDR.NSE == 0: ERR<n>ADDR.PADDR is a Non-secure address. When ERR<n>ADDR.NSE == 1: ERR<n>ADDR.PADDR is a Realm address.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure attribute.

NS	Meaning
0b0	ERR<n>ADDR.PADDR is a Secure address.
0b1	ERR<n>ADDR.PADDR is a Non-secure address.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SI, bit [62]

When FEAT_RME is implemented:

Secure Incorrect. Indicates whether ERR<n>ADDR.{NS, NSE} are valid.

SI	Meaning
0b0	ERR<n>ADDR.{NS, NSE} are correct. That is, they match the software's view of the physical address space for the recorded location.
0b1	ERR<n>ADDR.{NS, NSE} might not be correct, and might not match the software's view of the physical address space for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Secure Incorrect. Indicates whether ERR<n>ADDR.NS is valid.

SI	Meaning
0b0	ERR<n>ADDR.NS is correct. That is, it matches the software's view of the Non-secure attribute for the recorded location.
0b1	ERR<n>ADDR.NS might not be correct, and might not match the software's view of the Non-secure attribute for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

AI, bit [61]

Address Incorrect. Indicates whether ERR<n>ADDR.PADDR is a valid physical address that is known to match the software's view of the physical address for the recorded location.

AI	Meaning
0b0	ERR<n>ADDR.PADDR is a valid physical address. That is, it matches the software's view of the physical address for the recorded location.
0b1	ERR<n>ADDR.PADDR might not be a valid physical address, and might not match the software's view of the physical address for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

VA, bit [60]

Virtual Address. Indicates whether ERR<n>ADDR.PADDR field is a virtual address.

VA	Meaning
0b0	ERR<n>ADDR.PADDR is not a virtual address.
0b1	ERR<n>ADDR.PADDR is a virtual address.

No context information is provided for the virtual address. When ERR<n>ADDR.VA is recorded as 1, ERR<n>ADDR.{NS, SI, AI} are recorded as {0, 1, 1} and, if FEAT_RME is implemented, ERR<n>ADDR.NSE is recorded as 0.

Support for this field is optional. If this field is not implemented and ERR<n>ADDR.PADDR field is a virtual address, then ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1} and, if FEAT_RME is implemented, ERR<n>ADDR.NSE reads as 0.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [59]
When FEAT_RME is implemented:

Physical Address Space. Together with ERR<n>ADDR.NS, indicates the address space for ERR<n>ADDR.PADDR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [58:56]

Reserved, RES0.

PADDR, bits [55:0]

Physical Address. Address of the recorded location. If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value. Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing ERR<n>ADDR

ERR<n>ADDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x018` + (64 * n)	ERR<n>ADDR

Accessible as follows:

- When the node that owns error record n implements the Common Fault Injection Model Extension, ERRPFGF[FirstRecordOfNode(n)].AV == 0, and ERR<n>STATUS.AV == 1, accesses to this register are **RO**.
- When the node that owns error record n does not implement the Common Fault Injection Model Extension and ERR<n>STATUS.AV == 1, accesses to this register are **RO**.
- Otherwise, accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>CTLR, Error Record <n> Control Register, n = 0 - 65534

The ERR<n>CTLR characteristics are:

Purpose

The error control register contains enable bits for the node that writes to this record:

- Enabling error detection and correction.
- Enabling the critical error, error recovery, and fault handling interrupts.
- Enabling in-band error response for uncorrected errors.

For each bit, if the node does not support the feature, then the bit is RES0. The definition of each record is IMPLEMENTATION DEFINED.

Configuration

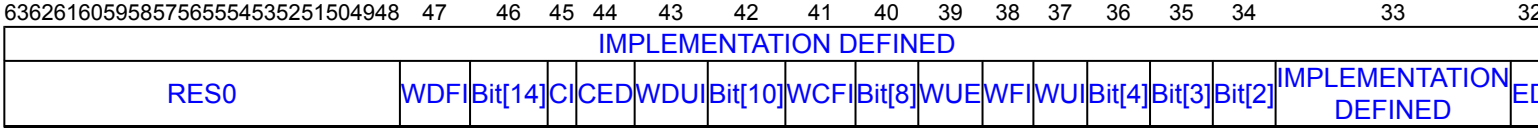
This register is present only when FEAT_RAS is implemented, error record n is implemented, and error record n is the first error record in the node. Otherwise, direct accesses to ERR<n>CTLR are RES0.

ERR<n>FR contains additional information about the node.

Attributes

ERR<n>CTLR is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:32]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

Bits [31:16]

Reserved, RES0.

WDFI, bit [15]

When RAS System Architecture v2 is implemented and ERR<n>FR.DFI == 0b11:

Fault handling interrupt for Deferred errors on writes enable, with ERR<n>CTLR.WFI.

When enabled by ERR<n>CTLR.{WDFI, `WFI`}:

- The fault handling interrupt is generated for errors recorded as Deferred error on writes.
- If the corresponding fault handling interrupt control for corrected error events, ERR<n>CTLR.WCFI, is not implemented, then the fault handling interrupt is generated for corrected error events on writes.

WDFI	Meaning
0b0	When ERR<n>CTLR.WFI == 0, Fault handling interrupt not generated for Deferred errors on writes. When ERR<n>CTLR.WFI == 1, Fault handling interrupt generated for Deferred errors on writes.
0b1	When ERR<n>CTLR.WFI == 0, Fault handling interrupt generated for Deferred errors on writes. When ERR<n>CTLR.WFI == 1, Fault handling interrupt not generated for Deferred errors on writes.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[14]
When RAS System Architecture v2 is implemented and ERR<n>FR.DFI == 0b10:

DFI, bit [14]

Fault handling interrupt for Deferred errors enable, with ERR<n>CTLR.FI.

When ERR<n>FR.DFI == 0b10, this control applies to errors on both reads and writes.

When enabled by ERR<n>CTLR.{DFI, FI}:

- The fault handling interrupt is generated for all errors recorded as Deferred error.
- If the fault handling interrupt control for corrected error events, ERR<n>CTLR.CFI, is not implemented, then the fault handling interrupt is generated for all corrected error events.

DFI	Meaning
0b0	When ERR<n>CTLR.FI == 0, Fault handling interrupt not generated for Deferred errors. When ERR<n>CTLR.FI == 1, Fault handling interrupt generated for Deferred errors.
0b1	When ERR<n>CTLR.FI == 0, Fault handling interrupt generated for Deferred errors. When ERR<n>CTLR.FI == 1, Fault handling interrupt not generated for Deferred errors.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When RAS System Architecture v2 is implemented and ERR<n>FR.DFI == 0b11:

RDFI, bit [14]

Fault handling interrupt for Deferred errors on reads enable, with ERR<n>CTLR.RFI.

When enabled by ERR<n>CTLR.{RDFI, RFI}:

- The fault handling interrupt is generated for errors recorded as Deferred error on reads.

- If the corresponding fault handling interrupt control for corrected error events, ERR<n>CTLR.RCFI, is not implemented, then the fault handling interrupt is generated for corrected error events on reads.

RDFI	Meaning
0b0	When ERR<n>CTLR.RFI == 0, Fault handling interrupt not generated for Deferred errors on reads. When ERR<n>CTLR.RFI == 1, Fault handling interrupt generated for Deferred errors on reads.
0b1	When ERR<n>CTLR.RFI == 0, Fault handling interrupt generated for Deferred errors on reads. When ERR<n>CTLR.RFI == 1, Fault handling interrupt not generated for Deferred errors on reads.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CI, bit [13]
When ERR<n>FR.CI == 0b10:

Critical error interrupt enable. When enabled, the critical error interrupt is generated for a critical error condition.

CI	Meaning
0b0	Critical error interrupt not generated for critical errors. Critical errors are treated as Uncontained errors.
0b1	Critical error interrupt generated for critical errors.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CED, bit [12]
When RAS System Architecture v2 is implemented, ERR<n>FR.CEC != 0b000, and ERR<n>FR.CED == 1:

Disable generation of corrected error events from error counters.

CED	Meaning
0b0	Corrected error events are generated by the error counter or counters.
0b1	Corrected error events are generated when a Corrected error is recorded.

See ERR<n>CTLR.CFI for more information on corrected error events.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WDUI, bit [11]

When ERR<n>FR.DUI == 0b11:

Error recovery interrupt for Deferred errors on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on writes.

WDUI	Meaning
0b0	Error recovery interrupt not generated for Deferred errors on writes.
0b1	Error recovery interrupt generated for Deferred errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[10]

When ERR<n>FR.DUI == 0b10:

DUI, bit [10]

Error recovery interrupt for Deferred errors enable.

When ERR<n>FR.DUI == 0b10, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Deferred error.

DUI	Meaning
0b0	Error recovery interrupt not generated for Deferred errors.
0b1	Error recovery interrupt generated for Deferred errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.DUI == 0b11:

RDUI, bit [10]

Error recovery interrupt for Deferred errors on reads enable.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on reads.

RDUI	Meaning
0b0	Error recovery interrupt not generated for Deferred errors on reads.
0b1	Error recovery interrupt generated for Deferred errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WCFI, bit [9]
When ERR<n>FR.CFI == 0b11:

Fault handling interrupt for corrected error events on writes enable.

When enabled, the fault handling interrupt is generated for corrected error events on writes.

WCFI	Meaning
0b0	Fault handling interrupt not generated for corrected error events on writes.
0b1	Fault handling interrupt generated for corrected error events on writes.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[8]
When ERR<n>FR.CFI == 0b10:

CFI, bit [8]

Fault handling interrupt for corrected error events enable.

When ERR<n>FR.CFI == 0b10, this control applies to errors on both reads and writes.

When enabled, the fault handling interrupt is generated for all corrected error events.

CFI	Meaning
0b0	Fault handling interrupt not generated for corrected error events.
0b1	Fault handling interrupt generated for corrected error events.

If the node implements a corrected error counter or counters, and either ERR<n>CTLR.CED is not implemented or ERR<n>CTLR.CED is 0, then a corrected error event is defined as follows:

- A corrected error event occurs when a counter overflows and sets a counter overflow flag to 1.
- It is UNPREDICTABLE whether a corrected error event occurs when a software write sets a counter overflow flag to 1.
- It is UNPREDICTABLE whether a corrected error event occurs when a counter overflows and the overflow flag was previously set to 1.

Otherwise, a corrected error event occurs when the error record records an error as a Corrected error.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.CFI == 0b11:

RCFI, bit [8]

Fault handling interrupt for corrected error events on reads enable.

When enabled, the fault handling interrupt is generated for corrected error events on reads.

RCFI	Meaning
0b0	Fault handling interrupt not generated for corrected error events on reads.
0b1	Fault handling interrupt generated for corrected error events on reads.

If the node implements a corrected error counter or counters, and either ERR<n>CTLR.CED is not implemented or ERR<n>CTLR.CED is 0, then a corrected error event is defined as follows:

- A corrected error event occurs when a counter overflows and sets a counter overflow flag to 1.
- It is UNPREDICTABLE whether a corrected error event occurs when a software write sets a counter overflow flag to 1.
- It is UNPREDICTABLE whether a corrected error event occurs when a counter overflows and the overflow flag was previously set to 1.

Otherwise, a corrected error event occurs when the error record records an error as a Corrected error.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUE, bit [7]
When ERR<n>FR.UE == 0b11:

In-band error response on writes enable.

When enabled, responses to writes that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

WUE	Meaning
0b0	In-band error response for uncorrected errors on writes disabled.
0b1	In-band error response for uncorrected errors on writes enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WFI, bit [6]
When ERR<n>FR.FI == 0b11:

Fault handling interrupt on writes enable.

When enabled:

- The fault handling interrupt is generated for errors recorded as Uncorrected error on writes.
- If the corresponding fault handling interrupt control for Deferred errors, ERR<n>CTLR.WDFI, is not implemented, then the fault handling interrupt is generated for errors recorded as Deferred error on writes.
- If the corresponding fault handling interrupt controls for Deferred errors and corrected error events, ERR<n>CTLR.{WDFI, WCFI}, are not implemented, then the fault handling interrupt is generated for corrected error events on writes.

WFI	Meaning
0b0	Fault handling interrupt on writes disabled.
0b1	Fault handling interrupt on writes enabled.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUI, bit [5]

When ERR<n>FR.UI == 0b11:

Uncorrected error recovery interrupt on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on writes.

WUI	Meaning
0b0	Error recovery interrupt on writes disabled.
0b1	Error recovery interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[4]

When ERR<n>FR.UE == 0b10:

UE, bit [4]

In-band error response enable.

When ERR<n>FR.UE == 0b10, this control applies to errors arising from both reads and writes.

When enabled, responses to transactions that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

UE	Meaning
0b0	In-band error response for uncorrected errors disabled.
0b1	In-band error response for uncorrected errors enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.UE == 0b11:

RUE, bit [4]

In-band error response on reads enable.

When enabled, responses to reads that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

RUE	Meaning
0b0	In-band error response for uncorrected errors on reads disabled.
0b1	In-band error response for uncorrected errors on reads enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[3]

When ERR<n>FR.FI == 0b10:

FI, bit [3]

Fault handling interrupt enable.

When ERR<n>FR.FI == 0b10, this control applies to errors on both reads and writes.

When enabled:

- The fault handling interrupt is generated for all errors recorded as Uncorrected error.
- If the fault handling interrupt control for Deferred errors, ERR<n>CTLR.DFI, is not implemented, then the fault handling interrupt is generated for all errors recorded as Deferred error.
- If the fault handling interrupt controls for Deferred errors and corrected error events, ERR<n>CTLR.{DFI, CFI}, are not implemented, then the fault handling interrupt is generated for all corrected error events.

FI	Meaning
0b0	Fault handling interrupt disabled.
0b1	Fault handling interrupt enabled.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.FI == 0b11:

RFI, bit [3]

Fault handling interrupt on reads enable.

When enabled:

- The fault handling interrupt is generated for errors recorded as Uncorrected error on reads.
- If the corresponding fault handling interrupt control for Deferred errors, ERR<n>CTLR.RDFI, is not implemented, then the fault handling interrupt is generated for errors recorded as Deferred error on reads.
- If the corresponding fault handling interrupt controls for Deferred errors and corrected error events, ERR<n>CTLR.{RDFI, RCFI}, are not implemented, then the fault handling interrupt is generated for corrected error events on reads.

RFI	Meaning
0b0	Fault handling interrupt on reads disabled.
0b1	Fault handling interrupt on reads enabled.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[2]

When ERR<n>FR.UI == 0b10:

UI, bit [2]

Uncorrected error recovery interrupt enable.

When ERR<n>FR.UI == 0b10, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Uncorrected error.

UI	Meaning
0b0	Error recovery interrupt disabled.
0b1	Error recovery interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.UI == 0b11:

RUI, bit [2]

Uncorrected error recovery interrupt on reads enable.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on reads.

RUI	Meaning
0b0	Error recovery interrupt on reads disabled.
0b1	Error recovery interrupt on reads enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMPLEMENTATION DEFINED, bit [1]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

ED, bit [0]

When ERR<n>FR.ED == 0b10:

Error reporting and logging enable. When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an IMPLEMENTATION DEFINED control for error injection.

ED	Meaning
0b0	Error reporting disabled.
0b1	Error reporting enabled.

It is IMPLEMENTATION DEFINED whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrected errors might result in corrupt data being silently propagated by the node.

Note

If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this field is set to 0 on Cold reset, meaning errors are not reported from Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. Otherwise, the Cold reset value is IMPLEMENTATION DEFINED. If the Cold reset value is 1, the reset values of other controls in this register are also IMPLEMENTATION DEFINED and should not be UNKNOWN.

The reset behavior of this field is:

- On an Error recovery reset, when RAS System Architecture v2 is implemented and ERR<n>FR.SRV == 1, this field resets to '0'.
- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERR<n>FR.SRV == 1, this field resets to '0'.
  - Otherwise, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

Accessing ERR<n>CTLR

ERR<n>CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x008 + (64 * n)	ERR<n>CTLR

Accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>FR, Error Record <n> Feature Register, n = 0 - 65534

The ERR<n>FR characteristics are:

Purpose

Defines whether error record <n> is the first record owned by a node:

- If error record <n> is the first error record owned by a node, then ERR<n>FR.ED is not `0b00`.
- If error record <n> is not the first error record owned by a node, then ERR<n>FR.ED is `0b00`.

If error record <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

Configuration

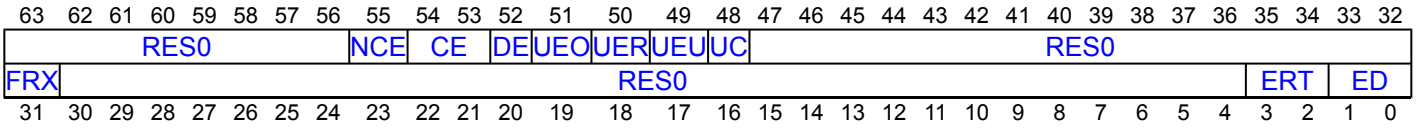
This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

Attributes

ERR<n>FR is a 64-bit register.

Field descriptions

When error record n is not implemented or error record n is not the first error record in the node:



Bits [63:56]

Reserved, RES0.

NCE, bit [55]

When ERR<n>FR.FRX == 1 and ERRFR[FirstRecordOfNode(n)].CEC != 0b000:

No countable errors. Describes whether this error record supports recording countable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NCE	Meaning
`0b0`	Records countable errors.
`0b1`	Does not record countable errors.

When ERRFR[FirstRecordOfNode(n)].CEC != `0b000`, at least one error record owned by the node records countable errors.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

CE, bits [54:53]

When ERR<n>FR.FRX == 1:

Corrected Error recording. Describes the types of Corrected errors the error record can record, if any.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CE	Meaning
0b00	Does not record Corrected errors.
0b01	Records only transient or persistent Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to either 0b01 or 0b11.
0b10	Records only non-specific Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to 0b10.
0b11	Records all types of Corrected error.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

DE, bit [52]

When ERR<n>FR.FRX == 1:

Deferred Error recording. Describes whether the error record supports recording Deferred errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DE	Meaning
0b0	Does not record Deferred errors.
0b1	Records Deferred errors.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

UEO, bit [51]

When ERR<n>FR.FRX == 1:

Latent or Restartable Error recording. Describes whether the error record supports recording Latent or Restartable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UEO	Meaning
0b0	Does not record Latent or Restartable errors.
0b1	Records Latent or Restartable errors.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

UER, bit [50]

When ERR<n>FR.FRX == 1:

Signaled or Recoverable Error recording. Describes whether the error record supports recording Signaled or Recoverable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UER	Meaning
0b0	Does not record Signaled or Recoverable errors.
0b1	Records Signaled or Recoverable errors.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

UEU, bit [49]

When ERR<n>FR.FRX == 1:

Unrecoverable Error recording. Describes whether the error record supports recording Unrecoverable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UEU	Meaning
0b0	Does not record Unrecoverable errors.
0b1	Records Unrecoverable errors.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

UC, bit [48]

When ERR<n>FR.FRX == 1:

Uncontainable Error recording. Describes whether the error record supports recording Uncontainable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UC	Meaning
0b0	Does not record Uncontainable errors.
0b1	Records Uncontainable errors.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [47:32]

Reserved, RES0.

FRX, bit [31]

When error record n is implemented, RAS System Architecture v2 is implemented, and ERR<n>FR.ERT == 0b00:

Feature Register extension. Defines whether ERR<n>FR[63:48] describe architecturally-defined properties of this error record, including the supported error types.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FRX	Meaning
0b0	ERR<n>FR[63:48] are RES0.
0b1	ERR<n>FR[63:48] are defined by the architecture.

If ERR<n>FR.FRX is 0, error record <n> is implemented, and ERRFR[FirstRecordOfNode(n)].FRX is 1, then ERRFR[FirstRecordOfNode(n)][63:48] describe the architecturally-defined properties of all error records owned by the node.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [30:4]

Reserved, RES0.

ERT, bits [3:2]

When RAS System Architecture v2 is implemented:

Error Record Type. Defines the type of error record.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ERT	Meaning
0b00	Error record <n> not implemented or is a normal record that is not the first error record of the node.
0b01	Error record <n> is a continuation record of the previous error record, <n-1>.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

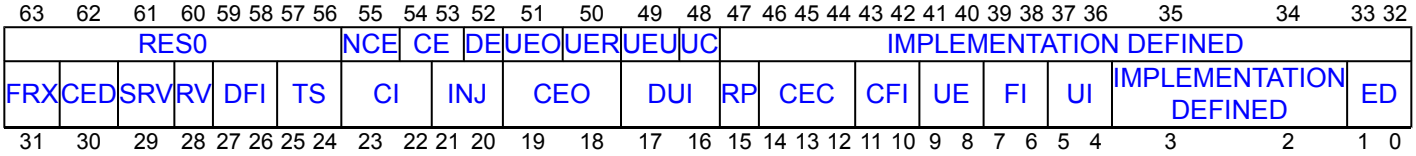
ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is not the first error record owned the node.

ED	Meaning
0b00	Error record <n> is not implemented or is not the first error record owned by the node.

Access to this field is **RO**.

When error record n is the first error record in the node:



Bits [63:56]

When ERR<n>FR.FRX == 1:

Reserved, RES0.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

NCE, bit [55]

When RAS System Architecture v2 is implemented, ERR<n>FR.FRX == 1, and ERR<n>FR.CEC != 0b000:

No countable errors. Describes whether this error record supports recording countable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NCE	Meaning
0b0	Records countable errors.
0b1	Does not record countable errors.

When ERR<n>FR.CEC != 0b000, at least one error record owned by the node records countable errors.

Access to this field is **RO**.

When ERR<n>FR.FRX == 1:

Reserved, RES0.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

CE, bits [54:53]

When ERR<n>FR.FRX == 1:

Corrected Error recording. Describes the types of Corrected errors the node can record, if any.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CE	Meaning
0b00	Does not record Corrected errors.
0b01	Records only transient or persistent Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to either 0b01 or 0b11.
0b10	Records only non-specific Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to 0b10.
0b11	Records all types of Corrected error.

Access to this field is **RO**.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

DE, bit [52]

When ERR<n>FR.FRX == 1:

Deferred Error recording. Describes whether the node supports recording Deferred errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DE	Meaning
0b0	Does not record Deferred errors.
0b1	Records Deferred errors.

Access to this field is **RO**.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEO, bit [51]

When ERR<n>FR.FRX == 1:

Latent or Restartable Error recording. Describes whether the node supports recording Latent or Restartable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UEO	Meaning
0b0	Does not record Latent or Restartable errors.
0b1	Records Latent or Restartable errors.

Access to this field is **RO**.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UER, bit [50]

When ERR<n>FR.FRX == 1:

Signaled or Recoverable Error recording. Describes whether the node supports recording Signaled or Recoverable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UER	Meaning
0b0	Does not record Signaled or Recoverable errors.
0b1	Records Signaled or Recoverable errors.

Access to this field is **RO**.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEU, bit [49]

When ERR<n>FR.FRX == 1:

Unrecoverable Error recording. Describes whether the node supports recording Unrecoverable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UEU	Meaning
0b0	Does not record Unrecoverable errors.
0b1	Records Unrecoverable errors.

Access to this field is **RO**.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UC, bit [48]

When ERR<n>FR.FRX == 1:

Uncontainable Error recording. Describes whether the node supports recording Uncontainable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UC	Meaning
0b0	Does not record Uncontainable errors.
0b1	Records Uncontainable errors.

Access to this field is **RO**.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

IMPLEMENTATION DEFINED, bits [47:32]

Reserved for identifying IMPLEMENTATION DEFINED controls.

FRX, bit [31]

When RAS System Architecture v1p1 is implemented:

Feature Register extension.

Defines whether ERR<n>FR[63:48] describe architecturally-defined properties of this error record or node, including the supported error types, or describe IMPLEMENTATION DEFINED properties.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FRX	Meaning
0b0	ERR<n>FR[63:48] are IMPLEMENTATION DEFINED.
0b1	ERR<n>FR[63:48] are defined by the architecture.

When ERR<n>FR.FRX is 1:

- If RAS System Architecture v2 is implemented and ERR<m>FR.FRX is 1 for other error records <m> owned by the same node, then ERR<n>FR[63:48] describe the architecturally-defined properties of error record <n> only, and ERR<m>FR[63:48] describe the properties for error record <m>.
- Otherwise, ERR<n>FR[63:48] describe the architecturally-defined properties of all error records owned by the node.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

CED, bit [30]

When RAS System Architecture v2 is implemented and ERR<n>FR.CEC != 0b000:

Error counter disable. Indicates whether the node implements a control to disable any implemented Corrected error counters.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CED	Meaning
0b0	Error counter disable control is not implemented and the error counter(s) are always enabled. ERR<n>CTLR.CED is RES0.
0b1	Enabling and disabling of error counter(s) is supported and controlled by ERR<n>CTLR.CED.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

SRV, bit [29]

When RAS System Architecture v2 is implemented:

Status Reset Value. Indicates how node <n> and each error record <m> owned by node <n> is reset.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SRV	Meaning
0b0	Node <n> and each error record <m> owned by node <n> are reset as follows: • ERR<m>STATUS.{AV, V, MV} are set to {0, 0, 0} on a Cold reset and preserved on Error Recovery reset. • ERR<n>CTLR.ED is set to an IMPLEMENTATION DEFINED value on a Cold reset and preserved on Error Recovery reset.
0b1	Node <n> and each error record <m> owned by node <n> are reset as follows: • ERR<m>STATUS.{AV, V, MV} are set to architecturally UNKNOWN values on a Cold reset and preserved on Error Recovery reset. • ERR<n>CTLR.ED is set to 0 on both Cold reset and Error Recovery reset.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

RV, bit [28]

When RAS System Architecture v2 is implemented:

Reset Valid. Indicates whether each error record <m> implemented by the node includes the Reset Valid flags, ERR<m>STATUS.{RV, RV2}.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RV	Meaning
0b0	ERR<m>STATUS.{RV, RV2} are RES0.
0b1	ERR<m>STATUS.{RV, RV2} are R/W1C bits. See ERR<m>STATUS.{RV, RV2} for more information.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

DFI, bits [27:26]

When RAS System Architecture v2 is implemented and !(ERR<n>FR.FI IN {0b0x}):

Fault handling interrupt for deferred errors control. Indicates whether the enabling and disabling of fault handling interrupts on deferred errors is supported by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DFI	Meaning
0b00	Does not support the enabling and disabling of fault handling interrupts on deferred errors. ERR<n>CTLR.DFI is RES0.
0b10	Enabling and disabling of fault handling interrupts on deferred errors is supported and controllable using ERR<n>CTLR.DFI.
0b11	Enabling and disabling of fault handling interrupts on deferred errors is supported, and controllable using ERR<n>CTLR.WDFI for writes and ERR<n>CTLR.RDFI for reads.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

TS, bits [25:24]

Timestamp Extension. Indicates whether, for each error record <m> owned by this node, ERR<m>MISC3 is used as the timestamp register, and, if it is, the timebase used by the timestamp.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TS	Meaning
0b00	Does not support a timestamp register.
0b01	Implements a timestamp register in ERR<n>MISC3 for each error record <m> owned by the node. The timestamp uses the same timebase as the system Generic Timer. **Note** For an error record that has an affinity to a PE, this is the same timer that is visible through CNTPCT_EL0 at the highest Exception level on that PE.
0b10	Implements a timestamp register in ERR<m>MISC3 for each error record <m> owned by the node. The timestamp uses an IMPLEMENTATION DEFINED timebase.

All other values are reserved.

Access to this field is **RO**.

CI, bits [23:22]

Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CI	Meaning
0b00	Does not support the critical error interrupt. ERR<n>CTLR.CI is RES0.
0b01	Critical error interrupt is supported and always enabled. ERR<n>CTLR.CI is RES0.
0b10	Critical error interrupt is supported and controllable using ERR<n>CTLR.CI.

All other values are reserved.

Access to this field is **RO**.

INJ, bits [21:20]

Fault Injection Extension. Indicates whether the Common Fault Injection Model Extension is implemented by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

INJ	Meaning
0b00	Does not support the Common Fault Injection Model Extension.
0b01	Supports the Common Fault Injection Model Extension. See ERR<n>PFGF for more information.

All other values are reserved.

Access to this field is **RO**.

CEO, bits [19:18]

When ERR<n>FR.CEC != 0b000:

Corrected Error overwrite. Indicates the behavior of the node when a second or subsequent Corrected error is recorded and a first Corrected error has previously been recorded by an error record <m> owned by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CEO	Meaning
0b00	Keeps the previous error syndrome.
0b01	If ERR<m>STATUS.OF is 1 before the Corrected error is counted, then the error record keeps the previous syndrome. Otherwise the previous syndrome is overwritten.

All other values are reserved.

The second or subsequent Corrected error is counted by the Corrected error counter, regardless of the value of this field. If counting the error causes unsigned overflow of the counter, then ERR<m>STATUS.OF is set to 1.

This means that, if no other error is subsequently recorded that overwrites the syndrome:

- If ERR<n>FR.CEO is 0b00, the error record holds the syndrome for the first recorded Corrected error.
- If ERR<n>FR.CEO is 0b01, the error record holds the syndrome for the most recently recorded Corrected error before the counter overflows.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

DUI, bits [17:16]

When ERR<n>FR.UI != 0b00:

Error recovery interrupt for deferred errors control. Indicates whether the enabling and disabling of error recovery interrupts on deferred errors is supported by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DUI	Meaning
0b00	Does not support the enabling and disabling of error recovery interrupts on deferred errors. ERR<n>CTLR.DUI is RES0.
0b10	Enabling and disabling of error recovery interrupts on deferred errors is supported and controllable using ERR<n>CTLR.DUI.
0b11	Enabling and disabling of error recovery interrupts on deferred errors is supported, and controllable using ERR<n>CTLR.WDUI for writes and ERR<n>CTLR.RDUI for reads.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

RP, bit [15]

When ERR<n>FR.CEC != 0b000:

Repeat counter. Indicates whether the node implements a second Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RP	Meaning
0b0	Implements a single Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.
0b1	Implements a first (repeat) counter and a second (other) counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. The repeat counter is the same size as the primary error counter.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

CEC, bits [14:12]

Corrected Error Counter. Indicates whether the node implements the standard format Corrected error counter mechanisms in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CEC	Meaning
0b000	Does not implement the standard format Corrected error counter model.
0b010	Implements an 8-bit Corrected error counter in ERR<m>MISC0[39:32] for each error record <m> owned by the node that can record countable errors.
0b100	Implements a 16-bit Corrected error counter in ERR<m>MISC0[47:32] for each error record <m> owned by the node that can record countable errors.

All other values are reserved.

Note

Implementations might include other error counter models, or might include the standard format model and not indicate this in ERR<n>FR.

Access to this field is **RO**.

CFI, bits [11:10]

When !(ERR<n>FR.FI IN {0b0x}):

Fault handling interrupt for corrected errors control. Indicates whether the enabling and disabling of fault handling interrupts on corrected errors is supported by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CFI	Meaning
0b00	Does not support the enabling and disabling of fault handling interrupts on corrected errors. ERR<n>CTLR.CFI is RES0.
0b10	Enabling and disabling of fault handling interrupts on corrected errors is supported and controllable using ERR<n>CTLR.CFI.
0b11	Enabling and disabling of fault handling interrupts on corrected errors is supported, and controllable using ERR<n>CTLR.WCFI for writes and ERR<n>CTLR.RCFI for reads.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

UE, bits [9:8]

In-band error response (External abort). Indicates whether the in-band error response and associated controls are implemented by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UE	Meaning
0b00	Does not support the in-band error response. ERR<n>CTLR.UE is RES0.
0b01	In-band error response is supported and always enabled. ERR<n>CTLR.UE is RES0.
0b10	In-band error response is supported and controllable using ERR<n>CTLR.UE.
0b11	In-band error response is supported, and controllable using ERR<n>CTLR.WUE for writes and ERR<n>CTLR.RUE for reads.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

Access to this field is **RO**.

FI, bits [7:6]

Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are implemented by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FI	Meaning
0b00	Does not support the fault handling interrupt. ERR<n>CTLR.FI is RES0.
0b01	Fault handling interrupt is supported and always enabled. ERR<n>CTLR.FI is RES0.
0b10	Fault handling interrupt is supported and controllable using ERR<n>CTLR.FI.
0b11	Fault handling interrupt is supported, and controllable using ERR<n>CTLR.WFI for writes and ERR<n>CTLR.RFI for reads.

Access to this field is **RO**.

UI, bits [5:4]

Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are implemented by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UI	Meaning
0b00	Does not support the error handling interrupt. ERR<n>CTLR.UI is RES0.
0b01	Error handling interrupt is supported and always enabled. ERR<n>CTLR.UI is RES0.
0b10	Error handling interrupt is supported and controllable using ERR<n>CTLR.UI.
0b11	Error handling interrupt is supported, and controllable using ERR<n>CTLR.WUI for writes and ERR<n>CTLR.RUI for reads.

Access to this field is **RO**.

IMPLEMENTATION DEFINED, bits [3:2]

IMPLEMENTATION DEFINED.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is a normal record and the first record owned the node, and whether the node implements the controls for enabling and disabling error reporting and logging.

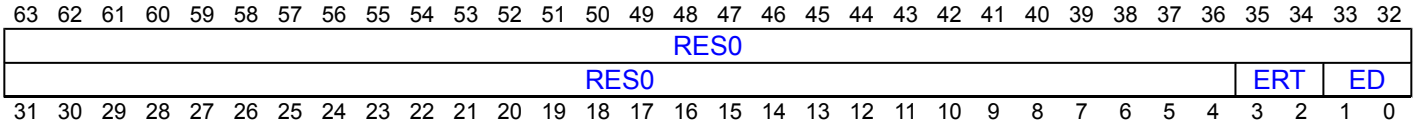
The value of this field is an IMPLEMENTATION DEFINED choice of:

ED	Meaning
0b01	Error reporting and logging always enabled. ERR<n>CTLR.ED is RES0.
0b10	Error reporting and logging is controllable using ERR<n>CTLR.ED.

All other values are reserved.

Access to this field is **RO**.

When RAS System Architecture v2 is implemented and error record <n> is a proxy for a RAS agent:



Bits [63:4]

Reserved, RES0.

ERT, bits [3:2]

Error Record Type. Defines the type of error record.

ERT	Meaning
0b01	Error record is a proxy for a RAS agent.

All other values are reserved.

Access to this field is **RO**.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is not a true error record.

ED	Meaning
0b11	Error record <n> is not an error record.

Access to this field is **RO**.

Accessing ERR<n>FR

ERR<n>FR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x000` + (64 * n)	ERR<n>FR

Accesses to this register are **RO**.

ERR<n>MISC0, Error Record <n> Miscellaneous Register 0, n = 0 - 65534

The ERR<n>MISC0 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record <n> implements a standard format Corrected error counter or counters (ERRFR[FirstRecordOfNode(n)].CEC != `0b000`), then it is IMPLEMENTATION DEFINED whether error record <n> can record countable errors, and:

- If error record <n> records countable errors, then ERR<n>MISC0 implements the standard format Corrected error counter or counters for error record <n>.
- If error record <n> does not record countable errors, then it is recommended that the fields in ERR<n>MISC0 defined for the standard format counter or counters are RES0. That is, the fields behave like counters that never count.

Configuration

This register is present only when FEAT_RAS is implemented and error record n is implemented. Otherwise, direct accesses to ERR<n>MISC0 are RES0.

ERRFR[FirstRecordOfNode(n)] describes the features implemented by the node that owns error record <n>. FirstRecordOfNode(n) is the index of the first error record owned by the same node as error record <n>. If the node owns a single record then FirstRecordOfNode(n) = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC0, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, nonzero, and ignore writes are compliant with this requirement.

Note

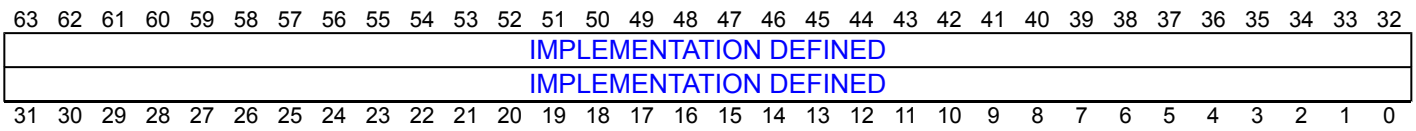
Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERRCTLR[FirstRecordOfNode(n)].

Attributes

ERR<n>MISC0 is a 64-bit register.

Field descriptions

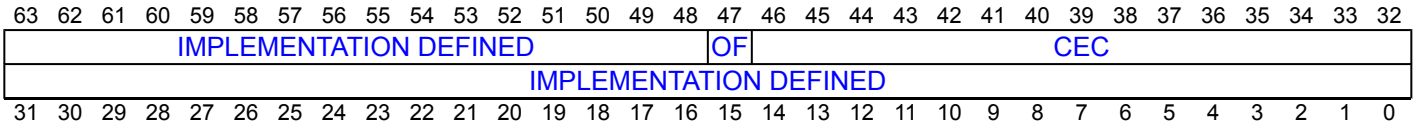
When ERRFR[FirstRecordOfNode(n)].CEC == 0b000 or error record n does not record countable errors:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

When ERRFR[FirstRecordOfNode(n)].CEC == 0b100, ERRFR[FirstRecordOfNode(n)].RP == 0, and error record n records countable errors:



IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OF, bit [47]

Sticky overflow bit. Set to 1 when ERR<n>MISC0.CEC is incremented and wraps through zero.

OF	Meaning
0b0	Counter has not overflowed.
0b1	Counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [46:32]

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

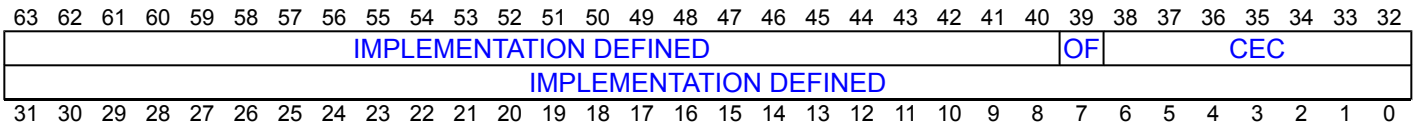
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERRFR[FirstRecordOfNode(n)].CEC == 0b010, ERRFR[FirstRecordOfNode(n)].RP == 0, and error record n records countable errors:



IMPLEMENTATION DEFINED, bits [63:40]

IMPLEMENTATION DEFINED syndrome.

OF, bit [39]

Sticky overflow bit. Set to 1 when ERR<n>MISC0.CEC is incremented and wraps through zero.

OF	Meaning
0b0	Counter has not overflowed.
0b1	Counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [38:32]

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

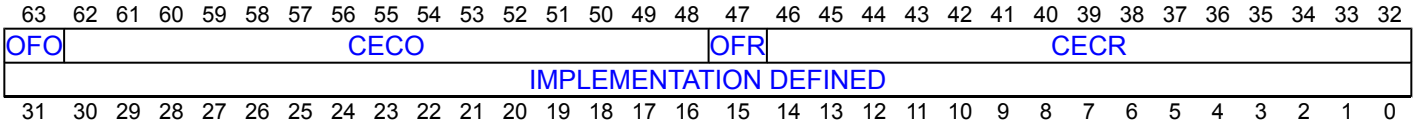
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERRFR[FirstRecordOfNode(n)].CEC == 0b100, ERRFR[FirstRecordOfNode(n)].RP == 1, and error record n records countable errors:



OFO, bit [63]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

OFO	Meaning
0b0	Other counter has not overflowed.
0b1	Other counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [62:48]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [47]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

OFR	Meaning
0b0	Repeat counter has not overflowed.
0b1	Repeat counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [46:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

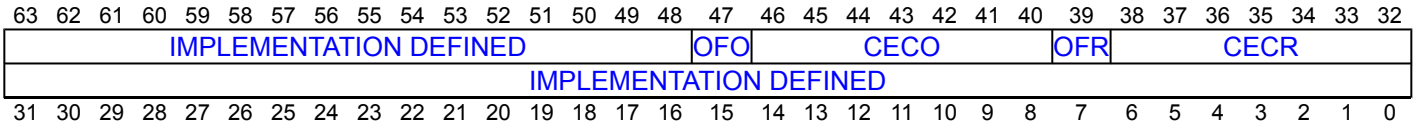
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERRFR[FirstRecordOfNode(n)].CEC == 0b010, ERRFR[FirstRecordOfNode(n)].RP == 1, and error record n records countable errors:



IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OFO, bit [47]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

OFO	Meaning
0b0	Other counter has not overflowed.
0b1	Other counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [46:40]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [39]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

OFR	Meaning
0b0	Repeat counter has not overflowed.
0b1	Repeat counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [38:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC0

Reads from ERR<n>MISC0 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERRPFGF[FirstRecordOfNode(n)].MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 0. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x020 + (64 * n)	ERR<n>MISC0

Accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>MISC1, Error Record <n> Miscellaneous Register 1, n = 0 - 65534

The ERR<n>MISC1 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when FEAT_RAS is implemented and error record n is implemented. Otherwise, direct accesses to ERR<n>MISC1 are RES0.

ERRFR[FirstRecordOfNode(n)] describes the features implemented by the node that owns error record <n>. FirstRecordOfNode(n) is the index of the first error record owned by the same node as error record <n>. If the node owns a single record then FirstRecordOfNode(n) = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC1, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, nonzero, and ignore writes are compliant with this requirement.

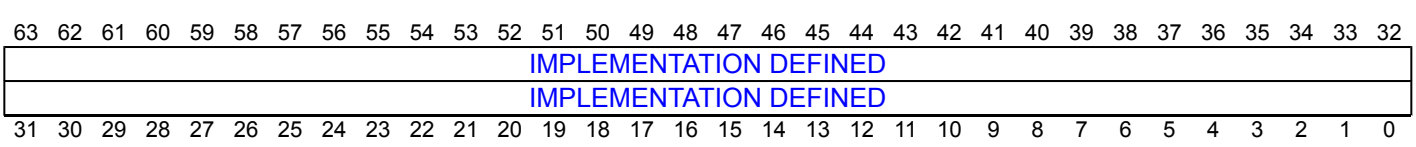
Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERRCTLR[FirstRecordOfNode(n)].

Attributes

ERR<n>MISC1 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC1

Reads from ERR<n>MISC1 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERRPFGF[FirstRecordOfNode(n)].MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 0. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x028` + (64 * n)	ERR<n>MISC1

Accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>MISC2, Error Record <n> Miscellaneous Register 2, n = 0 - 65534

The ERR<n>MISC2 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when FEAT_RAS is implemented and ((an implementation implements ERR<n>MISC2 or RAS System Architecture v1p1 is implemented) and error record n is implemented). Otherwise, direct accesses to ERR<n>MISC2 are RES0.

ERRFR[FirstRecordOfNode(n)] describes the features implemented by the node that owns error record <n>. FirstRecordOfNode(n) is the index of the first error record owned by the same node as error record <n>. If the node owns a single record then FirstRecordOfNode(n) = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC2, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, nonzero, and ignore writes are compliant with this requirement.

Arm recommends that if RAS System Architecture v1.1 is not implemented then ERR<n>MISC2 does not require zeroing to return the record to a quiescent state.

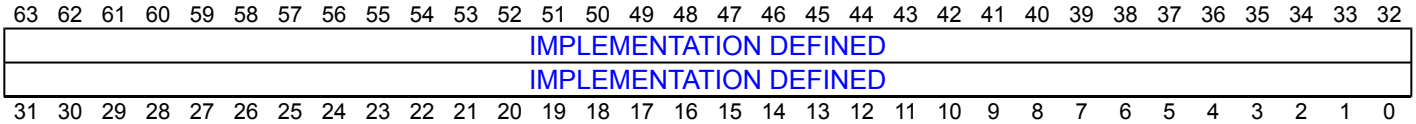
Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERRCTLR[FirstRecordOfNode(n)].

Attributes

ERR<n>MISC2 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC2

Reads from ERR<n>MISC2 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERRPFGF[FirstRecordOfNode(n)].MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 0. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x030` + (64 * n)	ERR<n>MISC2

Accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>MISC3, Error Record <n> Miscellaneous Register 3, n = 0 - 65534

The ERR<n>MISC3 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record n supports the RAS Timestamp Extension (ERRFR[FirstRecordOfNode(n)].TS != 0b00), then ERR<n>MISC3 contains the timestamp value for error record n when the error was detected. Otherwise the contents of ERR<n>MISC3 are IMPLEMENTATION DEFINED.

Configuration

This register is present only when FEAT_RAS is implemented and ((an implementation implements ERR<n>MISC3 or RAS System Architecture v1p1 is implemented) and error record n is implemented). Otherwise, direct accesses to ERR<n>MISC3 are RES0.

ERRFR[FirstRecordOfNode(n)] describes the features implemented by the node that owns error record <n>. FirstRecordOfNode(n) is the index of the first error record owned by the same node as error record <n>. If the node owns a single record then FirstRecordOfNode(n) = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC3, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, nonzero, and ignore writes are compliant with this requirement.

Arm recommends that if RAS System Architecture v1.1 is not implemented then ERR<n>MISC3 does not require zeroing to return the record to a quiescent state.

Note

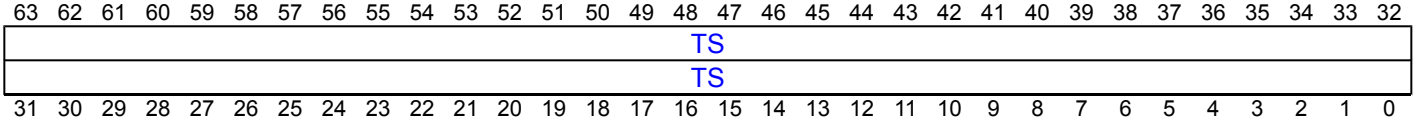
Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERRCTLR[FirstRecordOfNode(n)].

Attributes

ERR<n>MISC3 is a 64-bit register.

Field descriptions

When ERRFR[FirstRecordOfNode(n)].TS != 0b00:



TS, bits [63:0]

Timestamp. Timestamp value recorded when the error was detected. Valid only if ERR<n>STATUS.V == 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO or RW**.

When ERRFR[FirstRecordOfNode(n)].TS == 0b00:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC3

Reads from ERR<n>MISC3 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERRPFGF[FirstRecordOfNode(n)].MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 0. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x038` + (64 * n)	ERR<n>MISC3

Accesses to this register are **RW**.

ERR<n>PFGCDN, Error Record <n> Pseudo-fault Generation Countdown Register, n = 0 - 65534

The ERR<n>PFGCDN characteristics are:

Purpose

Generates one of the errors enabled in the corresponding ERR<n>PFGCTL register.

Configuration

This register is present only when FEAT_RAS is implemented, error record n is implemented, the node that owns error record n implements the Common Fault Injection Model Extension, and error record n is the first error record in the node. Otherwise, direct accesses to ERR<n>PFGCDN are RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGCDN is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
CDN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

CDN, bits [31:0]

Countdown value.

This field is copied to Error Generation Counter when either:

- Software writes 1 to ERR<n>PFGCTL.CDNEN.
- The Error Generation Counter decrements to zero and ERR<n>PFGCTL.R is 1.

While ERR<n>PFGCTL.CDNEN is 1 and the Error Generation Counter is nonzero, the counter decrements by 1 for each cycle at an IMPLEMENTATION DEFINED clock rate. When the counter reaches zero, one of the errors enabled in the ERR<n>PFGCTL register is generated.

Note

The current Error Generation Counter value is not visible to software.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing ERR<n>PFGCDN

This section shows the offset of ERR<n>PFGCDN in an error record group when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, or ERR<n>PFGCDN is accessed in a fault injection group, see 'RAS memory-mapped register views' for the offset of ERR<n>PFGCDN.

ERR<n>PFGCDN can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x810` + (64 * n)	ERR<n>PFGCDN

Accesses to this register are **RW**.

ERR<n>PFGCTL, Error Record <n> Pseudo-fault Generation Control Register, n = 0 - 65534

The ERR<n>PFGCTL characteristics are:

Purpose

Enables controlled fault generation.

Configuration

This register is present only when FEAT_RAS is implemented, error record n is implemented, the node that owns error record n implements the Common Fault Injection Model Extension, and error record n is the first error record in the node. Otherwise, direct accesses to ERR<n>PFGCTL are RES0.

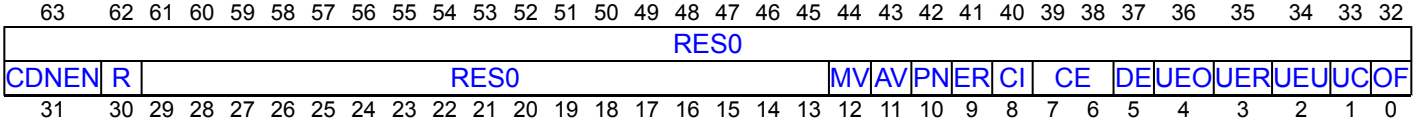
ERR<n>PFGF describes the Common Fault Injection features implemented by the node.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGCTL is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

CDNEN, bit [31]

Countdown Enable. Controls transfers of the value held in ERR<n>PFGCDN to the Error Generation Counter and enables this counter.

CDNEN	Meaning
0b0	The Error Generation Counter is disabled.
0b1	The Error Generation Counter is enabled. On a write of 1 to this field, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

R, bit [30]

When ERR<n>PFGF.R == 1:

Restart. Controls whether the Error Generation Counter restarts or stops counting on reaching zero.

R	Meaning
0b0	On reaching zero, the Error Generation Counter will stop counting.
0b1	On reaching zero, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:13]

Reserved, RES0.

MV, bit [12]

When ERR<n>PFGF.MV == 1:

Miscellaneous syndrome. The value written to ERR<n>STATUS.MV when an injected error is recorded.

MV	Meaning
0b0	ERR<n>STATUS.MV is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.MV is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the node always sets ERR<n>STATUS.MV to 1 when an injected error is recorded, access to this field is **RAO/WI**.

When the node always sets ERR<n>STATUS.MV to 1 when an injected error is recorded and this field is RAO/WI:

Reserved, RAO/WI.

Otherwise:

Reserved, RES0.

AV, bit [11]

When ERR<n>PFGF.AV == 1:

Address syndrome. The value written to ERR<n>STATUS.AV when an injected error is recorded.

AV	Meaning
0b0	ERR<n>STATUS.AV is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.AV is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the node always sets ERR<n>STATUS.AV to 1 when an injected error is recorded, access to this field is **RAO/WI**.

When the node always sets ERR<n>STATUS.AV to 1 when an injected error is recorded and this field is RAO/WI:

Reserved, RAO/WI.

Otherwise:

Reserved, RES0.

PN, bit [10]
When ERR<n>PFGF.PN == 1:

Poison flag. The value written to ERR<n>STATUS.PN when an injected error is recorded.

PN	Meaning
0b0	ERR<n>STATUS.PN is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.PN is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ER, bit [9]
When ERR<n>PFGF.ER == 1:

Error Reported flag. The value written to ERR<n>STATUS.ER when an injected error is recorded.

ER	Meaning
0b0	ERR<n>STATUS.ER is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.ER is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CI, bit [8]
When ERR<n>PFGF.CI == 1:

Critical Error flag. The value written to ERR<n>STATUS.CI when an injected error is recorded.

CI	Meaning
0b0	ERR<n>STATUS.CI is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.CI is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CE, bits [7:6]

When ERR<n>PFGF.CE != 0b00:

Corrected Error generation enable. Controls the type of injected Corrected error generated by the fault injection feature of the node.

CE	Meaning	Applies when
0b00	An injected Corrected error will not be generated by the fault injection feature of the node.	
0b01	An injected non-specific Corrected error is generated in the fault injection state. ERR<n>STATUS.CE is set to 0b10 when the injected error is recorded.	When ERR<n>PFGF.CE == 0b01
0b10	An injected transient Corrected error is generated in the fault injection state. ERR<n>STATUS.CE is set to 0b01 when the injected error is recorded.	When ERR<n>PFGF.CE == 0b11
0b11	An injected persistent Corrected error is generated in the fault injection state. ERR<n>STATUS.CE is set to 0b11 when the injected error is recorded.	When ERR<n>PFGF.CE == 0b11

The set of permitted values for this field is defined by ERR<n>PFGF.CE.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DE, bit [5]

When ERR<n>PFGF.DE == 1:

Deferred Error generation enable. Controls whether an injected Deferred error is generated by the fault injection feature of the node.

DE	Meaning
0b0	An injected Deferred error will not be generated by the fault generation feature of the node.
0b1	An injected Deferred error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEO, bit [4]

When ERR<n>PFGF.UEO == 1:

Latent or Restartable Error generation enable. Controls whether an injected Latent or Restartable error is generated by the fault injection feature of the node.

UEO	Meaning
0b0	An injected Latent or Restartable error will not be generated by the fault generation feature of the node.
0b1	An injected Latent or Restartable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UER, bit [3]

When ERR<n>PFGF.UER == 1:

Signaled or Recoverable Error generation enable. Controls whether an injected Signaled or Recoverable error is generated by the fault injection feature of the node.

UER	Meaning
0b0	An injected Signaled or Recoverable error will not be generated by the fault generation feature of the node.
0b1	An injected Signaled or Recoverable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEU, bit [2]

When ERR<n>PFGF.UEU == 1:

Unrecoverable Error generation enable. Controls whether an injected Unrecoverable error is generated by the fault injection feature of the node.

UEU	Meaning
0b0	An injected Unrecoverable error will not be generated by the fault generation feature of the node.
0b1	An injected Unrecoverable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UC, bit [1]

When ERR<n>PFGF.UC == 1:

Uncontainable Error generation enable. Controls whether an injected Uncontainable error is generated by the fault injection feature of the node.

UC	Meaning
0b0	An injected Uncontainable error will not be generated by the fault generation feature of the node.
0b1	An injected Uncontainable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OF, bit [0]
When ERR<n>PFGF.OF == 1:

Overflow flag. The value written to ERR<n>STATUS.OF when an injected error is recorded.

OF	Meaning
0b0	ERR<n>STATUS.OF is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.OF is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing ERR<n>PFGCTL

This section shows the offset of ERR<n>PFGCTL in an error record group when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, or ERR<n>PFGCTL is accessed in a fault injection group, see 'RAS memory-mapped register views' for the offset of ERR<n>PFGCTL.

ERR<n>PFGCTL can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x808 + (64 * n)	ERR<n>PFGCTL

Accesses to this register are **RW**.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>PFGF, Error Record <n> Pseudo-fault Generation Feature Register, n = 0 - 65534

The ERR<n>PFGF characteristics are:

Purpose

Defines which common architecturally-defined fault generation features are implemented.

Configuration

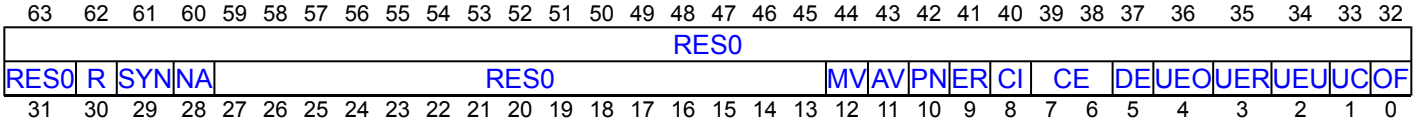
This register is present only when FEAT_RAS is implemented, error record n is implemented, the node that owns error record n implements the Common Fault Injection Model Extension, and error record n is the first error record in the node. Otherwise, direct accesses to ERR<n>PFGF are RES0 .

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGF is a 64-bit register.

Field descriptions



Bits [63:31]

Reserved, RES0.

R, bit [30]

Restartable. Support for Error Generation Counter restart mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

R	Meaning
0b0	The node does not support this feature. ERR<n>PFGCTL.R is RES0.
0b1	Error Generation Counter restart mode is implemented and is controlled by ERR<n>PFGCTL.R. ERR<n>PFGCTL.R is a read/write field.

Access to this field is **RO**.

SYN, bit [29]

Syndrome. Fault syndrome injection.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYN	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS.{IERR, SERR} to IMPLEMENTATION DEFINED values. ERR<n>STATUS.{IERR, SERR} are UNKNOWN when ERR<n>STATUS.V is 0.
0b1	When an injected error is recorded, the node does not update the ERR<n>STATUS.{IERR, SERR} fields. ERR<n>STATUS.{IERR, SERR} are writable when ERR<n>STATUS.V is 0.

Note

If ERR<n>PFGF.SYN is 1 then software can write specific values into the ERR<n>STATUS.{IERR, SERR} fields when setting up a fault injection event. The sets of values that can be written to these fields is IMPLEMENTATION DEFINED.

Access to this field is **RO**.

NA, bit [28]

No access required. Defines whether this component fakes detection of the error on an access to the component or spontaneously in the fault injection state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NA	Meaning
0b0	The component fakes detection of the error on an access to the component.
0b1	The component fakes detection of the error spontaneously in the fault injection state.

Access to this field is **RO**.

Bits [27:13]

Reserved, RES0.

MV, bit [12]

Miscellaneous syndrome.

Defines whether software can control all or part of the syndrome recorded in the ERR<n>MISC<m> registers when an injected error is recorded.

It is IMPLEMENTATION DEFINED which ERR<n>MISC<m> syndrome fields, if any, are updated by the node when an injected error is recorded. Some syndrome fields might always be updated by the node when an error, including an injected error, is recorded. For example, a corrected error counter might always be updated when any countable error, including a injected countable error, is recorded.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MV	Meaning
0b0	When an injected error is recorded, the node might update the ERR<n>MISC<m> registers: • If any syndrome is recorded by the node in the ERR<n>MISC<m> registers, then ERR<n>STATUS.MV is set to 1. • Otherwise, ERR<n>STATUS.MV is unchanged. If the node always sets ERR<n>STATUS.MV to 1 when recording an injected error then ERR<n>PFGCTL.MV might be RAO/WI. Otherwise ERR<n>PFGCTL.MV is RES0.
0b1	When an injected error is recorded, the node might update some, but not all ERR<n>MISC<m> syndrome fields: • If any syndrome is recorded by the node in the ERR<n>MISC<m> registers, then ERR<n>STATUS.MV is set to 1. • Otherwise, ERR<n>STATUS.MV is set to ERR<n>PFGCTL.MV. ERR<n>MISC<m> syndrome fields that are not updated by the node are writable when ERR<n>STATUS.MV is 0. If the node always sets ERR<n>STATUS.MV to 1 when recording an injected error then ERR<n>PFGCTL.MV is RAO/WI. Otherwise ERR<n>PFGCTL.MV is a read/write field.

If ERR<n>PFGF.MV is 1, software can write specific additional syndrome values into the ERR<n>MISC<m> registers when setting up a fault injection event. The permitted values that can be written to these registers are IMPLEMENTATION DEFINED.

Access to this field is **RO**.

AV, bit [11]

Address syndrome. Defines whether software can control the address recorded in ERR<n>ADDR when an injected error is recorded.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AV	Meaning
0b0	When an injected error is recorded, the node might record an address in ERR<n>ADDR. If an address is recorded in ERR<n>ADDR, then ERR<n>STATUS.AV is set to 1. Otherwise, ERR<n>ADDR and ERR<n>STATUS.AV are unchanged. If the node always records an address and sets ERR<n>STATUS.AV to 1 when recording an injected error then ERR<n>PFGCTL.AV might be RAO/WI. Otherwise ERR<n>PFGCTL.AV is RES0.
0b1	When an injected error is recorded, the node does not update ERR<n>ADDR and does one of: • Sets ERR<n>STATUS.AV to ERR<n>PFGCTL.AV. ERR<n>PFGCTL.AV is a read/write field. • Sets ERR<n>STATUS.AV to 1. ERR<n>PFGCTL.AV is RAO/WI. ERR<n>ADDR is writable when ERR<n>STATUS.AV is 0.

If ERR<n>PFGF.AV is 1 then software can write a specific address value into ERR<n>ADDR when setting up a fault injection event.

Access to this field is **RO**.

PN, bit [10]

When the node supports this flag:

Poison flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.PN status flag.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PN	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.PN to 1. ERR<n>PFGCTL.PN is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.PN is set to ERR<n>PFGCTL.PN. ERR<n>PFGCTL.PN is a read/write field.

This behavior replaces the architecture-defined rules for setting the ERR<n>STATUS.PN bit.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

ER, bit [9]

When the node supports this flag:

Error Reported flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.ER status flag.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ER	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS.ER according to the architecture-defined rules for setting the ER field. ERR<n>PFGCTL.ER is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.ER is set to ERR<n>PFGCTL.ER. This behavior replaces the architecture-defined rules for setting the ER bit. ERR<n>PFGCTL.ER is a read/write field.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

CI, bit [8]

When the node supports this flag:

Critical Error flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.CI status flag.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CI	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.CI to 1. ERR<n>PFGCTL.CI is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.CI is set to ERR<n>PFGCTL.CI. ERR<n>PFGCTL.CI is a read/write field.

This behavior replaces the architecture-defined rules for setting the ERR<n>STATUS.CI bit.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

CE, bits [7:6]

When the node supports this type of error:

Corrected Error generation. Describes the types of Corrected error that the fault generation feature of the node can generate.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CE	Meaning
0b00	The fault generation feature of the node does not generate Corrected errors. ERR<n>PFGCTL.CE is RES0.
0b01	The fault generation feature of the node allows generation of a non-specific Corrected error, that is, a Corrected error that is recorded by setting ERR<n>STATUS.CE to 0b10. ERR<n>PFGCTL.CE is a read/write field. The values 0b10 and 0b11 in ERR<n>PFGCTL.CE are reserved.
0b11	The fault generation feature of the node allows generation of transient or persistent Corrected errors, that is, Corrected errors that are recorded by setting ERR<n>STATUS.CE to 0b01 or 0b11 respectively. ERR<n>PFGCTL.CE is a read/write field. The value 0b01 in ERR<n>PFGCTL.CE is reserved.

All other values are reserved.

If ERR<n>FR.FRX is 1 then ERR<n>FR.CE indicates whether the node supports this type of error.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

DE, bit [5]

When the node supports this type of error:

Deferred Error generation. Describes whether the fault generation feature of the node can generate Deferred errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DE	Meaning
0b0	The fault generation feature of the node does not generate Deferred errors. ERR<n>PFGCTL.DE is RES0.
0b1	The fault generation feature of the node allows generation of Deferred errors. ERR<n>PFGCTL.DE is a read/write field.

If ERR<n>FR.FRX is 1 then ERR<n>FR.DE indicates whether the node supports this type of error.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

UEO, bit [4]

When the node supports this type of error:

Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate Latent or Restartable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UEO	Meaning
0b0	The fault generation feature of the node does not generate Latent or Restartable errors. ERR<n>PFGCTL.UEO is RES0.
0b1	The fault generation feature of the node allows generation of Latent or Restartable errors. ERR<n>PFGCTL.UEO is a read/write field.

If ERR<n>FR.FRX is 1 then ERR<n>FR.UEO indicates whether the node supports this type of error.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

UER, bit [3]

When the node supports this type of error:

Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate Signaled or Recoverable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UER	Meaning
0b0	The fault generation feature of the node does not generate Signaled or Recoverable errors. ERR<n>PFGCTL.UER is RES0.
0b1	The fault generation feature of the node allows generation of Signaled or Recoverable errors. ERR<n>PFGCTL.UER is a read/write field.

If ERR<n>FR.FRX is 1 then ERR<n>FR.UER indicates whether the node supports this type of error.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

UEU, bit [2]

When the node supports this type of error:

Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate Unrecoverable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UEU	Meaning
0b0	The fault generation feature of the node does not generate Unrecoverable errors. ERR<n>PFGCTL.UEU is RES0.
0b1	The fault generation feature of the node allows generation of Unrecoverable errors. ERR<n>PFGCTL.UEU is a read/write field.

If ERR<n>FR.FRX is 1 then ERR<n>FR.UEU indicates whether the node supports this type of error.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

UC, bit [1]

When the node supports this type of error:

Uncontainable Error generation. Describes whether the fault generation feature of the node can generate Uncontainable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UC	Meaning
0b0	The fault generation feature of the node does not generate Uncontainable errors. ERR<n>PFGCTL.UC is RES0.
0b1	The fault generation feature of the node allows generation of Uncontainable errors. ERR<n>PFGCTL.UC is a read/write field.

If ERR<n>FR.FRX is 1 then ERR<n>FR.UC indicates whether the node supports this type of error.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

OF, bit [0]

When the node supports this flag:

Overflow flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.OF status flag.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OF	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS.OF according to the architecture-defined rules for setting the OF field. ERR<n>PFGCTL.OF is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.OF is set to ERR<n>PFGCTL.OF. This behavior replaces the architecture-defined rules for setting the OF bit. ERR<n>PFGCTL.OF is a read/write field.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

Accessing ERR<n>PFGF

This section shows the offset of ERR<n>PFGF in an error record group when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, or ERR<n>PFGF is accessed in a fault injection group, see 'RAS memory-mapped register views' for the offset of ERR<n>PFGF.

ERR<n>PFGF can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x800 + (64 * n)	ERR<n>PFGF

Accesses to this register are **RO**.

ERR<n>STATUS, Error Record <n> Primary Status Register, n = 0 - 65534

The ERR<n>STATUS characteristics are:

Purpose

When RAS System Architecture v2 is implemented, error record <n> might be one of the following:

- A continuation record containing more information about the error recorded in error record <n-1>. In this case, ERR<n>STATUS contains a subset of the values of a normal error record status register.
- A proxy for a different RAS agent. In this case, ERR<n>STATUS reports the status of the RAS agent.

Otherwise, ERR<n>STATUS contains status information for error record <n>, including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An IMPLEMENTATION DEFINED extended error code.

Within this register:

- ERR<n>STATUS.{AV, V, MV} are valid bits that define whether error record <n> registers are valid.
- ERR<n>STATUS.{UE, OF, CE, DE, UET} encode the types of error or errors recorded.
- ERR<n>STATUS.{CI, ER, PN, IERR, SERR} are syndrome fields.

Configuration

This register is present only when FEAT_RAS is implemented and error record n is implemented. Otherwise, direct accesses to ERR<n>STATUS are RES0.

ERRFRPFGF[FirstRecordOfNode(n)] describes the features implemented by the node that owns error record <n>. FirstRecordOfNode(n) is the index of the first error record owned by the same node as error record <n>. If the node owns a single record then FirstRecordOfNode(n) = n.

For IMPLEMENTATION DEFINED fields in ERR<n>STATUS, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, nonzero, and ignore writes are compliant with this requirement.

Note

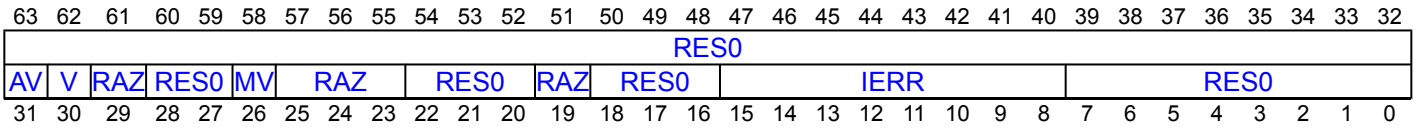
Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERRCTLR[FirstRecordOfNode(n)].

Attributes

ERR<n>STATUS is a 64-bit register.

Field descriptions

When RAS System Architecture v2 is implemented, ERR<n>FR.ED == 0b00, and ERR<n>FR.ERT == 0b01:



Continuation record.

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record n includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an additional address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == 1, this field resets to an architecturally UNKNOWN value.
  - Otherwise, this field resets to '0'.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. Additional syndrome has been recorded.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == 1, this field resets to an architecturally UNKNOWN value.
  - Otherwise, this field resets to '0'.

Access to this field is **W1C**.

Bit [29]

Reserved, RAZ.

Bits [28:27]

Reserved, RES0.

MV, bit [26]

When error record <n> includes additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The contents of the ERR<n>MISC<m> registers contain additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == 1, this field resets to an architecturally UNKNOWN value.
  - Otherwise, this field resets to '0'.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

Bits [25:23]

Reserved, RAZ.

Bits [22:20]

Reserved, RES0.

Bit [19]

Reserved, RAZ.

Bits [18:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED additional error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

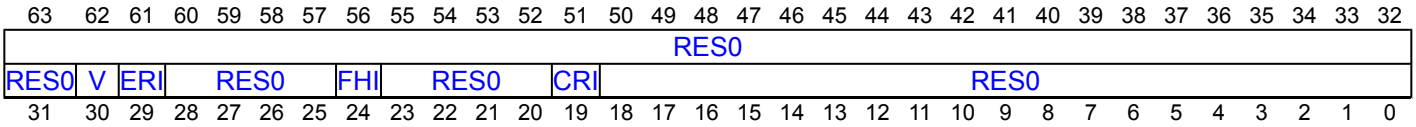
Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if all the following are true:
  - ERR<n>STATUS.V == 0.
  - the node that owns error record n does not implement the Common Fault Injection Model Extension.
- Access to this field is **UNKNOWN/WI** if all the following are true:
  - ERR<n>STATUS.V == 0.
  - ERRPFGF[FirstRecordOfNode(n)].SYN == 0.
- Otherwise, access to this field is **RW**.

Bits [7:0]

Reserved, RES0.

When RAS System Architecture v2 is implemented, ERR<n>FR.ED == 0b11, and ERR<n>FR.ERT == 0b01:



Proxy for a RAS agent.

Bits [63:31]

Reserved, RES0.

V, bit [30]

RAS agent error status.

V	Meaning
0b0	RAS agent error status is not asserted.
0b1	RAS agent error status is asserted.

Access to this field is **RO**.

ERI, bit [29]

RAS agent Error Recovery condition.

ERI	Meaning
0b0	RAS agent error recovery condition is false.
0b1	RAS agent error recovery condition is true.

Access to this field is **RO**.

Bits [28:25]

Reserved, RES0.

FHI, bit [24]

RAS agent Fault Handling condition.

FHI	Meaning
0b0	RAS agent fault handling condition is false.
0b1	RAS agent fault handling condition is true.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

CRI, bit [19]

RAS agent criticial error condition.

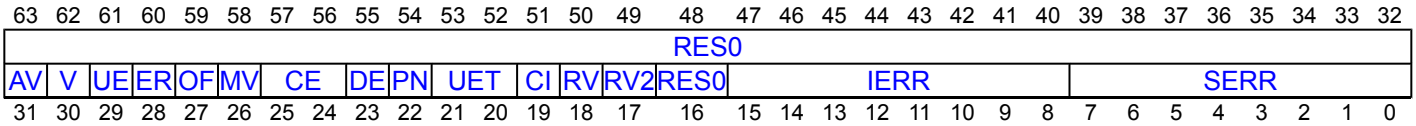
CRI	Meaning
0b0	RAS agent criticial error condition is false.
0b1	RAS agent criticial error condition is true.

Access to this field is **RO**.

Bits [18:0]

Reserved, RES0.

When RAS System Architecture v1p1 is implemented:



Normal record, from FEAT_RASSAv1p1.

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record n includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == 1, this field resets to an architecturally UNKNOWN value.
  - Otherwise, this field resets to '0'.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == 1, this field resets to an architecturally UNKNOWN value.
  - Otherwise, this field resets to '0'.

Access to this field is **W1C**.

UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

ER, bit [28]

When in-band error responses can be returned for a Deferred error:

Error Reported.

ER	Meaning
0b0	No in-band error response (External abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: • The ERRCTLR[FirstRecordOfNode(n)].UE field, or applicable one of the ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE} fields, is implemented and was 1 when an error was detected and not corrected. • The ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE, UE} fields are not implemented and the component always reports errors.

Note

An in-band error response signaled by the component might be masked and not generate any exception.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, can signal an in-band error response to the Requester, causing this field to be set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - ERR<n>STATUS.V == 0.
  - ERR<n>STATUS.[DE,UE] == 0b00.
- Otherwise, access to this field is **W1C**.

When in-band error responses are never returned for a Deferred error:

Error Reported.

ER	Meaning
0b0	No in-band error response (External abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: • The ERRCTLR[FirstRecordOfNode(n)].UE field, or applicable one of the ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE} fields, is implemented and was 1 when an error was detected and not corrected. • The ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE, UE} fields are not implemented and the component always reports errors.

Note

An in-band error response signaled by the component might be masked and not generate any exception.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, can signal an in-band error response to the Requester, causing this field to be set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - ERR<n>STATUS.V == 0.
  - ERR<n>STATUS.UE == 0.
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.
- ERR<n>STATUS.V was previously 1, a Corrected error counter is not implemented, and a Corrected error is recorded.
- ERR<n>STATUS.V was previously 1, and a type of error other than a Corrected error is recorded.

Otherwise, this field is unchanged when an error is recorded.

If a Corrected error counter is implemented, then:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.
- A direct write to this field that clears this field to zero might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
0b0	Since this field was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed.
0b1	Since this field was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

MV, bit [26]

When error record <n> includes additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The contents of the ERR<n>MISC<m> registers contain additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == 1, this field resets to an architecturally UNKNOWN value.
  - Otherwise, this field resets to '0'.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - ERR<n>STATUS.V == 0.
  - ERR<n>STATUS.[DE,UE] == 0b00.
- Otherwise, access to this field is **W1C**.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

UER can mean either Signaled or Recoverable error, and UEO can mean either Latent or Restartable error.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - ERR<n>STATUS.V == 0.
  - ERR<n>STATUS.UE == 0.
- Otherwise, access to this field is **W1C**.

CI, bit [19]

Critical Error. Indicates whether a critical error condition has been recorded.

CI	Meaning
0b0	No critical error condition.
0b1	Critical error condition.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

RV, bit [18]

When RAS System Architecture v2 is implemented:

Reset Valid. When ERR<n>STATUS.V is 1, indicating the error record is valid, this field indicates whether the error was recorded before or after the most recent Error Recovery reset.

RV	Meaning
0b0	If the error record is valid then one or more errors have been recorded after the last Error Recovery reset. This error or errors might have overwritten lower priority errors recorded before the last Error Recovery reset.
0b1	If the error record is valid then one or more errors were recorded before the last Error Recovery reset.

This field is set to 0 when an error is recorded and either the fault overwrites the error syndrome, or the error record was previously not valid.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to '1'.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

RV2, bit [17]

When RAS System Architecture v2 is implemented:

Reset Valid 2. When ERR<n>STATUS.{V, RV} is {1, 1}, indicating the error record is valid and one or more errors were recorded before the last Error Recovery reset, this field indicates whether any lower severity errors have been recorded after the Error Recovery reset that did not overwrite the syndrome.

RV2	Meaning
0b0	If the error record is valid then one or more errors were recorded after the last Error Recovery reset that did not overwrite the error syndrome. This includes errors that did not overwrite a previously recorded error syndrome.
0b1	If the error record is valid then one or more errors were recorded before the last Error Recovery reset.

This field is set to 0 when an error is recorded, including when the fault does not overwrite a previously recorded syndrome.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to '1'.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

Bit [16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if all the following are true:
  - the node that owns error record n does not implement the Common Fault Injection Model Extension.
  - ERR<n>STATUS.V == 0.
- Access to this field is **UNKNOWN/WI** if all the following are true:
  - ERRPFGF[FirstRecordOfNode(n)].SYN == 0.
  - ERR<n>STATUS.V == 0.
- Otherwise, access to this field is **RW**.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, **nSEI** pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, SVE, and SME registers are data registers.
0x11	Internal control register. For example, parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, SVE, and SME registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A	Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

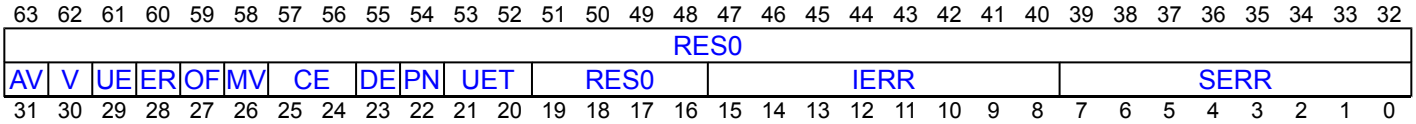
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if all the following are true:
  - the node that owns error record n does not implement the Common Fault Injection Model Extension.
  - ERR<n>STATUS.V == 0.
- Access to this field is **UNKNOWN/WI** if all the following are true:
  - ERRPFGF[FirstRecordOfNode(n)].SYN == 0.
  - ERR<n>STATUS.V == 0.

- Otherwise, access to this field is **RW**.

Otherwise:



Normal record, when FEAT_RASSAv1p1 is not implemented.

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record n includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == 1, this field resets to an architecturally UNKNOWN value.
  - Otherwise, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.[DE,UE] == 0b00.
  - ERR<n>STATUS.CE != 0b00.
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.UE == 0.
  - ERR<n>STATUS.DE != 0.
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.UE != 0.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

The reset behavior of this field is:

- On a Cold reset:

    - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == 1, this field resets to an architecturally UNKNOWN value.
    - Otherwise, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is **RO** if all the following are true:
    - ERR<n>STATUS.CE != 0b00.
    - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- Access to this field is **RO** if all the following are true:
    - ERR<n>STATUS.DE != 0.
    - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- Access to this field is **RO** if all the following are true:
    - ERR<n>STATUS.UE != 0.
    - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is **W1C**.

UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Access to this field is **RO** if all the following are true:
    - ERR<n>STATUS.OF == 1.
    - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is **W1C**.

ER, bit [28]

When in-band error responses can be returned for a Deferred error:

Error Reported.

ER	Meaning
0b0	No in-band error response (External abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: • The ERRCTLR[FirstRecordOfNode(n)].UE field, or applicable one of the ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE} fields, is implemented and was 1 when an error was detected and not corrected. • The ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE, UE} fields are not implemented and the component always reports errors.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing both ERR<n>STATUS.{DE, UE} to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - ERR<n>STATUS.V == 0.
  - ERR<n>STATUS.[DE,UE] == 0b00.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.UE != 0.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.UE == 0.
  - ERR<n>STATUS.DE != 0.
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is **W1C**.

When in-band error responses are never returned for a Deferred error:

Error Reported.

ER	Meaning
0b0	No in-band error response (External abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: • The ERRCTLR[FirstRecordOfNode(n)].UE field, or applicable one of the ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE} fields, is implemented and was 1 when an error was detected and not corrected. • The ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE, UE} fields are not implemented and the component always reports errors.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - ERR<n>STATUS.V == 0.
  - ERR<n>STATUS.UE == 0.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.UE != 0.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 1.
- A Deferred error is detected, ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE != 0b00. ERR<n>STATUS.CE might be updated for the new Corrected error.
- A Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is set to 1 when one of the following occurs:

- A Deferred error is detected and ERR<n>STATUS.UE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, and ERR<n>STATUS.{UE, DE} != {0, 0}.
- A Corrected error counter is implemented, ERR<n>STATUS.{UE, DE} != {0, 0}, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is cleared to 0 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0.
- A Deferred error is detected, ERR<n>STATUS.UE == 0, and ERR<n>STATUS.DE == 0.
- A Corrected error is detected, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE == `0b00`.

The IMPLEMENTATION DEFINED clearing of this field might also depend on the value of the other error status fields.

If a Corrected error counter is implemented, then:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.
- A direct write to this field that clears this field to 0 might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
`0b0`	If ERR<n>STATUS.UE == 1, then no error syndrome for an Uncorrected error has been discarded. If ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1, then no error syndrome for a Deferred error has been discarded. If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and a Corrected error counter is implemented, then the counter has not overflowed. If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, ERR<n>STATUS.CE != `0b00`, and no Corrected error counter is implemented, then no error syndrome for a Corrected error has been discarded. **Note** This field might have been set to 1 when an error syndrome was discarded and later cleared to 0 when a higher priority syndrome was recorded.
`0b1`	At least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

MV, bit [26]
When error record <n> includes additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
`0b0`	ERR<n>MISC<m> not valid.
`0b1`	The contents of the ERR<n>MISC<m> registers contain additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == 1, this field resets to an architecturally UNKNOWN value.

- Otherwise, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.[DE,UE] == 0b00.
  - ERR<n>STATUS.CE != 0b00.
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.UE == 0.
  - ERR<n>STATUS.DE != 0.
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.UE != 0.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.OF == 1.
  - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is **W1C**.

DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.OF == 1.
  - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is **W1C**.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing both ERR<n>STATUS.{DE, UE} to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:
  - ERR<n>STATUS.V == 0.
  - ERR<n>STATUS.[DE,UE] == 0b00.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.[DE,UE] == 0b00.
  - ERR<n>STATUS.CE != 0b00.
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.UE == 0.
  - ERR<n>STATUS.DE != 0.
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.UE != 0.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is **W1C**.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

UER can mean either Signaled or Recoverable error, and UEO can mean either Latent or Restartable error.

If this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if any the following are true:

        - ERR<n>STATUS.V == 0.
        - ERR<n>STATUS.UE == 0.
    - Access to this field is **RO** if all the following are true:
        - ERR<n>STATUS.[DE,UE] == 0b00.
        - ERR<n>STATUS.CE != 0b00.
        - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
    - Access to this field is **RO** if all the following are true:
        - ERR<n>STATUS.UE == 0.
        - ERR<n>STATUS.DE != 0.
        - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
    - Access to this field is **RO** if all the following are true:
        - ERR<n>STATUS.UE != 0.
        - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
    - Otherwise, access to this field is **W1C**.

Bits [19:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if all the following are true:
    - the node that owns error record n does not implement the Common Fault Injection Model Extension.
    - ERR<n>STATUS.V == 0.
- Access to this field is **UNKNOWN/WI** if all the following are true:
    - ERRPFGF[FirstRecordOfNode(n)].SYN == 0.
    - ERR<n>STATUS.V == 0.
- Access to this field is **RO** if all the following are true:
    - ERR<n>STATUS.[DE,UE] == 0b00.
    - ERR<n>STATUS.CE != 0b00.
    - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- Access to this field is **RO** if all the following are true:
    - ERR<n>STATUS.UE == 0.
    - ERR<n>STATUS.DE != 0.
    - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- Access to this field is **RO** if all the following are true:
    - ERR<n>STATUS.UE != 0.
    - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is **RW**.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, **nSEI** pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, SVE, and SME registers are data registers.
0x11	Internal control register. For example, parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, SVE, and SME registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A	Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **UNKNOWN/WI** if all the following are true:
  - the node that owns error record n does not implement the Common Fault Injection Model Extension.
  - ERR<n>STATUS.V == 0.
- Access to this field is **UNKNOWN/WI** if all the following are true:
  - ERRPFGF[FirstRecordOfNode(n)].SYN == 0.
  - ERR<n>STATUS.V == 0.

- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.DE == 0.
  - ERR<n>STATUS.UE == 0.
  - ERR<n>STATUS.CE != 0b00.
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.UE == 0.
  - ERR<n>STATUS.DE != 0.
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- Access to this field is **RO** if all the following are true:
  - ERR<n>STATUS.UE != 0.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is **RW**.

Accessing ERR<n>STATUS

ERR<n>STATUS.{AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI} are write-one-to-clear (W1C) fields, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero. ERR<n>STATUS.{IERR, SERR} are read/write (RW) fields, although the set of implemented valid values is IMPLEMENTATION DEFINED. See also ERR<n>PFGF.SYN.

After reading ERR<n>STATUS, software must clear the valid fields in the register to allow new errors to be recorded. However, between reading the register and clearing the valid fields, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to ERR<n>STATUS.{UE, DE, CE} are ignored if ERR<n>STATUS.OF is 1 and is not being cleared to 0.
- Writes to ERR<n>STATUS.V are ignored if any of ERR<n>STATUS.{UE, DE, CE} are nonzero and are not being cleared to zero.
